There is one very singular weapon among the Fans. Perhaps there is no part of the world where we could less expect to find the crossbow than among a cannibal tribe at the head of the Gaboon. Yet there the crossbow is regularly used as an engine of war, and a most formidable weapon it is, giving its possessors a terrible advantage over their foes. The ingenuity exhibited in the manufacture of this weapon is very great, and yet one cannot but wonder at the odd mixture of cleverness and stupidity which its structure shows. The bow is very strong, and when the warrior wishes to bend it he seats himself on the ground, puts his foot against the bow, and so has both hands at liberty, by which he can haul the cord into the notch which holds it until it is released by the trigger. The shaft is about five feet long, and is split for a considerable portion of its length. The little stick which is thrust between the split por-

tions constitutes the trigger, and the method of using it is as follows:—

Just below the notch which holds the string is a round hole through which passes a short peg. The other end of the peg, which is made of very hard wood, is fixed into the lower half of the split shaft, and plays freely through the hole. When the two halves of the shaft are separated by the trigger, the peg is pulled through the hole, and allows the cord to rest in the notch. But as soon as the trigger is removed the two halves close together, and the peg is thus driven up through the hole, knocking the cord out of the notch. I have in my collection a Chinese crossbow, the string of which is released on exactly the same principle.

Of course, an accurate aim is out of the question, for the trigger-peg is held so tightly between the two halves of the shaft that it cannot be pulled out without so great an effort that any aim must be effectually deranged. But in the use of this weapon aim is of very little consequence, as the bow is only used at very short ranges, fifteen yards being about the longest distance at which a Fan cares to expend an arrow. The arrows themselves are not calculated for long ranges, as they are merely little strips of wood a foot or so in length, and about the sixth of an inch in diameter. They owe their terrors, not to their sharpness, nor to the velocity with which they are impelled, but to the poison with which their tips are imbued. Indeed, they are so extremely light that they cannot be merely laid on the groove of the shaft, lest they should be blown away by the wind. They are therefore fastened in their place with a little piece of gum, of which the archer always takes care to have a supply at hand. Owing to their diminutive size, they cannot be seen until their force is expended, and to this circumstance they owe much of their power. They have no feathers, neither does any particular care seem to be taken about their tips, which, although pointed, are not nearly as sharp as those of the tiny arrows used by the Dyaks of Borneo, or the Macoushies of the *Ésse-qui-bo*.

The poison with which their points are imbued is procured from the juice of some plant at present unknown, and two or three coatings are given before the weapon is considered to be sufficiently envenomed. The Fans appear to be unacquainted with any antidote for the poison, or, if they do know of any, they keep it a profound secret. The reader may remember a parallel instance among the *Bosjesmans*, with regard to the antidote for the poison-grub.

Besides these arrows, they use others about two feet in length, with iron heads, whenever they go in search of large game; but in warfare, the little arrow is quite strong enough to penetrate the skin of a

human being, and is therefore used in preference to the larger and more cumbersome dart.

The only defensive weapon is the shield, which is made from the hide of the elephant. It varies slightly in shape, but is generally oblong, and is about three feet long by two and a half wide, so that it covers all the vital parts of the body. The piece of hide used for the shield is cut from the shoulders of the elephant, where, as is the case with the pachyderms in general, the skin is thickest and strongest. No spear can penetrate this shield, the axe cannot hew its way through it, the missile knife barely indents it, and the crossbow arrows rebound harmlessly from its surface. Even a bullet will glance off if it should strike obliquely on the shield. Such a shield is exceedingly valuable, because the skin of an elephant will not afford material for more than one or two shields, and elephant-killing is a task that needs much time, patience, courage, and ingenuity. Moreover, the elephant must be an old one, and, as the old elephants are proverbially fierce and cunning, the danger of hunting them is very great.

Like other savages, the Fan has no idea of "sport." He is necessarily a "pot-hunter," and thinks it the most foolish thing in the world to give the game a fair chance of escape. When he goes to hunt, he intends to kill the animal, and cares not in the least as to the means which he uses. The manner of elephant hunting is exceedingly ingenious.

As soon as they find an elephant feeding, the Fans choose a spot at a little distance where the monkey vines and other creepers dangle most luxuriantly from the boughs. Quietly detaching them, they interweave them among the tree trunks, so as to make a strong, net-like barrier, which is elastic enough to yield to the rush of an elephant, and strong enough to detain and entangle him. Moreover, the Fans know well that the elephant dreads anything that looks like a fence, and, as has been well said, may be kept prisoner in an enclosure which would not detain a calf.

When the barrier is completed, the Fans, armed with their spears, surround the elephant, and by shouts and cries drive him in the direction of the barrier. As soon as he strikes against it, he is filled with terror, and instead of exerting his gigantic strength, and breaking through the obstacle, he struggles in vague terror, while his enemies crowd round him, inflicting wound after wound with their broad-bladed spears. In vain does he strike at the twisted vines, or endeavor to pull them down with his trunk, and equally in vain he endeavors to trample them under foot. The elastic ropes yield to his efforts, and in the meanwhile the fatal missiles are poured on him from every side. Some of the hunters crawl through the brush, and wound him from below; others

climb up trees, and hurl spears from among the boughs; while the bolder attack him openly, running away if he makes a charge, and returning as soon as he pauses, clustering round him like flies round a carcass.

This mode of chase is not without its dangers, men being frequently killed by the elephant, which charges unexpectedly, knocks them down with a blow of the trunk, and then tramples them under foot. Sometimes an unfortunate hunter, when charged by the animal, loses his presence of mind, runs toward the vine barrier, and is caught in the very meshes which he helped to weave. Tree climbing is the usual resource of a chased hunter; and, as the Fans can run up trees almost as easily as monkeys, they find themselves safer among the branches than they would be if they merely tried to dodge the animal round the tree trunks.

The Fans also use an elephant trap which is identical in principle with that which is used in killing the hippopotamus, — namely, a weighted spear hung to a branch under which the elephant must pass, and detached by a string tied to a trigger. The natives are assisted in their elephant-hunting expeditions by the character of the animal. Suspicious and crafty as is the elephant, it has a strong disinclination to leave a spot where it finds the food which it likes best; and in consequence of this peculiarity, whenever an elephant is discovered, the Fans feel sure that it will remain in the same place for several days, and take their measures accordingly.

When they have killed an elephant, they utilize nearly the whole of the enormous carcass, taking out the tusks for sale, using the skin of the back for shields, and eating the whole of the flesh. To European palates the flesh of the elephant is distasteful, partly on account of its peculiar flavor, and partly because the cookery of the native African is not of the best character. M. du Chaillu speaks of it in very contemptuous terms. "The elephant meat, of which the Fans seem to be very fond, and which they have been cooking and smoking for three days, is the toughest and most disagreeable meat I ever tasted. I cannot explain its taste, because we have no flesh which tastes like it, but it seems full of muscular fibre or gristle; and when it has been boiled for two days, twelve hours each day, it is still tough. The flavor is not unpleasant; but, although I had tried at different times to accustom myself to it, I found only that my disgust grew greater."

Whether elephant meat is governed by the same culinary laws as ox meat remains to be seen; but, if such be the case, the cook who *boiled* the meat for twenty-four hours seems to have ingeniously hit upon a plan that would make the best beef tough, stringy, tasteless, and almost uneatable. Had it been gently simmered for six hours,

the result might have been different; but to boil meat for twenty-four hours by way of making it tender is as absurd as boiling an egg for the same period by way of making it soft.

As to their diet in general, the Fans do not deserve a very high culinary rank. They have plenty of material, and very slight notions of using it. The manioc affords them a large portion of their vegetable food, and is particularly valuable on account of the ease with which it is cultivated, a portion of the stem carelessly placed in the ground producing in a single season two or three large roots. The leaves are also boiled and eaten. Pumpkins of different kinds are largely cultivated, and even the seeds are rendered edible. M. du Chaillu says that during the pumpkin season the villages seem covered with the seeds, which are spread out to dry, and, when dried, they are packed in leaves and hung in the smoke over the fireplace, in order to keep off the attacks of an insect which injures them.

When they are to be eaten, they are first boiled, and then the skin is removed. The seeds are next placed in a mortar together with a little sweet oil, and are pounded into a soft, pulpy mass, which is finally cooked over the fire, either in an earthen pot or in a plantain leaf. This is a very palatable sort of food, and some persons prefer it to the pumpkin itself.

The mortars are not in the least like those of Europe, being long, narrow troughs, two feet in length, two or three inches deep, and seven or eight wide. Each family has one or two of these small implements, but there are always some enormous mortars for the common use of the village, which are employed in pounding manioc. When the seed is pounded into a paste, it is formed into cakes, and can be kept for some little time.

The cooking pots are made of clay, and formed with wonderful accuracy, seeing that the Fans have no idea of the potter's wheel, even in its simplest forms. Their cooking pots are round and flat, and are shaped something like milk pans. They also make clay water bottles of quite a classical shape, and vessels for palm wine are made from the same material. These wine jars are shaped much like the amphoræ of the ancients. The clay is moulded by hand, dried thoroughly in the sun, and then baked in a fire. The exterior is adorned with patterns much like those on the knives and axes.

The Fans also make the bowls of their pipes of the same clay, but always form the stems of wood. The richer among them make their pipes entirely of iron, and prefer them, in spite of their weight and apparent inconvenience, to any others. They also make very ingenious water bottles out of reeds, and, in order to render them water tight, plaster them within and without with a vegetable gum. This gum is first soft-

ened in the fire, and laid on the vessel like pitch. It has a very unpleasant flavor until it is quite seasoned, and is therefore kept under water for several weeks before it is used.

Like some other savage tribes, the Fans have a craving for meat, which sometimes becomes so powerful as to deserve the name of a disease. The elephant affords enough meat to quell this disease for a considerable time, and therefore they have a great liking for the flesh of this animal. But the great luxury of a Fan is the flesh of a sheep, an animal which they can scarcely ever procure. Mr. W. Reade, in his "Savage Africa," gives a most amusing description of the sensation produced among his Fan boatmen:—

"Before I left the village I engaged another man, which gave me a crew of eight. I also purchased a smooth-skinned sheep, and upon this poor animal, as it lay shackled in our prow, many a hungry eye was cast. When it bleated the whole crew burst into one loud carnivorous grin. Bushmen can sometimes enjoy a joint of stringy venison, a cut off a smoked elephant, a boiled monkey, or a grilled snake; but a sheep—a real domestic sheep!—an animal which had long been looked upon as the pride of their village, the eyesore of their poorer neighbors—whom they had been in the habit of calling 'brother,' and upon whom they had lavished all the privileges of a fellow-citizen!

"That fate should have sent the white and wealthy offspring of the sea to place this delicacy within their reach was something too strong and sudden for their feeble minds. They were unsettled; they could not paddle properly; their souls (which are certainly in their stomachs, wherever ours may be) were restless and quivering toward that sheep, as (I have to invent metaphors) the needle ere it rests upon its star.

"When one travels in the company of cannibals, it is bad policy to let them become too hungry. At mid-day I gave orders that the sheep should be killed. There was a yell of triumph, a broad knife steeped in blood, a long struggle; then three fires blazed forth, three clay pots were placed thereon, and filled with the bleeding limbs of the deceased. On an occasion like this, the negro is endowed for a few moments with the energy and promptitude of the European. Nor would I complain of needless delay in its preparation for the table—which was red clay covered with grass. The mutton, having been slightly warmed, was rapidly devoured.

"After this they wished to recline among the fragments of the feast, and enjoy a sweet digestive repose. But then the white man arose, and exercised that power with which the lower animals are quelled. His look and his tone drew them to their work, though they did not understand his words."

CHAPTER LII.

THE FANS — *Concluded.*

CANNIBALISM AND ITS DEVELOPMENT AMONG THE FANS — NATIVE IDEAS ON THE SUBJECT — EXCHANGE OF BODIES BETWEEN VILLAGES — ATTACK ON A TOWN AND ROBBERY OF THE GRAVES — MATRIMONIAL CUSTOMS — BARGAINING FOR A WIFE — COPPER "NEPTUNES" — THE MARRIAGE FEAST — RELIGION OF THE FANS — THE IDOL HOUSES — LOVE OF AMULETS — DANCE IN HONOR OF THE NEW MOON — PLAYING THE HANDJA — ELEPHANTS CAUGHT BY THE FETISH — PROBABLE CHARACTER OF THE "FETISH" IN QUESTION — THE GORILLA AND ITS HABITS — A GORILLA HUNT BY THE FANS — USE OF THE SKULL.

THE preceding story naturally brings us to the chief characteristic of the Fans, — namely, their cannibalism.

Some tribes where this custom is practised are rather ashamed of it, and can only be induced to acknowledge it by cautious cross-questioning. The Fans, however, are not in the least ashamed of it, and will talk of it with perfect freedom—at least until they see that their interlocutor is shocked by their confession. Probably on this account missionaries have found some difficulty in extracting information on the subject. Their informants acknowledged that human flesh was eaten by their tribe, but not in their village. Then, as soon as they had arrived at the village in which cannibalism was said to exist, the inhabitants said that the travellers had been misinformed. Certainly their tribe did eat human flesh, but no one in their village did so. But, if they wanted to see cannibalism, they must go back to the village from which they had just come, and there they would find it in full force.

Knowing this peculiarity, Mr. W. Reade took care to ask no questions on the subject until he had passed through all the places previously visited by white men, and then questioned an old and very polite cannibal. His answers were plain enough. Of course they all ate men. He ate men himself. Man's flesh was very good, and was "like monkey, all fat." He mostly ate prisoners of war, but some of his friends ate the bodies of executed wizards, a food of which he was rather afraid, thinking that it might disagree with him.

He would not allow that he ate his own

relations when they died, although such a statement is made, and has not as yet been disproved. Some travellers say that the Fans do not eat people of their own village, but live on terms of barter with neighboring villages, amicably exchanging their dead for culinary purposes. The Oshebas, another cannibal tribe of the same country, keep up friendly relations with the Fans, and exchange the bodies of the dead with them. The bodies of slaves are also sold for the pot, and are tolerably cheap, a dead slave costing, on the average, one small elephant's tusk.

The friendly Fan above mentioned held, in common with many of his dark countrymen, the belief that all white men were cannibals. "These," said a Bakalai slave, on first beholding a white man, "are the men that eat us!" So he asked Mr. Reade why the white men take the trouble to send to Africa for negroes, when they could eat as many white men as they liked in their own land. His interlocutor having an eye to the possible future, discreetly answered that they were obliged to do so, *because the flesh of white men was deadly poison*, with which answer the worthy cannibal was perfectly satisfied.

Just before M. du Chaillu came among the Fans a strange and wild incident had occurred. It has already been mentioned that the Fans have been for some years pushing their way westward, forming part of the vast stream of human life that continually pours over the great mountain wall which divides Central Africa from the coast tribes. After passing through various districts, and conquering their inhabitants,

they came upon a village of the Mpongwé, and, according to their wont, attacked it. The Mpongwé were utterly incapable of resisting these warlike and ferocious invaders, and soon fled from their homes, leaving them in the hands of the enemy. The reader may find an illustration of this scene on the next page.

The Fans at once engaged in their favorite pastime of plunder, robbing every hut that they could find, and, when they had cleared all the houses, invading the burial-grounds, and digging up the bodies of the chiefs for the sake of the ornaments, weapons, and tools which are buried with them.

They had filled two canoes with their stolen treasures when they came upon a grave containing a newly-buried body. This they at once exhumed, and, taking it to a convenient spot under some mangrove trees, lighted a fire, and cooked the body in the very pots which they had found in the same grave with it. The reader will remember that the Mpongwé tribe bury with the bodies of their principal men the articles which they possessed in life, and that a chief's grave is therefore a perfect treasure house.

All bodies, however, are not devoured, those of the kings and great chiefs being buried together with their best apparel and most valuable ornaments.

The matrimonial customs of the Fans deserve a brief notice. The reader may remember that, as a general rule, the native African race is not a prolific one—at all events in its own land, though, when imported to other countries as slaves, the Africans have large families. Children are greatly desired by the native tribes because they add to the dignity of the parent, and the lack of children is one of the reasons why polygamy is so universally practised; and, as a rule, a man has more wives than children. Yet the Fans offered a remarkable exception to this rule, probably on account of the fact that they do not marry until their wives have fairly arrived at woman's estate. They certainly betroth their female children at a very early age, often as soon as they are born, but the actual marriage does not take place until the child has become a woman, and in the meantime the betrothed girl remains with her parents, and is not allowed that unrestricted license which prevails among so many of the African tribes.

This early betrothal is a necessity, as the price demanded for a wife is a very heavy one, and a man has to work for a long time before he can gather sufficient property for the purchase. Now that the Fans have forced themselves into the trading parts of the country, "trader's goods" are the only articles that the father will accept in return for his daughter; and, as those goods are only to be bought with ivory, the Fan bride-

groom has to kill a great number of elephants before he can claim his wife.

Bargaining for a wife is often a very amusing scene (see illustration on next page), especially if the father has been sufficiently sure of his daughter's beauty to refrain from betrothing her as a child, and to put her up, as it were, to auction when she is nearly old enough to be married. The dusky suitor dresses himself in his best apparel, and waits on the father, in order to open the negotiation.

His business is, of course, to depreciate the beauty of the girl, to represent that, although she may be very pretty as a child of eleven or twelve, she will have fallen off in her good looks when she is a mature woman of fourteen or fifteen. The father, on the contrary, extols the value of his daughter, speaks slightly of the suitor as a man quite beneath his notice, and forthwith sets a price on her that the richest warrior could not hope to pay. Copper and brass pans, technically called "neptunes," are the chief articles of barter among the Fans, who, however, do not use them for cooking, preferring for this purpose their own clay pots, but merely for a convenient mode of carrying a certain weight of precious metal. Anklets and armlets of copper are also much valued, and so are white beads, while of late years the abominable "trade-guns" have become indispensable. At last, after multitudinous arguments on both sides, the affair is settled, and the price of the girl agreed upon. Part is generally paid at the time by way of earnest, and the bridegroom promises to pay the remainder when he comes for his wife.

As soon as the day of the wedding is fixed, the bridegroom and his friends begin to make preparations for the grand feast with which they are expected to entertain a vast number of guests. Some of them go off and busy themselves in hunting elephants, smoking and drying the flesh, and preserving the tusks for sale. Others prepare large quantities of manioc bread and plantains, while others find a congenial occupation in brewing great quantities of palm wine. Hunters are also engaged for the purpose of keeping up the supply of meat.

When the day is fixed, all the inhabitants of the village assemble, and the bride is handed over to her husband, who has already paid her price. Both are, of course, dressed in their very best. The bride wears, as is the custom among unmarried females, nothing but red paint and as many ornaments as she can manage to procure. Her hair is decorated with great quantities of white beads, and her wrists and ankles are hidden under a profusion of brass and copper rings. The bridegroom oils his body until his skin shines like a mirror, blackens and polishes his well-filed teeth, adorns his

(2.) BARGAINING FOR A WIFE. (See page 536.)

head with a tuft of brightly colored feathers, and ties round his waist the handsomest skin which he possesses.

A scene of unrestrained jollity then commences. The guests, sometimes several hundred in number, keep up the feast for three or four days in succession, eating elephants' flesh, drinking palm wine, and dancing, until the powers of nature are quite exhausted, and then sleeping for an hour or two with the happy facility that distinguishes the native African. Awakening from their brief slumber, they begin the feast afresh, and after the first few hours scarcely one of the guests is sober, or indeed is expected to be so. At last, however, all the wine is drunk, and then the guests return to an involuntary state of sobriety.

We now come to the religion and superstitions of the Fan tribe. As far as they have any real worship they are idolaters. Each village has a huge idol, specially dedicated to the service of the family or clan of which the inhabitants of the village are composed, and at certain times the whole family assemble together at the idol house or temple, and then go through their acts of worship, which consist chiefly of dancing and singing. Around each of the temples are placed a number of skulls of wild animals, among which the gorilla takes the most conspicuous place. Such spots are thought very sacred, and no one would venture to remove any of the skulls, such an act of desecration being thought a capital offence.

Like many other savage tribes, they are very careless of human life, and have many capital offences, of which witchcraft is the most common. It may seem strange that people who habitually eat the bodies of their fellow-men should have any superstitious feelings whatever, but among the Fans the dread of sorcery is nearly as great as among some of the tribes which have been already mentioned.

Witchcraft, however, is not always punished with death, the offender being sometimes sold into slavery, the "emigrant" ships having of late years received many Fans on board. It will be seen that the Fans always utilize their criminals. Those who are condemned for theft, or other ordinary crime, are executed, and their bodies eaten. But the wizards are supposed to possess some charms which would make their bodies as injurious after death as the culprits had been during life, and so they sell the criminal for "traders' goods."

No Fan ever dreams of going without a whole host of amulets, each of which is supposed to protect him from some special danger. The most valuable is one which is intended to guard the wearer in battle, and this is to be found on the person of every Fan warrior who can afford it. It is very simple, being nothing but an iron chain

with links an inch and a half long by an inch in width. This is hung over the left shoulder and under the right arm, and is thought to be very efficacious. Perhaps such a chain may at some time or other have turned the edge of a weapon, and, in consequence, the illogical natives have thought that the iron chains were effectual preservatives in war.

Next in value comes a small bag, which is hung round the neck, and which is a conspicuous ornament among the men. This is also a battle fetish, and is made of the skin of some rare animal. It contains bits of dried skin, feathers of scarce birds, the dried tips of monkeys' tails, the dried intestines of certain animals, shells, and bits of bone. Each article must have been taken from some rare animal, and have been specially consecrated by the medicine man. The warriors are often so covered with these and similar fetishes that they rattle at every step, much to the gratification of the wearer, and even the children are positively laden with fetish ornaments.

The reader will remember that throughout the whole of the tribes which have been described runs a custom of celebrating some kind of religious ceremony when the new moon is first seen. This custom is to be also found among the Fans. It has been graphically described by Mr. W. Reade, as follows:—

"The new moon began to rise. When she was high in the heavens, I had the fortune to witness a religious dance in her honor. There were two musicians, one of whom had an instrument called *handja*, constructed on the principle of an harmonicon; a piece of hard wood being beaten with sticks, and the notes issuing from calabashes of different sizes fastened below. This instrument is found everywhere in Western Africa. It is called *Batonda* in Senegambia; *Marimba* in Angola. It is also described by Froebel as being used by the Indians of Central America, where, which is still more curious, it is known by the same name—*Marimba*. The other was a drum which stood upon a pedestal, its skin made from an elephant's ear. The dull thud of this drum, beaten with the hands, and the harsh rattle of the *handja*, summoned the dancers.

"They came singing in procession from the forest. Their dance was uncouth; their song a solemn tuneless chant; they revolved in a circle, clasping their hands as we do in prayer, with their eyes fixed always on the moon, and sometimes their arms flung wildly toward her. The youth who played the drum assumed a glorious attitude. As I looked upon him—his head thrown back, his eyes upturned, his fantastic headdress, his naked, finely moulded form—I saw beauty in the savage for the first time.

"The measure changed, and two women, covered with green leaves and the skins of wild beasts, danced in the midst, where they

executed a *pas-de-deux* which would have made a *première danseuse* despair. They accompanied their intricate steps with miraculous contortions of the body, and obtained small presents of white beads from the spectators.

"It has always appeared to me a special ordinance of Nature that women, who are so easily fatigued by the ascent of a flight of stairs, or by a walk to church, should be able to dance for any length of time; but never did I see female endurance equal this. Never did I spend a worse night's rest. All night long those dreary deafening sounds drove sleep away, and the next morning these two infatuated women were still to be seen within a small but select circle of 'constant admirers,' writhing in their sinuous (and now somewhat odorous) forms with unabated ardor."

The form of marimba or handja which is used among the Fans has mostly seven notes, and the gourds have each a hole in them covered with a piece of spider's web, as has already been narrated of the Central African drums. The Fan handja is fastened to a slight frame; and when the performer intends to play the instrument, he sits down, places the frame on his knees, so that the handja is suspended between them, and then beats on the keys with two short sticks. One of these sticks is made of hard wood, but the end of the other is covered with some soft material so as to deaden the sound. The Fans have really some ear for music, and possess some pretty though rudely constructed airs.

Of course the Fans have drums. The favorite form seems rather awkward to Europeans. It consists of a wooden and slightly conical cylinder, some four feet in length and only ten inches in diameter at the wider end, the other measuring barely seven inches. A skin is stretched tightly over the large end, and when the performer plays on it, he stands with bent knees, holding the drum between them, and beats furiously on the head with two wooden sticks.

To return to the Fan belief in charms.

It has already been mentioned that the Fans mostly hunt the elephant by driving it against a barrier artificially formed of vines, and killing it as it struggles to escape from the tangled and twisted creepers. They have also another and most ingenious plan, which, however, scarcely seems to be their own invention, but to be partly borrowed from the tribes through which they have passed in their progress westward. This plan is called the Nghal, that being the name of the enclosure into which the animals are enticed. While Mr. Reade was in the country of the Mpongwé tribe, into which, it will be remembered, the Fans had forced their way, the hunters found out that three elephants frequented a certain portion of the forest. Honorably paying the

Mpongwé for permission to hunt in their grounds, they set out and built round an open patch of ground an enclosure, slightly made, composed of posts and railings. Round the nghal were the huts of the Fan hunters. When Mr. Reade arrived there, he was told that the three elephants were within the nghal, sleeping under a tree; and sure enough there they were, one of them being a fine old male with a large pair of tusks. If he had chosen he could have walked through the fence without taking the trouble to alter his pace, but here he was, together with his companions, without the slightest idea of escaping. So certain were the hunters that their mighty prey was safe, that they did not even take the trouble to close the openings through which the animals had entered the nghal. They were in no hurry to kill the elephants. They liked to look at them as they moved about in the nghal, apparently unconscious of the continual hubbub around them, and certainly undisturbed by it. The elephants were to remain there until the new moon, which would rise in a fortnight, and then they would be killed in its honor.

On inquiring, it was found that the enclosure was not built round the elephants, as might have been supposed. No. It was built at some distance from the spot where the elephants were feeding. "The medicine men made fetish for them to come in. They came in. The medicine men made fetish for them to remain. And they remained. When they were being killed, fetish would be made that they might not be angry. In a fortnight's time the new moon would appear, and the elephants would then be killed. Before that time all the shrubs and light grass would be cut down, the fence would be strengthened, and interlaced with boughs. The elephants would be killed with spears, crossbows, and guns."

The natives, however, would not allow their white visitor to enter the nghal, as he wished to do, and refused all his bribes of beads and other articles precious to the soul of the Fan. They feared lest the presence of a white man might break the fetish, and the sight of a white face might frighten the elephants so much as to make them disregard all the charms that had been laid upon them, and rush in their terror against the fragile barrier which held them prisoners.

As to the method by which the elephants were induced to enter the enclosure, no other answer was made than that which had already been given. In India the enclosure is a vast and complicated trap, with an opening a mile or so in width, into which the elephants are driven gradually, and which is closed behind them as they advance into smaller and smaller prisons. In Africa all that was done was to build an enclosure, to leave an opening just large

enough to admit an elephant, to make fetish for the elephants, and in they came.

The whole thing is a mystery. Mr. Reade, who frankly confesses that if he had not with his own eyes seen the nghal and its still open door he would have refused to believe the whole story, is of opinion that the "fetish" in question is threefold. He suggests that the first fetish was a preparation of some plant for which the elephants have the same mania that cats have for valerian and pigeons for salt, and thinks that they may have been enticed into the nghal by means of this herb. Then, after they had been induced to enter the enclosure, that they were kept from approaching the fence by means of drugs distasteful to them, and that the "fetish" which prevented them from being angry when killed was simply a sort of opiate thrown to them. The well-known fastidiousness of the elephant may induce some readers to think that this last suggestion is rather improbable. But it is also known that, in some parts of Africa, elephants are usually drugged by poisoned food, and that the Indian domesticated elephant will do almost anything for sweetmeats in which the intoxicating hemp forms an ingredient.

That the elephants are prevented from approaching the fence by means of a distasteful preparation seems likely from a piece of fetishism that Mr. Reade witnessed. At a certain time of the day the medicine man made his round of the fence, singing in a melancholy voice, and daubing the posts and rails with a dark brown liquid. This was acknowledged to be the fetish by which the elephants were induced to remain within the enclosure, and it is very probable that it possessed some odor which disgusted the keen-scented animals, and kept them away from its influence.

Mr. Reade also suggests that this method of catching elephants may be a relic of the days when African elephants were taken alive and trained to the service of man, as they are now in India and Ceylon. That the knowledge of elephant training has been lost is no wonder, considering the internecine feuds which prevail among the tribes of Africa, and prevent them from developing the arts of peace. But that they were so caught and trained, even in the old classical days, is well known; and from all accounts the elephants of Africa were not one whit inferior to their Indian relatives in sagacity or docility. Yet there is now no part of Africa in which the natives seem to have the least idea that such monstrous animals could be subjected to the sway of man, and even in Abyssinia the sight of elephants acting as beasts of burden and traction filled the natives with half incredulous awe.

When the Fans have succeeded in killing an elephant, they proceed to go through a

curious ceremony, which has somewhat of a religious character about it. No meat is touched until these rites have been completed. The whole hunting party assembles round the fallen elephant, and dances round its body. The medicine man then comes and cuts off a piece of meat from one of the hind legs and places it in a basket, there being as many baskets as slain elephants. The meat is then cooked under the superintendence of the medicine man and the party who killed the elephant, and it is then carried off into the woods and offered to the idol. Of course the idol is supposed to eat it, and the chances are that he does so through the medium of his representative, the medicine man. Before the baskets are taken into the woods, the hunters dance about them as they had danced round the elephant, and beseech the idol to be liberal toward them, and give them plenty of elephants so that they may be able to give him plenty of meat.

The spirits being thus propitiated, the flesh is stripped off the bones of the elephant, sliced, and hung upon branches, and smoked until it is dry, when it can be kept for a considerable time.

The reader may remember that one of the principal ornaments of the idol temple is the skull of the gorilla, and the same object is used by several of the tribes for a similar purpose. The fact is, all the natives of those districts in which the gorilla still survive are horribly afraid of the animal, and feel for it that profound respect which, in the savage mind, is the result of fear, and fear only. A savage never respects anything that he does not fear, and the very profound respect which so many tribes, even the fierce, warlike, and well-armed Fans, have for the gorilla, show that it is really an animal which is to be dreaded.

There has been so much controversy about the gorilla, and the history of this gigantic ape is so inextricably interwoven with this part of South Africa, that the present work would be imperfect without a brief notice of it. In the above-mentioned controversy, two opposite views were taken—one, that the gorilla was the acknowledged king of the forest, supplanting all other wild animals, and even attacking and driving away the elephant itself. Of man it had no dread, lying in wait for him and attacking him whenever it saw a chance, and being a terrible antagonist even in fair fight, the duel between man and beast being a combat *à l'outrance*, in which one or the other must perish.

Those who took the opposite view denounced all these stories as "old wives' fables, only fit to be relegated to your grandmother's bookshelves."—I quote the exact words—saying that the gorilla, being an ape, is necessarily a timid and retiring animal, afraid of man, and running away

when it sees him. It is hardly necessary to mention that M. du Chaillu is responsible for many of the statements contained in the former of these theories — several, however, being confessedly gathered from hearsay, and that several others were prevalent throughout Europe long before Du Chaillu published his well-known work.

The truth seems to lie between these statements, and it is tolerably evident that the gorilla is a fierce and savage beast when attacked, but that it will not go out of its way to attack a man, and indeed will always avoid him if it can. That it is capable of being a fierce and determined enemy is evident from the fact that one of Mr. W. Reade's guides, the hunter Etia, had his left hand crippled by the bite of a gorilla; and Mr. Wilson mentions that he has seen a man who had lost nearly the whole calf of one leg in a similar manner, and who said that he was in a fair way of being torn in pieces if he had not been rescued by his companions. Formidable as are the terrible jaws and teeth of the gorilla when it succeeds in seizing a man, its charge is not nearly so much to be feared as that of the leopard, as it is made rather leisurely, and permits the agile native to spring aside and avoid it.

On account of the structure common to all the monkey tribe, the gorilla habitually walks on all-fours, and is utterly incapable of standing upright like a man. It can assume a partially erect attitude, but with bent knees, stooping body, and incurved feet, and is not nearly so firmly set on its legs as is a dancing bear. Even while it stands on its feet, the heavy body is so ill supported on the feeble legs that the animal is obliged to balance itself by swaying its large arms in the air, just as a rope-dancer balances himself with his pole.

In consequence of the formation of the limbs, the tracks which it leaves are very curious, the long and powerful arms being used as crutches, and the short feeble hind legs swung between them. It seems that each party or family of gorillas is governed by an old male, who rules them just as the bull rules its mates and children.

The natives say that the gorilla not only walks, but charges upon all-fours, though it will raise itself on its hind legs in order to survey its foes. Etia once enacted for Mr. W. Reade the scene in which he had received the wound that crippled his hand. Directing Mr. Reade to hold a gun as if about to shoot, he rushed forward on all-fours, seized the left wrist with one of his hands, dragged it to his mouth, made believe to bite it, and then made off on all-fours as he had charged. And, from the remarkable intelligence which this hideous but polite hunter had shown in imitating other animals, it was evident that his story was a true one.

As to the houses which the gorilla is said to build, there is some truth in the story. Houses they can scarcely be called, inasmuch as they have no sides, and in their construction the gorilla displays an architectural power far inferior to that of many animals. The lodge of the beaver is a palace compared with the dwelling of the gorilla. Many of the deserted residences may be found in the forests which the gorilla inhabits, and look much like herons' nests on a rather large scale. They consist simply of sticks torn from the trees and laid on the spreading part of a horizontal branch, so as to make a rude platform. This nest, if we may so call it, is occupied by the female, and in process of time is shared by her offspring. The males sleep in a large tree.

Shy and retiring in its habits, the gorilla retreats from the habitations of man, and loves to lurk in the gloomiest recesses of the forest, where it finds its favorite food, and where it is free from the intrusion of man. As to the untamable character of the gorilla as contrasted with the chimpanzee, Mr. Reade mentions that he has seen young specimens of both animals kept in a tame state, and both equally gentle.

We now come to the statement that, while the gorilla is working himself up to an attack, he beats his breast until it re-sounds like a great drum, giving out a loud booming sound that can be heard through the forest at the distance of three miles. How such a sound can be produced in such a manner it is not easy to comprehend, and Mr. Reade, on careful inquiry from several gorilla hunters, could not find that one of them had ever heard the sound in question, or, indeed, had ever heard of it. They said that the gorilla had a drum, and, on being asked to show it, took their interlocutor to a large hollow tree, and said that the gorilla seized two neighboring trees with his hands, and swung himself against the hollow trunk, beating it so "strong-strong" with his feet that the booming sound could be heard at a great distance.

Etia illustrated the practice of the gorilla by swinging himself against the tree in a similar manner, but failed in producing the sound. However, he adhered to his statement, and, as a succession of heavy blows against a hollow trunk would produce a sort of booming noise, it is likely that his statement may have been in the main a correct one.

Now that the natives have procured firearms, they do not fear the gorilla as much as they used to do. Still, even with such potent assistance, gorilla hunting is not without its dangers, and, as we have seen, many instances are known where a man has been severely wounded by the gorilla, though Mr. Reade could not hear of a single case where the animal had killed any of its assailants.

When the native hunters chase the gorilla, and possess fire-arms, they are obliged to fire at very short range, partly because the dense nature of those parts of the forest which the gorilla haunts prevent them from seeing the animal at a distance of more than ten or twelve yards, and partly because it is necessary to kill at the first shot an animal which, if only wounded, attacks its foes, and uses fiercely the formidable weapons with which it has been gifted. Any one who has seen the skull of an adult gorilla, and noticed the vast jaw-bones, the enormous teeth, and the high bony ridges down the head which afford attachment to the muscles, can easily understand the terrible force of a gorilla's bite. The teeth, and not the paws, are the chief, if not the only weapons which the animal employs; and, although they are given to it in order to enable it to bite out the pith of the trees on which it principally feeds, they can be used with quite as great effect in combat.

So the negro hunter, who is never a good shot, and whose gun is so large and heavy that to take a correct aim is quite out of the question, allows the gorilla to come within three or four yards before he delivers his fire. Sometimes the animal is too quick for him, and in that case he permits it to seize the end of the barrel in its hands and drag it to its mouth, and then fires just as the great jaws enclose the muzzle between the teeth. Seizing the object of attack in the hands, and drawing it to the mouth, seems to be with the gorilla, as with others of the monkey tribe, the ordinary mode of fighting. The hunter has to be very careful that he fires at the right moment, as the gigantic strength of the gorilla enables it to make very short work of a trade gun, if it should happen to pull the weapon out of its owner's hands. A French officer told Mr. Reade that he had seen one of these guns which had been seized by a gorilla, who had twisted and bent the barrel "*comme une papillote*."

The same traveller, who is certainly not at all disposed to exaggerate the size or the power of the gorilla, was greatly struck by the aspect of one that had been recently killed. "One day Mongilambu came and told me that there was a freshly-killed gorilla for sale. I went down to the beach, and saw it lying in a small canoe, which it almost filled. It was a male, and a very

large one. The preserved specimen can give you no idea of what this animal really is, with its skin still unshrivelled, and the blood scarcely dry upon its wounds. The hideousness of its face, the grand breadth of its breast, its massive arms, and, above all, its hands, like those of a human being, impressed me with emotions which I had not expected to feel. But nothing is perfect. The huge trunk dwindled into a pair of legs, thin, bent, shrivelled, and decrepid as those of an old woman.

Such being the impression made on a civilized being by the dead body of a gorilla lying in a canoe, the natives may well be excused for entertaining a superstitious awe of it as it roams the forest in freedom, and for thinking that its skull is a fit adornment for the temple of their chief idol.

To a party of native hunters unprovided with fire-arms, the chase of the animal is a service of real difficulty and danger. They are obliged to seek it in the recesses of its own haunts, and to come to close quarters with it. (See the illustration on page 457). The spear is necessarily the principal weapon employed, as the arrow, even though poisoned, does not kill at once, and the gorilla is only incited by the pain of a wound to attack the man who inflicted it. Their fear of the animal is also increased by the superstition which has already been mentioned, that a man is sometimes transformed into a gorilla, and becomes thereby a sort of sylvan demon, who cannot be killed — at all events, by a black man — and who is possessed with a thirst for killing every human being that he meets.

Any specially large gorilla is sure to be credited with the reputation of being a transformed man; and as the adult male sometimes measures five feet six inches or so in height, there is really some excuse for the native belief that some supernatural power lies hidden in this monstrous ape.

After a careful investigation, Mr. Reade has come to the conclusion that, except in point of size, there is no essential difference in the gorilla and the chimpanzee, both animals going usually on all-fours, and both building slight houses or platforms in the trees, both changing their dwelling in search of food and to avoid the neighborhood of man, and both, without being gregarious, sometimes assembling together in considerable numbers.

CHAPTER LIII.

THE KRUMEN AND FANTI.

LOCALITY OF THE KRUMEN—THEIR FINE DEVELOPMENT AND WONDERFUL ENDURANCE—THEIR SKILL IN BOATING—COLOR OF THE KRUMEN—THEIR VERY SIMPLE DRESS—DOUBLE NOMENCLATURE—THEIR USE TO TRAVELLERS—GOVERNMENT OF THE KRUMEN—THEIR LIVELY AND CHEERFUL CHARACTER—DOMESTIC LIFE OF THE KRUMEN—EARNING WIVES—RELIGION OF THE KRUMEN—THE DEITY “SUFFIN”—KRUMAN FUNERAL—THE GRAIN COAST—THE FANTI TRIBE—THEIR NATIVE INDOLENCE—FANTI BOATS AND THEIR MANAGEMENT—THE KRA-KRA DISEASE—A WILD LEGEND—DRESS OF THE FANTI—IDEAS OF A FUTURE STATE.

ALONG the Grain Coast of Western Africa there is a race of men who come too prominently before European eyes to be omitted from this work. They have, in a degree, lost the habits of their original savage life, but they illustrate so well the peculiar negro character that a small space must be devoted to them.

The name Kru, or Croo, and sometimes Carew, or Crew—so diversified is the orthography of native names—is a corruption of the Grebo word “Kráo.” The tribe inhabits a district about twenty-five or thirty miles along the coast, and extending for a considerable, but uncertain, distance inland. A good many smaller tribes have been gradually absorbed into them, and, as they have adopted the language, manners, and customs, as well as the name of Kráo, we will treat of them all under the same title.

In the “Wanderings of a F. R. G. S.” there is a curious account of the derivation of the word Grebo, one of the absorbed tribes. According to their own tradition, they originally inhabited the interior, and, finding that their district was too thickly populated, a large number of them determined to emigrate westward, and secretly prepared for departure, the majority being averse to the scheme. As they embarked in a hurry, a number of the canoes were upset, but the remainder succeeded in bounding over the waves. The people who were capsized, and were left behind, were therefore called “Waibo,” or the Capsized, while the others took the name of Grebo, from the bounding gray monkey, called Gré.

The Krumen are a fine race, and present a great contrast to the usual slim-limbed and

almost effeminate savages of the interior. They are extremely powerful, and are able to paddle for some forty miles at a stretch, without seeming to be the least fatigued at the end of their labors. They are the recognized seamen of the coast, and have made themselves necessary to the traders, and even to Government vessels, as they can stand a wonderful amount of work, and are not affected by the climate like the white sailors.

A Kruman lays himself out for a sailor as soon as he becomes his own master, and is content to begin life as a “boy,” so that he may end it as a “man”—*i. e.* he hires himself out in order to obtain goods which will purchase a wife for him, and by dint of several voyages he adds to the number of his wives, and consequently to the respect in which he is held by his countrymen.

He is a marvellous canoe man, and manages his diminutive boat with a skill that must be seen to be appreciated. He drives it through the surf with fearless speed, and cares nothing for the boiling water around him. “The Kruman,” writes Mr. Reade, “squats in it on his knees, and bales the water out with one of his feet. Sometimes he paddles with his hands; sometimes, thrusting a leg in the water, he spins the canoe round when at full speed, like a skater on the ‘outside-edge.’ If it should capsize, as the laws of equilibrium sometimes demand, he turns it over, bales it out with a calabash, swimming all the while, and glides in again, his skin shining like a seal’s.”

These singular little canoes are pointed at each end, and crescent-shaped, so that they project fore and aft out of the water. They

are very narrow, and are made out of the single trunk of a tree, usually cotton-wood, or a kind of poplar. The interior is first hollowed out with fire, next trimmed with an adze, and the ribs are prevented from collapsing by four or five cross-sticks. They are very massively constructed, and, as the wood is very light, they do not sink even if they are filled with water. So small are they, that at a little distance they cannot be seen, and the inmates appear to be treading water.

It is a curious sight to watch a fleet of these canoes come off toward a ship. As soon as an English ship anchors, a swarm of these canoes comes dashing along, their black inmates singing songs at the top of their voices, and shouting "Bateo! Bateo! Gi' way! Bargri!" and similar exclamations, as they race with each other toward the vessel. No European has been known to manage one of these frail canoes, the usual result of getting into one being that the boat turns over, and deposits the rash adventurer in the sea.

The appearance of the men has been graphically described by the "F. R. G. S." "Conceive the head of a Socrates, or a Silenus, upon the body of the Antinous, or Apollo Belyvedere. A more magnificent development of muscle, such perfect symmetry in the balance of grace and strength, my eyes had never yet looked upon. But the faces! Except when lighted up by smiles and good humor—expression to an African face is all in all—nothing could be more unprepossessing. The flat nose, the high cheek-bones, the yellow eyes, the chalky white teeth, pointed like the shark's, the muzzle protruded like that of a dog-monkey, combine to form an unusual amount of ugliness.

"To this adds somewhat the tribe mark, a blue line of cuts half an inch broad, from the forehead scalp to the nose tip—in some cases it extends over both lips to the chin, whence they are called Bluenoses—whilst a broad arrow or wedge, pointed to the face, and also blue, occupies each temple, just above the zygomata. The marks are made with a knife, little cuts into which the oily husk of a gum is rubbed. Their bodies are similarly ornamented with stars, European emblems, as anchors, &c., especially with broad double lines down the breast and other parts.

"Their features are distinctly African, without a mixture of Arab; the conjunctiva is brown, yellow, or tarnished—a Hamitic peculiarity—and some paint white goggle-like ovals round the orbits, producing the effect of a loup. This is sometimes done for sickness, and individuals are rubbed over with various light and dark colored powders. The skin is very dark, often lamp-black; others are of a deep rich brown, or bronze tint, but a light-complexioned man is generally called Tom Coffee.

"They wear the hair, which is short and kinky, in crops, which look like a Buddha's skull-cap, and they shave when in mourning for their relations. A favorite 'fash' (*i. e.* fashion) is to scrape off a parallelogram behind the head, from the poll to the cerebellum; and others are decorated in that landscape or parterre style which wilder Africans love. The back of the cranium is often remarkably flat, and I have seen many heads of the pyramidal shape, rising narrow and pointed high to the apex. The beard is seldom thick, and never long; the moustachio is removed, and the pile, like the hair, often grows in tufts. The tattoo has often been described. There seems to be something attractive in this process—the English sailor can seldom resist the temptation.

"They also chip, sharpen, and extract the teeth. Most men cut out an inverted V between the two middle incisors of the upper jaw; others draw one or two of the central lower incisors; others, especially the St. Andrews men, tip or sharpen the incisors, like the Wahiao and several Central African tribes.

"Odontology has its mysteries. Dentists seem, or rather seemed, to hold as a theory that destruction of the enamel involved the loss of the tooth; the Krumen hack their masticators with a knife, or a rough piece of hoop iron, and find that the sharpening, instead of producing caries, acts as a preservative, by facilitating the laniatory process. Similarly there are physiologists who attribute the preservation of the negro's teeth to his not drinking anything hotter than blood heat. This is mere empiricism. The Arabs swallow their coffee nearly boiling, and the East African will devour his agali, or porridge, when the temperature would scald the hand. Yet both these races have pearls of teeth, except when they chew lime or tobacco."

The native dress of the men is simple enough, consisting of a pink and white or blue and white check cloth round the waist, and a variety of ornaments, made of skin, metal, glass, or ivory. The latter substance is mostly obtained either from the Gaboon or Cameroon, and is worn in the shape of large arm rings, cut slowly with a knife, and polished by drawing a wet cord backward and forward. Some of the sailor Krumen have their names (*i. e.* their nautical names) engraved on their armllets, and some of them wear on the breast a brass plate with the name engraved upon it. Of course some of their ornaments are charms or fetishes.

The women present a disagreeable contrast to the men, their stature being short, their proportions ungainly, and their features repulsive. Their style of dress, which is merely a much-attenuated petticoat, displays nearly the whole of the figure, and enables the spectator to form a very accurate opinion of their personal appearance. Of

course, the chief part of the work is done by the women, and this custom has doubtless some effect in stunting and deteriorating the form.

All the Krumen have two names, one being that by which they are called in their own tongue, and one by which they are known to their employers. It really seems a pity that these fine fellows should be degraded by the ludicrous English names which are given to them. Their own names—*e. g.* Kotä, Nákú, Tiyá, &c.—are easy enough to speak, and it would be far better to use them, and not to “call them out of their names,” according to the domestic phrase. Here are the names of five men who engaged to take Mr. Reade to the Gaboon: Smoke Jack, Dry Toast, Cockroach, Pot-of-Beer, and—of all the names in the world for a naked black man—Florence Nightingale.

They always demand rice, that being a necessity with them, and as long as they get their pint and a half per diem of rice they can stand unlimited work. They cook the rice for themselves in their primitive but effective manner, and feed themselves much as turkeys are crammed, seizing large handfuls of rice, squeezing them into balls, and contriving, in some mysterious way, to swallow them whole without being choked. When they enter the naval service they consider themselves as made men, getting not only their rice, but allowance in lieu of other rations plenty of clothing, and high wages, so that when they go ashore they are rich men, and take their rank. Of course they are fleeced by all their relations, who flock round them, and expect to be feasted for several days, but still the sailor Kruman can buy a wife or two, and set up for a “man” at once. In his own phrase, he is “nigger for ship, king for country.” One year is the usual term of engagement, and it is hardly possible to induce Krumen to engage for more than three years, so attached are they to “me country.”

Their government is simple. They are divided into four classes, or castes,—namely, the elders, the actual warriors, the probationary warriors, and the priests; the latter term including the priests proper, the exorcists, and the physicians. They are strictly republican, and no one is permitted to accumulate, or, at all events, to display, wealth much above the average of his fellows. Should even one of the elders do so, a palaver is held, and his property is reduced to proper level. This is described by the English-speaking Krumen as the punishment for “too much sass.” In fact, property is held on the joint stock principle, so that the word “commonwealth” is very applicable to their mode of government.

Capital punishment is rare, and is seldom used, except in cases of witchcraft or murder, and it is remarkable that, in the latter

case, no distinction is made between accidental manslaughter and murder with *malice prepense.*” The poison ordeal is common here, the draught being prepared from the “sass-wood” of the gidden tree; and there is a wholesome rule that, if the accused survives the ordeal, the accuser must drink it in his turn.

That they are arrant liars, that they are confirmed thieves, and that they have not the slightest notion of morality, is but to say that they are savages, and those who have to deal with them can manage well enough, provided that they only bear in mind these characteristics. If they hear that they are going to some place which they dislike—probably on account of some private feud, because they are afraid of some man whose domestic relations they have disturbed—they will come with doleful faces to their master, and tell him the most astounding lies about it.

Yet they are a cheerful, lively set of fellows, possessing to the full the negro’s love of singing, drumming, and dancing. Any kind of work that they do is aided by a song, and an experienced traveller who is paddled by Krumen always takes with him a drum of some sort, knowing that it will make the difference of a quarter of the time occupied in the journey. Even after a hard day’s work, they will come to their master, ask permission to “make play,” and will keep up their singing and dancing until after midnight. Under such circumstances the traveller will do well to grant his permission, under the condition that they remove themselves out of earshot. Even their ordinary talk is so much like shouting, that they must always be quartered in out-houses, and when they become excited with their music their noise is unendurable.

They are very fond of intoxicating liquors, and are not in the least particular about the quality, so that the intoxicating property be there.

It has already been mentioned that they are arrant thieves, and in nothing is their thieving talent more conspicuous than when they exercise it upon spirituous liquors. They even surpass the British sailor in the ingenuity which they display in discovering and stealing spirits, and there is hardly any risk which they will not run in order to obtain it. Contrary to the habit of most savage people, they are very sensitive to pain, and a flogging which would scarcely be felt by a Bush boy will elicit shrieks of pain from a Kruman. They dread the whip almost as much as death, and yet they will brave the terrors of a certain flogging in order to get at rum or brandy.

No precautions seem to be available against their restless cunning, and the unwary traveller is often surprised, when he feels ill and wants some brandy as a medicine, that not a drop is to be found, and yet,

to all appearance, his spirit-case has been under his own eyes, and so have the rascals who have contrived to steal it. Even so experienced a traveller as Captain Burton, a man who knows the negro character better than almost any European, says that he never had the chance of drinking his last bottle of cognac, it always having been emptied by his Krumen.

Provisions of all kinds vanish in the same mysterious way; they will strangle goats, and prepare them so as to look as if they had been bitten by venomous serpents; and as for fowls, they vanish as if they had voluntarily flown down the throats of the robbers. Anything bright or polished is sure to be stolen, and it is the hardest thing in the world to take mathematical instruments safely through Western Africa, on account of the thievish propensities of the Krumen.

Even when they steal articles which they cannot eat, it is very difficult to discover the spot where the missing object is hidden, and, as a party of Krumen always share their plunder, they have an interest in keeping their business secret. The only mode of extracting information is by a sound flogging, and even then it often happens that the cunning rascals have sent off their plunder by one of their own people, or have contrived to smuggle it on board some ship.

WE now come to the domestic habits of the Krumen as summed up in marriage, religion, death, and burial.

These people are, as has been seen, a prudent race, and have the un-African faculty of looking to the future. It is this faculty which causes them to work so hard for their wives, the fact being, that, when a man has no wife, he must work entirely for himself; when he has one, she takes part of the labor off his hands; and when he marries a dozen or so, they can support him in idleness for the rest of his days.

So, when a young man has scraped together sufficient property to buy a wife, he goes to the girl's father, shows the goods, and strikes the bargain. If accepted, he marries her after a very simple fashion, the whole ceremony consisting in the father receiving the goods and handing over the girl. He remains with her in her father's house for a week or two, and then goes off on another trip in order to earn enough money to buy a second. In like manner he possesses a third and a fourth, and then sets up a domicile of his own, each wife having her own little hut.

However many wives a Krumen may have, the first takes the chief rank, and rules the entire household. As is the case in most lands where polygamy is practised, the women have no objection to sharing the husband's affections. On the contrary, the

head wife will generally urge her husband to add to his number, because every additional wife is in fact an additional servant, and takes a considerable amount of work off her shoulders. And an inferior wife would always prefer to be the twelfth or thirteenth wife of a wealthy man, than the solitary wife of a poor man for whom she will have to work like a slave.

Although the women are completely subject to their husbands, they have a remedy in their hands if they are very badly treated. They run away to their own family, and then there is a great palaver. Should a separation occur, the children, although they love their mother better than their father, are considered his property, and have to go with him.

THEIR religion is of a very primitive character, and, although the Krumen have for so many years been brought in contact with civilization, and have been sedulously taught by missionaries, they have not exchanged their old superstitions for a new religion. That they believe in the efficacy of amulets and charms has been already mentioned, and therefore it is evident that they must have some belief in the supernatural beings who are supposed to be influenced by these charms. Yet, as to worship, very little is known of it, probably because very little is practised. On one occasion, when a vessel was wrecked, a Krumen stood all night by the sea-side, with his face looking westward, waving the right arm, and keeping up an incessant howling until daybreak. The others looked at him, but did not attempt to join him.

There is one religious ceremony which takes place in a remarkable cavern, called by the euphonious name of Grand Devil Cave. It is a hollow in an enormous rock, having at the end a smaller and interior cavern in which the demon resides. Evidently partaking that dislike to naming the object of their superstitions which caused the believing in fairies to term them the "Good people," and the Norwegians of the present day to speak of the bear as the "Disturber," or "He in the fur coat," the Krumen prudently designate this demon as "Suffin," *i. e.* Something.

When they go to worship they lay beads, tobacco, provisions, and rum in the inner cavern, which are at once removed by the mysterious Suffin, who is supposed to consume them all. In return for the liberality of his votaries, Suffin answers any questions in any language. The Krumen believe as firmly in the existence and supernatural character of Suffin as the Babylonians in the time of Daniel believed that Bell consumed daily the "twelve great measures of fine flour, the forty sheep, and the six vessels of wine" that were offered to him. And, as a convincing proof of the danger of

incredulity, they point with awe to a tree which stands near the mouth of the Grand Devil Cave, and which was formerly a Kruman who expressed his disbelief in Suffin, and was straightway transformed into the tree in question.

Their mode of swearing is by dipping the finger in salt, pointing to heaven and earth with it, as if invoking the powers of both, and then putting the tip of the finger in the mouth, as if calling upon the offended powers to avenge the perjury on the person of him who had partaken of the salt. Considering the wolfish voracity of the Krumen, which they possess in common with other savages, they show great self-control in yielding to a popular superstition which forbids them to eat the hearts of cattle, or to drink the blood.

The dead Kruman is buried with many ceremonies, and, notably, a fire is kept up before his house, so that his spirit may warm itself while it is prepared for appreciating the new life into which it has been born. Food is also placed near the grave for the same benevolent purpose. Should he be a good man, he may lead the cattle which have been sacrificed at his funeral, and so make his way to the spirit land, in which he will take rank according to the number of cattle which he has brought with him. Sometimes he may enter the bodies of children, and so reappear on earth. But should he be a bad man, and especially should he be a wizard — *i. e.* one who practises without authority the arts which raise

the regular practitioners to wealth and honor — his state after death is very terrible, and he is obliged to wander forever through gloomy swamps and fetid marshes.

It is a curious fact that the Krumen have some idea of a transitional or purgatorial state. The paradise of the Krumen is called Kwiga Oran, *i. e.* the City of the Ghosts, and before any one can enter it he must sojourn for a certain time in the intermediate space called Menu or Mennke.

It may be as well to remark here that the Grain Coast, on which the Krumen chiefly live, does not derive its name from corn, barley, or other cereals. The grain in question is the well-known cardamom, or Grain of Paradise, which is used as a medicine throughout the whole of Western Africa, and is employed as a remedy against various diseases. It is highly valued as a restorative after fatigue; and when a man has been completely worn out by a long day's march, there is nothing that refreshes him more than a handful of the cardamoms in a fresh state, the juicy and partly acid pulp contrasting most agreeably with the aromatic warmth of the seeds. The cardamom is used either internally or externally. It is eaten as a stomachic, and is often made into a poultice and applied to any part of the body that suffers pain. Headache, for example, is said to be cured by the cardamom seed, pounded and mixed with water into a paste; and, even during the hot fit of fever, the cardamom powder is applied as a certain restorative.

THE FANTI.

THE district of Western Africa, which is now known by the general title of the Gold Coast, Ashantee, or Ashanti, is occupied by two tribes, who are always on terms of deadly feud with each other. Internecine quarrels are one of the many curses which retard the progress of Africa, and, in this case, the quarrel is so fierce and persistent, that even at the present day, though the two great tribes, the Fanti and the Ashanti, have fought over and over again, and the latter are clearly the victors, and have taken possession of the land, the former are still a large and powerful tribe, and, in spite of their so called extermination, have proved their vitality in many ways.

The Fanti tribe are geographically separated from their formidable neighbors by the Bossumpea River, and if one among either tribe passes this boundary it is declared to be an overt act of war. Unfortunately, England contrived to drift into this war, and, as bad luck would have it, took the part of the Fanti tribe, and consequently shared in their defeat.

It is really not astonishing that the Fanti

should have been so completely conquered, as they have been termed by Mr. Duncan, a traveller who knew them well, the dirtiest and laziest of all the Africans that he had seen. One hundred of them were employed under the supervision of an Englishman, and, even with this incitement, they did not do as much as a gang of fifteen English laborers. Unless continually goaded to work they will lie down and bask in the sun; and even if a native overseer be employed, he is just as bad as the rest of his countrymen.

Even such work as they do they will only perform in their own stupid manner. For example, in fetching stone for building, they will walk, some twenty in a gang, a full mile to the quarry, and come back, each with a single stone weighing some eight or nine pounds on his head. Every burden is carried on the head. They were once supplied with wheelbarrows, but they placed one stone in each wheelbarrow, and then put the barrows on their heads. The reason why they are so lazy is plain enough. They can live well for a penny per diem, and

their only object in working is to procure rum, tobacco, and cotton cloths. So the wife has to earn the necessaries of life, and the husband earns—and consumes—the luxuries.

The Fanti tribe are good canoe men, but their boats are much larger and heavier than those which are employed by the Krumen. They are from thirty to forty feet in length, and are furnished with weather boards for the purpose of keeping out the water. The shape of the paddle is usually like that of the ace of clubs at the end of a handle; but, when the canoes have to be taken through smooth and deep water, the blades of the paddles are long and leaf-shaped, so as to take a good hold of the water. The Fanti boatmen are great adepts in conveying passengers from ships to the shore. Waiting by the ship's side, while the heavy seas raise and lower their crank canoes like corks, they seize the right moment, snatch the anxious passenger off the ladder to which he has been clinging, deposit him in the boat, and set off to shore with shouts of exultation. On account of the surf, as much care is needed in landing the passengers on shore as in taking them out of the vessel. They hang about the outskirts of the surf-billows as they curl and twist and dash themselves to pieces in white spray, and, as soon as one large wave has dashed itself on the shore, they paddle along on the crest of the succeeding wave, and just before it breaks they jump out of the boat, run it well up the shore, and then ask for tobacco.

The men are rather fine-looking fellows, tall and well-formed, but are unfortunately liable to many skin diseases, among which the terrible kra-kra is most dreaded. This horrible disease, sometimes spelt, as it is pronounced, *craw-craw*, is a sort of leprosy that overruns the entire body, and makes the surface most loathsome to the eye. Unfortunately, it is very contagious, and even white persons have been attacked by it merely by placing their hands on the spot against which a negro afflicted with kra-kra has been resting. Sometimes the whole crew of a ship will be seized with kra-kra, which even communicates itself to goats and other animals, to whom it often proves fatal.

The natives have a curious legend respecting the origin of this horrible disease. The first man, named Raychow, came one day with his son to a great hole in the ground, from which fire issues all night. They heard men speaking to them, but could not distinguish their faces. So Raychow sent his son down the pit, and at the bottom he met the king of the fire hole, who challenged him to a trial of spear-throwing, the stake being his life. He won the contest, and the fire king was so pleased with his prowess that he told the young

man to ask for anything that he liked before he was restored to the upper air. The boon chosen was a remedy for every disease that he could name. He enumerated every malady that he could recollect, and received a medicine for each. As he was going away, the fire king said, "You have forgotten one disease. It is the kra-kra, and by *that* you shall die."

Their color is rather dark chocolate than black, and they have a tolerably well-formed nose, and a facial angle better than that of the true negro. Their dress is simply a couple of cotton cloths, one twisted round the waist, and the other hung over the shoulders. This, however, is scarcely to be reckoned as clothing, and is to be regarded much as an European regards his hat, *i. e.* as something to be worn out of doors. Like the hat, it is doffed whenever a Fanti meets a superior; this curious salutation being found also in some of the South Sea Islands.

The women when young are ugly in face and beautiful in form—when old they are hideous in both. In spite of the Islamism with which they are brought so constantly in contact, and which has succeeded in making them the most civilized of the West African tribes, the women are so far from veiling their faces that their costume begins at the waist and ceases at the knees. Unfortunately, they spoil the only beauty they possess, that of shape, by an ugly appendage called the "cankey," *i. e.* a tolerably large oblong bag of calico, stuffed into cushion shape, and then tied by tapes to the wearer's back, so that the upper edge and two of the corners project upward in a very ludicrous way. It is, in fact, only a slight exaggeration of an article of dress which at one time was fashionable throughout Europe, and which, to artistic eyes, had the same demerit of spoiling a good shape and not concealing a bad one. The married women have some excuse for wearing it, as they say that it forms a nice cushion for the baby to sit upon; but the young girls who also wear it have no such excuse, and can only plead the fashion of the day.

Round the waist is always a string of beads, glass or clay if the wearer be poor, gold if she be rich. This supports the "shim," a sort of under-petticoat, if we may so term it, which is simply a strip of calico an inch or so in width, one end being fastened to the girdle of beads in front, and the other behind. They all wear plenty of ornaments of the usual description, *i. e.* necklaces, bracelets, armlets, anklets, and even rings for the toes.

The hair of the married women is dressed in rather a peculiar manner. Though crisp and curly, it grows to nine or ten inches in length, and is frizzled and teased out with much skill and more patience. A boldly-defined line is shaved round the roots of hair, and the remainder of the locks, previ-

ously saturated with grease, and combed out to their greatest length, are trained upward into a tall ridge. Should the hair be too short or too scanty to produce the required effect, a quantity of supplementary hair is twisted into a pad and placed under the veritable locks. This ridge of hair is supported by a large comb stuck in the back of the head, and, although the shape of the hair tufts differ considerably, it is always present, and always made as large as possible.

The Fanti have their peculiar superstitions, which have never yet been extirpated.

In accordance with their superstitious worship, they have a great number of holy days in the course of the year, during which they make such a noise that an European can scarcely live in the town. Besides uttering the horrible roars and yells which seem unproducable by other than negro throats, they blow horns and long wooden trumpets, the sound of which is described as resembling the roar of a bull, and walk in procession, surrounding with their horns and trumpets the noisiest instrument of all, — namely, the *kin-kasi*, or big drum. This is about four feet in length and one in width, and takes two men to play it, one carrying it, negro fashion, on his head, and the other walking behind, and belaboring it without the least regard to time, the only object being to make as much noise as possible.

Their fetishes are innumerable, and it is hardly possible to walk anywhere without seeing a fetish or two. Anything does for a fetish, but the favorite article is a bundle of rags tied together like a child's rag doll. This is placed in some public spot, and so great is the awe with which such articles are regarded, that it will sometimes remain in the same place for several weeks. A little image of clay, intended to represent a human being, is sometimes substituted for the rag doll.

The following succinct account of the religious system is given in the "Wanderings of a F. R. G. S.:" — "The religious ideas of the Fanti are, as usual in Africa, vague and indistinct. Each person has his *Samán* — literally a skeleton or goblin — or private fetish, an idol, rag, fowl, feathers, bunch of grass, a bit of glass, and so forth: to this he pays the greatest reverence, because it is nearest to him.

"The *Bosorus* are imaginary beings, probably of ghostly origin, called 'spirits' by the missionaries. *Abonsám* is a malevolent being that lives in the upper regions. *Sasabonsám* is the friend of witch and wizard, hates priests and missionaries, and inhabits huge silk-cotton trees in the gloomiest forests; he is a monstrous being, of human shape, of red color, and with long hair. The reader will not fail to remark the similarity of *Sasabonsám* to the East Indian *Rak-*

shasha, the malevolent ghost of a Brahmin, brown in color, inhabiting the pipul tree.

"*Nyankupon*, or *Nyawé*, is the supreme deity, but the word also means the visible firmament or sky, showing that there has been no attempt to separate the ideal from the material. This being, who dwells in *Nyankuponfi*, or *Nyankuponkroo*, is too far from earth to trouble himself about human affairs, which are committed to the *Bosorus*. This, however, is the belief of the educated, who doubtless have derived something from European systems — the vulgar confound him with sky, rain, and thunder.

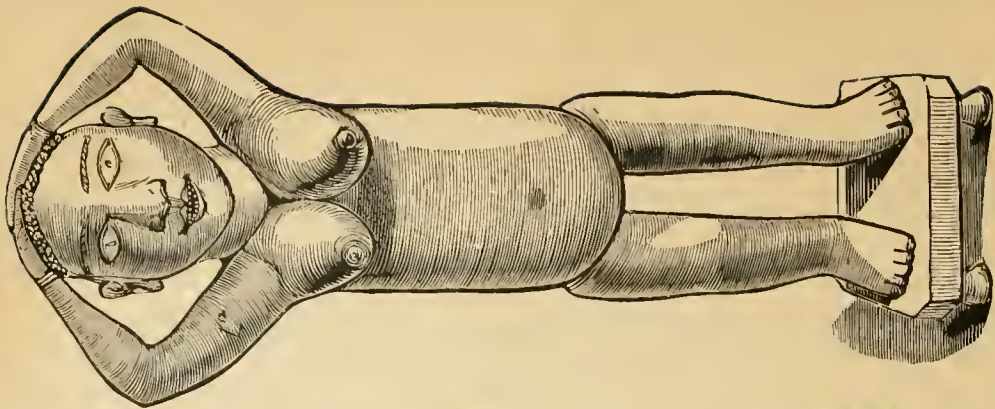

"'Kra,' which the vocabularies translate 'Lord,' is the Anglicised *okro*, or *ocroé*, meaning a favorite male slave, destined to be sacrificed with his dead master; and 'sun-sum,' spirit, means a shadow, the man's *umbra*. The Fantis have regular days of rest: Tuesdays for fishermen, Fridays for bushmen, peasants, and so on."

There is very little doubt that the conjecture of the author is right, and that several of these ideas have been borrowed from European sources.

The rite of circumcision is practised among the Fantis, but does not seem to be universal, and a sacred spot is always chosen for the ceremony. At *Aecra*, a rock rising out of the sea is used for the purpose.

Burial is conducted with the usual accompaniments of professional mourners, and a funeral feast is held in honor of the deceased. A sheep is sacrificed for the occasion, and the shoulder bone is laid on the grave, where it is allowed to remain for a considerable time. Sometimes travellers have noticed a corpse placed on a platform and merely covered with a cloth. These are the bodies of men who have died without paying their debts, and, according to Fanti laws, there they are likely to remain, no one being bold enough to bury them. By their laws, the man who buries another succeeds to his property, but also inherits his debts, and is legally responsible for them. And as in Western Africa the legal rate of interest is far above the wildest dreams of European usurers — say fifty per cent. per annum, or per mensem, or per diem, as the case may be — to bury an exposed corpse involves a risk that no one likes to run.

One of their oddest superstitions is their belief in a child who has existed from the beginning of the world. It never eats nor drinks, and has remained in the infantile state ever since the world and it came into existence. Absurd as is the idea, this miraculous child is firmly believed in, even by persons who have had a good education, and who say that they have actually seen it. Mr. Duncan, to whom we are indebted for the account of it, determined to see it, and was so quick in his movements that he quite disconcerted its nurse, and stopped her preparations for his visit.

(2.) FETISHES — MALE AND FEMALE. (See pages 562, 565.)

(1.) THE PRIMEVAL CHILD. (See page 553.)

"Being again delayed, I lost patience, and resolved to enter the dwelling. My African friends and the multitude assembled from all parts of the town, warned me of the destruction that would certainly overtake me if I ventured to go in without leave. But I showed them my double-barrelled gun as my fetish, and forced my way through the crowd.

"On entering through a very narrow door or gateway, into a circle of about twenty yards' diameter, fenced round by a close paling, and covered outside with long grass (so that nothing within could be seen), the first and only thing that I saw was an old woman who, but for her size and sex, I should have taken for the mysterious being resident there from the time of the creation. She certainly was the most disgusting and loathsome being I ever beheld. She had no covering on her person with the exception of a small piece of dirty cloth round her loins. Her skin was deeply wrinkled and extremely dirty, with scarcely any flesh on her bones. Her breasts hung half way down her body, and she had all the appearance of extreme old age. This ancient woman was the supposed nurse of the immortal child. The god's house and the principal actor in this strange superstition are represented on the previous page.

"On my entering the yard, the old fetish woman stepped before me, making the most hideous gestures ever witnessed, and endeavored to drive me out, that I might be prevented from entering into the god's house, but, in spite of all her movements, I pushed her aside, and forced my way into the house. Its outward appearance was that of a cone, or extinguisher, standing in the centre of the enclosure. It was formed by long poles placed triangularly, and thatched with long grass. Inside it I found a clay bench in the form of a chair. Its tenant was absent, and the old woman pretended that she had by her magic caused him to disappear."

Of course, the plan pursued by the old fetish woman was to borrow a baby whenever any one of consequence desired an interview, and to paint it with colored chalks, so that it was no longer recognizable. She

would have played the same trick with Mr. Duncan, and, from the repeated obstacles thrown in the way of his visit, was evidently trying to gain time to borrow a baby secretly.

At a Fanti funeral the natives excel themselves in noise making, about the only exertion in which they seem to take the least interest. As soon as a man of any note is dead, all his relations and friends assemble in front of his hut, drink, smoke, yell, sing, and fire guns continually. A dog is sacrificed before the hut by one of the relations, though the object of the sacrifice does not seem to be very clear. Rings, bracelets, and other trinkets are buried with the body, and, as these ornaments are often of solid gold, the value of buried jewelry is very considerable. Of course, the graves are sometimes opened and robbed, when the corpse is that of a wealthy person.

One ingenious Fanti contrived to enrich himself very cleverly. One of his sisters had been buried for some time with all her jewelry, and, as the average value of a well-to-do woman's trinkets is somewhere about forty or fifty pounds, the affectionate brother thought that those who buried his sister had been guilty of unjustifiable waste. After a while his mother died, and he ordered her to be buried in the same grave with his sister. The ingenious part of the transaction was that the man declared it to be contrary to filial duty to bury the daughter at the bottom of the grave, in the place of honor, and to lay the mother above her. The daughter was accordingly disinterred to give place to the mother, and when she was again laid in the grave all her trinkets had somehow or other vanished.

The dances of the Fanti tribe are rather absurd. Two dancers stand opposite each other, and stamp on the ground with each foot alternately. The stamping becomes faster and faster, until it is exchanged for leaping, and at every jump the hands are thrown out with the fingers upward, so that the four palms meet with a sharp blow. The couple go on dancing until they fail to strike the hands, and then they leave off and another pair take their place.

CHAPTER LIV.

THE ASHANTI.

ORIGIN AND GENERAL APPEARANCE OF THE ASHANTI—AN ASHANTI CAPTAIN AND HIS UNIFORM—THE GOLD COAST—GOLD WASHING—THE “TILIKISSI” WEIGHTS—INGENIOUS FRAUDS—THE CABOCEERS, OR NOBLES OF ASHANTI—PORTRAIT OF A MOUNTED CABOCEER—THE HORSE ACCOUTREMENTS—LAW OF ROYAL SUCCESSION—MARRIAGE RESTRICTIONS—THE YAM AND ADAI CUSTOMS—FETISH DRUM AND TRUMPET—RELIGIOUS SYSTEM OF ASHANTI—WORSHIP OF EARTH AND SKY—FETISHES—DERIVATION OF THE WORD—THE “KLA,” OR FAMILIAR SPIRIT.

WHENCE the Ashanti tribe came is not very certain, but it is probable that they formerly inhabited a more inland part of the continent, and worked their way westward, after the usual fashion of these tribes. Their traditions state that, about a hundred and fifty years ago, the Ashanti, with several other tribes, were gradually ousted from their own lands by the increasing followers of Islam, and that when they reached a land which was full of gold they took courage, made a bold stand for freedom, and at last achieved their own independence.

At this time the people were divided into a considerable number of states—between forty and fifty, according to one historian. After having driven away their oppressors, they came to quarrel among themselves, and fought as fiercely for precedence as they had formerly done for liberty, and at last the Ashanti tribe conquered the others, and so consolidated the government into a kingdom.

In general appearance, the Ashanti much resemble the Fanti, though they are not perhaps so strongly built. They are, however, quite as good-looking, and, according to Mr. Bowdich, the women are handsomer than those of the Fanti. As a rule, the higher classes are remarkable for their cleanliness, but the lower are quite as dirty as the generality of savage Africans.

As a specimen of the remarkable style of costume in which the Ashanti indulge, a description of an army captain is here introduced. On his head is a vast double plume of eagles' feathers, surmounting a sort of helmet made of rams' horns, gilt in

a spiral pattern, and tied under his chin by a strap covered with cowries. His bow is slung at his back, and his quiver of small poisoned arrows hangs from his wrist, while in his other hand is held an ivory staff, carved in a spiral pattern. His breast is covered with a vast number of little leathern pouches gilt and painted in light colors, mostly scarlet, and from his arms hang a number of horse tails. Great boots of red hide cover his legs to mid thigh, and are fastened to his belt by iron chains.

This belt is a very curious piece of leather work. One of these articles is in my collection, and is furnished with the following implements. First comes a small dagger-knife, with a blade about four inches long, and next to it is a little circular mirror about as large as a crown piece, and enclosed in a double case like that which is now used for prismatic compasses. Then comes a razor, a singularly primitive-looking specimen of cutlery, mounted in a handle which is little more than a piece of stick, with a slit in it. Next comes a leathern pouch about four inches square and one inch in depth, having its interior lined with coarse canvas, and its exterior decorated with little round holes punched in the leather, and arranged in a simple pattern. Lastly comes the razor strop, a very ingenious implement, consisting of a tube filled with emery powder, and sliding into a sheath so as to allow the powder to adhere to it. All these articles are protected by leathern sheaths stained of different colors, and are suspended by short straps from the belt.

The country where the Ashanti tribes now live is popularly termed the Gold

Coast, on account of the richness with which the precious metal is scattered over its surface. It is found almost entirely in the form of dust, and is obtained by a very rude and imperfect mode of washing. The women are the chief gold washers, and they set about their task armed with a hoe, a basin-shaped calabash, and several quills. With the hoe they scrape up a quantity of sand from the bed of some stream, and place it in the calabash. A quantity of water is then added, and, by a peculiar rotatory movement of the hand, the water and sand are shaken up, and made to fly gradually over the top of the basin.

When this movement is adroitly performed, the water and lighter sand escape from the bowl, while the gold dust sinks by its own weight to the bottom, and is thus separated, and put in the quills. Much skill is required in handling the calabash, and one woman will find a fair supply of gold where another will work all day and scarcely find a particle of the metal.

Of course, by this rude method of work the quantity of gold obtained is in very small proportion to the labor bestowed in obtaining it; and if the natives only knew the use of mercury, they would gain three or four times as much gold as they do at present. The quills, when filled with gold dust, are generally fastened to the hair, where they are supposed to be as ornamental as they are precious. The best time for gold washing is after violent rains, when the increased rush of water has brought down a fresh supply of sand from the upper regions. As one of the old voyagers quaintly remarked, "It raineth seldom, but every shower of rain is a shower of gold unto them, for with the violence of the water falling from the mountains it bringeth from them the gold."

A good gold washer will procure in the course of a year a quantity of the dust which will purchase two slaves. The average price of a slave is ten "minkali," each minkali being worth about 12*l.* 6*s.*; and being valued in goods at one musket, eighteen gun flints, twenty charges of powder, one cutlass, and forty-eight leaves of tobacco. The reader may judge what must be the quality of the musket and cutlass. Gold is weighed by the little familiar red and black seeds, called in Western Africa "tilikissi," and each purchaser always has his own balances and his own weights. As might be supposed, both vendor and purchaser try to cheat each other. The gold finder mixes with the real gold dust inferior sand, made by melting copper and silver together, or by rubbing together copper filings and red coral powder. If larger pieces of gold were to be imitated, the usual plan was to make little nuggets of copper, and surround them with a mere shell of gold. This, of course, was the most dangerous

imposition of the three, because the gold coating defied the test, and the fraud would not be discovered unless the nugget were cut in two — rather a tedious process when a great number were offered for sale.

As to the buyers, there was mostly something wrong about their balances; while as to the weights, they soaked the tilikissi seeds in melted butter to make them heavier, and sometimes made sham tilikissis of pebbles neatly ground down and colored.

In spite of all the drawbacks, the quantity of gold annually found in Ashanti-land is very great, and it is used by the richer natives in barbaric profusion. They know or care little about art. Their usual way of making the bracelets or armlets is this. The smith melts the gold in a little crucible of red clay, and then draws in the sand a little furrow into which he runs the gold, so as to make a rude and irregular bar or stick of metal. When cold, it is hammered along the sides so as to square them, and is then twisted into the spiral shape which seems to have instinctively impressed itself on gold workers of all ages and in all countries.

The collars, earrings, and other ornaments are made in this simple manner, and the wife of a chief would scarcely think herself dressed if she had not gold ornaments worth some eighty pounds. The great nobles, or Caboceers, wear on state occasions bracelets of such weight that they are obliged to rest their arms on the heads of little slave boys, who stand in front of them.

The Caboceers are very important personages, and in point of fact were on the eve of becoming to the Ashanti kingdom what the barons were to the English kingdom in the time of John. Indeed, they were gradually becoming so powerful and so numerous, that for many years the king of Ashanti has steadily pursued a policy of repression, and, when one of the Caboceers died, has refused to acknowledge a successor. The result of this wise policy is, that the Caboceers are now comparatively few in number, and even if they were all to combine against the king he could easily repress them.

An umbrella is the distinctive mark of the Caboceers, who, in the present day, exhibit an odd mixture of original savagery and partially acquired civilization. The Caboceers have the great privilege of sitting on stools when in the presence of the king. Moreover, "these men," says Mr. W. Reade, "would be surrounded by their household suites, like the feudal lords of ancient days; their garments of costly foreign silks unravelled and woven anew into elaborate patterns, and thrown over the shoulder like the Roman toga, leaving the right arm bare; a silk fillet encircling the temples; Moorish charms, enclosed in small

cases of gold and silver, suspended on their breasts, with necklaces made of 'aggrgy beads,' a peculiar stone found in the country, and resembling the 'glein-ndyr' of the ancient Britons; lumps of gold hanging from their wrists; while handsome girls would stand behind holding silver basins in their hands."

An illustration on page 564 represents a Caboceer at the head of his wild soldiery, and well indicates the strange mixture of barbarity and culture which distinguishes this as well as other West African tribes. It will be seen from his seat that he is no very great horseman, and, indeed, the Caboceers are mostly held on their horses by two men, one on each side. When Mr. Duncan visited Western Africa, and mounted his horse to show the king how the English dragoons rode and fought, two of the retainers ran to his side, and passed their arms round him. It was not without some difficulty that he could make them understand that Englishmen rode without such assistance. The Caboceer's dress consists of an ornamental turban, a jacket, and a loin cloth, mostly of white, and so disposed as to leave the middle of the body bare. On his feet he wears a remarkable sort of spur, the part which answers to the rowel being flat, squared, and rather deeply notched. It is used by striking or scoring the horse with the sharp angles, and not by the slight pricking movement with which an English jockey uses his spurs. The rowels, to use the analogous term, pass through a slit in an oval piece of leather, which aids in binding the spur on the heel. A pair of these curious spurs are now in my collection, and were presented by Dr. R. Irvine, R. N.

His weapons consist of the spear, bow, and arrows—the latter being mostly poisoned, and furnished with nasty-looking barbs extending for several inches below the head. The horse is almost hidden by its accoutrements, which are wonderfully like those of the knights of chivalry, save that instead of the brilliant emblazonings with which the housings of the chargers were covered, sentences from the Koran are substituted, and are scattered over the entire cloth. The headstall of the horse is made of leather, and, following the usual African fashion, is cut into a vast number of thongs.

One of these headstalls and the hat of the rider are in my collection. They are both made of leather, most carefully and elaborately worked. The hat or helmet is covered with flat, quadrangular ornaments also made of leather, folded and beaten until it is nearly as hard as wood, and from each of them depend six or seven leather thongs, so that, when the cap is placed on the head, the thongs descend as far as the mouth, and answer as a veil. The headstall of the horse is a most elaborate piece of workman-

ship, the leather being stamped out in bold and rather artistic patterns, and decorated with three circular leathern ornaments, in which a star-shaped pattern has been neatly worked in red, black, and white. Five tassels of leathern thongs hang from it, and are probably used as a means of keeping off the flies.

The common soldiers are, as may be seen, quite destitute of uniform, and almost of clothing. They wear several knives and daggers attached to a necklace, and they carry any weapons that they may be able to procure—guns if possible; and, in default of fire-arms, using bows and spears. Two of the petty officers are seen blowing their huge trumpets, which are simply elephant tusks hollowed and polished, and sometimes carved with various patterns. They are blown from the side, as is the case with African wind instruments generally.

In Ashanti, as in other parts of Africa, the royal succession never lies in the direct line, but passes to the brother or nephew of the deceased monarch, the nephew in question being the son of the king's sister, and not his brother. The reason for this arrangement is, that the people are sure that their future king has some royal blood in his veins, whereas, according to their ideas, no one can be quite certain that the son of the queen is also the son of the king, and, as the king's wives are never of royal blood, they might have a mere plebeian claimant to the throne. Therefore the son of the king's sister is always chosen; and it is a curious fact that the sister in question need not be married, provided that the father of her child be strong, good-looking, and of tolerable position in life.

In Ashanti the king is restricted in the number of his wives. But, as the prohibition fixes the magic number of three thousand three hundred and thirty-three, he has not much to complain of with regard to the stringency of the law. Of course, with the exception of a chosen few, these wives are practically servants, and do all the work about the fields and houses.

The natives have their legend about gold. They say that when the Great Spirit first created man, he made one black man and one white one, and gave them their choice of two gifts. One contained all the treasures of the tropics—the fruitful trees, the fertile soil, the warm sun, and a calabash of gold dust. The other gift was simply a quantity of white paper, ink, and pens. The former gift, of course, denoted material advantages, and the latter knowledge. The black man chose the former as being the most obvious, and the white man the latter. Hence the superiority of the white over the black.

Conceding to the white man all the advantages which he gains from his wisdom, they are very jealous of their own advantages,

and resent all attempts of foreigners to work their mines; if mines they can be called, where scarcely any subterraneous work is needed. They will rather allow the precious metal to be wasted than permit the white man to procure it. As to the mulatto, they have the most intense contempt for him, who is a "white-black man, silver and copper, and not gold."

It has already been mentioned that more stress will be laid upon Dahome than Ashanti, and that in cases where manners and customs are common to both kingdoms, they will be described in connection with the latter. In both kingdoms, for example, we find the terrible "Customs," or sacrifice of human life, and in Ashanti these may be reduced to two, namely, the Yam and the Adai.

The former, which is the greater of the two, occurs in the beginning of September, when the yams are ripe. Before the yams are allowed to be used for general consumption, the "Custom" is celebrated; *i. e.* a number of human beings are sacrificed with sundry rites and ceremonies. There are lesser sacrifices on the Adai Custom, which take place every three weeks, and the destruction of human life is terrible. The sacrifices are attended with the horrible music which in all countries where human sacrifices have been permitted has been its accompaniment.

On page 558, a Fetish drum and trumpet, both of which are in my collection, are illustrated, two of the instruments which are used as accompaniments to the sacrifice of human beings. The drum is carved with enormous perseverance out of a solid block of wood, and in its general form presents a most singular resemblance to the bicephalous or two-headed gems of the Gnostics. The attentive reader will notice the remarkable ingenuity with which the head of a man is combined with that of a bird, the latter being kept subservient to the former, and yet having a bold and distinct individuality of its own.

From the top of the united heads rises the drum itself, which is hollowed out of the same block of wood. The parchment head of the drum is secured to the instrument by a number of wooden pegs, and it is probable that the heat of the meridian sun was quite sufficient to tighten the head of the drum whenever it became relaxed. Of course, the plan of tightening it by means of a movable head is not known in Western Africa, and, even if it were known, it would not be practised. The natives never modify a custom. They exchange it for another, or they abolish it, but the reforming spirit never existed in the negro mind.

On the side of the drum may be seen the air-hole, which is usually found in African drums, and which is closed with a piece of spider web when the instrument is used.

Sometimes the drums are of enormous size, the entire trunk of a tree being hollowed out for the purpose. The skin which forms the head is mostly that of an antelope, but when the Ashanti wants a drum to be very powerful against strange fetishes, he makes the head of snake or crocodile skin.

The former material holds a high place in the second instrument, which is a fetish trumpet. As is the case with all African trumpets, it is blown, flute-fashion, from the side, and not, like an European trumpet, from the end. It is made from the tusk of an elephant, carefully hollowed out, and furnished with a curious apparatus, much like the vibrator in a modern harmonium or accordion. As the instrument has sustained rather rough treatment, and the ivory has been cracked here and there, it is impossible to produce a sound from it; and at the best the notes must have been of a very insignificant character, deadened as they must be by the snake-skin covering. The skin in question is that of a boa or python, which is a very powerful fetish among all Africans among whom the boa lives, and it covers almost the whole of the instrument.

A most weird and uncanny sort of look is communicated to the trumpet by the horrid trophy which is tied to it. This is the upper jaw of a human being, evidently a negro, by its peculiar development, the jaw being of the prognathous character, and the projecting teeth in the finest possible order. From the mere existence of these sacrifices it is evident that the religious system of the Ashanti must be of a very low character. They are not utter atheists, as is the case with some of the tribes which have already been mentioned; but they cannot be said even to have risen to deism, and barely to idolatry, their ideas of the Supreme Deity being exceedingly vague, and mixed up with a host of superstitious notions about demons, both good and evil, to whom they give the name of Wodsi, and which certainly absorb the greater part of their devotions and the whole of their reverence, the latter quality being with them the mere outbirth of fear.

Their name for God is "Nyonmo," evidently a modification of Nyame, the title which is given to the Supreme Spirit by the Cammas and other tribes of the Rembo. But Nyonmo also means the sky, or the rain, or the thunder, probably because they proceed from the sky, and they explain thunder by the phrase that Nyonmo is knocking. As the sky is venerated as one deity, so the earth is considered as another though inferior deity, which is worshipped under the name of "Sikpois."

As to the Wodsi, they seem to be divided into various ranks. For example, the earth, the air, and the sea are Wodsi which exercise their influence over all men; whereas other Wodsi, which are visible in the forms

of trees or rivers, have a restricted power over towns, districts, or individuals.

The scrap of rag, leopards' claws, sacred chains, peculiar beads, bits of bone, bird-beaks, &c., which are worn by the Wontse, or fetish men, have a rather curious use, which is well explained by the "F. R. G. S.":—"The West Africans, like their brethren in the East, have evil ghosts and haunting *evastra*, which work themselves into the position of demons. Their various rites are intended to avert the harm which may be done to them by their Pepos or Mulungos, and perhaps to shift it upon their enemies. When the critical moment has arrived, the ghost is adjured by the fetish man to come forth from the possessed, and an article is named—a leopard's claw, peculiar beads, or a rag from the sick man's body nailed to what Europeans call the 'Devil's tree'—in which, if worn about the person, the haunter will reside. It is technically called *Kehi*, or *Keti*, *i. e.* a

chair or a stool. The word 'fetish,' by the way, is a corruption of the Portuguese *Feitico*, *i. e.* witchcraft, or conjuring."

Their belief respecting the *Kra*, or *Kla*, or soul of a man, is very peculiar. They believe that the *Kla* exists before the body, and that it is transmitted from one to another. Thus, if a child dies, the next is supposed to be the same child born again into the world; and so thoroughly do they believe this, that when a woman finds that she is about to become a mother, she goes to the fetish man, and requests him to ask the *Kla* of her future child respecting its ancestry and intended career. But the *Kla* has another office; for it is supposed to be in some sort distinct from the man, and, like the demon of Socrates, to give him advice, and is a kind of small *Wodsi*, capable of receiving offerings. The *Kla* is also dual, male and female; the former urging the man to evil, and the latter to good.

CHAPTER LV.

DAHOMÉ.

CHARACTERISTIC OF THE WESTERN AFRICAN—LOCALITY OF DAHOMÉ—THE FIVE DISTRICTS—DAHOMAN ARCHITECTURE—"SWISH" HOUSES—THE VULTURE AND HIS FOOD—THE LEGBA—SNAKE WORSHIP IN DAHOMÉ—PUNISHMENT OF A SNAKE KILLER—ETIQUETTE AT COURT—JOURNEY OF A MAN OF RANK TO THE CAPITAL—AFRICAN HAMMOCK—SIGNIFICATION OF THE WORD DAHOMÉ—CEREMONIES ON THE JOURNEY—KANA, OR CANANINA, THE "COUNTRY CAPITAL"—BEAUTY OF THE SCENERY—THE OYOS AND GOZO'S CUSTOM—APPROACH TO KANA—A GHASTLY ORNAMENT—"THE BELL COMES"—THE AMAZONS—THEIR FEROCITY AND COURAGE—THEIR WAR TROPHIES AND WEAPONS—REVIEW OF THE AMAZONS—ORGANIZATION OF THE FORCES.

THERE is a very remarkable point about the true negro of Western Africa, namely, the use which he has made of his contact with civilization. It might be imagined that he would have raised himself in the social scale by his frequent intercourse with men wiser and more powerful than himself, and who, if perhaps they may not have been much better in a moral point of view, could not possibly have been worse. But he has done nothing of the kind, and, instead of giving up his old barbarous customs, has only increased their barbarity by the additional means which he has obtained from the white man.

Exchanging the bow and arrows for the gun, and the club for the sword, he has employed his better weapons in increasing his destructive powers, and has chiefly used them in fighting and selling into slavery those whom he had previously fought, and who respected him as long as the arms on both sides were equal. And the strangest thing is that, even considering his captives as so much property, the only excuse which could be found for the savage cruelty with which he makes raids on every town which he thinks he can conquer, he has not yet learned to abolish the dreadful "custom" of human sacrifices, although each prisoner or criminal killed is a dead loss to him.

WE now come to one of the strangest kingdoms on the face of the earth, that of Da-

home; a kingdom begun in blood and cruelty, and having maintained its existence of more than two centuries in spite of the terrible scenes continually enacted—scenes which would drive almost any other nation to revolt. But the fearful sacrifices for which the name of Dahomé has been so long infamous are not merely the offspring of a despotic king's fancy; they are sanctioned, and even forced upon him, by his people—fit subjects of such a king.

It is situated in that part of Africa commonly known as the Slave Coast, as distinguished from the Gold, Ivory, and Grain Coasts, and its shores are washed by the waters of the Bight of Benin. Dahomé alone, of the four great slave kingdoms, Ashanti, Yomba, Benin, and Dahomé, has retained its power, and, to the eye of an experienced observer, even Dahomé, which has outlived the three, will speedily follow them.

On its coast are the two celebrated ports, Lagos and Whydah, which have for so long been the outlets by which the slaves captured in the interior were sent on board the ships. Lagos, however, has been already ceded to England, and, under a better management, will probably become one of the great ports at which a legitimate trade can be carried on, and which will become one of the blessings instead of the curses of Western Africa.

Whydah, being one of the towns through which a traveller is sure to pass in going into the interior of Dahome, is worth a passing notice. Captain Burton, from whom the greater part of our knowledge of this strange land is derived, states that the very name is a misnomer. In the first place, we have attributed it to the wrong spot, and in the next we have given it a most corrupted title. The place which we call Whydah is known to the people as Gre-bwe (Plantation House), while the real Hwe-dah—as the word ought to be spelt—belongs rightly to a little kingdom whose capital was Savi.

Originally a port belonging to the king of Savi, and given up entirely to piracy, it passed into the hands of Agaja, king of Dahome, who easily found an excuse for attacking a place which was so valuable as giving him a direct communication from the interior to the sea, without the intervention of middle-men, who each take a heavy percentage from all goods that pass through their district. From 1725, when it thus passed into Dahoman hands, it rapidly increased in size and importance. Now it presents an extraordinary mixture of native and imported masters, and we will endeavor to cast a rapid glance at the former.

The place is divided into five districts, each governed by its own Caboceer; and it is a notable fact, that nowadays a Caboceer need not be a native. The post of Caboceer of the Sogtaji, or English quarter, was offered to Captain Burton, who, however could not be tempted to accept it even by the umbrella of rank—equal to the blue ribbon of our own system.

At the entrance of every town there is the De-sum, or Custom-house, and close by it are a number of little fetish houses, wherein the trader is supposed to return his thanks to the propitiating demons. The streets are formed by the walls of enclosures and the backs of houses; and, as Dahoman architecture is regulated by law, a very uniform effect is obtained. The walls are mud, popularly called "swish," sometimes mixed with oyster-shells to strengthen it, and built up in regular courses, each about two feet and a half in thickness. By law, no walls are allowed to be more than four courses high.

The hot sun soon bakes the mud into the consistence of soft brick; and, were it not for the fierce rains of the tropics, it would be very lasting. As it is, the rainy season is very destructive to walls, and the early part of the dry season is always a busy time with native architects, who are engaged in repairing the damages caused by the rains. There is a small amount of salt in the mud, which increases the liability to damage. On the Gold Coast the natives ingeniously strengthen the swish walls by growing cactus plants; but the negroes of Dahome neglect this precaution, and conse-

quently give themselves—as lazy people proverbially do—a vast amount of needless trouble. There are no windows to the houses; but the roofs, made of grass and leaves fastened on a light framework, are made so that they can be partially raised from the walls, like the "fly" of a tent.

In spite of the presence of localized Christian missions, and the continual contact of Islamism, the system of fetishism is rampant in Whydah. No human sacrifices take place there, all the victims being forwarded to the capital for execution. But, according to Captain Burton, "even in the bazaar many a hut will be girt round with the Zo Vodun, a country rope with dead leaves dangling from it at spaces of twenty feet. (Zo Vodun signifies fire-fetish.)

"After a conflagration, this fetish fire-prophylactic becomes almost universal. Opposite the house gates, again, we find the Vo-siva defending the inmates from harm. It is of many shapes, especially a stick or a pole, with an empty old calabash for a head, and a body composed of grass, thatch, palm leaves, fowls' feathers, achatina shells. These people must deem lightly of an influence that can mistake, even in the dark, such a scarecrow for a human being.

"Near almost every door stands the Legba-gbau, or Legba-pot, by Europeans commonly called the 'Devil's dish.' It is a common clay shard article, either whole or broken, and every morning and evening it is filled, generally by women, with cooked maize and palm oil, for the benefit of the turkey buzzard. 'Akrasu,' the vulture, is, next to the snake, the happiest animal in Dahome. He has always abundance of food, like storks, robins, swallows, crows, adjutant-cranes, and other holy birds in different parts of the world. Travellers abuse this 'obscene fowl,' forgetting that without it the towns of Yoruba would be uninhabitable. . . . The turkey-buzzard perched on the topmost stick of a blasted calabash tree is to the unromantic natives of Africa what the pea fowl is to more engaging Asians. It always struck me as the most appropriate emblem and heraldic bearing for decayed Dahome."

The Legba, or idol to whom the fowl is sacred, is an abominable image, rudely moulded out of clay, and represented in a squatting attitude. Sometimes Legba's head is of wood, with eyes and teeth made of cowries, or else painted white. Legba is mostly a male deity, rarely a female, and the chief object of the idol maker seems to be that the worshipper shall have no doubt on the subject. Legba sits in a little hut open at the sides; and, as no one takes care of him, and no one dares to meddle with him, the country is full of these queer little temples, inside which the god is sometimes seen in tolerable preservation, but in most cases has sunk into a mere heap of mud and

(1.) CABOCEER AND SOLDIERS. (See page 556.)

(2.) PUNISHMENT OF A SNAKE KILLER. (See page 565.)

dust. Some of these wooden Legbas may be seen on the 552nd page, but they are purposely selected on account of the exceptional delicacy displayed by the carver.

Snakes are fetish throughout Dahome, and are protected by the severest laws. All serpents are highly venerated, but there is one in particular, a harmless snake called the "Daubgbwe," which is held in the most absurd reverence. It is of moderate size, reaching some five or six feet in length, and is rather delicately colored with brown, yellow, and white. The Daubgbwe is kept tame in fetish houses, and, if one of them should stray, it is carefully restored by the man who finds it, and who grovels on the ground and covers himself with dust before he touches it, as he would in the presence of a king. Formerly the penalty for killing one of these snakes was death, but it is now commuted for a punishment which, although very severe, is not necessarily fatal to the sufferer. It partakes of the mixture of the horrible and the grotesque which is so characteristic of this land. Mr. Duncan saw three men undergo this punishment. Three small houses were built of dry sticks, and thatched with dry grass. The culprits were then placed in front of the houses by the fetish man, who made a long speech to the spectators, and explained the enormity of the offence of which they had been guilty.

They then proceeded to tie on the shoulders of each culprit a dog, a kid, and two fowls. A quantity of palm oil was poured over them, and on their heads were balanced baskets, containing little open calabashes filled with the same material, so that at the least movement the calabashes were upset, and the oil ran all over the head and body. They were next marched round the little houses, and, lastly, forced to crawl into them, the dog, kid, and fowls being taken off their shoulders and thrust into the house with them. The doors being shut, a large mob assembles with sticks and clods, and surrounds the house. The houses are then fired, the dry material blazing up like gunpowder, and the wretched inmates burst their way through the flaming walls and roof, and rush to the nearest running stream, followed by the crowd, who beat and pelt them unmercifully. If they can reach the water, they are safe, and should they be men of any consequence they have little to fear, as their friends surround them, and keep off the crowd until the water is reached.

The whole of the proceedings are shown in the illustration on the previous page.

In the distance is seen one of the culprits being taken to his fetish house, the basket of calabashes on his head, and the animals slung round his neck. Another is seen creeping into the house, near which the fetish man is standing, holding dead snakes in his hands, and horrible to look at by

reason of the paint with which he has covered his face. In the foreground is another criminal rushing toward the water, just about to plunge into it and extinguish the flames that are still playing about his oil-saturated hair and have nearly burned off all his scanty clothing. The blazing hut is seen behind him, and around are the spectators, pelting and striking him, while his personal friends are checking them, and keeping the way clear toward the water.

We will now leave Whydah, and proceed toward the capital.

When a person of rank wishes to pay his respects to the king, the latter sends some of his officers, bearing, as an emblem of their rank, the shark-stick, *i. e.* a kind of tomahawk about two feet long, carved at the end into a rude semblance of the shark, another image of the same fish being made out of a silver dollar beaten flat and nailed to the end of the handle. One of the officers will probably have the lion stick as his emblem of the trust reposed in him; but to unpractised eyes the lions carved on the stick would answer equally well for the shark, and both would do well as "crocodile" sticks, the shapes of the animals being purely conventional.

The mode of travelling is generally in hammocks, made of cotton cloth, but sometimes formed of silk: these latter are very gaudy affairs. The average size of a hammock is nine feet by five, and the ends are lashed to a pole some nine or ten feet in length. Upon the pole is fixed a slight framework, which supports an awning as a defence against the sun. The pole is carried not on the shoulders but the heads of the bearers, and, owing to their awkwardness and rough movements, an inexperienced traveller gets his head knocked against the pole with considerable violence. Two men carry it, but each hammock requires a set of seven men, some to act as relays, and others to help in getting the vehicle over a rough part of the road. Each man expects a glass of rum morning and evening, and, as he is able to make an unpopular master very uncomfortable, it is better to yield to the general custom, especially as rum is only threepence per pint.

Being now fairly in the midst of Dahome, let us see what is the meaning of the name. Somewhere about A. D. 1620, an old king died and left three sons. The oldest took his father's kingdom, and the youngest, Dako by name (some writers call him Tacudona), went abroad to seek his fortune, and settled at a place not far from Agbome. By degrees Dako became more and more powerful, and was continually encroaching upon the country belonging to a neighboring king called Danh, *i. e.* the Snake, or Rainbow. As the number of his followers increased, Dako pestered Danh for more and more land for them, until at last the king lost

patience, and said to the pertinacious mendicant, "Soon thou wilt build in my belly." Dako thought that this idea was not a bad one, and when he had collected sufficient warriors, he attacked Danh, killed him, took possession of his kingdom, and built a new palace over his corpse, thus literally and deliberately fulfilling the prediction made in haste and anger by his conquered foe. In honor of his victory, the conqueror called the place Danh-ome, or Danh's-belly. The "n" in this word is a nasal sound unknown to English ears, and the word is best pronounced Dah-ome, as a dissyllable.

The great neighboring kingdom of Allada was friendly with Dahome for nearly a hundred years, when they fell out, fought, and Dahome again proved victorious, so that Allada allowed itself to be incorporated with Dahome.

It was a little beyond Allada where Captain Burton first saw some of the celebrated Amazons, or female soldiers, who will be presently described, and here began the strange series of ceremonies, far too numerous to be separately described, which accompanied the progress of so important a visitor to the capital. A mere slight outline will be given of them.

At every village that was passed a dance was performed, which the travellers were expected to witness. All the dances being exactly alike, and consisting of writhings of the body and stamping with the feet, they soon became very monotonous, but had to be endured. At a place called Aquine a body of warriors rushed tumultuously into the cleared space of the village under its centre tree. They were about eighty in number, and were formed four deep. Headed by a sort of flag, and accompanied by the inevitable drum, they came on at full speed, singing at the top of their voices, and performing various agile antics. After circling round the tree, they all fell flat on the ground, beat up the dust with their hands, and flung it over their bodies. This is the royal salute of Western Africa, and was performed in honor of the king's canes of office, which he had sent by their bearers, accompanied by the great ornament of his court, an old liquor case, covered with a white cloth, and borne on a boy's head. From this case were produced bottles of water, wine, gin, and rum, of each of which the visitors were expected to drink three times, according to etiquette.

After this ceremony had been completed, the escort, as these men proved to be, preceded the party to the capital, dancing and capering the whole way. After several halts, the party arrived within sight of Kana, the country capital. "It is distinctly Dahome, and here the traveller expects to look upon the scenes of barbaric splendor of which all the world has read. And it has its own beauty; a French traveller has compared it

with the loveliest villages of fair Provence, while to Mr. Duncan it suggested 'a vast pleasure ground, not unlike some parts of the Great Park at Windsor.'

"After impervious but sombre forest, grass-barrens, and the dismal swamps of the path, the eye revels in these open plateaux; their seducing aspect is enhanced by scattered plantations of a leek-green studing the slopes, by a background of gigantic forest dwarfing the nearer palm tiles, by homesteads buried in cultivation, and by calabashes and cotton trees vast as the view, tempering the fiery summer to their subject growths, and in winter collecting the rains, which would otherwise bare the newly-buried seed. Nor is animal life wanting. The turkey buzzard, the kite, and the kestrel soar in the upper heights; the brightest fly-catchers flit through the lower strata; the little gray squirrel nimbly climbs his lofty home; and a fine large spur-fowl rises from the plantations of maize and cassava."

As is usual with African names, the word Kana has been spelled in a different way by almost every traveller and every writer on the subject. Some call it Canna, or Cannah, or Carnah, while others write the word as Calmina, evidently a corruption of Kana-mina, the "mina" being an addition. All the people between the Little Popo and Adua are called Mina. We shall, however, be quite safe, if throughout our account of Western Africa we accept the orthography of Captain Burton. Kana was seized about 1818 by King Gozo, who liked the place, and so made it his country capital—much as Brighton was to England in the days of the Regency. He drove out the fierce and warlike Oyos (pronounced Aw-yaws), and in celebration of so important a victory instituted an annual "Custom," *i. e.* a human sacrifice, in which the victims are dressed like the conquered Oyos.

This is called Gozo's Custom, and, although the details are not precisely known, its general tenor may be ascertained from the following facts. One traveller, who visited Kana in 1863, saw eleven platforms on poles about forty feet high. On each platform was the dead body of a man in an erect position, well dressed in the peasant style, and having in his hand a calabash containing oil, grain, or other product of the land. One of them was set up as if leading a sheep.

When Mr. Duncan visited Kana, or Canamina, as he calls it, he saw relics of this "Custom." The walls of the place, which were of very great extent, were covered with human skulls placed about thirty feet apart, and upon a pole was the body of a man in an upright position, holding a basket on his head with both his arms. A little further on were the bodies of two other men, hung by their feet from a sort of gallows, about twenty feet high. They had

been in that position about two months, and were hardly recognizable as human beings, and in fact must have presented as repulsive an appearance as the bodies hung in chains, or the heads on Temple Bar. Two more bodies were hung in a similar manner in the market-place, and Mr. Duncan was informed that they were criminals executed for intrigues with the king's wives.

At Kana is seen the first intimation of the presence of royalty. A small stream runs by it, and supplies Kana with water. At daybreak the women slaves of the palace are released from the duration in which they are kept during the night, and sent off to fetch water for the palace. They are not fighting women or Amazons, as they are generally called; but the slaves of the Amazons, each of these women having at least one female slave, and some as many as fifty.

The very fact, however, that they are servants of the Amazons, who are the servants of the king, confers on them a sort of dignity which they are not slow to assert. No man is allowed to look at them, much less to address them, and in consequence, when the women go to fetch water, they are headed by one of their number carrying a rude bell suspended to the neck. When the leader sees a man in the distance, she shakes the bell vigorously, and calls out, "Gan-ja," *i. e.* "the bell comes." As soon as the tinkle of the bell or the cry reaches the ears of any men who happen to be on the road, they immediately run to the nearest footpath, of which a number are considerably made, leading into the woods, turn their backs, and wait patiently until the long file of women has passed. This hurrying of men to the right and left, hiding their faces in the bushes and brakes, is admirably represented on the 569th page.

They had need to escape as fast as they can, for if even one of the water-pots should happen to be broken, the nearest man would inevitably be accused of having frightened the woman who carried it, and would almost certainly be sold into slavery, together with his wife and family.

As might be expected, the attendants at the palace are very proud of this privilege, and the uglier, the older, and the lower they are, the more perseveringly do they ring the bell and utter the dreaded shout, "Gan-ja." The oddest thing is that even the lowest of the male slaves employed in the palace assume the same privilege, and insist on occupying the road and driving all other travellers into the by-paths. "This," says Captain Burton, "is one of the greatest nuisances in Dahome. It continues through the day. In some parts, as around the palace, half a mile an hour would be full speed, and to make way for these animals of burthen, bought perhaps for a few pence, is, to say the least of it, by no means decorous."

The town of Kana has in itself few elements of beauty, however picturesque may be the surrounding scenery. It occupies about three miles of ground, and is composed primarily of the palace, and secondly of a number of houses scattered round it, set closely near the king's residence, and becoming more and more scattered in proportion to their distance from it. Captain Burton estimates the population at 4,000. The houses are built of a red sandy clay.

The palace walls, which are of great extent, are surrounded by a cheerful adornment in the shape of human skulls, which are placed on the top at intervals of thirty feet or so, and striking, as it were, the key note to the Dahoman character. In no place in the world is human life sacrificed with such prodigality and with such ostentation.

In most countries, after a criminal is executed, the body is allowed to be buried, or, at the most, is thrown to the beasts and the birds. In Dahome the skull of the victim is cleansed, and used as an ornament of some building, or as an appendage to the court and its precincts. Consequently, the one object which strikes the eye of a traveller is the human skull. The walls are edged with skulls, skulls are heaped in dishes before the king, skulls are stuck on the tops of poles, skulls are used as the heads of banner staves, skulls are tied to dancers, and all the temples, or Ju-ju houses, are almost entirely built of human skulls. How they come to be in such profusion we shall see presently.

Horrible and repulsive as this system is, we ought to remember that even in England, in an age when art and literature were held in the highest estimation, the quartered bodies of persons executed for high treason were exposed on the gates of the principal cities, and that in the very heart of the capital their heads were exhibited up to a comparatively recent date. This practice, though not of so wholesale a character as the "Custom" of Dahome, was yet identical with it in spirit.

As the Amazons, or female soldiers, have been mentioned, they will be here briefly described. This celebrated force consists wholly of women, officers as well as privates. They hold a high position at court, and, as has already been mentioned, are of such importance that each Amazon possesses at least one slave. In their own country they are called by two names, Akho-si, *i. e.* the King's wives, and Mi-no, *i. e.* our mothers; the first name being given to them on the *lucus a non lucendo* principle, because they are not allowed to be the wives of any man, and the second being used as the conventional title of respect. The real wives of the king do not bear arms, and though he sometimes does take a fancy to one of his women soldiers, she may not assume the position of a regular wife.

About one-third of the Amazons have been married, but the rest are unmarried maidens. Of course it is needful that such a body should observe strict celibacy, if their efficiency is to be maintained, and especial pains are taken to insure this object. In the first place, the strictest possible watch is kept over them, and, in the second, the power of superstition is invoked. At one of the palace gates, called significantly Agbodewe, *i. e.* the Discovery Gate, is placed a potent fetish, who watches over the conduct of the Amazons, and invariably discovers the soldier who breaks the most important of the military laws. The Amazons are so afraid of this fetish, that when one of them has transgressed she has been known to confess her fault, and to give up the name of her partner in crime, even with the knowledge that he will die a cruel death, and that she will be severely punished, and probably be executed by her fellow-soldiers. Besides, there is a powerful *esprit de corps* reigning among the Amazons, who are fond of boasting that they are not women, but men.

They certainly look as if they were, being, as a rule, more masculine in appearance than the male soldiers, tall, muscular, and possessed of unflinching courage and ruthless cruelty. To help the reader to a clearer idea of this stalwart and formidable soldiery, two full-length portraits are given on the next page. Bloodthirsty and savage as are the Dahomans naturally, the Amazons take the lead in both qualities, seeming to avenge themselves, as it were, for the privations to which they are doomed. The spinster soldiers are women who have been selected by the king from the families of his subjects, he having the choice of them when they arrive at marriageable age; and the once married soldiers are women who have been detected in infidelity, and are enlisted instead of executed, or wives who are too vixenish toward their husbands, and so are appropriately drafted into the army, where their combative dispositions may find a more legitimate object.

In order to increase their bloodthirsty spirit, and inspire a feeling of emulation, those who have killed an enemy are allowed to exhibit a symbol of their prowess. They remove the scalp, and preserve it for exhibition on all reviews and grand occasions. They have also another decoration, equivalent to the Victoria Cross of England, namely, a cowrie shell fastened to the butt of the musket. After the battle is over, the victorious Amazon smears part of the rifle butt with the blood of the fallen enemy, and just before it dries spreads another layer. This is done until a thick, soft paste is formed, into which the cowrie is pressed. The musket is then laid in the sun, and when properly dry the shell is firmly glued to the weapon.

The possession of this trophy is eagerly

coveted by the Amazons, and, after a battle, those who have not slain an enemy with their own hand are half-maddened with envious jealousy when they see their more successful sisters assuming the coveted decoration. One cowrie is allowed for each dead man, and some of the boldest and fiercest of the Amazons have their musket butts completely covered with cowries arranged in circles, stars, and similar patterns.

The dress of the Amazons varies slightly according to the position which they occupy. The ordinary uniform is a blue and white tunic of native cloth, but made without sleeves, so as to allow full freedom to the arms. Under this is a sort of shirt or kilt, reaching below the knees, and below the shirt the soldier wears a pair of short linen trousers. Round the waist is girded the ammunition-belt, which is made exactly on the same principle as the bandolier of the Middle Ages. It consists of some thirty hollow wooden cylinders sticking into a leathern belt, each cylinder containing one charge of powder. When they load their guns, the Amazons merely pour the powder down the barrel, and ram the bullet after it, without taking the trouble to introduce wadding of any description, so that the force of the powder is much wasted, and the direction of the bullet very uncertain. Partly owing to the great windage caused by the careless loading and badly fitting balls, and partly on account of the inferiority of the powder, the charges are twice as large as would be required by a European soldier.

Captain Burton rightly stigmatizes the existence of such an army as an unmixed evil, and states that it is one of the causes which will one day cause the kingdom of Dahome to be obliterated from the earth. "The object of Dahoman wars and invasions has always been to lay waste and to destroy, not to aggrandize.

"As the history puts it, the rulers have ever followed the example of Agaja, the second founder of the kingdom; aiming at conquest and at striking terror, rather than at accretion and consolidation. Hence there has been a decrease of population with an increase of territory, which is to nations the surest road to ruin. In the present day the wars have dwindled to mere slave hunts—a fact it is well to remember.

"The warrior troops, assumed to number 2,500, should represent 7,500 children; the waste of reproduction and the necessary casualties of 'service' in a region so depopulated are as detrimental to the body politic as a proportionate loss of blood would be to the body personal. Thus the land is desert, and the raw material of all industry, man, is everywhere wanting."

Fierce, cruel, relentless, deprived by severe laws of all social ties, the women

(1.) "THE BELL COMES." (See page 567.)

(2.) DAHOMAN AMAZONS. (See page 568.)

soldiers of Dahome are the only real fighters, the men soldiers being comparatively feeble and useless. They are badly and miscellaneously armed, some having trade guns, but the greater number being only furnished with bow and arrow, swords, or clubs. All, however, whether male or female, are provided with ropes wherewith to bind their prisoners, slave hunts being in truth the real object of Dahoman warfare. From his profound knowledge of negro character, Captain Burton long ago prophesied that the kingdom of Dahome was on the wane, and that "weakened by traditional policy, by a continual scene of blood, and by the arbitrary measures of her king, and demoralized by an export slave-trade, by close connection with Europeans, and by frequent failure, this band of black Spartans is rapidly falling into decay."

He also foretold that the king's constant state of warfare with Abeokuta was a political mistake, and that the Egbas would eventually prove to be the conquerors. How true these remarks were has been proved by the events of the last few years. The king Gelele made his threatened attack on Abeokuta, and was hopelessly beaten. In spite of the reckless courage of the Amazons, who fought like so many mad dogs, and were assisted by three brass six-pounder field guns, his attack failed, and his troops were driven off with the loss of a vast number of prisoners, while the killed were calculated at a thousand.

How recklessly these Amazons can fight is evident from their performances at a review. In this part of the country the simple fortifications are made of the acacia bushes, which are furnished with thorns of great length and sharpness, and are indeed formidable obstacles. At a review witnessed by Mr. Duncan, and finely illustrated for the reader on the 573rd page, model forts were constructed of these thorns, which were heaped up into walls of some sixty or seventy feet in thickness and eight in height. It may well be imagined that to cross such ramparts as these would be no easy task, even to European soldiers, whose feet are defended by thick-soled boots, and that to a barefooted soldiery they must be simply impregnable. Within the forts were built strong pens seven feet in height, inside of which were cooped up a vast number of male and female slaves belonging to the king.

The review began by the Amazons forming with shouldered arms about two hundred feet in front of the strong fort, and waiting for the word of command. As soon as it was given, they rushed forward, charged the solid fence as though thorns were powerless against their bare feet, dashed over it, tore down the fence, and returned to the king in triumph, leading with them the captured slaves, and exhibiting

also the scalps of warriors who had fallen in previous battles, but who were conventionally supposed to have perished on the present occasion. So rapid and fierce was the attack, that scarcely a minute had elapsed after the word of command was given and when the women were seen returning with their captives.

The organization of the Amazonian army is as peculiar as its existence. The regiment is divided into three battalions, namely, the centre and two wings. The centre, or Fanti battalion, is somewhat analogous to our Guards, and its members distinguished by wearing on the head a narrow white fillet, on which are sewed blue crocodiles. This ornament was granted to them by the king, because one of their number once killed a crocodile. As a mark of courtesy, the king generally confers on his distinguished visitors the honorary rank of commander of the Fanti battalion, but this rank does not entitle him even to order the corps out for a review.

The Grenadiers are represented by the Blunderbuss Company, who are selected for their size and strength, and are each followed by a slave carrying ammunition. Equal in rank to them are the sharpshooters, or "Sure-to-kill" Company, the Carbineers, and the Bayonet Company.

The women of most acknowledged courage are gathered into the Elephant Company, their special business being to hunt the elephant for the sake of its tusks, a task which they perform with great courage and success, often bringing down an elephant with a single volley from their imperfect weapons.

The youngest, best-looking, most active and neatly dressed, are the archers. They are furnished with very poor weapons, usually bow and small arrows, and a small knife. Indeed, they are more for show than for use, and wear by way of uniform a dress more scanty than that of the regular army, and are distinguished also by an ivory bracelet on the left arm, and a tattoo extending to the knee. They are specially trained in dancing, and, when in the field, they are employed as messengers and in carrying off the dead and wounded. Their official title is Go-hen-to, *i. e.* the bearers of quivers.

The greater number of the Amazons are of course line-soldiers, and if they only had a little knowledge of military manœuvres, and could be taught to load properly, as well as to aim correctly, would treble their actual power. Their manœuvres, however, are compared by Captain Burton to those of a flock of sheep, and they have such little knowledge of concerted action that they would be scattered before a charge of the very worst troops in Europe.

Lastly come the razor women. This curious body is intended for striking terror into the enemy, the soldiers being armed with a

large razor, that looks exactly as if it had been made for the clown in a pantomime. The blade is about two feet in length, and the handle of course somewhat larger, and, when opened, the blade is kept from shutting by a spring at the back. It is employed for decapitating criminals, but by way of a weapon it is almost worse than useless, and quite as likely to wound the person who holds it as it is him against whom it is directed. The razor was invented by a brother of the late King Gezo. On the 558th page is an illustration of one of the war-drums of the Amazons. It was taken from the slain warriors in the attack upon Abeokuta.

CHAPTER LVI.

DAHOMÉ — *Continued.*

THE DUPLICATE KING—THE “CUSTOMS” OF DAHOME — APPEARANCE OF KING GELELE — ETIQUETTE AT COURT—THE KING DRINKS — THE CALABASHES OF STATE—THE KING’S PROGRESS—THE ROYAL PROCESSION—THE FIRST DAY OF THE CUSTOMS—THE VICTIM-SHED AND ITS INMATES—THE ROYAL PAVILION—PRELIMINARY CEREMONIALS—THE SECOND DAY OF THE CUSTOMS—THE “ABLE-TO-DO-ANYTHING” CLOTH—THE THIRD DAY—SCRAMBLING FOR COWRIES, AND PROCESSION OF HUNCHBACKS—FETISHES—CONVERSATION WITH THE VICTIMS—THE FOURTH DAY AND ITS EVIL NIGHT—ESTIMATED NUMBER OF THE VICTIMS, AND MODE OF THEIR EXECUTION—OBJECT AND MEANING OF THE CUSTOMS—LETTER TO THE DEAD, AND THE POSTSCRIPT—EXECUTION AT AGHOME—THE BLOOD DRINKER.

BEFORE proceeding to the dread “customs” of Dahomé, we must give a brief notice of a remarkable point in the Dahoman statecraft. Like Japan, Dahomé has two kings, but, instead of being temporal and spiritual as in Japan, they are City king and Bush king, each having his throne, his state, his court, his army, his officers, and his customs. When Captain Burton visited Dahomé, the City king was Gelele, son of Gezo, and the Bush king was Addo-kpore.

The Bush king is set over all the farmers, and regulates tillage and commerce; while the City king rules the cities, makes war, and manages the slave trade. Consequently, the latter is so much brought into contact with the traders that the former is scarcely ever seen except by those who visit the country for the express purpose. He has a palace at a place about six miles from the capital, but the building was only made of poles and matting when Captain Burton visited it, and is not likely to be made of stronger materials, as it was not to be built of “swish” until Abeokuta was taken.

We will now proceed to describe, as briefly as is consistent with truth, the customs of both kings, our authorities being restricted to two, Mr. Duncan and Captain Burton, the latter having made many important corrections in the statements of the former and of other travellers. The present tense will therefore be used throughout the description.

Gelele is a fine-looking man, with a right royal aspect. He is more than six feet in height, thin, broad-shouldered, active, and powerful. His hair is nearly all shaven except two cockade-like tufts, which are used as attachments for beads and other trinkets of brass and silver. Contrary to the usual form, he has a firm and well-pronounced chin, and a tolerably good forehead, and, in spite of his cruel and blood-thirsty nature, has a very agreeable smile. He wears his nails very long, and is said, though the statement is very doubtful, that he keeps under his talon-like nails a powerful poison, which he slyly infuses in the drink of any of his Caboceers who happen to offend him. His face is much pitted with the small-pox, and he wears the mark of his race, namely, three perpendicular scars on the forehead just above the nose. This is the last remnant of a very painful mode of tattooing, whereby the cheeks were literally carved, and the flaps of flesh turned up and forced to heal in that position.

He is not nearly so black as his father, his skin approaching the copper color, and it is likely that his mother was either a slave girl from the northern Makhi, or a mulatto girl from Whydah.

On ordinary occasions he dresses very simply, his body cloth being of white stuff edged with green, and his short drawers of purple silk. He wears but few ornaments, the five or six iron bracelets which encircle

his arms being used more as defensive armor than as jewelry.

Still, though dressed in a far simpler style than any of his Caboceers, he is very punctilious with regard to etiquette, and preserves the smallest traditions with a minute rigidity worthy of the court of Louis XIV. Although he may be sitting on a mere earthen bench, and smoking a clumsy and very plain pipe, all his court wait upon him with a reverence that seems to regard him as a demi-god rather than a man. Should the heat, from which he is sheltered as much as possible by the royal umbrella, produce a few drops on his brow, they are delicately wiped off by one of his wives with a fine cloth; if the tobacco prove rather too potent, a brass or even a gold spittoon is placed before the royal lips. If he sneezes, the whole assembled company burst into a shout of benedictions. The chief ceremony takes place when he drinks. As soon as he raises a cup to his lips, two of his wives spread a white cloth in front of him, while others hold a number of gaudy umbrellas so as to shield him from view. Every one who has a gun fires it, those who have bells beat them, rattles are shaken, and all the courtiers bend to the ground, clapping their hands. As to the commoners, they turn their backs if sitting, if standing they dance like bears, paddling with their hands as if they were paws, bawling "Poo-oo-oo" at the top of their voices.

If a message is sent from him, it is done in a most circuitous manner. He first delivers the message to the Dakro, a woman attached to the court. She takes it to the Meu, and the Meu passes it on to the Mingan, and the Mingan delivers it to the intended recipient. When the message is sent to the king, the order is reversed, and, as each officer has to speak to a superior, a salutation is used neatly graduated according to rank. When the message at last reaches the Dakro, she goes down on all-fours, and whispers the message into the royal ears. So tenacious of trifles is the native memory, that the message will travel through this circuitous route without the loss or transposition of a word.

When any one, no matter what may be his rank, presents himself before the king, he goes through a ceremony called "Itte d'ai," or lying on the ground. He prostrates himself flat on his face, and with his hands shovels the dust all over his person. He also kisses the ground, and takes care when he rises to have as much dust as possible on his huge lips. Face, hands, limbs, and clothes are equally covered with dust, the amount of reverence being measured by the amount of dust. No one approaches the king erect; he must crawl on all-fours, shuttle on his knees, or wriggle along like a snake.

Wherever Gelele holds his court, there

are placed before him three large calabashes, each containing the skull of a powerful chief whom he had slain. The exhibition of these skulls is considered as a mark of honor to their late owners, and not, as has been supposed, a sign of mockery or disgrace. One is bleached and polished like ivory, and is mounted on a small ship made of brass. The reason for this curious arrangement is, that when Gezo died, the chief sent a mocking message to Gelele, saying that the sea had dried up, and men had seen the end of Dahome. Gelele retaliated by invading his territory, killing him, and mounting his skull on a ship, as a token that there was plenty of water left to float the vessel.

The second skull is mounted with brass so as to form a drinking cup. This was done because the owner had behaved treacherously to Gelele instead of assisting him. In token, therefore, that he ought to have "given water to a friend in affliction" — the metaphorical mode of expressing sympathy — Gelele and his courtiers now drink water out of his skull. The third was the skull of a chief who had partaken of this treachery, and his skull was accordingly mounted with brass fittings which represented the common country trap, in order to show that he had set a trap, and fallen into it himself. All these skulls were without the lower jaw, that being the most coveted ornament for umbrellas and sword-handles. Sad to say, with the usual negro disregard of inflicting pain, the captor tears the jaw away while the victim is still alive, cutting through both cheeks with one hand and tearing away the jaw with the other.

The same minute and grotesque etiquette accompanies the king as he proceeds to Agbome, the real capital, to celebrate the So-Sin Custom, and it is impossible to read the accounts of the whole proceeding without being struck with the ingenuity by which the negro has pressed into the service of barbarism everything European that he can lay his hands upon, while he has invariably managed thereby to make the rites ludicrous instead of imposing.

First came a long line of chiefs, distinguished by their flags and umbrellas, and, after marching once round the large space or square, they crossed over and formed a line of umbrellas opposite the gateway. Then came the royal procession itself, headed by skirmishers and led by a man carrying one of the skull-topped banners. After these came some five hundred musketeers, and behind them marched two men carrying large leathern shields painted white, and decorated with a pattern in black. These are highly valued, as remnants of the old times when shields were used in warfare, and were accompanied by a guard of tall negroes, wearing brass helmets and black horse-tails.

(1.) AMAZON REVIEW. (See page 571.)

(2.) THE KING'S DANCE. (See page 577.)

Next came the *Kafo*, or emblem of royalty, namely, an iron fetish-stick enclosed in a white linen case, topped with a white plume; and after the *Kafo* came the king, riding under the shade of four white umbrellas, and further sheltered from the sun by three parasols, yellow, purple, and bluish red. These were waved over him so as to act as fans.

After the king was borne the great fetish axe, followed by the "band," a noisy assemblage of performers on drums, rattles, trumpets, cymbals, and similar instruments. Two specimens of ivory trumpets, with various strange devices elaborately carved, are represented in an engraving on the 558th page. The right-hand trumpet has a crucified figure on it. Lastly came a crowd of slaves laden with chairs, baskets of cowries, bottles, and similar articles, the rear being brought up by a pair of white and blue umbrellas and a tattered flag.

Six times the king was carried round the space, during two of the circuits being drawn in a nondescript wheeled vehicle, and on the third circuit being carried, carriage and all, on the shoulders of his attendants. The fourth and fifth circuits were made in a *Bath chair*, and the sixth in the same vehicle carried as before. The king then withdrew to the opposite side of the space, and the Amazons made their appearance, dashing into the space in three companies, followed by the Fanti companies already described. These young women showed their agility in dancing, and were followed by a calabash adorned with skulls and a number of flags, escorted by twelve Razor women.

By this time the king had transferred himself to a hammock of yellow silk, suspended from a black pole ornamented with silver sharks — this fish being a royal emblem — and tipped with brass at each end. Twelve women carried the hammock, and others shaded and fanned him as before. These preliminaries being completed, all retired to rest until the following day, which was to be the first of the *So-Sin* or *Horse-tie* Customs.

The first object that strikes the eye of the observer is a large shed about one hundred feet long, forty wide, and sixty high, having at one end a double-storied turret, and the whole being covered with a red cloth. At the time of which we are treating there sat in the shed twenty of the victims to be sacrificed. They were all seated on stools, and bound tightly to the posts by numerous cords. No unnecessary pain was inflicted: they were fed four times in the day, were loosened at night for sleeping, and were furnished with attendants who kept off the flies. They were dressed in a sort of *San Benito* costume, namely, a white calico shirt, bound with red ribbon, and having a crimson patch on the left breast. On the head was a tall pointed white cap, with blue

ribbon wound spirally round it. In spite of their impending fate, the victims did not seem to be unhappy, and looked upon the scene with manifest curiosity.

Next came the rite from which the ceremony takes its name. The chief of the horse came up with a number of followers, and took away all horses from their owners, and tied them to the shed, whence they could only be released by the payment of cowries.

Another shed was built especially for the king, and contained about the same number of victims. Presently *Gelele* came, and proceeded to his own shed, where he took his seat, close to the spot on which was pitched a little tent containing the relics of the old king, and supposed to be temporarily inhabited by his ghost. After some unimportant ceremonies, *Gelele* made an address, stating that his ancestors had only built rough and rude *So-Sin* sheds, but that *Gezo* had improved upon them when "making customs" for his predecessor. But he, *Gelele*, meant to follow his father's example, and to do for his father what he hoped his son would do for him. This discourse was accompanied by himself on the drum, and after it was over, he displayed his activity in dancing, assisted by his favorite wives and a professional jester. (See engraving on the previous page.) Leaning on a staff decorated with a human skull, he then turned toward the little tent, and adored in impressive silence his father's ghost.

The next business was to distribute decorations and confer rank, the most prominent example being a man who was raised from a simple captain to be a *Caboccer*, the newly-created noble floundering on the ground, and covering himself and all his new clothes with dust as a mark of gratitude. More dancing and drumming then went on until the night closed in, and the first day was ended.

The second day exhibited nothing very worthy of notice except the rite which gives it the name of *Cloth-changing Day*. The king has a piece of patchwork, about six hundred yards long by ten wide, which is called the "*Nun-ce-pace-to*," *i. e.* the *Able-to-do-anything* cloth. This is to be worn by the king as a robe as soon as he has taken *Aboekuta*, and, to all appearances, he will have to wait a very long time before he wears it. It is unrolled, and held up before the king, who walked along its whole length on both sides, amid the acclamations of his people, and then passed to his shed, where he was to go through the cloth-changing. This rite consisted in changing his dress several times before the people, and dancing in each new dress, finishing with a fetish war-dress, *i. e.* a short under robe, and a dark blue cloth studded with charms and amulets, stained with blood, and edged with cowries.

The third day of the Customs exhibited

but little of interest, being merely the usual processions and speeches, repeated over and over again to a wearisome length. The most notable feature is the cowrie-scrambling. The king throws strings of cowries among the people, who fight for them on perfectly equal terms, the lowest peasant and the highest noble thinking themselves equally bound to join in the scramble. Weapons are not used, but it is considered quite legitimate to gouge out eyes or bite out pieces of limbs, and there is scarcely a scramble that does not end in maiming for life, while on some occasions one or two luckless individuals are left dead on the ground. No notice is taken of them, as they are, by a pleasant fiction of law, supposed to have died an honorable death in defence of their king.

Lastly there came a procession of hunchbacks, who, as Captain Burton tells us, are common in Western Africa, and are assembled in troops of both sexes at the palace. The chief of them wielded a formidable whip, and, having arms of great length and muscular power, easily cut a way for his followers through the dense crowd. Seven potent fetishes were carried on the heads of the principal hunchbacks. They were very strong fetishes indeed, being in the habit of walking about after nightfall.

They are described as follows:—"The first was a blue dwarf, in a gray paque, with hat on head. The second, a blue woman with protuberant breast. The third, a red dwarf with white eyes, clad *cap-à-pié* in red and brown. The fourth was a small black mother and child in a blue loin-cloth, with a basket or calabash on the former's head. The fifth, ditto, but lesser. The sixth was a pigmy baboon-like thing, with a red face under a black skull-cap, a war-club in the right hand and a gun in the left; and the seventh much resembled the latter, but was lamp-black, with a white apron behind. They were carved much as the face cut on the top of a stick by the country bumpkins in England."

The king next paid a visit to the victims, and entered into conversation with some of them, and presented twenty "heads" of cowries to them. At Captain Burton's request that he would show mercy, he had nearly half of them untied, placed on their hands and knees in front of him, and then dismissed them.

The fourth day of the Customs is traditionally called the Horse-losing Day, from a ceremony which has now been abolished, although the name is retained. More dances, more processions, and more boastings that Abeokuta should be destroyed, and that the grave of Gelele's father should be well furnished with Egba skulls. The same little fetishes already mentioned were again produced, and were followed by a curious *pas-de-seul* performed by a "So."

The So is an imitation demon, "a bull-faced mask of natural size, painted black, with glaring eyes and peep-holes. The horns were hung with red and white rag-strips, and beneath was a dress of bamboo fibre covering the feet, and fringed at the ends. It danced with head on one side, and swayed itself about to the great amusement of the people."

The whole of the proceedings were terminated by a long procession of slaves, bearing in their hands baskets of cowries. "It was the usual African inconsequence—100,000 to carry 20!"

The evening of the fourth day is the dreaded Evil Night, on which the king walks in solemn procession to the marketplace, where the chief executioner with his own hand puts to death those victims who have been reserved. The precise nature of the proceedings is not known, as none are allowed to leave their houses except the king and his retinue; and any one who is foolish enough to break this law is carried off at once to swell the list of victims. It is said that the king speaks to the men, charging them with messages to his dead father, telling him that his memory is revered, and that a number of new attendants have been sent to him, and with his own hand striking the first blow, the others being slain by the regular executioner.

The bodies of the executed were now set upon a pole, or hung up by their heels, and exhibited to the populace, much as used to be done in England, when a thief was first executed, and then hung in chains.

The number of these victims has been much exaggerated. In the annual Customs, the number appears to be between sixty and eighty. Some thirty of these victims are men, and suffer by the hand of the chief executioner or his assistants; but it is well known that many women are also put to death within the palace walls, the blood-thirsty Amazons being the executioners. The mode of execution is rather remarkable. After the king has spoken to the victims, and dictated his messages, the executioners fall upon them and beat them to death with their official maces. These instruments are merely wooden clubs, armed on one side of the head with iron knobs. Some, however, say that the victims are beheaded; and it is very likely that both modes are employed.

As to the stories that have been so frequently told of the many thousand human victims that are annually slain, and of the canoe which is paddled by the king in a trench filled with human blood, they are nothing more than exaggerations invented by traders for the purpose of frightening Englishmen out of the country. Even in the Grand Customs which follow the decease of a king the number of victims is barely five hundred.

We may naturally ask ourselves what is the meaning of the Customs, or So-Sin. This ceremony is the accepted mode of doing honor to the late king, by sending to him a number of attendants befitting his rank. Immediately after his burial, at the Grand Customs, some five hundred attendants, both male and female, are despatched to the dead king, and ever afterward his train is swelled by those who are slain at the regular annual Customs.

Besides the Customs there is scarcely a day when executions of a similar character do not take place. Whatever the king does must be reported to his father by a man, who is first charged with the message and then killed. No matter how trivial the occasion may be—if a white man visits him, if he has a new drum made, or even if he moves from one house to another—a messenger is sent to tell his father. And if after the execution the king should find that he has forgotten something, away goes another messenger, like the postscript of a letter.

All this terrible destruction of human life, which is estimated by Burton as averaging five hundred per annum in ordinary years, and a thousand in the Grand Customs year, is bad enough, but not so bad as it has been painted. The victims are not simple subjects of the king selected for the sacrifice of bloodthirsty caprice, as has been generally supposed. They are either criminals or prisoners of war, and, instead of being executed on the spot, are reserved for the customs, and are treated as well as is consistent with their safe custody.

Indeed, considering the object for which they are reserved, it would be bad policy for the Dahoman king to behave cruelly toward his victims. They are intended as messengers to his father, about whom they are ever afterward supposed to wait, and it would be extremely impolitic in the present king to send to his father a messenger who was ill-disposed toward himself, and who might, therefore, garble his message, or deliver an evil report to the dead sovereign.

As a rule, the victims in question are quite cheerful and contented, and about as unlike our ideas of doomed men as can well be imagined. In the first place, they are constitutionally indifferent to human life, their own lives with those of others being equally undervalued; and, as they know that their lives are forfeit, they accept the position without useless murmurs. Nor is the mode of death so painful as seems at first sight to be the case, for the king, actuated by that feeling of pity which caused the Romans to stupefy with a soporific draught the senses of those who were condemned to the cross, mostly administers to the victims a bottle or so of rum about an hour before the execution, so that they are for the most part insensible when killed.

This humane alleviation of their sufferings is, however, restricted to those who die at the customs, and is not extended to those who perish by the hands of the executioner as messengers to the deceased king. How these executions are conducted may be seen by the following account of a scene at Dahomie by Mr. Duncan:—

"The ceremonies of this day were nearly a repetition of those of yesterday, till the time arrived (an hour before sunset) when the four traitors were brought into the square for execution. They marched through the mob assembled round apparently as little concerned as the spectators, who seemed more cheerful than before the prisoners made their appearance, as if they were pleased with the prospect of a change of performance. The prisoners were marched close past me in slow time; consequently I had a good opportunity of minutely observing them, particularly as every person remained on his knees, with the exception of myself and the guard who accompanied the prisoners.

"They were all young men, of the middle size, and appeared to be of one family, or at least of the same tribe of Makees, who are much better-looking than the people of the coast. Each man was gagged with a short piece of wood, with a small strip of white cotton tied round each end of the stick, and passed round the pole. This was to prevent them from speaking. They were arranged in line, kneeling before the king.

"The head gang-gang man then gave four beats on the gong, as one—two, and one—two; the upper part of the gang-gang being smaller than the lower, and thus rendering the sounds different, similar to the public clocks in England when striking the quarters. After the four beats the gang-gang man addressed the culprits upon the enormity of their crime and the justice of their sentence. During this lengthened harangue the gang-gang was struck at short intervals, which gave a sort of awful solemnity to the scene. After this, the men were suddenly marched some distance back from his majesty, who on this occasion refused to witness the execution. The men were then ordered to kneel in line about nine feet apart, their hands being tied in front of the body, and the elbows held behind by two men, the body of the culprit bending forward.

"Poor old Mayho, who is an excellent man, was the proper executioner. He held the knife or bill-hook to me, but I again declined the honor; when the old man, at one blow on the back of the neck, divided the head from the body of the first culprit, with the exception of a small portion of the skin, which was separated by passing the knife underneath. Unfortunately the second man was dreadfully mangled, for the poor fellow at the moment the blow was struck having raised his head, the knife struck in a

slanting direction, and only made a large wound; the next blow caught him on the back of the head, when the brain protruded. The poor fellow struggled violently. The third stroke caught him across the shoulders, inflicting a dreadful gash. The next caught him on the neck, which was twice repeated. The officer steadying the criminal now lost his hold on account of the blood which rushed from the blood-vessels on all who were near. Poor old Mayho, now quite palsied, took hold of the head, and after twisting it several times round, separated it from the still convulsed and struggling trunk. During the latter part of this disgusting execution the head presented an awful spectacle, the distortion of the features, and the eyeballs completely upturned, giving it a horrid appearance.

"The next man, poor fellow, with his eyes partially shut and head drooping forward near to the ground, remained all this time in suspense: casting a partial glance on the head which was now close to him, and the trunk dragged close past him, the blood still rushing from it like a fountain. Mayho refused to make another attempt, and another man acted in his stead, and with one blow separated the spinal bones, but did not entirely separate the head from the body. This was finished in the same manner as the first. However, the fourth

culprit was not so fortunate, his head not being separated till after three strokes. The body afterward rolled over several times, when the blood spurted over my face and clothes.

"The most disgusting part of this abominable and disgusting execution was that of an ill-looking wretch, who, like the numerous vultures, stood with a small calabash in his hand, ready to catch the blood from each individual which he greedily devoured before it had escaped one minute from the veins. The old wretch had the impudence to put some rum in the blood and ask me to drink: at that moment I could with good heart have sent a bullet through his head.

"Before execution the victim is furnished with a clean white cloth to tie round the loins. After decapitation the body is immediately dragged off by the heels to a large pit at a considerable distance from the town, and thrown therein, and is immediately devoured by wolves and vultures, which are here so ravenous that they will almost take your victuals from you."

Captain Burton says that he never saw this repulsive part of the sacrificial ceremony, and states that there is only one approach to cannibalism in Dahomé. This is in connection with the worship of the thunder god, and is described on page 586.

CHAPTER LVII.

DAHOMÉ—*Concluded.*

THE GRAND CUSTOMS OF DAHOMÉ—CELEBRATED ONCE IN A LIFETIME—"WE ARE HUNGRY"—THE BASKET SACRIFICE—GELELE'S TOWER—THE FIRE TELEGRAPH AND ITS DETAILS—LAST DAY OF THE CUSTOMS—THE TIRED ORATORS—A GENERAL SMASH—CONCLUSION OF THE CEREMONY—DAHOMAN MARRIAGES—THE RELIGION OF DAHOMÉ—POLYTHEISM, AND DIFFERENT RANKS OF THE DEITIES—WORSHIP OF THE THUNDER GOD—CEREMONY OF HEAD WORSHIP—THE PRIESTS OR FETISHERS—THE FEMALE FETISHERS—IDEAS OF THE SPIRITUAL WORLD—INQUEST AFTER DEATH—BURIAL—THE DEATH OF A KING—THE WATER SPRINKLING CUSTOM—CAPTAIN BURTON'S SUMMARY OF THE DAHOMAN CHARACTER.

WE now pass to the Grand Customs of Dahomé, which only take place once in a monarch's lifetime. This fearful ceremony, or rather series of ceremonies, is performed in honor of a deceased king, and the duty of carrying it out devolves upon his successor. Each king tries to outvie his predecessor by sacrificing a greater number of victims, or by inventing some new mode of performing the sacrifice. In consequence of this habit the mode of conducting the Grand Custom is so exceedingly variable that a full description would entail a narration of the Custom as performed by each successive king.

It has already been stated that the victims are carefully saved for the purpose, Custom Day being the only general execution time in the year; and in consequence, if a new king finds that he has not a sufficient number of victims to do honor to his father's memory, and at least to equal those whom his father sacrificed when he came to the throne, he must wait until the required number can be made up.

The usual method of doing so is to go to war with some tribe with whom there is a feud; and for this reason, among others, both Gezo and Gelele made a series of attacks, Abeokuta winning at first, but being afterward beaten back, as has been narrated. It is chiefly for this reason that the Amazons are taught to rush so fiercely over the formidable thorn walls by which the towns are

fortified, and the prisoners whom they take are mostly handed over to the king to be kept in readiness for the next custom.

On the great day of the Grand Custom the king appears on a platform, decorated, according to Dahoman ideas, in a most gorgeous manner, with cloths on which are rudely painted the figures of various animals. Around him are his favorite wives and his principal officers, each of the latter being distinguished by his great umbrella. Below is a vast and surging crowd of negroes of both sexes, wild with excitement and rum, and rending the air with their yells of welcome to their sovereign. In recognition of their loyalty, he flings among them "heads" of cowries, strings of beads, rolls of cloth, and similar valuables, for which they fight and scramble and tear each other like so many wild beasts—and indeed, for the time, they are as fierce and as ruthless as the most savage beasts that the earth holds.

After these specimens of the royal favor are distributed, the cries and yells begin to take shape, and gradually resolve themselves into praises of the king and appeals to his bounty. "We are hungry, O King," they cry. "Feed us, O King, for we are hungry!" and this ominous demand is repeated with increasing fury, until the vast crowd have lashed themselves to a pitch of savage fury, which nothing but blood can appease. And blood they have in plenty. The victims are

now brought forward, each being gagged in order to prevent him from crying out to the king for mercy, in which case he must be immediately released, and they are firmly secured by being lashed inside baskets, so that they can move neither head, hand, nor foot. At the sight of the victims the yells of the crowd below redouble, and the air is rent with the cry, "We are hungry! Feed us, O King."

Presently the deafening yells are hushed into a death-like silence, as the king rises, and with his own hand or foot pushes one of the victims off the platform into the midst of the crowd below. The helpless wretch falls into the outstretched arms of the eager crowd, the basket is rent to atoms by a hundred hands; and in a shorter time than it has taken to write this sentence the man has been torn limb from limb, while around each portion of the still quivering body a mass of infuriated negroes are fighting like so many starved dogs over a bone.

Gelele, following the habits of his ancestors, introduced an improvement on this practice, and, instead of merely pushing the victims off the platform, built a circular tower some thirty feet in height, decorated after the same grotesque manner as the platform, and ordered that the victims should be flung from the top of this tower. Should the kingdom of Dahome last long enough for Gelele to have a successor, some new variation will probably be introduced into the Grand Customs.

After Gelele had finished his gift throwing, a strange procession wound its way to the tower—the procession of blood. First came a number of men, each carrying a pole, to the end of which was tied a living cock; and after them marched another string of men, each bearing on his head a living goat tied up in a flexible basket, so that the poor animals could not move a limb. Next came a bull, borne by a number of negroes; and lastly came the human victims, each tied in a basket, and carried, like the goats, horizontally on a man's head.

Three men now mounted to the top of the tower, and received the victims in succession, as they were handed up to them. Just below the tower an open space was left, in which was a block of wood, on the edge of a hole, attended by the executioners. The fowls were first flung from the top of the tower, still attached to the poles; and it seemed to be requisite that every creature which was then sacrificed should be tied in some extraordinary manner. As soon as they touched the ground, they were seized, dragged to the block, and their heads chopped off, so that the blood might be poured into the hole. The goats were thrown down after the fowls, the bull after the goats, and, lastly, the unfortunate men shared the same fate. The mingled blood of these victims was allowed to remain in the

hole, which was left uncovered all night, the blood-stained block standing beside it.

The illustration on the following page depicts the last feature of this terrible scene. On the right hand is the king, seated under his royal umbrella, surmounted with a leopard, the emblem of royalty, and around him are his wives and great men. In the centre rises the cloth-covered tower, from which a human victim has just been hurled, while another is being carried to his fate. Below is one of the executioners standing by the block, and clustering in front of the tower is the mob of infuriated savages.

Just below the king is seen the band, the most prominent instrument of which is the great drum carried on a man's head, and beaten by the drummer who stands behind him, and one of the king's banners is displayed behind the band, and guarded by a body of armed Amazons. In front are several of the fetishmen, their heads adorned with the conical cap, their bodies fantastically painted, and the inevitable skull in their hands. The house which is supposed to contain the spirit of the deceased king is seen on the left.

The last day of the Customs is celebrated after a rather peculiar manner.

A line of soldiers armed with guns is stationed all the way from Agbome to Whydah. These soldiers are placed at some little distance from each other, and their duty is to transmit a rolling fire all the way from the capital to the port and back again. This is a later invention, the former plan being to transmit a small present from hand to hand, starting from Whydah and having its destination in the palace. Another line of musketeers extended from the Komasi house to a suburb about a mile distant.

The method of arranging them is very curious. At intervals of three hundred yards or so are built little huts of grass, each being the lodging-place of two soldiers. Though slightly built, there is some attempt at ornament about them, as each hut has a pent roof, a veranda supported by light poles, and the side walls decorated with a diamond pattern of bamboo and a fetish shrub, which is supposed to repel lightning. A tuft of grass ornaments each end of the gables, and those huts that are situated nearest the palace are always the most decorated.

In front of each hut the muskets belonging to the soldiers are fixed horizontally on forked sticks. They are ready loaded, and the two are employed lest one of them should miss fire. There are nearly nine hundred of these huts upon the line to Whydah, and it is calculated that the time occupied in the fire ought to be about half an hour.

When Captain Burton attended this ceremony in 1863, Gelele had not been confirmed at Allada, and in consequence was

THE BASKET SACRIFICE.

(See page 582.)

not, by royal etiquette, allowed to live in a house built of anything better than stakes and matting. Consequently, his officers were obliged to follow his example, as it would have been equivalent to treason had a subject presumed to live in a "swish" house when his monarch only dwelt in matting.

However, on this occasion at all events the king tried to atone by barbarous finery for the wretched material of his "palace." The Agwajai gate led into an oblong court of matting, sprinkled with thick-leaved little fig trees of vivid green, and divided into two by the usual line of bamboos. At the bottom of the southern half was the royal pavilion, somewhat like a Shakniyana in Bengal, with an open wing on each side.

"The sloping roof of the central part, intended for the king, was of gold and lake damask, under two broad strips of red and green satin; the wings, all silk and velvet, were horizontally banded with red, white-edged green, purple and yellow, red and green in succession, from the top, and, where the tongue-shaped lappets started, with chrome yellow. The hangings, playing loosely in the wind, were remarkable chiefly for grotesque figures of men and beasts cut out of colored cloth and sewed to the lining."

Several little tables were placed near the inner entrances, each being sheltered by a huge umbrella, three decorated with figures and four white. These were for the women, who were dressed in their gayest apparel, magnificent in mantles of red, pink, and flowered silks and satins. Opposite to the king were five ragged white umbrellas, sheltering eleven small tables, and behind the tables was a small crowd of officials and captains, dressed in costumes somewhat similar to those of the women.

On the right of the throne was the court fool, a very important man indeed, his eyes surrounded with rings of white chalk, and his shoulders covered with an old red velvet mantle. Although not of sufficient rank to be permitted the use of an umbrella, he was sheltered from the sun by a piece of matting raised on poles. A model of a canoe was placed near him.

Just at the entrances eight muskets were tied horizontally, each supported on two forked sticks, as has already been described, and behind each musket stood the Amazon to whom it belonged.

After making his guests wait for at least two hours,—such a delay being agreeable to royal etiquette,—the king condescended to appear. This time he had arrayed himself after a very gorgeous and rather heterogeneous fashion. He wore a yellow silk tunic, covered with little scarlet flowers, a great black felt Spanish hat, or sombrero, richly embroidered with gold braid, and a broad belt of gold and pearls (probably

imitation) passed over his left shoulder to his right side. Suspended to his neck was a large crucifix, and in his left hand he carried an hour-glass. An old rickety table with metal legs, and covered with red velvet, was placed before him, and upon it were laid a silver mug, a rosary, sundry pieces of plate, and some silver armlets. On taking his seat, he put the silver mug to its proper use, by drinking with all his guests, his own face being, according to custom, hidden by a linen cloth while he drank.

After the usual complimentary addresses had been made, a woman rose at 1 P.M. and gave the word of command—"A-de-o." This is a corruption of Adios, or farewell. At this word two of the muskets in front of the king were discharged, and the firing was taken up by the Jegbe line. In three minutes the firing ran round Jegbe and returned to the palace. At 2 P.M. another "A-de-o" started the line of firing to Whydah, the time of its return having been calculated and marked by a rude device of laying covies on the ground, and weaving a cloth in a loom, the number of threads that are laid being supposed to indicate a certain duration of time.

As soon as the firing began, two officials marched up to the king and began an oration, which they were bound to maintain until the firing had returned. Amid the horrible noise of five heralds proclaiming the royal titles and a jester springing his rattle, they began their speech, but were sadly discomfited by a wrong calculation or a mismanagement of the firing. Instead of occupying only half an hour, it was not finished for an hour and a half, and the poor orators were so overcome with heat and the fine dust which hovered about, that toward the end of the time they were nearly choked, and could hardly get out short sentences, at long intervals, from their parched throats. "There will be stick for this," remarks Captain Burton.

Stick, indeed, is administered very freely, and the highest with the lowest are equally liable to it. On one occasion some of the chief officers of the court did not make their appearance exactly at the proper time. The king considered that this conduct was an usurpation of the royal prerogative of making every one else wait, whereas they had absolutely made him wait for them. So, as soon as they appeared, he ordered the Amazons to take their bamboos and beat them out of the court, a command which they executed with despatch and vigor. The beaten ministers did not, however, seem to resent their treatment, but sat cowering at the gate in abject submission.

After occupying several days in this feasting and speech-making and boasting, the king proceeded to the last act of the Customs. Having resumed his place at the velvet-covered table, he filled his glass with

rum, and drank with his visitors to the health of his father's ghost, who, by the way, had been seen bathing in the sea, and had received two slaves, sacrificed in order to tell him that his son was pleased at his visit. After a few unimportant ceremonies, he poured a little rum on the ground, and, dashing his glass to pieces on the table, rose and left the tent. His attendants followed his example, and smashed everything to pieces, even including the tables; this act probably accounting for the very mean and rickety condition of the royal furniture. With this general smash the Customs terminated, much to the relief of the visitors.

Marriages among the Dahomans are an odd compound of simplicity and complexity. The bridegroom commences his suit by sending a couple of friends to the father of the intended bride, and furnishes them with a doubly potent argument in the shape of two bottles of rum. Should the father approve of the proposition, he graciously drinks the rum, and sends back the empty bottles—a token that he accepts the proposal, and as a delicate hint that he would like some more rum. The happy man takes the hint, fills the bottles, sends them to the father, together with a present for the young lady; and then nothing more is required except to name the amount of payment which is demanded for the girl. Cloth is the chief article of barter, and a man is sometimes occupied for two or three years in procuring a sufficient quantity.

At last the day—always a Sunday—is settled, and more bottles of rum are sent by the bridegroom's messengers, who bring the bride in triumph to her future home, followed by all her family and friends. Then comes a general feast, at which it is a point of honor to consume as much as possible, and it is not until after midnight that the bride is definitely handed over to her husband. The feast being over, the bridegroom retires into his house and seats himself. Several fetish women lead in the bride by her wrists, and present her in solemn form, telling them both to behave well to each other, but recommending him to flog her well if she displeases him. Another two or three hours of drinking then follows, and about 3 or 4 A.M. the fetish women retire, and the actual marriage is supposed to be completed.

Next morning the husband sends more rum and some heads of cowries to the girl's parents as a token that he is satisfied, and after a week the bride returns to her father's house, where she remains for a day or two, cooking, however, her husband's food and sending it to him. On the day when she returns home another feast is held, and then she subsides into the semi-servile state which is the normal condition of a wife throughout the greater part of savage Africa.

We now come to the religion of Dahome, which, as may be imagined from the previous narrative, is of a very low character, and has been curtly summarized by Captain Burton in the following sentence:—"Africans, as a rule, worship everything except the Creator." As the contact of the Dahomans with the white men and with the Moslems has probably engrafted foreign ideas in the native mind, it is not very easy to find out the exact nature of their religion, but the following account is a short abstract of the result of Captain Burton's investigation.

He states that the reason why the natives do not worship the Creator is that, although they acknowledge the fact of a supreme Deity, they think that He is too great and high to trouble Himself about the affairs of mankind, and in consequence they do not trouble themselves by paying a worship which they think would be fruitless. Their devotion, such as it is, expends itself therefore upon a host of minor deities, all connected with some material object.

First we have the principal deities, who are ranked in distinct classes. The most important is the Snake god, who has a thousand snake wives, and is represented by the Danhgwe, which has already been mentioned. Next in order come the Tree gods, of which the silk-cotton (*Bombax*) is the most powerful, and has the same number of wives as the Danhgwe. It has, however, a rival in the Ordeal, or poison tree.

The last of these groups is the sea. This deity is represented at Whydah by a very great priest, who ranks as a king, and has five hundred wives in virtue of his representative office. At stated times he visits the shore to pay his respects, and to throw into the waves his offerings of beads, cowries, cloth, and other valuables. Now and then the king sends a human sacrifice from the capital. He creates the victim a Caboccer, gives him the state uniform and umbrella of his short-lived rank, puts him in a gorgeous hammock, and sends him in great pomp and state to Whydah. As soon as he arrives there, the priest takes him out of his hammock and transfers him to a canoe, takes him out to sea, and flings him into the water, where he is instantly devoured by the expectant sharks.

Lately a fourth group of superior deities has been added, under the name of the Thunder gods. In connection with the worship of this deity is found the only approach to cannibalism which is known to exist in Dahome. When a man has been killed by lightning, burial is not lawful, and the body is therefore laid on a platform and cut up by the women, who hold the pieces of flesh in their mouths, and pretend to eat them, calling out to the passengers, "We sell you meat, fine meat; come and buy!"

After these groups of superior deities come a host of inferior gods, too numerous to mention. One, however, is too curious to be omitted. It is a man's own head, which is considered a very powerful fetish in Dahome. An engraving on the 595th page illustrates this strange worship, which is as follows:—

“The head worshipper, after providing a fowl, kola nuts, rum, and water, bathes, dresses in pure white baft, and seats himself on a clean mat. An old woman, with her *medius* finger dipped in water, touches successively his forehead, poll, nape, and mid-breast, sometimes all his joints. She then breaks a kola into its natural divisions, throws them down like dice, chooses a lucky piece, which she causes a bystander to chew, and with his saliva retouches the parts before alluded to.

“The fowl is then killed by pulling its body, the neck being held between the big and first toe; the same *attouchements* are performed with its head, and finally with the boiled and shredded flesh before it is eaten. Meanwhile rum and water are drunk by those present.”

The fetishers, or priests, are chosen by reason of a sort of ecstatic fit which comes upon them, and which causes them at last to fall to the ground insensible. One of the older priests awaits the return of the senses, and then tells the neophyte what particular fetish has come to him. He is then taken away to the college, or fetish part of the town, where he learns the mysteries of his calling, and is instructed for several years in the esoteric language of the priests, a language which none but themselves can understand. If at the end of the novitiate he should return to his former home, he speaks nothing but this sacred language, and makes it a point of honor never to utter a sentence that any member of the household can understand.

When a man is once admitted into the ranks of the fetishes, his subsistence is provided for, whether he be one of the “regulars,” who have no other calling, and who live entirely upon the presents which they obtain from those who consult them, or whether he retains some secular trade, and only acts the fetisher when the fit happens to come on him. They distinguish themselves by various modes of dress, such as shaving half the beard, carrying a cow-tail flapper, or wearing the favorite mark of a fetisher, namely, a belt of cowries strung back to back, each pair being separated by a single black seed.

The fetish women greatly outnumber the men, nearly one-fourth belonging to this order. They are often destined to this career before their birth, and are married to the fetish before they see the light of day. They also take human spouses, but, from all accounts, the life of the husband is not the

most agreeable in the world. The women spend their mornings in going about begging for cowries. In the afternoon she goes with her sisters into the fetish house, and puts on her official dress. The whole party then sally out to the squares, where they drum and sing and dance and lash themselves into fits of raving ecstasy. This lasts for a few hours, when the women assume their ordinary costumes and go home.

It is illegal for any fetisher to be assaulted while the fetish is on them, and so the women always manage to shield themselves from their husband's wrath by a fetish fit whenever he becomes angry, and threatens the stick.

As to the position of the human soul in the next world, they believe that a man takes among the spirits the same rank which he held among men; so that a man who dies as a king is a king to all eternity, while he who is a slave when he dies can never be a free man, but must be the property of some wealthy ghost or other.

Visiting the world of spirits is one of the chief employments of the fetish men, who are always ready to make the journey when paid for their trouble. They are often called upon to do so, for a Dahoman who feels unwell or out of spirits always fancies that his deceased relatives are calling for him to join them, a request which he feels most unwilling to grant. So he goes to his favorite fetisher, and gives him a dollar to descend into the spirit world and present his excuses to his friends. The fetisher covers himself with his cloth, lies down, and falls into a trance, and, when he recovers, he gives a detailed account of the conversation which has taken place between himself and the friends of his client. Sometimes he brings back a rare bead or some other object, as proof that he has really delivered the message and received the answer. The whole proceeding is strangely like the ceremonies performed by the medicine men or Angokoks among the Esquimaux.

It is a strange thing that, in a country where human life is sacrificed so freely, a sort of inquest takes place after every death. The reason for this custom is rather curious. The king reserves to himself the right of life and death over his subjects, and any one who kills another is supposed to have usurped the royal privilege.

As soon as death takes place, notice is sent to the proper officers, called Gevi, who come and inspect the body, receiving as a fee a head and a half of cowries. When they have certified that the death was natural, the relatives begin their mourning, during which they may not eat nor wash, but may sing as much as they please, and drink as much rum as they can get. A coffin is prepared, its size varying according to the rank of the deceased person; the corpse is clothed in its best attire, decorated with

ornaments, and a change of raiment is laid in the coffin, to be worn when the deceased fairly reaches the land of spirits. The very poor are unable to obtain a coffin, and a wrapper of matting is deemed sufficient in such cases.

The grave is dug in rather a peculiar manner, a cavern being excavated on one side, the coffin being first lowered and then pushed sideways into the cave, so that the earth immediately above is undisturbed. After the grave is filled in, the earth is smoothed with water. Over the grave of a man in good circumstances is placed a vessel-shaped iron, into which is poured water or blood by way of drink for the deceased. Formerly a rich man used to have slaves buried with him, but of late years only the two chiefs of the king are allowed to sacrifice one slave at death, they being supposed not to need as many attendants in the next world as if they had been kings of Dahome in this.

As soon as the king dies, his wives and all the women of the palace begin to smash everything that comes in their way, exactly as has been related of the concluding scene of the Customs; and, when they have broken all the furniture of the palace, they begin to turn their destructive fury upon each other, so that at the death of Agagoro it was calculated that several hundred women lost their lives within the palace walls merely in this fight, those sacrificed at the succeeding Customs being additional victims. This blood-thirsty rage soon extends beyond the precincts of the palace, and Captain Burton, who has done so much in contradicting the exaggerated tales of Dahoman bloodshed that have been so widely circulated, acknowledges that, however well a white stranger may be received at Agbome, his life would be in very great danger were he to remain in the capital when the king died.

Even with the termination of the Customs the scenes of blood do not end. Next comes the "water-sprinkling," *i. e.* the graves of the kings must be sprinkled with "water," the Dahoman euphemism for blood. Of late years the number of human victims sacrificed at each grave has been reduced to two, the requisite amount of "water" being supplied by various animals.

Before each tomb the king kneels on all fours, accompanied by his chiefs and captains, while a female priest, who must be of royal descent, makes a long oration to the spirit of the deceased ruler, asking him to aid his descendant and to give success and prosperity to his kingdom. Libations of rum and pure water are then poured upon each grave, followed by the sacrificial "water," which flows from the throats of the men, oxen, goats, pigeons, and other victims. Kola nuts and other kinds of food are also brought as offerings.

The flesh of the animals is then cooked,

together with the vegetables, and a feast is held, the stool of the deceased ruler being placed on the table as an emblem of his presence. All the Dahoman kings are buried within the walls of the palace, a house being erected over each grave. During the water sprinkling, or "Sin-quain," custom, the king goes to each house separately, and sleeps in it for five or six nights, so as to put himself in communion with the spirits of his predecessors.

The reader will remember that the kings who formerly ruled Dahome are still supposed to hold royal rank in the spirit world, and the prevalence of the custom shows that this belief in the dead is strong enough to exercise a powerful influence over the living.

We have now very briefly glanced at the Dahoman in peace, in war, in religion, in death, and in burial. He is not a pleasant subject, and, though the space which has been given to him is much too small to afford more than outline of his history, it would have been more restricted but for the fact that the Dahoman is an excellent type of the true negro of Western Africa, and that a somewhat detailed description of him will enable us to dismiss many other negro tribes with but a passing notice.

Moreover, as the kingdom of Dahome is fast failing, and all the strange manners and customs which have been mentioned will soon be only matters of history, it was necessary to allot rather more space to them than would otherwise have been the case. The general character of the Dahoman has been so tersely summed up by Captain Burton, that our history of Dahome cannot have a better termination than the words of so competent an authority.

"The modern Dahomans are a mongrel breed and a bad. They are Cretan liars, *crétins* at learning, cowardly, and therefore cruel and bloodthirsty; gamblers, and consequently cheaters; brutal, noisy, boisterous, unvenervative, and disobedient; 'dipsas-bitten' things, who deem it duty to the gods to be drunk; a flatulent, self-conceited herd of barbarians, who endeavor to humiliate all those with whom they deal; in fact, a slave-race,—vermin with a soul apiece.

"They pride themselves in not being, like the Popos, addicted to the 'dark and dirty crime of poison,' the fact being that they have been enabled hitherto to carry everything with a high and violent hand. They are dark in skin, the browns being of xanthous temperament, middle-sized, slight, and very lightly made. My Krumen looked like Englishmen among them. In all wrestling bouts my Krumen threw the hammock bearers on their heads, and on one occasion, during a kind of party fight, six of them, with fists and sticks, held their own against twenty Dahomans.

“They are agile, good walkers, and hard dancers, but carry little weight. Their dress is a *godo*, or T bandage, a *nun-pwe* (under-cloth) or a *Tfon chokoto* (pair of short drawers), and an *own-chyon*, or body-cloth, twelve feet long by four to six broad, worn like the Roman toga, from which it may possibly be derived.

“The women are of the *Hastini*, or elephant order, dark, plain, masculine, and comparatively speaking of large, strong, and square build. They are the reapers as well as the sowers of the field, and can claim

the merit of laboriousness, if of no other quality.

“They tattoo the skin, especially the stomach, with alto-relievo patterns; their dress is a zone of beads, supporting a bandage beneath the *do-oo*, or scanty loin cloth, which suffices for the poor and young girls. The upper classes add an *aga-oo*, or over-cloth, two fathoms long, passed under the arms, and covering all from the bosom to the ancles. Neither sex wear either shirt, shoes, or stockings.”

CHAPTER LVIII.

THE EGBAS.

THE EGBA TRIBE—A BLACK BISHOP—GENERAL APPEARANCE OF THE EGBAS—THEIR TRIBAL MARK—TATTOO OF THE BREECHEE OR GENTLEMEN—SIGNIFICATION OF ORNAMENTS—MODE OF SALUTATION—EGBA ARCHITECTURE—SUBDIVISION OF LABOR—ABEOKUTA AND ITS FORTIFICATIONS—FEUD BETWEEN THE EGBAS AND DAHOMANS—VARIOUS SKIRMISHES AND BATTLES, AND THEIR RESULTS—THE GRAND ATTACK ON ABEOKUTA—REPULSE OF THE DAHOMAN ARMY—RELIGION OF THE EGBAS—THE SYSTEM OF OGBONI—MISCELLANEOUS SUPERSTITIONS AND SUPPLEMENTARY DEITIES—EGUGUN AND HIS SOCIAL DUTIES—THE ALAKÉ, OR KING OF THE EGBAS—A RECEPTION AT COURT—APPEARANCE OF THE ATTENDANTS.

WE are naturally led from Dahome to its powerful and now victorious enemy, the EGBA tribe, which has perhaps earned the right to be considered as a nation, and which certainly has as much right to that title as Dahome.

The Egbas have a peculiar claim on our notice. Some years ago an Egba boy named Ajai (*i. e.* "struggling for life") embraced Christianity, and, after many years of trial, was ordained deacon and priest in the Church of England. Owing to his constitution he was enabled to work where a white man would have been prostrated by disease; and, owing to his origin, he was enabled to understand the peculiar temperament of his fellow negroes better than any white man could hope to do. His influence gradually extended, and he was held in the highest esteem throughout the whole of Western Africa. His widely felt influence was at last so thoroughly recognized, that he was consecrated to the episcopal office, and now the negro boy Ajai is known as the Right Rev. Samuel Crowther, D. D., Lord Bishop of the Niger.

As far as their persons go, the Egbas are a fine race of men, varying much in color according to the particular locality which they inhabit. The skin, for example, of the Egba-do, or lower Egba, is of a coppery black, and that of the chiefs is, as a rule, fairer than that of the common people. Even the hair of the chiefs is lighter than that of the common folk, and sometimes assumes a decidedly sandy hue.

The men, while in the prime of life, are remarkable for the extreme beauty of their forms and the extreme ugliness of their features; and, as is mostly the case in uncivilized Africa, the woman is in symmetry of form far inferior to the man, and where one well-developed female is seen, twenty can be found of the opposite sex.

Whatever may be the exact color of the Egba's skin, it exhales that peculiar and indescribable odor which is so characteristic of the negro races; and, although the slight clothing, the open-air life, and the use of a rude palm-oil soap prevent that odor from attaining its full power, it is still perceptible. The lips are of course large and sausage-shaped, the lower part of the face protrudes, and the chin recedes to an almost incredible extent, so as nearly to deprive the countenance of its human character. The hair is short, crisp, and often grows in the little peppercorn tufts that have been already mentioned in connection with the Bosjesman race of Southern Africa. The men dress this scanty crop of hair in a thousand different ways, shaving it into patterns, and thus producing an effect which, to the eye of an European, is irresistibly ludicrous. The women contrive to tease it out to its full length, and to divide it into ridges running over the crown from the forehead to the nape of the neck, preserving a clean parting between each ridge, and so making the head look as if it were covered with the half of a black melon. The skin of the common people is hard and coarse,—so

coarse indeed that Captain Burton compares it to shagreen, and says that the hand of a slave looks very like the foot of a fowl.

As to the dress of the Egbas, when uncontaminated by pseudo-civilization, it is as easily described as procured. A poor man has nothing but a piece of cloth round his waist, while a man in rather better circumstances adds a pair of short linen drawers or trousers, called "shogo," and a wealthy man wears both the loin cloth and the drawers, and adds to them a large cloth wrapped gracefully round the waist, and another draped over the shoulders like a Scotch plaid. The cloths are dyed by the makers, blue being the usual color, and the patterns being mostly stripes of lesser or greater width.

Women have generally a short and scanty petticoat, above which is a large cloth that extends from the waist downward, and a third which is wrapped shawl-wise over the shoulders. The men and women who care much about dress dye their hands and feet with red wood. Formerly, this warlike race used to arm themselves with bows and arrows, which have now been almost wholly superseded by the "trade gun." Even now every man carries in his hand the universal club or knob-kerrie, which, among the Egbas, has been modified into a simple hooked stick bound with iron wire in order to increase the strength and weight, and studded with heavy nails along the convex side. Weapons of a similar nature are used at Dahome for clubbing criminals to death.

According to savage ideas of beauty, these people tattoo themselves profusely, covering their bodies with marks which must at some time have been produced by very painful operations, and which, from their diversity, serve to perplex observers who have not had time to examine them minutely, and to classify their wearer.

According to Captain Burton, "the skin-patterns were of every variety, from the diminutive prick to the great gash and the large boil-like lumps. They affected various figures — tortoises, alligators, and the favorite lizard; stars, concentric circles, lozenges, right lines, welts, gouts of gore, marble or button-like knobs of flesh, and elevated scars, resembling scalds, which are opened for the introduction of fetish medicines, and to expel evil influences.

"In this country every tribe, sub-tribe, and even family, has its blazon, whose infinite diversifications may be compared with the lines and ordinaries of European heraldry. A volume would not suffice to explain all the marks in detail. Ogubonna's family, for instance, have three small squares of blue tattoo on each cheek, combined with the three Egba cuts.

"The chief are as follows:—The distin-

guishing mark of the Eghas is a gridiron of three cuts, or a multiplication of three, on each cheek. Free-born women have one, two, or three raised lines, thread-like scars, from the wrist up the back of the arm, and down the dorsal region, like long necklaces. They call these 'Entice my husband.'

"The Yorubas draw perpendicular marks from the temples to the level of the chin, with slight lateral incisions, hardly perceptible, because allowed soon to heal. The Efons of Kakanda wear a blue patch, sometimes highly developed, from the cheekbones to the ear. The Takpas of Nupè make one long cut from the upper part of the nostril, sweeping toward the ear. At Ijasha, a country lying east of Yoruba proper, the tattoo is a long parallelogram of seven perpendicular and five transverse lines."

The most curious tattoo is that of the Breechee (*i. e.* gentleman), or eldest son and heir. He is not allowed to perform any menial office, and inherits at his father's death all the slaves, wives, and children. Before the Breechee attains full age, a slit is made across his forehead, and the skin is drawn down and laid across the brow, so as to form a ridge of hard, knotty flesh from one temple to the other. The severity of the operation is so great that even the negro often dies from its effects; but when he survives he is greatly admired, the unsightly ridge being looked upon as a proof of his future wealth and his actual strength of constitution.

So minutely does the African mind descend to detail, that even the ornaments which are worn have some signification well understood by those who use them. Rings of metal are worn on the legs, ankles, arms, wrists, fingers, and toes; and round the neck and on the body are hung strings of beads and other ornaments. Each of these ornaments signifies the particular deity whom the wearer thinks fit to worship; and although the number of these deities is very great, the invention of the negro has been found equal to representing them by the various ornaments which he wears.

The same minuteness is found in the ordinary affairs of life; and, even in the regular mode of uttering a salutation, the natives have invented a vast number of minutiae. For example, it would be the depth of bad manners to salute a man when sitting as if he were standing, or the latter as if he were walking, or a third as if he were returning from walking. Should he be at work, another form of address is needed, and another if he should be tired. No less than fifteen forms of personal salutation are mentioned by Captain Burton, so that the reader may easily imagine how troublesome the language is to a stranger.

Then the forms of salutation differ as much as the words. If an inferior meet a superior, a son meet his mother, a younger brother meet his elder, and so on, an elaborate ceremony is performed. Any burden that may be carried is placed on the ground, and the bearer proceeds first to kneel on all fours, then to prostrate himself flat in the dust, rubbing the earth with the forehead and each cheek alternately. The next process is to kiss the ground, and this ceremony is followed by passing each hand down the opposite arm. The dust is again kissed, and not until then does the saluter resume his feet.

This salutation is only performed once daily to the same person; but as almost every one knows every one whom he meets, and as one of them must of necessity be inferior to the other, a vast amount of salutation has to be got through in the course of a day. Putting together the time occupied in the various salutations, it is calculated that at least an hour is consumed by every Egba in rendering or receiving homage. Sometimes two men meet who are nearly equal, and in such a case both squat on the ground, and snap their fingers according to the etiquette of Western Africa.

The architecture of the Egba tribe is mostly confined to "swish" walls and thatched roofs. A vast number of workers, — or rather idlers — are engaged on a single house, and the subdivision of labor is carried out to an extreme extent. Indeed, as Captain Burton quaintly remarks, the Egbas divide the labor so much that the remainder is imperceptible.

Some of them dig the clay, forming thereby deep pits, which they never trouble themselves to fill up again, and which become the receptacles of all sorts of filth and offal. Water, in this wet country, soon pours into them, and sometimes the corpse of a slave or child is flung into the nearest pit, to save the trouble of burial. It may easily be imagined that such pits contribute their part to the fever-breeding atmosphere of the country.

Another gang is employed in kneading clay and rolling it into balls; and a third carries it, one ball at a time, to the builders. Another gang puts the clay balls into the squared shape needful for architectural purposes; and a fifth hands the shaped clay to the sixth, who are the actual architects. Yet a seventh gang occupies itself in preparing palm leaves and thatch; and those who fasten them on the roof form an eighth gang. Besides these, there is the chief architect, who by his plumb-line and level rectifies and smooths the walls with a broad wooden shovel, and sees that they are perfectly upright.

Three successive layers of clay or "swish" are needed, each layer being allowed to dry for a few days before the next is added. The

builders always manage, if possible, to complete their walls by November, so that the dry harmattan of December may consolidate the soft clay, and render it as hard as concrete. This, indeed, is the only reason why the Egbas approve of the harmattan, its cold, dusty breath being exceedingly injurious to native constitutions.

One might have thought that this elaborate subdivision of labor would have the effect of multiplying the working power, as is the case in Europe. So it would, if the negro worked like the European, but that he never did, and never will do, unless absolutely compelled by a master of European extraction. He only subdivides labor in order to spare himself, and not with the least idea of increasing the amount of work that he can do in a given time.

The capital of the Egbas and their kindred sub-tribes is called Abeokuta, a name that has already become somewhat familiar to English ears on account of the attempts which have been made to introduce Christianity, civilization, and manufactures among a pagan, savage, and idle race of negroes. The name of Abeokuta may be literally translated as Understone, and the title has been given to the place in allusion to the rock or stone around which it is built. The best description that has yet been given of Abeokuta is by Captain Burton, from whose writings the following particulars are gathered.

The city itself is surrounded with concentric lines of fortification, the outermost being some twenty miles in circumference. These walls are made of hardened mud, are about five or six feet in height, and have no embrasures for guns, an omission of very little importance, seeing that there are scarcely any guns to place in them, and that, if they were fired, the defenders would be in much greater danger than the attacking force.

Utterly ignorant of the first principles of fortification, the Egbas have not troubled themselves to throw out bastions, or to take any means of securing a flanking fire, and they have made so liberal a use of matting, poles, and dry leaves within the fortification, that a carcass or a rocket would set the whole place in a blaze; and, if the attacking force were to take advantage of the direction of the wind, they might easily drive out the defenders merely by the smoke and flames of their own burning houses. Moreover the wall is of such frail material, and so thinly built, that a single bag of powder hung against it, and fired, would make a breach that would admit a column of soldiers together with their field-guns. Around the inner and principal wall runs a moat some five feet in breadth, partly wet and partly dry, and of so insignificant a depth that it could be filled up with a few fascines, or even with a dozen or so of dead bodies.

These defences, ludicrously inefficient as they would be if attacked by European soldiers, are very formidable obstacles to the Dahoman and Ibadan, against whose inroads they are chiefly built. As a rule, the negro has a great horror of attacking a wall, and, as has been proved by actual conflict, the Dahomans could make no impression whatever upon these rude fortifications.

The real strength of the city, however, lies in the interior, and belongs to the rock or "stone" which gives the name to Abeokuta. Within the walls, the place is broken up into granite eminences, caverns, and forest clumps, which form natural fortifications, infinitely superior to those formed by the unskilful hands of the native engineer. Indeed, the selection of the spot seems to have been the only point in which the Egbas have exhibited the least appreciation of the art of warfare. The mode of fighting will presently be described.

The city itself measures some four miles in length by two in breadth, and is entered by five large gates, at each of which is placed a warder, who watches those who pass his gate, and exacts a toll from each passenger. The streets of Abeokuta are narrow, winding, and intricate, a mode of building which would aid materially in checking the advance of an enemy who had managed to pass the outer walls. There are several small market-places here and there, and one of them is larger than the rest, and called "Shek-pon," *i. e.* "Do the bachelors good," because on every fifth day, when the markets are held, there is a great concourse of people, and the single men can find plenty of persons who will fill their pipes, bring them drink, and cook their food.

"These, then, are my first impressions of Abeokuta. The streets are as narrow and irregular as those of Lagos, intersecting each other at every parallel angle, and, when broad and shady, we may be sure that they have been, or that they will be markets, which are found even under the eaves of the 'palace.' The sun, the vulture, and the pig are the only scavengers.

"The houses are of tempered mud—the sun-dried brick of Tuta and Nupè, is here unknown—covered with little flying roofs of thatch, which burn with exemplary speed. At each angle there is a 'Kobbi'—a high, sharp gable of an elevation—to throw off the heavy rain. The form of the building is the gloomy hollow square, totally unlike the circular huts of the Krumen and the Kaffirs. It resembles the Utum of the Arabs, which extending to Usaraga, and Unyavyembe in Central Intertropical Africa, produces the 'Tembe,' and which, through the 'Patio' of Spain, found its way into remote Galway.

"There are courts within courts for the various subdivisions of the polygamous fam-

ily, and here also sheep and goats are staked down. The sexes eat alone; every wife is a 'free-dealer,' consequently there is little more unity than in a nunnery. In each patio there is usually some central erection intended as a storehouse. Into these central courts the various doors, about four feet wide, open through a veranda or piazza, where, chimneys being unknown, the fire is built, and where the inmates sleep on mats spread under the piazza, or in the rooms, as the fancy takes them. Cooking also is performed in the open air, as the coarse earthen pots scattered over the surface prove.

"The rooms, which number from ten to twenty in a house, are windowless, and purposely kept dark, to keep out the sun's glare; they vary from ten to fifteen feet in length, and from seven to eight in breadth. The furniture is simple—rude cots and settles, earthen pots and coarse plates, grass bags for cloth and cowries, and almost invariably weapons, especially an old musket and its leathern case for ammunition. The number of inhabitants may vary from ten to five hundred, and often more in the largest. There is generally but one single large outer door, with charms suspended over it."

The military strength of Abeokuta has been tested by actual warfare, and has been found to be quite adequate to repel native troops. Generally, an African fight consists of a vast amount of noise attended by a very small amount of slaughter, but in the various attacks of Dahome on Abeokuta the feelings of both parties appear to have been so completely excited that the slaughter on both sides was really considerable.

The fact was, that each party had a long-standing grudge against the other, and meant to gratify it. Gezo, the father of King Gelele, had been defeated ignominiously near Abeokuta, and had even lost his stool, the emblem of sovereignty. Burning to avenge themselves, the Dahomans made friends with the inhabitants of Ishogga, a small town some fifteen miles to the southwest of Abeokuta, who advised their guests as to the particular gate which it was best to attack, the time of day when an assault would be most likely to succeed, and a ford by which they could pass the river.

Trusting to these counsellors, they crossed the river at the ford, which proved to be so bad that they wetted all their ammunition. They made the attack at mid-day, when they were told that every one would be asleep or at work in the gardens, which are situated at a considerable distance from the city. And when they came to the walls of the city they found the defenders all on the alert, and ready to give them a warm reception. Lastly, they attacked a gate which had been lately fortified, whereas another, on the opposite side of the town, was very weak, and might have been taken easily.

Consequently, they had to return to their own country, vowing vengeance against their treacherous allies.

After Gezo's death, Gelele took up the feud, and, after allaying suspicion by continually proclaiming war against the Egbas, and as invariably staying at home, in the tenth year he followed up his threat with a rapid attack upon Ishogga, carried off a great number of prisoners, and killed those whom he could not conveniently take away.

Flushed by success, he determined to assemble a large force and attack the capital itself. In Mareh, 1851, some fifteen or sixteen thousand Dahoman soldiers marched against Abeokuta, and a fierce fight ensued, the result being that the Dahomans had to retreat, leaving behind them some two thousand killed, and wounded, and prisoners. As might be supposed, the Amazons, being the fiercest fighters, suffered most, while the loss on the Egban side was comparatively trifling. Ten years afterward, another expedition marched against Abeokuta, but never reached it, small-pox having broken out in the ranks, and frightened the soldiers home again.

The last attack was fatal to Dahoman ambition. The Egbas, expecting their foe, had arranged for their reception, and had driven tunnels through their walls, so that they could make unexpected sallies on the enemy. When the Dahoman army appeared, all the Egban soldiers were at their posts, the women being told off to carry food and drink to the soldiers, while some of them seized swords, and insisted on doing duty at the walls. A sketch of this last fight is given on the next page.

As soon as the invaders approached, a strong sally was made, but, as the Dahomans marched on without returning the fire, the Egbas dashed back again and joined their comrades on the walls. Presently, a Dahoman cannon was fired, dismounting itself by the force of its recoil, so as to be of no further use, and its report was followed by an impetuous rush at the walls. Had the Dahomans only thought of making a breach, or even of filling up the tiny moat, they might have had a chance of success, but as it was they had none. The soldiers, especially the Amazons, struggled gallantly for some time; and, if individual valor could have taken the town, they would have done so. But they were badly commanded, the officers lost heart, and even though the soldiers were scaling the walls, creeping through the tunnels, and fighting bravely at the very muzzles of the enemy's guns, they gave the order for retreat.

Just at that time, a large body of Egbas, which had made unseen a wide circuit, fell upon them in the rear, and completed the rout. All fled without order, except the division which Gelele himself was commanding, and which retired with some

show of discipline, turning and firing on their adversaries, when pressed too closely, and indeed showing what they could have done if their officers had known their business.

The Dahomans lost everything that they had taken with them, their brass guns, a great number of new muskets, and other weapons falling into the hands of the enemy. Besides these, the king himself was obliged to abandon a number of his wives and daughters, his horse, his precious sandals with their golden crosses, his wardrobe, his carriages of which he was so proud, his provisions, and his treasures of coral and velvet. It was calculated that some four or five thousand Dahomans were killed in this disastrous battle, while some fifteen hundred prisoners were captured; the Egbas only losing forty killed, and about one hundred wounded. True to their savage nature, the Egbas cut the corpses of the dead to pieces, and even the women who passed by the body of a Dahoman soldier slashed it with a knife, or pelted it with stones.

It has been thought that the Abeokutas are comparatively guiltless in blood-shedding, but it is now known that in this respect there is really very little difference between the three great nations of Western Africa, except that the destruction of human life is less at Abeokuta than at Agbome, and perhaps that the Egbas are more reticent on the subject than the Ashantis or Dahomans. Even in Abeokuta itself, which has been supposed to be under the influence of Christianity, an annual human sacrifice takes place, and the same ceremony is performed in other parts of the kingdom. As in Agbome, when a human sacrifice is offered, it is with the intention of offering to the dead that which is most valuable to the living. The victim is enriched with cowries, and plied with rum until he is quite intoxicated, and then, after being charged with all sorts of messages to the spirits of the dead, he is solemnly decapitated. Victims are sacrificed when great men die, and are supposed to be sent to the dead man as his attendants in the spirit world.

As to the religion and superstitions of the Egbas, they are so exactly like those of other Western Africans that there is little need to mention them. It only remains to describe the remarkable system called "Ogboni." The Ogboni are a society of enormous power, which has been compared, but erroneously, to freemasonry. Any one who is acquainted with the leading principles of freemasonry, and has studied the mental condition of the Egbas, or indeed any other West African tribe, must see that such a parallel is ludicrously wrong. In freemasonry there are two leading principles, the one being the unity of the Creator, and the second the fellowship of man. Now, as the

(1.) HEAD WORSHIP.

(See page 587.)

(2.) THE ATTACK ON ABEOKUTA.

(See page 594.)

Egbas believe in numberless gods, and have the strongest interest in slavery, it is evident that they cannot have invented a system which is diametrically opposed to both these tenets.

The system of Ogboni is partly political and partly religious. It may be entered by a naked boy of ten years old, provided that he be a free-born Egba and of good repute. The fraternity extends itself throughout the whole of the country occupied by the Egbas, and in every village there is a hut or lodge devoted expressly to the use of the society. The form of this lodge varies slightly, but the general features are the same in all. "It is a long low building, only to be distinguished by the absence of loungers, fronted by a deep and shady veranda, with stumpy polygonal clay pillars, and a single door, carefully closed. The panels are adorned with iron alto-relievos of ultra-Egyptian form; snakes, hawk-headed figures, and armed horsemen in full front, riding what are intended to be horses in profile; the whole colored red, black, and yellow. The temples of Obatala are similarly decorated.

"The doors have distinct panels, upon which are seen a leopard, a fish, a serpent, and a land tortoise. Mr. Beaven remarks that one of the carvings was a female figure, with one hand and one foot, probably a half Obatala, or the female principle of Nature, and the monster was remarkable for having a queue of very long hair, with a ball or globe at the end.

"A gentleman who had an opportunity of overlooking the Ogboni lodge from the Ake church steeple described it as a hollow building with three courts, of which the innermost, provided with a single door, was that reserved for the elders, the holy of holies, like the Kadasta Kadastan of the Abyssinians. He considers that the courts are intended for the different degrees.

"The stranger must, however, be careful what he believes concerning these mysteries. The Rev. W. Beaven asserts that the initiated are compelled to kneel down and drink a mixture of blood and water from a hole in the earth. The Egbas deny this. Moreover they charge Mr. Beaven with endeavoring to worm out their secrets for the purpose of publication. As all are pledged to the deepest reticence, and as it would be fatal to reveal any mystery, if any there be, we are hardly likely to be troubled with over-information."

The miscellaneous superstitions of the Egbas are very miscellaneous indeed. Like the Dahomans, they divide their deities into different classes, like the major and minor gods of the ancients, and, like them, they occasionally deify a dead ruler, and class him with the minor gods. The native word for the greater god is Ovisha, a title which is prefixed to the special names of those deities.

Thus, Ovisha Klá, or the Great Ovisha, is the chief of them. His sacred emblem or symbol is a ship, and it was he who created the first man.

The next in order is Shango, who is evidently an example of an apotheosis, as he has the attributes of Vulcan, Hercules, Tubal Cain, and Jupiter Tonans, and is said to have a palace of brass, and ten thousand horses. He presides over lightning and fire, and, if thunder strikes a house, his priest rushes into the hut to find the weapon that Shango has cast, and is followed by a tumultuous mob, who plunder the dwelling effectually. Captain Burton saw one of the so called Shango stones, which was nothing but a lump of white quartz, of course placed in the hut by the priest.

His symbol is a small wooden bat, and his worshippers carry a leathern bag, because Shango was fond of predatory wars. If war impends, his priest takes sixteen cowries, and flings them in the air, and those which fall with the opening downward are thought to portend war, while those which have the opening upward signify peace. The last of the great three is Ipa, apparently an abstractive rather than an objective deity. He is worshipped by a select society called the "Fathers of Secrets," into which none but males can be initiated. His chief priest lives on a mountain at several days' distance from Abeokuta, and close by his dwelling is the sacred palm tree with sixteen boughs produced by the nuts planted by the sixteen founders of the empire. A second priest at Abeokuta is called the King of the Groove.

The emblem of Ipa is a palm nut with four holes, and these nuts are used in divination, the principle being something like the mode of casting lots with cowries. Captain Burton's account of the proceeding is interesting. "He counted sixteen nuts, freed them from dust, and placed them in a bowl on the ground, full of yams half-boiled, crushed, and covered with some acid vegetable infusion.

"His acolyte, a small boy, was then called, and made to squat near the bowl, resting his body on the outer edge of the feet, which were turned inward, and to take from the fetish man two or three bones, seeds, and shells, some of which are of good, others of bad omen. Elevating them, he rested his hands on his knees. The adept cast the nuts from one hand to the other, retaining some in the left, and, while manipulating, dropped others into the bowl. He then stooped down, drew with the index and medius fingers on the yams, inspected the nuts, and occasionally referred to the articles in the boy's hand."

The priests of Ipa are known by necklaces made of strings of beads twisted together, and having ten large white and green beads at some distance apart.

Then there is the Oyisha of children, one of which is carried about by women who have borne twins when one of them dies or is killed. It is a wooden little image, about seven or eight inches in height, carved into the rude semblance of humanity. The images are nearly all made by some men at Lagos, who charge about three shillings for each. Beside all these deities, which may be ranked among the beneficent class, there are evil deities, who are worshipped by way of propitiation.

Next come some semi-human deities, who serve as the correctors of public morals. The two chief of these deities are Egugun and Oro. The former is supposed to be a sort of a vampire, being a dead body risen temporarily from the grave, and acts the same rôle as Mumbo Jumbo in another part of Western Africa. Egugun makes his appearance in the villages, and very much frightens the women, who either actually believe him to be a veritable resuscitated corpse, or who assert that they believe it, in fear of public opinion. The adult males, and even the free-born boys, know all about Egugun, as is likely, when the deity in question is personated by any one who can borrow the requisite dress from the fetish man. Captain Burton once met Egugun in the street. The demon's face was hidden by a plaited network, worn like a mask, and on his head was a hood, covered with streamers of crimson and dirty white, which hung down to his waist and mingled with similar streamers attached to his dress. He wore on his breast a very powerful fetish, *i. e.* a penny mirror; and his feet were covered with great shoes, because Egugun is supposed to be a footless deity.

The other deity, Oro, has a wider range of duties, his business being to attend to public morality. He mostly remains in the woods, and but seldom makes his appearance in public. Oro has a very strong voice, arising, in point of fact, from a thin slip of wood, about a foot in length, which is tied firmly to a stick, and which produces a kind of roaring sound when properly handled.

He is supposed to be unknown to the women, who are not allowed to be out of their houses whenever the voice of Oro is heard. Consequently, about seven or eight in the evening, when the well-known booming cry of Oro is heard, the women scuffle off to their houses, and the adult males go out into the streets, and there is at once a scene of much excitement. Dances and tumbling, processions and speech-making, go on with vast vigor, while the Ogboni lodges are filled with devotees, all anxious to be talking at once, and every one giving his own opinion, no matter how absurd it may be.

Those who have been guilty of moral offences are then proclaimed and punished; and on some occasions there is so much

business to be done that the town is given up to Oro for an entire day. On these occasions the women pass a very unpleasant time, their hours of imprisonment being usually spent in quarrelling with each other. In order to make the voice of Oro more awful, the part of the demon is played by several of the initiated, who go into the woods in various directions, and by sounding their wooden calls at the same time carry the idea that Oro is omnipresent.

Oro does really act as a censor of public morals, and it is very clear that he is attended by armed followers, who carry out a sort of rude and extemporized justice, like that which was exercised by the "Regulators" of America, some fifty or sixty years ago. The bodies of delinquents have been found in the bush, their throats cut and their legs broken by the spirit in question.

The chief, or king, of the Egbas, is known by the name of Alaké, which is a transmissible title, like Pharaoh or Cæsar, and the whole system of government is a kind of feudal monarchy, not unlike that of England in the days of John. The Alaké does not reign supreme, like the King of Dahome or Ashanti, before whom the highest in the realm prostrate themselves and roll humbly in the dust. He is trammelled with a number of councillors and officers, and with a sort of parliament called the Bale, which is composed of the headmen or chiefs of the various towns. The reader may remember that the King of Ashanti found that he was in danger of suffering from a similar combination, and he took the prudent measure of limiting their number while he had the power. The Alaké has never done so, and in consequence those who are nominally and individually his servants are practically and collectively his masters.

The Ogboni lodges have also to be consulted in any important point, so that the private life of the Alaké of the Egbas is far from being so agreeable as that of the King of Dahome.

Okekunu, the Alaké at the time when Captain Burton lived in Abeokuta, was an ill-favored, petulant, and cunning old ruler. In his way, he was fond of state, and delighted to exhibit his so called power in a manner truly African, displaying an equal amount of pageantry and trashiness.

If he goes to pay a visit, he must needs do so under a huge pink silk umbrella. At the end of a motley procession. At the head is carried the sacred emblem of royalty, a wooden stool covered with coarse red serge, which is surrounded by a number of chiefs, who pay the greatest attention to it. A long train of ragged swordsmen followed; and last came the Alaké, clothed in a "Guinea fowl" shirt—a spotted article of some value—and a great red velvet robe under which he tottered along with much difficulty. He wears trousers of good pur-

ple velvet with a stripe of gold tinsel, and on his feet are huge slippers, edged with monkey skin. On his head he wears a sort of fez cap of crimson velvet, the effect of which is ruined by a number of blue beads hung fringe-wise round the top. The string of red coral beads hangs round the neck, and a double bracelet of the same material is wound upon each wrist. A view of him and his court may be found on the 605th page.

When he receives a visitor, he displays his grandeur by making his visitors wait for a time proportionate to their rank, but, in case they should be of great consequence, he alleviates the tediousness of the time by sending them rum and gin, both of the very worst quality; and, if they be of exceptionally high rank, he will send a bottle of liquors, *i. e.* spirits of wine and water, well sweetened, and flavored with a few drops of essential oil.

To a stranger, the place presents a mean and ugly appearance, and as, Captain Burton remarks, is as unworthy of Abeokuta as St. James's is of London. It is a tumble-down "swish" house, long and rambling, and has several courts. Along one side of the inner court runs a veranda, the edge of which comes within some four feet of the ground, and is supported by huge clay pillars. Five hexagonal columns divide the veranda into compartments, the centre of which is the Alaké's private room, and is kept veiled by a curtain. The veranda, or ante-chamber, is filled with the great men of Abeokuta, and, according to Burton's account, they are the most villanous-looking set of men that can well be conceived; and although he has seen as great a variety of faces as any one, he says that he never saw such hideous heads and faces elsewhere.

"Their skulls were depressed in front,

and projecting cocoa-nut-like behind; the absence of beards, the hideous lines and wrinkles that seared and furrowed the external parchment, and the cold, unrelenting cruelty of their physiognomy in repose, suggested the idea of the eunuch torturers erst so common in Asia. One was sure that for pity or merey it would be as well to address a wounded mandril. The atrocities which these ancients have witnessed, and the passion which they have acquired for horrors, must have set the mark of the beast upon their brows."

Though the assemblage consisted of the richest men of the Egbas, not a vestige of splendor or wealth appeared about any of them, the entire clothing of the most powerful among them being under sixpence in value. In fact, they dare not exhibit wealth, knowing that, if they should do so, it would be confiscated.

As for the Alaké himself, his appearance was not much more prepossessing than that of his subjects. Okekunu was a large, brawny, and clumsy-looking man, nearly seventy years of age, and his partially-shaven head did not add to his beauty. Besides, he had lost all his upper teeth except the canines, so that his upper lip sank into an unpleasant depression. His lower teeth were rapidly decaying from his habit of taking snuff negro fashion, by placing it between the lower lip and the teeth, and, in consequence of the gap, the tip of his tongue protruded in a very disagreeable manner. He had lost one eye by a blow from a stone, and, as he assumed a semi-comatose expression, was not a pleasant person to look at, and certainly not very regal in aspect."

The king must be selected from one of four tribes, and both the present king and his predecessor belonged to the Ake tribe.

CHAPTER LIX.

BONNY.

THE PRINCIPAL TRADE OF BONNY—KING PEPPEL AND HIS HISTORY—THE DEFRAUDED EMIGRANTS—MR. READE'S INTERVIEW WITH PEPPEL—ARCHITECTURE OF BONNY—THE JU-JU HOUSES, PRIVATE AND PUBLIC—CANNIBALISM AT BONNY—THE JU-JU EXECUTION—WHY THE EXECUTIONER DID NOT EAT THE HEAD—DAILY LIFE OF A BONNY GENTLEMAN—DRESS OF MEN AND WOMEN—SUPERSTITIONS—MUMBO-JUMBO AND HIS OFFICE—LAST RESOURCE OF A HEN-PECKED HUSBAND—A TERRIBLE GREGREE AND ITS RESULT—THE GREGREE MEN OR MAGICIANS—INGENIOUS MODE OF WEAVING THEIR SPELLS—ESCAPE OF AN IMPOSTOR.

PASSING a little southward along the west coast, we come to the well-known Bonny River, formerly the great slave depôt of Western Africa, and now the centre of the palm-oil trade. Unfortunately there is as much cheating in the palm-oil trade as in gold and ivory; the two latter being plugged, and the former mixed with sand, so that it has to be boiled down before it can be sent from the coast.

Bonny is familiar to English ears on account of the yellow-black chief who was pleased to call himself king, and who was well known in England as Pepper, King of Bonny. His name is varied as Pepper, Pimento, or Peppel. He is descended from Obullo, an Ibo (or Eboe) chief, who settled with his slaves on the Bonny River, and who was succeeded by his son and grandson, each of whom took the name of Pepper.

Being of a quarrelsome disposition, the present king shot a wife because she displeased him, murdered a chief called Manilla Peppel because he was jealous, and was ruining the trade of the river by his perpetual wars with the Calabars. So, at the request of all the native chiefs and traders, he was deposed, and his nephew Daphe placed in his stead. Daphe, however, died soon afterward.—poisoned, it is believed, at Peppel's instigation; and then the government was handed over to four regents, while Pimento was transported to Ascension, a place which he was afterward fond of calling his St. Helena. However, he proved himself to be a clever savage, and, by dint of importunity, contrived to be taken to England, where he arrived in 1857.

Possessing to the full the imitative capacity of the negro, he adopted English customs with wonderful facility, abandoning, according to Captain Burton, his favorite dish of a boy's palms, and drinking champagne and sherry instead of trade rum. Soon he became religious, was baptized, and turned teetotaler, gaining thereby the good-will of a large class of people. He asked for twenty thousand pounds to establish a missionary station, and actually induced a number of English who knew nothing of Africa, or the natural mendacity of the African savage, to accompany him as his suite, promising them splendid salaries and high rank at court.

No one who knows the negro character will be surprised to hear that when the king and his suite arrived at Bonny the latter found themselves cheated and ruined. They discovered that the "palace" was a collection of hovels inside a mud wall; that Bonny itself was nothing more than a quantity of huts in a mud flat; and that the best street was infinitely more filthy than the worst street in the worst part of London. As to the private life of the king, the less said about it the better.

Their health rapidly failed under the privations which they suffered, and the horrible odors of the Bonny River, which are so sickening that even the hardened traveller Captain Burton had to stop his experienced nostrils with camphorated cotton, as he was rowed up the river at low water. As to the royal salaries and apartments in the palace, they were found to be as imaginary as the palace itself and the rank at court, the king presenting each of the officials with a couple

of yams as an equivalent for pay and lodging.

How genuine was the civilization and Christianity and teetotalism of Peppel may be imagined from an interview which Mr. W. Reade had with him after his return:—"I went ashore with the doctor on a visit to Peppel, the famous king of Bonny. . . . In one of the hovels was seated the monarch, and the scene was well adapted to the muse of his poet laureate. The Africans have a taste for crockery ware, much resembling that of the last generation for old china, and a predilection for dog flesh, which is bred expressly for the table, and exposed for sale in the public market.

"And there sat Peppel, who had lived so long in England; behind him a pile of willow-pattern crockery, before him a calabash of dog stew and palaver sauce. It is always thus with these savages. The instincts inherited from their forefathers will ever triumph over a sprinkling of foreign reason. Their intellects have a *rete mucosum* as well as their skins. As soon as they return to their own country, take they off all their civilization and their clothes, and let body and mind go naked. Like most negroes of rank, Peppel has a yellow complexion, as light as that of a mulatto. His features express intelligence, but of a low and cunning kind. In every word and look he exhibits that habit of suspicion which one finds in half-civilized natures."

Peppel, although restored to Bonny, has scarcely any real power, even in his own limited dominions, from which he dares not stir. Yet, with the cool impudence of a thorough savage, he actually proposed to establish a consul in London at a salary of 500*l.*, stating as his reason that he had always allowed the English consuls to visit his dominions in the Bight of Benin.

The architecture of the Bonny country is not very elaborate, being composed of swish and wattle, supported by posts. The floors and walls are of mud, which can be obtained in any amount, and the general look of the houses has been well compared to Africanized Swiss, the roofs being very high, and the gables very sharp. Ordinary houses have three rooms, a kitchen, a living room, and a Ju-ju room or chapel; but those of the wealthy men have abundance of chambers and passages. There are no chimneys, and as the door must therefore be kept open if a fire is lighted, the threshold is at least eighteen inches high, in order to prevent the intrusion of strange beasts. It is not thought to be etiquette to step over the threshold when the master of the house is sitting within, or he will be afflicted with sickness, thinking himself bewitched.

The Ju-ju room or chapel is a necessary adjunct to every Bonny house, and within it is the fetish, or Ju-ju, which is the guardian of the house, and corresponds with the

Lares and Penates of the ancients. The negro contrives to utilize the ju-ju room, making it a storehouse for his most valued property, such as cowries, or rum, knowing that no one will touch it in so sacred a place. As to the Ju-ju itself, anything answers the purpose, and an Englishman is sometimes troubled to preserve his gravity when he sees a page of *Punch*, a cribbage peg, a pill box, or a pair of braces, doing duty as the household god of the establishment.

The great Ju-ju house of the place is a most ghastly-looking edifice, and is well described by Captain Burton. It is built of swish, and is an oblong roofless house, of forty or fifty feet in length. A sort of altar is placed at the end, sheltered from the rain by a small roof of its own. Under the roof are nailed rows of human skulls mostly painted in different colors, and one of them is conspicuous by a large black beard, which is doubtless a rude copy of the beard worn by the man to whom it originally belonged. Between them are rows of goat skulls streaked with red and white, while other skulls are strewn about the floor, and others again are impaled on the tops of sticks. Under the altar is a round hole with a raised clay rim, in which is received the blood of the victims together with the sacred libations. Within this Ju-ju house are buried the bodies of the kings.

This house well illustrates the character of the people—a race which take a positive pleasure in the sight of blood, and in inflicting and witnessing pain. All over the country the traveller comes upon scenes of blood, pain, and suffering. There is hardly a village where he does not come upon animals tied in some agonizing position and left to die there. Goats and fowls are mostly fastened to posts with their heads downward, and blood is the favorite color for painting the faces of men. Even the children of prisoners taken in war—the war in question being mostly an unsuspected attack on an unprepared village—are hung by the middle from the masts of the canoes, while the parents are reserved to be sacrificed and eaten.

About this last statement there has been much incredulity, and of course, when questioned, the Bonny negroes flatly deny the accusation. There is, however, no doubt of the fact, inasmuch as Europeans have witnessed the act of cannibalism. For example, old King Peppel, the father of the Pimento whose life has been briefly sketched, gave a great banquet in honor of a victory which he had gained over Calabar, and in which Amakree, the king of that district, was taken prisoner. The European traders were invited to the banquet, and were most hospitably entertained. They were, however, horrified to see the principal dish which was placed before Peppel. It was

the bleeding heart of Amakree, warm and palpitating as it was torn from the body. Peppel devoured the heart with the greatest eagerness, exclaiming at the same time, "This is the way I serve my enemies."

More recently, Dr. Hutchinson witnessed a scene of cannibalism. He had heard that something of the kind was contemplated, although it was kept very quiet. On the appointed morning he had himself rowed to the shore at some distance from the Ju-ju house, near which he concealed himself, and waited for the result. The rest of the adventure must be told in his own words.

"I know not of what kind are the sensations felt by those around Newgate, waiting for an execution in the very heart of London's great city; but I know that on the banks of an African river, in the gray dawn of morning, when the stillness was of that oppressive nature which is calculated to produce the most gloomy impressions, with dense vapors and foul smells arising from decomposing mangroves and other causes of malaria floating about, with a heaviness of atmosphere that depressed the spirits, amidst a community of cannibals, I *do* know that, although under the protection of a man-of-war, I felt on this occasion a combined sensation of suspense, anxiety, horror, and indefinable dread of I cannot tell what, that I pray God it may never be my fate to endure again.

"Day broke, and, nearly simultaneous with its breaking, the sun shone out. As I looked through the slit in the wall on the space between my place of concealment and the Ju-ju house, I observed no change from its appearance the evening before. No gibbet, nor axe, nor gallows, nor rope — no kind of preparation, nothing significant of death, save the skulls on the pillars of the Ju-ju house, that seemed leering at me with an expression at once strange and vacant. It would have been a relief in the awful stillness of the place to have heard something of what I had read of the preparations for an execution in Liverpool or London — of the hammering suggestive of driving nails into scaffold, drop, or coffin, of a crowd gathering round the place before early dawn, and of the solemn tolling of the bell that chimed another soul into eternity. Everything seemed as if nothing beyond the routine of daily life were to take place.

"Could it be that I had been misinformed; that the ceremony was adjourned to another time, or was to be carried out elsewhere? No, a distant murmur of gabbling voices was heard approaching nearer and nearer, till, passing the corner house on my left, I saw a group of negroes — an indiscriminate crowd of all ages and both sexes — so huddled together that no person whom I could particularly distinguish as either an executioner or a culprit was visible among them.

But above their clattering talk came the sound of a clanking chain that made one shudder.

"They stopped in the middle of the square opposite the Ju-ju house, and ceased talking. One commanding voice uttered a single word, and down they sat upon the grass, forming a circle round two figures, standing upright in the centre — the executioner and the man about to be killed. The former was remarkable only by the black skull-cap which he had on him, and by a common cutlass which he held in his hand. The latter had chains round his neck, his wrists, and his ankles. There was no sign of fear or cowardice about *him* — no seeming consciousness of the dreadful fate before him — no evidence even upon his face of that dogged stubbornness which is said to be exhibited by some persons about to undergo an ignominious death. Save that he stood upright one would scarcely have known that he was alive. Amongst the spectators, too, there was a silent impassiveness which was appalling. Not a word, nor gesture, nor glance of sympathy, that could make me believe I looked at beings who had a vestige of humanity among them. (See illustration on p. 619.)

"As the Ju-ju butcher stepped back and measured his distance to make an effectual swoop at his victim's neck, the man moved not a muscle, but stood as if he were unconscious — till —

"Chop! The first blow felled him to the ground. The noise of a chopper falling on meat is familiar to most people. No other sound was here — none from the man; not a whisper nor a murmur from those who were seated about! I was nearly crying out in mental agony, and the sound of that first stroke will haunt my ears to my dying day. How I wished some one to talk or scream, to destroy the impression of that fearful hough, and the still more awful silence that followed it!

"Again the weapon was raised to continue the decapitation — another blow as the man lay prostrate, and then a sound broke the silence! But, O Father of mercy! of what a kind was that noise — a gurgle and a gasp, accompanying the dying spasm of the struck-down man!

"Once more the weapon was lifted — I saw the blood flow in gory horror down the blade to the butcher's hand, and there it was visible, in God's bright sunshine, to the whole host of heaven. Not a word had yet been uttered by the crowd. More chopping and cleaving, and the head, severed from the body, was put by the Ju-ju executioner into a calabash, which was carried off by one of his women to be cooked. He then repeated another cabalistic word, or perhaps the same as at first, and directly all who were seated rose up, whilst he walked away.

"A yell, such as reminded me of a com-

pany of tigers, arose from the multitude—cutlasses were flourished as they crowded round the body of the dead man—sounds of cutting and chopping arose amidst the clamor of the voices, and I began to question myself whether, if I were on the other side of the river Styx, I should see what I was looking at here through the little slit in the wall of my hiding-place: a crowd of human vultures gloating over the headless corpse of a murdered brother negro—boys and girls walking away from the crowd, holding pieces of bleeding flesh in their hands, while the dripping life-fluid marked their road as they went along; and one woman snapping from the hands of another—both of them raising their voices in clamor—a part of the body of that poor man, in whom the breath of life was vigorous not a quarter of an hour ago.

“The whole of the body was at length divided, and nothing left behind but the blood. The intestines were taken away to be given to an iguana—the Bonny-man’s tutelary guardian. But the blood was still there, in glistening pools, though no more notice was taken of it by the gradually dispersing crowd than it were a thing as common in that town as heaven’s bright dew is elsewhere. A few dogs were on the spot, who devoured the fragments. Two men arrived to spread sand over the place, and there was no interruption to the familiar sound of coopers’ hammering just beginning in the cask-houses, or to the daily work of hoisting palm-oil puncheons on board the ships.”

On passing the Ju-ju house afterward, Dr. Hutchinson saw the relics of this sacrifice. They consisted of the larger bones of the body and limbs, which had evidently been cooked, and every particle of flesh eaten from them. The head is the perquisite of the executioner, as has already been mentioned. Some months afterward, Dr. Hutchinson met the same executioner, who was said to have exercised his office again a few days previously, and to have eaten the head of his victim. Being upbraided with having committed so horrible an act, he replied that he had not eaten the head—his cook having spoiled it by not having put enough pepper to it.

The whole life of the Bonny-man, and indeed of all the many tribes that inhabit the neighborhood of the Niger and live along it, is in accordance with the traits which have been mentioned. Of course, the women do all the real work, the man’s working day being usually employed in coming on board some trading ship early in the morning, chaffering with the agent, and making bargains as well as he can. He asks for everything he sees, on the principle that, even if he be refused, he is no worse after than before: contrives to breakfast as many times as possible at the ship’s expense, and about mid-day goes home to repose after the fatigues of the day.

As to his dress, it consists of a cloth, in the choice of which he is very fastidious. A handkerchief is folded diagonally and passed through the loop of his knife belt, so as to attach it to his right side, and this, with a few strings of beads and rings, completes his costume. His woolly hair is combed out with the coarsest imaginable comb, made of a few wooden skewers lashed side by side, and diverging from each other toward the points, and his skin is polished up with palm oil.

The women’s working day is a real fact, being begun by washing clothes in the creek, and consisting of making nets, hats, lines, and mats, and going to market. These are the favorites, and their life is a comparatively easy one; while the others, on whom their despotic master does not deign to cast an eye of affection, are simply his slaves, and are subjected to water drawing, wood cutting, catching and curing fish.

The dress of the women is not unlike that of the opposite sex, the chief distinction being that their fashionable paint is blue instead of red. The coloring is put on by a friend, usually one who regularly practises the art of painting the human body in patterns. Checkers, like those that were once so common on the door posts of public houses, are very much in favor, and so are wavy stripes, beginning with lines scarcely thicker than hairs, and swelling out to half an inch or more in breadth. Arabesque patterns, curves, and scrolls are also largely used.

Throughout a considerable portion of that part of Western Africa which is inhabited by the negroes there is found a semi-human demon, who is universally respected, at least by the feminine half of the community. His name is MUMBO JUMBO, and his sway is upheld by the men, while the women have no alternative but to submit to it.

On the branch of a tree near the entrance of each town hangs a dress, made of slips of bark sewed rudely together. It is the simplest possible dress, being little more than a bark sack, with a hole at the top for the head and another at each side for the hands. Close by it hangs an equally simple mask, made of an empty gourd, with two round holes for the eyes of the wearer, and decorated with a tuft of feathers. In order to make it more fantastically hideous, the mask is painted with scarlet, so that it looks very much like the face of a clown in a pantomime.

At night the people assemble as usual to sing and dance, when suddenly faint distant howlings are heard in the woods. This is the cry of Mumbo Jumbo, and all the women feel horribly frightened, though they are obliged to pretend to be delighted. The cries are heard nearer and nearer, and at last Mumbo Jumbo himself, followed by a number of attendants armed with sticks, and clothed in the dress which is kept for his use, appears in the noisy circle, carrying

a rod in his hand. He is loudly welcomed, and the song and dance go on around him with delight. Suddenly, Mumbo Jumbo walks up to one of the women and touches her with his rod. His attendants instantly seize on the unfortunate woman, tear off all her clothes, drag her to a post which is always kept for such occasions, tie her to it, and inflict a terrific beating on her. No one dares to pity her. The men are not likely to do so, and the women all laugh and jeer at their suffering companion, pointing at her and mocking her cries: partly because they fear that should they not do so they might be selected for the next victims, and partly because — like the savages that they are at heart — they feel an exultation at seeing some one suffering a penalty which they have escaped. (See engraving.)

The offence for which the woman has suffered is perfectly well known by all the spectators, and by none better than by the sufferer herself. The fact is, she has been bad-tempered at home, quarrelling, in all probability, with her fellow wives, and has not yielded to the admonitions of her husband. Consequently, at the next favorable opportunity, either the husband himself, or a man whom he has instructed, induces the dress of Mumbo Jumbo, and inflicts a punishment which serves equally as a corrective to the disobedient wife and a warning to others that they had better not follow her example.

Mumbo Jumbo does not always make his appearance on these nocturnal festivities, as the men know that he inspires more awe if he is reserved for those instances in which the husband has tried all the means in his power to keep the peace at home, but finds that his unsupported authority is no more respected. The reader will remember that a demon of a similar character is to be found in Dahome.

It is to be wished that all the superstitions of the land were as harmless as that of Mumbo Jumbo, which nobody believes, though every one pretends to do so, and which, at all events, has some influence on the domestic peace. Some of them, however, are very terrible, and involve an amount of human suffering which would deter any but a savage from performing them. It is very difficult to learn the nature of these superstitions, as the negroes always try to conceal them from Europeans, especially when they involve the shedding of blood. One astounding instance has, however, been related. A town was in danger of attack from a powerful tribe that inhabited the neighborhood, and the king was so much alarmed that he sent for the magicians, and consulted with them as to the best method of repelling the enemy.

Accordingly, the people were summoned together in front of the principal gate, when two holes were dug in the ground close to each other. Songs and dances began as

usual, until suddenly the chief magician pointed to a girl who was standing among the spectators. She was instantly seized, and a leg thrust into each hole, which was then filled up with earth so that she could not move. By command of the magicians, a number of men brought lumps of wet clay, which they built around her body in a pillar-like form, kneading them closely as they proceeded, and gradually covering her with clay. At last even her head was covered with the clay, and the poor victim of superstition soon ceased to breathe. This clay pillar with the body of the girl within it stood for years in front of the gate, and so terrified were the hostile tribes at so powerful a fetish, or gregree, that they dared not carry out their plan of attack.

The natives erect these gregees on every imaginable occasion, and so ward off every possible calamity: and, as they will pay freely for such safeguards, the fetish men are naturally unwilling to refuse a request, and so to break up a profitable trade. They are, of course, aware that their clients will in many cases suffer from the very calamity which they sought to avoid, and that they will come to make bitter complaints. They therefore take care to impose on the recipient some condition by way of a loop-hole, through which they may escape. On one such instance the man bought a fetish against fever, which, however, seized him and nearly killed him. The condition which had been imposed on him was abstinence from goat's flesh, and this condition he knew that he had fulfilled. But the fetish man was not to be baffled by such a complaint, and utterly discomfited his angry client by asserting that, when his patient was dining at another town, a personal enemy, who knew the conditions on which the gregree was given, dropped a little goat's-flesh broth into his bowl, and so broke the spell.

Absolute faith in the gregree is another invariable condition. On one stormy day a party of natives had to cross the river, and applied for a gregree against accidents. They crossed safely enough, but on recrossing the boat was upset, and some of the party were drowned. The survivors went in a body to the gregree maker, and upbraided him with the accident. He heard them very patiently, and then informed the complainants that the misfortune was entirely caused by the incredulity of the steersman, who tried to sound the river with his paddle in order to discover whether they were in shallow water. This action indicated mistrust, and so the power of the spell was broken. The cunning fellow had seen the accident, and, having ascertained that the steersman had been drowned, made the assertion boldly, knowing that the men had been too frightened to observe closely, and that the accused could not contradict the statement.

(1.) THE ALAKK'S COURT. (See page 599.)

CHAPTER LX.

THE MANDINGOES.

LANGUAGE AND APPEARANCE OF THE MANDINGOES—THEIR RELIGION—BELIEF IN AMULETS—A MANDINGO SONG—MARRIAGE AND CONDITION OF THE WOMEN—NATIVE COOKERY—A MANDINGO KING—INFLUENCE OF MAHOMETANISM.

BEFORE proceeding across the continent toward Abyssinia, we must briefly notice the Mandingo nation, who inhabit a very large tract of the country through which the Senegal and Gambia flow. They are deserving of notice, if it were only on the ground that their language is more widely spread than any that is spoken in that part of Africa, and that any traveller who desires to dispense as far as possible with the native interpreters, who cannot translate literally if they would, and would not if they could, is forced to acquire the language before proceeding through the country. Fortunately it is a peculiarly melodious language, almost as soft as the Italian, nearly all the words ending in a vowel.

In appearance the Mandingoes are tall and well made, and have the woolly hair, though not the jetty skin and enormous lips, of the true negro. "The structure of the language," says Mr. M'Brair, who has made it his special study, "is thoroughly Eastern. In some of its grammatical forms it resembles the Hebrew and Syriac; its most peculiar sound is of the Malay family; its method of interrogation is similar to that of the Chinese, and in the composition of some verbs it is like the Persian. A few religious terms have been borrowed from the Arabic, and some articles of foreign manufacture are called after their European names."

As a rule, the religion of the Mandingoes is Mahometanism, modified to suit the people, but they still retain enough of the original negro character to have an intense faith in greegres, which are made for them by the marabouts, or holy men, and almost invariably consist of sentences of the Koran,

sewed up in little leathern cases beautifully tanned and stamped in patterns. Mahometanism has put an end to the noisy songs and dances which make night hideous; but the Mandingoes contrive, nevertheless, to indulge their taste for religious noise at night. Instead of singing profane songs they sing or intone the Koran, bawling the sacred sentences at the full stretch of their voices, and murdering sleep as effectually as if they had been still benighted idolaters singing praises in honor of the moon. Some ceremonies in honor of the moon still remain, but are quite harmless. When it appears, they salute it by spitting in their hands and waving them round their heads. For eclipses they account by saying that there is a large cat living somewhere in the sky, who puts her paw between the moon and the earth.

They are very strict Mahometans indeed, the marabouts always calling them to prayers one hour before sunrise; that, according to theological astronomy, being the time at which the sun rises at Mecca. Mahometanism has done much for the Mandingoes. It has substituted monotheism for idolatry, and totally abolished human sacrifices. It has not extirpated the innate negro character of the Mandingoes; but it has raised them greatly in the scale of humanity. It has not cured them of lying and stealing—neither of which vices, by the way, are confined to idolaters; but it has brought them to abhor the system of child selling, which is so ingrained in the ordinary negro, and a Mandingo Mahometan will not even sell a slave unless there is just cause of complaint against him.

The Rhamadan, or Mahometan fast, is rigidly observed by the Mandingoes, and it is no small proof of the power of their religious system that it has made a negro abstain from anything which he likes.

The principal rite of Mahometanism is of course practised by the Mandingoes, who have contrived to engraft upon it one of their own superstitions, namely, that if a lad remains uncircumcised, he is swallowed by a peripatetic demon, who carries him for nine days in his belly. This legend is religiously believed, and no one has yet been daring enough to put it to the test.

Fourteen years is the usual age for performing this ceremony, whole companies of lads partaking of it at the same time, and proceeding to the appointed spot, accompanied by their friends and relatives, who dance and sing songs by the way, neither of them being peculiarly delicate. Here the old negro nature shows itself again, proving the truth of the axiom that nature expelled with a pitchfork always comes back again. After the ceremony they pass a month in an intermediate state of existence. They have taken leave of their boyhood, and are not yet men. So until the expiration of the month they are allowed unlimited license, but after that time they become men, and are ranked with their fathers. Even the girls undergo a ceremony of a somewhat similar character, the officiants being the wives of the marabouts.

As a natural consequence of this religion, which is a mixture of Mahometanism engrafted upon fetishism, the marabouts hold much the same exalted position as the fetish men of the idolaters, and are the most important men of the community. They do not dress differently from the laity, but are distinguished by the colors of their caps, which are of some brilliant hue, such as red, blue, or yellow. The whole of education is in their hands, some being itinerant teachers, and others establishing regular schools. Others, again, mingle the characters of musicians and merchants, and all make the principal part of their living by the sale of amulets, which are nothing more than Mahometanized gregees. So great is the demand for these amulets, that a wealthy man is sometimes absolutely enclosed in a leathern cuirass composed of nothing but amulets sewed up in their neat leathern cases.

One of the Mandingo songs, translated by Mr. W. Reade, shows clearly the opinion in which these men are held. "If you know how to write Marabout (*i. e.* Arabic, and not Mandingo), you will become one of the disciples of God. If you know Marabout, you are the greatest of your family. You maintain them. If they commit a fault, it is you who will protect them."

Another of these proverbial sayings expresses the uselessness of gregees. "The

Tubabs went against Galam. The King of Maiel said to a woman, 'Take your child, put it in a mortar, and pound it to dust. From its dust I will make a man rise who will save our town.' The woman pounded her child to dust. From the dust came a man; *but the Tubabs took Maiel.*" The "Tubabs" are the French, and the saying evidently refers to the manufacture of a gregee similar in character to that which has been mentioned on page 604.

Still, their innate belief in the power of gregees is too strong to be entirely eradicated; and if one of their chief men dies, they keep his death secret, and bury his body in a private spot, thinking that if an enemy could get possession of his blade-bone he would make a gregee with it, by means of which he could usurp the kingdom for himself.

Marriages are solemnized by the marabout, in the mosque, with an odd mixture of native and borrowed ceremonies. Next to the marabout the bridegroom's sister plays the most important part at the ceremony and in the future household; gives the article of clothing which takes the place of our wedding ring, and which in this country would be thought rather ominous,—namely, a pair of trousers,—and, if a child be born of the marriage, has the privilege of naming it. Polygamy is, of course, the rule, and each woman has her own house. So, when a girl is married, she stays with her parents until her own house is built, when she is conducted to it in great state by her young friends, who sing a mournful song deploring the loss of their companion.

The women have every reason to be contented with their lot. They are not degraded slaves, like the married women in so many parts of Africa, and, if anything, have the upper hand of their husbands. "They are the most tyrannical wives in Africa," writes Mr. Reade. "They know how to make their husbands kneel before their charms, and how to place their little feet upon them. When they are threatened with divorce, they shed tears, and, if a man repudiates his wife, they attack him *en masse*—they hate, but protect, each other.

"They go to this unfortunate husband, who has never felt or enjoyed a quiet moment in his own house, and say, 'Why do you ill treat your wife? A woman is helpless; a man has all things. Go, recall her, and, to appease her just anger, make her a kind present.' The husband prays for forgiveness, and, when his entreaties take the form of a bullock or a slave, she consents to return."

The food of the Mandingoes is chiefly rice and milk, but when they are wealthy they indulge in many luxuries. The same author who has just been quoted gives the details of an entertainment cooked by half-bred Mandingoes. First they had oysters

plucked from the branches of trees, to which they attached themselves at high water, and were left suspended when the floods recede. Then there were soles, carp, and mullet, all very bad, but very well cooked. "Then followed gazelle cutlets à la papillote; two small monkeys served cross-legged and with liver sauce, on toast; stewed iguana, which was much admired; a dish of roasted crocodiles' eggs; some slices of smoked elephant (from the interior), which none of us could touch; a few agreeable plates of fried locusts, land-crabs (previously fattened), and other crustaceæ; the breasts of a mermaid, or manatee, the grand *bonne-bouche* of the repast; some boiled alligator, which had a taste between pork and cod, with the addition of a musky flavor; and some hippopotamus' steaks — *aux pommes de terre*.

"We might have obtained a better dessert at Covent Garden, where we can see the bright side of the tropics without the trouble or expense of travelling. But we had pine-apples, oranges, roasted plantains, silver bananas, papaus (which, when made into a tart with cloves, might be taken for apples), and a variety of fruits which had long native names, curious shapes, and all of them very nasty tastes. The celebrated 'cabbage,' or topmost bud of the palm tree, also formed part of the repast, and it is said to be the finest vegetable in the world. When stewed *en sauce blanche*, it is not to be compared with any vegetable of mortal growth. It must have been the ambrosia of the gods."

The Mandingoes who have not embraced Mahometanism are much inferior to their compatriots who have renounced their fetishism. Mr. Reade tells a ludicrous story of a native "king," who was even dirtier than any of his subjects, and if possible was uglier, his face being devoid of intelligence and utterly brutish; he made long speeches in Mandingo, which, as usual with such speeches, were simply demands for everything he saw, and acted in a manner so consonant with his appearance, that he excited universal disgust, and remarks were made very freely on the disadvantages of being entirely in a savage state, and never having mixed with superior beings.

At last the tedious interpreting business was at an end, and nothing remained except the number of kola nuts to be given as the

present of friendship—a customary ceremony in this country. Six had been given, and the king made a long speech, which turned out to be a request for more. "Well, we can't very well refuse the dirty ruffian," said the visitor; "give him four more, that will make ten."

"*Make it twenty*," cried the king eagerly, forgetting that his rôle was to appear ignorant of English. He had lived for some years at Sierra Leone, and could speak English as well as any one when he chose, and had heard all the remarks upon his peculiar appearance without giving the least indication that he understood a word that was said.

One of the old superstitions which still holds its own against the advance of Mahometanism is one which belongs to an island on the Upper River. On this island there is a mountain, and on the mountain lives a spirit who has the unpleasant power of afflicting human beings so severely that they can never sit down for the rest of their lives. Therefore, on passing the hill, it is necessary to unclot the body from the waist downward, to turn the back to the mountain, and pray the spirit to have compassion on his votaries, and continue to them the privilege of sitting. Every one is forced to undergo this ceremony, but fortunately the spirit is content if it be performed by deputy, and all travellers therefore, whether men or women, pay natives of their own sex to perform this interesting rite for them. However, like the well-known etiquette of crossing the line, this ceremony need only be performed on the first time of passing the hill, the spirit being satisfied with the tribute to his power.

The universal superstition respecting the power of human beings to change themselves into bestial shapes still reigns among the Mandingoes, and it is rather doubtful whether even the followers of Mohammed have shaken themselves quite free from the old belief. The crocodile is the animal whose form is most usually taken among the Mandingoes, and on one occasion a man who had been bitten by a crocodile, and narrowly escaped with his life, not only said that the reptile was a metamorphosed man, but even named the individual whom he knew himself to have offended a few days before the accident.

CHAPTER LXI.

THE BUBÉS AND CONGOESE.

REAL NAME OF THE BUBÉS—THEIR LIMITED RANGE—APPEARANCE AND MANNERS OF THE MEN—TOLA PASTE—REASONS FOR NUDITY—BUBÉ ARCHITECTURE—GENERAL CHARACTER OF THE BUBÉS—A WEDDING AT FERNANDO PO—CONGO—ITS GEOGRAPHICAL POSITION—CURIOUS TAXATION—RELIGION OF CONGO—THE CHITOME AND HIS POWERS—HIS DEATH, AND LAW OF SUCCESSION—THE NGHOMBO AND HIS MODE OF WALKING—THE ORDEAL—CEREMONY OF CROWNING A KING—THE ROYAL ROBES—THE WOMEN OF CONGO—EARLY HISTORY OF THE COUNTRY—THE FEMALE MONARCH—THE FATE OF TEMBANDUMBA.

THE Bubé tribe (which unfortunately is pronounced Booby, is a really interesting one, and, but for the rapidly decreasing space, would be described in detail. The real name of the tribe is Adizah, but, as they are in the habit of addressing others as Bubé, *i. e.* Man, the term has clung to them.

The Bubés inhabit Fernando Po, and, although some of them believe themselves to be aborigines of the island, have evidently come from the mainland. They have, however, no particular pride in their autochthonic origin, and, if questioned, are perfectly content to say that they came from their parents.

The Bubés inhabit only one zone in Fernando Po. The sea air is too soft and warm for them, and, besides, there is danger of being carried off by the slayers. More than three thousand feet above the sea they cannot exist, not because the climate is too cold, but because the palms and plantains on which they live will not flourish there. With the exception of those individuals who have come under the sway of the missionaries, the Bubés wear no clothes except closely fitting coats of palm oil, or, on grand occasions, of tola paste, *i. e.* palm oil bruised and mixed with the leaves of the tola herb. This paste has a powerful and very peculiar odor, and the first intimation of the vicinity of a Bubé village is usually the scent of the tola paste borne on the breeze.

The men wear large flat hats made of wicker-work covered with monkey skin, and

used chiefly to guard themselves from the tree snake. The women are dressed in exactly the same fashion, but without the hat, their husbands perhaps thinking that women cannot be hurt by snakes. The hat is fastened to the head by skewers made of the bone of the monkey's leg, and the hair itself is plentifully greased and adorned with yellow ochre, and manipulated so that it looks as if it were covered with little gilded peas. Round the upper arm is tied a piece of string, which holds a knife for the man and a pipe for the woman. Clothing is to them a positive infliction, and Captain Burton remarks that, even at an elevation of ten thousand feet above the sea, he offered the Bubés blankets, but they would not have them, though they found the warmth of the fire acceptable to them.

They have a legend which explains their nudity. Many years ago a M'pongwe magician made fetish upon his great war spear, and killed numbers of them, so that they fled. They then made a law that the Bubé should wear no clothing until they had conquered the M'pongwe, and that law they have kept to the present day.

Taken as a savage, the Bubé is a wonderfully good specimen. He is very industrious, laying out yam fields and farms at some distance from his house, in order to prevent his domestic animals from straying into it, and he is the best palm-wine maker in Western Africa. He neither will be a slave himself, nor keep slaves, preferring to work for himself; and, after working hard at his

(1.) A BUBÈ MARRIAGE.
(See page 613.)

(2.) KANEMBO MAN AND WOMAN.
(See page 627.)

farm, he will start off into the woods to shoot monkeys or squirrels. He is a good athlete, and handles his great staff with such address that he is a very formidable antagonist. He is an admirable linguist, picking up languages with astonishing readiness, and he is absolutely honest. "You may safely deposit rum and tobacco in his street, and he will pay his debt as surely as the Bank of England." This testimony is given by Captain Burton, who certainly cannot be accused of painting the native African in too bright colors.

Yet he never trusts any one. He will deal with you most honorably, but he will never tell you his name. If you present gifts to him, he takes them, but with suspicion: "Timet Danaos et dona ferentes." If you enter his village unexpectedly, he turns out armed, and, "if you are fond of collecting vocabularies, may the god of speech direct you." The fact is, he has been so cheated and plundered that he now suspects all men alike, and will not trust even his fellow-countrymen of the next village.

He treats his wife pretty well, but has an odd ascending series of punishments. Should he detect her in an infidelity, he boils a pot of oil, cuts off the offender's left hand, and plunges the stump into the oil to heal the bleeding. For the second offence she loses the right hand, and for the third the head, on which occasion the boiling oil is not required. Partly on account of this law, and partly on account of their ugliness, which is said to be portentous, the women display better morals than the generality of their African sisters.

Dr. Hutchinson, who resided in Fernando Po for some time, has not a very favorable opinion of the Bubés, thinking that the twenty or thirty thousand of their tribe form the greatest obstacle to civilization. He states, moreover, that although the Baptist missionaries have been hard at work among them for seventeen years, they had not succeeded in Christianizing or civilizing, or even humanizing, a single Bubé.

They are not an intellectual race, and do not appear to know or care much about the division of time, the new moon and the beginning of the dry season marking their monthly and annual epochs. The latter begins in November, and for two months the Bubés hold a festival called Lobo, in which marriages are generally celebrated. Dr. Hutchinson was able to witness a Bubé marriage, and has given a very amusing account of it. The reader may find it illustrated on the preceding page. The bride was a daughter of the king. "On getting inside of the town our first object of attraction was the cooking going on in his Majesty's kitchen. Here a number of dead 'ipa' (porcupines) and 'litcha' (gazelles) were in readiness to be mingled up with palm oil, and several grubs writhing on skewers,

probably to add piquancy to the dishes. These are called 'inchaee,' being obtained from palm trees, and look at first sight like Brobdignagian maggots. Instead of waiting to see the art of the Fernandian Soyer on these components, I congratulated myself on my ham sandwiches and brandy-and-water bottle safely stowed in my portmanteau, which one of the Krumen carried on his back, and sat on my camp-stool beneath the grateful shade of a palm tree to rest a while.

"Outside a small hut belonging to the mother of the bride expectant, I soon recognized the happy bridegroom, undergoing his toilet from the hands of his future wife's sister. A profusion of tshibbu strings (*i. e.* small pieces of Achatectona shell, which represent the currency in Fernando Po) being fastened round his body, as well as his legs and arms, the anointing lady (having a short black pipe in her mouth) proceeded to putty him over with tola paste. He seemed not altogether joyous at the anticipation of his approaching happiness, but turned a sulky gaze now and then to a kidney-shaped piece of brown-painted yam, which he held in his hand, and which had a parrot's red feather fixed on its convex side. This I was informed was called 'ntsheba,' and is regarded as a protection against evil influence during the important day.

"Two skewer-looking hair-pins, with heads of red and white glass beads, fastened his hat (which was nothing more than a disk of bamboo plaiting) to the hair of his head; and his toilet being complete, he and one of the bridesmen, as elaborately dressed as himself, attacked a mess of stewed flesh and palm oil placed before them, as eagerly as if they had not tasted food for a fortnight. In discussing this meal they followed the primitive usage of 'fingers before forks,' only resting now and then to take a gulp of palm wine out of a calabash which was hard by, or to wipe their hands on napkins of cocoa-leaf, a process which, to say the least of it, added nothing to their washerwomen's bill at the end of the week.

"But the bride! Here she comes! Led forth by her own and her husband-expectant's mother, each holding her by a hand, followed by two 'nepees' (professional singers) and half-a-dozen bridesmaids. Nothing short of a correct photograph could convey an idea of her appearance. Borne down by the weight of rings, wreaths, and girdles of 'tshibbu,' the tola pomatum gave her the appearance of an exhumed mummy, save her face, which was all white—not from excess of modesty (and here I may add, the negro race are expected always to blush blue), but from being smeared over with a white paste, symbolical of purity.

"As soon as she was outside the paling, her bridal attire was proceeded with, and

the whole body was plastered over with white stuff. A veil of strings of tshibbu shells, completely covering her face, and extending from the crown of her head to the chin, as well as on each side from ear to ear, was then thrown over her; over this was placed an enormous helmet made of cowhide; and any one with a spark of compassion in him could not help pitying that poor creature, standing for more than an hour under the broiling sun, with such a load on her, whilst the nepees were celebrating her praises in an extempore epithalamium, and the bridegroom was completing his finery elsewhere.

“Next came a long chant—musical people would call it a howl—by the chief nepee. It was about as long as ‘Chevy Chase,’ and celebrated the beauties and many virtues of the bride, among which was rather oddly mentioned the delicious smell which proceeded from her. At every pause in the chant the audience struck in with a chorus of ‘Hee! hee! jee! eh!’ and when it was over the ceremony proceeded.

“The candidates for marriage having taken their positions side by side in the open air, fronting the little house from which the bride elect had been led out by the two mothers, and where I was informed she had been closely immured for fifteen months previous, the ceremony commenced. The mothers were the officiating priests—an institution of natural simplicity, whose homely origin no one will dare to impugn. On these occasions the mother-bishops are prophetically entitled ‘boowanas,’ the Fernandian for grandmother.

“Five bridesmaids marshalled themselves alongside the bride postulant, each, in rotation, some inches lower than the other, the outside one being a mere infant in stature, and all having bunches of parrots’ feathers on their heads, as well as holding a wand in their right hands. The mother stood behind the ‘happy pair,’ and folded an arm of each round the body of the other—nepees chanting all the while, so that it was barely possible for my interpreter to catch the words by which they were formally soldered. A string of tshibbu was fastened

round both arms by the bridegroom’s mother; she, at the same time, whispering to him advice to take care of this tender lamb, even though he had half-a-dozen wives before. The string was then unloosed. It was again fastened on by the bride’s mother, who whispered into her daughter’s ear her duty to attend to her husband’s farm, tilling his yams and cassava, and the necessity of her being faithful to him. The ratification of their promise to fulfil these conditions was effected by passing a goblet of palm wine from mother to son (the bridegroom), from him to his bride, from her to her mother, each taking a sip as it went round.

“Then an indiscriminate dance and chant commenced; and the whole scene—the tola paste laid on some faces so thickly that one might imagine it was intended to affix something to them by means of it—the dangling musk-cat and monkey tails—the disk hats and parrots’ feathers—the branches of wild fern and strings of tshibbu shells, fastened perhaps as nosegays to the ladies’ persons—the white and red and yellow spots painted under the eyes, and on the shoulders, and in any place where they could form objects of attraction—the *tout ensemble*, contrasted with the lofty *Bombax*, beautiful palm, cocoa-nut, and other magnificent tropical trees around, presented a picture rarely witnessed by an European, and one calculated to excite varied reflections.”

Lastly, the whole party—the tola paste now cracking from their bodies—proceeded to the house of the bridegroom, the old wives walking before the bride until they reached the door, and then allowing her to precede them. The newly-married pair then stood at their door facing the spectators, embracing each other as before. One of his children then presented the bride with a huge yam painted brown, others fixed tshibbu epaulets on her shoulders, the husband placed four rings on her fingers, and the ceremony was concluded by a second lecture from the bridegroom’s mother, at the expiration of which Dr. Hutchinson, as he rather quaintly says, “left the happy pair to the enjoyment of their tola-moon.”

CONGO.

PASSING southward down the West Coast, we come to the celebrated kingdom of CONGO.

In these days it has been so traversed by merchants of different countries and missionaries of different sects, that it no longer presents the uniform aspect of its earlier monarchical days, of which we will take a brief survey. The reader must understand that the sources from which the information is taken are not wholly reliable, but, as we

have none other, we must make the best of our information, and use our own discretion as to those parts which are best worthy of belief. The following account is mostly taken from Mr. Reade’s condensation.

The ancient constitution of the Congo kingdom much resembled that of Ashanti or Dahome; namely, a despotic monarchy controlled by councillors, the king and the council being mutually jealous, and each trying to overreach the other. When the

kingdom of Congo was first established, the royal revenues were much in the same condition as the civil list of a late Emperor of Russia—all belonged to the king, and he took as much as he wanted. In later days, however, the revenues were controlled by the council, who aided, not only in their disposal, but in the mode of their collection. The greater part of the income depended on the annual tributes of the inferior chiefs, but, as in times of pressure, especially during a protracted war, this tribute is inadequate to meet the expenses, the king and council devise various objects of taxation.

The most productive is perhaps the tax on beds, which are assessed according to their width, every span costing an annual payment of a slave. Now, as an ordinary man cannot sleep comfortably on a bed less than four spans in width, it is very evident that the tax must be a very productive one, if indeed it were not so oppressive as to cause a rebellion. The natives seem, however, to have quietly acquiesced in it, and a wealthy negro therefore takes a pride in having a very broad bed as a tangible proof of his importance.

As in more civilized nations, war is the great parent of taxation, the king being obliged to maintain a large standing army, and to keep it in good humor by constant largesses, for a large standing army is much like fire,—a useful servant, but a terrible master. The army is divided into regiments, each acting under the immediate command of the chief in whose district they live, and they are armed, in a most miscellaneous fashion, with any weapons they can procure. In these times the trade guns are the most valued weapons, but the native swords, bows and arrows, spears, and knives, still form the staple of their equipment. As to uniform, they have no idea of it, and do not even distinguish the men of the different regiments, as do the Kaffirs of Southern Africa.

The ancient religion of the Congo negro is simply polytheism, which they have suffered to degenerate into fetishism. There is one monotheistic sect, but they have gained very little by their religion, which is in fact merely a negation of many deities, without the least understanding of the one whom they profess to worship—a deity to whom they attribute the worst vices that can degrade human nature.

The fetish men or priests are as important here as the marabouts among the Mandingoes, and the chief of them, who goes by the name of Chitomè, is scarcely less honored than the king, who finds himself obliged to seek the favor of this spiritual potentate, while the common people look on him as scarcely less than a god. He is maintained by a sort of tithe, consisting of the first-fruits of the harvest, which are brought to him with great ceremony,

and are offered with solemn chants. The Congo men fully believe that if they were to omit the first-fruits of one year's harvest, the next year would be an unproductive one.

A sacred fire burns continually in his house, and the embers, which are supposed to be possessed of great medicinal virtues, are sold by him at a high price, so that even his fire is a constant source of income to him. He has the entire regulation of the minor priests, and every now and then makes a progress among them to settle the disputes which continually spring up. As soon as he leaves his house, the husbands and wives throughout the kingdom are obliged to separate under pain of death. In case of disobedience, the man only is punished, and cases have been known where wives who disliked their husbands have accused them of breaking this strange law, and have thereby gained a double advantage, freed themselves from a man whom they did not like, and established a religious reputation on easy terms.

In fact, the Chitomè has things entirely his own way, with one exception. He is so holy that he cannot die a natural death, for if he did so the universe would immediately be dissolved. Consequently, as soon as he is seized with a dangerous illness, the Chitomè elect calls at his house, and saves the universe by knocking out his brains with a club, or strangling him with a cord if he should prefer it. That his own death must be of a similar character has no effect upon the new Chitomè, who, true to the negro character, thinks only of the present time, and, so far as being anxious about the evils that will happen at some future time, does not trouble himself even about the next day.

Next to the Chitomè comes the Nghombo, a priest who is distinguished by his peculiar gait. His dignity would be impaired by walking like ordinary mortals, or even like the inferior priests, and so he always walks on his hands with his feet in the air, thereby striking awe into the laity. Some of the priests are rain-makers, who perform the duties of their office by building little mounds of earth and making fetish over them. From the centre of each charmed mound rises a strange insect, which mounts into the sky, and brings as much rain as the people have paid for. These priests are regularly instituted, but there are some who are born to the office, such as dwarfs, hunchbacks, and albinos, all of whom are highly honored as specially favored individuals, consecrated to the priesthood by Nature herself.

The priests have, as usual, a system of ordeal, the commonest mode being the drinking of the poison cup, and the rarest the test of the red-hot iron, which is applied to the skin of the accused, and burns

him if he be guilty. There is no doubt that the magicians are acquainted with some preparation which renders the skin proof against a brief application of hot iron, and that they previously apply it to an accused person who will pay for it.

The Chitomè has the privilege of conducting the coronation of a king. The new ruler proceeds to the house of the Chitomè, attended by a host of his future subjects, who utter piercing yells as he goes. Having reached the sacred house, he kneels before the door, and asks the Chitomè to be gracious to him. The Chitomè growls out a flat refusal from within. The king renews his supplications, in spite of repeated rebuffs, enumerating all the presents which he has brought to the Chitomè—which presents, by the way, are easily made, as he will extort an equal amount from his subjects as soon as he is fairly installed.

At last, the door of the hut opens, and out comes the Chitomè in his white robe of office, his head covered with feathers, and a shining mirror on his breast. The king lies prostrate before the house, while the Chitomè pours water on him, scatters dust over him, and sets his feet on him. He then lies flat on the prostrate monarch, and in that position receives from him a promise to respect his authority ever afterward. The king is then proclaimed, and retires to wash and change his clothes.

Presently he comes out of the palace, attended by his priests and nobles, and gorgeous in all the bravery of his new rank, his whole person covered with glittering ornaments of metal, glass, and stone, so that the eye can scarcely bear the rays that flash on every side as he moves in the sunbeams. He then seats himself, and makes a speech to the people. When it is finished, he rises, while all the people crouch to the ground, stretches his hands over them, and makes certain prescribed gestures, which are considered as the royal benediction. (See the engraving No. 2, on the next page.) A long series of banquets and revelry ends the proceedings.

At the present day, the Congo king and great men disfigure themselves with European clothing, such as silk jackets, velvet shoes, damask coats, and broad-brimmed hats. But, in the former times, they dressed becomingly in native attire. A simple tunic made of very fine grass cloth, and leaving the right arm bare, covered the upper part of the body, while a sort of petticoat, made of similar material, but dyed black, was tied round the waist, and an apron, or "sporrán," of leopard skin, was fastened to the girdle and hung in front. On their heads they wore a sort of hood, and sometimes preferred a square red and yellow cap. Sandals made of the palm tree were the peculiar privilege of the king and nobles, the common people being obliged to go bare-footed.

The wives in Congo are tolerably well off, except that they are severely beaten with the heavy hippopotamus-hide whip. The women do not resent this treatment, and indeed, unless a woman is soundly flogged occasionally, she thinks that her husband is neglecting her, and feels offended accordingly. The king has the power of taking any woman for his wife, whether married or not, and, when she goes to the royal harem, her husband is judiciously executed.

The people of Congo are—probably on account of the enervating climate—a very indolent and lethargic race, the women being made to do all the work, while the men lie in the shade and smoke their pipes and drink their palm wine, which they make remarkably well, though not so well as the Bubé tribe of Fernando Po. Their houses are merely huts of the simplest description; a few posts with a roof over them, and twigs woven between them in wicker-work fashion by way of walls, are all that a Congo man cares for in a house. His clothing is as simple as his lodging, a piece of native cloth, tied round his middle being all that he cares for; so that the ample clothes and handsome furs worn by the king must have had a very strong effect on the almost naked populace.

According to traditional history, Congo was in old times one of the great African kingdoms. Twice it rose to this eminence, and both times by the energy of a woman, who, in spite of the low opinion in which women are held, contrived to ascend the throne.

Somewhere about 1520—it is impossible in such history to obtain precision of dates—a great chief, named Zimbo, swept over a very large part of Africa, taking every country to which he came, and establishing his own dominion in it. Among other kingdoms, Congo was taken by him, and rendered tributary, and so powerful did he at last become, that his army outgrew his territory, and he had the audacity to send a division to ravage Abyssinia and Mozambique. The division reached the eastern sea in safety, but the army then met the Portuguese, who routed them with great loss. Messengers conveyed the tidings to Zimbo, who put himself at the head of his remaining troops, went against the Portuguese, beat them, killed their general, and carried off a great number of prisoners, with whose skulls he paved the ground in front of his house.

In process of time he died, and the kingdom separated, after African fashion, into a number of independent provinces, each governed by one of the leaders of the now useless army. One of these leaders had a daughter named Tembandumba, who, together with her mother, ruled the province when her father died. These women always accompanied the troops in war, and so

(1.) WASHING DAY.
(See page 648.)

(2.) A CONGO CORONATION.
(See page 616.)

fierce and bloodthirsty was Tembandumba, even as a girl, that her mother gave her the command of half the troops, the natural consequence of which was that she took the command of the whole, deposed her mother, and made herself queen.

Her great ambition was to found a nation of Amazons. Licentiousness she permitted to the fullest extent, but marriage was utterly prohibited; and, as soon as the women found themselves tired of their male companions, the latter were killed and eaten, their places being supplied by prisoners of war. All male children were killed, and she had nearly succeeded in the object of

her ambition, when she was poisoned by a young man with whom she fell violently in love, and from whom she imprudently accepted a bowl of wine at a banquet.

It is very remarkable that, about a hundred years after the death of Tembandumba, another female warrior took the kingdom. Her name was Shinga, and she obtained a power scarcely less than that of her predecessor. She, however, was wise in her generation, and, after she had fought the Portuguese, and been beaten by them, she concluded an humble peace, and retained her kingdom in safety.

THE JU-JU EXECUTION. (See page 602.)

CHAPTER LXII.

BORNU.

POSITION OF THE KINGDOM OF BORNU—APPEARANCE OF THE PEOPLE—MODE OF DRESSING THE HAIR—A RECEPTION BY THE SULTAN—COURT DRESS—THE SHEIKH OF BORNU—HIS PALACE AND ATTENDANTS—HIS NOBLE AND ENERGETIC CHARACTER—RECEPTION BY THE GUARDS—THEIR WEAPONS AND DISCIPLINE—THE KANEMBOO INFANTRY—JUSTICE OF THE SHEIKH—HIS POLICY AND TACT—REPUTED POWER OF CHARM WRITING—HIS ZEAL FOR RELIGION—A TERRIBLE PUNISHMENT—BORNU ARCHITECTURE—CURIOUS MODES OF FISHING AND HUNTING—HABITS AND CUSTOMS OF THE KANEMBOOS.

ON the western side of Lake Tchad, between 10° and 15° N. and 12° and 18° E., is situated the large kingdom of Bornu, which embraces a considerable number of tribes, and is of sufficient importance to demand a notice. There are about twelve or thirteen great cities in Bornu, and at least ten different dialects are spoken in the country, some having been due to the presence of the Shooas, who themselves speak nearly pure Arabic.

The pure Bornu people, or Kanowry, as they call themselves, are not handsome, having large, flat, and rather unmeaning faces, with flattish noses, and large mouths. The lips, however, are not those of the negro, and the forehead is high, betokening a greater amount of intellect than falls to the lot of the real negro.

As a rule, the Bornuese are not a wealthy people, and they are but indifferently clad, wearing a kind of shirt stained of an indigo blue by themselves, and, if they are tolerably well off, wearing two or even three such garments, according to their means. The head is kept closely shaven, and the better class wear a cap of dark blue, the scarlet caps being appropriated to the sultan and his court. When they walk they always carry a heavy stick with an enormous knob at the top, like a drum-major's bâton, and march much after the manner of that important functionary.

The women are remarkable for the mode in which they dress their hair. It is divided

into three longitudinal rolls, thick in the middle and diminishing toward the ends. One of these rolls passes over the top of the head, and the others lie over the ears, the three points uniting on the forehead, and being held firmly in their places by a thick plastering of beeswax and indigo. The other ends of the rolls are plaited very finely, and then turned up like the curled feathers of a drake's tail.

Sometimes a slight variation is made in the hair, five rolls being used instead of three. The women are so fond of indigo that they dye their eyebrows, hands, arms, feet, and legs with it, using the ruddy henna for the palms of the hands and the nails of the toes and fingers, and black antimony for the eyelashes. Beads, bracelets, and other ornaments are profusely worn, mostly of horn or brass. Silver and ivory mark the woman of rank. The dress is primarily composed of a sort of blue, white, or striped sheet called *toorkadee*, which is wrapped round the body under the arms, and falls as low as the knees. This is the usual costume, but if a woman be well off, she adds a second *toorkadee*, which she wears like a mantilla, over her head and shoulders.

Like other African tribes, though they belong to the Mahometan religion, they use the tattoo profusely. Twenty cuts are made on each side of the face, converging in the corners of the mouth, from the angle of the lower jaw and the cheek-bones, while a single cut runs down the centre of the fore-

head. Six cuts are made on each arm, six more on the thighs, and the same number on the legs, while four are on each breast, and nine on each side just above the hip-bone. These are made while they are infants, and the poor little things undergo frightful torments, not only from the pain of the wounds, but from the countless flies which settle on the hundred and three cuts with which their bodies are marked.

The Bornuese are governed, at least nominally, by a head chief or sultan, who holds his court with most quaint ceremony. When the travellers Denham and Clapperton went to pay their respects to him, they were visited on the previous evening by one of the royal chamberlains, who displayed the enormous staff, like a drum-major's bâton, wore eight or ten shirts in order to exhibit his wealth, and had on his head a turban of huge dimensions. By his orders a tent was pitched for the white visitors, and around it was drawn a linen screen, which had the double effect of keeping out the sun and the people, and of admitting the air. A royal banquet, consisting of seventy or eighty dishes, was sent for their refection, each dish large enough to suffice for six persons, and, lest the white men should not like the native cookery, the sultan, with much thoughtfulness, sent also a number of live fowls, which they might cook for themselves.

Next morning, soon after daylight, they were summoned to attend the sultan, who was sitting in a sort of cage, as if he had been a wild beast. No one was allowed to come within a considerable distance, and the etiquette of the court was, that each person rode on horseback past the cage, and then dismounted and prostrated himself before the sultan. The oddest part of the ceremony is, that as soon as the courtier has made his obeisance, he seats himself on the ground with his *back* toward his monarch. Nearly three hundred of the courtiers thus take their places, and nothing could be more ludicrous than the appearance which they presented, their bodies being puffed out by successive robes, their heads swathed in turbans of the most preposterous size, and their thin legs, appearing under the voluminous garments, showing that the size of the head and body was merely artificial.

In fact, the whole business is a sham, the sultan being the chief sham, and the others matching their sovereign. The sultan has no real authority, the true power being lodged in the hands of the sheikh, who commands the army. Those who serve the court of Bornu are, by ancient etiquette, obliged to have very large heads and stomachs, and, as such gifts of nature are not very common, an artificial enlargement of both regions is held to be a sufficient compliance with custom. Consequently, the courtiers pad themselves with wadding to such an extent that as they sit on horseback

their abdomens seem to protrude over the pommel of the saddle, while the eight or ten shirts which they wear, one over the other, aid in exaggerating the outline, and reducing the human body to a shapeless lump.

Their heads are treated in a similar fashion, being enveloped in great folds of linen or muslin of different colors, white, however, predominating; and those who are most careful in their dress fold their huge turbans so as to make their heads appear to be one-sided, and as unlike their original shape as possible. Besides all these robes and shirts and padding, they wear a vast number of charms, made up in red leather parcels, and hung all over the body. The sultan is always accompanied by his trumpeters, who blow hideous blasts on long wooden trumpets called *frum-frums*, and also by his dwarfs, and other grotesque favorites.

In war, as in peace, the sultan is nominally the commander, and in reality a mere nonentity. He accompanies the sheikh, but never gives orders, nor even carries arms, active fighting being supposed to be below his dignity. One of the sultans lost his life in consequence of this rule. According to custom he had accompanied the sheikh in a war against the great enemy of Bornu, the Sultan of Begharmi, and, contrary to the usual result of these battles, the engagement had gone against him, and he was obliged to take refuge in flight. Unfortunately for him, though he was qualified by nature for royalty, being large-bodied and of enormous weight, yet his horse could not carry him fast enough. He fled to Angala, one of his chief towns, and if he could have entered it would have been safe. But his enormous weight had distressed his horse so much that the animal suddenly stopped close to the gate, and could not be induced to stir.

The sultan, true to the principle of *noblesse oblige*, accepted the position at once. He dismounted from his horse, wrapped his face in the shawl which covered his head, seated himself under a tree, and died as became his rank. Twelve of his attendants refused to leave their master, and nobly shared his death.

Around the sultan are his inevitable musicians, continually blowing their *frum-frums* or trumpets, which are sometimes ten or twelve feet in length, and in front goes his ensign, bearing his standard, which is a long pole hung round at the top with strips of colored leather and silk. At either side are two officers, carrying enormous spears, with which they are supposed to defend their monarch. This, however, is as much a sham as the rest of the proceedings; for, in the first place, the spearmen are so fat and their weapons so unwieldy that they could not do the least execution, and, as if to render the spears still more harmless, they are covered with charms from the head to the butt.

It has been mentioned that the real power of Bornu rests, not with the sultan, but with the sheikh. This potentate was found to be of simple personal habits, yet surrounded with state equal to that of the sultan, though differing in degree. Dressed in a plain blue robe and a shawl turban, he preferred to sit quietly in a small and dark room, attended by two of his favorite negroes armed with pistols, and having a brace of pistols lying on a carpet in front of him.

But the approaches to this chamber were rigorously guarded. Sentinels stood at the gate, and intercepted those who wished to enter, and would not allow them to mount the staircase which led to the sheikh's apartment until they were satisfied. At the top of the staircase were negro guards armed with spears, which they crossed in front of the visitor, and again questioned him. Then the passages leading to the sheikh's chamber were lined with rows of squatting attendants, who snatched off the slippers of the visitors, and continually impeded their progress by seizing their ankles, lest they should infringe etiquette by walking too fast. Indeed, had not the passages been densely crowded, the guests would have been several times flung on their faces by the zeal of these courtiers.

At last they gained admission, and found this dread potentate a singularly quiet and unassuming man, well-disposed toward the travellers, and very grateful to them for the double-barrelled gun and pistols which they presented to him. In return, he fed them liberally, sending them fish by the camel load, and other provisions in like quantity.

According to his warlike disposition, his conversation chiefly turned on military affairs, and especially on the best mode of attacking walled towns. The account of breaching batteries had a great effect upon him, and the exhibition of a couple of rockets confirmed him in his respect for the wisdom of the English. Being a thoughtful man, he asked to see some rockets fired, because there were in the town a number of the hostile Shooas. The rockets were fired accordingly, and had the desired effect, frightening not only the Shooas, but all the inhabitants of the town, out of their senses, and even the steady nerves of the sheikh himself were much shaken.

The sheikh was a great disciplinarian, and managed his wild cavalry with singular skill, as is shown by the account of Major Denham. "Our accounts had been so contradictory of the state of the country that no opinion could be formed as to the real condition and the number of its inhabitants. We had been told that the sheikh's soldiers were a few ragged negroes armed with spears, who lived upon the plunder of the black Kaffir countries by which he was surrounded, and which he was able to subdue by the assistance of a few Arabs who were

in his service; and, again, we had been assured that his forces were not only numerous, but to a degree regularly trained. The degree of credit which might be attached to these reports was nearly balanced in the scales of probability, and we advanced toward the town of Kouka in a most interesting state of uncertainty whether we should find its chief at the head of thousands, or be received by him under a tree, surrounded by a few naked slaves.

"These doubts, however, were quickly removed. I had ridden on a short distance in front of Boo-Khaloom, with his train of Arabs all mounted and dressed out in their best apparel, and, from the thickness of the trees, now lost sight of them. Fancying that the road could not be mistaken I rode still onward, and, approaching a spot less thickly planted, was surprised to see in front of me a body of several thousand cavalry drawn up in line, and extending right and left as far as I could see. Checking my horse I awaited the arrival of my party under the shade of a wide-spreading acacia. The Bornu troops remained quite steady, without noise or confusion; and a few horsemen, who were moving about in front, giving directions, were the only persons out of the ranks.

"On the Arabs appearing in sight, a shout or yell was given by the sheikh's people, which rent the air; a blast was blown from their rude instruments of music equally loud, and they moved on to meet Boo-Khaloom and his Arabs. There was an appearance of tact and management in their movements, which astonished me. Three separate bodies from the centre of each flank kept charging rapidly toward us, within a few feet of our horses' heads, without checking the speed of their own until the moment of their halt, while the whole body moved onward.

"These parties were mounted on small but very perfect horses, who stopped and wheeled from their utmost speed with the greatest precision and expertness, shaking their spears over their heads, and exclaiming, 'Blessing! blessing! Sons of your country! Sons of your country!' and returning quickly to the front of the body in order to repeat the charge. While all this was going on, they closed in their right and left flanks, and surrounded the little body of Arabs so completely as to give the compliment of welcoming them very much the appearance of a declaration of their contempt for their weakness.

"I was quite sure this was premeditated; we were all so closely pressed as to be nearly smothered, and in some danger from the crowding of the horses and clashing of the spears. Moving on was impossible, and we therefore came to a full stop. Our chief was much enraged, but it was all to no purpose: he was only answered by shrieks of

'Welcome!' and spears most unpleasantly rattled over our heads expressive of the same feeling.

"This annoyance was not, however, of long duration. Barca Gana, the sheikh's first general, a negro of noble aspect, clothed in a figured silk robe, and mounted upon a beautiful Mandara horse, made his appearance, and after a little delay the rear was cleared of those who had pressed in upon us, and we moved forward, although but very slowly, from the frequent impediments thrown in our way by these wild warriors.

"The sheikh's negroes, as they were called, meaning the black chiefs and generals, all raised to that rank by some deed of bravery, were habited in coats of mail composed of iron chain, which covered them from the throat to the knees, dividing behind, and coming on each side of the horse. Some of them had helmets, or rather skull-caps, of the same metal, with chin-pieces, all sufficiently strong to ward off the shock of a spear. Their horses' heads were also defended by plates of iron, brass, and silver, just leaving sufficient room for the eyes of the animal."

In my collection there is one of the remarkable spears carried by these horsemen. In total length it is nearly six feet long, of which the long, slender, leaf-like blade occupies twenty inches. The shaft is five-eighths of an inch in diameter at the thickest part, but diminishes toward the head and butt. The material of the shaft is some hard, dark wood, which takes a high polish, and is of a rich brown color. The head is secured to the shaft by means of a rather long socket, and at the butt there is a sort of iron spud, also furnished with a socket, so that the length of the wooden portion of the spear is only thirty-two inches. It is a light, well-balanced, and apparently serviceable weapon.

Besides these weapons, there are several others, offensive and defensive. The chiefs wear a really well-formed cuirass made of iron plates, and having an ingenious addition of a kind of steel upright collar attached to the back piece of the cuirass, and protecting the nape of the neck. The cuirass is made of five plates of steel, laid horizontally and riveted to each other, and of as many similar plates attached to them perpendicularly, and forming the back piece and shoulder straps. It is made to open at one side to admit of being put on and off, and the two halves are kept together by loops and links, which take the place of straps and buckles.

The chief's horses are also distinguished by the quantity of armor with which they are protected, an iron chamfron covering the whole of the forehead, and extending as far as the nostrils.

By the saddle-bow hangs a battle-axe, shaped exactly like those axes with which

we have been so familiar in Southern and Central Africa, but being distinguished from them by the fact that an iron chain is passed through a hole in that part of the head which passes through the knob at the end of the handle, the other end of the chain being attached to a ring that slides freely up and down the handle. This arrangement enables the warrior to secure and replace the head of the axe if it should be struck out of the handle in the heat of battle. A long double-edged dagger, shaped almost exactly like the spear head, is fastened to the left arm by a strap, and is carried with the hilt downward.

The infantry carry, together with other weapons, an iron axe, shaped like a sickle, and closely resembling the weapon which has been mentioned as used by the Neam-Nam and Fan tribes. This is called the "hunga-munga," and is used for throwing at a retreating enemy. The infantry are mostly Kanemboo negroes. They are a tall, muscular race, and, being also courageous, have well deserved the estimation in which they are held by their master. Unlike the horsemen, they are almost completely naked, their only clothing being a rather fantastical belt, or "sporrán" of goat-skin, with the hair still remaining on the skin, and a few strips of cloth, called "gubkas," tied round their heads, and brought under the nose. These gubkas are the currency of the country, so that a soldier carries his wealth on his head.

Their principal weapons are the spear and shield. The former is a very horrible weapon, seven feet or so in length, and armed with a number of hook-shaped barbs. The shield is made from the wood of the fogo, a tree which grows in the shallow waters of Lake Tchad, and which is so light that, although the shield is large enough to protect the whole body and upper part of the legs, it only weighs a few pounds. The pieces of wood of which it is made are bound together by strips of raw bullock's hide, on which the hair is suffered to remain as an ornament, and which, after doing their duty, are carried along the outer edge of the shield in a vandyked pattern. The shield is slightly convex. Besides the spear and shield, the Kanemboo soldier mostly carries on his left arm a dagger like that which has already been described, but not so neatly made. The Kanemboos will be presently described.

At least nine thousand of these black soldiers are under the command of the sheikh, and are divided into regiments of a thousand or so strong. It may be imagined that they are really formidable troops, especially under the command of such a leader, who, as will be seen by Major Denham's description of a review, had introduced strict discipline and a rough-and-ready sort of tactics. The sheikh had ordered out the Kanemboo

soldiers, and galloped toward them on his favorite horse, accompanied by four sultans who were under his command. His staff were gaily adorned with scarlet berouses decorated with gold lace, while he himself preserved his usual simplicity of dress, his robes being white, and a Cashmere shawl forming his turban. As soon as he gave the signal, the Kanemboos raised a deafening shout, and began their manœuvres, their officers being distinguished by wearing a dark blue robe and turban.

"On nearing the spot where the sheikh had placed himself, they quickened their pace, and after striking their spears against their shields for some minutes, which had an extremely grand and stunning effect, they filed off to the outside of the circle, where they again formed and awaited their companions, who succeeded them in the same order. There appeared to be a great deal of affection between these troops and the sheikh. He spurred his horse onward into the midst of some of the tribes as they came up, and spoke to them, while the men crowded round him, kissing his feet and the stirrups of his saddle. It was a most pleasing sight. He seemed to feel how much his present elevation was owing to their exertions, while they displayed a devotion and attachment deserving and denoting the greatest confidence.

"I confess I was considerably disappointed at not seeing these troops engage, although more than compensated by the reflection of the slaughter that had been prevented by that disappointment."

It seems rather curious that this leader, so military in all his thoughts, should take women with him into the field, especially when he had to fight against the terrible Munga archers, whose poisoned arrows are certain death to all who are wounded by them. Yet, whenever he takes the field, he is accompanied by three of his favorite wives, who are mounted on trained horses, each being led by a boy, and their whole figures and faces so wrapped in their wide robes that the human form is scarcely distinguishable. The sultan, as becomes his superior rank, takes with him an unlimited number of wives, accompanied by a small court of palace officers. Nine, however, is the usual number allotted to the sultan, and there are nearly a hundred non-combatants to wait upon them.

The army, well ordered as it is, shows little signs of its discipline until it is near the enemy, the troops marching much as they like, and beguiling the journey with songs and tales. As soon, however, as they come within dangerous ground, the sheikh gives the word, and they all fall into their places, and become steady and well-disciplined troops.

The sheikh's place is one of no ordinary peril, for, besides having the responsibility

of command, and the practical care of the sultan's unwieldy person, he is the object at which the enemy all aim, knowing well that, if they can only kill the sheikh, their victory is assured. This particular sheikh entirely disregarded all notion of personal danger, and was the most conspicuous personage in the army. He marches in front of his soldiers, and before him are borne five flags — two green, two striped, and one red — upon which are written in letters of gold extracts from the Koran. Behind him rides his favorite attendant, bearing his master's shield, mail coat, and helmet, and beside him is the bearer of his drum which is considered as almost equivalent to himself in value. The Begharmis say of this sheikh, that it is useless to attack him, because he has the power of rendering himself invisible; and that on one occasion, when they routed his army, and pursued the sheikh himself, they could not see either him or his drum, though the instrument was continually sounding.

Before passing to another branch of this subject, we will finish our account of this sheikh. His name was Alameen Ben Mohammed el Kanemy, and, according to Major Denham's portrait, he was a man of mark, his boldly-cut features expressing his energetic character even under the folds of the turban and tobe in which he habitually enveloped himself. Being the virtual ruler of the kingdom, he administered justice as well as waged war, and did so with stern impartiality.

On one occasion, when a slave had offended against the law, and was condemned to death, his master petitioned the sheikh against the capital punishment, saying that, as the slave was his property, the real punishment fell upon him, who was not even cognizant of his slave's offence. The sheikh admitted the validity of the plea, but said that public justice could not be expected to yield to private interests. So he ordered the delinquent for execution, but paid his price to the owner out of his own purse.

He was equally judicious in enforcing his own authority. His favorite officer was Barca Gana, who has already been mentioned. El Kanemy had an especial liking for this man, and had committed to his care the government of six districts, besides enriching him with numbers of slaves, horses, and other valuable property. It happened that on one occasion El Kanemy had sent him a horse which he had inadvertently promised to another person, and which, accordingly, Barca Gana had to give up. Being enraged by this proceeding, he sent back to the sheikh all the animals he had presented, saying that in future he would ride his own animals.

El Kanemy was not a man to suffer such an insolent message to be given with impunity. He sent for Barca Gana, stripped

him on the spot of all his gorgeous clothing, substituted the slave's leathern girdle for his robes, and ordered him to be sold as a slave to the Tibboos. Humbled to the dust, the disgraced general acknowledged the justice of the sentence, and only begged that his master's displeasure might not fall on his wives and children. Next day, as Barca Gana was about to be led away to the Tibboos, the negro body guards, who seem to have respected their general for his courage in spite of his haughty and somewhat overbearing manner, came before the sheikh, and begged him to pardon their commander. Just at that moment the disgraced chief came before his offended master, to take leave before going off with the Tibboos to whom he had been sold.

El Kanemy was quite overcome by the sight, flung himself back on his carpet, wept like a child, allowed Barca Gana to embrace his knees, and gave his free pardon. "In the evening there was great and general rejoicing. The timbrels beat, the Kanemboos yelled and struck their shields; everything bespoke joy, and Barca Gana, in new robes and a rich berronuse, rode round the camp, followed by all the chiefs of the army."

Even in war, El Kanemy permitted policy and tact to overcome the national feeling of revenge. For example, the formidable Munga tribe, of whom we shall presently treat, had proved themselves exceedingly troublesome, and the sheikh threatened to exterminate them—a threat which he could certainly have carried out, though with much loss of life. He did not, however, intend to fulfil the threat, but tried, by working on their fears and their interests, to conciliate them, and to make them his allies rather than his foes. He did not only frighten them by his splendidly-appointed troops, but awed them by his accomplishments as a writer, copying out a vast number of charmed sentences for three successive nights. The illiterate Muugas thought that such a proceeding was a proof of supernatural power, and yielded to his wisdom what they would not have yielded to his veritable power. They said it was useless to fight against a man who had such terrible powers. Night after night, as he wrote the potent words, their arrows were blunted in their quivers. Their spears snapped asunder, and their weapons were removed out of their huts, so that some of the chiefs absolutely became ill with terror, and all agreed that they had better conclude peace at once. The performance of Major Denham's rockets had also reached their ears, and had added much to the general consternation.

He carried his zeal for religion to the extreme of fanaticism, constituting himself the guardian of public morals, and visiting offences with the severest penalties. He

was especially hard on the women, over whom he kept a vigilant watch by means of his spies. On one occasion, two young girls of seventeen were found guilty, and condemned to be hanged. Great remonstrances were made. The lover of one of the girls, who had previously offered to marry her, threatened to kill any one who placed a rope round her neck, and a general excitement pervaded the place. For a long time the sheikh remained inexorable, but at last compounded the affair by having their heads shaved publicly in the market-place—a disgrace scarcely less endurable than death.

On another occasion the delinquents had exaggerated their offence by committing it during the fast of the Rhamadan. The man was sentenced to four hundred stripes, and the woman to half that number. The punishment was immediate. The woman was stripped of her ornaments and all her garments, except a cloth round the middle, and her head shaved. She was then suspended by the cloth, and the punishment inflicted.

Her partner was treated far worse. The whip was a terrible weapon, made of the skin of the hippopotamus, and having a metal knob on the end. Each blow was struck on the back, so that the lash curled round the body, and the heavy knob came with terrible violence on the breast and stomach. Before half the lashes were inflicted, blood flowed profusely from his mouth, and, a short time after the culprit was taken down, he was dead. Strange to say, he acknowledged the justice of the sentence, kissed the weapon, joined in the profession of faith which was said before the punishment began, and never uttered a cry.

Fierce in war, and, as we have seen, a savage fanatic in religion, the sheikh was no stranger to the softer emotions. Major Denham showed him a curious musical snuff-box, the sweetness of which entranced him. He sat with his head in his hands, as if in a dream; and when one of his courtiers spoke, he struck the mau a violent blow for interrupting the sweet sounds.

His punishment for theft was usually a severe flogging and a heavy fine. But, in cases of a first offence of a young delinquent, the offender was buried in the ground up to his shoulders, and his head and neck smeared with honey. The swarms of flies that settled on the poor wretch's head made his existence miserable during the time that he was thus buried, and no one who had undergone such a punishment once would be likely to run the risk of suffering it again, even though it did no permanent injury, like the whip. Beheading is also a punishment reserved for Mahometans, while "Kaffirs" are either impaled or crucified, sometimes living for several days in torments.

The slaves of the Bornuese are treated

with great kindness, and are almost considered as belonging to their master's family, their condition being very like that of the slaves or servants, as they are called, of the patriarchal ages. Much of the marketing is done by female slaves, who take to market whole strings of oxen laden with goods or cowries, and conduct the transaction with perfect honesty. The market, by the way, in which these women buy and sell, is really a remarkable place. It is regulated in the strictest manner, and is divided into districts, in each of which different articles are sold. It is governed by a sheikh, who regulates all the prices, and gets his living by a small commission of about a half per cent. on every purchase that exceeds four dollars. He is aided by dylalas, or brokers, who write their private mark inside every parcel.

The whole place is filled with rows of stalls, in which are to be found everything that a Bornuese can want, and one great convenience of the place is, that a parcel need never be examined in order to discover whether any fraud has been perpetrated. Should a parcel, when opened at home, be defective, the buyer sends it back to the dylala, who is bound to find out the seller, and to force him to take back the parcel and refund the money. As an example of the strange things which are sold in this market, Major Denham mentions that a young lion was offered to him. It was perfectly tame, and was led about by a cord round his neck, walking among the people without displaying any ferocity. Tame lions seem to be fashionable in Bornu, as the sheikh afterward sent Major Denham another lion equally tame.

The architecture of the Bornuese is superior to that of Dahome. "The towns," writes Major Denham, "are generally large, and well built: they have walls thirty-five and forty feet in height, and nearly twenty feet in thickness. They have four entrances, with three gates to each, made of solid planks eight or ten inches thick, and fastened together with heavy clamps of iron. The houses consist of several courtyards between four walls, with apartments leading out of them for slaves, then a passage and an inner court leading into habitations of the different wives, which have each a square space to themselves, enclosed by walls, and a handsome thatched hut. From thence also you ascend a wide staircase of five or six steps, leading to the apartments of the owner, which consist of two buildings like towers or turrets, with a terrace of communication between them, looking into the street, with a castellated window. The walls are made of reddish clay, as smooth as stones, and the roofs are most tastefully arched on the inside with branches, and thatched on the outside with a grass known in Bombay by the name of *lidther*.

"The horns of the gazelle and antelope serve as a substitute for nails or pegs. These are fixed in different parts of the walls, and on them hang the quivers, bows, spears, and shields of the chief. A man of consequence will sometimes have four of these terraces and eight turrets, forming the faces of his mansion or domain, with all the apartments of his women within the space below. Horses and other animals are usually allowed an enclosure near one of the courtyards forming the entrance."

Such houses as these belong only to the wealthy, and those of the poor are of a much simpler description, being built of straw, reeds, or mats, the latter being the favorite material.

As is mostly the case in polygamous Africa, each wife has her own special house, or rather hut, which is usually of the kind called "coosie," *i. e.* one that is built entirely of sticks and straw. The wives are obliged to be very humble in presence of their husbands, whom they always approach on their knees, and they are not allowed to speak to any of the male sex except kneeling, and with their heads and faces covered. Marriage is later in Bornu than in many parts of Africa, the girls scarcely ever marrying until they are full fifteen, and mostly being a year or two older.

Weddings are conducted in a ceremonious and noisy manner. The bride is perched on the back of an ox, and rides to the bridegroom's house attended by her mother and friends, and followed by other oxen carrying her dowry, which mostly consists of toorkadees and other raiment. All her male friends are mounted, and dash up to her at full gallop, this being the recognized salute on such occasions. The bridegroom is in the mean time parading the streets with a shouting mob after him, or sitting in his house with the same shouting mob in front of him, yelling out vociferous congratulations, blowing horns, beating drums, and, in fact, letting their African nature have its full sway.

In this country, the people have a very ingenious method of counteracting the effects of the rain storms, which come on suddenly, discharge the water as if it were poured from buckets, and then pass on. On account of the high temperature, the rain soon evaporates, so that even after one of these showers, though the surface of the ground is for the time converted into a marsh intersected with rivulets of running water, the sandy ground is quite dry at the depth of two feet or so.

As soon as the Bornuese perceive one of these storms approaching, they take off all their clothes, dig holes in the ground, bury the clothes, and cover them up carefully. The rain falls, and is simply a shower-bath over their naked bodies, and, as soon as the storm has passed over, they reopen the hole,

and put on their dry clothes. When they are preparing a resting-place at night, they take a similar precaution, digging deep holes until they come to the dry sand, on which they make their beds.

THE KANEMBOOS.

IF the reader will refer to the illustration on page 612, he will see that by the side of the Kanemboo warrior is his wife. The women are, like their husbands, dark and well-shaped. They are lively and brisk in their manners, and seem always ready for a laugh. Their clothing is nearly as limited as that of their husbands, but they take great pains in plaiting their hair into numerous little strings, which reach as far as the neck. The head is generally ornamented with a flat piece of tin or silver hanging from the hair. This custom is prevalent throughout the kingdom, and, indeed, the principal mode of detecting the particular tribe to which a woman belongs is to note the color and pattern of her scanty dress. Most of the Kanemboo women have a string of brass beads or of silver rings hanging upon each side of the face. In the latter case they mostly have also a flat circular piece of silver on their foreheads.

The architecture of the Kanemboos is very similar to that of the Kafirs of Southern Africa, the huts more resembling those of the Bechuans than the Zulu, Kosa, or Ponda tribes. They are compared to haystacks in appearance, and are made of reeds. Each house is situated in a neat enclosure made of the same reed, within which a goat or two, a cow, and some fowls are usually kept. The hut is divided into two portions, one being for the master and the other for the women. His bed is supported on a wooden framework and covered with the skins of wild animals. There is no window, and the place of a door is taken by a mat.

In this country, they subsist generally on fish, which they obtain from the great Lake Tchad in a very ingenious manner. The fisherman takes two large gourds, and connects them with a stout bamboo, just long enough to allow his body to pass easily between them. He then takes his nets, to the upper part of which are fastened floats made of cane, and to the lower edge are attached simple weights of sand tied up in leathern bags.

He launches the gourds, and, as he does so, sits astride the bamboo, so that one gourd is in front of him and the other behind. Having shot his nets, he makes a circuit round them, splashing the water so as to drive the fish against the meshes. When

he thinks that a sufficiency of fish has got into his net, he draws it up gently with one hand, while the other hand holds a short club, with which he kills each fish as its head is lifted above the water. The dead fish is then disengaged from the net, and flung into one of the gourds; and when they are so full that they can hold no more without running the risk of admitting water, the fisherman paddles to shore, lands his cargo, and goes off for another haul. He has no paddles but his hands, but they are efficient instruments, and propel him quite as fast as he cares to go.

The women have a very ingenious mode of catching fish, constituting themselves into a sort of net. Thirty or forty at a time go into the water, and wade up to their breasts. They then form in single file, and move gradually toward the muddy shore, which slopes very gradually, stamping and beating the water so as to make as much disturbance as possible. The terrified fishes retire before this formidable line, and at last are forced into water so shallow, that they can be scooped out by the hands and flung ashore.

The fish are cooked in a very simple manner. A fire is lighted; and when it has burnt up properly, each fish has a stick thrust down its throat. The other end of the stick is fixed into the ground close to the fire, and in a short time the fire is surrounded with a circle of fish, all with their heads downward and their tails in the air as if they were diving. They can be easily turned on the sticks, the tail affording an excellent leverage, and in a very short time they are thoroughly roasted.

The Kanemboos catch the large animals in pitfalls called "blaquas." These blaquas are laboriously and ingeniously made, and are often used to protect towns against the Tuaricks and other invaders, as well as to catch wild animals. The pits are very deep, and at the bottom are fixed six or seven perpendicular stakes, with sharpened points, and hardened by being partially charred. So formidable are they, that a Tuarick horse and his rider have been known to fall into one of them, and both to have been found dead, pierced through the body with the stakes.

CHAPTER LXIII.

THE SHOOS, TIBBOOS, TUARICKS, BEGHARMIS, AND MUSGUESE.

THE SHOOA TRIBE—THEIR SKILL IN HORSEMANSHIP—A SHOOA BUFFALO-HUNT—CHASE OF THE ELEPHANT—TRACES OF THEIR ARABIC ORIGIN—SHOOA DANCES—APPEARANCE AND DRESS OF THE WOMEN—THE TIBBOO TRIBE—THEIR ACTIVITY—DRESS AND APPEARANCE OF BOTH SEXES—THEIR SKILL WITH THE SPEAR—TIBBOO DANCES—THEIR CITIES OF REFUGE—THE TUARICKS—THEIR THIEVISH CHARACTER AND GRAVE MANNERS—TUARICK SINGING—THE BEGHARMIS—LOCALITY OF THE PEOPLE—THE SULTAN AND HIS RETINUE—CURIOUS ARCHITECTURE—COSTUME AND WEAPONS OF THE LANCERS—WRESTLERS, BOXERS, AND DANCERS—THE MUSGU TRIBE—APPEARANCE OF THE WOMEN—THE LIP ORNAMENT—A MUSGU CHIEF AND ATTENDANTS—A DISASTROUS BATTLE.

ONE of the most important of the many tribes which surround Lake Tchad is the Shooa tribe, which, like the Kanemboos, has been absorbed into the Bornuan kingdom. Their chief value is their soldierly nature, and, as they are splendid horsemen, they form the greater part of the cavalry. Arabs by descent, they preserve the Arabic language, and speak it nearly pure, only mixing with it certain words and phrases of Bornuan origin. They present a strong contrast to the pure Bornuese, who are peaceable, quiet, slow, and good-natured. They are absurdly timid, and, except in pursuing an already routed enemy, are useless in the field, running away when there is the least sign of danger.

The Shooas, on the contrary, are bold, active, energetic, and daring, passing a considerable part of their lives on horseback, and such admirable equestrians that man and horse look like one animal. They are mighty hunters, not being contented to dig pits and catch the animals that fall into them, but boldly chasing the fierce and dangerous buffaloes and killing them with the spear alone.

The Shooa hunter rides to the swampy grounds where the buffalo loves to wallow, and drives the animals upon the firm land. He then makes choice of one, and gives chase to it, getting on its off side and pressing it closely. His horse is trained to run side by side with the buffalo, and the rider then stands like a circus-rider upon the two

animals, one foot on his horse's back, and the other on that of the buffalo.

He then drives his spear through the shoulders of the buffalo toward the heart, and, if he has time, will fix another spear. He then drops on his horse, which leaps away from the wounded animal, so as to avoid the stroke of the horn which the buffalo is apt to give as it feels the pain of the wound. As a rule, the buffalo can run but a very short distance when thus injured, and, as soon as it staggers, the bold hunter dismounts, and gives the final stroke. Sometimes a badly-trained horse will be too eager, and press so far forward that the turn of the buffalo's head will wound it severely; but an old and experienced horse knows the danger as well as its rider, and just keeps itself far enough back to avoid the blow.

The Shooas chase the elephant in a similar manner, but, as the animal is so enormous, twenty or thirty hunters generally unite their forces, one always riding in front so as to draw the angry animal's attention, while the others follow it up, and inflict a series of wounds, under which it soon sinks. Sometimes, when the elephant is very active and savage, one of the hunters will dismount, and try to hamstring the animal, or will even creep under it and drive his spears into its belly.

It may be easily imagined that such hunters as these are likely to make good soldiers, and that the Bornuan sheikh was fully

Justified in forming them into so large a contingent of his army.

Their constant practice in hunting the wild buffalo renders them bold and successful cattle managers. They are excellent drivers, and contrive to make whole herds of half-wild cattle obey them implicitly. In nothing is their skill shown so much as in forcing the cattle to cross the rivers in spite of their instinctive dread of the crocodiles that infest the water. One driver, or rather leader, enters the water first, dragging after him an ox by a cord tied to the ring through his nose. As soon as the timid cattle see that one of their number has ventured into the water, they are easily induced to follow its example, and whole herds of oxen and flocks of sheep are thus taken across in safety, the noise and splashing which they make frightening the crocodiles away. Even the women assist in cattle-driving, and not unfrequently the part of leader is taken by a woman.

As might be expected, the Shooas possess great numbers of cattle, and Major Denham calculated that this single tribe owned at least sixty thousand oxen, sheep, and goats, besides multitudes of horses. The Shooas, indeed, are the chief horsebreeders of the Soudan.

True to their origin, the Shooas have retained many of their Arabic characteristics. They build no houses, but live in tents, or rather movable huts, composed of a simple framework of sticks, covered either with leather or rush mats. They have, however, lost much of the nomad character of the Arabs, probably because the fertile soil permits their flocks to remain permanently in the same spot. They pitch their tents in a circle, each such circle representing a town, and having two openings or entrances for the cattle.

Even the governor or sultan of the largest settlement does not inhabit a house. The establishment of one of these potentates, who was visited by Dr. Oudney, consisted of a great quadrangular enclosure made of mats suspended on poles, within which were a number of small huts, or rather tents, with walls of the same materials, but with thatched roofs, and much like straw beehives in shape. The doorway, or opening of each tent, is always placed westward, because rain always comes from the east. The furniture of the tents is as simple as their architecture, and consists of a rude bed, some mats, and a few gourds and earthen jars. The dwelling of a man of rank is distinguished by an ostrich egg-shell.

Not only do they build no houses of their own, but they never inhabit those which others have built, and, though they have overcome many a district, they have never peopled or conquered towns. For the surrounding negro nations they have the supreme contempt, and yet, with strange

inconsistency, they are always tributary to one of the nations which they despise. Probably on this account, unless they are well officered, they do not care to fight even in the service of that nation which they serve; and although they are foremost when plunder seems within their reach, they are always apt to retire from the battle when it seems likely to go against them.

Their amusements consist principally of dances, one of which is very peculiar, and is performed exclusively by women. They advance by pairs at a time, and throw themselves into various attitudes, accompanied by the wild and rude music of the band. Suddenly they turn their backs on each other, stoop, and butt backward at each other, the object being to upset the adversary. "She who keeps her equilibrium and destroys that of her opponent is greeted with cheers and shouts, and is led out of the ring by two matrons, covering her face with her hands. They sometimes come together with such violence as to burst the belt of beads which all the women of rank wear round their bodies just above the hips, and showers of beads would fly in every direction. Some of these belts are twelve or sixteen inches wide, and cost fifteen or twenty dollars.

"Address, however, is often attended in these contests with better success than strength, and a well-managed feint exercised at the moment of the expected concussion, even when the weight of metal would be very unequal, often brings the more weighty tumbling to the ground, while the other is seen quietly seated on the spot where she had with great art and agility dropped herself. The Shooas are particularly happy in these feints, which were practised in different ways, either by suddenly stepping on one side, or by lying down."

The young girls are fond of skipping with a long rope, just as is practised in Europe. They display very great agility, which is not hindered by the presence of any garment. Major Denham once came on a party of girls amusing themselves in this manner, and enjoying the sport so thoroughly that nothing but the fear of losing dignity prevented him from joining them.

The manners of the Shooas are pleasing and gentle. They are a hospitable people, and give freely of the milk on which they almost entirely live, as is always the case with a pastoral tribe. Major Denham seems to have been particularly charmed with the manners of the Shooas, which he describes as peculiarly interesting and expressive. Even when bringing milk to their guests, the girls do so in a sort of punctilious way, each sitting down by the side of the bowl, and making a little ceremonious speech with her head wrapped in a mantle, which she afterward removes for the sake of freer conversation.

The Shooa women are remarkable for their beauty. Their color is a light ruddy copper, and they have fine open countenances, with aquiline noses and large eyes — all very remarkable among the negro tribes that surround them. The women are especially good-looking, and remind the observer of the gipsy women. Their dress (see engraving on page 631) consists of two wrappers, one round the waist and the other thrown over the shoulders. The latter is worn in different ways, sometimes like a shawl, sometimes tied under the arms so as to leave both shoulders bare, and some-

times thrown over one shoulder and under the other. On their feet they wear curious shoes without heels, but coming up the sides of the foot above the ankles. Their hair is dressed in rather a curious manner, being plaited into innumerable little tresses, which are first pressed tightly to the head, and then suddenly diverge.

Handsome as are the Shooa women, their beauty is held in great contempt by the negro tribes among which they live, and who naturally think that thick lips, flat noses, and black skins constitute the only real beauty in man or woman.

THE TIBBOOS.

ALLIED, in all probability, to the Shooas are the Tibboos.

They are a small and active race, and are admirable horsemen, always leaping on their horses at a single bound, aiding themselves with the shaft of a spear, which is used as a leaping-pole. Their saddles are of wood, lashed together with thongs of cow-hide, and left open along the middle, so as to avoid galling the horse's back. They are well stuffed with camel's hair, and are comfortable enough when the rider is used to them. Both the girth and the stirrup leathers are of plaited leather, and the stirrups themselves are so small that they only admit of four toes. In fact, the Tibboo saddle is almost exactly like that of the Patagonian.

The men are very ugly, but the women are tolerably good-looking, and those who live in the country are better made and more active than those who live in the towns. The color is copper, but the noses are flat, and the mouth is very large, though without the thick lips of the negro.

Their dress is a tolerably large Soudan wrapper, folded round the body and tied on the left shoulder so as to leave the right side bare. It is, however, disposed in such a manner as to be a perfectly delicate as well as a graceful costume. A smaller wrapper is thrown over the head, and is drawn across the face or flung back at pleasure. The hair is dressed in triangular flaps, which fall on either side of the face; and they wear necklaces of amber, which they prize very highly, and bits of red coral in their noses. They invariably carry something by way of a sun-screen, such as a bunch of ostrich-feathers, a tuft of long grass, or even a leafy bough.

Ugly as the men are, they are exceedingly vain of their personal appearance; and on one occasion, when Major Denham had lent a Tibboo chief a small looking-glass, the man spent several hours in contemplating his own features, bursting every now and then into loud ejaculations of joy at his own beauty, and sometimes leaping in the air in the extremity of his delight.

They contrive to make their naturally ugly faces still less attractive by their inveterate habit of taking snuff, which they take both by the mouth and the nostrils, the latter becoming enormously extended by their habit of thrusting the snuff into their heads with their fingers. Their mouths are also distended by their custom of placing quantities of snuff between the lips and gums.

The dress of the Tibboos is generally a single robe, or shirt. Close garments would only embarrass them by affording a lodgement for the sand, which has the effect of irritating the skin greatly, and making almost intolerable sores. They have, however, a mode of alleviating the pain of such sores by shampooing them with fat, a process which is always conducted by the women. The only article of dress about which they seem to trouble themselves is the turban, which is worn high on the head, and the ends brought under the chin and across the face, so as to conceal all but the nose, eyes, and part of the forehead. The turban is dyed of a dark indigo blue, and is mostly decorated with a vast number of charms, sewed in little leathern cases.

Their horses, though small, are very handsome, and are quite strong enough to carry the light and active men who ride them. They are kept in admirable condition, and are fed almost entirely on camel's milk, which they take both fresh and when clotted. This diet suits them admirably, and the animals are in excellent condition.

The Tibboos stand in great dread of the Arabs, who plunder them unmercifully when they have the chance. They are better riders and better mounted than their foes; but they do not possess fire-arms, which they look upon with absolute terror. Major Denham remarks that "five or six of them will go round and round a tree where an Arab has laid down his gun for a minute, stepping on tiptoe, as if afraid of disturbing it; talking to each other in whispers, as if the gun could understand their exclamations; and, I

(1.) SHOOA WOMEN.

(See page 630.)

(2.) TURICKS AND TIBBOOS.

(See page 634.)

dare say, praying to it not to do them any injury as fervently as ever Man Friday did to Robinson Crusoe's musket."

Though they have no guns, they are more formidable warriors than they seem to know, hurling the spear with deadly aim and wonderful force. In throwing it, they do not raise the hand higher than the shoulder; and, as it leaves the hand, they give it a twist with the fingers that makes it spin like a rifle bullet. The shaft is elastic, and, when the blade strikes the ground, the shaft bends nearly double. One young man threw his spear a good eighty yards; and, as each man carries two of these spears, it may be imagined that even the Arabs, with all their fire-arms, are not much more than a match for the Tibboos. They also carry the strange missile-sword which has already been mentioned. The warriors carry bows and arrows, as well as two daggers, one about eighteen inches long, stuck in the belt, and the other only six inches in length, and fastened to the arm by a ring. The Tibboos metaphorically term the long dagger their gun, and the short one their pistol.

The dances of the Tibboo women are not in the least like those of the Shooas. Dancing is among them one of the modes of greeting an honored guest; and when a man of rank approaches, the women meet him with dances and songs, just as Jephthah's daughter met her victorious father, and the women of Israel met David after he had killed Goliath.

Nor are these dances the slow, gliding movements with which we generally associate Oriental dances. The women display very great activity, and fling themselves about in an astonishing manner. They begin by swaying their heads, arms, and bodies from side to side, but gradually work themselves up to a great pitch of excitement, leaping in the air, gnashing their teeth, whirling their arms about, and seeming to be in a perfect frenzy.

Some of the Tibboo settlements, or villages, are ingeniously placed on the tops of rocks with almost perpendicular sides. The situation is an inconvenient one, but it is useful in warding off the attacks of the Tuaricks, who make raids upon the unfortunate Tibboos, sweep off all the cattle and other property that they can find, and carry away the inhabitants to be sold as slaves, sparing neither age nor sex. Consequently, as soon as the Tibboos have warning of the approach of their enemies, they take refuge on the top of the rock, carrying with them all their portable property, draw up the ladders by which they ascend, and abandon the cattle to the invaders.

Partly on this account, and partly from natural carelessness, the Tibboos are almost regardless of personal appearance, and even

their sultan, when he went to meet Major Denham, though he had donned in honor of his guests a new scarlet berronson, wore it over a filthy checked shirt; and his cap and turban, which purported to be white, were nearly as black as the hair of the wearer.

One might have thought that the continual sufferings which they undergo at the hands of the Tuaricks would have taught the Tibboos kindness to their fellow creatures, whereas there are no people more reckless of inflicting pain. The Tibboo slave-dealers are notorious for the utter indifference to the sufferings of their captives whom they are conveying to the market, even though they lose many of them by their callous neglect. They often start on their journey with barely one quarter the proper amount of provisions or water, and then take their captives over wide deserts, where they fall from exhaustion, and are left to die. The skeletons of slaves strew the whole of the road. As the traveller passes along, he sometimes hears his horse's feet crashing among the dried and brittle bones of the dead. Even round the wells lie hundreds of skeletons, the remains of those who had reached the water, but had been too much exhausted to be revived by it. In that hot climate the skin of the dead person dries and shrivels under the sun like so much horn, and in many cases the features of the dead are preserved. Careless even of the pecuniary loss which they had suffered, the men who accompanied Major Denham only laughed when they recognized the faces of the shrivelled skeletons, and knocked them about with the butts of their weapons, laughing the while, and making jokes upon their present value in the market.

The Tibboos are, from their slight and active figures, good travellers, and are employed as couriers to take messages from Bornu to Moorzuk, a task which none but a Tibboo will undertake. Two are sent in company, and so dangerous is the journey, that they do not expect that both will return in safety. They are mounted on the swiftest dromedaries, and are furnished with parched corn, a little brass basin, a wooden bowl, some dried meat, and two skins of water. Not only do they have to undergo the ordinary perils of travel, such as the hot winds, the sand-storms, and the chance of perishing by thirst, but they also run great risk of being killed by Arab robbers, who would not dare to attack a caravan, but are glad of the opportunity of robbing defenceless travellers.

Such events do frequently occur, and the consequence is that the Tibboos and the Arabs are in perpetual feuds, each murdering one of the enemy whenever he gets a chance, and reckoning each man killed as a point on his own side.

THE TUARICKS.

WE ought, before leaving the Tibboos, to give a few words to their enemies the Tuaricks. These are emphatically a nation of thieves, never working themselves, and gaining the whole of their subsistence by robbing those who do labor. They do not even plant or sow, and their whole education consists in the art of robbery, in the management of the dromedary, and the handling of the spear. They live in tents, which are something like those of the ordinary Bedouin Arabs, and have, like our gipsies, a supreme contempt for all who are so degraded as to live in houses and congregate in cities. In the engraving No. 2 on page 631, the artist has illustrated the characteristics of the Tuaricks and Tibboos.

Like the gipsies, the Tuaricks have their own language, into which they have only inserted occasional words of Arabic, and they have their own written alphabet, in which several letters are exactly the same as some of the Roman characters, though they do not express the same sounds, such as the H, the S, and the W. There are also the Greek θ and λ , and the Hebrew \beth , while several letters are composed of dots grouped in various ways. These letters are either written from right to left, as the Arabic, or *vice versa*, as European languages, or perpendicularly, as the Chinese; and in their country almost every large stone is engraved with Tuarick characters. Yet they have no literature, and assert that no book exists in their language. In sound the Tuarick language is harsh, but it is expressive, and seems to be capable of strength.

In their manners the Tuaricks are grave and sedate, and before Denham and Clapperton visited them they were carefully lectured by the guide on their proper behavior, the demeanor of Captain Clapperton being considered too cheerful and humorous to suit the grave Tuaricks. This applies only to the men, the women being lively and amusing. They are very fond of singing, joining in little bands for the purpose, and continuing their songs until midnight. The men, however, never sing, considering the song to be essentially a feminine amusement, and, probably for the same reason, they are never heard to recite poetry like most Orientals. The women wear the usual striped blue and white dress, and they mostly carry earrings made of shells. Wives are conveniently valued at six camels each; and whether on account of their value, or whether from an innate courtesy, the men treat their wives with respect, and permit them a freedom of manner which denotes the admission of equality.

The depredations of the Tuaricks have

been mentioned when treating of the Tibboos, on whom the chief brunt of their attacks seems to fall. That they carry off all the cattle, and would seize even the Tibboos themselves for slaves, is a standing and reasonable grievance. But even the constant fear of these attacks does not seem to anger the Tibboos so much as the raids which the Tuaricks make on their salt-market. In the Tibboo country there are some large salt marshes, which are extremely valuable to the owners, salt being a marketable commodity, fetching a high price, indeed being itself used as a sort of currency; a cylinder of coarse brown salt, weighing eleven pounds, being worth four or five dollars. The purified salt, which they obtain in a beautifully clear and white state, is put into baskets, and brings a correspondingly high price.

Not choosing to take the trouble of procuring salt for themselves, the Tuaricks supply themselves as well as their market by robbing the Tibboos, and in one season these robbers carried off twenty thousand bags of salt, selling the greater part in the Soudan market. The Tibboos were particularly enraged at this proceeding. It was bad enough to have their property stolen, but it was still worse to take their remaining salt to the market, and then find that the price had fallen in consequence of the Tuaricks having filled the market with the twenty thousand bags which they had stolen, and which they could therefore afford to sell at a very low price.

Among these people medicine and surgery are necessarily at a very low ebb, shampooing and cauterizing being the chief remedies for almost every complaint. One man who was suffering from an enlarged spleen was advised to undergo the operation, and was laid on his back and firmly held down by five or six assistants. An iron was heated in the fire, and three spots burned on his side, just under the ribs. Each spot was about as large as a sixpence.

The iron was then replaced in the fire, and, while it was being heated, the assistants punched him in the side with their thumbs, asking whether the pressure hurt him; and, as their hard thumbs bruised his flesh, he was obliged to admit that it did hurt him. So four more scars were made, close to the others. He was then burned on his face, and three large scars burned near the spine; and, by way of making the cure quite complete, a large burn was made on his neck, just above the collar-bone. The poor man endured the torture with great patience, and, when the operation was over, he drank a draught of water, and went on as usual with the camels.

THE BEGHARMIS.

WE now come to the curious Begharmi kingdom, between which and Bornu there rages a perpetual warfare. War was the ancient custom in 1824, when Denham and Clapperton visited the country, and many years afterward, when Dr. Barth travelled through the district, it was going on as fiercely as ever. Indeed, if they could, each kingdom would exterminate the other, and, even as it is, great loss of life takes place by the continual battles, in which no quarter is given, except to those prisoners who are to be qualified for the harem. Consequently, the wives of the Bornuan sultan are guarded by Begharmi eunuchs, and those of the Begharmi sultan by Bornuese.

Even the Bornuan sheikh had yielded to the prevailing custom, and maintained thirty of these unfortunate individuals. Major Denham saw about a dozen of them shortly after their admission, and evidently showed pity by his countenance. The chief, seeing this, exclaimed, "Why, Christian, what signifies all this? They are only Begharmis! dogs! Kaffirs! enemies! They ought to have been cut in four quarters alive; and now they will drink coffee, eat sugar, and live in a palace all their lives."

When Dr. Barth visited Begharmi, the sultan was absent on one of his warlike expeditions, and it was some time before he was allowed to proceed to Massena, the capital. At last he did so, and had an opportunity of seeing the sultan return after his expedition, in which he had been victorious. First rode the lieutenant-governor, surrounded by his horsemen, and next came another officer, behind whom was borne a long and peculiarly-formed spear, connected in some way with their religion. After him rode the commander-in-chief, and then the sultan himself, riding on a gray horse, wearing a yellow berouse, and sheltered from the sun by two umbrellas, one green and one yellow, held over him by slaves. He was continually cooled by six slaves wielding long ostrich-feather fans, and having their right arms clothed in iron armor; and around him rode a few of the principal chiefs.

Then came the war camel, bearing the battle-drums, which were vigorously belabored by the drummer. Next came a long line of the sultan's wives, clothed in black; then the baggage, and then the soldiers. Prisoners are led in the triumphal procession, and are taken to the harem, where they are insulted by the inmates. The handsomest among them are selected for the service of the harem, and the remainder are put to death.

In this case the Begharmi sultan had been victorious; but in one battle witnessed by Major Denham the Bornuese won the day,

the sheikh having arranged his few fire-arms with such skill that the Begharmis, nearly five thousand strong, fell back in confusion, and were at once attacked by the Bornuan horse, who are ready enough to fight when the enemy seems to be running away. The slaughter was enormous, considering the number of the combatants. Of the two hundred Begharmi chiefs who came into the field, only one was said to have escaped, seven sons of the sultan were killed, together with some seventeen hundred soldiers, while many more were reported to have been murdered after the battle was over. They also lost nearly five hundred horses, and nearly two hundred women, who, according to the odd custom of the land, followed their lords to battle.

In the greater part of the country, as well as at Loggun, the houses are built in a very curious manner, being composed of cell within cell, like a nest of pill-boxes. This curious architecture is intended to keep out the flies, which at some seasons of the year swarm in such numbers that even the inhabitants dare not move out of their houses for several hours in the day. Major Denham would not believe the story until it was corroborated by the appearance of one of his men, who imprudently ventured into the open air, and came back with his eyes and head swollen up, and so bitten that he was laid up for three days.

The Begharmis, though they are always at war with the Bornuese, resemble them in so many points that a detailed description is not needed, and we will only glance at a few of their peculiarities.

As we have mentioned the constant warfare in which they are engaged, we will give a few words to the remarkable cavalry force which forms the chief strength of the Begharmi army. These men present a most remarkable appearance, as may be seen by reference to the illustration No. 1 on page 638. They carry a most curious spear, with a double head, something like a pitchfork with flattened prongs.

The most remarkable point is, however, the armor with which the Begharmi lancer is defended. It is made of quilted cloth or cotton, and is almost exactly identical with the quilted armor worn by the Chinese, and which caused the miserable deaths of so many soldiers by the cotton taking fire from the flash of their own muskets. The whole of the body and limbs of the rider are covered with this armor, while he wears on his head a helmet of the same material; and his horse is defended as well as himself. Although useless against fire-arms, the cotton quilting is proof against arrows, and is therefore useful in guarding the soldier against the poisoned weapons of his foes.

As this armor, though light, is very cumbersome, it is seldom worn except in actual combat, or when the general reviews his troops; and it may be doubted whether it is not such an impediment, both to horse and soldier, that the troops would be more efficient without it. Perhaps the confidence which it inspires is its chief use, after all. These men are always employed as heavy horse, to protect the van and guard the rear of the army, the archers being stationed just behind them, and shooting whenever they find a chance. The saddle is as awkward as the armor, rising both in front and behind to such a height that the soldier could hardly fall to the ground even if he were killed. In front it forms a sort of little table, on which the soldier can rest his bridle-arm, which might be fatigued with holding the reins and lifting the sleeve of the quilted coat.

The Begharmis may be almost reckoned as negroes, their skins being black, and their faces having much of the flatness and thickness of the negro. They are powerful and active men, and the sultans of other countries pride themselves on their trained Begharmi wrestlers, these men being chosen for their gigantic stature and well-knit muscles.

When two athletes contend, it is no child's play, the vanquished being sometimes killed on the spot, and frequently maimed for life. Their masters have a positive monomania on the subject, and urge on the wrestlers by loud cries, promising great rewards to the victor, and threatening the severest punishment to the vanquished. The great object of the wrestlers is to catch the opponent by the hips, and so to lift him off his feet and dash him to the ground. The master cares nothing for a wrestler who has been once conquered; and a man for whom his owner would refuse a couple of hundred dollars in the morning may be sold for a fiftieth of the sum before night.

Similar to these combats are the boxing-matches, in which the negroes from Haussa are thought to be the best that can be obtained. A spirited account of one of these matches is given by Major Denham:—

“Having heard a great deal of the boxers of Haussa, I was anxious to witness their performance. Accordingly I sent one of my servants last night to offer 2,000 whydah for a pugilistic exhibition in the morning. As the death of one of the combatants is almost certain before a battle is over, I expressly prohibited all fighting in earnest; for it would have been disgraceful, both to myself and my country, to hire men to kill one another for the gratification of idle curiosity.

“About half an hour after the ‘massudubu’ were gone, the boxers arrived, attended by two drums and the whole body of butchers, who here compose ‘the fancy.’ A ring was soon formed by the master of the

ceremonies throwing dust on the spectators to make them stand back. The drummers entered the ring, and began to drum lustily. One of the boxers followed, quite naked, except a skin round the middle. He placed himself in an attitude as if to oppose an antagonist, and wrought his muscles into action, seemingly to find out that every sinew was in full power for the approaching combat; then, coming from time to time to the side of the ring, and presenting his right arm to the bystanders, he said, ‘I am a hyæna’—‘I am a lion’—‘I am able to kill all that oppose me.’ The spectators to whom he presented himself laid their hands on his shoulder, repeating, ‘The blessing of God be upon thee’—‘thou art a hyæna’—‘thou art a lion.’ He then abandoned the ring to another, who showed off in the same manner.

“The right arm and hand of the pugilists were then bound with narrow country cloth, beginning with a fold round the middle finger; when, the hand being first clenched with the thumb between the fore and mid fingers, the cloth was passed in many turns round the fist, the wrist, and the forearm.

“After about twenty had separately gone through their attitudes of defiance and appeals to the bystanders, they were next brought forward by pairs. If they happened to be friends, they laid their left breasts together twice, and exclaimed, ‘We are lions’—‘We are friends.’ One then left the ring, and another was brought forward. If the two did not recognize one another as friends, the set-to immediately commenced.

“On taking their stations, the two pugilists first stood at some distance, parrying with the left hand open, and, whenever opportunity offered, striking with the right. They generally aimed at the pit of the stomach and under the ribs. Whenever they closed, one seized the other's head under his arm, and beat it with his fist, at the same time striking with his knee between his antagonist's thighs. In this position, with the head ‘in chancery,’ they are said sometimes to attempt to gouge or scoop out one of the eyes. When they break loose, they never fail to give a swingeing blow with the heel under the ribs, or sometimes under the left ear. It is these blows that are so often fatal.

“The combatants were repeatedly separated by my orders, as they were beginning to lose their temper. When this spectacle was heard of, girls left their pitchers at the wells, the market-people threw down their baskets, and all ran to see the fight. The whole square before my house was crowded to excess. After six pairs had gone through several rounds, I ordered them, to their great satisfaction, the promised reward, and the multitude quietly dispersed.”

The Begharmi women are good dancers,

(1.) BEGHARMI LANCERS. (See page 635.)

(2.) MUSGU CHIEF. (See page 639.)

their movements being gentle and graceful. They make much use of their hands, sometimes crossing them on their breasts, sometimes clasping them together, and sometimes just pressing the tips of the fingers against those of the opposite hand. As they

dance, they sing in low and plaintive tones, swinging the body backward and forward, and bending the head from side to side, ending by sinking softly on the ground, and covering their faces.

MUSGU.

NEARLY, if not quite equal to the Begharmis in stature and strength are the MUSGU tribe, which inhabit a district of Mandara. In consequence of their fine proportions, Musgu slaves are greatly valued by the surrounding nations, and are employed in various ways. The sultans and great chiefs are fond of having their male Musgu slaves as wrestlers; and next in interest to a match between two Begharmis is a contest between a Begharmi and a Musgu wrestler.

The female slaves are proportionately strong, but they are never purchased by the Fezzan traders, because they lack beauty of feature as much as they possess strength of muscle. Their faces are large and ugly, and they have a custom of wearing a silver ornament in the lower lip. This ornament is about as large as a shilling, and is worn exactly after the fashion of the "pelele," which has already been described and figured. In order to make room for this ugly appendage, the women knock out the two middle teeth of the lower jaw, and, in process of time, the lip is dragged down by the inserted metal, and has a very horrid and repulsive appearance. Their hair is dressed like that of the Bornu women, *i. e.* one large plait or roll from the forehead to the nape of the neck, and two others on each side.

They are very trustworthy, and are set to laborious tasks, from which weaker slaves would shrink. They do all the agricultural work, — digging the ground, planting the seed, and carrying home the crops. They also perform the office of watchers, by night as well as by day, and there is scarcely a year passes that one or two of these patient creatures are not carried off by the lions, who creep up to them under shelter of the corn, and then spring upon them.

The men are equally ugly. Only the chiefs wear any clothing, and even they are seldom clad in anything more than a goat-skin or leopard's hide, hung over the shoulders so as to bring the head of the animal on the wearer's breast. Their heads are covered with rather strange-looking caps, and their hair, as it straggles from under the caps, is thick and bristly. They wear on their arms large rings of bone or ivory, and round their necks hang trophies of their valor, being necklaces made of the strung teeth of slain enemies. They paint their bodies with red, and stain their teeth of the same color, so that they present a sin-

gularly wild and savage appearance. They are mounted on small but strong and active horses, which they ride without saddles and almost without bridles, a slight piece of cord being tied halter-wise round the animal's muzzle.

Their weapons consist mostly of the spear and the missile knives, similar to those which have been already described. The inferior men, though they are mounted, and carry the same weapons as the chief, wear no clothing except a leather girdle round the waist, and the same light attire is worn by the women. Though so liable to be enslaved themselves, they are great slave-dealers; and when they pay tribute to the sultan of Mandara, or wish to make a peace-offering, the greater part of it consists of slaves, both male and female.

In illustration No. 2, page 638, is seen a Musgu chief going to battle. He is one of the very great chiefs, as is shown from the fact that he wears a tobe instead of a skin. In his right hand is a spear, and in his left a couple of the missile knives. Behind him ride his soldiers, naked men on naked horses. In the background is seen a party of women engaged in the water, with which element they are very familiar, and are not kept out of it by any fear of wetting their clothes. Near them is one of the mound-like tombs under which a dead chief has been buried — the Musguese being almost the only African tribe who erect such a monument.

The huts are seen a little farther back, and near them are two of the remarkable granaries, covered with projecting ornaments, and mostly kept so well filled that marauders are nearly as anxious to sack the granaries as to steal the people. On the branches of the trees is a quantity of grass which has been hung there to dry in the sun, and to be used as hay for the horses.

When Major Denham was near the Musgu territory, he was told that these strange and wild-looking people were Christians. He said that they could not be so, because they had just begged of him the carcass of a horse which had died during the night, and were at that time busily employed in eating it. The man, however, adhered to his opinion, saying that, although he certainly never had heard that Christians ate horse-flesh, they did eat swine's-flesh, and that was infinitely more disgusting.

These people were unwittingly the cause of great loss to the Bornuese and Mandaras. The Arabs who had accompanied Denham and Clapperton from Tripoli were very anxious, before returning home, to make a raid on their own account, and bring back a number of Musgu slaves. The sheikh of Bornu thought that this would be a good opportunity of utilizing the fire-arms of the Arabs against the warlike and unyielding Fellatahs, and sent them off together with three thousand of his own troops.

As had been anticipated, when they reached Mandara, the sultan would not allow them to attack Musgu, which he looked upon as his own particular slave-preserve, but added some of his own troops to those of the Bornuan sheikh, and sent them to capture as many Fellatahs as they liked, doing them the honor of accompanying the expedition in person. It is also evident that both the sultan and the sheikh disliked as well as feared the Arabs, and were very willing to turn to account the terrible weapons which they carried, and by means of which they had made themselves so overbearing and disagreeable.

When they reached the first Fellatah town and attacked it, they found it to be strongly defended with *chevaux de frise* of sharpened stakes six feet in height, behind which were stationed their archers, who poured showers of poisoned arrows on the invaders. The Arabs, after a struggle, carried the fence and pursued the Fellatahs up the hill. Here they were received with more arrows, brought to the archers by the women, and with stones rolled down the hill. Had the Bornu and Mandara soldiers pushed forward, the whole town must have been taken, instead of which they prudently kept out of range of the poisoned arrows. The Fellatahs, seeing their cowardice, then assumed the offensive, whereupon the Bornu and Mandara soldiers at once ran away, headed by the sultan, who would have laid claim to the town had the Arabs taken it. The whole force was routed with great loss, the Bornu leader—a truly brave man—was killed with a poisoned arrow, and Major Denham was severely wounded, stripped of all his clothes, and barely escaped with his life.

CHAPTER LXIV.

ABYSSINIA.

ABYSSINIA, THE LAND OF MYSTERY—ORIGIN OF THE NAME—THE KINGDOM OF PRESTER JOHN—THE THREE ABYSSINIAN DISTRICTS OR KINGDOMS—GENERAL APPEARANCE OF THE ABYSSINIANS—DRESS OF THE MEN—THE QUARRY AND THE TROUSERS—GOING TO BED—THE DINO AND ITS FASHIONS—MEN'S ORNAMENTS—HOW THE JEWELLER IS PAID—WEAPONS OF THE ABYSSINIANS—THE SWORD OR SHOTEL, AND ITS SINGULAR FORM AND USES—THE SPEAR AND MODE OF KEEPING IT IN ORDER—THE SHIELD AND ITS ORNAMENTS—APPEARANCE OF A MOUNTED CHIEF—SWORDSMANSHIP—THE ABYSSINIAN AS A SOLDIER—DRESS AND APPEARANCE OF THE WOMEN—THEIR ORNAMENTS—TATTOOING—MODES OF DRESSING THE HAIR—THE ABYSSINIAN PILLOW.

ABYSSINIA is one of the most wonderful nations on the face of the earth. It was long a land of mystery, in which the unicorn and the lion held their deadly combats, in which dragons flapped their scaly wings through the air, in which the mountains were of gold and the river-beds paved with diamonds, and, greatest marvel of all, in which Prester John, the priest and king, held his court, a Christian Solomon of the Middle Ages.

In this last tale there was this amount of truth, that a Christian Church existed in Abyssinia—a Church of extreme antiquity, which has remained to the present day, having accommodated itself in a most remarkable manner to the race-characteristics of the people. Setting aside the interest which has been excited in Abyssinia by the successful march of a British force to the military capital, Abyssinia deserves description in this volume. At first sight it would appear that a Christian country would find no place in a work which has nothing to do with civilization; but, as we proceed with the account, we shall find that Christianity in Abyssinia has done scarcely anything to civilize the nation, as we understand the word, and, instead of extirpating the savage customs of the people, has in a strange manner existed alongside of them, if such a term may be used.

It is my purpose in the following pages to give a succinct description of the uncivil-

ized manners and customs of the Abyssinians, together with a brief account of that peculiar system of Christianity which could survive for nearly fifteen hundred years, and yet leave the people in a scarcely better moral state than if they had never heard the name of Christ.

LIKE many other large communities, the great Abyssinian nation is composed of several elements, differing as much from each other as the Scotch, the Irish, the Welsh, and the other mixed races who together form the English nation. In Abyssinia, however, these different elements have not fused themselves so much together as is the case with this kingdom, and each principality is independent, having its own ruler and its own laws.

That such a state of things is injurious to the interests of the kingdom is evident to all students of history, and we find that every great ruler has attempted to unite them under one head. The peculiar character of the Africans is, however, strong in these people; and as soon as the strong hand that held them together is removed, they fly asunder, and resume their individuality. To the Abyssinian kingdom may be well applied the familiar epigram of a "concurrency of antagonistic atoms."

Their native name, "Ifabash," of which our word Abyssinia is a corruption, signifies "mixture," and is exceedingly appropriate

to them. Among the many mixtures which compose the Abyssinian nation, the natives reckon a considerable Jewish element. They say that the Sheba of Scripture was Abyssinia, and that their queen went to visit Solomon for the express purpose of introducing the blood of so eminent a sovereign into the royal succession of Abyssinia. She waited till she had borne a son, and through that son the successive kings of Abyssinia believe themselves to be lineal descendants of Solomon. Whether this story be true or not, it is thoroughly in consonance with the very lax morality of Abyssinian females. When the queen returned to her own country, she was followed by a number of Jews, and they say that at the time of the destruction of the Temple, and the captivity, a great multitude of fugitives followed their compatriots, and took refuge in Abyssinia.

Numbers of Greeks and Portuguese have at different times taken up their residence in Abyssinia, and, like the immigrant Jews, been absorbed into the country, so that the native name of Habash is seen to be well deserved.

Three of the districts or sub-kingdoms have the best claim to the title of Abyssinia, and are inhabited by Christians of that peculiar kind to which allusion has just been made. The first is the Tigré (pronounced Teegray) country, which takes its name as a province from a small district to which this name belongs. It extends to the Red Sea on the east, and to the Taccazy River on the west, and has a rather uncertain range between lat. 15° and 12° N. It is divided from Nubia by a number of independent tribes, while some of the Gallas and other tribes are on its northern boundary.

Westward of the Taccazy lies the second kingdom or province, called Amhara, in the middle of which is situated the city of Gondar; and the third is Shooa, which lies southward of Tigré and Amhara, and, strangely enough, is separated from them by Gallas and other tribes.

Of these three districts, Tigré seems to afford the best characteristic of the Abyssinians, and therefore the chief part of the account will be devoted to the Tigréans. Among these people Mr. Mansfield Parkyns lived for a considerable time, and to him we are indebted for the greater part of our information concerning this remarkable nation.

As a rule, the Abyssinians are of moderate stature, rather below than above the English average. Mr. Parkyns saw one or two men who attained the height of six feet two inches, but remarks that such examples were very rare.

As is often the case with Africans, the complexion is exceedingly variable, sometimes being of a very pale coppery brown, and sometimes almost as dark as the negro. This variation, which is often the effect of locality, is attributed by Mr. Parkyns to the

mixture of races. As, moreover, marriages are of the loosest description in Abyssinia, Christian though it be, a man may be often seen with a number of children by different wives, all unlike each other in point of complexion; a brother and sister, for example, being totally dissimilar, one short and black as a negro, and the other tall and fair as an European.

The negro element seems to expend itself chiefly in color, the peculiarity of the negro form having been nearly obliterated by continual mixture with other races. Now and then the negro conformation of leg shows itself, but even this evidence is rather uncommon.

The women of the higher class are remarkable for their beauty, not only of feature but of form, and possess singularly small and pretty hands and feet, all of which beauties their style of dress exhibits freely. Their features are almost of the European type, and the eyes are exceedingly large and beautiful—so large, indeed, that an exact drawing would have the appearance of exaggeration to persons who are unaccustomed to them. It is said, indeed, that the only women who can be compared with the Abyssinians are the French half-caste of the Mauritius. The engraving No. 2 on the next page will give a good idea of the features and general appearance of the Abyssinians.

Beginning at the top, we have first a profile view of a woman's head, to show the elaborate way in which the hair is plaited and arranged. Next comes a front view of a head, showing the appearance of the hair as it is teased and combed out before plaiting. The third figure gives a view of the head and bust of a lady of rank. This is drawn to show another mode of arranging the hair, as well as the elaborate tattoo with which the women love to decorate every inch of the body and limbs from the neck to the tips of the fingers and toes.

Below are the portraits of two men. One, a priest, has covered his shaven head with a white turban, the mark of the priesthood among the Abyssinians, among whom the laity wear no head covering save their highly-decorated and well-greased locks. The second portrait is the profile view of a man, and gives a good idea of the cast of countenance. The reader may scarcely believe that the Abyssinians have been cited by a certain school of philanthropists as examples of the intellectual capability of the negro.

Next to the personal appearance of the Abyssinians comes their dress. Varying slightly in different parts of the country, and changing in some of its details according to the fashion of the day, the dress of the Abyssinians is essentially the same throughout the kingdom. The principal articles of dress are trousers, and a large mantle or "quarry."

(1.) DINNER PARTY. (See page 656.)

(2.) ABYSSINIAN HEADS. (See page 642.)

The trousers are of soft cotton, and of two kinds, the one descending some three inches below the knee, and the other terminating the same distance above it. The trousers are very tight, and an Abyssinian dandy will wear them of so very close a fit that to get them on is nearly an hour's work.

Round the waist is rolled the sash or belt, about one yard in width. This is also of cotton, and varies in length according to the fineness of the material. A common belt will be about fifteen yards in length, but a very fine one, which only contains the same amount of material, will be from fifty to sixty yards long. From thirty to forty yards is the ordinary length for an Abyssinian gentleman's belt. It is put on by holding the end with one hand to the side, and getting a friend to spread it with his hands, while the wearer turns round and round, and so winds himself up in the belt, just as our officers did when the long silk sashes were worn round the waist.

These belts are not only useful in preserving health, but act as defensive armor in a country where all the men are armed, and where they are apt to quarrel terribly as soon as they are excited by drink. Even in war time, the belt often protects the wearer from a blow which he has only partially guarded with his shield.

Like the trousers and belt, the mantle or "quarry" is made of cotton, and is very fine and soft. It is made in a rather curious manner. The ordinary quarry consists of three pieces of cotton cloth, each fifteen feet long by three wide, and having at each end a red stripe, some five or six inches in width. These are put together after a rather curious and complicated manner. "One is first taken and doubled carefully, so that the red stripes of each end come exactly together. A second piece is then taken, and also folded, but inside out, and one half of it laid under and the other half over the first piece, so that the four red borders now come together. One edge of this quadruple cloth is then sewed from top to bottom, and the last-mentioned piece is turned back, so that the two together form one double cloth of two breadths. The third piece is now added in a similar manner, the whole forming a 'quarry' which, lest any reader should have got confused with the above description, is a white double cloth, with a red border near the bottom only." A completed quarry is seven feet six inches long, by nine feet wide. The quarries are seldom washed more than once a year, and, in consequence of the abundant grease used in the Abyssinian toilet, they become horribly dirty. The natives, however, rather admire this appearance. An Abyssinian dandy despises a clean quarry, and would no more wash his mantle than a fashionable lady would bleach a piece of old lace.

There are different qualities of quarry, the best being made of materials so fine that six pieces are required, and it is folded four times double. The colored stripe at the edge is of red, yellow, and blue silk, neatly worked together. It is worn in various modes, the most usual resembling that in which a Highlander wears his plaid, so as to leave the right arm at liberty.

The quarry forms the sleeping costume of the Abyssinians, who take off their trousers, and roll themselves up so completely in their mantles that they cover up their entire bodies, limbs, and heads. When they arrange themselves for the night, they contrive to remove their trousers, and even their belts, without exposing themselves in the least; and when we remember the extreme tightness of the former article of dress, and the inordinate length of the latter, it is a matter of some surprise that the feat should be accomplished so cleverly.

Married persons pack themselves up in a similar manner, but in pairs, their mantles forming a covering for the two. It is very curious to see how they manage to perform this seemingly impossible task. They seat themselves side by side, the man on the woman's right hand, and place the short end of the quarry under them. The long end is then thrown over their heads, and under its shelter the garments are removed. The quarry is rolled tightly round the couple, and they are ready for repose.

So large a mantle is, of course, inconvenient on a windy day, and in battle would be a fatal encumbrance. On the former occasion it is confined to the body by a short, cape-like garment called the "dino" or "lemd," and in war the quarry is laid aside, and the dino substituted for it. The dino is often a very elaborate garment, made of cloth, velvet, or, more frequently, the skin of some animal, cut in a peculiar manner so as to leave eight strips pendent from the lower edge by way of a fringe.

The skins of the lion and black leopard are most esteemed, and are only worn on gala days by chiefs and very great warriors. They are lined with scarlet cloth, and are fitted with a number of amulets which appear in front of the breast. A dino made of the black-maned lion skin will often be valued at eight or ten pounds, while a common one will scarcely cost one-tenth of that amount. A very favorite skin is that of the unborn calf, which takes a soft lustre like that of velvet, and accordingly can only be worn by dandies who are rich enough to purchase it, or kill a cow for the sake of this skin. An ordinary calf-skin is contemned, and would only be worn by a man of the lowest class. A peculiar kind of sheep is kept by the Abyssinians for the sake of its wool, which is sometimes more than two feet in length.

The sheep lead a very artificial life, are

kept day and night on couches, are fed with meat and milk, and their fleeces washed and combed regularly as if they were ladies' lap-dogs. The result of this treatment is, that they have beautiful fleeces, which are worth from twenty to thirty shillings each, but their flesh is utterly useless for consumption, being very small in quantity, and offensive in quality. The fleeces are generally dyed black, that being a fashionable color in Abyssinia.

The skin of the hyæna or the dog is never used for clothing, and the natives have a superstitious fear of the red jackal, thinking that if they should be wounded while wearing a dino of jackal skin, one of the hairs might enter the wound, and so prove fatal to the sufferer. The leopard skin is never worn by ordinary Abyssinians, being exclusively used by the Gallas and Shooas, and by a certain set of dervishes called the Zaccâri.

Contrary to the habit of most African nations, the men wear but few ornaments, those which they employ being almost always signs of valor. Amulets are found on almost every man, and many of them wear whole strings of these sacred articles, crossed over the shoulders and falling as low as the knees. Most Abyssinians carry a pair of tweezers for extracting thorns from the feet and legs, and the wealthier among them place their tweezers in a highly ornamented silver case, which is hung from the handle of the sword.

Whenever an Abyssinian is seen wearing a silver chain, he is known to have killed an elephant, while those who have distinguished themselves in battle are known by a sort of silver bracelet, which extends from the wrist nearly as far as the elbow. It opens longitudinally by hinges, and is fastened with a clasp. This ornament is called the "bitoa," and is often very elegantly engraved, and adorned with gilded patterns. The silversmiths who make these and similar articles are rather oddly treated. They are considered as slaves, are not allowed to leave the country, and yet are treated with considerable kindness, save and except the payment for their labor.

Consequently, the silversmith, finding that he has to wait a very long time for his money, and probably will not get it at all, is forced to pay himself by embezzling a quantity of the gold and silver which are given him for the manufacture of the bracelet, and substituting an equal amount of less precious metal. Mr. Parkyns mentions that he has known a man to receive silver equal to thirty sequins, and to use in the work rather less than eight. Many of these bracelets are ornamented with little bell-like pieces of silver round the edge, which tinkle and clash as the wearer moves. Similar bells are attached to a sort of silver coronet worn by very great men, and, together with the

silver chains to which they are attached, hang over the ears and neck of the wearer.

As to the weapons of the Abyssinians, they consist chiefly of the sword, spear, and shield. In later days fire-arms have been introduced, but, as this work treats only of the uncivilized part of mankind, these weapons will not be reckoned in the Abyssinian armory.

The sword, or "Shotel," is a very oddly-shaped weapon. The blade is nearly straight for some two feet, and then turns suddenly like a sickle, but with a more angular bend. The edge is on the inside, and this peculiar form is intended for striking downward over the enemy's shield. In order to give weight to the blow, the blade is much wider and heavier toward the point than at the hilt. As if this form of blade did not make the sword feeble enough, the hilt is so constructed that it prevents all play of the wrist. The handle is made of a pyramidal piece of rhinoceros horn, five inches wide at one end, and three at the other. It is made into the proper shape for a handle by cutting out semicircular pieces along the sides, leaving the four sharp corners in their previous form. When the sword is grasped, one of the four angles must come under the wrist, so that if the weapon were allowed to play freely, as in ordinary swordsmanship, the point would be driven into the wrist.

As with the natives of Southern Africa, the Abyssinians prefer soft iron to tempered steel, the former admitting of being straightened when bent, but the latter being apt to snap. The sword is always hung on the right side, in order to be out of the way of the shield, especially when, as in travelling, it is swung backward and forward with the play of the left arm.

The sheath of the sword is made of leather or red morocco, and is ornamented by the great men with a number of silver plates. At the end of the sheath is a metal ball, called "lomita." This curious ornament is mostly of silver, and is almost as large as a billiard ball. The sword-belt is of the same material as the scabbard.

The spear is from six to seven feet in length, and the head is squared like that of a pike. The four sides are mostly grooved, so that the head of the weapon looks something like a quadrangular bayonet. This spear is used both as a lance and as a javelin, a good soldier being able to strike a man at thirty or forty yards' distance. The cavalry always carry two spears, one of which is thrown, and the other retained to be used as a lance. They have rather a curious mode of using the lance, aiming it at the adversary as if they meant to throw it, but only letting the shaft slip through the hand, and catching it by the butt.

The shafts of the spears are very neatly made and much pains are bestowed upon

them. They are made of very young trees, which are cleared of the bark by fire, and are then straightened and dried. This operation requires a very skillful manipulator, as, if the wood be too much dried, it is brittle and snaps; if irregularly heated, it never will remain straight; and if not dried sufficiently, it warps with every change of weather. When properly straightened, the shafts are greased and hung over the fire for several months, until they assume the proper reddish-yellow hue.

When not in use, each lance is kept in a sheath, to the top of which is fastened a loop by which it can be hung to the end of the cow's horn which does duty for a peg in Abyssinian houses, and which is just long enough to allow the lance to hang straight without touching the wall.

The Abyssinian shield is made of buffalo hide, and is strong enough to resist any sword cut, and to throw off a spear if received obliquely upon it. If, however, a good spear should strike the shield fairly, it will pierce it. In order to preserve the needful obliquity, the shield is made like the segment of a sphere, and has a projecting boss in the centre. The shield is almost always ornamented, the most valued decorations being the mane, tail, and paw of a lion, arranged in various ways according to the taste of the owner. To some shields is attached the skin of the Guereza monkey, which, with its bold contrast of long jetty-black and snowy-white hair, has really a striking and artistic effect. This, however, is always discarded when the native kills a lion.

Chiefs always have their shields nearly covered with silver plates and bosses, a fashion which is imitated in brass by the poorer soldiers. Still, if a common soldier had a good shield, he would not hide its beauties with brass plates. A chief is distinguished not only by his silver-mounted shield, but by his silver-plated sword-scabard. On his head he wears a silver frontlet, called "akodamir," having silver chains hanging from it, and a white feather stuck in the hair behind the frontlet. If a man of notable courage, he also wears the lion-skin dino.

Round the edge of the shield are pierced a number of holes, through which is passed the thong that suspends it to the wall when not in use. Each day, as it hangs on the wall, the owner takes it down and shifts the thong from one hole to another, so that the shield may not be warped, and lose its prized roundness. The shield must swing quite clear of the wall.

To a good swordsman the shield would be an encumbrance, and not a means of safety. On account of the necessity of holding out the shield with the left arm, the sword becomes of little value as an offensive weapon, the owner not daring to strike lest he should expose himself to a counter blow.

Whereas he who, like Fitz-James, finds his "blade both sword and shield," makes very light of an Abyssinian warrior's prowess. Mr. Parkyns says on this subject, that any ordinary swordsman, without a shield, can easily beat the best Abyssinian armed with sword and shield also. The best mode of fighting the Abyssinian warrior is to make a feint at his head. Up goes his heavy shield, which certainly guards his head, but prevents the owner from seeing that his adversary is making a sweeping cut at his legs. Should the cut 5 or 6 fail, make another feint at the head, and follow it up with a real blow. Anticipating a feint, the Abyssinian lowers his shield to protect his legs, and, as he does so, receives the edge of the sword full on his unprotected crown.

Although he is well armed, looks very fierce, and is of a quarrelsome disposition, the Abyssinian soldier is not remarkable for courage, and prefers boasting to fighting. He never seems to enter the battle with the idea of merely killing or routing the enemy, but is always looking out for trophies for himself. As with many nations, and as was the case with the Israelites in the earlier times, the Abyssinian mutilates a fallen enemy, and carries off a portion of his body as a trophy, which he can exhibit before his chieftain, and on which he can found a reputation for valor for the rest of his life.

So much do the Abyssinians prize this savage trophy that, just as American Indians have feigned death and submitted to the loss of their scalps without giving the least sign of life, men wounded in battle have suffered an even more cruel mutilation, and survived the injury. An Abyssinian has even been known to kill a comrade in order to secure this valued trophy, when he has been unable, either from mischance or want of courage, to kill an enemy.

WE come now to the women and their dress.

Young girls are costumed in the simplest possible style, namely, a piece of cotton stuff wrapped round the waist, and descending half way to the knee. Should the girl be rich enough to afford a large wrapper, she brings one end of it upward and throws it over the left shoulder. In Tigré the girls prefer a black goatskin, ornamented with cowries. A married woman wears a sort of loose shirt, and a mantle, or quarry, similar to that which is worn by the men, but of finer materials. Should she be able to own a mule, she wears trousers, which are very full at the waist, and decrease gradually to the ankle, where they fit like the skin.

As to their ornaments, they are so numerous as to defy description. That which costs the least, and is yet the most valued, is the tattoo, which is employed with a profusion worthy of the New Zealander. "The Tigréan ladies," so writes Mr. Par-

kyns, "tattoo themselves; though, as this mode of adorning the person is not common excepting among the inhabitants of the capital and persons who have passed some time there, I should judge it to be a fashion imported from the Amhara.

"The men seldom tattoo more than one ornament on the upper part of the arm, near the shoulder, while the women cover nearly the whole of their bodies with stars, lines, and crosses, often rather tastefully arranged. I may well say nearly the whole of their persons, for they mark the neck, shoulders, breasts, and arms, down to the fingers, which are enriched with lines, to imitate rings, nearly to the nails. The feet, ankles, and calves of the legs are similarly adorned, and even the gums are by some pricked entirely blue, while others have them striped alternately blue and the natural pink.

"To see some of their designs, one would give them credit for some skill in the handling their pencil; but, in fact, their system of drawing the pattern is purely mechanical. I had one arm adorned; a rather blind old woman was the artist; her implements consisted of a small pot of some sort of blacking, made, she told me, of charred herbs, a large home-made iron pin, about one-fourth of an inch at the end of which was ground fine, a bit or two of hollow cane, and a piece of straw. The two last-named items were her substitutes for pencils.

"Her circles were made by dipping the end of a piece of cane of the required size into the blacking, and making its impression on the skin; while an end of the straw, bent to the proper length, and likewise blackened, marked all the lines, squares, diamonds, &c., which were to be of equal length. Her design being thus completed, she worked away on it with her pin, which she dug in as far as the thin part would enter, keeping the supply of blacking sufficient, and going over the same ground repeatedly to insure regularity and unity in the lines. With some persons the first effect of this tattooing is to produce a considerable amount of fever, from the irritation caused by the punctures, especially so with the ladies, from the extent of surface thus rendered sore. To allay this irritation, they are generally obliged to remain for a few days in a case of vegetable matter, which is plastered all over them in the form of a sort of green poultice. A scab forms over the tattooing, which should not be picked off, but allowed to fall off of itself. When this disappears, the operation is complete, and the marks are indelible; nay, more, the Abyssinians declare that they may be traced on the person's bones even after death has bared them of their fleshy covering."

The women also wear a vast number of silver ornaments, such as several chains round the neck, three pairs of silver or gilt bracelets, a number of little silver orna-

ments hung like bells to the ankles, above which are a series of bangles of the same metal. A wealthy woman has also a large flat silver case, containing talismans, and ornamented with bells of the same metal, suspended by four silver chains; while her hair is decorated with a large silver pin, elaborately made, and furnished with a number of pendent ornaments.

The illustration No. 1, 617th page, exhibits the costume of an Abyssinian lady, and the difference in dress between herself and her servants. The latter—who, of course, are her slaves, no other idea of servitude entering the Abyssinian mind—are washing clothes in a brook, in preparation for the Feast of St. John, the only day in the year when the Abyssinians trouble themselves to wash either their clothes or themselves. Other slaves are carrying water-jars on their backs—not on their heads; and in the foreground stands their mistress giving her orders. The reader will note the graceful way in which the mantle is put on, and the string of leathern amulet cases which hangs by her side.

As to the hair itself, it is dressed in a peculiar manner. It is gathered into a multitude of plaits, beginning at the very top of the head, and falling as low as the neck. Both sexes have the hair plaited in this manner, but the men wear their plaits in various ways. According to strict Abyssinian etiquette, which has greatly faded in later years, a youth who has not distinguished himself ought to wear his hair unplaited. As soon as he has killed a man in battle, he shaves his head, with the exception of a single plait, and for every additional victim a fresh plait is added. When he kills the fifth, he is allowed to wear the whole of his hair in tresses.

This mode of dressing the hair occupies a vast amount of time, but time is of no value to an Abyssinian, who expends several hours upon his head once every fortnight or so. The plaits are held in their places by a sort of fixture made of boiled cotton-seeds, and are plentifully saturated with butter. Vast quantities of this latter article are consumed in Abyssinian toilets, and it is considered a mark of fashion to place a large pat of butter on the top of the head before going out in the morning, and to allow it to be melted by the heat of the sun and run over the hair. Of course it drips from the ends of the long tresses on the neck and clothes of the wearer, but such stains are considered as marks of wealth. Sometimes it runs over the face, and is apt to get into the eyes, so that in hot weather the corner of the quarry is largely used in wiping away the trickling butter.

In order to preserve the arrangement of the hair during the night, they use instead of a pillow a sort of short crutch, looking very like a common scraper with a rounded top.

CHAPTER LXV.

ABYSSINIA — *Continued.*

GOVERNMENT OF ABYSSINIA — THE EMPEROR AND HIS GENEALOGY — THE THREE DISTRICTS AND THEIR RULERS — THE MINOR CHIEFS AND THEIR DISTINGUISHING EMBLEMS — KING THEODORE — A BRIEF SKETCH OF HIS LIFE — CAREER FROM THE RANKS TO THE THRONE — HIS ATTEMPTS AT REFORM — ADMINISTRATION OF JUSTICE — A MODERN SOLOMON — MODES OF PUNISHMENT — THE LADIES' GAME — ABYSSINIAN PLEADING — THE TRIAL BY WAGER — QUARRELSOME CHARACTER OF THE ABYSSINIANS — THEIR VANITY AND BOASTFULNESS — THE LAW OF DEBT — HOSPITALITY AND ITS DUTIES — COOKERY AND MODES OF EATING — THE RAW FLESH FEAST — PEPPER SAUCE — THE USE OF THE SHOTEL — A WEDDING FEAST — ABYSSINIAN DIGESTION.

THE government of the Abyssinians has varied several times, but has mostly settled down into a sort of divided monarchy.

There is an Emperor, supreme king, or Negust, who must be a lineal descendant of Solomon and the Queen of Sheba, and who must be crowned by the high priest or Abuna, an ecclesiastic who corresponds very nearly with the Greek Patriarch. Mostly, the king holds but nominal sway over the fierce and insubordinate chiefs of provinces, and, as is likely, the fiercest, cleverest, and most unscrupulous chief generally contrives to manage the king much as he likes. Should the king be strong-minded enough to hold his own opinions, the chiefs become dissatisfied, and by degrees fall into a state of chronic rebellion, as was the case during the last years of Theodore's life.

Each of the great districts has its own Ras, chief, or prince, according to the title that may be used, and his authority is absolute in his own province. The Ras appoints under him a number of great chiefs, who bear the title of Dejasmatch (commonly contracted into Dejatch), corresponding in some degree with our ducal rank. Under these great chiefs are lesser officers, and each of them is appointed by beat of the great drum of ceremony and proclamation by the heralds. Men so appointed have the privilege of drums beating before them on a march or in battle, and their rank, that of "addy

negarie," or men of honor, confers the same practical power as that of Dejasmatch, the title alone being wanting.

It may be as well to mention that the late King Theodore held the title of Dejasmatch before he had himself named King of Ethiopia; and as the history of this remarkable man gives some idea of the Abyssinian mode of government, a very brief sketch will be given of his progress to the throne.

Putting together the various histories that have appeared, and rejecting their many discrepancies, we come to the following series of events.

Kassai, for such was his name before he changed it to Theodorus, was the son of a very small chief named Hailu Weleda Georgis, whose only distinction seems to have been his reputed descent from the Queen of Sheba, a tradition of which Kassai afterward took advantage. When he died, his little property was seized by his relations, and his widow was forced to support herself by selling the "kosso," the popular remedy for the tape-worm, a creature which is singularly prevalent in this country. Kassai, then a boy, took refuge in a monastery, where he might have remained until this day, had not a Dejasmatch, who had turned rebel after their custom, attacked the monastery, burned the huts of which it was composed, and killed the boys who inhabited it by way of avenging himself on their parents. Kassai, however,

escaped the massacre, and fled to a powerful and warlike relation, the Dejasmatch Coulu, under whom he learned the management of arms, and as much of the art of war as was known.

His uncle however died, and his two sons immediately fought for the patrimony; and, while they were quarrelling, another powerful Dejasmatch saw his opportunity, swept down suddenly upon them, and made himself master of the best and most fertile part of the district.

Again ejected from a home, Kassai contrived to get together a band of followers, whom we should not wrong very greatly by calling robbers, and for some years lived a wandering life marvellously resembling that of David in his earlier years. By degrees his band increased until some of the petty chiefs joined him with their followers, and he became a man of such importance that the well-known Waisoro Mennen, the crafty and ambitious mother of Ras Ali, finding that he could not be beaten in the field, gave him in marriage the daughter of the Ras. She, however, proved a faithful wife to him, and would have nothing to do with the schemes of her grandmother. At last Kassai and Waisoro Mennen came to an open rupture, and fought a battle, in which the former was victorious, and captured both the lady and her fine province of Dembea. The latter he kept, but the former he set at liberty.

Ras Ali then tried to rid himself of his troublesome son-in-law by assigning Dembea to Berru Goshu, a powerful Dejasmatch, who accordingly invaded the district, and drove Kassai out of it. This happened in 1850. In less than two years, however, Kassai reorganized an army, attacked the camp of Berru Goshu, shot him with his own hand, and got back his province. Thinking that matters were now becoming serious, Ras Ali took the field in person and marched against Kassai, who conquered him, drove him among the Gallas for safety, and took possession of the whole of Ambara.

Having secured this splendid prize, he sent to Ras Onbi, the Prince of Tigré, and demanded tribute. Onbi refused, led his army against Kassai, and lost both his province and his liberty. The conqueror kept him in prison until 1860, when his first wife died, and he married the daughter of Onbi, whom he released and made a tributary vassal.

Being now practically master of the whole country, he sent for Abba Salama, the then Abuna or Patriarch, and had himself crowned by the title of Theodorus, King of the kings of Ethiopia. This event took place in 1855; and from that time to his death Theodore maintained his supremacy, his astonishing personal authority keeping in check the fierce and rebellious spirits by whom he was surrounded. How he really tried to do the best for his country we all

know. Semi-savage as he was by nature, he possessed many virtues, and, had he known his epoch better, would still have been on the throne, the ruler of a contented instead of a rebellious people. But he was too far ahead of his age. He saw the necessity for reforms, and impatiently tried to force them on the people, instead of gently paving the way for them. The inevitable results followed, and Theodore's mind at last gave way under the cares of empire and the continual thwartings of his many schemes. Still, even to the last he never lost his self-reliance nor his splendid courage, and, though the balance of his mind was gone, and he alternated between acts of singular kindness and savage cruelty, he fought to the last, and not until he was deserted by his soldiers did he die by his own hand at the entrance of his stronghold.

He saw very clearly that the only way to establish a consolidated kingdom was to break the power of the great chiefs or princes. This he did by the simple process of putting them in chains until they yielded their executive powers, and contented themselves rather with the authority of generals than of irresponsible rulers. He was also desirous of doing away with the custom that made every man an armed soldier, and wished to substitute a paid standing army for the miscellaneous horde of armed men that filled the country. He was anxious to promote agriculture, and, according to his own words, not only to turn swords into reaping-hooks—a very easy thing, by the way, with an Abyssinian sword—but to make a ploughing ox more valuable than a war-horse. To his own branch of the Church he was deeply attached, and openly said that he had a mission to drive Islamism from his country, and for that reason was at war with the Gallas, who, as well as the Shooas and other tribes, profess the religion of Mohammed. That being done, he intended to march and raze to the ground Mecca and Medina, the two sacred cities of Islam; and even projected a march to Jerusalem itself.

His most difficult task, however, was the suppression of the immorality that reigns throughout Abyssinia, and which, according to Mr. Parkyns, has a curious effect on the manners of the people. Neither men nor women seem to have any idea that the least shame can be attached to immorality, and the consequence is that both in word and manner they are perfectly decorous. To cope with so ingrained a vice seems an impracticable task, and such it turned out to be. He set the example to his people by only taking one wife, and when she died he had many scruples about the legality of taking another, and did not do so until after consultation with European friends and careful examination of the Bible. He could not, however, keep up the fight against

(1.) THEODORE AND THE LIONS. (See page 653.)

(2.) PLEADERS. (See page 651.)

nature, and in his last years he had resorted to the old custom of the harem.

As the reader would probably like to see what kind of a man was this Theodorus, I give a portrait on page 652, taken from a sketch made of him while he was in the enjoyment of perfect health of body and mind, and while he was the irresponsible ruler of his country, knowing of none greater than himself, and having his mind filled with schemes of conquest of other lands, and reform of his own. The portrait was taken by M. Lejean, some ten years before the death of Theodorus; and, in spite of the loss of his hair, which he wore short in the last years of his life, and of the ravages which time, anxiety, and misdirected zeal had made in his features, the face is essentially the same as that of the dead man who lay within the gates of Magdala on the fatal Good Friday of 1863.

Knowing the character of the people over whom he reigned, Theodore made liberal use of external accessories for the purpose of striking awe into them, such as magnificent robes and weapons adorned with the precious metals. Among the most valued of these accessories were four tame lions, of which he was very fond. These animals travelled about with him, and even lived in the same stable with the horses, never being chained or shut up in cages, but allowed to walk about in perfect liberty. They were as tame and docile as dogs, and M. Lejean states that the only objection to them was the over-demonstrative affection of their manners. Like cats they delighted to be noticed and made much of, and were apt to become unpleasantly importunate in soliciting caresses.

They were, however, somewhat short-tempered when travelling over the mountain ranges, the cold weather of those elevated regions making them uncomfortable and snappish. With an idea of impressing his subjects with his importance, an art in which he was eminently successful, Theodore was accustomed to have his lions with him when he gave audience, and the accompanying portrait was taken from a sketch of the Lion of Abyssinia seated in the audience-chamber, and surrounded with the living emblems of the title which he bore, and which he perpetuated in his royal seal.

JUSTICE is administered in various modes, sometimes by the will of the chief, and sometimes by a sort of court or council of elders. The former process is generally of a very summary character, and is based on the old Mosaic principle of an eye for an eye, and a tooth for a tooth. If one man murders another, for example, and the culprit be detected, the Ras will direct the nearest relation of the murderer to kill him in precisely the same manner that he killed

his victim. One very odd case was investigated by Oubi, the Ras or Prince of Tigre.

Two little boys, the elder eight and the younger five years of age, had been walking together, when they saw a tree laden with fruit. After some difficulty, the elder climbed into the tree, and, standing on a branch, plucked the fruit and threw it to his little companion who stood below him. By some accident or other he fell from the tree upon the head of his playfellow, and killed him on the spot. The parents of the poor child insisted that the boy who killed him should be arraigned for murder, and, after a vast amount of consultation, he was found guilty. Ras Oubi then gave sentence. The culprit was to stand under the branch exactly where had stood the poor little boy. The eldest brother was then to climb up the tree and fall on the other boy's head until he killed him.

Theft is generally punished with flogging, the whip being a most formidable weapon, made of hide, and called, from its length and weight, the "giraffe." A thief is sometimes taken into the market-place, stripped to the waist, and led by two men, while a third delivers a terrific series of blows with the giraffe whip. After each blow the delinquent is forced to exclaim, "All ye who see me thus, profit by my example."

Many other offences, such as sacrilege, rebellion, and the like, are punished by the loss of a hand or a foot, sometimes of both. The forfeited member is amputated in a very clumsy way, with a small curved knife, so that a careless or maladroit executioner can inflict frightful suffering. The culprit generally gives a fee to the executioner, who will then put as keen an edge as possible on the knife, and tell the sufferer how to arrange his hand, and spread his fingers, so that the tendons may be stretched, and the joint separated easily. One man of rank, who had been condemned to lose his left hand, suffered the operation without moving a muscle of his countenance, and when the hand was severed, he took it up with his right, and flung it in the face of the presiding chief, with the exclamation that he still had a hand wherewith to fling a spear. With the same equanimity he dipped the bleeding stump into the boiling oil which is generally used as a styptic. Sometimes, however, the use of the hot oil is forbidden, and the sufferer is left to bleed to death.

The Abyssinians, however, are as little sensitive to pain as most African tribes, and endure with ease injuries which would kill an European. The young men have a curious amusement, which well exemplifies their insensibility to pain. "When a party of young men are seated together, the ladies present will bring bits of the pith of millet stems, cut to about an inch long, and of the thickness of a man's thumb, or, what is bet-

ter still, pieces of old rag, rolled tight, so as to form a pellet of similar dimensions. These are arranged in patterns by each lady on the extended arm of any one whom she may choose, and their tops lighted.

"The only merit in the man is to allow them to burn themselves out entirely, without moving his arm so as to cause them to fall, or evincing the slightest consciousness of pain either by word, look, or gesture. On the contrary, he must continue a flow of agreeable conversation, as if nothing were occurring. The lady operator usually blows her fires to keep them going, and the material, whether pith or rag, being of a very porous nature, and burning slowly like tinder, the action of the fire is felt on the skin long before it actually reaches it. It is, in fact, an operation similar to the 'moxa' of European surgery. When the pellets are completely burned out, the lady rubs her hand roughly over the cauterized parts, so as to remove the burnt skin. On a copper-colored person the scars, when well healed, assume a polished black surface, which contrasts very prettily with the surrounding skin."

The courts of justice, to which allusion has been made, are composed of elders; or not unfrequently the chief of the district acts as the magistrate. When two persons fall into a dispute and bring it before the court, an officer comes for the litigants, and ties together the corner of their quarries. Holding them by the knot, he leads them before the magistrate, where each is at liberty to plead his own cause. From the moment that the knot is tied, neither is allowed to speak, under penalty of a heavy fine, until they have come before the magistrate; and when the trial has begun, (see engraving No. 2, p. 652,) the plaintiff has the first right of speech, followed by the defendant in reply. Neither is allowed to interrupt the other under pain of a fine; but, in compassion to the weakness of human nature, the non-speaker may grunt if he likes when the adversary makes any statement that displeases him.

The oddest part of the proceeding is the custom of betting, or rather paying forfeits, on the result of the investigation. A plaintiff, for example, offers to bet one, two, or more mules, and the defendant feels himself bound to accept the challenge, though he may sometimes modify the amount of the bet. When the case is determined, the loser pays the sum, not to the winner, but to the chief who decides the case. A "mule," by the way, does not necessarily mean the animal, but the word is used conventionally to represent a certain sum of money, so that a "mule" means ten dollars, just as among English sporting men a "pony" signifies £25.

This practice is carried on to such an extent that Mr. Parkyns has seen ten mules betted upon the payment of a small quantity of

corn, worth only two or three shillings. The object of the "bet" seems to be that the offer binds the opposite party to carry out the litigation, and when it is offered, the chief forces the loser to pay under the penalty of being put in chains.

It may be seen from the foregoing observations that the Abyssinians are rather a quarrelsome people. This arises chiefly from their vanity, which is extreme, and which culminates to its highest point when the brain is excited and the tongue loosened by drink. It was this national characteristic which induced King Theodore to imagine himself the equal of any monarch on the face of the earth, and to fancy that he could cope successfully with the power of England.

Mr. Mansfield Parkyns gives a very amusing account of this national failing.

"Vanity is one of the principal besetting sins of the Abyssinians, and it is to this weakness, when brought out by liquor, that the origin of most of their quarrels may be traced. I remember more than once to have heard a remark something like the following made by one of two men who, from being 'my dear friends,' had chosen to sit next to each other at table: 'You're a very good fellow, and my very dear friend; but (hiccup) you aren't half so brave or handsome as I am!' The 'very dear friend' denies the fact in a tone of voice denoting anything but amity, and states that his opinion is exactly the reverse. The parties warm in the argument; words, as is usual when men are in such a state, are bandied about without any measure, and often without much meaning; insults follow; then blows; and if the parties round them be in a similar condition to themselves, and do not immediately separate them, it frequently happens that swords are drawn.

"Dangerous wounds or death are the consequence; or, as is not uncommon, others of the party, siding with the quarrellers, probably with the idea of settling the affair, are induced to join in the row, which in the end becomes a general engagement. I have noticed this trait of vanity as exhibiting itself in various ways in a drunken Abyssinian. I always found that the best plan for keeping a man quiet, when in this state, was to remark to him that it was unbecoming in a great man to behave in such a way, that people of rank were dignified and reserved in their manners and conversation. And thus I have argued very successfully with my own servants on more than one occasion, flattering them while they were tipsy, and then paying them off with a five-foot male bamboo when they got sober again.

"I recollect one fellow who was privileged, for he had asked my leave to go to a party and get drunk. On returning home in the evening, he staggered into my room in as dignified a manner as he could, and, seating

himself beside me on my couch, embraced me with tears in his eyes, made me a thousand protestations of attachment and affection, offering to serve me in any way he could, but never by a single expression evincing that he considered me as other than a dear friend, and that indeed in rather a patronizing fashion, although the same fellow was in the habit of washing my feet, and kissing them afterward, every evening, and would, if sober, have no more thought of seating himself, even on the ground, in my presence, than of jumping over the moon.

"With his fellow-servants, too, he acted similarly; for though he knew them all, and their characters and positions, he addressed them as his servants, ordering them about, and upbraiding them for sundry peccadilloes which they had doubtless committed, and which thus came to my knowledge. In fact, in every point he acted to perfection the manners and language of a great man; and so often have I seen the same mimicry, that it has led me to believe that the chief mental employment of the lowest fellow in the country is building castles in the air, and practising to himself how he would act, and what he would say, if he were a great man."

The law of debt is a very severe one. The debtor is thrown into prison, and chained to the wall by the wrist. The ring that encloses the wrist is a broad hoop or bracelet of iron, which is forced asunder far enough to permit the hand to enter, and is then hammered together tightly enough to prevent the hand from being withdrawn. After a while, if the sum be not paid, the bracelet is hammered a little tighter; and so the creditor continues to tighten the iron until it is driven into the flesh, the course of the blood checked, and the hand finally destroyed by mortification.

Should the Government be the creditor for unpaid tribute, a company of soldiers is quartered on the debtor, and he is obliged to feed them with the best of everything under pain of brutal ill-treatment. Of course this mode of enforcing payment often has the opposite effect, and, when a heavy tax has been proclaimed in a district, the people run away *en masse* from the villages. In such a case the headman of the village is responsible for the entire amount, and sometimes is obliged to make his escape with as much portable property as he can manage to carry off.

WHEN rightly managed, the Abyssinians are a hospitable people. Some travellers take a soldier with them, and demand food and lodging. These of course are given, through fear, but without a welcome. The right mode is, that when a traveller comes to a village, he sits under a tree, and waits. The villagers soon gather round him, question him, and make remarks on his appear-

ance with perfect candor. After he has undergone this ordeal, some one is sure to ask him to his house, and, should he happen to be a person of distinction, one of the chief men is certain to be his host.

When Mr. Parkyns was residing in Abyssinia, he always adopted this plan. On one occasion the headman invited him to his house, and treated him most hospitably, apologizing for the want of better food on the ground that he had lately been made liable for the tribute of a number of persons who had run away, and was consequently much reduced in the world. It proved that sixteen householders had escaped to avoid the tax, and that the unfortunate man had to pay the whole of it, amounting to a sum which forced him to sell his horse, mule, and nearly all his plough oxen, and, even when he was entertaining his visitor, he was in dread lest the soldiers should be quartered on him.

The question of hospitality naturally leads us to the cooking and mode of eating as practised in Abyssinia, about which so many strange stories have been told. We have all heard of Bruce's account of the eating of raw meat cut from the limbs of a living bullock, and of the storm of derision which was raised by the tale. We will see how far he was borne out by facts.

The "staff of life" is prepared in Abyssinia much after the same fashion as in other parts of Africa, the grain being ground between two stones, and then made into a sort of very thin paste, about the consistency of gruel. This paste is allowed to remain in a jar for a day and night in order to become sour, and is then taken to the oven. This is a very curious article, being a slab of earthenware in which a concave hollow is made, and furnished with a small cover of the same material. A fire is made beneath the oven, or "magogo," as it is termed, and when it is hot the baker, who is always a woman, proceeds to work.

She first rubs the hollow with an oily seed in order to prevent the bread from adhering to it, and then with a gourd ladle takes some of the thin dough from the jar. The gourd holds exactly enough to make one loaf, or rather cake. With a rapid movement the woman spreads the dough over the entire hollow, and then puts on the cover. In two or three minutes it is removed, and the bread is peeled off in one flat circular piece, some eighteen inches in width, and about the eighth of an inch in thickness. This bread, called "teff," is the ordinary diet of an Abyssinian. It is very sour, very soft, and very spongy, and requires an experienced palate to appreciate it. There are several other kinds of bread, but the teff is that which is most valued.

As to the meat diet of the Abyssinians, it may be roughly divided into cooked and

uncooked meat. Cooked meat is usually prepared from the least valued parts of the animal. It is cut up into little pieces, and stewed in a pot together with other ingredients, a considerable quantity of butter, and such an amount of capsicum pods that the whole mess is of a light red color, and a drop of it leaves a red stain on any garment on which it may happen to fall. This paste is called "dillikh," and is made by grinding together a quantity of capsicum pods and an equal amount of onions, to which are added ginger, salt, black pepper, and other herbs, according to the taste of the preparer. The poorer class, who cannot afford meat, can still make dillikh paste, and live almost entirely on tefl, clotted milk, and dillikh.

But the great treat for an Abyssinian epicure is the "broundo," or raw meat, about which he is as fastidious as the European *bon vivant* about his sauces and ragouts. Not an Abyssinian will eat any animal which has incisor teeth in its upper jaw, and, like the Jews, they even reject the camel, because it has not a cloven hoof.

According to the account given by Bruce, when a dinner party is assembled, a cow is brought to the door of the house, bound, flung down, and a few drops of its blood poured on the ground in order to save the letter of the Mosaic law. The butchers then cut large strips of meat from the poor beast, taking care to avoid the vital parts and larger vessels, and managing so as to remove the flesh without much effusion of blood.

The still warm flesh is taken within the house, where it is sliced into strips by the men, and handed to the women who sit by their side. The women cut it up into small squares, lay it on the "teff" bread, season it plentifully with the dillikh paste, roll it up into balls, and push the balls into the mouth of their companion, who eats until he is satisfied, and then reciprocates the attention by making up a couple of similar balls, and putting them into the mouths of the women. (See page 643.) Mead and tedge are then consumed as largely as the meat, and, according to Bruce, a scene of the most abominable licentiousness accompanies the conclusion of the festival.

These statements have been much controverted, but there is no doubt that, in the main, the narrative of Bruce was a truthful one. Many of the facts of which he wrote have since been corroborated, while the changes to which Abyssinia has been subjected will account for unimportant variations. Later travellers, for example, have not witnessed such a scene as has been narrated by Bruce, but that is no reason why such a scene should not have occurred. The most important part of it, namely, the eating of raw flesh, has been repeatedly corroborated, especially by Mansfield Parkyns, who lived

so long with the Abyssinians, dressed like them, fed like them, and accommodated himself in most respects to their mode of life.

He found that meat was always, if possible, eaten in the raw state, only the inferior qualities being made fit for consumption by cookery. His description of the mode of eating tallies exactly with that of Bruce. The meat is always brought to the consumer while still warm and quivering with life, as it becomes tough and stringy when suffered to become cold. Each guest is furnished with plenty of tefl and the invariable pepper sauce. His fingers take the place of a fork, and his sword, or shotel, does duty for a knife. Holding the broundo in his left hand, he takes into his capacious mouth as much as it can accommodate, and then, with an adroit upward stroke of the sword, severs the piece of meat, and just contrives to avoid cutting off his nose. He alternates the pieces of meat with tefl and dillikh, and, when he has finished, refreshes himself copiously with drink.

Such food as this appears to be indescribably disgusting, and very unfit for a nation that prides itself on its Christianity. Many persons, indeed, have said that no one *could* eat raw meat except when pressed by starvation, and have therefore discredited all accounts of the practice.

Perhaps my readers may remember that after Bruce's return a gentleman was making very merry with this account in the traveller's presence, treating the whole story as a fabrication, on the ground that to eat raw meat was impossible. Bruce said nothing, but quietly left the room, and presently returned with a piece of beef rolled and peppered after the Abyssinian fashion, and gave his astonished opponent the choice of eating the meat or fighting him on the spot. As Bruce was of gigantic strength and stature, and an accomplished swordsman to boot, the meat was eaten, and the fact proved to be possible.

Mr. Parkyns, who, when in Abyssinia, very wisely did as the Abyssinians do, found that he soon became accustomed to the taste of raw meat, and learned how to prefer one part of an animal to another. He discovered that a very good imitation of an oyster could be made by chopping up a sheep's liver very fine, and seasoning it with pepper, vinegar, and a little salt, provided that the consumer shut his eyes while eating it. He even learned to appreciate a dish called chogera, which seems to be about the very acme of abomination. It consists of the liver and stomach chopped up fine, mixed with a little of the half-digested grass found in the stomach, flavored with the contents of the gall bladder, plentifully seasoned with pepper, salt, and onions, and eaten uncooked.

An Abyssinian's digestion is marvellous,

and almost rivals that of a pike, which will digest half of a fish in its stomach while the other half is protruding from its mouth. He will go to any number of feasts in a day, and bring a fine fresh appetite to each of them, consuming at a meal a quantity that would suffice seven or eight hungry Englishmen. Mr. Parkyns once gave a breakfast to fourteen guests, thinking that, as they were engaged for three or four other feasts on the same day, they would perhaps eat but little.

Keeping up, however, the old hospitable customs, he killed a cow and two fat sheep, and provided many gallons of mead and an infinite quantity of "teff." To his astonishment, the whole of this enormous supply vanished, as he says, "like smoke," before his guests, who left scarcely a scrap for their servants. And, after this feast, the whole of the party proceeded to another house, where they were treated in a similarly liberal manner, and employed the day in a series of four or five such banquets.

The Abyssinians are very fastidious respecting the part of the animal from which the broondo is cut, and have a vast number of names to express the different qualities of meat. The most valued portion is the hump of the shoulder, the first cut of which is always given to the man of the highest rank. Consequently, when several men of nearly equal rank meet, a polite controversy is carried on for some time, each offering the cut of honor to his neighbor.

On one occasion this piece of etiquette produced fatal results. Several Amhara chiefs were present, together with one Tigréan. The latter, in order to assert the superiority of his own province, drew his sword and helped himself to the first cut, whereupon he was immediately challenged by two Amhara warriors. He accepted the challenge, fought them both, killed them both, and so vindicated the course which he had taken.

The quantity which an Abyssinian will eat when he gets the chance must be seen to be appreciated. See for example Mr. Parkyns' account of a feast at an Abyssinian wedding:—

"The Abyssinian guests were squatted round the tables in long rows, feeding as if their lives depended on the quantity they could devour, and washing it down with floods of drink. I never could have believed that any people could take so much food, and certainly, if the reader wishes to see a curious exhibition in the feeding line, he has only to run over to Abyssinia, and be present at a wedding-feast.

"Imagine two or three hundred half-naked men and women all in one room, eating and drinking in the way I have described in a former chapter, but with this difference—that the private party is well ordered and arranged, while the public 'hang-out' is a scene of the most terrible confusion. Here all decorum is lost sight of; and you see the waiters, each with a huge piece of raw beef in his hands, rushing frantically to and fro in his desire to satisfy the voracious appetites of the guests, who, as he comes within their reach, grasp the meat, and with their long crooked swords hack off a lump or strip, as the case may be, in their eagerness not to lose their share.

"One man was reported on this occasion to have eaten 'tallak' and 'tamash' of raw beef (each weighing from four to five pounds) and seven cakes of bread, and to have drunk twenty-six pints of beer and 'tedge.' From what I saw I can believe a good deal, but this appears rather a 'stretcher.'

"We of the Frank sect were presented with our share of the 'broondo;' but as our thoughtful host had informed us that a dinner, cooked by his own hands in the Turkish style, was awaiting us in an inner apartment, we merely, for formality's sake, tasted the offered delicacies, and then handed them over to our servants, who, standing behind us, were ready enough to make away with them. The silversmith Michael, before coming to the feast, had, it would appear, been pouring a tolerably copious libation to some god or other, for he was considerably elevated, and, being anxious to show off, commenced eating in the Abyssinian fashion, nor did he stop until he had cut a large gash in his nose."

The hands are always carefully washed both before and after a meal. Just before the feast is over, the servants come round with baskets to the guests, each of whom places in the basket a portion of his food. As to the little boys, they crawl about under the tables, and among the legs of the guests, and are always ready for any fragments that may be accidentally dropped or intentionally given to them.

The beer, or "tedge," and mead, which have been mentioned, are favorite drinks among the Abyssinians. The former is very thick and gruel-like, and to a European is very repulsive. The latter, however, is tolerably good, and is kept carefully in large jars. The mouth of each jar is covered with a piece of cotton cloth drawn tightly over it. This is not removed when the mead is poured out, and acts as a strainer.

CHAPTER LXVI.

ABYSSINIA—*Concluded.*

BIRTH, LIFE, AND DEATH OF THE ABYSSINIANS—CEREMONIES AT BIRTH—THE CIRCUMCISION AND BAPTISM—CARE AS TO THE EXACT DATE OF EACH RITE—MARRIAGE, CIVIL AND RELIGIOUS, AND THEIR DIFFERENT CHARACTERS—THE CIVIL MARRIAGE AND ITS ATTENDANT CEREMONIES—DEATH AND FUNERAL—SHAPE OF THE GRAVE—THE HIRED MOURNERS—THE SUCCESSIVE COMMEMORATIONS OF THE DEAD—RAISING THE HAI-HO—THE RELIGION OF ABYSSINIA—FASTING AND FEASTING BOTH CARRIED TO EXTREMES—ST. PARKYNS—ABYSSINIAN ARCHITECTURE.

WE will now cursorily glance at the life of an Abyssinian from his birth to his funeral.

As soon as the birth of a child is expected, all the men leave the house, as they would be considered as polluted if they were under the same roof, and would not be allowed to enter a church for forty days. The women take immediate charge of the new comer, wash and perfume it, and mould its little features in order to make them handsome. Should it be a boy, it is held up to the window until a warrior thrusts a lance into the room and pokes it into the child's mouth, this ceremony being supposed to make it courageous. The throat of a fowl is then cut in front of the child, and the women utter their joy-cries—twelve times for a boy and three times for a girl. They then rush tumultuously out of the house, and try to catch the men. If they succeed, they hustle their captives about, and force them to ransom themselves by a jar of mead, or some such present.

Next come the religious ceremonies; and it is not the least curious point in the religious system of the Abyssinians that they have retained the Jewish rite, to which they superadded Christian baptism. Eight days after birth the child is circumcised, twenty days afterward the priests enter the house, and perform a purification service which restores it to general use, and forty days afterward the baptism takes place, should the child be a boy, and eighty days if a girl.

A plaited cord of red, blue, and white silk is then placed round the child's neck, as a token that it has been baptized, which is afterward exchanged for the blue cord, or "match," worn by all Christian Abyssinians. There is a curious law that, if either of the sponsors should die without issue, his godchild becomes the heir to his property.

The priests are very particular about the date of the baptism. They believe that Adam and Eve did not receive the spirit of life until they had been created forty and eighty days. Should the father miscalculate the date, he would be sentenced to a year's fasting; while the priest is liable to a similar penalty if he should happen to assign the wrong day.

As to their marriages, the Abyssinians manage them very easily. As soon as betrothal takes place, which is mostly at a very early age, the couple are not allowed to see each other, even though they may have enjoyed the greatest liberty beforehand. So rigidly is this practice carried out in Tigre, that the bride never leaves her father's house until her marriage, believing that if she did so she would be bitten by a snake.

Just before the wedding-day, a "dass," or marquee, is built of stakes and reeds for the reception of the wedding-party, in which the marriage-feast is prepared. Certain distinguished guests have special places

reserved for them; but any one is at liberty to enter and eat to his heart's content. A scene of great turmoil always occurs on these occasions, a crowd of men who have already been fed trying to gain re-admission, whilst another crowd of hungry applicants is fighting and pushing toward the entrance. Order is kept to some extent by a number of young men who volunteer their services, and are allowed to exercise their office as they think best, hitting about at the crowd, and no man returning their blows. As soon as one batch of guests have eaten as much as they can be expected to consume, the door-keepers turn them out by main force and admit a fresh batch.

After the feast, the bride is carried in upon a man's back, and put down, like a sack of coals, on a stool. Music and dancing then take place, while the bridegroom, attended by his groomsmen, or "arkees," is proceeding to the house, accompanied by his friends, and preceded by music. When he arrives, the marriage—which is a civil rather than a religious ceremony—takes place, an address being delivered to the married couple by a priest, should one happen to be present; if not, by an elder; and the actual ceremony is at an end.

The arkees have a number of curious offices to perform, among which is the custom of collecting gifts for the newly-married couple, begging with songs and drum-beating before the houses. If nothing be given them, they take whatever they wish; and, after a wedding the robberies are countless, the arkees being privileged persons during, their term of office. They are even allowed to perjure themselves—a crime which is held in the deepest abhorrence by all Abyssinian Christians. Should a person from whom anything is stolen offer a present as a ransom, the arkees are obliged to give up the stolen property; but should they have taken fowls or any other edibles, there is no restitution possible, the arkees taking care to have them cooked and eaten at once.

Such marriages, being merely civil ceremonies, are dissolved as easily as they are made, the slightest pretext on either side being considered as sufficient for the separation. Should there be children, the father takes the boys, and the mother the girls, and each will probably marry again almost immediately.

In consequence of this very easy arrangement, it often happens that, in one family of children, two may be by one mother, two by another, and one or two more by a third; and it is almost invariably the case that the children of one father by different mothers hate each other cordially, while the children of one mother by different fathers live together in amity.

Besides these civil marriages, which are really no marriages at all, there are ecclesiastical marriages, which are held to be

indissoluble. These, however, are very seldom contracted except between persons who have been civilly married, and have found, after many years of experience, that they cannot be better suited. They therefore go to the church, are married by the priest, and receive the Communion together.

When an Abyssinian dies, the funeral takes place within a very short time, the same day being preferred if possible. The death being announced from the house-top by the relatives, and by messengers to the neighboring villages, a grave is at once dug by volunteers. There are no professional grave-diggers in Abyssinia, but, as the act of burying the dead is considered as a meritorious one, plenty of assistance is always found. The body is then placed on a couch and carried to the grave, the whole of the Psalter being repeated as the procession makes its way. Six halts are made during the progress of the body to the church, at each of which incense is burned over it, and certain portions of the Scriptures are read, or rather gabbled, as fast as the words can be repeated. In order to save time, each priest or scribe who is present has a certain portion assigned to him, and they all read at once, so that not a word can be caught by the mourners. These, however, are making such a noise on their own account that they do not trouble themselves about hearing the Scriptures.

The bearers of the corpse manage so that their seventh halt is made at the church gate. Here more portions of Scripture are read in the same time-saving fashion, while the body is wrapped in a cloth made of palm leaves, this being emblematical of the palms thrown before our Lord on His triumphal entry into Jerusalem. When the grave is ready, the priest descends into it and censes it, after which the body is lowered and the earth filled in.

In consequence of the rapidity with which burial follows death, the mourning ceremonies are postponed for three days, so as to give time for assembling the mourners, and making the corresponding preparations.

On that day the mourners proceed to a spot near the church, on which is placed a couch containing a rude figure of a human being, supposed to represent the deceased person. The relations appear with their heads shaven like those of the priests, and among the Tigréans they rub their foreheads and temples with the borders of their robes until they take off the skin, and produce sores which often occupy many weeks in healing. Mostly the injury is so great, that when the skin is renewed it is blacker than the rest of the body, and remains so during life, giving to the face a very singular expression. The Amharas do not employ this mode of showing their grief.

Each of the mourners then advances, and pronounces a sort of eulogy on the deceased,

generally uttering their panegyrics in a sort of rude verse. In case, however, the relatives should not be good poets, a number of professional mourners attend the funeral, some being hired, but the greater number coming merely in hope of a fee and a share in the funeral banquet which concludes the proceedings. According to Mr. Parkyns, these people will give minute details of the history of the dead man, his deeds, character, and even his property; and this to a great length, thus: "O Gabron, son of Welda Mousa, grandson of Itta Garra Raphael, &c. &c.; rider of the bay horse with white feet, and of the grey ambling mule; owner of the Damascus barrel-gun, and bearer of the silver-mounted shield, why have you left us?" &c., entering with astonishing readiness into every particular of the deceased's life and actions. All the bystanders, at the end of each verse, break in with a chorus of sobbing lamentations, adapted to a mournful chant, "Moni! wai! wai! wailayay! wailay! wailayay!" &c., which has a pretty plaintive sound, especially when, as is usually the case, a number of soft female voices join in.

"The 'ambilta' and the 'cundan' keep time with them, and add not a little to the effect. This continues until all the expected friends have arrived, and had their fill of wailing; and about noon the whole party retire to the house, where a cow is killed, and a quantity of provisions provided for those who have come from a distance. Everything, except the cow, is usually furnished by the neighbors, as the mourners are supposed to be so overwhelmed with grief as to be unable to attend to such preparations."

The "ambilta," which is mentioned above, is a musical instrument composed of a set of six pipes, each performer having one pipe, and each pipe only having one note. The "cundan melakhat" is made of four long cane tubes, each having a bell, and a reed mouth-piece, like that of a clarinet. They are played in succession like the ambilta, and give forth very harsh and unpleasant notes. Both instruments are generally accompanied by a small drum. Although the immediate ceremonies of the funeral terminate with this feast, they are not totally completed. Indeed, for a whole year, masses are said regularly for forty days, and another mass is said on the eightieth day. A second and larger edition of the funeral feast, called the "teskar," is held six months after the burial, and sometimes lasts for several days.

To this feast come all the poor, who claim for themselves the right of being helped before any of the regular guests. They seat themselves in the "dass," and pour out loud invocations, until an official comes round, and slightly taps each one on the head with a stick. The man who has been thus signalled holds

out his hands, and receives in them a portion of meat rolled up in "teff" bread. When all have been served, they hold the food under their mouths, and call, in a very loud voice, "Hai . . . oh!" the last syllable being protracted until they have no more breath.

"This 'Hai . . . oh!' is thought to be a sort of benediction, and very few would dare to omit it. Such an omission would be taken as a drawing down of the maledictions of the poor, and would excite the greatest contempt. If such a man were to quarrel, his opponent would be sure to say to him, 'Ah! you are the man who made no 'Hai . . . oh!' for his brother.'"

On the next day the priests and men of highest rank assemble, and day by day the rank of the guests diminishes, until the seventh day is contemptuously given to the women. Six months after the teskar another feast, but of a larger kind, is held, and on every anniversary of the funeral food is sent to the priests.

WE now naturally come to the religion of the Abyssinians.

This is a kind of Christianity which consists chiefly in fasting, so that an Abyssinian life oscillates between alternate severe fasts and inordinate gluttony. The fasts of the Abyssinian Church occupy nearly two-thirds of the year, and are measured in duration by the length of the shadow. One fast, for example, must be kept until a man's shadow measures in length nine and a half of his own feet, another until it is nine feet, and a third until it is ten feet long. And these fasts are real ones, no food of any kind being taken until the prescribed time, and no such modifications as fish, &c., being allowed to mitigate their severity. During Good Friday and the following Saturday the clergy, and all who have any pretensions to religion, fast for forty-eight hours; and, altogether, including the Wednesdays and Fridays, two hundred and sixty days of fasting occur in the year. During the long fasts, such as that of Lent, which lasts for fifty-five days, the people are allowed to eat on the mornings of Saturday and Sunday, but, even in that case, meat in any form is strictly forbidden.

As soon as the lengthening shadow proclaims the end of the fast, the feasting sets in, and during the season of Epiphany the whole night is passed in a succession of eating, drinking, singing, dancing, and praying, each being considered equally a religious duty. Then there is a sort of game, much resembling our "hockey," at which all the people play, those from one district contending against those of another, much as the Ashburne North and South football match used to be conducted on Shrove Tuesday.

St. John's Day is a great feast among the

(1.) THE BATTLE FIELD. (See page 663.)

(2.) INTERIOR OF AN ABYSSINIAN HOUSE. (See page 667.)

Abyssinians, and has this pre-eminence over the others, that all the people not only wash themselves, but their clothes also. It is the only day when the Abyssinians apply water externally, with the exception of washing the hands before and after meals, and the feet after a journey. In fact, they consider that washing the body is a heathenish and altogether un-Christian practice, only to be practised by the Mohammedans and such like contemptible beings.

Between St. John's Day and the feast of Mascal, or the Cross, the young people of both sexes keep up a continual skirmishing. In the evening they all leave their houses, the boys with bunches of nettles, and the girls with gourds filled with all kinds of filth. When they meet, they launch volleys of abuse at each other, the language being not the most delicate in the world, and then proceed to active measures, the girls flinging the contents of the gourds at the boys, while the latter retaliate by nettling the girls about their naked shoulders.

The day on which the greatest ceremonies take place is the feast of Mascal. On the eve of Mascal every one goes about with torches, first carrying them over the houses, and peering into every crevice like the Jews looking for leaven, and then sallying into the air. The play which ensues mostly turns into a fight, which reminded Mr. Parkyns of the town and gown rows at college, and which begin in the same way, *i. e.* with the mischievous little boys. These begin at first to abuse each other, and then to fight. Next, a man sees his son getting rather roughly handled, drags him out of the fray, and pommels his antagonist. The father of the latter comes to the rescue of his son, the friends of each party join in the struggle, and a general fight takes place. Mostly these contests are harmless, but, if the combatants have been indulging too freely in drink, they are apt to resort to their weapons, and to inflict fatal injuries.

During the night great fires of wood are built by the chiefs on the highest hills near the towns, and set on fire before daybreak. Oxen and sheep are then led three times round the fires, slaughtered, and left to be eaten by the birds and beasts of prey. This is distinctly a heathen custom, both the position of the altar and the mode of sacrifice designating clearly the fire-worshipper. When, therefore, the people awake in the morning after the fatigue and dissipation of the night, they find the whole country illuminated with these hill-fires.

They then go to their several chiefs, and all the soldiers boast before him of their prowess, some describing the feats which they have done before the enemy, and others prophesying the feats that they intend to do when they happen to meet an enemy. Gifts are mostly presented at this time, and feasting goes on as usual; every

chief, however petty, slaughtering as many cows as he can afford, and almost every householder killing at least one cow.

The churches of Abyssinia are not in the least like those edifices with which we generally associate the name of church, being small, low, flat-roofed, and, indeed, very much like the old Jewish tabernacle transformed into a permanent building. Some of the more modern churches are oblong or square, but the real ancient Abyssinian buildings are circular, and exactly resemble the ordinary houses, except that they are rather larger. They are divided into three compartments by concentric walls. The space between the first and second wall is that in which the laity stand, the priests alone having the privilege of entering the holy place within the second wall.

In the very centre is a small compartment, sometimes square and sometimes circular. This is the Most Holy Place, and contains the ark, which is venerated almost as much by the Abyssinians as the ancient ark was revered by the Jews. The ark is merely a wooden box, in many churches being of extreme antiquity, and within it is placed the Decalogue. Over the ark is a canopy of silk or chintz, and around it are a vast number of silken and cotton rags. They even fancy that the original ark of the Jews is deposited within a rock-shrine in Abyssinia.

The Abyssinians also follow the old Jewish custom of taking their sacred shrine into battle.

In an illustration on page 662, which represents a battle between the Abyssinians and Gallas, is seen the king, shaded with his umbrellas, giving orders to a mounted chief, whose ornamented shield and silver coronal denote his rank. In the distance may be seen villages on fire, while on the right an attack is being made on one of the lofty strongholds in which the people love to entrench themselves. Several dead Gallas are seen in the foreground, and in front of the king are some of the fallen prisoners begging for mercy. In the right-hand corner of the illustration is seen a conical object on the back of a mule. This is one of their shrines, which accompanies them as the ark used to accompany the Israelites to battle. The shrine mostly contains either a Bible or the relics of some favorite saint, and the covering of the mule is always of scarlet cloth. Two priests, with their white robes and turbans, are seen guarding the mule.

Paintings of the rudest possible description decorate the walls of the church, and are looked upon with the greatest awe, though they are no better in execution than the handiwork of a child of six. Their subjects are generally the Crucifixion and conventional portraits of saints, St. George being, perhaps, the greatest favorite, and having the most numerous representations.

The priesthood are, as may be imagined, no very good examples either of piety or letters. Some of them, but by no means all, can read; and even of those who do possess this accomplishment, very few trouble themselves to understand what they read, but gabble the words in parrot fashion, without producing the least impression on the brain.

Such being the education of the teachers, that of the taught may be inferred; in fact, no Abyssinian layman can read. The late King Theodore was a brilliant exception to this general rule; but then it must be remembered that he had passed several years in a monastery, and had partaken of the same educational privileges as those who were intended for the priesthood. Consequently, the Bible is a sealed book to all the laity and to a very large proportion of the priests, and the lives of the saints, and the various written charms which they purchase so freely, are by the Abyssinians valued far above the sacred volume itself.

As moreover the scribes, who are the most educated men in the country, gain their living by writing copies of the Bible, of the lives of the saints, and by writing charms, it is their interest to keep the people in ignorance, even though the laity were to manifest any desire to think for themselves. As, however, thinking is far too troublesome a process for them, they very contentedly leave all their religious matters in the hands of their clergy. Each man to his own business, say they—the warriors to fight, the priests to pray.

As for these lives of the saints, they are a collection of the most marvellous tales, often ludicrous and puerile, mostly blasphemous according to our ideas on the subject, but sometimes highly poetic and even touching the sublime. There is one tale of St. Gabro Memtis Kouddos, *i. e.* Slave of the Holy Spirit, which contrives to comprise in itself all these elements. He was born a saint, stood up and repeated the threefold invocation three days after his birth, and was so very holy that for his entire life he took no nourishment of any kind. Once he fell over a precipice three hundred feet deep, and when the angels spread their wings under him he declined their assistance, giving his reasons at such length that the fall must have been a very slow one. The apparently blasphemous portions of his life I omit, and proceed to the end of it.

He *would* go on living for such an unconscionable time that at last the angel of death was sent personally to fetch him. The saint, however, declined the invitation, and logically argued that, as he had neither eaten nor drunk, his body did not belong to earth, therefore could not be restored to earth, and that, on the whole, any change must be for the worse. All the previous saints came and tried to persuade him, and at last he

found himself obliged to die. But then there was a great controversy as to the destination of his body. Air, of course, would not take it; and as the saint had never eaten nor drunk nor used a fire, neither of the elements could receive his body; and so he was again restored to it, and, still living, was taken up to heaven. Any of our readers who have perused the Talmud will remember a similar legend, which is doubtless the origin of the above-mentioned story.

This being a sample, and a very mild one, of the religion of the Abyssinians, we may easily imagine what must be their superstitions. These are of the genuine African cast, and have survived with undiminished strength in spite of the system of Christianity which has so long existed in Abyssinia.

The people fully believe in the power of transformation. There is a sort of demon, called Bouda, who possesses this power, and is supposed to be the special demon of blacksmiths. Now in Abyssinia the trade of blacksmith is hereditary, and is considered a disgraceful one, all smiths being looked upon as sorcerers. This idea has evidently taken its rise from times of great antiquity, when the power of smelting, forging, and welding iron was thought to be too wonderful to be possessed by ordinary human beings.

Mr. Parkyn narrates several instances of this belief in transformation. He knew, for example, of two little girls who had been in the forest to gather wood, and came back in a great fright. They had met a blacksmith, and had begun to jeer at him for a wizard, asking him as a proof of his power to turn himself into a hyæna. The man took them at their word, untied a corner of his robe, took out some ashes, and sprinkled them over his shoulders. Immediately his head changed into that of a hyæna, hair spread itself over his body, and, before they could recover from the terror which paralyzed them, the now complete hyæna grinned and laughed at them, and then trotted into the neighboring bush.

Another story curiously resembles some of the transformation tales of the Arabian Nights. Two Bouda brothers used to make a good living by their powers of transformation. One of them would change himself into a horse, mule, or some other valuable animal, and was then sold by his brother. In the middle of the night the transformed man resumed his human shape, and walked home to join his brother. This went on for some time, but at last no one would buy from them, as they kept no stock. No one knew where they obtained the animals which they sold, and, moreover, no one liked to buy animals which had a knack of always escaping before twenty-four hours. At last one man determined to solve the mystery. One of the Bouda brothers offered for sale a peculiarly handsome horse. The

man bought it, and as soon as he got the animal out of the town, he drove his lance through its heart, and killed it on the spot.

He then threw himself in the way of the seller, and uttered loud lamentations over his hasty temper, which had caused him to kill so splendid an animal. The Bouda contrived to hide his emotion until he reached his home, and then began the usual lamentations for the dead, rubbing the skin off his temples and wailing loudly. On being questioned, he said that he was mourning the death of his brother, who had been robbed and murdered by the Gallas, from whom he had been buying horses for sale.

It seems also that the Boudas can transform other persons into animals, even without their consent. A woman had died, and, immediately after the funeral, a blacksmith came to the priest in charge of the cemetery, and bribed him to give up the newly-buried corpse. This was done, and the neighbors all remarked that the blacksmith had purchased a remarkably fine donkey, on which he always rode. There was this peculiarity about the animal, that it always wanted to run into the house where the dead woman had lived, and whenever it met any of the young people brayed loudly, and ran toward them.

The eldest son being a very intelligent young man, suddenly declared that the animal in question must be his mother, and insisted on bringing the ass and its rider into the hut. Here the animal seemed quite at home; and the smith was charged with being a Bouda, and with changing the body of the woman into an ass. At first he repudiated the assertion, but at last, by dint of mingled threats and promises, he confessed that he had indeed wrought the change. The woman was not dead, but was only in a trance into which he had thrown her, and could be restored to her own form again. Being promised forgiveness, he began his incantations, when the ass gradually threw off the furry coat and assumed the human form. The transformation was nearly complete, when one of the sons, in a sudden access of fury, drove his spear through the blacksmith and stopped the transformation, so that ever afterward the woman had one human foot and one ass's hoof. Many persons told Mr. Parkyns that they had actually seen the hoof in question.

The Bouda exhibits his power in various modes, one of which is a kind of possession, in which the afflicted person is, as it were, semi-demoniacal, and performs feats which are utterly impossible to the human body in the normal condition. Men and women are alike seized with the Bouda madness, although the females are naturally more liable to its attacks than the men, generally accounting for the fact by stating that they have rejected the love of some Bouda or other. The chief object of the Bouda seems

to be to lay a spell on the afflicted persons which will cause them to come at his call. Consequently, he assumes the shape of the hyæna, calls the victims at night, and, if they are not bound and carefully watched, they are forced to go to the hyæna, and are then devoured.

A remarkable example of this Bouda illness was watched by Mr. Parkyns with the greatest care. The afflicted person was a servant woman of Rohabaita. The complaint began by languor and headache, and then changed into an ordinary fit of hysterics, together with great pain.

"It was at this stage that the other servants began to suspect that she was under the influence of the Bouda. In a short time she became quiet, and by degrees sank into a state of lethargy, approaching to insensibility. Either from excellent acting and great fortitude, or from real want of feeling, the various experiments which were made on her seemed to have no more effect than they would have had on a mesmeric somnambulist. We pinched her repeatedly; but, pinch as hard as we could, she never moved a muscle of her face, nor did she otherwise express the least sensation. I held a bottle of strong sal-volatile under her nose, and stopped her mouth; and this having no effect, I steeped some rag in it, and placed it in her nostrils; but, although I would wager any amount that she had never either seen, smelt, or heard of such a preparation as liquid ammonia, it had no more effect on her than rosewater.

"She held her thumbs tightly inside her hands, as if to prevent their being seen. On my observing this to a bystander, he told me that the thumbs were the Bouda's particular perquisite, and that he would allow no person to take them. Consequently, several persons tried to open her hands and get at them; but she resisted with what appeared to me wonderful strength for a girl, and bit their fingers till in more than one instance she drew blood. I, among others, made the attempt, and, though I got a bite or two for my pains, yet either the devil had great respect for me as an Englishman and a good Christian, or she had for me as her master, for the biting was all a sham, and struck me as more like kissing than anything else, compared with the fearful wounds she had inflicted on the rest of the party.

"I had a string of ornamental amulets which I usually wore, having on it many charms for various maladies; but I was perfectly aware that none for the Bouda was among them. Still, hoping thereby to expose the cheat, I asserted that there was a very celebrated one, and laid the whole string on her face, expecting that she would pretend to feel the effects, and act accordingly; but, to my surprise and disappointment, she remained quite motionless. Sev-

eral persons had been round the village to look for some talisman, but only one was found. On its being applied to her mouth she for an instant sprang up, bit at it, and tore it, but then laughed, and said it was weak, and would not vex *him*.

"I here use the masculine gender, because, although the patient was a woman, the Bouda is supposed to speak through her medium; and, of whatever sex they be, the sufferers, or rather the spirits, when speaking of themselves, invariably use that gender. I deluged her with bucketfuls of water, but could not either elicit from her a start or a pant, an effect usually produced by water suddenly dashed over a person.

"At night she could not sleep, but became more restless, and spoke several times. She even remarked, in her natural tone of voice, that she was not ill, nor attacked by the Bouda, but merely wished to return to Adoun. She said this so naturally that I was completely taken off my guard, and told her that of course she might go, but that she must wait till the morrow. The other people smiled, and whispered to me that it was only a device of the Bouda to get her out into the forest, and then devour her."

By one of those curious coincidences that sometimes occur, a hyæna, who, according to the popular ideas was the transformed Bouda, was heard hooting and laughing close to the village for the whole of the night, that being the only time that Mr. Parkyns had known the animal do so during the whole of his stay at Rohabaita. In consequence of the presence of the animal, the young woman was tightly bound, and sentinels were placed within and without the door of the hut. Whenever the hyæna called, the woman moaned and started up, and once, after she had been quiet for nearly an hour, and the inner sentinel had dropped off to sleep, the hyæna came close to the hut, and the woman rose, *without her bonds*, crept on all-fours to the door, and had partly succeeded in opening it when one of the sentinels made a noise, and she went back to her place. In this way she was kept under the strictest watch for three days, during which time she would neither eat nor drink, rejecting even a small piece of bread when she had swallowed it, and on the third evening she mended and gradually recovered.

If this were imposture, as Mr. Parkyns remarks, it is difficult to find a motive. She had scarcely any work to do, and the wonder is what could make her voluntarily prefer three days confinement, with pinches, cords, cold water, and other ill-treatment — not to mention that severest of all punishments to an Abyssinian, total abstinence from food and drink.

According to the people, this enchantment is caused by a Bouda, who has learned the

baptismal name of the affected person. This is always concealed, and the Abyssinians are only known by a sort of nickname, which is given by the mother as they leave the church. When, however, a Bouda learns the baptismal name, he takes a straw, bends it into a circle, mutters charms over it, and puts it under a stone. As the straw is bent, the illness begins; and should it break, the victim dies.

Charms of certain kinds have a potent effect on the Bouda. On one occasion a poor weakly girl was lying apparently senseless, on whom Mr. Parkyns had uselessly tried, by the application of false charms, to produce an effect. Suddenly the woman flew into violent convulsions, screaming and struggling so that four strong men could scarcely hold her. Just then an Amhara soldier entered the outer court, and she cried out, "Let me alone and I will speak." This man, it appeared, had heard that a patient was ill of the Bouda, and had brought with him a charm of known power.

After much threatening with the amulet, accompanied by fierce and frantic rage on the part of the possessed, the Bouda promised to come out if food were given him. It is remarkable by the way, that the Bouda is always of the male sex, and, whether the possessed be a man or a woman, always uses the masculine gender in language. The rest must be told in Mr. Parkyns' own words:—

"A basin was fetched, in which was put a quantity of any filth that could be found (of fowls, dogs, &c.), and mixed up with a little water and some ashes. I took the basin myself, and hid it where I was positive that she could not see me place it, and covered it up with some loose stones which were heaped in the corner. The Bouda was then told that his supper was prepared, and the woman rose and walked down the court on all-fours, smelling like a dog on either side, until, passing into the yard where the basin was, she went straight up to it, and, pulling it out from the place where it was hidden, devoured its abominable contents with the utmost greediness. The Bouda was then supposed to leave her, and she fell to the ground, as if fainting. From this state she recovered her health in a few days."

A somewhat similar sort of possession is called *Tigritiya*. In this case the patient falls into a sort of wasting away, without apparent cause, and at last sits for several days together without eating or speaking. Music is the only means of curing a patient, who will then spring from the couch on which he has lain, apparently without strength to sit up, and will dance with the most violent contortions, keeping up the exercise with a vigor and pertinacity that would tire the strongest man in perfect

health. This is a sign that the demon may be driven out; and when the music ceases, the patient falls to the ground, and then begins to speak (always in the person of the demon), demanding all kinds of ornaments — sometimes, even if a poor woman, asking for the velvet robes and silver-mounted weapons of a chief. These cannot be obtained without much expense, but at last are procured, when the dancing is resumed, and, after several accessions of the fit, the patient takes off all the borrowed ornaments, and runs at full speed until the demon suddenly departs, and the possessed person loses all the fictitious strength that had animated him, and falls to the earth in a swoon. The demon takes his leave, and is deterred from returning by the firing of guns, and a guard with drawn swords that surrounds the prostrate form of the moaning patient.

THE architecture of the Abyssinians is simple, but characteristic. Houses differ in form according to the means of their owner, those of the commonalty being merely circular huts, while those of the wealthy are square and flat-roofed.

A rich man's house is rather a complicated piece of architecture. It stands in an enclosure, like an Indian compound, and the principal gateway is covered and flanked on either side by a porter's lodge, in which sleep the actual gate-keeper and other servants. Within the enclosure are generally a few slight huts of straw, for the reception of strangers or servants. About one-fourth of the compound is divided by a wall, and contains the kitchen, store-houses, &c. At the end opposite the gateway is the *Adderash*, or reception room, which is square or oblong, and often of considerable size. The roof is flat; but when the room is too large to be crossed by beams, only the angles are roofed in the ordinary way, so as to leave an octagonal opening in the centre. A wooden wall about four or five feet high is next built round the opening, and there is then no difficulty in roofing it.

The *Adderash* is divided into three rooms, the largest of which is the reception room. At the end is the stable, the horses and mules passing into it through the reception room. The "medeb," or bed-room (if it may be so called), is merely a strip of the apartment, about eight feet wide, separated by a partition wall; and if the owner of the house should be a married man, the entrance of the medeb is closed by a curtain. This apartment takes its name from the medeb, or divan, which is simply a part of the floor raised a foot or so above the rest, about five feet in width, and extending for the whole length of the room. Opposite the medeb is a small alcove, in which is placed the couch of the master of the house. This couch, or "arat," is a stont wooden framework, across which is stretched a network of raw hide

thongs, an inch or two in width. These contract when drying, and form a tolerably elastic bed.

In warm weather the arat is placed out of doors, and is only covered with a slight cloth roof. One of these outdoor beds may be seen in the illustration No. 2, on page 662.

The floor of the reception room is covered with grass, just as in the olden times even palace floors were strewn with rushes. Whenever a visitor enters, fresh grass is strewn to make a clean seat for him, but no one thinks of removing that which already has become discolored. Consequently, what with the continual washing of hands by pouring water over them, the spilling of beer and mead, and the mud that clings to the horses' feet as they pass to and from their stable, the flooring of the house becomes nothing more or less than a fermenting manure-heap. At last, when even the Abyssinian nose can endure it no longer, the room is cleared, and left empty for a day or two in order to rid it of the intolerable odor which still clings to it.

Round the walls of the reception room are a number of cows' horns by way of pegs, on which are hung the spears, shields, horse-accoutrements, drinking-horns, and other property of the owner.

The store-houses contain huge earthenware jugs, the mouths of which nearly reach the roof of the house, though their bases are sunk a yard or so in the ground. The Abyssinians value these jars highly, inasmuch as they are evidences of wealth.

As to the other two provinces, Shoa and Amhara, there is so little difference between them and Tigré that there is no need to occupy space with them. Practically they form one kingdom, just as England, Wales, Scotland, and Ireland, and there is among them a very strong provincial jealousy, analogous to that which still prevails among the uneducated members of our own United Kingdom. Even Mr. Parkyns could not resist the feeling, and was a strenuous admirer of Tigré, considering the Amharas as ferocious and overbearing boors, and despising the Shoas altogether.

The province of Shoa, however, is by no means a despicable one, as may be seen from the following description of the great annual feast which is given by the king or prince at Easter. This hospitable banquet is on a truly royal scale, and is continued for a whole week, so that every free man who can attend the capital may have an opportunity of taking part in it.

The banqueting room is a very large and lofty chamber, having on one side a curtained alcove, in which the prince sits. Fresh grass is daily strewn on the floor, and round the room are set the tables, which are low, circular pieces of wickerwork. It is only in such houses that the tables are uni-

form in shape or size. Behind the tables and ranged along the wall are the body guards of the prince, armed with shields and a sword much resembling the old Roman weapon. Troops of servants are in waiting, and before the banquet begins they bring in the bread in piles, and place it on the tables. Sometimes as many as thirty loaves will be placed for each guest, the finest bread being always at the top and the coarsest below.

The object of this arrangement is to suit the different ranks of the party. Those of highest rank come first, and eat the finest, using the second-class bread as table-napkins. When they have finished, the guests of the next rank come in, eat the second-class bread, and wipe their fingers on the third-class bread, and so on until the whole is consumed.

Round the room are hung rows of shields, lion skins, and mantles of honor to be conferred by the prince on his subjects, while above them is a wide carpet, on which are depicted lions, camels, horses, and other animals.

All being ready, the guests assemble, and the prince takes his seat in the alcove, where he gives audience. Professional musicians enliven the scene with their instruments, and professional dancers aid their efforts. In the mean time, the guests are eating as fast as they can, the servants carrying meat from one guest to the other, and making up neat little sausages of meat, bread, and pepper, which they put adroitly into the mouths of the guests. As in more civilized lands, it is always better to propitiate the servants, because they can give the best parts of the meat to those whom they like, and reserve the gristle and toughest parts for those who displease them.

The politer guests, having by means of two or three pounds of meat, a pile of bread, and a gallon or so of mead, taken the edge off their own appetites, make up similarly seasoned balls, and put them into their neighbors' mouths. This is done with such rapidity that a man who happens to have made himself agreeable to his right and left hand neighbors is nearly choked by the haste with which etiquette requires that he shall despatch the highly-spiced morsels.

After this preliminary portion of the feast, in which cooked mutton is mostly employed, acting as a provocative to the real banquet which is to follow, the servants bring in raw meat still warm with life, and cut from a cow that has been slaughtered at the door while the mutton and bread has been consumed.

The giver of the feast sits in his alcove, and below him are the armed guards. The guests sit at wickerwork tables, using their curved swords with the national adroitness, and servants wait on the guests carrying great pieces of raw beef about. The liquors, by the way, are drunk from horns, which are

always served by women. In the centre are the musicians, playing the curious fiddle and harp of Shoa, and a little further on are the dancers.

As to the other tribes which are either in or about Abyssinia, a very few words must suffice for them.

There is one curious and very wild tribe, known by the name of BAREA. They are inborn marauders, executing their raids with marvellous rapidity and skill. So clever are they at concealing themselves, that even on an open plain, where there is not the least cover, they manage to dispose of themselves in such a way as to deceive an eye unpractised in their arts.

Once Mr. Parkyns was passing through a district over which one of the bush fires had swept, when he was astonished by the exclamation of his guide, that Barea were in sight, pointing at the same time to a dead tree, standing on an eminence at a distance of several hundred yards, and charred black by last year's fires. "All I saw was a charred stump of a tree, and a few blackened logs or stones lying at its foot. The hunter declared that neither the tree nor the stones were there the last time that he passed, and that they were simply naked Barea, who had placed themselves in that position to observe us, having no doubt seen us for some time, and prepared themselves.

"I could scarcely believe it possible that they should remain so motionless, and determined to explore a little. The rest of the party advised me to continue quietly in the road, as it was possible that, from our presenting a rather formidable appearance, we should pass unmolested; but, so confident was I of his mistake, that, telling the rest to go on slowly as if nothing had happened, I dropped into the long grass and stalked toward them. A shot from my rifle, at a long distance (I did not venture too close), acted on the tree and stones as promptly as the fiddle of Orpheus, but with the contrary effect, for the tree disappeared, and the stones and logs, instead of running after me, ran in the opposite direction.

"I was never more surprised in my life, for so complete was the deception, that even up to the time I fired I could have declared the objects before me were vegetable or mineral—anything but animal. The fact was that the cunning rascals who represented stones were lying flat, with their little round shields placed before them as screens."

Some of the wild tribes of India act in the same manner. There is a well-known story of an officer on the march, who was so completely deceived that he stood close by one of these metamorphosed men for some time, and at last hung his helmet on a projecting bough. This was nothing more than a

(1.) BUFFALO DANCE. (See page 671.)

(2.) BEDOUIN CAMP. (See page 682.)

leg of the dark savage, who was standing on his head, with his limbs fantastically disposed to represent the branches of an old tree-stump, the illusion being heightened by the spear-shafts, which did duty for the smaller branches. This mark of confidence was too much for the gravity of the savage, who burst into a shriek of laughter, turned head-over-heels, and disappeared into the jungle, the helmet still attached to his leg.

These clever and withal amusing marauders are very thorns in the side of the Abyssinians, who never know when the Barea may not be upon them. In many respects they resemble the warlike tribes of the Red Indians, though they are certainly superior to them in size and strength. They will follow a travelling party for days, giving not an indication of their presence, and speaking to one another wholly by signs, of which they have an extensive vocabulary. But they will never show themselves until the

time comes for striking the long-meditated blow, when they will make their attack, and then vanish as mysteriously as they had come. On one occasion nearly two hundred Barea came overnight to the outskirts of a village, and there lay in wait. In the early morning, two of the principal men of the village, one a man who was celebrated for his majestic and somewhat pompous demeanor, took a walk toward their cotton-fields, and found themselves in the midst of the Barea, who captured them, and carried them off to be sold as slaves to the Arabs, who would probably sell them again to the Turks.

When the Barea encamp round a village, they keep themselves warm for the night by the ingenious plan of each man digging a hole in the ground, making a small fire in it, and squatting over it enveloped in his cloth, so as to retain the heat and to prevent the fire from being seen.

THE GALLAS.

SURROUNDING a very considerable portion of Abyssinia proper are various tribes of the fierce and warlike GALLAS.

The Galla men are a fine and even handsome race, extremely variable in the hue of their skin, as may be supposed from the very large extent of ground which is inhabited by their tribes. Moreover, they have mixed considerably with the Abyssinians proper, and are often employed as slaves by them. Female Galla slaves are frequently kept in the households of Abyssinians, and the consequence is, that a mixed progeny has sprung up which partakes of the characteristics of both parents. This has taken place considerably in Shoa, where the Galla element is very conspicuous among the population. As a rule, however, they are much darker than the Abyssinians, a circumstance which has induced Mr. Johnstone to derive their name from the word "calla," or black. Their language is a dialect of the Amhara tongue, but varied, like their skins, according to the precise locality of the tribe.

The features of the Gallas have none of the negro characteristics, such as the length of the skull, the contracted (though not receding) forehead, and the full development of the lips and jaws. The hair resembles that of the Abyssinians, and is dressed in various modes. Sometimes it is formed into long, narrow plaits, hanging nearly to the shoulders, and in others it is frizzed out into tufts. The most singular way of dressing the hair is to collect it into three divisions, one occupying the top of the head, and one crossing each temple. The divided tresses being then combed and frizzed to the greatest possible extent, the whole head

has a most comical aspect, and has been likened to the ace of clubs.

The young women are bold and handsome, but are anything but good-looking when they grow old. Three old women who visited Mr. Johnstone, and evidently acted as spies, were remarkable for their ugliness. They wore the hair in the usual multitudinous plaits, which they had connected by means of threads, so as to form them into a continuous curtain, and had been exceedingly lavish of butter. They wore a sort of soft leather petticoat, and had on their feet a simple sandal of ox-hide, fastened to the foot by a lap passing over the great toe, and a thong over the instep. They came ostensibly to sell tobacco and ropes. The latter articles they made even while they were bargaining, a bundle of hemp being fastened to their girdles in front, and the ropes, as fast as they were twisted, being coiled round their waists.

The Gallas are a warlike race, and far more courageous than the Abyssinians, who are more given to vamping than fighting. When they return home after a victory they celebrate a curious and violent dance, called the Buffalo Dance. A head and the attached skin of a buffalo is laid on the ground, and the men assemble round it armed as if for war, with their spears and crooked swords. They then dance vigorously round the buffalo skin, leaping high in the air, striking with their swords, and thrusting with their spears, and going through all the manœuvres of killing the animal. The women take an active part in the dance. It is illustrated in the engraving No. 1, on the preceding page.

THE DANKALLI AND SOMAULI.

THEN there are the Dankalli and Somauli tribes, each of them subdivided into a number of smaller tribes, and having some traits peculiar to themselves, and others common to the Abyssinians proper. Indeed, Mr. Johnstone remarks that he has no doubt that, although they are now distinct nations, they are derived from a common origin.

The Somaulis are a warlike people, and, instead of the spears and shields which are almost the universal weapons through this part of Africa, they carry light bows and large quivers, which hang under the left arm by a broad strap passed over the same shoulder. The bow, though light, is very strong, and is much after the classical or Cupid's bow form. In consequence of this shape, when the arrow is discharged, the string comes quickly against the handle, and if the archer be inexpert his thumb gets a violent blow.

The quiver is made of an emptied gourd, the mouth of which is closed with a cover like that which is represented on several of the African quivers mentioned in this work. It contains about a dozen arrows, about a foot in length, and made of a hollow reed. Each is armed with a head of blue steel, shaped something like the ace of spades, and having its neck lengthened into a spike about an inch and a half long; this is not attached to the arrow, but is loose, and when wanted for use the spike is simply slipped into the unfeathered end of the hollow shaft. Of course, when the weapon strikes its object, the shaft falls off, and the head, which is poisoned, remains in the wound, and soon causes death.

Instead of the sword, they carry a knife with a blade about eight inches in length, the handle being merely a piece of wood

rounded, and slightly hollowed to give a firmer grasp.

The dress of the men consists of a "fotah," or waist cloth, and a robe called the "sarree." Differing in use, these cloths are of exactly the same shape and size, *i. e.* about eleven feet in length. The fotah is wound twice round the waist, the end being tucked in behind, and the whole garment made secure by the broad belt which holds the knife. The sarree is worn in robe fashion, round the body, and a man of taste disposes it so as to show off the two broad stripes of blue or scarlet at the end.

The women also wear the fotah, over which, when out of doors, they wear a long blue skirt without sleeves, and very open down the front. This is laid aside in the house, where nothing but the fotah is worn. The mode of dressing the hair into a continuous veil has been already mentioned, and Mr. Johnstone was fortunate enough to witness the process of dressing "this entangled mass, which reminded me of the hair of Samson, interwoven with the web of the loom. The lady whose hair was to be operated upon sat upon a stone in the court beneath one of our windows, and behind her, on her knees, was a stout slave-girl, who held in both hands a long-handled wooden fork-like comb, having four very strong prongs, which she dragged through the woolly, greasy, and black hair of her mistress, with the force of a groom currying a horse's tail."

The particular sub-tribe to which the people belong is denoted by sundry incised marks, which are cut with a fragment of obsidian, and are formed into patterns which sometimes extend over the whole back and breast.

CHAPTER LXVII.

NUBIANS AND HAMRAN ARABS.

TINT OF THE NUBLAN SKIN—DRESS AND WEAPONS OF THE MEN—PECULLAR SWORD AND SHIELD—
DRESS OF THE WOMEN—RĀHAT, OR THONG APRON—AMULETS—NUBLAN ARCHITECTURE—THE

ADMIRABLE HORSEMANSHIP—CATCHING BABOONS—HUNTING THE LION—CATCHING A
BUFFALO BY THE TAIL—HARPOONING THE HIPPOPOTAMUS.

INASMUCH as, in spite of the continual contact with civilization, caused by their locality on the Nile bank, the Nubians have preserved their ancient style of dress and much of their ancient manners, they deserve a place in this work.

In color the Nubians are mostly black, some being of quite a jetty hue, while others are of much lighter color. Even in the blackest Nubian, however, the tint of the skin is not that of the tropical negro, but there is a certain transparency about it, which, in the sunbeams, gives a sort of amber hue to the limbs. Besides being a fine and well-built race, the Nubians possess pleasing features, the only fault being that the lower part of the face is somewhat apt to project.

While young the boys wear no clothing whatever, but when adult they wear short trousers, a shirt, and a kind of large scarf which passes over the left shoulder, and is fastened by a girdle round the waist. Being Mahometans, they shave the hair except one tuft on the crown, and cover their bare heads with a white cotton cap.

The Nubian men mostly go armed according to their ability. The usual weapons are the sword, dagger, spear, and shield. The sword is shaped somewhat like that of the Abyssinian, but the curve is not so abrupt. The general style of the weapon, however, and the shape of the handle, proclaim a common origin. With some of the Nubians the favorite weapon is the straight sword, like that of the Hamran Arabs, which will be described in a future page.

Perhaps on account of the facility which the Nile affords for travelling into South Central Africa, they wear a dagger fastened to the left arm just above the elbow, exactly as do several of the tribes that are found near the sources of the Nile. This dagger is short and crooked, and is kept in a red leathern sheath, and, on account of its position on the arm, is covered by the garments. The spear is simply the ordinary wooden shaft with an iron head, and has nothing about it specially worthy of notice.

The shield, however, is remarkable for its structure. It is generally made of the hide of the hippopotamus or of crocodile skin, and is easily known by the projecting boss in the centre. The hide is stretched on a wooden framework, and the boss is made of a separate piece of skin. The Nubians value these shields very highly, and, in consequence, it is extremely difficult to procure them.

The women are dressed after the usual African manner. As girls they wear nothing but a little apron of leathern thongs called a rāhat. This apron is about nine inches or a foot in width, and perhaps six or seven in depth, and in general appearance resembles that of the Kaffir girl. Instead of being cut from one piece of leather, each thong is a separate strip of hide, scarcely thicker than packthread, and knotted by the middle to the thong which passes round the waist. The apron is dyed of a brick-red color, and, after it has been in use for any time, becomes so saturated with the castor-oil which stands these primitive belles in lieu of clothing, that

the smell is unendurable. Travellers often purchase them from the Nubian girls, who, as a rule, are perfectly willing to sell them; but the buyers are obliged to hang their purchases on the top of the mast for a month or so, before they can be taken into the cabin. One of these aprons in my collection has still the familiar castor-oil odor about it, though many years have passed since it was purchased from a Nubian girl.

Of course they wear as many ornaments as they can procure; and some of these, which are handed down from one generation to another, are of great value. Few characteristics are more striking to an observant traveller than the fact that a Nubian girl whose whole dress may perhaps be worth three-pence, and who really could not afford to wear any clothing at all if it cost sixpence, will yet carry on her neck, her wrists, her ankles, and in her ears, a quantity of gold sufficient to purchase a handsome equipment.

It is rather a remarkable point that these aprons always become narrower toward the left side. The daughters of wealthy parents, though they wear no clothing except the apron, still contrive to satisfy the instinctive love of dress by covering the leathern thongs with beads, white shells, and pieces of silver twisted round them. When the girls marry, they retain the apron, but wear over it a loose garment, which passes over one shoulder, and hangs as low as the knee.

The ornaments with which they profusely decorate their persons are of various materials, according to the wealth of the woman who owns them. Those of the wealthy are of gold and silver, while those of the poorer class are of buffalo horn, brass, and similar materials. The metal amulets are of a crescent shape, and are open at one side, so as to be clasped on the arm or removed, according to the wearer's pleasure.

The hair is dressed in a way that recalls the ancient Egyptian woman to the traveller. It is jetty black and tolerably long, and is twisted with hundreds of small and straight tresses, generally finished off at the tips with little knobs of yellow clay, which look at a distance as if they were little lumps of gold. Amulets of different kinds are woven into the locks, and the whole is so saturated with castor-oil that an experienced traveller who wishes to talk to a Nubian woman takes care to secure the windward side, and not to approach nearer than is absolutely needful. As a rule, the Nubian women are not so dark as the men, but approach nearly to a coffee tint.

"Two beautiful young Nubian women visited me in my boat, with hair in the little plaits finished off with lumps of yellow clay, burnished like golden tags, soft deep bronze skins, and lips and eyes fit for Iris and Athor. Their very dress and ornaments were the same as those represented in the tombs, and I felt inclined to ask them how many thou-

sand years old they were." (Lady Duff Gordon's "Letters from Egypt.")

The same writer well remarks that the whole country is a palimpsest, in which the Bible is written over Herodotus, and the Koran over the Bible. In the towns the Koran is most visible; in the country, Herodotus.

One of these graceful Nubian girls is represented in the frontispiece to this volume.

The amulets which have been just mentioned are worn by men and women alike, and are sewed up in red leather cases like those of the Bornuans. It is an essential part of their efficacy that their contents should not be known, and if once a case be opened, the enclosed amulet loses its power. The men often wear great numbers of them, tying them on their arms above the elbows.

The houses in which the Nubians live, or rather in which they sleep, are of very simple construction. Residing among the ruins of palaces, the Nubians have never learned to build anything better than a mud hut. These huts are of much the same shape as the old Egyptian buildings, being squared towers, large at the base, and decreasing toward the top, which is square, and in the better class of house answers as a terrace. The roof is covered with palm branches, and every good house possesses a sort of courtyard surrounded by walls, in which the women can pursue their different vocations while sheltered from the sun.

Granaries are seen near every village, and consist of shallow pits sunk in the ground and covered with a sort of white plaster. The villages also possess a shed for the reception of strangers, and each house has a jar of fresh water always kept ready for use.

Fortunately for themselves, the Nubians are both proud and fond of their country; and, although they are despised by the Arabs to such an extent that a Nubian always tries to pass himself off as an Arab whenever he has the opportunity, they are ever boasting of the many perfections of the land which they thus reject.

How long the Nubians may possess this land is doubtful. The Turk, "under whose foot no grass grows," is doing his best to depopulate the country. The men are pressed for soldiers, as many as thirty per cent. having been carried off in one conscription, and they are always being seized for forced labor — *i. e.* a life somewhat worse than that of plantation slaves. Consequently, as soon as they take alarm, they leave their village and escape into the interior, abandoning their crops and allowing them to perish rather than serve under the hated rule of the Turk. The least resistance, or show of resistance, is punished by death, and several travellers have related incidents of cold-blooded cruelty which seem almost too hor-

rible to tell, but which were taken quite as matters of ordinary occurrence. Taxation, too, is carried out to a simply ruinous extent, and the natural result is fast taking place, namely, the depopulation of the land, and the gradual lessening of the number of tax-payers.

THE HAMRAN ARABS.

To describe, however briefly, all the tribes which inhabit the vast district called Arabia, would be a task far beyond the pretensions of this work. Some have advanced very far in civilization, while others have retained, with certain modifications, their pristine and almost savage mode of life. I shall therefore select these latter tribes as examples of the Arab life, and shall briefly describe one or two of the most characteristic examples.

SOUTH of Cassala there is a remarkable tribe of Arabs known as the Hamrans, who are celebrated through all the country for their skill in hunting. They possess the well-cut features and other characteristics of the Arab race, and are only to be distinguished by the style of wearing the hair. They permit the hair to grow to a great length, part it down the middle, and carefully train it into long curls. Each man always carries the only two weapons he cares about, namely, the sword and shield. The latter is of no very great size, is circular in shape, and about two feet in diameter, with a boss in the centre much like that of the Nubian shield already described. It is made of the skin of the hippopotamus, and, being meant for use and not for show, is never ornamented.

As to the sword, it is the chief friend of the Hamrau Arab's life, and he looks upon it with a sort of chivalric respect. It is straight, double-edged, and is furnished with a cross-handle, like that of the ancient Crusaders, from whom the fashion seems to have been borrowed. The blades are of European make, and the Arabs are excellent judges of steel, valuing a good blade above everything. They keep both edges literally as sharp as razors, and prove the fact by shaving with them. When a Hamran Arab is travelling and comes to a halt, the first thing he does after seating himself is to draw his sword and examine both edges with the keenest attention. He then sharpens the weapon upon his leathern shield, and when he can shave the hair on his own arm with both edges, he carefully returns the blade into the sheath.

The length of the blade is three feet, and the handle is about six inches long, so that the weapon is a very weighty one, and a fair blow from its keen edge will cut a man in two. Still, it is not serviceable in single combat, as, although its weight renders a successful blow fatal, it prevents

the recovery of the sword after an unsuccessful blow. Sir S. Baker, to whom we are indebted for an account of this remarkable tribe, says that a Hamran Arab, with his sword and shield, would be at the mercy of an ordinary swordsman. He can cut and slash with wonderful energy, but knows nothing of using the point or parrying, so that, if a feint be made at his head, he will instinctively raise the shield, and lay his whole body open to the point of his adversary's sword.

The scabbard in which the sword is carried is very ingeniously made of two strips of soft and elastic wood, slightly hollowed to receive the blade, and covered with leather. The absurd metal scabbards still in use in our army would be scorned by an Arab, who knows the value of a keen edge to his weapon. On the scabbard are fitted two projecting pieces of leather. When the Arab is on the march, he slings the sword on the pommel of his saddle, and passes his leg between these leather projections, so that the sword is held in its place, and does not jump and bang against the sides of the horse.

Armed with merely the sword, these mighty hunters attack all kinds of game, and match themselves with equal coolness against the elephant, the rhinoceros, the giraffe, the lion, or the antelope. Their mode of procedure is almost invariably the same. They single out some particular animal, and contrive to cut the tendon of the hind leg with a blow of the sword, thus rendering the unfortunate beast helpless.

When they chase the elephant, they proceed in the following manner. The elephant hunters, or *aggageers*, as they call themselves, convert their swords into two-handed weapons by wrapping thin cord very closely round the blade, for about nine inches from the handle. The guarded portion of the blade is held in the right hand, and the hilt in the left.

Two hunters generally set out in chase of the elephant. Having selected the bull with the largest tusks, they separate it from its fellows, and irritate it until it charges them. One of the *aggageers* takes on himself this duty, and draws the attention of the elephant upon himself. The irritated animal makes its furious onset, and goes off at full speed after the *aggageer*, who carefully accommodates his pace to that of the elephant, so that it always thinks it is going to catch him, and forgets that he has a companion.

Meanwhile, the other aggageer rides close to the side of the elephant, draws his sword, springs to the ground, bounds alongside of the elephant, delivers one tremendous cut on the ankle of the hind foot, and springs again on his horse. As soon as the elephant puts the injured foot on the ground, the joint becomes dislocated, and the foot turns up like an old shoe. The animal is now helpless, and, while its attention is still engaged by the aggageer whom it has been pursuing, the swordsman passes to its other side, slashes the ankle of the remaining leg, and brings the animal to a dead halt. The sword is carefully wiped, sharpened, and returned to the sheath, while the wounded elephant sinks to the ground, and in a short time dies from loss of blood. Thus one man will kill an elephant with two blows of a sword.

It is evident that such hunting as this requires the most perfect horsemanship, and it is accordingly found that the Hamran Arabs are among the best horsemen in the world. They and their steeds seem to be actuated by one spirit, and they sit as if the horse and his rider were but one animal. In his travels in Abyssinia Sir S. Baker gives a very graphic account of their mode of riding.

"Hardly were we mounted and fairly started, than the monkey-like agility of our aggageers was displayed in a variety of antics, that were far more suited to performance in a circus than to a party of steady and experienced hunters, who wished to reserve the strength of their horses for a trying journey.

"Abou Do was mounted on a beautiful Abyssinian horse, a gray; Suleiman rode a rough and inferior-looking beast; while little Jali, who was the pet of the party, rode a gray mare, not exceeding fourteen hands in height, which matched her rider exactly in fire, spirit, and speed. Never was there a more perfect picture of a wild Arab horseman than Jali on his mare. Hardly was he in the saddle, than away flew the mare over the loose shingles that formed the dry bed of the river, scattering the rounded pebbles in the air from her flinty hoofs, while her rider in the vigor of delight threw himself almost under her belly while at full speed, and picked up stones from the ground, which he flung, and again caught as they descended.

"Never were there more complete Centaurs than these Hamran Arabs; the horse and man appeared to be one animal, and that of the most elastic nature, that could twist and turn with the suppleness of a snake; the fact of their separate being was proved by the rider springing to the earth with his drawn sword while the horse was in full gallop over rough and difficult ground, and, clutching the mane, he again vaulted into the saddle with the agility of a monkey, without once checking the speed.

"The fact of being on horseback had suddenly altered the character of these Arabs; from a sedate and proud bearing they had become the wildest examples of the most savage disciples of Nimrod; excited by enthusiasm, they shook their naked blades aloft till the steel trembled in their grasp, and away they dashed, over rocks, through thorny bush, across ravines, up and down steep inclinations, engaging in a mimic hunt, and going through the various acts supposed to occur in the attack of a furious elephant."

This capability of snatching up articles from the ground stands the hunters in good stead. If, for example, they should come across a flock of sheep, each man will dash through the flock, stoop from his saddle, pick up a lamb, and ride off with it. They can even catch far more active prey than the lamb or kid. On one occasion, as the party were travelling along, they came upon a large troop of baboons, who had been gathering gum arabic from the mimosas. "Would the lady like to have a baboon?" asked Jali, the smallest and most excitable of the party.

Three of the hunters dashed off in pursuit of the baboons, and in spite of the rough ground soon got among them. Stooping from their saddles, two of the aggageers snatched each a young baboon from its mother, placed it on the neck of the horse, and rode off with it. Strange to say, the captive did not attempt to escape, nor even to bite, but clung convulsively to the mane of the horse, screaming with fear. As soon as they halted, the hunters stripped some mimosa bark from the trees, bound the baboons, and with their heavy whips inflicted a severe flogging on the poor beasts. This was to make them humble, and prevent them from biting. However, in the course of the next halt, when the baboons were tied to trees, one of them contrived to strangle itself in its struggles to escape, and the other bit through its bonds and made off unseen.

For such work as this, the hunter must be able to stop his horse in a moment, and accordingly the bit must be a very severe one. The saddle is a very clumsy affair, made of wood and unstuffed, while the stirrups are only large enough to admit the great toe.

The rhinoceros gives far more trouble to the hunters than the elephant. It is much swifter, more active, and can turn more rapidly, spinning round as if on a pivot, and baffling their attempts to get at its hind leg. Unlike the elephant, it can charge on three legs, so that a single wound does not disable it. Still the Hamran Arabs always kill the rhinoceros when they can, as its skin will produce hide for seven shields, each piece being worth two dollars, and the horn is sold to the Abyssinians as material for

sword hilts, the best horn fetching two dollars per pound.

Lion-hunting is not a favorite pursuit with the Hamrans, as they gain little if successful, and they seldom come out of the contest without having suffered severely. They always try to slash the animal across the loins, as a blow in that spot disables it instantly, and prevents it from leaping. Sometimes the lion springs on the crupper of the horse, and then a back-handed blow is delivered with the two-edged sword, mostly with fatal effect.

The buffalo, fierce and active as it is, they hunt with the sword. Nothing, perhaps, shows the splendid horsemanship and daring courage of the Hamrans better than a scene which was witnessed by Sir S. Baker.

A large herd of buffaloes was seen and instantly charged by the aggageers, and, while the buffaloes and hunters were mixed together in one mass, the irrepressible little Jali suddenly leaned forward, and seized the tail of a fine young buffalo, some twelve hands high. Two other hunters leaped from their horses, snatched off their belts, and actually succeeded in taking the animal alive. This was a great prize, as it would be sold for a considerable sum at Cassala. Now as Jali was barely five feet three inches in height, and very slightly made, such a feat as seizing and finally capturing a powerful animal like a buffalo bull was really a wonderful one.

They are as active on foot as on horseback. On one occasion, three of them, Jali of course being one, were so excited with the chase of a wounded elephant that they actually leaped from their horses and pursued the animal on foot. The elephant was mad with rage, but seemed instinctively to know that his enemies wanted to get behind him, and always turned in time to prevent them. Active as monkeys, the aggageers managed to save themselves from the charges of the elephant, in spite of deep sand, which impeded them, while it had no effect on the elephant. Time after time he was within a yard or so of one of the hunters, when the other two saved him by dashing upon either flank, and so diverting his attention.

They hunt the hippopotamus as successfully as they chase the elephant, and are as mighty hunters in the water as upon land. In this chase they exchange the sword and shield for the harpoon and lance. The former weapon is made on exactly the same principle as that which has already been described when treating of the hippopotamus hunters of South Central Africa, but it is much lighter. The shaft is a stout bamboo about ten feet in length, and the head is a piece of soft steel about a foot long, sharply pointed at one end and having a single stout barb. One end of a rope, about twenty feet in length, is firmly at-

tached to the head, and to the other end is fastened a float made of a very light wood called ambatch, which is also used for making canoes and rafts.

When the hunter sees a hippopotamus, and means to attack it, he puts on his hunting dress, *i. e.* he braces a leathern belt round his waist, and takes off all his clothes. He then fixes the iron head on the bamboo shaft, winds the rope round the latter, and boldly enters the water, holding the harpoon in the right hand and the ambatch float in the left. As soon as he comes within striking distance of his victim, the harpoon is hurled, and the hunter tries to find a spot in which the infuriated animal cannot reach him. The wounded hippopotamus dashes about, first in the river, then on the bank, and then in the river again, always trailing after it the rope and float, and so weakening itself, and allowing its enemies to track it. Sooner or later they contrive to seize the end, drag the animal near the bank, and then with their lances put it to death.

Often, when they have brought the hippopotamus to the shore, it charges open-mouthed at its tormentors. Some of them receive it with spears, while others, though unarmed, boldly await its onset, and fling handfuls of sand into its eyes. The sand really seems to cause more pain and annoyance than the spears, and the animal never can withstand it, but retreats to the water to wash the sand out of its eyes. In the mean time, weapon after weapon is plunged into its body, until at last loss of blood begins to tell upon it, and by degrees it yields up its life.

Sir S. Baker gives a most animated description of one of these strange hunts.

One of the old Hamran hunters, named Abou Do—an abbreviated version of a very long string of names—was celebrated as a howarti, or hippopotamus hunter. This fine old man, some seventy years of age, was one of the finest conceivable specimens of humanity. In spite of his great age, his tall form, six feet two in height, was as straight as in early youth, his gray locks hung in thick curls over his shoulders, and his bronze features were those of an ancient statue. Despising all encumbrances of dress, he stepped from rock to rock as lightly as a goat, and, dripping with water, and bearing his spear in his hand, he looked a very Neptune. The hunters came upon a herd of hippopotami in a pool, but found that they were too much awake to be safely attacked.

“About half a mile below this spot, as we clambered over the intervening rocks through a gorge which formed a powerful rapid, I observed, in a small pool just below the rapid, an immense head of a hippopotamus close to a perpendicular rock that formed a wall to the river, about six feet

above the surface. I pointed out the hippo to old Abou Do, who had not seen it.

"At once the gravity of the old Arab disappeared, and the energy of the hunter was exhibited as he motioned us to remain, while he ran nimbly behind the thick screen of bushes for about a hundred and fifty yards below the spot where the hippo was unconsciously basking, with his ugly head above the surface. Plunging into the rapid torrent, the veteran hunter was carried some distance down the stream, but, breasting the powerful current, he landed upon the rocks on the opposite side, and, retiring to some distance from the river, he quickly advanced toward the spot beneath which the hippopotamus was lying. I had a fine view of the scene, as I was lying concealed exactly opposite the hippo, who had disappeared beneath the water.

"Abou Do now stealthily approached the ledge of rock beneath which he had expected to see the head of the animal; his long, sinewy arm was raised, with the harpoon ready to strike as he carefully advanced. At length he reached the edge of the perpendicular rock, the hippo had vanished, but, far from exhibiting surprise, the old Arab remained standing on the sharp ledge, unchanged in attitude.

"No figure of bronze could have been more rigid than that of the old river-king, as he stood erect upon the rock with the left foot advanced, and the harpoon poised in his ready right hand above his head, while in the left he held the loose coils of rope attached to the ambatch buoy. For about three minutes he stood like a statue, gazing intently into the clear and deep water beneath his feet.

"I watched eagerly for the reappearance of the hippo; the surface of the water was still barren, when suddenly the right arm of the statue descended like lightning, and the harpoon shot perpendicularly into the pool with the speed of an arrow. What river-fiend answered to the summons? In an instant an enormous pair of open jaws appeared, followed by the ungainly head

and form of the furious hippopotamus, who, springing half out of the water, lashed the river into foam, and, disdaining the concealment of the deep pool, he charged straight up the violent rapids. (See engraving No. 1, on the next page.) With extraordinary power he breasted the descending stream; gaining a footing in the rapids, about five feet deep, he ploughed his way against the broken waves, sending them in showers of spray upon all sides, and upon gaining broader shallows he tore along through the water, with the buoyant float hopping behind him along the surface, until he landed from the river, started at full gallop along the dry shingly bed, and at length disappeared in the thorny nabbuk jungle."

During one of these flights, the hippopotamus took it into his head that the ambatch float was the enemy that was damaging him, and attacked it furiously. Taking advantage of his pre-occupation, two hunters swam across the river, carrying with them a very long and tough rope, and holding one end on each bank and "sweeping," as the sailors say, they soon caught the float in the centre of the rope and brought it ashore. The hippopotamus then made a charge, and the slackened line was immediately coiled round a rock, while two hunters fixed additional harpoons in the animal; and though he made six charges at his foes, bit one of the ropes asunder, and crushed the lance-shafts between his teeth like straws, the hardy hunters got the better of him, and his death was a mere matter of time.

The hippopotamus is nearly as great a prize as the rhinoceros, as it affords an almost unlimited supply of food, and the hide is extremely valuable, being cut into strips two inches in width, which are used in the manufacture of the koorbash, or hide whip, so universally employed throughout Africa.

In the water, the crocodile is even a more dangerous antagonist than the hippopotamus, and yet the Hamrans attack it with their harpoons, boldly entering the water, and caring no more for crocodiles than for so many frogs.

(2.) TRAVELLERS AND THE MIRAGE. (See page 689.)

CHAPTER LXVIII.

BEDOUINS, HASSANIYEHHS, AND MALAGASY.

SIGNIFICATION OF THE NAME—GENERAL APPEARANCE OF THE BEDOUINS—THEIR ROBBER NATURE—HOSPITALITY AND ITS DUTIES—LIFE AMONG THE BEDOUINS—THE BEDOUIN WOMEN—SIMPLE MODE OF GOVERNMENT—CONSTANT FEUDS—MODE OF COOKING—THE DATE AND ITS USES—THE HASSANIYEHHS—GENERAL APPEARANCE—THEIR VILLAGES—STRANGE MARRIAGE CUSTOMS—A HASSANIYEH DANCE—SUPERSTITIONS OF THE ARABS—THE HAUNTED HOUSE—NOTIONS OF THE MIRAGE—THE INK MIRROR—THE MALAGASY AND THEIR TRIBES—THE FIRST BEEF-EATER—THE HOVA TRIBE—ARCHITECTURE—THE TRAVELLER'S TREE AND ITS USES—TREATMENT OF SLAVES—NOTIONS OF RELIGION—THE BLACKSMITH TRIBE.

OF all the many tribes which are designated by the common title of Arab, the typical tribes are those which are so well known by the name of BEDOUIN, or BEDAWEEEN. The former is the more familiar mode of spelling the word, and it will therefore be employed. The name is a most appropriate one, being derived from an Arabic word which signifies the desert, and meaning, therefore, a man of the wilderness. The Bedouins are indeed men of the desert. True Ishmaelites, their hand is against every man, and every man's hand against them. They build no houses, they cultivate no lands, they conduct no merchandise; but are nomad and predatory, trusting chiefly for their living to the milk of their camels, and looking upon their horses and dromedaries as means whereby they can plunder with greater security.

As Mr. Patgrave pithily remarks, while treating of the character of the Bedouin: "The Bedouin does not fight for his home, he has none; nor for his country, that is anywhere; nor for his honor, he has never heard of it; nor for his religion, he owns and cares for none. His only object in war is the temporary occupation of some bit of miserable pasture-land, or the use of a brackish well; perhaps the desire to get such a one's horse or camel into his own possession."

In person the Bedouins are fine specimens of the human race. They are tall, stately, with well-cut features, and have feet and hands that are proverbial for their beauty. Their demeanor in public is grave and haughty, and every man walks as if he were

monarch of the world. While other Arab tribes have lost their distinctive manners by contact with civilization, the Bedouins alone have preserved them, and, even when they visit the cities which they hate so much, they can be at once distinguished by their demeanor. Lady Duff-Gordon was greatly struck with it. "To see a Bedawee and his wife walk through the streets of Cairo is superb. Her hand resting on his shoulder, and scarcely deigning to cover her haughty face, she looks down on the Egyptian veiled woman, who carries the heavy burden and walks behind her lord and master."

The dress of the Bedouins is simple enough. The men wear a sort of a tunic or shirt, covered with a large thick mantle called the haik. Another cloth is disposed over the head, and falls on either side of the face so as to shield it from the sun, and is kept in its place by a cord of camel's hair, that is wound several times across the brows. As for the women, they wear a blue shirt, much open at the bosom, and care for no other clothing.

Being a predatory race, the Bedouins are always armed, their chief weapon being the spear, which is of enormous length, and often so weighty that a powerful as well as a practised arm is required to wield it. At the present day those who can afford fire-arms carry guns of such length of barrel that they seem to have been made in emulation of the spear shafts. These weapons are of very indifferent quality, and the Bedouin is never a good marksman, his clumsy weapon taking a long time to load, and the

owner taking a long time to aim, and then aiming very badly.

In consequence of the robber nature of the Bedouins, no one will venture to pass through their districts without being well armed, or protected by a sufficient escort. At the present day, Europeans can travel with comparative safety, as they have a way of fighting when attacked, and of generally hitting their mark when they fire, so that even the wandering Bedouins have conceived a respect for such incomprehensible beings, and would rather receive them as guests than fight them as enemies.

If, however, they come upon a solitary traveller, they pounce upon him, and rob him of everything, even of his clothes. Still, they are not brutal about it, except perhaps in enforcing haste by a menacing gesture with a spear. They seldom accompany robbery with murder, and have been known to take the traveller whom they have robbed into their tents, feed him, give him old clothes instead of the new which they have taken from him, keep him all night, and send him on his journey, even taking the trouble to accompany him for some distance, lest he should lose his way. The robber feels no enmity toward the man, and simply looks on him as a providential benefit cast in his way, and as such rather respects him than otherwise.

The reader will remember that the Bedouin takes the man to his tent *after* he has robbed him. Had he begun operations by allowing the traveller to enter his tent, and partake of his food, he could not have robbed his guest afterward. There is a chivalrous sort of feeling in the Arab mind that the person of a guest is sacred; and if the fiercest Bedouin had received a man under the shadow of his tent, he would be bound to protect that man as if he were his own son. So far is this feeling carried, that instances have been known where a strange Arab has taken refuge in a tent and received protection, though the owner discovered that his guest had killed one of his nearest relations.

The only habitations of the Bedouins are their tents. These tents, on which so much poetry has been lavished, are about as unpoetical as anything can be. Any one can make a Bedouin tent in five minutes. He has only to take a few sticks, some five feet in length, thrust one end into the ground, throw over them a piece of black and very dirty sackcloth, peg the edges to the ground, and there is the tent. Being only some four feet in height in the middle, no one can stand upright in it, and only in the middle can any one even sit upright. But as the tent is not regarded as we regard a house, and is only used as a sort of convenient shelter in which the Arabs can sleep, height is of no importance. The engraving No. 2, on page 670, illustrates a "Bedouin camp."

These low, dark tents are almost invariably pitched in the form of a semicircle, the openings eastward, and just enough space left between each hut for the passage of their camels and horses. The area inclosed between the arms of the crescent is intended for the children, as a place wherein they may disport themselves while still under the mother's eye. When new, the tents are mostly striped in broad bands of two or three feet in width, but the rough usage to which they are subjected soon destroys the color.

Such are the tents of the ordinary Bedouins. The sheikh, or chief of each clan, has a larger and better tent, which is divided into compartments by curtains, so disposed as to leave a set of rooms on the outside, and one or more rooms in the centre. Those on the outside are for the men, and those in the interior for the women belonging to the sheikh's family. A certain amount of privacy is gained, which belongs, however, only to the eye and not to the ear, the partitions being nothing more than curtains, and the Arabs all speaking in the loudest of voices—a bawling nation, as a French traveller described them.

The furniture is suitable to the dwelling, and consists merely of a mat or two and a few pots. Some of the wealthier are very proud of possessing brass mortars in which they pound their coffee, and every morning is heard the musical tinkle of the coffee-maker. Even the men condescend to make coffee, and the sheikh himself may be seen at work in the morning, pounding away at the berries, and rejoicing equally in the musical sound of the pestle and the fragrant odor of the freshly-roasted coffee.

Thus bred entirely in the open air, the only shelter being the tattered sackcloth of the tent, the true Bedouin can endure no other life. He is as miserable within the walls of a town as a wolf in a trap. His eyes, accustomed to range over the vast expanse of desert, are affronted by the walls over which he cannot see. The streets oppress him, and within the atmosphere of a room he can scarcely breathe. Both he and his camel are equally out of their element when among civilized people, and they are ever looking forward to the happy moment when they may again breathe the free air of the desert.

Life among the Bedouins is not pleasant to a European, and is by no means the sort of paradisaical existence that we are often led to think. It is certainly a free life in its way, and has that peculiar charm which is felt by all civilized beings when first allowed to do as they like. But it has its drawbacks, not the least being that every one is equally free; and if a stronger man should choose to assert his freedom by plundering the traveller, he is at perfect liberty to do so.

Then the "Arab maids," who look so picturesque — in a painting — are not quite so pleasant in reality. Dirt, evil odors, screaming voices and detestable manners are not seen in a picture, but in reality force themselves on more senses than one. Even in youth the Bedouin girls are not so handsome as is generally thought. They are tall, well made, and graceful, but are deficient in that gentleness and softness which we naturally associate with the feminine nature. They are fond of tattooing themselves, and cover their arms and chins with blue patterns, such as stars or arabesque figures. Some of them extend the tattoo over the breast nearly as low as the waist. The corners of the eyes are sometimes decorated with this cheap and indestructible ornament. They are fond of ornaments, especially of ear-rings, which can scarcely be too large for them.

Unlike the more civilized Mahometans, they care little about veiling their faces, and, in fact, pass a life nearly as free as that of the men. Even the women's apartment of the tent is thrown open by day for the sake of air, and any one can see freely into it.

Feminine beauty differs as much among the Arabs as among other people. Mr. Palgrave says wittily that if any one could invent an instrument which could measure beauty — a kalometer, as he calls it — the Bedouin would be "represented by zero, or at most 1°." A degree higher would represent the female sex of Nejed; above them rank the women of Shomer, who are in their turn surmounted by those of Djowf. The fifth or sixth degree symbolizes the fair ones of Hasa; the seventh those of Katar; and lastly, by a sudden rise of ten degrees at least, the seventeenth or eighteenth would denote the pre-eminent beauties of Oman.

"Arab poets occasionally languish after the charmers of Hejaz; I never saw anyone to charm *me*, but then I only skirted the province. All bear witness to the absence of female loveliness in Yamen; and I should much doubt whether the mulatto races and dusky complexions of Hadramout have much to vaunt of. But in Hasa a decided improvement in this important point is agreeably evident to the traveller arriving from Nejed, and he will be yet further delighted on finding his Calypsos much more conversible, and having much more to in their conversation, than those he left behind him in Sedeys and Aared."

It is popularly thought that Arab manners are like those of the Turk, — grave, polite, and majestic. The fact is far different. Though, like the American Indian, the Arab has a proud and stately walk, and knows well enough how to assume a regally indifferent demeanor on occasion, he is by nature lively and talkative, not caring very much what he talks about; and fond of sing-

ing Arab songs in that curious mixture of high screaming falsetto and guttural intonation which he is pleased to consider vocal music.

Then the general manners are by no means dignified, even when the Bedouins want to do special honor to a guest. Mr. Palgrave spent much time among them, and has drawn a vivid picture of life in a Bedouin encampment. It is no unfavorable one, the inmates being described as "ajaweed," or gentlemen — though the author remarks rather wickedly that, if they were gentlemen, he very much wondered what the blackguards were like.

"The chief, his family (women excepted), his intimate followers, and some twenty others, young and old, boys and men, came up, and, after a kindly salutation Bedouin-wise, seated themselves in a semicircle before us. Every man held a short crooked stick for camel-driving in his hand, to gesticulate with in speaking, or to play with in the intervals of conversation; while the younger members of society, less prompt in discourse, politely employed their leisure in staring at us, or in pinching up dried pellets of dirt from the sand, and tossing them about.

"But how am I to describe their conversation, their questions and answers, their manners and jests? 'A sensible person in this city is like a man tied up among a drove of mules in a stable,' I once heard from a respectable stranger in the Syrian town of Homs, a locality proverbial for the utter stupidity of its denizens. But among Bedouins in the desert, where the advantages of the stable are wanting, the guest rather resembles a man in the middle of a field among untied mules, frisking and kicking their heels in all directions around him.

"Here you may see human nature at its lowest stage, or very nearly. One sprawls stretched out on the sand, another draws unmeaning lines with the end of his stick, a third gries, a fourth asks purposeless or impertinent questions, or cuts jokes meant for wit, but in fact only coarse in the extreme. Meanwhile the boys thrust themselves forward without restraint, and interrupt their elders (their betters I can hardly say) without the smallest respect or deference.

"And yet, in all this, there is no real intention of rudeness, no desire to annoy — quite the reverse. They sincerely wish to make themselves agreeable to the new comers, to put them at their ease, nay, to do them what good service they can, only they do not exactly know how to set about it. If they violate all laws of decorum or courtesy, it is out of sheer ignorance, not *malice prepense*. And, amid the aimlessness of an utterly uncultivated mind, they occasionally show indications of considerable tact and shrewdness; while, through all the fickleness proper to man accustomed to no

moral or physical restraint, there appears the groundwork of a manly and generous character, such as a Persian, for instance, seldom offers.

"Their defects are inherent in their condition, their redeeming qualities are their own—they have them by inheritance from one of the noblest races of earth, from the Arabs of inhabited lands and organized governments. Indeed, after having travelled much and made pretty intimate acquaintance with many races, African, Asiatic, and European, I should hardly be inclined to give the preference to any over the genuine unmixed clans of Central and Eastern Africa. Now these last-mentioned populations are identical in blood and tongue with the myriads of the desert, yet how immeasurably inferior! The difference between a barbarous Highlander and an English gentleman, in 'Rob Roy' or 'Waverley,' is hardly less striking."

The resemblance between the gipsy and the Bedouin is almost too evident to need mention, and the author of this passage has here drawn attention to the singular resemblance between the Bedouin and the Highlander, as described by Scott. There is, however, in the "Legend of Montrose," a passage which is worthy of being quoted in this place, so strangely close is the parallel. It occurs in the scene where the wounded Mac-Eogh is dying in prison, and is giving his last commands to his grandson. "Keep thou unsoiled the freedom which I leave thee as a birthright. Barter it not, neither for the rich garment, nor for the stone roof, nor for the covered board, nor for the couch of down. Son of the Mist, be free as thy forefathers. Own no land—receive no law—take no hire—give no stipend—build no hut—inclose no pasture—sow no grain. . . . Begone—shake the dust from thy feet against the habitations of men, whether banded together for peace or war." Shift the scene from Scotland to Arabia, and no more appropriate words could have been put into the mouth of a dying Bedouin chief.

With characters so impatient of control, it is evident that there can be no government worthy of the name. Like the Son of the Mist, they acknowledge no lord, and there is no one who bears even by courtesy the title of King of the Bedouins. Each clan is governed by its own sheikh, and occasionally a few clans unite for some raid under the presidency of the eldest or most important sheikh, and remain united for some time. But his rule only lasts as long as the others choose to obey him, and instead of being a sovereign, or even a commander-in-chief, he is but *primus inter pares*.

The clans themselves vary exceedingly in numbers, and, as a general rule, each clan consists of one family, gathered together after the patriarchal system. Then if one of the men should happen to excel his fellows

he is sure to get together a band of followers, to separate in time from his family, and found a clan of his own.

In consequence of this insubordinate nature, war, as we understand it, is impossible, simply because discipline cannot be maintained. If, for example, several clans unite under the presidency of one of their number, should one of the confederated sheikhs feel dissatisfied with the commander, he will go off together with his people, and probably join another who is more to his mind.

Though war is unknown, the Bedouins live in a chronic state of feud, no one knowing whether his encampment may not be assailed by another clan, all his little property—dress included—torn from him, if he submits, and his throat very probably cut if he resists. No one ever thinks of giving notice of attack, or of fighting anything like equal numbers. Should they not be far superior in numbers, they contrive to project their assault secretly, and to take their victims by surprise, and the man who is most ingenious in planning such raids, and the most active and courageous in carrying them out, is sure to be the man who will rise to a sort of eminence in his own clan, and finish by founding one of his own. The only object of such a raid is the acquisition of property; and even a handsome horse, or a remarkably swift dromedary, will cause the destruction of a whole clan.

Living in the desert, and only travelling from one fertile spot to another, they cannot be expected to be very delicate in regard to provisions, nor to possess any great skill in cookery. Their greatest luxury is a feast on boiled mutton and the whole process of cooking and serving is almost ludicrously simple. The body of a sheep is cut up and thrown into a pot, together with a sufficiency of water. The pot is then placed on the fire, and in process of time it boils. When it is about two-thirds cooked, according to our ideas, the hungry Bedouins can wait no longer; it is all turned into a large wooden bowl, and the guests assemble round it. Their hands are plunged into the bowl, the scalding and half-raw meat is quickly torn to pieces, and in five minutes nothing is left but the cleanly picked bones. No vegetables are added to it, and no condiments are thought needful. Water is then passed round in another bowl or pail, a deep draught is taken, and the feast is over.

The bread of the Bedouin is as simple as the cookery. The baker pours a few handfuls of flour upon a circular piece of leather, pours a little water upon it, and kneads it into dough. Another man has in the mean time been preparing a fire, and, as soon as it burns up, the dough is patted into a thin circular cake, about one inch thick and six inches diameter. This is laid on the fire and covered with embers, and after being

turned once or twice, and the ashes brushed off, it is taken from the fire, broken up, and eaten as it is — "half-kneaded, half-raw, half-roasted, and burnt all round." Were it not eaten while still hot, it would become so tough and leathery that not even a Bedouin could eat it. In fact, it very much resembles the rough-and-ready bread of the Australian shepherds, which is so well known under the name of "damper." One advantage of this style of bread is, that it can be readily cooked on a journey, and, on special occasions, a camel-rider can even bake his bread while on the back of his dromedary.

The date is, however, the chief resource of the Bedouin, and on that fruit alone he can exist for a long time, even through the many hardships which he has to endure in his journeying through the desert. In England we do not know what the date really is, nor can understand the rich lusciousness of the fruit before it is dried and preserved. In the latter state it is very heating to a European, and slightly so even to a native, whereas in its fresh state it has no such evil qualities. It contains a marvellous amount of nourishment, and when fresh does not cloy the palate, as is always the case when it is dried.

In consequence of this nourishing property of the fruit, the date tree is not only valued, but absolutely honored. The Arab addresses it as his mother, and treats it with as much reverence as if it were really his parent. A single date tree is a valuable property among all Arab tribes, and, although the genuine Bedouins own none, they reverence it as much as their more stationary brethren. Cutting down the date trees of an enemy is looked upon as the last extremity of cruelty, while planting the trees on a new piece of ground is a sign of peace and prosperity.

The date is eaten in various ways. It is usually preferred while fresh and full of its own sweet juices, but, as it cannot be kept fresh very long, it is dried, pressed together, and so stored for future use. When the dried date forms a portion of a feast, the fruit is served in a large wooden bowl, in the middle of which is a cup containing melted butter. Each guest then picks out the dates singly from the mass, and dips each slightly into the butter before eating it.

There are many qualities of dates, and the best, which grow at Kaseem, are in great estimation, and are largely imported to the non-producing parts of Arabia. At Kaseem, the date-palm is cultivated to a great extent, and probably owes its peculiar excellence to the constant presence of water

six or seven feet below the surface of the ground. The ripening season corresponds with our autumn, extending through the latter part of August and the beginning of September.

Some connoisseurs, however, prefer the Khalas date. It grows only in Hasa, and fully deserves its name, which signifies quintessence. It is smaller than the Kaseem date, semi-transparent, and of a rich amber color. The sale of this particular date brings in a large income to Hasa, the fruit being exported as far as Bombay and Zanzibar.

Of religion, the genuine Bedouin has not the least idea. He is nominally a Mahometan, and will repeat certain formulæ with perfect accuracy. He will say his Bismillahs, and Mashallahs, and other pious ejaculations as well as any one, but he has not the least idea who Allah may be, neither does he care. As far as Mr. Palgrave could ascertain, their only idea of Allah was that of a very great sheikh, who would have about the same authority over them in the next world as their own sheikh in this sphere. That is to say, they consider that they will be quite as independent after death as before, and that they will acknowledge allegiance to this great sheikh as long as they choose, and no longer.

Like all men who are ignorant of religion, they are superstitious in proportion to their ignorance. Profoundly illiterate themselves, they have the greatest reverence for book-learning, and any one who can read a book is respected, while he who can write as well as read is regarded with a curious mixture of admiration, envy, and fear. The latter feeling is excited by his presumed ability of writing saphies, or charms, which are mostly sentences from the Koran, and are supposed to possess every imaginable virtue.

Before leaving the Bedouin Arabs, a few words must be said about the Arab and his horse. Many tales are told of the love that exists between the animal and its master, of the attention which is lavished on a favorite mare, and how she and her colt inhabit the tent together with the children, and are all playfellows together. This certainly may be the case occasionally, but not invariably. That they are brought up in close contact is true enough, and that the animal thereby acquires an intelligence which it never could possess under less sociable treatment. But the Arab has no more real affection for his steed than has many an English gentleman for his favorite horse; and, if he be angered, he is capable of treating the animal with hasty cruelty.

THE HASSANIYEH.

WE are come to a branch of the Arabs called the Hassaniyeh, who inhabit a large tract of land south of Khartoum. They are paler in complexion than those of whom we have already treated, having a decided tinge of yellow in their skins. They are slight, tall, and straight-featured. The men part their hair in the middle, plait it into long braids, and fasten it at the back of the head, so that they have rather a feminine aspect.

The villages of the Hassaniyeh are mere assemblages of slight huts, circular in shape, and having conical roofs, with a hole in the centre by way of a chimney. The walls are made of sticks and reeds, and the roofs of straw, and at a little distance the huts look more like tents than houses. Each hut is surrounded with a fence of thorns.

As among other Arab tribes, the sheikh's house is much larger and better than those of the commonalty, and is divided into several chambers. Sometimes a sort of second hut is placed in the interior, is made of fine yellow grass, and is inhabited by the women. Now and then a sheikh has his tent covered with camel's-hair cloth, and one of them, seen by Mr. Bayard Taylor, was thirty feet in length, and contained two inner chambers. The walls were covered with skins, gourds, and similar articles; the principal chamber contained a large bedstead or angarep; and the cloth roof was decorated with great quantities of cowrie shells, sewed upon it in crosses, stars, and other patterns.

The people have some very strange customs, among which is one that is almost peculiar to themselves, though an analogous custom prevails in one or two parts of the world. A woman when she marries does not merge her identity entirely in that of her husband, but reserves to herself one-fourth of her life. Consequently, on every fourth day she is released from her marriage vows; and, if she happens to take a fancy to any man, the favored lover may live with her for four-and-twenty hours, during which time the husband may not enter the hut. With this curious exception, the Hassaniyeh women are not so immoral as those of many parts of the world. When a traveller passes through the country, they are bound to fulfil the rites of hospitality by assigning him a house during the time of his visit, and lending him a wife for the same period. Mr. Taylor suggests that if the Hassaniyeh would also lend him a family of children their generosity would be complete.

When a stranger of rank visits their domains, they perform a curious dance of welcome by way of salutation. Mr. Bayard Taylor has well described one of these dances which he witnessed on his voyage to Khartoum. He had won the hearts of the people by presenting them with a hand-

ful of tobacco and fourpence in copper. "In a short time I received word that the women of the village would come to perform a dance of welcome and salutation, if I would allow them. As the wind was blowing strongly against us and the sailors had not finished skinning the sheep, I had my carpet spread on the sand in the shade of a group of mimosas, and awaited their arrival.

"Presently we heard a sound of shrill singing and the clapping of hands in measured beat, and discerned the procession advancing slowly through the trees. They came two by two, nearly thirty in all, singing a shrill, piercing chorus, which sounded more like lamentation than greeting.

"When they had arrived in front of me, they ranged themselves into a semicircle, with their faces toward me, and, still clapping their hands to mark the rhythm of the song, she who stood in the centre stepped forth, with her breast heaved almost to a level with her face, which was thrown back, and advanced with a slow undulating motion, till she had reached the edge of my carpet. Then, with a quick jerk, she reversed the curve of her body, throwing her head forward and downward, so that the multitude of her long twists of black hair, shining with butter, brushed my cap. This was intended as a salutation and sign of welcome; I bowed my head at the same time, and she went back to her place in the ranks.

"After a pause the chorus was resumed and another advanced, and so in succession, till all had saluted me, a ceremony which occupied an hour. They were nearly all young, between the ages of fourteen and twenty, and some were strikingly beautiful. They had the dark-olive Arab complexion, with regular features, teeth of pearly whiteness, and black, brilliant eyes. The coarse cotton robe thrown over one shoulder left free the arms, neck, and breasts, which were exquisitely moulded. Their bare feet and ankles were as slender as those of the Venus of Cleomenes."

All the women took their part successively in this curious dance, and by far the most beautiful and graceful of them was the wife of the sheikh, a young woman barely twenty years old, with features compared by Mr. Taylor to those of Guido's Cleopatra, the broad round forehead, full oval face, and regal bearing all adding to the resemblance. Her hair was plaited into at least fifty braids, and was thickly plastered with butter, and upon her head was a diadem of white beads. She moved with a stately grace down the line, and so charmed were the guests with her mode of performing the curious salutation, that she repeated it several times for their gratification.

Even the men took part in the dance, and one of them, a splendid example of the purest Arab blood, possessed so perfect a form, and moved in the dance with such entire and absolute grace, that he even drew away the traveller's attention from the women.

WE now come to some of the manners and customs of the Arabs, which are not restricted to certain tribes, but are characteristic of the Arab nature. Some of them are remarkable for the fact that they have survived through many centuries, and have resisted the influence of a comparatively new religion, and the encroachments of a gradually advancing civilization.

As may be expected, their superstitions have undergone but little change, and the learned and most civilized Arab acknowledges their power in his heart as well as the ignorant and half-savage Arab who never saw a book or entered a house. He will not openly admit that he believes in these superstitions, but he does believe in them very firmly, and betrays his belief in a thousand ways. Educated though he be, he has a lingering faith in the efficacy of written charms; and if he should happen to see in the possession of another man a scrap of paper covered with characters he does not understand, he will feel uneasy as often as the mysterious writing occurs to him. Should he get such a piece of paper into his own possession, he cherishes it fondly, and takes care to conceal it from others.

In consequence of this widely-diffused superstition, travellers have passed safely through large tracts of country, meeting with various tribes of Arabs, all at variance with each other, in true Arab fashion, and yet have managed to propitiate them by the simple process of writing a sentence or two of any language on a scrap of paper. One favorite form of the "saphiès," as these written charms are called, exhibits a curious mixture of medicine and literature. A man who is ill, or who wants a charm to prevent him from being ill, brings to the saphiè writer a smooth board, a pen and ink. The saphiè is written on the board, and the happy possessor takes it home, washes off every vestige of the writing, and then drinks the blackened water.

Even at the present day, the whole of the Arabian tribes have the full and implicit belief in the Jinns, Efreetts, Ghouls, and other superhuman beings, that forms the chief element in the "Arabian Nights." This belief is inbred with them, and no amount of education can drive it out of them. They do not parade this belief, nor try to conceal it, but accept the existence of these beings as an acknowledged fact which no one would dream of disputing.

According to their ideas, every well has its peculiar spirit, mostly an efreet or semi-

evil genius, and every old tower is peopled with them, and there is scarcely a house that has not at least one spirit inmate. Many of the Arabs say that they have seen and conversed with the efreetts, and relate very curious adventures. Generally, the efreet is harmless enough, if he be only let alone, but sometimes he becomes so troublesome that strong measures must be used. What was done in the way of exorcism before the discovery of fire-arms is not known, but in the present day, when an efreet can be seen, he can be destroyed by a bullet as if he were a human being.

Mr. Lane relates a most curious story of such an encounter. It is so interesting, and is so well told, that nothing but our very limited space prevents its insertion. The gist of it, however, is as follows:—

An European lady had been looking after a house in Cairo, and at last had found a very handsome one, with a large garden, for a very low rent—scarcely more than £12 per annum. She took the house, which pleased her well enough, though it did not have the same effect on the maid-servants, all of whom left it as soon as possible. At last the reason came out. The house was haunted by an efreet, which lived mostly in the bath, and at night used to go about the house, banging at the doors, knocking against the walls, and making such a perpetual riot that he had frightened tenant after tenant out of it, and kept the house to himself. The family had heard the noises, but attributed them to the festivities which had been going on for some time at the next house.

In spite of the change of servants, the noises continued, and rather increased than decreased in violence. "Very frequently the door of the room in which we were sitting, late in the evening within two or three hours of midnight, was violently knocked at many short intervals. At other times it seemed as if something very heavy fell upon the pavement, close under the windows of the same room or one adjoining; and, as these rooms were on the top of the house, we imagined at first that some stones or other things had been thrown by a neighbor, but we could find nothing outside after the noise I have mentioned. The usual sounds continued during the greater part of the night, and were generally varied with a heavy tramping, like the walking of a person in large clogs, varied by knocking at the doors of many of the apartments, and at the large water-jars, which are placed in recesses in the galleries."

During the fast of Ramadhan the house was free from noises, as efreetts are supposed to be imprisoned during that season, but as soon as it was over they recommenced with added violence. After a while, the efreet began to make himself visible, and a new door-keeper was greatly amazed by hearing and seeing the figure walking nightly round

the gallery. He begged to be allowed to fire at it, and at last he was permitted to do so, provided that he only used blank cartridge. The man, however, not only put balls into his pistol, but loaded it with two bullets and a double charge of powder. Just about midnight the report of the pistol rang through the house, followed by the voice of the door-keeper, crying out, "There he lies, the accursed!" and accompanied by sounds as of a wounded creature struggling and gasping for breath.

The man continued to call to his fellow-servants to come up, and the master of the house ran at once to the spot. The door-keeper said that the efreet had appeared in his usual shape, a tall white figure, and on being asked to leave the house, refused to do so. He then passed as usual down the passage, when the man fired at him and struck him down. "Here," said he, "are the remains." So saying, he picked up, under the spot where the bullets had entered the wall, a small mass of something that looked like scorched leather, perforated by fire in several places, and burnt to a cinder. This, it appears, is always the relic which is left when an efreet is destroyed. Ever afterward the house was free from disturbance.

The reader will notice the curious resemblance to the efreet stories in the "Arabian Nights," more especially to the story of the Second Calender, in which the efreet and the princess who fought him were both reduced to ashes. The idea, too, of the wells being inhabited by efreets repeatedly occurs in those wonderful tales.

Another curious tale of the efreet was told to Mr. Taylor by an Arab of some rank. He was walking one night near Cairo, when he saw a donkey near him. The animal seemed to be without an owner, and, as he happened to be rather tired, he mounted, and rode on his way pleasantly. In a short time, however, he became startled by finding that the donkey was larger than it was when he mounted it, and no sooner had he made this discovery than the animal increased rapidly in size, and in a few minutes was as large as a camel. Of course he was horribly frightened, but he remembered that a disguised efreet could be detected by wounding him with a sharp instrument. Accordingly, he cautiously drew his dagger, and was about to plunge it into the animal's back. The efreet, however, was too clever for him, and, as soon as he saw the dagger, suddenly shrank to his former size, kicked off his rider, and vanished with a peal of laughter and the exclamation, "Oh, you want to ride, do you?"

According to the Arab belief, the spirit of a man is bound to pass a certain time on earth, and a natural death is the token of reaching that time. Should he be killed by violence, his spirit haunts the spot where his body was buried, and remains there until

the term on earth has been fulfilled. The same Arab told Mr. Taylor that for many years, whenever he passed by night over the place where Napoleon defeated the Mamelukes, the noise of battle was heard, the shouts of the soldiers, the cries of the wounded, and the groans of the dying. At first the sounds were loud, as of a multitude; but year by year they gradually decreased, as the time of earthly sojourn expired, and at the time when he told the story but few could be heard.

Among some of the tribes they have a rather odd superstition. A traveller was struck with the tastefulness of a young girl's headdress, and wanted to buy it. She was willing enough to sell it for the liberal price which was offered, but her father prohibited the sale, on the ground that from the headdress could be made a charm which would force the girl to fly to the possessor, no matter in what part of the world he might be.

It is not wonderful that, saturated as they are with these ideas, many of the wonders of nature appear to them to be of supernatural origin. Chief among them is that extraordinary phenomenon, the mirage, in which a place far below the horizon is suddenly made visible, and appears to be close at hand. Even in our own country we have had examples of the mirage, though not in so striking a manner as is often seen among the sandy plains of Arabia. Water is a favorite subject of the mirage, and the traveller, as he passes over the burning plains, sees before him a rolling river or a vast lake, the palm trees waving on its edge and reflected on its surface, and the little wavelets rippling along as driven by the wind. Beasts as well as men see it, and it is hardly possible to restrain the thirsty camels from rushing to the seeming water.

The Arabs call the mirage, "Water of the Janns," and believe that it is an illusion caused by the janns—our old friends the geni of "The Arabian Nights." A very vivid account of this phenomenon is given in St. John's "Egypt and Nubia:"—

"I had been riding along in a reverie, when, chancing to raise my head, I thought I perceived, desertward, a dark strip on the far horizon. What could it be? My companion, who had very keen sight, was riding in advance of me, and, with a sudden exclamation, he pulled up his dromedary and gazed in the same direction. I called to him, and asked him what he thought of yonder strip, and whether he could make out anything in it distinctly. He answered that water had all at once appeared there; that he saw the motion of the waves, and tall palms and other trees bending up and down over them, as if tossed by a strong wind. An Arab was at my side, with his face muffled up in his burnous; I roused his attention, and pointed to the object of our inquiry. 'Mashallah!' cried the old man, with a face

as if he had seen a ghost, and stared with all his might across the desert.

"All the other Arabs of the party evinced no less emotion; and our interpreter called out to us, that what we saw was the evil spirit of the desert, that led travellers astray, luring them farther and farther into the heart of the waste, ever retreating before them as they pursued it, and not finally disappearing till its deluded victims had irrecoverably lost themselves in the pathless sands. This, then, was the mirage. My companion galloped toward it, and we followed him, though the Arabs tried to prevent us, and ere long I could with my own eyes discern something of this strange phenomenon. It was, as my friend reported, a broad sheet of water, with fresh green trees along its banks; and yet there was nothing actually before us but parched yellow sand. The apparition occasioned us all very uncomfortable feelings, and yet we congratulated ourselves in having seen for once the desert wonder.

"The phenomenon really deserves the name the Arabs give it, of *Goblin of the Desert*; an evil spirit that beguiles the wanderer from the safe path, and mocks him with a false show of what his heated brain paints in glowing colors. Whence comes it that this illusion at first fills with uneasiness—I might even say with dismay—those even who ascribe its existence to natural causes? On a spot where the bare sands spread out for hundreds of miles, where there is neither tree nor shrub, nor a trace of water, there suddenly appeared before us groups of tall trees, proudly girdling the running stream, on whose waves we saw the sunbeams dancing. Hills clad in pleasant green rose before us and vanished; small houses, and towns with high walls and ramparts, were visible among the trees, whose tall boles swayed to and fro in the wind like reeds.

"Far as we rode in the direction of the apparition, we never came any nearer to it; the whole seemed to recoil step by step with our advance. We halted, and remained long in contemplation of the magic scene, until whatever was unpleasant in its strangeness ceased by degrees to affect us. Never had I seen any landscape so vivid as this seeming one, never water so bright, or trees so softly green, so tall and stately. Everything seemed far more charming there than in the real world; and so strongly did we feel this attraction that, although we were not driven by thirst to seek for water where water there was none, still we would willingly have followed on and on after the phantom; and thus we could well perceive how the despairing wanderer, who with burning eyes thinks he gazes on water and human dwellings, will struggle onward to his last gasp to reach them, until his fearful, lonely doom befalls him." This singular illusion and its effect

upon travellers is well illustrated by the artist, on the 679th page.

"We returned slowly to our Arabs, who had not stirred from the spot where we left them. Looking back once more into the desert, we saw the apparition gradually becoming fainter, until at last it melted away into a dim land, not unlike a thin mist sweeping over the face of a field (*Hoehländer*). It was probably this phenomenon, which is beheld as well in Hadramaut and Yemen as in the deserts of Egypt, which gave rise to the fable of the Garden of Irem, described in the story of the Phantom Camel, in the 'Tales of the Ramad'han.'"

I cannot part from the Arab superstitions without mentioning one which is of very great antiquity, and which has spread itself widely over the world. I allude to the celebrated ink-mirror of the Arab magicians, in which they see, through the eyes of another, the events of the future and the forms of persons far distant.

The mirror is made as follows:—The magician calls a very young boy, not old enough, according to their ideas, to be tainted with sin, and makes him sit on the ground. The magician sits opposite him, holding the boy's opened right hand in his, and after repeating prayers, and burning incense, he draws a crossed square on the palm of the hand—thus \boxtimes —writes cabalistic words in all the angles, and pours about a spoonful of ink into the centre. More prayers and suffumigations follow, and the boy is then directed to look closely into the ink. Should he be really pure, and a fit subject for the magic art, he sees a series of figures, always beginning with a man sweeping the ground, and ending with a camp, with the sultan's tent and flag in the centre. These vanish, and the mirror is left clear for any figure which may be invoked.

All parties seem to have the most implicit belief in the proceeding; and though several boys in succession may fail to see anything but the reflection of their own faces, the failure is set down to their bad moral character, and others are tried until one is found who possesses the requisite vision. It is a curious fact that the magician himself never pretends to this inner sight, the sins which he has committed being an effectual hindrance. Educated Europeans have often witnessed this curious ceremony, and have given different accounts of it. With some it has been an utter failure, the boy evidently trying to deceive, and inventing, according to his ability, scenes which are supposed to be represented in the mirror. With others it has been as singular a success. European scenes and persons have been described accurately by the boy, though the greatest care was taken that no clue should be given either to the magician or the boy.

MADAGASCAR.

WE complete the account of African tribes with a brief notice of some of the tribes which inhabit the island of Madagascar. For my information I am chiefly indebted to Ellis's well-known work, and to a valuable paper read by Lieutenant Oliver, R. A., before the Anthropological Society of London, on March 3, 1868.

The name of Madagascar is entirely of European invention, the native name for this great island being Nosindambo, *i.e.* the island of wild hogs. The inhabitants are known by the general name of Malagasy, and they are divided into several tribes. These tribes differ from each other in their color, mode of dress, and other particulars, and may be roughly divided according to their color into the fair and the dark tribes, each consisting of four in number, and ranging through almost every shade of skin, from the light olive of the Hovas to the black tribes of the south. According to Ellis the entire population is only three millions, while Lieutenant Oliver, who gives the approximate numbers of each tribe, estimates them at five millions.

The origin of the Malagasy is rather obscure, and, although so close to the continent of Africa, they have scarcely anything in common with the African races. The hypothesis which has been generally accepted is that they are of Malay origin, their ancestors having been in all probability blown out to sea in their canoes, and eventually landed on the island. That they are not of African origin has been argued from several points, while they have many habits belonging to the oceanic race. For example, although they are so close to Africa, they have never adopted the skin dresses which are generally found throughout the savage races of the continent, but, on the contrary, make use of the hibiscus bark beaten out exactly after the fashion of the Polynesians.

"It is evident," writes Lieutenant Oliver, "that the Malagasy have never deteriorated from any original condition of civilization, for there are no relics of primæval civilization to be found in the country. Yet the Malagasy seem to have considerably advanced themselves in the art of building houses, and originating elaborate fortifications, which they have themselves modified to suit their offensive and defensive weapons, previous to any known intercourse with civilized people. They had domesticated oxen, and pigs, and made advances in the cultivation of rice, yams, &c.; but whether by their own unaided intellect, or by external example, we cannot say."

With regard to the domestication of cattle, they themselves refer it to a very recent date, and even state that the use of beef was

accidentally discovered during the last century. A chief named Rabiby was superintending the planting of his rice, when he noticed that one of his men was remarkable for his increase in strength and corpulence, and interrogated him on the subject. The man told him that some time previously he happened to kill a bullock, and had the curiosity to cook some of the meat. Finding it to be remarkably good, he continued to kill and eat, and so improved his bodily condition. Rabiby very wisely tried the experiment for himself, and, finding it successful, had a bullock killed, and gave a feast to his companions. The general impression was so favorable that he gave orders for building folds in which the cattle might be collected, and he further extended the native diet by the flesh of the wild hog. The original folds built by his orders are still in existence.

Chief among the Malagasy are the HOVA tribe, who have gradually extended themselves over a considerable portion of the island, and are now virtually its masters. They are the lightest in color of all the tribes, and have more of the Spanish than the negro expression. The hair is black, long, and abundant, and is worn in several fashions. The men usually cut the hair rather short, and arrange it over the forehead and temples much after the style that was prevalent in the days of the Regency. The women spend much time over their hair, sometimes frizing it out until they remind the spectator of the Fiji race, and sometimes plaiting it into an infinity of braids, and tying them in small knots or bunches all over the head.

Their dress has something of the Abyssinian type. Poor people wear little except a cloth twisted round their loins, while the more wealthy wear a shirt covered with a mantle called a lamba. This article of apparel is disposed as variously as the Abyssinian's tobe. The Hovas are distinguished by having their lambas edged with a border of five broad stripes. Their houses, to which allusion has already been made, are formed exclusively of vegetable materials. The walls are formed by driving rows of posts into the ground at unequal distances, and filling in the spaces with the strong leaf-stalks of the "traveller's tree." Each leaf-stalk is about ten feet in length, and they are fixed in their places by flat laths. The roof is thatched with the broad leaves of the same tree, tied firmly on the very steep rafters. The eaves project well beyond the walls, so as to form a veranda round the house, under which the benches are placed. The floor is covered with a sort of boarding made of the traveller's tree. The bark is stripped off and beaten flat, so as to form boards of twenty feet or so in length, and fifteen inches in width. These boards are laid on the floor,

TRAVELLING IN MADAGASCAR.

(See page 693.)

and, although they are not nailed, they keep their places firmly.

This traveller's tree is one of the most useful plants in Madagascar. It is a sort of palm, and its broad leaves, besides supplying thatch and walls for the houses, furnish a copious supply of fresh water. The water is found in the hollow formed by the manner in which the base of the leaf-stem embraces the trunk from which it springs, and the liquid is obtained by piercing the leaf-stem with a spear. A full quart of water is obtained from each leaf, and it is so pure that the natives will rather walk a little distance to a traveller's tree, than supply themselves with water from a stream at their feet.

The Malagasy have some knowledge of musical sounds, and have invented some instruments which are far superior to those of the African tribes. One of the best is the violin. It is played with a bow equally rude in character, and, although the sounds which it produces are not particularly harmonious to English ears, they are at all events quite as agreeable as those produced by the stringed instruments of China, Japan, or Turkey.

Slavery exists among the Malagasy, but is not of a very severe character, and may possibly, through the exertions of the missionaries, become extinguished altogether. The slaves do all the hard work of the place, which is really not very hard, and, as they take plenty of time over everything that they do, their work would be thought very light by an ordinary English laborer. Drawing water is perhaps the hardest labor the female slaves undergo, and it is not such very hard work after all. They draw the water by means of cows' horns tied to ropes, and pour it into ingenious pails made of bamboo. The hardest work which the men do is acting as bearer to their master's hammock or litter, and, as the roads often lie through uncleared forests, and are very rough and rocky, they have a fatiguing task. These litters are very convenient, and are covered with a roof to shield the occupant from the sun. They are rather unwieldy, and sometimes as many as twenty or thirty men are attached to each litter, some bearing the poles on their shoulders, and others dragging it by ropes, while the whole proceedings are directed by a superintendent. The engraving on the preceding page illustrates the mode of travelling in Madagascar.

Within the last few years, Christianity has made wonderful progress among the Malagasy, although at first missionaries were driven out, and the native converts put to death with frightful tortures. The old superstitions, however, still remain, but they are of a more harmless character than is generally the case with the superstitions

of a people who are only beginning to emerge out of the savage state. All reptiles, especially snakes, are regarded with great veneration. Whether any of the serpents are poisonous is not clearly ascertained, though the natives deny that venomous snakes are found on the island. Be this as it may, they never kill a snake, and, even if a large serpent should come into their house, they merely guide it through the doorway with sticks, telling it to go away.

They do not appear to possess idols, though Mr. Ellis found certain objects to which a sort of worship was paid. These were simply "pieces of wood about nine feet high, not square and smooth at the base, but spreading into two or three branches at about five feet from the ground, and gradually tapering to a point." Near them was a large basaltic stone, about five feet high, and of its natural prismatic form, and near it was another stone, smooth and rounded, and about as large as a man's head. The natives said that blood was poured on one stone, and fat burned on the other, but they were very averse to any conversation on the subject, and very probably did not tell the truth.

Some of their domestic superstitions — if we may use such a term — are rather curious. Mr. Ellis had noticed that on several occasions a spot of white paint had been placed on the forehead, or a white circle drawn round the eye. One morning, he found these marks adorning nearly the whole of his bearers. On inquiring into the cause of this decoration, he found that it was a charm to avert the consequences of bad dreams. As, however, they had partaken copiously of beef on the preceding evening, the cause of the bad dreams was clearly more material than spiritual.

Partly connected with their superstitious ideas is the existence of a distinct class, the Zanakambony. They are hereditary blacksmiths, and are exempt from forced labor except in their own line, so that, as Lieutenant Oliver writes, they will make a spade, but cannot be compelled to use it. They have the right of carrying deceased kings to the grave, and building monuments over them. They are very proud, and behave most arrogantly to other clans, refusing to associate with them, to eat with them, or even to lend them any article to be defiled by the touch of plebeian hands. As they will not even condescend to the ordinary labor of their countrymen, and think that even to build a house is a degradation, they are very poor; as they refuse to associate with others, they are very ignorant, but they console themselves for their inferiority in wealth and learning by constantly dwelling on their enormous superiority in rank.

CHAPTER LXIX.

AUSTRALIA.

THE NATIVE AUSTRALIANS—THE GENERAL CONFORMATION OF THE HEAD AND FEATURES—THEIR AVERAGE STATURE AND FORM—THE WOMEN AND THEIR APPEARANCE—CHARACTER OF THE NATIVES—THEIR THIEFISH PROPENSITIES—THEIR CUNNING, AND POWER OF DISSIMULATION—A PAIR OF CLEVER THIEVES—THE "GOOD NATIVE"—A CLEVER OLD WOMAN—INCENTIVES TO ROBBERY—HIDEOUS ASPECT OF THE OLD WOMEN—A REPULSIVE SUBJECT FOR AN ARTIST—YOUNGER WOMEN OF SAME TRIBE—THEIR STRANGE DRESS—THE CIRCULAR MAT CLOAK AND ITS USES—THE NATIVE BASKET—TREACHEROUS CHARACTER OF THE NATIVES—MR. BAINES'S NARRATIVE—THE OUTRIGGER CANOE OF NORTH AUSTRALIA, AND ITS PROBABLE ORIGIN—PIPE, AND MODE OF SMOKING—THE MAMMALS OF AUSTRALIA, AND THEIR MARSUPIAL CHARACTER—CONFUSION OF NOMENCLATURE—EFFECT OF THE ANIMALS ON THE HUMAN INHABITANTS OF THE COUNTRY—PRIMARY USE OF WEAPONS.

FOLLOWING up the principle of taking the least civilized races in succession, we naturally pass to the great continent of Australia and its adjacent islands.

This wonderful country holds a sort of isolated position on the earth, owing to the curious contrast which reigns between it and all the lands with which we are familiar. It is situated, as my readers will see by reference to a map, just below the equator, and extends some forty degrees southward, thus having at its northern extremity a heat which is tropical, and at its southern point a climate as cold as our own. But there is perhaps no country where the temperature is so variable as Australia, and there is one instance recorded where the thermometer registered a change of fifty degrees in twenty-five minutes. This sudden change is owing to the winds, which if they blow from the sea are cool, but if they blow toward the coast, after passing over the heated sand-wastes of the interior, raise the temperature in the extraordinary manner which has been mentioned. Still, the climate, changeable though it be, is a pleasant one; and the colonists who visit England nearly always grumble at the damp climate of the mother country, and long to be back again in Australia. Both the animal and vegetable products of this country are strangely unlike those of other lands, but, as we shall have occasion to describe them in the course of the following pages, they will not be mentioned at present; and we will proceed

at once to the human inhabitants of Australia.

It is exceedingly difficult, not to say impossible, to treat of the aborigines of Australia with much accuracy of system. Differing as do the tribes with which we are acquainted in many minor particulars, they all agree in general characteristics; and, whether a native be taken from the north or south of the vast Australian continent, there is a similitude of habits and a cast of features which point him out at once as an Australian.

The plan that will be adopted will therefore be to give a general sketch of the natives, together with an account of those habits in which they agree, and then to glance over as much of Australia as travellers have laid open to us, and to mention briefly the most interesting of the manners and customs which exist in the several tribes.

IN color the Australians are quite black, as dark indeed as the negro, but with nothing of the negro character in the face. The forehead does not recede like that of the negro; and though the nose is wide, the mouth large, and the lips thick, there is none of that projection of jaw which renders the pure negro face so repulsive. The eye is small, dark, and, being deeply sunken, it gives to the brows a heavy, overhanging sort of look. The hair is by no means close and woolly, like that of the negro, but is plentiful, rather long, and disposed to curl, mostly

undulating, and sometimes even taking the form of ringlets. In texture it is very coarse and harsh, but cannot be described as wool.

The beard and moustache are very thick and full, and the men take a pride in these ornaments, sometimes twisting the beard into curious shapes. Indeed, as a rule they are a hairy race. There is now before me a large collection of photographs of native Australians, in many of which the men are remarkable for the thickness of the beard, and some of them have their faces so heavily bearded that scarcely the nose is perceptible among the mass of hair that covers the cheeks nearly up to the eyes. Several of the elder men are very remarkable for the development of the hair, which covers the whole of the breast and arms with a thick coating of pile, and looks as if they were clothed with a tightly-fitting fur garment. The illustration No. 1, on the 698th page, will give a good idea of the features of the Australian. It is exactly copied from photographic portraits; and although the subjects have disfigured themselves by putting on European dress, and the woman has actually combed her hair, the general cast of the features is well preserved.

In stature the Australian is about equal to that of the average Englishman—say five feet eight inches, although individuals much below and above this height may be seen. The bodily form of the Australian savages is good, and their limbs well made. There are several well-known drawings of Australians, which have been widely circulated on account of their grotesqueness, and which have been accepted as the ordinary form of this curious people, and they have given the idea that the native Australian is distinguished by a very large head, a very small body, and very long and attenuated limbs; in fact, that he is to the European what the spider-monkey is to the baboon.

Such drawings are, however, only taken from exceptional cases, and give no idea of the real contour of the native Australian. Indeed, Mr. Pickering, who traversed the greater part of the world in search of anthropological knowledge, writes in very strong terms of the beautiful forms which can be seen among these natives. "The general form, though sometimes defective, seemed on the average better than that of the negro, and I did not find the undue slenderness of limb which has been commonly attributed to the Australians. Strange as it may appear, I would refer to an Australian as the finest model of human proportions I have ever met with, in muscular development combining perfect symmetry, activity, and strength; while his head might have compared with an antique bust of a philosopher."

Those of my readers who happened to see the native Australians that came over to England as cricketers and athletes in general must have noticed the graceful forms

for which some of the men were remarkable, while all were possessed of great elegance of limb.

The disadvantageous effect of European clothing on the dark races was well shown in these men, who seemed to undergo a positive transformation when they laid aside their ordinary clothes for a costume which represented, as far as possible, the light and airy apparel of the native Australian. Dressed in gray, or clad in the cricketer's costume, there was nothing remarkable about them, and in fact they seemed to be very ordinary persons indeed. But with their clothes they threw of their commonplace look, and, attired only in tight "fleshings," dyed as nearly as possible the color of their black skins, with a piece of fur wrapped round their loins and a sort of fur cap on their heads, they walked with a proud, elastic step that contrasted strangely with their former gait.

It may perhaps be said that this change of demeanor was only the natural result of removing the heavy clothing and giving freedom to the limbs. This was not the case, for several professional English athletes contended with the Australians, and, when they came to run or leap, wore the usual light attire of the professional acrobat. In them, however, no such improvement took place, and, if anything, they looked better in their ordinary dress.

The women are, as a rule, much inferior to the men in appearance. Even when young, although they possess symmetrical forms, their general appearance is not nearly so pleasing as that of the young African girl, and, when the woman becomes old, she is, if possible, even more hideous and hag-like than the African. This deterioration may partly be due to the exceedingly hard life led by the women, or "gins"—in which word, by the way, the *g* is pronounced hard as in "giddy." That they have to do all the hard work, and to carry all the heavy weights, including the children, while their husbands sit or sleep, or, if on the march, burden themselves with nothing more weighty than their weapons, is to be expected, as it is the universal practice among natives. But it is not so much the hard work as the privation which tells upon the woman, who is treated with the same contemptuous neglect with which a savage treats his dog, and, while her husband, father, or brother, is feasting on the game which she has cooked, thinks herself fortunate if they now and then toss a nearly cleaned bone or a piece of scorched meat to her.

Like most savages, the Australian natives are adroit and daring thieves, displaying an amount of acuteness in carrying out their designs which would do honor to the most expert professional thief of London or Paris. In his interesting work entitled "Savage Life and Scenes," Mr. G. F. Angas has re-

lated several anecdotes respecting this propensity.

"Leaving Rivoli Bay, we fell in with two very droll natives, the only ones who had made bold to approach our camp; both were in a state of nudity. One of these fellows was a perfect supplejack; he danced and capered about as though he were filled with quicksilver. We mounted them on horses, from which they were continually tumbling off, and they travelled with us all day.

"When we encamped at an old resting-place, near Lake Howden, they, by signs, requested permission to remain by our fires, which we allowed them to do, and gave them for supper the head and refuse of a sheep that was just killed and hung up to a tree near the tents. They showed great surprise on seeing our various utensils and articles of cookery. So modest and well-behaved did these artful gentlemen appear, that they would not touch the slightest article of food without first asking permission by signs; and they so far gained our confidence that one of them was adorned with a tin plate, suspended round his neck by a string, on which was inscribed 'Good Native.'

"In the dead of the night we were all aroused by the unusual barking of the dogs. At first it was supposed that the wild dogs were 'rushing' the sheep; but as the tumult increased, the Sergeant-Major unwrapped his opossum rug, and looked around for his hat, to go and ascertain the cause of the disturbance. To his surprise, he found that his hat had vanished. The hat of his companion, who lay next him near the fire, was also nowhere to be found; and, casting his eyes to the spot where the sheep hung suspended from the tree, he saw in a moment that our fond hopes for to-morrow's repast were blighted, for the sheep too had disappeared. The whole camp was roused, when it was ascertained that forks, spoons, and the contents of the Governor's canteen, pannikins and other articles, were likewise missing, and that our two remarkably docile natives had left us under cover of the night.

"A council of war was held. Black Jimmy protested that it was useless to follow their tracks until the morning, and that from the nature of the country they had doubtless taken to the swamps, walking in the water, so that pursuit was in vain. We had been completely duped by these artful and clever fellows, who probably had a large party of their colleagues lying in ambush amid the surrounding swamps, ready to assist in carrying away the stolen property. Retaliation was useless; and we contented ourselves by giving utterance to our imprecations and commenting on the audacity and cunning of the rogues until daybreak."

Another instance of theft—in this case single-handed—occurred not long before the robbery which has just been recorded. While the exploring party was on the march,

they fell in with a number of natives who were cooking their food.

"At our approach, they flew down the descent, and hid among the bulrushes; but one old woman, unable to escape as speedily as the rest, finding flight useless, began to chatter very loud and fast, pointing to her blind eye, and her lean and withered arms, as objects of commiseration. Dampier was given to her and she continued in terror to chew it very fast without swallowing any, until she was almost choked; when suddenly she got hold of Gisborne's handkerchief and made off with it. With a vigorous leap she plunged into the mud and reeds beneath, effecting her escape by crawling into the swamp and joining her wild companions, to whom she doubtless recounted her adventures that night over a dish of fried tadpoles."

The dish of fried tadpoles, to which allusion has been made, is quite a luxury among this wretched tribe, and, when the exploring party pushed on to the spot where the people had been cooking, it was found that they had been engaged in roasting a dish of water-beetles over a fire.

It is impossible to withhold admiration for the skill displayed by these sable thieves in stealing the property which they coveted, and, in excuse for them, it must be remembered that the articles which were stolen were to the blacks of inestimable value. Food and ornaments are coveted by the black man as much as wealth and titles by the white man, and both these articles were ready to hand. The temptation to which these poor people was exposed seems very trifling to us, but we must measure it, not from our own point of view, but from theirs.

The strange visitors who so suddenly appeared among them possessed abundance of the very things which were dearest to them. There was a whole sheep, which would enable them to enjoy the greatest luxury of which they could form any notion, *i. e.* eating meat to repletion; and there was store of glittering objects which could be worn as ornaments, and would dignify them forever in the eyes of their fellows. The happy possessor of a spoon, a fork, or a tin plate, which would be hung round the neck and kept highly polished, would be exalted above his companions like a newly ennobled man among ourselves, and it should not be expected that such an opportunity, which could never again be looked for, would be allowed to pass. The temptation to them was much as would be a title and a fortune among ourselves, and there are many civilized men who have done worse than the savage Australian when tempted by such a bait.

Reference has been made to the haggard appearance of the old woman who so ingeniously stole the handkerchief, the love of finery overcoming the dread of the white man in spite of her age and hideous aspect, which would only be made more repulsive

(1.) AUSTRALIAN MAN AND WOMAN.

(See page 695.)

(2.) WOMEN AND OLD MAN OF THE LOWER MURRAY AND THE LAKES.

(See page 699.)

by any attempt at ornament. It is scarcely possible to imagine the depths of ugliness into which an Australian woman descends after she has passed the prime of her life. As we have seen, the old woman of Africa is singularly hideous, but she is quite passable when compared with her aged sister of Australia.

The old Australian woman certainly does not possess the projecting jaws, the enormous mouth, and the sausage-like lips of the African, but she exhibits a type of hideousness peculiarly her own. Her face looks like a piece of black parchment strained tightly over a skull, and the mop-like, unkempt hair adds a grotesque element to the features which only makes them still more repulsive. The breasts reach to the waist, flat, pendent, and swinging about at every movement; her body is so shrunken that each rib stands out boldly, the skin being drawn deeply in between them, and the limbs shrivel up until they look like sticks, the elbows and knees projecting like knots in a gnarled branch.

Each succeeding year adds to the hideous look of these poor creatures, because the feebleness of increasing years renders them less and less useful; and accordingly they are neglected, ill-treated, and contemptuously pushed aside by those who are younger and stronger than themselves, suffering in their turn the evils which in their youth they carelessly inflicted on those who were older and feebler.

Mr. Angus has among his sketches one which represents a very old woman of the Port Fairy tribe. They had built their rude huts or miam-miams under some gum-trees, and very much disgusted the exploring party by their hideous appearance and neglected state. There was one old woman in particular, who exemplified strongly all the characteristics which have just been described; and so surpassingly hideous, filthy, and repulsive was she, that she looked more like one of the demoniacal forms that Callot was so fond of painting than a veritable human creature. Indeed, so very disgusting was her appearance, that one of the party was made as ill as if he had taken an emetic.

Not wishing to shock my readers by the portrait of this wretched creature, I have introduced on page preceding, two younger females of the same tribe.

The remarkable point about this and one or two other tribes of the same locality and the neighborhood, is the circular mat which is tied on their backs, and which is worn by both sexes. The mat is made of reeds twisted into ropes, coiled round, and fastened together very much as the archer's targets of the present day are made. The fibres by which the reed ropes are bound together are obtained from the chewed roots of the bulrush. The native name for this

mat is *paingkoont*. One of the women appears in her ordinary home dress, *i. e.* wearing the paingkoont and her baby, over whose little body she has thrown a piece of kangaroo skin. The mat makes a very good cradle for the child, which, when awake and disposed to be lively, puts its head over the mat and surveys the prospect, but when alarmed pops down and hides itself like a rabbit disappearing into its burrow. The old woman, whose portrait is withheld, was clothed in the paingkoont, and wore no other raiment, so that the full hideousness of her form was exposed to view.

The woman standing opposite is just starting upon a journey. She is better clad than her companion, having beside the paingkoont a rude sort of petticoat. On her back she has slung the net in which she places the roots which she is supposed to dig out of the ground, and, thrust through the end which ties it, she carries the digging-stick, or *katta*, which serves her for a spade. She has in her hand the invariable accompaniment of a journey,—namely, the fire-stick, smouldering amid dry grass between two pieces of bark, and always ready to be forced into a flame by whirling it round her head.

Behind them is seated an old man, also wearing the mat-cloak, and having by his side one of the beautifully constructed native baskets. These baskets are made, like the mat, of green rushes or reeds, and are plaited by the women. One of these baskets is illustrated in an engraving on the 722d page. The reader will doubtless observe that the mode of plaiting it is almost identical with that which is employed by the natives of Southern Africa, the rushes being twisted and coiled upon each other and bound firmly together at short intervals by strong fibrous threads. They are rather variable in shape; some, which are intended to stand alone, being flat-bottomed, and others, which are always suspended by a string, ending in a point.

In common with other savage races, the Australians are apt to behave treacherously to the white man when they find themselves able to do so with impunity. This behavior is not always the result of ferocity or cruelty, though an Australian can on occasion be as fierce and cruel as any savage. Oftentimes it is the result of fear, the black people standing in awe of the white stranger and his deadly weapons, and availing themselves of their native cunning to deprive him of his unfair advantages as soon as possible.

Ignorant of the object of travel, and having from infancy been accustomed to consider certain districts as the property of certain tribes, and any man who intruded into the district of another as an enemy, it is but natural that when they see, especially for the first time, a man of different color from

themselves travelling through the country, such strangers must necessarily be enemies, come for the purpose of using against the aborigines the weapons which they possess. Again, a feeling of acquisitiveness has much to do with the treachery.

Add to their ideas of the inimical character of the strangers the cupidity that must be excited by the sight of the valuable property brought into their country by those whom they consider as enemies delivered into their hand, and there is no reason for wonder that they should take both the lives and the property of the strangers, and thus secure the valued trophies of war at the same time that they rid their country of strange and powerful enemies, and attain at one stroke an amount of wealth which they could not hope to gain through the labors of a life.

This phase of their character is well shown by Mr. T. Baines, in a letter which he has kindly allowed me to transfer to these pages. He was one of an exploring expedition, which had also undertaken to convey a number of sheep and horses. "While making the inner passage along the coast, we fell in with several canoes, some of very rude construction, being in fact mere logs capable of carrying a couple of men, who, perhaps in terror of the telescopes pointed at them, did not approach us.

"Others were of greater size and power, being large hollowed logs, very straight and narrow, and steadied on either side by other logs, pointed at the ends, and acting as outriggers, neatly enough attached by pegs driven into them through a framing of bamboo. Others again were strictly double canoes, two of the narrow vessels being connected by a bamboo platform so as to lie parallel to each other at some little distance apart.

"They were manned by crews of from six to twelve, or even more in number, all tolerably fine fellows, perfectly naked, with shock heads of woolly hair and scanty beards. They were ornamented with scars and raised cicatrices tastefully cut on their shoulder and elsewhere. They were armed with long spears, some of them tipped with wood, others with bone, and having from one to four points. They also had bows and arrows, as well as their curious paddles, the looms of which were barbed and pointed, so as to be useful as spears. When these weapons were thrown at a fish, the owner always plunged into the water after his weapon, so as to secure the fish the moment that it was struck.

"Their arrival caused various emotions among our party. One gentleman ruined his revolver by hurriedly trying to load it, while a little girl, so far from being afraid of them, traded with them for almost everything they had in their canoes. Just as they dropped astern after reaching us, the cap-

tain's little daughters were being bathed in a tub on the main-hatch, and, naturally enough, jumped out of their bath, and ran aft wet and glistening in the sunlight, to hide themselves from the strange black fellows who were stretching themselves to look over our low bulwarks at the little naked white girls.

"We bought spears, bows, arrows, tortoise-shell, &c., for hats, handkerchiefs, and other things; and they were greatly interested in the white baby, which, at their express request, was held up for them to look at."

Up to this point we find the natives mild and conciliatory, but we proceed with the letter, and find an unexpected change in their demeanor.

"We had here an instance of the capriciousness of the natives. We met about a dozen on shore, and endeavored by all friendly signs to induce them to come to terms with us. We showed them that we had no guns, but our attempts were useless. They fell into regular battle array, with their long spears ready shipped on the throwing sticks, six standing in front, and the rest acting as supports behind. As it was unsafe to parley longer, we mounted our horses, and again tried to make them understand that we wished to be on friendly terms. It was all useless, and the only thing that we could do was to ride straight at them. They ran like antelopes, and gained the thick bush where we could not follow them. B—— wanted to shoot one of them, but I would not allow it.

"The prospect of killing and eating our horses seemed to be their great temptation. They made constant war upon our stud for a fortnight or three weeks, in my camp at Depôt Creek, and I had to patrol the country with B—— daily, to keep them from ringing the horses round with fire.

"The character of the Australian canoe-men is variously spoken of, some reporting them as good-natured and peaceable, while others say that they are treacherous and savage. Both speak the truth from their own experience. A fellow artist, who generally landed from a man-of-war's boat, with the ship in the offing, found them peaceable enough, but poor Mr. Strange, the naturalist, was murdered on one of the islands.

"While we were on board our vessels, they were quite friendly; and even during my boat's voyage of 750 miles, while we had a dashing breeze and the boat well under command, we found the groups we met with civil enough. But when we were helplessly becalmed at the entrance of the Gulf of Carpentaria, and supposed by the natives to be the unarmed survivors of some vessel wrecked in Torres Straits, we were deliberately and treacherously attacked.

"We watched the preparations for nearly an hour through the telescope, and refrained

from giving them the slightest ground even to suspect that we looked on them otherwise than as friends. As soon as they thought they had us in their power, they began to throw spears at us, so I put a rifle-bullet through the shoulder of the man who threw at us, to teach him the danger of interfering with supposed helpless boats, but did not fire again. The wounded man was led on shore by one of his mates, and we were not molested again.

"These people are very capricious. They have the cunning and the strong passions of men, but in reason they are only children. Life is not held sacred by them, and, when their thirst for blood is raised, they revel in cruelty."

These Australian canoes, with outriggers attached, indicate a Polynesian origin, as indeed do the bows and arrows, which will be fully described on a future page. The tobacco pipes in use in that part of Australia are curious. One form consists of a hollow tube as thick as a man's arm, stopped at the ends and having one hole near the bottom into which is introduced the stem of a pipe, and another hole near the top through which the smoke is imbibed. Their use of the pipe is rather singular. When a party desires to smoke, the chief man lights the pipe, places his mouth to the orifice, and continually inhales until the interior of the hollow stem is filled with smoke. The bowl is then removed, and the aperture stopped with a plug which is kept in readiness. The first smoker closes with his thumb the hole through which he has been imbibing the smoke, and passes the pipe to his neighbor, who applies his lips to the hole, fills his lungs with smoke, and then passes the pipe to the next man. In this way, the tobacco is made to last as long as possible, and the greatest possible amount of enjoyment is got out of the least possible amount of material. The exterior of the stem is generally carved into the simple patterns which are found on nearly all Australian weapons and implements.

BEFORE proceeding further with the character and habits of the natives, we will cast a glance at the country which they inhabit, and the peculiarities which have contributed toward forming that character.

It is a very strange country, as strange to us as England would be to a savage Australian. Its vegetable and animal productions are most remarkable, and are so strange that when the earlier voyagers brought back accounts of their travels they were not believed; and when they exhibited specimens of the flora and fauna, they were accused of manufacturing them for the purpose of deception.

In the first place, with a single exception, the mammalia are all marsupials, or edentates. The solitary exception is the dingo,

or native dog, an animal which somewhat resembles the jackal, but is altogether a handsomer animal. Whether it be indigenous, or a mere variety of the dog modified by long residence in the country, is rather doubtful, though the best zoologists incline to the latter opinion, and say that the marsupial type alone is indigenous to this strange country. Of course the reader is supposed to know that the young of a marsupial animal is born at a very early age, and attains its full development in a supplementary pouch attached to the mother, into which pouch the teats open.

The animal which is most characteristic of Australia is the kangaroo. Of this singular type some forty species are known, varying in size from that of a tall man to that of a mouse. Some of them are known as kangaroos, and others as kangaroo-rats, but the type is the same in all. As their form implies, they are made for leaping over the ground, their enormously long legs and massive development of the hind quarters giving them the requisite power, while their long tails serve to balance them as they pass through the air.

Nearly all the so-called "rats" of Australia belong to the kangaroo tribe, though some are members of other marsupial families. Here I may mention that the nomenclature of the colonists has caused great perplexity and labor to incipient zoologists. They are told in some books that the dingo is the only Australian animal that is not a marsupial or an edentate, and yet they read in books of travel of the bear, the monkey, the badger, the wolf, the cat, the squirrel, the mole, and so forth. The fact is, that, with the natural looseness of diction common to colonists all over the world, the immigrants have transferred to their new country the nomenclature of the old. To the great trouble of index-searchers, there is scarcely a part of the world inhabited by our colonists where London, Oxford, Boston, and fifty other places are not multiplied. The first large river they meet they are sure to call the Thames, and it is therefore to be expected that natural history should suffer in the same way as geography.

Thus, should, in the course of this account of Australia, the reader come across a passage quoted from some traveller in which the monkey or bear is mentioned, he must remember that the so-called "monkey" and "bear" are identical, and that the animal in question is neither the one nor the other, but a marsupial, known to the natives by the name of koala, and, as if to add to the confusion of names, some travellers call it the sloth.

The so-called "badger" is the wombat, probably called a badger because it lives in holes which it burrows in the ground. The Australian "wolf" is another marsupial, belonging to the Dasyures, and the "cat"

belongs to the same group. The "squirrels" are all marsupials, and by rights are called phalangists, and it is to this group that the koala really belongs. As to the "hedgehog," it is the spiny ant-eater or echidna, and the "mole" is the celebrated duck-bill or ornithorhynchus.

With few exceptions these animals are not easily captured, many of them being nocturnal, and hiding in burrows or hollow trees until the shades of night conceal their movements; while others are so shy, active, and watchful, that all the craft of the hunter must be tried before they can be captured. Much the same may be said of the birds, the chief of which, the emu, is nearly as large as an ostrich, and is much valued by the natives as food. It is evident, therefore, that the existence of these peculiar animals must exercise a strong influence on the character of the natives, and must make them more active, wary, and quicksighted than the creatures on which they live.

Possessing, as he does, the most minute acquaintance with every vegetable which can afford him food, and even knowing where to obtain a plentiful supply of food and water in a land where an European could not find a particle of anything eatable, nor discover a drop of moisture in the dry and parched expanse, the Australian native places his chief reliance on animal food, and supports himself almost entirely on the creatures which he kills. His appetite is very indiscriminate; and although he prefers the flesh of the kangaroo and the pigeon, he will devour any beast, bird, reptile, or fish, and will also eat a considerable number of insects. Consequently the life of the Australian savage is essentially one of warfare, not against his fellow-man, but against the lower animals, and, as the reader will see in the course of the following pages, the primary object of his weapons is the hunt, and war only a secondary use to which they are directed.

CHAPTER LXX.

AUSTRALIA—*Continued.*

MANNERS AND CUSTOMS OF THE NATIVES—DRESS AND ORNAMENTS OF NORTHERN AUSTRALIA—MODE OF DRESSING THE HAIR—THE “DIBBI-DIBBI”—TATTOOING AND CICAtrizING—PATTERN OF THE SCARS—SIGNIFICATION OF THE VARIOUS PATTERNS—POMP AND VANITY—THE NOSE-BONE—NECKLACES—THE GIRDLE AND TASSEL—TATTOOS AND SCARS AMONG THE WOMEN—THE TURTLE SCAR—HIGH SHOULDERS OF THE AUSTRALIANS—INDIFFERENCE TO DRESS—THEIR FUR MANTLES, AND THEIR USES—THE SEA-GRASS MANTLE—FOOD OF THE AUSTRALIANS—VEGETABLE FOOD—MODE OF PROCURING ROOTS—THE BIYU—THE NARDOO PLANT AND ITS USES—THE “BURKE AND WILLS” EXPEDITION—THE BULRUSH ROOT, ITS USE FOR FOOD AND ROPE MAKING—SUBTERRANEAN WATER STORES—MOLLUSCS, AND MODE OF COLLECTING THEM—HARD WORK FOR THE WOMEN—DIVING FROM THE RAFT—RELAXATION WHEN THEY RETURN HOME—COOKING THE MOLLUSCS AND CRUSTACEA—FISH CATCHING WITH LINE, NET, AND SPEAR—INSECT FOOD—THE BEE CATCHERS—TREE AND EARTH GRUBS, AND MODE OF CATCHING THEM—THE PILEYAH—THE DUGONG—ITS LOCALITIES, AND MODES OF TAKING AND COOKING IT—CAPTURING AND COOKING THE GREEN TURTLE—CURIOUS USE OF THE SUCKING FISH—TAMING THE TURTLE—THE HAWKBELL TURTLE, AND MODE OF CATCHING IT—TURTLE OIL AND DRIED FLESH—SALE OF TORTOISE-SHELL—TWO FORMS OF AUSTRALIAN OVENS—COOKING AND EATING SNAKES—CATCHING THE SNAKE ALIVE—THE CLOAK AND THE SHIELD—THE DUGONG, AND ITS CAPTURE—SMALL TENACITY OF LIFE—A SAVORY FEAST.

WE will now proceed to the various manners and customs of the Australians, not separating them into the arbitrary and fluctuating distinctions of tribes, but describing as briefly as is consistent with justice, the most interesting of their habits, and mentioning those cases where any particular custom seems to be confined to any one tribe or district.

We have in the illustration No. 1, on page 707, a good example of a native of North Western Australia. The sketch was kindly made by Mr. T. Baines. A profile of the man is given, in order to show the peculiar contour of the face, which, as the reader may see, has nothing of the negro character about it; the boldly prominent nose, the full beard, and the long hair fastened up in a top-knot being the distinguishing features. The man carries in his belt his provisions for the day, namely, a snake and one of the little kangaroo-rats, and having these he knows no care, though of course he would prefer larger game.

Round his neck may be seen a string. This supports an ornament which hangs upon his breast. Several forms of this ornament, which is called in the duplicative

Australian language a “dibbi-dibbi,” are employed, and there are in my collection two beautiful specimens made from the shell of the pearl-oyster. The ordinary dibbi-dibbi is fan-shaped, and does not depart very much from the original outline of the shell. There is, however, one kind of dibbi-dibbi which is valued exceedingly, and which is shaped like a crescent. The specimen in my possession is almost as large as a cheese plate, and must have been cut from an enormous shell, economy, whether of material or time, not being understood by these savages. Owing to the shape of the shell, it is slightly convex, and was worn with the concave side next the body.

Not being satisfied with the natural smooth polish of the nacre, the native has ornamented the dibbi-dibbi with a simple but tolerably effective pattern. Along the margin of the scooped edge he has bored two parallel rows of small and shallow holes about half an inch apart, and on either side of each row he has cut a narrow line. From the outer line he has drawn a series of scalloped patterns made in a similar fashion; and, simple as this pattern is, its effect is

really remarkable. The man has evidently begun a more elaborate pattern on the broad surface of the shell, but his mind seems to have misgiven him, and he has abandoned it. The cord by which it is suspended round the neck is nearly an inch wide, and is made of string and a sort of rattan plaited together.

On the shoulder of the man may be seen a number of raised marks. These are the scars of wounds with which the Australians are in the habit of adorning their bodies, and which they sometimes wear in great profusion. The marks are made by cutting deeply into the skin, and filling the wounds with clay and other substances, so that when the wound heals an elevated scar is made. These scars are made in patterns which partly differ according to the taste of the individual, and partly signifying the district to which the tattooed person belongs. For example, the scars as shown in the illustration are the mark of a Northern Australian; and, although he may have plenty other scars on his body and limbs, these will always appear on his shoulder as the distinguishing mark of his tribe.

In my photographs, which represent natives from various parts of the continent, these scars are very prominent, and there is not an individual who does not possess them. Some have them running longitudinally down the upper arm, while others have them alternately longitudinal and transverse. They occasionally appear on the breast, and an old man, remarkable for the quantity of hair which covered his breast and arms, has disposed them in a fan shape, spreading from the centre of the body to the arms. He has evidently spent a vast amount of time on this adornment, and suffered considerable pain, as scars, although not so large as in many other instances, are exceedingly numerous; the man has adorned his arms and shoulders with little scars of the same character arranged in regular lines.

In some parts of Australia the scars assume a much more formidable appearance, being long and heavy ridges. One chief, who was very proud of his adornments, — as well he might be, seeing that their possession must nearly have cost him his life, — was entirely covered from his neck to his knees with scars at least an inch broad, set closely together, and covering the whole of the body. The front of the chest and stomach was adorned with two rows of these scars, each scar being curved, and reaching from the side to the centre of the body, where they met. The man was so inordinately proud of this ornament that nothing could induce him to wear clothing of any kind, and he stalked about in his grandeur, wearing nothing but his weapons. The photograph of this man has a very singular aspect, the light falling on the polished

ridge of the scars having an effect as if he were clad in a suit of some strange armor.

By way of adding to the beauty of their countenances, they are in the habit of perforating the septum of the nose, and of thrusting through it a piece of bone or stick, the former being preferred on account of its whiteness. It is almost impossible to describe the exceedingly grotesque appearance presented by an Australian dandy, who has his body covered with scars, and his face crossed by a wide piece of bone some six inches in length, making his naturally broad nose wider, and seeming as it were to cut his face in half. The hole through which this ornament is thrust is made when a child is a fortnight old.

As to other ornaments, they consist of the usual necklaces, bracelets, and anklets which are common to savage tribes in all parts of the world. Some of these necklaces which are in my collection are really pretty, and some skill is shown in their manufacture. One is made of pieces of yellow reed as thick as quills and almost an inch in length, strung alternately with scarlet reeds; another is made entirely of the same reeds, while a third is, in my opinion, the handsomest, though not the most striking of them. At first sight it appears to be made entirely of the reeds already mentioned, but on a closer examination it is seen to be composed entirely of the antennæ of lobsters, cut into short lengths and strung together. To the necklaces is attached a small mother-of-pearl dibbi-dibbi four inches long and one inch wide, and the pieces of lobster antennæ are so disposed that the thinner parts of the antennæ, taken from the extremities, come next to the dibbi-dibbi and hang on the breast, while the larger and thicker parts, taken from the base of the antennæ, come on the neck. The native basket in which these necklaces were kept is more than half filled with bright colored seeds of various hues, that are evidently intended for the manufacture of necklaces.

Girdles of finely twisted human hair are often worn by the men, and the native who is represented in the engraving No. 1, on page 707, is wearing one of these girdles. Sometimes, as in the present instance, a small tassel made of the hair of a phalangist or "flying-squirrel," as it is wrongly termed, is hung to the front of the girdle, by no means as a covering, but as an ornament.

The scars are so highly valued that the women wear them nearly as profusely as the men. In my photographs, there are portraits of many women of all ages, not one of whom is without scars. They do not wear them so large as the men, but seem to be more careful in the regularity of the pattern.

Taking a series of three women, the first has three cuts on the shoulder, showing her

northern extraction, and a row of small horizontal and parallel scars along the front of the body from the breast-bone downward. The second, in addition to the shoulder cuts, has several rows of scars extending from the breast to the collar-bones, together with a central line as already described, and some similar rows of cuts on the ribs and sides. The third woman, a mere girl of fourteen or so, has been very careful in the arrangement of the scars, which descend in regular and parallel rows from the breast downward, and then radiate fan-wise in six rows from the breast upward to the collar bones.

Mr. McGillivray, who accompanied H. M. S. *Rattlesnake* in her voyage, writes as follows concerning the scar ornaments and their uses:—"The Torres Straits islanders are distinguished by a large complicated oval scar, only slightly raised, and of neat construction. This, which I have been told has some connection with a turtle, occupies the right shoulder, and is occasionally repeated on the left. (See engraving at foot of page 722.) At Cape York, however, the cicatrices were so varied that I could not connect any particular style with an individual tribe. At the same time, something like uniformity was noticed among the Katchialaigas, nearly all of whom had, in addition to the horned breast mark, two or three long transverse scars on the chest, which the other tribes did not possess.

"In the remaining people the variety of marking was such that it appeared fair to consider it as being regulated more by individual caprice than by any fixed custom. Many had a simple two-horned mark on each breast, and we sometimes saw upon them a clumsy imitation of the elaborate shoulder mark of the islanders."

Well-shaped as are these women, they have one defect in form, namely, the high and square shoulder, which detracts so much from feminine beauty, and which is equally conspicuous in the child of six, the girl of thirteen or fourteen, and the old woman. The men also exhibit the same defective form.

The reader will have noticed the elaborate manner in which the hair of the Australian savage is sometimes dressed. The style of hair-dressing varies with the locality, and often with the time, fashion having as absolute a reign among the native Australians, and being quite as capricious, as among ourselves. Sometimes the hair is twisted up into long and narrow ringlets, and, if the savage should not happen to have enough hair for this fashion, he straightway makes a wig in imitation of it. Now and then the head is shaved, except a transverse crest of hair, and sometimes the natives will take a fashion of rubbing red ochre and turtle-fat into their heads until they are saturated with the compound, and will then twist up the hair into little strands.

The men of this part of Australia never wear any dress, and the women are often equally indifferent to costume. At Cape York, however, they mostly wear an apology for a petticoat, consisting of a tuft of long grass or split pandanus leaves suspended to the front of the girdle. On great occasions, and especially in their dances, they wear over this a second petticoat mostly made of some leaf, and having the ends woven into a sort of waistband. The material of the petticoat is generally pandanus leaf, but, whatever may be the material, the mode of plaiting it and the general form are the same among all the tribes of Torres Straits. From this useful leaf, the women also make the rude sails for their canoes, which serve the double purpose of sails and coverings under which the natives can sleep in wet weather.

The women have rather a curious mode of wearing one of their ornaments. This is a very long belt, composed of many strands of plaited or twisted fibre, and passed round the body in such a manner that it crosses on the breast like the now abolished cross-belts of the soldier. It is drawn rather tight, and may perhaps be of some service in supporting the bosom. In neither case does clothing seem to be worn as a mode of concealing any part of the body, but merely as a defence against the weather or as an ornament. Even when dress is worn it is of a very slight character, with one or two exceptions. These exceptions are the fur cloaks, with which the women sometimes clothe themselves, and a remarkable garment which presently will be described.

The fur cloaks are made almost universally from the skin of the opossum, and, as the animal is a small one, a considerable number are sewed together to make a single robe. The mode of manufacture is exactly similar to that which was described when treating of the kaross of the Kaffir tribes, the skins being cut to the proper shape, laid side by side, and sewed laboriously together with threads formed of the sinews of the kangaroo's tail, or often with those which are drawn out of the tails of the very creatures which furnish the skin.

Sometimes a piece of kangaroo skin is used for the same purpose, but in neither case does it fulfil the office of a dress according to our ideas. The cloak is a very small one in proportion to the size of the women, and it is worn by being thrown over the back and tied across the chest by a couple of thongs, so as to leave the whole front of the body uncovered. If the garment in question be the skin of the kangaroo, it is slung over one shoulder, and allowed to fall much as it likes, the only object seeming to be that it shall cover the greater part of the back and one shoulder. Occasionally a man wears a fur cloak, but he seems to be very indifferent as to the manner in which it hangs upon his

body, sometimes draping it about his shoulders, sometimes letting it fall to his waist and gathering it about his loins, and sometimes, especially if walking, holding two corners together with his left hand in front of his breast, while his right hand grasps his bundle of weapons.

Mr. Angas mentions one instance of a singularly perfect dress in use among the Australians — the only dress in fact that is really deserving of the name. It is a large cloak made from the *zostera* or sea grass, a plant that is remarkable for being the only true flowering plant that grows in the sea. It has very long grass-like blades, and is found in vast beds, that look in a clear sea like luxuriant hay-fields just before mowing.

The fibre of the *zostera* is long, and wonderfully tough, and indeed the fibre is so good, and the plant so abundant, that the uses to which it is now put, such as packing and stuffing, are far below its capabilities, and it ought to be brought into use for purposes for which a long and strong fibre are needed. Some time ago, when the supply of rags for paper seemed to be failing, there was an attempt made to substitute the *zostera* for rags; and, although it was not a perfectly successful experiment, it had at all events the elements of success in it.

With this long grass the Australian native occasionally makes a large cloak, which will cover the whole body. It is made by laying the fibres side by side, and lashing them together at regular intervals, much as the well-known New Zealand mantle is made from the *phormium*. Anxious to avoid trouble, the native only fastens together a sufficient quantity to make a covering for his body as low as the knees, the loose ends of the *zostera* being left as a kind of long fringe that edges the mantle all round, and really has a very graceful effect.

The illustration No. 2, on the next page, shows one of those curious mantles, which was sketched while on the body of the wearer. As the manufacture of such a mantle involves much trouble, and the Australian native has the full savage hatred of labor, very few of these cloaks are to be seen. Indeed, nothing but a rather long inclement season will induce a native to take the trouble of making a garment which he will only use for a comparatively short period, and which is rather troublesome to carry about when not wanted.

WE now come to the food of the natives. As has already been stated, they eat almost anything, but there are certain kinds of food which they prefer, and which will be specially mentioned.

As to vegetable food, there are several kinds of yams which the more civilized tribes cultivate — the nearest approach to labor of which they can be accused. It is almost exclusively on the islands that cultivation is

found, and Mr. McGillivray states that on the mainland he never saw an attempt at clearing the ground for a garden. In the islands, however, the natives manage after a fashion to raise crops of yams.

When they want to clear a piece of ground, they strew the surface with branches, which are allowed to wither and dry; as soon as they are thoroughly dried, fire is set to them, and thus the space is easily cleared from vegetation. The ground is then pecked up with a stick sharpened at the point and hardened by fire; the yams are cut up and planted, and by the side of each hole a stick is thrust into the ground, so as to form a support for the plant when it grows up. The natives plant just before the rainy season. They never trouble themselves to build a fence round the simple garden, neither do they look after the growth of the crops, knowing that the rains which are sure to fall will bring their crops to perfection.

There are also multitudes of vegetable products on which the natives feed. One of them, which is largely used, is called by them "biyu." It is made from the young and tender shoots of the mangrove tree. The sprouts, when three or four inches in length, are laid upon heated stones, and covered with bark, wet leaves, and sand. After being thoroughly stewed, they are beaten between two stones, and the pulp is scraped away from the fibres. It then forms a slimy gray paste, and, although it is largely eaten, the natives do not seem to like it, and only resort to it on a necessity. They contrive, however, to improve its flavor by adding large quantities of wild yams and other vegetable products.

Perhaps the most celebrated wild food of the Australians is the "nardoo," which has become so familiar to the British reader since the important expedition of Burke and Wills. The nardoo is the produce of a cryptogamous plant which grows in large quantities, but is rather local. The fruit, is about as large as a pea, and is cleaned for use by being rubbed in small wooden troughs. It is then pounded into a paste, and made into cakes, like oatmeal.

The nardoo plant is one of the ferns, and those of my readers who are skilled in botany will find it in the genus *Marsilea*. Like many of the ferns, the plant presents a strangely fernlike aspect, consisting of upright and slender stems, about twelve inches high, each having on its tips a small quadruple frond, closely resembling a flower. The fruit, or "sporocarp," of the nardoo is the part that is eaten; and it is remarkable for its powers of absorbing water, and so increasing its size. Indeed, when the fruit is soaked in water, it will in the course of a single hour swell until it is two hundred times its former size.

The nardoo is useful in its way, and, when mixed with more nutritious food, is a valu-

(1.) THE HUNTER AND HIS DAY'S PROVISIONS.

(See page 704.)

(2.) THE SEA GRASS CLOAK.

(See page 706.)

able article of diet. Taken alone, however, it has scarcely the slightest nutritive powers, and though it distends the stomach, and so keeps off the gnawing sense of hunger, it gives no strength to the system. Even when eaten with fish, it is of little use, and requires either fat or sugar to give it the due power of nourishment. With the wonderful brightness of spirit which Mr. Wills managed to keep up, even when suffering the severest hardships, and feeling himself gradually dying, he gives in his diary a curiously accurate picture of the effects of living for a length of time on an innutritious substance. He liked the nardoo, and consumed considerable quantities of it, but gradually wasted away, leaving a record in his diary that "starvation on nardoo is by no means unpleasant but for the weakness one feels, and the utter inability to rouse one's self; for as far as appetite is concerned, it gives the greatest satisfaction."

The death of this fine young man affords another proof of the disadvantage at which a stranger to the country is placed while traversing a new land. Many native tribes lived on the route along which the travellers passed, and, from their knowledge of the resources of the country, were able to support themselves; whereas the white travellers seem to have died of starvation in the midst of plenty.

The chief vegetable food, however, is furnished by the bulrush root, which is to the Australians who live near rivers the staff of life. As the task of procuring it is a very disagreeable one, it is handed over to the women, who have to wade among the reeds and half bury themselves in mud while procuring the root.

It is cooked after the usual Australian manner. A heap of limestones is raised, and heated by fire. The roots are then laid on the hot stones, and are covered with a layer of the same material. In order to produce a quantity of steam, a heap of wet grass is thrown on the upper layer of stones, and a mound of sand heaped over all.

As the root, however well cooked, is very fibrous, the natives do not swallow it, but, after chewing it and extracting all the soft parts, they reject the fibres, just as a sailor throws aside his exhausted quid; and great quantities of these little balls of fibre are to be found near every encampment. The same fibre is convertible into string, and is used in the manufacture of fishing lines and nets.

The singular knowledge of vegetable life possessed by the natives is never displayed with greater force than in the power which they have of procuring water. In an apparently desert place, where no signs of water are to be found, and where not even a pigeon can be seen to wing its way through the air, as the guide to the distant water toward which it is flying, the native will

manage to supply himself with both water and food.

He looks out for certain eucalypti or gum-trees, which are visible from a very great distance, and makes his way toward them. Choosing a spot at three or four yards from the trunk, with his katta he digs away at the earth, so as to expose the roots, tears them out of the ground, and proceeds to prepare them. Cutting them into pieces of a foot or so in length, he stands them upright in the bark vessel which an Australian mostly carries with him, and waits patiently. Presently a few drops of water ooze from the lower ends of the roots, and in a short time water pours out freely, so that an abundant supply of liquid is obtained.

Should the native be very much parched, he takes one of the pieces of root, splits it lengthwise, and chews it, finding that it gives as much juice as a water-melon. The youngest and freshest-looking trees are always chosen for the purpose of obtaining water, and the softest-looking roots selected. After the water has all been drained from them, they are peeled, pounded between two stones, and then roasted; so that the eucalyptus supplies both food and drink.

As, however, as has been stated, the chief reliance of the natives is upon animal food and fish, molluscs, crustacea, reptiles, and insects form a very considerable proportion of their food. Collecting the shell-fish is the duty of the women, chiefly because it is really hard work, and requires a great amount of diving. Throughout the whole of this vast continent this duty is given to the women; and whether in the Gulf of Carpentaria, on the extreme north, or in the island of Van Diemen's Land, in the extreme south, the same custom prevails. During Labillardière's voyage in search of La Perouse, the travellers came upon a party of the natives of Van Diemen's Land while the women were collecting shell-fish, and the author gives a good description of the labors to which these poor creatures were subjected:—

"About noon we saw them prepare their repast. Hitherto we had but a faint idea of the pains the women take to procure the food requisite for the subsistence of their families. They took each a basket, and were followed by their daughters, who did the same. Getting on the rocks that projected into the sea, they plunged from them to the bottom in search of shell-fish. When they had been down some time, we became very uneasy on their account; for where they had dived were seaweeds of great length, among which we observed the *fucus pyriferus*, and we feared that they might have been entangled in these, so as to be unable to regain the surface.

"At length, however, they appeared, and convinced us that they were capable of remaining under water twice as long as our

ablest divers. An instant was sufficient for them to take breath, and then they dived again. This they did repeatedly till their baskets were nearly full. Most of them were provided with a little bit of wood, cut into the shape of a spatula, and with these they separated from beneath the rocks, at great depths, very large sea-ears. Perhaps they chose the biggest, for all they brought were of a great size.

"On seeing the large lobsters which they had in their baskets, we were afraid that they must have wounded these poor women terribly with their large claws; but we soon found that they had taken the precaution to kill them as soon as they caught them. They quitted the water only to bring their husbands the fruits of their labor, and frequently returned almost immediately to their diving till they had procured a sufficient meal for their families. At other times they stayed a little while to warm themselves, with their faces toward the fire on which their fish was roasting, and other little fires burning behind them, that they might be warmed on all sides at once.

"It seemed as if they were unwilling to lose a moment's time; for while they were warming themselves, they were employed in roasting fish, some of which they laid on the coals with the utmost caution, though they took little care of the lobsters, which they threw anywhere into the fire; and when they were ready they divided the claws among the men and the children, reserving the body for themselves, which they sometimes ate before returning into the water.

"It gave us great pain to see these poor women condemned to such severe toil; while, at the same time, they ran the hazard of being devoured by sharks, or entangled among the weeds that rise from the bottom of the sea. We often entreated their husbands to take a share in their labor at least, but always in vain. They remained constantly near the fire, feasting on the best bits, and eating broiled fucus, or fern-roots. Occasionally they took the trouble to break boughs of trees into short pieces to feed the fire, taking care to choose the driest.

"From their manner of breaking them we found that their skulls must be very hard; for, taking hold of the sticks at each end with the hand, they broke them over their heads, as we do at the knee, till they broke. Their heads being constantly bare, and often exposed to all weathers in this high latitude, acquire a capacity for resisting such efforts: besides, their hair forms a cushion which diminishes the pressure, and renders it much less painful on the summit of the head than any other part of the body. Few of the women, however, could have done as much, for some had their hair cut pretty short, and wore a string several times round the head; others had only a simple crown of hair. We made the same observa-

tion with respect to several of the children, but none of the men. These had the back, breast, shoulders, and arms covered with downy hair."

Sometimes a party of women will go out on a raft made of layers of reeds, pushing themselves along by means of very long poles. When they arrive at a bed of mussels, they will stay there nearly all day diving from the raft, with their nets tied round their necks, and, after remaining under water for a considerable time, come up with a heavy load of mussels in their nets.

They even manage to cook upon this fragile raft. They make a heap of wet sand upon the reeds, put a few stones on it, and build their fire on the stones, just as if they had been on shore. After remaining until they have procured a large stock of mussels, they pole themselves ashore, and in all probability have to spend several hours in cooking the mussels for the men. The mussels are usually eaten with the blubrush root.

There is a sort of crayfish which is found in the mud-flats of rivers and lakes. These are also caught by the women, who feel for them in the mud with their feet, and hold them down firmly until they can be seized by the hand. As soon as the creatures are taken, the claws are crushed to prevent them from biting, and they are afterward roasted, while still alive, on the embers of the fire. Tadpoles are favorite articles of diet with the Australians, who fry them on grass.

The ordinary limpet, mussel, and other molluses, are largely eaten by the natives, who scoop them out by means of smaller shells, just as is done by boys along our own coasts—a plan which is very efficacious, as I can testify from personal experience. Sometimes they cook the molluscs by the simple process of throwing them on the embers, but as a general rule they eat them in a raw state, as we eat oysters.

Fish they catch in various ways. The usual method is by a hook and line: the former of which is ingeniously cut out of the shell of the hawk-bill turtle. Two of these hooks are now before me, and raise a feeling of wonder as to the fish which could be induced to take such articles into its mouth. It is flat, very clumsily made, and there is no barb, the point being curved very much inward, so as to prevent the fish from slipping off the hook. In fact the whole shape of the hook is almost exactly identical with that of the hook which is found throughout Polynesia and extends to New Zealand.

The hook is fastened to a long and stout line, made by chewing reeds, stripping them into fibres, and rolling them on the thighs. Two of these strings are then twisted together, and the line is complete. My own specimen of a line is about as thick as the fishing lines used on our coasts, and it is very long, having a hook at either end. The hook is lashed to the line by a very firm but

rather clumsy wrapping. Sometimes the line is made of scraped rattan fibres.

Another mode of fishing is by the net. This requires at least two men to manage it. The net is many feet in length, and about four feet in width. It is kept extended by a number of sticks placed a yard or so apart, and can then be rolled up in a cylindrical package and be taken to the water. One man then takes an end of the net, unrolls it, and with the assistance of his comrade drops it into the water. As soon as the lower edge of the net touches the bottom, the men wade toward the shore, drawing with them the two ends of the net and all the fish that happen to be within its range. As soon as they near the shore, they bring the two ends of the net to the land, fix them there, and are then able to pick up and throw ashore all the fish that are in the net. Some of the more active fish escape by leaping over the upper edge of the net, and some of the mud-loving and crafty wriggle their way under the lower edge; but there is always a sufficiency of fish to reward the natives for their labor.

Like the fishing line, the net is made of chewed reeds, and the labor of chewing and twisting the string belongs exclusively to the women.

A third mode of fishing is by employing certain traps or baskets, ingeniously woven of rattan, and made so that the fish can easily pass into them, but cannot by any possibility get out again. Sometimes fish are speared in the shallow water, the native wading in, and with unerring aim transfixing the fish with his spear. Even the children take part in this sport, and, though armed with nothing better than a short stick, sharpened at one end, contrive to secure their fish. With the same stick they dig molluscs out of the mud, and turn crustacea out of their holes; and when they can do this, they are supposed to be able to shift for themselves, and their parents take no more trouble about feeding them.

They are not more fastidious in the cooking of fish than of crustacea or molluscs, but just throw them on the fire, turn them once or twice with a stick, and when they are warmed through and the outside scorched, they pick them out of the fire, scrape off the burnt scales, and eat them without further ceremony.

Insect food is much used among the Australians. As might be expected, honey is greatly valued by them, and they display great ingenuity in procuring it. When a native sees a bee about the flowers, and wishes to find the honey, he repairs to the nearest pool, selects a spot where the bank shelves very gradually, lies on his face, fills his mouth with water, and patiently awaits the arrival of a bee. These insects require a considerable amount of moisture, as every one knows who has kept them, and the bee-

hunter reckons on this fact to procure him the honey which he desires. After a while a bee is sure to come and drink, and the hunter, hearing the insect approaching him, retains his position and scarcely breathes, so fearful is he of alarming it. At last it alights, and instantly the native blows the water from his mouth over it, stunning it for the moment. Before it can recover itself, he seizes it, and by means of a little gum attaches to it a tuft of white down obtained from one of the trees.

As soon as it is released, the insect flies away toward its nest, the white tuft serving the double purpose of making it more conspicuous and retarding its flight. Away goes the hunter after it at full speed, running and leaping along in a wonderful manner, his eyes fixed on the guiding insect, and making very light of obstacles. (See illustration No. 1, on the 716th page.) Sometimes a fallen tree will be in his way, and if he can he jumps over it; but at all risks he must get over without delay, and so he dashes at the obstacle with reckless activity. Should he surmount it, well and good; but if, as often happens, he should fall, he keeps his eyes fixed, as well as he can, on the bee, and as soon as he springs to his feet he resumes the chase. Even if he should lose sight of it for a moment, he dashes on in the same direction, knowing that a bee always flies in a straight line for its home; and when he hears it, the angry hum of the hampered insect soon tells him that he has recovered the lost ground.

The reader will see that this mode of tracking the bee to its home is far inferior to that of the American bee-hunters, and is rather a business of the legs than of the head. The Australian bee-hunter waits until a bee happens to come to the spot where he lies; the American bee-hunter baits an attractive trap, and induces the insect to come to the spot which he selects. Then the Australian bee-hunter only runs after the single bee; whereas the American bee-hunter economizes his strength by employing two bees, and saving his legs.

He puts honey on a flat wooden slab, having drawn a circle of white paint round it. The bee alights on the honey, and, after filling its crop, crawls through the white paint and sets off homeward. The hunter follows the "bee-line" taken by the insect, and marks it by scoring or "blazing" a few trees. He then removes his honeyed trap to a spot at an angle with his former station and repeats the process. There is no need for him to race after the flying bee, and to run considerable risk of damaging himself more or less seriously; he simply follows out the lines which the two bees have taken, and, by fixing on the point at which they meet, walks leisurely up to the nest.

Having found his bee nest, the Australian loses no time in ascending to the spot.

whether it be a cleft in a rock, or, as is usually the case, a hole in a tree. This latter spot is much favored by the bees, as well as by many of the arboreal mammals, of which there are so many in Australia. The sudden and violent tempests which rage in that part of the world tear off the branches of trees and hurl them to the ground. During succeeding rainy seasons, the wet lodges in the broken branch, and by degrees rots away the wood, which is instantly filled with the larvæ of beetles, moths, flies, and other insects that feed upon decaying wood. Thus, in a few years, the hollow extends itself until it burrows into the tree itself, and sometimes descends nearly from the top to the bottom, thus forming an admirable locality for the bees.

Taking with him a batchet, a basket, and a quantity of dry grass or leaves, the native ascends, lights the grass, and under cover of the smoke chops away the wood until he can get at the combs, which he places in the basket, with which he descends. Should he be too poor to possess even a basket, he extemporizes one by cutting away the bark of the tree; and should the nest be a very large one, he is supplied by his friends from below with a number of vessels, and passes them down as fast as they are filled.

Perhaps some of my readers may remark that honey cannot be rightly considered as insect food, and that it ought to have been ranked among the vegetable productions. The Australian, however, does not content himself with extracting the honey from the comb, but eats it precisely in the state in which it is brought from the nest. As the bees are not forced, as amongst English bee-masters, to keep their honey-cells distinct from those which contain the hoard and the "bee-bread," each comb contains indiscriminately bee-bread, young bee-grubs, and honey, and the Australian eats all three with equal satisfaction.

Another kind of insect food is a grub which inhabits the trunks of trees, and of which the natives are inordinately fond. They have a wonderful faculty of discovering the presence of this grub, and twist it out of its hole with an odd little instrument composed of a hook fastened to the end of a slender twig. This implement is carried in the hair so as to project over the ear, like a clerk's pen, and for a long time puzzled travellers, who thought it to be merely an ornament, and could not understand its very peculiar shape.

The larva is the caterpillar of a moth which is closely allied to the goat-moth of our own country, and has the same habit of burrowing into the wood of living trees. The hooked instrument which is used for drawing them out of their holes is called the "pileyah," and is employed also for hooking beetles, grubs, and other insects out of their holes in the ground. When the

pileyah is used for extracting grubs from the earth, the ground is first loosened by means of a wooden scoop that looks something like a hollowed waddy. The pileyah is then tied to the end of a polygonum twig of sufficient length, and by such means can be introduced into the holes.

Perhaps the most celebrated of the various insect banquets in which the Australians delight is that which is furnished by the bugong moth, as the insect is popularly, but wrongly, called. Instead of belonging to the moth tribe, it is one of the butterflies, and belongs to the graceful family of the Heliconide. Its scientific name is *Euplaea hamata*. The bugong is remarkable for the fact that its body, instead of being slender like that of most butterflies, is very stout, and contains an astonishing amount of oily matter. The color of the insect is dark brown, with two black spots on the upper wings. It is a small insect, measuring only an inch and a half across the wings.

It is found in the New South Wales district, and inhabits a range of hills that are called from the insect the Bugong Mountains. The Australians eat the bugong butterflies just as locusts are eaten in many parts of the world, and, for the short time during which the insect makes its appearance, feast inordinately upon it, and get quite fat. The following account is given by Mr. G. Bennett:—

"After riding over the lower ranges, we arrived a short distance above the base of the Bugong Mountain, tethered the horses, and ascended on foot, by a steep and rugged path, which led us to the first summit of the mountain: at this place, called Ginandery by the natives, enormous masses of granite rock, piled one upon another, and situated on the verge of a wooded precipice, excited our attention. An extensive and romantic view was here obtained of a distant, wooded, mountainous country.

"This was the first place where, upon the smooth sides or crevices of the granite blocks, the bugong moths congregated in such incredible multitudes; but, from the blacks having recently been here, we found but few of the insects remaining. At one part of this group of granite rocks were two pools, apparently hollowed naturally from the solid stone, and filled with cool and clear water; so, lighting a fire, we enjoyed a cup of tea previous to recommencing our further ascent. On proceeding we found the rise more gradual, but unpleasant, from the number of loose stones and branches of trees strewn about; several of the deserted bark huts of the natives (which they had temporarily erected when engaged in collecting and preparing the bugong) were scattered around. Shrubs and plants were numerous as we proceeded, but, with few exceptions, did not differ from those seen in other parts of the colony.

"Near a small limpid stream a species of *Lycopodium* grew so dense as to form a carpet over which we were able to walk. The timber trees towered to so great an elevation that the prospect of the country we had anticipated was impeded. At last we arrived at another peculiar group of granite rocks in enormous masses and of various forms; this place, similar to the last, formed the locality where the bugong moths congregate, and is called 'Warrongong' by the natives. The remains of recent fires apprised us that the aborigines had only recently left the place for another of similar character a few miles further distant.

"Our native guides wished us to proceed and join the tribe, but the day had so far advanced that it was thought more advisable to return, because it was doubtful, as the blacks removed from a place as soon as they had cleared it of the insects, whether we should find them at the next group, or removed to others still further distant.

"From the result of my observations it appears that the insects are only found in such multitudes on these insulated and peculiar masses of granite, for about the other solitary granite rocks, so profusely scattered over the range, I did not observe a single moth, or even the remains of one. Why they should be confined only to these particular places, or for what purpose they thus collect together, is not a less curious than interesting subject of inquiry. Whether it be for the purpose of emigrating, or any other cause, our present knowledge cannot satisfactorily answer.

"The bugong moths, as I have before observed, collect on the surfaces, and also in the crevices, of the masses of granite in incredible quantities. To procure them with greater facility, the natives make smothered fires underneath these rocks about which they are collected, and suffocate them with smoke, at the same time sweeping them off frequently in bushfuls at a time. After they have collected a large quantity, they proceed to prepare them, which is done in the following manner.

"A circular space is cleared upon the ground, of a size proportioned to the number of insects to be prepared; on it a fire is lighted and kept burning until the ground is considered to be sufficiently heated, when, the fire being removed, and the ashes cleared away, the moths are placed upon the heated ground, and stirred about until the down and wings are removed from them; they are then placed on pieces of bark, and *winnowed* to separate the dust and wings mixed with the bodies; they are then eaten, or placed into a wooden vessel called 'walbumi,' or 'calibum,' and pounded by a piece of wood into masses or cakes resembling lumps of fat, and may be compared in color and consistence to dough made from smutty wheat mixed with fat.

"The bodies of the moths are large and filled with a yellowish oil, resembling in taste a sweet nut. These masses (with which the 'netbuls,' or 'talabats,' of the native tribes are loaded during the season of feasting upon the bugong) will not keep more than a week, and seldom even for that time; but by smoking they are able to preserve them for a much longer period. The first time this diet is used by the native tribes, violent vomiting and other debilitating effects are produced, but after a few days they become accustomed to its use, and then thrive and fatten exceedingly upon it.

"These insects are held in such estimation among the aborigines, that they assemble from all parts of the country to collect them from these mountains. It is not only the native blacks that resort to the bugong, but crows also congregate for the same purpose. The blacks (that is, the crows and the aborigines) do not agree about their respective shares: so the stronger decides the point; for, when the crows (called 'arabul' by the natives) enter the hollows of the rocks to feed upon the insects, the natives stand at the entrance and kill them as they fly out; and they afford them an excellent meal, being fat from feeding upon the rich bugong. So eager are the feathered blacks or arabuls after this food that they attack it even when it is preparing by the natives: but as the aborigines never consider any increase of food a misfortune, they lay in wait for the arabuls with waddies or clubs, kill them in great numbers, and use them as food."

REPTILES form a very considerable part of an Australian's diet, and he displays equal aptitude in capturing and cooking them. Turtle is an especial favorite with him, not only on account of its size, and of the quantity of meat which it furnishes, but on account of the oil which is obtained from it.

On the coast of Australia several kinds of turtle are found, the most useful of which are the ordinary green turtle and the hawk-bill. They are caught either in the water, or by watching for them when they come on shore for the purpose of laying their eggs, and then turning them on their backs before they can reach the sea. As, however, comparatively few venture on the shore, the greater number are taken in the water. Along the shore the natives have regular watchtowers or cairns made of stones and the bones of turtles, dugongs, and other creatures. When the sentinel sees a turtle drifting along with the tide, he gives the alarm, and a boat puts out after it. The canoe approaches from behind, and paddles very cautiously so that the reptile may not hear it. As soon as they come close to it, the chief hunter, who holds in his hand one end of a slight but tough rope, leaps on the turtle's back, and clings to it with both

hands on its shoulders. The startled reptile dashes off, but before it has got very far the hunter contrives to upset it, and while it is struggling he slips the noose of the rope over one of its flippers. The creature is then comparatively helpless, and is towed ashore by the canoe.

In some districts the turtle is taken by means of a harpoon, which is identical in principle with that which is used by the hippopotamus hunters of Africa. There is a long shaft, into the end of which is loosely slipped a movable head. A rope is attached to the head, and a buoy to the other end of the rope. As soon as the reptile is struck, the shaft is disengaged, and is picked up by the thrower; while the float serves as an indication of the turtle's whereabouts, and enables the hunters to tow it toward the shore.

One of the natives, named Gi'om, told Mr. McGillivray that they sometimes caught the turtle by means of the remora, or sucking-fish. One of these fish, round whose tail a line has been previously made fast, is kept in a vessel of water on board the boat, and, when a small turtle is seen, the remora is dropped into the sea. Instinctively it makes its way to the turtle, and fastens itself so firmly to the reptile's back that they are both hauled to the boat's side and lifted in by the fishermen. Only small turtles can be thus taken, and there is one species which never attains any great size which is generally captured in this curious manner.

The hawkbill turtle is too dangerous an antagonist to be chased in the water. The sharp-edged scales which project from its sides would cut deeply into the hands of any man who tried to turn it; and even the green turtle, with its comparatively blunt-edged shell, has been known to inflict a severe wound upon the leg of the man who was clinging to its back. The native, therefore, is content to watch it ashore, and by means of long, stout poles, which he introduces leverwise under its body, turns it over without danger to himself.

When the Australians have succeeded in turning a turtle, there are great rejoicings, as the very acme of human felicity consists, according to native ideas, in gorging until the feasters can neither stand nor sit. They may be seen absolutely rolling on the ground in agony from the inordinate distension of their stomachs, and yet, as soon as the pain has abated, they renew their feasting. Mostly they assemble round the turtle, cook it rudely, and devour it on the spot; but in Torres Straits they are more provident, and dry the flesh in order to supply themselves with food during their voyages. They cut up the meat into thin slices, boil the slices, and then dry them in the sun.

During the process of cooking, a considerable amount of oil rises to the surface, and is skimmed off and kept in vessels made of

bamboo and turtles' bladders. The cook, however, has to exercise some vigilance while performing his task, as the natives are so fond of the oil that, unless they are closely watched, they will skim it off and drink it while in an almost boiling state. The boiling and subsequent drying render the flesh very hard, so that it will keep for several weeks; but it cannot be eaten without a second boiling.

The shell of the hawkbill turtle is doubly valuable to the natives, who reserve a little for the manufacture of hooks, and sell the rest to shippers or traders, who bring it to Europe, where it is converted into the "tortoise-shell" with which we are so familiar. There is in my collection a beautiful specimen of one of these scales of tortoise-shell as it was purchased from the natives. It is about eleven inches in length and seven in width, and has a hole at one end by which they string the scales together. There are the scars of eight large limpet shells upon it, showing the singular appearance which the animal must have presented when alive.

The cooking of turtle is a far more important process than that of boiling fish, and a sort of oven is required in order to dress it properly. In principle the oven resembles that which is in use in so many parts of the world, and which has been already described when shewing how the hunters of South Africa cook the elephant's foot. Instead, however, of digging a hole and burning wood in it, the Australian takes a number of stones, each about the size of a man's fist, and puts them into the fire. When they are heated, they are laid closely together, and the meat placed upon them. A second layer of heated stones is arranged upon the meat, and a rim or bank of tea-tree bush, backed up with sand or earth, is built round this primitive oven. Grass and leaves are then strewn plentifully over the stones, and are held in their places by the circular bank. The steam is thus retained, and so the meat is cooked in a very effectual manner.

In some parts of the country, however, a more elaborate oven is used. It consists of a hole some three feet in diameter and two feet in depth, and is heated in the following manner:—It is filled to within six inches of the top with round and hard stones, similar to those which have already been described, and upon them a fire is built and maintained for some time. When the stones are thought to be sufficiently heated, the embers are swept away, and the food is simply laid upon the stones and allowed to remain there until thoroughly cooked.

This kind of oven is found over a large range of country, and Mr. McGillivray has seen it throughout the shores of Torres Straits, and extending as far southward as Sandy Cape on the eastern side.

Although the idea of snake eating is so repugnant to our ideas that many persons can-

(1.) BEE HUNTING.

(See page 711.)

(2.) COOKING A SNAKE.

(See page 717.)

not eat eels because they look like snakes, the Australian knows better, and considers a snake as one of the greatest delicacies which the earth produces. And there is certainly no reason why we should repudiate the snake as disgusting while we accept the turtle and so many of the tortoise kind as delicacies, no matter whether their food be animal or vegetable. The Australian knows that a snake in good condition ought to have plenty of fat, and to be well flavored, and is always easy in his mind so long as he can catch one.

The process of cooking (see page 716) is exactly like that which is employed with fish, except that more pains are taken about it, as is consistent with the superior character of the food. The fire being lighted, the native squats in front of it and waits until the flame and smoke have partly died away, and then carefully coils the snake on the embers, turning it and recoiling it until all the scales are so scorched that they can be rubbed off. He then allows it to remain until it is cooked according to his ideas, and eats it deliberately, as becomes such a dainty, picking out the best parts for himself, and, if he be in a good humor, tossing the rest to his wives.

Snake hunting is carried on in rather a curious manner. Killing a snake at once, unless it should be wanted for immediate consumption, would be extremely foolish, as it would be unfit for food before the night had passed away. Taking it alive, therefore, is the plan which is adopted by the skilful hunter, and this he manages in a very ingenious way.

Should he come upon one of the venomous serpents, he cuts off its retreat, and with his spear or with a forked stick he irritates it with one hand, while in his other he holds the narrow wooden shield. By repeated blows he induces the reptile to attack him, and dexterously receives the stroke on the shield, flinging the snake back by the sudden repulse. Time after time the snake renews the attack, and is as often foiled; and at last it yields the battle, and lies on the ground completely beaten. The hunter then presses his forked stick on the reptile's neck, seizes it firmly, and holds it while a net is thrown over it and it is bound securely to his spear. It is then carried off, and reserved for the next day's banquet.

Sometimes the opossum-skin cloak takes the place of the shield, and the snake is allowed to bite it.

The carpet snake, which sometimes attains the length of ten or twelve feet, is favorite game with the Australian native, as its large size furnishes him with an abundant supply of meat, as well as the fat in which his soul delights. This snake mostly lives in holes at the foot of the curious grass-tree, of which we shall see several figures in the course of the following pages, and in many places it is so plentiful that there is scarcely a grass-tree without its snake.

As it would be a waste of time to probe each hole in succession, the natives easily ascertain those holes which are inhabited by smearing the earth around them with a kind of white clay mixed with water, which is as soft as putty. On the following day they can easily see, by the appearance of the clay, when a snake has entered or left its hole, and at once proceed to induce the reptile to leave its stronghold. This is done by putting on the trunk of the tree immediately over the hole a bait, which the natives state to be honey, and waiting patiently, often for many hours, until the serpent is attracted by the bait and climbs the tree. As soon as it is clear of the hole, its retreat is cut off, and the result of the ensuing combat is a certainty. The forked spear which the native employs is called a bo-bo.

All the tribes which live along the eastern coast, especially those which inhabit the northern part of the country, are in the habit of capturing the dugong. This animal is very fond of a green, branchless, marine alga, and ventures to the shore in order to feed upon it. The natives are on the watch for it, and, as soon as a dugong is seen, a canoe puts off after it.

Each canoe is furnished with paddles and a harpooner, who is armed with a weapon very similar to that which is used by the turtle catchers, except that no buoy is required. It is composed of a shaft some twelve or fifteen feet in length, light at one end, and heavy at the other. A hole is made at the heavy end, and into the hole is loosely fitted a kind of spear head made of bone, about four inches in length, and covered with barbs. One end of a stout and long rope is made fast to this head, and the other is attached to the canoe.

As soon as he is within striking distance, the harpooner jumps out of the boat into the water, striking at the same time with his weapon, so as to add to the stroke the force of his own weight. Disengaging the shaft, he returns to the canoe, leaving the dugong attached to it by the rope. The wounded animal dives and tries to make its way seaward. Strange to say, although the dugong is a large animal, often eight feet in length, and very bulky in proportion to its length, it seldom requires to be struck a second time, but rises to the surface and dies in a few minutes from a wound occasioned by so apparently insignificant a weapon as a piece of bone struck some three inches into its body. When it is dead, it is towed ashore, and rolled up the bank to some level spot, where preparations are at once made for cooking and eating it.

Those who are acquainted with zoölogy are aware that the dugong is formed much after the manner of the whale, and that it is covered first with a tough skin and then with a layer of blubber over the muscles. This structure, by the way, renders the sne-

cumbing to the wound of the harpoon the more surprising. The natives always cut it up in the same manner. The tail is sliced much as we carve a round of beef, while the body is cut into thin slices as far as the ribs, each slice having its own proportion of meat, blubber, and skin. The blubber is esteemed higher than any other portion of the animal, though even the tough skin can be rendered tolerably palatable by careful cooking.

Of all Australian animals, the kangaroo is most in favor, both on account of the excellent quality of the flesh, and the quantity which a single kangaroo will furnish. It is hardly necessary to remind the reader that with the Australian, as with other savages, quantity is considered rather than quality. A full grown "boomah" kangaroo will, when standing upright, in its usual attitude of defence, measure nearly six feet in height, and is of very considerable weight. And, when an Australian kills a kangaroo, he performs feats of gluttony to which the rest of the world can scarcely find a parallel, and certainly not a superior. Give an

Australian a kangaroo and he will eat until he is nearly dead from repletion; and he will go on eating, with short intervals of rest, until he has finished the entire kangaroo.

Like other savage creatures, whether human or otherwise, he is capable of bearing deprivation of food to a wonderful extent; and his patient endurance of starvation, when food is not to be obtained, is only to be excelled by his gluttony when it is plentiful. This curious capacity for alternate gluttony and starvation is fostered by the innately lazy disposition of the Australian savage, and his utter disregard for the future. The animal that ought to serve him and his family for a week is consumed in a few hours; and, as long as he does not feel the pain of absolute hunger, nothing can compel the man to leave his rude couch and go off on a hunting expedition. But when he does make up his mind to hunt, he has a bulldog sort of tenacity which forbids him to relinquish the chase until he has been successful in bringing down his game.

CHAPTER LXXI.

AUSTRALIA — *Continued.*

WEAPONS OF THE AUSTRALIANS, THEIR FORMS AND USES — THE CLUB OR WADDY, AND ITS VARIOUS FORMS — USES OF THE WADDY — A DOMESTIC PANACEA — AN AUSTRALIAN DUEL — THICK SKULLS OF THE NATIVES — LOVE OF THE NATIVE FOR HIS WADDY — THE BLACK POLICE FORCE — THE MISSILE WADDY — THE KATTA, OR DIGGING-STICK, AND ITS VARIED USES — HOW AN AUSTRALIAN DIGS A HOLE — THE STONE TOMAHAWK AND ITS USE — THE ASCENT OF TREES — HOW AN AUSTRALIAN KNOWS WHETHER AN ANIMAL IS IN A TREE — SMOKING OUT THE PREY — THE BLACK-BOY GUM — THE GRASS-TREE OF AUSTRALIA — THE AUSTRALIAN SAW.

As in the course of the following pages all the weapons of the Australian will have to be mentioned, we will take the opportunity of describing them at once, without troubling ourselves as to the peculiar locality in which each modification is found.

We will begin with the club, the simplest of all weapons. Several examples of the club are to be seen in the illustration entitled "Australian Clubs," on the 722d page. All the figures are drawn from actual specimens, some belonging to my own collection, some being sketched from examples in the British Museum, and others being taken from the fine collection of Colonel Lane Fox.

The simplest form of Australian club is that which is known by the name of "waddy," and which is the favorite weapon of an Australian savage, who never seems to be happy without a waddy in his hands, no matter what other weapons he may happen to carry. One of these waddies may be seen at fig. 4, and another at fig. 5. The latter is a specimen in my own collection, and affords a very good example of the true Australian waddy. It is made of the tough and heavy wood of the gum-tree, and is really a most effective weapon, well balanced, and bears marks of long usage. The length is two feet eight inches, and, as the reader may see from the illustration, it is sharpened at the point, so that in close combat it can be used for stabbing as well as for striking. It weighs exactly twenty-one ounces.

Four deep grooves run along the waddy, from the point to the spot where it is grasped, and seem to be intended as edges whereby a blow may cut through the skin as well as inflict a bruise. Besides these grooves, there are sundry carvings which the native evidently has thought to be ornamental. On two of the sides the pattern is merely the double-headed T seen in the illustration, but on the other two sides the pattern is varied. In every case the top figure is the double T; but on one side there is first a T, then a cross with curved arms, then a T, and then a pattern that looks something like a key, having a bow at each end. The fourth side is evidently unfinished, there being only two patterns on it; the second, evidently an attempt to imitate the letter B, showing that the maker had some acquaintance with civilization.

With this waddy the native is better armed than most men would be with the keenest sword that ever was forged, and with it he strikes and stabs with marvellous rapidity, seeming to be actuated, when in combat, by an uncontrollable fury. He can use it as a missile with deadly effect; and if, as is generally the case, he has several of these waddies in his hand, he will hurl one or two of them in rapid succession, and, while the antagonist is still attempting to avoid the flying weapon, precipitate himself upon the foe, and attack him with the waddy which he has reserved for hand-to-hand combat.

The waddy is the Australian panacea for

domestic troubles, and if one of his wives should presume to have an opinion of her own, or otherwise to offend her dusky lord, a blow on the head from the ever-ready waddy settles the dispute at once by leaving her senseless on the ground. Sometimes the man strikes the offender on a limb, and breaks it; but he does not do this unless he should be too angry to calculate that, by breaking his slave's arm or leg, he deprives himself of her services for a period.

With the Australian man of honor the waddy takes the place which the pistol once held in England and the United States, and is the weapon by which disputes are settled. In case two Australians of reputation should fall out, one of them challenges the other to single combat, sending him a derisive message to the effect that he had better bring his stoutest waddy with him, so that he may break it on the challenger's head.

Thickness of skull—a reproach in some parts of the world—is among the Australians a matter of great boast, and one Australian can hardly insult another in more contemptuous words than by comparing his skull to an emu's egg-shell. I have examined several skulls of Australian natives, and have been much surprised by two points: the first is the astonishing thickness and hardness of the bone, which seems capable of resisting almost any blow that could be dealt by an ordinary weapon; and the second is the amount of injury which an Australian skull can endure. Owing to the thickness of the skull, the Australian puts his head to strange uses, one of the oddest of which is his custom of breaking sticks on his head instead of snapping them across the knee.

In due time the combatants appear on the ground, each bearing his toughest and heaviest waddy, and attended by his friends. After going through the usual gesticulations and abuse which always precede a duel between savages, the men set definitely to work.

The challenged individual takes his waddy, and marches out into the middle of the space left by the spectators. His adversary confronts him, but unarmed, and stooping low, with his hands on his knees, he offers his head to the opponent. The adversary executes a short dance of delight at the blow which he is going to deal, and then, after taking careful aim, he raises his waddy high in the air, and brings it down with all his force on the head of his foe.

The blow would fell an ordinary ox; but the skull of an Australian is made of sterner stuff than that of a mere ox, and the man accordingly raises himself, rubs his head, and holds out his hand to his nearest friend, who gives him the waddy, which he is about to use in his turn. The challenged man now takes his turn at stooping, while the challenger does his best to smash the skull of

the antagonist. Each man, however, knows from long experience the hardest part of his own skull, and takes care to present it to the enemy's blow. In this way they continue to exchange blows until one of them falls to the ground, when the victory is decided to remain with his antagonist.

In consequence of the repeated injuries to which the head of a native Australian is subjected, the skull of a warrior presents, after death, a most extraordinary appearance, being covered with dents, fractures, and all kinds of injuries, any one of which would have killed an European immediately, but which seems to have only caused temporary inconvenience to the Australian.

So fond is the Australian of his waddy, that even in civilized life he cannot be induced to part with it. Some of my readers may be aware that a great number of captives are now enrolled among the police, and render invaluable service to the community, especially against the depredations of their fellow-blacks whom they persecute with a relentless vigor that seems rather surprising to those who do not know the singular antipathy which invariably exists between wild and tamed animals, whether human or otherwise. In fact, the Australian native policeman is to the colonist what the "Totty" of South Africa is to the Dutch and English colonists, what the Ghoorka or Sikh of India is to the English army, and what the tamed elephant of Ceylon or India is to the hunter.

These energetic "black fellows" are armed with the ordinary weapons of Europeans, and are fully acquainted with their use. But there is not one of them who thinks himself properly armed unless he has his waddy; and, when he enters the bush in search of native thieves, he will lay aside the whole of his clothing, except the cap which marks his office, will carry his gun with him, buckle his cartoneh-pouch round his naked waist, and will take his waddy as a weapon, without which even the gun would seem to him an insufficient weapon.

This form of waddy (fig. 4), although it is often used as a missile, is not the one which the native prefers for that purpose. His throwing waddy or "wadna," is much shorter and heavier, and very much resembles the short missile club used so effectively by the Polynesians. Two other forms of waddy are shown at figs. 3 and 5, the latter of which is generally known by the name of "picaninny waddy," because it is generally smaller and lighter than the others, and can be used by a child.

Nos. 1 and 2 are also clubs, but are made in a different form, and used in a different manner. If the reader will refer to the account of the Abyssinian curved sword, or shotel, he will see that in general form it much resembles this club, the long pointed

TOMAHAWKS. (See page 723.)

BASKET. (See page 699.)

head of each being equally useful in striking downward over a shield. This weapon is not only used in combat, but is employed in the native dances to beat time by repeated strokes on the shield.

The reader will notice that many of these clubs have the ends of the handles pointed. This formation is partly for the purpose of increasing their efficiency as offensive weapons, and partly for another object. As was the case with the warriors of the Iliad, both combatants will occasionally rest, and give each other time to breathe, before renewing the fight. During these intervals the Australian combatants squat down, dig up the earth with the handle of the club, and rub their hands with the dusty soil, in order to prevent the weapons from slipping out of their grasp.

This club is made in a very ingenious way, the artificer taking advantage of some gnarled branch, and cutting it so that the grain of the wood follows the curve, or rather the angle of the head, which adds greatly to its strength. A club of almost the same shape, and cut similarly from the angle of a branch, is used in New Caledonia, and, but for the great superiority of the workmanship, might easily be mistaken for the angular club of the Australian.

This particular form of club has a tolerably wide range, and among the tribes which inhabit the shores of Encounter Bay is called Marpangye.

In many parts of Australia the natives have a curious weapon which much resembles a sword. It is from three to four feet in length, is flat, about three inches in width, and has the outer edge somewhat sharpened. Being made of the close-grained wood of the gum-tree, it is very heavy in proportion to its size, and in practised hands is a most formidable weapon.

The Australian women carry an instrument which is sometimes thought to be a spear, and sometimes a club, but which in the hands of a woman is neither, though a man will sometimes employ it for either purpose. It is simply a stick of variable length, sharpened at one end and the point hardened by fire. It is called by the natives the "katta," and is popularly known by the appropriate name of the digging-stick.

With this stick the natives contrive to dig up the ground in a most astonishing manner, and an English "navvy," with his pick, spade, and barrow, would feel considerably surprised at the work which is done by the naked black, who has no tools except a pointed stick. Let, for example, a navy be set to work at the task of digging out an echidna from its hole, and he would find his powers of digging baffled by the burrowing capabilities of the animal, which would make its way through the earth faster than could the navy. In order to sink some six feet deep into the ground, the white man would

be obliged to make a funnel-shaped hole of very large size, so as to allow him to work in it, and to give the pick and spade free play as he threw out the soil.

The black man, on the contrary, would have no such difficulty, but knows how to sink a hole without troubling himself to dig a foot of needless soil. This he does by handling the katta precisely as the Bosjesman handles his digging-stick, *i. e.* by holding it perpendicularly, jobbing the hardened point into the ground, and throwing out with his hands the loosened earth.

In digging out one of the burrowing animals, the black hunter pushes a long and flexible stick down the hole, draws it out, measures along the ground to the spot exactly above the end of the burrow, replaces the stick, and digs down upon it. By the time that he has reached it, the animal has gone on digging, and has sunk its burrow still further. The stick is then pushed into the lengthened burrow, and again dug down upon; and the process is repeated until the tired animal can dig no more, and is captured. The katta also takes the part of a weapon, and can be wielded very effectively by a practised hand, being used either for striking or thrusting.

We now come to a curious instrument which is often thought to be a weapon, but which, although it would answer such a purpose very well, is seldom used for it. This is the tomahawk, or hammer, as it is generally called. Three varieties of the tomahawk are given in the illustration "Tomahawks" on the 722d page. In all of them the cutting part is made of stone and the handle of wood, and the head and the handle are joined in several different ways, according to the fashion of the locality in which the instrument is made. The simplest plan is that which is shown in fig. 1. In this instrument, a conveniently shaped piece of stone has been selected for a head, and the handle is made of a flexible stick bent over it, and the two ends firmly lashed together, just as the English blacksmith makes handles for his punches and cold chisels. This weapon was made in New South Wales.

At fig. 3 is shown a tomahawk of a more elaborate construction. Here the stone head has been lashed to the shaft by a thong, which is wrapped over it in a way that exactly resembles the lashing employed by the New Zealander or the Dyak for the same purpose. The tomahawk at fig. 4 is, however, the best example of the instrument, and is taken from a specimen in the British Museum. The handle and head are shaped much like those of fig. 3, but the fastening is much more elaborate.

In the first place, the head is held to the handle by lashings of sinews, which are drawn from the tail of the kangaroo, and always kept in readiness by the Australian savage. The sinews are steeped in hot

water, and pounded between two stones, in order to separate them into fibres; and, while still wet and tolerably elastic, they are wrapped round the stone and the handle. Of course, as they dry, they contract with great force, and bind the head and handle together far more securely than can be done with any other material. Even raw hide does not hold so firmly as sinew.

When the sinew lashing is perfectly dry, the native takes a quantity of the peculiar substance called "black-boy" wax, and kneads it over the head and the end of the handle, so as to bind everything firmly together.

Another instrument is shown at fig. 2, in which the combination of stone and vegetable is managed in another way. The blade is formed from a piece of quartz about as long as a man's hand, which has been chipped into the form of a spear-head. The handle, instead of being a piece of wood, is simply a number of fibres made into a bundle. The base of the stone head has been pushed among the loose ends of the fibres, and then the whole has been bound firmly together by a lashing of string made of reeds. This is a sort of dagger; and another form of the same instrument is made by simply sharpening a stick about eighteen inches in length, and hardening the sharpened end in the fire. It is, in fact, a miniature katta, but is applied to a different purpose.

These axes and daggers have been mentioned together, because they are used for the same purpose, namely, the ascent of trees.

Active as a monkey, the Australian native can climb any tree that grows. Should they be of moderate size, he ascends them, not by clasping the trunk with his legs and arms (the mode which is generally used in England), and which is popularly called "swarming." Instead of passing his legs and arms round the tree-trunk as far as they can go, he applies the soles of his feet to it in front, and presses a hand against it on either side, and thus ascends the tree with the rapidity of a squirrel. This mode of ascent is now taught at every good gymnasium in England, and is far superior to the old fashion, which has the disadvantage of slowness, added to the certainty of damaging the clothes.

Those who have seen our own acrobats performing the feat called *La Perche*, in which one man balances another on the top of a pole, or the extraordinary variations on it performed by the Japanese jugglers, who balance poles and ladders on the soles of their feet, will be familiar with the manner in which one of the performers runs up the pole which is balanced by his companion. It is by this method that the Australian ascends a tree of moderate dimensions, and, when he is well among the boughs, he traverses them with perfect certainty and quickness.

Trees which will permit the man to ascend after this fashion are, however, rather scarce in the Australian forests, and, moreover, there is comparatively little inducement to climb them, the hollows in which the bees make their nests and the beasts take up their diurnal abode being always in the branch or trunk of some old and decaying tree. Some of these trees are so large that their trunks are veritable towers of wood, and afford no hold to the hands; yet they are ascended by the natives as rapidly as if they were small trees.

By dint of constant practice, the Australian never passes a tree without casting a glance at the bark, and by that one glance he will know whether he will need to mount it. The various arboreal animals, especially the so called opossums, cannot ascend the tree without leaving marks of their claws in the bark. There is not an old tree that has not its bark covered with scratches, but the keen and practised eye of the native can in a moment distinguish between the ascending and descending marks of the animal, and can also determine the date at which they were made.

The difference between the marks of an ascending and descending animal is easy enough to see when it has once been pointed out. When an animal climbs a tree, the marks of its claws are little more than small holes, with a slight scratch above each, looking something like the conventional "tears" of heraldry. But, when it descends, it does so by a series of slippings and catchings, so that the claws leave long scratches behind them. Nearly all arboreal animals, with the exception of the monkey tribe, leave marks of a similar character, and the bear hunter of North America and the 'possum hunter of Australia are guided by similar marks.

Should the native hunter see an ascending mark of more recent date than the other scratches, he knows that somewhere in the tree lies his intended prey. Accordingly, he lays on the ground everything that may impede him, and, going to the tree-trunk, he begins to deliver a series of chopping blows with his axe. These blows are delivered in pairs, and to an Englishman present rather a ludicrous reminiscence of the postman's double rap. By each of these double blows he chops a small hole in the tree, and manages so as to cut them alternately right and left, and at intervals of two feet or so.

Having cut these notches as high as he can reach, he places the great toe of his left foot in the lowermost hole, clasps the tree with his left arm, and strikes the head of the tomahawk into the tree as high as he can reach. Using the tomahawk as a handle by which he can pull himself up, he lodges the toe of his right foot in the second hole, and is then enabled to shift the toe of the left foot into the third hole. Here he waits for a moment, holding tightly by both his feet and

the left hand and arm, while he cuts more notches; and, by continuing the process, he soon reaches the top of the tree.

When he reaches the first branch, he looks carefully to find the spot toward which the tell-tale scratches are directed, and, guided by them alone, he soon discovers the hole in which the animal lies hidden. He tests the dimensions of the hollow by tapping on the trunk with the axe, and, if it should be of moderate depth, sets at work to chop away the wood, and secure the inmate.

Should, however, the hollow be a deep one, he is obliged to have recourse to another plan. Descending the tree by the same notches as those by which he had climbed it, he takes from his bundle of belongings a fire-stick, *i. e.* a sort of tinderlike wood, which keeps up a smouldering fire, like that of the willow "touchwood" so dear to schoolboys. Wrapping up the fire-stick in a bundle of dry grass and leaves, he reascends the tree, and, when he has reached the entrance of the burrow, he whirls the bundle round his head until the fire spreads through the mass, and the grass bursts into flame.

As soon as it is well inflamed, he pushes some of the burning material into the burrow, so as to fall upon the enclosed animal, and to rouse it from the heavy sleep in which it passes the hours of daylight. He also holds the rest of the torch at the entrance of the burrow, and manages to direct the smoke into it. Did he not rouse the animal by the burning leaves, he would run a chance of suffocating it in its sleep. This may seem to be a very remote contingency, but in fact it is very likely to happen. I have known a cat to be baked alive in an oven, and yet not to have awaked from sleep, as was evident by the attitude in which the body of the animal was found curled up, with its chin on its paws, and its tail wrapped round its body. Yet the slumber of a domesticated cat, which can sleep as often as it likes in the day or night, is not nearly so deep as that which wraps in oblivion the senses of a wild animal that is abroad all night, and whose whole structure is intended for a nocturnal life.

The chopping holes, and getting the toes into them, seems in theory to be rather a tedious business, but in practice it is quite the contrary, the native ascending almost as quickly as if he were climbing a ladder. As the large trees are so capable of containing the animals on which the Australians feed, there is scarcely one which does not exhibit several series of the notches that denote the track of a native. Strange to say, the Australian hunters will not avail themselves of the notches that have been made by other persons, but each man chops a new series of holes for himself every time that he wants to ascend a tree.

Sometimes a man sees the track of an

animal or the indication of a bee's nest on a tree when he happens not to have an axe in hand. In such a case he is still able to ascend the tree, for he can make use of the dagger which has been already described, punching holes in the bark, and pulling himself up exactly as if he had a tomahawk, the only difference being that the holes are smaller and the work is harder.

When the hunter has once found the entrance of the burrow, the capture of the inmate is simply a matter of time, as the heat and smoke are sure to force it into the air, where it has the double disadvantage of being half-choked with smoke and being blind with the flame and the daylight, to which its eyes are unaccustomed. A blow on the head from the tomahawk, or a stab from the dagger, renders it senseless, when it is flung on the ground, and the successful hunter proceeds to traverse the tree in case some other animal may be hidden in it.

The skill of the natives in tree climbing is also exercised for another purpose besides hunting for bees and animals. The well-known cabbage-palm grows to a very great height, and, like other palms, never grows quite straight, but has always a bend in the trunk. After the manner of the palm-tribe, it grows by a succession of buds from the top, and this bud, popularly called the "cabbage," is a favorite article of food. It has been called the prince of vegetables, and one enthusiastic traveller declares that it must have been the ambrosia of the Olympic gods. The removal of the bud causes the death of the tree, and for that reason the vegetable is forbidden in civilized regions under penalty of a heavy fine. The savage, however, who has no idea of care for the morrow, much less of looking forward to future years, takes the bud wherever he meets it, caring nothing for the death of the useful tree. He ascends by means of a little wooden dagger, or warpo, or makes use of the tomahawk. The quartz dagger which was shown in a previous illustration would not be used for tree climbing, unless the owner could not procure a tomahawk or warpo. Its chief use is as a weapon, and it can be also employed as a knife, by means of which the savage can mutilate a fallen enemy, after the manner which will be described when we come to treat of warfare in Australia.

The "black-boy" gum, which plays so large a part in the manufacture of Australian weapons and implements, is obtained from the grass-tree, popularly called the "black boy," because at a distance it may easily be mistaken for a native, with his spear and cloak. It is very tenacious in its own country, but when brought to England it becomes brittle, and is apt to break away from the weapon in fragments, just as does a similar preparation called "kurumanni" gum, which is made by the natives of Gni-

ana. It is quite black, and when dry is extremely hard.

The grass-tree is one of the characteristic plants of Australia, and partakes of the strange individuality of that curious country. The trunk is cylindrical, and looks like that of a palm, while an enormous tuft of long leaves starts from the top and droops in all directions, like a gigantic plume of feathers. The flower shoots up straight from the centre; and the long stalk becomes, when dried, so hard, tough, and light, that it is made into spear shafts.

There is in my collection an Australian saw (illustrated on page 722), in the manufacture of which the black-boy gum plays a considerable part. No one would take it for a saw who did not know the implement, and indeed it looks much more like a rude dagger than a saw. It is made from a piece of wood usually cut from a branch of the gum-tree, and about as thick as a man's finger at the thickest part, whence it tapers gradually to a point. The average length of the saw is fourteen inches, though I have seen them nearly two feet long.

Along the thicker end is cut a groove, which is intended to receive the teeth of the saw. These teeth are made from chips of quartz or obsidian, the latter being preferred; and some makers, who have been brought in contact with civilization, have taken to using fragments of glass bottles. A number of flat and sharp-edged chips are selected as nearly as possible of the same

size, and being on an average as large as a shilling. These the natives insert into the groove with their sharp edges uppermost. A quantity of black-boy wax is then warmed and applied to them, the entire wood of the saw being enveloped in it, as well as the teeth for half their depth, so as to hold them firmly in their places. As the chips of stone are placed so as to leave little spaces between them, the gaps are filled in with this useful cement.

For Australian work this simple tool seems to answer its purpose well enough. Of course it is very slow in its operation, and no great force can be applied to it, lest the teeth should be broken, or twisted out of the cement. The use of this saw entails great waste of material, time, and labor; but as the first two of these articles are not of the least value to the natives, and the third is of the lightest possible kind, the tool works well enough for its purpose. A perfect specimen of this saw is not often seen in this country, as the black-boy wax flakes off, and allows the teeth to drop out of their place. Even in my own specimen, which has been carefully tended, the wax has been chipped off here and there, while in instruments that have been knocked about carelessly scarcely a tooth is left in its place. Owing to the pointed end of the handle, the saw can be used after the fashion of a dagger, and can be employed, like the war-poo, for the ascent of trees.

CHAPTER LXXII.

AUSTRALIA — *Continued.*

THE AUSTRALIAN SPEAR AND ITS MANY FORMS—THE THROWING-SPEAR OR JAVELIN—A GROUP OF AUSTRALIAN SPEARS—THE LIGHTNESS OF THE SHAFT—THE MANY-POINTED FISH-SPEAR—INGENIOUS MODE OF TIPPING THE POINTS WITH BONE, AND FASTENING THEM TO THE SHAFT—ELASTICITY OF THE POINTS—DOUBLE USE AS PADDLE AND SPEAR—AN ELABORATELY-MADE WEAPON—FLINT-HEADED SPEARS—EXCELLENCE OF THE AUSTRALIAN AS A THROWER OF MISSILES—THE CLUB, THE STONE, AND THE “KANGAROO-RAT”—THE THROW-STICK, MIDLAH, OR WUMMERAH—PRINCIPLE ON WHICH IT IS CONSTRUCTED—MODES OF QUIVERING THE SPEAR—DISTANCE TO WHICH IT CAN BE THROWN—THE UNDERHAND THROW—ACCURACY OF AIM—SPEARING THE KANGAROO—THE BOW AND ARROW—STRENGTH OF THE BOW—THE RATTAN STRING AND INGENIOUS KNOT—CAREFUL MANUFACTURE OF THE ARROWS—PRESUMED ORIGIN OF THE WEAPONS—THE BOOMERANG AND ITS VARIOUS FORMS—MODE OF THROWING THE WEAPON—ITS PROBABLE ORIGIN—STRUCTURE OF THE BOOMERANG—THE AUSTRALIAN SHIELD, ITS FORMS AND USES—THE WOODEN AND THE BARK SHIELDS.

WE now come to the various forms of the spears which are used by the native Australians.

The usual weapon is slight, and scarcely exceeds in diameter the assagai of Southern Africa. It is, however, considerable longer, the ordinary length being from nine to eleven feet. As a general rule, the spear is constructed after a very rude fashion, and the maker seems to care but little whether the shaft be perfectly straight, so that the weapon be tolerably well balanced. There are several specimens of Australian spears in my collection, one of which (a weapon that has evidently been a favorite one, as it shows marks of long usage) is twice bent, the second bend counteracting the former, and so bringing the weapon tolerably straight.

The butt of the Australian spear, like that of the South African assagai, is very slight, the shaft tapering gradually from the head, which is about as large as a man's finger, to the butt, where it is hardly thicker than an artist's pencil. This, being one of the common spears, is simply sharpened at the end, and a few slight barbs cut in the wood. I have, however, specimens in which there is almost every variety of material, dimensions, and structure that can be found in Australia.

Some of these are made on the same principle as that which has just been described, but differ from it in having a separate head,

made of hard and heavy wood. This is deeply cut with barbs; so that the weapon is a more formidable one than that which is made simply from one piece of wood. The head of one of these spears is shown at fig. 7 in the illustration “Heads of Spears,” on page 731.

Several of the spears are perfectly plain, being simply long sticks, pointed at the larger end. These, however, have been scraped very carefully, and seem to have had more pains bestowed upon them than those with more elaborate heads. These spears are about eight feet in length.

Then there are other spears with a variable number of heads, and of variable dimensions. The commonest form of multiheaded spears has either three or four points; but in every other respect, except number, the spear heads are constructed in the same manner. One of these spears, now before me, has a shaft about nine feet in length, and rather more than an inch in diameter at the thickest part, which, as is usual with Australian spears, is just below the head. The wood of which it is made is exceedingly light and porous; but this very quality has unfortunately made it so acceptable to the pillius beetles that they have damaged it sadly, and rendered it so brittle that a very slight shock would snap it. Indeed, the shaft of one of them was broken into three pieces by a little child stumbling against it while coming down stairs.

The four points which constitute the head are cut from the gum-tree, the wood of which is hard and durable, and can be trimmed to a very sharp point without danger of breakage. Each of them is twenty inches in length, and they are largest in the middle, tapering slightly at one end so as to permit of their being fastened to the shaft, and being scraped to a fine point at the other end.

On examination I find that the large end of the shaft has been cut into four grooves, in each of which is placed the butt end of one of the points, which is fixed temporarily by black-boy gum. Wedgelike pegs have then been pushed between the points, so as to make them diverge properly from each other, and, when they have assumed the proper position, they have been tightly bound together with cord. A layer of black-boy gum has then been kneaded over the string, so as to keep all firmly together.

So much for the mode of putting on the points, the end of one of which may be seen at fig. 3 in the illustration. My own specimen, however, is better made than that from which the sketch has been taken. The reader will perceive that there is a barb attached to the point, and lashed in its place by string. In my specimen the barb is made of a piece of bone about as long as a skewer, and sharply pointed at both ends. In the example shown in the illustration, the barb merely projects from the side of the point, whereas in my specimen the bone answers the purpose both of point and barb. In order to enable it to take the proper direction, the top of the wooden point is bevelled off, and the piece of bone lashed to it by the middle, so that one end becomes the point of the weapon, and the other end does duty for the barb. Wishing to see how this was done, I have cut away part of the lashings of one of the four points, and have been much struck with the ingenuity displayed by the maker in fastening the bone to the point, so as to make it discharge its double duty. The barbs are all directed inward, so that, when the native makes a stroke at a fish, the slippery prey is caught between the barbs, and held there just as is an eel between the prongs of the spear. The elasticity of the four long points causes them to diverge when they come upon the back of a fish, and to contract tightly upon it, so that the points of the barbs are pressed firmly into its sides.

This spear also stands the native instead of a paddle, and with it he contrives to guide his fragile bark with moderate speed. How he manages to stand erect in so frail a vessel, to paddle about, to strike the fish, and, lastly, to haul the struggling prey aboard, is really a marvel. The last-mentioned feat is the most wonderful, as the fish are often of considerable size, and the mere leverage of their weight at the end of a

ten-foot spear, added to the violent struggles which the wounded fish makes, seems sufficient to upset a far more stable vessel.

Yet the natives manage to pass hour after hour without meeting with an accident, and in one of their tiny boats, which seem scarcely large enough to hold a single European, even though he should be accustomed to the narrow outrigger skiff, or the comparatively modern canoe, two men will be perfectly comfortable, spearing and hauling in their fish, and even cooking them with a fire made on an extemporized hearth of wet sand and stones in the middle of the canoe.

Night is the favorite time for fish spearing, and then the sight of a number of natives engaged in the watery chase is a most picturesque one. They carry torches, by means of which they see to the bottom of the water, and which have also the advantage of dazzling the fish; and the effect of the constantly moving torches, the shifting glare on the rippled water, and the dark figures moving about, some searching for fish, others striking, and others struggling with the captured prey, is equally picturesque and exciting. The torches which they use are made of inflammable bark; and the whole scene is almost precisely like that which is witnessed in "burning the water," in North America, or, to come nearer home, "leistering" in Scotland.

In the daytime they cannot use the torch, and, as the slightest breeze will cause a ripple on the surface of the water that effectually prevents them from seeing the fish, they have an ingenious plan of lying flat across the canoe, with the upper part of the head and the eyes immersed in the water, and the hand grasping the spear ready for the stroke. The eyes being under the ripple, they can see distinctly enough.

I have often employed this plan when desirous of watching the proceedings of sub-aquatic animals. It is very effectual, though after a time the attitude becomes rather fatiguing, and those who are not gymnasts enough to be independent as to the relative position of their heads and heels are apt to find themselves giddy from the determination of blood to the head.

Another spear, also used for fishing, and with an elaborate head, is seen at fig. 8. In this spear one point is iron, and the other two are bone. The weapon is remarkable for the manner in which the shaft is allowed to project among the points, and for the peculiar mode in which the various parts are lashed together. This specimen comes from the Lower Murray River.

There is in my collection a weapon which was brought from Cape York. It is a fishing spear, and at first sight greatly resembles that which has just been described. It is, however, of a more elaborate character, and deserves a separate description. It is seven feet in length, and very slender, the

thickest part of the shaft not being more than half an inch in diameter. It has four points, two of which are iron and without barbs, the iron being about the thickness of a crow-quill, and rather under three inches in length. The two bone points are made from the flat tail-bone of one of the rays, and, being arranged with the point of the bone in front, each of these points has a double row of barbs directed backward, one running along each edge.

At fig. 6 of the same illustration is seen a very formidable variety of the throwing-spear. Along each side of the head the native warrior has cut a groove, and has stuck in it a number of chips of flint or quartz, fastened in their places by the black-boy gum, just as has been related of the saw. The workmanship of this specimen is, however, far ruder than that of the saw, the pieces of flint not being the same size, nor so carefully adjusted. Indeed, it seems as if the saw maker laid aside the fragments of flint which he rejected for the tool, and afterward used them in arming the head of his spear. One of these weapons in my collection is armed on one side of the head only, along which are arranged four pieces of obsidian having very jagged edges, and being kept in their places by a thick coating of black-boy gum extending to the very point of the spear.

At figs 4 and 5 of the same illustration are seen two spear heads which remind the observer of the flint weapons which have of late years been so abundantly found in various parts of the world, and which belonged to races of men now long extinct. The spear heads are nearly as large as a man's hand, and are made of flint chipped carefully into the required shape. They are flat, and the maker has had sufficient knowledge of the cleavage to enable him to give to each side a sharp and tolerably uniform edge. It will be observed that fig. 5 is much darker than fig. 4. This distinction is not accidental, but very well expresses the variety in the hue of the material employed, some of the spear heads being pale brown, and some almost black. The weapons are, in fact, nothing but elongations of the dagger shown in fig. 2, of the "tomahawks," on page 722.

If the reader will look at figs. 1 and 2 of the illustration, he will see that there are two heads of somewhat similar construction, except that one is single and the other double. These spears were brought from Port Essington.

Specimens of each kind are in my collection. They are of great size, one being more than thirteen feet in length, and the other falling but little short of that measurement. In diameter they are as thick as a man's wrist; and, however light may be the wood of which they are made, they are exceedingly weighty, and must be very in-

ferior in efficiency to the light throwing-spears which have already been described. Of course such a weapon as that is meant to be used as a pike, and not as a missile. Besides these, I have another with three heads, and of nearly the same dimensions as the two others.

In every case the head and the shaft are of different material, the one being light and porous, and the other hard, compact, and heavy. Instead of being lashed together with the neatness which is exhibited in the lighter weapons, the head and shaft are united with a binding of thick string, wrapped carefully, but yet roughly, round the weapon, and not being covered with the coating of black-boy gum, which gives so neat a look to the smaller weapons. In the three-pointed spear, the maker has exercised his ingenuity in decorating the weapon with paint, the tips of the points being painted with red and the rest of the head white, while the lashing is also painted red.

In his wild state the Australian native never likes to be without a spear in his hand, and, as may be expected from a man whose subsistence is almost entirely due to his skill in the use of weapons, he is a most accomplished spear thrower. Indeed, as a thrower of missiles in general the Australian stands without a rival. Putting aside the boomerang, of which we shall presently treat, the Australian can hurl a spear either with his hand or with the "throw-stick," can fling his short club with unerring aim, and, even should he be deprived of these missiles, he has a singular faculty of throwing stones. Many a time, before the character of the natives was known, has an armed soldier been killed by a totally unarmed Australian. The man has fired at the native, who, by dodging about, has prevented the enemy from taking a correct aim, and then has been simply cut to pieces by a shower of stones, picked up and hurled with a force and precision that must be seen to be believed. When the first Australian discoverer came home, no one would believe that any weapon could be flung and then return to the thrower, and even at the present day it is difficult to make some persons believe in the stone-throwing powers of the Australian. To fling one stone with perfect precision is not so easy a matter as it seems, but the Australian will hurl one after the other with such rapidity that they seem to be poured from some machine; and as he throws them he leaps from side to side, so as to make the missiles converge from different directions upon the unfortunate object of his aim.

In order to attain the wonderful skill which they possess in avoiding as well as in throwing spears, it is necessary that they should be in constant practice from childhood. Accordingly, they are fond of get-

ting up sham fights, armed with shield, throw-stick, and spear, the latter weapon being headless, and the end blunted by being split and scraped into filaments, and the bushy filaments then turned back, until they form a soft fibrous pad. Even with this protection, the weapon is not to be despised; and if it strike one of the combatants fairly, it is sure to knock him down; and if it should strike him in the ribs, it leaves him gasping for breath. This mimic spear goes by the name of "matamoodlu," and is made of various sizes according to the age and capabilities of the person who uses it.

There is one missile which is, I believe, as peculiar to Australia as the boomerang, though it is not so widely spread, nor of such use in war or hunting. It is popularly called the "kangaroo-rat," on account of its peculiar leaping progression, and it may be familiar to those of my readers who saw the Australian cricketers who came over to England in the spring of 1868. The "kangaroo-rat" is a piece of hard wood shaped like a double cone, and having a long flexible handle projecting from one of the points. The handle is about a yard in length, and as thick as an artist's drawing-pencil, and at a little distance the weapon looks like a huge tadpole with a much elongated tail. In Australia the natives make the tail of a flexible twig, but those who have access to the resources of civilization have found out that whalebone is the best substance for the tail that can be found.

When the native throws the kangaroo-rat, he takes it by the end of the tail and swings it backward and forward, so that it bends quite double, and at last he gives a sort of underhanded jerk and lets it fly. It darts through the air with a sharp and menacing hiss like the sound of a rifle ball, its greatest height being some seven or eight feet from the ground. As soon as it touches the earth, it springs up and makes a succession of leaps, each less than the preceding, until it finally stops. In fact, it skims over the ground exactly as a flat stone skims over the water when boys are playing at "ducks and drakes." The distance to which this instrument can be thrown is really astonishing. I have seen an Australian stand at one side of Kennington Oval, and throw the "kangaroo-rat" completely across it. Much depends upon the angle at which it first takes the ground. If thrown too high, it makes one or two lofty leaps, but traverses no great distance; and, if it be thrown too low, it shoots along the ground, and is soon brought up by the excessive friction. When properly thrown, it looks just like a living animal leaping along, and those who have been accustomed to traverse the country say that its movements have a wonderful resemblance to the long leaps of a kangaroo-rat fleeing in alarm, with its long tail trailing as a balance behind it.

A somewhat similarly shaped missile is used in Fiji, but the Fijian instrument has a stiff shaft, and it is propelled by placing the end of the forefinger against the butt, and throwing it underhanded. It is only used in a game in which the competitors try to send it skimming along the ground as far as possible.

To return to our spears. It is seldom that an Australian condescends to throw a spear by hand, the native always preferring to use the curious implement called by the aborigines a "wummerah," or "midlah," and by the colonists the "throw-stick." The theory of the throw-stick is simple enough, but the practice is very difficult, and requires a long apprenticeship before it can be learned with any certainty.

The principle of this implement is that of the sling; and the throw-stick is, in fact, a sling made of wood instead of cord, the spear taking the place of the stone. So completely is the throw-stick associated with the spear, that the native would as soon think of going without his spear as without the instrument whereby he throws it. The implement takes different forms in different localities, although the principle of its construction is the same throughout. In the illustration entitled "Throw-sticks," on page 731, the reader may see every variety of form which the throw-stick takes. He will see, on inspecting the figures, that it consists of a stick of variable length and breadth, but always having a barblike projection at one end. Before describing the manner in which the instrument is used, I will proceed to a short notice of the mode of its construction, and the various forms which it takes.

In the first place, it is always more or less flattened; sometimes, as in fig. 3, being almost leaf-shaped, and sometimes, as in fig. 6, being quite narrow, and throughout the greater part of its length little more than a flattened stick. It is always made of some hard and elastic wood, and in many cases it is large and heavy enough to be serviceable as a club at close quarters. Indeed, one very good specimen in my collection, which came from the Swan River, was labelled, when it reached me, as an Indian club. This form of the throw-stick is shown at fig. 3.

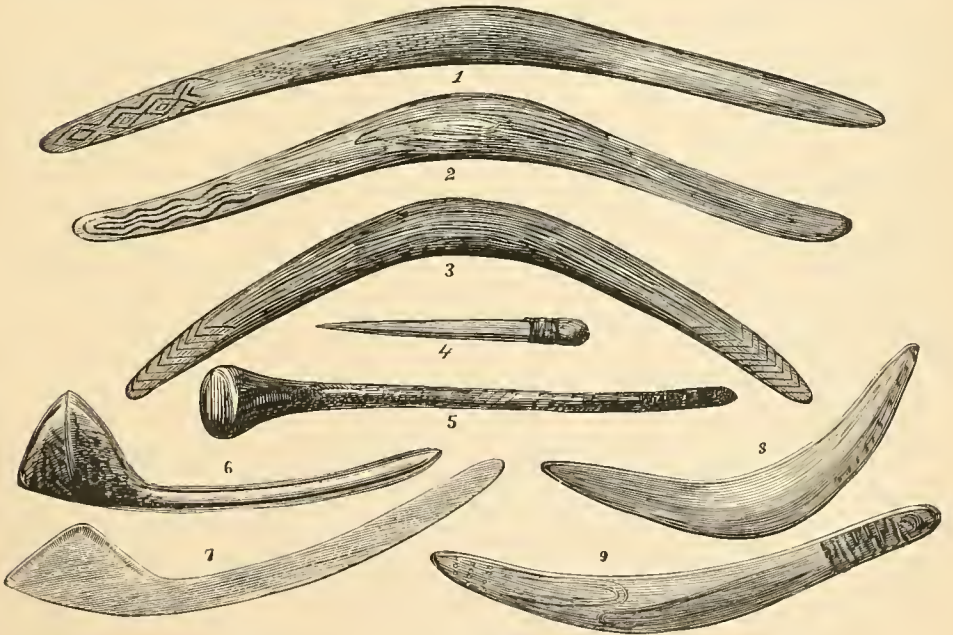

This particular specimen is a trifle under two feet in length, and in the broadest part it measures four inches and a half in width. In the centre it is one-sixth of an inch in thickness, and diminishes gradually to the edges, which are about as sharp as those of the wooden sword already mentioned. Toward the end, however, it becomes thicker, and at the place where the peg is placed it is as thick as in the middle. Such a weapon would be very formidable if used as a club—scarcely less so, indeed, than the well-known "merai" of New Zealand.

HEADS OF AUSTRALIAN SPEARS. (See page 727.)

THROW-STICKS. (See page 730.)

BOOMERANGS. (See page 737.)

That it has been used for this purpose is evident from a fracture, which has clearly been caused by the effect of a severe blow. The wood is split from one side of the handle half along the weapon, and so it has been rendered for a time unserviceable. The careful owner has, however, contrived to mend the fracture, and has done so in a singularly ingenious manner. He has fitted the broken surfaces accurately together, and has then bound them with the kangaroo-tail sinews which have already been mentioned. The sinews are flat, and have been protected by a thick coating of black-boy gum. Perhaps the reader may be aware that, when catgut is knotted, the ends are secured by scorching them, which makes them swell into round knobs. The sinew has the same property, and the native has secured the ends precisely as an English artisan would do.

The wood is that of the tough, hard, wavy-grained gum-tree. Whether in consequence of much handling by greasy natives, or whether from other causes, I do not know, but I cannot make a label adhere to it. To each of the specimens in my collection is attached a catalogue number, and though I have tried to affix the label with paste, gum, and glue, neither will hold it, and in a few days the label falls off of its own accord. This specimen has been cut from a tree which has been attacked by some boring insect, and the consequence is, that a small hole is bored through it edgewise, and has a very curious appearance. The hole looks exactly like that of our well-known insect, the great *Sirex*.

The peculiarly-shaped handle is made entirely of black-boy gum, and, with the exception of a tendency to warp away from the wood, it is as firm as on the day when it was first made. The peg which fits into the butt of the spear is in this case made of wood, but in many throw-sticks it is made of bone. Figs. 1 and 2 are examples of this flattened form of midlah, and were drawn from specimens in Southern Australia. At figs. 4 and 5 may be seen examples of the throw-stick of Port Essington, one of which, fig. 4, is remarkable for the peculiarly-shaped handle. That of fig. 5 seems to be remarkably inconvenient, and almost to have been made for the express purpose of preventing the native from taking a firm hold of the weapon. Fig. 6 is an example of the throw-stick of Queensland, and, as may easily be seen, can be used as a club, provided that it be reversed, and the peg end used as a handle.

There is another form of throw-stick used in Northern Australia, an example of which may be seen at fig. 6. It is a full foot longer than that which came from the Murray, and is one of the "flattened sticks" which have been casually mentioned. It has a wooden spike for the spear-butt, and a most remarkable handle. Two pieces of melon-shell

have been cut at rather long ovals, and have been fixed diagonally across the end of the weapon, one on each side. Black-boy gum has been profusely used in fixing these pieces, and the whole of the interior space between the shells has been filled up with it. A diagonal lashing of sinew, covered with the same gum, passes over the shells, and the handle is strongly wrapped with the same material for a space of five inches.

We will now proceed to see how the native throws the spear.

Holding the throw-stick by the handle, so that the other end projects over his shoulder, he takes a spear in his left hand, fits a slight hollow in its butt to the peg of the midlah, and then holds it in its place by passing the forefinger of the right hand over the shaft. It will be seen that the leverage is enormously increased by this plan, and that the force of the arm is more than doubled.

Sometimes, especially when hunting, the native throws the spear without further trouble, but when he is engaged in a fight he goes through a series of performances which are rather ludicrous to an European, though they are intended to strike terror into the native enemy. The spear is jerked about violently, so that it quivers just like an African assagai, and while vibrating strongly it is thrown. There are two ways of quivering the spear; the one by merely moving the right hand, and the other by seizing the shaft in the left hand, and shaking it violently while the butt rests against the peg of the throw-stick. In any case the very fact of quivering the spear acts on the Australian warrior as it does upon the African. The whirring sound of the vibrating weapon excites him to a pitch of frenzied excitement, and while menacing his foe with the trembling spear, the warrior dances and leaps and yells as if he were mad—and indeed for the moment he becomes a raving madman.

The distance to which the spear can be thrown is something wonderful, and its aspect as it passes through the air is singularly beautiful. It seems rather to have been shot from some huge bow, or to be furnished with some innate powers of flight, than to have been flung from a human arm, as it performs its lofty course, undulating like a thin black snake, and writhing its graceful way through the air. As it leaves the throw-stick, a slight clashing sound is heard, which to the experienced ear tells its story as clearly as the menacing clang of an archer's bowstring.

To me the distance of its flight is not nearly so wonderful as the precision with which it can be aimed. A tolerably long throw-stick gives so powerful a leverage that the length of range is not so very astonishing. But that accuracy of aim should be attained as well as length of flight is really

wonderful. I have seen the natives, when engaged in mock battle, stand at a distance of eighty or ninety yards, and throw their spears with such certainty that, in four throws out of six, the antagonist was obliged to move in order to escape the spears.

Beside the powerful and lofty throw, they have a way of suddenly flinging it underhand, so that it skims just above the ground, and, when it touches the earth, proceeds with a series of ricochets that must be peculiarly embarrassing to a novice in that kind of warfare.

The power of the spear is never better shown than in the chase of the kangaroo. When a native sees one of these animals engaged in feeding, he goes off to a little distance where it cannot see him, gathers a few leafy boughs, and ties them together so as to form a screen. He then takes his spears, throw-stick, and waddy, and goes off in chase of the kangaroo. Taking advantage of every cover, he slips noiselessly forward, always taking care to approach the animal against the wind, so that it shall not be able to detect his presence by the nostrils, and gliding along with studied avoidance of withered leaves, dry twigs, and the other natural objects which, by their rustling and snapping, warn the animal that danger is at hand.

As long as possible, the hunter keeps under the shelter of natural cover, but when this is impossible, he takes to his leafy screen, and trusts to it for approaching within range. Before quitting the trees or bush behind which he has been hiding himself, he takes his spear, fits it to the throw-stick, raises his arm with the spear ready poised, and never moves that arm until it delivers the spear. Holding the leafy screen in front of him with his left hand, and disposing the second spear and other weapons which cannot be hidden so as to look like dead branches growing from the bush, he glides carefully toward the kangaroo, always advancing while it stoops to feed, and crouching quietly behind the screen whenever it raises itself, after the fashion of kangaroos, and surveys the surrounding country.

At last he comes within fair range, and with unerring aim he transfixes the unsuspecting kangaroo. Sometimes he comes upon several animals, and in that case his second spear is rapidly fixed in the midrib and hurled at the flying animals, and, should he have come to tolerably close quarters, the short missile club is flung with certain aim. Having thrown all the missiles which he finds available, he proceeds to despatch the wounded animals with his waddy.

In the illustration No. 1, on the 739th page, the action of the throw-stick is well shown, and two scenes in the hunt are depicted. In the foreground is a hunter who has succeeded in getting tolerably close to the kangaroos

by creeping toward them behind the shadow of trees, and is just poising his spear for the fatal throw. The reader will note the curious bone ornament which passes through the septum of the nose, and gives such a curious character to the face. In the background is another hunter, who has been obliged to have recourse to the bough screen, behind which he is hiding himself like the soldiers in "Macbeth," while the unsuspecting kangaroos are quietly feeding within easy range. One of them has taken alarm, and is sitting upright to look about it, just as the squirrel will do while it is feeding on the ground.

The reader will now see the absolute necessity of an accurate aim in the thrower — an accomplishment which to me is a practical mystery. I can hurl the spear to a considerable distance by means of a throw-stick, but the aim is quite another business, the spear seeming to take an independent course of its own without the least reference to the wishes of the thrower. Yet the Australian is so good a marksman that he can make good practice at a man at the distance of eighty or ninety yards, making due allowance for the wind, and calculating the curve described by the spear with wonderful accuracy; while at a short distance his eye and hand are equally true, and he will transfix a kangaroo at twenty or thirty yards as certainly as it could be shot by an experienced rifleman.

In some parts of Australia the natives use the bow and arrow; but the employment of such weapons seems to belong chiefly to the inhabitants of the extreme north. There are in my collection specimens of bows and arrows brought from Cape York, which in their way are really admirable weapons, and would do credit to the archers of Polynesia. The bow is more than six feet long, and is made from the male, *i. e.* the solid bamboo. It is very stiff, and a powerful as well as a practised arm is needed to bend it properly.

Like the spear shaft, this bow is greatly subject to being worm-eaten. My own specimen is so honeycombed by these tiny borers that when it arrived a little heap of yellow powder fell to the ground wherever the bow was set, and, if it were sharply struck, a cloud of the same powder came from it. Fortunately, the same looseness of texture which enabled the beetle to make such havoc served also to conduct the poisoned spirit which I injected into the holes; and now the ravages have ceased, and not the most voracious insect in existence can touch the weapon. The string is very simply made, being nothing but a piece of rattan split to the required thickness. Perhaps the most ingenious part of this bow is the manner in which the loop is made. Although unacquainted with the simple yet effective bowstring knot, which is so well known to our archers, and which would not suit the stiff and harsh rattan, the native has invented a knot which is

quite as efficacious, and is managed on the same principle of taking several turns, with the cord round itself just below the loop. In order to give the rattan the needful flexibility it has been beaten so as to separate it into fibres and break up the hard, flinty coating which surrounds it, and these fibres have then been twisted round and round into a sort of rude cord, guarded at the end with a wrapping of the same material in order to preserve it from unravelling.

The arrows are suitable to the bow. They are variable in length, but all are much longer than those which the English bowmen were accustomed to use, and, instead of being a "cloth yard" in length, the shortest measures three feet seven inches in length, while the longest is four feet eight inches from butt to point. They are without a vestige of feathering, and have no nock, so that the native archer is obliged to hold the arrow against the string with his thumb and finger, and cannot draw the bow with the fore and middle finger, as all good English archers have done ever since the bow was known.

The shafts of the arrows are made of reed, and they are all headed with long spikes of some dark and heavy wood, which enable them to fly properly. Some of the heads are plain, rounded spikes, but others are elaborately barbed. One, for example, has a single row of six barbs, each an inch in length, and another has one double barb, like that of the "broad arrow" of England. Another has, instead of a barb, a smooth bulb, ending gradually in a spike, and serving no possible purpose, except perhaps that of ornament. Another has two of these bulbs; and another, the longest of them all, has a slight bulb, and then an attempt at carving. The pattern is of the very simplest character, but it is the only piece of carving on all the weapons. The same arrow is remarkable for having the point covered for some two inches with a sort of varnish, looking exactly like red sealing-wax, while a band of the same material encircles the head about six inches nearer the shaft. The sailor who brought the weapons over told me that this red varnish was poison, but I doubt exceedingly whether it is anything but ornament.

The end of the reed into which the head is inserted is guarded by a wrapping of rattan fibre, covered with a sort of dark varnish, which, however, is not the black-boy gum that is so plentifully used in the manufacture of other weapons. In one instance the place of the wrapping is taken by an inch or so of plaiting, wrought so beautifully with the outside of the rattan cut into flat strips scarcely wider than ordinary twine, that it betrays the Polynesian origin of the weapons, and confirms me in the belief that the bow and arrow are not indigenous to Australia, but have only been imported from New Guinea, and have not

made their way inland. The natives of Northern Australia have also evidently borrowed much from Polynesia, as we shall see in the course of this narrative.

The bow is usually about six feet in length, though one in my possession is somewhat longer. Owing to the dimensions of the bow and arrows, a full equipment of them is very weighty, and, together with the other weapons which an Australian thinks it his duty to carry, must be no slight burden to the warrior.

Ferocity of countenance is very characteristic of the race, and, as we shall see when we come to the canoes and their occupants, the people are very crafty: mild and complaisant when they think themselves overmatched, insolent and menacing when they fancy themselves superior, and tolerably sure to commit murder if they think they can do so with impunity. The only mode of dealing with these people is the safe one to adopt with all savages: *i. e.* never trust them, and never cheat them.

We now come to that most wonderful of all weapons, the boomerang. This is essentially the national weapon of Australia, and is found throughout the West country. As far as is known, it is peculiar to Australia, and, though curious missiles are found in other parts of the world, there is none which can be compared with the boomerang.

On one of the old Egyptian monuments there is a figure of a bird-catcher in a canoe. He is assisted by a cat whom he has taught to catch prey for him, and, as the birds fly out of the reeds among which he is pushing his canoe, he is hurling at them a curved missile which some persons have thought to be the boomerang. I cannot, however, see that there is the slightest reason for such a supposition.

No weapon in the least like the boomerang is at present found in any part of Africa, and, so far as I know, there is no example of a really efficient weapon having entirely disappeared from a whole continent. The harpoon with which the Egyptians of old killed the hippopotamus is used at the present day without the least alteration; the net is used for catching fish in the same manner; the spear and shield of the Egyptian infantry were identical in shape with those of the Kanemboo soldier, a portrait of whom may be seen on page 612; the bow and arrow still survive; and even the whip with which the Egyptian task masters beat their Jewish servants is the "khorobash" with which the Nubian of the present day beats his slave.

In all probability, the curved weapon which the bird-catcher holds in his hand, and which he is about to throw, is nothing more than a short club, analogous to the knob-kerry of the Kaffir, and having no returning power. Varying slightly in some of its details, the boomerang is identical in

principle wherever it is made. It is a flatfish curved piece of wood, various examples of which may be seen in the illustration on the 731st page; and neither by its shape nor material does it give the least idea of its wonderful powers.

The material of which the boomerang (or boomereng, as the word is sometimes rendered) is made is almost invariably that of the gum-tree, which is heavy, hard, and tough, and is able to sustain a tolerably severe shock without breaking. It is slightly convex on the upper surface, and flat below, and is always thickest in the middle, being scraped away toward the edges, which are moderately sharp, especially the outer edge. It is used as a missile, and it is one of the strangest weapons that ever was invented.

In the old fairy tales, with which we are more or less acquainted, one of the strange gifts which is presented by the fairy to the hero is often a weapon of some wonderful power. Thus we have the sword of sharpness, which cut through every thing at which it was aimed, and the coat of mail, which no weapon would pierce. It is a pity, by the way, that the sword and the coat never seem to have been tried against each other. Then there are arrows (in more modern tales modified into bullets) that always struck their mark, and so on. And in one of the highest flights of fairy lore we read of arrows that always returned of their own accord to the archer.

In Australia, however, we have, as an actual fact, a missile that can be thrown to a considerable distance, and which always returns to the thrower. By a peculiar mode of hurling it the weapon circles through the air, and then describes a circular course, falling by the side of or behind the man who threw it. The mode of throwing is very simple in theory, and very difficult in practice. The weapon is grasped by the handle, which is usually marked by a number of cross cuts, so as to give a firm hold, and the flat side is kept downward. Then, with a quick and sharp fling, the boomerang is hurled, the hand at the same time being drawn back, so as to make the weapon revolve with extreme rapidity. A billiard-player will understand the sort of movement when told that it is on the same principle as the "screw-back" stroke at billiards. The weapon must be flung with great force, or it will not perform its evolutions properly.

If the reader would like to practice throwing the boomerang, let me recommend him, in the first place, to procure a genuine weapon, and not an English imitation thereof, such as is generally sold at the toy-shops. He should then go alone into a large field, where the ground is tolerably soft and there are no large stones about, and then stand facing the wind. Having grasped it as described, he should mark with his eye a spot on the ground at the distance of forty

yards or so, and hurl the boomerang at it. Should he throw it rightly, the weapon will at first look as if it were going to strike the ground; but, instead of doing so, it will shoot off at a greater or less angle, according to circumstances, and will rise high into the air, circling round with gradually diminishing force, until it falls to the ground. Should sufficient force have been imparted to it, the boomerang will fall some eight or ten yards behind the thrower.

It is necessary that the thrower should be alone, or at least have only an instructor with him, when he practises this art, as the boomerang will, in inexperienced hands, take all kinds of strange courses, and will, in all probability, swerve from its line, and strike one of the spectators; and the force with which a boomerang can strike is almost incredible. I have seen a dog killed on the spot, its body being nearly cut in two by the boomerang as it fell; and I once saw a brass spur struck clean off the heel of an incautious spectator, who ran across the path of the weapon.

It is necessary that he choose a soft as well as spacious field, as the boomerang has a special knack of selecting the hardest spots on which to fall, and if it can find a large stone is sure to strike it, and so break itself to pieces. And if there are trees in the way, it will get among the boughs, perhaps smash itself, certainly damage itself, and probably stick among the branches. The learner should throw also against the wind, as, if the boomerang is thrown with the wind, it does not think of coming back again, but sails on as if it never meant to stop, and is sure to reach a wonderful distance before it falls.

Nearly thirty years ago, I lost a boomerang by this very error. In company with some of my schoolfellows, I was throwing the weapon for their amusement, when one of them snatched it up, turned round, and threw it with all his force in the direction of the wind. The distance to which the weapon travelled I am afraid to mention, lest it should not be believed. The ground in that neighborhood is composed of successive undulations of hill and vale, and we saw the boomerang cross two of the valleys, and at last disappear into a grove of lime-trees that edged the churchyard.

In vain we sought for the weapon, and it was not found until four years afterward, when a plumber, who had been sent to repair the roof of the church, found it sticking in the leads. So it had first traversed that extraordinary distance, had then cut clean through the foliage of a lime-tree, and lastly had sufficient force to stick into the leaden roofing of a church. The boomerang was brought down half decayed, and wrenched out of its proper form by the shock.

Should the reader wish to learn the use

of the weapon, he should watch a native throw it. The attitude of the man as he hurls the boomerang is singularly graceful. Holding three or four of the weapons in his left hand, he draws out one at random with his right, while his eyes are fixed on the object which he desires to hit, or the spot to which the weapon has to travel. Balancing the boomerang for a moment in his hand, he suddenly steps a pace or two forward, and with a quick, sharp, almost angry stroke, launches his weapon into the air.

Should he desire to bring the boomerang back again, he has two modes of throwing. In the one mode, he flings it high in the air, into which it mounts to a wonderful height, circling the while with a bold, vigorous sweep, that reminds the observer of the grand flight of the eagle or the buzzard. It flies on until it has reached a spot behind the thrower, when all life seems suddenly to die out of it; it collapses, so to speak, like a bird shot on the wing, topples over and over, and falls to the ground.

There is another mode of throwing the returning boomerang which is even more remarkable. The thrower, instead of aiming high in the air, marks out a spot on the ground some thirty or forty yards in advance, and hurls the boomerang at it. The weapon strikes the ground, and, instead of being smashed to pieces, as might be thought from the violence of the stroke, it springs from the ground Anteus-like, seeming to attain new vigor by its contact with the earth. It flies up as if it had been shot from the ground by a catapult; and, taking a comparatively low elevation, performs the most curious evolutions, whirling so rapidly that it looks like a semi-transparent disc with an opaque centre, and directing its course in an erratic manner that is very alarming to those who are unaccustomed to it. I have seen it execute all its manœuvres within seven or eight feet from the ground, hissing as it passed through the air with a strangely menacing sound, and, when it finally came to the ground, leaping along as if it were a living creature.

We will now examine the various shapes of boomerangs, as seen in the illustration on the 731st page. Some of the specimens are taken from the British Museum, some from the collection of Colonel Lane Fox, some from my own, and the rest are drawn by Mr. Angas from specimens obtained in the country. I have had them brought together, so that the reader may see how the boomerang has been gradually modified out of the club.

At fig. 4 is the short pointed stick which may either answer the purpose of a miniature club, a dagger, or an instrument to be used in the ascent of trees. Just below it is a club or waddy, with a rounded head, and at fig. 6 the head has been developed into a point, and rather flattened. If the

reader will refer to figs. 6 and 7, he will see two clubs which are remarkable for having not only the knob, but the whole of the handle flattened, and the curve of the head extended to the handle.

The transition from this club to the boomerang is simple enough, and, indeed, we have an example (fig. 1) of a weapon which looks like an ordinary boomerang, but is in fact a club, and is used for hand-to-hand combat.

These figures show pretty clearly the progressive structure of the boomerang. The flattened clubs were probably made from necessity, the native not being able to find a suitable piece of wood, and taking the best that he could get. If, then, one of these clubs were, on the spur of the moment, hurled at an object, the superior value which this flatness conferred upon it as a missile would be evident as well as the curved course which it would take through the air. The native, ever quick to note anything which might increase the power of his weapons, would be sure to notice this latter peculiarity, and to perceive the valuable uses to which it could be turned. He would therefore try various forms of flattened missiles, until he at last reached the true boomerang.

The strangest point about the boomerang is, that the curve is not uniform, and, in fact, scarcely any two specimens have precisely the same curve. Some have the curve so sharp that it almost deserves the name of angle, for an example of which see fig. 8; others, as in fig. 9, have the curve very slight; while others, as in fig. 2, have a tendency to a double curve, and there is a specimen in the British Museum in which the double curve is very boldly marked. The best and typical form of boomerang is, however, that which is shown at fig. 3. The specimen which is there represented was made on the banks of the river Darling.

The natives can do almost anything with the boomerang, and the circuitous course which it adopts is rendered its most useful characteristic. Many a hunter has wished that he only possessed that invaluable weapon, a gun which would shoot round a corner, and just such a weapon does the Australian find in his boomerang. If, for example, he should see a kangaroo in such a position that he cannot come within the range of a spear without showing himself and alarming the animal, or say, for example, that it is sheltered from a direct attack by the trunk of a tree, he will steal as near as he can without disturbing the animal, and then will throw his boomerang in such a manner that it circles round the tree, and strikes the animal at which it is aimed.

That such precision should be obtained with so curious a weapon seems rather remarkable, but those of my readers who are accustomed to play at bowls will call to

mind the enormous power which is given to them by the "bias," or weighted side of the bowl, and the bold curves which they can force the missile to execute, when they wish to send the bowl round a number of obstacles which are in its way. The boomerang is used as a sort of aerial bowl, with the advantage that the expert thrower is able to alter the bias at will, and to make the weapon describe almost any curve that he chooses.

It is even said that, in case there should be obstacles which prevent the boomerang from passing round the tree, the native has the power of throwing it so that it strikes the ground in front of the tree, and then, by the force of the throw, leaps over the top of the branches, and descends upon the object at which it is thrown.

On page 739 is shown a scene on the river Murray, in which the natives are drawn as they appear when catching the shag, a species of cormorant, which is found there in great numbers. They capture these birds in various ways, sometimes by climbing at night the trees on which they roost, and seizing them, getting severely bitten, by the way, on their naked limbs and bodies. They have also a very ingenious mode of planting sticks in the bed of the river, so that they project above the surface, and form convenient resting-places for the birds. Fatigued with diving, the cormorants are sure to perch upon them; and as they are dozing while digesting their meal of fish, the native swims gently up, and suddenly catches them by the wings, and drags them under water. He always breaks the neck of the bird at once.

They are so wonderfully skilful in the water, that when pelicans are swimming unsuspectingly on the surface, the natives approach silently, dive under them, seize the birds by the legs, jerk them under water, and break both the wings and legs so rapidly that the unfortunate birds have no chance of escape.

Sometimes, as shown in the illustration, the natives use their boomerangs and clubs, knock the birds off the branches on which they are roosting, and secure them before they have recovered from the stunning blow of the weapon. When approaching cormorants and other aquatic birds, the native has a very ingenious plan of disguising himself. He gathers a bunch of weeds, ties it on his head, and slips quietly into the water, keeping his whole body immersed, and only allowing the artificial covering to be seen. The bird being quite accustomed to see patches of weeds floating along the water, takes no notice of so familiar an object, and so allows the disguised man to come within easy reach.

To return to the boomerang. The reader may readily have imagined that the manufacture of so remarkable an implement is

not a very easy one. The various points which constitute the excellence of a boomerang are so light that there is scarcely an European who can see them, especially as the shape, size, and weight of the weapon differ so much according to the locality in which it was made. The native, when employed in making a boomerang, often spends many days over it, not only on account of the very imperfect tools which he possesses, but by reason of the minute care which is required in the manufacture of a good weapon.

Day after day he may be seen with the boomerang in his hand, chipping at it slowly and circumspectly, and becoming more and more careful as it approaches completion. When he has settled the curve, and nearly flattened it to its proper thickness, he scarcely makes three or four strokes without balancing the weapon in his hand, looking carefully along the edges, and making movements as if he were about to throw it. The last few chips seem to exercise a wonderful effect on the powers of the weapon, and about them the native is exceedingly fastidious.

Yet, with all this care, the weapon is a very rough one, and the marks of the flint axe are left without even an attempt to smooth them. In a well-used boomerang the projecting edges of the grooves made by various cuts and chips become quite polished by friction, while the sunken portion is left rough. In one fine specimen in my possession the manufacturer has taken a curious advantage of these grooves. Besides marking the handle end by covering it with cross-scorings as has already been described, he has filled the grooves with the red ochre of which the Australian is so fond, and for some eight inches the remains of the red paint are visible in almost every groove.

So delicate is the operation of boomerang making, that some men, natives though they be, cannot turn out a really good weapon, while others are celebrated for their skill, and can dispose of their weapons as fast as they make them. One of the native "kings" was a well-known boomerang maker, and his weapons were widely distributed among the natives, who knew his handiwork as an artist knows the touch of a celebrated painter. To this skill, and the comparative wealth which its exercise brought him, the king in question owed the principal part of his authority.

A fair idea of the size and weight of the boomerang may be gained by the measurements of the weapon which has just been mentioned. It is two feet nine inches long when measured with the curve, and two feet six inches from tip to tip. It is exactly two inches in width, only narrowing at the tips, and its weight is exactly eleven ounces. This, by the way, is a war boomerang, and is

(1.) SPEARING THE KANGAROO. (See page 731.)

(2.) CATCHING THE CORMORANT. (See page 738.)

shaped like that which is shown in "Boomerangs" on page 731, fig. 3. Another specimen, which is of about the same weight, is shaped like that of fig. 8. It measures two feet five inches along the curve, two feet one inch from tip to tip, and is three inches in width in the middle, diminishing gradually toward the tips.

IN order to enable them to ward off these various missiles, the natives are armed with a shield, which varies exceedingly in shape and dimensions, and, indeed, in some places is so unlike a shield, and apparently so inadequate to the office of protecting the body, that when strangers come to visit my collection I often have much difficulty in persuading them that such strange-looking objects can by any possibility be shields. As there is so great a variety in the shields, I have collected together a number of examples, which, I believe, comprise every form of shield used throughout Australia. Two of them are from specimens in my own collection, several from that of Colonel Lane Fox, others are drawn from examples in the British Museum, and the rest were sketched by Mr. Angus in the course of his travels through Australia.

As a general fact, the shield is very solid and heavy, and in some cases looks much more like a club with which a man can be knocked down, than a shield whereby he can be saved from a blow, several of them having sharp edges as if for the purpose of inflicting injury.

If the reader will look at the row of shields on page 742, he will see that figs. 2 and 3 exhibit two views of the same shield. This is one of the commonest forms of the weapon, and is found throughout a considerable portion of Western Australia. It is cut out of a solid piece of the ever useful gum-tree, and is in consequence very hard and very heavy. As may be seen by reference to the illustration, the form of the shield is somewhat triangular, the face which forms the front of the weapon being slightly rounded, and the handle being formed by cutting through the edge on which the other two faces converge. The handle is very small, and could scarcely be used by an ordinary European, though it is amply wide enough for the small and delicate looking hand of the Australian native. My own is a small hand, but is yet too large to hold the Australian shield comfortably.

The reader will see that by this mode of forming the handle the wrist has great play, and can turn the shield from side to side with the slightest movement of the hand. This faculty is very useful, especially when the instrument is used for warding off the spear or the club, weapons which need only to be just turned aside in order to guide them away from the body.

One of these shields in my own collection is a very fine example of the instrument, and

its dimensions will serve to guide the reader as to the usual form, size, and weight of an Australian shield. It measures exactly two feet seven inches in length, and is five inches wide at the middle, which is the broadest part. The width of the hole which receives the hand is three inches and three-eighths, and the weight of the shield is rather more than three pounds.

The extraordinary weight of the shield is needed in order to enable it to resist the shock of the boomerang, the force of which may be estimated by its weight, eleven ounces, multiplied by the force with which it is hurled. This terrible weapon cannot be merely turned aside, like the spear or the waddy, and often seems to receive an additional impulse from striking any object, as the reader may see by reference to page 737, in which the mode of throwing the boomerang is described. A boomerang must be stopped, and not merely parried, and moreover, if it be not stopped properly, it twists round the shield, and with one of its revolving ends inflicts a wound on the careless warrior.

Even if it be met with the shield and stopped, it is apt to break, and the two halves to converge upon the body. The very fragments of the boomerang seem able to inflict almost as much injury as the entire weapon; and, in one of the skirmishes to which the natives are so addicted, a man was seen to fall to the ground with his body cut completely open by a broken boomerang.

It is in warding off the boomerang, therefore, that the chief skill of the Australian is shown. When he sees the weapon is pursuing a course which will bring it to him, he steps forward so as to meet it; and, as the boomerang clashes against the shield, he gives the latter a rapid turn with the wrist. If this manœuvre be properly executed, the boomerang breaks to pieces, and the fragments are struck apart by the movement of the shield.

Perhaps some of my readers may remember that "Dick-a-dick," the very popular member of the Australian cricketers who came to England in 1868, among other exhibitions of his quickness of eye and hand, allowed himself to be pelted with cricket balls, at a distance of fifteen yards, having nothing wherewith to protect himself but the shield and the leowal, or angular club, the former being used to shield the body, and the latter to guard the legs. The force and accuracy with which a practised cricketer can throw the ball are familiar to all Englishmen, and it was really wonderful to see a man, with no clothes but a skin-tight elastic dress, with a piece of wood five inches wide in his left hand, and a club in his right, quietly stand against a positive rain of cricket-balls as long as any one liked to throw at him, and come out of the ordeal unscathed.

Not the least surprising part of the performance was the coolness with which he treated the whole affair, and the almost instinctive knowledge that he seemed to possess respecting the precise destination of each ball. If a ball went straight at his body or head, it was met and blocked by the shield; if it were hurled at his legs, the club knocked it aside. As to those which were sure not to hit him, he treated them with contemptuous indifference, just moving his head a little on one side to allow the ball to pass, which absolutely ruffled his hair as it shot by, or lifting one arm to allow a ball to pass between the limb and his body, or, if it were aimed but an inch wide of him, taking no notice of it whatever. The shield which he used with such skill was the same kind as that which has just been described, and was probably selected because its weight enabled it to block the balls without the hand that held it feeling the shock.

To all appearances, the natives expend much more labor upon the shield than upon the boomerang, the real reason, however, being that much ornament would injure the boomerang, but can have no injurious effect

grooves, and each groove has been filled with red ochre. The space between is filled in with a double zigzag pattern, and the effect of all these lines, simple as they are, is perfectly artistic and consistent.

The pattern, by the way, is one that seems common to all savage races of men, wherever they may be found, and is to be seen on weapons made by the ancient races now long passed away, among the Kaffir tribes of South Africa, the cannibal tribes of Central Western Africa, the inhabitants of the various Polynesian islands, the savages of the extreme north and extreme south of America, and the natives of the great continent of Australia.

At fig. 7 of the accompanying illustration may be seen a shield made of solid wood, in which the triangular form has been developed in a very curious manner into a quadrangular shape. The handle is made in the same manner as that of the former shield, *i. e.* by cutting through two of the faces of the triangle, while the front of the shield, instead of being a tolerably round face, is flattened out into a sharp edge. It is scarcely possible to imagine any instrument

SHIELDS.

upon the shield. By reference to the illustration, the reader will see that the face of the shield is covered with ornament, which, simple in principle, is elaborate in detail.

There is a specimen in my collection which is ornamented to a very great extent on its face, the sides and the handle being perfectly plain. It has a number of lines drawn transversely in bands, which, however, are seven instead of five in number. Each band is composed of three zigzag

that looks less like a shield than does this curious weapon, which seems to have been made for the express purpose of presenting as small a surface as possible to the enemy.

The fact is, however, that the Southern Australian who uses these shields has not to defend himself against arrows, from which a man can only be defended by concealing his body behind shelter which is proof against them: he has only to guard against the spear and boomerang, and occa-

sionally the missile club, all which weapons he can turn aside with the narrow shield that has been described.

One of these shields in my collection is two feet seven inches in length, rather more than six inches in width, and barely three inches thick in the middle. Its weight is just two pounds. Such a weapon seems much more like a club than a shield, and, indeed, if held by one end, its sharp edge might be used with great effect upon the head of an enemy. Like most Australian shields, it is covered with a pattern of the same character as that which has already been mentioned, and it has been so thoroughly painted with ochre that it is of a reddish mahogany color, and the real hue of the wood can only be seen by scraping off some of the stained surface. The name for this kind of shield is tamarang, and it is much used in dances, in which it is struck at regular intervals with the waddy.

In the British Museum is a shield which is much more solid than either of those which have been described. The manufacturer evidently found the labor of chipping the wood too much for him, and accordingly made much use of fire, forming his shield by alternate charring and scraping. The handle is rather curiously made by cutting two deep holes side by side in the back of the shield, the piece of wood between them being rounded into a handle. As is the case

with most of the shields, the handle is a very small one. The face of the shield is much wider than either of those which have been noticed, and is very slightly rounded. It is ornamented with carved grooves, but rough usage has obliterated most of them, and the whole implement is as rough and unsightly an article as can well be imagined, in spite of the labor which has been bestowed upon it.

We now come to another class of shield, made of bark, and going by the title of Mulabakka. Shields in general are called by the name of Hieleman. Some of these bark shields are of considerable size, and are so wide in the middle that, when the owner crouches behind them, they protect the greater part of his body. As the comparatively thin material of which they are composed prevents the handle from being made by cutting into the shield itself, the native is obliged to make the handle separately, and fasten it to the shield by various methods.

The commonest mode of fixing the handle to a Mulabakka shield is seen at figs. 4 and 5, on page 742, which exhibit the front and profile views of the same shield. Another Mulabakka is shown at fig. 6. The faces of all the Mulabakka shields are covered with ornamented patterns, mostly on the usual zigzag principle, but some having a pattern in which curves form the chief element.

CHAPTER LXXIII.

AUSTRALIA — *Continued.*

REAL WAR UNKNOWN TO THE AUSTRALIANS — FEUDS AND THE CAUSES OF THEM — A SAVAGE TOURNAMENT — VENGEANCE FOR DEATH — THE TROPHY OF VICTORY — AUSTRALIAN VENDETTA — FIRE-SIGNALS — DEATH OF TARMEENIA — ORDEAL OF BATTLE — CANNIBALISM AS AN ADJUNCT OF WAR — DANCES OF THE ABORIGINES — THE KURI DANCE AND ITS STRANGE ACCOMPANIMENTS — THE PALTI DANCE — THE CONCLUDING FIGURE — DANCE OF THE PARNKALLA TRIBE — ORDINARY CORROBOOREES — THE KANGAROO DANCE — TASMANIAN DANCE.

THE mention of these various weapons naturally leads us to warfare; and that they are intended for that purpose the existence of the shields is a proof. Offensive weapons, such as the spear and the club, may be used merely for killing game; but the shield can only be employed to defend the body from the weapons of an enemy.

War, however, as we understand the word, is unknown among the Australians. They have not the intellect nor the organization for it, and so we have the curious fact of skilled warriors who never saw a battle. No single tribe is large enough to take one side in a real battle; and, even supposing it to possess sufficient numbers, there is no spirit of discipline by means of which a force could be gathered, kept together, or directed, even if it were assembled.

Yet, though real war is unknown, the Australian natives are continually fighting, and almost every tribe is at feud with its neighbor. The cause of quarrel with them is almost invariably the possession of some territory. By a sort of tacit arrangement, the various tribes have settled themselves in certain districts; and, although they are great wanderers, yet they consider themselves the rightful owners of their own district.

It mostly happens, however, that members of one tribe trespass on the district of another, especially if it be one in which game of any kind is plentiful. And sometimes, when a

tribe has gone off on a travelling expedition, another tribe will settle themselves in the vacated district; so that, when the rightful owners of the soil return, there is sure to be a quarrel. The matter is usually settled by a skirmish, which bears some resemblance to the *mêlée* of ancient chivalry, and is conducted according to well-understood regulations.

The aggrieved tribe sends a challenge to the offenders, the challenger in question bearing a bunch of emu's feathers tied on the top of a spear. At daybreak next morning the warriors array themselves for battle, painting their bodies in various colors, so as to make themselves look as much like demons, and as much unlike men, as possible, laying aside all clothing, and arranging their various weapons for the fight.

Having placed themselves in battle array, at some little distance from each other, the opposite sides begin to revile each other in quite a Homeric manner, taunting their antagonists with cowardice and want of skill in their weapons, and boasting of the great deeds which they are about to do. When, by means of interposing these taunts with shouts and yells, dancing from one foot to the other, quivering and poisoning their spears, and other mechanical modes of exciting themselves, they have worked themselves up to the requisite pitch of fury, they begin to throw the spears, and the combat becomes general. Confused as it appears, it is, how-

ever, arranged with a sort of order. Each warrior selects his antagonist; so that the fight is, in fact, a series of duels rather than a battle, and the whole business bears a curious resemblance to the mode of fighting in the ancient days of Troy.

Generally the combatants stand in rather scattered lines, or, as we should say, in wide skirmishing order. The gestures with which they try to irritate their opponents are very curious, and often grotesque; the chief object being apparently to induce the antagonist to throw the first spear. Sometimes they stand with their feet very widely apart, and their knees straight, after the manner which will be seen in the illustrations of the native dances. While so standing, they communicate a peculiar quivering movement to the legs, and pretend to offer themselves as fair marks. Sometimes they turn their backs on their adversary, and challenge him to throw at them; or they drop on a hand and knee for the same purpose.

Mr. McGillivray remarked that two spearmen never throw at the same combatant; but, even with this advantage, the skill of the warrior is amply tested, and it is surprising to see how, by the mere inflection of the body, or the lifting a leg or arm, they avoid a spear which otherwise must have wounded them. While the fight is going on, the women and children remain in the bush, watching the combat, and uttering a sort of wailing chant, rising and falling in regular cadence.

Sometimes the fight is a very bloody one, though the general rule is, that when one man is killed the battle ceases, the tribe to which the dead man belonged being considered as having been worsted. It might be thought that a battle conducted on such principles would be of very short duration; but the Australian warriors are so skilful in warding off the weapons of their antagonists that they often fight for a considerable time before a man is killed. It must be remembered, too, that the Australian natives can endure, without seeming to be much the worse for them, wounds which would kill an European at once. In such a skirmish, however, much blood is spilt, even though only one man be actually killed, for the barbed spears and sharp-edged boomerangs inflict terrible wounds, and often cripple the wounded man for life.

Other causes beside the quarrel for territory may originate a feud between two tribes. One of these cases is a very curious one. A woman had been bitten by a snake; but, as no blood flowed from the wound, it was thought that the snake was not a venomous one, and that there was no danger. However, the woman died in a few hours, and her death was the signal for a desperate war between two tribes. There seems to be but little connection between the two

events, but according to Australian ideas the feud was a justifiable one.

The natives of the part of Australia where this event occurred have a curious idea concerning death. Should any one die without apparent cause, they think that the death is caused by a great bird called marralya, which comes secretly to the sick person, seizes him round the waist in his claws, and squeezes him to death. Now the marralya is not a real bird, but a magical one, being always a man belonging to a hostile tribe, who assumes the shape of the bird, and so finds an opportunity of doing an injury to the tribe with which he is at feud. Having made up his mind that the snake which bit the woman was not a venomous one, her husband could not of course be expected to change his opinion, and so it was agreed upon that one of a neighboring tribe with whom they were at feud must have become a marralya, and killed the woman. The usual challenge was the consequence, and from it came a series of bloody fights.

Like most savage nations, the Australians mutilate their fallen enemies. Instead, however, of cutting off the scalp, or other trophy, they open the body, tear out the fat about the kidneys, and rub it over their own bodies. So general is this custom, that to "take fat" is a common paraphrase for killing an enemy; and when two antagonists are opposed to each other, each is sure to boast that his antagonist shall furnish fat for him. As far as can be learned, they have an idea that this practice endues the victor with the courage of the slain man in addition to his own; and, as a reputation for being a warrior of prowess is the only distinction that a native Australian can achieve, it may be imagined that he is exceedingly anxious to secure such an aid to ambition.

Not from deliberate cruelty, but from the utter thoughtlessness and disregard of inflicting pain which characterizes all savages, the victorious warrior does not trouble himself to wait for the death of his enemy before taking his strange war trophy. Should the man be entirely disabled it is enough for the Australian, who turns him on his back, opens his body with the quartz knife which has already been described, tears out the coveted prize, and rubs himself with it until his whole body and limbs shine as if they were burnished. Oftentimes it has happened that a wounded man has been thus treated, and has been doomed to see his conqueror adorn himself before his eyes. Putting aside any previous injury, such a wound as this is necessarily mortal; but a man has been known to live for more than three days after receiving the injury, so wonderfully strong is the Australian constitution.

Sometimes these feuds spread very widely, and last for a very long time. Before the declaration of war, the opposing tribes

refrain from attacking each other, but, after that declaration is once made, the greatest secrecy is often observed, and the warrior is valued the highest who contrives to kill his enemy without exposing himself to danger. Sometimes there is a sort of wild chivalry about the Australians, mingled with much that is savage and revolting. A remarkable instance of these traits is recorded by Mr. M'Gillivray.

An old man had gone on a short expedition in his canoe, while the men of his tribe were engaged in catching turtle. He was watched by a party belonging to a hostile tribe, who followed and speared him. Leaving their spears in the body to indicate their identity, they returned to shore, and made a great fire by way of a challenge. Seeing the signal, and knowing that a column of thick smoke is almost always meant as a challenge, the men left their turtling, and, on finding that the old man was missing, instituted a search after him. As soon as they discovered the body they lighted another fire to signify their acceptance of the challenge, and a party of them started off the same evening in order to inflict reprisals on the enemy.

They soon came upon some natives who belonged to the inimical tribe, but who had not been concerned in the murder, and managed to kill the whole party, consisting of four men, a woman, and a girl. They cut off the heads of their victims, and returned with great exultation, shouting and blowing conch-shells to announce their victory.

The heads were then cooked in an oven, and the eyes scooped out and eaten, together with portions of the cheeks. Only those who had been of the war-party were allowed to partake of this horrible feast. When it was over the victors began a dance, in which they worked themselves into a perfect frenzy, kicking the skulls over the ground, and indulging in all kinds of hideous antics. Afterward the skulls were hung up on two cross sticks near the camp, and allowed to remain there undisturbed.

Fire, by the way, is very largely used in making signals, which are understood all over the continent. A large fire, sending up a great column of smoke, is, as has already been mentioned, almost invariably a sign of defiance, and it is sometimes kindled daily until it is answered by another. If a man wishes to denote that he is in want of assistance, he lights a small fire, and, as soon as it sends up its little column of smoke, he extinguishes it suddenly by throwing earth on it. This is repeated until the required assistance arrives.

Some years ago, when the character and habits of the natives were not known so well as they are now, many of the settlers were murdered by the natives, simply through their system of fire-signalling. One or two natives, generally old men or

women, as causing least suspicion, and being entirely unarmed, would approach the farm or camp, and hang about it for some days, asking for food, and cooking it at their own little fires.

The white men had no idea that every fire that was lighted was a signal that was perfectly well understood by a force of armed men that was hovering about them under cover of the woods, nor that the little puffs of smoke which occasionally arose in the distance were answers to the signals made by their treacherous guests. When the spies thought that their hosts were lulled into security, they made the battle-signal, and brought down the whole force upon the unsuspecting whites.

The Australians are wonderfully clever actors. How well they can act honesty and practise theft has already been mentioned. They have also a way of appearing to be unarmed, and yet having weapons ready to hand. They will come out of the bush, with green boughs in their hands as signs of peace, advance for some distance, and ostentatiously throw down their spears and other weapons. They then advance again, apparently unarmed, but each man trailing a spear along the ground by means of his toes. As soon as they are within spear range, they pick up their weapons with their toes, which are nearly as flexible and useful as fingers, hurl them, and then retreat to the spot where they had grounded their weapons.

The Australians have a tenacious memory for injuries, and never lose a chance of reprisal. In 1849, some men belonging to the Badulega tribe had been spending two months on a friendly visit to the natives of Muralug. One of their hosts had married an Italega woman, and two of the brothers were staying with her. The Badulegas happened to remember that several years before one of their own tribe had been insulted by an Italega. So they killed the woman, and tried to kill her brothers also, but only succeeded in murdering one of them. They started at once for their home, taking the heads as proof of their victory, and thought that they had done a great and praiseworthy action.

A similar affair took place among some of the tribes of Port Essington. A Monobar native had been captured when thieving, and was imprisoned. He attempted to escape, and in so doing was shot by the sentinel on duty. By rights his family ought to have executed reprisals on a white man; but they did not venture on such a step, and accordingly picked out a native who was on good terms with the white man, and killed *him*. The friends of the murdered man immediately answered by killing a Monobar, and so the feud went on. In each case the victim was murdered while sleeping, a number of natives quietly surrounding

him, and, after spearing him, beating him with their waddies into a shapeless mass.

Should the cause of the feud be the unexplained death of a man or woman, the duty of vengeance belongs to the most formidable male warrior of the family. On such occasions he will solemnly accept the office, adorn himself with the red war-paint, select his best weapons, and promise publicly not to return until he has killed a male of the inimical tribe. How pertinaciously the Australian will adhere to his bloody purpose may be seen from an anecdote related by Mr. Lloyd.

He was startled one night by the furious barking of his dogs. On taking a lantern he found lying on the ground an old black named Tarmeenia, covered with wounds inflicted by spears, and boomerangs, and waddies. He told his story in the strange broken English used by the natives. The gist of the story was, that he and his son were living in a hut, and the son had gone out to snare a bird for his father, who was ill. Presently a "bunglearney coolie," i. e. an enemy from another tribe, entered the hut and demanded, "Why did your son kill my wife? I shall kill his father." Whereupon he drove his spear into the old man's side, and was beating him to death, when he was disturbed by the return of his son. The young man, a singularly powerful native, knowing that his father would be certainly murdered outright if he remained in the hut, actually carried him more than four miles to Mr. Lloyd's house, put him down in the yard, and left him.

A hut was at once erected close to the house, and Tarmeenia was installed and attended to. He was very grateful, but was uneasy in his mind, begging that the constable might visit his hut in his nightly rounds, " 'cos same bunglearney coolie cum agin, and dis time too much kill 'im Tarmeenia." The alarm of the old man seemed rather absurd, considering the position of the hut, but it was fully justified. About three weeks after Tarmeenia had been placed in the hut, Mr. Lloyd was aroused at daybreak by a servant, who said that the old black fellow had been burned to death. Dead he certainly was, and on examining the body two fresh wounds were seen, one by a spear just over the heart, and the other a deep cut in the loins, through which the "bunglearney" had torn the trophy of war.

Occasionally a man who has offended against some native law has to engage in a kind of a mimic warfare, but without the advantage of having weapons. Mr. Lloyd mentions a curious example of such an ordeal.

"The only instance I ever witnessed of corporeal punishment being inflicted — evidently, too, by some legal process — was upon the person of a fine sleek young black, who, having finished his morning's repast,

rose in a dignified manner, and, casting his rug from his shoulders, strode with Mohican stoicism to the appointed spot, divested of his shield, waddy, or other means of defence. Nor, when once placed, did he utter one word, or move a muscle of his graceful and well-moulded person, but with folded arms and defiant attitude awaited the fatal ordeal.

"A few minutes only elapsed when two equally agile savages, each armed with two spears and a boomerang, marched with stately gait to within sixty yards of the culprit. One weapon after another was hurled at the victim savage, with apparently fatal precision, but his quick eye and wonderful activity set them all at defiance, with the exception of the very last cast of a boomerang, which, taking an unusual course, severed a piece of flesh from the shoulder-blade, equal in size to a crown-piece, as if sliced with a razor, and thus finished the affair."

The *lex talionis* forms part of the Australian traditional law, and is sometimes exercised after a rather ludicrous fashion. A young man had committed some light offence, and was severely beaten by two natives, who broke his arm with a club, and laid his head open with a fishing spear. Considerable confusion took place, and at last the elders decided that the punishment was much in excess of the offence, and that, when the wounded man recovered, the two assailants were to offer their heads to him, so that he might strike them a certain number of blows with his waddy.

In the description of the intertribal feuds, it has been mentioned that the men who assisted in killing the victims of reprisal par took of the eyes and cheeks of the murdered person. This leads us to examine the question of cannibalism, inasmuch as some travellers have asserted that the Australians are cannibals and others denying such a propensity as strongly.

That the flesh of human beings is eaten by the Australians is an undeniable fact; but it must be remarked that such an act is often intended as a ceremonial, and not merely as a means of allaying hunger or gratifying the palate. It has been ascertained that some tribes who live along the Murray River have been known to kill and eat children, mixing their flesh with that of the dog. This, however, only occurs in seasons of great scarcity; and that the event was exceptional and not customary, is evident from the fact that a man was pointed out as having killed his children for food. Now it is plain, that, if cannibalism was the custom, such a man would not be sufficiently conspicuous to be specially mentioned. These tribes have a horrible custom of killing little boys for the sake of their fat, with which they bait fish-hooks.

Another example of cannibalism is de-

scribed by Mr. Angas as occurring in New South Wales. A lad had died, and his body was taken by several young men, who proceeded to the following remarkable ceremonies. They began by removing the skin, together with the head, rolling it round a stake, and drying it over the fire. While this was being done, the parents, who had been uttering loud lamentations, took the flesh from the legs, cooked, and ate it. The remainder of the body was distributed among the friends of the deceased, who carried away their portions on the points of their spears; and the skin and bones were kept by the parents, and always carried about in their wallets.

It may seem strange that the mention of the weapons and mode of fighting should lead us naturally to the dances of the Australians. Such, however, is the case; for in most of their dances weapons of some sort are introduced. The first which will be mentioned is the Kuri dance, which was described to Mr. Angas by a friend who had frequently seen it, and is illustrated on the next page. This dance is performed by the natives of the Adelaide district. It seems to have one point in common with the cotillon of Europe, namely, that it can be varied, shortened, or lengthened, according to the caprice of the players; so that if a spectator see the Kuri dance performed six or seven times, he will never see the movements repeated in the same order. The following extract describes a single Kuri dance, and from it the reader may form his impressions of its general character:—

“But first the *dramatis personæ* must be introduced, and particularly described. The performers were divided into five distinct classes, the greater body comprising about twenty-five young men, including five or six boys, painted and decorated as follows: in nudity, except the *yoodna*, which is made expressly for the occasion, with bunches of gum-leaves tied round the legs just above the knee, which, as they stamped about, made a loud switching noise. In their hands they held a *katta* or *wirri*, and some a few gum-leaves. The former were held at arm's length, and struck alternately with their legs as they stamped. They were painted, from each shoulder down to the hips, with five or six white stripes, rising from the breast; their faces also, with white perpendicular lines, making the most hideous appearance. These were the dancers.

“Next came two groups of women, about five or six in number, standing on the right and left of the dancers, merely taking the part of supernumeraries; they were not painted, but had leaves in their hands, which they shook, and kept beating time with their feet during the whole performance, but never moved from the spot where they stood.

“Next followed two remarkable characters, painted and decorated like the dancers, but with the addition of the *palyertatta*—a singular ornament made of two pieces of stick put crosswise, and bound together by the *maugna*, in a spreading manner, having at the extremities feathers opened, so as to set it off to the best advantage. One had the *palyertatta* stick sideways upon his head, while the other, in the most wizard-like manner, kept waving it to and fro before him, corresponding with the action of his head and legs.

“Then followed a performer distinguished by a long spear, from the top of which a bunch of feathers hung suspended, and all down the spear the *maugna* was wound; he held the *koonteroo* (spear and feathers) with both hands behind his back, but occasionally altered the position, and waved it to the right and left over the dancers. And last came the singers—two elderly men in their usual habiliments; their musical instruments were the *katta* and *wirri*, on which they managed to beat a double note; their song was one unvaried, gabbling tone.

“The night was mild; the new moon shone with a faint light, casting a depth of shade over the earth, which gave a sombre appearance to the surrounding scene that highly conduced to enhance the effect of the approaching play. In the distance, a black mass could be discerned under the gum-trees, whence occasionally a shout and a burst of flame arose. These were the performers dressing for the dance, and no one approached them while thus occupied.

“Two men, closely wrapped in their opossum-skins, noiselessly approached one of the *wurlics*, where the Kuri was to be performed, and commenced clearing a space for the singers; this done, they went back to the singers, but soon after returned, sat down, and began a peculiar harsh and monotonous tune, keeping time with a *katta* and a *wirri* by rattling them together. All the natives of the different *wurlics* flocked round the singers, and sat down in the form of a horse-shoe, two or three rows deep.

“By this time the dancers had moved in a compact body to within a short distance of the spectators; after standing for a few minutes in perfect silence, they answered the singers by a singular deep shout simultaneously; twice this was done, and then the man with the *koonteroo* stepped out, his body leaning forward, and commenced with a regular stamp; the two men with the *palyertattas* followed, stamping with great regularity, the rest joining in: the regular and alternate stamp, the waving of the *palyertatta* to and fro, with the loud switching noise of the gum leaves, formed a scene highly characteristic of the Australian natives. In this style they approached the singers, the spectators every now and then shouting forth

(1.) THE KURI DANCE. (See page 748.)

(2.) PALTI DANCE, OR CORROBOREE. (See page 752.)

their applause. For some time they kept stamping in a body before the singers, which had an admirable effect, and did great credit to their dancing attainments; then one by one they turned round, and danced their way back to the place they first started from, and sat down. The *palyertatta* and *koonteroo* men were the last who left, and as these three singular beings stamped their way to the other dancers they made a very odd appearance.

"The singing continued for a short time, and then pipes were lighted; shouts of applause ensued, and boisterous conversation followed. After resting about ten minutes, the singers commenced again; and soon after the dancers huddled together, and responded to the call by the peculiar shout already mentioned, and then performed the same feat over again—with this variation, that the *palyertatta* men brought up the rear, instead of leading the way. Four separate times these parts of the play were performed with the usual effect; then followed the concluding one, as follows: after tramping up to the singers, the man with the *koonteroo* commenced a part which called forth unbounded applause; with his head and body inclined on one side, his spear and feathers behind his back, standing on the left leg, he beat time with the right foot, twitching his body and eye, and stamping with the greatest precision; he remained a few minutes in this position, and then suddenly turned round, stood on his right leg, and did the same once with his left foot.

"In the mean while the two men with the mystic *palyertatta* kept waving their instruments to and fro, corresponding with the motions of their heads and legs, and the silent trampers performed their part equally well. The *koonteroo* man now suddenly stopped, and, planting his spear in the ground, stood in a stooping position behind it; two dancers stepped up, went through the same manœuvre as the preceding party with wonderful regularity, and then gave a final stamp, turned round, and grasped the spear in a stooping position, and so on with all the rest, until every dancer was brought to the spear, so forming a circular body.

"The *palyertatta* men now performed the same movement on each side of this body, accompanied with the perpetual motion of the head, leg, and arm, and then went round and round, and finally gave the arrival stamp, thrust in their arm, and grasped the spear: at the same time all sunk on their knees and began to move away in a mass from the singers, with a sort of grunting noise, while their bodies leaned and tossed to and fro; when they had got about ten or twelve yards they ceased, and, giving one long semi-grunt or groan (after the manner of the red kangaroo, as they say), dispersed.

"During the whole performance, the singing went on in one continued strain, and,

after the last act of the performers, the rattling accompaniment of the singing ceased, the strain died gradually away, and shouts and acclamations rent the air."

There are many other dances among the Australians. There is, for example, the Frog-dance. The performers paint themselves after the usual grotesque manner, take their *wirris* in their hands, beat them together, and then squat down and jump after each other in circles, imitating the movements of the frog. Then there is the emu-dance, in which all the gestures consist of imitation of emu-hunting, the man who enacts the part of the bird imitating its voice.

In some parts of Australia they have the canoe dance, one of the most graceful of these performances.

Both men and women take part in this dance, painting their bodies with white and red ochre, and each furnished with a stick which represents the paddle. They begin to dance by stationing themselves in two lines, but with the stick across their backs and held by the arms, while they move their feet alternately to the tune of the song with which the dance is accompanied. At a given signal they all bring the sticks to the front, and hold them as they do paddles, swaying themselves in regular time as if they were paddling in one of their light canoes.

Another dance, the object of which is not very certain, is a great favorite with the Moorundi natives. The men, having previously decorated their bodies with stripes of red ochre, stand in a line, while the women are collected in a group and beat time together. The dance consists in stamping simultaneously with the left foot, and shaking the fingers of the extended arms. This dance is called *Pedeku*.

There is a rather curious dance, or movement, with which they often conclude the performance of the evening. They sit cross-legged round their fire, beating time with their spears and *wirris*. Suddenly they all stretch out their arms as if pointing to some distant object, rolling their eyes fearfully as they do so, and finish by leaping on their feet with a simultaneous yell that echoes for miles through the forest.

In his splendid work on South Australia, Mr. Angas describes a rather curious dance performed by the Pankalla tribe, in which both sexes take part. Each man carries a belt made either of human hair or opossum fur, holding one end in each hand, and keeping the belt tightly strained. There is a slight variation in the mode of performing this dance, but the usual plan is for all the men to sit down, while a woman takes her place in the middle. One of the men then dances up to her, jumping from side to side, and swaying his arms in harmony with his movements. The woman begins jumping as her partner approaches, and then they dance

back again, when their place is taken by a fresh couple.

Some persons have supposed that this dance is a religious ceremony, because it is usually held on clear moonlight evenings. Sometimes, however, it is performed during the day-time.

The commonest native dance, or "corroboree," is that which is known as the Palti, and which is represented on the 749th page. It is always danced by night, the fitful blaze of the fire being thought necessary to bring out all its beauties.

Before beginning this dance, the performers prepare themselves by decorating their bodies in some grotesque style with white and scarlet paints, which contrast boldly with the shining black of their skins. The favorite pattern is the skeleton, each rib being marked by a broad stripe of white paint, and a similar stripe running down the breast and along the legs and arms. The face is painted in a similar fashion. The effect produced by this strange pattern is a most startling one. Illuminated only by the light of the fire, the black bodies and limbs are scarcely visible against the dark background, so that, as the performers pass backward and forward in the movements of the dance, they look exactly like a number of skeletons endued with life by magic powers.

This effect is increased by the curious quivering of the legs, which are planted firmly on the ground, but to which the dancers are able to impart a rapid vibratory movement from the knees upward. The *wirris*, or clubs, are held in the hands, as seen in the illustration, and at certain intervals they are brought over the head, and clashed violently together. The Palti, as well as the Kuri dance is conducted by a leader, who gives the word of command for the different movements. Some of the dancers increase their odd appearance by making a fillet from the front teeth of the kangaroo, and tying it round their foreheads.

Once in a year, the natives of some districts have a very grand dance, called the "cob-bongo corroboree," or great mystery dance. This dance is performed by the natives of the far interior. An admirable account of this dance was published in the *Illustrated London News* of October 3, 1863, and is here given. "The time selected for this great event is every twelfth moon, and during her declination. For several days previous a number of tribes whose territories adjoin one another congregate at a particular spot, characterized by an immense mound of earth covered with ashes (known amongst the white inhabitants as 'a black's oven') and surrounded by plenty of 'couraway' or water holes. To this place they bring numbers of kangaroos, 'possums, emus, and wild ducks, and a large quantity of wild honey, together with the grass from the seeds of which they make a sort of bread.

"Upon the evening on which the 'corroboree' is celebrated, a number of old men (one from each tribe), called by the natives 'wammaroogo,' signifying medicine men or charm men, repair to the top of the mound, where, after lighting a fire, they walk round it, muttering sentences and throwing into it portions of old charms which they have worn round their necks for the past twelve months. This is continued for about half an hour, when they descend, each carrying a fire-stick, which he places at the outskirts of the camp, and which is supposed to prevent evil spirits approaching. As soon as this is over, during which a most profound silence is observed by all, the men of the tribe prepare their toilet for the 'corroboree,' daubing themselves over with chalk, red ochre, and fat.

"While the men are thus engaged, the gentler sex are busy arranging themselves in a long line, and in a sitting posture, with rugs made of 'possum skins doubled round their legs, and a small stick called 'nullà-nullà' in each hand. A fire is lighted in front of them, and tended by one of the old charmers. As the men are ready, they seat themselves cross-legged like tailors, and in regular 'serried file,' at the opposite side of the fire to the women, while one of the medicine men takes up his position on the top of the mound to watch the rising of the moon, which is the signal for 'corroboree.' All is now still; nothing disturbs the silence save the occasional jabber of a woman or child, and even that, after a few minutes, is hushed. The blaze of the fire throws a fitful light along the battalion-like front of the black phalanx, and the hideous faces, daubed with paint and smeared with grease, show out at such a moment to anything but advantage.

"As soon as the old gentleman who has been 'taking the lunar' announces the advent of that planet, which seems to exercise as great an influence over the actions of these people as over many of those amongst ourselves, the 'corroboree' commences. The women beat the little sticks together, keeping time to a peculiar monotonous air, and repeating the words, the burden of which when translated may be—

"The kangaroo is swift, but swifter is Ngoyullo-man;

The snake is cunning, but more cunning is Ngoyulloman,' &c.,

each woman using the name of her husband or favorite in the tribe. The men spring to their feet with a yell that rings through the forest, and, brandishing their spears, boomerangs, &c., commence their dance, flinging themselves into all sorts of attitudes, howling, laughing, grinning, and singing; and this they continue till sheer exhaustion compels them to desist, after which they roast and eat the product of the chase, gathered

for the occasion, and then drop off to sleep one by one."

The reader will see that this great mystery "corroboree" combines several of the peculiar movements which are to be found in the various dances that have already been described.

A dance of somewhat similar character used to be celebrated by the Tasmanians at the occasion of each full moon, as is described by Mr. G. T. Lloyd. The various tribes assembled at some trysting-place; and while the women prepared the fire, and fenced off a space for the dance, the men retired to adorn themselves with paint, and to fasten bunches of bushy twigs to their ankles, wrists, and waists.

The women being seated at the end of this space, one of the oldest among them strode forward, calling by name one of the performers, reviling him as a coward, and challenging him to appear and answer her charge. The warrior was not long in his response, and, bounding into the circle through the fire, he proclaimed his deeds of daring in war and in the hunt. At every pause he made, his female admirers took up his praises, vaunting his actions in a sort of chant, which they accompanied by extemporized drums formed of rolled kangaroo skins.

Suddenly, upon some inspiring allegretto movement of the thumping band, thirty or forty grim savages would bound successively through the furious flames into the sacred arena, looking like veritable demons on a special visit to *terra firma*, and, after thoroughly exhausting themselves by leaping in imitation of the kangaroo around and through the fire, they vanished in an instant. These were as rapidly succeeded by their lovely gins, who, at a given signal from the belated speaker, rose *en masse*, and ranging themselves round the fresh-plied flames in a state unadorned and genuine as imported into the world, contorted their arms, legs, and bodies into attitudes that would shame first-class acrobats. The grand point, however, with each of the well-greased beauties was to scream down her sable sister.

This dance, as well as other native customs, has departed, together with the aborigines, from the island, and the native Tasmanians are now practically extinct. There is before me a photograph of the three remaining survivors of these tribes, which some sixty years ago numbered between six and seven thousand. That they should have so rapidly perished under the influence of the white man is explained from the fact that their island is but limited in extent, and that they are altogether inferior to the aborigines of the continent. They are small in stature, the men averaging only five feet three inches in height, and they are very ill-favored in countenance, the line from the nose to the corners of the mouth

being very deep and much curved, so as to enclose the mouth in a pair of parentheses. The hair is cut very closely. This is done by means of two sharp-edged fragments of flint, broken glass being preferred since Europeans settled in the country. Cutting the hair is necessarily a tedious ceremony, only ten or twelve hairs being severed at a time, and upwards of three hours being consumed in trimming a head fit for a dance. Shaving is conducted after the same manner.

The general habits of the Tasmanian natives agree with those of the continent. The mode of climbing trees, however, is a curious mixture of the Australian and Polynesian custom. When the native discovers the marks of an opossum on the bark, he plucks a quantity of wire grass, and rapidly lays it up in a three-stranded plait, with which he encircles the tree and his own waist. By means of a single chop of the tomahawk he makes a slight notch in the bark, into which he puts his great toe, raises himself by it, and simultaneously jerks the grass band up the trunk of the tree. Notch after notch is thus made, and the native ascends with incredible rapidity, the notches never being less than three feet six inches apart.

Often, the opossum, alarmed at the sound of the tomahawk, leaves its nest, and runs along some bare bough, projecting horizontally from eighty to a hundred feet above the ground. The native walks along the bough upright and firm as if the tree were his native place, and shakes the animal into the midst of his companions who are assembled under the tree.

The natives never, in their wild state, wear clothes of any kind. They manufacture cloaks of opossum and kangaroo skins, but only in defence against cold. They are wonderful hunters, and have been successfully employed by the colonists in tracing sheep that had strayed, or the footsteps of the thief who had stolen them. The slightest scratch tell its tale to these quick-eyed people, who know at once the very time at which the impression was made, and, having once seen it, start off at a quick pace, and are certain to overtake the fugitive.

The untimely end of the aboriginal Tasmanians is greatly to be attributed to the conduct of a well-known chief, called Mosquito. He was a native of Sydney, and, having been convicted of several murders, was, by a mistaken act of lenity, transported to Tasmania, when he made acquaintance with the Oyster Bay tribe. Being much taller and stronger than the natives, he was unanimously elected chief, and took the command. His reign was most disastrous for the Tasmanians. He ruled them with a rod of iron, punishing the slightest disobedience with a blow of his tomahawk, not caring in the least whether the culprit were killed or not. He organized a series of depredations on the

property of the colonists, and was peculiarly celebrated for his skill in stealing potatoes, teaching his followers to abstract them from the ridges, and to rearrange the ground so as to look as if it had never been disturbed, and to obliterate all traces of their footmarks with boughs.

Under the influence of such a leader, the natives became murderers as well as thieves, so that the lives of the colonists were always in peril. It was therefore necessary to take some decided measures with them; and after sundry unsuccessful expeditions, the natives at last submitted themselves, and the whole of them, numbering then (1837) scarcely more than three hundred, were removed to Flinder's Island, where a number of comfortable stone cottages were built for them, infinitely superior to the rude bough huts or miamians of their own construction. They were liberally supplied with food, clothing, and other necessaries, as well as luxuries,

and the Government even appointed a resident surgeon to attend them when ill. All this care was, however, useless. Contact with civilization produced its usual fruits, and in 1861 the native Tasmanians were only thirteen in number. Ten have since died, and it is not likely that the three who survived in 1867 will perpetuate their race.

That the singularly rapid decadence of the Tasmanians was partly caused by the conduct of the shepherds, and other rough and uneducated men in the service of the colonists, cannot be denied. But the white offenders were comparatively few, and quite unable themselves to effect such a change in so short a time. For the real cause we must look to the strange but unvariable laws of progression. Whenever a higher race occupies the same grounds as a lower, the latter perishes, and, whether in animate or inanimate nature, the new world is always built on the ruins of the old.

CHAPTER LXXIV.

AUSTRALIA — *Continued.*

DOMESTIC LIFE.

MARRIAGE — PURCHASE AND EXCHANGE OF WIVES — A ROUGH WOOING — TREATMENT OF THE WIVES — A BRUTAL HUSBAND — NARROW ESCAPE — A FAITHFUL COMPANION — AUSTRALIAN MOTHERS — TREATMENT OF THE NEW-BORN INFANT — PRACTICE OF INFANTICIDE — THE MOTHER AND HER DEAD CHILD.

WE will now proceed to the domestic life of the native Australian, if, indeed, their mode of existence deserves such a name, and will begin with marriage customs.

Betrothal takes place at a very early age, the girl being often promised in marriage when she is a mere child, her future husband being perhaps an old man with two or three wives and a number of children. Of course the girl is purchased from her father, the price varying according to the means of the husband. Articles of European make are now exceedingly valued; and as a rule, a knife, a glass bottle, or some such article, is considered as a fair price for a wife.

Exchange is often practised, so that a young man who happens to have a sister to spare will look out for some man who has a daughter unbetrothed, and will effect an amicable exchange with him, so that a man who possesses sisters by his father's death is as sure of a corresponding number of wives as if he had the means wherewith to buy them.

Until her intended husband takes her to wife, the betrothed girl lives with her parents, and during this interval she is not watched with the strictness which is generally exercised toward betrothed girls of savages. On the contrary, she is tacitly allowed to have as many lovers as she chooses, provided that a conventional amount of secrecy be observed, and her husband, when he marries her, makes no complaint. After marriage, however, the case is altered, and, if a former lover were to attempt a continuance of the

acquaintance, the husband would avenge himself by visiting both parties with the severest punishment. There is no ceremony about marriage, the girl being simply taken to the hut of her husband, and thenceforth considered as his wife.

In some parts of Australia, when a young man takes a fancy to a girl he obtains her after a rather curious fashion, which seems a very odd mode of showing affection. Watching his opportunity when the girl has strayed apart from her friends, he stuns her with a blow on the head from his waddy, carries her off, and so makes her his wife. The father of the girl is naturally offended at the loss of his daughter, and complains to the elders. The result is almost invariably that the gallant offender is sentenced to stand the ordeal of spear and boomerang. Furnished with only his narrow shield, he stands still, while the aggrieved father and other relatives hurl a certain number of spears and boomerangs at him. It is very seldom that he allows himself to be touched, but, when the stipulated number of throws has been made, he is considered as having expiated his offence, whether he be hit or not.

Polygamy is of course practised, but to no very great extent. Still, although a man may never have more than two or three wives at a time, he has often married a considerable number, either discarding them, when they are too old to please his taste, or perhaps killing them in a fit of anger. The last is no uncommon mode of

getting rid of a wife, and no one seems to think that her husband has acted cruelly. Indeed, the genuine native would not be able to comprehend the possibility of being cruel to his wife, inasmuch as he recognizes in her no right to kind treatment. She is as much his chattel as his spear or hut, and he would no more think himself cruel in beating his wife to death than in breaking the one or burning the other.

Since white men came to settle in the country the natives have learned to consider them as beings of another sphere, very powerful, but unfortunately possessed with some unaccountable prejudices. Finding, therefore, that breaking a wife's limb with a club, piercing her with a spear, or any other mode of expressing dissatisfaction, shocked the prejudices of the white men, they ceased to mention such practices, though they did not discontinue them.

Quite recently, a native servant was late in keeping his appointment with his master, and, on inquiry, it was elicited that he had just quarrelled with one of his wives, and had speared her through the body. On being rebuked by his master he turned off the matter with a laugh, merely remarking that white men had only one wife, whereas he had two, and did not mind losing one until he could buy another.

Considering and treating the women as mere articles of property, the men naturally repose no confidence in them, and never condescend to make them acquainted with their plans. If they intend to make an attack upon another tribe, or to organize an expedition for robbery, they carefully conceal it from the weaker sex, thinking that such inferior animals cannot keep secrets, and might betray them to the objects of the intended attack.

The utter contempt which is felt by the native Australians for their women is well illustrated by an adventure which occurred after a dance which had been got up for the benefit of the white men, on the understanding that a certain amount of biscuit should be given to the dancers. When the performance was over, the biscuit was injudiciously handed to a woman for distribution. A misunderstanding at once took place. The men, although they would not hesitate to take away the biscuit by force, would not condescend to ask a woman for it, and therefore considered that the promised payment had not been made to them. Some of them, after muttering their discontent, slipped away for their spears and throwing-sticks, and the whole place was in a turmoil.

Fortunately, in order to amuse the natives, the white visitors, who had never thought of the offence that they had given, sent up a few rockets, which frightened the people for a time, and then burned a blue light. As the brilliant rays pierced the

dark recesses of the forest, they disclosed numbers of armed men among the trees, some alone and others in groups, but all evidently watching the movements of the visitors whose conduct had so deeply insulted them. A friendly native saw their danger at once, and hurried them off to their boats, saying that spears would soon be thrown.

There was much excuse to be found for them. They had been subjected to one of the grossest insults that warriors could receive. To them, women were little better than dogs, and, if there were any food, the warriors first satisfied their own hunger, and then threw to the women any fragments that might be left. Therefore, that a woman — a mere household chattel — should be deputed to distribute food to warriors was a gross, intolerable, and, as they naturally thought, intentional insult. It was equivalent to degrading them from their rank as men and warriors, and making them even of less account than women. No wonder, then, that their anger was roused, and the only matter of surprise is that an attack was not immediately made. Australian warriors have their own ideas of chivalry, and, like the knights of old, feel themselves bound to resent the smallest aspersion cast upon their honor.

Mr. McGillivray, who narrates this anecdote makes a few remarks which are most valuable, as showing the errors which are too often committed when dealing with savages, not only those of Australia, but of other countries.

"I have alluded to this occurrence, trivial as it may appear, not without an object. It serves as an illustration of the policy of respecting the known customs of the Australian race, even in apparently trifling matters, at least during the early period of intercourse with a tribe, and shows how a little want of judgment in the director of our party caused the most friendly intentions to be misunderstood, and might have led to fatal results.

"I must confess that I should have considered any injury sustained on our side to have been most richly merited. Moreover, I am convinced that some at least of the collisions which have taken place in Australia between the first European visitors and the natives of any given district have originated in causes of offence brought on by the indiscretion of one or more of the party, and revenged on others who were innocent."

Mr. McGillivray then proceeds to mention the well-known case of the night attack on Mr. Leichhardt's expedition. For no apparent reason, a violent assault was made on the camp, and Mr. Gilbert was killed. The reason of this attack did not transpire until long afterward, when a native attached to the expedition divulged, in a

state of intoxication, the fact that he and a fellow-countryman had grossly insulted a native woman.

Yet, in spite of this brutal treatment, the women often show a depth of affectionate feeling which raises them far above the brutal savages that enslave them. One remarkable instance of this feeling is mentioned by Mr. Bennett. She had formed an attachment to an escaped convict, who became a bushranger, and enabled him, by her industry and courage, to prolong the always precarious life of a bushranger beyond the ordinary limits.

The chief dangers that beset these ruffians are the necessity for procuring food, and the watch which is always kept by the police. Her native skill enabled her to supply him with food, and, while he was lying concealed, she used to fish, hunt, dig roots, and then to cook them for him. Her native quickness of eye and ear enabled her to detect the approach of the police, and, by the instinctive cunning with which these blacks are gifted, she repeatedly threw the pursuers off the scent. He was utterly unworthy of the affection which she bestowed on him, and used to beat her unmercifully, but, undeterred by his cruelty, she never flagged in her exertions for his welfare; and on one occasion, while he was actually engaged in ill-treating her, the police came upon his place of refuge, and must have captured him, had she not again misled them, and sent them to a spot far from the place where he was hidden. At last, he ventured out too boldly, during her accidental absence, was captured, tried and hanged. But up to the last this faithful creature never deserted him, and, even when he was imprisoned, she tried to follow him, but was reclaimed by her tribe.

When a native woman is about to become a mother she retires into the bush, sometimes alone, but generally accompanied by a female friend, and, owing to the strong constitution of these women, seldom remains in her retirement more than a day or so. Among the natives of Victoria, the ceremony attending the birth of a child is rather curious, and is amusingly described by Mr. Lloyd: "While upon the subject of the Australian aborigines, I must not omit to describe the very original *modus operandi* of the indigenous *sage femme*.

"The unhappy loobra (native woman) retired with her wise woman into some lone secluded dell, abounding with light sea-sand. A fire was kindled, and the wretched mianmiam speedily constructed. Then came the slender repast, comprising a spare morsel of kangaroo or other meat, supplied with a sparing hand by her stoical coolie (male native), grilled, and graced with the tendrils of green opiate cow-histles, or the succulent roots of the bulbous leaf 'mernong.'

"The sable attendant soon entered upon

her interesting duties. One of the first was, to light a second fire over a quantity of prepared sand, that had been carefully divested of all fibrous roots, pebbles, or coarser matter. The burning coals and faggots were removed from thence, upon some nice calculation as to the period of the unfortunate little nigger's arrival. When the miniature representative of his sable father beheld the light of day, a hole was scratched in the heated sand, and the wee russet-brown thing safely deposited therein, in a state of perfect nudity, and buried to the very chin, so effectually covered up as to render any objectionable movement on his or her part utterly impossible.

"So far as any infantine ebullitions of feeling are concerned, the learned *sages femmes* appeared to have a thorough knowledge as to the world-wide method of treating the mewling and puking importunities of unreasoning nurslings. They knew well that a two-hours' sojourn in the desert sand, warm as it might be, would do much to cool the new comer, and temper it into compliance. At the expiration of that time, having acquired so much knowledge of earthly troubles, the well-baked juvenile was considered to be thoroughly done, and thereupon introduced to his delighted loobra mamma."

Following the custom of many savage nations, the Australians too often destroy their children in their first infancy. Among the Muralug tribes the practice is very common. It has already been mentioned that the girls live very unrestrainedly before marriage, and the result is, that a young woman will sometimes have several children before her marriage. As a general rule, these children are at once killed, unless the father be desirous of preserving them. This, however, is seldom the case, and he usually gives the order "Máraná teio," *i. e.* Throw it into the hole, when the poor little thing is at once buried alive. Even those children which are born after marriage are not always preserved. In the first place, a woman will scarcely ever take charge of more than three children, and many a female child is destroyed where a male would be allowed to live.

All children who have any bodily defect are sure to be killed, and, as a general rule, half-caste children are seldom allowed to live. The mothers are usually ashamed to acknowledge these murders, but in one case the unnatural parent openly avowed the deed, saying that the infant was like a waragul, *i. e.* the native dog or dingo. The fact was that its father was a sailor who had fiery red hair, and his offspring partook of the same rufous complexion. Of course there are exceptions to the rule, one of which may be found in the case of the poor woman who was so faithful to her convict mate. She had a male child, which was brought up by

the tribe to which she belonged, and they were so fond of him that they refused to give him up when some benevolent persons tried to obtain possession of him in order to educate him in civilization.

If, however, the child is allowed to live, the Australian mother is a very affectionate one, tending her offspring with the greatest care, and in her own wild way being as loving a parent as can be found in any part of the world. The engraving No. 2, on the next page, illustrates this devotion of Australian mothers to their children.

In nothing is this affection better shown than in the case of a child's death. Although she might have consigned it when an infant to a living grave without a pang of remorse, yet, when it dies after having been nurtured by her, she exhibits a steady sorrow that exhibits the depth of affection with which she regarded the child. When it dies, she swathes the body in many wrappers, places it in her net-bul, or native wallet,

and carries it about with her as if it were alive. She never parts with it for a moment. When she eats she offers food to the dead corpse, as if it were still alive, and when she lies down to sleep, she lays her head upon the wallet, which serves her as a pillow. The progress of decay has no effect upon her, and though the body becomes so offensive that no one can come near her, she seems unconscious of it, and never dreams of abandoning the dreadful burden. In process of time nothing is left but the mere bones, but even these are tended in the same loving manner, and even after the lapse of years the mother has been known to bear, in addition to her other burdens, the remains of her dead child. Even when the child has been from six to seven years old she will treat it in the same manner, and, with this burden on her back, will continue to discharge her heavy domestic duties.

(1.) AN AUSTRALIAN FEAST. (See page 763.)

(2.) AUSTRALIAN MOTHERS.

(See page 758.)

CHAPTER · LXXV.

AUSTRALIA — *Continued.*

FROM CHILDHOOD TO MANHOOD.

AUSTRALIAN CHILDREN — CEREMONIES ATTENDANT ON BECOMING MEN — ADMISSION TO THE RANK OF HUNTER — CEREMONY OF THE KANGAROO — THE KORADJEEES AND THEIR DUTIES — KNOCKING OUT THE TOOTH — TRIAL BY ENDURANCE — TEST OF DETERMINATION — THE MAGIC CRYSTAL — THE FINAL FEAST — INITIATION AMONG THE MOORUNDI AND PARNKALLA TRIBE — THE WITARNA, AND ITS DREADED SOUND — THE WHISPERERS — TAKING THE SECOND DEGREE — THE APRON AND HEAD-NET — THE THIRD AND LAST CEREMONY — ENDURANCE OF PAIN — A NAUO MAN — STORY OF GI'OM — MAKING KOTAIGA OR BROTHERHOOD.

AUSTRALIAN children, while they remain children, and as such are under the dominion of their mothers, are rather engaging little creatures. They cannot be called pretty, partly owing to the total neglect, or rather ignorance, of personal cleanliness, and partly on account of the diet with which they are fed. Their eyes are soft, and possess the half-wistful, half-wild expression that so peculiarly distinguishes the young savage. But they are never washed except by accident, their profuse black hair wanders in unkempt masses over their heads, and their stomachs protrude exactly like those of the young African savage.

In process of time they lose all these characteristics. The wistful expression dies out of their eyes, while the restless, suspicious glance of the savage takes its place. They become quarrelsome, headstrong, and insubordinate, and, after exhibiting these qualifications for a higher rank in life, they become candidates for admission into the rights and privileges of manhood. Among civilized nations, attaining legal majority is a simple process enough, merely consisting of waiting until the candidate is old enough; but with many savage nations, and specially with the Australians, the process of becoming men is a long, intricate, and singularly painful series of ceremonies.

These rites vary according to the locality in which they are celebrated, but they all

agree in one point, namely, — in causing very severe pain to the initiates, and testing to the utmost their endurance of pain. As many of these rites are almost identical in different tribes, I shall not repeat any of them, but only mention those points in which the ceremonies differ from each other.

One of these customs, which seems to belong to almost every variety of savage life, namely, the loss of certain teeth, flourishes among the Australians. The mode of extracting the teeth is simple enough. The men who conduct the ceremony pretend to be very ill, swoon, and writhe on the ground, and are treated after the usual method of healing the sick, *i. e.* their friends make a great howling and shouting, dance round them, and hit them on the back, until each sick man produces a piece of sharp bone.

This ceremony being intended to give the initiates power over the various animals, a series of appropriate ceremonies are performed. On the morning after the sharp bones have been mysteriously produced, the Koradjees, or operators, dress themselves up with bits of fur and other decorations, which are conventionally accepted as representing the dingo, or native dog. The wooden sword, which is thrust into a belt, sticks up over the back, and takes the place of the tail. The boys are then made to sit on the ground, while the koradjees run

round and round them on all fours, thus representing dogs, and giving the lads to understand that the succeeding ceremony will give them power over dogs. In token of this power, each time that they pass the boys they throw sand and dust over them.

Here it must be remarked that the Australian natives are great dog-fanciers, the dog being to them what the pig is to the Sandwich Islanders. There is scarcely a lad who does not possess at least one dog, and many have several, of which they take charge from earliest puppyhood, and which accompany their masters wherever they go. Besides their value as companions, these dogs are useful for another reason. They are a safeguard against famine; for when a man is in danger of starving, he is sure to rescue himself by killing and cooking his faithful dog. The animal has never cost him any trouble. It forages for itself as it best can, and always adheres to its owner, and is always at hand when wanted. The object, therefore, of the first part of the ceremony is to intimate to the lads that they are not only to have dominion over the dogs, but that they ought to possess its excellent qualities.

The next part of the ceremony is intended to give them power over the kangaroos.

Accordingly, a stout native now appears on the scene, bearing on his shoulders the rude effigy of a kangaroo, made of grass; and after him walks another man with a load of brushwood. The men move with measured steps, in time to the strokes of clubs upon shields, wherewith the spectators accompany the songs which they sing. At the end of the dance, the men lay their burdens at the feet of the youths, the grass effigy signifying the kangaroo, and the brushwood being accepted as a sign of its haunts.

The koradjees now take upon themselves the character of the kangaroo, as they formerly personated the dog. They make long ropes of grass in imitation of the kangaroo's tail, and fasten them at the back of their girdles. They then imitate the various movements of the kangaroo, such as leaping, feeding, rising on their feet and looking about them, or lying down on their sides and scratching themselves, as kangaroos do when basking in the sun. As they go through these performances, several men enact the part of hunters, and follow them with their spears, pretending to steal upon them unobserved, and so to kill them.

After a few more ceremonies, the men lie on the ground, and the boys are led over their prostrate bodies, the men groaning and writhing, and pretending to suffer horrible agony from the contact with uninitiates. At last the boys are drawn up in a row, and opposite to them stands the principal koradjee, holding his shield and waddy, with which he keeps up a series of regular

strokes, the whole party poisoning their spears at him, and at every third stroke touching his shield.

The operators now proceed to the actual removal of the tooth. The initiates are placed on the shoulders of men seated on the ground, and the operator then lances the gums freely with the sharp bone. One end of a wummerah, or throw-stick, is next placed on the tooth, and a sharp blow is struck with the stone, knocking out the tooth, and often a piece of gum also if the lancing has not been properly done.

Among another tribe, the initiate is seated opposite a tree. A stick is then placed against the trunk of the tree, with its other end resting on the tooth. The operator suddenly pushes the lad's head forward, when, as a matter of course, the tooth comes out. The blood is allowed to flow over the spot, and, as it is a sign of manhood, is never washed off.

The tooth being finally extracted, the boy is led to a distance, and his friends press the wounded gum together, and dress him in the emblems of his rank as a man. The opossum fur belt, or kumeel, is fastened round his waist, and in it is thrust the wooden sword, which he, as a warrior, is now expected to use. A bandage is tied round his forehead, in which are stuck a number of grass-tree leaves; his left hand is placed over his mouth, and for the rest of the day he is not allowed to eat.

In some parts of the country there is a curious addition to the mere loss of the tooth. The warriors stand over the lad, exhorting him to patience, and threatening him with instant death if he should flinch, cry out, or show any signs of pain. The operators then deliberately cut long gashes all down his back, and others upon his shoulders. Should he groan, or display any symptoms of suffering, the operators give three long and piercing yells, as a sign that the youth is unworthy to be a warrior. The women are summoned, and the recreant is handed over to them, ever after to be ranked with the women, and share in their menial and despised tasks.

Even after passing the bodily ordeal, he has to undergo a mental trial. There is a certain mysterious piece of crystal to which various magic powers are attributed, and which is only allowed to be seen by men, who wear it in their hair, tied up in a little packet. This crystal, and the use to which it is put, will be described when we come to treat of medicine among the Australians.

The youth having been formally admitted as a huntsman, another ring is formed round him, in order to see whether his firmness of mind corresponds with his endurance of body. Into the hands of the maimed and bleeding candidate the mysterious crystal is placed. As soon as he has taken it, the old men endeavor by all their arts to persuade

him to give it up again. Should he be weak-minded enough to yield, he is rejected as a warrior; and not until he has successfully resisted all their threats and cajoleries is he finally admitted into the rank of men.

The ceremony being over, a piercing yell is set up as a signal for the women to return to the camp, and the newly-admitted man follows them, accompanied by their friends, all chanting a song of joy, called the *korindubraia*. They then separate to their respective fires, where they hold great feastings and rejoicings (see engraving No. 1, page 759); and the ceremonies are concluded with the dances in which the Australians so much delight.

As may be gathered from the account of these ceremonies, the lad who is admitted into the society of hunters thinks very much of himself, and addresses himself to the largest game of Australia; namely, the emu and the dingo. When he has succeeded in killing either of these creatures, he makes a trophy, which he carries about for some time, as a proof that he is doing credit to his profession. This trophy consists of a stick, a yard or so in length, to one end of which is tied the tail of the first dingo he kills, or a huge tuft of feathers from the first emu. These trophies he displays everywhere, and is as proud of them as an English lad of his first brush, or of his first pheasant's tail.

Among the Moorundi natives, who live on the great Murray River, another ceremony is practised. When the lads are about sixteen years old, and begin to grow the beard and moustache which become so luxuriant in their after-life, preparations are quietly made by sending for some men from a friendly tribe, who are called, from their office, the *wearoos*, or pluckers. When they have arrived, the lads who have been selected are suddenly pounced upon by some one of their own tribe, and conducted to the place of initiation, which is marked by two spears set in the ground, inclining to each other, and being decorated with bunches of emu feathers. They are then smeared over with red ochre and grease, and the women flock round them, crying bitterly, and cutting their own legs with mussel-shells, until they inflict horrible gashes, and cause the blood to flow abundantly. In fact, a stranger would think that the women, and not the lads, were the initiates.

The boys lie down, with their heads to the spears, surrounded by their anxious friends, who watch them attentively to see if they display any indications of flinching from pain. The wearoos now advance, and pluck off every hair from their bodies, thus causing a long and irritating torture. When they have endured this process, green branches are produced, and fastened to the bodies of the lads, one being worn as an apron, and the others under the arms. Two kangaroo teeth are then fastened in the

hair, and the young men, as they are now termed, are entitled to wear a bunch of emu feathers in their hair.

With another tribe there is a curious variation. The initiate is brought to the selected spot by an old man, and laid on his back in the midst of five fires, each fire consisting of three pieces of wood laid across each other so as to form a triangle. An opossum-skin bag is laid on his face, and the various operations are then performed.

Among the Parakallas, and other western tribes, there are no less than three distinct ceremonies before the boys are acknowledged as men.

The first ceremony is a very simple one. When the boys are twelve or fifteen years old, they are carried away from the women, and are blindfolded. The operators then begin to shout the words "Herri, herri" with the full force of their lungs, swinging at the same time the mysterious instrument called the *witarna*.

This mysterious implement is a small shuttle-shaped piece of wood, covered with carved ornaments, and being suspended, by a hole cut at one end, from a string made of plaited human hair. When swung rapidly in the air, it makes a loud humming or booming sound. The *witarna* is kept by the old men of the tribe, and is invested with sundry and somewhat contradictory attributes. Its sound is supposed to drive away evil spirits, and at the same time to be very injurious to women and children, no uninitiated being allowed to hear it. Consequently the women are horribly afraid of it, and take care to remove themselves and their children so far from the place of initiation that there is no chance of being reached by the dreaded sound.

When the *witarna* has been duly swung, and the blindfolded boys have for the first time heard its booming sound, the operators advance, and blacken the faces of the boys, ordering them at the same time to cease from using their natural voices, and not to speak above a whisper until they are released from their bondage. They remain whisperers for several months, and, when they resume their voices, assume the title of *warrara*.

They remain in the condition of *warrara* for at least two, and sometimes three years, when they undergo a ceremony resembling the circumcision of the Jews. Their hair is tied in a bunch on the top of the head, is not allowed to be cut, and is secured by a net.

The net used for this purpose is made out of the tendons drawn from the tails of kangaroos. When they kill one of these animals, the natives always reserve the tendons, dry them carefully in the sun, and keep them in reserve for the many uses to which they are put. The sinews taken from the leg of the emu are dried and prepared in the same manner. In order to convert the sinew

into thread, two of the fibres are taken and rolled upon the thigh, just as is done with the fibre of the butrush root. A thread of many yards long is thus spun, and is formed into a net with meshes made exactly after the European fashion. Sometimes it is left plain, but usually it is colored with red ochre, or white with pipe-clay, according to the taste of the wearer. These tendons, by the way, are valued by the white colonists, who use them chiefly for whip-lashes, and say that the tendon is more durable than any other material.

The initiates of the second degree are also distinguished by wearing a bell-shaped apron, made of opossum fur spun together, and called "mabbirringe." This is worn until the third and last ceremony. The young men are now distinguished by the name of Partnapas, and are permitted to marry, though they are not as yet considered as belonging to the caste, if we may so call it, of warriors.

Even now, the young men have not suffered sufficient pain to take their full rank, and in course of time a ceremony takes place in which they become, so to speak, different beings, and change, not only their appearance, but their names. Up to this time, they have borne the names given to them by their mothers in childhood, names which are always of a trivial character, and which are mostly numerical. For example, if the first child be a boy, it is called Peri (*i. e.* Primus); if a girl, Kartanya (*i. e.* Prima). The second boy is Wari (or Secundus), the second girl Waruyau, and so on. Sometimes the name is taken from the place where the child was born, or from some accidental circumstance, such as the appearance of a bird or insect, or the falling of a shower of rain. But, when the youth becomes a man, he puts away this childish name, and chooses another for himself, which marks him out as a man and a warrior. The process of converting a lad into a man is admirably told by Mr. G. F. Angas:—

"In the third and last ceremony the young men are styled *Wilyalkanye*, when the most important rites take place. Each individual has a sponsor chosen for him, who is laid on his back upon another man's lap, and surrounded by the operators, who enjoin him to discharge his duties aright. The young men are then led away from the camp, and blindfolded; the women lamenting and crying, and pretending to object to their removal.

"They are taken to a retired spot, laid upon their stomachs, and entirely covered over with kangaroo skins; the men uttering the most dismal wail imaginable, at intervals of from three to five minutes. After lying thus for some time, the lads are raised, and, whilst still blindfolded, two men throw green boughs at them, while the others stand

in a semicircle around, making a noise with their *wirris* and voices combined, which is so horrible that the wild dogs swell the hideous chorus with their howlings. Suddenly one of the party drops a bough, others follow; and a platform of boughs is made, on which the lads are laid out. The sponsors then turn to and sharpen their pieces of quartz, choosing a new name for each lad, which is retained by him during life. These names all end either in *alta*, *ilti*, or *ulta*. Previous to this day they have borne the names of their birth-places, &c.; which is always the case amongst the women, who never change them afterward. The sponsors now open the veins of their own arms, and, raising the lads, open their mouths, and make them swallow the first quantity of blood.

"The lads are then placed on their hands and knees, and the blood caused to run over their backs, so as to form one coagulated mass; and when this is sufficiently cohesive, one man marks the places for the tattooing by removing the blood with his thumb nail. The sponsor now commences with his quartz, forming a deep incision in the nape of the neck, and then cutting broad gashes from the shoulder to the hip down each side, about an inch apart. These gashes are pulled open by the fingers as far as possible; the men all the while repeating very rapidly, in a low voice, the following incantation:—

"Kanya, marra, marra,
Kano, marra, marra,
Pilibiri, marra, marra."

When the cutting is over, two men take the *witarnas*, and swing them rapidly round their heads, advancing all the time toward the young men. The whole body of operators now draw round them, singing and beating their *wirris*, and, as they reach the lads, each man puts the string of the *witarna* over the neck of every lad in succession. A bunch of green leaves is tied round the waist, above which is a girdle of human hair; a tight string is fastened round each arm just above the elbow, with another about the neck, which descends down the back, and is fixed to the girdle of hair; and their faces and the upper part of their bodies, as far as the waist, are blackened with charcoal.

"The ceremony concludes by the men all clustering round the initiated ones, enjoining them again to whisper for some months, and bestowing upon them their advice as regards hunting, fighting and contempt of pain. All these ceremonies are carefully kept from the sight of the women and children; who, when they hear the sound of the *witarna*, hide their heads, and exhibit every outward sign of terror."

The illustration No. 1, on page 765, is given in order to show the curious appearance

(1.) MINTALTA, A NATIVE MAN.
(See page 704.)

(2.) YOUNG MAN AND BOY. (South Australia.) (See page 721.)

(4.) TOMB OF SKULLS. (Tape York.) (See page 728.)

(3.) SMALL STONE HUT FOR CURE OF DISEASE. (See p. 721.)

which is sometimes presented by the men when they have successfully passed through their various ordeals. The name of the man was Mintalta, and he belonged to the Nano tribe, which lives near Coffin's Bay. In his hand he holds the waddy, and, by way of apron, he wears a bunch of emu feathers. Across his breast are seen the bold ridges which mark his rank as a man, and others are seen upon his arms. His beard is gathered into a long pointed tuft, and decorated with a little bunch of white cockatoo feathers at the tip. In his hair he wears two curious ornaments. These are not feather plumes, as they seem to be in the illustration, but are simply slender sticks of white wood, scraped so as to let the shavings adhere by one end. Indeed, they are made exactly like those little wooden brooms that are sometimes hawked by German girls about the streets, or, to use a more familiar simile, like the curly-branched trees in children's toy-boxes.

Many of the particulars which have been and will be related of the domestic life of the Australians were obtained in a very curious manner. In the autumn of 1849 some persons belonging to H.M.S. *Rattlesnake* were out shooting, when they came across a native woman, or gin, dressed rather better than the generality of native women, as she wore a narrow apron of leaves. To their astonishment, the supposed gin addressed them in English, saying that she was a white woman, and desired their help. They immediately furnished her with some clothing, and brought her on board the *Rattlesnake*, where she contrived to make known her sad story. Her name was Thomson, and she was the widow of the owner of a small vessel. Cruising one day in search of a wreck, the pilot missed his way, a gale of wind came on, and the vessel was dashed on a reef on the Eastern Prince of Wales Island. The men tried to swim on shore through the surf, but were drowned, while the woman was saved by a party of natives, who came on board the wreck after the gale had subsided, and took her ashore.

The tribe into whose hands she had fallen was the Kowrárega, which inhabits Muralug, on the Western Prince of Wales Island. When she got ashore, one of the principal men, who fully held the popular idea that the white men are the ghosts of dead natives, recognized in Mrs. Thomson a daughter named Gi'òm, who had long ago died. He accordingly took her home as his daughter, she was acknowledged by the tribe as one of themselves, and was forced to become the wife of one of the natives, called Boroto.

For nearly five years she was kept prisoner by the blacks, and, although she could see many English ships pass within a few miles, she was so closely watched that escape was hopeless. At last, when the smoke sig-

nals told the tribe that another vessel was approaching, Gi'òm cleverly worked on the cupidity of the aborigines, and persuaded them to take her to the mainland, promising them to procure plenty of axes, knives, tobacco, and other things which an Australian savage values above all things, and saying that she had lived so long with the natives that she could not think of leaving them. When she was safely lodged on board, many of her friends came to see her, bringing presents of fish and turtle, but always expecting an equivalent. Boroto was one of the visitors, and in vain tried to persuade her to return. When she definitely refused, he became very angry, and left the ship in a passion, declaring that, if he or any of his friends could catch her ashore, they would take off her head and carry it to Muralug. Not feeling the least doubt that the threat would be fulfilled, she never ventured on shore near those parts of the coast which the Kowráregas seemed likely to visit.

Being a woman of no education, she had in the course of her sojourn among the natives almost forgotten how to express herself in her native tongue, and for some time mixed Kowrárega words and phrases with English in a very curious manner. A vast amount of valuable information was obtained from her, but, when she was restored to civilization, she forgot the language and customs of savage life with singular rapidity, her untrained mind being unable to comprehend the mutual relationship of ideas, and utterly incapable of generalization.

From her was learned the curious but dreadful fact that many of the really unprovoked assaults on ships' crews while unsuspectingly visiting the shore were instigated by white men, who had degraded themselves into companionship with native tribes, and, by reason of their superior knowledge, had gained a supremacy over them. One of these men had lived with the Badu tribe many years, and, having heard of a white woman among the Kowráregas, visited Muralug, and tried to induce Gi'òm to leave Boroto and share his fortunes. Who he was is not known. He goes by the name of Wini, and is supposed to be an escaped convict, who repels the visits of English ships, lest he should be captured and sent back to prison. By means of his instigations, the Badu people became so violently opposed to all white men that any European who visited that part of the country would do so at the imminent hazard of his life.

Among many of these tribes, there is a custom which is common also to many savages in all parts of the world. This is the custom of making "kofaiga," or brotherhood, with strangers. When Europeans visit their districts, and behave as they ought to do, the natives generally unite themselves in bonds of fellowship with the strangers, each selecting one of them as

his kotaiga. The new relations are then considered as having mutual responsibilities, each being bound to forward the welfare of the other.

The memory of the natives is wonderful, and, even if a ship does not repeat a visit until after a lapse of several years, no sooner does she arrive than the natives swarm on board, and at once pick out their kotaigas. They bring presents to their guests while on board; they accompany them joyfully to the shore; they carry their bags and haversacks for them; they take them on hunting,

shooting, and fishing excursions, point out the game, retrieve it, no matter where it may have fallen, and carry it home on their shoulders rejoicing. Of course they expect biscuit and tobacco in return for their kind offices, but the wages are very cheap, and their services are simply invaluable. The rescue of Mr. McGillivray and his party from the threatened attack of the natives was owing to the fact that one of them, the friendly native who gave him warning, and saw him and his party safely off in their boats, was his kotaiga, and bound in honor to save him.

A REPRESENTATION OF UNCIVILIZED ISLANDERS AND INDIANS.

THE
UNCIVILIZED
RACES OF MEN

ALL COUNTRIES OF THE WORLD;

BEING

A COMPREHENSIVE ACCOUNT OF THEIR MANNERS AND CUSTOMS,
AND OF THEIR PHYSICAL, SOCIAL, MENTAL, MORAL AND
RELIGIOUS CHARACTERISTICS.

BY

REV. J. G. WOOD, M.A., F.L.S.

AUTHOR OF "ILLUSTRATED NATURAL HISTORY OF ANIMALS," "ANECDOTES OF ANIMAL LIFE," "HOMES
WITHOUT HANDS," "BIBLE ANIMALS," "COMMON OBJECTS OF THE COUNTRY AND SEASHORE," ETC.

WITH NEW DESIGNS

BY ANGAS, DANBY, WOLF, ZWECKER, ETC., ETC.

IN TWO VOLUMES.

VOL. II.

HARTFORD:

J. B. BURR AND HYDE, PUBLISHERS.

1872.

B. 114960

Entered, according to Act of Congress, in the year 1870, by
J. B. BURR & COMPANY,
In the Clerk's Office of the United States, for the District of Connecticut.

P R E F A C E .

In this volume will be found a selection of the most interesting uncivilized tribes that inhabit, or once inhabited, America and the vast number of islands which lie between that country and the eastern coast of Asia, including among them the great groups of Australia and New Zealand. A short notice is given of the long-perished Lake-dwellers of Switzerland, and the partial civilization of India, China, Japan and Siam is also represented.

My best thanks are due to the Geographical and Anthropological Societies, for the constant access permitted to their libraries, and to the Curator of the "Christy Collection," for the assistance which he rendered in the illustration of the work.

CHAPTER LXIX.

AUSTRALIA.

THE NATIVE AUSTRALIANS—THE GENERAL CONFORMATION OF THE HEAD AND FEATURES—THEIR AVERAGE STATURE AND FORM—THE WOMEN AND THEIR APPEARANCE—CHARACTER OF THE NATIVES—THEIR THIEVISH PROPENSITIES—THEIR CUNNING, AND POWER OF DISSIMULATION—A PAIR OF CLEVER THIEVES—THE “GOOD NATIVE”—A CLEVER OLD WOMAN—INCENTIVES TO ROBBERY—HIDEOUS ASPECT OF THE OLD WOMEN—A REPULSIVE SUBJECT FOR AN ARTIST—YOUNGER WOMEN OF SAME TRIBE—THEIR STRANGE DRESS—THE CIRCULAR MAT CLOAK AND ITS USES—THE NATIVE BASKET—TREACHEROUS CHARACTER OF THE NATIVES—MR. BAINES’S NARRATIVE—THE OUTRIGGER CANOE OF NORTH AUSTRALIA, AND ITS PROBABLE ORIGIN—PIPE, AND MODE OF SMOKING—THE MAMMALS OF AUSTRALIA, AND THEIR MARSUPIAL CHARACTER—CONFUSION OF NOMENCLATURE—EFFECT OF THE ANIMALS ON THE HUMAN INHABITANTS OF THE COUNTRY—PRIMARY USE OF WEAPONS.

FOLLOWING up the principle of taking the least civilized races in succession, we naturally pass to the great continent of Australia and its adjacent islands.

This wonderful country holds a sort of isolated position on the earth, owing to the curious contrast which reigns between it and all the lands with which we are familiar. It is situated, as my readers will see by reference to a map, just below the equator, and extends some forty degrees southward, thus having at its northern extremity a heat which is tropical, and at its southern point a climate as cold as our own. But there is perhaps no country where the temperature is so variable as Australia, and there is one instance recorded where the thermometer registered a change of fifty degrees in twenty-five minutes. This sudden change is owing to the winds, which if they blow from the sea are cool, but if they blow toward the coast, after passing over the heated sand-wastes of the interior, raise the temperature in the extraordinary manner which has been mentioned. Still, the climate, changeable though it be, is a pleasant one; and the colonists who visit England nearly always grumble at the damp climate of the mother country, and long to be back again in Australia. Both the animal and vegetable products of this country are strangely unlike those of other lands, but, as we shall have occasion to describe them in the course of the following pages, they will not be mentioned at present; and we will proceed

at once to the human inhabitants of Australia.

It is exceedingly difficult, not to say impossible, to treat of the aborigines of Australia with much accuracy of system. Differing as do the tribes with which we are acquainted in many minor particulars, they all agree in general characteristics; and, whether a native be taken from the north or south of the vast Australian continent, there is a similitude of habits and a cast of features which point him out at once as an Australian.

The plan that will be adopted will therefore be to give a general sketch of the natives, together with an account of those habits in which they agree, and then to glance over as much of Australia as travellers have laid open to us, and to mention briefly the most interesting of the manners and customs which exist in the several tribes.

IN color the Australians are quite black, as dark indeed as the negro, but with nothing of the negro character in the face. The forehead does not recede like that of the negro; and though the nose is wide, the mouth large, and the lips thick, there is none of that projection of jaw which renders the pure negro face so repulsive. The eye is small, dark, and, being deeply sunken, it gives to the brows a heavy, overhanging sort of look. The hair is by no means close and woolly, like that of the negro, but is plentiful, rather long, and disposed to curl, mostly

undulating, and sometimes even taking the form of ringlets. In texture it is very coarse and harsh, but cannot be described as wool.

The beard and moustache are very thick and full, and the men take a pride in these ornaments, sometimes twisting the beard into curious shapes. Indeed, as a rule they are a hairy race. There is now before me a large collection of photographs of native Australians, in many of which the men are remarkable for the thickness of the beard, and some of them have their faces so heavily bearded that scarcely the nose is perceptible among the mass of hair that covers the cheeks nearly up to the eyes. Several of the elder men are very remarkable for the development of the hair, which covers the whole of the breast and arms with a thick coating of pile, and looks as if they were clothed with a tightly-fitting fur garment. The illustration No. 1, on the 698th page, will give a good idea of the features of the Australian. It is exactly copied from photographic portraits; and although the subjects have disfigured themselves by putting on European dress, and the woman has actually combed her hair, the general cast of the features is well preserved.

In stature the Australian is about equal to that of the average Englishman—say five feet eight inches, although individuals much below and above this height may be seen. The bodily form of the Australian savages is good, and their limbs well made. There are several well-known drawings of Australians, which have been widely circulated on account of their grotesqueness, and which have been accepted as the ordinary form of this curious people, and they have given the idea that the native Australian is distinguished by a very large head, a very small body, and very long and attenuated limbs; in fact, that he is to the European what the spider-monkey is to the baboon.

Such drawings are, however, only taken from exceptional cases, and give no idea of the real contour of the native Australian. Indeed, Mr. Pickering, who traversed the greater part of the world in search of anthropological knowledge, writes in very strong terms of the beautiful forms which can be seen among these natives. "The general form, though sometimes defective, seemed on the average better than that of the negro, and I did not find the undue slenderness of limb which has been commonly attributed to the Australians. Strange as it may appear, I would refer to an Australian as the finest model of human proportions I have ever met with, in muscular development combining perfect symmetry, activity, and strength; while his head might have compared with an antique bust of a philosopher."

Those of my readers who happened to see the native Australians that came over to England as cricketers and athletes in general must have noticed the graceful forms

for which some of the men were remarkable, while all were possessed of great elegance of limb.

The disadvantageous effect of European clothing on the dark races was well shown in these men, who seemed to undergo a positive transformation when they laid aside their ordinary clothes for a costume which represented, as far as possible, the light and airy apparel of the native Australian. Dressed in gray, or clad in the cricketer's costume, there was nothing remarkable about them, and in fact they seemed to be very ordinary persons indeed. But with their clothes they threw of their commonplace look, and, attired only in tight "fleshings," dyed as nearly as possible the color of their black skins, with a piece of fur wrapped round their loins and a sort of fur cap on their heads, they walked with a proud, elastic step that contrasted strangely with their former gait.

It may perhaps be said that this change of demeanor was only the natural result of removing the heavy clothing and giving freedom to the limbs. This was not the case, for several professional English athletes contended with the Australians, and, when they came to run or leap, wore the usual light attire of the professional acrobat. In them, however, no such improvement took place, and, if anything, they looked better in their ordinary dress.

The women are, as a rule, much inferior to the men in appearance. Even when young, although they possess symmetrical forms, their general appearance is not nearly so pleasing as that of the young African girl, and, when the woman becomes old, she is, if possible, even more hideous and hag-like than the African. This deterioration may partly be due to the exceedingly hard life led by the women, or "gins"—in which word, by the way, the *g* is pronounced hard as in "giddy." That they have to do all the hard work, and to carry all the heavy weights, including the children, while their husbands sit or sleep, or, if on the march, burden themselves with nothing more weighty than their weapons, is to be expected, as it is the universal practice among natives. But it is not so much the hard work as the privation which tells upon the woman, who is treated with the same contemptuous neglect with which a savage treats his dog, and, while her husband, father, or brother, is feasting on the game which she has cooked, thinks herself fortunate if they now and then toss a nearly cleaned bone or a piece of scorched meat to her.

Like most savages, the Australian natives are adroit and daring thieves, displaying an amount of acuteness in carrying out their designs which would do honor to the most expert professional thief of London or Paris. In his interesting work entitled "Savage Life and Scenes," Mr. G. F. Angus has re-

lated several anecdotes respecting this propensity.

"Leaving Rivoli Bay, we fell in with two very droll natives, the only ones who had made bold to approach our camp; both were in a state of nudity. One of these fellows was a perfect supplejack; he danced and capered about as though he were filled with quicksilver. We mounted them on horses, from which they were continually tumbling off, and they travelled with us all day.

"When we encamped at an old resting-place, near Lake Howden, they, by signs, requested permission to remain by our fires, which we allowed them to do, and gave them for supper the head and refuse of a sheep that was just killed and hung up to a tree near the tents. They showed great surprise on seeing our various utensils and articles of cookery. So modest and well-behaved did these artful gentlemen appear, that they would not touch the slightest article of food without first asking permission by signs; and they so far gained our confidence that one of them was adorned with a tin plate, suspended round his neck by a string, on which was inscribed 'Good Native.'

"In the dead of the night we were all aroused by the unusual barking of the dogs. At first it was supposed that the wild dogs were 'rushing' the sheep; but as the tumult increased, the Sergeant-Major unwrapped his opossum rug, and looked around for his hat, to go and ascertain the cause of the disturbance. To his surprise, he found that his hat had vanished. The hat of his companion, who lay next him near the fire, was also nowhere to be found; and, casting his eyes to the spot where the sheep hung suspended from the tree, he saw in a moment that our fond hopes for to-morrow's repast were blighted, for the sheep too had disappeared. The whole camp was roused, when it was ascertained that forks, spoons, and the contents of the Governor's canteen, pannikins and other articles, were likewise missing, and that our two remarkably docile natives had left us under cover of the night.

"A council of war was held. Black Jimmy protested that it was useless to follow their tracks until the morning, and that from the nature of the country they had doubtless taken to the swamps, walking in the water, so that pursuit was in vain. We had been completely duped by these artful and clever fellows, who probably had a large party of their colleagues lying in ambush amid the surrounding swamps, ready to assist in carrying away the stolen property. Retaliation was useless; and we contented ourselves by giving utterance to our imprecations and commenting on the audacity and cunning of the rogues until daybreak."

Another instance of theft—in this case single-handed—occurred not long before the robbery which has just been recorded. While the exploring party was on the march,

they fell in with a number of natives who were cooking their food.

"At our approach, they flew down the descent, and hid among the bulrushes; but one old woman, unable to escape as speedily as the rest, finding flight useless, began to chatter very loud and fast, pointing to her blind eye, and her lean and withered arms, as objects of commiseration. Dampier was given to her and she continued in terror to chew it very fast without swallowing any, until she was almost choked; when suddenly she got hold of Gisborne's handkerchief and made off with it. With a vigorous leap she plunged into the mud and reeds beneath, effecting her escape by crawling into the swamp and joining her wild companions, to whom she doubtless recounted her adventures that night over a dish of fried tadpoles."

The dish of fried tadpoles, to which allusion has been made, is quite a luxury among this wretched tribe, and, when the exploring party pushed on to the spot where the people had been cooking, it was found that they had been engaged in roasting a dish of water-beetles over a fire.

It is impossible to withhold admiration for the skill displayed by these sable thieves in stealing the property which they coveted, and, in excuse for them, it must be remembered that the articles which were stolen were to the blacks of inestimable value. Food and ornaments are coveted by the black man as much as wealth and titles by the white man, and both these articles were ready to hand. The temptation to which these poor people was exposed seems very trifling to us, but we must measure it, not from our own point of view, but from theirs.

The strange visitors who so suddenly appeared among them possessed abundance of the very things which were dearest to them. There was a whole sheep, which would enable them to enjoy the greatest luxury of which they could form any notion, *i. e.* eating meat to repletion; and there was store of glittering objects which could be worn as ornaments, and would dignify them forever in the eyes of their fellows. The happy possessor of a spoon, a fork, or a tin plate, which would be hung round the neck and kept highly polished, would be exalted above his companions like a newly ennobled man among ourselves, and it should not be expected that such an opportunity, which could never again be looked for, would be allowed to pass. The temptation to them was much as would be a title and a fortune among ourselves, and there are many civilized men who have done worse than the savage Australian when tempted by such a bait.

Reference has been made to the haggard appearance of the old woman who so ingeniously stole the handkerchief, the love of finery overcoming the dread of the white man in spite of her age and hideous aspect, which would only be made more repulsive

(1.) AUSTRALIAN MAN AND WOMAN.

(See page 695.)

(2.) WOMEN AND OLD MAN OF THE LOWER MURRAY AND THE LAKES.

(See page 699.)

by any attempt at ornament. It is scarcely possible to imagine the depths of ugliness into which an Australian woman descends after she has passed the prime of her life. As we have seen, the old woman of Africa is singularly hideous, but she is quite passable when compared with her aged sister of Australia.

The old Australian woman certainly does not possess the projecting jaws, the enormous mouth, and the sausage-like lips of the African, but she exhibits a type of hideousness peculiarly her own. Her face looks like a piece of black parchment strained tightly over a skull, and the mop-like, unkempt hair adds a grotesque element to the features which only makes them still more repulsive. The breasts reach to the waist, flat, pendent, and swinging about at every movement; her body is so shrunken that each rib stands out boldly, the skin being drawn deeply in between them, and the limbs shrivel up until they look like sticks, the elbows and knees projecting like knots in a gnarled branch.

Each succeeding year adds to the hideous look of these poor creatures, because the feebleness of increasing years renders them less and less useful; and accordingly they are neglected, ill-treated, and contemptuously pushed aside by those who are younger and stronger than themselves, suffering in their turn the evils which in their youth they carelessly inflicted on those who were older and feebler.

Mr. Angas has among his sketches one which represents a very old woman of the Port Fairy tribe. They had built their rude huts or miam-miams under some gum-trees, and very much disgusted the exploring party by their hideous appearance and neglected state. There was one old woman in particular, who exemplified strongly all the characteristics which have just been described; and so surpassingly hideous, filthy, and repulsive was she, that she looked more like one of the demoniacal forms that Callot was so fond of painting than a veritable human creature. Indeed, so very disgusting was her appearance, that one of the party was made as ill as if he had taken an emetic.

Not wishing to shock my readers by the portrait of this wretched creature, I have introduced on page preceding, two younger females of the same tribe.

The remarkable point about this and one or two other tribes of the same locality and the neighborhood, is the circular mat which is tied on their backs, and which is worn by both sexes. The mat is made of reeds twisted into ropes, coiled round, and fastened together very much as the archer's targets of the present day are made. The fibres by which the reed ropes are bound together are obtained from the chewed roots of the bulrush. The native name for this

mat is *paingkoont*. One of the women appears in her ordinary home dress, *i. e.* wearing the paingkoont and her baby, over whose little body she has thrown a piece of kangaroo skin. The mat makes a very good cradle for the child, which, when awake and disposed to be lively, puts its head over the mat and surveys the prospect, but when alarmed pops down and hides itself like a rabbit disappearing into its burrow. The old woman, whose portrait is withheld, was clothed in the paingkoont, and wore no other raiment, so that the full hideousness of her form was exposed to view.

The woman standing opposite is just starting upon a journey. She is better clad than her companion, having beside the paingkoont a rude sort of petticoat. On her back she has slung the net in which she places the roots which she is supposed to dig out of the ground, and, thrust through the end which ties it, she carries the digging-stick, or katta, which serves her for a spade. She has in her hand the invariable accompaniment of a journey, — namely, the fire-stick, smouldering amid dry grass between two pieces of bark, and always ready to be forced into a flame by whirling it round her head.

Behind them is seated an old man, also wearing the mat-cloak, and having by his side one of the beautifully constructed native baskets. These baskets are made, like the mat, of green rushes or reeds, and are plaited by the women. One of these baskets is illustrated in an engraving on the 722d page. The reader will doubtless observe that the mode of plaiting it is almost identical with that which is employed by the natives of Southern Africa, the rushes being twisted and coiled upon each other and bound firmly together at short intervals by strong fibrous threads. They are rather variable in shape; some, which are intended to stand alone, being flat-bottomed, and others, which are always suspended by a string, ending in a point.

In common with other savage races, the Australians are apt to behave treacherously to the white man when they find themselves able to do so with impunity. This behavior is not always the result of ferocity or cruelty, though an Australian can on occasion be as fierce and cruel as any savage. Oftentimes it is the result of fear, the black people standing in awe of the white stranger and his deadly weapons, and availing themselves of their native cunning to deprive him of his unfair advantages as soon as possible.

Ignorant of the object of travel, and having from infancy been accustomed to consider certain districts as the property of certain tribes, and any man who intruded into the district of another as an enemy, it is but natural that when they see, especially for the first time, a man of different color from

themselves travelling through the country, such strangers must necessarily be enemies, come for the purpose of using against the aborigines the weapons which they possess. Again, a feeling of acquisitiveness has much to do with the treachery.

Add to their ideas of the inimical character of the strangers the cupidity that must be excited by the sight of the valuable property brought into their country by those whom they consider as enemies delivered into their hand, and there is no reason for wonder that they should take both the lives and the property of the strangers, and thus secure the valued trophies of war at the same time that they rid their country of strange and powerful enemies, and attain at one stroke an amount of wealth which they could not hope to gain through the labors of a life.

This phase of their character is well shown by Mr. T. Baines, in a letter which he has kindly allowed me to transfer to these pages. He was one of an exploring expedition, which had also undertaken to convey a number of sheep and horses. "While making the inner passage along the coast, we fell in with several canoes, some of very rude construction, being in fact mere logs capable of carrying a couple of men, who, perhaps in terror of the telescopes pointed at them, did not approach us.

"Others were of greater size and power, being large hollowed logs, very straight and narrow, and steadied on either side by other logs, pointed at the ends, and acting as outriggers, neatly enough attached by pegs driven into them through a framing of bamboo. Others again were strictly double canoes, two of the narrow vessels being connected by a bamboo platform so as to lie parallel to each other at some little distance apart.

"They were manned by crews of from six to twelve, or even more in number, all tolerably fine fellows, perfectly naked, with shock heads of woolly hair and scanty beards. They were ornamented with scars and raised cicatrices tastefully cut on their shoulder and elsewhere. They were armed with long spears, some of them tipped with wood, others with bone, and having from one to four points. They also had bows and arrows, as well as their curious paddles, the looms of which were barbed and pointed, so as to be useful as spears. When these weapons were thrown at a fish, the owner always plunged into the water after his weapon, so as to secure the fish the moment that it was struck.

"Their arrival caused various emotions among our party. One gentleman ruined his revolver by hurriedly trying to load it, while a little girl, so far from being afraid of them, traded with them for almost everything they had in their canoes. Just as they dropped astern after reaching us, the cap-

tain's little daughters were being bathed in a tub on the main-batch, and, naturally enough, jumped out of their bath, and ran aft wet and glistening in the sunlight, to hide themselves from the strange black fellows who were stretching themselves to look over our low bulwarks at the little naked white girls.

"We bought spears, bows, arrows, tortoise-shell, &c., for hats, handkerchiefs, and other things; and they were greatly interested in the white baby, which, at their express request, was held up for them to look at."

Up to this point we find the natives mild and conciliatory, but we proceed with the letter, and find an unexpected change in their demeanor.

"We had here an instance of the capriciousness of the natives. We met about a dozen on shore, and endeavored by all friendly signs to induce them to come to terms with us. We showed them that we had no guns, but our attempts were useless. They fell into regular battle array, with their long spears ready shipped on the throwing sticks, six standing in front, and the rest acting as supports behind. As it was unsafe to parley longer, we mounted our horses, and again tried to make them understand that we wished to be on friendly terms. It was all useless, and the only thing that we could do was to ride straight at them. They ran like antelopes, and gained the thick bush where we could not follow them. B—— wanted to shoot one of them, but I would not allow it.

"The prospect of killing and eating our horses seemed to be their great temptation. They made constant war upon our stud for a fortnight or three weeks, in my camp at Dépôt Creek, and I had to patrol the country with B—— daily, to keep them from ringing the horses round with fire.

"The character of the Australian canoe-men is variously spoken of, some reporting them as good-natured and peaceable, while others say that they are treacherous and savage. Both speak the truth from their own experience. A fellow artist, who generally landed from a man-of-war's boat, with the ship in the offing, found them peaceable enough, but poor Mr. Strange, the naturalist, was murdered on one of the islands.

"While we were on board our vessels, they were quite friendly; and even during my boat's voyage of 750 miles, while we had a dashing breeze and the boat well under command, we found the groups we met with civil enough. But when we were helplessly becalmed at the entrance of the Gulf of Carpentaria, and supposed by the natives to be the unarmed survivors of some vessel wrecked in Torres Straits, we were deliberately and treacherously attacked.

"We watched the preparations for nearly an hour through the telescope, and refrained

from giving them the slightest ground even to suspect that we looked on them otherwise than as friends: As soon as they thought they had us in their power, they began to throw spears at us, so I put a rifle-bullet through the shoulder of the man who threw at us, to teach him the danger of interfering with supposed helpless boats, but did not fire again. The wounded man was led on shore by one of his mates, and we were not molested again.

"These people are very capricious. They have the cunning and the strong passions of men, but in reason they are only children. Life is not held sacred by them, and, when their thirst for blood is raised, they revel in cruelty."

These Australian canoes, with outriggers attached, indicate a Polynesian origin, as indeed do the bows and arrows, which will be fully described on a future page. The tobacco pipes in use in that part of Australia are curious. One form consists of a hollow tube as thick as a man's arm, stopped at the ends and having one hole near the bottom into which is introduced the stem of a pipe, and another hole near the top through which the smoke is imbibed. Their use of the pipe is rather singular. When a party desires to smoke, the chief man lights the pipe, places his mouth to the orifice, and continually inhales until the interior of the hollow stem is filled with smoke. The bowl is then removed, and the aperture stopped with a plug which is kept in readiness. The first smoker closes with his thumb the hole through which he has been imbibing the smoke, and passes the pipe to his neighbor, who applies his lips to the hole, fills his lungs with smoke, and then passes the pipe to the next man. In this way, the tobacco is made to last as long as possible, and the greatest possible amount of enjoyment is got out of the least possible amount of material. The exterior of the stem is generally carved into the simple patterns which are found on nearly all Australian weapons and implements.

BEFORE proceeding further with the character and habits of the natives, we will cast a glance at the country which they inhabit, and the peculiarities which have contributed toward forming that character.

It is a very strange country, as strange to us as England would be to a savage Australian. Its vegetable and animal productions are most remarkable, and are so strange that when the earlier voyagers brought back accounts of their travels they were not believed; and when they exhibited specimens of the flora and fauna, they were accused of manufacturing them for the purpose of deception.

In the first place, with a single exception, the mammalia are all marsupials, or edentates. The solitary exception is the dingo,

or native dog, an animal which somewhat resembles the jackal, but is altogether a handsomer animal. Whether it be indigenous, or a mere variety of the dog modified by long residence in the country, is rather doubtful, though the best zoologists incline to the latter opinion, and say that the marsupial type alone is indigenous to this strange country. Of course the reader is supposed to know that the young of a marsupial animal is born at a very early age, and attains its full development in a supplementary pouch attached to the mother, into which pouch the teats open.

The animal which is most characteristic of Australia is the kangaroo. Of this singular type some forty species are known, varying in size from that of a tall man to that of a mouse. Some of them are known as kangaroos, and others as kangaroo-rats, but the type is the same in all. As their form implies, they are made for leaping over the ground, their enormously long legs and massive development of the hind quarters giving them the requisite power, while their long tails serve to balance them as they pass through the air.

Nearly all the so-called "rats" of Australia belong to the kangaroo tribe, though some are members of other marsupial families. Here I may mention that the nomenclature of the colonists has caused great perplexity and labor to incipient zoologists. They are told in some books that the dingo is the only Australian animal that is not a marsupial or an edentate, and yet they read in books of travel of the bear, the monkey, the badger, the wolf, the cat, the squirrel, the mole, and so forth. The fact is, that, with the natural looseness of diction common to colonists all over the world, the immigrants have transferred to their new country the nomenclature of the old. To the great trouble of index-searchers, there is scarcely a part of the world inhabited by our colonists where London, Oxford, Boston, and fifty other places are not multiplied. The first large river they meet they are sure to call the Thames, and it is therefore to be expected that natural history should suffer in the same way as geography.

Thus, should, in the course of this account of Australia, the reader come across a passage quoted from some traveller in which the monkey or bear is mentioned, he must remember that the so-called "monkey" and "bear" are identical, and that the animal in question is neither the one nor the other, but a marsupial, known to the natives by the name of koala, and, as if to add to the confusion of names, some travellers call it the sloth.

The so-called "badger" is the wombat, probably called a badger because it lives in holes which it burrows in the ground. The Australian "wolf" is another marsupial, belonging to the Dasyures, and the "cat"

belongs to the same group. The "squirrels" are all marsupials, and by rights are called phalangists, and it is to this group that the koala really belongs. As to the "hedgehog," it is the spiny ant-eater or echidna, and the "mole" is the celebrated duck-bill or ornithorhynchus.

With few exceptions these animals are not easily captured, many of them being nocturnal, and hiding in burrows or hollow trees until the shades of night conceal their movements; while others are so shy, active, and watchful, that all the craft of the hunter must be tried before they can be captured. Much the same may be said of the birds, the chief of which, the emu, is nearly as large as an ostrich, and is much valued by the natives as food. It is evident, therefore, that the existence of these peculiar animals must exercise a strong influence on the character of the natives, and must make them more active, wary, and quicksighted than the creatures on which they live.

Possessing, as he does, the most minute acquaintance with every vegetable which can afford him food, and even knowing where to obtain a plentiful supply of food and water in a land where an European could not find a particle of anything eatable, nor discover a drop of moisture in the dry and parched expanse, the Australian native places his chief reliance on animal food, and supports himself almost entirely on the creatures which he kills. His appetite is very indiscriminate; and although he prefers the flesh of the kangaroo and the pigeon, he will devour any beast, bird, reptile, or fish, and will also eat a considerable number of insects. Consequently the life of the Australian savage is essentially one of warfare, not against his fellow-man, but against the lower animals, and, as the reader will see in the course of the following pages, the primary object of his weapons is the hunt, and war only a secondary use to which they are directed.

CHAPTER LXX.

AUSTRALIA—*Continued.*

MANNERS AND CUSTOMS OF THE NATIVES—DRESS AND ORNAMENTS OF NORTHERN AUSTRALIA—MODE OF DRESSING THE HAIR—THE “DIBBI-DIBBI”—TATTOOING AND CICATRIZING—PATTERN OF THE SCARS—SIGNIFICATION OF THE VARIOUS PATTERNS—POMF AND VANITY—THE NOSE-BONE—NECKLACES—THE GIRDLE AND TASSEL—TATTOOS AND SCARS AMONG THE WOMEN—THE TURTLE SCAR—HIGH SHOULDERS OF THE AUSTRALIANS—INDIFFERENCE TO DRESS—THEIR FUR MANTLES, AND THEIR USES—THE SEA-GRASS MANTLE—FOOD OF THE AUSTRALIANS—VEGETABLE FOOD—MODE OF PROCURING ROOTS—THE BIYU—THE NARDOO PLANT AND ITS USES—THE “BURKE AND WILLS” EXPEDITION—THE BULEUSH ROOT, ITS USE FOR FOOD AND ROPE MAKING—SUBTERRANEAN WATER STORES—MOLLUSCS, AND MODE OF COLLECTING THEM—HARD WORK FOR THE WOMEN—DIVING FROM THE RAFT—RELAXATION WHEN THEY RETURN HOME—COOKING THE MOLLUSCS AND CRUSTACEA—FISH CATCHING WITH LINE, NET, AND SPEAR—INSECT FOOD—THE BEE CATCHERS—TREE AND EARTH GRUBS, AND MODE OF CATCHING THEM—THE PLEYAH—THE DUGONG—ITS LOCALITIES, AND MODES OF TAKING AND COOKING IT—CAPTURING AND COOKING THE GREEN TURTLE—CURIOUS USE OF THE SUCKING FISH—TAMING THE TURTLE—THE HAWKBELL TURTLE, AND MODE OF CATCHING IT—TURTLE OIL AND DRIED FLESH—SALE OF TORTOISE-SHELL—TWO FORMS OF AUSTRALIAN OVENS—COOKING AND EATING SNAKES—CATCHING THE SNAKE ALIVE—THE CLOAK AND THE SHIELD—THE DUGONG, AND ITS CAPTURE—SMALL TENACITY OF LIFE—A SAVORY FEAST.

WE will now proceed to the various manners and customs of the Australians, not separating them into the arbitrary and fluctuating distinctions of tribes, but describing as briefly as is consistent with justice, the most interesting of their habits, and mentioning those cases where any particular custom seems to be confined to any one tribe or district.

We have in the illustration No. 1, on page 707, a good example of a native of North Western Australia. The sketch was kindly made by Mr. T. Baines. A profile of the man is given, in order to show the peculiar contour of the face, which, as the reader may see, has nothing of the negro character about it; the boldly prominent nose, the full beard, and the long hair fastened up in a top-knot being the distinguishing features. The man carries in his belt his provisions for the day, namely, a snake and one of the little kangaroo-rats, and having these he knows no care, though of course he would prefer larger game.

Round his neck may be seen a string. This supports an ornament which hangs upon his breast. Several forms of this ornament, which is called in the duplicative

Australian language a “dibbi-dibbi,” are employed, and there are in my collection two beautiful specimens made from the shell of the pearl-oyster. The ordinary dibbi-dibbi is fan-shaped, and does not depart very much from the original outline of the shell. There is, however, one kind of dibbi-dibbi which is valued exceedingly, and which is shaped like a crescent. The specimen in my possession is almost as large as a cheese plate, and must have been cut from an enormous shell, economy, whether of material or time, not being understood by these savages. Owing to the shape of the shell, it is slightly convex, and was worn with the concave side next the body.

Not being satisfied with the natural smooth polish of the nacre, the native has ornamented the dibbi-dibbi with a simple but tolerably effective pattern. Along the margin of the scooped edge he has bored two parallel rows of small and shallow holes about half an inch apart, and on either side of each row he has cut a narrow line. From the outer line he has drawn a series of scalloped patterns made in a similar fashion; and, simple as this pattern is, its effect is

really remarkable. The man has evidently begun a more elaborate pattern on the broad surface of the shell, but his mind seems to have misgiven him, and he has abandoned it. The cord by which it is suspended round the neck is nearly an inch wide, and is made of string and a sort of rattan plaited together.

On the shoulder of the man may be seen a number of raised marks. These are the scars of wounds with which the Australians are in the habit of adorning their bodies, and which they sometimes wear in great profusion. The marks are made by cutting deeply into the skin, and filling the wounds with clay and other substances, so that when the wound heals an elevated scar is made. These scars are made in patterns which partly differ according to the taste of the individual, and partly signifying the district to which the tattooed person belongs. For example, the scars as shown in the illustration are the mark of a Northern Australian; and, although he may have plenty other scars on his body and limbs, these will always appear on his shoulder as the distinguishing mark of his tribe.

In my photographs, which represent natives from various parts of the continent, these scars are very prominent, and there is not an individual who does not possess them. Some have them running longitudinally down the upper arm, while others have them alternately longitudinal and transverse. They occasionally appear on the breast, and an old man, remarkable for the quantity of hair which covered his breast and arms, has disposed them in a fan shape, spreading from the centre of the body to the arms. He has evidently spent a vast amount of time on this adornment, and suffered considerable pain, as scars, although not so large as in many other instances, are exceedingly numerous; the man has adorned his arms and shoulders with little scars of the same character arranged in regular lines.

In some parts of Australia the scars assume a much more formidable appearance, being long and heavy ridges. One chief, who was very proud of his adornments,—as well he might be, seeing that their possession must nearly have cost him his life,—was entirely covered from his neck to his knees with scars at least an inch broad, set closely together, and covering the whole of the body. The front of the chest and stomach was adorned with two rows of these scars, each scar being curved, and reaching from the side to the centre of the body, where they met. The man was so inordinately proud of this ornament that nothing could induce him to wear clothing of any kind, and he stalked about in his grandeur, wearing nothing but his weapons. The photograph of this man has a very singular aspect, the light falling on the polished

ridge of the scars having an effect as if he were clad in a suit of some strange armor.

By way of adding to the beauty of their countenances, they are in the habit of perforating the septum of the nose, and of thrusting through it a piece of bone or stick, the former being preferred on account of its whiteness. It is almost impossible to describe the exceedingly grotesque appearance presented by an Australian dandy, who has his body covered with scars, and his face crossed by a wide piece of bone some six inches in length, making his naturally broad nose wider, and seeming as it were to cut his face in half. The hole through which this ornament is thrust is made when a child is a fortnight old.

As to other ornaments, they consist of the usual necklaces, bracelets, and anklets which are common to savage tribes in all parts of the world. Some of these necklaces which are in my collection are really pretty, and some skill is shown in their manufacture. One is made of pieces of yellow reed as thick as quills and almost an inch in length, strung alternately with scarlet reeds; another is made entirely of the same reeds, while a third is, in my opinion, the handsomest, though not the most striking of them. At first sight it appears to be made entirely of the reeds already mentioned, but on a closer examination it is seen to be composed entirely of the antennæ of lobsters, cut into short lengths and strung together. To the necklaces is attached a small mother-of-pearl dibbi-dibbi four inches long and one inch wide, and the pieces of lobster antennæ are so disposed that the thinner parts of the antennæ, taken from the extremities, come next to the dibbi-dibbi and hang on the breast, while the larger and thicker parts, taken from the base of the antennæ, come on the neck. The native basket in which these necklaces were kept is more than half filled with bright colored seeds of various hues, that are evidently intended for the manufacture of necklaces.

Girdles of finely twisted human hair are often worn by the men, and the native who is represented in the engraving No. 1, on page 707, is wearing one of these girdles. Sometimes, as in the present instance, a small tassel made of the hair of a phalangist or "flying-squirrel," as it is wrongly termed, is hung to the front of the girdle, by no means as a covering, but as an ornament.

The scars are so highly valued that the women wear them nearly as profusely as the men. In my photographs, there are portraits of many women of all ages, not one of whom is without scars. They do not wear them so large as the men, but seem to be more careful in the regularity of the pattern.

Taking a series of three women, the first has three cuts on the shoulder, showing her

northern extraction, and a row of small horizontal and parallel scars along the front of the body from the breast-bone downward. The second, in addition to the shoulder cuts, has several rows of scars extending from the breast to the collar-bones, together with a central line as already described, and some similar rows of cuts on the ribs and sides. The third woman, a mere girl of fourteen or so, has been very careful in the arrangement of the scars, which descend in regular and parallel rows from the breast downward, and then radiate fan-wise in six rows from the breast upward to the collar bones.

Mr. M'Gillivray, who accompanied H. M. S. *Rattlesnake* in her voyage, writes as follows concerning the scar ornaments and their uses:—"The Torres Straits islanders are distinguished by a large complicated oval scar, only slightly raised, and of neat construction. This, which I have been told has some connection with a turtle, occupies the right shoulder, and is occasionally repeated on the left. (See engraving at foot of page 722.) At Cape York, however, the cicatrices were so varied that I could not connect any particular style with an individual tribe. At the same time, something like uniformity was noticed among the Katchialaigas, nearly all of whom had, in addition to the horned breast mark, two or three long transverse scars on the chest, which the other tribes did not possess.

"In the remaining people the variety of marking was such that it appeared fair to consider it as being regulated more by individual caprice than by any fixed custom. Many had a simple two-horned mark on each breast, and we sometimes saw upon them a clumsy imitation of the elaborate shoulder mark of the islanders."

Well-shaped as are these women, they have one defect in form, namely, the high and square shoulder, which detracts so much from feminine beauty, and which is equally conspicuous in the child of six, the girl of thirteen or fourteen, and the old woman. The men also exhibit the same defective form.

The reader will have noticed the elaborate manner in which the hair of the Australian savage is sometimes dressed. The style of hair-dressing varies with the locality, and often with the time, fashion having as absolute a reign among the native Australians, and being quite as capricious, as among ourselves. Sometimes the hair is twisted up into long and narrow ringlets, and, if the savage should not happen to have enough hair for this fashion, he straightway makes a wig in imitation of it. Now and then the head is shaved, except a transverse crest of hair, and sometimes the natives will take a fashion of rubbing red ochre and turtle-fat into their heads until they are saturated with the compound, and will then twist up the hair into little strands.

The men of this part of Australia never wear any dress, and the women are often equally indifferent to costume. At Cape York, however, they mostly wear an apology for a petticoat, consisting of a tuft of long grass or split pandanus leaves suspended to the front of the girdle. On great occasions, and especially in their dances, they wear over this a second petticoat mostly made of some leaf, and having the ends woven into a sort of waistband. The material of the petticoat is generally pandanus leaf, but, whatever may be the material, the mode of plaiting it and the general form are the same among all the tribes of Torres Straits. From this useful leaf, the women also make the rude sails for their canoes, which serve the double purpose of sails and coverings under which the natives can sleep in wet weather.

The women have rather a curious mode of wearing one of their ornaments. This is a very long belt, composed of many strands of plaited or twisted fibre, and passed round the body in such a manner that it crosses over the breast like the now abolished cross-belts of the soldier. It is drawn rather tight, and may perhaps be of some service in supporting the bosom. In neither case does clothing seem to be worn as a mode of concealing any part of the body, but merely as a defence against the weather or as an ornament. Even when dress is worn it is of a very slight character, with one or two exceptions. These exceptions are the fur cloaks, with which the women sometimes clothe themselves, and a remarkable garment which presently will be described.

The fur cloaks are made almost universally from the skin of the opossum, and, as the animal is a small one, a considerable number are sewed together to make a single robe. The mode of manufacture is exactly similar to that which was described when treating of the kaross of the Kaffir tribes, the skins being cut to the proper shape, laid side by side, and sewed laboriously together with threads formed of the sinews of the kangaroo's tail, or often with those which are drawn out of the tails of the very creatures which furnish the skin.

Sometimes a piece of kangaroo skin is used for the same purpose, but in neither case does it fulfil the office of a dress according to our ideas. The cloak is a very small one in proportion to the size of the women, and it is worn by being thrown over the back and tied across the chest by a couple of thongs, so as to leave the whole front of the body uncovered. If the garment in question be the skin of the kangaroo, it is slung over one shoulder, and allowed to fall much as it likes, the only object seeming to be that it shall cover the greater part of the back and one shoulder. Occasionally a man wears a fur cloak, but he seems to be very indifferent as to the manner in which it hangs upon his

body, sometimes draping it about his shoulders, sometimes letting it fall to his waist and gathering it about his loins, and sometimes, especially if walking, holding two corners together with his left hand in front of his breast, while his right hand grasps his bundle of weapons.

Mr. Angas mentions one instance of a singularly perfect dress in use among the Australians — the only dress in fact that is really deserving of the name. It is a large cloak made from the *zostera* or sea grass, a plant that is remarkable for being the only true flowering plant that grows in the sea. It has very long grass-like blades, and is found in vast beds, that look in a clear sea like luxuriant hay-fields just before mowing.

The fibre of the *zostera* is long, and wonderfully tough, and indeed the fibre is so good, and the plant so abundant, that the uses to which it is now put, such as packing and stuffing, are far below its capabilities, and it ought to be brought into use for purposes for which a long and strong fibre are needed. Some time ago, when the supply of rags for paper seemed to be failing, there was an attempt made to substitute the *zostera* for rags; and, although it was not a perfectly successful experiment, it had at all events the elements of success in it.

With this long grass the Australian native occasionally makes a large cloak, which will cover the whole body. It is made by laying the fibres side by side, and lashing them together at regular intervals, much as the well-known New Zealand mantle is made from the phormium. Anxious to avoid trouble, the native only fastens together a sufficient quantity to make a covering for his body as low as the knees, the loose ends of the *zostera* being left as a kind of long fringe that edges the mantle all round, and really has a very graceful effect.

The illustration No. 2, on the next page, shows one of those curious mantles, which was sketched while on the body of the wearer. As the manufacture of such a mantle involves much trouble, and the Australian native has the full savage hatred of labor, very few of these cloaks are to be seen. Indeed, nothing but a rather long inclement season will induce a native to take the trouble of making a garment which he will only use for a comparatively short period, and which is rather troublesome to carry about when not wanted.

WE now come to the food of the natives. As has already been stated, they eat almost anything, but there are certain kinds of food which they prefer, and which will be specially mentioned.

As to vegetable food, there are several kinds of yams which the more civilized tribes cultivate — the nearest approach to labor of which they can be accused. It is almost exclusively on the islands that cultivation is

found, and Mr. M'Gillivray states that on the mainland he never saw an attempt at clearing the ground for a garden. In the islands, however, the natives manage after a fashion to raise crops of yams.

When they want to clear a piece of ground, they strew the surface with branches, which are allowed to wither and dry; as soon as they are thoroughly dried, fire is set to them, and thus the space is easily cleared from vegetation. The ground is then pecked up with a stick sharpened at the point and hardened by fire; the yams are cut up and planted, and by the side of each hole a stick is thrust into the ground, so as to form a support for the plant when it grows up. The natives plant just before the rainy season. They never trouble themselves to build a fence round the simple garden, neither do they look after the growth of the crops, knowing that the rains which are sure to fall will bring their crops to perfection.

There are also multitudes of vegetable products on which the natives feed. One of them, which is largely used, is called by them "biyu." It is made from the young and tender shoots of the mangrove tree. The sprouts, when three or four inches in length, are laid upon heated stones, and covered with bark, wet leaves, and sand. After being thoroughly stewed, they are beaten between two stones, and the pulp is scraped away from the fibres. It then forms a slimy gray paste, and, although it is largely eaten, the natives do not seem to like it, and only resort to it on a necessity. They contrive, however, to improve its flavor by adding large quantities of wild yams and other vegetable products.

Perhaps the most celebrated wild food of the Australians is the "nardoo," which has become so familiar to the British reader since the important expedition of Burke and Wills. The nardoo is the produce of a cryptogamous plant which grows in large quantities, but is rather local. The fruit is about as large as a pea, and is cleaned for use by being rubbed in small wooden troughs. It is then pounded into a paste, and made into cakes, like oatmeal.

The nardoo plant is one of the ferns, and those of my readers who are skilled in botany will find it in the genus *Marsilea*. Like many of the ferns, the plant presents a strangely infernal aspect, consisting of upright and slender stems, about twelve inches high, each having on its tips a small quadruple frond, closely resembling a flower. The fruit, or "sporocarp," of the nardoo is the part that is eaten; and it is remarkable for its powers of absorbing water, and so increasing its size. Indeed, when the fruit is soaked in water, it will in the course of a single hour swell until it is two hundred times its former size.

The nardoo is useful in its way, and, when mixed with more nutritious food, is a valu-

(1.) THE HUNTER AND HIS DAYS PROVISIONS.

(See page 704.)

(2.) THE SEA GRASS CLOAK.

(See page 706.)

able article of diet. Taken alone, however, it has scarcely the slightest nutritive powers, and though it distends the stomach, and so keeps off the gnawing sense of hunger, it gives no strength to the system. Even when eaten with fish, it is of little use, and requires either fat or sugar to give it the due power of nourishment. With the wonderful brightness of spirit which Mr. Wills managed to keep up, even when suffering the severest hardships, and feeling himself gradually dying, he gives in his diary a curiously accurate picture of the effects of living for a length of time on an innutritious substance. He liked the nardoo, and consumed considerable quantities of it, but gradually wasted away, leaving a record in his diary that "starvation on nardoo is by no means unpleasant but for the weakness one feels, and the utter inability to rouse one's self; for as far as appetite is concerned, it gives the greatest satisfaction."

The death of this fine young man affords another proof of the disadvantage at which a stranger to the country is placed while traversing a new land. Many native tribes lived on the route along which the travellers passed, and, from their knowledge of the resources of the country, were able to support themselves; whereas the white travellers seem to have died of starvation in the midst of plenty.

The chief vegetable food, however, is furnished by the bulrush root, which is to the Australians who live near rivers the staff of life. As the task of procuring it is a very disagreeable one, it is handed over to the women, who have to wade among the reeds and half bury themselves in mud while procuring the root.

It is cooked after the usual Australian manner. A heap of limestones is raised, and heated by fire. The roots are then laid on the hot stones, and are covered with a layer of the same material. In order to produce a quantity of steam, a heap of wet grass is thrown on the upper layer of stones, and a mound of sand heaped over all.

As the root, however well cooked, is very fibrous, the natives do not swallow it, but, after chewing it and extracting all the soft parts, they reject the fibres, just as a sailor throws aside his exhausted quid; and great quantities of these little balls of fibre are to be found near every encampment. The same fibre is convertible into string, and is used in the manufacture of fishing lines and nets.

The singular knowledge of vegetable life possessed by the natives is never displayed with greater force than in the power which they have of procuring water. In an apparently desert place, where no signs of water are to be found, and where not even a pigeon can be seen to wing its way through the air, as the guide to the distant water toward which it is flying, the native will

manage to supply himself with both water and food.

He looks out for certain eucalypti or gum-trees, which are visible from a very great distance, and makes his way toward them. Choosing a spot at three or four yards from the trunk, with his katta he digs away at the earth, so as to expose the roots, tears them out of the ground, and proceeds to prepare them. Cutting them into pieces of a foot or so in length, he stands them upright in the bark vessel which an Australian mostly carries with him, and waits patiently. Presently a few drops of water ooze from the lower ends of the roots, and in a short time water pours out freely, so that an abundant supply of liquid is obtained.

Should the native be very much parched, he takes one of the pieces of root, splits it lengthwise, and chews it, finding that it gives as much juice as a water-melon. The youngest and freshest-looking trees are always chosen for the purpose of obtaining water, and the softest-looking roots selected. After the water has all been drained from them, they are peeled, pounded between two stones, and then roasted; so that the eucalyptus supplies both food and drink.

As, however, as has been stated, the chief reliance of the natives is upon animal food and fish, molluscs, crustacea, reptiles, and insects form a very considerable proportion of their food. Collecting the shell-fish is the duty of the women, chiefly because it is really hard work, and requires a great amount of diving. Throughout the whole of this vast continent this duty is given to the women; and whether in the Gulf of Carpentaria, on the extreme north, or in the island of Van Diemen's Land, in the extreme south, the same custom prevails. During Labillardière's voyage in search of La Perouse, the travellers came upon a party of the natives of Van Diemen's Land while the women were collecting shell-fish, and the author gives a good description of the labors to which these poor creatures were subjected:—

"About noon we saw them prepare their repast. Hitherto we had but a faint idea of the pains the women take to procure the food requisite for the subsistence of their families. They took each a basket, and were followed by their daughters, who did the same. Getting on the rocks that projected into the sea, they plunged from them to the bottom in search of shell-fish. When they had been down some time, we became very uneasy on their account; for where they had dived were seaweeds of great length, among which we observed the *fucus pyrifera*, and we feared that they might have been entangled in these, so as to be unable to regain the surface.

"At length, however, they appeared, and convinced us that they were capable of remaining under water twice as long as our

ablest divers. An instant was sufficient for them to take breath, and then they dived again. This they did repeatedly till their baskets were nearly full. Most of them were provided with a little bit of wood, cut into the shape of a spatula, and with these they separated from beneath the rocks, at great depths, very large sea-ears. Perhaps they chose the biggest, for all they brought were of a great size.

"On seeing the large lobsters which they had in their baskets, we were afraid that they must have wounded these poor women terribly with their large claws; but we soon found that they had taken the precaution to kill them as soon as they caught them. They quitted the water only to bring their husbands the fruits of their labor, and frequently returned almost immediately to their diving till they had procured a sufficient meal for their families. At other times they stayed a little while to warm themselves, with their faces toward the fire on which their fish was roasting, and other little fires burning behind them, that they might be warmed on all sides at once.

"It seemed as if they were unwilling to lose a moment's time; for while they were warming themselves, they were employed in roasting fish, some of which they laid on the coals with the utmost caution, though they took little care of the lobsters, which they threw anywhere into the fire; and when they were ready they divided the claws among the men and the children, reserving the body for themselves, which they sometimes ate before returning into the water.

"It gave us great pain to see these poor women condemned to such severe toil; while, at the same time, they ran the hazard of being devoured by sharks, or entangled among the weeds that rise from the bottom of the sea. We often entreated their husbands to take a share in their labor at least, but always in vain. They remained constantly near the fire, feasting on the best bits, and eating broiled fucus, or fern-roots. Occasionally they took the trouble to break boughs of trees into short pieces to feed the fire, taking care to choose the dryest.

"From their manner of breaking them we found that their skulls must be very hard; for, taking hold of the sticks at each end with the hand, they broke them over their heads, as we do at the knee, till they broke. Their heads being constantly bare, and often exposed to all weathers in this high latitude, acquire a capacity for resisting such efforts: besides, their hair forms a cushion which diminishes the pressure, and renders it much less painful on the summit of the head than any other part of the body. Few of the women, however, could have done as much, for some had their hair cut pretty short, and wore a string several times round the head; others had only a simple crown of hair. We made the same observa-

tion with respect to several of the children, but none of the men. These had the back, breast, shoulders, and arms covered with downy hair."

Sometimes a party of women will go out on a raft made of layers of reeds, pushing themselves along by means of very long poles. When they arrive at a bed of mussels, they will stay there nearly all day diving from the raft, with their nets tied round their necks, and, after remaining under water for a considerable time, come up with a heavy load of mussels in their nets.

They even manage to cook upon this fragile raft. They make a heap of wet sand upon the reeds; put a few stones on it, and build their fire on the stones, just as if they had been on shore. After remaining until they have procured a large stock of mussels, they pile themselves ashore, and in all probability have to spend several hours in cooking the mussels for the men. The mussels are usually eaten with the bulrush root.

There is a sort of crayfish which is found in the mud-flats of rivers and lakes. These are also caught by the women, who feel for them in the mud with their feet, and hold them down firmly until they can be seized by the hand. As soon as the creatures are taken, the claws are crushed to prevent them from biting, and they are afterward roasted, while still alive, on the embers of the fire. Tadpoles are favorite articles of diet with the Australians, who fry them on grass.

The ordinary limpet, mussel, and other molluscs, are largely eaten by the natives, who scoop them out by means of smaller shells, just as is done by boys along our own coasts—a plan which is very efficacious, as I can testify from personal experience. Sometimes they cook the molluscs by the simple process of throwing them on the embers, but as a general rule they eat them in a raw state, as we eat oysters.

Fish they catch in various ways. The usual method is by a hook and line; the former of which is ingeniously cut out of the shell of the hawksbill turtle. Two of these hooks are now before me, and raise a feeling of wonder as to the fish which could be induced to take such articles into its mouth. It is flat, very clumsily made, and there is no barb, the point being curved very much inward, so as to prevent the fish from slipping off the hook. In fact the whole shape of the hook is almost exactly identical with that of the hook which is found throughout Polynesia and extends to New Zealand.

The hook is fastened to a long and stout line, made by chewing reeds, stripping them into fibres, and rolling them on the thighs. Two of these strings are then twisted together, and the line is complete. My own specimen of a line is about as thick as the fishing lines used on our coasts, and it is very long, having a hook at either end. The hook is lashed to the line by a very firm but

rather clumsy wrapping. Sometimes the line is made of scraped rattan fibres.

Another mode of fishing is by the net. This requires at least two men to manage it. The net is many feet in length, and about four feet in width. It is kept extended by a number of sticks placed a yard or so apart, and can then be rolled up in a cylindrical package and be taken to the water. One man then takes an end of the net, unrolls it, and with the assistance of his comrade drops it into the water. As soon as the lower edge of the net touches the bottom, the men wade toward the shore, drawing with them the two ends of the net and all the fish that happen to be within its range. As soon as they near the shore, they bring the two ends of the net to the land, fix them there, and are then able to pick up and throw ashore all the fish that are in the net. Some of the more active fish escape by leaping over the upper edge of the net, and some of the mud-loving and crafty wriggle their way under the lower edge; but there is always a sufficiency of fish to reward the natives for their labor.

Like the fishing line, the net is made of chewed reeds, and the labor of chewing and twisting the string belongs exclusively to the women.

A third mode of fishing is by employing certain traps or baskets, ingeniously woven of rattan, and made so that the fish can easily pass into them, but cannot by any possibility get out again. Sometimes fish are speared in the shallow water, the native wading in, and with unerring aim transfixing the fish with his spear. Even the children take part in this sport, and, though armed with nothing better than a short stick, sharpened at one end, contrive to secure their fish. With the same stick they dig molluscs out of the mud, and turn crustacea out of their holes; and when they can do this, they are supposed to be able to shift for themselves, and their parents take no more trouble about feeding them.

They are not more fastidious in the cooking of fish than of crustacea or molluscs, but just throw them on the fire, turn them once or twice with a stick, and when they are warmed through and the outside scorched, they pick them out of the fire, scrape off the burnt scales, and eat them without further ceremony.

Insect food is much used among the Australians. As might be expected, honey is greatly valued by them, and they display great ingenuity in procuring it. When a native sees a bee about the flowers, and wishes to find the honey, he repairs to the nearest pool, selects a spot where the bank shelves very gradually, lies on his face, fills his mouth with water, and patiently awaits the arrival of a bee. These insects require a considerable amount of moisture, as every one knows who has kept them, and the bee-

hunter reckons on this fact to procure him the honey which he desires. After a while a bee is sure to come and drink, and the hunter, hearing the insect approaching him, retains his position and scarcely breathes, so fearful is he of alarming it. At last it alights, and instantly the native blows the water from his mouth over it, stunning it for the moment. Before it can recover itself, he seizes it, and by means of a little gum attaches to it a tuft of white down obtained from one of the trees.

As soon as it is released, the insect flies away toward its nest, the white tuft serving the double purpose of making it more conspicuous and retarding its flight. Away goes the hunter after it at full speed, running and leaping along in a wonderful manner, his eyes fixed on the guiding insect, and making very light of obstacles. (See illustration No. 1, on the 716th page.) Sometimes a fallen tree will be in his way, and if he can he jumps over it; but at all risks he must get over without delay, and so he dashes at the obstacle with reckless activity. Should he surmount it, well and good; but if, as often happens, he should fall, he keeps his eyes fixed, as well as he can, on the bee, and as soon as he springs to his feet he resumes the chase. Even if he should lose sight of it for a moment, he dashes on in the same direction, knowing that a bee always flies in a straight line for its home; and when he nears it, the angry hum of the hampered insect soon tells him that he has recovered the lost ground.

The reader will see that this mode of tracking the bee to its home is far inferior to that of the American bee-hunters, and is rather a business of the legs than of the head. The Australian bee-hunter waits until a bee happens to come to the spot where he lies; the American bee-hunter baits an attractive trap, and induces the insect to come to the spot which he selects. Then the Australian bee-hunter only runs after the single bee; whereas the American bee-hunter economizes his strength by employing two bees, and saving his legs.

He puts honey on a flat wooden slab, having drawn a circle of white paint round it. The bee alights on the honey, and, after filling its crop, crawls through the white paint and sets off homeward. The hunter follows the "bee-line" taken by the insect, and marks it by scoring or "blazing" a few trees. He then removes his honeyed trap to a spot at an angle with his former station and repeats the process. There is no need for him to race after the flying bee, and to run considerable risk of damaging himself more or less seriously; he simply follows out the lines which the two bees have taken, and, by fixing on the point at which they meet, walks leisurely up to the nest.

Having found his bee nest, the Australian loses no time in ascending to the spot,

whether it be a cleft in a rock, or, as is usually the case, a hole in a tree. This latter spot is much favored by the bees, as well as by many of the arboreal mammals, of which there are so many in Australia. The sudden and violent tempests which rage in that part of the world tear off the branches of trees and hurl them to the ground. During succeeding rainy seasons, the wet lodges in the broken branch, and by degrees rots away the wood, which is instantly filled with the larvæ of beetles, moths, flies, and other insects that feed upon decaying wood. Thus, in a few years, the hollow extends itself until it burrows into the tree itself, and sometimes descends nearly from the top to the bottom, thus forming an admirable locality for the bees.

Taking with him a hatchet, a basket, and a quantity of dry grass or leaves, the native ascends, lights the grass, and under cover of the smoke chops away the wood until he can get at the combs, which he places in the basket, with which he descends. Should he be too poor to possess even a basket, he extemporizes one by cutting away the bark of the tree; and should the nest be a very large one, he is supplied by his friends from below with a number of vessels, and passes them down as fast as they are filled.

Perhaps some of my readers may remark that honey cannot be rightly considered as insect food, and that it ought to have been ranked among the vegetable productions. The Australian, however, does not content himself with extracting the honey from the comb, but eats it precisely in the state in which it is brought from the nest. As the bees are not forced, as amongst English bee-masters, to keep their honey-cells distinct from those which contain the hoard and the "bee-bread," each comb contains indiscriminately bee-bread, young bee-grubs, and honey, and the Australian eats all three with equal satisfaction.

Another kind of insect food is a grub which inhabits the trunks of trees, and of which the natives are inordinately fond. They have a wonderful faculty of discovering the presence of this grub, and twist it out of its hole with an odd little instrument composed of a hook fastened to the end of a slender twig. This implement is carried in the hair so as to project over the ear, like a clerk's pen, and for a long time puzzled travellers, who thought it to be merely an ornament, and could not understand its very peculiar shape.

The larva is the caterpillar of a moth which is closely allied to the goat-moth of our own country, and has the same habit of burrowing into the wood of living trees. The hooked instrument which is used for drawing them out of their holes is called the "pileyah," and is employed also for hooking beetles, grubs, and other insects out of their holes in the ground. When the

pileyah is used for extracting grubs from the earth, the ground is first loosened by means of a wooden scoop that looks something like a hollowed waddy. The pileyah is then tied to the end of a polygonum twig of sufficient length, and by such means can be introduced into the holes.

Perhaps the most celebrated of the various insect banquets in which the Australians delight is that which is furnished by the bugong moth, as the insect is popularly, but wrongly, called. Instead of belonging to the moth tribe, it is one of the butterflies, and belongs to the graceful family of the Heliconidæ. Its scientific name is *Euplœa hamata*. The bugong is remarkable for the fact that its body, instead of being slender like that of most butterflies, is very stout, and contains an astonishing amount of oily matter. The color of the insect is dark brown, with two black spots on the upper wings. It is a small insect, measuring only an inch and a half across the wings.

It is found in the New South Wales district, and inhabits a range of hills that are called from the insect the Bugong Mountains. The Australians eat the bugong butterflies just as locusts are eaten in many parts of the world, and, for the short time during which the insect makes its appearance, feast inordinately upon it, and get quite fat. The following account is given by Mr. G. Bennett:—

"After riding over the lower ranges, we arrived a short distance above the base of the Bugong Mountain, tethered the horses, and ascended on foot, by a steep and rugged path, which led us to the first summit of the mountain: at this place, called Ginandery by the natives, enormous masses of granite rock, piled one upon another, and situated on the verge of a wooded precipice, excited our attention. An extensive and romantic view was here obtained of a distant, wooded, mountainous country.

"This was the first place where, upon the smooth sides or crevices of the granite blocks, the bugong moths congregated in such incredible multitudes; but, from the blacks having recently been here, we found but few of the insects remaining. At one part of this group of granite rocks were two pools, apparently hollowed naturally from the solid stone, and filled with cool and clear water; so, lighting a fire, we enjoyed a cup of tea previous to recommencing our further ascent. On proceeding we found the rise more gradual, but unpleasant, from the number of loose stones and branches of trees strewed about; several of the deserted bark huts of the natives (which they had temporarily erected when engaged in collecting and preparing the bugong) were scattered around. Shrubs and plants were numerous as we proceeded, but, with few exceptions, did not differ from those seen in other parts of the colony.

"Near a small limpid stream a species of *Lycopodium* grew so dense as to form a carpet over which we were able to walk. The timber trees towered to so great an elevation that the prospect of the country we had anticipated was impeded. At last we arrived at another peculiar group of granite rocks in enormous masses and of various forms; this place, similar to the last, formed the locality where the bugong moths congregate, and is called 'Warrogong' by the natives. The remains of recent fires apprised us that the aborigines had only recently left the place for another of similar character a few miles further distant.

"Our native guides wished us to proceed and join the tribe, but the day had so far advanced that it was thought more advisable to return, because it was doubtful, as the blacks removed from a place as soon as they had cleared it of the insects, whether we should find them at the next group, or removed to others still further distant.

"From the result of my observations it appears that the insects are only found in such multitudes on these insulated and peculiar masses of granite, for about the other solitary granite rocks, so profusely scattered over the range, I did not observe a single moth, or even the remains of one. Why they should be confined only to these particular places, or for what purpose they thus collect together, is not a less curious than interesting subject of inquiry. Whether it be for the purpose of emigrating, or any other cause, our present knowledge cannot satisfactorily answer.

"The bugong moths, as I have before observed, collect on the surfaces, and also in the crevices, of the masses of granite in incredible quantities. To procure them with greater facility, the natives make smothered fires underneath these rocks about which they are collected, and suffocate them with smoke, at the same time sweeping them off frequently in bushfuls at a time. After they have collected a large quantity, they proceed to prepare them, which is done in the following manner.

"A circular space is cleared upon the ground, of a size proportioned to the number of insects to be prepared; on it a fire is lighted and kept burning until the ground is considered to be sufficiently heated, when, the fire being removed, and the ashes cleared away, the moths are placed upon the heated ground, and stirred about until the down and wings are removed from them; they are then placed on pieces of bark, and winnowed to separate the dust and wings mixed with the bodies; they are then eaten, or placed into a wooden vessel called 'walbum,' or 'calibum,' and pounded by a piece of wood into masses or cakes resembling lumps of fat, and may be compared in color and consistence to dough made from smutty wheat mixed with fat.

"The bodies of the moths are large and filled with a yellowish oil, resembling in taste a sweet nut. These masses (with which the 'netbuls,' or 'talabats,' of the native tribes are loaded during the season of feasting upon the bugong) will not keep more than a week, and seldom even for that time; but by smoking they are able to preserve them for a much longer period. The first time this diet is used by the native tribes, violent vomiting and other debilitating effects are produced, but after a few days they become accustomed to its use, and then thrive and fatten exceedingly upon it.

"These insects are held in such estimation among the aborigines, that they assemble from all parts of the country to collect them from these mountains. It is not only the native blacks that resort to the bugong, but crows also congregate for the same purpose. The blacks (that is, the crows and the aborigines) do not agree about their respective shares: so the stronger decides the point; for, when the crows (called 'arabul' by the natives) enter the hollows of the rocks to feed upon the insects, the natives stand at the entrance and kill them as they fly out; and they afford them an excellent meal, being fat from feeding upon the rich bugong. So eager are the feathered blacks or arabuls after this food that they attack it even when it is preparing by the natives; but as the aborigines never consider any increase of food a misfortune, they lay in wait for the arabuls with waddies or clubs, kill them in great numbers, and use them as food."

REPTILES form a very considerable part of an Australian's diet, and he displays equal aptitude in capturing and cooking them. Turtle is an especial favorite with him, not only on account of its size, and of the quantity of meat which it furnishes, but on account of the oil which is obtained from it.

On the coast of Australia several kinds of turtle are found, the most useful of which are the ordinary green turtle and the hawk-bill. They are caught either in the water, or by watching for them when they come on shore for the purpose of laying their eggs, and then turning them on their backs before they can reach the sea. As, however, comparatively few venture on the shore, the greater number are taken in the water. Along the shore the natives have regular watchtowers or cairns made of stones and the bones of turtles, dugongs, and other creatures. When the sentinel sees a turtle drifting along with the tide, he gives the alarm, and a boat puts out after it. The canoe approaches from behind, and paddles very cautiously so that the reptile may not hear it. As soon as they come close to it, the chief hunter, who holds in his hand one end of a slight but tough rope, leaps on the turtle's back, and clings to it with both

hands on its shoulders. The startled reptile dashes off, but before it has got very far the hunter contrives to upset it, and while it is struggling he slips the noose of the rope over one of its flippers. The creature is then comparatively helpless, and is towed ashore by the canoe.

In some districts the turtle is taken by means of a harpoon, which is identical in principle with that which is used by the hippopotamus hunters of Africa. There is a long shaft, into the end of which is loosely slipped a movable head. A rope is attached to the head, and a buoy to the other end of the rope. As soon as the reptile is struck, the shaft is disengaged, and is picked up by the thrower; while the float serves as an indication of the turtle's whereabouts, and enables the hunters to tow it toward the shore.

One of the natives, named Gi'om, told Mr. M'Gillivray that they sometimes caught the turtle by means of the remora, or sucking-fish. One of these fish, round whose tail a line has been previously made fast, is kept in a vessel of water on board the boat, and, when a small turtle is seen, the remora is dropped into the sea. Instinctively it makes its way to the turtle, and fastens itself so firmly to the reptile's back that they are both hauled to the boat's side and lifted in by the fishermen. Only small turtles can be thus taken, and there is one species which never attains any great size which is generally captured in this curious manner.

The hawksbill turtle is too dangerous an antagonist to be chased in the water. The sharp-edged scales which project from its sides would cut deeply into the hands of any man who tried to turn it; and even the green turtle, with its comparatively blunt-edged shell, has been known to inflict a severe wound upon the leg of the man who was clinging to its back. The native, therefore, is content to watch it ashore, and by means of long, stout poles, which he introduces leverwise under its body, turns it over without danger to himself.

When the Australians have succeeded in turning a turtle, there are great rejoicings, as the very acme of human felicity consists, according to native ideas, in gorging until the feasters can neither stand nor sit. They may be seen absolutely rolling on the ground in agony from the inordinate distension of their stomachs, and yet, as soon as the pain has abated, they renew their feasting. Mostly they assemble round the turtle, cook it rudely, and devour it on the spot; but in Torres Straits they are more provident, and dry the flesh in order to supply themselves with food during their voyages. They cut up the meat into thin slices, boil the slices, and then dry them in the sun.

During the process of cooking, a considerable amount of oil rises to the surface, and is skimmed off and kept in vessels made of

bamboo and turtles' bladders. The cook, however, has to exercise some vigilance while performing his task, as the natives are so fond of the oil that, unless they are closely watched, they will skim it off and drink it while in an almost boiling state. The boiling and subsequent drying render the flesh very hard, so that it will keep for several weeks; but it cannot be eaten without a second boiling.

The shell of the hawksbill turtle is doubly valuable to the natives, who reserve a little for the manufacture of hooks, and sell the rest to shippers or traders, who bring it to Europe, where it is converted into the "tortoise-shell" with which we are so familiar. There is in my collection a beautiful specimen of one of these scales of tortoise-shell as it was purchased from the natives. It is about eleven inches in length and seven in width, and has a hole at one end by which they string the scales together. There are the scars of eight large limpet shells upon it, showing the singular appearance which the animal must have presented when alive.

The cooking of turtle is a far more important process than that of boiling fish, and a sort of oven is required in order to dress it properly. In principle the oven resembles that which is in use in so many parts of the world, and which has been already described when showing how the hunters of South Africa cook the elephant's foot. Instead, however, of digging a hole and burning wood in it, the Australian takes a number of stones, each about the size of a man's fist, and puts them into the fire. When they are heated, they are laid closely together, and the meat placed upon them. A second layer of heated stones is arranged upon the meat, and a rim or bank of tea-tree bush, backed up with sand or earth, is built round this primitive oven. Grass and leaves are then strewn plentifully over the stones, and are held in their places by the circular bank. The steam is thus retained, and so the meat is cooked in a very effectual manner.

In some parts of the country, however, a more elaborate oven is used. It consists of a hole some three feet in diameter and two feet in depth, and is heated in the following manner:—It is filled to within six inches of the top with round and hard stones, similar to those which have already been described, and upon them a fire is built and maintained for some time. When the stones are thought to be sufficiently heated, the embers are swept away, and the food is simply laid upon the stones and allowed to remain there until thoroughly cooked.

This kind of oven is found over a large range of country, and Mr. M'Gillivray has seen it throughout the shores of Torres Straits, and extending as far southward as Sandy Cape on the eastern side.

Although the idea of snake eating is so repugnant to our ideas that many persons can-

(1.) BEE HUNTING.
(See page 711.)

(2.) COOKING A SNAKE.
(See page 717.)

not eat eels because they look like snakes, the Australian knows better, and considers a snake as one of the greatest delicacies which the earth produces. And there is certainly no reason why we should repudiate the snake as disgusting while we accept the turtle and so many of the tortoise kind as delicacies, no matter whether their food be animal or vegetable. The Australian knows that a snake in good condition ought to have plenty of fat, and to be well flavored, and is always easy in his mind so long as he can catch one.

The process of cooking (see page 716) is exactly like that which is employed with fish, except that more pains are taken about it, as is consistent with the superior character of the food. The fire being lighted, the native squats in front of it and waits until the flame and smoke have partly died away, and then carefully coils the snake on the embers, turning it and recoiling it until all the scales are so scorched that they can be rubbed off. He then allows it to remain until it is cooked according to his ideas, and eats it deliberately, as becomes such a dainty, picking out the best parts for himself, and, if he be in a good humor, tossing the rest to his wives.

Snake hunting is carried on in rather a curious manner. Killing a snake at once, unless it should be wanted for immediate consumption, would be extremely foolish, as it would be unfit for food before the night had passed away. Taking it alive, therefore, is the plan which is adopted by the skilful hunter, and this he manages in a very ingenious way.

Should he come upon one of the venomous serpents, he cuts off its retreat, and with his spear or with a forked stick he irritates it with one hand, while in his other he holds the narrow wooden shield. By repeated blows he induces the reptile to attack him, and dexterously receives the stroke on the shield, flinging the snake back by the sudden repulse. Time after time the snake renews the attack, and is as often foiled; and at last it yields the battle, and lies on the ground completely beaten. The hunter then presses his forked stick on the reptile's neck, seizes it firmly, and holds it while a net is thrown over it and it is bound securely to his spear. It is then carried off, and reserved for the next day's banquet.

Sometimes the opossum-skin cloak takes the place of the shield, and the snake is allowed to bite it.

The carpet snake, which sometimes attains the length of ten or twelve feet, is favorite game with the Australian native, as its large size furnishes him with an abundant supply of meat, as well as the fat in which his soul delights. This snake mostly lives in holes at the foot of the curious grass-tree, of which we shall see several figures in the course of the following pages, and in many places it is so plentiful that there is scarcely a grass-tree without its snake.

As it would be a waste of time to probe each hole in succession, the natives easily ascertain those holes which are inhabited by smearing the earth around them with a kind of white clay mixed with water, which is as soft as putty. On the following day they can easily see, by the appearance of the clay, when a snake has entered or left its hole, and at once proceed to induce the reptile to leave its stronghold. This is done by putting on the trunk of the tree immediately over the hole a bait, which the natives state to be honey, and waiting patiently, often for many hours, until the serpent is attracted by the bait and climbs the tree. As soon as it is clear of the hole, its retreat is cut off, and the result of the ensuing combat is a certainty. The forked spear which the native employs is called a bo-bo.

All the tribes which live along the eastern coast, especially those which inhabit the northern part of the country, are in the habit of capturing the dugong. This animal is very fond of a green, branchless, marine alga, and ventures to the shore in order to feed upon it. The natives are on the watch for it, and, as soon as a dugong is seen, a canoe puts off after it.

Each canoe is furnished with paddles and a harpooner, who is armed with a weapon very similar to that which is used by the turtle catchers, except that no buoy is required. It is composed of a shaft some twelve or fifteen feet in length, light at one end, and heavy at the other. A hole is made at the heavy end, and into the hole is loosely fitted a kind of spear head made of bone, about four inches in length, and covered with barbs. One end of a stout and long rope is made fast to this head, and the other is attached to the canoe.

As soon as he is within striking distance, the harpooner jumps out of the boat into the water, striking at the same time with his weapon, so as to add to the stroke the force of his own weight. Disengaging the shaft, he returns to the canoe, leaving the dugong attached to it by the rope. The wounded animal dives and tries to make its way seaward. Strange to say, although the dugong is a large animal, often eight feet in length, and very bulky in proportion to its length, it seldom requires to be struck a second time, but rises to the surface and dies in a few minutes from a wound occasioned by so apparently insignificant a weapon as a piece of bone struck some three inches into its body. When it is dead, it is towed ashore, and rolled up the bank to some level spot, where preparations are at once made for cooking and eating it.

Those who are acquainted with zoölogy are aware that the dugong is formed much after the manner of the whale, and that it is covered first with a tough skin and then with a layer of blubber over the muscles. This structure, by the way, renders its suc-

cumbing to the wound of the harpoon the more surprising. The natives always cut it up in the same manner. The tail is sliced much as we carve a round of beef, while the body is cut into thin slices as far as the ribs, each slice having its own proportion of meat, blubber, and skin. The blubber is esteemed higher than any other portion of the animal, though even the tough skin can be rendered tolerably palatable by careful cooking.

Of all Australian animals, the kangaroo is most in favor, both on account of the excellent quality of the flesh, and the quantity which a single kangaroo will furnish. It is hardly necessary to remind the reader that with the Australian, as with other savages, quantity is considered rather than quality. A full grown "boomah" kangaroo will, when standing upright, in its usual attitude of defence, measure nearly six feet in height, and is of very considerable weight. And, when an Australian kills a kangaroo, he performs feats of gluttony to which the rest of the world can scarcely find a parallel, and certainly not a superior. Give an

Australian a kangaroo and he will eat until he is nearly dead from repletion; and he will go on eating, with short intervals of rest, until he has finished the entire kangaroo.

Like other savage creatures, whether human or otherwise, he is capable of bearing deprivation of food to a wonderful extent; and his patient endurance of starvation, when food is not to be obtained, is only to be excelled by his gluttony when it is plentiful. This curious capacity for alternate gluttony and starvation is fostered by the innately lazy disposition of the Australian savage, and his utter disregard for the future. The animal that ought to serve him and his family for a week is consumed in a few hours; and, as long as he does not feel the pain of absolute hunger, nothing can compel the man to leave his rude couch and go off on a hunting expedition. But when he does make up his mind to hunt, he has a bulldog sort of tenacity which forbids him to relinquish the chase until he has been successful in bringing down his game.

CHAPTER LXXI.

AUSTRALIA — *Continued.*

WEAPONS OF THE AUSTRALIANS, THEIR FORMS AND USES—THE CLUB OR WADDY, AND ITS VARIOUS FORMS—USES OF THE WADDY—A DOMESTIC PANACEA—AN AUSTRALIAN DUEL—THICK SKULLS OF THE NATIVES—LOVE OF THE NATIVE FOR HIS WADDY—THE BLACK POLICE FORCE—THE MISSILE WADDY—THE KATTA, OR DIGGING-STICK, AND ITS VARIED USES—HOW AN AUSTRALIAN DIGS A HOLE—THE STONE TOMAHAWK AND ITS USE—THE ASCENT OF TREES—HOW AN AUSTRALIAN KNOWS WHETHER AN ANIMAL IS IN A TREE—SMOKING OUT THE PREY—THE BLACK-BOY GUM—THE GRASS-TREE OF AUSTRALIA—THE AUSTRALIAN SAW.

As in the course of the following pages all the weapons of the Australian will have to be mentioned, we will take the opportunity of describing them at once, without troubling ourselves as to the peculiar locality in which each modification is found.

We will begin with the club, the simplest of all weapons. Several examples of the club are to be seen in the illustration entitled "Australian Clubs," on the 722d page. All the figures are drawn from actual specimens, some belonging to my own collection, some being sketched from examples in the British Museum, and others being taken from the fine collection of Colonel Lane Fox.

The simplest form of Australian club is that which is known by the name of "waddy," and which is the favorite weapon of an Australian savage, who never seems to be happy without a waddy in his hands, no matter what other weapons he may happen to carry. One of these waddies may be seen at fig. 4, and another at fig. 5. The latter is a specimen in my own collection, and affords a very good example of the true Australian waddy. It is made of the tough and heavy wood of the gum-tree, and is really a most effective weapon, well balanced, and bears marks of long usage. The length is two feet eight inches, and, as the reader may see from the illustration, it is sharpened at the point, so that in close combat it can be used for stabbing as well as for striking. It weighs exactly twenty-one ounces.

Four deep grooves run along the waddy, from the point to the spot where it is grasped, and seem to be intended as edges whereby a blow may cut through the skin as well as inflict a bruise. Besides these grooves, there are sundry carvings which the native evidently has thought to be ornamental. On two of the sides the pattern is merely the double-headed T seen in the illustration, but on the other two sides the pattern is varied. In every case the top figure is the double T; but on one side there is first a T, then a cross with curved arms, then a T, and then a pattern that looks something like a key, having a bow at each end. The fourth side is evidently unfinished, there being only two patterns on it; the second, evidently an attempt to imitate the letter B, showing that the maker had some acquaintance with civilization.

With this waddy the native is better armed than most men would be with the keenest sword that ever was forged, and with it he strikes and stabs with marvellous rapidity, seeming to be actuated, when in combat, by an uncontrollable fury. He can use it as a missile with deadly effect; and if, as is generally the case, he has several of these waddies in his hand, he will hurl one or two of them in rapid succession, and, while the antagonist is still attempting to avoid the flying weapon, precipitate himself upon the foe, and attack him with the waddy which he has reserved for hand-to-hand combat.

The waddy is the Australian panacea for

domestic troubles, and if one of his wives should presume to have an opinion of her own, or otherwise to offend her dusky lord, a blow on the head from the ever-ready waddy settles the dispute at once by leaving her senseless on the ground. Sometimes the man strikes the offender on a limb, and breaks it; but he does not do this unless he should be too angry to calculate that, by breaking his slave's arm or leg, he deprives himself of her services for a period.

With the Australian man of honor the waddy takes the place which the pistol once held in England and the United States, and is the weapon by which disputes are settled. In case two Australians of reputation should fall out, one of them challenges the other to single combat, sending him a derisive message to the effect that he had better bring his stoutest waddy with him, so that he may break it on the challenger's head.

Thickness of skull—a reproach in some parts of the world—is among the Australians a matter of great boast, and one Australian can hardly insult another in more contemptuous words than by comparing his skull to an emu's egg-shell. I have examined several skulls of Australian natives, and have been much surprised by two points: the first is the astonishing thickness and hardness of the bone, which seems capable of resisting almost any blow that could be dealt by an ordinary weapon; and the second is the amount of injury which an Australian skull can endure. Owing to the thickness of the skull, the Australian puts his head to strange uses, one of the oddest of which is his custom of breaking sticks on his head instead of snapping them across the knee.

In due time the combatants appear on the ground, each bearing his toughest and heaviest waddy, and attended by his friends. After going through the usual gesticulations and abuse which always precede a duel between savages, the men set definitely to work.

The challenged individual takes his waddy, and marches out into the middle of the space left by the spectators. His adversary confronts him, but unarmed, and stooping low, with his hands on his knees, he offers his head to the opponent. The adversary executes a short dance of delight at the blow which he is going to deal, and then, after taking careful aim, he raises his waddy high in the air, and brings it down with all his force on the head of his foe.

The blow would fell an ordinary ox; but the skull of an Australian is made of sterner stuff than that of a mere ox, and the man accordingly raises himself, rubs his head, and holds out his hand to his nearest friend, who gives him the waddy, which he is about to use in his turn. The challenged man now takes his turn at stooping, while the challenger does his best to smash the skull of

the antagonist. Each man, however, knows from long experience the hardest part of his own skull, and takes care to present it to the enemy's blow. In this way they continue to exchange blows until one of them falls to the ground, when the victory is decided to remain with his antagonist.

In consequence of the repeated injuries to which the head of a native Australian is subjected, the skull of a warrior presents, after death, a most extraordinary appearance, being covered with dents, fractures, and all kinds of injuries, any one of which would have killed an European immediately, but which seems to have only caused temporary inconvenience to the Australian.

So fond is the Australian of his waddy, that even in civilized life he cannot be induced to part with it. Some of my readers may be aware that a great number of captives are now enrolled among the police, and render invaluable service to the community, especially against the depredations of their fellow-blacks whom they persecute with a relentless vigor that seems rather surprising to those who do not know the singular antipathy which invariably exists between wild and tamed animals, whether human or otherwise. In fact, the Australian native policeman is to the colonist what the "Totty" of South Africa is to the Dutch and English colonists, what the Ghoorka or Sikh of India is to the English army, and what the tamed elephant of Ceylon or India is to the hunter.

These energetic "black fellows" are armed with the ordinary weapons of Europeans, and are fully acquainted with their use. But there is not one of them who thinks himself properly armed unless he has his waddy; and, when he enters the bush in search of native thieves, he will lay aside the whole of his clothing, except the cap which marks his office, will carry his gun with him, buckle his cartouch-pouch round his naked waist, and will take his waddy as a weapon, without which even the gun would seem to him an insufficient weapon.

This form of waddy (fig. 4), although it is often used as a missile, is not the one which the native prefers for that purpose. His throwing waddy or "wadna," is much shorter and heavier, and very much resembles the short missile club used so effectively by the Polynesians. Two other forms of waddy are shown at figs. 3 and 5, the latter of which is generally known by the name of "piccaninny waddy," because it is generally smaller and lighter than the others, and can be used by a child.

Nos. 1 and 2 are also clubs, but are made in a different form, and used in a different manner. If the reader will refer to the account of the Abyssinian curved sword, or shotel, he will see that in general form it much resembles this club, the long pointed

TOMAHAWKS. (See page 723.)

BASKET. (See page 699.)

head of each being equally useful in striking downward over a shield. This weapon is not only used in combat, but is employed in the native dances to beat time by repeated strokes on the shield.

The reader will notice that many of these clubs have the ends of the handles pointed. This formation is partly for the purpose of increasing their efficiency as offensive weapons, and partly for another object. As was the case with the warriors of the Iliad, both combatants will occasionally rest, and give each other time to breathe, before renewing the fight. During these intervals the Australian combatants squat down, dig up the earth with the handle of the club, and rub their hands with the dusty soil, in order to prevent the weapons from slipping out of their grasp.

This club is made in a very ingenious way, the artificer taking advantage of some gnarled branch, and cutting it so that the grain of the wood follows the curve, or rather the angle of the head, which adds greatly to its strength. A club of almost the same shape, and cut similarly from the angle of a branch, is used in New Caledonia, and, but for the great superiority of the workmanship, might easily be mistaken for the angular club of the Australian.

This particular form of club has a tolerably wide range, and among the tribes which inhabit the shores of Encounter Bay is called Marpangye.

In many parts of Australia the natives have a curious weapon which much resembles a sword. It is from three to four feet in length, is flat, about three inches in width, and has the outer edge somewhat sharpened. Being made of the close-grained wood of the gum-tree, it is very heavy in proportion to its size, and in practised hands is a most formidable weapon.

The Australian women carry an instrument which is sometimes thought to be a spear, and sometimes a club, but which in the hands of a woman is neither, though a man will sometimes employ it for either purpose. It is simply a stick of variable length, sharpened at one end and the point hardened by fire. It is called by the natives the "katta," and is popularly known by the appropriate name of the digging-stick.

With this stick the natives contrive to dig up the ground in a most astonishing manner, and an English "navvy," with his pick, spade, and barrow, would feel considerably surprised at the work which is done by the naked black, who has no tools except a pointed stick. Let, for example, a navvy be set to work at the task of digging out an echidna from its hole, and he would find his powers of digging baffled by the burrowing capabilities of the animal, which would make its way through the earth faster than could the navvy. In order to sink some six feet deep into the ground, the white man would

be obliged to make a funnel-shaped hole of very large size, so as to allow him to work in it, and to give the pick and spade free play as he threw out the soil.

The black man, on the contrary, would have no such difficulty, but knows how to sink a hole without troubling himself to dig a foot of needless soil. This he does by handling the katta precisely as the Bosjesman handles his digging-stick, *i. e.* by holding it perpendicularly, jobbing the hardened point into the ground, and throwing out with his hands the loosened earth.

In digging out one of the burrowing animals, the black hunter pushes a long and flexible stick down the hole, draws it out, measures along the ground to the spot exactly above the end of the burrow, replaces the stick, and digs down upon it. By the time that he has reached it, the animal has gone on digging, and has sunk its burrow still further. The stick is then pushed into the lengthened burrow, and again dug down upon; and the process is repeated until the tired animal can dig no more, and is captured. The katta also takes the part of a weapon, and can be wielded very effectively by a practised hand, being used either for striking or thrusting.

We now come to a curious instrument which is often thought to be a weapon, but which, although it would answer such a purpose very well, is seldom used for it. This is the tomahawk, or hammer, as it is generally called. Three varieties of the tomahawk are given in the illustration "Tomahawks" on the 722d page. In all of them the cutting part is made of stone and the handle of wood, and the head and the handle are joined in several different ways, according to the fashion of the locality in which the instrument is made. The simplest plan is that which is shown in fig. 1. In this instrument, a conveniently shaped piece of stone has been selected for a head, and the handle is made of a flexible stick bent over it, and the two ends firmly lashed together, just as the English blacksmith makes handles for his punches and cold chisels. This weapon was made in New South Wales.

At fig. 3 is shown a tomahawk of a more elaborate construction. Here the stone head has been lashed to the shaft by a thong, which is wrapped over it in a way that exactly resembles the lashing employed by the New Zealander or the Dyak for the same purpose. The tomahawk at fig. 4 is, however, the best example of the instrument, and is taken from a specimen in the British Museum. The handle and head are shaped much like those of fig. 3, but the fastening is much more elaborate.

In the first place, the head is held to the handle by lashings of sinews, which are drawn from the tail of the kangaroo, and always kept in readiness by the Australian savage. The sinews are steeped in hot

water, and pounded between two stones, in order to separate them into fibres; and, while still wet and tolerably elastic, they are wrapped round the stone and the handle. Of course, as they dry, they contract with great force, and bind the head and handle together far more securely than can be done with any other material. Even raw hide does not hold so firmly as sinew.

When the sinew lashing is perfectly dry, the native takes a quantity of the peculiar substance called "black-boy" wax, and kneads it over the head and the end of the handle, so as to bind everything firmly together.

Another instrument is shown at fig. 2, in which the combination of stone and vegetable is managed in another way. The blade is formed from a piece of quartz about as long as a man's hand, which has been chipped into the form of a spear-head. The handle, instead of being a piece of wood, is simply a number of fibres made into a bundle. The base of the stone head has been pushed among the loose ends of the fibres, and then the whole has been bound firmly together by a lashing of string made of reeds. This is a sort of dagger; and another form of the same instrument is made by simply sharpening a stick about eighteen inches in length, and hardening the sharpened end in the fire. It is, in fact, a miniature katta, but is applied to a different purpose.

These axes and daggers have been mentioned together, because they are used for the same purpose, namely, the ascent of trees.

Active as a monkey, the Australian native can climb any tree that grows. Should they be of moderate size, he ascends them, not by clasping the trunk with his legs and arms (the mode which is generally used in England), and which is popularly called "swarming." Instead of passing his legs and arms round the tree-trunk as far as they can go, he applies the soles of his feet to it in front, and presses a hand against it on either side, and thus ascends the tree with the rapidity of a squirrel. This mode of ascent is now taught at every good gymnasium in England, and is far superior to the old fashion, which has the disadvantage of slowness, added to the certainty of damaging the clothes.

Those who have seen our own acrobats performing the feat called *La Perche*, in which one man balances another on the top of a pole, or the extraordinary variations on it performed by the Japanese jugglers, who balance poles and ladders on the soles of their feet, will be familiar with the manner in which one of the performers runs up the pole which is balanced by his companion. It is by this method that the Australian ascends a tree of moderate dimensions, and, when he is well among the boughs, he traverses them with perfect certainty and quickness.

Trees which will permit the man to ascend after this fashion are, however, rather scarce in the Australian forests, and, moreover, there is comparatively little inducement to climb them, the hollows in which the bees make their nests and the beasts take up their diurnal abode being always in the branch or trunk of some old and decaying tree. Some of these trees are so large that their trunks are veritable towers of wood, and afford no hold to the hands; yet they are ascended by the natives as rapidly as if they were small trees.

By dint of constant practice, the Australian never passes a tree without casting a glance at the bark, and by that one glance he will know whether he will need to mount it. The various arboreal animals, especially the so called opossums, cannot ascend the tree without leaving marks of their claws in the bark. There is not an old tree that has not its bark covered with scratches, but the keen and practised eye of the native can in a moment distinguish between the ascending and descending marks of the animal, and can also determine the date at which they were made.

The difference between the marks of an ascending and descending animal is easy enough to see when it has once been pointed out. When an animal climbs a tree, the marks of its claws are little more than small holes, with a slight scratch above each, looking something like the conventional "tears" of heraldry. But, when it descends, it does so by a series of slippings and catchings, so that the claws leave long scratches behind them. Nearly all arboreal animals, with the exception of the monkey tribe, leave marks of a similar character, and the bear hunter of North America and the 'possum hunter of Australia are guided by similar marks.

Should the native hunter see an ascending mark of more recent date than the other scratches, he knows that somewhere in the tree lies his intended prey. Accordingly, he lays on the ground everything that may impede him, and, going to the tree-trunk, he begins to deliver a series of chopping blows with his axe. These blows are delivered in pairs, and to an Englishman present rather a ludicrous reminiscence of the postman's double rap. By each of these double blows he chops a small hole in the tree, and manages so as to cut them alternately right and left, and at intervals of two feet or so.

Having cut these notches as high as he can reach, he places the great toe of his left foot in the lowermost hole, clasps the tree with his left arm, and strikes the head of the tomahawk into the tree as high as he can reach. Using the tomahawk as a handle by which he can pull himself up, he lodges the toe of his right foot in the second hole, and is then enabled to shift the toe of the left foot into the third hole. Here he waits for a moment, holding tightly by both his feet and

the left hand and arm, while he cuts more notches; and, by continuing the process, he soon reaches the top of the tree.

When he reaches the first branch, he looks carefully to find the spot toward which the tell-tale scratches are directed, and, guided by them alone, he soon discovers the hole in which the animal lies hidden. He tests the dimensions of the hollow by tapping on the trunk with the axe, and, if it should be of moderate depth, sets at work to chop away the wood, and secure the inmate.

Should, however, the hollow be a deep one, he is obliged to have recourse to another plan. Descending the tree by the same notches as those by which he had climbed it, he takes from his bundle of belongings a fire-stick, *i. e.* a sort of tinderlike wood, which keeps up a smouldering fire, like that of the willow "touchwood" so dear to schoolboys. Wrapping up the fire-stick in a bundle of dry grass and leaves, he re-ascends the tree, and, when he has reached the entrance of the burrow, he whirls the bundle round his head until the fire spreads through the mass, and the grass bursts into flame.

As soon as it is well inflamed, he pushes some of the burning material into the burrow, so as to fall upon the enclosed animal, and to rouse it from the heavy sleep in which it passes the hours of daylight. He also holds the rest of the torch at the entrance of the burrow, and manages to direct the smoke into it. Did he not rouse the animal by the burning leaves, he would run a chance of suffocating it in its sleep. This may seem to be a very remote contingency, but in fact it is very likely to happen. I have known a cat to be baked alive in an oven, and yet not to be awaked from sleep, as was evident by the attitude in which the body of the animal was found curled up, with its chin on its paws, and its tail wrapped round its body. Yet the slumber of a domesticated cat, which can sleep as often as it likes in the day or night, is not nearly so deep as that which wraps in oblivion the senses of a wild animal that is abroad all night, and whose whole structure is intended for a nocturnal life.

The chopping holes, and getting the toes into them, seems in theory to be rather a tedious business, but in practice it is quite the contrary, the native ascending almost as quickly as if he were climbing a ladder. As the large trees are so capable of containing the animals on which the Australians feed, there is scarcely one which does not exhibit several series of the notches that denote the track of a native. Strange to say, the Australian hunters will not avail themselves of the notches that have been made by other persons, but each man chops a new series of holes for himself every time that he wants to ascend a tree.

Sometimes a man sees the track of an

animal or the indication of a bee's nest on a tree when he happens not to have an axe in hand. In such a case he is still able to ascend the tree, for he can make use of the dagger which has been already described, punching holes in the bark, and pulling himself up exactly as if he had a tomahawk, the only difference being that the holes are smaller and the work is harder.

When the hunter has once found the entrance of the burrow, the capture of the inmate is simply a matter of time, as the heat and smoke are sure to force it into the air, where it has the double disadvantage of being half-choked with smoke and being blind with the flame and the daylight, to which its eyes are unaccustomed. A blow on the head from the tomakawk, or a stab from the dagger, renders it senseless, when it is flung on the ground, and the successful hunter proceeds to traverse the tree in case some other animal may be hidden in it.

The skill of the natives in tree climbing is also exercised for another purpose besides hunting for bees and animals. The well-known cabbage-palm grows to a very great height, and, like other palms, never grows quite straight, but has always a bend in the trunk. After the manner of the palm-tribe, it grows by a succession of buds from the top, and this bud, popularly called the "cabbage," is a favorite article of food. It has been called the prince of vegetables, and one enthusiastic traveller declares that it must have been the ambrosia of the Olympic gods. The removal of the bud causes the death of the tree, and for that reason the vegetable is forbidden in civilized regions under penalty of a heavy fine. The savage, however, who has no idea of care for the morrow, much less of looking forward to future years, takes the bud wherever he meets it, caring nothing for the death of the useful tree. He ascends by means of a little wooden dagger, or warpoos, or makes use of the tomahawk. The quartz dagger which was shown in a previous illustration would not be used for tree climbing, unless the owner could not procure a tomahawk or warpoos. Its chief use is as a weapon, and it can be also employed as a knife, by means of which the savage can mutilate a fallen enemy, after the manner which will be described when we come to treat of warfare in Australia.

The "black-boy" gum, which plays so large a part in the manufacture of Australian weapons and implements, is obtained from the grass-tree, popularly called the "black boy," because at a distance it may easily be mistaken for a native, with his spear and cloak. It is very tenacious in its own country, but when brought to England it becomes brittle, and is apt to break away from the weapon in fragments, just as does a similar preparation called "kurumanni" gum, which is made by the natives of Gui-

ana. It is quite black, and when dry is extremely hard.

The grass-tree is one of the characteristic plants of Australia, and partakes of the strange individuality of that curious country. The trunk is cylindrical, and looks like that of a palm, while an enormous tuft of long leaves starts from the top and droops in all directions, like a gigantic plume of feathers. The flower shoots up straight from the centre; and the long stalk becomes, when dried, so hard, tough, and light, that it is made into spear shafts.

There is in my collection an Australian saw (illustrated on page 722), in the manufacture of which the black-boy gum plays a considerable part. No one would take it for a saw who did not know the implement, and indeed it looks much more like a rude dagger than a saw. It is made from a piece of wood usually cut from a branch of the gum-tree, and about as thick as a man's finger at the thickest part, whence it tapers gradually to a point. The average length of the saw is fourteen inches, though I have seen them nearly two feet long.

Along the thicker end is cut a groove, which is intended to receive the teeth of the saw. These teeth are made from chips of quartz or obsidian, the latter being preferred; and some makers, who have been brought in contact with civilization, have taken to using fragments of glass bottles. A number of flat and sharp-edged chips are selected as nearly as possible of the same

size, and being on an average as large as a shilling. These the natives insert into the groove with their sharp edges uppermost. A quantity of black-boy wax is then warmed and applied to them, the entire wood of the saw being enveloped in it, as well as the teeth for half their depth, so as to hold them firmly in their places. As the chips of stone are placed so as to leave little spaces between them, the gaps are filled in with this useful cement.

For Australian work this simple tool seems to answer its purpose well enough. Of course it is very slow in its operation, and no great force can be applied to it, lest the teeth should be broken, or twisted out of the cement. The use of this saw entails great waste of material, time, and labor; but as the first two of these articles are not of the least value to the natives, and the third is of the lightest possible kind, the tool works well enough for its purpose. A perfect specimen of this saw is not often seen in this country, as the black-boy wax flakes off, and allows the teeth to drop out of their place. Even in my own specimen, which has been carefully tended, the wax has been chipped off here and there, while in instruments that have been knocked about carelessly scarcely a tooth is left in its place. Owing to the pointed end of the handle, the saw can be used after the fashion of a dagger, and can be employed, like the war-poo, for the ascent of trees.

CHAPTER LXXII.

AUSTRALIA — *Continued.*

THE AUSTRALIAN SPEAR AND ITS MANY FORMS—THE THROWING-SPEAR OR JAVELIN—A GROUP OF AUSTRALIAN SPEARS—THE LIGHTNESS OF THE SHAFT—THE MANY-POINTED FISH-SPEAR—INGENIOUS MODE OF TIPPING THE POINTS WITH BONE, AND FASTENING THEM TO THE SHAFT—ELASTICITY OF THE POINTS—DOUBLE USE AS PADDLE AND SPEAR—AN ELABORATELY-MADE WEAPON—FLINT-HEADED SPEARS—EXCELLENCE OF THE AUSTRALIAN AS A THROWER OF MISSILES—THE CLUB, THE STONE, AND THE “KANGAROO-RAT”—THE THROW-STICK, MIDLAH, OR WUMMERAH—PRINCIPLE ON WHICH IT IS CONSTRUCTED—MODES OF QUIVERING THE SPEAR—DISTANCE TO WHICH IT CAN BE THROWN—THE UNDERHAND THROW—ACCURACY OF AIM—SPEARING THE KANGAROO—THE BOW AND ARROW—STRENGTH OF THE BOW—THE BATTAN STRING AND INGENIOUS KNOT—CAREFUL MANUFACTURE OF THE ARROWS—PRESUMED ORIGIN OF THE WEAPONS—THE BOOMERANG AND ITS VARIOUS FORMS—MODE OF THROWING THE WEAPON—ITS PROBABLE ORIGIN—STRUCTURE OF THE BOOMERANG—THE AUSTRALIAN SHIELD, ITS FORMS AND USES—THE WOODEN AND THE BARK SHIELDS.

WE now come to the various forms of the spears which are used by the native Australians.

The usual weapon is slight, and scarcely exceeds in diameter the assagai of Southern Africa. It is, however, considerable longer, the ordinary length being from nine to eleven feet. As a general rule, the spear is constructed after a very rude fashion, and the maker seems to care but little whether the shaft be perfectly straight, so that the weapon be tolerably well balanced. There are several specimens of Australian spears in my collection, one of which (a weapon that has evidently been a favorite one, as it shows marks of long usage) is twice bent, the second bend counteracting the former, and so bringing the weapon tolerably straight.

The butt of the Australian spear, like that of the South African assagai, is very slight, the shaft tapering gradually from the head, which is about as large as a man's finger, to the butt, where it is hardly thicker than an artist's pencil. This, being one of the common spears, is simply sharpened at the end, and a few slight barbs cut in the wood. I have, however, specimens in which there is almost every variety of material, dimensions, and structure that can be found in Australia.

Some of these are made on the same principle as that which has just been described, but differ from it in having a separate head,

made of hard and heavy wood. This is deeply cut with barbs; so that the weapon is a more formidable one than that which is made simply from one piece of wood. The head of one of these spears is shown at fig. 7 in the illustration “Heads of Spears,” on page 731.

Several of the spears are perfectly plain, being simply long sticks, pointed at the larger end. These, however, have been scraped very carefully, and seem to have had more pains bestowed upon them than those with more elaborate heads. These spears are about eight feet in length.

Then there are other spears with a variable number of heads, and of variable dimensions. The commonest form of multiheaded spears has either three or four points; but in every other respect, except number, the spear heads are constructed in the same manner. One of these spears, now before me, has a shaft about nine feet in length, and rather more than an inch in diameter at the thickest part, which, as is usual with Australian spears, is just below the head. The wood of which it is made is exceedingly light and porous; but this very quality has unfortunately made it so acceptable to the pillinus beetles that they have damaged it sadly, and rendered it so brittle that a very slight shock would snap it. Indeed, the shaft of one of them was broken into three pieces by a little child stumbling against it while coming down stairs.

The four points which constitute the head are cut from the gum-tree, the wood of which is hard and durable, and can be trimmed to a very sharp point without danger of breakage. Each of them is twenty inches in length, and they are largest in the middle, tapering slightly at one end so as to permit of their being fastened to the shaft, and being scraped to a fine point at the other end.

On examination I find that the large end of the shaft has been cut into four grooves, in each of which is placed the butt end of one of the points, which is fixed temporarily by black-boy gum. Wedgelike pegs have then been pushed between the points, so as to make them diverge properly from each other, and, when they have assumed the proper position, they have been tightly bound together with cord. A layer of black-boy gum has then been kneaded over the string, so as to keep all firmly together.

So much for the mode of putting on the points, the end of one of which may be seen at fig. 3 in the illustration. My own specimen, however, is better made than that from which the sketch has been taken. The reader will perceive that there is a barb attached to the point, and lashed in its place by string. In my specimen the barb is made of a piece of bone about as long as a skewer, and sharply pointed at both ends. In the example shown in the illustration, the barb merely projects from the side of the point, whereas in my specimen the bone answers the purpose both of point and barb. In order to enable it to take the proper direction, the top of the wooden point is bevelled off, and the piece of bone lashed to it by the middle, so that one end becomes the point of the weapon, and the other end does duty for the barb. Wishing to see how this was done, I have cut away part of the lashings of one of the four points, and have been much struck with the ingenuity displayed by the maker in fastening the bone to the point, so as to make it discharge its double duty. The barbs are all directed inward, so that, when the native makes a stroke at a fish, the slippery prey is caught between the barbs, and held there just as is an eel between the prongs of the spear. The elasticity of the four long points causes them to diverge when they come upon the back of a fish, and to contract tightly upon it, so that the points of the barbs are pressed firmly into its sides.

This spear also stands the native instead of a paddle, and with it he contrives to guide his fragile bark with moderate speed. How he manages to stand erect in so frail a vessel, to paddle about, to strike the fish, and, lastly, to haul the struggling prey aboard, is really a marvel. The last-mentioned feat is the most wonderful, as the fish are often of considerable size, and the mere leverage of their weight at the end of a

ten-foot spear, added to the violent struggles which the wounded fish makes, seems sufficient to upset a far more stable vessel.

Yet the natives manage to pass hour after hour without meeting with an accident, and in one of their tiny boats, which seem scarcely large enough to hold a single European, even though he should be accustomed to the narrow outrigger skiff, or the comparatively modern canoe, two men will be perfectly comfortable, spearing and hauling in their fish, and even cooking them with a fire made on an extemporized hearth of wet sand and stones in the middle of the canoe.

Night is the favorite time for fish spearing, and then the sight of a number of natives engaged in the watery chase is a most picturesque one. They carry torches, by means of which they see to the bottom of the water, and which have also the advantage of dazzling the fish; and the effect of the constantly moving torches, the shifting glare on the rippled water, and the dark figures moving about, some searching for fish, others striking, and others struggling with the captured prey, is equally picturesque and exciting. The torches which they use are made of inflammable bark; and the whole scene is almost precisely like that which is witnessed in "burning the water," in North America, or, to come nearer home, "leistering" in Scotland.

In the daytime they cannot use the torch, and, as the slightest breeze will cause a ripple on the surface of the water that effectually prevents them from seeing the fish, they have an ingenious plan of lying flat across the canoe, with the upper part of the head and the eyes immersed in the water, and the hand grasping the spear ready for the stroke. The eyes being under the ripple, they can see distinctly enough.

I have often employed this plan when desirous of watching the proceedings of sub-aquatic animals. It is very effectual, though after a time the attitude becomes rather fatiguing, and those who are not gymnasts enough to be independent as to the relative position of their heads and heels are apt to find themselves giddy from the determination of blood to the head.

Another spear, also used for fishing, and with an elaborate head, is seen at fig 8. In this spear one point is iron, and the other two are bone. The weapon is remarkable for the manner in which the shaft is allowed to project among the points, and for the peculiar mode in which the various parts are lashed together. This specimen comes from the Lower Murray River.

There is in my collection a weapon which was brought from Cape York. It is a fishing spear, and at first sight greatly resembles that which has just been described. It is, however, of a more elaborate character, and deserves a separate description. It is seven feet in length, and very slender, the

thickest part of the shaft not being more than half an inch in diameter. It has four points, two of which are iron and without barbs, the iron being about the thickness of a crow-quill, and rather under three inches in length. The two bone points are made from the flat tail-bone of one of the rays, and, being arranged with the point of the bone in front, each of these points has a double row of barbs directed backward, one running along each edge.

At fig. 6 of the same illustration is seen a very formidable variety of the throwing-spear. Along each side of the head the native warrior has cut a groove, and has stuck in it a number of chips of flint or quartz, fastened in their places by the black-boy gum, just as has been related of the saw. The workmanship of this specimen is, however, far ruder than that of the saw, the pieces of flint not being the same size, nor so carefully adjusted. Indeed, it seems as if the saw maker laid aside the fragments of flint which he rejected for the tool, and afterward used them in arming the head of his spear. One of these weapons in my collection is armed on one side of the head only, along which are arranged four pieces of obsidian having very jagged edges, and being kept in their places by a thick coating of black-boy gum extending to the very point of the spear.

At figs 4 and 5 of the same illustration are seen two spear heads which remind the observer of the flint weapons which have of late years been so abundantly found in various parts of the world, and which belonged to races of men now long extinct. The spear heads are nearly as large as a man's hand, and are made of flint chipped carefully into the required shape. They are flat, and the maker has had sufficient knowledge of the cleavage to enable him to give to each side a sharp and tolerably uniform edge. It will be observed that fig. 5 is much darker than fig. 4. This distinction is not accidental, but very well expresses the variety in the hue of the material employed, some of the spear heads being pale brown, and some almost black. The weapons are, in fact, nothing but elongations of the dagger shown in fig. 2, of the "tomahawks," on page 722.

If the reader will look at figs. 1 and 2 of the illustration, he will see that there are two heads of somewhat similar construction, except that one is single and the other double. These spears were brought from Port Essington.

Specimens of each kind are in my collection. They are of great size, one being more than thirteen feet in length, and the other falling but little short of that measurement. In diameter they are as thick as a man's wrist; and, however light may be the wood of which they are made, they are exceedingly weighty, and must be very in-

ferior in efficiency to the light throwing-spears which have already been described. Of course such a weapon as that is meant to be used as a pike, and not as a missile. Besides these, I have another with three heads, and of nearly the same dimensions as the two others.

In every case the head and the shaft are of different material, the one being light and porous, and the other hard, compact, and heavy. Instead of being lashed together with the neatness which is exhibited in the lighter weapons, the head and shaft are united with a binding of thick string, wrapped carefully, but yet roughly, round the weapon, and not being covered with the coating of black-boy gum, which gives so neat a look to the smaller weapons. In the three-pointed spear, the maker has exercised his ingenuity in decorating the weapon with paint, the tips of the points being painted with red and the rest of the head white, while the lashing is also painted red.

In his wild state the Australian native never likes to be without a spear in his hand, and, as may be expected from a man whose subsistence is almost entirely due to his skill in the use of weapons, he is a most accomplished spear thrower. Indeed, as a thrower of missiles in general the Australian stands without a rival. Putting aside the boomerang, of which we shall presently treat, the Australian can hurl a spear either with his hand or with the "throw-stick," can fling his short club with unerring aim, and, even should he be deprived of these missiles, he has a singular faculty of throwing stones. Many a time, before the character of the natives was known, has an armed soldier been killed by a totally unarmed Australian. The man has fired at the native, who, by dodging about, has prevented the enemy from taking a correct aim, and then has been simply cut to pieces by a shower of stones, picked up and hurled with a force and precision that must be seen to be believed. When the first Australian discoverer came home, no one would believe that any weapon could be flung and then return to the thrower, and even at the present day it is difficult to make some persons believe in the stone-throwing powers of the Australian. To fling one stone with perfect precision is not so easy a matter as it seems, but the Australian will hurl one after the other with such rapidity that they seem to be poured from some machine; and as he throws them he leaps from side to side, so as to make the missiles converge from different directions upon the unfortunate object of his aim.

In order to attain the wonderful skill which they possess in avoiding as well as in throwing spears, it is necessary that they should be in constant practice from childhood. Accordingly, they are fond of get-

ting up sham fights, armed with shield, throw-stick, and spear, the latter weapon being headless, and the end blunted by being split and scraped into filaments, and the bushy filaments then turned back, until they form a soft fibrous pad. Even with this protection, the weapon is not to be despised; and if it strike one of the combatants fairly, it is sure to knock him down; and if it should strike him in the ribs, it leaves him gasping for breath. This mimic spear goes by the name of "matamoodlu," and is made of various sizes according to the age and capabilities of the person who uses it.

There is one missile which is, I believe, as peculiar to Australia as the boomerang, though it is not so widely spread, nor of such use in war or hunting. It is popularly called the "kangaroo-rat," on account of its peculiar leaping progression, and it may be familiar to those of my readers who saw the Australian cricketers who came over to England in the spring of 1868. The "kangaroo-rat" is a piece of hard wood shaped like a double cone, and having a long flexible handle projecting from one of the points. The handle is about a yard in length, and as thick as an artist's drawing-pencil, and at a little distance the weapon looks like a huge tadpole with a much elongated tail. In Australia the natives make the tail of a flexible twig; but those who have access to the resources of civilization have found out that whalebone is the best substance for the tail that can be found.

When the native throws the kangaroo-rat, he takes it by the end of the tail and swings it backward and forward, so that it bends quite double, and at last he gives a sort of underhanded jerk and lets it fly. It darts through the air with a sharp and menacing hiss like the sound of a rifle ball, its greatest height being some seven or eight feet from the ground. As soon as it touches the earth, it springs up and makes a succession of leaps, each less than the preceding, until it finally stops. In fact, it skims over the ground exactly as a flat stone skims over the water when boys are playing at "ducks and drakes." The distance to which this instrument can be thrown is really astonishing. I have seen an Australian stand at one side of Kennington Oval, and throw the "kangaroo-rat" completely across it. Much depends upon the angle at which it first takes the ground. If thrown too high, it makes one or two lofty leaps, but traverses no great distance; and, if it be thrown too low, it shoots along the ground, and is soon brought up by the excessive friction. When properly thrown, it looks just like a living animal leaping along, and those who have been accustomed to traverse the country say that its movements have a wonderful resemblance to the long leaps of a kangaroo-rat fleeing in alarm, with its long tail trailing as a balance behind it.

A somewhat similarly shaped missile is used in Fiji, but the Fijian instrument has a stiff shaft, and it is propelled by placing the end of the forefinger against the butt, and throwing it underhanded. It is only used in a game in which the competitors try to send it skimming along the ground as far as possible.

To return to our spears. It is seldom that an Australian condescends to throw a spear by hand, the native always preferring to use the curious implement called by the aborigines a "wummerah," or "midlah," and by the colonists the "throw-stick." The theory of the throw-stick is simple enough, but the practice is very difficult, and requires a long apprenticeship before it can be learned with any certainty.

The principle of this implement is that of the sling; and the throw-stick is, in fact, a sling made of wood instead of cord, the spear taking the place of the stone. So completely is the throw-stick associated with the spear, that the native would as soon think of going without his spear as without the instrument whereby he throws it. The implement takes different forms in different localities, although the principle of its construction is the same throughout. In the illustration entitled "Throw-sticks," on page 731, the reader may see every variety of form which the throw-stick takes. He will see, on inspecting the figures, that it consists of a stick of variable length and breadth, but always having a barblike projection at one end. Before describing the manner in which the instrument is used, I will proceed to a short notice of the mode of its construction, and the various forms which it takes.

In the first place, it is always more or less flattened; sometimes, as in fig. 3, being almost leaf-shaped, and sometimes, as in fig. 6, being quite narrow, and throughout the greater part of its length little more than a flattened stick. It is always made of some hard and elastic wood, and in many cases it is large and heavy enough to be serviceable as a club at close quarters. Indeed, one very good specimen in my collection, which came from the Swan River, was labelled, when it reached me, as an Indian club. This form of the throw-stick is shown at fig. 3.

This particular specimen is a trifle under two feet in length, and in the broadest part it measures four inches and a half in width. In the centre it is one-sixth of an inch in thickness, and diminishes gradually to the edges, which are about as sharp as those of the wooden sword already mentioned. Toward the end, however, it becomes thicker, and at the place where the peg is placed it is as thick as in the middle. Such a weapon would be very formidable if used as a club—scarcely less so, indeed, than the well-known "merai" of New Zealand.

HEADS OF AUSTRALIAN SPEARS. (See page 727.)

THROW-STICKS. (See page 730.)

BOOMERANGS. (See page 737.)

That it has been used for this purpose is evident from a fracture, which has clearly been caused by the effect of a severe blow. The wood is split from one side of the handle half along the weapon, and so it has been rendered for a time unserviceable. The careful owner has, however, contrived to mend the fracture, and has done so in a singularly ingenious manner. He has fitted the broken surfaces accurately together, and has then bound them with the kangaroo-tail sinews which have already been mentioned. The sinews are flat, and have been protected by a thick coating of black-boy gum. Perhaps the reader may be aware that, when catgut is knotted, the ends are secured by scorching them, which makes them swell into round knobs. The sinew has the same property, and the native has secured the ends precisely as an English artisan would do.

The wood is that of the tough, hard, wavy-grained gum-tree. Whether in consequence of much handling by greasy natives, or whether from other causes, I do not know, but I cannot make a label adhere to it. To each of the specimens in my collection is attached a catalogue number, and though I have tried to affix the label with paste, gum, and glue, neither will hold it, and in a few days the label falls off of its own accord. This specimen has been cut from a tree which has been attacked by some boring insect, and the consequence is, that a small hole is bored through it edgewise, and has a very curious appearance. The hole looks exactly like that of our well-known insect, the great *Sirex*.

The peculiarly-shaped handle is made entirely of black-boy gum, and, with the exception of a tendency to warp away from the wood, it is as firm as on the day when it was first made. The peg which fits into the butt of the spear is in this case made of wood, but in many throw-sticks it is made of bone. Figs. 1 and 2 are examples of this flattened form of midlah, and were drawn from specimens in Southern Australia. At figs. 4 and 5 may be seen examples of the throw-stick of Port Essington, one of which, fig. 4, is remarkable for the peculiarly-shaped handle. That of fig. 5 seems to be remarkably inconvenient, and almost to have been made for the express purpose of preventing the native from taking a firm hold of the weapon. Fig. 6 is an example of the throw-stick of Queensland, and, as may easily be seen, can be used as a club, provided that it be reversed, and the peg end used as a handle.

There is another form of throw-stick used in Northern Australia, an example of which may be seen at fig. 6. It is a full foot longer than that which came from the Murray, and is one of the "flattened sticks" which have been casually mentioned. It has a wooden spike for the spear-butt, and a most remarkable handle. Two pieces of melon-shell

have been cut at rather long ovals, and have been fixed diagonally across the end of the weapon, one on each side. Black-boy gum has been profusely used in fixing these pieces, and the whole of the interior space between the shells has been filled up with it. A diagonal lashing of sinew, covered with the same gum, passes over the shells, and the handle is strongly wrapped with the same material for a space of five inches.

We will now proceed to see how the native throws the spear.

Holding the throw-stick by the handle, so that the other end projects over his shoulder, he takes a spear in his left hand, fits a slight hollow in its butt to the peg of the midlah, and then holds it in its place by passing the forefinger of the right hand over the shaft. It will be seen that the leverage is enormously increased by this plan, and that the force of the arm is more than doubled.

Sometimes, especially when hunting, the native throws the spear without further trouble, but when he is engaged in a fight he goes through a series of performances which are rather ludicrous to an European, though they are intended to strike terror into the native enemy. The spear is jerked about violently, so that it quivers just like an African assagai, and while vibrating strongly it is thrown. There are two ways of quivering the spear; the one by merely moving the right hand, and the other by seizing the shaft in the left hand, and shaking it violently while the butt rests against the peg of the throw-stick. In any case the very fact of quivering the spear acts on the Australian warrior as it does upon the African. The whirring sound of the vibrating weapon excites him to a pitch of frenzied excitement, and while menacing his foe with the trembling spear, the warrior dances and leaps and yells as if he were mad—and indeed for the moment he becomes a raving madman.

The distance to which the spear can be thrown is something wonderful, and its aspect as it passes through the air is singularly beautiful. It seems rather to have been shot from some huge bow, or to be furnished with some innate powers of flight, than to have been flung from a human arm, as it performs its lofty course, undulating like a thin black snake, and writhing its graceful way through the air. As it leaves the throw-stick, a slight clashing sound is heard, which to the experienced ear tells its story as clearly as the menacing clang of an archer's bowstring.

To me the distance of its flight is not nearly so wonderful as the precision with which it can be aimed. A tolerably long throw-stick gives so powerful a leverage that the length of range is not so very astonishing. But that accuracy of aim should be attained as well as length of flight is really

wonderful. I have seen the natives, when engaged in mock battle, stand at a distance of eighty or ninety yards, and throw their spears with such certainty that, in four throws out of six, the antagonist was obliged to move in order to escape the spears.

Beside the powerful and lofty throw, they have a way of suddenly flinging it underhand, so that it skims just above the ground, and, when it touches the earth, proceeds with a series of ricochets that must be peculiarly embarrassing to a novice in that kind of warfare.

The power of the spear is never better shown than in the chase of the kangaroo. When a native sees one of these animals engaged in feeding, he goes off to a little distance where it cannot see him, gathers a few leafy boughs, and ties them together so as to form a screen. He then takes his spears, throw-stick, and waddy, and goes off in chase of the kangaroo. Taking advantage of every cover, he slips noiselessly forward, always taking care to approach the animal against the wind, so that it shall not be able to detect his presence by the nostrils, and gliding along with studied avoidance of withered leaves, dry twigs, and the other natural objects which, by their rustling and snapping, warn the animal that danger is at hand.

As long as possible, the hunter keeps under the shelter of natural cover, but when this is impossible, he takes to his leafy screen, and trusts to it for approaching within range. Before quitting the trees or bush behind which he has been hiding himself, he takes his spear, fits it to the throw-stick, raises his arm with the spear ready poised, and never moves that arm until it delivers the spear. Holding the leafy screen in front of him with his left hand, and disposing the second spear and other weapons which cannot be hidden so as to look like dead branches growing from the bush, he glides carefully toward the kangaroo, always advancing while it stoops to feed, and crouching quietly behind the screen whenever it raises itself, after the fashion of kangaroos, and surveys the surrounding country.

At last he comes within fair range, and with unerring aim he transfixes the unsuspecting kangaroo. Sometimes he comes upon several animals, and in that case his second spear is rapidly fixed in the midlah and hurled at the flying animals, and, should he have come to tolerably close quarters, the short missile club is flung with certain aim. Having thrown all the missiles which he finds available, he proceeds to despatch the wounded animals with his waddy.

In the illustration No. 1, on the 739th page, the action of the throw-stick is well shown, and two scenes in the hunt are depicted. In the foreground is a hunter who has succeeded in getting tolerably close to the kangaroos

by creeping toward them behind the shadow of trees, and is just poising his spear for the fatal throw. The reader will note the curious bone ornament which passes through the septum of the nose, and gives such a curious character to the face. In the background is another hunter, who has been obliged to have recourse to the bough screen, behind which he is hiding himself like the soldiers in "Macbeth," while the unsuspecting kangaroos are quietly feeding within easy range. One of them has taken alarm, and is sitting upright to look about it, just as the squirrel will do while it is feeding on the ground.

The reader will now see the absolute necessity of an accurate aim in the thrower — an accomplishment which to me is a practical mystery. I can hurl the spear to a considerable distance by means of a throw-stick, but the aim is quite another business, the spear seeming to take an independent course of its own without the least reference to the wishes of the thrower. Yet the Australian is so good a marksman that he can make good practice at a man at the distance of eighty or ninety yards, making due allowance for the wind, and calculating the curve described by the spear with wonderful accuracy; while at a short distance his eye and hand are equally true, and he will transfix a kangaroo at twenty or thirty yards as certainly as it could be shot by an experienced rifleman.

In some parts of Australia the natives use the bow and arrow; but the employment of such weapons seems to belong chiefly to the inhabitants of the extreme north. There are in my collection specimens of bows and arrows brought from Cape York, which in their way are really admirable weapons, and would do credit to the archers of Polynesia. The bow is more than six feet long, and is made from the male, *i. e.* the solid bamboo. It is very stiff, and a powerful as well as a practised arm is needed to bend it properly.

Like the spear shaft, this bow is greatly subject to being worm-eaten. My own specimen is so honeycombed by these tiny borers that when it arrived a little heap of yellow powder fell to the ground wherever the bow was set, and, if it were sharply struck, a cloud of the same powder came from it. Fortunately, the same looseness of texture which enabled the beetle to make such havoc served also to conduct the poisoned spirit which I injected into the holes; and now the ravages have ceased, and not the most voracious insect in existence can touch the weapon. The string is very simply made, being nothing but a piece of rattan split to the required thickness. Perhaps the most ingenious part of this bow is the manner in which the loop is made. Although unacquainted with the simple yet effective bowstring knot, which is so well known to our archers, and which would not suit the stiff and harsh rattan, the native has invented a knot which is

quite as efficacious, and is managed on the same principle of taking several turns, with the cord round itself just below the loop. In order to give the rattan the needful flexibility it has been beaten so as to separate it into fibres and break up the hard, flinty coating which surrounds it, and these fibres have then been twisted round and round into a sort of rude cord, guarded at the end with a wrapping of the same material in order to preserve it from unravelling.

The arrows are suitable to the bow. They are variable in length, but all are much longer than those which the English bowmen were accustomed to use, and, instead of being a "cloth yard" in length, the shortest measures three feet seven inches in length, while the longest is four feet eight inches from butt to point. They are without a vestige of feathering, and have no nock, so that the native archer is obliged to hold the arrow against the string with his thumb and finger, and cannot draw the bow with the fore and middle finger, as all good English archers have done ever since the bow was known.

The shafts of the arrows are made of reed, and they are all headed with long spikes of some dark and heavy wood, which enable them to fly properly. Some of the heads are plain, rounded spikes, but others are elaborately barbed. One, for example, has a single row of six barbs, each an inch in length, and another has one double barb, like that of the "broad arrow" of England. Another has, instead of a barb, a smooth bulb, ending gradually in a spike, and serving no possible purpose, except perhaps that of ornament. Another has two of these bulbs; and another, the longest of them all, has a slight bulb, and then an attempt at carving. The pattern is of the very simplest character, but it is the only piece of carving on all the weapons. The same arrow is remarkable for having the point covered for some two inches with a sort of varnish, looking exactly like red sealing-wax, while a band of the same material encircles the head about six inches nearer the shaft. The sailor who brought the weapons over told me that this red varnish was poison, but I doubt exceedingly whether it is anything but ornament.

The end of the reed into which the head is inserted is guarded by a wrapping of rattan fibre, covered with a sort of dark varnish, which, however, is not the black-boy gum that is so plentifully used in the manufacture of other weapons. In one instance the place of the wrapping is taken by an inch or so of plaiting, wrought so beautifully with the outside of the rattan cut into flat strips scarcely wider than ordinary twine, that it betrays the Polynesian origin of the weapons, and confirms me in the belief that the bow and arrow are not indigenous to Australia, but have only been imported from New Guinea, and have not

made their way inland. The natives of Northern Australia have also evidently borrowed much from Polynesia, as we shall see in the course of this narrative.

The bow is usually about six feet in length, though one in my possession is somewhat longer. Owing to the dimensions of the bow and arrows, a full equipment of them is very weighty, and, together with the other weapons which an Australian thinks it his duty to carry, must be no slight burden to the warrior.

Ferocity of countenance is very characteristic of the race, and, as we shall see when we come to the canoes and their occupants, the people are very crafty: mild and complaisant when they think themselves overmatched, insolent and menacing when they fancy themselves superior, and tolerably sure to commit murder if they think they can do so with impunity. The only mode of dealing with these people is the safe one to adopt with all savages: *i. e.* never trust them, and never cheat them.

We now come to that most wonderful of all weapons, the boomerang. This is essentially the national weapon of Australia, and is found throughout the West country. As far as is known, it is peculiar to Australia, and, though curious missiles are found in other parts of the world, there is none which can be compared with the boomerang.

On one of the old Egyptian monuments there is a figure of a bird-catcher in a canoe. He is assisted by a cat whom he has taught to catch prey for him, and, as the birds fly out of the reeds among which he is pushing his canoe, he is hurling at them a curved missile which some persons have thought to be the boomerang. I cannot, however, see that there is the slightest reason for such a supposition.

No weapon in the least like the boomerang is at present found in any part of Africa, and, so far as I know, there is no example of a really efficient weapon having entirely disappeared from a whole continent. The harpoon with which the Egyptians of old killed the hippopotamus is used at the present day without the least alteration; the net is used for catching fish in the same manner; the spear and shield of the Egyptian infantry were identical in shape with those of the Kanembo soldier, a portrait of whom may be seen on page 612; the bow and arrow still survive; and even the whip with which the Egyptian task masters beat their Jewish servants is the "khorbash" with which the Nubian of the present day beats his slave.

In all probability, the curved weapon which the bird-catcher holds in his hand, and which he is about to throw, is nothing more than a short club, analogous to the knob-kerry of the Kafir, and having no returning power. Varying slightly in some of its details, the boomerang is identical in

principle wherever it is made. It is a flat-tish curved piece of wood, various examples of which may be seen in the illustration on the '731st page; and neither by its shape nor material does it give the least idea of its wonderful powers.

The material of which the boomerang (or bommereng, as the word is sometimes rendered) is made is almost invariably that of the gum-tree, which is heavy, hard, and tough, and is able to sustain a tolerably severe shock without breaking. It is slightly convex on the upper surface, and flat below, and is always thickest in the middle, being scraped away toward the edges, which are moderately sharp, especially the outer edge. It is used as a missile, and it is one of the strangest weapons that ever was invented.

In the old fairy tales, with which we are more or less acquainted, one of the strange gifts which is presented by the fairy to the hero is often a weapon of some wonderful power. Thus we have the sword of sharpness, which cut through every thing at which it was aimed, and the coat of mail, which no weapon would pierce. It is a pity, by the way, that the sword and the coat never seem to have been tried against each other. Then there are arrows (in more modern tales modified into bullets) that always struck their mark, and so on. And in one of the highest flights of fairy lore we read of arrows that always returned of their own accord to the archer.

In Australia, however, we have, as an actual fact, a missile that can be thrown to a considerable distance, and which always returns to the thrower. By a peculiar mode of hurling it the weapon circles through the air, and then describes a circular course, falling by the side of or behind the man who threw it. The mode of throwing is very simple in theory, and very difficult in practice. The weapon is grasped by the handle, which is usually marked by a number of cross cuts, so as to give a firm hold, and the flat side is kept downward. Then, with a quick and sharp fling, the boomerang is hurled, the hand at the same time being drawn back, so as to make the weapon revolve with extreme rapidity. A billiard-player will understand the sort of movement when told that it is on the same principle as the "screw-back" stroke at billiards. The weapon must be flung with great force, or it will not perform its evolutions properly.

If the reader would like to practice throwing the boomerang, let me recommend him, in the first place, to procure a genuine weapon, and not an English imitation thereof, such as is generally sold at the toy-shops. He should then go alone into a large field, where the ground is tolerably soft and there are no large stones about, and then stand facing the wind. Having grasped it as described, he should mark with his eye a spot on the ground at the distance of forty

yards or so, and hurl the boomerang at it. Should he throw it rightly, the weapon will at first look as if it were going to strike the ground; but, instead of doing so, it will shoot off at a greater or less angle, according to circumstances, and will rise high into the air, circling round with gradually diminishing force, until it falls to the ground. Should sufficient force have been imparted to it, the boomerang will fall some eight or ten yards behind the thrower.

It is necessary that the thrower should be alone, or at least have only an instructor with him, when he practises this art, as the boomerang will, in inexperienced hands, take all kinds of strange courses, and will, in all probability, swerve from its line, and strike one of the spectators; and the force with which a boomerang can strike is almost incredible. I have seen a dog killed on the spot, its body being nearly cut in two by the boomerang as it fell; and I once saw a brass spur struck clean off the heel of an incautious spectator, who ran across the path of the weapon.

It is necessary that he choose a soft as well as spacious field, as the boomerang has a special knack of selecting the hardest spots on which to fall, and if it can find a large stone is sure to strike it, and so break itself to pieces. And if there are trees in the way, it will get among the boughs, perhaps smash itself, certainly damage itself, and probably stick among the branches. The learner should throw also against the wind, as, if the boomerang is thrown with the wind, it does not think of coming back again, but sails on as if it never meant to stop, and is sure to reach a wonderful distance before it falls.

Nearly thirty years ago, I lost a boomerang by this very error. In company with some of my schoolfellows, I was throwing the weapon for their amusement, when one of them snatched it up, turned round, and threw it with all his force in the direction of the wind. The distance to which the weapon travelled I am afraid to mention, lest it should not be believed. The ground in that neighborhood is composed of successive undulations of hill and vale, and we saw the boomerang cross two of the valleys, and at last disappear into a grove of lime-trees that edged the churchyard.

In vain we sought for the weapon, and it was not found until four years afterward, when a plumber, who had been sent to repair the roof of the church, found it sticking in the leads. So it had first traversed that extraordinary distance, had then cut clean through the foliage of a lime-tree, and lastly had sufficient force to stick into the leaden roofing of a church. The boomerang was brought down half decayed, and wrenched out of its proper form by the shock.

Should the reader wish to learn the use

of the weapon, he should watch a native throw it. The attitude of the man as he hurls the boomerang is singularly graceful. Holding three or four of the weapons in his left hand, he draws out one at random with his right, while his eyes are fixed on the object which he desires to hit, or the spot to which the weapon has to travel. Balancing the boomerang for a moment in his hand, he suddenly steps a pace or two forward, and with a quick, sharp, almost angry stroke, launches his weapon into the air.

Should he desire to bring the boomerang back again, he has two modes of throwing. In the one mode, he flings it high in the air, into which it mounts to a wonderful height, circling the while with a bold, vigorous sweep, that reminds the observer of the grand flight of the eagle or the buzzard. It flies on until it has reached a spot behind the thrower, when all life seems suddenly to die out of it; it collapses, so to speak, like a bird shot on the wing, topples over and over, and falls to the ground.

There is another mode of throwing the returning boomerang which is even more remarkable. The thrower, instead of aiming high in the air, marks out a spot on the ground some thirty or forty yards in advance, and hurls the boomerang at it. The weapon strikes the ground, and, instead of being smashed to pieces, as might be thought from the violence of the stroke, it springs from the ground Antæus-like, seeming to attain new vigor by its contact with the earth. It flies up as if it had been shot from the ground by a catapult; and, taking a comparatively low elevation, performs the most curious evolutions, whirling so rapidly that it looks like a semi-transparent disc with an opaque centre, and directing its course in an erratic manner that is very alarming to those who are unaccustomed to it. I have seen it execute all its manoeuvres within seven or eight feet from the ground, hissing as it passed through the air with a strangely menacing sound, and, when it finally came to the ground, leaping along as if it were a living creature.

We will now examine the various shapes of boomerangs, as seen in the illustration on the 731st page. Some of the specimens are taken from the British Museum, some from the collection of Colonel Lane Fox, some from my own, and the rest are drawn by Mr. Angas from specimens obtained in the country. I have had them brought together, so that the reader may see how the boomerang has been gradually modified out of the club.

At fig. 4 is the short pointed stick which may either answer the purpose of a miniature club, a dagger, or an instrument to be used in the ascent of trees. Just below it is a club or waddy, with a rounded head, and at fig. 6 the head has been developed into a point, and rather flattened. If the

reader will refer to figs. 6 and 7, he will see two clubs which are remarkable for having not only the knob, but the whole of the handle flattened, and the curve of the head extended to the handle.

The transition from this club to the boomerang is simple enough, and, indeed, we have an example (fig. 1) of a weapon which looks like an ordinary boomerang, but is in fact a club, and is used for hand-to-hand combat.

These figures show pretty clearly the progressive structure of the boomerang. The flattened clubs were probably made from necessity, the native not being able to find a suitable piece of wood, and taking the best that he could get. If, then, one of these clubs were, on the spur of the moment, hurled at an object, the superior value which this flatness conferred upon it as a missile would be evident as well as the curved course which it would take through the air. The native, ever quick to note anything which might increase the power of his weapons, would be sure to notice this latter peculiarity, and to perceive the valuable uses to which it could be turned. He would therefore try various forms of flattened missiles, until he at last reached the true boomerang.

The strangest point about the boomerang is, that the curve is not uniform, and, in fact, scarcely any two specimens have precisely the same curve. Some have the curve so sharp that it almost deserves the name of angle, for an example of which see fig. 8; others, as in fig. 9, have the curve very slight; while others, as in fig. 2, have a tendency to a double curve, and there is a specimen in the British Museum in which the double curve is very boldly marked. The best and typical form of boomerang is, however, that which is shown at fig. 3. The specimen which is there represented was made on the banks of the river Darling.

The natives can do almost anything with the boomerang, and the circuitous course which it adopts is rendered its most useful characteristic. Many a hunter has wished that he only possessed that invaluable weapon, a gun which would shoot round a corner, and just such a weapon does the Australian find in his boomerang. If, for example, he should see a kangaroo in such a position that he cannot come within the range of a spear without showing himself and alarming the animal, or say, for example, that it is sheltered from a direct attack by the trunk of a tree, he will steal as near as he can without disturbing the animal, and then will throw his boomerang in such a manner that it circles round the tree, and strikes the animal at which it is aimed.

That such precision should be obtained with so curious a weapon seems rather remarkable, but those of my readers who are accustomed to play at bowls will call to

mind the enormous power which is given to them by the "bias," or weighted side of the bowl, and the bold curves which they can force the missile to execute, when they wish to send the bowl round a number of obstacles which are in its way. The boomerang is used as a sort of aerial bowl, with the advantage that the expert thrower is able to alter the bias at will, and to make the weapon describe almost any curve that he chooses.

It is even said that, in case there should be obstacles which prevent the boomerang from passing round the tree, the native has the power of throwing it so that it strikes the ground in front of the tree, and then, by the force of the throw, leaps over the top of the branches, and descends upon the object at which it is thrown.

On page 739 is shown a scene on the river Murray, in which the natives are drawn as they appear when catching the shag, a species of cormorant, which is found there in great numbers. They capture these birds in various ways, sometimes by climbing at night the trees on which they roost, and seizing them, getting severely bitten, by the way, on their naked limbs and bodies. They have also a very ingenious mode of planting sticks in the bed of the river, so that they project above the surface, and form convenient resting-places for the birds. Fatigued with diving, the cormorants are sure to perch upon them; and as they are dozing while digesting their meal of fish, the native swims gently up, and suddenly catches them by the wings, and drags them under water. He always breaks the neck of the bird at once.

They are so wonderfully skilful in the water, that when pelicans are swimming unsuspectingly on the surface, the natives approach silently, dive under them, seize the birds by the legs, jerk them under water, and break both the wings and legs so rapidly that the unfortunate birds have no chance of escape.

Sometimes, as shown in the illustration, the natives use their boomerangs and clubs, knock the birds off the branches on which they are roosting, and secure them before they have recovered from the stunning blow of the weapon. When approaching cormorants and other aquatic birds, the native has a very ingenious plan of disguising himself. He gathers a bunch of weeds, ties it on his head, and slips quietly into the water, keeping his whole body immersed, and only allowing the artificial covering to be seen. The bird, being quite accustomed to see patches of weeds floating along the water, takes no notice of so familiar an object, and so allows the disguised man to come within easy reach.

To return to the boomerang. The reader may readily have imagined that the manufacture of so remarkable an implement is

not a very easy one. The various points which constitute the excellence of a boomerang are so light that there is scarcely an European who can see them, especially as the shape, size, and weight of the weapon differ so much according to the locality in which it was made. The native, when employed in making a boomerang, often spends many days over it, not only on account of the very imperfect tools which he possesses, but by reason of the minute care which is required in the manufacture of a good weapon.

Day after day he may be seen with the boomerang in his hand, chipping at it slowly and circumspectly, and becoming more and more careful as it approaches completion. When he has settled the curve, and nearly flattened it to its proper thickness, he scarcely makes three or four strokes without balancing the weapon in his hand, looking carefully along the edges, and making movements as if he were about to throw it. The last few chips seem to exercise a wonderful effect on the powers of the weapon, and about them the native is exceedingly fastidious.

Yet, with all this care, the weapon is a very rough one, and the marks of the flint axe are left without even an attempt to smooth them. In a well-used boomerang the projecting edges of the grooves made by various cuts and chips become quite polished by friction, while the sunken portion is left rough. In one fine specimen in my possession the manufacturer has taken a curious advantage of these grooves. Besides marking the handle end by covering it with cross-scorings as has already been described, he has filled the grooves with the red ochre of which the Australian is so fond, and for some eight inches the remains of the red paint are visible in almost every groove.

So delicate is the operation of boomerang making, that some men, natives though they be, cannot turn out a really good weapon, while others are celebrated for their skill, and can dispose of their weapons as fast as they make them. One of the native "kings" was a well-known boomerang maker, and his weapons were widely distributed among the natives, who knew his handiwork as an artist knows the touch of a celebrated painter. To this skill, and the comparative wealth which its exercise brought him, the king in question owed the principal part of his authority.

A fair idea of the size and weight of the boomerang may be gained by the measurements of the weapon which has just been mentioned. It is two feet nine inches long when measured with the curve, and two feet six inches from tip to tip. It is exactly two inches in width, only narrowing at the tips, and its weight is exactly eleven ounces. This, by the way, is a war boomerang, and is

(1.) SPEARING THE KANGAROO. (See page 734.)

(2.) CATCHING THE CORMORANT. (See page 738.)
(739)

shaped like that which is shown in "Boomerangs" on page 731, fig. 3. Another specimen, which is of about the same weight, is shaped like that of fig. 8. It measures two feet five inches along the curve, two feet one inch from tip to tip, and is three inches in width in the middle, diminishing gradually toward the tips.

In order to enable them to ward off these various missiles, the natives are armed with a shield, which varies exceedingly in shape and dimensions, and, indeed, in some places is so unlike a shield, and apparently so inadequate to the office of protecting the body, that when strangers come to visit my collection I often have much difficulty in persuading them that such strange-looking objects can by any possibility be shields. As there is so great a variety in the shields, I have collected together a number of examples, which, I believe, comprise every form of shield used throughout Australia. Two of them are from specimens in my own collection, several from that of Colonel Lane Fox, others are drawn from examples in the British Museum, and the rest were sketched by Mr. Angus in the course of his travels through Australia.

As a general fact, the shield is very solid and heavy, and in some cases looks much more like a club with which a man can be knocked down, than a shield whereby he can be saved from a blow, several of them having sharp edges as if for the purpose of inflicting injury.

If the reader will look at the row of shields on page 742, he will see that figs. 2 and 3 exhibit two views of the same shield. This is one of the commonest forms of the weapon, and is found throughout a considerable portion of Western Australia. It is cut out of a solid piece of the ever useful gum-tree, and is in consequence very hard and very heavy. As may be seen by reference to the illustration, the form of the shield is somewhat triangular, the face which forms the front of the weapon being slightly rounded, and the handle being formed by cutting through the edge on which the other two faces converge. The handle is very small, and could scarcely be used by an ordinary European, though it is amply wide enough for the small and delicate looking hand of the Australian native. My own is a small hand, but is yet too large to hold the Australian shield comfortably.

The reader will see that by this mode of forming the handle the wrist has great play, and can turn the shield from side to side with the slightest movement of the hand. This faculty is very useful, especially when the instrument is used for warding off the spear or the club, weapons which need only to be just turned aside in order to guide them away from the body.

One of these shields in my own collection is a very fine example of the instrument, and

its dimensions will serve to guide the reader as to the usual form, size, and weight of an Australian shield. It measures exactly two feet seven inches in length, and is five inches wide at the middle, which is the broadest part. The width of the hole which receives the hand is three inches and three-eighths, and the weight of the shield is rather more than three pounds.

The extraordinary weight of the shield is needed in order to enable it to resist the shock of the boomerang, the force of which may be estimated by its weight, eleven ounces, multiplied by the force with which it is hurled. This terrible weapon cannot be merely turned aside, like the spear or the waddy, and often seems to receive an additional impulse from striking any object, as the reader may see by reference to page 737, in which the mode of throwing the boomerang is described. A boomerang must be stopped, and not merely parried, and moreover, if it be not stopped properly, it twists round the shield, and with one of its revolving ends inflicts a wound on the careless warrior.

Even if it be met with the shield and stopped, it is apt to break, and the two halves to converge upon the body. The very fragments of the boomerang seem able to inflict almost as much injury as the entire weapon; and, in one of the skirmishes to which the natives are so addicted, a man was seen to fall to the ground with his body cut completely open by a broken boomerang.

It is in warding off the boomerang, therefore, that the chief skill of the Australian is shown. When he sees the weapon is pursuing a course which will bring it to him, he steps forward so as to meet it; and, as the boomerang clashes against the shield, he gives the latter a rapid turn with the wrist. If this manœuvre be properly executed, the boomerang breaks to pieces, and the fragments are struck apart by the movement of the shield.

Perhaps some of my readers may remember that "Dick-a-dick," the very popular member of the Australian cricketers who came to England in 1868, among other exhibitions of his quickness of eye and hand, allowed himself to be pelted with cricket balls, at a distance of fifteen yards, having nothing wherewith to protect himself but the shield and the leawal, or angular club, the former being used to shield the body, and the latter to guard the legs. The force and accuracy with which a practised cricketer can throw the ball are familiar to all Englishmen, and it was really wonderful to see a man, with no clothes but a skin-tight elastic dress, with a piece of wood five inches wide in his left hand, and a club in his right, quietly stand against a positive rain of cricket-balls as long as any one liked to throw at him, and come out of the ordeal unscathed.

Not the least surprising part of the performance was the coolness with which he treated the whole affair, and the almost instinctive knowledge that he seemed to possess respecting the precise destination of each ball. If a ball went straight at his body or head, it was met and blocked by the shield; if it were hurled at his legs, the club knocked it aside. As to those which were sure not to hit him, he treated them with contemptuous indifference, just moving his head a little on one side to allow the ball to pass, which absolutely ruffled his hair as it shot by, or lifting one arm to allow a ball to pass between the limb and his body, or, if it were aimed but an inch wide of him, taking no notice of it whatever. The shield which he used with such skill was the same kind as that which has just been described, and was probably selected because its weight enabled it to block the balls without the hand that held it feeling the shock.

To all appearances, the natives expend much more labor upon the shield than upon the boomerang, the real reason, however, being that much ornament would injure the boomerang, but can have no injurious effect

grooves, and each groove has been filled with red ochre. The space between is filled in with a double zigzag pattern, and the effect of all these lines, simple as they are, is perfectly artistic and consistent.

The pattern, by the way, is one that seems common to all savage races of men, wherever they may be found, and is to be seen on weapons made by the ancient races now long passed away, among the Kaffir tribes of South Africa, the cannibal tribes of Central Western Africa, the inhabitants of the various Polynesian islands, the savages of the extreme north and extreme south of America, and the natives of the great continent of Australia.

At fig. 7 of the accompanying illustration may be seen a shield made of solid wood, in which the triangular form has been developed in a very curious manner into a quadrangular shape. The handle is made in the same manner as that of the former shield, *i. e.* by cutting through two of the faces of the triangle, while the front of the shield, instead of being a tolerably round face, is flattened out into a sharp edge. It is scarcely possible to imagine any instrument

SHIELDS.

upon the shield. By reference to the illustration, the reader will see that the face of the shield is covered with ornament, which, simple in principle, is elaborate in detail.

There is a specimen in my collection which is ornamented to a very great extent on its face, the sides and the handle being perfectly plain. It has a number of lines drawn transversely in bands, which, however, are seven instead of five in number. Each band is composed of three zigzag

that looks less like a shield than does this curious weapon, which seems to have been made for the express purpose of presenting as small a surface as possible to the enemy.

The fact is, however, that the Southern Australian who uses these shields has not to defend himself against arrows, from which a man can only be defended by concealing his body behind shelter which is proof against them: he has only to guard against the spear and boomerang, and occa-

sionally the missile club, all which weapons he can turn aside with the narrow shield that has been described.

One of these shields in my collection is two feet seven inches in length, rather more than six inches in width, and barely three inches thick in the middle. Its weight is just two pounds. Such a weapon seems much more like a club than a shield, and, indeed, if held by one end, its sharp edge might be used with great effect upon the head of an enemy. Like most Australian shields, it is covered with a pattern of the same character as that which has already been mentioned, and it has been so thoroughly painted with ochre that it is of a reddish mahogany color, and the real hue of the wood can only be seen by scraping off some of the stained surface. The name for this kind of shield is tamarang, and it is much used in dances, in which it is struck at regular intervals with the waddy.

In the British Museum is a shield which is much more solid than either of those which have been described. The manufacturer evidently found the labor of chipping the wood too much for him, and accordingly made much use of fire, forming his shield by alternate charring and scraping. The handle is rather curiously made by cutting two deep holes side by side in the back of the shield, the piece of wood between them being rounded into a handle. As is the case

with most of the shields, the handle is a very small one. The face of the shield is much wider than either of those which have been noticed, and is very slightly rounded. It is ornamented with carved grooves, but rough usage has obliterated most of them, and the whole implement is as rough and unsightly an article as can well be imagined, in spite of the labor which has been bestowed upon it.

We now come to another class of shield, made of bark, and going by the title of Mulabakka. Shields in general are called by the name of Hieleman. Some of these bark shields are of considerable size, and are so wide in the middle that, when the owner crouches behind them, they protect the greater part of his body. As the comparatively thin material of which they are composed prevents the handle from being made by cutting into the shield itself, the native is obliged to make the handle separately, and fasten it to the shield by various methods.

The commonest mode of fixing the handle to a Mulabakka shield is seen at figs. 4 and 5, on page 742, which exhibit the front and profile views of the same shield. Another Mulabakka is shown at fig. 6. The faces of all the Mulabakka shields are covered with ornamented patterns, mostly on the usual zigzag principle, but some having a pattern in which curves form the chief element.

CHAPTER LXXIII.

AUSTRALIA — *Continued.*

REAL WAR UNKNOWN TO THE AUSTRALIANS — FEUDS AND THE CAUSES OF THEM — A SAVAGE TOURNAMENT — VENGEANCE FOR DEATH — THE TROPHY OF VICTORY — AUSTRALIAN VENDETTA — FIRE-SIGNALS — DEATH OF TARMEENIA — ORDEAL OF BATTLE — CANNIBALISM AS AN ADJUNCT OF WAR — DANCES OF THE ABORIGINES — THE KURI DANCE AND ITS STRANGE ACCOMPANIMENTS — THE PALTI DANCE — THE CONCLUDING FIGURE — DANCE OF THE PARNKALLA TRIBE — ORDINARY CORROBOREEES — THE KANGAROO DANCE — TASMANIAN DANCE.

THE mention of these various weapons naturally leads us to warfare; and that they are intended for that purpose the existence of the shields is a proof. Offensive weapons, such as the spear and the club, may be used merely for killing game; but the shield can only be employed to defend the body from the weapons of an enemy.

War, however, as we understand the word, is unknown among the Australians. They have not the intellect nor the organization for it, and so we have the curious fact of skilled warriors who never saw a battle. No single tribe is large enough to take one side in a real battle; and, even supposing it to possess sufficient numbers, there is no spirit of discipline by means of which a force could be gathered, kept together, or directed, even if it were assembled.

Yet, though real war is unknown, the Australian natives are continually fighting, and almost every tribe is at feud with its neighbor. The cause of quarrel with them is almost invariably the possession of some territory. By a sort of tacit arrangement, the various tribes have settled themselves in certain districts; and, although they are great wanderers, yet they consider themselves the rightful owners of their own district.

It mostly happens, however, that members of one tribe trespass on the district of another, especially if it be one in which game of any kind is plentiful. And sometimes, when a

tribe has gone off on a travelling expedition, another tribe will settle themselves in the vacated district; so that, when the rightful owners of the soil return, there is sure to be a quarrel. The matter is usually settled by a skirmish, which bears some resemblance to the *mêlée* of ancient chivalry, and is conducted according to well-understood regulations.

The aggrieved tribe sends a challenge to the offenders, the challenger in question bearing a bunch of emu's feathers tied on the top of a spear. At daybreak next morning the warriors array themselves for battle, painting their bodies in various colors, so as to make themselves look as much like demons, and as much unlike men, as possible, laying aside all clothing, and arranging their various weapons for the fight.

Having placed themselves in battle array, at some little distance from each other, the opposite sides begin to revile each other in quite a Homeric manner, taunting their antagonists with cowardice and want of skill in their weapons, and boasting of the great deeds which they are about to do. When, by means of interposing these taunts with shouts and yells, dancing from one foot to the other, quivering and poisoning their spears, and other mechanical modes of exciting themselves, they have worked themselves up to the requisite pitch of fury, they begin to throw the spears, and the combat becomes general. Confused as it appears, it is, how-

ever, arranged with a sort of order. Each warrior selects his antagonist; so that the fight is, in fact, a series of duels rather than a battle, and the whole business bears a curious resemblance to the mode of fighting in the ancient days of Troy.

Generally the combatants stand in rather scattered lines, or, as we should say, in wide skirmishing order. The gestures with which they try to irritate their opponents are very curious, and often grotesque; the chief object being apparently to induce the antagonist to throw the first spear. Sometimes they stand with their feet very widely apart, and their knees straight, after the manner which will be seen in the illustrations of the native dances. While so standing, they communicate a peculiar quivering movement to the legs, and pretend to offer themselves as fair marks. Sometimes they turn their backs on their adversary, and challenge him to throw at them; or they drop on a hand and knee for the same purpose.

Mr. M'Gillivray remarked that two spearmen never throw at the same combatant; but, even with this advantage, the skill of the warrior is amply tested, and it is surprising to see how, by the mere inflection of the body, or the lifting a leg or arm, they avoid a spear which otherwise must have wounded them. While the fight is going on, the women and children remain in the bush, watching the combat, and uttering a sort of wailing chant, rising and falling in regular cadence.

Sometimes the fight is a very bloody one, though the general rule is, that when one man is killed the battle ceases, the tribe to which the dead man belonged being considered as having been worsted. It might be thought that a battle conducted on such principles would be of very short duration; but the Australian warriors are so skilful in warding off the weapons of their antagonists that they often fight for a considerable time before a man is killed. It must be remembered, too, that the Australian natives can endure, without seeming to be much the worse for them, wounds which would kill an European at once. In such a skirmish, however, much blood is spilt, even though only one man be actually killed, for the barbed spears and sharp-edged boomerangs inflict terrible wounds, and often cripple the wounded man for life.

Other causes beside the quarrel for territory may originate a feud between two tribes. One of these cases is a very curious one. A woman had been bitten by a snake; but, as no blood flowed from the wound, it was thought that the snake was not a venomous one, and that there was no danger. However, the woman died in a few hours, and her death was the signal for a desperate war between two tribes. There seems to be but little connection between the two

events, but according to Australian ideas the feud was a justifiable one.

The natives of the part of Australia where this event occurred have a curious idea concerning death. Should any one die without apparent cause, they think that the death is caused by a great bird called marralya, which comes secretly to the sick person, seizes him round the waist in his claws, and squeezes him to death. Now the marralya is not a real bird, but a magical one, being always a man belonging to a hostile tribe, who assumes the shape of the bird, and so finds an opportunity of doing an injury to the tribe with which he is at feud. Having made up his mind that the snake which bit the woman was not a venomous one, her husband could not of course be expected to change his opinion, and so it was agreed upon that one of a neighboring tribe with whom they were at feud must have become a marralya, and killed the woman. The usual challenge was the consequence, and from it came a series of bloody fights.

Like most savage nations, the Australians mutilate their fallen enemies. Instead, however, of cutting off the scalp, or other trophy, they open the body, tear out the fat about the kidneys, and rub it over their own bodies. So general is this custom, that to "take fat" is a common paraphrase for killing an enemy; and when two antagonists are opposed to each other, each is sure to boast that his antagonist shall furnish fat for him. As far as can be learned, they have an idea that this practice endues the victor with the courage of the slain man in addition to his own; and, as a reputation for being a warrior of prowess is the only distinction that a native Australian can achieve, it may be imagined that he is exceedingly anxious to secure such an aid to ambition.

Not from deliberate cruelty, but from the utter thoughtlessness and disregard of inflicting pain which characterizes all savages, the victorious warrior does not trouble himself to wait for the death of his enemy before taking his strange war trophy. Should the man be entirely disabled it is enough for the Australian, who turns him on his back, opens his body with the quartz knife which has already been described, tears out the coveted prize, and rubs himself with it until his whole body and limbs shine as if they were burnished. Oftentimes it has happened that a wounded man has been thus treated, and has been doomed to see his conqueror adorn himself before his eyes. Putting aside any previous injury, such a wound as this is necessarily mortal; but a man has been known to live for more than three days after receiving the injury, so wonderfully strong is the Australian constitution.

Sometimes these feuds spread very widely, and last for a very long time. Before the declaration of war, the opposing tribes

refrain from attacking each other, but, after that declaration is once made, the greatest secrecy is often observed, and the warrior is valued the highest who contrives to kill his enemy without exposing himself to danger. Sometimes there is a sort of wild chivalry about the Australians, mingled with much that is savage and revolting. A remarkable instance of these traits is recorded by Mr. M'Gillivray.

An old man had gone on a short expedition in his canoe, while the men of his tribe were engaged in catching turtle. He was watched by a party belonging to a hostile tribe, who followed and speared him. Leaving their spears in the body to indicate their identity, they returned to shore, and made a great fire by way of a challenge. Seeing the signal, and knowing that a column of thick smoke is almost always meant as a challenge, the men left their turtling, and, on finding that the old man was missing, instituted a search after him. As soon as they discovered the body they lighted another fire to signify their acceptance of the challenge, and a party of them started off the same evening in order to inflict reprisals on the enemy.

They soon came upon some natives who belonged to the inimical tribe, but who had not been concerned in the murder, and managed to kill the whole party, consisting of four men, a woman, and a girl. They cut off the heads of their victims, and returned with great exultation, shouting and blowing conch-shells to announce their victory.

The heads were then cooked in an oven, and the eyes scooped out and eaten, together with portions of the cheeks. Only those who had been of the war-party were allowed to partake of this horrible feast. When it was over the victors began a dance, in which they worked themselves into a perfect frenzy, kicking the skulls over the ground, and indulging in all kinds of hideous antics. Afterward the skulls were hung up on two cross sticks near the camp, and allowed to remain there undisturbed.

Fire, by the way, is very largely used in making signals, which are understood all over the continent. A large fire, sending up a great column of smoke, is, as has already been mentioned, almost invariably a sign of defiance, and it is sometimes kindled daily until it is answered by another. If a man wishes to denote that he is in want of assistance, he lights a small fire, and, as soon as it sends up its little column of smoke, he extinguishes it suddenly by throwing earth on it. This is repeated until the required assistance arrives.

Some years ago, when the character and habits of the natives were not known so well as they are now, many of the settlers were murdered by the natives, simply through their system of fire-signalling. One or two natives, generally old men or

women, as causing least suspicion, and being entirely unarmed, would approach the farm or camp, and hang about it for some days, asking for food, and cooking it at their own little fires.

The white men had no idea that every fire that was lighted was a signal that was perfectly well understood by a force of armed men that was hovering about them under cover of the woods, nor that the little puffs of smoke which occasionally arose in the distance were answers to the signals made by their treacherous guests. When the spies thought that their hosts were lulled into security, they made the battle-signal, and brought down the whole force upon the unsuspecting whites.

The Australians are wonderfully clever actors. How well they can act honesty and practise theft has already been mentioned. They have also a way of appearing to be unarmed, and yet having weapons ready to hand. They will come out of the bush, with green boughs in their hands as signs of peace, advance for some distance, and ostentatiously throw down their spears and other weapons. They then advance again, apparently unarmed, but each man trailing a spear along the ground by means of his toes. As soon as they are within spear range, they pick up their weapons with their toes, which are nearly as flexible and useful as fingers, hurl them, and then retreat to the spot where they had grounded their weapons.

The Australians have a tenacious memory for injuries, and never lose a chance of reprisal. In 1849, some men belonging to the Badulega tribe had been spending two months on a friendly visit to the natives of Muralug. One of their hosts had married an Itálega woman, and two of the brothers were staying with her. The Badulegas happened to remember that several years before one of their own tribe had been insulted by an Itálega. So they killed the woman, and tried to kill her brothers also, but only succeeded in murdering one of them. They started at once for their home, taking the heads as proof of their victory, and thought that they had done a great and praiseworthy action.

A similar affair took place among some of the tribes of Port Essington. A Monobar native had been captured when thieving, and was imprisoned. He attempted to escape, and in so doing was shot by the sentinel on duty. By rights his family ought to have executed reprisals on a white man; but they did not venture on such a step, and accordingly picked out a native who was on good terms with the white man, and killed *him*. The friends of the murdered man immediately answered by killing a Monobar, and so the feud went on. In each case the victim was murdered while sleeping, a number of natives quietly surrounding

him, and, after spearing him, beating him with their waddies into a shapeless mass.

Should the cause of the feud be the unexplained death of a man or woman, the duty of vengeance belongs to the most formidable male warrior of the family. On such occasions he will solemnly accept the office, adorn himself with the red war-paint, select his best weapons, and promise publicly not to return until he has killed a male of the inimical tribe. How pertinaciously the Australian will adhere to his bloody purpose may be seen from an anecdote related by Mr. Lloyd.

He was startled one night by the furious barking of his dogs. On taking a lantern he found lying on the ground an old black named Tarmeenia, covered with wounds inflicted by spears, and boomerangs, and waddies. He told his story in the strange broken English used by the natives. The gist of the story was, that he and his son were living in a hut, and the son had gone out to snare a bird for his father, who was ill. Presently a "bungilcarney coolie," *i. e.* an enemy from another tribe, entered the hut and demanded, "Why did your son kill my wife? I shall kill his father." Whereupon he drove his spear into the old man's side, and was beating him to death, when he was disturbed by the return of his son. The young man, a singularly powerful native, knowing that his father would be certainly murdered outright if he remained in the hut, actually carried him more than four miles to Mr. Lloyd's house, put him down in the yard, and left him.

A hut was at once erected close to the house, and Tarmeenia was installed and attended to. He was very grateful, but was uneasy in his mind, begging that the constable might visit his hut in his nightly rounds, "cos same bungilcarney coolie cum agin, and dis time too much kill 'im Tarmeenia." The alarm of the old man seemed rather absurd, considering the position of the hut, but it was fully justified. About three weeks after Tarmeenia had been placed in the hut, Mr. Lloyd was aroused at daybreak by a servant, who said that the old black fellow had been burned to death. Dead he certainly was, and on examining the body two fresh wounds were seen, one by a spear just over the heart, and the other a deep cut in the loins, through which the "bungilcarney" had torn the trophy of war.

Occasionally a man who has offended against some native law has to engage in a kind of a mimic warfare, but without the advantage of having weapons. Mr. Lloyd mentions a curious example of such an ordeal.

"The only instance I ever witnessed of corporeal punishment being inflicted — evidently, too, by some legal process — was upon the person of a fine sleek young black, who, having finished his morning's repast,

rose in a dignified manner, and, casting his rug from his shoulders, strode with Mohican stoicism to the appointed spot, divested of his shield, waddy, or other means of defence. Nor, when once placed, did he utter one word, or move a muscle of his graceful and well-moulded person, but with folded arms and defiant attitude awaited the fatal ordeal.

"A few minutes only elapsed when two equally agile savages, each armed with two spears and a boomerang, marched with stately gait to within sixty yards of the culprit. One weapon after another was hurled at the victim savage, with apparently fatal precision, but his quick eye and wonderful activity set them all at defiance, with the exception of the very last cast of a boomerang, which, taking an unusual course, severed a piece of flesh from the shoulder-blade, equal in size to a crown-piece, as if sliced with a razor, and thus finished the affair."

The *lex talionis* forms part of the Australian traditional law, and is sometimes exercised after a rather ludicrous fashion. A young man had committed some light offence, and was severely beaten by two natives, who broke his arm with a club, and laid his head open with a fishing spear. Considerable confusion took place, and at last the elders decided that the punishment was much in excess of the offence, and that, when the wounded man recovered, the two assailants were to offer their heads to him, so that he might strike them a certain number of blows with his waddy.

In the description of the intertribal feuds, it has been mentioned that the men who assisted in killing the victims of reprisal partook of the eyes and cheeks of the murdered person. This leads us to examine the question of cannibalism, inasmuch as some travellers have asserted that the Australians are cannibals and others denying such a propensity as strongly.

That the flesh of human beings is eaten by the Australians is an undeniable fact; but it must be remarked that such an act is often intended as a ceremonial, and not merely as a means of allaying hunger or gratifying the palate. It has been ascertained that some tribes who live along the Murray River have been known to kill and eat children, mixing their flesh with that of the dog. This, however, only occurs in seasons of great scarcity; and that the event was exceptional and not customary, is evident from the fact that a man was pointed out as having killed his children for food. Now it is plain, that, if cannibalism was the custom, such a man would not be sufficiently conspicuous to be specially mentioned. These tribes have a horrible custom of killing little boys for the sake of their fat, with which they bait fish-hooks.

Another example of cannibalism is de-

scribed by Mr. Angas as occurring in New South Wales. A lad had died, and his body was taken by several young men, who proceeded to the following remarkable ceremonies. They began by removing the skin, together with the head, rolling it round a stake, and drying it over the fire. While this was being done, the parents, who had been uttering loud lamentations, took the flesh from the legs, cooked, and ate it. The remainder of the body was distributed among the friends of the deceased, who carried away their portions on the points of their spears; and the skin and bones were kept by the parents, and always carried about in their wallets.

It may seem strange that the mention of the weapons and mode of fighting should lead us naturally to the dances of the Australians. Such, however, is the case; for in most of their dances weapons of some sort are introduced. The first which will be mentioned is the Kuri dance, which was described to Mr. Angas by a friend who had frequently seen it, and is illustrated on the next page. This dance is performed by the natives of the Adelaide district. It seems to have one point in common with the cotillon of Europe, namely, that it can be varied, shortened, or lengthened, according to the caprice of the players; so that if a spectator see the Kuri dance performed six or seven times, he will never see the movements repeated in the same order. The following extract describes a single Kuri dance, and from it the reader may form his impressions of its general character:—

“But first the *dramatis personæ* must be introduced, and particularly described. The performers were divided into five distinct classes, the greater body comprising about twenty-five young men, including five or six boys, painted and decorated as follows: in nudity, except the *yoodna*, which is made expressly for the occasion, with bunches of gum-leaves tied round the legs just above the knee, which, as they stamped about, made a loud switching noise. In their hands they held a *katta* or *wirri*, and some a few gum-leaves. The former were held at arm's length, and struck alternately with their legs as they stamped. They were painted, from each shoulder down to the hips, with five or six white stripes, rising from the breast; their faces also, with white perpendicular lines, making the most hideous appearance. These were the dancers.

“Next came two groups of women, about five or six in number, standing on the right and left of the dancers, merely taking the part of supernumeraries; they were not painted, but had leaves in their hands, which they shook, and kept beating time with their feet during the whole performance, but never moved from the spot where they stood.

“Next followed two remarkable characters, painted and decorated like the dancers, but with the addition of the *palyertatta*—a singular ornament made of two pieces of stick put crosswise, and bound together by the *mangna*, in a spreading manner, having at the extremities feathers opened, so as to set it off to the best advantage. One had the *palyertatta* stick sideways upon his head, while the other, in the most wizard-like manner, kept waving it to and fro before him, corresponding with the action of his head and legs.

“Then followed a performer distinguished by a long spear, from the top of which a bunch of feathers hung suspended, and all down the spear the *mangna* was wound; he held the *koonteroo* (spear and feathers) with both hands behind his back, but occasionally altered the position, and waved it to the right and left over the dancers. And last came the singers—two elderly men in their usual habiliments; their musical instruments were the *katta* and *wirri*, on which they managed to beat a double note; their song was one unvaried, gabbling tone.

“The night was mild; the new moon shone with a faint light, casting a depth of shade over the earth, which gave a sombre appearance to the surrounding scene that highly conduced to enhance the effect of the approaching play. In the distance, a black mass could be discerned under the gum-trees, whence occasionally a shout and a burst of flame arose. These were the performers dressing for the dance, and no one approached them while thus occupied.

“Two men, closely wrapped in their opossum-skins, noiselessly approached one of the *wurlies*, where the Kuri was to be performed, and commenced clearing a space for the singers; this done, they went back to the singers, but soon after returned, sat down, and began a peculiar harsh and monotonous tune, keeping time with a *katta* and a *wirri* by rattling them together. All the natives of the different *wurlies* flocked round the singers, and sat down in the form of a horse-shoe, two or three rows deep.

“By this time the dancers had moved in a compact body to within a short distance of the spectators; after standing for a few minutes in perfect silence, they answered the singers by a singular deep shout simultaneously: twice this was done, and then the man with the *koonteroo* stepped out, his body leaning forward, and commenced with a regular stamp; the two men with the *palyertatta*s followed, stamping with great regularity, the rest joining in: the regular and alternate stamp, the waving of the *palyertatta* to and fro, with the loud switching noise of the gum leaves, formed a scene highly characteristic of the Australian natives. In this style they approached the singers, the spectators every now and then shouting forth

(1.) THE KURI DANCE. (See page 748.)

(2.) PALTÍ DANCE, OR CORROBOREE. (See page 752.)
(749)

their applause. For some time they kept stamping in a body before the singers, which had an admirable effect, and did great credit to their dancing attainments; then one by one they turned round, and danced their way back to the place they first started from, and sat down. The *palyertatta* and *koonteroo* men were the last who left, and as these three singular beings stamped their way to the other dancers they made a very odd appearance.

"The singing continued for a short time, and then pipes were lighted; shouts of applause ensued, and boisterous conversation followed. After resting about ten minutes, the singers commenced again; and soon after the dancers huddled together, and responded to the call by the peculiar shout already mentioned, and then performed the same feat over again—with this variation, that the *palyertatta* men brought up the rear, instead of leading the way. Four separate times these parts of the play were performed with the usual effect; then followed the concluding one, as follows: after tramping up to the singers, the man with the *koonteroo* commenced a part which called forth unbounded applause; with his head and body inclined on one side, his spear and feathers behind his back, standing on the left leg, he beat time with the right foot, twitching his body and eye, and stamping with the greatest precision; he remained a few minutes in this position, and then suddenly turned round, stood on his right leg, and did the same once with his left foot.

"In the mean while the two men with the mystic *palyertatta* kept waving their instruments to and fro, corresponding with the motions of their heads and legs, and the silent trampers performed their part equally well. The *koonteroo* man now suddenly stopped, and, planting his spear in the ground, stood in a stooping position behind it; two dancers stepped up, went through the same manoeuvre as the preceding party with wonderful regularity, and then gave a final stamp, turned round, and grasped the spear in a stooping position, and so on with all the rest, until every dancer was brought to the spear, so forming a circular body.

"The *palyertatta* men now performed the same movement on each side of this body, accompanied with the perpetual motion of the head, leg, and arm, and then went round and round, and finally gave the arrival stamp, thrust in their arm, and grasped the spear: at the same time all sunk on their knees and began to move away in a mass from the singers, with a sort of grunting noise, while their bodies leaned and tossed to and fro; when they had got about ten or twelve yards they ceased, and, giving one long semi-grunt or groan (after the manner of the red kangaroo, as they say), dispersed.

"During the whole performance, the singing went on in one continued strain, and,

after the last act of the performers, the rattling accompaniment of the singing ceased, the strain died gradually away, and shouts and acclamations rent the air."

There are many other dances among the Australians. There is, for example, the Frog-dance. The performers paint themselves after the usual grotesque manner, take their *wirris* in their hands, beat them together, and then squat down and jump after each other in circles, imitating the movements of the frog. Then there is the emu-dance, in which all the gestures consist of imitation of emu-hunting; the man who enacts the part of the bird imitating its voice.

In some parts of Australia they have the canoe dance, one of the most graceful of these performances.

Both men and women take part in this dance, painting their bodies with white and red ochre, and each furnished with a stick which represents the paddle. They begin to dance by stationing themselves in two lines, but with the stick across their backs and held by the arms, while they move their feet alternately to the tune of the song with which the dance is accompanied. At a given signal they all bring the sticks to the front, and hold them as they do paddles, swaying themselves in regular time as if they were paddling in one of their light canoes.

Another dance, the object of which is not very certain, is a great favorite with the Moorundi natives. The men, having previously decorated their bodies with stripes of red ochre, stand in a line, while the women are collected in a group and beat time together. The dance consists in stamping simultaneously with the left foot, and shaking the fingers of the extended arms. This dance is called Pedeku.

There is a rather curious dance, or movement, with which they often conclude the performance of the evening. They sit cross-legged round their fire, beating time with their spears and *wirris*. Suddenly they all stretch out their arms as if pointing to some distant object, rolling their eyes fearfully as they do so, and finish by leaping on their feet with a simultaneous yell that echoes for miles through the forest.

In his splendid work on South Australia, Mr. Angas describes a rather curious dance performed by the Parnkalla tribe, in which both sexes take part. Each man carries a belt made either of human hair or opossum fur, holding one end in each hand, and keeping the belt tightly strained. There is a slight variation in the mode of performing this dance, but the usual plan is for all the men to sit down, while a woman takes her place in the middle. One of the men then dances up to her, jumping from side to side, and swaying his arms in harmony with his movements. The woman begins jumping as her partner approaches, and then they dance

back again, when their place is taken by a fresh couple.

Some persons have supposed that this dance is a religious ceremony, because it is usually held on clear moonlight evenings. Sometimes, however, it is performed during the day-time.

The commonest native dance, or "corroboree," is that which is known as the Palti, and which is represented on the 749th page. It is always danced by night, the fitful blaze of the fire being thought necessary to bring out all its beauties.

Before beginning this dance, the performers prepare themselves by decorating their bodies in some grotesque style with white and scarlet paints, which contrast boldly with the shining black of their skins. The favorite pattern is the skeleton, each rib being marked by a broad stripe of white paint, and a similar stripe running down the breast and along the legs and arms. The face is painted in a similar fashion. The effect produced by this strange pattern is a most startling one. Illuminated only by the light of the fire, the black bodies and limbs are scarcely visible against the dark background, so that, as the performers pass backward and forward in the movements of the dance, they look exactly like a number of skeletons endued with life by magic powers.

This effect is increased by the curious quivering of the legs, which are planted firmly on the ground, but to which the dancers are able to impart a rapid vibratory movement from the knees upward. The *wirris*, or clubs, are held in the hands, as seen in the illustration, and at certain intervals they are brought over the head, and clashed violently together. The Palti, as well as the Kuri dance is conducted by a leader, who gives the word of command for the different movements. Some of the dancers increase their odd appearance by making a fillet from the front teeth of the kangaroo, and tying it round their foreheads.

Once in a year, the natives of some districts have a very grand dance, called the "cob-bongo corroboree," or great mystery dance. This dance is performed by the natives of the far interior. An admirable account of this dance was published in the *Illustrated London News* of October 3, 1863, and is here given. "The time selected for this great event is every twelfth moon, and during her declination. For several days previous a number of tribes whose territories adjoin one another congregate at a particular spot, characterized by an immense mound of earth covered with ashes (known amongst the white inhabitants as 'a black's oven') and surrounded by plenty of 'couraway' or water holes. To this place they bring numbers of kangaroos, 'possums, emus, and wild ducks, and a large quantity of wild honey, together with the grass from the seeds of which they make a sort of bread.

"Upon the evening on which the 'corroboree' is celebrated, a number of old men (one from each tribe), called by the natives 'wammaroogo,' signifying medicine men or charm men, repair to the top of the mound, where, after lighting a fire, they walk round it, muttering sentences and throwing into it portions of old charms which they have worn round their necks for the past twelve months. This is continued for about half an hour, when they descend, each carrying a fire-stick, which he places at the outskirts of the camp, and which is supposed to prevent evil spirits approaching. As soon as this is over, during which a most profound silence is observed by all, the men of the tribe prepare their toilet for the 'corroboree,' daubing themselves over with chalk, red ochre, and fat.

"While the men are thus engaged, the gentler sex are busy arranging themselves in a long line, and in a sitting posture, with rugs made of 'possum skins doubled round their legs, and a small stick called 'nulla-nulla' in each hand. A fire is lighted in front of them, and tended by one of the old charmers. As the men are ready, they seat themselves cross-legged like tailors, and in regular 'serried file,' at the opposite side of the fire to the women, while one of the medic men takes up his position on the top of the mound to watch the rising of the moon, which is the signal for 'corroboree.' All is now still; nothing disturbs the silence save the occasional jabber of a woman or child, and even that, after a few minutes, is hushed. The blaze of the fire throws a fitful light along the battalion-like front of the black phalanx, and the hideous faces, daubed with paint and smeared with grease, show out at such a moment to anything but advantage.

"As soon as the old gentleman who has been 'taking the lunar' announces the advent of that planet, which seems to exercise as great an influence over the actions of these people as over many of those amongst ourselves, the 'corroboree' commences. The women beat the little sticks together, keeping time to a peculiar monotonous air, and repeating the words, the burden of which when translated may be—

"The kangaroo is swift, but swifter is Ngoyulloman;
The snake is cunning, but more cunning is Ngoyulloman, &c.,

each woman using the name of her husband or favorite in the tribe. The men spring to their feet with a yell that rings through the forest, and, brandishing their spears, boomerangs, &c., commence their dance, flinging themselves into all sorts of attitudes, howling, laughing, grinning, and singing; and this they continue till sheer exhaustion compels them to desist, after which they roast and eat the product of the chase, gathered

for the occasion, and then drop off to sleep one by one."

The reader will see that this great mystery "corrobboree" combines several of the peculiar movements which are to be found in the various dances that have already been described.

A dance of somewhat similar character used to be celebrated by the Tasmanians at the occasion of each full moon, as is described by Mr. G. T. Lloyd. The various tribes assembled at some trysting-place; and while the women prepared the fire, and fenced off a space for the dance, the men retired to adorn themselves with paint, and to fasten bunches of bushy twigs to their ankles, wrists, and waists.

The women being seated at the end of this space, one of the oldest among them strode forward, calling by name one of the performers, reviling him as a coward, and challenging him to appear and answer her charge. The warrior was not long in his response, and, bounding into the circle through the fire, he proclaimed his deeds of daring in war and in the hunt. At every pause he made, his female admirers took up his praises, vaunting his actions in a sort of chant, which they accompanied by extemporized drums formed of rolled kangaroo skins.

Suddenly, upon some inspiring allegretto movement of the thumping band, thirty or forty grim savages would bound successively through the furious flames into the sacred arena, looking like veritable demons on a special visit to *terra firma*, and, after thoroughly exhausting themselves by leaping in imitation of the kangaroo around and through the fire, they vanished in an instant. These were as rapidly succeeded by their lovely gins, who, at a given signal from the beladame speaker, rose *en masse*, and ranging themselves round the fresh-plied flames in a state unadorned and genuine as imported into the world, contorted their arms, legs, and bodies into attitudes that would shame first-class acrobats. The grand point, however, with each of the well-greased beauties was to scream down her sable sister.

This dance, as well as other native customs, has departed, together with the aborigines, from the island, and the native Tasmanians are now practically extinct. There is before me a photograph of the three remaining survivors of these tribes, which some sixty years ago numbered between six and seven thousand. That they should have so rapidly perished under the influence of the white man is explained from the fact that their island is but limited in extent, and that they are altogether inferior to the aborigines of the continent. They are small in stature, the men averaging only five feet three inches in height, and they are very ill-favored in countenance, the line from the nose to the corners of the mouth

being very deep and much curved, so as to enclose the mouth in a pair of parentheses. The hair is cut very closely. This is done by means of two sharp-edged fragments of flint, broken glass being preferred since Europeans settled in the country. Cutting the hair is necessarily a tedious ceremony, only ten or twelve hairs being severed at a time, and upwards of three hours being consumed in trimming a head fit for a dance. Shaving is conducted after the same manner.

The general habits of the Tasmanian natives agree with those of the continent. The mode of climbing trees, however, is a curious mixture of the Australian and Polynesian custom. When the native discovers the marks of an opossum on the bark, he plucks a quantity of wire grass, and rapidly lays it up in a three-stranded plait, with which he encircles the tree and his own waist. By means of a single chop of the tomahawk he makes a slight notch in the bark, into which he puts his great toe, raises himself by it, and simultaneously jerks the grass band up the trunk of the tree. Notch after notch is thus made, and the native ascends with incredible rapidity, the notches never being less than three feet six inches apart.

Often, the opossum, alarmed at the sound of the tomahawk, leaves its nest, and runs along some bare bough, projecting horizontally from eighty to a hundred feet above the ground. The native walks along the bough upright and firm as if the tree were his native place, and shakes the animal into the midst of his companions who are assembled under the tree.

The natives never, in their wild state, wear clothes of any kind. They manufacture cloaks of opossum and kangaroo skins, but only in defence against cold. They are wonderful hunters, and have been successfully employed by the colonists in tracing sheep that had strayed, or the footsteps of the thief who had stolen them. The slightest scratch tell its tale to these quick-eyed people, who know at once the very time at which the impression was made, and, having once seen it, start off at a quick pace, and are certain to overtake the fugitive.

The untimely end of the aboriginal Tasmanians is greatly to be attributed to the conduct of a well-known chief, called Mosquito. He was a native of Sydney, and, having been convicted of several murders, was, by a mistaken act of lenity, transported to Tasmania, when he made acquaintance with the Oyster Bay tribe. Being much taller and stronger than the natives, he was unanimously elected chief, and took the command. His reign was most disastrous for the Tasmanians. He ruled them with a rod of iron, punishing the slightest disobedience with a blow of his tomahawk, not caring in the least whether the culprit were killed or not. He organized a series of depredations on the

property of the colonists, and was peculiarly celebrated for his skill in stealing potatoes, teaching his followers to abstract them from the ridges, and to rearrange the ground so as to look as if it had never been disturbed, and to obliterate all traces of their footmarks with boughs.

Under the influence of such a leader, the natives became murderers as well as thieves, so that the lives of the colonists were always in peril. It was therefore necessary to take some decided measures with them; and after sundry unsuccessful expeditions, the natives at last submitted themselves, and the whole of them, numbering then (1837) scarcely more than three hundred, were removed to Flinder's Island, where a number of comfortable stone cottages were built for them, infinitely superior to the rude bough huts or miammams of their own construction. They were liberally supplied with food, clothing, and other necessaries, as well as luxuries,

and the Government even appointed a resident surgeon to attend them when ill. All this care was, however, useless. Contact with civilization produced its usual fruits, and in 1861 the native Tasmanians were only thirteen in number. Ten have since died, and it is not likely that the three who survived in 1867 will perpetuate their race.

That the singularly rapid decadence of the Tasmanians was partly caused by the conduct of the shepherds, and other rough and uneducated men in the service of the colonists, cannot be denied. But the white offenders were comparatively few, and quite unable themselves to effect such a change in so short a time. For the real cause we must look to the strange but unvariable laws of progression. Whenever a higher race occupies the same grounds as a lower, the latter perishes, and, whether in animate or inanimate nature, the new world is always built on the ruins of the old.

CHAPTER LXXIV.

AUSTRALIA—*Continued.*

DOMESTIC LIFE.

MARRIAGE—PURCHASE AND EXCHANGE OF WIVES—A ROUGH WOOING—TREATMENT OF THE WIVES—
A BRUTAL HUSBAND—NARROW ESCAPE—A FAITHFUL COMPANION—AUSTRALIAN MOTHERS—
TREATMENT OF THE NEW-BORN INFANT—PRACTICE OF INFANTICIDE—THE MOTHER AND HER
DEAD CHILD.

WE will now proceed to the domestic life of the native Australian, if, indeed, their mode of existence deserves such a name, and will begin with marriage customs.

Betrothal takes place at a very early age, the girl being often promised in marriage when she is a mere child, her future husband being perhaps an old man with two or three wives and a number of children. Of course the girl is purchased from her father, the price varying according to the means of the husband. Articles of European make are now exceedingly valued; and as a rule, a knife, a glass bottle, or some such article, is considered as a fair price for a wife.

Exchange is often practised, so that a young man who happens to have a sister to spare will look out for some man who has a daughter unbetrothed, and will effect an amicable exchange with him, so that a man who possesses sisters by his father's death is as sure of a corresponding number of wives as if he had the means wherewith to buy them.

Until her intended husband takes her to wife, the betrothed girl lives with her parents, and during this interval she is not watched with the strictness which is generally exercised toward betrothed girls of savages. On the contrary, she is tacitly allowed to have as many lovers as she chooses, provided that a conventional amount of secrecy be observed, and her husband, when he marries her, makes no complaint. After marriage, however, the case is altered, and, if a former lover were to attempt a continuance of the

acquaintance, the husband would avenge himself by visiting both parties with the severest punishment. There is no ceremony about marriage, the girl being simply taken to the hut of her husband, and thenceforth considered as his wife.

In some parts of Australia, when a young man takes a fancy to a girl he obtains her after a rather curious fashion, which seems a very odd mode of showing affection. Watching his opportunity when the girl has strayed apart from her friends, he stuns her with a blow on the head from his waddy, carries her off, and so makes her his wife. The father of the girl is naturally offended at the loss of his daughter, and complains to the elders. The result is almost invariably that the gallant offender is sentenced to stand the ordeal of spear and boomerang. Furnished with only his narrow shield, he stands still, while the aggrieved father and other relatives hurl a certain number of spears and boomerangs at him. It is very seldom that he allows himself to be touched, but, when the stipulated number of throws has been made, he is considered as having expiated his offence, whether he be hit or not.

Polygamy is of course practised, but to no very great extent. Still, although a man may never have more than two or three wives at a time, he has often married a considerable number, either discarding them, when they are too old to please his taste, or perhaps killing them in a fit of anger. The last is no uncommon mode of

getting rid of a wife, and no one seems to think that her husband has acted cruelly. Indeed, the genuine native would not be able to comprehend the possibility of being cruel to his wife, inasmuch as he recognizes in her no right to kind treatment. She is as much his chattel as his spear or hut, and he would no more think himself cruel in beating his wife to death than in breaking the one or burning the other.

Since white men came to settle in the country the natives have learned to consider them as beings of another sphere, very powerful, but unfortunately possessed with some unaccountable prejudices. Finding, therefore, that breaking a wife's limb with a club, piercing her with a spear, or any other mode of expressing dissatisfaction, shocked the prejudices of the white men, they ceased to mention such practices, though they did not discontinue them.

Quite recently, a native servant was late in keeping his appointment with his master, and, on inquiry, it was elicited that he had just quarrelled with one of his wives, and had speared her through the body. On being rebuked by his master he turned off the matter with a laugh, merely remarking that white men had only one wife, whereas he had two, and did not mind losing one until he could buy another.

Considering and treating the women as mere articles of property, the men naturally repose no confidence in them, and never condescend to make them acquainted with their plans. If they intend to make an attack upon another tribe, or to organize an expedition for robbery, they carefully conceal it from the weaker sex, thinking that such inferior animals cannot keep secrets, and might betray them to the objects of the intended attack.

The utter contempt which is felt by the native Australians for their women is well illustrated by an adventure which occurred after a dance which had been got up for the benefit of the white men, on the understanding that a certain amount of biscuit should be given to the dancers. When the performance was over, the biscuit was injudiciously handed to a woman for distribution. A misunderstanding at once took place. The men, although they would not hesitate to take away the biscuit by force, would not condescend to ask a woman for it, and therefore considered that the promised payment had not been made to them. Some of them, after muttering their discontent, slipped away for their spears and throwing-sticks, and the whole place was in a turmoil.

Fortunately, in order to amuse the natives, the white visitors, who had never thought of the offence that they had given, sent up a few rockets, which frightened the people for a time, and then burned a blue light. As the brilliant rays pierced the

dark recesses of the forest, they disclosed numbers of armed men among the trees, some alone and others in groups, but all evidently watching the movements of the visitors whose conduct had so deeply insulted them. A friendly native saw their danger at once, and hurried them off to their boats, saying that spears would soon be thrown.

There was much excuse to be found for them. They had been subjected to one of the grossest insults that warriors could receive. To them, women were little better than dogs, and, if there were any food, the warriors first satisfied their own hunger, and then threw to the women any fragments that might be left. Therefore, that a woman—a mere household chattel—should be deputed to distribute food to warriors was a gross, intolerable, and, as they naturally thought, intentional insult. It was equivalent to degrading them from their rank as men and warriors, and making them even of less account than women. No wonder, then, that their anger was roused, and the only matter of surprise is that an attack was not immediately made. Australian warriors have their own ideas of chivalry, and, like the knights of old, feel themselves bound to resent the smallest aspersion cast upon their honor.

Mr. McGillivray, who narrates this anecdote makes a few remarks which are most valuable, as showing the errors which are too often committed when dealing with savages, not only those of Australia, but of other countries.

"I have alluded to this occurrence, trivial as it may appear, not without an object. It serves as an illustration of the policy of respecting the known customs of the Australian race, even in apparently trifling matters, at least during the early period of intercourse with a tribe, and shows how a little want of judgment in the director of our party caused the most friendly intentions to be misunderstood, and might have led to fatal results.

"I must confess that I should have considered any injury sustained on our side to have been most richly merited. Moreover, I am convinced that some at least of the collisions which have taken place in Australia between the first European visitors and the natives of any given district have originated in causes of offence brought on by the indiscretion of one or more of the party, and revenged on others who were innocent."

Mr. McGillivray then proceeds to mention the well-known case of the night attack on Mr. Leichhardt's expedition. For no apparent reason, a violent assault was made on the camp, and Mr. Gilbert was killed. The reason of this attack did not transpire until long afterward, when a native attached to the expedition divulged, in a

state of intoxication, the fact that he and a fellow-countryman had grossly insulted a native woman.

Yet, in spite of this brutal treatment, the women often show a depth of affectionate feeling which raises them far above the brutal savages that enslave them. One remarkable instance of this feeling is mentioned by Mr. Bennett. She had formed an attachment to an escaped convict, who became a bushranger, and enabled him, by her industry and courage, to prolong the always precarious life of a bushranger beyond the ordinary limits.

The chief dangers that beset these ruffians are the necessity for procuring food, and the watch which is always kept by the police. Her native skill enabled her to supply him with food, and, while he was lying concealed, she used to fish, hunt, dig roots, and then to cook them for him. Her native quickness of eye and ear enabled her to detect the approach of the police, and, by the instinctive cunning with which these blacks are gifted, she repeatedly threw the pursuers off the scent. He was utterly unworthy of the affection which she bestowed on him, and used to beat her unmercifully, but, undeterred by his cruelty, she never flagged in her exertions for his welfare; and on one occasion, while he was actually engaged in ill-treating her, the police came upon his place of refuge, and must have captured him, had she not again misled them, and sent them to a spot far from the place where he was hidden. At last, he ventured out too boldly, during her accidental absence, was captured, tried and hanged. But up to the last this faithful creature never deserted him, and, even when he was imprisoned, she tried to follow him, but was reclaimed by her tribe.

When a native woman is about to become a mother she retires into the bush, sometimes alone, but generally accompanied by a female friend, and, owing to the strong constitution of these women, seldom remains in her retirement more than a day or so. Among the natives of Victoria, the ceremony attending the birth of a child is rather curious, and is amusingly described by Mr. Lloyd: "While upon the subject of the Australian aborigines, I must not omit to describe the very original *modus operandi* of the indigenous *sage femme*.

"The unhappy loobra (native woman) retired with her wise woman into some lone secluded dell, abounding with light sea-sand. A fire was kindled, and the wretched miamiam speedily constructed. Then came the slender repast, comprising a spare morsel of kangaroo or other meat, supplied with a sparing hand by her stoical coolie (male native), grilled, and graced with the tendrils of green opiate cow-thistles, or the succulent roots of the bulbous leaf 'mernong.'

"The sable attendant soon entered upon

her interesting duties. One of the first was, to light a second fire over a quantity of prepared sand, that had been carefully divested of all fibrous roots, pebbles, or coarser matter. The burning coals and faggots were removed from thence, upon some nice calculation as to the period of the unfortunate little nigger's arrival. When the miniature representative of his sable father beheld the light of day, a hole was scratched in the heated sand, and the wee russet-brown thing safely deposited therein, in a state of perfect nudity, and buried to the very chin, so effectually covered up as to render any objectionable movement on his or her part utterly impossible.

"So far as any infantine ebullitions of feeling are concerned, the learned *sages femmes* appeared to have a thorough knowledge as to the world-wide method of treating the mewling and puking importunities of unreasoning nurslings. They knew well that a two-hours' sojourn in the desert sand, warm as it might be, would do much to cool the new comer, and temper it into compliance. At the expiration of that time, having acquired so much knowledge of earthly troubles, the well-baked juvenile was considered to be thoroughly done, and thereupon introduced to his delighted loobra mamma."

Following the custom of many savage nations, the Australians too often destroy their children in their first infancy. Among the Muralug tribes the practice is very common. It has already been mentioned that the girls live very unrestrainedly before marriage, and the result is, that a young woman will sometimes have several children before her marriage. As a general rule, these children are at once killed, unless the father be desirous of preserving them. This, however, is seldom the case, and he usually gives the order "*Márana teio*," *i. e.* Throw it into the hole, when the poor little thing is at once buried alive. Even those children which are born after marriage are not always preserved. In the first place, a woman will scarcely ever take charge of more than three children, and many a female child is destroyed where a male would be allowed to live.

All children who have any bodily defect are sure to be killed, and, as a general rule, half-caste children are seldom allowed to live. The mothers are usually ashamed to acknowledge these murders, but in one case the unnatural parent openly avowed the deed, saying that the infant was like a waragul, *i. e.* the native dog or dingo. The fact was that its father was a sailor who had fiery red hair, and his offspring partook of the same rufous complexion. Of course there are exceptions to the rule, one of which may be found in the case of the poor woman who was so faithful to her convict mate. She had a male child, which was brought up by

the tribe to which she belonged, and they were so fond of him that they refused to give him up when some benevolent persons tried to obtain possession of him in order to educate him in civilization.

If, however, the child is allowed to live, the Australian mother is a very affectionate one, tending her offspring with the greatest care, and in her own wild way being as loving a parent as can be found in any part of the world. The engraving No. 2, on the next page, illustrates this devotion of Australian mothers to their children.

In nothing is this affection better shown than in the case of a child's death. Although she might have consigned it when an infant to a living grave without a pang of remorse, yet, when it dies after having been nurtured by her, she exhibits a steady sorrow that exhibits the depth of affection with which she regarded the child. When it dies, she swathes the body in many wrappers, places it in her net-bul, or native wallet,

and carries it about with her as if it were alive. She never parts with it for a moment. When she eats she offers food to the dead corpse, as if it were still alive, and when she lies down to sleep, she lays her head upon the wallet, which serves her as a pillow. The progress of decay has no effect upon her, and though the body becomes so offensive that no one can come near her, she seems unconscious of it, and never dreams of abandoning the dreadful burden. In process of time nothing is left but the mere bones, but even these are tended in the same loving manner, and even after the lapse of years the mother has been known to bear, in addition to her other burdens, the remains of her dead child. Even when the child has been from six to seven years old she will treat it in the same manner, and, with this burden on her back, will continue to discharge her heavy domestic duties.

(1.) AN AUSTRALIAN FEAST. (See page 763.)

(2.) AUSTRALIAN MOTHERS.

(See page 768.)

CHAPTER LXXV.

AUSTRALIA — *Continued.*

FROM CHILDHOOD TO MANHOOD.

AUSTRALIAN CHILDREN — CEREMONIES ATTENDANT ON BECOMING MEN — ADMISSION TO THE RANK OF HUNTER — CEREMONY OF THE KANGAROO — THE KORADJEEES AND THEIR DUTIES — KNOCKING OUT THE TOOTH — TRIAL BY ENDURANCE — TEST OF DETERMINATION — THE MAGIC CRYSTAL — THE FINAL FEAST — INITIATION AMONG THE MOORUNDI AND PARNKALLA TRIBE — THE WITARNA, AND ITS DREADED SOUND — THE WHISPEREES — TAKING THE SECOND DEGREE — THE APHON AND HEAD-NET — THE THIRD AND LAST CEREMONY — ENDURANCE OF PAIN — A NAUO MAN — STORY OF GI'OM — MAKING KOTAIGA OR BROTHERHOOD.

AUSTRALIAN children, while they remain children, and as such are under the dominion of their mothers, are rather engaging little creatures. They cannot be called pretty, partly owing to the total neglect, or rather ignorance, of personal cleanliness, and partly on account of the diet with which they are fed. Their eyes are soft, and possess the half-wistful, half-wild expression that so peculiarly distinguishes the young savage. But they are never washed except by accident, their profuse black hair wanders in unkempt masses over their heads, and their stomachs protrude exactly like those of the young African savage.

In process of time they lose all these characteristics. The wistful expression dies out of their eyes, while the restless, suspicious glance of the savage takes its place. They become quarrelsome, headstrong, and insubordinate, and, after exhibiting these qualifications for a higher rank in life, they become candidates for admission into the rights and privileges of manhood. Among civilized nations, attaining legal majority is a simple process enough, merely consisting of waiting until the candidate is old enough; but with many savage nations, and specially with the Australians, the process of becoming men is a long, intricate, and singularly painful series of ceremonies.

These rites vary according to the locality in which they are celebrated, but they all

agree in one point, namely, — in causing very severe pain to the initiates, and testing to the utmost their endurance of pain. As many of these rites are almost identical in different tribes, I shall not repeat any of them, but only mention those points in which the ceremonies differ from each other.

One of these customs, which seems to belong to almost every variety of savage life, namely, the loss of certain teeth, flourishes among the Australians. The mode of extracting the teeth is simple enough. The men who conduct the ceremony pretend to be very ill, swoon, and writhe on the ground, and are treated after the usual method of healing the sick, *i. e.* their friends make a great howling and shouting, dance round them, and hit them on the back, until each sick man produces a piece of sharp bone.

This ceremony being intended to give the initiates power over the various animals, a series of appropriate ceremonies are performed. On the morning after the sharp bones have been mysteriously produced, the Koradjees, or operators, dress themselves up with bits of fur and other decorations, which are conventionally accepted as representing the dingo, or native dog. The wooden sword, which is thrust into a belt, sticks up over the back, and takes the place of the tail. The boys are then made to sit on the ground, while the koradjees run

round and round them on all fours, thus representing dogs, and giving the lads to understand that the succeeding ceremony will give them power over dogs. In token of this power, each time that they pass the boys they throw sand and dust over them.

Here it must be remarked that the Australian natives are great dog-fanciers, the dog being to them what the pig is to the Sandwich Islanders. There is scarcely a lad who does not possess at least one dog, and many have several, of which they take charge from earliest puppyhood, and which accompany their masters wherever they go. Besides their value as companions, these dogs are useful for another reason. They are a safeguard against famine; for when a man is in danger of starving, he is sure to rescue himself by killing and cooking his faithful dog. The animal has never cost him any trouble. It forages for itself as its best can, and always adheres to its owner, and is always at hand when wanted. The object, therefore, of the first part of the ceremony is to intimate to the lads that they are not only to have dominion over the dogs, but that they ought to possess its excellent qualities.

The next part of the ceremony is intended to give them power over the kangaroos.

Accordingly, a stout native now appears on the scene, bearing on his shoulders the rude effigy of a kangaroo, made of grass; and after him walks another man with a load of brushwood. The men move with measured steps, in time to the strokes of clubs upon shields, wherewith the spectators accompany the songs which they sing. At the end of the dance, the men lay their burdens at the feet of the youths, the grass effigy signifying the kangaroo, and the brushwood being accepted as a sign of its haunts.

The koradjees now take upon themselves the character of the kangaroo, as they formerly personated the dog. They make long ropes of grass in imitation of the kangaroo's tail, and fasten them at the back of their girdles. They then imitate the various movements of the kangaroo, such as leaping, feeding, rising on their feet and looking about them, or lying down on their sides and scratching themselves, as kangaroos do when basking in the sun. As they go through these performances, several men enact the part of hunters, and follow them with their spears, pretending to steal upon them unobserved, and so to kill them.

After a few more ceremonies, the men lie on the ground, and the boys are led over their prostrate bodies, the men groaning and writhing, and pretending to suffer horrible agony from the contact with uninitiates. At last the boys are drawn up in a row, and opposite to them stands the principal koradjee, holding his shield and waddy, with which he keeps up a series of regular

strokes, the whole party poisoning their spears at him, and at every third stroke touching his shield.

The operators now proceed to the actual removal of the tooth. The initiates are placed on the shoulders of men seated on the ground, and the operator then lances the gums freely with the sharp bone. One end of a wummerah, or throw-stick, is next placed on the tooth, and a sharp blow is struck with the stone, knocking out the tooth, and often a piece of gum also if the lancing has not been properly done.

Among another tribe, the initiate is seated opposite a tree. A stick is then placed against the trunk of the tree, with its other end resting on the tooth. The operator suddenly pushes the lad's head forward, when, as a matter of course, the tooth comes out. The blood is allowed to flow over the spot, and, as it is a sign of manhood, is never washed off.

The tooth being finally extracted, the boy is led to a distance, and his friends press the wounded gum together, and dress him in the emblems of his rank as a man. The opossum fur belt, or kumeel, is fastened round his waist, and in it is thrust the wooden sword, which he, as a warrior, is now expected to use. A bandage is tied round his forehead, in which are stuck a number of grass-tree leaves; his left hand is placed over his mouth, and for the rest of the day he is not allowed to eat.

In some parts of the country there is a curious addition to the mere loss of the tooth. The warriors stand over the lad, exhorting him to patience, and threatening him with instant death if he should flinch, cry out, or show any signs of pain. The operators then deliberately cut long gashes all down his back, and others upon his shoulders. Should he groan, or display any symptoms of suffering, the operators give three long and piercing yells, as a sign that the youth is unworthy to be a warrior. The women are summoned, and the recreant is handed over to them, ever after to be ranked with the women, and share in their menial and despised tasks.

Even after passing the bodily ordeal, he has to undergo a mental trial. There is a certain mysterious piece of crystal to which various magic powers are attributed, and which is only allowed to be seen by men, who wear it in their hair, tied up in a little packet. This crystal, and the use to which it is put, will be described when we come to treat of medicine among the Australians.

The youth having been formally admitted as a huntsman, another ring is formed round him, in order to see whether his firmness of mind corresponds with his endurance of body. Into the hands of the maimed and bleeding candidate the mysterious crystal is placed. As soon as he has taken it, the old men endeavor by all their arts to persuade

him to give it up again. Should he be weak-minded enough to yield, he is rejected as a warrior; and not until he has successfully resisted all their threats and cajoleries is he finally admitted into the rank of men.

The ceremony being over, a piercing yell is set up as a signal for the women to return to the camp, and the newly-admitted man follows them, accompanied by their friends, all chanting a song of joy, called the *korinda braia*. They then separate to their respective fires, where they hold great feasting and rejoicings (see engraving No. 1, page 759); and the ceremonies are concluded with the dances in which the Australians so much delight.

As may be gathered from the account of these ceremonies, the lad who is admitted into the society of hunters thinks very much of himself, and addresses himself to the largest game of Australia; namely, the emu and the dingo. When he has succeeded in killing either of these creatures, he makes a trophy, which he carries about for some time, as a proof that he is doing credit to his profession. This trophy consists of a stick, a yard or so in length, to one end of which is tied the tail of the first dingo he kills, or a huge tuft of feathers from the first emu. These trophies he displays everywhere, and is as proud of them as an English lad of his first brush, or of his first pheasant's tail.

Among the Moorundi natives, who live on the great Murray River, another ceremony is practised. When the lads are about sixteen years old, and begin to grow the beard and moustache which become so luxuriant in their after-life, preparations are quietly made by sending for some men from a friendly tribe, who are called, from their office, the *wearoos*, or pluckers. When they have arrived, the lads who have been selected are suddenly pounced upon by some one of their own tribe, and conducted to the place of initiation, which is marked by two spears set in the ground, inclining to each other, and being decorated with bunches of emu feathers. They are then smeared over with red ochre and grease, and the women flock round them, crying bitterly, and cutting their own legs with mussel-shells, until they inflict horrible gashes, and cause the blood to flow abundantly. In fact, a stranger would think that the women, and not the lads, were the initiates.

The boys lie down, with their heads to the spears, surrounded by their anxious friends, who watch them attentively to see if they display any indications of flinching from pain. The *wearoos* now advance, and pluck off every hair from their bodies, thus causing a long and irritating torture. When they have endured this process, green branches are produced, and fastened to the bodies of the lads, one being worn as an apron, and the others under the arms. Two kangaroo teeth are then fastened in the

hair, and the young men, as they are now termed, are entitled to wear a bunch of emu feathers in their hair.

With another tribe there is a curious variation. The initiate is brought to the selected spot by an old man, and laid on his back in the midst of five fires, each fire consisting of three pieces of wood laid across each other so as to form a triangle. An opossum-skin bag is laid on his face, and the various operations are then performed.

Among the Parnkallas, and other western tribes, there are no less than three distinct ceremonies before the boys are acknowledged as men.

The first ceremony is a very simple one. When the boys are twelve or fifteen years old, they are carried away from the women, and are blindfolded. The operators then begin to shout the words "Herri, herri" with the full force of their lungs, swinging at the same time the mysterious instrument called the *witarna*.

This mysterious implement is a small shuttle-shaped piece of wood, covered with carved ornaments, and being suspended, by a hole cut at one end, from a string made of plaited human hair. When swung rapidly in the air, it makes a loud humming or booming sound. The *witarna* is kept by the old men of the tribe, and is invested with sundry and somewhat contradictory attributes. Its sound is supposed to drive away evil spirits, and at the same time to be very injurious to women and children, no uninitiated being allowed to hear it. Consequently the women are horribly afraid of it, and take care to remove themselves and their children so far from the place of initiation that there is no chance of being reached by the dreaded sound.

When the *witarna* has been duly swung, and the blindfolded boys have for the first time heard its booming sound, the operators advance, and blacken the faces of the boys, ordering them at the same time to cease from using their natural voices, and not to speak above a whisper until they are released from their bondage. They remain whisperers for several months, and, when they resume their voices, assume the title of *warrara*.

They remain in the condition of *warrara* for at least two, and sometimes three years, when they undergo a ceremony resembling the circumcision of the Jews. Their hair is tied in a bunch on the top of the head, is not allowed to be cut, and is secured by a net.

The net used for this purpose is made out of the tendons drawn from the tails of kangaroos. When they kill one of these animals, the natives always reserve the tendons, dry them carefully in the sun, and keep them in reserve for the many uses to which they are put. The sinews taken from the leg of the emu are dried and prepared in the same manner. In order to convert the sinew

into thread, two of the fibres are taken and rolled upon the thigh, just as is done with the fibre of the bulrush root. A thread of many yards long is thus spun, and is formed into a net with meshes made exactly after the European fashion. Sometimes it is left plain, but usually it is colored with red ochre, or white with pipe-clay, according to the taste of the wearer. These tendons, by the way, are valued by the white colonists, who use them chiefly for whip-lashes, and say that the tendon is more durable than any other material.

The initiates of the second degree are also distinguished by wearing a bell-shaped apron, made of opossum fur spun together, and called "mabbirringe." This is worn until the third and last ceremony. The young men are now distinguished by the name of Partnapas, and are permitted to marry, though they are not as yet considered as belonging to the caste, if we may so call it, of warriors.

Even now, the young men have not suffered sufficient pain to take their full rank, and in course of time a ceremony takes place in which they become, so to speak, different beings, and change, not only their appearance, but their names. Up to this time, they have borne the names given to them by their mothers in childhood, names which are always of a trivial character, and which are mostly numerical. For example, if the first child be a boy, it is called Peri (*i. e.* Primus); if a girl, Kartanya (*i. e.* Prima). The second boy is Wari (or Secundus), the second girl Waruyau, and so on. Sometimes the name is taken from the place where the child was born, or from some accidental circumstance, such as the appearance of a bird or insect, or the falling of a shower of rain. But, when the youth becomes a man, he puts away this childish name, and chooses another for himself, which marks him out as a man and a warrior. The process of converting a lad into a man is admirably told by Mr. G. F. Angas:—

"In the third and last ceremony the young men are styled *Wilyalkanye*, when the most important rites take place. Each individual has a sponsor chosen for him, who is laid on his back upon another man's lap, and surrounded by the operators, who enjoin him to discharge his duties aright. The young men are then led away from the camp, and blindfolded; the women lamenting and crying, and pretending to object to their removal.

"They are taken to a retired spot, laid upon their stomachs, and entirely covered over with kangaroo skins; the men uttering the most dismal wail imaginable, at intervals of from three to five minutes. After lying thus for some time, the lads are raised, and, whilst still blindfolded, two men throw green boughs at them, while the others stand

in a semicircle around, making a noise with their *wirris* and voices combined, which is so horrible that the wild dogs swell the hideous chorus with their howlings. Suddenly one of the party drops a bough, others follow; and a platform of boughs is made, on which the lads are laid out. The sponsors then turn to and sharpen their pieces of quartz, choosing a new name for each lad, which is retained by him during life. These names all end either in *alta*, *ilti*, or *ulta*. Previous to this day they have borne the names of their birth-places, &c.; which is always the case amongst the women, who never change them afterward. The sponsors now open the veins of their own arms, and, raising the lads, open their mouths, and make them swallow the first quantity of blood.

"The lads are then placed on their hands and knees, and the blood caused to run over their backs, so as to form one coagulated mass; and when this is sufficiently cohesive, one man marks the places for the tattooing by removing the blood with his thumb nail. The sponsor now commences with his quartz, forming a deep incision in the nape of the neck, and then cutting broad gashes from the shoulder to the hip down each side, about an inch apart. These gashes are pulled open by the fingers as far as possible; the men all the while repeating very rapidly, in a low voice, the following incantation:—

"Kanya, marra, marra,
Kano, marra, marra,
Pilbirri, marra, marra."

When the cutting is over, two men take the *witarnas*, and swing them rapidly round their heads, advancing all the time toward the young men. The whole body of operators now draw round them, singing and beating their *wirris*, and, as they reach the file lads, each man puts the string of the *witarna* over the neck of every lad in succession. A bunch of green leaves is tied round the waist, above which is a girdle of human hair; a tight string is fastened round each arm just above the elbow, with another about the neck, which descends down the back, and is fixed to the girdle of hair; and their faces and the upper part of their bodies, as far as the waist, are blackened with charcoal.

"The ceremony concludes by the men all clustering round the initiated ones, enjoining them again to whisper for some months, and bestowing upon them their advice as regards hunting, fighting and contempt of pain. All these ceremonies are carefully kept from the sight of the women and children; who, when they hear the sound of the *witarna*, hide their heads, and exhibit every outward sign of terror."

The illustration No. 1, on page 765, is given in order to show the curious appearance

(1.) MINTALTA, A NAYO MAN.
(See page 704.)

(2.) YOUNG MAN AND BOY. (South Australia.) (See page 771.)

(3.) SMALL STONE HUT FOR CURE OF DISEASE. (See p. 771.)

(4.) TOMB OF SKULLS. (Cape York.) (See page 773.)

which is sometimes presented by the men when they have successfully passed through their various ordeals. The name of the man was Mintalta, and he belonged to the Nao tribe, which lives near Coffin's Bay. In his hand he holds the waddy, and, by way of apron, he wears a bunch of emu feathers. Across his breast are seen the bold ridges which mark his rank as a man, and others are seen upon his arms. His beard is gathered into a long pointed tuft, and decorated with a little bunch of white cockatoo feathers at the tip. In his hair he wears two curious ornaments. These are not feather plumes, as they seem to be in the illustration, but are simply slender sticks of white wood, scraped so as to let the shavings adhere by one end. Indeed, they are made exactly like those little wooden brooms that are sometimes hawked by German girls about the streets, or, to use a more familiar simile, like the curly-branched trees in children's toy-boxes.

Many of the particulars which have been and will be related of the domestic life of the Australians were obtained in a very curious manner. In the autumn of 1849 some persons belonging to H.M.S. *Rattlesnake* were out shooting, when they came across a native woman, or gin, dressed rather better than the generality of native women, as she wore a narrow apron of leaves. To their astonishment, the supposed gin addressed them in English, saying that she was a white woman, and desired their help. They immediately furnished her with some clothing, and brought her on board the *Rattlesnake*, where she contrived to make known her sad story. Her name was Thomson, and she was the widow of the owner of a small vessel. Cruising one day in search of a wreck, the pilot missed his way, a gale of wind came on, and the vessel was dashed on a reef on the Eastern Prince of Wales Island. The men tried to swim on shore through the surf, but were drowned, while the woman was saved by a party of natives, who came on board the wreck after the gale had subsided, and took her ashore.

The tribe into whose hands she had fallen was the Kowrárega, which inhabits Muralug, on the Western Prince of Wales Island. When she got ashore, one of the principal men, who fully held the popular idea that the white men are the ghosts of dead natives, recognized in Mrs. Thomson a daughter named Gi'òm, who had long ago died. He accordingly took her home as his daughter, she was acknowledged by the tribe as one of themselves, and was forced to become the wife of one of the natives, called Boroto.

For nearly five years she was kept prisoner by the blacks, and, although she could see many English ships pass within a few miles, she was so closely watched that escape was hopeless. At last, when the smoke sig-

nals told the tribe that another vessel was approaching, Gi'òm cleverly worked on the cupidity of the aborigines, and persuaded them to take her to the mainland, promising them to procure plenty of axes, knives, tobacco, and other things which an Australian savage values above all things, and saying that she had lived so long with the natives that she could not think of leaving them. When she was safely lodged on board, many of her friends came to see her, bringing presents of fish and turtle, but always expecting an equivalent. Boroto was one of the visitors, and in vain tried to persuade her to return. When she definitely refused, he became very angry, and left the ship in a passion, declaring that, if he or any of his friends could catch her ashore, they would take off her head and carry it to Muralug. Not feeling the least doubt that the threat would be fulfilled, she never ventured on shore near those parts of the coast which the Kowráregas seemed likely to visit.

Being a woman of no education, she had in the course of her sojourn among the natives almost forgotten how to express herself in her native tongue; and for some time mixed Kowrárega words and phrases with English in a very curious manner. A vast amount of valuable information was obtained from her, but, when she was restored to civilization, she forgot the language and customs of savage life with singular rapidity, her untrained mind being unable to comprehend the mutual relationship of ideas, and utterly incapable of generalization.

From her was learned the curious but dreadful fact that many of the really unprovoked assaults on ships' crews while unsuspectingly visiting the shore were instigated by white men, who had degraded themselves into companionship with native tribes, and, by reason of their superior knowledge, had gained a supremacy over them. One of these men had lived with the Badu tribe many years, and, having heard of a white woman among the Kowráregas, visited Muralug, and tried to induce Gi'òm to leave Boroto and share his fortunes. Who he was is not known. He goes by the name of Wini, and is supposed to be an escaped convict, who repels the visits of English ships, lest he should be captured and sent back to prison. By means of his instigations, the Badu people became so violently opposed to all white men that any European who visited that part of the country would do so at the imminent hazard of his life.

Among many of these tribes, there is a custom which is common also to many savages in all parts of the world. This is the custom of making "kotaiga," or brotherhood, with strangers. When Europeans visit their districts, and behave as they ought to do, the natives generally unite themselves in bonds of fellowship with the strangers, each selecting one of them as

his kotaiga. The new relations are then considered as having mutual responsibilities, each being bound to forward the welfare of the other.

The memory of the natives is wonderful, and, even if a ship does not repeat a visit until after a lapse of several years, no sooner does she arrive than the natives swarm on board, and at once pick out their kotaigas. They bring presents to their guests while on board; they accompany them joyfully to the shore; they carry their bags and haversacks for them; they take them on hunting,

shooting, and fishing excursions, point out the game, retrieve it, no matter where it may have fallen, and carry it home on their shoulders rejoicing. Of course they expect biscuit and tobacco in return for their kind offices, but the wages are very cheap, and their services are simply invaluable. The rescue of Mr. McGillivray and his party from the threatened attack of the natives was owing to the fact that one of them, the friendly native who gave him warning, and saw him and his party safely off in their boats, was his kotaiga, and bound in honor to save him.

>

CHAPTER LXXVI.

AUSTRALIA — *Continued.*

MEDICINE, SURGERY, AND THE DISPOSAL OF THE DEAD.

BILBOS, OR NATIVE DOCTORS — WOUNDS AND BRUISES — A STRANGE CURE — TREATMENT OF THE HEADACHE — A DREAM AND ITS RESULTS — THE MAGIC CRYSTAL, OR DOCTOR-STONE — ITS EFFECTS ON WOMEN AND CHILDREN — THE DOCTOR-HOUSE — SUCTION AS A MEANS OF CURE — BELIEF IN CHARMS — THE PARENT'S SKULL — CEREMONIES OF MOURNING — CUTTING THE HEAD AND BODY AS A SIGN OF WOE — DRIVING AWAY THE EVIL SPIRITS — FEAR OF GHOSTS — BURIAL AMONG THE PARNKALLAS AND NAUOS — THE TOMB OF SKULLS — A SUMMARY MODE OF BURIAL — FUNERAL OF BOYS — THE TREE-TOMBS — SMOKING THE WARRIORS — INCONSISTENT BEHAVIOR — BURIAL OF OLD WOMEN — THE WIDOWS' CAPS — RELIGIOUS IDEAS OF THE ABORIGINES — THE VARIOUS EVIL SPIRITS — THE BUNYIP — ROCK AND CAVE PAINTINGS — THEORY OF TRANSMIGRATION.

WE will now see how the Australian natives treat sickness of various kinds. Among them are certain personages called bilbos, or doctors, to whom the sick usually appeal in cases of illness or pain. It is not known, however, whether the mere fact of age gives a man the rank of bilbo, or whether it is attained by sundry ceremonials, as is the case with the Africans and other savages.

The most usual mode of treating any local disease or pain is by pressing the hands upon the affected part, and kneading it, a remedy which is found in every part of the world, and which is really efficacious in many complaints, especially in rheumatic affections, or in sprained or over-exerted muscles. If a limb be wounded, bruised, or sore, the native practitioners tie a fillet tightly above it, for the purpose, as they say, of preventing the malady from reaching the body. Headaches are treated by tying a bandage firmly round the temples, and, if the pain be obstinate, the doctors bleed the patient under the arm, using a sharp piece of quartz as a lancet. The flowing blood is never allowed to be wasted, but is received on the body of the operator, and diligently rubbed into the skin, under the notion that by this process both parties are strengthened. This depends, however, on the sex of the patient, women being never bled, nor allowed to have the blood of any other person sprinkled upon them.

About 1832, a curious disease broke out among the natives of Wellington Valley,

resembling the small-pox in many things, and yet displaying symptoms which scarcely belong to that dread disease, the one fatal scourge of savage tribes. It was preceded by headache, fever, sore-throat, &c., and accompanied by pustules very much resembling those of the small-pox. It was, however, scarcely virulent enough for the real disease, though it was probably a milder form of it, and was subject to the power of vaccine matter. It was not limited to the natives, but attacked many Europeans just like the genuine small-pox, and in one case was fatal.

It is here mentioned on account of the mode of cure adopted by the native doctors. They punctured the pustules with sharp fish-bones, and squeezed them well with the blunt end of their rude lancets, and it is a noteworthy fact that the rate of mortality was very much reduced. Of course the doctors used other modes, whereby they gave their patients confidence in their powers. The chief of these was performed by means of a number of slender rods, six to nine feet in length, which were stuck in the ground in the form of a crescent, and addressed with long speeches and many mysterious gestures. Among the Australians, this disease, whatever it may be, does not strike the abject terror with which it is usually accompanied. Although they know that it is infectious, they do not abandon the sick person, unless perhaps the doctor pronounces the patient incurable; in which

case they save him prolonged pain, and themselves useless trouble, by burying him alive. The native term for this disease is "thunna-thunna," and it is known to have existed when the country was first discovered, so that it is not imported from civilized countries.

Another remarkable kind of cure for the headache is mentioned by Mr. Angas. The patient being seated on the ground, a string is tied round his head, the knot being carefully adjusted to the middle of the forehead. The operator, who is always a woman, seats herself opposite the patient, places the line between her lips, and frets them with it until they bleed freely. The idea is that the disease, attracted by the blood, passes along the line from the patient's head, and is cast out together with the blood.

A very remarkable instance of this mode of cure is related in Tyerman and Bennett's "Voyage round the World." A man had dreamed that he had been speared in the side, and had died in consequence of the wound. Although, when he woke, he knew it was but a dream, he was so frightened that he became very ill, retired to his hut, chose the place of his burial, and lay down to die.

Nearly a week elapsed, during which he could take no food, grew worse and worse, and it was plain that nature would not hold out much longer. The priests — or rather sorcerers, for it cannot be ascertained that the New Hollanders have any other kind of priests, having, in fact, no religious worship — came to do what they could for him with their enchantments. By their order he was carried down to the side of a running water, and tumbled into the stream, where it was pretty deep, head foremost. When taken out, he was rolled in the sand till his body was quite entased with it. This again was washed off by pouring water over him.

"Meanwhile a young woman of the company was perceived plaiting a cord of kangaroo's hair, which, when completed, was bound round his chest, and a knot, very cunningly implicated by one of the operators, was placed over that part of his side into which the spear of his dream had entered. From this knot a line was passed to the young woman who had prepared the bandage. This she drew through her mouth backward and forward (as children sometimes do with a piece of packthread) until she began to spit blood, which was said to be sucked by that process from the wound in the sick man's side. There it was now perceptible that, from whatever cause, a considerable swelling had arisen under the knot. Toward this one of the sorcerers began to stroke the man's flesh from all the adjacent regions of the back, belly, and chest, as though to force the blood thither. He then applied his mouth to the swelling, and, with hideous noises, sometimes sucked it

with his lips, sometimes pressed it violently with his hands, till *forth came the point of a spear*, four inches in length, which he presented to the astonished spectators and the expecting sufferer, as verily extracted from the man's side.

"Then he applied his mouth again to the swollen part, from which, although there was no visible wound, he appeared to draw blood and corrupt matter, stains of both being soon seen on the swarthy skin. At length, with distended cheeks, as though he had filled his mouth with the abominable matter, he ran about, anxiously looking for a fit place to discharge it upon; but, affecting to find none, he crossed the water, and deposited the nauseous extract behind a bush. The poor man's hopes revived, and he now believed that he should get well again. Mr. Dunlop thereupon sent him some tea, which, however, he would not drink, but requested that it might be given to the sorcerer, and, if he drank it, then it would do himself (the patient) good. He was deceived, disappointed, and died."

The Australians are tolerably good surgeons in a rough-and-ready sort of way, and are clever at setting broken limbs. After bringing the broken ends of the bone together, they support the limb by several pieces of wood which act as splints, and then make the whole secure by bandages, which they often strengthen with gum, exactly as is done in modern surgery.

One of the most powerful remedies employed by the native practitioners is the "doctor-stone." This is nothing but a common quartz crystal; but the doctors aver that they manufacture it themselves, and that the ingredients are kept secret. Like the *witarna*, mentioned on page 747, women are never allowed even to look upon the doctor-stone, and are impressed with the belief that, if they dared to set their eyes upon the forbidden object, they would be immediately killed by its radiant powers. The larger the crystal, the more valuable is it; and a tolerably large one can scarcely be procured from the natives at any price.

The doctors say that this stone is not only fatal to women, but also destroys men if flung at them with certain incantations. An European settler once challenged a native doctor to say as many charms as he liked, and throw the magic stone as much as he pleased. This offer, however, he declined, giving the usual excuse of savages, that the white man belonged to a totally different order of beings, and, although the poor black fellow would die from the effects of the doctor-stone, the white man was much too powerful to be hurt by it.

The mode in which the crystal is used is very curious, and has been described by an eye-witness.

A native of the *Tumat* country, named *Golong*, was suffering from a spear wound

received in a skirmish with a hostile tribe, and was brought to a bilbo, named Baramumbup, to be healed. The patient being laid on the ground outside the encampment so that women could not run the risk of death through the accidental sight of the crystal, the doctor began a close examination of the wound, and sucked it. He then retired to a distance from the patient, muttered some magic words for a minute or so, and placed the crystal in his mouth. Having retained it there for a short time, he removed it, spat on the ground, and with his feet trampled on the saliva, pressing it deeply into the ground. This was repeated several times, and the doctor took his leave.

For several successive evenings the whole of the process was gone through, and the recovery of the patient, which was really rapid, was attributed by all parties to the wonderful efficacy of the doctor-stone. "On making inquiry," writes Dr. Bennett, "why the physician is so careful in trampling the saliva discharged from his mouth into the ground, no satisfactory reason could be obtained, a vague answer only being returned to the query. But it is not improbable that they consider, by this practice, that they finally destroy the power of the evil spirit, extracted by the operation through the virtues of the stone. Some such reason for this proceeding may be inferred from an observation made to any European who may be present at this part of the ceremony, 'that he (*i. e.* the disease) may not come up again.'"

It is remarkable that a ceremony almost exactly identical in principle is employed by the Guaycura tribe of Brazil. Among them the doctors, or *payés*, cure local ailments, whether wounds or otherwise, by sucking the part affected, spitting into a hole dug in the ground, and then filling in the earth, as if to bury the complaint.

The Australian doctors make great use of the principle of suction, and employ it in all kinds of cases. If, for example, a patient has a bad pain in his stomach from over-eating, or suffers more than he thinks right from the blow of a waddy, the doctor sucks at the afflicted part vigorously, and at last produces from his mouth a piece of bone, or some other hard substance, which he asserts to be the concentrated essence of the pain, or other ailment. The reader may remark that the bones with which the gums of youths are lanced in the ceremonies of initiation are supposed to be produced from the bodies of the operators by means of suction.

A very remarkable curative agent is shown in the illustration No. 3, page 765, which is taken from a sketch by Mr. Baines. It consists of a stone building, which at first sight looks so like an ordinary Druidical remain that it might be taken for one, except for its dimensions. Instead,

however, of being composed of huge stones, each weighing several tons, it is quite a tiny edifice, scarcely larger than the grotto which children erect with oyster-shells. The patient lies in, or rather under it, the aperture being just wide enough to admit his body, and the small roof only covering a very small portion of the inmate. Sundry superstitious rites are employed at the same time, and the remedy is efficacious, like the crystal already mentioned, in consequence of enlisting the imagination of the sufferer. These little buildings are found along the Victoria River, and for a considerable time the object for which they were built greatly puzzled the discoverers.

A medicine scarcely less efficacious than the doctor's stone is human fat, which is carefully preserved, and administered by being rubbed in and around the affected part. As, however, it is highly valued by the warriors it is not easily procured, and had it to be taken solely from the bodies of slain enemies, would in all probability never be used at all. The efficacy of this repulsive remedy does not depend on the individual from whom it is taken, that of a child or woman being quite as useful as that of a warrior.

According to Mr. G. T. Lloyd, the practice of deserting the helpless is found in Australia as well as in other countries, and is practised exactly as is the case in Africa. When a person is ill the relations, as a rule, do not trouble themselves to visit the sick person, and, when there is no apparent hope of recovery, a supply of food and firing enough to last them for several days is left near them, and they are then abandoned to their fate. Even in the case of poor old Tarmeenia, mentioned on page 747, the son, although he carried his wounded father more than four miles in order to place him in safety, never once came to see him.

Seeing that the natives place such implicit faith in the healing power of the doctor's stone, it is natural that they should also believe in sundry charms as preservatives against disease and misfortune. One of these charms is a sort of girdle, several inches wide in the middle, and tapering to a mere thong at each end. If it be made of string prepared from the bulrush root, it is called Taara or Kuretti; and if made of human hair, it goes by the name Godlotti. It is used more as a curative than a preventive, and is mostly found among the tribes of the lower Murray River. The hair, when twisted into thread, is wound upon a curious spindle, consisting of two slender pieces of wood placed across each other at right angles.

Another charm is shown in the illustration No. 2, on the 765th page, slung round the neck of the boy. It is the beak of the black swan, which, from its scarlet color, contrasts well with the black skin of the

wearer. The little boy's name is Rimmilliperingery, and Mr. G. F. Angas remarks that he was an engaging little fellow, and had the largest and softest pair of dark eyes that could be imagined. The elder figure is that of a young man named Tyilkilli, belonging to the Parnkalla tribe of Port Lincoln. He has been selected as a favorable example of the Australian young man in good circumstances, well-fed, careless, and gay with the unthinking happiness of mere animal life, which finds a joy in the very fact of existence.

Among many of the tribes may be seen a strange sort of ornament, or rather utensil; namely, a drinking-cup made of a human skull. It is slung on cords and carried by them, and the owner takes it wherever he or she goes. These ghastly utensils are made from the skulls of the nearest and dearest relatives; and when an Australian mother dies, it is thought right that her daughter should form the skull of her mother into a drinking-vessel. The preparation is simple enough. The lower jaw is removed, the brains are extracted, and the whole of the skull thoroughly cleaned. A rope handle made of bulrush fibre is then attached to it, and it is considered fit for use. It is filled with water through the vertebral aperture, into which a wisp of grass is always stuffed, so as to prevent the water from being spilled.

Inconsistency is ever the attribute of savage minds. Although they consider that to convert the skull of a parent into a drinking vessel, and to carry it about with them, is an important branch of filial duty, they seem to have no very deep feelings on the subject. In fact, a native named Wooloo sold his mother's skull for a small piece of tobacco. His mind was evidently not comprehensive enough to admit two ideas together, and the objective idea of present tobacco was evidently more powerful than the comparative abstraction of filial reverence.

Mr. Angas saw one which was carried by a little girl ten years of age. Like "Little Nell," she was in attendance upon an old and infirm grandfather, and devoted her little life to him. In nothing was the difference of human customs shown more plainly than in the use of the mother's skull as a drinking vessel—an act which we should consider as the acme of heathen brutality, but with these aborigines is held to be a duty owed by the child to the parent.

Perhaps my classical readers will remember a chapter in Herodotus which bears on this very subject. He finds fault with Cambyses for breaking into the temples of the Cabeiri, burning their idols, and so hurting the religious feelings of the people; and remarks that he was wary in offending against any religious sentiment, however absurd it might appear to himself. He then

proceeds to tell an anecdote of Darius, who had at his court some "Indians called Callatians," and some Greeks. He asked the Greeks (who always burned their dead, as the Hindoos do now), what bribe would induce them to eat the bodies of their dead parents, and they naturally replied that for no bribe could they perform so horrible a deed. Then, in the presence of the Greeks, he asked the Callatians, who ate their dead (as several savage nations do now), for what sum they would consent to burn the bodies of their dead. They, as it appears from the style of their answer, were even more shocked than the Greeks at the idea of such horrible sacrilege, and would not deign to give a direct answer, but begged Darius to "speak words of good omen." (See *Thalía*, xxxvii. 8.)

A somewhat similar proceeding is narrated in the life of Nussir-er-deen, the late king of Oude. His native ministers, jealous of the influence exercised over him by some of his European friends, complained that the English guests treated the monarch with disrespect, by retaining their shoes in his royal presence. The king, who, enervated as he was by vanity, dissipation, self-indulgence, and flattery, was no fool, immediately proposed a compromise. "Listen to me, nawab; and you, general, listen to me. The King of England is my master, and these gentlemen would go into his presence with their shoes on. Shall they not come into mine, then? Do they come before me with their hats on? Answer me, your excellency."

"They do not, your majesty."

"No, that is *their* way of showing respect. *They* take off their hats, and *you* take off your shoes. But come now, let us have a bargain. Wallah! but I will get them to take off their shoes and leave them without, as you do, if you will take off your turban and leave it without, as they do." (See Knighton's "Private Life of an Eastern King.")

We now come naturally to the burial of the dead, and the various ceremonies which accompany the time of mourning. Although the relatives seem so careless about the sick person, they really keep a watch, and, as soon as death actually takes place, they announce the fact by loud cries. The women are the principal mourners, and they continue to sob and shriek and moan until they are forced to cease from absolute exhaustion. They cut their bodies until the blood streams freely from their wounds, and some of them chop their own heads with their tomahawks until their shoulders and bodies are covered with blood.

The reader will probably have noticed how widely spread is this custom of wounding the body as a sign of mourning, and especially as a lamentation for the dead. We have seen that it exists in Africa, and we shall see that it is practised in many other countries. That

it was practised in ancient days by the people among whom the Jews lived, we see from several passages of Scripture. See for example Deut. xiv. 1: "Ye shall not cut yourselves, nor make any baldness between your eyes for the dead." Also Jer. xvi. 6: "They shall not be buried, neither shall men lament for them, nor cut themselves, nor make themselves bald for them." There is also the well-known passage concerning the sacrifice that the priests of Baal offered, in the course of which they "cut themselves after their manner with knives and lancets, till the blood gushed out upon them."

The body is not disposed of at once, but is suffered to remain for a considerable time, during which decomposition takes place, and is allowed to work its course until the flesh is separated from the bones. The body is watched carefully during the night; and if a passing meteor should appear in the sky, the people shout and wave firebrands in order to drive away a certain evil spirit named *Yumburbar*, which is thought to be the real though invisible cause of death and all calamities, and to haunt the spot where a dead body lies for the purpose of feeding upon it.

When decomposition has done its work, the bones are carefully collected, cleaned, and painted red, after which they are wrapped up in bark, and carried about with the tribe for a time. This term being fulfilled, they are finally disposed of in various ways, according to the customs of the tribe to which they belonged. Some tribes scoop holes in soft rocks, and place the remains therein, while others prefer hollow trees for that purpose. Sometimes the body is placed in the cave without being reduced to a skeleton, and in some places the soil is of such a nature that the body becomes dried before decomposition can proceed very far. During the Exhibition of 1862 one of these desiccated bodies was exhibited in England, and called the "petrified" man. It was, however, nothing but a shrivelled and dried-up body, such as is often found in very dry soils.

Near the Murrumbidgee River, in the Wellington Valley, there is a remarkable stalactitic cavern, divided into several "halls." This cavern is, or has been, a favorite burying-place of the aborigines, who seem to have employed it for the same purpose that Abraham purchased the cave of Machpelah. In consequence of the use of the cavern as a burial place, the natives are rather nervous about entering it, and they flatly refuse to venture into the darker recesses, for fear of the "dibbil-dibbil." When Dr. Bennett visited it in 1832, he found in a small side cave the skeleton of a woman. The bones had been placed there nearly twenty years before.

The Parnkalla and Nauo tribes have another mode of burial, which somewhat resembles that which is employed by the Bechuanas. The body is placed in a crouching

or squatting position, such as is employed by the natives when sitting, the knees being drawn up to the chin, the legs close to the body, and the hands clasped over the legs. Examples of this attitude may be seen in many of the illustrations. A circular pit or grave, about five feet in depth, is then dug, and after the body is lowered into the pit a number of sticks are laid over the grave, nearly touching one another. A thick layer of leaves and another of grass are then placed on the sticks, and over all is heaped the earth which has been dug out of the pit, so that the grave looks something like a huge anthill.

In Northern Australia the natives have a curious method of disposing of the dead. They gather the skulls together, and heap them into a circular mound, placing stones round them to keep them in their places. They do not cover the skulls, but make the tomb in an open and conspicuous place. Such a tomb is illustrated on page 765.

The blacks of the Clarence River build monuments which are somewhat similar in appearance, but are made of different materials. They place a number of stones in a circle, and in the centre they erect an upright slab of stone. They can give no reason for this custom, but only say that "black-fella make it so," or "it belong to black-fella." The former reply signifies that the custom has always prevailed among the natives; and the second, that the tomb shows that a native lies buried beneath the upright stone.

Some of the tribes along the Clarence River have a curious mode of disposing of the dead—a mode which certainly has its advantages in its great economy of trouble. When an old man feels that the hand of death is on him, he looks out for a hollow tree, climbs it, lets himself down to the bottom of the hollow, and so dies in his tomb.

In New South Wales the young people are buried beneath small tumuli, but the adults are buried in a rather curious fashion. A pile of dry wood, leaves, &c. is built, about three feet in height and six or seven in length. On the pile the body is laid on its back, having the face directed toward the rising sun. The fishing apparatus, spears, and other weapons and implements of the dead man are next laid on the pile, and the body is then covered over with large logs of wood. The pile is fired by the nearest relative, and on the following day, when the place is cool, the ashes of the dead are collected, and carefully buried.

Should a woman die, leaving an unweaned child, the poor little creature is buried together with the ashes of its mother. The natives defend this practice as a humane one, saying, with savage justice, that it is better to kill the child speedily than to allow it to pine to death from starvation.

As is the case with many tribes in different parts of the world, as soon as any one

dies the name borne by the deceased is no more mentioned. So strictly is this rule observed, that if another member of the tribe should happen to bear the same name, it must be abandoned, and a new name taken, by which the bearer will ever afterward be known.

Mr. Angas, to whom we are indebted for so much of our knowledge of the Australians, gives an interesting account of the burial of a boy, as described to him by an eye-witness :

"Previously to burying the corpse of the boy, a contest with clubs and spears took place, but no injury was done to the parties engaged. The body was placed in a bark canoe, cut to the proper length, a spear, a fishing-spear, and a throwing-stick, with several other articles, being placed besides the corpse. The women and children made great lamentations during the ceremony, and the father stood apart, a picture of silent grief.

"The canoe was placed on the heads of two natives, who proceeded with it slowly toward the grave; some of the attendants waving tufts of dried grass backward and forward under the canoe and amongst the bushes as they passed along. The grave being dug, a native strewed it with grass, and stretched himself at full length in the grave, first on his back and then on his side. As they were about to let down the child into the grave, they first pointed to the deceased and then to the skies, as though they had a vague idea that the spirit had ascended to another world.

"The body was then laid in the grave, with the face looking toward the rising sun, and, in order that the sunshine might fall upon the spot, care was taken to cut down all shrubs around that could in any way obstruct its beams. Branches were placed over the grave, grass and boughs on them, and the whole was crowned with a log of wood, on which a native extended himself for some minutes, with his face to the sky."

At the beginning of this description is mentioned a sham fight. This is held in consequence of a curious notion prevalent among the aborigines, that death from natural causes must be ransomed with blood. It suffices if blood be drawn even from a friend, and the mode by which they make the required offering, and at the same time gratify their combative nature, is by getting up a sham fight, in which some one is nearly sure to be wounded more or less severely.

Sometimes the body of the dead man is disposed of rather oddly. In some parts of Australia the natives, instead of consuming the body by fire, or hiding it in caves or in graves, make it a peculiarly conspicuous object. Should a tree grow favorably for their purpose, they will employ it as the final resting-place of the dead body. Lying in its

canoe coffin, and so covered over with leaves and grass that its shape is quite disguised, the body is lifted into a convenient fork of the tree, and lashed to the boughs by native ropes. No further care is taken of it, and if, in process of time, it should be blown out of the tree, no one will take the trouble of replacing it.

Should no tree be growing in the selected spot, an artificial platform is made for the body, by fixing the ends of stout branches in the ground, and connecting them at their tops by smaller horizontal branches. Such are the curious tombs which are represented in the illustration No. 3, on page 775. These strange tombs are mostly placed among the reeds, so that nothing can be more mournful than the sound of the wind as it shakes the reeds below the branch in which the corpse is lying. The object of this aerial tomb is evident enough, namely, to protect the corpse from the dingo, or native dog. That the ravens and other carrion-eating birds should make a banquet upon the body of the dead man does not seem to trouble the survivors in the least, and it often happens that the traveller is told by the croak of the disturbed ravens that the body of a dead Australian is lying in the branches over his head.

The aerial tombs are mostly erected for the bodies of old men who have died a natural death; but when a young warrior has fallen in battle the body is treated in a very different manner. A moderately high platform is erected, and upon this is seated the body of the dead warrior, with the face toward the rising sun. The legs are crossed, and the arms kept extended by means of sticks. The fat is then removed, and, after being mixed with red ochre, is rubbed over the body, which has previously been carefully denuded of hair, as is done in the ceremony of initiation. The legs and arms are covered with zebra-like stripes of red, white, and yellow, and the weapons of the dead man are laid across his lap.

The body being thus arranged, fires are lighted under the platform, and kept up for ten days or more, during the whole of which time the friends and mourners remain by the body, and are not permitted to speak. Sentinels relieve each other at appointed intervals, their duty being to see that the fires are not suffered to go out, and to keep the flies away by waving leafy boughs or bunches of emu feathers. When a body has been treated in this manner, it becomes hard and mummy-like, and the strangest point is, that the wild dogs will not touch it after it has been so long smoked. It remains sitting on the platform for two months or so, and is then taken down and buried, with the exception of the skull, which is made into a drinking-cup for the nearest relative, as has already been mentioned.

(1.) CARVED FEATHER BOX, NEW ZEALAND. (See page 813.)

(2.) SMOKING THE BODIES OF SLAIN WARRIORS. (See page 777.)

(3.) TREE TOMBS OF AUSTRALIA. (See page 774.)

Considering the trouble which is taken in the preparation of these bodies, and the evident respect which is felt for a brave warrior in death as well as in life, the after-treatment of them is very remarkable. When a friend, or even an individual of the same tribe, sees one of these mummified bodies for the first time, he pays no honor to it, but loads it with reproaches, abusing the dead man for dying when the tribe stood in such need of brave and skilful men, and saying that he ought to have known better than to die when there was plenty of food in the country. Then, after contemplating the body for some time, he hurls his spear and club at it, crying out at the same time, "Why did you die? Take that for dying."

In the illustration No. 2, on page 775, two of these bodies are seen seated on the platform, supported by being tied to the uprights by their hands and heads, and having their weapons in their laps. On one side is one of the sentinels engaged in driving away the flies with his flapper, and on the other is a second sentinel bringing fuel for the fire. The seated figures belong to the same tribe.

Around Portland Bay, and toward the south-eastern parts of the continent, the natives have a curious combination of entombment and burning. They let the dead body down into one of the hollow trees, where it is supported in an upright position. A quantity of dry leaves and grass is then heaped upon the tree, and the whole consumed by fire, amid the dismal screams and cries of the women.

It is rather curious that funeral ceremonies are only employed in the case of those whose death is supposed to be a loss to the tribe. Men, and even boys, are therefore honored with funeral rites, because the younger men are warriors, the boys would have been warriors, and the old men have done service by arms, and are still useful for their wisdom. Even young women are buried with some amount of show, because they produce children for the tribe.

But of all beings an old woman is most utterly despised. She can render no service; she has never been considered as anything but a mere domesticated animal, and even for domestic purposes she has ceased to be useful. When she dies, therefore, no one regrets her. She is nothing but a useless burden on her people, consuming food which she does not earn, and sitting by the fire when the younger women are engaged in work. It is nothing to them that she has worn herself out in the hard, thankless, and never ceasing labor which constitutes the life of an Australian woman, and so when she dies her body is drawn away out of the camp by the heels, and stuffed away hastily in some hollow tree or cave that may be most convenient. Sometimes the body is laid on a bough, as has already been described; but even in such a case it is merely

laid on the branch, without being placed in a canoe, or covered with matting, boughs, and leaves, as is the case with the bodies of men. The corpse is allowed to remain on the branch until it falls to pieces; and when any of her relatives choose to take the trouble, they will scrape a hole in the sand and bury the scattered bones.

The shee-oak, or casuarina, is the tree which is generally selected for this purpose, partly because it is one of the commonest trees of Australia, and partly because the peculiar growth of its boughs affords a firm platform for the corpse.

The time of mourning does not cease with the funeral, nor, in case of a tree-tomb, with the subsequent interment of the bones. At stated times the women, by whom the mourning is chiefly performed, visit the tomb, and with their kattas, or digging-sticks, peck up the earth around them, and make the place look neat. This done they sit down and utter their most doleful cries and lamentations. In some places they content themselves with vocal lamentations, but in others the women think it necessary to show their grief by repeating the head chopping, limb scarring, and other marks of blood-letting which accompany that portion of the funeral ceremonies.

In one part of Australia, near the north-west bend of the Murray, a most remarkable custom prevails. Widows attend upon the tombs of their dead husbands, and, after shaving their heads, cover them with pipe-clay kneaded into a paste. The head is first covered with a net, to prevent the pipe-clay from sticking too tightly to the skin; a misfortune which is partly averted by the amount of grease with which every Australian is anointed.

A layer of this clay more than an inch in thickness is plastered over the head, and when dry it forms a skull-cap exactly fitting the head on which it was moulded, and on account of its weight, which is several pounds, must be very uncomfortable to the wearer. These badges of mourning may be found lying about near the tumuli, and, until their real use was discovered, they were very mysterious objects to travellers. In the illustration No. 1, on the 781st page, is seen a burying place near the river. Several of the mound tombs of the natives are shown, and in the foreground are two widows, seated in the peculiar attitude of Australian women, and wearing the widow's cap of pipe-clay. Several other caps are lying near the tombs, having been already employed in the ceremonies of mourning.

So careful are the natives of the marks of respect due from the survivors to the dead, that a widow belonging to one of the tribes on the Clarence River was put to death because she neglected to keep in order the tomb of her late husband, and to dig up periodically the earth around it.

From the disposal of the dead, we are naturally led to the religious belief of the Australians. Like all savages, they are very reticent about their religious feelings, concealing as far as possible their outward observances from the white people, and avowing ignorance, if questioned respecting the meaning of those which have become known to the strangers. Some observances, however, have been explained by Gi'om, the unfortunate Scotch woman who had to reside so long among the Kowráregas, and others by native converts to Christianity. Even these latter have not been able to shake off the superstitious ideas which they had contracted through the whole of their previous lives, and there is no doubt that they concealed much from their interrogators, and, if pressed too closely, wilfully misled them.

The following short account will, however, give an idea of the state of religious feeling among the aborigines, as far as can be ascertained. And, in consequence of the rapid and steady decrease of the native tribes, it is possible that our knowledge of this subject will never be greater than it is at present.

In the first place, there are no grounds for thinking that the aborigines believe in any one Supreme Deity, nor, in fact, in a deity of any kind whatever. As is usual with most savage nations, their belief in supernatural beings is limited to those who are capable of doing mischief, and, although the conception of a beneficent spirit which will do good never seems to enter an Australian's mind, he believes fully, in his misty fashion, in the existence of many evil spirits which will do harm.

Of these there are many. One of them is the *Arlak*, a being which takes the shape of a man. It is only seen at night, and is in the habit of watching for stragglers in the dark, seizing them and carrying them off. Several natives told Mr. McGillivray that they had seen the arlak; and one man, who had summoned enough courage to fight it when it attacked him, showed the marks of the demon's teeth upon his body. Fortunately, the arlak cannot endure light, and therefore the natives, if they have to go the smallest distance in the dark, take a fire-stick in one hand and a weapon of some sort in the other.

One kind of evil spirit, which is very much dreaded by the aborigines, is the one in whom death is personified. He is short, thick, very ugly, and has a disagreeable smell. The natives of the Moorundi district believe in a native spirit, wonderfully similar in attributes to the Necker of German mythology. Although, according to their accounts, it is very common, they have great difficulty in describing it, and, as far as can be ascertained from their statements, it is like a huge star-fish. This demon inhabits the fresh water, or there might have

been grounds for believing it to be merely an exaggeration of the cuttle-fish.

Throughout the greater part of Australia is found the belief in the Bunyip, a demon which infests woods, and which has been seen, as is said, not only by natives but by white men. The different accounts of the animal vary extremely. Some who have seen it aver it to be as large as a horse, to have a pair of eyes as big as saucers, and a pair of enormous horns.

Others give a very different account of it, and one of the Barrabool Hill natives gave a very animated description of the dreaded bunyip. He illustrated his lecture by a spirited drawing, in which the bunyip was represented as having a long neck and head, something like that of the giraffe, a thick flowing mane, and two short and massive fore-legs, each of which was armed with four powerful talons. The entire body was covered with strong scales, overlapping each other like those of the hawksbill turtle. This creature he represented as half beast, half demon, and vaunted the superior courage of his ancestors, who ventured to oppose this terrible creature as it lay in wait for their wives and children, and drove it out of the reeds and bush into the water whence it came.

Thinking that some large and now extinct beast might have lived in Australia, which might have been traditionally known to the aborigines, scientific men have taken particular pains to ransack those portions of the country which they could reach, in hopes of finding remains which might be to Australia what those of the megatherium and other huge monsters are to the Old World. Nothing of the kind has, however, been found. Some very large bones were once discovered on the banks of a shallow salt lagoon (just the place for the bunyip), but when sent to the British Museum they were at once found to be the remains of a gigantic kangaroo. At present, the legend of the bunyip stands on a level with that of the kraken—every native believes it, some aver that they have seen it, but no one has ever discovered the least tangible proof of its existence.

To these evil spirits the natives attribute every illness or misfortune, and in consequence are anxious to avoid or drive them away. All meteors are reckoned by them among the evil spirits, and are fancifully thought to be ghosts which multiply by self-division. The aborigines think, however, that by breathing as loudly as they can, and repeating some cabalistic words, they disarm the demons of their power.

They have one very curious belief,—namely, that any one who ventured to sleep on the grave of a deceased person, he would ever afterward be freed from the power of evil spirits. The ordeal is, however, so terrible that very few summon up sufficient courage to face it. "During that awful

sleep the spirit of the deceased would visit him, seize him by the throat, and, opening him, take out his bowels, which it would afterward replace, and close up the wound! Such as are hardy enough to go through this terrible ordeal — encounter the darkness of the night and the solemnity of the grave — are thenceforth ‘koradjee’ men, or priests, and practise sorcery and incantations upon the others of their tribe.”

In Southern Australia, the natives believe that the sun and moon are human beings, who once inhabited the earth. The planets are dogs belonging to the moon, who run about her; and the various constellations are groups of children. An eclipse of either the sun or moon is looked upon as a terrible calamity, being sure to be the forerunner of disease and death.

All burial-places of the dead are held as liable to be haunted by evil spirits, and are therefore avoided. Promontories, especially those which have rocky headlands, are also considered as sacred; and it is probably on account of that idea that the skull monuments, mentioned on page 773, are raised.

Some of these places are rendered interesting by specimens of native drawings, showing that the aborigines of Australia really possess the undeveloped elements of artistic power. Owing to the superstition which prevails, the natives can scarcely be induced to visit such spots, giving as their reason for refusing that “too much dibbil-dibbil walk there.” Mr. Angas was fortunate enough, however, to discover a considerable number of these drawings and carvings, and succeeded in impressing into his service an old native woman. His description is so vivid, that it must be given in his own words:—

“The most important result of our rambles around the bays and rocky promontories of Port Jackson was the discovery of a new and remarkable feature connected with the history of the natives formerly inhabiting this portion of New South Wales.

“I refer to their carvings in outline, cut into the surface of flat rocks in the neighborhood, and especially on the summits of the various promontories about the harbors of the coast. Although these carvings exist in considerable numbers, covering all the flat rocks upon many of the headlands overlooking the water, it is a singular fact that up to the present time they appear to have remained unobserved; and it was not until my friend Mr. Miles first noticed the rude figure of a kangaroo cut upon the surface of a flat rock near Camp Cove, that we were led to make a careful search for these singular and interesting remains of a people who are now nearly extinct.

“About a dozen natives of the Sydney and Broken Bay tribes were encamped amongst the bushes on the margin of a small freshwater lake, close to Camp Cove; and from

amongst them we selected ‘Old Queen Gooseberry’ (as she is generally styled by the colonists) to be our guide, promising her a reward of flour and tobacco if she would tell us what she knew about these carvings, and conduct us to all the rocks and headlands in the neighborhood where like figures existed. At first the old woman objected, saying that such places were all *koradjee* ground, or ‘priest’s ground,’ and that she must not visit them; but at length, becoming more communicative, she told us all she knew, and all that she had heard her father say, respecting them. She likewise consented at last to guide us to several spots near the North Land, where she said the carvings existed in greater numbers; as also the impressions of hands upon the sides of high rocks.

“With some difficulty we prevailed upon the haggard old creature to venture with us into a whale-boat; so, with Queen Gooseberry for our guide, we crossed to the North Land. After examining the flat rocks in every direction, we found sufficient examples of these singular outlines to confirm at once the opinion that they were executed by the aboriginal inhabitants; but at what period is quite uncertain. From the half-obliterated state of many of them (although the lines are cut nearly an inch deep into the hard rock), and from the fact that from several of them we were compelled to clear away soil and shrubs of long-continued growth, it is evident that they have been executed a very long time.

“At first we could not bring ourselves to believe that these carvings were the work of savages, and we conjectured that the figure of the kangaroo might have been the work of some European; but when, pursuing our researches further, we found all the most out-of-the-way and least accessible headlands adorned with similar carvings, and also that the whole of the subjects represented *indigenous* objects — such as kangaroos, opossums, sharks, the *heileman* or shield, the boomerang, and, above all, the human figure *in the attitudes of the corroboree dances* — we could come to no other conclusion than that they were of native origin. Europeans would have drawn ships, and horses, and men with hats upon their heads, had they attempted such a laborious and tedious occupation.

“An old writer on New South Wales, about the year 1803, remarks, when referring to the natives, ‘They have some taste for sculpture, most of their instruments being carved with rude work, effected with pieces of broken shell; and on the rocks are frequently to be seen various figures of *fish, clubs, swords, animals, &c.*, not contemptibly represented.’

“Some of the figures of fish measured twenty-five feet in length; and it is curious that the representations of the shield ex-

actly corresponded with that used by the natives of Port Stephens at the present day. These sculptured forms prove that the New Hollanders exercised the art of design, which has been questioned, and they also serve to corroborate Captain Grey's discoveries of native delineations in caves upon the north-west coast of Australia, during his expedition of discovery. At Lane Cove, at Port Aiken, and at Point Piper, we also met with similar carvings. Whilst on a visit at the latter place, it occurred to me that on the flat rocks at the extremity of the grounds belonging to the estate where I was staying, there might be carvings similar to those at the Heads; and on searching carefully I found considerable numbers of them in a tolerably perfect state of preservation. Of all these I took measurements, and made careful fac-simile drawings on the spot."

In the appendix to his work, Mr. Angas gives reduced copies of these figures, some of which are executed with wonderful spirit and fidelity. Even the human figures, which are shown with extended arms and spread legs, as in the dance, are far better than those usually drawn by savages, infinitely superior to those produced by the artists of Western Africa, while some of the animals are marvellously accurate, reminding the observer of the outline drawings upon Egyptian monuments. The best are, perhaps, a shark and a kangaroo. The latter is represented in the attitude of feeding.

In some parts of Australia, the carvings and paintings are usually in caves by the water's edge, and of such a character is the cave which is shown in the illustration No. 2, on the following page. These caves are in sandstone rock, and the figures upon them are mostly those of men and kangaroos, and it is a remarkable fact that in the human figures, although their eyes, noses, and even the joints of the knees, are boldly marked, the mouth is invariably absent.

Human hands and arms are often carved on rocks. One very remarkable example was discovered by Captain Grey in North-West Australia. When penetrating into a large cave, out of which ran a number of smaller caves, the explorers were struck by a really astonishing trick of native art. The sculptor had selected a rock at the side of the cavity, and had drawn upon it the figure of a hand and arm. This had then been painted black, and the rock around it colored white with pipe-clay, so that on entering the cave it appeared exactly as if the hand and arm of a black man were projecting through some crevice which admitted light.

Their belief in ghosts implies a knowledge that the spirit of man is immortal. Yet their ideas on this subject are singularly misty, not to say inconsistent, one part of

their belief entirely contradicting the other. They believe, for example, that when the spirit leaves the body, it wanders about for some time in darkness, until at last it finds a cord, by means of which a "big black-fella spirit" named Oomudoo pulls it up from the earth. Yet they appropriate certain parts of the earth as the future residence of the different tribes, the spirits of the departed Nauos being thought to dwell in the islands of Spencer's Gulf, while those of the Parnkallas go to other islands toward the west. As if to contradict both ideas, we have already seen that throughout the whole of Australia the spirits of the dead are supposed to haunt the spots where their bodies lie buried.

And, to make confusion worse confounded, the aborigines believe very firmly in transmigration, some fancying that the spirits of the departed take up their abode in animals, but by far the greater number believing that they are transformed into white men. This latter belief was put very succinctly by a native, who stated in the odd jargon employed by them, that "when black-fella tumble down, he jump up all same white-fella."

This idea of transmigration into the forms of white men is very remarkable, as it is shared by the negro of Africa, who could not have had any communication with the black native of Australia. And, still more strangely, like the Africans, they have the same word for a white man and for a spirit. The reader may remember that when Mrs. Thompson was captured by the natives, one of them declared that she was his daughter Gi'ôm, who had become a white woman, and the rest of the tribe coincided in the belief. Yet, though she became for the second time a member of the tribe, they always seemed to feel a sort of mistrust, and often, when the children were jeering at her on account of her light complexion and ignorance of Australian accomplishments, some elderly person would check them, and tell them to leave her in peace, as, poor thing, she was nothing but a ghost.

It has been found, also, that numbers of white persons have been recognized by the blacks as being the spirits of their lost relatives, and have in consequence been dignified with the names of those whom they represented. Mr. M'Gillivray mentions that the natives of Port Essington have a slight modification of this theory, believing that after death they become Malays.

Of their belief in the metempsychosis, or transmigration into animal forms, there are but few examples. Dr. Bennett mentions that on one occasion, at Bérana Plains, when an European was chasing one of the native animals, a native who was with him begged him not to kill it, but to take it alive, as it was "him brother." When it was killed, he was very angry, and, as a proof his sin,

(See page 777.)

(2.) CAVE WITH NATIVE DRAWINGS.

(See page 780.)

cerity, refused to eat any of it, continually grumbling and complaining of the "tumbling down him brother."

The Nauo tribe preserve a tradition which involves this metempsychosis. Once upon a time, a certain great warrior, named Willoo, fought their tribe, and carried off all the women, and killed all the men except two. The survivors climbed up a great tree, followed by Willoo. They, however, broke off the branch on which he was climbing, so that he fell to the ground, and was seized by a dingo below, when he immediately died, and was changed into an eagle hawk, which has ever afterward been called by the name of Willoo.

The same tribe think that a small lizard was the originator of the sexes, and in consequence call it by different names; the men using the term *ibirri*, and the women *waka*. Following up the idea, the men kill every male lizard that they can find, while the women do the same by the females.

Connected with this subject is their idea of creation. Of a single Creator of all things they have not the least notion, but they possess some traditions as to the origin of men

or natural objects. The Kowrárega tribe say that the first created man was a huge giant named Adi. One day, while he was fishing off Hammond Island, he was caught by the tide and drowned, a great rock starting up to mark the spot. This is now called Hammond's Rock. His wives saw his fate, committed suicide by flinging themselves into the sea, and were immediately changed into a series of dry rocks on a neighboring reef. These rocks are still called by the natives *Ipile*, i. e. the Wives.

The natives of the Lower Murray have a curious tradition respecting the origin of the river, and the Alexandrina and Albert Lakes. The river was made by Oomudoo, the "big black-fella spirit," already mentioned. He came down from the sky in his canoe, and ordered the water to rise and form the river, which he then clothed with bulrushes and populated with fish. He brought two wives with him, but they unfortunately proved intractable, and ran away from him, whereupon Oomudoo made the two lakes in question, one of which drowned each wife.

CHAPTER LXXVII.

AUSTRALIA — *Concluded*

ARCHITECTURE AND BOAT-BUILDING.

PARALLEL BETWEEN THE BOSJESMAN AND THE AUSTRALIAN—MODES OF BUILDING HUTS—A SUMMER ENCAMPMENT—RUDE NATURE OF THE HUTS—RETREATS OF THE WOMEN—BONE HUTS OF ENCOUNTER BAY—WINTER HOUSES—HUTS NEAR THE COORUNG—FIRE-MAKING—BIRD-SNARING—A SELF-ACTING SNARE—BOAT-BUILDING—USES OF THE STRINGY BARK—A FRAIL VESSEL—CANOE FOR GENERAL USE—THE REED CANOE—GRADUAL EXTINCTION OF NATIVE TRIBES.

IN many points the Australian savage bears a curious resemblance to the Bosjesman of Southern Africa, of whom a full account has already been given at 242-268 page.

So similar, indeed, are they, that the colonists use the word Bushman to designate the native savage, just as they call the spotted dasyure by the name of cat, and the wombat by that of badger. Much confusion has consequently arisen; and there is now before me a book descriptive of savage life, in which the author has mixed up the Bosjesman of Africa and the Bushman of Australia in the most amusing manner, actually transplanting a quotation from a book of African travels into the account of Australia.

Like the Bosjesman, the Australian depends upon his weapons for the greater part of his food, living almost entirely upon the game which he kills, and being skilled in the art of destroying the wariest and most active of animals with the simplest of weapons. He lives in a state of perpetual feud, his quarrels not being worthy of the name of warfare; and his *beau idéal* of a warrior is a man who steals upon his enemy by craft, and kills his foe without danger to himself.

He cultivates no land, neither has he the least notion of improving his social condition. He cares nothing for clothes, except, perhaps, as a partial shelter from the elements, and utterly ridicules the notion that there is any connexion between clothing and modesty.

Indeed, on one occasion, when a girl had been presented with a petticoat by a white lady, and returned to her people, displaying with pride her newly acquired property, her companions instead of displaying envy at her finery, only jeered at her, inquiring whether she thought herself so much better

than her forefathers, that she should want to wear clothes like the white strangers. The consequence was, that in a day or two the solitary garment was thrown aside, and she walked about as before, in the primitive accoutrements of her tribe.

Like the African Bosjesman, the Australian native has no settled home, although he considers himself as having a right to the district in which his tribe have taken up their abode. Contrary to the usage of civilized life, he is sensitive on the general question, and careless in detail. With civilized beings the hearth and home take the first place in the affections, the love of country being merely an extension of the love of home. With the Australian, however, as well as the Bosjesman, the case is just reversed. He has no home, and cares not for any one spot more than another, except that some spots are sheltered and others exposed. He passes a semi-nomad existence, not unlike that of the Arab, save that instead of pitching his tent on a convenient spot, and taking it away when he leaves it, he does not trouble himself even to carry the simple materials of a tent, but builds a rude hut in any spot which he may happen to fancy, and leaves it to decay when he forsakes the spot.

The chief object of the ordinary hut made by an Australian savage is to defend the inmates from the cold south-west breezes. Consequently, the entrances of the huts may be found, as a rule, turned toward the north-east, whence come the warm winds that have passed over the equator.

The summer encampment (see page 787) of an Australian family is very simple. A number of leafy boughs are stuck in the ground in a semicircular form, the size of the enclosed space varying with the number of the family. These boughs are seldom

more than four feet in height, and often scarcely exceed a yard, their only object being to keep off the wind from the fire, and from the bodies of the natives as they squat round the flame or lie asleep. That any one should expect a shelter while he is standing never seems to enter the imagination of an Australian savage, who, like other savages, never dreams of standing when he can sit, or, indeed, of taking any trouble that is not absolutely necessary.

All the stories that are told of the industry of savage life are pure inventions, and if labor be, as we are often told, the truest nobility, we ought to hear no more of the "noble savage." Consistently with this idea, the native Australian's only idea of the hut is a place where he can sit and gorge himself with food, and lie down to sleep after his enormous meal. A fence a yard in height is therefore quite good enough for him, and, as long as no rain falls, he thinks a roof to be a needless expenditure of labor.

In the illustration referred to we have an example of an encampment on which the natives have bestowed rather more care than usual, and have actually taken the pains to form the branches into rude huts. The spears, shields, and other weapons of the natives are seen scattered about, while round the fire sit or lie the men who have satisfied their hunger. The reader will perceive that from a little distance such an encampment would be almost invisible; and, indeed, except by the thin smoke of the fire, the most practised eye can scarcely detect the spot where natives are encamping. Even the spears which project above the bush huts look at a little distance merely like dried sticks; and, if the inhabitants be very anxious to escape observation, they establish their encampment in a retired spot, where the surrounding objects harmonize as closely as possible with the rude shelter which answers all their needs.

In many places the natives construct a habitation similar in principle, but differing in structure. Should the locality abound in the eucalyptus, or stringy-bark tree, the natives make a hut altogether different in appearance. With wonderful dexterity, they strip off the bark of the tree in large flakes, six or seven feet in length. A few large branches of trees are then laid on the ground, so that they form a rough sort of framework, and upon these branches the flakes of bark are laid. An hour's labor will make one of these huts, so that the natives have really no inducement to take any care of them. Even the very best hut which a native Australian ever made would be inferior to the handiwork of an English boy of ten years old. For my own part, I remember building far better huts than those of the Australians, though I was at the time much below ten years of age, and

had gained all my knowledge of practical architecture from "Sandford and Merton."

There is, however, one great advantage in these bark huts—namely, the rapidity with which they can be made, and the shelter which they really do give from the traveller's great enemy, the night wind. Even European travellers have been glad to avail themselves of these simple structures, and have appreciated the invaluable aid of a few sheets of bark propped against a fallen branch. Those who have been forced to travel without tents through a houseless country have learned by experience that the very best shelter from the night winds is not height, but width. A tree, for example, forms but a very poor shelter, while a low wall barely eighteen inches high and six feet in length keeps off the wind, and enables the wearied traveller to rest in comparative comfort. Such a shelter is easily made from the sheets of stringy bark, one or two of which will form a shelter for several sleepers.

Perhaps the simplest huts that human beings ever dignified by the name of habitation are those which are made by the women of a tribe when the men are away. It sometimes happens that the whole of the adult males go off on an expedition which will last for a considerable time—such, for example, as a raid upon a neighboring tribe—leaving the women and children to take care of themselves. These, knowing that they might be pounced upon by enemies who would take advantage of the absence of their defenders, retire into the recesses of the woods, where they build the oddest houses imaginable, half burrows scraped among the roots of trees, and half huts made of bark and decayed wood. These habitations are so inconspicuous that even the practised eye of the native can scarcely discover them.

On the shores of Encounter Bay may be seen some very curious habitations. Every now and then a whale is thrown ashore by a tempest; and in such a case the tribes of the neighborhood flock round it with great rejoicings, seeing in it an unlimited supply of food. Huge as the animal may be, it is ere long consumed, and nothing left but the skeleton. Of the bones the natives make the framework of their huts, the ends of the ribs being fixed in the ground, so that the bones form the supports of the arched roof, which is nothing more than boughs, grass, and matting thrown almost at random upon the bony framework.

During the winter time the native huts are of better construction, although the best hut that an Australian ever made is but a very rude and primitive specimen of architecture. These winter huts are made on the same principle as those employed in summer, but the materials are more closely put together. The framework of these huts

is made by sticking a number of saplings in the ground, and tying them together. Smaller branches and twigs are then passed in and out of the uprights, and pressed down to make a tolerably firm wall. Over the wall comes a layer of large leaves, and an outer covering of tea-tree bark is placed over the trees, and held in its place by a lashing of rattan. These houses are about five feet in height, and have an arched opening just large enough for a man to enter on his hands and knees.

Such huts as these, however, are but seldom seen, the ordinary winter dwellings being made of bushes, as seen in an illustration on the next page. Near the entrance, but not within it, the fire is kindled, and at night the natives crowd into the hut, filling it so completely that a view of the interior displays nothing but a confused mass of human limbs. The reader will perceive that the luxury of a door has not been contemplated by the native architects — an omission which is perhaps rather fortunate, considering the crowded state of the interior.

Along the shores of the Coorong a rather peculiar kind of habitation is used. It must first be mentioned that the Coorong is a back-water inlet of the sea, running parallel to it for some ninety miles or so, never more than a mile and a half from the sea, and divided from it only by a range of enormous sandhills. It is a wild and desolate place, but is inhabited by the Milnendura tribe, who made themselves so notorious for the massacre of the passengers and men of the ship *Maria*. The natives probably like the spot, because in the Coorong, which is protected from the ocean waves by the sandhills, they can take fish without danger, and because the sandhills furnish a fruit called the monterry, or native apple, as, although a berry growing upon a creeping plant, it looks and tastes like a miniature apple.

The situation is much exposed in the winter time to the cold south-west blasts, and the natives accordingly make comparatively strong huts. Their dwellings are formed of a framework of sticks, over which is plastered a thick layer of turf and mud. In addition to this they heap over the hut a great quantity of the sand and shells of which the ground is chiefly composed, so that the houses of the Milnendura look like mere mounds or hillocks rising from the sandy soil.

The fire which is found in every Australian encampment is generally procured by friction from two pieces of wood, one being twirled rapidly between the hands and the other held firmly by the feet. Indeed, the Australian savage produces fire exactly as does the South African (see page 100). This accomplishment, however, is not universal, some tribes being unable to produce fire, and being dependent on the "fire-sticks" which

the women carry with them. It has occasionally happened that the women have been careless enough to allow all their fire-sticks to expire, and in such a case they are obliged to go to the nearest friendly tribe, and beg a light from them, in order to procure fire wherewith to cook the game that their husbands have brought home.

Before leaving this part of the subject, it will be as well to mention briefly a few of the devices used by the Australian natives in taking their game.

One of these devices is remarkably ingenious, and is principally employed in duck catching. The natives find out a spot where the ducks resort in order to feed, and arrange their nets so that they may intercept birds that fly down upon them. When the ducks are all busy feeding, the native hunter, who has concealed himself near the place, alarms the birds by suddenly imitating the cry of the fish-hawk, one of their deadliest foes. The terrified ducks rise in a body; but, just as they ascend, the wily native flings into the air a triangular piece of bark, imitating again the cry of the hawk. The birds, fancying that the hawk is sweeping down upon them, try to escape by darting into the reeds, and are caught in the nets.

Another ingenious plan is used for capturing birds singly. The native makes a sort of screen of branches, and conceals himself within it. In his hand he carries a long and slender rod, at the end of which there is a noose, and within the noose a bait. Under cover of the screen he comes close to the bird, and gently places the treacherous noose near it. By degrees the bird comes closer and closer to the bait, and, as soon as its head is fairly within the noose, it is secured by a dexterous twist of the hand. Sometimes the native does not employ a bait. He builds his simple shelter by some spot where birds are accustomed to drink, and calls them by imitating their note. They come to the spot, and, not seeing their companions, perch upon the sticks under which the hunter is concealed, a large bunch of grass being generally used to prevent the birds from seeing him. As soon as the bird perches, he slips the noose over its head, draws it inside the shelter, kills it, and waits for another.

In some parts of the country the natives make a self-acting snare, very much on the principle of the nets used in snaring rabbits. It consists of a sort of bag, and has its opening encircled by a running string, the other end of which is fastened to some fixed object, such as a tree-stump. The bag is made of split rattans, so that it remains open, and, as the meshes are very wide, the bait which is placed within it can easily be seen.

If a bird or animal should come to the bait, which is fixed at the very extremity of the bag, it naturally forces its way toward the tempting object, and in so doing pulls

(1.) WINTER HUTS.

(See page 786.)

(2.) A SUMMER ENCAMPMENT.

(See page 784.)

upon the string and closes the mouth of the bag behind it. The more it struggles, the firmer is it held; and so it remains until it is taken out, and the trap set again. This very ingenious snare is used mostly for bandicoots and similar animals, though birds are sometimes caught in it.

The natives have another self-acting trap, which is identical in principle with the eel baskets and lobster pots of our own country. A number of these traps were found by Mr. Carron in some huts near Princess Charlotte's Bay. They were made of strips of cane, and were about five feet in length by eight or nine inches in diameter at the mouth. From the opening they gradually tapered for some four feet, and then suddenly enlarged into a large round basket or pocket, the lower ends of the neck projecting into the basket so as to hinder any animal from returning through the passage by which it entered. This trap was used indifferently for catching fish and small animals. For the latter purpose it was laid in their track, and for the former it was placed in a narrow channel, through which the fish were forced to pass by being driven by a party of natives in the water.

The reader will remember that on page 785 there is a reference to the "stringy-bark," and its use in architecture. The same bark is used for a great number of purposes, among which that of boat-building is perhaps the most conspicuous. Should a native come to the side of a river which he does not wish to swim, he supplies himself with a boat in a very expeditious manner. Going to the nearest stringy-bark trees, and choosing one which has the lines of the bark straight and not gnarled, he chops a circle round the tree so as to sever the bark, and about seven or eight feet higher he chops a second circle. His next proceeding is to make a longitudinal cut down one side of the tree, and a corresponding one on the other side. He then inserts the handle of his tomahawk, his digging-stick, or any such implement, between the bark and the wood, and, by judicious handling, strips off the bark in two semi-cylindrical, trough-like pieces each of which is capable of being made into a boat.

Should he be alone, he seldom troubles himself to do more than tie the bark together at each end of the trough, and in this frail vessel he will commit himself to the river. But if his wife, or any second person, should be with him, he makes the simple boat more trustworthy by digging a quantity of clay out of the river bank, kneading it into each end of the trough, and tying the bark over the clay. As soon as he reaches the opposite shore, he lands, pushes the canoe back into the river and abandons it, knowing that to make a second canoe will not be nearly so troublesome as to take care of the first.

If, however, he wants a canoe in which he goes fishing, and which, in consequence, must be of a stronger make, he still adheres to the stringy bark as his material, though he takes more care in the manufacture. The bark is bent, like the birch bark of the North American Indians, by moisture and heat; and even with this better kind of boat clay is required at each end, and is also used for stopping up any leakage.

He also exhibits a still better use of the stringy-bark. The bark is not only formed into a boat-like shape, but it is kept in its form by cross-pieces of wood. The edges are also strengthened; and altogether this canoe shows a wonderful advance in boat-building. The vessel is propelled with a regular paddle instead of the fish spear; and altogether the boat and the accompanying implements remind the observer of the birch-bark canoes and vessels of America.

Another simple form of boat is made on a totally different principle from those which have already been described, and, instead of being a hollow trough of bark, is a solid bundle of reeds and sticks tied together in a very ingenious manner, and giving support to one or more persons, according to its size.

SUCH is the history of the aboriginal tribes of Australia, whose remarkable manners and customs are fast disappearing, together with the natives themselves. The poor creatures are aware of the fact, and seem to have lost all pleasure in the games and dances that formerly enlivened their existence. Many of the tribes are altogether extinct, and others are disappearing so fast that the people have lost all heart and spirit, and succumb almost without complaint to the fate which awaits them. In one tribe, for example, the Barrabool, which numbered upward of three hundred, the births during seventeen years were only twenty-four, being scarcely two births in three years; while the deaths had been between eighteen and nineteen per annum.

Mr. Lloyd gives a touching account of the survivors of this once flourishing tribe:—

"When I first landed in Geelong, in 1837, the Barrabool tribe numbered upward of three hundred sleek and healthy-looking blacks. A few months previous to my leaving that town, in May 1853, on casually strolling up to a couple of miam-miams, or native huts, that were erected upon the banks of the Burwan River, I observed seated there nine loobras (women) and one sickly child.

"Seeing so few natives, I was induced to ask after numbers of my old dark friends of early days — Ballyyang, the chief of the Barrabool tribe; the great Jaga-jaga, Panigerong, and many others, when I received the following pathetic reply: 'Aha, Mitter

Looyed, Ballyyang dedac (dead), Jaga-jaga dedac; Panigerong dedac,' &c., naming many others; and, continuing their sorrowful tale, they chanted, in minor and funereal tones, in their own soft language, to the following effect:

"The stranger white man came in his great swimming corong (vessel), and landed at Corayio with his dedabul boulganas (large animals), and his anaki boulganas (little animals). He came with his boom-booms (double guns), his white miam-miams (tents), blankets, and tomahawks; and the dedabul ummageet (great white stranger) took away the long-inherited hunting-grounds of the poor Barrabool coolies and their children,' &c., &c.

"Having worked themselves into a fit of passion and excited grief, weeping, shaking their heads, and holding up their hands in bitter sorrow, they exclaimed, in wild and frenzied tones: 'Coolie! coolie! coolie! where are our coolies now! Where are our fathers — mothers — brothers — sisters? Dead! — all gone! dead!' Then, in broken English, they said, 'Nebber mind, Mitter Looyed, tir; by 'm by all dem black fella come back white fella like it you.' Such is the belief of the poor aborigines of Victoria; hence we may firmly infer that they possess a latent spark of hope in their minds as to another and better world.

"Then, with outstretched finger, they showed me the unhappy state of the aboriginal population. From their statement it appeared that there existed of the tribe at that moment only nine women, seven men, and one child. Their rapid diminution in numbers may be traced to a variety of causes. First, the chances of obtaining their natural food were considerably lessened by the entire occupation of the best grassed parts of the country, which originally abounded in kangaroo and other animals upon which they subsisted. The greater number of these valuable creatures, as an irresistible consequence, retired into the wild uninhabitable countries, far from the haunts of the white man and his destructive dogs.

"Having refused the aid of the Government and the Missionary Societies' establishments at the River Burwan and Mount Rouse, the natives were to a serious extent deprived of animal food, so essential to a people who were ever exposed to the inclemencies of winter and the exhausting heats of summer. Influenza was one of the greatest scourges under which they suffered. Then, among other evils attending their association with the colonists, the brandy, rum, and tobacco told fearfully upon their already weakened constitutions."

This one tribe is but an example of the others, all of whom are surely, and some not slowly, approaching the end of their existence. For many reasons we cannot but

regret that entire races of men, possessing many fine qualities, should be thus passing away; but it is impossible not to perceive that they are but following the order of the world, the lower race preparing a home for the higher.

In the present instance, for example, the aborigines performed barely half of their duties as men. They partially exercised their dominion over the beasts and the birds — killing, but not otherwise utilizing them. But, although they inherited the earth, they did not subdue it, nor replenish it. They cleared away no useless bush or forest, to replace them with fruits; and they tilled no land, leaving the earth exactly in the same condition that they found it. Living almost entirely by the chase, it required a very large hunting-ground to support each man, and a single tribe gained a scanty and precarious living on a tract of land sufficient, when cultivated, to feed a thousand times their number. In fact, they occupied precisely the same relative position toward the human race as do the lion, tiger, and leopard toward the lower animals, and suffered in consequence from the same law of extinction.

In process of time white men came to introduce new arts into their country, clearing away useless forest, and covering the rescued earth with luxuriant wheat crops, sufficient to feed the whole of the aborigines of the country; bringing also with them herds of sheep and horned cattle to feed upon the vast plains which formerly nourished but a few kangaroo, and to multiply in such numbers that they not only supplied the whole of their adopted land with food, but their flesh was exported to the mother country.

The superior knowledge of the white man thus gave to the aborigines the means of securing their supplies of food; and therefore his advent was not a curse, but a benefit to them. But they could not take advantage of the opportunities thus offered to them, and, instead of seizing upon these new means of procuring the three great necessities of human life, food, clothing, and lodging, they not only refused to employ them, but did their best to drive them out of the country, murdering the colonists, killing their cattle, destroying their crops, and burning their houses.

The means were offered to them of infinitely bettering their social condition, and the opportunity given them, by substituting peaceful labor for perpetual feuds, and of turning professional murderers into food-producers, of replenishing the land which their everlasting quarrels, irregular mode of existence, and carelessness of human life had well-nigh depopulated. These means they could not appreciate, and, as a natural consequence, had to make way for those who could. The inferior must always make way for the superior, and such has ever been the case with the savage. I am persuaded that

the coming of the white man is not the sole, nor even the chief, cause of the decadence of savage tribes. I have already shown that we can introduce no vice in which the savage is not profoundly versed, and feel sure that the cause of extinction lies within the savage himself, and ought not to be attributed to the white man, who comes to take the place which the savage has practically vacated.

CHAPTER LXXVIII.

NEW ZEALAND.

GENERAL REMARKS.

LOCALITY OF NEW ZEALAND—GENERAL APPEARANCE OF THE PEOPLE—THE TWO CASTES, AND THEIR SUPPOSED ORIGIN—CONTRAST BETWEEN THE SEXES—LAXNESS OF MORALS—NUMBER OF THE POPULATION, AND THE DIFFERENT TRIBES—MODE OF GOVERNMENT—DISTINCTION BETWEEN RANKS—FORMATION OF THE CLANS, OR SUB-TRIBES—THE SLAVES, THEIR VALUE AND TREATMENT—THE TENURE OF LAND—A COMPLEX ARRANGEMENT AND CONSEQUENT DIFFICULTIES—ESTABLISHING A CLAIM—NATIVE LAW—THE “LEX TALIONIS”—SENSITIVENESS TO DISGRACE—THE PREVALENCE OF SUICIDE—STRANGE CONDUCT OF A MAORI CHIEF—THE SISTER’S VENGEANCE.

SOUTHWARD and eastward of Australia we come to the group of islands known collectively as New Zealand. Like Australia, New Zealand possesses many peculiarities of climate and natural production, and is inhabited by a number of tribes which are generally hostile to each other, but which are almost identical in appearance and habits. We shall therefore be enabled to treat of this important portion of the globe with much more brevity than could be the case if, as in Africa, the tribes differed from each other in hue, dress, and customs.

TAKEN as a whole, the New Zealanders are a singularly fine race of people—tall, powerful, and well made. Though varying somewhat in shade, the color is always a brown of some kind, the complexion being sometimes as light as that of a Spaniard, and sometimes of a dark umber. It is, however, always of a clear tint and never approaches to the deep black of the Australian. The nose is straight and well formed, in many cases being boldly aquiline; and the mouth is rather large, and the lips moderately full, though not resembling those of the negro. The cheekbones are rather high, but not much more prominent than those of a genuine Scotchman; and the eyes are large, dark, and vivacious.

The teeth are remarkably white and even, and the feet and hands small and well proportioned. The foot is very well developed, the native never having spoiled its beautiful mechanism with shoes or boots, and being accustomed to use the toes in many tasks wherein a civilized European requires his fingers. The toes are, for example, contin-

ually employed in holding one end of a rope, while the fingers are engaged in twisting or plaiting it; and the consequence is that the natives are able to ridicule with justice the misshapen feet and toes of the European.

The men have naturally a full beard; but they always remove every vestige of hair on the face, in order to show the patterns which are tattooed upon it. Now and then a very old and powerful chief will dare to allow his beard to grow; but, as a rule, the face is divested of all covering: so that the absence of the beard, together with the profuse tattoo, destroys all evidences of age, and makes the countenance of a young man of twenty look nearly as old as that of his grandfather aged sixty.

The hair is plentiful, and mostly straight, being twisted and curled by art into the various fashionable forms. In some cases it is light, or even reddish, in color; and in such instances accompanies a complexion of peculiar fairness. Albinism exists among the New Zealanders, but is not agreeable in appearance, the eyes being always weak, and the skin looking as if it had been artificially whitened. In fact, such an albino looks among his dark fellows like a plant that has been bleached by growing in the dark.

There seems to be two castes of men among the New Zealanders. The upper caste is distinguished by the above characteristics; but the lower is shorter in stature, and has coarse and curly, though not woolly hair, more prominent cheekbones, and a much blacker skin. This second race, according to Dr. Dieffenbach, “is mixed in insensible gradations with the former, and is

NEW ZEALANDER FROM CHILDHOOD TO AGE.

(See page 795.)

far less numerous; it does not predominate in any one part of the island, nor does it occupy any particular station in a tribe; and there is no difference made between the two races among themselves.

"But I must observe that I never met any man of consequence belonging to this tribe, and that, although freemen, they occupied the lower grades: from this we may, perhaps, infer the relation in which they stood to the earliest immigrants into the country, although their traditions and legends are silent on the subject.

"From the existence of two races in New Zealand the conclusion might be drawn that the darker were the original proprietors of the soil, anterior to the arrival of a stock of true Polynesian origin; that they were conquered by the latter, and nearly exterminated. This opinion has been entertained regarding all Polynesian islands; but I must observe that it is very doubtful whether those differences which we observe among the natives of New Zealand are really due to such a source. We find similar varieties in all Polynesian islands, and it is probable that they are a consequence of the difference of castes so extensively spread among the inhabitants of the tribes of the great ocean.

"If one part of the population of New Zealand are a distinct race—a fact which cannot be denied as regards other islands—it is very curious that there should be no traces of such a blending in the language, where they would have been most durable, or in the traditions, which certainly would have mentioned the conquest of one race by the other, if it had happened. Captain Crozet, a Frenchman, who early visited New Zealand, says that he found a tribe at the North Cape darker than the rest. I could observe nothing of the kind there, though I visited all the natives. Nor are those darker-colored individuals more common in the interior; I should say, even less so.

"There is undoubtedly a greater variety of color and countenance among the natives of New Zealand than one would expect—a circumstance which might prove either an early blending of different races, or a difference of social conditions, which latter supposition would go far to explain the fact. All the New Zealanders speak of the Mango-Mango, or Blacks of New South Wales, as unconnected with and inferior to themselves; but they never make such a distinction regarding their own tribes."

As is often the case with uncivilized people, the women are decidedly inferior to the men, being much shorter, and not nearly so well made. They are not treated with the harshness which is the usual characteristic of married life among savages, and are even taken into their husbands' counsels; and have great influence in political affairs. Still, the heavy work of the household falls

upon their shoulders, and the lot of an ordinary New Zealand wife is rather a severe one. She has to cultivate the ground, to carry the produce of the distant fields to the house, and, when the family is travelling, the women have to carry all the heavy loads. It is no wonder, therefore, that a life of such drudgery should tell upon the women, both in preventing the proper development of their frame and in causing their beauty to decay. Those who preserve their beauty longest are the daughters of wealthy chiefs, who can afford slaves by whom all the hard work is done, and who therefore free their mistresses from one of the causes of deterioration.

There is, however, another cause, which is perhaps equally effective, but not so palpable. This is the very lax code of morality which prevails among them, a young girl being permitted the utmost freedom until she is married, although afterward she is a model of constancy. This license is exercised at a very early age, and the natural consequence is that the due development of the frame is checked. This vicious system is so much a matter of course, that it carries no reproach with it, and the young girls are remarkable for their modest and child-like demeanor.

Of course they become aged much earlier than those whose development takes place at a later period of life; but they compensate for their deteriorated appearance by their peculiar kindness of demeanor. The engraving No. 1, illustrates the countenance and dress of a New Zealand woman and her boy.

Unlike the men, the women do not disfigure their faces by the tattoo, which gives to them the stern and fixed expression so characteristic of a New Zealand warrior; and they thus allow the really flexible and intelligent features to have full play. The only portions of the face that are marked with the tattoo are the lips, which are rendered blue by the process, as it is considered disgraceful for a woman to have red lips. The tattooing is always performed when the child is allowed to take her place among women; and, as may be imagined, it gives a livid and altogether unpleasant appearance to the mouth.

The children are very pleasing and interesting little creatures. They are full of intelligence, and unusually free and open in their manner. Unlike the children of most savage nations, they live as much with the men as with the women, and partake even in the councils of their parents, thus having their faculties sharpened at a very early age. The illustration opposite gives typical examples of the New Zealander from childhood to age, and the reader will notice the contrast between the soft and rounded outlines of the youth, and the harsh, rigid countenances of the old man and his consort.

IN proportion to the dimensions of New Zealand, the population is very small; and, even in the earliest days of our acquaintance with it, the land seems to have been but thinly inhabited. That such should be the case is very remarkable, as a very thin population is generally found in those countries where, as in Australia, the inhabitants live principally by the chase, and therefore require a very large tract of land to support them. The New Zealanders, however, do not live by the chase, for the simple reason that there are no animals which are worth the trouble of hunting; so that a family of twenty or so, even if they had the entire country as a hunting-ground, would find themselves in very great straits were they obliged to procure their food by the chase. The reasons for this thin population will be presently seen.

According to Dieffenbach's calculation, the native population of the entire country may be reckoned rather below one hundred and fifteen thousand. These are divided into twelve great tribes, which are again subdivided into sub-tribes, or clans, each of which has its separate name, and is supposed to belong to a certain district. The fighting men, or warriors, form about one-fourth of the whole population; the remaining three-fourths being made up of old men, women, and children. Since this calculation the numbers of the aborigines have considerably lessened. The most important of the tribes seems to be the Waikato, which is divided into eighteen clans, and which occupies a very large proportion of the country. This tribe alone can bring into the field six thousand fighting men; so that the entire number of the tribe may be calculated at twenty-four thousand or so.

The Waikato clans have managed to preserve their individuality better than the others, and, though brought much in contact with civilization, and having adopted some of the habits of their white visitors, they have still retained many of their ancient customs, and, as Dieffenbach remarks, have preserved much of their ancient vigor and original virtues.

The tribe that is strongest in mere numbers is the Nga-te-kahuhuna, which inhabits the east coast, and may be reckoned at thirty-six thousand strong. In fact, these two tribes alone outnumber the whole of the others taken collectively. One tribe, the Rangitani, is interesting from the fact that it was described by Captain Cook. In his days it was evidently a large and flourishing tribe, but some few years ago it could scarcely muster three hundred warriors, representing a total number of twelve hundred. The decadence of this tribe is probably owing to the destructive wars in which the New Zealanders engage, and which are often so fierce as to erase a tribe entirely.

The government of the New Zealanders

is a curious mixture of simplicity and complication. Monarchy is unknown, each tribe having its own great chief, while an inferior chief presides over each clan, or sub-tribe. The whole of the population may be roughly divided into three ranks. First come the nobility, then the free men, and lastly the slaves. The nobility go by the general name of Rangatira—a title which is always given to officers, missionaries, and other white men who are placed in command over others.

In each tribe one of the Rangatira is the Ariki, or principal chief; but, as he is necessarily a Rangatira, he is always addressed by that title, and, in consequence, a stranger finds some difficulty, even after a prolonged visit, in ascertaining who is the Ariki. Among the New Zealanders there is no Salic law, so that the Ariki need not be a warrior, and may be a woman. The office is hereditary, and the existing Ariki is always held in the highest veneration in virtue of his descent. Even the hostile tribes respect an Ariki, and in most cases, if he should be captured in battle, the victors will spare his life. One or two of the most powerful chiefs living have been captured and afterward released, whereas, had they been common men, or even ordinary Rangatiras, they would have been killed, their bodies eaten, and their heads dried and fixed as trophies on the houses of their conquerors.

A sort of tax, or tribute, is paid by the different families, though the tax is entirely a voluntary one, and may be great or small, or withheld altogether, at pleasure. Mostly the Ariki is a man of considerable mental powers, and, in such a case, he exercises great authority over the tribe, either as a priest or a warrior. There is nothing to prevent the Ariki from assuming the office of priest, and in many instances he has been able to exercise a far greater influence by spiritual than by physical means.

The Rangatira are the great men, or nobles, of the land, and with them, as with the Ariki, the rank is hereditary. The law of succession is very remarkable, the eldest son being the heir to his father's rank; but if the child dies, the youngest, and not the next eldest, becomes the lawful successor. These two heirs, the eldest and the youngest sons, are called by a name which signifies the fat of the earth.

Each Rangatira is independent of his fellows, though they collectively form a sort of body which we may compare with the House of Peers in England. Any Rangatira who has sufficient influence may gather together the members of his clan, build a fortified village, or pah, and become a petty sovereign in his own dominions. It is in this way that the various clans, or sub-tribes, are formed, each gathering round a noble of more than usual ability, and adopting a name by which the members will ever afterward be known.

The free men form the great body of the warriors; some of them being the sons of Rangatira, and others merely having the privilege of free birth; which carries with it the right of tattooing the face. Sometimes a free man who is remarkable for his generalship and courage will take the command of an expedition, even though men of higher rank than himself should be engaged in it.

Last come the slaves. These are always procured from two sources: they are either captives taken in battle, or are the children of such captives. The value of such slaves is very great. All savages are idle, but the New Zealander is one of the laziest of mortals in time of peace. In war he is all fire and spirit; but in peace he lounges listlessly about, and will not do a stroke of work that can possibly be avoided.

He may, perhaps, condescend to carve the posts of his house into some fantastical semblance of the human form, or he may, perchance, employ himself in slowly rubbing a stone club into shape, or in polishing or adorning his weapons. Whatever real work is to be done is left to the women or the slaves, and a man who values his wife or daughter will endeavor to procure slaves who will relieve her of the drudgery.

There are slaves of both sexes, to whom the appropriate work is allotted. They are considered the absolute property of their owner, who may treat them as he pleases, and, if he prefers to kill them, may do so without attracting any attention. Of course he would not do so except for very good reasons, as he would deprive himself of a valuable article of property. There have been cases, as we shall presently see, when the owner of slaves has deliberately murdered them for the sake of selling their heads.

Once a slave, always a slave. Should one of these unfortunates manage to escape and get back to his own tribe, his owner would apply for him, and he would be given up, the right of the master to his slave being universally recognized. Still, as a rule, the slaves are treated well, and some of them, who have attained excellence in certain arts, often become richer men than their owners. So great is the value of slaves, that many a war has been undertaken for the mere purpose of slave hunting, and some of the most disastrous and obstinate feuds have originated in the slave hunt.

Connected with the government of the New Zealanders is the land question. This is a strangely complicated business, as every inch of ground has an actual owner, while there are usually several claimants who allow their rights, real or imagined, to lie in abeyance as long as the land is owned by one who can hold his own, while they will all prefer their claims at his death, or even during a lengthened absence.

So it has often happened that the white men, while desiring to act according to law and honor, have involved themselves in a very net of difficulties. A chief, for example, may agree to sell a portion of territory, will receive the price, and will sign a deed, which will be witnessed by natives as well as by Europeans. No sooner has he done so, than a claimant comes forward, declaring that the chief in question had no real right to the land, and therefore had no right to sell it.

His claim will be inquired into, and, if it seems to be tolerably consistent with likelihood, the man will be paid an additional sum for his consent to the sale. The matter, however, is not at an end, for such is the jealousy with which the natives regard land, that, as long as a foreigner holds an inch of ground, so long will there be a native who prefers a claim to it. Strange as it may seem, the white man would incur less odium by taking the land by force, and seizing it by right of conquest, than by trying to act according to justice and equity.

War is a fertile source of misunderstanding about land. A tribe may be driven out of a district, and their land given to others, who hold it as long as they can keep it, the original possessors being sure to reconquer it if possible. It has sometimes happened that a chief to whom such lands have been presented has transferred them to another chief, and he, in his turn, has sold them to European settlers, the bargain being ratified by his own followers, who are considered as having a share in such property.

The colonists take the land, clear it, cultivate it, and when the crops are fairly in the ground, the dispossessed tribe will come forward and prefer their claim to it. Those to whom it was sold have already received their price, and do not trouble themselves to oppose the claim; and the consequence is, that the colonists are obliged either to make a second payment or to run the risk of war.

As to the claims themselves, they are of the most curious and unexpected character, such as no European would be likely to anticipate. According to Dieffenbach, "There exists a very distinct notion of the rights of landed property among the natives, and every inch of land in New Zealand has its proprietor. Sometimes land is given to a strange tribe, either as pay, or from other considerations, but the proprietor reserves certain rights, some of which are what we should term manorial.

"It was formerly very common that the fat of the native rats (Kiore) killed on such lands should be given to the principal proprietor, and in many cases a title to land seems to have been derived from the fact of having killed rats on it. Thus a chief will say, 'This or that piece of land is mine; I have killed rats on it.' Generally, how-

ever, land descends, as with us, by inheritance."

Such being the complicated tenure on which land is held—a tenure which is often puzzling to the natives themselves—it is no matter of wonder that English settlers should have found themselves in difficulties. It is said that the colonists tried to make themselves masters of the land by unfair means, *i. e.* either by forcibly taking possession of it, or by inveigling the ignorant natives into signing documents which they did not understand, and thus selling their paternal estates for rum, tobacco, and a few blankets.

This may to some extent have been the case when the colonists first came to settle in the country. But the natives are far too intelligent to remain long ignorant of the power of pen, ink, and paper, and there is no doubt that in many cases they intentionally outwitted the purchaser, either by putting forward a sham owner of the ground, who had no right to sell it, and who vanished with his share of the prize as soon as the bargain was concluded, or by asserting ignorance of the meaning of the document which had been signed, and refusing to carry out its conditions. That the white men succeeded too often in cheating the natives is unfortunately true, but it is no less true that the natives as often cheated the colonists.

Law among the New Zealanders seems to be of the simplest kind, and, as far as we know, is not so well developed as among some of the tribes of Southern Africa. The three offences of which the law takes cognizance are murder, theft, and adultery. For the first of these offences a sort of *lex talionis* holds good, the relatives of the slain man being sure, sooner or later, to kill the murderer, unless he manages to compromise with them. Even theft is punished in a similar fashion, the thief being robbed in his turn.

As to the third offence, it is punishable in various ways; but both the offending parties are supposed to have forfeited their lives to the husband. If, therefore, the fact be discovered, and the culprit be a person of low rank, he seeks safety in flight, while, if he be a man of rank, he expects that the offended husband will make war upon him. Sometimes, if a wife discovers that her husband has been unfaithful to her, she will kill his paramour, or, at all events, disgrace her after the native custom, by stripping off all her clothes, and exposing her in public. Even the husband is sometimes subjected to this punishment by the wife's relations; and so much dreaded is this disgrace that men have been known to commit suicide when their offence has been discovered.

Suicide, by the way, is not at all uncommon among the New Zealanders, who always think that death is better than disgrace, and

sometimes destroy themselves under the most trivial provocation. One such case is mentioned by Mr. Angas. "On arriving at the village or kainga of Ko Nghahokowitu, we found all the natives in a state of extraordinary excitement. We had observed numbers of people running in that direction, along the margin of the river, from the different plantations, and, on inquiry, we learned that an hour previously to our arrival the son of an influential chief had committed suicide by shooting himself with a musket.

"Our fellow-travellers, with Wisihona their chief, were all assembled, and we followed them to the shed where the act had been perpetrated, and where the body still lay as it fell, but covered with a blanket. The mourners were gathered round, and the women commenced crying most dolefully, wringing their hands, and bending their bodies to the earth. We approached the body, and were permitted to remove the blanket from the face and breast. The countenance was perfectly placid, and the yellow tint of the skin, combined with the tattooing, gave the corpse almost the appearance of a wax model. The deceased was a fine and well-made young man. He had placed the musket to his breast, and deliberately pushed the trigger with his toes, the bullet passing right through his lungs. Blood was still oozing from the orifice made by the bullet, and also from the mouth, and the body was still warm."

The cause of this suicide was that which has already been mentioned. The young man had been detected in an illicit correspondence with the wife of another man in the same village. The woman had been sent away to a distant settlement, a proceeding which had already made her lover sullen and gloomy; and, on the day when Mr. Angas visited the place, he had become so angry at the reproaches which were levelled at him by some of his relations, that he stepped aside and shot himself.

The determined manner in which the New Zealanders will sometimes commit suicide was exemplified by the conduct of another man, who deliberately wrapped himself up in his blanket, and strangled himself with his own hands. The crime was perpetrated in the common sleeping-house, and was achieved with so much boldness that it was not discovered until the man had been dead for some time.

A remarkable instance of this phase of New Zealand law took place when Mr. Dieffenbach visited the Waipa district. He was accompanied by a chief, who called a girl to him, and handed her over to the police magistrate as a murderess. The fact was, that her brother, a married man, had formed an intimacy with a slave girl, and, fearing the vengeance of his wife's relatives, had killed himself. His sister, in order to

avenge the death of her brother, found out the slave girl in the bush, and killed her. The strangest part of the business was, that the accused girl was the daughter of the chief who denounced her.

The girl pleaded her own cause well, saying, what was perfectly true, that she had acted according to the law of the land in avenging the death of her brother, and was

not amenable to the laws of the white man, which had not yet been introduced into her country. As might be imagined, her plea was received, and the girl was set at liberty; but her father was so earnest in his wish to check the system of retaliatory murder, that he actually offered himself in the place of his daughter, as being her nearest relation.

CHAPTER LXXIX.

NEW ZEALAND—*Continued.*

DRESS.

DRESS AND ORNAMENTS OF THE NEW ZEALANDER—THE TATTOO OR THE MOKO—ITS FORMIDABLE CHARACTER—THE TATTOO A MARK OF FREEDOM—THE TATTOO OF THE FACE, AND ITS DIFFERENT PORTIONS—COST OF THE OPERATION—THE IMPLEMENTS, AND MODE OF USING THEM—TIME OCCUPIED IN COMPLETING IT—PAYMENT OF THE OPERATOR, AND THE TATTOO SONG—SOURCE WHENCE THE PIGMENT IS OBTAINED—SCARLET PAINT, AND MODE OF MAKING IT—THE NEW ZEALAND BELT—SYMBOLISM OF THE TATTOO—PRESERVING THE HEADS OF WARRIORS—THE TRAFFIC IN HEADS—A COOL BARGAINER.

WE will now proceed to the appearance and dress of the natives of New Zealand, or Maories, as they term themselves. As the most conspicuous part of the New Zealander's adornment is the tattooing with which the face and some other portions of the body are decorated, we will begin our account with a description of the moko, as it is called by the natives.

There are many parts of the world where the tattoo is employed, but in none is it of so formidable a description as among the New Zealanders. As the reader is probably aware, the tattoo consists of patterns made by introducing certain coloring matters under the skin; charcoal, variously prepared, being the usual material for the purpose. We have already seen among the Kaffirs examples of ornamenting the skin by cutting it deeply so as to form scars, and in Australia a similar but more cruel custom prevails. In neither of these countries, however, is there any attempt at producing an artistic effect, while in New Zealand beauty of design is the very object of the tattoo.

There is a distinction between the tattoo of the New Zealanders and the Polynesians; that of the latter people being formed by rows of little dots, and that of the former by lines cut completely through the skin. On account of this distinction, though a New Zealander and a Polynesian be covered from head to foot with tattoo marks, there is no possibility of mistaking the one for the other.

The moko of the New Zealander is a mark of rank, none but slaves being without a more or less complete tattooing of the face. In the present day, even the chiefs have begun to discontinue the ancient custom, chiefly owing to the exertions of the mis-

sionaries, who objected to the practice as a mark of heathendom. Consequently, several of the most powerful convert chiefs present a very curious, not to say ludicrous, aspect, which can hardly have a good effect in recommending Christianity to the people. Having been converted before the moko was completed, and being unwilling to continue the process and unable to obliterate those portions which were already drawn, they appear with one half of their faces tattooed and the other half plain, or perhaps with a solitary ring round one eye, and a couple of curves round one side of the mouth.

As, however, the present work treats only of the native customs, and not of modern civilization, the New Zealanders will be described as they were before they had learned to abandon the once-prized tattoo, to exchange the native mat for the English blanket, the picturesque war canoe for the commonplace whaling boat, and the spear and club for the rifle and bayonet.

The principal tattoo is that of the face and upper part of the head, which, when completed, leaves scarcely an untouched spot on which the finger can be placed. When finished, the whole face is covered with spiral scrolls, circles, and curved lines; and it is remarkable, that though a certain order is observed, and the position of the principal marks is the same in every case, no two persons are tattooed in precisely the same manner, the artists being able to produce an infinite variety with the few materials at his command.

For example, the first portion of the tattoo is always a series of curved lines, reaching from the corners of the nose to the chin,

and passing round the mouth. This portion of the tattoo goes by the name of *rerepi*. Next comes a spiral scroll on the cheek-bone; and below it is another spiral, reaching as low as the jaw-bone. These are called respectively *kakoti* and *korohaha*. Next come four lines on the middle of the forehead, called *titi*; and besides these there are several lines which run up the centre of the nose and cover its sides, some which spread over the forehead, others which occupy the chin; and even the lips, eyelids, and ears are adorned with this singular ornament.

Besides possessing these marks, a great chief is seldom content unless he can cover his hips with similar lines, each of which has, like those of the face, its proper name.

Although the moko was considered as a mark of rank, there were no sumptuary laws which forbade its use. Any one, provided he were not a slave, might be tattooed as much as he pleased; but the expense of the operation was so great, that none but men of position could afford a complete suit of moko. No man could tattoo himself, and the delicacy of touch and certainty of line was so difficult of attainment, that tattooing became an art or science, which was left in the hands of a few practitioners, who derived a good income from their business. Some of those who had attained much reputation for their skill used to command very high fees when called in to decorate a client, and their services could therefore only be secured by the men of high position. It is rather remarkable that some of the most celebrated operators were slaves, men who were forbidden to wear the tattoo on their own persons.

The mode of operation is as follows. The patient lies on his back, and places his head between the knees of the operator, who squats on the ground after the usual native fashion. The latter then takes a little of the black pigment, and draws on the face the line of the pattern which he intends to follow; and in some cases he slightly scratches them with a sharp instrument, so as to make a sketch or outline drawing. The object of this scratching is to prevent the pattern from being obliterated by the flowing blood and the black pigment which is rubbed into the wounds.

Next, he takes his instrument or chisel, which is usually made of teeth, or the bone of a bird, and with it follows the pattern, cutting completely through the skin. Sometimes, when engaged in tattooing the face, a careless operator has been known to cut completely through the cheek, so as to put a temporary check to smoking, the sufferer experiencing some difficulty in getting the smoke into his mouth at all, and then finding it escape through the holes in his cheek. On page 722 the reader may find an illustration which gives a good idea of the different

forms of the tattooing chisel. As the operator proceeds, he continually dips the edge of his chisel in the black pigment, and, when he has cut a line of a few inches in length, he rubs more of the pigment into the wound, using a little bunch of fibre by way of a brush or sponge.

The cutting is not done as with a knife, but by placing the edge of the chisel on the skin, and driving it along the lines of the pattern by repeated blows with a small mallet. As may be imagined, the pain caused by this operation is excruciating. It is painful enough to have the skin cut at all, even with the keenest blade, as any one can testify who has been unfortunate enough to come under the surgeon's knife. But when the instrument employed is a shark's tooth, or a piece of bone, when it is driven slowly through the skin by repeated blows, and when the wound is at once filled with an irritating pigment, it may be imagined that the torture must be dreadful. It is, however, reckoned a point of honor to endure it without giving any signs of suffering.

Owing to the character of the tattoo, the destruction of the skin, and the consequent derangement of its functions, only a small portion can be executed at a time, a complete moko taking from two to three years, according to the constitution of the individual. Dreadful swellings are always caused by it, especially of the glands in the neighborhood of the wounds, and the effects are so severe that men have died when too large a portion has been executed at one time.

Every stroke of the chisel or *uki* leaving an indelible mark, it is of the greatest consequence that the operator should be a man of skill, and devote all his energies to tracing a clear, though elaborate pattern, in which the lines are set closely together, sweep in regular curves, and never interfere with each other.

While a man is being tattooed, his friends and those of the operator sing songs to him, in which he is encouraged to endure the pain bravely, and to bear in mind the lasting beauty which will be conferred upon him when the pattern is completed. The songs of the operator's friends contain some very broad hints as to the scale of payment which is expected. Although, as has been stated, the best of tattooers are paid very highly, there is no definite fee, neither is any bargain made, the operator trusting to the liberality of his client. But, as a man would be contemned as a skulking fellow if he were to ask the services of a good operator and then pay him badly, the practical result is that a good tattooer always secures good pay.

Moreover, he has always the opportunity of avenging himself. As only a small portion of the moko can be executed at a time — say, for example, the spiral curve on one

cheek — if the operator be badly paid for the first portion of his work, he will take care to let the chisel slip out of its course when he proceeds to the second part, or will cut his lines coarsely and irregularly, thus disfiguring the stingy man for life.

Mr. Taylor gives a translation of one of these tattooing songs :

“ He who pays well, let him be beautifully ornamented;
 But he who forgets the operator, let him be done carelessly.
 Be the lines wide apart.
 O hiki Tangaroa!
 O hiki Tangaroa!
 Strike that the chisel as it cuts along may sound.
 O hiki Tangaroa!
 Men do not know the skill of the operator in driving his sounding chisel along.
 O hiki Tangaroa!

The reader will see that the song is a very ingenious one, magnifying the skill of the operator, promising a handsome moko to the liberal man, and threatening to disfigure him if he be niggardly in his payments.

While the operation of tattooing is going on, all persons in the pah, or enclosure, are under the tabu, or tapu, lest any harm should happen to them; the work of tattooing being looked upon with a kind of superstitious reverence. The meaning of the word ‘tapu’ will be explained when we come to treat of the religious system of the New Zealander.

The effect of the moko on the face is well shown in illustration No. 2, on the next page, which represents a chief and his wife. The reader will probably observe that on the face of the woman there are marks which resemble the tattoo. They are, however, the scars left by mourning over the body of some relative, a ceremony in which the women cut themselves unmercifully. The dress worn by both persons will be presently described.

The pigment used in tattooing is made from the resin of the kauri pine, and the greater part of it is made at one spot, where the tree grows plentifully. There is a rocky precipice, and a little distance from its edge a deep and narrow pit is sunk. A channel is cut through the face of the cliff into the pit, and the apparatus is complete. When a native wishes to make a supply of tattooing pigment, he cuts a quantity of kauri wood, places it in the pit, and sets fire to it, thus causing the burnt resin to fall to the bottom of the pit, whence it is scraped out through the channel.

Scarlet paint is much employed by the natives, especially when they decorate themselves for battle. It is obtained from an ochreous substance which is deposited in many places where water has been allowed to become stagnant. Some spots are celebrated for the excellence of the ochre, and the natives come from great distances to procure it. When they wish to make their

scarlet paint, they first carefully dry and then burn the ochre; the result of which operation is, that a really fine vermilion is obtained.

This paint is used for many purposes, and before being used it is mixed with oil obtained from the shark. The natives are fond of decorating their houses with it, and by means of the scarlet lines increase, according to their own ideas, the beauty of the carved work with which every available point is adorned. Even their household goods are painted after a similar manner, the fashionable mode being to paint all the hollows scarlet, and the projecting portions black. Their canoes and wooden ornaments are profusely adorned with red paint. But the most valued use of this pigment is the part which it plays in the decoration of a warrior when he goes to battle.

In such cases paint constitutes the whole of his costume, the mats in which he takes so great a pride in time of peace being laid aside, many warriors being perfectly naked, and with the others the only covering of any kind being a belt made of plaited leaves.

One of these belts in my collection is seven feet in length, and only three and a half inches wide in the broadest part; while at either end it diminishes to a mere plaited thong. It is folded fourfold, and on opening it the mode of construction is plainly seen; all the loose ends being tucked inside.

The material is phormium leaf cut into strips an inch in width, each alternate strip being dyed black. Each strip is then divided into eight little strips or thongs, and they are so plaited as to produce an artistic checkered pattern of black and white. The ingenuity in forming so elaborate a pattern with so simple a material is extreme; and, as if to add to the difficulty of his task, the dusky artist has entirely changed the pattern at either end of the belt, making it run at right angles to the rest of the fabric. The belt is also used in lieu of clothing when the men are engaged in paddling a canoe.

The paint, therefore, becomes the characteristic portion of the New Zealander's war dress, and is applied for the purpose of making himself look as terrible as possible, and of striking terror into his enemies. It is, however, used in peace as well as in war, being regarded as a good preservative against the bites and stings of insects, especially the sandflies and mosquitoes. It is also used in mourning, being rubbed on the body as a sign of grief, precisely as ashes are used among some of the Oriental nations. Some travellers have thought that the continual use of this pigment gives to the New Zealanders the peculiar softness and sleekness of skin for which they are remarkable, and which distinguishes them from the Fijians, whose skin feels as if it had been roughened with a file. This theory, however, is scarcely tenable, the soft texture of the skin being

(1.) NEW ZEALAND WOMAN AND HER BOY.
(See page 795.)

(2.) TATTOOED CHIEF AND HIS WIFE.
(See page 802.)

evidently due to physical and not to external causes.

A warrior adorned in all the pride of the tattoo and scarlet paint is certainly a terrific object, and is well calculated to strike terror into those who have been accustomed to regard the Maori warriors with awe. When, however, the natives found that all the painting in the world had no effect upon the disciplined soldiers of the foreigner, they abandoned it, and contented themselves with the weapons that none are more able to wield than themselves.

Moreover, the paint and tattoo, however well it might look on a warrior armed after the primitive fashion, has rather a ludicrous effect when contrasted with the weapons of civilization. There is now before me a portrait of a Maori chief in full battle array. Except a bunch of feathers in his hair, and a checked handkerchief tied round his loins, evidently at the request of the photographer, he has no dress whatever. He is tall, splendidly made, stern, and soldierlike of aspect. But instead of the club, his proper weapon, he bears in his hand a Belgian rifle, with fixed bayonet, and has a cartouche-box fastened by a belt round his naked body.

His face is tattooed, and so are his hips, which are covered with a most elaborate pattern, that contrasts boldly with his really fair skin. Had he his club and chief's staff in his hands, he would look magnificent; having a rifle and a cartouche-box, he looks absurd. Even a sword would become him better than a rifle, for we are so accustomed to associate a rifle with a private soldier, that it is difficult to understand that a powerful chief would carry such a weapon.

The curious mixture of native and European dress which the Maories are fond of wearing is well described by Mr. Angas. "Raupahara's wife is an exceedingly stout woman, and wears her hair, which is very stiff and wiry, combed up into an erect mass upon her head about a foot in height, somewhat after the fashion of the Tonga islanders, which, when combined with her size, gives her a remarkable appearance.

"She was well dressed in a flax mat of native manufacture, thickly ornamented with tufts of cotton wool; and one of her nieces wore silk stockings and slippers of patent leather. This gay damsel was, moreover, a very pretty girl, and knew how to set off her charms to advantage; for over an European dress she had retained her native ornaments, and had wrapped herself coquetishly in a beautiful, 'kaitaka,' displaying her large hazel eyes above its silky folds."

It has often been thought that the warrior regarded his moko, or tattoo, as his name, permanently inscribed on his face; and this notion was strengthened by two facts: the one, that in the earlier times of the colonists the natives signed documents by appending a copy of their moko; and the

other, that each man knows every line of his tattoo, and sometimes carves a wooden bust on which he copies with admirable fidelity every line which appears on his own head or face. Such a work of art is greatly valued by the Maories, and a man who has carved one of them can scarcely be induced by any bribe to part with it.

Moreover, the moko of a warrior is often accepted as the conventional representation of himself. For example, on the pillars of a very celebrated house, which we shall presently describe, are numerous human figures which represent certain great chiefs, while men of lesser mark are indicated by their moko carved on the posts. Thus it will be seen that the moko of a chief is as well known to others as to himself, and that the practised eye of the native discerns among the various curves and spirals, which are common to all free men, the characteristic lines which denote a man's individuality, and in producing which the tattooers' skill is often sorely tried.

It has already been mentioned, that when a warrior falls in battle, and his body can be carried off by the enemy, the head is preserved, and fixed on the dwelling of the conqueror. No dishonor attaches itself to such an end; and, indeed, a Maori warrior would feel himself direfully insulted if he were told that in case of his death in the field his body would be allowed to remain untouched.

In fact, he regards his moko precisely in the same light that an American Indian looks upon his scalp-lock; and, indeed, there are many traits in the character of the Maori warrior in which he strangely resembles the best examples of North American savages.

In order to preserve the head of a slain warrior, some process of embalming must evidently be pursued, and that which is commonly followed is simple enough.

The head being cut off, the hair is removed, and so are the eyes; the places of which are filled up with pledgets of tow, over which the eyelids are sewed. Pieces of stick are then placed in the nostrils in order to keep them properly distended, and the head is hung in the smoke of the wood fire until it is thoroughly saturated with the pyroigneous acid. The result of this mode of preparation is, that the flesh shrinks up, and the features become much distorted; though, as the Maori warrior always distorts his countenance as much as possible before battle, this effect is rather realistic than otherwise.

It is often said that heads prepared in this fashion are proof against the attacks of insects. This is certainly not the case, as I have seen several specimens completely riddled by the ptlinus and similar creatures, and have been obliged to destroy the little pests by injecting a solution of corrosive sublimate. In spite of the shrivelling

to which the flesh and skin are subject, the tattooing retains its form; and it is most curious to observe how the finest lines completely retain their relative position to each other.

Not only are the heads of enemies treated in this fashion, but those of friends are also preserved. The difference is easily perceptible by looking at the mouth, which, if the head be that of a friend, is closed, and if of an enemy, is widely opened.

Some years ago, a considerable number of these preserved heads were brought into Europe, having been purchased from the natives. Of late years, however, the trade in them has been strictly forbidden, and on very good grounds. In the first place, no man who was well tattooed was safe for an hour, unless he were a great chief, for he might at any time be watched until he was off his guard, and then knocked down, killed, and his head sold to the traders. Then, when the natives became too cautious to render head hunting a profitable trade, a new expedient was discovered.

It was found that a newly tattooed head

looked as well when preserved as one which had been tattooed for years. The chiefs were not slow in taking advantage of this discovery, and immediately set to work at killing the least valuable of their slaves, tattooing their heads as though they had belonged to men of high rank, drying, and then selling them.

One of my friends lately gave me a curious illustration of the trade in heads. His father wanted to purchase one of the dried heads, but did not approve of any that were brought for sale, on the ground that the tattoo was poor, and was not a good example of the skill of the native artists. The chief allowed the force of the argument, and, pointing to a number of his people who had come on board, he turned to the intending purchaser, saying, "Choose which of these heads you like best, and when you come back I will take care to have it dried and ready for your acceptance." As may be imagined, this speech put an abrupt end to all head purchasing, and gave an unexpected insight into the mysteries of trading as conducted by savage nations.

CHAPTER LXXX.

NEW ZEALAND—*Continued.*

DRESS AND ORNAMENTS.

THE "MATS" OF THE NEW ZEALANDERS—THE MATERIAL OF WHICH THEY ARE MADE—THE NEW ZEALAND FLAX, OR PHORMIUM—MODE OF MAKING THE MATS—VARIOUS KINDS OF MATS—THE RAIN MAT AND ITS USES—THE OPEN-WORKED MAT—THE DIFFERENT ORNAMENTS OF THE MAT: STRINGS AND TAGS, SCARLET TUFTS AND BORDERS—WAR CLOAKS OF THE CHIEFS—THE DOGS'-HAIR MAT—THE CHIEF PARÁTENE IN HIS CLOAK—MODE OF MAKING THE WAR CLOAKS—BRIEF ACCOUNT OF THE CHIEF—AMUSING INSTANCE OF VANITY IN A CHIEF—SUBSTITUTION OF THE BLANKET AND ITS ATTENDANT EVILS—ORNAMENTS OF THE NEW ZEALANDER'S HEAD—FEATHERS, AND FEATHER BOXES—VARIOUS DECORATIONS OF GREEN JADE—TIKIS AND EARRINGS—A REMARKABLE AMULET—THE SHARK'S TOOTH—MODES OF DRESSING THE HAIR—HAIR-CUTTING AND SHAVING—A PRIMITIVE RAZOR.

We now come to the costume of the New Zealanders. This is of a rather remarkable character, and may be characterized by the generic title of mat, with the exception of the belt which has just been described. The costume of the New Zealander consists of a square or oblong mat, varying considerably in size, though always made on the same principle. In this mat the natives envelop themselves after a very curious fashion, generally muffling themselves up to the neck, and often throwing the folds round them after the fashion of a conventional stage villain.

These mats are of various textures, and differ as much in excellence and value as do the fabrics of more civilized lands. The material is, however, the same in all cases, and even the mode of wearing the garment, the value being estimated by the fineness of the material, the amount of labor bestowed upon it, and the ornaments introduced into it.

The material of which the mats are made is the so-called New Zealand "flax," scientifically known by the name of *Phormium tenax*. It belongs to the natural family of the Liliaceæ and the tribe Asparagaceæ. The plant has a number of showy yellow flowers arranged on a tall branch-panicle, and a number of straightish leaves, all starting from the root, and being five or six feet long, and not more than two inches wide at the broadest part.

The fibres which run along these leaves are very strong and fine, and, when properly dressed and combed, have a beautiful silky

look about them. At one time great quantities of New Zealand flax, as it was called, were imported into Europe, and the plant was cultivated in some of the southern parts of the Continent. Strong, however, as it may be, it has the curious fault of snapping easily when tied in a knot, and on this account is not valued so much in Europe as in its own country. I have before me a large roll of string made by natives from the phormium. It is very strong in proportion to its thickness, and much of it has been used in suspending various curiosities in my collection; but it cannot endure being made into a knot. It is useful enough in hitches, especially the "clove-hitch;" but as soon as it is tied into a knot, it will hardly bear the least strain.

The principle on which the mats are made is very simple. A weaving frame is erected on sticks a foot or so from the ground, and upon it is arranged the weft, made of strings or yarns, placed as closely together as possible, and drawn quite tight. The weft is double, and is passed under and over each yarn, and the upper one is always passed between the ends of the under weft before it is drawn tight. The mat is therefore nothing more than a number of parallel strings laid side by side, and connected, at intervals of an inch or so, by others that pass across them. More care is taken of the edges, which are turned over, and the yarns are so interwoven as to make a thick and strong border.

When the wefts are hauled tight, they are beaten into their place by means of a bone

instrument, very much like a paper knife in shape; and in every respect the weaving of a New Zealander most strongly reminds the spectator of the process of making the Gobelins tapestries. In both cases there is a fixed warp on which the weft is laboriously woven by hand, and is kept straight and regular by being struck with an instrument that passes between the threads of the warp. Although at the present day the warp of the Gobelins tapestry is stretched perpendicularly, in former times it was stretched longitudinally in a low frame, exactly similar in principle to that which is employed by the New Zealander.

The reader will perceive that the process of weaving one of these mats must be a work of considerable time, and an industrious woman can scarcely complete even a common mat under eighteen months, while one of the more elaborate robes will occupy twice that time.

The illustration No. 1 on the next page, is drawn from a sketch of a house belonging to one of the great chiefs, and in it are seen some women busily employed in making mats. One of them is scraping the leaves with a shell or stone, while another is engaged at the primitive loom. The mat is represented as nearly completed, and the woman is seen with the four ends of the double weft in her hand, passing them across each other before she draws them tight. A heap of dressed leaves of the phormium is seen in the background, and a bundle of the long swordlike leaves is strewn on the floor. Various baskets and other implements, made of the same material, are hung from the rafters; and in front is one of the curiously carved poles which support the roof.

It has been mentioned that there is but one principle on which all the mats are made, but that there is a very great variety in making them. There is, for example, the rain mat, which is used in wet weather. As the structure proceeds, the manufacturer inserts into each knot of the weft an undressed blade of the phormium upon which the epidermis has been allowed to remain. When wrapped round the body, the leaves all fall over each other, so as to make a sort of penthouse, and to allow the rain to run over their smooth and polished surfaces until it falls to the ground.

When rain comes on, and a number of natives are seen squatting on the ground, each wearing his rain mat, they have a most absurd appearance, and look like a number of human beings who had hidden themselves in haycocks. On page 803 may be seen the figure of a chief wearing one of these dresses. The name of the mat is *E mangaika*.

I have seen another kind of mat, which is made in a kind of open-work pattern, produced by crossing every fifth strand of the

warp. This mat is of the very best quality, and, considering the nature of the material of which it is made, is wonderfully light, soft, and pliant.

Another kind is the woman's mat, of which there are several varieties. It is of larger size than that employed by the men, and is capable of enveloping the entire figure from head to foot. It is of rather lighter material than the rain mat, and is decorated on the exterior with a number of strings, varying in length from a few inches to three feet or so. A variety of this mat is distinguished by having the strings white instead of black. Specimens of both these mats are in my collection, and the general effect of them can be seen by reference to any of the illustrations which represent the native women.

Strings or tags are undoubtedly the most characteristic portion of the dress, and there is scarcely a mat of any description that is not ornamented with them. One variety of mat, which is called *E wakaiwa*, is covered with long cylindrical ornaments that look very much as if they were made of porcupine quills, being hard, and colored alternately black and yellow. The ornaments are, however, made of the phormium leaf in a very ingenious manner. The epidermis is carefully scraped off the under side of the leaf with a sharp-edged shell, and the leaf is then turned over. On the upper side the epidermis is removed at regular intervals, so as to expose the fibres.

The next process is to put the scraped leaf into a dye made of a decoction of *kinan* bark, and to let it remain for a definite time. When it is taken out, the dye has stained the exposed fibres a deep glossy black, while it has not been able to touch the polished yellow epidermis that is allowed to remain. The dyed leaves are next rolled up until they form cylinders as large as goose quills, and are then woven in regular rows into the material of a mat. As the wearer moves about, the cylinders rustle and clatter against each other, producing a sound which seems to be peculiarly grateful to the ears of the natives. Such a mat or cloak is highly prized. Several of these mats are in my collection, and very curious examples of native art they are.

One of these has cost the weaver an infinity of trouble. It is nearly five feet wide and three in depth. The warp has been dyed black, while the weft is white; and the effect of the weft passing in reverse lines across the warp is very good. Every other line of weft is decorated with the cylindrical tassels each of which is nine inches in length, and is divided into four parts by the removal of the epidermis. These tassels begin at the fourth line of warp, and are regularly continued to the lower edge, whence they hang so as to form a fringe. On account of their number, they would

(1.) WOMEN MAKING MATS.

(See page 808.)

(2.) THE TANGI.

(See page 824.)

qualify the garment as a rain mat on an emergency; and the rattling they make as the mat is moved is very much like that which is produced by a peacock when it rustles its train.

Along the upper edge, which passes over the shoulders, the strings have been rolled together into ropes as thick as the finger, and then plaited so as to form a thick and soft border which will not hurt the neck. The portion of the mat which comes between the edge and the first row of tassels is ornamented with scraps of scarlet wool plaited into the weft. This wool is a favorite though costly ornament to the natives, being procured from seamen's woollen caps, which they unpick, and the yarns used to ornament the dress.

One of these mantles brought from New Zealand by Stiverd Vores, Esq., is adorned very largely with scarlet wool. It is completely bordered with the precious material, a narrow line of scarlet running under the upper edge, a broader under the lower, while the two sides are decorated with a band nearly four inches in width. In this case the wool has been arranged in a series of loops; but in another specimen the loops are cut so as to form a fringe.

In this latter mantle the tags, instead of being cylindrical and alternately black and yellow, are entirely black, each rolled leaf being wholly divested of its epidermis, and the fibres radiating from each other in tassel fashion. I rather think that the object of this mode of treatment is to prevent the eye from being distracted by the jangling yellow tags, and so to permit the scarlet border to exhibit its beauties to the best advantage.

Scarlet worsted is, of course, a comparatively late invention, and has only been introduced since the visits of Europeans. In former days the natives were equally fond of ornamenting their cloaks, and were obliged to use the plumage of birds for the purpose. The feathers taken from the breast of the kaka (a species of nestor) were mostly used for this purpose. Although the colored ornaments are generally disposed in lines, they are sometimes arranged in tufts, which are disposed in regular intervals over the whole of the dress. Examples of this kind of decoration may be seen in several of the costumes which are drawn in this work.

The yarns or strings of which the warp is made are not twisted or plaited, but consist merely of the phormium fibres as they lie in the leaf. The leaves are prepared for this purpose by scraping off the epidermis on both sides, and then beating them on a flat stone with a pestle made of the hard volcanic stone employed in the manufacture of adzes and other tools.

The most valuable of all the dresses are the war cloaks of the great chiefs. They are

very large, being sometimes nearly six feet in depth, and wide enough to be wrapped over the entire body and limbs. Their native name is Parawai.

Before making one of these great war mats, the weaver collects a large quantity of dog's hair, which she assort into parcels of different colors. She then sets up her simple loom, and fixes the warp as usual. But with every knot or mesh which she makes with the weft she introduces a tuft of hair, taking care to make each tuft long enough to overlap and conceal the insertion of the tufts in the next row. She is also careful about the regular arrangement of the hues, so that when a complete mat is made by a skilful weaver, it looks exactly as if it was composed of the skin of some large animal, the vegetable fibres which form the fabric itself being entirely concealed by the tufts of hair.

One of these mats is the result of some four years' constant labor, and causes some surprise that a people so naturally indolent as the Maories should prove themselves capable of such long and steady industry. But the fact is, the mat maker is a woman and not a man, and in consequence is obliged to work, whether she likes it or not.

In the next place, mat weaving scarcely comes under the denomination of labor. The woman is not tied to time, nor even bound to produce a given number of mats within a given period. Her living, too, does not depend upon the rate of her work, and whether she takes eighteen months or two years to produce a garment is a matter of total indifference to all parties. Besides, she never works alone, but is always accompanied by friends, one of whom, perhaps, may be occupied in a similar manner, another may be employed in scraping the phormium leaves, and another is engaged in pounding and softening the fibres, or drying those that have just been dyed black.

But, whatever their hands may be doing, the weavers' tongues are never still. A continual stream of talk flows round the looms, and the duty of mat making is thus changed into an agreeable mode of enjoying the pleasures of conversation while the hands are employed in a light and easy labor.

Very great ingenuity is displayed by the woman to whom is entrusted the onerous task of making a war mat. No two are alike, the weaver exercising her discretion respecting the colors and their arrangement. Some of them are made on the same principle as the Bechuana kaross,—namely, darkest in the centre, and fading into the lightest hues round the edges. Others are white or pale in the middle, and edged with a broad band of black or dark brown hair. Sometimes the colors are arranged in a zigzag pattern, and several mats are striped like tiger skins. They always have a sort of

collar, composed of strips of fur, which hang about six inches over the shoulders.

In New Zealand there are one or two dresses which are made almost entirely of fur, the skins being dressed with the hair adhering to them, and then sewed together. A very remarkable mat is possessed by a powerful chief named Parátene Maioha. It is made of strips of dogs' fur sewed over a large flaxen mat. Of this garment he is very proud, and reserves it to be worn on grand occasions. A portrait of this celebrated chief is given in the illustration No. 1, on the 820th page, partly to show the aspect of a Maori chief in time of peace, and partly to give the reader an idea of the peculiar look of the war cloak.

There is also before me a photographic portrait of Parátene, authenticated by his autograph, in which he is represented as clad in a different manner. He wears two mats or cloaks, the lower being of the finest flax, and called by the natives kaitaka. A description of this kind of cloak will be presently given. Over the kaitaka he wears a very remarkable war cloak, which is made of dogs' fur sewed upon a flax mat. It reaches a little below the knees, and is made in perpendicular stripes alternately dark and pale, and is furnished with a thick collar or cape of the same material. This cape, by the way, bears a curious resemblance to the ornament which is worn by the Abyssinian chiefs.

Unfortunately for the general effect of the picture, Parátene has combed, divided, and brushed his hair in European fashion; and muffed up as he is to the chin, it is too evident that he is wearing a complete European suit under his mats. The cape has fallen off a little on the right side, and we have the absurd anomaly of a face profusely tattooed surmounted with hair that has just been brushed and combed, a dog-skin war mat, from which protrudes a bare right arm, a jade earring six inches long, and a black cravat and turn-down collar. In his right hand he grasps his cherished meral; his staff of office, or E'hani, rests against his shoulder; and by his side is his long battle-axe, adorned with a tuft of feathers and dog-skin. This same Parátene is a man of great mark among the Maories.

As is the case with natives of rank who have associated with Europeans, he is known by several names. The following account of him is given by Mr. G. F. Angas:

"Parátene (Broughton), whose native name was Te Maihoa, is a cousin of Te Whero-where, and one of the leading men of the Ngatimahuta branch of the Waikato tribes. He generally resides in a village (or kainga) on the northern bank of the picturesque little harbor of Waingarua, on the west coast of the Northern Island; and the correctness of his general conduct, and the gravity of his demeanor, have obtained

for him a marked ascendancy over many of his equals in rank.

"Eccentricity is the principal feature in the character of this chief; and the scrupulous attention which he invariably pays to those trifling circumstances which constitute his notions of etiquette often renders his conduct highly curious. He has gained, by unwearied application, a smattering of arithmetic, and one of his most self-satisfactory exploits is the correct solution of some such important problem as the value of a pig of a certain weight, at a given price per pound, making the usual deduction for the offal. His erudite quality and the dignified gravity of his carriage have commanded the deferential respect of his people, and encouraged them to consider him quite an oracle.

"One little incident will place the harmless foible of this chief's character in a striking light. When the author was about to employ his pencil in the delineation of his figure, Parátene desired to be excused for a few moments. Having gained his point, he sought an interview with Mrs. Wells, the missionary's wife (under whose hospitable roof his portrait was taken), and, preferring his request with some solemn intimations of its paramount importance, begged 'Mother' to lend him a looking-glass, that he might compose his features in a manner suitable to his own idea of propriety ere he took his stand before the easel of the artist."

It may be observed, by the way, that "Mother" is the term always employed by the natives when addressing the wife of a missionary. The autograph of Parátene, to which allusion has already been made, is written with pencil, and is perfectly intelligible, though the characters are shaky, large, and sprawling, and look as if they had been made by fingers more accustomed to handle the club than the pencil.

The last kind of mat which will be mentioned is the kaitaka. This garment is made of a peculiar kind of flax, cultivated for the express purpose, and furnishing a fibre which is soft and fine as silk. The whole of the mat is plain, except the border, which is in some cases two feet in depth, and which is most elaborately woven into a vandyked pattern of black, red, and white. At the present day a good kaitaka is scarcely anywhere to be seen, the skill required in making them being so great that only a few weavers can produce them, and European blankets being so easily procured that the natives will not take the trouble of weaving garments that take so much time and trouble.

Handsome as are these native garments, they are not very pleasant to wear. As the threads are only laid parallel to each other, and are not crossed, as in fabrics woven in the loom, they form scarcely any protection against the wind, although they may serve to keep out the rain. The mats are very

heavy, my own small specimen of the waikawa cloak weighing five pounds and a half, and so stiff that they cannot be conveniently rolled up and packed away when out of use. An English blanket, on the contrary, is close-textured, resists the wind, is very light, and can be rolled up into a small compass; so that it is no wonder that the natives prefer it.

Unfortunately for them, it is not nearly so healthy a garment as that which is made by themselves, as it is worn for a long time without being washed, and so becomes saturated with the grease and paint with which the natives are fond of adorning their bodies. In consequence, it fosters several diseases of the skin to which the Maories are subject, and it has been found that those who wear blankets are much more subject to such ailments than those who adhere to the native raiment.

In some parts of the country, where the ground is hard and stony, the natives plait for themselves sandals or slippers, which very much resemble those which are used by the Japanese. They consist of the ever-useful phormium fibres, which are twisted into cords, and then plaited firmly into the shape of a shoe sole.

WE now proceed from the dress to the ornaments worn by the New Zealanders.

In some respects they resemble those which are in use among other dark tribes. Feathers are much valued by them, and among the commonest of these adornments is a bunch of white feathers taken from the pelican, and fastened to the ears so as to fall on the shoulder. An example of this may be seen in the portrait of the old warrior on page 794. Sometimes the skin of a small bird is rudely stuffed, and then suspended as an earring, and sometimes one wing will be placed at each side of the head, the tips nearly meeting above.

The most prized of these adornments are the tail feathers of the bird called by the natives E Elia, or E Huia (*Neomorpha Gouldii*). It is allied to the hoopoes, and is remarkable for the fact that the beak of the male is straight and stout, while that of the female is long, slender, and sickle-shaped. The color of the bird is a dark glossy green of so deep a hue that in some lights it seems to be black. The tail feathers, however, are tipped with snowy white, so that when the bird spreads its plumage for flight, the tail looks at a little distance as if it were black, edged with white.

The bird is only found in the hills near Port Nicholson, and, as it is very wary, can scarcely be obtained except by the help of a native, who imitates its cry with wonderful perfection. The name E Elia is said to be merely an imitation of the long shrill whistle of the bird. The birds are so valued by the Maories that in all probability the species

would have been extinct by this time, but for the introduction of European customs, which to a certain degree have driven out the ancient customs.

The feathers of the tail are the parts of the bird that are most valued by the chiefs, who place them in their hair on great occasions. So much do they prize these feathers, that they take the trouble to make boxes in which they are kept with the greatest care. These boxes are made by the chiefs themselves, and are covered with the most elaborate carvings, some of them being the finest specimens of art that can be found in New Zealand. They are of various shapes, but a very good idea of their usual form may be obtained from the illustration No. 3, on page 775. The usual forms are similar to that of the illustration, but in some cases the boxes are oblong. There is now before me a drawing of one of these boxes, which is covered with an equally elaborate pattern, in which the lines are mostly straight instead of curved, the pattern being of a vandyked character, similar to that upon the kaitaka cloak. There is a projecting handle upon the lid, and an almost similar handle upon each end.

The natives do not, however, confine themselves to wearing the tail feathers, but, when they can obtain so valuable a bird, are sure to use every portion of it. The head seems to be thought of next importance to the tail, and is suspended to the ear by a thong.

Perhaps the most characteristic ornaments that are worn by the New Zealanders are those which are made of green jade. This mineral, called by the natives Poonamu, is mostly found near the lakes in the Middle Island, and is valued by them with almost a superstitious reverence. If a very large piece be found, it is taken by some chief, who sets to work to make a club from it. This club, called a merai, will be described when we come to treat of war as conducted by the Maories.

In the illustration No. 1, on page 841, are represented some of the most characteristic jade ornaments.

Fig. 1 is a flat image bearing the rude semblance of a human being, and made of various sizes. That which is here given is rather smaller than the usual dimensions. It is called by the natives Tiki, and is at the same time one of the commonest and the highest prized articles among the New Zealanders. A new one can be purchased for a sum which, though it would be considered absurdly high in England for such an object, is in New Zealand really a low price, and scarcely repays the trouble of carving it.

Jade is an extremely hard mineral, ranking next to the ruby in that respect, and, in consequence of its extreme hardness, taking a peculiar glossy polish that is seen on no other substance. The time which is occupied in carving one of these ornaments is necessarily very great, as the native does

not possess the mechanical means which render its manipulation a comparatively easy task to the European engraver, and can only shape his ornaments by laboriously rubbing one piece of stone upon another.

That ornaments made of such a material should be highly prized is not a matter of surprise, and it is found that a wealthy chief will give an extraordinarily high price for a handsome jade ornament. There is in my collection a very ancient Buddhist amulet, made of the purest green jade, and beautifully carved, the remarkable portion of it being a revolving wheel with spiral spokes, the wheel being cut out of the solid jade. The amulet was found in the apartments of the Queen of Oude, and had evidently been imported from China, where it was engraved, the whole character of the work belonging to a very ancient epoch of Chinese art. It was shown to a Maori chief, who was then visiting England, and who was intensely pleased with it, saying that, if it were sent to New Zealand and offered for sale to one of the great chiefs, it would be purchased for £20 or £25 of English money.

It has been just mentioned that, in spite of the labor bestowed on the ornament, a new tiki can be purchased for a moderate sum. Such, however, would not be the case were the tiki an old one. These ornaments are handed down from father to son, and in process of time are looked upon with the greatest reverence, and treated as heirlooms which no money can buy.

One of these tikis was seen by Mr. Angas lying on the tomb of a child, where it had been placed as an offering by the parents. It had lain there for a long time; but, in spite of the value of the ornament, no one had ventured to touch it. It was a very small one, even less in size than the drawing in the illustration, and had in all probability been worn by the child on whose tomb it lay.

Most of these tikis are plain, but some of them have their beauty increased by two patches of scarlet cement with which the sockets of the eyes are filled.

The tikis are worn on the breast, suspended by a cord round the neck; and almost every person of rank, whether man or woman, possesses one. They are popularly supposed to be idols, and are labelled as such in many museums; but there is not the least reason for believing them to fulfil any office except that of personal decoration. The Maories are fond of carving the human figure upon everything that can be carved. Their houses are covered with human figures, their canoes are decorated with grotesque human faces, and there is not an implement or utensil which will not have upon it some conventional representation of the human form. It is therefore not remarkable that when a New Zealander finds a piece of

jade which is too small to be converted into a weapon, and too flat to be carved into one of the cylindrical earrings which are so much valued, he should trace upon it the same figure as that which surrounds him on every side.

The most common forms of earring are those which are shown at figs. 4 and 5, the latter being most usually seen. It is so strangely shaped that no one who did not know its use would be likely to imagine that it was ever intended to be worn in the ear. Two rather remarkable earrings are worn in New Zealand as marks of rank; one being a natural object, and the other an imitation of it. This earring is called mako tamina, and is nothing but a tooth of the tiger shark. Simple though it be, it is greatly prized, as being a mark of high rank, and is valued as much as a plain red button by a Chinese mandarin, or, to come nearer home, the privilege of wearing a piece of blue ribbon among ourselves.

Still more prized than the tooth itself is an imitation of it in pellucid jade. The native carver contrives to imitate his model wonderfully well, giving the peculiar curves of a shark's tooth with singular exactness. Such an ornament as this is exceedingly scarce, and is only to be seen in the ears of the very greatest chiefs. Anything seems to serve as an earring, and it is not uncommon to see natives of either sex wearing in their ears a brass button, a key, a button-hook, or even a pipe.

There is very little variety in the mode of dressing the hair, especially among women. Men generally keep it rather short, having it cut at regular intervals, while some of the elders adhere to the ancient custom of wearing it long, turning it up in a bunch on the top of the head, and fastening it with combs.

These are formed after a fashion common to all Polynesia, and extending even to Western Africa. The teeth are not cut out of a single piece of wood, but each is made separately, and fastened to its neighbor by a strong cross-lashing. The teeth, although slight, are strong and elastic, and are well capable of enduring the rather rough handling to which they are subjected.

Children of both sexes always wear the hair short like the men; but as the girls grow up, they allow the hair to grow, and permit it to flow over their shoulders on either side of the face. They do not part it, but bring it down over the forehead, and cut it in a straight line just above the eyebrows. When they marry, they allow the whole of the hair to grow, and part it in the middle. They do not plait or otherwise dress it, but merely allow it to hang loosely in its natural curls.

Hair-cutting is with the New Zealanders a long and tedious operation, and is conducted after the fashion which prevails in so many parts of the world. Not knowing the

use of scissors, and being incapable of producing any cutting instrument with an edge keen enough to shave, they use a couple of shells for the operation, placing the edge of one under the hair that is to be cut, and scraping it with the edge of the other.

Although this plan is necessarily a very slow one, it is much more efficacious than might be imagined, and is able not only to cut the hair of the head, but to shave the stiff beards of the men. In performing the

latter operation, the barber lays the edge of the lower shell upon the skin, and presses it well downward, so as to enable the upper shell to scrape off the hair close to the skin. Beard-shaving is necessarily a longer process than hair-cutting, because it is not possible to cut more than one or two hairs at a time, and each of them takes some little time in being rubbed asunder between the edges of the shells.

CHAPTER LXXXI.

NEW ZEALAND—*Continued.*

DOMESTIC LIFE.

CEREMONIES ATTENDANT ON BIRTH—PREVALENCE AND CAUSES OF INFANTICIDE—A CURIOUS INSTANCE OF SUPERSTITION—NAMES AND THEIR SIGNIFICATION—THE CEREMONY OF SPRINKLING—THE RECITATIONS—CHANGES OF NAME—MARRIAGE—COURTSHIP AND WIFE-SNATCHING—AMUSEMENTS OF THE NEW ZEALANDERS—THE SWING, OR GIANT STRIDE—DRAUGHTS AND OTHER SEDENTARY GAMES—CHILDREN'S SPORTS—TOP-SPINNING, KITE-FLYING—AND CAT'S-CRADLE—SWIMMING AND DIVING—CURIOUS PETS: DOGS, PIGS, AND PARROTS—BALL-PLAYING—MUSIC AND SINGING—CHARACTER OF THE SONGS—MUSICAL INSTRUMENTS—THE FIFE, THE WAR TRUMPET, AND THE WAR BELL—CURIOUS MODE OF SALUTATION—THE "TANGI," AND ITS LUDICROUS APPEARANCE—ITS WEARISOME EFFECT ON A FOREIGNER—UNCERTAIN TEMPER OF THE MAORIES—STRENGTH OF MEMORY, AND CURIOSITY.

WE will now examine the domestic life of the New Zealander, and begin at the beginning, *i. e.* with his birth.

As is mostly the case in those nations which do not lead the artificial life of civilization, there is very little trouble or ceremony about the introduction of a new member of society. The mother does not trouble herself about medical attendants or nurses, but simply goes off into some retired place near a stream, and seldom takes with her even a companion of her own sex. When the baby is born, the mother bathes her child and then herself in the stream, ties the infant on her back, and in a short time resumes the business in which she was engaged. Until the child is named the mother is sacred, or "tapu," and may not be touched by any one.

The New Zealand women are too often guilty of the crime of infanticide, as indeed might be imagined to be the case in a land where human life is held at so cheap a rate. Various causes combine to produce this result. If, for example, the child is deformed or seems sickly, it is sacrificed as an act of mercy toward itself, the Maories thinking that it is better for the scarcely conscious child to be destroyed at once than to die slowly under disease, or to live a despised life as a cripple.

Revenge, the leading characteristic of the Maori mind, has caused the death of many an infant, the mother being jealous of her husband, or being separated from him longer than she thinks to be necessary. Even a sudden quarrel will sometimes cause the

woman, maddened by anger, to destroy her child in the hope of avenging herself upon her husband. Slave women often systematically destroy their children, from a desire to save them from the life of servitude to which they are born. In many cases the life of the child is sacrificed through superstitious terror.

A very curious example of such a case is given by Dr. Dieffenbach. A recently married wife of a young chief was sitting near a pah or village, on the fence of which an old priestess had hung her blanket. As is generally the case with New Zealand garments, the blanket was infested with vermin. The young woman saw one of these loathsome insects crawling on the blanket, caught it, and, according to the custom of the country, ate it. The old woman to whom the garment belonged flew into a violent passion, poured a volley of curses on the girl for meddling with the sacred garment of a priestess, and finished by prophesying that the delinquent would kill and eat the child which she was expecting.

The spirit of revenge was strong in the old hag, who renewed her imprecations whenever she met the young woman, and succeeded in terrifying her to such a degree that she was almost driven mad. Immediately after the child was born the old woman found out her victim, and renewed her threats, until the young mother's mind was so completely unhinged, that she hastily dug a hole, threw her child into it, and buried it alive. She was, however, filled with remorse for the crime that she had

committed; and before very long both she and her husband had emancipated themselves from their superstitious thralldom, and had become converts to Christianity.

It is seldom, however, that a mother kills her child after it has lived a day; and, as a general rule, if an infant survives its birth but for a few hours, its life may be considered as safe from violence. Both parents seem equally fond of infants, the father nursing them quite as tenderly as the mother, lulling it to sleep by simple songs, and wrapping its little naked body in the folds of his mat.

Soon after its birth the child is named, either by its parents or other relatives, the name always having some definite signification, and mostly alluding to some supposed quality, or to some accidental circumstance which may have happened at the time of birth. Much ingenuity is shown in the invention of these names, and it is very seldom found that the son is named after his father or other relative. All the names are harmonious in sound, and end with a vowel; and even in the European names that are given by the missionaries at baptism the terminal syllable is always changed into a vowel, in order to suit the native ideas of euphony.

When the child is about two or three months old, a ceremony is performed which is remarkable for its resemblance to Christian baptism. The origin of the ceremony is not known, and even the signification of the words which are employed is very obscure. Very few persons are present at the ceremony, which is carried on with much mystery, and is performed by the priest.

The three principal parts of the rite are that the child should be laid on a mat, that it should be sprinkled with water by the priest, and that certain words should be used. As far as has been ascertained, the mode of conducting the ceremony is as follows: The women and girls bring the child and lay it on a mat, while the priest stands by with a green branch dipped in a calabash of water. A sort of incantation is then said, after which the priest sprinkles the child with water. The incantation differs according to the sex of the child, but the sense of it is very obscure. Indeed, even the natives cannot explain the meaning of the greater part of the incantation: so that in all probability it consists of obsolete words, the sounds of which have been retained, while their sense has been lost.

As far as can be ascertained, the incantation consists of a sort of dialogue between the priest and the women who lay the child on the mat. The following lines are given by Dieffenbach, as the translation of the beginning of the incantation said over female children. He does not, however, guarantee its entire accuracy, and remarks that the true sense of several of the words

is very doubtful. The translation runs as follows:

Girls. "We wish this child to be immersed." — *Priest.* "Let it be sprinkled."

Girls. "We wish the child to live to womanhood." — *Priest.* "Dance for Atua."

Girls. "Me ta nganahau." (These words are unintelligible.) — *Priest.* "It is sprinkled in the waters of Atua."

Girls. "The mat is spread." — *Priest.* "Dance in a circle."

"Thread the dance."

The reader must here be told that the word "Atua" signifies a god, and that the word which is translated as "womanhood" is a term that signifies the tattooing of the lips, which is performed when girls are admitted into the ranks of women. The above sentences form only the commencement of the incantation, the remainder of which is wholly unintelligible.

When the child is old enough to undertake a journey to the priest's house, another ceremony takes place, in which the baby name that the parents have given to the infant is exchanged for another. According to Mr. Taylor's interesting account, when the child has arrived at the house of the priest, the latter plants a sapling as a sign of vigorous life, and holds a wooden idol to the ear of the child, while he enumerates a long string of names which had belonged to its ancestors. As soon as the child sneezes, the priest stops, the name which he last uttered being that which is assumed by the child. We are left to infer that some artificial means must be used to produce sneezing, as otherwise the task of the priest would be rather a tedious one.

After the requisite sign has been given, and the child has signified its assent to the name, the priest delivers a metrical address, differing according to the sex. Boys are told to clear the land and be strong to work; to be bold and courageous in battle, and comport themselves like men. Girls are enjoined to "seek food for themselves with panting of breath," to weave garments, and to perform the other duties which belong to their sex.

Even this second name is not retained through life, but may be changed in after life in consequence of any feat in war, or of any important circumstance. Such names, like the titles of the peerage among ourselves, supersede the original name in such a manner that the same person may be known by several totally distinct names at different periods of his life.

There seems to be no definite ceremony by which the young New Zealand lad is admitted into the ranks of men. The tattoo is certainly a sign that his manhood is acknowledged; but this is a long process, extending over several years, and cannot be considered as an initiatory rite like those which are performed by the Australians.

When a young man finds himself able to maintain a wife, he thinks about getting married, and sets about it very deliberately. Usually there is a long courtship, and, as a general fact, when a young man fixes his affections on a girl, he is sure to marry her in the end, however much she or her friends may object to the match. He thinks his honor involved in success, and it is but seldom that he fails.

Sometimes a girl is sought by two men of tolerably equal pretensions; and when this is the case, they are told by the father to settle the matter by a pulling match. This is a very simple process, each suitor taking one of the girl's arms, and trying to drag her away to his own house. This is a very exciting business for the rivals as well as for the friends and spectators, and indeed to every one except the girl herself, who is always much injured by the contest, her arms being sometimes dislocated, and always so much strained as to be useless for some time.

In former times the struggle for a wife assumed a more formidable aspect, and several modern travellers have related instances where the result has been a tragic one. If a young man has asked for a girl and been refused, his only plan is to take her by force. For this purpose he assembles his male friends, and makes up his mind to carry the lady off forcibly if he cannot obtain her peacefully. Her friends in the meantime know well what to expect, and in their turn assemble to protect her. A fierce fight then ensues, clubs, and even more dangerous weapons being freely used; and in more than one case the intended bride has been killed by one of the losing side. Sometimes, though not very often, a girl is betrothed when she is quite a child. In that case she is as strictly sacred as if she were actually a married woman, and the extreme laxity of morals which has been mentioned cannot be imputed to such betrothed maidens. Should one of them err, she is liable to the same penalties as if she were actually married.

The New Zealanders seldom have more than one wife. Examples are known where a chief has possessed two and even more wives; but, as a general rule, a man has but one wife. Among the Maories the wife has very much more acknowledged influence than is usually the case among uncivilized people, and the wife always expects to be consulted by her husband in every important undertaking. Marriage usually takes place about the age of seventeen or eighteen, sometimes at an earlier age in the case of the woman and a later in the case of the man.

As to the amusements of the New Zealanders, they are tolerably varied, and are far superior to the mere succession of singing and dancing, in which are summed up

the amusements of many uncivilized races. Songs and dances form part of the amusements of this people, but only a part, and they are supplemented by many others.

One of the most curious was seen by Mr. Angas in the interior of the country, but never on the coasts. A tall and stout pole, generally the trunk of a pine, is firmly set in the ground on the top of a steep bank, and from the upper part of the pole are suspended a number of ropes made of phormium fibre. The game consists in seizing one of the ropes, running down the bank, and swinging as far as possible into the air. Sometimes they even run round and round the pole as if they were exercising on the giant stride; but as they have not learned to make a revolving top to the pole or swivels for the ropes, they cannot keep up this amusement for any long time.

They have a game which is very similar to our draughts, and is played on a checkered board with pebbles or similar objects as men. Indeed, the game bears so close a resemblance to draughts, that it may probably be a mere variation of that game, which some New Zealander has learned from an European, and imported into his country.

There is also a game which much resembles the almost universal "morro," and which consists in opening and closing the hand and bending the elbow, performing both actions very sharply, and accompanying them with a sort of doggerel recitation, which has to be said in one breath.

The children have many games which are very similar to those in use among ourselves. They spin tops, for example, and fly kites, the latter toy being cleverly made of the flat leaves of a kind of sedge. It is triangular in form, and the cord is made of the universal flax fibre. Kite-flying is always accompanied by a song; and when the kites are seen flying near a village, they are a sign that the village is at peace, and may be approached with safety.

Perhaps the chief amusement of the children is the game called Maui, which is in fact a sort of "cat's-cradle." The Maori children, however, are wonderful proficient at the game, and would look with contempt on the few and simple forms which English children produce. Instead of limiting themselves to the "cradle," the "pound of candles," the "net," and the "purse," the New Zealander produces figures of houses, canoes, men and women, and various other patterns. They say that this game was left to them as an inheritance by Maui, the Adam of New Zealand, and it appears to be intimately connected with their early traditions.

The elder children amuse themselves with spear-throwing, making their mimic weapons of fern-stems bound at the end. These they throw with great dexterity, and emulate each other in aiming at a small target.

Swimming is one of the favorite amuse-

(See page 850.)

ments of the New Zealanders, who can swim almost as soon as they can walk, and never have an idea that the water is an unfriendly element. Both sexes swim alike well, and in the same manner, *i. e.* after the fashion which we call "swimming like a dog," paddling the water with each arm alternately. Being constantly in the water, they can keep up the exertion for a long time, and in their bathing parties sport about as if they were amphibious beings. They dive as well as they swim, and the women spend much of their time in diving for crayfish.

In those parts of the country where hot springs are found the natives are fond of bathing in the heated water. Mr. Angas makes the following observations on this custom:—"Upon the beach of the lake, near Te Rapa, there is a charming natural hot bath, in which the natives, especially the young folks, luxuriate daily. Sunset is the favorite time for bathing, and I have frequently seen of an evening at least twenty persons squatting together in the water, with only their heads above the surface.

"Boiling springs burst out of the ground, close to a large circular basin in the volcanic rock, which, by the assistance of a little art, had been rendered a capacious bath. The boiling stream is conducted into this reservoir gradually, and the temperature of the water is kept up or decreased by stopping out the boiling stream with stones, through which it trickles slowly, whilst the main body runs steaming into the lake.

"The medicinal properties of these hot mineral springs preserve the natives in a healthy state, and render their skins beautifully smooth and clear. Indeed, some of the finest people in the island are to be observed about Taupo, and the beauty and symmetry of the limbs of many of the youth would render them admirable studies for the sculptor."

Perhaps the oddest amusement with which the New Zealanders have ever recreated themselves is one that only occurred some sixty years ago, and is not likely to be reproduced. About that date Captain King took away two New Zealanders to Norfolk Island for the purpose of teaching the settlers the art of flax-dressing. When he came back to restore them to their homes, he planted a quantity of maize, which was then new in the country, and presented the natives with three pigs. Most of them had never seen any animal larger than a cat, and the others, who had a vague recollection of seeing horses on board Captain Cook's vessel, naturally mistook them for those animals. Thinking them to be horses, they treated them as horses, and speedily rode two of them to death. The third did not come to a better end, for it strayed into a burial-ground, and was killed by the indignant natives.

Nowadays the Maories understand pigs far too well to ride them. Pigs have de-

come quite an institution in New Zealand. Every village is plentifully populated with pigs, and, as may be seen in the illustration of a village which will be given on a future page, one of the commonest objects is a sow with a litter of pigs.

Little pigs may be seen tottering about the houses, and the natives, especially the women, pet pigs exactly as European women pet dogs and cats. They carry them in their arms, fondle and pet them; and nothing is more common than to see a young girl unfold her mantle and discover a pig nestling under its folds. Such a girl, for example, as the one who is represented in the illustration No. 2, on the preceding page, would be very likely indeed to have a pig in her arms under the shelter of her mantle.

The figure in question is the portrait of the daughter of a chief. Her name is Tienga, and she is the daughter of a very powerful and celebrated chief. Her costume is, like her character, an odd mixture of civilization and nature. Her mantle is the native flax mat, under which she may probably wear a muslin, or even silken, garment, articles of dress of which the young lady in question was, when her portrait was taken, exceedingly proud. On her head she wears a common straw hat, purchased from the trader at some five hundred per cent. or so above its value, and round it she has twisted a bunch of a species of clematis, which grows with great luxuriance in the forests.

It is a curious study to note the different characteristics of the human mind. An Oriental would turn with unspeakable disgust from the very touch of a pig, and is scarcely less fastidious concerning the dog. Yet the inhabitants of that wonderful group of islands which stretches from Asia to America have a wonderful affinity for both these animals, and especially for pigs, displaying, as we shall find on a future page, their affection in a manner that seems to our minds extremely ludicrous.

Pigs are now fast becoming acclimatized to the country, just like the mustang horses of America. When a tribe has suffered extinction, as too often happens in the sanguinary and ferocious wars in which the people engage, the pigs escape as well as they can; and those that evade the enemy have to shift for themselves, and soon resume all the habits of the wild swine from which they were originally descended. Those which now inhabit the country are easily to be distinguished from their immediate ancestors, having short heads and legs and round compact bodies.

The native name for the pig is "poaka," a word which some have thought to be derived from the English word "pork." Dr. Dieffenbach, however, differs from this theory, and thinks that the native word, although of European origin, is derived from a source common both to England and New Zealand.

He thinks that the New Zealanders had some knowledge of the pig previous to its introduction by England, and that they derived their knowledge from Spanish voyagers. He is strengthened in this opinion by the fact that the name for dog, "perro," is likewise Spanish.

Pigs and dogs are not the only pets, the natives being in the habit of catching the kaka parrot, which has already been mentioned, and keeping it tame about their houses. They make a very effective and picturesque perch for the bird, covering it with a sloping roof as a protection against the sun, and securing it to the perch by a string round its leg. Mr. Angas mentions that he has brought these birds to England, but that the climate did not agree with them, and they all died.

Many of the New Zealanders, especially the women, are dexterous ball-players, throwing four balls in various ways so as always to keep them in the air. Some few of them are so skilful that they surpass our best jugglers, playing with five balls at a time, and throwing them over the head, round the neck, and in various other ingenious modes of increasing the difficulty of the performance.

Most of their sports are accompanied with songs, which, indeed, seem to be suited to all phases of a New Zealander's life. In paddling canoes, for example, the best songster takes his stand in the head of a vessel and begins a song, the chorus of which is taken up by the crew, who paddle in exact time to the melody.

Respecting the general character of these songs Dieffenbach writes as follows: "Some songs are lyric, and are sung to a low, plaintive, uniform, but not at all disagreeable tune. . . . E' Waiata is a song of a joyful nature; E' Haka one accompanied by gestures of mimicry; E' Karakia is a prayer or an incantation used on certain occasions. In saying this prayer there is generally no modulation of the voice, but syllables are lengthened and shortened, and it produces the same effect as reading the Talmud in synagogues. Most of these songs live in the memory of all, but with numerous variations. Certain Karakia, or invocations, however, are less generally known, and a stranger obtains them with difficulty, as they are only handed down among the tohunga, or priests, from father to son.

"To adapt words to a certain tune, and thus to commemorate a passing event, is common in New Zealand, and has been the beginning of all national poetry. Many of these children of the moment have a long existence, and are transmitted through several generations; but their allusions become unintelligible, and foreign names, having undergone a thorough change, cannot be recognized."

All these songs are accompanied by gesticulations more or less violent and in that

which is known as E' Haka the bodily exertion is extreme. The singers sit down in a circle, throw off their upper mats, and sing in concert, accompanying the song with the wildest imaginable gestures, squinting and turning up their eyes so as to show nothing but the whites.

Of musical instruments they have but very vague and faint ideas. Even the drum, which is perhaps the instrument that has the widest range through the world, is unknown to the native New Zealander. Drums resound in all the islands of the Pacific, but the New Zealander never indulges himself in a drumming. The sole really musical instrument which he possesses is a sort of fife made out of human bone. Generally, the flute is formed from the thigh-bone of a slain enemy; and when this is the case, the Maori warrior prizes the instrument inordinately, and carries it suspended to the tiki which he wears slung on his breast.

There are certainly two noise-producing instruments, which have no right to be honored with the title of musical instruments. These are the war bell and the war trumpet.

The former is called the war bell in default of a better word. It consists of a block of hard wood about six feet long and two thick, with a deep groove in the centre. This "bell" is suspended horizontally by cords, and struck by a man who squats on a scaffold under it. With a stick made of heavy wood he delivers slow and regular strokes in the groove, the effect being to produce a most melancholy sound, dully booming in the stillness of the night. The war bell is never sounded by day, the object being to tell the people inside the pah, or village, that the sentinel is awake, and to tell any approaching enemy that it would be useless for him to attempt an attack by surprise. Its native name is Pahu.

The war trumpet is called Putara-putara. It is a most unwieldy instrument, at least seven feet in length. It is hollowed out of a suitably-shaped piece of hard wood, and an expanding mouth is given to it by means of several pieces of wood lashed together with flaxen fibre, and fitted to each other like the staves of a cask. Toward the mouth-piece it is covered with the grotesque carvings of which the New Zealanders are so fond. It is only used on occasions of alarm, when it is laid over the fence of the pah, and sounded by a strong-lunged native. The note which the trumpet produces is a loud roaring sound, which, as the natives aver, can be heard, on a calm night, the distance of several miles. In fact, the sound appears to be very much the same as that which is produced by the celebrated Blowing Stone of Wiltshire.

In some places a smaller trumpet is used in time of war. The body of this trumpet is always made of a large shell, generally that of a triton, and the mode of blowing it

differs according to the locality. The simplest kind of shell-trumpet is that which is in use throughout the whole of the Pacific Islands. It is made by taking a large empty shell, and boring a round hole on one side near the point. The shell is blown like a flute, being placed horizontally to the lips, and the air directed across the aperture. In fact, it exactly resembles in principle the horn and ivory trumpets of Africa, which are shown on a preceding page.

There is, however, in the British Museum a much more elaborate form of trumpet, which is blown with a mouth-piece. In this case the point of the shell has been removed and a wooden mouth-piece substituted for it, so that it is blown at the end, like trumpets in our own country.

The dances of the New Zealander are almost entirely connected with war and will therefore be mentioned when we come to treat of that subject.

The mode of salutation at parting and meeting is very curious, and to an European sufficiently ludicrous. When two persons meet who have not seen each other for some time, it is considered a necessary point of etiquette to go through the ceremony called *tangi*. The "g," by the way, is pronounced hard, as in the word "begin." They envelope themselves in their mats, covering even their faces, except one eye, squat on the ground, opposite each other, and begin to weep copiously. They seem to have tears at command, and they never fail to go through the whole of the ceremony as often as etiquette demands it. Having finished their cry, they approach each other, press their noses together for some time, uttering the while a series of short grunts! Etiquette is now satisfied and both parties become very cheerful and lively, chatting and laughing as if there had never been such a thing as a tear in existence.

Mr. Angas tells a ludicrous story of a *tangi* which he once witnessed. A woman was paddling a very small canoe, and fell in with the exploring party, who were in two large canoes. Seeing some friends on board of the large canoes, she ran her little vessel between them, and began a vigorous *tangi*.

Time being pressing, she could not stop to wrap herself up in the orthodox style, but burst into a flood of tears in the most approved fashion, and paddled and howled with equal vigor. Still crying, she put on board a basket of potatoes as a present, and received in return a fig of tobacco. The *tangi* being by this time complete, the old woman burst into a loud laugh, had a lively talk with her friends, turned her little canoe round, and paddled briskly out of sight.

In one instance this force of habit was rather ludicrously exemplified. The writer shall tell his own story.

"At Hopeton we met with a sister of

Karake, or Clark, the chief of Waikato Heads, whose portrait I had painted when at Auckland. This portrait I showed to the old woman, who had not seen her brother for some time, when, to my surprise and amusement, she at once commenced a most affectionate *tangi* before the sketch; waving her hands in the usual manner, and uttering successively low whining sounds expressive of her joy.

"After she had, as I imagined, satisfied herself with seeing the representation of her brother, I was about to replace the sketch in my portfolio, when she begged of Forsaith that she might be permitted to *tangi* over it in good earnest, saying, 'It was her brother—her brother; and she must *TANGI* till the tears come.' And sure enough, presently the tears did come, and the old woman wept and moaned, and waved her hands before the picture, with as much apparent feeling as if her brother himself had thus suddenly appeared to her. I could not prevail upon the old creature to desist, and was at length compelled to leave the portrait in Forsaith's care, whilst I was employed in sketching elsewhere. In future I shall be more cautious how I show my sketches to the old women, finding that they are liable to produce such melancholy results."

Mr. A. Christie, to whom I am indebted for much information about the country, told me an anecdote of a *tangi* performed in England by a party of Maories who had visited this country. They were about to bid farewell to one of their friends, and visited his house for that purpose, desiring to be allowed to perform the *tangi*.

Knowing their customs, their host took them into an empty room, previously cautioning his family not to be surprised at the ceremony. The whole party then sat down on the floor, and raised a most dismal howl, wailing, waving their hands, shedding floods of tears, and, in fact, enjoying themselves in their own queer way. The *tangi* being over, they all became lively and chatty, and finally took leave after the undemonstrative English fashion.

To a stranger the performance of the *tangi* is very amusing for the first few times of witnessing it; but he soon becomes tired of it, and at last looks upon it as an unmitigated nuisance, wasting time, and subjecting him to a series of doleful howls from which he has no mode of escape. Mr. Angas describes a *tangi* to which he was subjected.

"At sunset we reached a small fortified port, on the summit of a hill overlooking the lake. There were but few natives residing in it, to whom the sight of a pakeha (white man) was indeed astonishing; and, after the salutation of welcome, they commenced a *tangi* at my guides and myself.

"The man who introduced us uttered a

faint sound in his throat, like that of a person crying at a distance, and continued to look mournfully on the ground. The welcome of the men was voluble and loud: they howled dismally, and their tears fell fast for some time.

"Another female soon arrived, who, squatting on the ground, commenced a tangi with her friends, so loud and doleful—now muttering and anon howling like a hyena—that it made me feel quite dismal. There she sat, yelling horribly, to my great annoyance, but Maori etiquette compelled me to look grave and not to disturb her. There seemed to be no end to this woman's wallings of welcome. The night was cold, and she still continued to sit by the fire prolonging her lugubrious and discordant strains. Sometimes she would pitch a higher key, going upward with a scream, shaking her voice, and muttering between every howl; then it would be a squall with variations, like 'housetop cats on moonlight nights.'

"Then blowing her nose with her fingers, she made some remarks to the woman next her, and recommenced howling in the most systematic way. Once again she became furious; then, during an interval, she spoke about the pakeha, joined in a hearty laugh with all the rest, and at last, after one long continued howl, all was silent, to my great relief."

The manner in which the natives can produce such torrents of tears is really marvellous; and they exhibit such apparent agony of grief, acting the part to such perfection, that for some time a stranger can hardly believe that the profusely weeping natives are simply acting a conventional part.

In the illustration No. 2, on the 809th page, is shown the sort of scene which takes place at a pah when some of the inhabitants return after a long absence—a scene which would be very pathetic did it not trench upon the ludicrous.

When a party of strangers arrive at a pah, the preliminary part of the tangi, *i. e.* the sitting down and weeping, is omitted, another ceremony being substituted for it. The visitors are introduced into the interior of the pah, where a large space has been kept clear. The principal chief of the village then advances, clad as if for war, *i. e.* wearing nothing but his moko and plenty of scarlet paint, and bearing a spear in his hand. He brandishes and aims the spear as if he meant to pierce the chief of the opposite party, and then throws it toward, but not at, the stranger. The visitors then squat silently on the ground, according to Maori etiquette, and presently each stranger is faced by one of the receiving tribe, who goes through the ceremony of *ongi*, or pressing noses, which is the last part of the tangi. This lasts for some time, and, when it is com-

pleted, the provisions are brought out and a great feasting ensues.

As to the general character of the natives, it presents a curious mixture of wildness and ferocity, affection and fickleness, benevolence and vengefulness, hospitality and covetousness. The leading characteristic of the Maori mind is self-esteem, which sometimes takes the form of a lofty and even chivalrous pride, and at other times degenerates into childish vanity. It is this feeling which leads a New Zealander to kill himself rather than live to suffer disgrace, and which causes him to behave with the politeness for which the well-bred New Zealander is so conspicuous. Degenerating into vanity, it is easily wounded; and hence the accidentally hurt feelings of a Maori, added to the vengefulness which forms so large a portion of his nature, have occasioned long and desolating wars, in which whole tribes have been extinguished.

The temper of the Maories is, as is often the case with uncultivated natures, quick, tetchy, and, though pleasing enough as a general rule, is apt to change suddenly without the least provocation; a lively, agreeable person becoming suddenly dull, sullen, and ill-tempered. This fickleness of demeanor is very troublesome to Europeans, and, indeed, is sometimes assumed by the natives, for the purpose of seeing how much their white companion will endure. When they find that he meets them with firmness, they lay aside their unpleasant manner, and become quite gay and sociable.

Often, however, an European hurts their feelings quite unintentionally, through sheer ignorance of the minute code of etiquette which they observe. If, for example two Europeans meet and wish to discuss a subject, they stand still and have their talk, or perhaps they walk backward and forward. Two New Zealanders, on the contrary, would always sit down, as it is thought a mark of inattention to stand while addressed by another. Again, when a New Zealander enters a house, he makes his salutation and then squats down in silence for some time, the omission of this ceremony being looked upon as great a mark of ill-breeding as to go into a drawing-room with the hat on is considered among ourselves.

One curious trait of the Maori character is the inability to keep a secret. This curious disposition sometimes subjects the natives to very unpleasant consequences. Those, for example, who have adopted the laws of the white man, have discovered that there are many delinquencies which can be done with impunity, provided that they are committed in secret. But according to Dieffenbach, "with the art of keeping a secret the New Zealander is little acquainted. Although he possesses in many other respects great self-control, the secret must come out, even if his death should be the immediate consequence."

They have a strong and tenacious memory, easily acquiring knowledge, and retaining it with wonderful accuracy. The strength of their memory is well exemplified by the native converts to Christianity, who will repeat long passages of the Bible and many hymns with absolute exactness.

One of the most remarkable examples of this characteristic is afforded by an old chief named Horomana Marahau, who is popularly known as Blind Solomon. He has led a most exciting and varied life, having been engaged in war ever since he was a boy, and once actually taken prisoner by the ferocious chief E' Hongi, or Shongi, as he is generally called. He has captured many a pah, and assisted in eating many a slain enemy, and had he not escaped when he himself was made prisoner, he would have shared the same fate.

His last exploit was an attack on Poverty Bay where he and his followers took the pah, and killed and afterward ate six hundred of the enemy. Shortly after this feat he became blind, at Otawaho, where he first met with the missionary. In process of time he became a convert, and afterward labored as a teacher, displaying the same earnest energy which distinguished his military career, and, though an old man, undertaking long and toilsome journeys for the purpose of instructing his fellow-countrymen. Mr. Angas once heard him deliver a funeral oration over the body of a child, which he describes as one of the finest and most impassioned bursts of eloquence he ever heard.

Horomana was peculiarly suited for the office of instructor in consequence of his exceptionally retentive memory. He knows the whole of the Church Service by heart, together with many hymns and long passages of the Bible, and when he was examined in the Catechism, it was found that he knew every word correctly. This strength of memory, by the way, useful as it is when rightly employed, is sometimes abused by becoming an instrument of revenge, a Maori never forgetting an insult, whether real or imaginary, nor the face of the person by whom he was insulted.

The curiosity of the people is insatiable, and they always want to hear all about everything they see. This spirit of curiosity has naturally led them to take the greatest interest in the various arts and sciences possessed by the white man, and in order to gratify it they will often hire themselves as sailors in European ships. Accustomed to the water all their lives, and being admirable canoe men, they make excellent sailors, and soon learn to manage boats after the European fashion, which differs essentially from their own. Some of them penetrate into the higher mysteries of navigation, and in 1843 a New Zealander was captain of a whaler.

They take quite as much interest in the familiar objects of their own country as in those which are brought to them by foreigners. They have names for all their animal, vegetable, and even mineral productions, pointing out and remarking upon any peculiarities which may be found in them.

CHAPTER LXXXII.

NEW ZEALAND—*Continued.*

FOOD AND COOKERY.

HOSPITALITY OF THE NEW ZEALANDERS—EFFECTS OF CIVILIZATION—THE CHURLISH HOSTS AND THEIR REWARD—A NEW ZEALAND FEAST—THE WALL OF PROVISIONS—FOOD-BASKETS—THE KUMARA OR SWEET POTATO—WASHING AND COOKING VEGETABLES—THE CABBAGE PALM AND FERN ROOT—A NATIVE LEGEND—THE PAWA SHELL—THE MUSSEL AND OYSTER—FISHING—THE NET, THE TRAP, THE HOOK, AND THE SPEAR—BIRD-CATCHING—CAPTURING THE KIWI-KIWI AND PARROT—PIG-CATCHING AND COOKING—CANNIBALISM, ITS SIGNIFICATION AND EXTENT—EATING HUMAN FLESH A SUPERSTITIOUS CUSTOM—ANECDOTES OF CANNIBALISM.

THE New Zealanders are the most hospitable and generous of people; a stranger, whether native or European, is welcomed into the villages, is furnished with shelter, and provided at once with food. Should the visitor be a relative, or even an intimate friend, they hold all their property in common, and will divide with him everything that they possess. Even if a Maori has earned by long labor some article of property which he was very anxious to possess, he will give it to a relation or friend who meets him after a long separation.

This generosity of disposition has unfortunately been much checked by contact with the white man, and those natives who have much to do with the white settlers have lost much of their politeness as well as their hospitality. Instead of welcoming the traveller, housing him in their best hut, providing him with their choicest food, and tending him as if he were a near relation, they have become covetous and suspicious, and instead of offering aid gratuitously will sometimes refuse it altogether, and at the best demand a high rate of payment for their assistance.

The native converts to Christianity have deteriorated greatly in this respect through the misjudged zeal of the missionaries, who have taught their pupils to refuse food and shelter to, or to perform any kind of work for, a traveller who happens to arrive at their houses on a Sunday—a circum-

stance which must continually occur in a country where the travellers are entirely dependent on the natives. Dr. Dieffenbach, who always speaks in the highest terms of the zeal and self-denial of the missionaries, writes as follows on this subject: "Highly as I appreciate the merits of the missionaries, I must say that they have omitted to teach their converts some most important social, and therefore moral, duties, which they will only acquire by a more intimate intercourse with civilized Europeans.

"In their native state they are as laborious as their wants require; but, easily satisfying those, and incapable even by their utmost exertions to compete with the lowest of Europeans, they get lazy and indolent, prefer begging to working, and pass a great part of their time in showing their acquired fineries and in contemplating the restless doings of the colonist. As servants they are very independent, and Europeans will do well, if they want any native *helpers*, to treat them with attention, and rather as belonging to the family than as servants. They have this feeling of independence very strongly, and it is very creditable to them.

"There is every reason to believe that in a short time the character of the New Zealanders will be entirely changed, and any one who wishes to see what they were formerly must study them in the interior,

where they are still little influenced by intercourse with us, which I must repeat, has been little advantageous to them."

The same writer relates an amusing anecdote respecting the ancient custom of hospitality. He had been travelling for some distance with scarcely any provisions, and came upon a tribe which churlishly refused hospitality to the party, and would not even furnish a guide to show them their way. One of them condescended to sell a small basket of potatoes in exchange for some needles, but nothing more could be obtained, and, after spending a day in vain, the party had to pack up and resume their march.

After they had left the pah, they came suddenly across a family of pigs. One of the native attendants immediately killed a large sow, and in a few minutes the animal was cut up and the pieces distributed. Not liking to take food without paying for it, Dr. Dieffenbach hung the offal of the pig on a bush, together with an old pair of trousers and an iron kettle. His attendants, however, went back and took them away, saying that it was the custom of the country that a stranger should be supplied with food, and that, if it were not given to him, he had a right to take it when, where, and how he could. They were very much amused at the whole proceeding, and made many jokes on the disappointment of the churlish people who refused to sell a pig at a good price, and then found that it had been taken for nothing.

Hospitality being such a universal and imperative characteristic of the aboriginal Maori, it may be imagined that when a chief gives a feast he does so with a liberal hand. Indeed, some of these banquets are on so enormous a scale, that a whole district is ransacked to furnish sufficient provisions, and the inhabitants have in consequence to live in a state of semi-starvation for many months. Mr. Angas mentions that, when he visited the celebrated chief Te Whero-Whero, he saw more than a thousand men planting sweet potatoes in order to furnish provisions for a feast that the chief intended to give to all the Waikato tribes in the following spring.

These feasts are continued as long as any food is left, and a very liberal chief will sometimes get together so enormous a supply of provisions that the banquet lasts for several weeks. Songs and dances, especially the war dance, are performed at intervals throughout the time of feasting.

The first illustration on the 831st page gives a good idea of the preliminaries which are observed before the celebration of an ordinary feast, such as would be given by a well-to-do Rangatira. A sort of scaffold is erected, on the bars of which are hung large supplies of fish, mostly dried shark, together with pieces of pork, and

similar luxuries. The upper part of the scaffold is formed into a flat stage, on which are placed large baskets full of sweet potatoes and common potatoes. The guests range themselves in a circle round the scaffold, and the chief who gives the feast makes a speech to them, brandishing his staff of office, running up and down the open space, leaping in the air, and working himself up by gestures to an extraordinary pitch of excitement.

One of my friends was distinguished by having a feast given in his honor, and described the ceremony in a very amusing manner. The generous founder of the feast had built a sort of wall, the contents of which were potatoes, sweet potatoes, pigs, and fish. By way of ornament, he had fixed a number of sticks into the wall, like so many flagstaves, and to the top of each he had fastened a living eel by way of a flag or streamer, its contortions giving, according to his ideas, a spirit to the whole proceedings.

He then marched quickly backward and forward between the wall of provisions and his guests, who were all seated on the ground, and as he marched uttered a few broken sentences. By degrees his walk became quicker and quicker, and changed into a run, diversified with much leaping into the air, brandishing of imaginary weapons, and utterance of loud yells. At last he worked himself up into a pitch of almost savage fury, and then, suddenly squatted down silently, and made way for another orator.

The waste which takes place at such a feast, which is called in the native language *hui*, is necessarily very great. In one such party mentioned by Mr. Angas, the donor arranged the provisions and presents for his guests in the form of a wall, which was five feet high, as many wide, *more than a mile in length*, and supplied for many days thousands of natives who came to the feast from very great distances. The great chiefs take great pleasure in rivalling each other in their expenditure, and it was for the purpose of building a still larger food wall that Te Whero-Whero was so busily setting his men to work in planting the kumeras, or sweet potatoes.

Considerable variety is shown in the manner of presenting the food to the guests. Generally it is intended to be eaten on the spot, but sometimes it is meant to be given away to the people, to be consumed when and where they like. In such a case either the scaffold or the wall is used. The scaffold is sometimes fifty or sixty feet high, and divided into a number of stories, each of which is loaded with food. If the wall be employed, it is separated into a number of divisions. In either case, when the guests are seated, a chief who acts as the master of the ceremonies marches about and makes a

speech, after the fashion of his country; and, after having delivered his oration, he points out to each tribe the portion which is intended for it. The chief man of each tribe takes possession of the gift, and afterward subdivides it among his followers.

It is rather remarkable that the baskets in which the provisions are served are made for the express purpose, and, having fulfilled their office, are thrown aside and never used again. Should a chief take one of these baskets and begin to eat from it, not only the basket but any food which he may leave in it is thrown away, no chief ever eating after any one, or allowing any one to eat after him.

So when a chief takes his basket of food, he withdraws himself from the rest of the company and consumes his food, so that no one shall be incommoded by his rank. Ordinary people, even the Rangatiras, are not nearly so fastidious, one basket of food sufficing several of them, three or four being the usual number for a basket. Each of these baskets contains a complete meal, and is usually supplied with plenty of potatoes and kumeras, some fish, and a piece of pork. The meat is passed from one to another, each taking a bite, or tearing off a portion; and when they have finished, they wipe their hands on the backs of the dogs which are sure to thrust themselves among the revelers.

These feasts naturally lead us to the various kinds of food used by the New Zealanders, and their modes of procuring and preparing them.

We will begin with the plant which is the very staff of life to the New Zealander, namely, the kumera, or sweet potato, as it is popularly though erroneously called. This plant is largely cultivated by the Maories, who are very careful in selecting a proper soil for it. The best ground for the kumera is that which has been thickly wooded, and is cleared for the purpose. The natives take but little trouble about preparing the land, merely cutting down the trees and burning the brushwood, but never attempting to root up the stumps.

The ground is torn up rather than dug by a simple instrument, which is nothing more than a sharpened pole with a cross-piece fastened to it, on which the foot can rest. As the New Zealanders do not wear shoes, they cannot use an iron spade as we do; and it may easily be imagined that the unprotected foot of the Maori would suffer terribly in performing a task which, even among our stoutly-shod laborers, forces them to wear a plate of iron on the sole of the boot.

The *kaheru*, as this tool is called, is more effective than an iron spade could be, in consequence of the peculiar character of the soil, which is thickly interlaced with the roots of ferns, brushwood, and shrubs. A few of these curious spades are tipped with

a piece of green jade, and are then highly valued by the natives. Such a tool is called E Toki. The Maories have also a kind of hoe which is very useful in some soils.

The kumeras are planted in regular rows, and the greatest care is taken to keep the field clear of weeds. The dark agriculturists even remove every caterpillar that is seen upon the plants; and altogether such elaborate care is taken that the best managed field in Europe cannot surpass, and very few even equal, a piece of land cultivated by the New Zealander.

Each family has its own peculiar field, the produce of which is presumed to belong to the family. But a great portion of the labor performed in it may be done by poor men who have no land of their own. In such a case, they acquire, in virtue of their labor, a legal right over the fruits of the land which they have helped to till. Sometimes the head or chief of a tribe, considering himself as the father of the family, institutes a general sale, and distributes the proceeds according to the amount of material or labor which each has contributed.

Before the potatoes are cooked, they are carefully washed in a simple and very effective manner. A woman puts them into a basket with two handles, popularly called a "kit," wades into a running stream, puts one foot into the basket, takes hold of the handles, and rocks the basket violently backward and forward, while with her foot she continually stirs up and rubs the potatoes. In this manner the earth is washed away from the vegetables, and is carried off by the stream through the interstices of the basket.

At the present day, the kumera, although very highly valued, and used at every important feast, has been rivalled, if not superseded, by the common potato which can be raised with less trouble and cooked more easily. Both the kumera and potato are cooked in a sort of oven, made by heating stones, and much resembling the cooking-place of the Australians. No cooking is allowed to take place in the house, the act of preparing food being looked upon as a desecration of any building. Through ignorance of this curious superstition, Europeans have frequently brought upon themselves the anger of the natives by eating, and even cooking, food within a house which is looked upon as sacred.

In consequence of this notion, the oven is either constructed in the open air, or at best in a special house called *Te-kauta*, which is made of logs piled loosely upon each other, so as to permit the smoke to escape.

The bud, or "cabbage," of the *nikau*-palm, a species of *Areca*, is highly prized by the Maories, who fell every tree which they think likely to produce a young and tender bud. This vegetable is sometimes eaten raw, and sometimes cooked in the same

mode as the potato. Fortunately, the tree is not wasted by being cut down, as its leaves are used for many purposes, such as making temporary sheds when travellers are benighted in the forest, thatching houses, and similar uses. Still, the destruction of this useful and graceful palm is very great, and there is reason to fear that the improvident natives will wholly extirpate it, unless means be taken to preserve it by force of law.

The Maories have one curious plan of preparing food, which seems to have been invented for the purpose of making it as disgusting as possible. They take the kumera, the potato, or the maize, and steep it in fresh water for several weeks, until it is quite putrid. It is then made into cakes, and eaten with the greatest zest. To an European nothing can be more offensive, and the very smell of it, not to mention the flavor, is so utterly disgusting that even a starving man can hardly manage to eat it. The odor is so powerful, so rancid, and so penetrating, that when Europeans have been sitting inside a house and a man has been sitting in the open air eating this putrid bread, they have been forced to send him away from the vicinity of the door. By degrees travellers become more accustomed to it, but at first the effect is inexpressibly disgusting; and when it is cooked, the odor is enough to drive every European out of the village.

In former days the fern-root (*Pteris esculenta*) was largely eaten by the natives, but the potatoes and maize have so completely superseded it that fern root is very seldom eaten, except on occasions when nothing else can be obtained. When the fern root is cooked, it is cut into pieces about a foot long, and then roasted. After it is sufficiently cooked, it is scraped clean with a shell. The flavor of this root is not prepossessing, having an unpleasant mixture of the earthy and the medicinal about it.

About December another kind of food comes into season. This is the pulpos stem of one of the tree-ferns which are so plentiful in New Zealand (*Cyathea medullaris*). It requires long cooking, and is generally placed in the oven in the evening, and eaten in the morning.

With regard to the vegetables used in New Zealand, Dr. Dieffenbach has the following remarks. After mentioning the native idea that they were conquerors of New Zealand, and brought with them the dog and the taro plant (*Arum esculentum*), he proceeds as follows:—"A change took place in their food by the introduction of the sweet potato or kumera (*Convolvulus batata*)—an introduction which is gratefully remembered and recorded in many of their songs, and has given rise to certain religious observances.

"It may be asked, What was the period

when the poor natives received the gift of this wholesome food, and who was their benefactor? On the first point they know nothing; their recollection attaches itself to events, but not to time. The name, however, of the donor lives in their memory. It is E' Pau, or Ko Pau, the wife of E'Tiki, who brought the first seeds from the island of Tawai. E'Tiki was a native of the island of Tawai, which is not that whence, according to tradition, the ancestors of the New Zealanders had come. He came to New Zealand with his wife, whether in less frail vessels than they possess at present, and whether purposely or driven there by accident, tradition is silent.

"He was well received, but soon perceived that food was more scanty here than in the happy isle whence he came. He wished to confer a benefit upon his hosts, but knew not how to do it, until his wife, E' Pau, offered to go back and fetch kumera, that the people who had received them kindly might not suffer want any longer. This she accomplished, and returned in safety to the shores of New Zealand.

"What a tale of heroism may lie hidden under this simple tradition! Is it a tale connected with the Polynesian race itself? or does it not rather refer to the arrival in New Zealand of the early Spanish navigators, who may have brought this valuable product from the island of Tawai, one of the Sandwich Islands, where the plant is still most extensively cultivated? There can be scarcely any doubt but that New Zealand was visited by some people antecedent to Tasman. Kaipuke is the name of a ship in New Zealand—*buque* is a Spanish word—Kai means to eat, or live. No other Polynesian nation has this word to designate a ship. Pero (dog) and poaca (pig) are also Spanish. Tawai, whence E' Pau brought the kumera, is situated to the east of New Zealand according to tradition, and the first discoverers in the great ocean, Alvaro Mendana (1595), Quiros (1608), Lemaire, and others, arrived from the eastward, as they did at Tahiti, according to the tradition of the inhabitants. Tasman did not come to New Zealand until 1642."

However this may be, the fields of kumera are strictly "tapu," and any theft from them is severely punished. The women who are engaged in their cultivation are also tapu. They must pray together with the priests for the increase of the harvest. These women are never allowed to join in the cannibal feasts, and it is only after the kumera is dug up that they are released from the strict observance of the tapu. They believe that kumera is the food consumed in the "reinga," the dwelling-place of the departed spirits; and it is certainly the food most esteemed among the living.

They have several ways of preparing the

sweet potato. It is either simply boiled, or dried slowly in a "hangi," when it has the taste of dates, or ground into powder and baked into cakes. The kumera, like most importations, is rather a delicate vegetable, and while it is young it is sheltered by fences made of brushwood, which are set up on the windward side of the plantation when bad weather is apprehended. Great stacks of dried brushwood are seen in all well-managed kumera gardens, ready to be used when wanted. So great is the veneration of the natives for the kumera, that the storehouses wherein it is kept are usually decorated in a superior style to the dwelling of the person who owns them.

In illustration No. 2, on the next page, several of these elaborate storehouses are shown. They are always supported on posts in such a way that the rats cannot get among the contents, and in some instances they are set at the top of poles fifteen or twenty feet high, which are climbed by means of notches in them. These, however, are almost without ornamentation, whereas those which belong specially to the chief are comparatively low, and in some cases every inch of them is covered with graceful or grotesque patterns, in which the human face always predominates.

Some of these curious storehouses are not rectangular, but cylindrical, the cylinder lying horizontally, with the door at the end, and being covered with a pointed roof. Even the very posts on which the storehouses stand are carved into the rude semblance of the human form.

The Maories also say that the calabash, or *hue*, is of comparatively late introduction, the seeds having been obtained from a calabash which was carried by a whale and thrown on their shores.

A very curious article of vegetable food is the cowdie gum, which issues from a species of pine. This gum exudes in great quantities from the feres, and is found in large masses adhering to the trunk, and also in detached pieces on the ground. It is a clear, yellowish resin; and it is imported into England, where it is converted into varnish. The flavor of the cowdie gum is powerfully aromatic, and the natives of the northern island chew it just as sailors chew tobacco. They think so much of this gum, that when a stranger comes to visit them, the highest compliment that can be paid to him is for the host to take a partially chewed piece of gum from his mouth, and offer it to the visitor.

The New Zealanders eat great quantities of the pawa, a species of *Haliotis*, from which they procure the pearly shell with which they are so fond of inlaying their carvings, especially the eyes of the human figures. Shells belonging to this group are well known in the Channel Islands under the name of Ormer shells, and the molluscs

are favorite articles of diet. Those which are found in New Zealand are very much larger than the species of the Channel Islands, and the inhabitants are tough and, to European taste, very unpalatable. Great quantities are, however, gathered for food. The putrid potato cakes are generally eaten with the pawa; and the two together form a banquet which an Englishman could hardly prevail on himself to taste, even though he were dying of hunger.

Mussels, too, are largely used for food; and the natives have a way of opening and taking out the inmate which I have often practised. If the bases of two mussels be placed together so that the projections interlock, and a sharp twist be given in opposite directions, the weaker of the two gives way, and the shell is opened. Either shell makes an admirable knife, and scrapes the mollusc out of its home even better than a regular oyster-knife.

Oysters, especially the Cockscomb oyster (*Ostræa cristata*), are very plentiful in many parts of the coast, and afford an unfailing supply of food to the natives. They are mostly gathered by women, who are in some places able to obtain them by waiting until low water, and at other places are forced to dive at all states of the tide.

Fish form a large portion of New Zealand diet; and one of their favorite dishes is shark's flesh dried and nearly putrescent. In this state it exhales an odor which is only less horrible than that of the putrid cakes. Mr. Angas mentions one instance where he was greatly inconvenienced by the fondness of the natives for these offensive articles of diet. He was travelling through the country with some native guides, and on arriving at a pah had procured for breakfast some remarkably fine kumeras. The natives immediately set to work at cooking the kumeras, among which they introduced a quantity of semi-putrid shark's flesh. This was not the worst of the business, for they next wove some of the phormium baskets which have already been described, filled them with the newly-cooked provisions, and carried them until the evening repast, giving the traveller the benefit of the horrible odor for the rest of the day.

Fish are either taken with the net, the weir, or the hook. The net presents nothing remarkable, and is used as are nets all over the world, the natives weighting them at the bottom, floating them at the top, shooting them in moderately shallow water, and then beating the water with poles in order to frighten the fish into the meshes.

Traps, called pukoro-tuna, are made of funnel-shaped baskets, just like the eel-traps of our own country; but the most ingenious device is the weir, which is built quite across the river, and supported by poles for many yards along its side. Often, when the net or the weir is used, the fish taken are

(1.) PREPARING FOR A FEAST. (See page 827.)

(2.) CHIEFS' STOREHOUSES. (See page 830.)

considered as belonging to the community in general, and are divided equally by the chief.

Sometimes a singularly ingenious net is used, which has neither float nor sinkers. This net is about four feet wide, thirty or forty feet in length, and is tied at each end to a stout stick. Ropes are lashed to the stick, and the net is then taken out to sea in a canoe. When they have arrived at a convenient spot, the natives throw the net over the side of the canoe, holding the ropes at either end of the boat, so that the net forms a large semicircle in the water as the boat drifts along. In fact it is managed much as an English fisherman manages his dredge.

In the middle of the canoe is posted a man, who bears in his hand a very long and light pole, having a tuft of feathers tied to one end of it. With the tufted end he beats and stirs the water, thus driving into the meshes of the net all the small fishes within the curve of the net. Those who hold the ropes can tell by the strain upon the cords whether there are enough fish in the net to make a haul advisable, and when that is the case, the net is brought to the side of the canoe, emptied, and again shot.

Spearing fish is sometimes, but not very largely, employed. The hooks employed by the New Zealanders present a curious mixture of simplicity and ingenuity. It really seems strange that any fish should be stupid enough to take such an object in its mouth. There is, however, one which is a singularly admirable contrivance. The body of the hook is made of wood, curved, and rather hollowed on the inside. The hook itself is bone, and is always made from the bone of a slain enemy, so that it is valued as a trophy, as well as a means of catching fish. This bone is fastened to the rest of the hook by a very ingenious lashing; and, in some instances, even the bone is in two pieces, which are firmly lashed together. In consonance with the warlike character of the natives, who seem to be as ready to offer an insult to other tribes as to take offence themselves, the use of the enemy's bone is intended as an insult and a defiance to a hostile tribe.

The body of the hook is lined with the pawa shell, and to the bottom of it is attached a tuft of fibres. This hook is remarkable for requiring no bait. It is towed astern of the canoe, and when pulled swiftly through the water it revolves rapidly, the pearly lining flashing in the light like the white belly of fish, and the tuft of fibres representing the tail. Consequently, the predatorial fish take it for the creature which it represents, dash at it as it flashes by them, and are hooked before they discover their mistake. If any of my readers should happen to be anglers, they will see that this hook of the New Zealander

is exactly similar in principle with the "spoon-bait" which is so efficacious in practised hands. One of these hooks in my collection is quite a model of form, the curves being peculiarly graceful, and the effect being as artistic as if the maker had been a professor in the school of design. The length of my hook is rather more than four inches: and this is about the average size of these implements. The string by which it is held is fastened to the hook in a very ingenious manner; and indeed it scarcely seems possible that so apparently slight a lashing could hold firmly enough to baffle the struggles of a fish large enough to swallow a hook more than four inches in length, and three-quarters of an inch in width. Some of these hooks are furnished with a feather of the apteryx, which serves the purpose of an artificial fly.

Both salt and fresh water crayfish are taken in large quantities. The latter, which are very large, are almost invariably captured by the women, who have to dive for them, and the former are taken in traps baited with flesh, much like our own lobster-pots. Birds are almost always caught by calling them with the voice, or by using a decoy bird. The apteryx, or kiwi-kiwi, is taken by the first of these methods. It is of nocturnal habits, and is seldom seen, never venturing out of its haunts by day. It is very thinly scattered, living in pairs, and each pair inhabiting a tolerably large district. At night it creeps out of its dark resting-place among the ferns, where it has been sleeping throughout the day, and sets off in search of worms, grubs, and other creatures, which it scratches out of the ground with its powerful feet. During the night it occasionally utters its shrill cry; that of the male being somewhat like the words "hoire, hoire, hoire," and that of the female like "ho, ho, ho."

When the natives wish to catch the apteryx, they go to the district where the bird lives, and imitate its cry. As soon as it shows itself, it is seized by a dog which the hunter has with him, and which is trained for the purpose. As the bird is a very strong one, there is generally a fight between itself and the dog, in which the powerful legs and sharp claws of the bird are used with great effect. Sometimes the hunter has ready a torch made of the cowdie resin, and by lighting it as soon as the kiwi-kiwi comes in sight he blinds the bird so effectually by the unwonted light that it is quite bewildered, does not know in what direction to run, and allows itself to be taken alive.

At some seasons of the year the bird is very fat, and its flesh is said to be well flavored. In former days, when it was plentiful, it was much used for food, but at the present time it is too scarce to hold any real place among the food-producing animals of New Zealand, its wingless state rendering it an easy prey to those who know its habits. The skin is

very tough, and, when dressed, was used in the manufacture of mantles.

The parrots are caught by means of a decoy bird. The fowler takes with him a parrot which he has taught to call its companions, and conceals himself under a shelter made of branches. From the shelter a long rod reaches to the branches of a neighboring tree, and when the bird calls, its companions are attracted by its cries, fly to the tree, and then walk down the rod in parrot fashion, and are captured by the man in the cover.

Formerly the native dog used to be much eaten; but as the species has almost entirely been transformed by admixture with the various breeds of English dogs, its use, as an article of food, has been abandoned. Pigs are almost the only mammalia that are now eaten; but they are not considered as forming an article of ordinary diet, being reserved for festive occasions. The pork of New Zealand pigs is said to surpass that of their European congeners, and to bear some resemblance to veal. This superiority of flavor is caused by their constantly feeding on the fern roots. In color they are mostly black, and, although tame and quiet enough with their owners, are terribly frightened when they see a white man, erect their bristles and dash off into the bush.

We now come to the question of cannibalism, a custom which seems to have resisted civilization longer in New Zealand than in any other part of the world. In some places cannibalism is an exception; here, as among the Neam-Nam of Africa, it is a rule. An illustration on the next page represents a cannibal cooking-house, that was erected by a celebrated Maori chief, in the Waitahanui Pah. This was once a celebrated fort, and was originally erected in order to defend the inhabitants of Te Rapa from the attacks of the Waikato tribes. Both these and their enemies having, as a rule, embraced Christianity, and laid aside their feuds, the pah has long been deserted, and will probably fall into decay before many years have passed. Mr. Angas, description of this pah is an exceedingly interesting one.

"Waitahanui Pah stands on a neck of low swampy land jutting into the lake, and a broad, deep river, forming a delta called the Tongariro, and by some the Waikato (as that river runs out again at the other end of Tampo Lake), empties itself near the pah. The long façade of the pah presents an imposing appearance when viewed from the lake; a line of fortifications, composed of upright poles and stakes, extending for at least half a mile in a direction parallel to the water. On the top of many of the posts are carved figures, much larger than life, of men in the act of defiance, and in the most savage posture, having enormous protruding tongues; and, like all the Maori carvings, these images, or waikapokos, are colored with kōkōwai, or red ochre.

"The entire pah is now in ruins, and has been made tapu by Te Heuheu since its desertion. Here, then, all was forbidden ground; but I eluded the suspicions of our natives, and rambled about all day amongst the decaying memorials of the past, making drawings of the most striking and peculiar objects within the pah. The cook houses, where the father of Te Heuheu had his original establishment, remained in a perfect state; the only entrance to these buildings was a series of circular apertures, in and out of which the slaves engaged in preparing the food were obliged to crawl.

"Near to the cook houses there stood a carved patuka, which was the receptacle of the sacred food of the chief; and nothing could exceed the richness of the elaborate carving that adorned this storehouse. I made a careful drawing of it, as the frail material was falling to decay. Ruined houses—many of them once beautifully ornamented and richly carved—numerous *waki-tapu*, and other heathen remains with images and carved posts, occur in various portions of this extensive pah; but in other places the hand of Time has so effectually destroyed the buildings as to leave them but an unintelligible mass of ruins. The situation of this pah is admirably adapted for the security of its inmates: it commands the lake on the one side, and the other fronts the extensive marshes of Tukanu, where a strong palisade and a deep moat afford protection against any sudden attack. Water is conveyed into the pah through a sluice or canal for the supply of the besieged in times of war.

"There was an air of solitude and gloomy desolation about the whole pah, that was heightened by the screams of the plover and the tern, as they uttered their mournful cry through the deserted courts. I rambled over the scenes of many savage deeds. Ovens, where human flesh had been cooked in heaps, still remained, with the stones used for heating them lying scattered around, blackened by fire; and here and there a dry skull lay bleaching in the sun and wind, a grim memorial of the past."

The chief reason for the persistent survival of cannibalism is to be found in the light in which the natives regard the act. As far as can be ascertained, the Maories do not eat their fellow-men simply because they have any especial liking for human flesh, although, as might be expected, there are still to be found some men who have contracted a strong taste for the flesh of man. The real reason for the custom is based on the superstitious notion that any one who eats the flesh of another becomes endowed with all the best qualities of the slain person. For this reason, a chief will often content himself with the left eye of an adversary, that portion of the body being considered as the seat of the

(1.) CANNIBAL COOK HOUSE. (See page 834.)

(2.) MAORI PAH. (See page 846.)

soul. A similar idea prevails regarding the blood.

When the dead bodies of enemies are brought into the villages, much ceremony attends the cooking and eating of them. They are considered as tapu, or prohibited, until the tohunga, or priest, has done his part. This consists in cutting off part of the flesh, and hanging it up on a tree or a tall stick, as an offering to the deities, accompanying his proceedings with certain mystic prayers and invocations.

Most women are forbidden to eat human flesh, and so are some men and all young children. When the latter reach a certain age, they are permitted to become eaters of human flesh, and are inducted into their new privileges by the singing of chants and songs, the meaning of which none of the initiates understand, and which, it is probable, are equally a mystery to the priest himself who chants them.

The palms of the hands and the breast are supposed to be the best parts; and some of the elder warriors, when they have overcome their reluctance to talk on a subject which they know will shock their interlocutors, speak in quite enthusiastic terms of human flesh as an article of food.

That cannibalism is a custom which depends on warfare is evident from many sources. In war, as we shall presently see, the New Zealander can hardly be recognized as the same being in a state of peace. His whole soul is filled with but one idea—that of vengeance; and it is the spirit of revenge, and not the mere vulgar instinct of gluttony, that induces him to eat the bodies of his fellow-men. A New Zealander would not dream of eating the body of a man who had died a natural death, and nothing could be further from his thoughts than the deliberate and systematic cannibalism which disgraces several of the African tribes.

How completely this spirit of vengeance enters into the very soul of the Maories can be inferred from a short anecdote of a battle. There is a small island in the Bay of Plenty called Tuhua, or Mayor's Island, the inhabitants of which, about two hundred in number, had erected a strong pah, or fort, in order to defend themselves from the attacks of tribes who lived on the main-

land, and wanted to capture this very convenient little island. The fort was built on a very steep part of the island, craggy, precipitous, and chiefly made up of lava.

After making several unsuccessful attacks, the enemy at last made an onslaught in the night, hoping to take the people off their guard. The inmates were, however, awake and prepared for resistance; and as soon as the enemy attacked the pah, the defenders retaliated on them by allowing them to come partly up the hill on which the pah stands, and then rolling great stones upon them. Very many of the assailants were killed, and the rest retreated.

Next morning the successful defenders related this tale to a missionary, and showed the spot where so sanguinary an encounter had taken place. The missionary, finding that all the stones and rocks were perfectly clean, and betrayed no traces of the bloody struggle which had taken place only a few hours previously, asked to be shown the marks of the blood. His guide at once answered that the women had licked it off. It has sometimes been stated that the Maories will kill their slaves in order to furnish a banquet for themselves; but such statements are altogether false.

Cannibalism is at the present day nearly, though not quite, extinct. Chiefly by the efforts of the missionaries, it has been greatly reduced; and even in cases where it does take place the natives are chary of speaking about it. In wars that took place some forty years ago, we learn that several hundred warriors were slain, and their bodies eaten by their victors. In comparatively recent times twenty or thirty bodies have been brought into the pah and eaten, while at the present day many a native has never seen an act of cannibalism. This strange and ghastly custom is, however, so dear to the Maori mind that one of the chief obstacles to the conversion of the natives to Christianity is to be found in the fact that the Christian natives are obliged to abjure the use of human flesh. Still, the national instinct of vengeance is rather repressed than extirpated, and there are many well-known occasions when it has burst through all its bonds, and the savage nature of the Maori has for a time gained ascendancy over him.

CHAPTER LXXXIII.

WAR.

THE MODE OF WARFARE DEPENDENT ON WEAPONS—THE SPEAR, NOW EXTINGUISHED—THE MERAI, AND THE MATERIALS OF WHICH IT IS MADE—THE GREEN JADE MERAI, AND ESTIMATION IN WHICH IT IS HELD BY THE CHIEFS—THE STONE MERAI—THE BONE MERAI, AND ITS VARIED SHAPES—MODE OF USING THE WEAPON—CAPTURE OF SHIPS—AN EXCITING SCENE AND TIMELY RELIEF—THE BATTLE-AXE, OR PATU—ITS FORM, AND MODE OF USING IT—THE CHIEF'S SPEAR, OR HANI—ITS RESEMBLANCE TO THE ANCIENT SCEPTRE—THE TONGUE OF DEFLANCE—THE WAR DANCE—ITS EFFECT ON BOARD SHIP—THE FORT, OR PAH, AND ITS CONSTRUCTION—NATIVE ENGINEERING—THE REPULSE AT THE GATE PAH—CONCEALING AN AMBUSH—FATE OF CAPTIVES—THE CHIEF E'HONGI AND HIS BATTLES—SLAVE-DRIVING WITH A MERAI—ETIQUETTE OF WAR—A TRUCE AND A BARTER—RETALIATION FOR BLOODSHED—CELEBRATIONS BEFORE AND AFTER A BATTLE.

WE now come to the one great object of a Maori's life, namely, war. Before we treat of actual warfare, it will be necessary to describe the weapons which are used, as much of the character of warfare materially depends on them.

In those parts of the world, for instance, where missiles, such as bows and arrows or spears, are the principal weapons, war becomes a series of skirmishes, each individual trying to conceal himself as much as possible from the enemy, and to deal his own blows without exposing himself to retaliation. But when the weapons are of a nature that necessitates hand-to-hand combat, warfare naturally assumes a different aspect, and, if the forces be at all disciplined, more resembles the regulated war of civilized nations than the independent single combats which represent war in most savage countries.

To this latter category belong the weapons of the New Zealander. In former days the Maori warriors used to employ the spear, but that weapon has long been laid aside. A few specimens are still retained, but they are intended, not to be used against an enemy, but in welcoming a friend, the chief who receives his guests pointing the spear at them, and throwing it toward them, as has already been described. When Mr. Angas visited the islands, he found only a very few of these spears, and they were used entirely for peaceful purposes. They were of the same character as those of the great

Polynesian group, *i. e.* made entirely of wood, long, sharply pointed, and armed with a series of barbs.

One of these spears is shown at figure 1, of "Maori weapons," on page 841. The reader will understand that only the head of the spear is shown, the entire length of the weapon being about twelve feet. The barbs are seen to be arranged in double order, a number of them pointing backward; and then, after a blank space, several rows pointing forward. The object of this device was ingenious enough. The spear was supposed to be pushed through the body of a man until it was stopped by the second row of barbs. It will be seen that his body would then rest in the blank space, and the barbs on either side of him would prevent it from being drawn out or pushed through, so that a wound from the weapon was necessarily mortal. A spear made on the same principle, and employed by the Bechuanas, is shown on page 281.

The weapons used by the Maories are very few in number, and of the simplest possible construction. It is extraordinary, by the way, what misconceptions exist on this subject. With the generality of persons almost every club, axe, or spear is set down as belonging to New Zealand, especially if it has any carving about it. Even the best public collections are not free from these errors, and in one of the most celebrated collections of arms I discovered within five minutes ten or twelve wrong labels.

There is now before me an illustrated work on savage manners and customs, in which is a group of "New Zealand arms," containing thirteen objects. Of these only one is a genuine weapon of New Zealand, and two others are doubtful. There are two Fiji clubs (one of them with a hollow tubular handle!), one stone knife of New Caledonia, two clubs of the Tonga Islands, one Maori chief's staff of office, one New Zealander's carpenter's adze, one "poi" mallet and one "gnatoo" mallet from Tonga, and two articles which the draughtsman may have intended for clubs, but which have been transformed by the engraver's art into bottle-gourds. Besides, there is one nondescript article which may be a drum (and therefore cannot belong to New Zealand), or it may be a pail, or it may be a jar, and another nondescript article.

We need not, however, wonder at these trifling errors when, in the same work, a scene in a North American wigwam is described as a "New Zealand christening," and the "Interior of a Caffre hut" is fitted with Abyssinian arms and implements: the men are represented as wearing long two-forked beards like those of the Fans, head-dresses like those of Tonga, and capes like those of Abyssinia; while a smooth-haired woman, instead of being dressed in Kaffir fashion, is naked with the exception of a white cloth tied round her hips. The hut itself is a singularly ingenious example of perversity on the part of the draughtsman, who has selected precisely those very characteristics which do not belong to the Kaffir hut. In the first place, the hut is three times too large, and the walls are apparently of clay — certainly not of the basket-work employed by Kaffirs in house-building. The floor, which in a Kaffir hut is laid down with clay, as smooth as a table and hard as concrete, is irregular and covered with grass; while, by way of climax, the door is high enough to allow a man to pass without stooping, and is finished with a beautiful arched porch covered with creepers.

With the exception of one man, who may, by some stretch of imagination, be taken for a Hottentot, neither the hut, its furniture, its inhabitants, nor their weapons, bear the slightest similitude to those of any part of Southern Africa. Such being the case with museums and books, we need not be surprised that the popular ideas respecting the weapons and warfare of New Zealand are very indefinite.

Of course, at the present day, the Maories have, practically discarded their ancient weapons in favor of the rifle, which they know well how to use, retaining the aboriginal weapons more as marks of rank than for active service. We have, however, nothing to do with these modern innovations, and will restrict ourselves to the weapons that belong to the country.

The first and most important of these is the merai, or short club. This weapon is exactly analogous to the short sword used by the ancient Romans, and in some cases resembles it so closely that if the cross-guard were removed from the sword and the blade rendered convex instead of flat, the shapes of the two weapons would be almost exactly identical.

The material of which these weapons are made is sometimes wood and sometimes stone, but mostly bone, the latter material being furnished by the spermaceti whale. The stone merai is the most valued, on account of the difficulty of finding a suitable piece for the purpose, and of the enormous time which is consumed in cutting it to the desired shape with the very imperfect instrument which the Maori possesses. In fact, a stone merai is lowly and laboriously ground into shape by rubbing it with a piece of stone and a sort of emery powder.

Every merai has a hole drilled through the end of the handle. Through this hole is passed a loop of plaited cord, by means of which the weapon is slung to the wrist, to prevent the wearer from being disarmed in battle. Drilling the hole is a very slow process, and is done by means of a wetted stick dipped in emery powder.

The finest merai of this description that I have seen belongs to H. Christie, Esq., and is remarkable not merely for its size, but for the regularity and beauty of its curves. The material is the dark, dull green volcanic stone of which the New Zealanders make so many of their implements. It is nearly eighteen inches in length, and rather more than four inches wide at the broadest part. There is a similar weapon, nearly as large, in the collection of the United Service Institution; but the curves are not so regular, nor is the article so handsome.

One of these weapons is in my collection. It is of equal beauty in shape with that which has been described, but is not so long. It is rather more than fourteen inches in length, and not quite four inches wide. It weighs two pounds six ounces, and is a most formidable weapon, a blow from its sharp edge being sufficient to crash through the skull of an ox, not to mention that of a human being.

Every chief, however low in rank, is sure to have one of these merais, of which he is very proud, and from which he can scarcely be induced to part. The great chiefs have their merais made of green jade, such as has already been described when treating of Maori ornaments. These weapons are handed down from father to son, and are so highly valued by the natives that it is hardly possible to procure one, unless it be captured in battle. If a chief should die without a son to whom his merai can descend, the weapon is generally buried with him.

At fig. 6, in the "weapons," on page 841,

is seen one of these green jade merais. The shape is not nearly so elegant as that of my weapon which has just been described. Indeed, with so valuable and rare a mineral as this green jade, it is not easy to find a piece large enough to be cut into an ordinarily shaped weapon and the manufacturer is obliged to do his best with the material at his command.

At fig. 7 is an example of the commonest kind of merai, that which is made of wood. As the material of such a weapon is comparatively valueless, the Maories seem to indemnify themselves by adding ornament to the weapon. For example, they very seldom make the merai of the same simple shape as that at fig. 6, but give it a distinct edge and back as at fig. 7. In some cases they make it into a most elaborate piece of native art, the whole being so beautifully carved that it looks more like a number of carved pieces of wood fitted together than a weapon cut out of one solid block.

A singularly beautiful example of such a weapon is to be seen in fig. 1 of the illustration "Merai," on page 841. As the reader may see it is one mass of carving, the design being cut completely through the wood, and therefore being alike on both sides. The back of the merai is carved into a pattern of singular beauty and boldness, and the edge is armed with a row of shark's teeth, which make its blows very formidable when directed against the naked bodies of the Maori warriors. The specimen from which the drawing was taken may be seen in the collection of the British Museum.

The second fig. of the illustrations shows a merai made of bone. The material is mostly obtained from the blade bone of the spermaceti whale, and in consequence the weapon is said in books of travel to be made of whalebone, thus misleading the ordinary reader, who is sure to understand "whalebone" to be the black elastic substance obtained from the Greenland whale.

These merais are extremely variable in shape. Some of them are made like the stone weapons, except that they are much flatter, and have in consequence both edges alike. Sometimes they are studded with knobs and cut into hollows; sometimes carved into patterns, much resembling that of the wooden merai, but not so elaborate. The specimen which I have selected for the illustration shows examples of the ornaments and studs.

I possess a very good merai which has been made from the lower jaw of the spermaceti whale. This weapon is shown in fig. 4 of the same illustration, opposite, and close by it is a section of the jaw of the whale, in order to show the manner in which it is cut. This weapon measures seventeen inches in length by three and a half inches in width, and weighs one pound nine ounces. In consequence of this comparative lightness,

it is a much more efficient weapon than the stone merai; for the latter is so heavy that, if a blow misses its aim, the striker is unable to recover the weapon in time to guard himself, or to repeat the blow, and so lays himself open to the enemy.

If the reader will look at the section of bone, he will see that it is porous in the centre and hard and solid at the edges. It is from the solid part that the merai has been cut, and in consequence the weapon is very flat. The numerous channels through which pass the blood vessels that nourish the bone are seen in the section, and in the drawing of the merai one of them is shown traversing the weapon longitudinally. The name of the merai is "patu-patu," the *u* having the same sound as in flute.

Many of the natives have found out that the English bill-hook answers admirably as a merai, and can be obtained with very little trouble. Great quantities of them were at one time imported from Birmingham; but the rifle and bayonet have in latter days so completely superseded all other weapons that the Maories trouble themselves little about the bill-hook.

When a Maori fights with the merai, he does not merely strike, his usual movement being to thrust sharply at the chin of the enemy; and if he succeeds in striking him with the point, he cuts him down with the edge before he can recover himself.

At fig. 5 of the "Maori weapons," on the next page, is seen an axe, or tomahawk. This is a curious mixture of European and Maori work, the blade being obtained from England, and the handle made and carved in New Zealand with the usual grotesque patterns which a Maori likes to introduce into all objects connected with warfare. The thigh bone of a slain enemy is a favorite handle for such a tomahawk.

Before the fierce and warlike character of the New Zealanders was known, they took several vessels by the use of the merai. It was easy to suspend the short club over the shoulder, where it was hidden by the mat, so that when a party of natives came on board, apparently unarmed, having ostentatiously left their patus and other weapons in their canoes, each man was in fact armed with the weapon that he most trusted. The plan pursued was, that the Maories should mingle freely with the crew, until each man was close to one of the sailors. At a signal from the chief, the concealed merai was snatched from beneath the mat, and in a moment it had crashed through the head of the selected victim.

Even after this ruse was discovered, the ingenious Maories contrived to get hold of more than one vessel under pretence of exhibiting their war dance, which in a moment was changed from the mimicry of battle into reality, the warriors leaping among the spectators and dealing their blows right and left.

(3.) MAORI WEAPONS. (See pages 838, 840, 844.)

among them. Ship-taking seems, indeed, to be a proceeding so dear to the New Zealander, that he can scarcely resist the temptation when it is offered him. In Messrs. Tyerman and Bennet's "Missionary Voyage" there is an anecdote of an adventure that befell them, which, but for the timely aid of a friendly chief, would undoubtedly have had a tragic issue.

The ship had arrived off New Zealand, and while at anchor the following events occurred:—"This morning our little vessel was surrounded with canoes, containing several hundreds of the natives, of both sexes, who presently climbed up, and crowded it so much that we were obliged to put a bar across the quarter-deck, and *tabu* it from intrusion. The commerce in various articles, on both sides, went on pretty well for some time, till one provoking circumstance after another occurred, which had nearly led to the seizure of the ship and the loss of our lives.

"In the confusion occasioned by the great throng in so narrow a space, the natives began to exercise their pilfering tricks, opportunities for which are seldom permitted to slip away unimproved. Suddenly the cook cried out, 'They have stolen this thing;' but scarcely had he named the thing (some kitchen article), when he called out again, 'They have stolen the beef out of the pot!' and then a third time, 'They have stolen my cooking pan!' Presently another voice bawled out from the fore-castle, 'Captain! they have broken open your trunk, and carried away your clothes!'

"Up to this time we had been in friendly intercourse with the chiefs, rubbing noses, and purchasing their personal ornaments and other curiosities, suspecting no mischief. But now, in the course of a few moments, without our perceiving the immediate reason, the whole scene was changed. We found afterward that the captain (Dibbs), on hearing of the audacious thefts above mentioned, had become angry, and while he was endeavoring, rather boisterously, to clear the deck of some of the intruders, one of them, a chief, on being jostled by him, fell over the ship's side into the sea, between his own canoe and the vessel. This was seized instantaneously as the pretext for commencing hostilities. The women and children in the course of a few minutes had all disappeared, leaping overboard into their canoes, and taking with them the kakaous, or mantles, of the warriors. The latter, thus stripped for action, remained on deck; of which, before we were aware, they had taken complete possession; and forthwith made us their prisoners.

"Tremendous were the bawlings and screechings of the barbarians, while they stamped, and brandished their weapons, consisting principally of clubs and spears. One chief with his cookies (his slaves) had surrounded the captain, holding their spears at his breast and his sides, on the larboard quar-

ter of the vessel. Mr. Tyerman, under guard of another band, stood on the starboard; and Mr. Bennet on the same side, but aft, toward the stern. Mr. Threlkeld and his little boy, not seven years old, were near Mr. Bennet not under direct manual grasp of the savages. The chief who, with his gang, had been trafficking with Mr. Bennet, now brought his huge tattooed visage near to Mr. B.'s, screaming, in tones the most odious and horrifying: "Tongata, New Zealandi, tongata kakino?—Tongata, New Zealandi, tongata kakino?"

"This he repeated as rapidly as lips, tongue, and throat could utter the words, which mean, 'Man of New Zealand, is he bad man?—Man of New Zealand, a bad man?' Happily Mr. Bennet understood the question (the New Zealand dialect much resembling the Tahitian); whereupon, though convinced that inevitable death was at hand, he answered, with as much composure as could be assumed, 'Kaore kakino tongata New Zealandi, tongata kapai' ('Not bad; the New Zealander is a good man'); and so often as the other, with indescribable ferocity of aspect and sharpness of accent, asked the same question (which might be a hundred times), the same answer was returned.

"But," inquired Mr. Bennet, 'why is all this uproar? Why cannot we still rub noses, and buy and sell, and barter, as before?' At this moment a stout slave, belonging to the chief, stepped behind Mr. Bennet, and pinned both his arms close to his sides. No effort was made to resist or elude the gigantic grasp, Mr. B. knowing that such would only accelerate the threatened destruction. Still, therefore, he maintained his calmness, and asked the chief the price of a neck ornament which the latter wore. Immediately another slave raised a large tree-felling axe (which, with others, had been brought to be sharpened by the ship's company) over the head of the prisoner. This ruffian looked with demon-like eagerness and impatience toward his master for the signal to strike.

"And here it may be observed that our good countrymen can have no idea of the almost preternatural fury which savages can throw into their distorted countenances, and infuse into their deafening and appalling voices, when they are possessed by the legion-fiend of rage, cupidity, and revenge. Mr. Bennet persevered in keeping up conversation with the chief, saying, 'We want to buy bruaa, kumera, ika, &c. (hogs, potatoes, fish), of you.'

"Just then he perceived a youth stepping on deck with a large fish in his hand. 'What shall I give you for that fish?'—'Why, so many fish-hooks.'—'Well, then, put your hand into my pocket and take them.' The fellow did so. 'Now put the fish down there, on the binnacle, and bring some more, if you have any,' said Mr. Bennet. At once the fish that he had just bought was brought round from behind and presented to him

again for sale. He took no notice of the knavery, but demanded, 'What shall I give you for that fish?'—'So many hooks.'—'Take them. Have you no other fish to sell?' A third time the same fish was offered, and the same price in hooks required and given, or rather taken, by the vendor, out of his jacket pockets, which happened to be well stored with this currency for traffic. A fourth time Mr. Bennet asked, 'Have you never another fish?' At this the rogues could contain their scorn no longer, but burst into laughter, and cried, 'We are cheating the foreigner!' ('Tangata ke!') supposing that their customer was not aware how often they had caught him with the same bait."

By this ingenious plan of pretending to be the dupe of the Maories, Mr. Bennet contrived to gain time, of which he knew that every minute was of the greatest importance, and at last he was rewarded for his courageous diplomacy by the arrival of a boat, in which was a friendly chief, who at once cleared the ship.

The reader will observe that at this time the New Zealanders had not abandoned the use of the spear as a weapon of war, though only twenty years afterward scarcely a spear could be found that was not intended as an emblem of hospitality instead of strife.

At fig. 3 of "Weapons" is shown a very curious club, called Patu by the natives, and popularly, but wrongly, called by sailors a battle-axe. It is about five feet in length, and has at one end a flat, axe-like head, and at the other a sharp point. One of these weapons in my possession, presented to me, together with many similar articles, by E. Randell, Esq., is five feet one inch in length, and weighs two pounds six ounces, being exactly the same weight as the stone merai already described. The rounded edge of the axe-like head is very sharp, and certainly looks as if it was intended for the purpose of inflicting wounds. Such, however, is not the case, the Maori using the pointed butt as a spear or pike, and striking with the back of the head and not with the edge.

Through the lower portion of the head is bored a hole, to which is suspended a bunch of feathers and streamers. Sometimes this tuft is only a foot in length, but is often longer. In a specimen taken by Sir J. E. Alexander it is half as long as the patu itself. At first sight this appendage seems, like the multitudinous feathers which decorate a North American spear or club, to be merely an ornament, and to detract from, rather than add to, the efficiency of the weapon. But the Maori warrior is far too keen a soldier to sacrifice use to ornament, and, if he employs the latter, he is sure to take care that the former is not endangered by it.

In the present case, this apparently useless appendage adds materially to the effectiveness of the weapon. When the warrior,

armed with the patu, meets an adversary, he does not rush at him heedlessly, but fences, as it were, with his weapon, holding it in both hands, twirling it about, and flourishing the bunch of feathers in the face of his foe so as to distract his attention. Neither does he stand in the same spot, but leaps here and there, endeavoring to take the foe off his guard, and making all kinds of feints in order to test the adversary's powers. Should he see the least opening, the sharp point of the butt is driven into his adversary's body, or a severe blow delivered with the head, the stroke being generally made upward and not downward, as might be imagined.

In fact, the whole management of the patu is almost identical with that of the old quarterstaff of England, a weapon whose use is unfortunately forgotten at the present day. The bunch of feathers is not an invariable appendage. In my own specimen, for example, it has never been used, and I have seen many others in which the hole has not been bored for the insertion of the string that ties the feathers together.

The last weapon drawn in this illustration is hardly worthy of the name. It is a dagger, and is shown at fig. 4. At fig. 2 of the same illustration is seen an implement which is generally mistaken for a spear, and is labelled as such in many a collection. It is, however, no spear at all, but a sceptre, or staff of office belonging to a chief. The Maori name is E'Hani. It is shaped at the butt like an exceedingly elongated merai, and indeed the entire implement looks as if the hani and the merai were but different modifications of the same weapon.

Be this as it may, the hani is no spear, but a staff of office, almost identical in form with that which was borne by the ancient kings and heralds in the times of Troy. At the upper end is seen the head, which bears some resemblance to the point of a spear, and has given ground to the notion that the implement in question is really a spear. This portion, however, does not serve the purpose of offence, but is simply a conventional representation of the human tongue, which, when thrust forth to its utmost, conveys, according to Maori ideas, the most bitter insult and defiance. When the chief wishes to make war against any tribe, he calls his own people together, makes a fiery oration, and repeatedly thrusts his hani in the direction of the enemy, each such thrust being accepted as a putting forth of the tongue in defiance.

In order to show that the point of the hani is really intended to represent the human tongue, the remainder of it is carved into a grotesque and far-fetched resemblance of the human face, the chief features of which are two enormous circular eyes made of haliotis shell.

Generally, the hani is ornamented with

feathers like the patu; but many of the staves are without this decoration, which is looked upon as a mere non-essential. These staves vary greatly in length. My own specimen is between five and six feet in length, and is without the feather ornaments, whereas others are not more than a yard in length, and are decorated with a bunch of feathers as long as themselves. The chiefs are nearly as tenacious of the hani as the merai, and do not seem to be easy if it be put out of their reach. Some years ago several Maori chiefs came to visit England, and were taken to see the various sights of London. But whether they went to the theatre, or to the Zoological Gardens, or to make calls, they invariably took their hanis with them, sometimes carrying a short one for convenience' sake, but appearing to attach the greatest value to its possession.

One of these curious implements in my collection is six feet in length, and is made of the same wood as the patu. If held upright the resemblance of the point to the outstretched tongue is not very plain; but if it be held horizontally, the effect is quite altered, and the whole of the tip is seen to represent a human head with the tongue thrust out as far as possible between the lips. As the tongue is only a conventional representation, it is covered with a pattern, a ridge running along the centre, and each side being marked with precisely similar curves and semi-spirals.

In spite of its length, it really makes a very convenient walking-staff, and, on an emergency, might do duty as a weapon, the tongue-like tip being sharp enough to act as a spear head, and the flattened butt being heavy enough to stun a man with a well-directed blow. My specimen does not possess the tuft of feathers and dog's-hair which decorates the hani shown in the "weapons" (fig. 2, p. 841); but this adornment is not considered as forming a necessary part of the implement.

Before a party engage in war, they think themselves bound to join in the war dance. There are war dances in almost all savage tribes, but that of the New Zealander surpasses them all. In other cases, each warrior gives himself up to the excitement of the moment, and shouts, yells, dances, and brandishes his weapons as he seems to think fit; but the Maori warrior's dance is of a far different character, being guided by a discipline and precision of drill to which that of the Russians themselves is loose and irregular.

They begin by smearing the whole of their clothing and by painting their faces with scarlet ochre, so as to make themselves as hideous as possible. When they assemble for the dance, they arrange themselves in lines, mostly three deep, and excite their naturally passionate disposition to the high-

est pitch by contorting their faces and thrusting out their tongues as an act of defiance, interspersing these gestures with shouts, yells, and challenges to the enemy. The dance itself begins with stamping the feet in perfect time with each other, the vigor of the stamp increasing continually, and the excitement increasing in similar proportion.

Suddenly, with a yell, the whole body of men leap side-ways into the air, as if actuated by one spirit, and, as they touch the ground, come down on it with a mighty stamp that makes the earth tremble. The war song is raised, and in accordance with its rhythm the men leap from side to side, each time coming down with a thud as of some huge engine. The effect of the dance upon the performers is extraordinary. It seems to make them for the time absolute maniacs, their whole nature being given up to the furious excitement of the moment. Their faces are frightfully contorted, and thus assume an absolutely demoniacal expression.

Even when war is not impending, the magic influence of the dance affects the performers as strongly as if they were close to a pah or fort of the enemy, ready for battle; and when, as is sometimes the case, the Maories give a dance in honor of a visitor, they become so furiously excited that they are quite dangerous until they have had time to cool.

On one such occasion a party of Maories who had visited a ship were requested to exhibit their war dance, and very good-naturedly did so. But in a short time their measured leaps became so vehement, and their stamps so powerful, as they shouted the martial rhymes of the war song, that they shook the whole ship as if by blows of a battering-ram; and the commanding officer, fearful that they would absolutely smash the deck, begged them to desist. His entreaties were in vain, even if they were heard, though it is very likely that, in their furious excitement, the dancers were deaf to every sound except the war song which they were yelling at the top of their voices; and the dance proceeded to its end, and did not cease until the performers were quite exhausted by the furious exertions they had made.

The most ludicrous part of the dance was the conduct of the chief. He had been treated with much attention, and presented with a full suit of naval uniform, of which he was mightily proud, and in which he stalked about the deck to the great admiration of his subjects. When he was asked whether the war dance could be given, he at once ordered his followers to accede to the request, and at first stood quietly by while they went through the performance.

The influence of the dance was, however, too contagious to be resisted, and rapidly

extended itself to him. First he merely swayed his body in rhythm with the steps of the dancers, then he joined *sotto voce* in the song, then he began to stamp in time with them, and at last threw off all restraint, sprang into line, and leaped, yelled, and stamped as enthusiastically as any of them, splitting his new garments to pieces, and presenting a very sorry sight when his excitement had died away.

The illustration opposite represents a portion of a party of warriors as they appear when performing their war dance. Only the first three ranks of them are seen; but the reader must picture for himself the long lines of warriors stretching into the distance, numbering often from one to two hundred. The leading chief is seen in front, with his green jade merai in his hand; and another but inferior chief is stationed behind him. In the background is shown a portion of the pah in which the dance is taking place; a chief's storehouse for food is seen on the right, and under the shelter of the houses are seated the women who are watching the dance.

I have already said that war is always in the thoughts of a genuine Maori. Unlike the vaporing Fiji warrior, who is always ready to boast, and seldom ready to fight, preferring to knock his enemy on the head when asleep, the Maori is a brave soldier, accustomed from his earliest childhood to deeds of war. A mimic war forms one of the favorite games of the Maori children, though it is necessarily restricted to boys. Just as boys of our country build snow castles, and attack and defend them with snowballs, so do the young New Zealanders build miniature forts, and enact on a small scale the deeds of actual war, using light sticks instead of the merai and patu. They make their forts by erecting mounds of earth, and building the fortresses of stakes, in exact imitation of the more substantial architecture of the veritable pah.

These ingenious pahas well exemplify the whole system of Maori warfare. The two opposing parties seldom meet each other in the open ground, as is the case with European warfare; neither do they employ an irregular skirmishing fight among trees or under cover, as is the case with many savage tribes. The attacking party is sure to be very superior in numbers to their foes, and the latter, knowing that this will be the case, resort to the system of fortification, and entrench themselves in forts, or pahas.

These pahas are marvellous examples of uncivilized engineering, and are admirably adapted to the purpose which they are intended to fulfil. They are always placed in some strong situation, sometimes on the seashore, sometimes on heights, and one or two of the strongest are built on the very edge of a perpendicular precipice, so that they cannot be attacked on three sides, while the

fourth can only be approached by a narrow and awkward path, along which only a few men can pass, and which can be defended by a comparatively limited number of the besieged. (See p. 835.)

Taking one of these pahas is really a great enterprise for the natives, and before they knew the use of firearms it is wonderful that they ever took a pah at all. Many of them are indeed impregnable, and, until firearms were introduced into the colony, could bid defiance to all enemies. They were so situated that by merely rolling stones down the approach the path could be cleared of every foe. They are surrounded with trenches, and have ingenious sally-ports so constructed that the defenders can issue from unexpected parts of the fort, make a sudden attack on the assailants, and retreat through the same aperture when they have attained their purpose.

They are fenced round with very strong posts, lashed together so firmly that they are able to resist any ordinary attack. Since firearms were introduced, the Maories have modified the structure of the pahas to suit their new weapons, throwing out angles to secure a flanking fire, and filling the interior with trenches in which the defenders can lie secure from the fire of the enemy. Since they learned the terrible power of shells, the natives have learned to construct "traverses," *i. e.* cross-walls, in the trenches, which not only guard the inmates from the fragments of the shells, but prevent an enfilading fire from doing much damage. Rifle-pits are also constructed with singular ingenuity. One pah was remarkable for being built over a number of boiling springs, which were used as traps for the enemy when the fort was besieged.

The reader may remember the unfortunate business at the Gate Pah, at Tauranga. When taken by storm, the pah appeared to be empty and deserted, the natives having apparently escaped, according to their custom, when they found the place no longer tenable. They had, however, laid a trap, into which the assailants fell. When the latter had scattered themselves over the interior, and were quite off their guard, picking up arms, utensils, and other objects lying carelessly about, a terrific musketry fire was opened from under their very feet, the natives having constructed pits in which they hid themselves until the enemy were attracted within their range by the weapons and implements which they had laid on purpose to act as a bait. The men, who were entirely off their guard, and many of whom besides were but raw recruits, were struck with a sudden panic, and, with a few honorable exceptions, rushed out of the pah, followed and cut up by the fire of the wily foe.

Of course the repulse was but temporary; but such a stratagem as this is sufficient to show the military genius of the Maori, who,

THE MAORI WAR DANCE.
(See page 846.)

if he becomes an enemy, is one that cannot be despised with impunity. This system of taking the enemy by surprise is the usual mode of fighting among the Maories, who display wonderful ingenuity in contriving ambushes, and enticing the enemy into them. When we were first driven into war with the natives of New Zealand, we were frequently entrapped in an ambuscade; and in one case the hidden enemy were so close to our men, their dusky forms being hidden in the shadows of the bush, that many of the soldiers who escaped with life had their faces completely tattooed with grains of unburnt powder from the muskets of the enemy.

If the assailants succeed in taking the pah, a terrible massacre always ensues. Every man is killed who is capable of wielding a weapon, while the women and children are carried off to become the slaves of the conquerors—a doom from which, as I have already stated, there is no escape; the unfortunate women, their children, and any future offspring, being slaves without the possibility of release, not even their own tribe being able, according to Maori law, to interfere with the right of the captors.

The bodies of the warriors are of course reserved to be baked and eaten. Sometimes even the prisoners fall victims to the thirst for blood which characterizes these islanders; and in this respect the women are as bad as the men, if not worse. For example, the principal wife of a very great chief, named E'Hongi, was accustomed, even though blind, to murder some of the captives, when they were brought home by her formidable husband. Her own end was, however, more tragic than that of any of her victims. E'Hongi was in the habit of making long excursions to different parts of the country, in which he took his wife with him. On one of these excursions she fell sick, and had to be left behind. In consequence of her blindness, added to her debility, she was unable to act in her own defence, and a number of dogs, discovering her weakness, tore her to pieces and devoured her.

She seems, however, to have been a woman of unexceptionally strong feelings of vengeance. "She had," writes Mr. Angas, "a little slave-girl to attend upon her, toward whom she evinced a strong attachment. The little creature was interesting and good-tempered, and her mistress was apparently so fond of her that she was spared the experience of the misery of slavery; she was only a favorite.

"Hongi returned from one of his successful expeditions of war, but had left a son upon the field of battle, and the lamentation was great. The petted slave-child laid her head upon the lap of her mistress, and poured out her share of the general sorrow. But the spirit of vengeance or of insane retribution came over the heart of the be-

reaved mother; and she carried the child to the water, and cruelly suffocated her in satisfaction of her selfish sorrow."

It was not long after this incident that she met with her death. When she was left behind, a small shed was erected on poles, according to native custom, and a supply of food was placed near her. When the party returned the shed was lying prostrate, and among its ruins were the whitened bones of the inmate. It is supposed that the wind blew down the shed, and so enabled the dogs to reach her.

This same E'Hongi was a really remarkable man, and earned a great name for wisdom and courage. Having made a voyage to England, he threw all his energies into strengthening his military power, and took back with him a quantity of muskets and ammunition.

He came back to his own country exactly at the proper time. A long and somewhat desultory war had been going on between the Waikatos and other tribes, in which the former had, after many vicissitudes, been victorious, and, after finally conquering their enemies, had returned to their country in triumph.

Just then E' Hongi came back to his own tribe, the Nga Puis, distributed his firearms among the best warriors, and when he had instructed them in the use of the new and terrible weapons, entered the Waikato country, and attacked their great pah called Matuketuke. The Waikatos, having only their clubs, and not having sunk the trenches which in these days are dug in every pah that is intended to resist an assault, could not contend against firearms, and in a few minutes the fort was taken. It was in this engagement that Horomona and Te Whero-Whero were captured.

The slaughter on this occasion was terrible, two thousand warriors being killed, and their bodies eaten by the victorious tribe, who built vast numbers of ovens for the special purpose of cooking the bodies of the slain. For many years afterward the remains of the ovens, and the whitened bones of the two thousand warriors, might be seen as tokens of the terrible scene, where feasts were kept up until all the bodies had been consumed, and every evil passion of unrestrained human nature was allowed to have its full sway.

One of the very muskets which were used on this occasion, and which was given by George IV. to E' Hongi when he visited England, is now in the collection of Colonel Sir. J. E. Alexander. It is one of the regular "Brown Bess" weapons, once so dear to soldiers, and now irreverently termed a gaspipe.

Prisoners without number were captured on this occasion; and indeed the supply of slaves thus obtained so far exceeded the demand for them, that the Nga Puis killed

many of them on their journey home, merely to rid themselves of them. E'Hongi, though known to be a man of the most determined courage, not to say ferocity, when engaged in war, and rather disposed to behave in an overbearing manner toward those whom he considered as his inferiors, was at the same time peculiarly mild and courteous in his demeanor to his equals, and toward strangers was remarkable for his gentle courtesy.

There was another very celebrated chief of a somewhat similar name, Hongi-Hongi, who has sometimes been confounded with his great predecessor. One feat of this warrior is so characteristic that it deserves mention. He was leading an attack on a pah near Mount Egmont, captured it, and, according to custom, killed the warriors, and took the rest of the inmates as his slaves. Sixty of these unfortunate beings fell to the share of Hongi, who drove them like a flock of sheep, with his green jade merai, all the way to his home, a distance of one hundred and eighty miles.

This chief was proof against the missionaries of all kinds. Mr. Angas once asked him whether he was a *mihonari*, i. e. a Protestant convert, or a *pikopo*, i. e. a Roman Catholic. Hongi denied that he was either one or the other, and confessed with glee that he was a *revera*, or devil, i. e. that he still remained a heathen.

It is very unfortunate that intolerance in religious matters has been fostered by those who ought to have made it their business to repress any such feeling. The consequence is, that the Protestant converts regard their Roman Catholic brethren as reveras, or devils, while the latter have allied themselves with their acknowledged heathen countrymen; and thus, under the pretence of religion, the customary feuds are kept up with perhaps even additional bitterness.

I have the pleasure of presenting to the reader, on the 820th page, a portrait of Hongi-Hongi, as he appeared in the year 1844, dressed in his full panoply of war costume. This, of course, would be doffed before he went into actual fight. In his ear is one of the green jade ornaments which have already been described, and in his right hand he bears his merai, the celebrated weapon with which he drove the slaves before him. He is represented as standing just inside the wall of his pah, a position which he insisted on taking up, and having his portrait drawn to send to the Queen of England. In fact, he was so decided on this point, that he refused to let Mr. Angas leave the pah until the portrait was completed. The portion of the pah which is shown in the illustration gives a good idea of this kind of fortification, the enormous posts with their circular tops being sunk deeply into the ground, and smaller posts placed between them; a hor-

izontal pole is laid across them; and the whole is firmly lashed together, either with the ordinary phormium rope, or with the stem of the wild vine.

Warfare among the Maories, fierce and relentless as it may be in some particulars, is not devoid of a sort of chivalry which somewhat relieves it from its more ferocious aspect. There is, for example, a well-known code of military etiquette which is sometimes exhibited in a mode that to us seems rather ludicrous.

For example, the Waikatos and Taranaki tribes were at war as usual, and the Waikatos were besieging a pah belonging to their enemies. The pah, however, was too strong for them; and moreover the defenders had contrived to get hold of several guns belonging to a vessel that had been wrecked on the shore, and had induced some Europeans to mount and work them, which they did with such success that the Waikatos were forced at last to abandon the siege.

But, in the very midst of the contest, a vessel appeared in the offing, and a truce was immediately concluded in order to allow both parties to trade. Accordingly, both the besiegers and besieged set off amicably to the vessel, and, having completed their bargains, returned to resume their hostilities. A very amusing scene then occurred. The Taranakis, who were the besieged party, had much the best of the trading, as they possessed a large quantity of dressed flax, or phormium, and exchanged it for a quantity of tobacco.

Now tobacco is one of the greatest luxuries that a New Zealander can possess; and unfortunately for the besieging Waikatos, they had no tobacco. They had, however, a plentiful supply of muskets, which they had taken in an attack upon another pah, while the besieged were very short of arms. So they struck up a trade, the Waikatos being so inordinately desirous of obtaining tobacco, that they gave in return fire-arms which were to be turned against themselves.

"The scene," writes Mr. Angas, "as described by an eye-witness, must have been most ludicrous. The Waikato thrust his musket half-way through the palisades of the pah, retaining, however, a firm hold of his property until the intending purchaser from within thrust out in a similar manner the quantity of tobacco he was willing to give; neither party relinquishing his hold of the property about to change hands until he had secured a firm grasp of that offered by his adversary."

The chief who led the Waikatos on this occasion was the celebrated Wiremu Nera, or William Taylor; the former name being the nearest approach that the Maories can make to the proper pronunciation. His Maori name was Te Awaitaia, and he was widely celebrated for his dauntless courage and his generalship in conducting or resist-

ing an attack. Being closely allied with the famous chief Te Whero-Whero (or Potatau), he was engaged in nearly all the combats between the Waikatos and the Taranakis. On one of his warlike expeditions he took a pah containing nearly eighteen hundred inhabitants, and, of course, killed nearly all of them, and carried the survivors as slaves into the Waikato district.

Latterly, he embraced Christianity, and became as zealous in the cause of peace as he had been in that of war. When he became a Christian, Te Whero-Whero was so well aware of his value as a warrior, that he exclaimed to those who brought him the news, "I have lost my right arm!"

Although repulsed on this occasion by the three guns taken from the wrecked ship, the Waikatos were not discouraged, and made a second attack. The Taranakis, however, had seen too much of Waikato courage to risk a second siege, and so quietly made off, some two thousand in number, accompanied by the Europeans who had served the guns for them. The latter very rightly spiked the guns when they left the pah, so that when the Waikatos came again and took the pah, they found it deserted, and the guns useless to the captors.

The Taranakis lived in deadly fear of the powerful and warlike Waikatos, and, but for the love which they felt toward their native country, would have fled, and left the conquerors to take quiet possession. They were even obliged to have their plantations in the bush, where none but the owner could find them; for they feared, and with reason, that if their dreaded enemies could discover the sources whence their provisions were obtained, they would destroy the whole plantation, and leave their victims to starve. They were in such a state of nervous alarm about a suspected invasion by their powerful neighbors, that on one occasion, when a fire was seen in the distance, every one took it for granted to be a fire lighted by the Waikatos, and in consequence every one kept awake all night, ready to give the alarm at the first unwonted sight or sound.

Among the New Zealanders is a custom

of retaliation which is found with but little variation in many parts of the world. If blood has been shed, the friends of the dead man issue from the pah, with the determination of killing the first person whom they may happen to meet. Should he belong to an inimical tribe, so much the better; should he belong to the same tribe, so much the worse; for in either case he is killed. On such an occasion one of the avengers would be bound to kill his own brother, should he happen to be the first man who came in the way of the party.

Such an exercise of vengeance is rather an inconvenient one to those who are engaged in it; for they are forbidden the use of their ordinary comforts, they may not eat any food except that which is indigenous to New Zealand, and, above all, they are not allowed to smoke. When, therefore they have been unable to find any human being whom they can sacrifice, the aid of the priest, or tohunga, is called in. He pulls up a tuft of grass, and, after repeating one of the many incantations which abound in New Zealand lore, and of which neither the hearers nor the reciter understand one word in ten, he throws the grass into the nearest stream, in token that the avengers are released from their vow. Blood, however, must still be shed; but after this ceremony has been performed, the blood of any living thing, even though it be a bird, is held sufficient to satisfy the traditional custom of the Maori race.

Elaborate rites closely allied with this ceremony are employed both before and after battle; but, as they belong rather to the subject of religion than of war, we will postpone them for the present.

As the New Zealanders know that it is a point of military honor combined with personal gratification to eat the bodies of slain enemies, they are equally desirous of securing the bodies of their foes and of carrying off those who have fallen on their own side; and in many instances the anxiety to save those who have fallen has caused others to share the same fate while attempting to carry off their dead or wounded comrades.

CHAPTER LXXXIV.

NEW ZEALAND—*Continued.*

CANOEES.

THE CANOE, AND ITS USES IN PEACE AND WAR—THE COMMON TRADING CANOE—SKILL OF THE BOATMEN—THE LARGE WAR CANOES, AND MODE OF BUILDING THEM—DECORATIONS OF THE CANOES—SKILFUL CARVINGS—THE THEORY OF THE VARIOUS PATTERNS—NAMES OF CANOES—MANAGEMENT OF THE SAIL—CANOE SONGS—A COMPLETE BOAT-LOAD—MODE OF LANDING—SHAPE OF THE PADDLES, AND MODE OF USING THEM—CARVING TOOLS—SUPPOSED COMPASSES.

WAR is carried on quite as much by water as by land, and a chief who knows the principles of good generalship always uses the sea as well as the land to serve as a basis for his attack. For this reason the Maories take care to build their paha in spots where they are well defended from attack both on the seaward and the landward side. Some of them are on the very verge of high-water mark, while others are perched on the tops of cliffs, the base of which is washed by the waves.

One of the most picturesque of these is a pah situate near Mount Egmont, and known by the name of the Waimate Pah. There is a cliff that rises perpendicularly some four or five hundred feet above the level of the water which laves its foot, and on the very summit of this cliff is situated the pah in question. It is of considerable size, containing many houses and is fortified with the usual wooden fence. In order to render it as nearly as possible impregnable, the only approach is by a very narrow and very steep path, that cannot be ascended except by people who have strong heads, the path being so narrow, so steep, and so dangerous that two men could defend it against fifty.

In his warlike expeditions E'Hongi made great use of his canoes, taking them inland as far as they would go, and then having them dragged over land to the next river.

These canoes play so important a part in the life of a New Zealander, whether in war or peace, that they require a detailed description. The canoes are of several kinds, according to the work which they have to perform. The simplest form of the New Zealander's canoe is little more than a

trunk of a tree hollowed into a sort of trough. Being incapable of withstanding rough weather, this canoe is only used upon rivers. Some of these canoes, which are called by the name of *kawpapas*, are from forty to fifty feet in length, and in the widest part not exceeding a yard in "beam." A plentiful supply of fern leaves is laid at the bottom of the canoe, and upon these the passengers recline. Canoes of a similar character, called *tuwai*, are used in the inland lakes, and sit so low in the water that they appear to have no gunwale.

Owing to their want of beam, these canoes are as easily upset as the slight skiffs in which races are rowed on English rivers. The agile Maori, accustomed from childhood to balance himself in these crank vessels, traverses them with ease and security, but an European generally upsets four or five canoes before he learns how to enter or leave them properly. The natives manage these canoes with wonderful skill, and, apparently regardless of the risk of capsizing the canoe, dash their paddles into the water with furious energy, driving up spray on all sides, and making the canoe and its rowers look at a distance like some gigantic centipede dashing through the water.

The vessels, however, of which the Maories are most fond, and on which they expend the most labor, are the large canoes in which the warriors embark when on a campaign. Those canoes are made from the cowrie pine (the same tree which furnishes the aromatic gum already mentioned); and the tree being a very large one, the natives are able to make their canoes of considerable size. Some of these canoes are upward of

eighty feet in length and in consequence are able to carry a great number of warriors.

They are built in rather an elaborate manner. First the trough-like vessel is formed from the tree trunk; and if it were left in that state, it would be simply a very large kaupapa. As, however, it is intended for sea voyages, and may have to endure rough weather; it is much wider in proportion than the boat which is only used on rivers, and is, moreover, rendered more seaworthy by gunwales. These are made separately, and are lashed firmly to the sides of the boat by the ordinary flax ropes.

Both the head and stern of the canoe are decorated with carving, exactly similar in character to the specimens of native art which have already been described. They are pierced with the most elaborate patterns, which have as their basis the contour of the human countenance and the semi-spiral curve. Perhaps a single canoe head will have fifty or sixty human faces on it, each with the tongue protruded, with the cheeks and forehead covered with tattooed lines, and with a pair of goggle eyes made of the haliotis shell. The mode which a native adopts when carving these elaborate patterns is as follows:

After shaping out the general form of the article to be carved, he fixes on some part which he thinks will be suitable for the purpose, and carves a human head upon it. When this is completed, he pitches upon a second spot at some distance from the first, and carves another head, proceeding in this way until he has carved as many heads as he thinks the pattern will require.

He next furnishes the heads with bodies and limbs, which are always represented in a very squat and ungainly manner, and fills in the vacant spaces with the beautiful curved lines which he loves so well to draw and carve. The minute elaboration of some of these war canoes is so intricate that it baffles all power of description, and nothing but a well executed photograph could give a correct idea of the beauty of the workmanship. It is a marvellous example of the development of art under difficulties. It is quite unique in its character, so that no one who is acquainted with the subject can for a moment mistake a piece of New Zealand carving for that of any other country.

Besides carving the canoes, the Maori paints them with vermilion in token of their warlike object, and decorates them profusely with bunches of feathers and dog's hair, just like the tufts which are attached to the patu. When the canoes are not wanted, they are drawn up on shore, and are thatched in order to save them from the weather.

Like more civilized nations, the New Zealanders give names to their canoes, and seem to delight in selecting the most sonorous titles that they can invent. For ex-

ample, one canoe is called Maratuhai, i. e. Devouring Fire; and others have names that coincide almost exactly with our Invincibles, Terribles, Thunderers, and the like.

These boats are furnished with a very remarkable sail made of the raupo rush. It is small in proportion to the size of the vessel, is triangular in shape, and is so arranged that it can be raised or lowered almost in a moment. They are better sailors than would be imagined from their appearance, and run wonderfully close to the wind.

Sometimes from fifty to sixty men paddle in one of these war canoes, singing songs in time to the stroke, and guided both in song and stroke by a conductor who stands in the middle of the canoe, prompting the words of the song, and beating time for the paddlers with a staff which he holds in his hand. Owing to the power of the water in reflecting sound, the measured chant of the paddle-song can be heard on a river long before the canoe comes in sight.

Mr. Angas gives an interesting account of a journey in a Maori canoe. After mentioning that the vessel was so deeply laden that its sides were not more than two inches above the water, he proceeds as follows: "The paddles were plied with great spirit; the exertions of the natives being stimulated by the animated shouting song kept up incessantly by the one or other of the party. At length the splashing was so violent that we became nearly drenched, and on requesting the Maori before us to throw less water in our faces, he replied with a proverb common among them, that 'No one is dry who travels with the Waikatos,' meaning that the people of this tribe excel all others in the speed and dexterity with which they manage their canoes.

"Our natives were in excellent spirits. They had been on a long journey to Auckland, where they had seen the *pakeha* (white man, or stranger) in his settlement, and had witnessed many sights of civilization to which they were previously strangers. They had also purchased articles of European manufacture, and longing to return home to the peaceful banks of the Waipa, to present them to their friends as tokens of their regard. Their wild, deafening songs, with their heads all undulating at every stroke, the contortions of their eyes, and their bare, tawny shoulders, finely developing their muscles as they all dashed their paddles simultaneously into the water, rendered the scene at once novel and animating.

"The canoe songs are generally improvised, and frequently have reference to passing objects. Such ejaculations as the following were uttered by our companions at the highest pitch of their voices, 'Pull away! Pull away! Pull away!' 'Dig into the water!' 'Break your backs,' &c. From

the prow of one of the canoes a native flute sounded plaintively. This is a very rude and imperfect instrument, and they do not play it with any degree of skill, it having only two or three notes." The flute in question is that which is made of human bone, and has been described on a previous page. It is played by placing the orifice against one nostril, and stopping the other with the finger.

When the natives proceed on a journey in their canoes, they are so sure of their own skill and management that they overload them to a degree which would cause an immediate capsizing in most countries. One chief, named Wirihona, who was travelling with his family, afforded a curious example of overloading a boat with impunity. The canoe was delicate and frail, and in the bow sat a little boy with a small fire kept between two pieces of bark. In the fore part of the canoe, where it was narrow, sat the younger children, the adult members of the family being placed in the middle, where the boat was widest. Toward the stern came another batch of young children, and on the stern, which projects over the water, sat Wirihona himself, steering the vessel with his paddle.

The canoe in which were Mr. Angas and his companion was, as the reader may recollect, so laden that her gunwale barely rose two inches above the surface. As long as they were paddling along the narrower and more sheltered parts of the river, all went smoothly enough, though the deeply-laden state of the crank boat gave cause for uneasiness. At last, however, they came to some wide and open reaches exposed to the wind, and had, moreover, to cross the current diagonally.

"The wind blew violently, and meeting the current, caused an unpleasant sea in the middle channel of the river. Our heavily-laden canoe was not fitted to encounter anything beyond still water; and, as our natives related to each other where this and that canoe were upset, they dashed their paddles into the water with all their energy, and our bark was soon in the midst of the terrible current. We were every moment in imminent danger of being swamped; the water rushed in on both sides; and nothing but the extreme swiftness with which we glided through the current prevented us from filling.

"As the canoe dashed against the opposite shore, our natives gave a loud shout and commenced bailing out the water, which we had shipped in great quantities, with a *tatau* or scoop. We now looked anxiously toward the second canoe, and watched them literally pulling for their lives, splashing and dashing with the utmost vehemence. The frail bark appeared almost swallowed up by the angry stream, but she glided securely through it, and the drenched chief and his

family repeated the sound of welcome to the opposite shore, as their canoe also dashed in safety against its banks."

The paddles with which the Maories propel their canoes are curious-looking implements, and are so formed that they will answer almost equally well as paddles or weapons. Indeed, it is not unlikely that their peculiar shape was given to them for this very reason. In the illustration No. 1, on page 881, are seen two examples of the New Zealand paddle, both being drawn from specimens in my collection, and being useful as showing the typical form of the implement.

They are rather more than five feet in length, and have very long blades which are leaf-shaped and sharply pointed at the tips, so that a thrust from one of these paddles would be quite as dangerous as if it were made with the butt of the patu. The blade, too, is sharp at the edges, and, being made of rather heavy wood, is capable of splitting a man's skull as effectually as if it had been the short merai.

In one of these paddles the handle is curved in a peculiar manner, while in the other it is straight, and forms a continuation of the blade. The former of these implements is quite plain, and even at the end of the handle there is no carving, while the latter is liberally adorned with patterns both on the blade and handle, and at their junction there is the inevitable human figure with the protruding tongue, the goggle eyes, and the generally aggressive expression that characterizes all such figures. None of the New Zealand paddles are adorned with the minute and elaborate carving which is found upon the paddles of several of the Polynesian islands. The carving of the New Zealanders is of a far different and much bolder character; and, instead of covering his paddle with small patterns repeated some hundreds of times, the Maori carves nothing but bold, sweeping curves and imitations of the human face.

As far as is known, the Maori carver makes no use of measuring tools, doing all his work by the eye alone. He does not even use compasses in describing his circles; and in consequence, whenever he carves, as is often the case, a number of concentric circles on a rafter or beam, the circles are quite undeserving of the name, and always tend rather to an irregular oval form.

There is in my collection a remarkable instrument, presented to me by C. Heaton, Esq. It bears a label with the following inscription, "A New Zealand Compass, by which the natives turn the volute in their carving." In shape it resembles one half of a parenthesis , and is armed at each point with a shark's tooth, which is inserted into a groove, and then lashed firmly with a cord passing through holes bored in the tooth and through the semicircular handle.

It is made of the same wood as the paddle. Having, as I have already stated, abundant reason to distrust the accuracy of labels, and thinking that the curves of New Zealand carving did not possess the regularity which would accompany them had they been sketched out by an instrument, I showed the tool to several observant travelers who have spent much time in New Zealand, and asked them if they recognized it. None of them had seen the implement. Mr. Christie, who gave much attention to the manufactures of New Zealand, knew nothing about it, and Mr. Angas, who visited the island for the express purpose of collecting information respecting the Maories, and to whose pen I am indebted for nearly all the illustrations of the life and manners of the New Zealanders, had never seen or heard of such a tool. I possess many specimens of

New Zealand carving, and have seen many others, together with a great number of photographs, and in no case have I noticed a single circle or portion of a circle that was regular enough to have been drawn by the aid of compasses.

I even doubt whether this article was made in New Zealand at all, and am inclined to think that it belongs to the Tonga or the Kingsmill Islands. As to its use, I have no opinion.

In propelling these canoes, the New Zealander holds his paddle in both hands, and always keeps it on the same side of the vessel, being balanced by a companion on the other side. He employs no rowlock, but uses one hand as a fulcrum near the blade, while the other holds the handle nearer the tip. The boat is steered by means of a large paddle in the stern.

CHAPTER LXXXV.

NEW ZEALAND—*Continued.*

RELIGION.

THE GOOD AND EVIL INFLUENCES—THE LIZARD ATUAS—ALARM OF THE CHIEF—MAORI PRAYERS—DIFFICULTY IN TRANSLATING THEM—THE SACRED LANGUAGE—THE TOHUNGAS, OR PRIESTS—BELIEF IN THE FUTURE STATE—THE SACRED BRANCH—THE MALEVOLENT SPIRITS—HAUNTED MOUNTAINS—THE TIKIS, OR SUPPOSED IDOLS OF THE MAORIES—SOME GIGANTIC WOODEN TIKIS—BELIEF IN WITCHCRAFT—FATE OF A WITCH—COUNTRY OF THE WIZARDS—INCANTATION OVER THE SICK—MAORI ANATOMISTS.

WE now come to the religion of the Maories. This is a curious mixture of simplicity and elaboration, having the usual superstitions common to all savage tribes, and being complicated with the remarkable system of "tapu," or "taboo," as the word is sometimes spelt.

Of real religion they have no idea, and, so far as is known, even their superstitions lack that infusion of sublimity which distinguishes the religious system of many savage nations. They have a sort of indefinite belief in a good and evil influence; the former going by the generic name of Atua, and the latter of Wairua. Now, Atua is a word that has a peculiar significance of its own. It may signify the Divine Essence, or it may be applied to any object which is considered as a visible representative of that essence.

Thus, if a Maori wishes to speak of God, he would use the word Atua. But he would equally apply it to a lizard, a bird, a sun-ray, or a cloud. There is one species of lizard, of a lovely green color, called by the natives *kakariki*, which is held in the greatest veneration as a living representative of divinity, and is in consequence always dreaded as an atua. The belief which the natives hold on this subject is well shown by an anecdote told by Mr. Angas.

"The following incident will show how deeply the belief in witchcraft and the supposed influence of the atuas obtains among those who are still heathens. The missionary was shown some small green lizards preserved in a phial of spirits, Muriwenna

and another man being in the room. We forgot at the moment that the little creatures in the phial were atuas, or gods, according to the superstitious belief of Maori polytheism, and inadvertently showed them to the man at the table.

"No sooner did he perceive the atuas than his Herculean frame shrank back as from a mortal wound, and his face displayed signs of extreme horror. The old chief, on discovering the cause, cried out, 'I shall die! I shall die!' and crawled away on his hands and knees; while the other man stood as a defence between the chief and the atuas, changing his position so as to form a kind of shield, till Muriwenna was out of the influence of their supposed power. It was a dangerous mistake to exhibit these atuas, for the chief is very old, and in the course of nature cannot live long, and, if he dies shortly, his death will certainly be ascribed to the baneful sight of the lizard gods, and I shall be accused of *makutu* or witchcraft." In connection with this superstition about the lizard, the same traveller mentions a curious notion which prevails regarding a spider.

"On the beach of the west coast is found a small, black, and very venomous spider, called *katipo* by the natives. Its bite is exceedingly painful, and even dangerous, and the natives think that if the *katipo* bites a man and escapes, the man will die. But if he contrives to catch the spider, and makes a circle of fire round it so that it perishes in the flames, then the man recovers as the spider dies."

The extent to which the imagination of

the natives^s is excited by their fear of witchcraft is scarcely credible. There was one woman named Eko, who was the most celebrated witch of the Waikato district. She exercised extraordinary influence over the minds of the people, who looked upon her as a superior being. On one occasion, when angry with a man, she told him that she had taken out his heart. The man entirely believed her, and died from sheer terror.

Objects which they cannot understand are often considered by the Maories as atuas. Thus a compass is an atua, because it points in one direction, and directs the traveller by its invisible power. A barometer is an atua, because it foretells the weather. A watch is an atua, on account of the perpetual ticking and moving of the hands. Fire-arms used to be atuas until they came into common use, and lost the mystery which was at first attached to them.

Yet the Maori never addresses his prayers to any of these visible objects, but always to the invisible Atua of whom these are but the representatives. The prayers are almost entirely made by the priests or tohungas, and are a set form of words known only to the priests and those whom they instruct. The meaning of the prayers is often uncertain, owing to the obsolete words which are profusely employed in them, and of which, indeed, the prayer almost entirely consists. Prayers, or incantations, as they may perhaps be called with more precision, are made on almost every occasion of life, however trivial, and whether the Maori desires safety in a battle, a favorable wind when on the water, success in a campaign, or good luck in fishing, the tohunga is called upon to repeat the appropriate prayer. Many of these prayers or incantations have been preserved by Dr. Dieffenbach and others. One of these prayers, which can be more correctly translated than many of them, is uttered at the offering of a pigeon. It is designated as "A prayer that the pigeon may be pure, that it may be very fat; when the fire burns, the prayer is said."

"When it is lighted, when it is lighted, the sacred fire, O Tiki! When it burns on the sacred morning, O give, O give, O Tiki, the fat. It burns for thee the fat of the pigeon; for thee the fat of the owl; for thee the fat of the parrot; for thee the fat of the flycatcher; for thee the fat of the thrush. A water of eels; where is its spring? Its spring is in heaven; sprinkle, give, be it poured out."

Offerings of food are common rites of Maori native worship, and offerings are made of both vegetable and animal food. It is much to be regretted that very many of the ancient religious rites of the New Zealanders have perished, and that they have been entirely forgotten by the present generation. Such a loss as this can never be replaced, and the fact that it has occurred ought to make us the more careful in rescuing from

speedy oblivion the expiring religious customs of other uncivilized nations.

Prayers, such as have been mentioned, are handed down by the tohungas or priests from father to son, and the youths undergo a long course of instruction before they can take rank among the priests. Dr. Dieffenbach was once fortunate enough to witness a portion of this instruction. "I was present at one of the lessons. An old priest was sitting under a tree, and at his feet was a boy, his relative, who listened attentively to the repetition of certain words, which seemed to have no meaning, but which it must have required a good memory to retain in their due order. At the old tohunga's side was part of a man's skull filled with water. Into this from time to time he dipped a green branch, which he moved over the boy's head. At my approach the old man smiled, as if to say, 'See how clever I am,' and continued his *abracadabra*."

"I have been assured by the missionaries that many of these prayers have no meaning; but this I am greatly inclined to doubt. The words of the prayers are perhaps the remains of a language now forgotten; or, what is more probable, we find here what has existed among most of the nations of antiquity, even the most civilized, viz: that religious mysteries were confined to a certain class of men, who kept them concealed from the *profanum vulgus*, or communicated only such portions of them as they thought fit.

"They often had a sacred symbolic language, the knowledge of which was confined to the priesthood, as, for instance, the Egyptian hieroglyphics and the Sanscrit; or, if we look nearer home, we find the religion of Thor, Odin, and Freya enveloped in a poetical mythos, which has for its foundation deep and grand philosophical conceptions of morals and ethics."

It is a rather curious fact that, contrary to the usual custom of heathen priests, the tohungas did not oppose the Christian missionaries, but were among the first to receive the new religion. Some of them seem to have received it too hastily and without sufficient knowledge of its principles, as we see from the miserable travesty of Christianity which has sprung up of late years among the Maories, and which is in New Zealand what the system of Taeping is in China.

The priests are, as a rule, the most expert artists and woodcarvers in the country; so that the word "tohunga" is often applied by the natives to a man who is skilful in any art, no matter whether he be a priest or not.

The illustration No. 1, on the 860th page, is a portrait of a very celebrated tohunga, taken by Mr. Angas in 1844. His name was Te Ohu. The portrait was obtained during a great meeting of chiefs at Ahuahu. Te Ohu distinguished himself greatly on this occasion, running about after the fashion of

Maori orators, shaking his long and grizzled locks from side to side, stamping furiously on the ground, and uttering his speech in a singularly deep and sonorous voice.

In the background of the sketch may be seen two remarkable articles. The one, which is the half of a canoe, stuck upright in the ground, marks the grave of a deceased chief; and the other is a pole, on which are hung a calabash of water and a basket of food, with which the spirit of the dead can refresh himself when he returns to visit the scene of his lifetime. Sometimes a dish of cooked pigeons is added; and in one case a model of a canoe, with its sail and paddles, was placed on the tomb, as a conveyance for the soul of the departed when he wished to cross the waters which lead to the eternal abodes of the spirit.

Concerning the state of the spirit after the death of the body the Maories seem to have very vague ideas. The sum of their notions on this subject is as follows:— They believe that the spirit of man is immortal, and that when it leaves the body it goes to the Reinga, or place of departed spirits. Shooting and falling stars are thought to be the souls of men going to this place. The entrance to the Reinga is down the face of a rocky cliff at Cape Maria Van Diemen. Lest the spirit should hurt itself by falling down this precipice, there is a very old tree which grows there, on which the spirits break their fall. One particular brauch was pointed out as being the portion of the tree on which the spirits alighted.

One of the missionaries cut off this branch, and in consequence the natives do not regard it with quite so much awe as they did in former days. Still Dr. Dieffenbach remarks that, when he visited the islands, they held the spot in great veneration, and not even the Christian natives would go near it.

All spirits do not enter the Reinga in the same manner, those of chiefs ascending first the upper heavens, where they leave the left eye, which becomes a new star. For this reason, if a chief is killed in war, his left eye is eaten by the chief of the victorious party, who thinks that he has thus incorporated into his own being the courage, skill; and wisdom of the dead man.

Spirits are not considered as imprisoned in the Reinga, but are able to leave it when they please, and to return to the scene of their former life. They can also hold converse with their friends and relatives, but only through the tohungas. Sometimes, but very rarely, the tohunga sees the spirit; and even then it is only visible as a sunbeam or a shadow. The voice of the spirit is a sort of low whistling sound, like a slight breeze, and is sometimes heard by others beside the tohunga. He, however, is the only one who can understand the mysterious voice and can interpret the wishes of the dead to the living.

As to the life led by departed spirits, the Maories seem to have no idea; neither do they seem to care. They have a notion that in Reinga the kumeras, or sweet potatoes, abound; but beyond that tradition they appear to know nothing.

As to the malevolent spirits, or wairuas, the same cloudy indefiniteness of ideas seems to prevail. The word wairua signifies either the soul or a dream, and is mostly used to signify the spirit of some deceased person who desires to act malevolently toward the living. Such spirits are supposed to haunt certain spots, which are in consequence avoided by the New Zealander. Mountains are especial objects of his veneration, and those which are lofty enough to have their tops covered with perpetual snow are specially feared. He fancies that they are inhabited by strange and monstrous animals, that fierce birds of huge size sit continually on their whitened tops, and that every breeze which blows from them is the voice of the spirit which haunts it.

In consequence of these superstitions, the natives can no more be induced to ascend one of these mountains than to approach a burial ground. They have a curious legend about the Tongariro and Mount Egmont, saying that they were originally brother and sister, and lived together, but that they afterward quarrelled and separated. There is another strange legend of a spot near Mount Egmont. Owing to the nature of the ground, a strong chemical action is constantly taking place, which gives out great quantities of sulphuretted hydrogen gas. The natives say that in former days an Atua was drowned near the spot, and that ever since that time his body has been decomposing.

As to the idols of the New Zealanders, it is very doubtful whether they ever existed. There are, it is true, many representations of the human form, which are popularly supposed to be idols. It was formerly supposed that the green jade ornaments, called "tikis," which are worn suspended from the neck, were idols; but it is now known that they are merely ornaments, deriving their sole value from being handed down from one generation to another.

Three examples of the so-called idols are here given. One of them is remarkable for its gigantic proportions and curious shape. It is about sixteen feet in height, and instead of consisting of a single human figure, as is usually the case, the enormous block of wood is carved into the semblance of two figures, one above the other. This arrangement is not uncommon in New Zealand, and is found also in Western Africa. I possess a walking staff of both countries, which are composed of several human figures, each upon the other's head. The New Zealand staff will be presently described and figured.

(1.) TE OHU, A NATIVE PRIEST.
(See page 857.)

(2.) A TIKI AT RAOERA PAH.
(See page 861.)

(3.) TIKI FROM WHAKAPOKOKO.
(See page 861.)

This gigantic tiki stands, together with several others, near the tomb of the daughter of Te Whero-Whero, and, like the monument which it seems as if were to guard, is one of the finest examples of native carving to be found in New Zealand. The precise object of the tiki is uncertain; but the protruding tongue of the upper figure seems to show that it is one of the numerous defiant statues which abound in the islands. The natives say that the lower figure represents Maui, the Atua who, according to Maori tradition, fished up the islands from the bottom of the sea.

As may be seen in the illustration No. 2, on the preceding page, nearly the whole of both figures is carved with most elaborate curved patterns, which descend over the arms, and adorn those parts of the statue which do duty for hips. A portion of the paling of Raroera Pah is seen in the background, and around the tiki grow many plants of the phormium, or New Zealand flax.

Near this wonderful and mysterious piece of carving stand several others, all of the ordinary type. Two such tikis are shown in the illustration No. 3, opposite, drawn from sketches taken at Whakapokoko. Although not quite so large as the double tiki of Raroera, they are of very great size, as may be seen by contrasting them with the figure of the woman who is standing by one of them.

The firmest belief in witchcraft prevails in New Zealand, though not to such an extent as in many parts of Africa. In cases of illness for which no ordinary cause can be discovered, especially if the patient be of high rank, "makuta," or witchcraft, is always suspected. If a chief, for example, fancies that he has been bewitched, he thinks over the names of those who are likely to have a spite against him, and pitches upon some unfortunate individual, who is thereby doomed to death. One curious example of such a murder is related by Mr. Angas.

He met a party of natives, who told him that a woman, a relation of the chief Ngawaka, had been shot by another chief, who suspected that she had bewitched his son. The young man had been taken ill, and, though the woman in question did her best to cure him, he died. His father took it into his head that she had killed him by her incantations, and, after loading his musket with a stick, shot her through the body. As, however, she was the relation of Ngawaka, it was expected that the chief would demand compensation for her death, and that the murderer would have to pay a very heavy sum. This sort of compensation is called "taua."

There are several modes of witchcraft; but that which is most practised is performed by digging a hole in the ground and invoking the spirit of the person who is to

be bewitched. After the incantations are said, the invoked spirit appears above the hole like a flickering light, and is then solemnly cursed by the witch. Sometimes, instead of digging a hole, the witch goes by night to the river bank, and there invokes the spirit, who appears as a flame of fire on the opposite bank.

Dr. Dieffenbach gives rather a curious account of a district named Urewera, which is supposed to be the special abode of witches. It is situated in the northern island, between Taupo and Hawkes' Bay, and consists of steep and barren hills. The inhabitants of this district are few and scattered, and have the reputation of being the greatest witches in the country.

"They are much feared, and have little connection with the neighboring tribes, who avoid them, if possible. If they come to the coast, the natives there scarcely venture to refuse them anything, for fear of incurring their displeasure. They are said to use the saliva of the people whom they intend to bewitch, and visitors carefully conceal it, to give them no opportunity of working them evil. Like our witches and sorcerers of old, they appear to be a very harmless people, and but little mixed up with the quarrels of their neighbors.

"It is a curious fact that many of the old settlers in the country have become complete converts to the belief in these supernatural powers. Witchcraft has been the cause of many murders: a few days before I arrived at Aotea, on the western coast, three had been committed, in consequence of people declaring on their deathbeds that they had been bewitched. . . .

"It is another curious fact, which has been noticed in Tahiti, Hawaii, and the islands inhabited by the great Polynesian race, that their first intercourse with Europeans produces civil wars and social degradation, but that a change of ideas is quickly introduced, and that the most ancient and deeply-rooted prejudices soon become a subject of ridicule to the natives, and are abolished at once. The grey priest, or tohunga, deeply versed in all the mysteries of witchcraft and native medical treatment, gives way in his attendance on the sick to every European who pretends to a knowledge of the science of surgery or medicine, and derides the former credulity of his patient.

"If a chief or his wife fall sick, the most influential tohunga, or a woman who has the odor of sanctity, attends, and continues day and night with the patient, sometimes repeating incantations over him, and sometimes sitting before the house and praying. The following is an incantation which is said by the priest as a cure for headache. He pulls out two stalks of the *Pteris esculenta*, from which the fibres of the root must be removed, and, beating them together over the head of the patient, says

this chant."—The chant in question is as unintelligible as those which have already been mentioned. Its title is "A prayer for the dead (*i. e.* the sick man) when his head aches: to Atua this prayer is prayed, that he, the sick man, may become well."

When a chief is ill, his relations assemble near the house and all weep bitterly, the patient taking his part in the general sorrowing; and when all the weeping and mourning has been got out of one village, the patient is often carried to another, where the whole business is gone over again. Should the sick person be of an inferior class, he goes off to the bush, and remains there until he is well again, choosing the neighborhood of a hot spring if he

can find one, or, if no such spring is at hand, infusing certain herbs in boiling water and inhaling the steam.

As may be imagined from the practice which they have in cutting up the dead for their cannibal feasts, the Maories are good practical anatomists, and know well the position of all the principal organs and vessels of the body. Consequently, they can operate in cases of danger, using sharp-edged shells if they have no knives. They can also set broken limbs well, bringing the broken surfaces together, binding the limb with splints, laying it on a soft pillow, and surrounding it with a wickerwork contrivance in order to guard it against injury.

CHAPTER LXXXVI.

NEW ZEALAND—*Continued.*

THE TAPU.

THE TAPU, OR LAW OF PROHIBITION—TAPU A SUBSTITUTE FOR GOVERNMENT—PROTECTION TO PROPERTY AND MORALS—ABUSE OF THE TAPU—THE CHIEF AND THE SAILOR—THE CHIEF AND HIS MAT—A VALUABLE SPLINTER—THE HEAD OF THE CHIEF—AN UNLUCKY MISTAKE—HOW TAONU I GOT HIS ARMOR—HAIR CUTTING—TROUBLES OF AN ARTIST—THE CARVED HEAD—TE-WHERO-WHERO AND HIS PORTRAIT—THE TAPU MOUNTAIN—BANEFUL EFFECTS OF THE TAPU ON NATIVE ART—DESTRUCTION OF THE PAHS AND HOUSES—THE TERMINABLE TAPU—THE BATTLE-TAPU—TAKING OFF THE TAPU—DUTY OF THE TOHUNGA—THE TAPU THE STRENGTH OF THE CHIEFS.

WE now come naturally to the custom of Tapu or Taboo, that extraordinary system which extends throughout the whole of Polynesia, modified slightly according to the locality in which it exists.

The general bearings of the law of tapu may be inferred from the sense of the word, which signifies prohibition. The system of tapu is therefore a law of prohibition, and, when stripped of the extravagances into which it often deteriorates, it is seen to be a very excellent system, and one that answers the purpose of a more elaborate code of laws. In countries where an organized government is employed the tapu is needless, and we find that even in those parts of the earth where it was once the only restrictive law it has fallen into disuse since regular government has been introduced.

Were it not for the law of tapu, an absolute anarchy would prevail in most parts of Polynesia, the tapu being the only guardian of property and morality. In order that it may be enforced on the people, the terrors of superstition are called into play, and, in the absence of secular law, the spiritual powers are evoked.

Unprotected by the tapu, property could not exist: protected by it, the most valued and coveted articles are safer than they would be in England or America despite the elaborate legal system that secures to every man that which is his own. In New Zealand, when a man has cultivated a field of kumeras, or sweet potatoes, he needs no

fence and no watchman. He simply sends for the tohunga, who lays the tapu on the field; and from that moment no one save the owner will venture within its boundaries.

Sometimes a canoe is hauled up on the beach, and must be left there for some time unwatched. The owner need not trouble himself about securing his vessel. He has the tapu mark placed upon it, and the boat is accordingly held sacred to all except its possessor. Similarly, if a native boat-builder fixes on a tree which he thinks can be made into a canoe, he places the tapu on it, and knows that no one but himself will dare to cut it down. The mark of tapu in this case, is almost invariably the removal of a strip of bark round the trunk of the tree.

Then the system of tapu is the only guardian of morals. It has been already mentioned that an extreme laxity in this respect prevails among the unmarried girls. But as soon as a girl is married she becomes tapu to all but her husband, and any one who induces her to become unfaithful must pay the penalty of the tapu if the delinquents be discovered. Nor is the tapu restricted to married women. It is also extended to young girls when they are betrothed; and any girl on whom the tapu has thus been laid is reckoned as a married woman.

It will be seen, therefore, that the principle of the tapu is a good one, and that it serves as protection both to property and morals. There are, of course, many instan-

ces where this system has run into extravagances, and where, instead of a protection, it has developed into a tyranny.

Take, for example, the very praiseworthy idea that the life of a chief is most important to his people, and that his person is therefore considered as tapu. This is a proper and wholesome idea, and is conducive to the interests of law and justice. But the development of the system becomes a tyranny. The chief himself being tapu, everything that he touched, even with the skirt of his garment, became tapu, and thenceforth belonged to him. So ingrained is this idea that on one occasion, when a great chief was wearing a large and handsome mantle and found it too heavy for a hot day, he threw it down a precipice. His companion remonstrated with him, saying that it would have been better to have hung the mat on a bough, so that the next comer might make use of it. The chief was horror-struck at such an idea. It was hardly possible that a superior to himself should find the mat, and not likely that an equal should do so, and if an inferior were to wear it, he would at once die.

As the very contact of a chief's garment renders an object tapu, *à fortiori* does his blood, and one drop of the blood of a chief falling upon even such objects as are free from the ordinary laws of tapu, renders them his property. A curious example of the operation of this law occurred when a meeting of chiefs was called at the Taupo lake. As the principal man of the tribes, the celebrated chief Te Heu-heu was invited, and a new and beautifully carved canoe sent to fetch him. As he stepped into it, a splinter ran into his foot, inflicting a very slight wound. Every man leaped out of the canoe, which was at once drawn up on the beach and considered as the property of Te Heu-heu. Another canoe was procured, and in it the party proceeded on their journey.

Another kind of tapu takes place with regard to any object which is connected with the death of a native. If, for example, a Maori has fallen overboard from a canoe and been drowned, the vessel can never be used again, but is tapu. Or if a man commits suicide by shooting himself, as has already been mentioned, the musket is tapu. But in these cases the articles are tapu to the atua, and not to men. Sometimes they are left to decay on the spot, no man daring to touch them, or they are broken to pieces, and the fragments stuck upright in the earth to mark the spot where the event occurred.

Sometimes this personal tapu becomes exceedingly inconvenient. The wife of an old and venerable tohunga had been ill, and was made tapu for a certain length of time, during which everything that she touched became tapu. Even the very ground on

which she sat was subject to this law, and accordingly, whenever she rose from the ground, the spot on which she had sat was surrounded with a fence of small boughs stuck archwise into the earth, in order to prevent profane feet from polluting the sacred spot.

The most sacred object that a New Zealander can imagine is the head of the chief. It is so sacred that even to mention it is considered as an affront. Europeans have often given deadly offence through ignorance of this superstition, or even through inadvertence. Mr. Angas narrates a curious instance of such an adventure. A friend of his was talking to a Maori chief over his fence, and the conversation turned upon the crops of the year. Quite inadvertently he said to the chief, "Oh, I have in my garden some apples as large as that little boy's head"—pointing at the same time to the chief's son, who was standing near his father.

He saw in a moment the insult that he had offered, and apologized, but the chief was so deeply hurt that it was with the greatest difficulty that a reconciliation was brought about. The simile was a peculiarly unfortunate one. To use the head of a chief's son as a comparison at all was bad enough, but to compare it to an article of food was about the most deadly insult that could be offered to a Maori. All food and the various processes of preparation are looked down upon with utter contempt by the free Maori, who leaves all culinary operations to the slaves or "cookies."

One of the very great chiefs of New Zealand was remarkable for his snowy white hair and beard, which gave him a most venerable aspect. He was held in the highest respect, and was so extremely sacred a man that his head might only be mentioned in comparison with the snow-clad top of the sacred mountain.

The same traveller to whom we are indebted for the previous anecdote relates a curious story illustrative of this etiquette. There was a certain old chief named Taonui, who was in possession of the original suit of armor which was given by George IV. to E'Hongi when he visited England. "The subsequent history of this armor is somewhat curious. It passed from the Nga Puis to Tetori and from Tetori to Te Whero-Whero at the Waikato feast, and came into Taonui's hands under the following circumstances.

"On the death of a favorite daughter Te Whero-Whero made a song, the substance of which was, that he would take off the scalps of all the chiefs except Ngawaka, and fling them into his daughter's grave to avenge her untimely death. The words of this song highly insulted the various individuals against whom it was directed, more especially as it was a great curse for the

hair of a chief, which is sacred, to be thus treated with contempt. But the only chief who dared to resent this insult from so great a man as Te Whero-Whero was Taonui, who demanded a 'taua,' or gift, as recompense for the affront, and received the armor of 'E' Hongi in compensation.

"I made a drawing of the armor, which was old and rusty. It was of steel, inlaid with brass, and, though never worn by the possessors in battle—for it would sadly impede their movements—it is regarded with a sort of superstitious veneration by the natives, who look upon it as something extraordinary."

A chief's head is so exceedingly sacred that, if he should touch it with his own fingers, he may not touch anything else without having applied the hand to his nostrils and smelt it so as to restore to the head the virtue which was taken out of it by the touch. The hair of a chief is necessarily sacred, as growing upon his head. When it is cut, the operation is generally confided to one of his wives, who receives every particle of the cut hair in a cloth, and buries it in the ground. In consequence of touching the chief's head, she becomes tapu for a week, during which time her hands are so sacred that she is not allowed to use them. Above all things, she may not feed herself, because she would then be obliged to pollute her hands by touching food, and such a deed would be equivalent to putting food on the chief's head—a crime of such enormity that the mind of a Maori could scarcely comprehend its possibility.

When engaged in his explorations in New Zealand, and employed in sketching every object of interest which came in his way, Mr. Angas found this notion about the chief's head to be a very troublesome one. He was not allowed to portray anything connected with food with the same pencil with which he sketched the head of a chief, and to put a drawing of a potato, a dish for food, or any such object, into the same portfolio which contained the portrait of a chief, was thought to be a most fearful sacrilege.

The artist had a narrow escape of losing the whole of his sketches, which a chief named Ko Tarui wanted to burn, as mixing sacred with profane things. They were only rescued by the intervention of Te Heu-heu, a superstitious old savage, but capable of seeing that the white man had meant no harm. Warned by this escape, Mr. Angas always made his drawings of tapu objects by stealth, and often had very great difficulty in eluding the suspicious natives.

Even the carved image of a chief's head is considered as sacred as the object which it represents. Dr. Dieffenbach relates a curious instance of this superstition.

"In one of the houses of Te Puai, the head chief of all the Waikato, I saw a bust, made by himself, with all the serpentine

lines of the moko, or tattooing. I asked him to give it to me, but it was only after much pressing that he parted with it. I had to go to his house to fetch it myself, as none of his tribe could legally touch it, and he licked it all over before he gave it to me; whether to take the tapu off, or whether to make it more strictly sacred, I do not know. He particularly engaged me not to put it into the provision bag, nor to let it see the natives at Rotu-nua, whither I was going, or he would certainly die in consequence.

"Payment for the bust he would not take; but he had no objection to my making him a present of my own free will: which I accordingly did, presenting him and his wife with a shirt each."

Once the natives were very angry because Mr. Angas went under a cooking shed, having with him the portfolio containing the head of Te Heu-heu. Even his hands were tapu because they had painted the portrait of so great a chief, and he was subjected to many annoyances in consequence. Finding that the tapu was likely to become exceedingly inconvenient, he put a stop to further encroachments by saying that, if the people made any more complaints, he would put Te Heu-heu's head into the fire. This threat shocked them greatly, but had the desired effect.

Sometimes this sanctity of the chief is exceedingly inconvenient to himself. On one occasion, when Mr. Angas was visiting the chief Te Whero-Whero, he found the great man superintending the plantation of a kumera ground and the erection of a house for himself. Rain was falling fast, but the old chief sat on the damp ground, wrapped up in his blanket, and appearing to be entirely unconcerned at the weather, a piece of sail-cloth over the blanket being his only defence.

He did not rise, according to the custom of the old heathen chiefs, who will sometimes sit for several days together, in a sort of semi-apathetic state. To the request that his portrait might be taken Te Whero-Whero graciously acceded, and talked freely on the all important subject of land while the painter was at work. Finding the rain exceedingly unpleasant, the artist suggested that they had better move into a house. The old chief, however, knowing that he could not enter a house without making it his property by reason of contact with his sacred person, declined to move, but ordered a shelter to be erected for the white man. This was done at once, by fastening a blanket to some upright poles: and so the portrait was completed, the painter under cover and the sitter out in the rain.

Localities can be rendered tapu, even those which have not been touched by the person who lays the tapu upon them. The chief Te Heu-heu, for example, was pleased to declare the volcano Tongariro under the

tapu, by calling it his backbone, so that not a native would dare approach it, nor even look at it, if such an act could be avoided. Mr. Angas was naturally desirous of visiting this mountain, but found that such a scheme could not be carried out. He offered blankets and other articles which a New Zealander prizes; but all to no purpose, for the tapu could not be broken. The chief even tried to prevent his white visitors from travelling in the direction of the mountain, and only gave his consent after ordering that the sacred Tongariro should not even be looked at. So deeply is this superstition engraven in the heart of the New Zealander, that even the Christian natives are afraid of such a tapu, and will not dare to approach a spot that has thus been made sacred by a tohunga. Reasoning is useless with them; they will agree to all the propositions, admit the inference to be drawn from them, and then decline to run so terrible a risk.

One of the finest examples of native architecture was made tapu by this same chief, who seems to have had a singular pleasure in exercising his powers. It was a pah called Waitahanui, and was originally the stronghold of Te Heu-heu. It is on the borders of the lake, and the side which fronts the water is a full half-mile in length. It is made, as usual, of upright posts and stakes, and most of the larger posts are carved into the human form, with visages hideously distorted, and tongues protruded seaward, as if in defiance of expected enemies.

Within this curious pah were the cannibal cook-houses which have already been figured, together with several of the beautifully carved patukas or receptacles for the sacred food of the chief. Specimens of these may be seen figured on page 831. In this pah Mr. Angas found the most elaborate specimen of the patuka that he ever saw. It was fortunate that he arrived when he did, as a very few years more would evidently complete the destruction of the place. Many of the most beautiful implements of native art were already so decayed that they were but a shapeless heap of ruins, and the others, were rapidly following in the same path. Of these specimens of Maori carving and architecture nothing is now left but the sketches from which have been made the illustrations that appear in this work.

Here I may be allowed to controvert a popular and plausible fallacy, which has often been brought before the public. Travellers are blamed for bringing to England specimens of architecture and other arts from distant countries. It is said, and truly too, that such articles are out of place in England. So they are: but it must be remembered that if they had not been in England they would not have been in existence. The marvellous sarcophagus, for example,

brought to London by Belzoni, and now in the Soane Museum, would have been broken to pieces and hopelessly destroyed if it had been allowed to remain in the spot where it was found.

Again, had not the Assyrian sculptures found a home in the British Museum, they would have been knocked to pieces by the ignorant tribes who now roam over the ruins of Nineveh the Great. Even had the vast statues defied entire destruction, the inscriptions would long ago have been defaced, and we should have irreparably lost some of the most valuable additions to our scanty knowledge of chronology.

So again with the Elgin Marbles. Undoubtedly they were more in their place in Greece than they are in England; but, if they had not been brought to England, the iconoclastic hand of the Mussulman would have utterly destroyed them, and the loss to art would have been indeed terrible.

Thus is it with regard to the specimens of savage art, no matter in what way it is developed. Taking New Zealand as an example, there is not in England a single specimen of a Maori house. It could be easily taken to pieces and put together again; it is peculiarly valuable to ethnologists on account of the extraordinary mixture which it displays of ancient Egyptian architecture and ancient Mexican art; and in a very few years there will not be a single specimen of aboriginal architecture in the whole of New Zealand. The Maories, who have abandoned the club for the rifle, the mat for the blanket, and even the blanket for the coat and trousers, have begun to modify their ancient architecture, and to build houses after the European models.

Unless, therefore, means be taken to rescue specimens of Maori architecture from destruction, it is much to be doubted whether in twenty years' time from the present date a single specimen will exist as a type of native art. So it is with the canoes. Graceful, picturesque, and adorned with the finest specimens of Maori art, the canoes were unique among vessels. At the present day the more useful but more commonplace whaleboat has superseded the canoe, and in a few years the elaborately decorated vessels of the Maories will have utterly passed away.

We may be sure that the tide of civilization is sweeping so rapidly over the world, that a very few years will see the end of savage life in all lands to which the white man can gain access. The relics of the ancient mode of life are left by the natives to perish, and, unless they are rescued, and brought to a country where they can be preserved, they will necessarily vanish from the face of the earth. Having this idea in my own mind, I set myself some years ago to collect articles of daily use from all parts

of the world. The light which they throw upon anthropology is really astonishing, and, among some eight or nine hundred specimens, there is not one that does not tell its own story.

Take, for example, the stone *merai* that lies before me. What a tale does it not tell of the country where it was found, and of the workman who made it! The stone shows that it was obtained from a volcanic country; the short, weighty form of the weapon shows that it was made for a courageous race who fought hand to hand; and the graceful curves and perfect balance of the weapon show that the maker was a true artist. More than that. The *merai* has been made by rubbing it with another stone, and must have occupied years of labor. See, then, what a tale this weapon tells us—the volcanic region, the courageous warrior, and the worthlessness of time. Year after year the man must have worked at that *merai*, bending his tattooed face over it, balancing it in his hand, and watching its soft curves grow into perfection. Then, after it was made, he has evidently carried it about with him, fought with his foes, and dashed out their brains with its once sharp and now notched edge. Afterward, when he, or may be his grandson, came to fight against the white men, their fire-arms were too terrible to be opposed, and the *merai* was taken from the hand of the dead warrior as he lay on the field of battle, its plaited cord still round his wrist. Nevermore will a stone *merai* be made, and before very long the best examples of Maori weapons will be found in English museums.

We will now return to the subject of the tapu. Useful as it may be as a guardian of property, it often exaggerates that duty, and produces very inconvenient results. For example, some travellers were passing through the country, and were hungry and wearied, and without food. Very opportunely there came in sight a fine pig; but the animal contrived to run across a piece of ground which was tapu, and in consequence became tapu itself for a certain number of days, and could not be eaten.

There are thousands of such tapu spots in the country. If, for example, a great chief has been travelling, every place where he sits to rest is tapu, and is marked by a slight fence of sticks. In many cases, each of these sacred spots has its own name. The same is the case when the body of a chief is carried to his own pah for burial, every resting place of the bearers becoming tapu. Therefore nothing was more likely than to come across one of these tapu spots, or more easy than for the pig to break through its slight fence.

A curious modification of the tapu took place before and after a battle. The *tohunga* assembled the warriors of his own party, and went with them to the lake or river, which

had been made tapu for the purpose. The men then threw off all their clothing, and went into the water, which they scooped up with their hands and threw over their heads and bodies. The priest then recited the appropriate incantation.

Thus the battle tapu was laid upon the warriors, who were thereby prohibited from undertaking any other business except that of fighting, and were supposed, moreover, to be under the protection of the gods. This tapu was most strictly regarded, and the warriors had to learn quite a long list of occupations which were forbidden to them, such as carrying a load, cutting their own hair, touching the head of a woman, and so forth.

After the fighting is over, it is necessary that the tapu should be taken off from the survivors, so that they should be enabled to return to their usual mode of life. This ceremony is rather a complicated one, and varies slightly in different parts of the country. The chief features, however, are as follows:—

Each man who had killed an enemy, or taken a slave, pulled off a lock of hair from the victim, and retained it as a trophy. They then went in a body to the *tohunga*, and gave him a portion of the hair. This he tied on a couple of little twigs, raised them high above his head, and recited the incantation; after which the whole body joined in the war song and dance. This being over, the warriors clapped their hands together and struck their legs, that act being supposed to take off the tapu which had been contracted by imbruing them in the blood of the enemy.

The war party then goes home, and a similar ceremony is undergone in the presence of the principal *tohunga* of their pah, the hands being clapped and the war dance performed. The remainder of the hair is given to the *tohunga*, who, after reciting his incantation, flings the tuft of hair away, and ends by another incantation, which declares that the tapu is taken away.

As a general rule, the tapu can only be taken off by the person who imposed it; but if a man imposed a tapu on anything, another who was very much his superior would not have much scruple in breaking through it. By courtesy the tapu was mostly respected by great and small alike, and, by courtesy also, the very great men often put themselves to great inconvenience by refraining from actions that would lay the tapu on the property of inferiors. Thus we have seen how a chief refused to enter a house, lest he should render it his property, and preferred to sit in the pouring rain, rather than run the risk of depriving an inferior of his property.

Should an object become tapu by accident, the *tohunga* can take off the tapu and restore the object to use. A curious instance

of the exercise of this power is related by a traveller. A white man, who had borrowed an iron pot for cooking, wanted some soft water, and so he placed the pot under the eaves of a house from which the rain was running. Now, the house happened to be tapu, and in consequence the water running from it made the pot tapu. It so happened that a woman, who was ignorant of the circumstance, used the pot for cooking, and when she was told that the vessel was tapu she was greatly frightened, declaring that she would die before night. In this difficulty a tohunga came to her relief, repeated an incantation over the vessel, and made it "noa," or common, again.

Sometimes the tapu only lasts for a period, and, after that time has elapsed, expires without the need of any ceremony. Thus, if a person who is tapu by sickness is touched by another, the latter is tapu for a definite time, usually three days. If a sick person dies inside a house, that house is *ipso facto*, tapu and may never again be used. It is painted with red ochre, as a sign of its sanctity, and is left to decay. In consequence of this superstition, when the patient seems likely to die, he is removed from the house, and taken to a spot outside the pah, where a shed is built for his reception.

It will be seen from the foregoing account how great is the power of the tapu, and how much it adds to the power of the chiefs. Indeed, without the power of tapu, a chief would be but a common man among his people—he would be liable to the tapu of others, and could not impose his own. The tapu is one of the chief obstacles against the spread of Christianity. Knowing that the

missionaries treat the tapu as a mere superstition, the great chiefs do not choose to embrace a religion which will cause them to lose their highest privilege, and would deprive them of the one great power by which they exercise their authority.

Mr. Williams, the well-known missionary, sums up the subject of the tapu in very bold and graphic language:—"It is the secret of power, and the strength of despotic rule. It affects things both great and small. Here it is seen tending a brood of chickens, and there it directs the energies of a kingdom. Its influence is variously diffused. Coasts, islands, rivers, and seas; animals, fruit, fish, and vegetables; houses, beds, pots, cups, and dishes; canoes, with all that belong to them, with their management; dress, ornaments, and arms; things to eat and things to drink; the members of the body; the manners and customs; language, names, temper; and even the gods also; all come under the influence of the tapu.

"It is put into operation by religious, political, or selfish motives; and idleness lounges for months beneath its sanction. Many are thus forbidden to raise their hands or extend their arms in any useful employment for a long time. In this district it is tapu to build canoes; on that island it is tapu to erect good houses. The custom is much in favor among chiefs, who adjust it so that it sits easily on themselves, while they use it to gain influence over those who are nearly their equals; by it they supply many of their wants, and command at will all who are beneath them. In imposing a tapu, a chief need only be checked by a care that he is countenanced by ancient precedents."

CHAPTER LXXXVII.

NEW ZEALAND—*Concluded.*

FUNERAL CEREMONIES AND ARCHITECTURE.

THE MOURNING OVER THE DEAD CHIEF—THE TANGI, AND THE SCARS WHICH IT LEAVES—FIRST BURIAL OF THE CHIEF—THE WAHI TAPU—THE SECOND BURIAL, OR “HAHUNGA”—REMOVAL OF THE TAPU, AND INSTALLATION OF THE SUCCESSOR—E’ HONGI’S DEATHBED—A DECAYING PAH—CANOE TOMBS—MONUMENT TO E’TOKI—TOMB OF TE WHERO-WHERO’S DAUGHTER—SAVAGE SENTIMENT—MAORI ARCHITECTURE—MATERIAL, SHAPE, AND SIZE OF THE HOUSES—A CROWDED SLEEPING PLACE—THE EAT MAN HOUSE—RANGIHAEATA’S REVENGE—PUATIA’S WAR-HOUSE AND ITS SCULPTURES—INTERIOR VIEW OF A PAH—TOOLS USED IN HOUSE-BUILDING—THE AXE AND THE CHISEL—THE TOKO-TOKO, OR WALKING STICK.

WE now come to the ceremonies that belong to funerals.

When a chief, or indeed any Rangatira, dies, his friends and relations deck the body in the finest clothes which the deceased had possessed in his lifetime, lay it out, and assemble round it for the customary mourning. The women are the chief mourners, and indulge in the most demonstrative, not to say ostentatious, ebullitions of grief. Sometimes they squat upon the ground, their bodies and faces wrapped in their mantles, as if utterly overpowered by grief. Sometimes they wave their arms in the air, shaking their hands with expressive gestures of sorrow; and all the while they utter loud wailing cries, while the tears stream down their cheeks.

Much of this extravagant sorrow is necessarily feigned, according to the custom of New Zealand life, which demands tears on so many occasions; but there is no doubt that much is real and truly felt. The women cut themselves severely with shells, making incisions in the skin several inches in length. These incisions are filled with charcoal, as if they had been part of the regular moko or tattoo, and become indelible, being, in fact, perpetual records of sorrow. Some of these women cut themselves with such severity, that in their old age they are covered with the thin blue lines of the “tangi,” their faces, limbs, and bodies being traversed by them in rather a ludicrous manner. The tangi lines might be mistaken for regular tattooing, except for one point. They have

no pattern, and instead of being curved, as is always the case with the moko, they are straight, about two inches in length, and run parallel to each other.

They address long speeches to the dead man, enumerating his many virtues, his courage, his liberality, the strength of his tapu, and so forth, mixed with reproaches to him for dying and going away from them when they stood in such need of him. Indeed, the whole of the proceedings, with the exception of cutting the skin, are very like those of an Irish wake.

In the illustration No. 1, on the 872nd page, are shown these various ceremonies. The dead body of the chief is lying under the shed, wrapped in the best mantle, and with a coronal of feathers in the hair. In the front sits a chief, whose rank is denoted by his hani, or staff of office, that lies by him, and by the elaborate mantle in which he has wrapped himself. Standing near the corpse is one of the mourners, with arms upraised and hands quivering, while others are seen sitting in various attitudes of woe. The fence of the pah is shown in the background, with its grotesque images and curious architecture.

When the old people attend a funeral, they usually paint themselves freely with red ochre, and wear wreaths of green leaves upon their heads. The house in which the death took place is rendered tapu until the body is finally disposed of—an event which does not take place for some time.

After the mourning ceremonies have been

completed, the body is placed in a sort of coffin and allowed to decay, the green jade merai, the tiki, the hani, and other emblems of rank being placed with the corpse. In some parts of the country this coffin is canoe-shaped, and suspended to the branches of a tree, certain places being kept sacred for this purpose. There existed, for example, several graves belonging to the Nga-pui tribe, which had been preserved on account of the sacred character which belonged to them. The natives had long abandoned the custom of hanging the coffins of the dead on the trees, but the sacred character still clung to them, and, though the woods in that part of the country had been felled, the sacred groves were allowed to flourish unharmed.

Sometimes the body of a very great chief was placed in a wooden receptacle in the midst of the pah, called the waki-tapu, and there allowed to decay. As might be expected, a most horrible odor is disseminated through the pah during the process of decomposition; but the inhabitants do not seem to trouble themselves, their nostrils not being easily offended. For example, when a whale is thrown ashore, the stench of the huge mass of decomposition is so overpowering that an European cannot endure it. The natives, however, say that they are used to it, and do not notice it. Indeed, people who can eat the horrible messes of putrid maize of which they are so fond must be so obtuse of scent as to be indifferent to any ill odor.

Be it as it may, in time the process of decay is supposed to be complete, — seven or eight months being the usual time. A curious ceremony, called the “habunga,” then takes place. The friends and relatives of the deceased chief are again assembled, and the bones are solemnly taken from their receptacle and cleaned. The person who cleans them is necessarily tapu, but is rendered “noa,” or common again, by the eldest son and daughter of the deceased chief eating of the sacred food offered to the dead. Should the eldest girl happen to be dead, the food is placed in a calabash, and laid in the now empty coffin, the spirit of the girl being called by name, and the food offered to her. The spirit is supposed to partake of the food; and the tapu is thus removed as effectually as if she were alive, and had visibly eaten the provisions. Should the chief have had no daughter, the nearest female relative takes the office. The usual orations are made in honor of the deceased and the merai, tiki, and other ornaments of the dead chief are then handed over to his eldest son, who thus takes possession of the post which his father had vacated, the ceremony being analogous to a coronation among Europeans.

When the celebrated chief E' Hongi, the “Scourge of New Zealand,” as he has been called, died, his children were so afraid that they would be attacked by those whom the terror of his name had kept quiet, that they

wanted to omit the preliminary orations and “tangi,” and to lay his body in the “waki-tapu,” or sacred place, on the day after his death. This intention was, however, overruled, chiefly in consequence of the foresight of the dying chief.

Feeling that his end was close at hand, he rallied his sons round him, sent for all his warlike stores, the merais, patus, muskets, ammunition, and, above all, the armor which he had received from George IV., and bequeathed them to his children. He was asked what “utu,” or satisfaction, should be exacted for his death, but replied that the only utu which his spirit would desire was, that his tribe should be valiant, and repel any attack that might be made upon them. But for this really noble sentiment, there would have been great slaughter at his death, in order to furnish attendants for him.

That his tribe should for the future be valiant, and repel the attacks of their enemies, was the ruling idea in E' Hongi's mind; and on March 6, 1828, he died, continually repeating the words, “Kia toa! kia toa!” — *i. e.* “Be valiant! be valiant!”

After the ceremony of cleaning the bones is over, they are taken by the principal tohunga, or priest, who generally disposes of them in some secret spot sacred to the remains of dead chiefs, and known only to himself. Sometimes, however, they are laid in beautifully carved boxes, which are supported on posts in the middle of the pah.

Sometimes the waki-tapu, or sacred place in which the body of a chief is placed while it undergoes decomposition, is marked in a very curious manner, and the entire village deserted for a time. For example, at the pah of Hurewenua, the chief had died about six weeks before Mr. Angas arrived at the place, which he found deserted. “Not far from this island pah stood the village of Huriwenua, the gaily-ornamented tomb of the late chief forming a conspicuous object in the centre. Here, although everything was in a state of perfect preservation, not a living soul was to be seen; the village, with its neat houses made of raupo, and its court-yards and provision boxes, was entirely deserted. From the moment the chief was laid beneath the upright canoe, on which were inscribed his name and rank, the whole village became strictly tapu, or sacred, and not a native, on pain of death, was permitted to trespass near the spot. The houses were all fastened up, and on most of the doors were inscriptions denoting that the property of such an one remained there.

“An utter silence pervaded the place. After ascertaining that no natives were in the vicinity of the forbidden spot, I landed, and trod the sacred ground; and my footsteps were probably the first, since the desertion of the village, that had echoed along its palisaded passages.

“On arriving at the tomb, I was struck

(1.) MOURNING OVER A DEAD CHIEF. (See page 869.)

(2.) TOMB OF E TOKI. (See page 873.)

with the contrast between the monument of the savage and that of the civilized European. In the erection of the latter, marble and stone and the most durable of metals are employed, while rapidly decaying wood, red ochre, and feathers form the decorations of the Maori tomb. Huriwenua having been buried only six weeks, the ornaments of the *waki-tapu*, or sacred place, as those erections are called, were fresh and uninjured. The central upright canoe was richly painted with black and red, and at the top was written the name of the chief; above which there hung in clusters, bunches of *kaka* feathers, forming a large mass at the summit of the canoe. A double fence of high palings, also painted red, and ornamented with devices in arabesque work, extended round the grave, and at every fastening of flax, where the horizontal rails were attached to the upright fencing, were stuck two feathers of the albatross, the sunny whiteness of which contrasted beautifully with the sombre black and red of the remainder of the monument."

One of these tombs may be seen in the background of illustration No. 1, on p. 860, containing the portrait of an old priest, and another is shown in the view of a village which will be given on a future page.

Within the pah is often erected a monument or mausoleum of the dead. A very beautiful example of this kind of tomb was erected in the pah of Rangihæta to the memory of E' Toki, the mother of Raupahara.

It was nearly semi-circular in shape, and the body was placed in it in an upright position. It was covered with a roof, squared at the corners, and projecting like a verandah all round, and sloping toward the back. The central tomb, the roof, and the posts which supported it, were all covered with the most elaborate arabesque pattern, mostly of a spiral character. Paint was liberally used on it, that, on the central tomb or coffin being red and white, while that which decorated the roof and posts was red and black. In front of the projecting roof was hung the beautifully woven kaitaka mat of the deceased woman, and tufts of the white feathers of the albatross were arranged at regular intervals upon it.

Even when Mr. Angas saw this beautiful example of Maori art, it was beginning to decay, the climate being damp, and the natives never repairing a decaying tomb. It was, of course, strictly tapu. No native liked to go close to it, and for a slave, or even a free man of inferior rank, to go within a certain distance of it would have been a crime punishable with instant death.

I have much pleasure in presenting on the preceding page an illustration of this beautiful monument of Maori art, taken from a drawing made by Mr. Angas in 1844, while the perishable materials of

which the tomb was made were yet in tolerable preservation. Under the carved and decorated roof may be seen the semi-circular coffin in which the body had been placed, distinguished from the outer portion of the tomb by the red and white colors with which it was painted, in contrast to the red and black of the outer portions. The reader will notice that red is the prevalent color in all tombs, because red is the hue of mourning as well as of war among the Maories. Immediately under the eaves of the front may be seen the highly ornamented border of the kaitaka mat once worn by the deceased, and now left to decay upon her tomb.

Round the tomb itself runs a slight and low fence. This palisade, small as it might appear, afforded ample protection to the tomb, inasmuch as the whole space within it was rendered sacred by a tapu laid upon it by Raupahara, so that not even the highest chief would venture to enter the forbidden enclosure.

One of the finest specimens of carving in New Zealand—perhaps the finest in the whole country—is, or rather was, a mausoleum erected by Te Whero-Whero to his favorite daughter. It was upon the death of this daughter that Te Whero-Whero gave such dire offence to the other chiefs by threatening to throw their scalps into his daughter's grave, for which offence he had to give up the celebrated armor of E' Hongi by way of fine.

The monument was erected in Raroera, formerly one of the largest and finest pahas in New Zealand, but rendered desolate by the act of the headstrong and determined chief. He had this wonderful tomb built for his daughter, and, as soon as her body was placed within it, he pronounced the whole pah to be tapu. It was at once deserted: old and young quitted the place, leaving everything behind them, the provisions to moulder and the weapons to decay. Solid houses that had occupied many years in building and carving were allowed to fall into mere shapeless heaps of ruins; and even in 1844 the rank vegetation had so completely overrun the place that many of the best pieces of native work were covered by the foliage.

The tomb is about twelve feet high, and consists of the usual box for the reception of the body, covered by a projecting roof, which is supported by pillars. Were it as graceful in form as the monument to E' Toki, this would be by far the finest specimen of native art; but unfortunately it does not possess the bold outline and contrast of the curve and the straight line which are so characteristic of E' Toki's tomb.

The elaboration of the carving on this monument is so great that it almost baffles the skill of the draughtsman. Mr. Angas

succeeded in copying it, and when the drawing was shown to the artist who had executed the work he was astounded, and pronounced the white man to be a great tohunga. The roof is supported by pillars, each pillar consisting of two human figures, the upper standing on the head of the lower. The upper figure is about seven feet in height, and has a gigantic head, with an enormous protruding tongue that reaches to the breast.

The whole of the tomb is covered with human heads. Exclusive of those upon the posts, the front alone of the tomb contains fourteen faces, each differing from the other in expression and pattern of the moko, but all wearing the same defiant air. Their enormous eyes are made peculiarly conspicuous by being carved out of haliotis shell, carrying out on a large scale the plan adopted in the chiefs' hakis and other sculptures. The whole of the space between the figures is covered with the most elaborate arabesques, intertwining with each other in a bewildering manner, but each running its own boldly curved course. Between the various pieces that compose this tomb are set bunches and tufts of white and green feathers, which serve to adorn as well as disguise the necessary seams of the wood-work.

This wonderful monument was entirely carved by one man, named Paranui. He was lame, and in consequence had expended his energies in art, in which he had so greatly distinguished himself that he took rank as a tohunga. He was equally celebrated as a tattooer; and it may well be imagined that a man who could design so extraordinary a piece of workmanship must be skilful in inventing the endless variety of patterns needful in the decoration of chief's faces. In performing this work, Paranui had but one tool, the head of an old bayonet.

The loss of such specimens of native art as those which have been described carries out my former remarks on the necessity for removing to our own country every memorial of savage life that we can secure. We inflict no real injury upon the savages, and we secure an invaluable relic of vanishing customs. These monuments, for example, were simply carved and then left to decay. Had they been removed to this country, where they would have been guarded from the power of the elements and the encroachments of vegetation, we should have seen them in complete preservation at the present day, and likely to last as long as the building which contained them.

Of course the sentimental argument may be pleaded against this view of the case; but in matters which are of vital importance in the grand study of anthropology mere sentiment ought to have no place. Neither has it such place as some often

imagine. The savage, finding that the white man yields to him on this point, is only too glad to find any vantage ground, and always presses on as fast as the other yields — just as has been done in India with the question of caste. We cannot measure their mental sensibilities any more than their physical by our own. A savage endures with stoicism tortures which would kill an European, simply because he does not feel them as much. And the mental and physical sensibilities are very much on a par.

The Maori is perhaps the finest savage race on the face of the earth, and yet we cannot think that he is exactly an estimable being, whose ambition is murder, and whose reward is to eat the body of his victim, who never does a stroke of work that he can avoid, and who leads a life of dissipation as far as his capabilities go. Of all savage nations, the New Zealander displays most sorrow for the loss of a friend or relation. Tears flow profusely from his eyes, and every tone of his voice and every gesture of his body convey the impression that he is borne down by unendurable woe. Yet we have seen that this effusion of sorrow is mostly premeditated, and merely a conventional mode of acting required by the etiquette of the country.

When two people can be bathed in tears, speak only in sobbing accents, utter heart-rending cries, and sink to the ground as overwhelmed by grief, we cannot but compassionate their sorrow and admire their sensibility. But if, in the middle of all these touching demonstrations of grief, we see them suddenly cease from their sobs and cries, enter into a little lively conversation, enjoy a hearty laugh, and then betake themselves afresh to their tears and sobs, we may take the liberty of doubting their sincerity.

So with those beautiful houses and monuments that are left to perish by neglect. The builder did in all probability feel very keenly at the time, though the feeling of grief seems sometimes to take a curious turn, and be metamorphosed into vengeance and an excuse for war; but it is very much to be doubted whether grief for the departed is a feeling that is really permanent in the savage mind. The Maori chief may lay his tapu on an entire village when a relative dies, and if, after the lapse of years, any one be rash enough to invade the forbidden precincts, he will visit the offence with instant punishment. But it must be remembered that the infringement of the tapu in question is not an insult to the dead but to the living, and that when the chief punishes the offender, he does not avenge an affront offered to his dead relative, but a direct insult to himself.

In spite of his sentiment, I think that the Maori might have been induced to sell such

specimens of art, and even if he refused to yield to such a proposition, he would have respected us none the less if, when we had captured a pah, we exercised the right of conquest, and took that which we could not buy. Or even supposing that the first idea had proved impracticable, and the second unadvisable; it would not have been very difficult to have induced a native artist to execute a duplicate which he could sell for a price which would enrich him for life.

Such sentiments are, I know, unpopular with the mass of those who only see the savage at a distance, which certainly, in the case of savage life, lends the only enchantment to the view that it can possess. But I believe them to be just and true, and know that the closer is our acquaintance with savage life, the more reason we have to be thankful for civilization. The savage knows this himself, and bitterly feels his inferiority. He hates and fears the white man, but always ends by trying to imitate him.

To return to these monuments. In former times they existed in great numbers, and even in more recent days those which survive are so characteristic of a style of art that may have taken its rise from ancient Mexico, that I should have been glad to transfer to these pages several more of Mr. Angas' sketches.

It will be seen from several of the previous illustrations that the New Zealanders must possess much skill in architecture. The observant reader must have remarked that the art of house-building is practically wanting in Australia; and that such should be the case is most extraordinary, seeing that architectural skill is singularly developed among the great Polynesian families. The New Zealander, whose country has much in common with Australia, is remarkable for the skill and taste which he displays in architecture; and a short space will therefore be devoted to this subject.

As is the case throughout Polynesia in general, the material used in house-building is wood, and the various pieces of which a house is composed are fastened together not by nails, but by ropes and strings, which in many cases are applied in a most elaborate and artistic manner, beauty being studied not only in the forms of the houses and in the carved patterns with which they are adorned, but in the complicated lashings with which they are bound together. As, however, this branch of ornamental architecture is carried to a greater extent in Fiji than in New Zealand, I shall reserve the details for the description of the Fiji Islands.

The size of some of these edifices is very great. For example, in 1843 the Maori converts built for themselves a place of worship large enough to contain a thousand persons, and measuring eighty-six feet in length by forty-two in width. The size of

this edifice was evidently determined by the length of the ridge-pole. This was cut from a single tree, and was dragged by the natives a distance of three miles. The cross-lashings of the building were all ornamental, giving to it a peculiar richness of finish.

We are, however, chiefly concerned with the domestic architecture of the Maories. Within each pah or enclosed village are a number of houses, each representing a family, and separated from each other by fences, several houses generally standing near each other in one enclosure. A full-sized house is about forty feet long by twenty wide, and is built on precisely the same principle as the tombs which have been just described, the actual house taking the position of the coffin, and being sheltered from the weather by a gable roof, which extends far beyond the walls, so as to form a sort of verandah. The roof is supported on separate posts, and does not, as with ourselves, rest upon the walls of the house. The roof always projects greatly at the principal end of the house, in which the door is situated, so that it forms a sort of shed, under which the members of the family can shelter themselves from the sun or rain without going into the house. A genuine New Zealander has a great love for fresh air, and, as we have seen, will composedly sit for a whole day on the wet ground in a pouring rain, although a house may be within easy reach. Yet at night, when he retires to rest, he is equally fond of shutting himself up, and of excluding every breath of fresh air.

Indeed, the native does not look upon a house as a place wherein to live, but merely as a convenient shelter from the elements by day and a comfortable sleeping-place by night. As soon as evening is near, a fire is lighted in the middle of the house, which fills it with smoke, as there is no chimney. The New Zealander, however, seems to be smoke-proof, and sits composedly in a place which would drive an European half mad with smarting eyes. Indeed, before the natives become inured to the acrid vapor, their eyes have much to endure, and it is to the habit of sitting in the smoke that the bleared look so prevalent in old people is chiefly due.

Not only do the natives thus surround themselves with a smoky atmosphere, but they limit its quantity as well as its quality. The number of men and women that will pack themselves into one house at night is almost incredible, each person lying down on a simple mat, and retaining the same clothes that have been worn during the day. As, however, the heat becomes excessive, the inmates generally contrive to throw off their clothing during the night. By day-break the heat and closeness are almost stifling to an European, and it is rather an

amusing sight to see a hut give up its inmates on the morning of a cold day, the whole party being enveloped in steam as they come into the cold air.

At the principal end of the house, under the verandah, is the entrance. This strangely resembles the gate of an Egyptian temple, being made of three large beams, the two side posts slightly inclining to each other, and the third laid upon them. The aperture is closed by a sliding door, and at the side of the door is generally a square window, which can be closed in the same manner. In some large houses there were two of these windows, one on either side of the door.

As the roof is made with a considerable slant, the walls are seldom more than two or three feet high where the roof touches them, though in the middle the house is lofty enough. The roof is supported on the inside by one or two posts, which are always carved elaborately, and almost invariably have the human figure as one of the ornaments upon them. The ridge-pole is flattened and boardlike, and in good houses is carved and painted in patterns, usually of the spiral character. This board, as well as those which are used in different parts of the building, is made by hacking the trunk of a tree on both sides, until it is reduced to the required thickness, the native Maories having no tool which can answer the purpose of a saw.

At the end of the ridge-pole, over the door, is carved a distorted human figure, intended to represent the owner of the house, and recognized as such by the lines of the moko or tattoo on its face, and generally having the tongue thrust out to an inordinate extent.

An illustration on page 877 represents the most celebrated of all Maori houses, namely, the war house of the ruthless chief Rangihæta, an edifice which fully expresses the ferocious character of the builder. These houses are designed by chiefs in honor of some great victory, and are surrounded with wooden figures, which either represent in derision the leading warriors of the enemy who have been killed, or the victorious chief and his own warriors in the act of defying and insulting the enemy by thrusting out their tongues at them. This house bears the ominous name of Kai-tangata, or Eat-man.

The illustration is taken from a sketch made by Mr. Angas, who describes the building as follows: "Kai-tangata, or Eat-man House, is a wooden edifice in the primitive Maori style, of large dimensions, with the door-posts and the boards forming the portico curiously and elaborately carved in grotesque shapes, representing human figures, frequently in the most indecent attitudes. The eyes are inlaid with pawa shell, and the tattooing of the faces is carefully cut.

The tongues of all these figures are monstrously large, and protrude out of the mouth, as a mark of defiance toward their enemies who may approach the house. The whole of the carved work, as well as the wooden parts of the building, are colored red with *kokowai*, an ochre found principally on the side of the volcano of Taranaki.

"The portico or verandah of Rangihæta's house is about twelve feet deep, and the ridge-pole and frame boards of the roof are richly painted in spiral arabesques of black and red; the margin of each spiral being dotted with white spots, which add richness to the effect. The spaces between the woodwork are filled up with variegated reeds, beautifully arranged with great skill, and fastened together with strips of flax dyed red, and tied crosswise, so as to present the appearance of ornamental basket-work.

"Above the centre of the gable-roofed portico is fixed a large wooden head, elaborately tattooed, with hair and a beard fastened on, composed of dogs' tails. Within the house is a carved image of most hideous aspect, that supports the ridge-pole of the roof. This is intended to represent the proprietor, and is said by the natives to be entirely the work of Rangihæta's own hand."

This figure, together with the pole that issues from the head, may be seen in illustration No. 1, on page 809, which represents the interior of the house. On account of the circumstance recorded in the beginning of this description, the artist has been unable to draw a vast number of carvings which decorated this house, so that much of the extraordinary elaboration is necessarily omitted.

Rangihæta displayed his merciless disposition in one of the unfortunate skirmishes which often took place between the Maories and the English, and which have afterward been equally regretted by both parties, the white men having generally offered an unintentional insult to the natives, and the latter having resented it in the heat of passion. On this occasion, a number of the white men had been captured by the Maories under the two chiefs Rangihæta and Raupahara, who were related to each other by marriage, the former having married a daughter of the latter. Some time previously, this woman had been accidentally killed by a chance shot, which, as a matter of course, her relations insisted on considering as intentional.

While the prisoners and their capturers were standing together, another chief named Puatia tried to make peace, saying that the slain on both sides were about equal. His proposition was accepted, the lately opposing parties shook hands, and all would have gone well had they not been joined by

(1.) RANGIHAETA'S WAR HOUSE. (See page 876.)

(2.) INTERIOR OF A PAH OR VILLAGE. (See page 879.)

Rangihaeta, who had been employing himself in the congenial task of killing all the wounded. He immediately demanded the lives of the prisoners, and when Raupahara refused to accede to his demand, Rangihaeta told him to remember his daughter. The bereaved chief was silent at this implied reproach, and, before he had time to collect his thoughts, Rangihaeta glided round the party, getting behind each of the captives as they stood among the Maories, and killed them successively with his merai. The ubiquitous land question was at the bottom of this sad business.

Houses like the Kai-tangata were formerly common, answering the purpose of the ancient trophies. A war house nearly as celebrated as that which has just been described was erected by Puatia, the chief of Otawahao Pah, in order to commemorate the capture of Maketu on the east coast. Since Puatia died, the whole of this splendid pah was rendered tapu, and, in consequence, the buildings within it were given up to decay. Mr. Angas was fortunate enough to secure a sketch of the war house before, like the rest of the buildings in the pah, it had entirely decayed.

The house itself is perhaps scarcely so neatly made as the Kai-tangata, but it derives great interest from the number of figures with which the beams, rafters, and posts are decorated. On either side of the verandah stand two huge wooden figures, which are intended to represent two chiefs who fell in battle, but who, as belonging to the victorious side, are represented with their tongues defiantly menacing the beaten enemy.

The figure that supports the central pole represents a chief who was one of the principal warriors at the capture of Maketu. At the height of six and ten feet respectively, on the same pole, are carvings which represent two other warriors, their moko, or tattoo, doing duty for the whole of the person. Still higher are a couple of figures representing warriors, the upper figure appearing to stand on the roof itself. Just within the upper part of the gable is the figure of Pokana, a warrior who was living at the time when the house was built, and who is represented with a pipe in his mouth. Around the house are numbers of similar figures, each representing some well-known individual, and having a signification which is perfectly well understood by the natives.

It was in this ruined pah of Otawahao that the disused wooden war-bell was found. The former owner, Puatia, was converted to Christianity before his death, and, while he lay sick within his pah, he had a school established for the purpose of disseminating Christianity, and used to call his people round him for the morning and evening prayers.

It has been mentioned that, owing to the

contempt with which the Maories regard everything that pertains to the preparation of food, cooking is never carried on in the dwelling-houses. If possible, it is conducted in the open air; but when the weather is too wet or too windy, a shed is employed. These cooking sheds are built expressly for the purpose, and no one with any claims to rank ever enters within them. Were no shelter but a cooking shed to be found within miles, the Maori chief would not enter it, no matter how severe the weather might be.

The cooking sheds are built very simply, the sides or walls being purposely made with considerable interstices, so that the wind may pass freely between them. They are roofed with beams, over which is placed a thatch of the raupo rush. As, among other articles of diet, the putrid maize is prepared in these sheds, the European traveller is often glad to find that the abominable mess will be cooked at a distance from him.

Some of the larger pahas contain a great number of houses, and several of them are inhabited by at least two thousand people. Civilization has at the present day exercised great influence upon the pahas, and reduced them, as a rule, to fortresses rather than villages. In many districts the use of the pah has been practically abandoned, those natives who wish to be at peace devoting themselves to the cultivation of the ground and living in scattered houses, without caring for the protection of the fence.

The illustration No. 2, on page 877, is taken from a sketch by Mr. Angas, representing the interior of a pah as seen by him in 1844. One or two of the houses are seen scattered about, adorned with the grotesque figures of which the Maori is so fond, and having several of the inmates sitting under the shelter of the deep verandah. Rather in the background are one or two of the ingenious and beautifully carved storehouses, in which food is protected from the rats, and on one side is a great wooden tiki projecting from the ground. Just behind the large storehouse is seen the curious monument that marks the waki-tapu, or sacred burial-place of a chief, a half canoe being planted in the ground and painted with elaborate patterns in red, the color for mourning and war among the New Zealanders.

Groups of the natives may be seen scattered about, conspicuous among whom is the council that is sitting in the foreground, under the presidency of the seated chief, whose hani, or staff of office, marks his dignity. A slave woman is seen working at her task of beating the flax leaves; and wandering promiscuously about the pah, or lying comfortably asleep, are the pigs, with which every village swarms.

WE now come to the tools with which the Maori performs all this wonderful amount of carpentering and carving.

Looking at the results, we might naturally fancy that the dusky architect possessed a goodly array of tools; but, in fact, his tools are as few and simple as his weapons, and may be practically considered as two, the adze and the chisel. On the next page an example of each is drawn, the artist having taken care to select the best and most valuable specimens; the blades being formed from the precious green jade, and the handles carved elaborately, so as to be worthy of the valuable material from which the blades are shaped.

As may be imagined, these tools cannot have very sharp edges given to them, as the brittleness of the stone would cause it to chip into an edge like that of a bad saw, and in consequence the worst iron axe is a far better tool than the best specimen of green stonework that a Maori ever made.

At No. 3 may be seen one of the common "tokis," or stone axes, that were formerly so much used in building canoes. The specimen from which it is drawn is in my collection, and I have selected it for illustration because it gives so excellent an idea of the structure of the tool, and the mode of fastening the blade to the handle. This is achieved in a very ingenious manner, and although it scarcely seems possible to secure the requisite firmness by a mere lashing of string, the Maori workman has contrived to attach the blade as firmly as if it had been socketed.

This mode of fastening the blade to the handle prevails over the greater part of the Polynesian group, and, although the elaboration of the lashings varies considerably, the principle is exactly the same throughout. The same plan prevails even in Borneo, and there is in my collection a boat-builder's adze, the iron blade of which is lashed to the socket in precisely the same manner, the only difference being that split rattan is employed instead of string. The reader will notice the peculiar shape of the adze-edge, which is exactly that of the incisor tooth of any rodent animal. Whether the maker intentionally copied the tooth is doubtful, but that he has done so is evident.

Tools such as these are necessarily imperfect; yet with these the Maories patiently executed the elaborate and really artistic designs which they once lavished on their dwellings, their canoes, their weapons, and their tools. They could not even make a walking stick but they must needs cover it with carvings. There is in my collection, and illustrated at fig. 4, a remarkably fine example of such a walking stick, called in the Maori tongue "toko-toko," which was presented to me by Stiverd Vores, Esq. As

the reader may see from the illustration it is ornamented with six complete human figures, and a human face on the knob of the handle. The portions of the stick that come between the figures are completely covered with carving, and the only plain surface is that which is intended to be grasped by the hand.

The six figures are in three pairs, set back to back, and those of each pair exactly resemble one another. A distinct gradation is observed in them, the uppermost pair having their faces most elaborately tattooed, the middle pair being less ornamented, and the lowermost pair having a comparatively simple tattoo. In the position of the heads there is also a distinction, which I believe to have some signification known to the carver. The upper pair have the left hand laid on the breast, and the right hand pressed to the lips; the middle pair have the left hand still on the breast, and the right fingers touching the throat; while the lower figures have both hands clasped on the breast.

All the figures are separated, except at the backs of the heads, the hips, and the heels, where they touch each other; so that the labor expended on this stick has been very great.

WE now take farewell of this interesting race—a race which is fast waning away, and will soon perish altogether. No New Zealander will ever sit on the broken arches of London Bridge, and contemplate the ruins of St. Paul's. The Maori is fast disappearing, and in a comparatively few years it is certain that not a Maori of pure blood will be found in the islands; and before a century has elapsed, even the characteristic tattoo will be a remembrance of the past, of which the only memorials will be the dried heads that have been preserved in European museums. It is pitiful that such a race should be passing away; but its decadence cannot be arrested, and in a short time the Maories will be as completely extinct as the people of the stone age, leaving nothing but their manufactures as memorials of their existence. Such memorials, therefore, ought to be sedulously preserved. Every piece of genuine native carving that can be found in New Zealand ought to be secured and brought to England, where it can be preserved for future ages, and, with the isolated specimens that are scattered in private houses throughout the country, ought to be gathered together in some central museum, where they can be accessible to all who interest themselves in the grand science of anthropology.

CHAPTER LXXXVIII.

NEW CALEDONIA.

POSITION AND DIMENSIONS OF NEW CALEDONIA—APPEARANCE AND DRESS OF THE NATIVES—THE DANCING MASK—NATIVE ARCHITECTURE—SMOKE AND MOSQUITOES—WARFARE—CURIOUS WEAPONS—THE SLING AND THE SPEAR—MODE OF THROWING THE SPEAR—THE OUNEP, OR “AMENTUM” OF THE ANCIENTS—SHAPE OF THE CLUB—OBJECTS OF WAR—CANNIBALISM—THE KNIFE AND FORK—DIET AND COOKERY IN GENERAL—THE NOUGUI SPIDER—MODE OF DRINKING—CHARACTER OF THE NEW CALEDONIANS—AN INGENUOUS THEFT—THE KATA—THE ISLE OF PINES, AND ITS INHABITANTS.

EAST of Australia is a tolerably large island known by the name of New Caledonia. It is of no very great extent, but is inhabited by a people who deserve a short notice in these pages.

The new Caledonians are nearly black in color, and in general form and appearance bear some resemblance to the aborigines of Tasmania. They are, however, better looking, and wear altogether a less savage aspect, probably on account of the comparatively regular supplies of food which they can obtain. They are of ordinary stature, but one man was seen who measured rather more than six feet in height. His form, however, was ill proportioned. They wear scarcely any dress, the men having generally a single leaf hanging from their girdles, or at the most a strip of soft bark answering the purpose of drawers, while the adult women wear a narrow fringed girdle, which passes several times round the waist.

Their hair is woolly and short, but at a distance many of them would be taken for long-haired people, in consequence of a habit of making artificial tresses some two feet in length, out of grass and the hair of a bat. Some of these appendages are so long that they fall to the middle of the back. Round the head is sometimes tied a small net with wide meshes, and the chiefs wear an odd sort of a hat. These hats are cylindrical, and decorated with a large circular ornament at each side, a plume of feathers at the top, and a long drooping tuft of grass and hair

that hangs down the back. The hat forms no protection to the head, having no crown to it, and is only used as a mark of rank.

The natives also make a sort of mask, very ingeniously cut out of wood, having the mouth open and the eyes closed. The wearer looks, not through the eyes, but through some apertures which are made in the upper part of the mask. It is supposed that these masks are employed in war, when the combatants desire to disguise themselves from their opponents. This however, is only a conjecture. I have little doubt that the wooden mask described and figured by D'Entrecasteaux is nothing more than an ornament used in the native dances. It is, in fact, the “momo,” which is described by more recent travellers. When complete, the “momo” is decorated with plumes of feathers, long tufts of hair, and a thick, coarse network, which does duty for a beard, and descends as far as the knees of the wearer.

A mask made in a precisely similar manner is used by the natives of Vancouver's Island, but is employed by them in their dances. One of these masks is in my collection, and will be described in the course of the work.

Ear ornaments of various kinds are in favor among the New Caledonians, and some of the natives enlarge the hole in the lobe to such an extent that it forms a long loop, the end of which falls on the shoulders. Occasionally, they try the elasticity of the ear too much, and tear it completely through. Anything seems to be worn in the ears, and

when a New Caledonian cannot find a suitable ornament, he fills up the ear with a leaf or a roll of bark. They do not tattoo themselves, but draw black lines across the breast with charcoal, the lines being broad, and traced diagonally across the breast. Necklaces of various kinds are worn, and these ornaments bear a certain resemblance to those of New Guinea, consisting principally of a twisted string, to which is suspended a shell or piece of bone, carved in a manner which the natives are pleased to consider as ornamental.

Although by nature the men possess thick and stiff beards, these hirsute ornaments are generally removed, the hair being pulled up by the roots by means of a pair of shells used in lieu of tweezers.

Architecture among the New Caledonians is infinitely superior to that of Australia, and in some respects almost equals that of New Zealand. The houses are conical in shape, and often reach from ten to eleven feet in height in the middle.

The principle on which the huts are built is perfectly simple. The native architect begins by digging a hole in the ground, and planting in it a stout pole, some fifteen feet in length, and nine or ten inches in circumference. A number of smaller poles or rafters are set in the ground around the standard or central pole, their bases being planted in the earth and their tips leaning against the standard. Smaller branches are interwoven among the rafters, and the whole is rendered weather-tight by dried herbage lashed to the walls.

These simple walls are often several inches in thickness; and as the natives spread thick mats on the floor, they are well sheltered from the weather.

The entrance is very small, never above three feet in height, and on occasions can be closed with a rude door made of palm branches. Some of the latter kind of huts have regular door-posts, on which are carved rude imitations of the human face. A fire is almost always kept burning inside the hut, not so much for the sake of warmth or for culinary purposes, as to form a defence against mosquitoes. Smoke, therefore, is encouraged; and, though it may be the lesser of two evils, it forms a great drawback to the comfort of Europeans, who can defy the mosquitoes by their clothes, and can protect themselves at night by means of curtains. The central post of the house is mostly decorated with shells, and carved at the top into the shape of a human being.

Each house is usually surrounded with a fence some four or five feet in height, and within the hut there is a curious piece of furniture which gives to the rude habitation quite a civilized look. This is a wooden shelf, suspended by cords exactly like our hanging bookshelves. It is hung about four feet from the ground, but as the cords are very slight,

it can support only a trifling weight. The native name for this shelf is "paite."

WE will now proceed from domestic to military life, and devote a small space to warfare among the New Caledonians.

It is very remarkable that among these naked and peculiarly savage cannibals we should find two of the weapons of war which were in greatest favor among the civilized Romans of the classic times. These are the sling and the javelin, the latter being cast by a peculiar arrangement of a thong, so that, in point of fact, the New Caledonian warrior does not only sling the stone, but the spear also.

We will take these weapons in order, the sling coming first, as being the simpler of the two weapons.

The construction of the sling or "wendat," as the natives call it, is very simple, the weapon being merely a doubled thong with a pouch in the middle, in which the stone is placed. This pouch is made of two small cords laid side by side, and as the smooth stone might slip out of it, the slinger always wets the missile in his mouth before placing it in the pouch. The stones are cut out of a hard kind of steatite, which can take a good polish. They are oval in shape, and are carefully ground down by friction, the surface becoming very smooth in the process.

Thirty or forty of these stones are kept in a small net, which is fastened to the left side of the slinger. In illustration No. 1, on page 893, one of the warriors is seen with his sling in his hand, and the net filled with stones fastened to his side. When the slinger wishes to hurl a stone, he does not waste time and strength by whirling the sling round and round, but merely gives it one half turn in the air, and discharges the missile with exceeding force and wonderful accuracy of aim. In consequence of only giving one half turn to the sling, the stones can be hurled nearly as fast as they can be thrown by the hand, and the weapon is therefore an exceedingly formidable one in the open field when fire-arms are not opposed to it.

We now come to the spear, or rather javelin.

This weapon is of very great length, some specimens measuring fourteen or fifteen feet from butt to point; and unless the warrior were able to supplement the natural strength of his arm by artificial means, he would not be able to throw the spear more than a few yards. He has therefore invented an instrument by which he can hurl this long and unwieldy weapon to a considerable distance. The principle on which this instrument is formed is identical with that of the Australian throw-stick, but there is a difference in the application. The Australian throw-stick is straight, rigid, and is applied to the butt of the spear, whereas the implement

used by the New Caledonian is flexible, elastic, and applied to a spot a little behind the middle of the spear.

This instrument is ingeniously simple. It is nothing more than a plaited cord or thong made of a mixture of cocoa-nut fibre and fish-skin. It is a foot or more in length, and is furnished at one end with a knob, while the other is worked into a loop. This elastic cord is called by the natives "ounep." When the warrior desires to throw a spear, he slips the loop over the forefinger of his right hand, and allows it to hang in readiness for the spear. As soon as the time comes for the spear to be thrown, the man balances the weapon for a moment so as to find the middle, and then casts the end of the thong round it in a sailor's half-hitch, drawing it tight with his forefinger.

As long as pressure is thus kept upon the thong, it retains its hold of the spear; and as soon as it is released, "the half-hitch" gives way and allows the spear to free itself. The mode of throwing is therefore evident. The warrior holds the loop of the thong on his forefinger, the rest of the hand grasping the spear. As he throws the weapon, he loosens the hold of his hand, and so hurls the spear by means of the thong.

The classical reader will doubtless remember that this thong or "ounep" is precisely the "amentum" of the ancients, but is actually superior in its construction and manipulation. The amentum was simply a loop of cord or leather fastened to the shaft of the javelin just behind the balance. When the warrior wished to throw a spear, he grasped the shaft in his hand, inserted his fingers in the loop, and by means of the additional leverage was able to throw a heavy weapon to a considerable distance. See, for example, Ovid's *Metamorphoses*, xii. 321:

"Inserit amento digitos, nec plura locutus,
In juvenem torsit jaculum."

in English, "He inserted his fingers into the amentum, and, without saying more, whirled the dart at the youth." Commentators have been extremely perplexed about this passage. In the first place they were rather uncertain as to the meaning of the word "amentum," and in the second place, they could not see the force of the word "torsit," *i. e.* whirled. The reader will, however, see how perfectly appropriate is the term, the spear being flung with a whirling movement as a stone from a sling. The same word is used by Virgil: "Intendunt acres arcus, amentaue torquent." Another writer also alludes to this instrument:

"Amentum digitis tende prioribus,
Et totis jaculum dinige viribus;"

i. e. "Stretch the amentum with your first fingers, and aim the javelin with your full strength."

Ingenious as was the amentum of the ancients, the ounep is far superior to it. With the ancients a separate amentum had to be fixed to each spear, while among the New Caledonians only one ounep is required.

Besides these weapons, the club is much used, and great ingenuity is shown in its manufacture. The shape and size of the clubs are extremely variable, and in some of them the natives have exhibited a surprising amount of artistic skill, the curves being singularly bold and flowing. One of these clubs, which is indeed a typical form, is in my collection. The form of the head is evidently taken from the beak of a bird, and the curves are exceedingly bold and sweeping. It is rather more than three feet in length, and it weighs almost exactly two pounds and a half.

War is in New Caledonia, as in New Zealand, the chief occupation of the men. The first lesson that a child receives is fighting, and the idea is prevalent with him as long as he lives. As soon as he is born, the boy is consecrated to the god of war, and a hard black stone is laid on his breast, as a symbol that his heart must be as hard as a stone in battle. Even the women take a share in the fighting, and, though they are not actual combatants, they follow their relatives to the battle, in order to seize the bodies of slain enemies, and drag them away to the cooking oven. Strife is always fomented by the priests from interested motives, inasmuch as the hands of the slain are their perquisites, and among the connoisseurs in cannibalism the palms of the hands are the most delicate portions of the human body.

Primarily the New Caledonians are cannibals because they are warriors, the body of a dead enemy being always supposed to be eaten by the victors. There is mostly a fight over the body of a fallen warrior, the one party trying to drag it away to the cooking oven, and the other endeavoring to save it for burial by themselves.

As a rule, however, the body is carried off by the women, who have the task of cooking it. The preparation of the body is quite a ceremonial, each part of it belonging by right to certain individuals, and even the carving being regulated by strict rules. A peculiar kind of knife is made of flat serpentine stone, oval in form, and about seven inches in length. Two holes are bored on one side of it, by means of which it is fastened to a wooden handle. This knife is called "nbouet."

With the nbouet the body is opened, and the whole of the intestines are torn out by means of a fork made expressly for the purpose. This fork is composed of two human arm-bones placed side by side, about an inch apart, and fastened tightly together. They are sharply pointed, and are very effectual instruments for the purpose. Sometimes

the bodies are cut up for cooking, but in many cases they are baked entire, the women priding themselves in serving them up in a sitting posture, furnished and dressed in full war costume.

Thus, then, we see that cannibalism is connected with warfare; but unfortunately it is not restricted to war. When Captain D'Entrecasteaux went in search of *La Pérouse*, one of the natives was eating a newly-roasted piece of meat. The naturalist to the expedition immediately recognized it as being part of the body of a child. The man who was eating it did not attempt to deny the fact, but even pointed out on the body of a little boy the part of the body which he was eating, and gave his hearers to understand that the flesh of children was very good.

This cannibalism of New Caledonia explained some curious gestures which the natives were fond of making. They used to be very familiar with their white visitors, feeling their arms and legs, looking at each other with admiration, and then whistling and smacking their lips loudly. In point of fact, they were admiring the well-fed limbs of the white men, and anticipating to each other the delights of a feast upon the plump Europeans.

As, however, flesh is but a luxury among the New Caledonians, and cannot be considered as an ordinary article of diet, the natives depend chiefly for their existence on vegetable food. Roots of various kinds are eaten by them, as well as cocoa-nut and other fruit; all the cooking, as well as the work in general, being performed by the women. Shell-fish are also much eaten, and are procured by the women. The large clam-shell is found on the shores of the island, and supplies abundance of food; while the smaller molluscs are mostly dug out of the sand by women, who frequently spend half a day up to their waists in water.

Two very strange articles of diet are in use among the New Caledonians. The first is a sort of spider, which spins large and thick nets in the woods, often incommencing travellers by the number and strength of the silken cords. They are not eaten raw, but cooked by being placed in a covered earthen jar, which is set on a brisk fire. The natives call the spider by the name of "nougui." It is gray above, the back being covered with a fine silvery down, and below it is black.

The second article of diet is clay, of which the natives will consume a great amount. The earth in question is a soft greenish steatite, which crumbles very easily, and has the property of distending the stomach, and so allays the cravings of hunger, even though it does not nourish the body. A well-distended stomach is one of the great luxuries of a savage, and, in accordance with

this idea, a man was seen to eat a piece of steatite twice as large as his fist, even though he had just taken a full meal. Some of the natives have been known to eat as much as two pounds of this substance. A similar propensity is found both in Africa and America.

When they drink at a pool or river, they have an odd fashion of dipping the water with their hands, and flinging it into their mouths, so that much more water is splashed over their heads than enters their mouths.

With regard to the bodies of those who fall in war, and are rescued from the enemy, many ceremonies are employed. According to Captain Head, in his "*Voyage of the Fawn*," they are "brought home with loud lamentations, and buried with great wailing and shrieking from the appointed mourners, who remain unclean often for several years after burying a great chief, and are subject to many strict observances. For weeks they continue nightly to waken the forest echoes with their cries. After ten days have elapsed, the grave is opened, and the head twisted off; and, again in this custom resembling the Andaman islanders, the teeth are distributed as relics among the relatives, and the skull preserved as a memorial by the nearest kin, who daily goes through the form of offering it food."

"The only exceptions are in the case of the remains of old women, whose teeth are sown in the yam patches as a charm to produce good crops; their skulls set up upon poles being deemed equally potent in this respect."

The general character of the New Caledonians seems to be tolerably good, and, in spite of their evident longing after the flesh of their visitors, they are not on the whole inhospitable. They are clever thieves, and are ingenious in robbery by means of an accomplice. On one occasion, when a native was offering for sale a basket full of sling-stones, and was chaffering about the price, an accomplice came quietly behind the white man and uttered a loud yell in his ears. Naturally startled, he looked behind him, and in a moment the man with whom he was trading snatched away the basket and the goods offered in exchange, and ran away with them.

One of the officers was robbed of his cap and sword in an equally ingenious manner. He had seated himself on the ground, and for better security had placed his sword under him. Suddenly one of the natives snatched off his cap, and as he instinctively rose to rescue it, another man picked up his sword and escaped with it. They even tried to steal a ship's boat, together with the property in it, and would not leave it until they were attacked by a strong body of armed sailors.

They make very good canoes — as, indeed, is generally the case with islanders. The

largest canoes are mostly double, two boats being placed alongside of each other, and connected by a platform. They have a single mast, which is stepped toward one end of the compound vessel, and can sail with considerable swiftness, though they are not so manageable as those of New Guinea, some of which are marvels of boat-building. They can accommodate a considerable number of passengers, and have generally a fire burning on the platform, which is protected from the heat by a thick layer of earth.

A rather remarkable custom prevails among them, which derives its chief interest from the fact that it is practised in Northern Asia. This is the *Kata*, or scarf of felicity. It is a little scarf, of white or red material; and when two persons meet they exchange their *katas*—a ceremony

which is analogous to shaking hands among ourselves.

Whether these savages are the aborigines of the island is doubtful. If they be so, they seem to have declined from the comparative civilization of their ancestors. This, indeed, is their own opinion; and, in support of this theory, they point to the ruins which are still to be seen, and which tell of architecture far beyond the power of the present natives. There are even the remains of an aqueduct eight miles in length, a piece of engineering which would never have entered the head of the New Caledonian of the present day. Perhaps these works of art may have been constructed by immigrants, who have since left them to perish; but, in any case, their presence in such a spot is most remarkable.

THE ISLE OF PINES.

SOME thirty miles to the south-east of New Caledonia, and in fact forming part of the same group, there is a small island, called by Captain Cook the Isle of Pines, in consequence of the number of araucarias with which its hills are covered. The strait between the Isle of Pines and New Caledonia proper is nearly all shoal water, caused by the numerous coral reefs.

In many respects the inhabitants of this island resemble those of New Caledonia. They are not, however, so dark, and their features are tolerably good. They are cannibals from choice, wrapping up the bodies of the dead in banana leaves, and then cooking them in ovens. Some years ago, they contrived to indulge their taste for human flesh at the expense of their neighbors.

About 1840, it was found that sandal wood grew on the island, and several vessels proceeded thither for the sake of procuring this valuable product. At first they did so with great risk, and lost many of their men from the onslaughts of the natives. Afterward, however, a Sydney merchant set up an establishment for the collecting and storing of sandal wood and *bèches-de-mer*, and since that time the natives have become quite peaceable.

In course of this transitional time between utter barbarism and commerce, they

learned by painful experience the power of fire-arms. As soon as they became accustomed to trade, the first thing that they did was to procure a large stock of fire-arms and to go off with them to New Caledonia, where they landed, shot as many of the natives as they could, and brought their bodies home for consumption. It is true that a constant feud raged between the two islands, but the sudden acquisition of fire-arms gave the people of the Isle of Pines a terrible advantage over their hereditary foes, and enabled them almost to depopulate the south-eastern part of the island.

They care no more for dress than the New Caledonians, but are very fond of ornament, the men appropriating all the best decorations, and leaving the women to take what they can get. The men friz their hair out as much as possible, and wrap a thin scarf round it, or sometimes cut it short, leaving only a tuft on one side of the head. The women shave off the whole of the hair, thus depriving themselves of their natural ornament, and rendering themselves very unprepossessing to European eyes. The rough work is done by them, the men reserving to themselves the noble occupations of war, fishing, house building, and canoe making, the only real work which they do being yam planting, after the ground has been prepared by the women.

CHAPTER LXXXIX.

THE ANDAMAN AND NICOBAR ISLANDS.

POSITION OF THE ANDAMAN ISLANDS—ORIGIN OF THE NATIVES—THEIR ROVING HABITS AND LACK OF CLOTHING—THEIR HATRED OF STRANGERS—THE NATIVES AND THE STEAMER—APPEARANCE OF THE WOMEN—THE ENORMOUS BOW AND SKILL OF THE MINCOPIE ARCHERS—VARIOUS MODES OF FISHING—EXCELLENCE OF THEIR CANOES, AND MODE OF MAKING THEM—THE LONG PADDLES—THE SHIP'S CREW BEATEN BY THE MINCOPIE CANOE MEN—CANNIBALISM NOT PRACTISED IN THE ANDAMAN ISLANDS—INGENIOUS FIREPLACES AND METHOD OF COOKING—WANT OF ARCHITECTURAL SKILL—EDUCATION OF THE CHILDREN, AND THEIR GAMES—POWERS OF SWIMMING—MATRIMONIAL ARRANGEMENTS—DEATH AND BURIAL—THE NICOBAR ISLANDS—APPEARANCE AND COSTUME OF THE INHABITANTS—THE CROSS-BOW AND ITS ARROW—A PRIMITIVE HAMMOCK—TOMBS IN THE NICOBAR ISLANDS.

WE will now pass to the westward, and travel gradually through the wonderful group of islands which extends almost from Asia to America, and which is known by the general title of Polynesia. One or two of them will have to be omitted for the present, so as not to break the continuity of races, but will be described before we pass upward through America, from Tierra del Fuego to the Esquimaux.

In the Bay of Bengal, and not much to the eastward of India, is seen a group of islands, named the Andamans. They are of considerable length, but very narrow, seldom exceeding twenty miles in breadth, and are arranged very much after the fashion of the New Zealand islands, though on a smaller scale. These islands exhibit a phenomenon almost unparalleled in the history of the human race.

They lie close to India, a country in which a high state of civilization has been reached many centuries ago. They are almost in the middle of the track which is traversed by multitudes of ships, and yet their inhabitants are sunk in the deepest depths of savage degradation. Even the regular visits made by the Chinese vessels to the Andaman coasts, for the purpose of procuring the trepang, have had not the least effect upon them; and they afford perhaps the most perfect example of savage life which the surface of the earth can show.

The origin of the Andamaners is a prob-

lem to anthropologists. They are small in stature, the men being on an average but little above five feet in height, and the women being still smaller. They are very dark, but have scarcely anything except their color in common with the negro. They have neither the huge projecting jaws and cavernous mouth of the true negro, nor his curiously elongated heel; and though they are so small as almost to merit the name of pigmies, they are perfectly well formed. The hair, when it is allowed to grow, is seen to be thick and bushy, and resembles that of the Papuans; and it is the opinion of many competent judges that the Andamaners are the aborigines of the Papuan race, who have never permitted contact with strangers, and have preserved their own individuality intact.

In habits they are absolutely savage, their arts being limited to the manufacture of canoes and weapons, architecture and agriculture being equally unknown. They possess one of the chief characteristics of savage life in their roving disposition, never remaining long in one spot, a stay of three or four days being considered a long visit to any place. They have no laws, no religion, and no tribal distinctions. Marriage, as we understand the word, is unknown to them; and there seems to be few restrictions of consanguinity, a mother and her daughter being sometimes the wives of the same husband.

Clothing is entirely unknown to them; and

when captives have been taken, they have always found clothes to be an incumbrance to them, though they were pleased with gaudy handkerchiefs tied round their heads. The only covering which they care for is one which they share in common with many of the pachydermatous animals, and employ for the same purpose. It is nothing more than a layer of mud, with which the natives plaster themselves in the morning and evening, in order to defend themselves from the attacks of the mosquitoes, sandflies, and other insect plagues.

Until the last few years our knowledge of the Andamaners has been almost *nil*, in consequence of their hatred of strangers, and the determined opposition which they offer to any foreigners landing on their shores. The very presence of a boat or a ship seems to excite them to frenzy. In Captain Mouatt's valuable account of these islands is an animated description of a scene which occurred off the coast.

The steamer, on rounding a point, came suddenly upon two groups of savages, who were at first paralyzed by fear at the sudden apparition of the unknown object, with its columns of white steam roaring from the escape-pipe; its smoke, and its plashing paddles. In a few moments they recovered from their surprise, and raised a simultaneous shout of defiance. Two boats' crews were sent ashore, to the extreme anger of the Mincopies.

"A peculiar natural phenomenon rendered the scene still more striking and impressive as the interval between the two parties, the savage and the civilized, was gradually diminished by the onward motion of the boats. The spray as it rose in clouds from the breakers dashing on the shore, reflecting the rays of the declining sun, magnified considerably the slight figures of the natives, making massive and formidable giants of men who were in reality little more than sable dwarfs. As the cutters neared that part of the shore where they had stationed themselves, and they clearly perceived that we were making preparations to land, their excitement was such that they appeared as if they had suddenly become frantic.

"They seemed to lose that restraint and control which it is the pride of the savage to exhibit in time of danger, and jumped and yelled like so many demons let loose from the bottomless pit, or as if there had been a Bedlam in that locality, and they the most unmanageable of its frantic inmates. Their manner was that of men determined and formidable in the midst of all their excitement. They brandished their bows in our direction; they menaced us with their arrows, said by common report—so often a liar—to be poisoned; exhibiting by every possible contortion of savage pantomime their hostile determination. To

use a common vulgar expression of some of the seamen, they seemed to have made up their minds to 'chaw us all up.' . . .

"The spear which he flourished incessantly was terminated by a bright, flat, pointed head, which gleamed with flashes of light, as, circling rapidly in the air, it reflected the rays of the sun. Sometimes he would hold it aloft, poising it in his uplifted hand, as if with the intention of hurling it with unerring and deadly aim at the first who dared to approach the shore of his native island. At length, in a paroxysm of well-acted fury, he dashed boldly into the water, boiling and seething round him as it broke in great billows on the beach, and on the rocks, by which it was defended, and, fixing an arrow in his bow, he shot it off in the direction of the steamer, as if that were the arch enemy that had provoked his bellicose fury."

The second party of natives, who turned out to be females, were as frightened as their male friends were angry. After several failures in launching a canoe, they rushed in a body to the jungle and hid themselves from the strangers. They exhibited the usual characteristics of the people, a basket for fish doing duty for clothes, and a patch of red oehre on their heads taking the place of hair. So repulsive were they in their appearance, that the sailors declined to leave mirrors on the shore as presents for them, saying that such hideous creatures ought not to be allowed to look at their own features.

The weapons with which the Mincopie men threatened the strangers are really formidable, and before very long the exploring party learned to hold them in great respect. The bows are sometimes six feet long and enormously powerful,—so powerful in fact that the strongest sailors tried in vain to bend the weapons which the pigmy Mincopies handled with such skilful ease.

The shape of the bow is very peculiar. Instead of being nearly cylindrical, largest in the middle and tapering regularly to each end, it is nearly flat except at the handle, on either side of which it becomes very broad. In fact, a good idea of it may be taken from a flattened hour-glass, the channel in the middle being the handle.

The force and accuracy with which these tiny men can shoot are really wonderful. They very seldom fail to hit their mark at any reasonable distance, and can make tolerably sure of a man at sixty or seventy yards, so that the Mincopie bow is really a far better weapon than the old "Brown Bess" musket ever was. One arrow that was shot at a boat's crew at a distance of sixty yards struck a hickory oar, and knocked off a piece of wood as large as a man's hand.

These arrows are very neatly made.

They are about three feet in length, and are made of a reed by way of shaft, to the end of which is fastened a piece of hard wood in order to give weight. Upon this tip is fixed the head, which is usually the barbed tail bone of the sting-ray, and sometimes, though not always, poisoned. Should this terrible weapon enter the body, it cannot be removed without a severe operation, the sharp brittle barbs being apt to snap off and remain in the wound if any force be used in extracting the arrow.

Their consummate skill in the use of the bow is obtained by constant practice from earliest infancy. As is the assagai to the Kaffir, the boomerang to the Australian, and the lasso to the Guacho, so is the bow to the Andamaner. The first plaything that a Mincopie boy sees is a miniature bow made for him by his father, and, as he advances in age, bows of progressive strength are placed in his hands. Consequently, he is so familiarized with the weapon that, by the time he is of full age, the pigmy Andamaner draws with graceful ease a bow which seems made for a giant.

Numbers of the toy bows and arrows may be seen scattered about an encampment if the natives are forced to leave it in a hurry, and their various sizes show the ages of the children to whom they belonged. The education of the Mincopie archer is in fact almost precisely like that of the old English bowmen, who, from constant practice in the art, and being trained from childhood in the use of the bow, obtained such a mastery of the weapon as made them the terror of Europe.

Being such skillful archers, they trust almost entirely to the bow and arrow, caring little for any other weapon. Even the harpoon, with which they catch the larger fish, is shot from the powerful bow. It is, in fact, a very large arrow, with a moveable head. This head fits loosely into a hole at the end of the arrow, and is secured to the shaft by a thong. It is a very remarkable fact that the bow and harpoon arrow of the Mincopies are almost exactly like those which are used by the inhabitants of Vancouver's Island. They are twice as large, but in shape almost identical, as will be seen when we come to the North of America.

When they use the harpoon, a long and elastic cord is attached to it, one end of which is retained by the archer. The cord is made from a fibre which has the useful property of hardening by being soaked in water. For killing the fish when held with the harpoon the Mincopies use smaller arrows, without barbs or movable heads.

The Mincopies are very expert fishermen, and use nets which are made from the same fibre that has been mentioned. For small fish they make the nets of rather thin but very tough string, but for turtle and

large fish they make nets of cord as thick as a man's finger. One side of the net is held to the bed of the sea by heavy stones laid on it, and the other is upheld by floats.

The women search for molluscs, a business which occupies a considerable part of their time. They always carry neat baskets, in which to put the results of their industry, and each woman has generally a small net fixed to a handle, like that which is used by butterfly collectors.

In nothing do the Andamaners show their superior skill more than in canoe making. Their bows and arrows are, as we have seen, good specimens of savage manufacture, but in the making and management of canoes they are simply unapproachable, even though their tools are of the rudest possible description.

Furnished merely with a simple adze made of a stone fixed into a handle, the Mincopie boat maker searches the forest for a suitable tree, and after a week or ten days succeeds in bringing it to the ground. The rest of the process is so well described by Captain Mouatt, that it must be given in his own words.

"The next operation is to round the trunk, a process which they perform with remarkable dexterity, it being almost impossible to conceive how, with the imperfect instruments at their command, they execute their work with so much skill and neatness. Practice, however, must render them, as well as others, perfect; and hence it is that in a short time the rough and shapeless trunk begins to assume form and proportions; and, when the process is finished, exhibits a finish and perfection that even a Chinese carpenter, by far the most handy and ingenious of human 'chips,' would regard with a feeling of envy, as a work of dexterity which it would be vain for him to attempt to imitate.

"As soon as the trunk has been rounded, they commence the operation of cutting and chipping at it externally; until eventually the outlines of the elegant canoe begin to appear from the shapeless mass of the knotted trunk, just as, by the skill of the statuary, the beautiful figure gradually assumes its fair proportions in the block of marble. The shape externally is generally finished with great care and elaboration before they proceed to hollow it internally, the next process to which they direct their attention. The interior is excavated in the same perfect and business-like manner, until the shell is no thicker than the side of a deal bonnet-box, although it still preserves that strength which would enable it to resist successfully the utmost force and violence of the waves, should it even be assailed by a storm—a thing not at all probable, as, unless carried out to sea by some accident, it is rare that the Andamaners venture far from the shore.

"The buoyancy of these boats, when they are well constructed and carefully finished, is remarkable. They float lightly on the top of the waves, and, unless they have received some injury, it is considered almost impossible to sink them. We sometimes made the attempt, but never succeeded. We fired at them repeatedly when at Port Mouatt — which may be regarded as a sort of Andaman Pembroke-yard, where a fleet of Mincopie men-of-war were lying in every stage of preparation — but they still floated with as great ease and buoyancy as ever. They would make excellent life-boats, such, we believe, as have never yet been constructed by any of our most experienced boat-builders."

Near shore the boatmen paddle about with perfect ease in these fragile vessels, though an European can hardly proceed twenty yards without being upset. When they go further to sea they add a light outrigger to one side of the canoe, and then venture forty or fifty miles from land. They always, in such cases, take fire with them, which has the double advantage of attracting the fish at night, and of cooking them when taken. Sometimes a number of boats will remain all night at sea, and the effect of their fires and torches is very picturesque when seen from the land.

The outrigger is certainly a new invention. The earlier travellers, who were always minute enough in their accounts, did not mention the outrigger, and, as far as can be seen, the idea has been borrowed from some Cingalese canoe which had got into a current and been drifted toward the island.

The paddles are rather peculiar in their form, and, apparently, very ineffective, looking something like long spoons with flattened bowls, or, on a smaller scale, the "peels" with which bakers take bread out of their ovens. The women are the paddle makers, and the implements vary from three to four feet long. They are cut from a very hard wood, and the work of making them is necessarily laborious.

Imperfect as the canoe and paddles seem to be, they are in fact absolute marvels of efficiency. The tiny Mincopies, furnished with these simple paddles, and seated in a canoe cut by themselves out of a tree trunk, can beat with ease our best oarsmen. Captain Mouatt got up several races between the Mincopies and his own prize crew in their favorite boat. In point of fact there was never any race at all, the Andamaners having it all their own way, and winning as they liked. The powerful, sweeping stroke of the man-of-war's crew was beautiful to see, but the little Mincopies shot through, or rather over, the water with such speed that the sailors were hopelessly beaten, although they strained themselves so much that they felt the results of their exertions for some time afterward.

Slight, and almost as active as monkeys, the Mincopies ascend the tallest trees with the like agility, applying the soles of their feet and the palms of their hands to the trunk, and literally running up them. When they reach the branches, they traverse them with as much ease and security as if they were on firm land. Indeed, their powers of tree climbing seem to be equal to those of the inhabitants of Dourga Strait, of whom an account will presently be given.

We now come to a question which has often been agitated, namely, the asserted cannibalism of the Andamaners.

It is a question that every observant reader would be sure to ask himself, as the Andamaners are just such a savage race as might be expected to feed habitually on human bodies. Yet, though we find the comparatively civilized New Zealander sharing with the savage New Caledonian the habit of eating human flesh, the Mincopie, who is infinitely below the New Zealander, and certainly not above the New Caledonian, is free from that revolting practice. He undoubtedly has been known to eat human flesh, but only when urged by extreme hunger to eat the flesh of man or to die; and in so doing he has but set an example which has been followed by members of the most civilized countries.

That they are fierce and cruel toward foreigners is true enough, and it is also true that the bodies of those whom they have killed have been found frightfully mutilated, the flesh being almost pounded from the bones by the blows which have been showered upon the senseless clay in the blind fury of the savage. But no attempt has been made to remove any part of the body, and it was evident that the victors had not even entertained the idea of eating it.

The food of the Andamaners is tolerably varied, and is prepared in a very simple and ingenious oven. A large tree is selected for this purpose, and fire is applied to it at the bottom, so that by degrees a large hole is burned in it, the charred wood being scraped away so as to form eventually a large hole. This is the Mincopie oven, and at the bottom a heap of ashes, about three feet in depth, is always left. The fire smoulders away gradually among the ashes, and never entirely goes out; so that whenever a native wishes to cook his pig, turtle, or fish, he has only to blow up the smouldering embers, and in a few moments he has fire sufficient for his purposes.

These oven-trees are very carefully preserved, the natives never cutting them down, and always managing to prevent them from being entirely burned through. In illustration No. 2, on the 893d page, one of these trees is shown, with the fire burning in the hollow, and the natives sitting round it. The Mincopies always contrive to have the opening of the oven in such a direction that

the man cannot get into it and put out the fire.

Pigs have been mentioned as forming part of the Andamaners' food. These pigs are small and black, with sparse, hard bristles, that look like pieces of wire. They are wonderfully active, and, according to Captain Mouatt, "are the most curious and mischievous little animals in creation. They have a leer that makes them look like so many Mephistopheles, who have chosen to assume that peculiar form, in many respects a very appropriate one, for, if they are not so many little devils, they are certainly possessed by them.

"At the time of our visit to the Cinque Islands, we turned out a dozen of them, and, our unwonted appearance filling them with alarm, they ran off from us with the velocity of an Indian express train, squeaking like mad. We set off and had a regular hunt after them — a hunt that beats to chinks the most exciting scene of pig-sticking ever seen in Bengal. After discharging their rifles, some of the hunters would probably find the pigs between their legs, making them measure their length on the sand. The falls were made with considerable violence, though they were not dangerous, for they only excited our risible faculties; and as each one came down he was greeted with a loud and hearty burst of laughter, as a sort of congratulation to him in his misfortune."

The architecture of the Andamaners is very primitive. Four posts are stuck in the ground in the form of a square, and the builder is quite indifferent as to their straightness. Two of them are much longer than the others, so that when they are connected by sticks, a sloping roof is formed. Palm leaves are then placed upon them, one lying over the other in tile fashion, so that they form a protection from perpendicularly falling rain. A number of these huts are generally erected in a circle, in some cleared space in the forest, which is sheltered by large trees, and within a convenient distance of water. One or two of these simple houses may be seen in the illustration.

Primitive as are these huts, some attempt is made at ornamenting them, the decorations being characteristically the trophies of the chase. Skulls of pigs and turtles, bundles of fish-bones, and similar articles are painted with stripes of red ochre, and hung to the roofs of the huts. Ochre painting, indeed, seems to be the only idea that the Andamaners have of ornament, if perhaps we except a string which the dandies tie round the waist, having a piece of bone or other glittering article hanging from it.

This ochre is in great request among the Mincopies, the women being especially fond of it by way of a decoration of their heads. As has already been mentioned, they shave the head completely, using, instead of a razor,

a piece of flint chipped very thin, and having a sharp edge. They are wonderfully adroit at making these primitive knives, which are exactly like those of the stone age. The hair having been scraped off, a tolerably thick plastering of red ochre is rubbed on the head, and the toilet of a Mincopie belle is complete.

Not only is the ochre used for external application, but it is administered internally. What is good for the outside, the Mincopie logically thinks will be equally good for the inside. So, when he feels ill, he makes a sort of bolus of red ochre and turtle oil, swallows it, and thinks that he has cured himself. Wounds are dressed by binding certain leaves upon them, and in many cases of internal pains, bruises, or swellings, scarification is freely used. Certain individuals enjoy a sort of reputation for success in the treatment of disease, and are much honored by the less skillful.

It has already been mentioned that marriage is nothing more than taking a female slave.

When a wife becomes a mother, the only treatment which she receives is, that after the birth of her child she is plentifully rubbed with the red ochre and turtle oil, and is expected to follow her usual occupations on the next day. The young child is soused with cold water, poured out of one of the great bamboo vessels which the Mincopies use, and is dried by rubbing with the hand. Like its parent, the child wears no clothing; but if the party should be on their travels, and rain begin to fall, the mother pulls a few leaves from the next tree, ties them together with a fibre of rattan, and fastens them on the body of the child. This is the only clothing which an Andamaner ever wears.

Children are never weaned, but continue to take their childish nourishment until the mother is absolutely incapable of affording it. Both parents redeem much of their savage nature by their affection for their children, the father being quite as loving a parent as the mother — a trait which is often absent among savage tribes. The children reciprocate the affection, so that, in spite of the absence of any definite home, there is a domestic character about the family which could scarcely have been expected from such a race.

It has been already mentioned that the boys amuse themselves chiefly with small bows and arrows, having these toys of a continually increasing size to suit their growth. The girls are fond of disporting themselves by the sea-shore, and building sand houses for the waves to knock down, precisely as is done by the civilized children of Europe and America. Their great amusement is to build an enclosure with walls of sand, and to sit in it as if it were a house of their own until the rising tide washes away the frail walls. Both sexes are fond

(1.) NEW CALEDONIANS DEFENDING THEIR COAST. (See page 884.)

(2.) ANDAMANERS COOKING A FIG. (See page 892.)

of swimming, and as soon as they can walk the little black children are seen running into and out of the water, and, if they can pick some sheltered spot free from waves, they dive and swim like so many ducks. A Hindoo, named Pooteeah, who was taken prisoner by the Mincopies, and his life spared for some reason or other, states that they are such excellent swimmers that several of them will dive together among the rocks, search for fish in the crevices, and bring their struggling captives to shore. This statement was discredited by those to whom it was made, as were several other of his accounts. As, however, subsequent observations showed that he was right in many of the statements which were at first disbelieved, it is possible that he was right in this case also.

This man, by the way, was furnished with two wives, mother and daughter, and, as he was above the ordinary size, Captain Mouatt expresses some curiosity as to the appearance of the progeny. He made his escape from the island before the birth of a child that one of his wives was expecting, and, as the Mincopie mothers are remarkable for their affection toward their children, it is likely that the little half-caste was allowed to live, and that a new element may thus be introduced into the race.

They have more than once made use of their swimming powers in escaping from captivity. Several instances have been known where Andamaners have been kept prisoners on board ship, and have seemed tolerably reconciled to their lot. As soon, however, as the ship neared land, they contrived to escape for a moment from the eye of the sentry, slipped overboard, and swam to land. They always dived as soon as they struck the water, swam as far as they could without rising to the surface, and then, after taking a single respiration, dived again, and so swam the greater part of the distance under water. This mode of swimming was doubtless practised by them when trying to escape from the arrows of an unfriendly party.

In Captain Syme's "Embassy to Ava" there is a curious account of two young Mincopie girls who had been decoyed on board the ship. They were treated very kindly, and soon learned that no harm would be done to them. "They suffered clothes to be put on, but took them off again as soon as opportunity offered, and threw them away as useless encumbrances. When their fears were over, they became cheerful, chattered with freedom, and were inexpressibly diverted at the sight of their own persons in a mirror.

"They were fond of singing, sometimes

in a melancholy recitative, at others in a lively key; and often danced about the deck with great agility, slapping the lower part of their bodies with the back of their heels. Wine and spirituous liquors were disagreeable to them; no food seemed so palatable as fish, rice, and sugar. In a few weeks, having recovered strength and become fat, from the more than half-famished state in which they were brought on board, they began to think confinement irksome, and longed to regain their native freedom.

"In the middle of the night, when all but the watchman were asleep, they passed in silence into the Captain's cabin, jumped out of the stern windows into the sea, and swam to an island half a mile distant, where it was in vain to pursue them, had there been any such intention; but the object was to retain them by kindness, and not by compulsion, an attempt that has failed on every trial. Hunger may (and these instances are rare) induce them to put themselves into the power of strangers; but the moment that their want is satisfied nothing short of coercion can prevent them from returning to a way of life more congenial to their savage nature."

Like many other savage races, the Mincopies make a kind of festivity on each new moon; and as soon as the thin crescent appears they salute it after their odd fashion, and get up a dance. Their dances are rather grotesque, each performer jumping up and down, and kicking himself violently with the sole of his foot, so as to produce a smart slapping sound. This is the dance which is mentioned in the preceding account of the two captives.

When a Mincopie dies, he is buried in a very simple manner. No lamentations are made at the time; but the body is tied in a sitting position, with the head on the knees, much after the fashion employed among the Bechuanas, and described on page 300. It is then buried, and allowed to decay, when the remains are dug up, and the bones distributed among the relatives. The skull is the right of the widow, who ties it to a cord and hangs it round her neck, where it remains for the rest of her life. This outward observance is, however, all that is required of her, and is the only way in which she troubles herself to be faithful to the memory of her dead husband. It is rather strange that, though the Andamaners make no lamentations on the death of a relative, they do not altogether dispense with these expressions of sorrow, but postpone them to the exhumation and distribution of the relics, when each one who gets a bone howls over it for some time in honor of the dead.

THE NICOBAR ISLANDS.

IMMEDIATELY to the south of the Andaman Islands, and barely thirty miles distant, lie the NICOBAR ISLANDS. The group consists of nine tolerably large islands, and several of much smaller size. One of the large islands, called Great Nicobar, is twenty miles long by eight wide, while Little Nicobar is barely half these dimensions.

The islands are singularly fertile, and abound in various kinds of vegetation, especially in the cocoa-nut palm, not a specimen of which is to be found in the Andaman Islands. This curious fact is accounted for by the character of the Andamaners, who have an almost superstitious love for the cocoa-nut. If one of the nuts be washed ashore, it is always broken up and eaten; and if perchance one of the fruit happens to escape the sharp eyes of the natives and to germinate, its green feathery shoots are sure to attract the attention of the first Mincopie who passes in that direction. A similar barrier to the production of the cocoa-nut is found on the coast of Australia.

Although so close to the Andaman Islands, the inhabitants of Nicobar are very unlike the Mincopies, being a fine tall race, and of a copper rather than a black hue. Unlike the Mincopies, the men are very fat, especially about the breast, so that at a little distance they might easily be mistaken for women. Moreover, they wear the hair long, and parted in the middle, which to the eyes of a modern European, gives them a peculiar effeminate look. They wear neither beard nor moustache, their features are ugly, and their large mouths are stained a dark red from the juice of the betel-nut, which they are continually chewing.

There is one distinction, however, which is apparent at a considerable distance. In lieu of clothes, the men wear a strip of cloth, never more than two inches wide. This is passed round the waist, under the legs in front, and tucked through itself behind, the end being left as long as possible. The men place great value on the length of this tail, and he is the best dressed man who wears it the longest. Some of the wealthy among them have the tail dragging along the ground for several feet, like an European lady's train. If possible, this tail is made of blue cloth, an article that is held in very high estimation by the natives.

The women are quite as ill-favored as the men, and increase their natural ugliness by shaving off all their hair. They do not wear tails like the men, but have a plaited grass girdle, from which depends a soft fibrous fringe about a foot in depth.

The character of the Nicobarians is far gentler than that of the Mincopies, the latter being proverbially fierce and cruel toward strangers, and the former soon learning to

welcome foreigners when they have made up their minds that no harm is intended them. Captain Campbell, to whom I am indebted for most of the information respecting these natives, found them very agreeable and hospitable, ready to barter, and always welcoming him to their houses.

After a short time, even the women and children, who had at first been scrupulously concealed, after the manner of savages, came boldly forward, and were as hospitable as the men. On one occasion, while paying a visit to one of their huts, Captain Campbell tried to make friends with one of the children, all of whom were terribly frightened at the white face of their visitor. Finding that no response was made to his advances, he pulled the child from his hiding-place, and held him for a little time, in spite of his struggles. The mother made no opposition, but laughed heartily at the skirmish, evidently feeling that no harm was intended toward her little one.

The native weapons of the Nicobarians are very curious. As the people are not of a warlike character like the Mincopies, their weapons are used almost exclusively for killing game. The most formidable is a tolerably large spear headed with iron, which is used for killing hogs, and is thrown like the assagai of Southern Africa. They have also a smaller javelin for fish-killing, and a number of many-pointed hand-spears for the same purpose. The most remarkable of their weapons is a cross-bow, which is almost exactly like that of the Fan tribe of Africa. It is not very powerful, and only propels a small arrow. Its chief use is in killing birds.

Besides these weapons, every man carries a cutlass-blade from which the hilt has been removed, and a handle roughly made by wrapping some six inches of the butt with cocoa-nut fibre. It is intended not so much as a weapon as a tool, and with it the natives cut down trees, carve their canoes, and perform similar operations.

The architecture of the Nicobarians is infinitely superior to that of the Mincopies, and is precisely similar in character to that which is found among the inhabitants of New Guinea, the home of the Papuan race.

The native architect begins by fixing a number of posts in the ground, and erecting on them a platform of split bamboo. Over this platform he builds a roof shaped exactly like a beehive, and his house is then complete. The bamboo platform is the floor of the hut, and, being elastic as well as firm, serves also for a bed. To this hut the native ascends by a primitive sort of ladder, and passes into the chamber through a hole cut in the floor. The sides of the hut are adorned with the skulls of hogs, intermixed with spears,

knives, bows, and arrows. The huts are kept peculiarly neat and clean.

A rather remarkable use is made of the hut. The open space between the floor and the ground is far too valuable not to be utilized, as it affords a cool and airy shelter from the sunbeams. Under this floor is suspended a primitive sort of hammock, which is a board about six feet in length, slung by ropes. In, or rather on, this very uncomfortable hammock the Nicobarian likes to lounge away his time, dozing throughout the hot hours of the day, sipping palm wine at intervals, and smoking without cessation. In fact, we seem to have got again among the inhabitants of Western Africa, so similar is the character of the Nicobarian to that of the negro. The "Scene in the Nicobar Islands," represented on the 903d page, shows the personal appearance of the Nicobarians and their style of architecture.

The canoes of the Nicobarians are not so beautifully formed as those of the Mincopies, but are constructed on the same principle, being hollowed out of the trunks of trees, and supported by a slight outrigger. They have a very high and ornamental prow, and are propelled by short paddles. They are very light, and, when properly manned, skim over

the water at an astonishing pace. Some of them are nearly sixty feet in length, while others are barely six or seven feet long, and only intended for one person.

The mode of burial is not in the least like that which is employed among the Mincopies. When a man dies, the body is placed in a coffin, which is generally made from a canoe. The canoe is cut in half, the body being laid in one moiety, and covered with the other half. In order to supply the deceased with provisions for his journey to the spirit-land, a pig is killed and placed in the coffin, together with a supply of yams and cocoa-nuts. In case he should be attacked on his journey, a quantity of weapons, such as bows, spears, and cutlasses, are placed in the coffin.

The body is buried in the middle of the village, and the spot marked by a stick, to which is attached a small streamer. After some time, when the body has been consumed by the earth, the coffin is dug up again. The deceased being now supposed to have completed his journey to his spirit-home, his bones are thrown into the bush, and the cutlasses and other weapons distributed among his relatives.

CHAPTER XC.

NEW GUINEA.

THE HOME OF THE PAPUAN RACE—DISTINGUISHING MARKS OF THE RACE—DERIVATION OF THE NAME—GENERAL CHARACTER OF THE PAPUANS—THE SIGN OF PEACE—AN UNFORTUNATE MIS-UNDERSTANDING—DRESS AND ORNAMENTS OF THE TRIBES OF DOURGA STRAIT—THEIR AGILITY AMONG THE TREES—THE OUTANATA TRIBES—TATTOOING AND ORNAMENTS—ELABORATE ARCHITECTURE—WEAPONS—THE DUST SIGNALS AND THEIR MEANING—THEIR UNSUSPICIOUS NATURE—ABRAUW, THE CHIEF.

WE now come to the very home and centre of the Papuan race.

New Guinea is a very large island, fourteen hundred miles in length, and, as far as has been ascertained, containing some two hundred thousand geographical square miles. It is separated from Australia only by Torres Strait, and, as we have seen, a certain amount of intercourse has taken place between the Papuans of the south of New Guinea and the natives who inhabit the north of Australia. Fertile in the vegetable kingdom, it possesses one or two animals which have the greatest interest for the naturalist, such as the tree-kangaroo, the crowned pigeon, and the bird of paradise. It is equally interesting to the ethnologist as being the home of the Papuan race.

Taken as a race, they are very fine examples of savage humanity, tall, well-shaped, and powerful. They are remarkable for two physical peculiarities. The one is a roughness of the skin, and the other is the growth of the hair. The reader may remember that some of the tribes of Southern Africa have the hair of the head growing in regular tufts or patches, each about the size of a pea.

It is a remarkable fact that, in the Papuan race, the hair grows in similar patches, but, instead of being short like that of the South African, it grows to a considerable length, sometimes measuring eighteen inches from root to tip. The Papuans are very proud of this natural ornament, and therefore will seldom cut it off; but as, if left untrained, it would fall over the eyes, they have various

modes of dressing it, but in most cases manage to make it stand out at right angles from the head. Sometimes they take the hair of each patch separately and screw it up into a ringlet. Sometimes they tease out all the hairs with a wooden comb of four or five prongs, and, as the hair is very coarse and stiff, it is soon induced to assume a mop-like shape, and to increase the apparent size of the head to an enormous extent.

Indeed, the word Papua is derived from this peculiarity of the hair. In the Malay language, the word which signifies "crisped" is *pua-pua*, which is easily contracted into *pa-pua*. Even the hair of the face grows in similar patches, and so does that on the breast of the man, and in the latter case the tufts are much further apart than on the head or face.

The color of the Papuans is a very dark chocolate, sometimes inclining to black, but having nothing in common with the deep shining black of the negro. Their features are large and tolerably well made, though the nose is very broad at the wings, and the lips wide. The nose, however, is not flat like that of the negro, but is prominent, rather arched, and descends so low that when seen in front the tip nearly reaches the upper lip. The natives seem to be perfectly aware of this peculiarity, and perpetuate it in their carvings.

Although taken as a whole, they are a fine race, there are many diversities among the different tribes, and they may be divided into the large and small tribes. The former are powerfully built, but more remark-

able for strength than symmetry — broad-breasted and deep-chested, but with legs not equal in strength to the upper parts of the body.

Their character has been variously given, some travellers describing them as gentle and hospitable, while others decry them as fierce and treacherous. Suspicious of strangers they certainly are, and with good reason, having suffered much from the ships that visited their coasts. A misunderstanding may soon arise between savage and civilized people, especially when neither understands the language of the other. An example of such a misunderstanding is given by Mr. Earle in his valuable work on the native races of the Indian Archipelago. Lieutenant Modera, an officer in the Dutch navy, embarked with several other gentlemen in the ship's boat, for the purpose of landing on the shore of Dourga Strait, a passage between the mainland and Frederick Henry Island.

"When the boat had proceeded to within a musket-shot distance from them, the natives, who were armed with bows, arrows, and lances, commenced making singular gestures with their arms and legs. The native interpreter called out to them in a language partly composed of Ceramese, and partly of a dialect spoken by a Papuan tribe dwelling a little further to the north; but his words were evidently quite unintelligible to them, as they only answered with loud and wild yells. We endeavored, for a long time without success, to induce them to lay aside their weapons, but at length one of them was prevailed upon to do so, and the others followed his example, on which we also laid down our arms, keeping them, however, at hand.

"We now slowly approached each other, and the interpreter, dipping his hand into the sea, sprinkled some of the water over the crown of his head as a sign of peaceful intentions. This custom seems to be general among all the Papuan tribes, and in most cases their peaceful intentions may be depended upon after having entered into this silent compact.

"This they seemed to understand, for two of them immediately did the same, on which the interpreter jumped into the shallow water, and approached them with some looking-glasses and strings of beads, which were received with loud laughter and yells. They now began dancing in the water, making the interpreter join, and the party was soon increased by other natives from the woods, who were attracted by the presents. Mr. Hagenholtz also jumped into the shallow water and joined in the dance, and they soon became so friendly as to come close round the boat; indeed some of them were even induced to get in."

Meanwhile their confidence increased, and they began to barter with their visitors,

exchanging their ornaments, and even their weapons, for beads, mirrors, and cloth. They were very inquisitive about the strange objects which they saw in the boat, and, although they handled everything freely, did not attempt to steal. One of them took up a loaded pistol, but laid it down at once when the owner said it was tapu, or forbidden. Unfortunately, a misunderstanding then took place, which destroyed all the amicable feeling which had been established.

"While all this was going on, they kept drawing the boat — unperceived, as they thought — toward the beach, which determined us to return, as our stock of presents was exhausted, and there seemed no probability of our inducing any of them to go on board with us. Shortly before this, Mr. Boers had ornamented a Papuan with a string of beads, who, on receiving it, joined two of his countrymen that were standing a little distance off with the arms that had been laid aside, but which they had been gradually getting together again — a proceeding we had observed, but, trusting in the mutual confidence that had been established, we did not much heed it.

"At the moment in which we were setting off the boat to return on board, this man fixed an arrow in his bow, and took aim at Mr. Boers, who was sitting in the fore part of the boat, on which the latter turned aside to take up his gun, but before he could do so he received the arrow in his left thigh, which knocked him over, shouting, 'Fire! fire! I am hit!' as he fell. The order was scarcely given before every one had hold of his arms (which, as before stated, were kept at hand), and a general discharge put the natives to flight, swimming and diving like ducks.

"Before they took to flight, however, they discharged several more arrows at our people, one of which struck Mr. Hagenholtz in the right knee, another hit a sailor in the leg, while a third pierced a sailor's hat and remained sticking in it; and lastly, a Javanese had the handkerchief shot off his head, but without receiving any personal injury."

Three of the natives were severely wounded, if not killed, in this unfortunate affair, which evidently arose, as Mr. Earle points out, from misunderstanding, and not from deliberate treachery. Seeing the boats being pulled toward the ships while four of their companions were on board, they probably thought that they were being carried off as captives, as has so often been done along their coast by the slavers. They could not be expected to understand the difference between one white man and another, and evidently mistook the Dutch sailors for slavers, who had come for the purpose of inveigling them into the ships, where they could not be rescued.

The tribes of this part of the coast are not agreeable specimens of the Papuan race.

They are barely of the middle size, and lightly built. Their skin is decidedly black, and they ornament their bodies with red ochre, paying especial attention to their faces, which are made as scarlet as ochre can make them. The hair is deep black, and is worn in various ways. Most of the men plait it in a number of tresses, which fall nearly on the shoulders, while others confine it all into two tails, and several were seen with a curious headdress of rushes, the ends of which were firmly plaited among the hair. They are a dirty set of people, and are subject to diseases of the skin, which give them a very repulsive appearance.

Dress is not used by the men, who, however, wear plenty of ornaments. They mostly have a belt made of plaited leaves or rushes, about five inches wide, and so long that, when tied together behind, the ends hang down for a foot or so. Some of them adorn this belt with a large white shell, placed exactly in the middle. Earrings of plaited rattan, necklaces, and bracelets, were worn by nearly all. Some of them had a very ingenious armlet, several inches in width. It was made of plaited rattan, and fitted so tightly to the limb that, when a native wished to take it off for sale, he was obliged to smear his arm with mud, and have the ornament drawn off by another person.

Their principal weapons are bows, arrows, and spears, the latter being sometimes tipped with the long and sharp claw of the tree-kangaroo.

The agility of these Papuans is really astonishing. Along the water's edge there run wide belts of mangroves, which extend for many miles in length with scarcely a break in them. The ground is a thick, deep, and soft mud, from which the mangrove-roots spring in such numbers that no one could pass through them even at low water without the constant use of an axe, while at high water all passage is utterly impossible.

As the natives, who are essentially maritime in their mode of life, have to cross this belt several times daily in passing from their canoes to their houses, and *vice versa*, they prefer doing so by means of the upper branches, among which they run and leap, by constant practice from childhood, as easily as monkeys. (See p. 909.) There is really nothing extraordinary in this mode of progress, which can be learned by Europeans in a short time, although they never can hope to attain the graceful ease with which the naked savages pass among the boughs. In some places the mangroves grow so closely together that to traverse them is a matter of perfect ease, and Mr. Earle remarks that he once saw a file of marines, with shouldered arms, making their way thus over a mangrove swamp.

The familiarity of these people with the trees causes them to look upon a tree as a natural fortress, and as soon as explorers suc-

ceeded in reaching the villages, the natives invariably made off, and climbed into the trees that surrounded the villages.

Wild and savage as they are, the Papuans of Dourga Strait display some acquaintance with the luxuries of civilized life and are inordinately fond of tobacco, the one luxury that is common to the highest and lowest races of mankind.

Some travellers have stated that these Papuans are cannibals, and it is certain that their gestures often favor such an opinion.

The Papuans of Dourga Strait are admirable canoe men, and paddle with singular skill and power. They always stand while paddling, a plan whereby they obtain a great increase of power, though perhaps at the expense of muscular exertion. They give as their chief reason for preferring the erect position, that it enables them to detect turtle better than if they were sitting, and to watch them as they dive under water after being wounded.

SKIRTING the coast of New Guinea and proceeding northward from Dourga Strait, we come to the OUTANATA River, at the embouchure of which is a tribe that differs much from those natives which have already been described. They are a finer and taller set of men than those of Dourga Strait, and seem to have preserved many of their customs intact since the time when Captain Cook visited them. Their skin is a very dark brown, and is described as having a bluish tinge, and they are said to rub themselves with some aromatic substance which causes them to diffuse an agreeable odor.

It is probable that the bluish gloss may be due to the same aromatic substance with which the body is perfumed. Mr. Earle thinks that the odoriferous material in question is the bark of the tree called the "rosamala."

The blue tinge is never seen among Papuan slaves, and this circumstance adds force to Mr. Earle's conjecture.

The features are rather large, especially the mouth, and the lips are thick. The custom of filing the teeth to a sharp point prevails among this tribe, but is not universal. The eyes are small, and the septum of the nose is always pierced so as to carry a piece of white bone, a boar's tusk, or some similar ornament. The hair is thick, and, instead of being trained into long tails like that of the Dourga Strait natives, it is plaited from the forehead to the crown.

The men wear scarcely any real dress, many of them being entirely naked, and none of them wearing more than a small piece of bark or a strip of coarse cloth made either of cocoa-nut fibre or of split bamboo. They are, however, exceedingly fond of ornament, and have all the savage love of tattooing, or rather scarifying, the body, which is done in a way that reminds the

observer of the same process among the Australians. The scarifications project above the skin to the thickness of a finger, and the natives say that this effect is produced by first cutting deeply into the flesh, and then applying heat to the wounds. Anklets, bracelets, and other articles of savage finery are common, and a man who does not wear an inch of clothing will pride himself on his boar's teeth necklace, his bracelets of woven rattan, and his peaked rush cap.

The women always wear some amount of clothing, however small, the very fact of possessing apparel of any kind being conventionally accepted as constituting raiment. Their solitary garment consists of a small apron, about six inches square, made from the cocoa-nut fibre.

It is rather remarkable that these people have the same habit of placing their newborn children in hot sand, as has already been described when treating of the now extinct Tasmanians. When the mother goes about her work, she carries the child by means of a sort of sling made of leaves or the bark of a tree.

The architecture of the Outanatas is far superior to that of their brethren of Dourga Strait. One of these houses, described by Lieutenant Modera, was at least a hundred feet in length, though it was only five feet high and six wide, so that a man could not stand upright in it. There were nineteen doors to this curious building, which was at first mistaken for a row of separate huts. The floor is covered with white sand, and the inhabitants generally seat themselves on mats. Each of these doors seemed to be appropriated to a single family, and near the doors were placed the different fireplaces. Over the roof a fishing net had been spread to dry in the sun, while a number of weapons were hung under the roof.

This house was built in a few days by the women and girls, and was placed near a much larger building, which had been raised on piles.

The weapons of the Outanatas are spears, clubs, and the usual bow and arrows, which form the staple of Polynesian arms.

The bows are about five feet in length, and are furnished with a string sometimes made of bamboo and sometimes of rattan. The arrows are about four feet in length, and made of cane or reed, to the end of which is attached a piece of hard wood, generally that of the betel-tree. The tips are mostly simple, the wood being scraped to a sharp point and hardened in the fire, but the more ambitious weapons are armed with barbs, and furnished with a point made of bone. The teeth of the sawfish are often employed for this purpose, and a few of the arrows are tipped with the kangaroo claw, as already mentioned in the description of the Dourga Strait spear.

Beside these weapons, the natives carry a

sort of axe made of stone lashed to a wooden handle, but this ought rather to be considered as a tool than a weapon, although it can be used in the latter capacity. With this simple instrument the Outanatas cut down the trees, shape them into canoes, and perform the various pieces of carpentering that are required in architecture.

The most remarkable part of an Outanata's equipment is an instrument which greatly perplexed the earlier voyagers, and led them to believe that these natives were acquainted with fire-arms. Captain Cook, who visited New Guinea in 1770, mentions that as soon as he reached the shore and had left his boat, three natives, or "Indians," as he calls them, rushed out of the wood, and that one of them threw out of his hand something which "flew on one side of him and burnt exactly like powder, but made no report." The two others hurled their spears at the travellers, who were in self-defence obliged to use their fire-arms.

Not wishing to come to an engagement, they retired to the boat, and reached it just in time, the natives appearing in considerable force. "As soon as we were aboard, we rowed abreast of them, and their number then appeared to be between sixty and a hundred. We took a view of them at our leisure. They made much the same appearance as the New Hollanders, being nearly of the same stature, and having their hair short-cropped. Like them they also were all stark naked, but we thought the color of their skin was not quite so dark; this, however, might be merely the effect of their being not quite so dirty.

"All this time they were shouting defiance, and letting off their fires by four or five at a time. What those fires were, or for what purpose intended, we could not imagine. Those who discharged them had in their hands a short piece of stick—possibly a hollow cane—which they swung sideways from them, and we immediately saw fire and smoke, exactly resembling those of a musket, and of no longer duration. This wonderful phenomenon was observed from the ship, and the deception was so great that the people on board thought they had fire-arms; and in the boat, if we had not been so near that we must have heard the report, we should have thought they had been firing volleys."

The reader will doubtless remark here that the travellers were so accustomed to associate fire with smoke that they believed themselves to have seen flashes of fire as well as wreaths of smoke issue from the strange weapon. Many years afterward, Lieutenant Modera contrived to see and handle some of these implements, and found that they were simply hollow bamboos, filled with a mixture of sand and wood-ashes, which could be flung like smoke-wreaths from the tubes. The Outanatas, their weap-

ons, canoes and the remarkable instrument just described, are illustrated on the following page.

Some persons have thought that the natives used these tubes in imitation of fire-arms, but the interpreters gave it as their opinion that they were employed as signals, the direction of the dust cloud being indicative of the intention of the thrower. Others say that the tubes are really weapons, made for the purpose of blinding their adversaries by flinging sand in their eyes. I cannot agree with this last suggestion, because the other weapons of the Outanatas show that the natives do not fight hand to hand like the New Zealanders. I think that the interpreters were right in their statement that the tubes are used for signalling, and this supposition is strengthened by the fact that the natives of Australia do use smoke for the same purpose, as has already been described.

The canoes of the Outanatas are often of considerable size, measuring fifty or sixty feet, and, although narrow in proportion to their length from stem to stern, containing a great number of men. They are handsomely carved and adorned with paint, and both ends are flat and broad. The rowers stand up when they use their paddles, which are necessarily of considerable length, having long handles and oval blades slightly hollowed. The narrowness of these canoes strengthens the opinion of several travellers, that the Outanatas are really an inland tribe, descending the river in flotillas, and returning to their inland home when the object of their expedition is accomplished.

They seem to be less suspicious than their countrymen of Dourga Strait, and have no hesitation in meeting Europeans and exchanging their own manufactures for cloth, knives, and glass bottles, the last mentioned objects being always favorite articles of barter with Polynesian savages, who employ them when entire for holding liquids, and, if they should unfortunately be broken, use the fragments for knives, lancets, points of weapons, and similar purposes. Lieutenant Modera describes the appearance of one of their flotillas as repre-

senting a perfect fair, the boats being laid closely together, and their decks crowded with natives laden with articles for barter.

Unlike the Dourga Strait natives, those of the Outanata River had no objection to come on board the European ships, and visited the vessels in great numbers. Even their principal chief came on board frequently. On the first occasion he disguised his rank, and merely came as an ordinary native, but he afterward avowed himself, and came freely on board in his own character. For convenience' sake he called himself *Abrauw*, i. e. *Abraham*, a name by which he was well known for a considerable distance. He offered no objection to going below and entering the Captain's cabin, though his subjects were rather uneasy at his absence, and shouted his name so perseveringly that he was obliged every now and then to put his head out of the cabin window. He had all the regal power of concealing astonishment, and witnessed with utter imperturbability the discharge of fire-arms, the ticking of watches, and examples of similar marvels. He did, however, display a little interest in the musketry practice, which was directed at a succession of bottles, slung from the yard-arm, but whether he was struck with the accuracy of aim or with the needless destruction of valuable bottles is doubtful.

He seemed to be worthy of his position as chief, and was desirous of establishing an European settlement near the mouth of the Outanata. Unfortunately, the river, although a noble stream, has a sandbar across the mouth which effectually prevents vessels of even light draught from passing except at high water. The people in general were wonderfully honest, not displaying the thievish propensities which cause the visits of many savage tribes to be so troublesome. They even brought on board articles which had been accidentally left on shore. They probably owe much of their superiority to their connection with the Malay Mohammedans, many of whom visit New Guinea as traders.

CHAPTER XCI.

NEW GUINEA — *Concluded.*

THE ALFOËRS OR HARAFORAS — VARIOUS REPORTS RESPECTING THEM — THEIR MODE OF GOVERNMENT — AN ALFOËRIAN DIVORCE COURT — TREPANG COLLECTING — DESTRUCTION OF PROPERTY — FUNERAL RITES — TRIBES OF THE SOUTH-EASTERN COAST — A QUAINT DRUMMER — DRESS AND ORNAMENT — THE TATTOO — THE FULL-DRESS PETTICOAT — HAIR-DRESSING — EXCELLENCE OF THEIR CANOES — AN INGENIOUS SAIL — HOW TO STOP A LEAK — THE PIG-PET — ARCHITECTURE — DEFENCE AGAINST VERMIN — HOUSES OF REDSCAR BAY — DREAD OF STEEL — TRIBES OF THE NORTH-WEST COAST — THEIR CANOES — MODES OF FISHING — AQUATIC HOUSES — MODE OF GOVERNMENT — APPOINTMENT OF A NEW CHIEF — NEW GUINEA WEDDINGS — THE KARWAR, OR HOUSEHOLD GOD — THE WAR-DANCE — CEREMONIES AT FUNERALS.

WE must here give a short space to some tribes called by various names, such as Haraforas, Alfouras, and Alfoërs, and supposed by many ethnologists to be a separate family living in New Guinea and the neighboring islands, but as distinct from the generality of the inhabitants as the Bosjesman of Southern Africa are from the Kaffir.

This theory, however, has now been shown to be untenable, and it is now known that the word Alfoërs, or Alfouras, is applied by the tribes of the coast to those who live in the interior. The word has a Portuguese origin, and as Mr. Earle remarks, is applied to the mountaineers of the interior, just as the Spaniards called the aborigines of America "Indians," and the Mohammedan inhabitants of Salee and Mindano "Moros," or "Moors."

Most of the accounts that have been received of the Alfoërs are not at all to be trusted. They have been described as peculiarly disgusting and repulsive, ferocious, gloomy, living in the depths of the forest, and murdering all strangers who came in their way. In fact, they have a worse reputation than the Andamaners. It has been ascertained, however, that these evil reports have originated from the coast tribes, who have a very strong objection to allow foreigners to penetrate inland.

The reason is obvious. The visits of the traders are exceedingly valuable, furnishing all kinds of tools, weapons and orna-

ments, which constitute the wealth of the savage. The natives, having purchased these with articles which to themselves are comparatively valueless, can sell their superabundance to the inland Alfoërs, and make an enormous profit on their bargain. If the white men were allowed to go inland and trade directly with the natives, their profitable traffic would be broken up.

As far as can be ascertained, the Alfoërs are in much the same state as were the Outanatas before they were visited by traders. Those who were seen were remarkable for a certain stupidity of aspect, a taciturnness of disposition, and a slowness of movement, which are not found among the Outanatas. As, however, they were slaves, it is more than likely that these characteristics were the result of servitude.

Subsequently some discoveries were made among the Alfoërs, which entirely contradicted the reports of the coast tribes. They are certainly rough in their manners, and if they take a dislike to a foreigner, or if he should perchance offend any of their prejudices, they eject him from the district with more speed than ceremony; taking care, however, not to inflict personal damage, and refraining from confiscating his property.

As far as can be ascertained from the slight intercourse which has been held with these tribes, there is no regular form of government, the elders deciding disputes, and their decisions being respected. They

are an honest set of people, paying the greatest regard to the rights of property; and being so scrupulous in this respect, that if any one should even enter the house of an absent man he is called to account, and made to pay a fine to the owner of the house. A similar law exists with regard to the women. If a man should even touch, though accidentally, the wife of another, he makes himself liable to a fine.

A curious example of this regulation is mentioned by Lieutenant Kolff. A man set out in his canoe to fish, intending to return in a week; but being caught by contrary winds, he was driven away from his own part of the coast, and was detained two months. Unfortunately he had only left at home provisions for a week, and his wife, finding herself without food, asked a neighbor to provide it for her. This he did, and as, day after day, nothing was heard of the husband, the woman transferred her affections and herself to the neighbor who had assisted her, and the pair went off to another island.

After two months had elapsed the husband came back, and, not finding his wife, demanded her from her brothers, who were then bound to produce her. They set off in search of the guilty couple, discovered them, and brought them back, when the injured husband demanded an enormous sum by way of fine. The man said that he could not possibly pay such a sum if he were to work for the rest of his lifetime. The affair was eventually brought before the elders, who decided that the husband had done wrong in leaving his wife so ill provided for, and that if he had supplied her with a sufficiency of provisions the acquaintance between herself and her paramour would probably have been avoided. So they decreed that the man should pay a small fine, and advised the husband to leave plenty of provisions at home when he next went out fishing.

The principal object for which the natives make these expeditions is the trepang, or sea-slug (*Holothuria*), which is in great demand in China, and is purchased by traders from the natives for the Chinese market. It is chiefly by means of the trepang that a man procures a wife. As is the case among many savage tribes, a wife can only be obtained by purchase, so that daughters are quite as valuable to their parents as sons. With the Alfoers, the marriage present must always consist of foreign valuables, such as elephants' tusks, gongs, China dishes, cloth, and similar objects. These are obtained by exchanging trepang with the traders.

When, therefore, a young man wants a wife, and has settled the amount of the marriage portion with the father, he goes off for a year on a hunting expedition. He takes a canoe, and sails from island to island,

catching as much trepang as possible, and begging from all those whom he visits. At the end of the year he returns home, knowing that by means of the protective law his house and property will be perfectly safe, and presents himself to the father of the girl with the goods which he has obtained. It is seldom that he is able to make up the entire amount at once, but he is allowed to pay by instalments.

Property cannot be inherited, owing to a peculiar custom. As soon as any one dies, his relations assemble, gather together all his valuables, break them to pieces, and throw the fragments away. Even the precious brass gongs are thus broken, the survivors thinking that no one may use anything belonging to the dead. Large heaps of broken china, ivory, and metal are found on the outskirts of villages that have existed for any long time, showing that many deaths must have occurred within its limits.

The rest of the funeral ceremonies are curious, and are worthy of a brief description.

When death is ascertained, notice is sent to all the relatives of the deceased, who often are scattered widely apart, so that several days usually elapse before they can all assemble. The body meanwhile is kept sprinkled with lime, in order to retard decay as much as possible, and aromatic resins are burned in the house to counteract any ill odor. As the relatives come, they take their places in the house, and begin drinking. Before the traders supplied them with arrack, they had a fermented liquor made by themselves from fruit. They always offer the deceased a share of everything, putting a little food into the mouth of the dead person, and pouring a little liquid between the senseless lips. Meanwhile the women utter loud lamentations, gongs are beaten, and a stunning uproar is kept up until the time of the funeral.

When the relatives have all assembled, a bier is provided, covered with cloth, the quantity and quality of which accord with the wealth of the deceased; and the body is then brought out in front of the house, and supported in a sitting position against a post. The villagers then assemble, and a general feast takes place, a share of which is offered to the deceased as before. Finding that he will neither eat nor drink, in spite of the solicitations of his friends and companions, the body is carried into the woods, where it is placed on a platform erected on four feet.

This being done, the concluding ceremony is left to the women. They remove all their clothing, and then plant by the side of the platform a young sapling; this ceremony being called the "casting away of the body," and considered as a symbol that the deceased has done with his body, and thrown it from him.

PASSING more to the eastward of New Guinea, we come to some interesting nations inhabiting Brumer's Island, and the neighborhood. These islands are situate about lat. 10° 45' S. and lon. 150° 23' E.

Living as they do on a number of small islands, the largest being rather less than three miles in width, the natives are necessarily maritime, passing from one island to another in their admirably contrived vessels. They are accustomed to the visits of ships, and boldly put off to meet them, taking no weapons, except for sale, and displaying the greatest confidence in their visitors.

One of these natives caused great amusement by his imitation of the ship's drummer. Some one gave him a large tin can, which he, being a musical genius, immediately converted into a drum. At first he merely pounded it with his hands, but when the ship's drummer was sent into the chains, and began to play upon his instrument, the man watched him for a little time, and then began to imitate him in the most ludicrous manner, his antics and grimaces being especially provocative of laughter. The effect of his buffoonery was heightened by the manner in which he had adorned his face. He had blackened his naturally dark features with charcoal, and had drawn a streak of white paint over each eyebrow, and another under the chin to the cheek-bones.

The mode of salutation is rather ludicrous to a stranger, as it consists of pinching. When they desire to salute any one, they pinch the tip of the nose with the finger and thumb of the right hand, while with the left they pinch the middle of their stomachs, accompanying this odd and complex gesture with the word "Magasûka." These natives seem to be a hospitable people, for, after several of them had been received on board and treated kindly, they returned on the following day, and brought with them a great quantity of cooked yams, for which they refused payment.

The men wear nothing but a small strip of pandanus leaf, but the women have a dress which in principle is exactly similar to the thong-aprons of Southern Africa. It consists of a number of very narrow strips of pandanus leaf, reaching nearly to the knee. The girls wear only a single row of these strips, but the women wear several layers of them, one coming a little below the other, like flounces. In wet weather the uppermost petticoat is taken from the waist and tied round the neck, so as to protect the shoulders from the rain, which shoots off the leaf-strips as off a thatched roof.

On gala days a much handsomer petticoat is worn. This consists of much finer leaf strips than those which constitute the ordinary dress, and it is dyed of various colors.

Some of them which were seen by Mr. M'Gillivray were red and green, with bands of pale yellow and pure white. The tufts of which they were composed were extremely light and soft, and looked like very fine-twisted grass blades. Several of the women, by way of finishing their toilet, had blackened their faces. This process, if it did not add to their beauty, certainly did not detract from it, as their faces were originally so plain that the black covering could not make them more ugly. The young men and lads formed a curious contrast to the women in this respect, many of them being remarkable for their good looks.

The women usually, though not invariably, divide their hair into a vast number of little tresses, and twist them up like the thrums of a mop, while the men tease out their stiff and wiry locks as much as possible, and fix in them a slender stick, some two feet in length, decorated with a little plume at the top, the base being cut into teeth and so used as a comb.

The inhabitants of Redscar Bay use a more elaborate system of tattooing than that which has been described above. The men generally restrict themselves to certain portions of the body, such as the breast, cheeks, forehead, and arms, and even on those spots the tattooing is comparatively slight. But the women are so covered with blue patterns, that there is hardly a portion of their bodies which has not been thus decorated. They have various patterns, but the usual type is formed by double parallel lines, the intervals between which are filled with smaller patterns, or with zigzag lines. As the dress of the women consists merely of the leaf-strip petticoat, the patterns of the tattooing are very fully displayed.

The hair of the men is dressed here after a rather singular fashion. It is shaved from the forehead for some three inches, and the remainder is combed backward to its full length. A string is then tied round it, so as to confine it as closely as possible to the head, leaving rather more than half its length to be frizzed into a mop-like bundle projecting from the crown.

Those who are especially careful of their personal appearance add an ornament which is not unlike the pigtail of the last century. A tolerably large bunch of hair is gathered together and tied into a long and straight tail, the end of which is decorated with some ornament. In one case, a man had attached to his pigtail a bunch of dogs' teeth. The mouths, naturally wide, are disfigured with the universal custom of chewing the betel-leaf mixed with lime, which stains the lips of a dull brick-red, and makes the whole mouth look as if it had been bleeding.

The hair is usually black, but some diversities of color are often seen. Sometimes it is black except the tips of each tress, where

the hue becomes yellow or reddish, and sometimes the whole of the hair is red. In all probability, this change of tint is produced by artificial means, such as lime-water, the use of which is known in various parts of New Guinea. Those who have the entire hair red have probably dyed it lately, while those who have only the tips red have passed several months without dyeing it. There is but little beard or moustache.

As far as can be judged from appearances, the women are treated better than is usually the case among savages, and seem to be considered as equal with the men. They are affectionate parents, as was proved by the fact that children were often brought by their fathers to look at the ships.

The average stature of these natives was rather small, few exceeding five feet four inches in height. They were very active, but not powerful, as was proved by testing their strength against that of the ship's crew.

Allusion has already been made to their skill in boating. These natives possess various canoes, some so small as only to hold, and by no means to accommodate, one person, while others contain with ease fifty or sixty at once.

The commonest canoe is that which is popularly called a catamaran, and which is more of a raft than a boat. It is formed of three planks lashed together with rattan. The man sits, or rather kneels, a little behind the centre, and is able to propel this simple vessel with great speed. Some of these catamarans are large enough to carry ten or twelve persons, together with a cargo. Instead of being merely three planks, they consist of three great logs of wood laid side by side, and lashed firmly together with rattan at their ends, in the centre, and midway between the centre and each end. There is no particular bow or stern, but the central log is longer than the others, so as to project at each end, and is generally carved into rude patterns, and ornamented with red and white paint.

Of course the sea washes freely over this primitive vessel, so that the natives are obliged to erect a small platform in the middle, on which they can place any goods that might be damaged by wetting.

One of the smaller catamarans is shown in the foreground of illustration, No. 2, on the next page, and just behind it is one of the large canoes with its sail struck. Such a canoe as this is about twenty-five feet in length. It consists of two parts, the canoe proper and the outrigger. The canoe proper is very curiously formed. It is cut from the trunk of a tree, and, in spite of its length, is not more than eighteen or nineteen inches in extreme width. The most curious part of its construction is, that the sides, after bulging out below, come together above, so that the space between the

gunwale is barely eight inches, there is only just room for a man's legs to pass into the interior of the boat. A section of the canoe would present an outline very much like that of the Greek Omega reversed, thus — ∩. In order to preserve the gunwales from injury, a slight pole is lashed to them throughout their entire length.

As is the case with the catamaran, both ends of the canoe are alike. They are generally raised well above the water, and are carved into the semblance of a snake's or turtle's head, and decorated with paint, tufts of feathers, shells, and similar ornaments.

The outrigger is as long as the canoe, to which it is attached by a series of light poles to the gunwale of the canoe itself. The method by which the outer ends of the poles are fastened to the outrigger is very curious, and can be better understood by reference to the illustration than by a description. Like the ends of the canoe, those of the outrigger poles are fashioned into a snake-like form.

The natives can run along these poles to the outrigger with perfect safety, often sitting upon it when the wind is high, so as to preserve the balance of the vessel. In many canoes, however, a slight platform is laid upon these poles, so as greatly to increase the burthen-carrying space of the vessel; and a corresponding but smaller platform projects from the opposite side of the canoe. On this platform several paddlers are stationed, finding it easier to work their long-handled paddles from the platform than from the narrow space of the canoe itself.

The sail is made of strips of palm leaf, interlaced with each other. When it is not required, the sail is struck and rolled up, so as to occupy as little room as possible, and the mast can also be struck, like those of our sailing barges while passing under a bridge.

Two other kinds of New Guinea canoes are shown in the same illustration. These canoes are not found in the same part of New Guinea, but, as the natives travel in them for considerable distances, they have been brought together in the same illustration for the convenience of comparison.

Beyond the large canoe is a smaller one, with a sail that is set in rather a curious manner. There is no mast, but the two edges of the sail are fastened to slight spars, and when the native finds the wind to be favorable, he fixes the lower ends of these spars in the canoe, and supports the upper ends by stays or ropes that were fore and aft. The reader will notice the pointed end of the cylindrical outrigger. On the opposite side to the outrigger is a slight platform made of planks. The platform itself is out of sight, but the reader may see the heads and shoulders of the two men who are sitting on it.

This canoe is made near Redscar Point,

(1.) THE MONKEY MEN OF DOURGA STRAIT. (See page 900.)

(2.) CANOES OF NEW GUINEA. (See page 908.)

and, except in the arrangement of the sail, is somewhat similar to the vessels which are built at Brumer Island. The paddles are between six and seven feet in length, and are rather clumsily formed, without any attempt at ornament.

The canoe to the right of the illustration is the most curious of these vessels. The body of the canoe is made out of the trunk of a tree, which is first shaped to a conical form at each end, and then hollowed. Over the ends is firmly fixed a piece of wood, several feet in length, so as to make the two ends into hollow cones into which the water cannot force its way. The gunwale is raised about two feet by planks which box in the opening of the canoe, and act as wash-boards, the seams being pitched and rendered water-tight.

These particulars are mentioned because in general the natives of New Guinea are singularly indifferent as to the amount of water which is taken in by their canoes, provided that they are not sunk. There is, for example, one kind of New Guinea canoe found in Coral Haven, in which the gunwales are not connected at the stern, which is left open. The water would of course rush in, were it not that one of the crew sits in the opening, forcing his body into it so as to render it temporarily water-tight. Even with this precaution it is impossible to prevent some water from making its way between the body of the man and the sides of the canoe, as it heels over by the force of the wind, and in squally weather another of the crew is obliged to keep perpetually baling with a large shell.

The most curious part of the canoe which we are now examining is the sail, which, clumsy as it looks, is a very great improvement on those which have been previously described, inasmuch as it can be shifted and trimmed to suit the wind.

The mast, instead of being merely stuck upright when wanted, is permanently fixed, but is so short that it causes no inconvenience when the sail is struck and the paddles alone are employed. It is fixed, or "stepped," into a hole in a board at the bottom of the canoe, and is lashed to a transverse spar that extends across the canoe from one gunwale to the other. At the head of the mast is a stout projecting arm, through which is bored a hole.

The sail is made by matting stretched between two slight spars, and when not wanted it can be rolled up and laid up on the platform of the outrigger. The halyard, a rope by which the sail is hauled to its place, is fixed to the middle of the sail, and passes through the hole in the projecting arm of the mast-head. Ropes are fastened to each end, constituting the "tack" and the "sheet." When the crew wish to put their canoe about, they do so in a very expeditious manner, merely letting go the ropes and hauling

them in again, so as to turn the sail and convert the sheet into the tack, and *vice versa*. As both ends of the canoe are alike, the vessel at once obeys the new impulse, and goes off in the required direction.

The canoe is steered with one special paddle some nine feet in length, of which the oblong, rounded blade occupies half.

THE inhabitants of the New Guinea coasts are remarkable for their skill in swimming and diving. When H. M. S. *Rattlesnake* was off New Guinea, the anchor of one of the boats caught in the coral, and could not be dislodged. An old man who was standing on the beach saw that something was wrong, and swam off to the boat. He soon understood the case, and, after diving several times, succeeded in clearing the anchor, a feat for which he was rewarded by an axe. He always dived feet foremost, without an effort, and remained under water for about half a minute.

It is rather curious that the love of pigs which is found among the New Zealanders should be quite as strongly developed among the natives of New Guinea. The girls and women make great pets of them, and it is not at all an uncommon event to see a young girl tripping along in all the graceful freedom of the savage, holding a young pig in her arms, and caressing and talking to it as an European girl talks to her doll, or to her pet lapdog. These pigs are long-legged, black-skinned, stiff-haired animals, not at all agreeing with our ideas of a pig's proper form.

The dress used by the women consists of slender leaf-strips, and forms a really graceful costume. Many of the women employ a kind of tattooing, though they do not carry it to such an extent as to disfigure themselves. The patterns, though elaborate, are very small and delicate, and extend over a considerable portion of the body. The arms and front of the body display a regular pattern, which is usually carried over the shoulder for a little way, but leaves the back untouched. The most delicate pattern is reserved for the arm and waist, where it looks like a delicate blue lace fitting tightly to the skin. The women are very proud of this ornament, and are always gratified when a stranger expresses admiration of it. The men occasionally use the tattoo, but in a comparatively scanty manner, confining the patterns to a star or two on the breast. Now and then a man will have a double series of stars and dots extending from the centre of the chest to the shoulders, but on an average a native of this part of the country is not so much tattooed as an ordinary English sailor.

The architecture of this part of New Guinea differs from that of Dourga Strait in being much more elaborate, but throughout New Guinea the style of house-building is so similar that we will take a few examples as representatives of the whole group of islands.

All the houses are elevated on posts like those of the Nicobar Islands, but have several improvements in architecture.

The posts vary in number according to the size of the house, and about four feet from the ground each post passes through a wide circular wooden disc, which serves as an effectual barrier against the rats and snakes, which would otherwise take possession of the dwellings. The posts are connected together at about five feet from the ground by rafters, on which the floor is laid.

These rafters, or joists, support a row of poles laid horizontally side by side, and upon them are laid crosswise a great number of slighter spars, thus forming a framework, on which is fixed the floor itself, which consists of a number of thin planks taken from the cocoa-nut tree. The supporting posts are about ten feet in total length, and are connected at their tops by horizontal poles, on which a second or upper floor is fixed, precisely similar to the principal floor, though much smaller. On this upper floor are kept the weapons, implements, provisions, and similar articles, for which accommodation cannot be found on the principal floor. A supply of water, for example, is generally kept in the huts; a number of empty cocoa-nut shells being used in lieu of bottles, and closed at the orifice by a plug of grass. In fact, they are identical in principal with the ostrich-egg vessels of the South African savage, which have been already described upon a preceding page.

Entrance is gained to the house by a square hole in the flooring, and the primitive staircase by which the inhabitants ascend into their houses is equally simple and effectual. It is necessary that the stairs—if we may use the term—should be so constructed, that while human beings can easily obtain access to the house, the rats and other vermin shall be kept out. If an ordinary ladder or even a notched pole were fixed to the house, the rats and snakes would be sure to climb up it and take possession of the dwelling. The native architect, therefore, proceeds after a different fashion.

Immediately under the opening in the floor he fixes two stout posts in the ground, leaving them to project rather more than three feet. The posts have forked heads, and upon them is laid a transverse pole, which is firmly lashed to them. From this transverse pole another pole is laid to the ground; so as to form an inclined plane up which the inhabitants of the house can walk. It will now be seen, that if a man walk up the inclined pole, to the transverse one, he can pass along the latter in a stooping attitude until he comes to the opening in the floor. He can then pass his body through the opening and lift himself to the level of the floor, while the space which intervenes between the horizontal post and the floor affords an effectual barrier against the rats and other vermin.

The reader will better understand this description by comparing it with illustration No. 1, on the 916th page, which represents three of these huts. That on the right is seen from the end, and is represented as half finished, in order to show the structure of the interior.

The sides and roof of the hut are formed of slight spars which are lashed together by a framework, so as to form a support for the thatching. This is made of coarse grass pulled up by the roots in large tufts, and covered with an outer layer of cocoa-nut leaves. If the house be a large one, there is an entrance at each end, and another in the middle, each being closed with neatly woven mats. Similar but coarser mats are fastened to the lower portion of the sides, in order to exclude the wind.

Up to this point the architecture is identical throughout the island, but a divergence takes place in the shape of the house itself, according to the locality. The usual form is that which is represented in the illustration. Such a house as is there drawn is on the average thirty feet in length, nine in width, and thirteen in total height, so that a space of about three feet intervenes between the upper floor and the roof. The central figure of the illustration shows the side view of a finished hut, and the left-hand figure shows the end view of a similar dwelling.

In some places, however, such for example as Redscar Bay, the form of the houses is different. Instead of having the slender poles which form the framework of the walls bent over in a curved form, they are arranged so as to make a lofty and sharply-pointed gable roof. A house of this description, which measures thirty feet in length, will reach, on an average, twenty-five feet in height. There is no distinction between the roof and walls of the huts, except that the lower portion of the roof is covered with sheets of a bark-like substance, which is supposed to be the base of the cocoa-nut leaf flattened by pressure. The entrance or door of these huts is at one end, and is covered with a mat as has already been mentioned. Access is obtained by a sloping pole resting on a short post. In some of these huts a number of spears were seen in the interior, lashed along the sides, together with several human skulls; but whether the latter were intended as ornaments, or whether they were preserved in memorial of the dead owners, is not certain.

The people who inhabit Redscar Bay and its vicinity exhibited a curious mixture of shyness and confidence. They came freely to the ships as they anchored in the bay, and were very anxious to be admitted on board, peeping into the ports in the most inquisitive manner, and holding up their weapons and implements for sale. They have in use a rather remarkable arrow, with

a head in the form of a pointed gouge or scoop.

One of these arrows is in my collection. The shaft is made in the usual manner from a reed, and is weighted at one end with a piece of hard and heavy wood. Into this wooden tip is cut a deep groove, into which slips the butt of the head. This is about eight inches in length, and is made of bamboo, the reed being nearly cut away so as to leave a piece rather more than half an inch in width in the middle, and tapering gently to one end so as to form a point, and abruptly to the other end in order to form a butt which can be slipped into the wooden tip of the arrow.

Bamboo scoops of a similar description, but of a larger size, are used as knives, and are sharpened by the simple process of biting off a piece of the edge. When Mr. McGillivray visited New Guinea, he asked a native the use of the bamboo scoop; and when he found that it was used as a knife, he produced his own knife, and, taking up a piece of wood, he showed the superiority of steel over bamboo by cutting a stick vigorously with it.

Strangely enough, instead of being gratified with the performance of the knife, the man was so frightened that he pushed off his canoe, called his friends around him, and explained to them the terrible deed that had been done. The knife was offered to him, but he looked upon the proffered gift as an aggravation of the original offence, and declined all overtures toward reconciliation. This aversion to steel was found to be prevalent among the inhabitants of this part of New Guinea.

The bow by which these arrows are propelled is a very effective though clumsily made weapon. My own specimen is about six feet in length, and is made from some hard and tough wood, apparently that of the cocoa-nut tree. It is very stiff, and requires a strong arm to draw it. The string is a strip of rattan, like that which has already been mentioned when treating of North Australia.

Passing to the north-west of the island, we find that their appearance and manners are not very dissimilar from those which belong to their brethren of the southern coast. Taking the Dory people as our type, we find that they often display good examples of the high and narrow forehead of the Papuan family, and many of them have narrow and arched noses, together with lips nearly as thin as those of an European. Indeed, some of these natives possess a cast of countenance which is so like that of an European that several travellers have thought that there must have been some admixture of foreign blood. Such, however, is not the case, these peculiarities belonging to the individual, and not implying any foreign mixture.

The canoes of this part of the country are rather different from those of the southern coast. The mast is made of three distinct spars, united at their tops. Two of them are fastened to the side by pins passing through them, on which they work backward and forward, as if on hinges. The third is not fastened to the vessel, but its butt fits into a cavity from which it can be removed at pleasure. If, therefore, the natives wish to use their paddles, all they have to do is to lift the foot of this spar out of its socket, when the whole of the triple mast can be lowered on deck. When the wind becomes favorable, and the sail is to be employed, the masts are raised again, the butt of the third spar is stepped into its socket, and the triple mast is thus kept firmly upright. A similar contrivance is now proposed for our ships of war, as these triple masts made of three slight iron bars cannot be so easily shot away as the single and solid mast.

The natives are very expert canoe-men, and are accustomed to the use of their vessels from childhood. Even the small boys have their little canoes, which are so light that they can be carried to and from the water without difficulty.

They excel as fishermen, being as expert in the water as on it. The trepang fishery is energetically conducted by them, as it is by the sale of trepang to the merchants that they obtain the greater part of the foreign luxuries on which they set so high a value. The hawksbill turtle is captured principally for the sake of the shell, which is also purchased by the traders, and, together with mother-of-pearl shell, is mostly sent to the Chinese markets.

The mode of fishing with a net is much the same as on all these coasts. The net is three or four feet in depth, and a hundred feet or more in length. The meshes are about an inch in width. One edge is furnished with a row of flat pieces of light wood, which act as floats, and along the other edge are fastened a number of perforated shells by way of weights.

When the natives wish to use this net, they place it in a canoe, and look out for a shoal of fish. As soon as a favorable opportunity is found, the canoe is taken to seaward of the shoal, and let carefully into the water. Each end is taken in charge by one or two men, who bring the net round the shoal in semi-circular form, so as to enclose the fish. These men gradually approach each other, while another man beats the water with a pole, or flings stones into it, so as to frighten the fish into the enclosure. As soon as the two ends of the net have been brought together, the canoe comes up, and the net, with the fish hanging in its meshes, is hauled on board. They also use fish-traps, like those which have been already described in the account of Australia, sinking them by

means of a stone, and raising them by a cord, to the end of which a bamboo buoy is fastened.

They are tolerable smiths, and have a kind of bellows identical in principle with those of savage Africa, but worked in a different manner. Instead of having a couple of inflated skins, they have a pair of wide bamboo tubes, about four feet in length, the lower ends of which are buried in the earth, and connected by means of channels with the hole in which the fire is made. The pistons are formed of bunches of feathers tied to bamboos, and the blower works them alternately up and down, so as to produce a tolerably constant blast. It is remarkable that the bellows of the Chinese itinerant jeweller are fitted with feather pistons. It is most probable that these bellows have been borrowed from the more eastern islands.

As to the actual working of the metal, it bears a curious similitude to that which is employed in savage Africa. The anvil is generally a stone, unless the native smiths can procure an iron "pig" or a piece of a broken anchor. They can work in silver and copper as well as iron, melting the two former metals and running them into moulds, to be afterward beaten and worked into shape.

The architecture of these tribes is rather remarkable. Like the generality of houses in New Guinea, the huts are raised on stakes in order to preserve them from vermin; but those of the Dory people are similarly elevated in order to preserve them from water. These natives have a curious predilection for building their huts on the sea-shore, and place them below the level of low water. They begin this curious style of architecture by building a long pier, or rather jetty, which extends far into the sea, and which keeps open a communication between the house and the shore.

At the end of this jetty the hut itself is situated, and is made of boarded walls and a thatched roof. Great as is the labor that is bestowed upon it, the house does not come up to our ideas of comfort. In the first place, the floors are made of rough spars, placed parallel to each other, but still far enough apart to cause some uneasiness, not to say danger, to an unpractised walker.

A good specimen of a Dory house is about seventy feet long, twenty-five wide, and fifteen high. Along the centre runs a tolerably wide passage, and at either side are a number of rooms, separated from each other and from the passage by mats. At the end next the sea there are no walls, but only a roof, so that a sort of verandah is formed, under which the inhabitants spend much of their time when they are not actively employed. Such a house as this is usually occupied by some forty or fifty individuals, consisting of about twenty men,

together with the wives and families of those who are married. All cooking is carried on by the different families in their own chambers, each of which is furnished with its own fireplace.

The dress of the Dory natives varies but little from that of other Papuans of New Guinea. The men, however, often ornament their bodies with raised scars like those of the Australians, and they are fond of tattooing their breasts and arms with figures of their weapons. They are fond of ornaments, such as shells, twisted wire, and armlets of plaited rattan. They ingeniously utilize the latter ornament by plaiting a very thick and strong bracelet, and wearing it on the left wrist and fore-arm, so as to protect the wearer from the recoil of the bowstring.

Though not a warlike people, they always go armed, carrying the invariable parang, or chopper, which, as its very name imparts, is procured from the Malay tribes. These parangs are chiefly made in Borneo, as we shall see when we come to treat of the Dyaks. The Dory Papuans do not seem to fight, as do some savage tribes, for the mere love of combat; the chief object of warfare being the capture of slaves, each of whom is valued at fifty shillings.

This value is, however, a conventional term; and when a bargain is made with the Dory people for so many slaves, in most cases the conventional money value is intended, and not the actual slaves. In fact, the word "slaves" is used much as we use the word "horses" in reckoning the power of a steam-engine, or "tons" in describing the capacity of a ship. Perhaps the words "pony" and "monkey," of modern sporting slang, are better illustrations.

Still, slavery is rife among the Dory people, who sometimes make a raid into a district, capture a village, and carry off the inhabitants into servitude. They do not, however, treat their captives badly, but feed them well, and seem to consider them partly in the light of domestic servants, and partly as available capital, or as a means of exchange when any of their own friends are taken prisoners by hostile tribes.

The government of the Dory tribes is nominally a delegated chieftainship, but in reality a sort of oligarchy. There is a certain dignitary, called the Sultan of Tidore, under whose sway this part of the country is supposed to be, and from him the chief of the Dory tribes receives his rank. When the chief dies, one of his relatives goes to convey the news to the Sultan, taking with him a present of slaves and birds of paradise as tokens of allegiance. This man is almost always appointed to the vacant place, and is bound to pay a certain tribute of slaves, provisions, and war canoes, the latter being employed in collecting the Sultan's taxes. Should he fail to comply with these

(1.) HUTS, NEW GUINEA. (See page 912.)

(2.) DANCE BY TORCHLIGHT, NEW GUINEA. (See page 917.)

conditions, his village would be attacked by the Sultan's fleet, and the whole district ransacked; so that the position of chief has its anxieties as well as its privileges.

His authority is more nominal than real, for he decides nothing but unimportant matters, leaving more weighty subjects to a council of elders, who, as a rule, administer justice with impartiality. Their laws are really good and sensible, and, though lenient, are based on the principle of the old Jewish law, the eye for the eye and the tooth for the tooth.

Marriages are managed in a very simple manner, the bride and bridegroom sitting opposite each other, in front of an idol, and the former giving the latter some betel-leaf and tobacco. His acceptance of the present, and taking the hand of the giver, constitute the whole of the ceremony.

The idol which has been mentioned is called the Karwar, and is found in every house except those which belong to Mohammedan natives. The Karwar is a wooden figure, about eighteen inches in height, large-headed, wide-mouthed, and long-nosed,—this peculiarity of the Papuan face being exaggerated. It is represented as holding a shield, and wearing a calico wrapper on the body and a handkerchief on the head.

The Karwar plays an important part in the life of a Dory native. It is present at his birth, takes part in his funeral, and, as we have seen, is witness to his marriage. In all cases of perplexity the Karwar is consulted, the devotee stating his intentions, and abandoning them if he should feel nervous, such a sensation being supposed to be the Karwar's answer. There are plenty of fetishes, but these are only supplementary to the Karwar.

Without going into the details of the various tribes which inhabit this part of the earth, we will glance at a few of the most interesting customs.

These Papuans have a strong love for flowers, especially those which possess a powerful scent. They twine such flowers in their hair, weave them into garlands for their necks, and carry them in their bracelets and armlets.

They are fond of singing and music, and, as far as has been ascertained, are in the habit of composing extempore songs, as well as singing those ditties which they know by heart. As for their musical instruments, they consist chiefly of the cylindrical drum, a trumpet made of a triton shell, and a sort of Pandean pipe, composed of six or seven reeds of different lengths lashed firmly together. There is also a wind instrument, which is nothing but a bamboo tube some two feet in length.

Accompanied by these instruments, they perform their curious dances, one of which has been well described by Mr. M'Gillivray.

"They advanced and retreated together by sudden jerks, beating to quick or short time as required, and chanting an accompanying song, the cadence rising and falling according to the action. The attitude was a singular one—the back straight, chin protruded, knees bent in a crouching position, and the arms advanced.

"On another occasion, one of the same men exhibited himself before us in a war dance. In one hand he held a large wooden shield, nearly three feet in length, and rather more than one in width, and in the other a formidable looking weapon, two feet in length—a portion of the snout of the sword-fish, with long, sharp teeth projecting on each side. Placing himself in a crouching attitude, with one hand covered by the shield, and holding his weapon in a position to strike, he advanced rapidly in a succession of short bounds, striking the inner side of his shield with his left knee at each jerk, causing the large cowries hung round his waist and ankles to rattle violently. At the same time, with fierce gestures, he loudly chanted a song of defiance. The remainder of the pantomime was expressive of attack and defence, and exultation after victory.

"But a still more curious dance was once performed a few nights ago by a party of natives who had left the ship after sunset, and landed abreast of the anchorage. On seeing a number of lights along the beach, we at first thought they proceeded from a fishing party, but on looking through a night-glass the group was seen to consist of above a dozen people, each carrying a blazing torch, and going through the movements of the dance. At one time they extended rapidly into line, at another closed, dividing into two parties, advancing and retreating, crossing and recrossing, and mixing up with each other. This continued for half an hour, and, it having apparently been got up for our amusement, a rocket was sent up for theirs, and a blue light burned, but the dancing had ceased, and the lights disappeared."

An accompanying illustration represents this wild and curious scene. In the foreground are the dancers, each with his torch in his hand, and indulging in the grotesque movements of the dance. To the left are seen the musicians, one playing on the bamboo pipe, and the other beating the drum which has before been mentioned. One of these drums is lying in the foreground. It is a hollow cylinder of palm wood, about two feet in length and four inches in diameter. One end is covered with lizard-skin, and along the side there run longitudinal slits. The native name for this drum is "baiati."

The funeral ceremonies appear to differ according to the locality. Among the Dory people, when a man dies, the body is rolled in white calico, and laid on its side in a

grave, its head resting on an earthenware dish. The weapons and ornaments of the dead man are laid in the grave, which is then filled up, and a thatched roof erected over it.

Should the deceased be a head of a family, the Karwar is brought to perform its last duties. When the man is buried, the Karwar is placed near the grave, and violently

execrated by all the mourners for allowing its charge to die. The thatched roof being finished, the idol is laid upon it, and idol and roof are left to decay together. As is usual with savage tribes, funeral feasts are held at the time of burial and for some days afterward, those which celebrate the deaths of chiefs being kept up for a whole month.

CHAPTER XCII.

THE PHILIPPINE ISLANDS.

THE AJITAS, OR AHITAS.

POSITION AND DIMENSIONS OF THE PHILIPPINE ISLANDS—THE MALAYS AND THE NEGRITOS, OR AJITAS—RESEMBLANCE TO THE BOSJESMAN—THE BOW AND POISONED ARROWS—SKILL IN ARCHERY—THE SAVAGE INSTINCT—MEETING A PARTY OF AJITAS—THEIR APPEARANCE, AND CHIRPING SOUND OF THEIR LANGUAGE—CONCILIATING THE ABORIGINES—GOVERNMENT OF THE AJITAS—THEIR ACTIVITY IN HUNTING—NOMADIC PROPENSITIES OF THE AJITAS—REVERENCE FOR THE DEAD—A QUARREL, AND ITS CAUSE.

To the north-west of New Guinea lie several islands, which are grouped together under the general name of Philippines. They consist of a considerable number of islands, of which the northern island, called Luza, and the southern island, called Magindano, are by far the largest.

The inhabitants of the Philippines are of two kinds; namely, the Malays and the Negritos. The former are evidently not the aboriginal inhabitants, but have voyaged to the islands in their canoes and formed a number of settlements. As in the course of the work we shall see much of the Malay race, we will pass them by for the present, and only notice the Negritos, or little negroes, so called by the Spanish on account of their dark skins and small size.

This strange little race is mostly known by a name which is given in different forms. By some writers it is spelt Ajitas, by some Ahitas, and by others Itas. Of these different forms I select the first, which, by the way, is pronounced as if it were spelled Aheetas.

The Ajitas are quite as small as the Bosjesmans of Southern Africa, their average height being four feet six inches. They are well shaped, and their skins, though of a very dark hue, are not so black as those of the negro tribes. The features are tolerably good, except that the nose is broad and rather flat, and that there is a marked deficiency of chin. The hair is woolly, like that of other Papuans, and, as they do not know how to dress it, they wear it in a sort of mop

round the head. The eyes are remarkable for a decided yellow tinge.

In common with other savages who lead an uncertain kind of life, fasting sometimes for two days together, and then gorging themselves like wolves, they are apt to have their limbs and projecting stomachs with a recurved back such as is the case with the Bosjesman, the back being bent like the letter S. Their shape is in no way concealed by their dress, which is nothing more than a wide belt of plaited bark fastened round the waist.

In many respects there is a great similarity between the Bosjesman and the Ajita. The latter live by the chase and by plunder, having no idea of agriculture. They always go armed, their weapons being bamboo lances and bows and arrows, the latter being poisoned. The effect of the poison with which they are tipped is to produce an unextinguishable thirst in the animal, which seeks the nearest water, drinks, and dies. As soon as it is dead, the hunter cuts away the flesh from around the wound, as the poison would otherwise communicate so bitter a taste to the whole carcass that the flesh could not be eaten.

Their bows are but slight, as are their arrows, the poison doing the work of death, and the depth of the wound being of no consequence. They are skilful archers, having the bow and arrow in their hands from infancy, and practising at any object that may take their attention. Both sexes use the bow, and the little boys and girls are fond of

wading along the banks of streams and shooting the fish.

Like the Bosjesman, the Ajita is always at feud with the other races that inhabit the same country, and, small as he is, makes himself dreaded by reason of his poisoned weapons. Sometimes Ajitas are taken prisoners, and are generally enslaved. As they are light, active, and not bad-looking, they are often employed as servants by the dignitaries of Manilla.

One of these people was in the household of an Archbishop of Manilla, and was educated by him with great care. To all appearance he was thoroughly civilized, and at last was ordained priest. But the instincts of his savage nature were too strong for him, and the man escaped from his position and civilized society, threw off his garments, and rejoined his savage relatives. Such instances are continually occurring, and it is almost impossible to retain an Ajita in civilized society, no matter how well he may be treated, or how young he may be when captured.

The habits of the Ajitas are essentially of a savage character, and, as a rule, travellers in the Philippines are obliged to be very careful lest they should suddenly be set upon by these dangerous little creatures. Sometimes, however, they can be gentle, and even hospitable, and an instance of such conduct is related by M. de la Gironière, part of whose narrative has been translated and quoted by Mr. Earle: "We directed our course toward the north, among mountains always covered with thick forests, and which, like those we had just quitted, presented no traced route, excepting a few narrow pathways beaten by wild beasts. We advanced with caution, for we were now in the parts inhabited by the Ajitas. At night we concealed our fires, and one of us always acted as sentinel, for what we feared most was a surprise.

"One morning, while pursuing our way in silence, we heard before us a chorus of squeaking tones, which had more resemblance to the cries of birds than to the human voice. We kept on our ground, concealing our approach as much as possible with the aid of the trees and brambles. All at once we perceived at a little distance about forty savages, of all sexes and ages, who had absolutely the air of animals. They were on the banks of a rivulet, surrounding a great fire. We made several steps in advance, and presented the butt-end of our guns toward them. As soon as they perceived us, they set up shrill cries and prepared to take to flight; but I made signs to them, by showing them some packets of cigars, that we wished to offer them for their acceptance.

"I had fortunately received at Binangan all the instructions necessary for knowing how to open a communication with

them. As soon as they comprehended us, they ranged themselves into a line, like men preparing for a review; this was the signal that we might approach. We went up to them with our cigars in our hands, and I commenced distributing them from one extremity of the line. It was very important that we should make friends with them, and give each an equal share, according to their custom. The distribution being over, an alliance was cemented, and peace concluded, when they commenced smoking.

"A deer was hanging to a tree, from which the chief cut three large slices with a knife of bamboo, and threw them upon the fire, and, drawing them out an instant afterward, presented a piece to each of us. The exterior was slightly burned and sprinkled with ashes, but the interior was perfectly raw and bloody. It would not do, however, to show the repugnance I felt at making a repast scarcely better than that of a cannibal, for my hosts would have been scandalized, and I wished to live in good correspondence with them for some days. I therefore ate my piece of venison, which, after all, was not ill flavored, and my Indian having followed my example, our good repute was established, and treason on their part no longer possible."

M. de la Gironière showed his wisdom in accommodating himself to circumstances, and in sacrificing his own predilections in favor of expediency; and if all travellers had acted in a similar manner, we should have known much more of savage manners and customs than we do at the present time. After propitiating his little black hosts by tact and kindness, he remained among them for some time, and by means of an interpreter, whom he was fortunate enough to obtain, continued to procure a considerable amount of information concerning a people of whom scarcely anything had been previously known since their existence.

The Ajitas live in small tribes, consisting of some fifty or sixty individuals. They have no fixed residence, but wander about the country according to the amount of game which they find. They have not the least notion of house-building, and in this respect are even below the aborigines of Australia, and at night they crowd round the fire and lie as close to it as possible. This fire is the central point of the tribe, the old people and children assembling round it during the day while the adults are hunting for game; and if the hunters should be able to bring in enough food to last for some days, they remain round the fire until it is all consumed.

There seems to be no particular form of government among the Ajitas, who always choose one of the oldest men to be the chief of each little tribe, and do not acknowledge any principal chief or king. Age is respected among them, and in this point the

Ajitas show their superiority over many savage tribes. The language of the Ajitas is said to resemble the chirping of birds rather than the voice of mankind, but it must be remembered that the same was said of the Bosjesmen's language when European travellers first came among them. Any language which is heard for the first time affects the ear unpleasantly, and even those of Europe are generally stigmatized by foreigners as gabbling or grunting, according to the pitch of the voice. Of the structure of the Ajitas' language nothing is yet known.

In one point they are superior to many savage people. A man has but one wife, and both are faithful in the married state. When a young man wishes to marry, he asks the consent of her parents, who, on a fixed day, send her into the woods alone before sunrise, and after an hour the young man goes after her. If he can find her, and bring her back before sunset, the marriage is acknowledged; but if he cannot succeed in his search, he must yield all claims to her. It will be seen that the real choice lies with the girl, who can always conceal herself if she dislikes the intended bridegroom, or, even if he did find her, could refuse to come back with him until the stipulated time has passed.

The religion of the Ajitas seems to be, as far as can be ascertained on a subject from which a savage always shrinks, a mere fetishism; any object, such as an oddly-shaped tree trunk or stone, being worshipped for a day, and then forsaken in favor of some other idol.

Any real reverence in the nature of the Ajitas seems to be given to the dead, whom

they hold in veneration. Year after year they will resort to the burial-places of their friends for the purpose of laying betel-nut and tobacco upon the grave. Over each spot where a warrior is buried his bow and arrows are hung, the Ajitas having an idea that at night the man leaves his grave, and hunts until the morning. Owing to this reverence for the dead, M. de la Gironière's expedition nearly came to a fatal termination. They had succeeded in procuring a skeleton from the burial-place, when the theft was discovered by the Ajitas, who at once set upon them, and fairly chased them out of their country, the poisoned arrows proving to be weapons too formidable to be resisted, especially when used by foes as active as monkeys, who could pour their arrows on their foes, while they scarcely exposed an inch of their little dark bodies to the enemy.

It is owing to another form of this veneration for the dead that travellers have so often come in collision with the Ajitas. When a warrior dies, his companions are bound to take their weapons and roam through the country, for the purpose of killing the first living thing that they meet, whether man or beast. As they pass along, they break the boughs in a peculiar manner as warnings to others, for even one of their own tribe would be sacrificed if he fell in their way. Travellers from other countries would either fail to see, or, if they saw, to understand, the meaning of these little broken twigs, and in consequence have been attacked by the Ajitas, not from any unfriendly feelings, but in fulfilment of a national custom.

CHAPTER XCIII.

FIJI.

APPEARANCE AND DRESS OF THE FIJIANS.

POSITION OF THE FIJI ISLANDS—GENERAL APPEARANCE OF THE NATIVES—THEIR PECULIAR HAIR, AND VARIOUS MODES OF DRESSING IT—HAIR-DYES—THE FIJIAN MIRROR—WIG-MAKING—THE AMBASSADOR AND HIS MESSAGE—THE FIJIAN TURBAN—WATER-PROOF BEADDRESSES—DRESS OF THE FIJIANS—THE “MASI,” AND METHOD OF WEARING IT—EAR-ORNAMENTS—NECKLACES AND FLOWERS—TATTOOING AND PAINT—PATTERNS USED FOR THE FACE—DRESS OF THE WOMEN—THE ROUGHNESS OF THE SKIN AND USE OF PAINT—HAIR-DRESSING—MAKING MASI AND MODE OF PRODUCING PATTERNS—INGENIOUS MODE OF STENCILLING—THE WOMAN’S APRON, OR “LIKU,” AND MODE OF WEARING IT.

To describe the inhabitants of all the multitudinous islands of Polynesia would be an agreeable, but impossible task, our space confining us within limits which may not be transgressed. We will therefore pass at once to the large and important group of islands which is popularly known by the name of FIJI.

This group of islands lies due north of New Zealand, and to the eastward of New Guinea, so that they are just below the Equator. The collective name of the islands has been variously given, such as Fiji, Beetee, Feegee, Fidge, Fidschi, Vihi, and Viti. Of all these names, the first and the last are correct, the northern portion of the islands being known as Fiji, and the southern as Viti. The reader must remember that these names are pronounced as if written Feegee and Veetee.

The inhabitants of Fiji are a fine race of savages, tolerably well formed, and with dark, though not black skin. Like other Papuans, they are remarkable for their thick, bushy hair, which they dress in a singular variety of patterns. As the appearance and costume of savage races are the first points which strike a stranger, we will at once proceed to describe them.

The most conspicuous part of a Fijian’s general appearance is his headdress, in the arrangement of which he gives the reins to his fancy, and invents the most extraordinary variations of form and color. Examples of the Fijian headdress will be seen in most of the illustrations. But as it would be tedious to describe them as they occur, I

will mention a few of the most prominent varieties.

The hair of the Papuan race is always stiff, wiry, and plentiful, and grows to a considerable length; so that it necessarily assumes a bushy form if suffered to grow according to its own will. The Fijian, however, thinks that nature is to be improved by art, and accordingly lavishes all the resources of a somewhat artistic character on his hair. To train the hair into any of the graceful and flowing methods which distinguish those soft-haired races would be utterly impossible for a Fijian. He goes on quite the opposite principle, and, true to real artistic feeling, tries to develop to the utmost those characteristics which rightly belong to him, instead of endeavoring to produce effects which would not be consonant with their surroundings.

The principle on which a Fijian *coiffure* is arranged is, that every hair is presumed to grow naturally at right angles to the skin, and to stand out stiffly and boldly. Supposing, then, that each hair could be induced to follow its own course, without being entangled by others, it is evident that the whole head of hair would form a large globular mass, surrounding the face. It is, therefore, the business of the Fijian hair-dresser to accept this as the normal form of the hair, and to change or modify it as he thinks best.

It is impossible to describe the various modes of Fijian hair-dressing better than has been done by Mr. Williams, who resided in Fiji for thirteen years. “Most of the chiefs have a hair-dresser, to whose care his

(1.) THE AMBASSADOR'S MESSAGE. (See page 925.)

(2.) FIJIAN CANOE IN A BREEZE. (See page 932.)

master's hair is intrusted, often demanding daily attention, and at certain stages of progress requiring several hours' labor each day. During all this time, the operator's hands are *tapu* from touching his food, but not from working in his garden.

"The hair is strong, and often quite wiry, and so dressed that it will retain the position in which it is placed, even when projecting from the head a distance of six or eight inches. One stranger, on seeing their performance in this department, exclaims, 'What astonishing wigs!' another thinks, 'Surely the *beau idéal* of hair-dressing must exist in Fiji,' a third, 'Their heads surpass imagination.'" No wonder, then, that they defy description.

"Whatever may be said about the appearance being unnatural, the best *coiffures* have a surprising and almost geometrical accuracy of outline, combined with a round softness of surface and uniformity of dye which display extraordinary care, and merit some praise. They seem to be carved out of some solid substance, and are variously colored. Jet-black, blue-black, ashy white, and several shades of red prevail. Among young people, bright red and flaxen are in favor. Sometimes two or more colors meet on the same head. Some heads are finished, both as to shape and color; nearly like an English counsellor's wig.

"In some, the hair is a spherical mass of jet black hair, with a white roll in front, as broad as the hand; or, in lieu of this, a white, oblong braid occupies the length of the forehead, the black passing down on either side. In each case the black projects further than the white hair. Some heads have all the ornamentation behind, consisting of a cord of twisted coils, ending in tassels. In others, the cords give place to a large red roll or a sandy projection falling on the neck. On one head, all the hair is of one uniform length, but one-third in front is ashy or sandy, and the rest black, a sharply defined separation dividing the two colors.

"Not a few are so ingeniously grotesque as to appear as if done purposely to excite laughter. One has a large knot of fiery hair on his crown, all the rest of the head being bald. Another has the most of his hair cut away, leaving three or four rows of small clusters, as if his head were planted with small paint brushes. A third has his head bare, except where a black patch projects over each temple. One, two, or three cords of twisted hair often fall from the right temple, a foot or eighteen inches long. Some men wear a number of these braids so as to form a curtain at the back of the neck, reaching from one ear to the other.

"A mode that requires great care has the hair wrought into distinct locks, radiating from the head. Each lock is a perfect cone, about seven inches in length, having the base outward, so that the surface of the hair

is marked out into a great number of small circles, the ends being turned in, in each lock, toward the centre of the cone. In another kindred style, the locks are pyramidal, the sides and angles of each being as regular as though formed of wood. All round the head they look like square black blocks, the upper tier projecting horizontally from the crown, and a flat space being left at the top of the head. When the hair, however, is not more than four inches long, this flat does not exist, but the surface consists of a regular succession of squares or circles. The violent motions of the dance do not disturb these elaborate preparations, but great care is taken to preserve them from the effects of the dew or rain."

Whenever the Fijian desires to know whether his headdress is in proper order, he has recourse to his mirror. This is not a portable, but a fixed article of manufacture, and is necessarily situated in the open air. When the native sees a large tree with a sloping trunk, he cuts in the upper part of the trunk several deep hollows, and arranges the leaves of the tree so that the water from the foliage drips into them, and keeps them full. These are his mirrors, and by their aid he examines his hair, sees if the outline be quite correct, and, if he be dissatisfied, arranges it with his long-handled comb, and then replaces the comb in his mop of a head, carefully sticking it over one ear as a soldier does his forage cap.

Not content with having the hair plaited and frizzed out as has already been described, many of the Fijians wear great wigs over their own hair, thus increasing the size of their heads to the most inordinate dimensions. The natives are excellent wig-makers and, as their object is not to imitate nature, but to produce as fantastic an effect as possible, it is evident that the result of their labor is often very ludicrous. As is the case with their own hair, they dye these wigs of various colors, red and white being the favorite hues.

Three examples of these curious head-dresses are shown in illustration No. 1, on preceding page, which represents an ambassador delivering a message from his chief to some man of consequence. Savages such as these have no idea of writing, but, lest they should forget the various terms of their message, they have recourse to a simple *memoria technica*, consisting of a bundle of sticks, no two being of the same length.

Each of these sticks answers to one of the terms of the message, which is repeated once or twice to the ambassador, who reckons them over on his sticks. When he delivers his message, he unties the bundle, selects the sticks in their order, and, laying them down in succession, delivers the message without a mistake.

In the illustration, the principal figure represents the ambassador, the others being

his attendants. He has laid down several of the sticks, and is delivering the message belonging to one of them, while he is holding the rest in his left hand. His headdress is of that remarkable kind which consists of a number of conical locks of hair—a fashion which denotes a man of rank, as no other could afford to have such a *coiffure* kept in order. The man seated next to the ambassador has his hair in two colors, the greater part being dark and frizzed out from the head, while a couple of rolls of a lighter hue pass over the forehead. The central figure exhibits a favorite mode of hair-dressing, in which the hair is clipped very short, except in certain spots, in which it is allowed to grow, so as to form a series of brush-like tufts.

Men of consequence mostly protect their enormous mops of hair by a sort of thin turban, which is wrapped round them. The turban is made of a piece of very delicate bark cloth, or masi, nearly as thin as gauze, and perfectly white. It is sometimes six feet in length, but varies according to the quantity of hair. It is twisted round the head in different fashions, but is mostly fastened by a bow on the forehead, or on the top of the head. Several examples of the turban will be seen in the course of the following pages. Men of rank often wear the masi of such length that the ends fall down behind like a scarf.

In order to preserve their hair from being displaced by rain, they use a waterproof covering of their own invention. This is a young banana leaf, which is heated over a fire, and then becomes as thin, transparent, and impervious to water as oiled silk. The light turban offers no protection whatever, being soaked as easily as tissue paper, which it somewhat resembles.

Material similar to that which is worn on the head is used for the dress. The masi which is employed for this purpose is mostly from twenty to thirty feet in length, though a wealthy man will sometimes wear a masi of nearly three hundred feet long. In this case, it is made of very delicate material. It is put on in a very simple manner, part being wound round the loins, and the rest passed under the legs and tucked into the belt, so as to hang as low as the knees in front, and to fall as low as possible behind. A wealthy man will often have his masi trailing far behind him like a train. This is all the dress which a Fiji man needs. Clothing as a protection from the weather is needless, owing to the geniality of the climate, and the masi is worn simply as a matter of fashion.

Ornaments are worn in great profusion, and are of the kinds which seem dear to all savage races. Ear ornaments of portentous size are worn by the inhabitants of Fiji, some of them stretching the lobe to such an extent that a man's two fists could be placed

in the opening. The Fijians also wear breast ornaments, very similar in shape and appearance to the large dibbi-dibbi which is worn by the Northern Australians, and has evidently been borrowed from the Papuan race. Any glittering objects can be made into necklaces, which often combine the most incongruous objects, such as European beads, bits of tortoise-shell, dogs' teeth, bats' jaws, and the like.

Flowers are plentifully worn by the Fijian, who keeps up a constant supply of these natural ornaments, weaving them into strings and chaplets, and passing them, like belts, over one shoulder and under the other. In the illustration on page 937th, which represents the payment of taxes, several girls are seen adorned with these garlands.

Tattooing is almost entirely confined to the women, and even in them is but little seen, the greater part of the patterns being covered by the *liku* or fringe apron. When young, the women usually tattoo their fingers with lines and stars in order to make them look ornamental as they present food to the chief, and, after they become mothers, they add a blue patch at each corner of the mouth. The operation is a painful one, though not so torturing as that which is employed in New Zealand, the pattern being made by the punctures of a sharp-toothed instrument, and not by the edge of a chisel driven completely through the skin.

Paint is used very largely, the three principal colors being black, white, and red. With these three tints they contrive to produce a variety of effect on their faces, that is only to be rivalled by the fancy displayed in their hair-dressing. Sometimes the face is all scarlet with the exception of the nose, which is black, and sometimes the face is divided like a quartered heraldic shield, and painted red and black, or white, red, and black in the different quarterings. Some men will have one side of the face black and the other white, while others paint their countenances black as far as the nose, and finish them off with white.

Reversing the first-mentioned pattern, the Fijian dandy will occasionally paint his face black and his nose red, or will have a black face, a white nose, a scarlet ring round each eye, and a white crescent on the forehead. Sometimes he will wear a white face covered with round scarlet spots like those on a toy horse; or will substitute for the round spots a large patch on each cheek and another round the mouth, just like the face of a theatrical clown.

Some very curious effects are produced by lines. A white face with a single broad black stripe from the forehead to the chin has a very remarkable appearance, and so has a face of which one side is painted longitudinally with black stripes on a white ground, and the other half with transverse

stripes of the same colors. A similar pattern is sometimes produced with black upon red. Perhaps the oddest of all the patterns is formed by painting the face white, and upon the white drawing a number of undulating lines from the forehead downward, the lines crossing each other so as to form a sort of rippling network over the face.

So much for the dress of the men. That of the women is different in every way. Though possessing the same kind of stiff, wiry, profuse hair as the men, they do not trouble themselves to weave it into such fantastic designs, but mostly content themselves with combing it out so as to project as far as possible on every side. Sometimes they twist it into a series of locks, which are allowed to fall on the head merely at random, like the thrums of a mop.

Paint is employed by them as by the men, though not with such profusion. Scarlet seems to be their favorite color in paint, and to this predilection Mr. Pickering was indebted for opportunities of ascertaining by touch the peculiar roughness of the Papuan skin. The Fijians, an essentially ceremonious and punctilious people, will not allow themselves to be handled, and Mr. Pickering was rather perplexed as to the means of ascertaining whether this roughness belonged to the race, or whether it were only a peculiarity belonging to individuals. The love of scarlet paint here came to his assistance. The vermilion prepared by European art was so much superior to the pigments of Fiji, that the natives were only too glad to have so brilliant a color put on their faces and bodies. Accordingly men and women, old and young, pressed forward to have a little vermilion rubbed on them, and the mothers, after having their own faces painted, held out their infants to participate in the same benefit.

The native cloth, or masi, which has already been mentioned, is made from the inner bark of the malo tree, and is manufactured in a simple and ingenious manner.

As at the present day English fabrics are largely imported into Fiji, and are rapidly supplanting the delicate and becoming native manufactures, the art of making the masi will soon become extinct in Fiji, as has been the case in other islands where Europeans have gained a footing. I shall therefore devote a few lines to the description of its manufacture.

The natives cut off the bark in long strips, and soak them in water for some time, until the inner bark can be separated from the outer, an operation which is performed with the edge of a shell. After it has been removed from the coarse outer bark, it is kept in water so as to preserve it in the necessary state of moisture; and when a sufficient quantity is collected, the operation of beating it begins.

Masi is beaten upon a log of wood flat-

tened on the upper surface, and so arranged as to spring a little with the blows of the mallet. This tool does not resemble our mallet with a handle and a head, but is simply a piece of wood about fourteen inches in length and two in thickness, rounded at one end so as to form a handle, and squared for the remainder of its length. Three sides of this mallet, or iki, as it is called, are covered with longitudinal grooves, while the fourth side is left plain. Those specimens that I have seen have the sides not quite flat, but very slightly convex, perhaps by use, perhaps rounded intentionally. A masi maker has several of these mallets, sometimes as many as six or seven, each having some difference in the fluting, and with them she contrives to produce a fabric that has all the effect of woven linens among ourselves, the pattern being incorporated with the material.

There are in my collection several specimens of masi, one of which is singularly beautiful. It is thin, snowy white, and soft as silk, and, even at a distance, must have looked very graceful when wrapped round the dark body of a Fijian warrior. But it is only on a closer examination that the real beauty of the fabric is displayed. Instead of merely beating the masi after the usual fashion, so as to impress upon it the longitudinal grooves of the mallet, the native manufacturer has contrived to change the position of her mallet at every blow, so as to produce a zigzag pattern on the fabric, very much like the well-known Greek pattern of European decorators. It is beautifully regular, and, when the fabric is held up to the light, looks like the water mark in paper.

The plasticity of the malo bark is really wonderful. A strip of two inches in length can be beaten to the width of eighteen inches, its length being slightly reduced as the width increases. As the material is very thin and flimsy, a single piece being, when beaten out, no thicker than tissue paper, two or more pieces are usually laid on each other and beaten so as to form a single thickness, the natural gluten which this material contains being sufficient to unite them as if they had been one piece. Some specimens of their larger mantles, now in my collection, are as thick as stout brown paper, and very much tougher, appearing both to the eye and the touch as if made of leather.

When a large masi has to be made, many lengths of the bark are united to each other, the ends being soaked in arrowroot starch, laid carefully over each other, and then subjected to the mallet, which forces the two pieces of bark to unite as if they were one substance, and does not exhibit the least trace of the junction. As I have already mentioned, some of these masis are of very great length. Mr. Williams measured one which was for the use of the king on festival days, and found its length to be five hundred and

forty feet. Many of the large, and at the same time thin masis, are used as mosquito curtains, and in that case are decorated with patterns of dusky red and black. The patterns generally commence at the centre, and are gradually extended toward the edges. The mode of making these patterns is well described by Mr. Williams :—

“Upon a convex board, several feet long, are arranged parallel, at about a finger's width apart, thin straight strips of bamboo, a quarter of an inch wide; and by the side of these, curved pieces, formed of the mid-rib of cocoa-nut leaflets, are arranged. Over the board thus prepared the cloth is laid, and rubbed over with a dye obtained from the *lauci* (*Aleurites triloba*). The cloth, of course, takes the dye upon those parts which receive pressure, being supported by the strips beneath, and thus shows the same pattern in the color employed. A stronger preparation of the same dye, laid on with a sort of brush, is used to divide the squares into oblong compartments, with large round or radiated dots in the centre. The *kesa*, or dye, when good, dries bright.

“Blank borders, two or three feet wide, are still left on each side of the square, and to elaborate the ornamentation of these so as to excite applause is the pride of every Fijian lady. There is now an entire change of apparatus. The operator works on a plain board; the red dye gives place to a jet black; her pattern is now formed by a strip of banana leaf placed on the upper surface of the cloth. Out of the leaf is cut the pattern, not more than an inch long, which she wishes to print upon the border, and holds by her first and middle finger, pressing it down with the thumb. Then, taking in her right hand a soft pad of cloth steeped in dye, she rubs it firmly over the stencil, and a fair, sharp figure is made.

“The practised fingers of the women move quickly, but it is after all a tedious process. In the work above described, the Lakemba women excel. On the island of Matuku very pretty curtains are made, but the pattern is large, and covers the entire square, while the spaces between the black lines are filled in with red and yellow.”

We now pass to the *liku*, or fringed girdle of the women. This is made of various materials, and much trouble is usually ex-

pended in its manufacture. The ordinary *likus* are little more than a number of slight thongs fixed to a belt, and allowed to hang down for several inches. When worn, it is passed round the waist and tied, not behind, but on one side, and on festivals the bark cord by which it is fastened is allowed to hang so low that it often trails on the ground as the wearer walks along.

The thongs are made of the bark of a species of hibiscus, called by the natives *vanu*, and used for many purposes, of long flexible roots like that of the *cascus* grass, and of different grasses. One kind of *liku* which is rather fashionable, is made of a vegetable parasite, called by the natives *waloca*. The thongs of this *liku* are not thicker than packthread, and when fresh, are as flexible as silk. In process of time, however, they become brittle, and are apt to break. The color of this material is deep glossy black.

There are in my collection two specimens of the *liku*, one of them being made of the fashionable *waloca*. The other is the common *liku*. It is made of split grass, the blades of which are more than three feet in length. In order to make them into the garment they have been doubled, and the loops woven into a narrow plaited belt of the same material. The better kind of *likus* are, however, made with far greater care than is bestowed on this article. There is but little difference in the thongs, the chief labor being bestowed on the belt. In some cases the belt of the *liku* is four inches in width, and is plaited into elegant patterns, plaiting being an art in which the natives excel.

In general shape the *liku* never varies, being worn by girls and women alike. As long as a girl is unmarried, she wears a *liku* the fringe of which is not more than three inches in depth, and the whole article is so scanty that when tied round the waist the ends do not meet at the hips by several inches. As soon as the girl is married, she changes her *liku* in token of her new rank, and wears a garment with a fringe that reaches half-way to her knees, and which entirely surrounds the body. After she has become a mother, she wears an apron which quite reaches to the knees, and sometimes falls below them.

CHAPTER XCIV.

FIJI—Continued.

MANUFACTURES.

MAT MAKING—SAILS FOR THE CANOES—FLOOR MATS AND BEDDING—ROPE AND STRING—SINNET AND ITS VARIOUS USES—THE NETTING NEEDLE AND MESH—FANS AND SUNSHADES—THE ORATOR'S FLAPPER—BASKET WORK—FIJIAN POTTERY, AND NATIVE ART—POTTERY RESTRICTED TO THE WOMEN—THEIR SIMPLE TOOLS AND IMPERFECT MATERIALS—MODE OF "FIRING" THE VESSELS—GLAZING THE WATER VESSELS—FIJIAN FISHERMEN—VARIOUS KINDS OF NETS, AND MODES OF USING THEM—THE TURTLE FISHERY—A BOLD DIVER—CONTRACTORS FOR TURTLE—MODES OF CATCHING THE REPTILE—A "HEAD" OF TURTLE AND ITS VALUE—DANGERS OF THE FISHERY—FIJIAN CANOES, AND MODE OF MANAGING THEM—BUILDING CANOES—INGENIOUS METHOD OF JOINING THE PLANKS—TONGA CARPENTERS—THE FIJIANS INFERIOR SAILORS TO THE TONGANS—FIJIAN TRADERS.

MATS of various kinds are made by the women, and they display as much ingenuity in mat-making as in the manufacture of masi. Mats are employed for many purposes. The sails of the Fijian canoes are always made of matting, which is woven in lengths and then sewed together afterward, just as is the case with our own canvas sails. The width of the strips varies from two to four feet, and their length from three to a hundred yards. On an average, however, the usual length of these strips is twenty feet, that being the ordinary length of a sail. Sail mats are necessarily rather coarse, and are made from the leaf of the cocoa-nut palm.

Then there are floor-mats, which are used as carpets in the houses. These vary in size according to the dimensions of the house, but twenty feet by sixteen is a very ordinary measurement. They are generally adorned with a border or pattern round the edges, this border being about six inches wide, and often decorated with feathers and scraps of any colored material that can be procured. Mats of a similar character, but much finer texture, are used as bedding; the best kind, which is called *ono*, being of a very fine texture.

The native love of ornament is in no way better displayed than in their rope and string making. The best rope is formed from several strands of sinnet. This is a sort of plait made from the fibre of the cocoa-nut. The fibre is carefully removed from the nut,

baked, and combed out like wool. Cordage is made by twisting sinnet together, and some of the Fijian cords are nearly as thick as a cable, and possessed of extraordinary elasticity and strength. The sinnet is used in a great variety of offices, houses being built and the planks of the canoes tied together with this most useful material.

When made, the sinnet is made into great rolls, some of them being of gigantic dimensions. Mr. Williams saw one which was twelve feet long, and nearly seven feet in diameter. These rolls are differently shaped, and each shape is known by its own name, such as the double cone, the plain hank, the oval ball, the honeycomb ball, and the variegated roll. These rolls are given as presents, and offered to the chiefs as tribute, together with other property. In the large illustration on page 937, which represents a tax-paying scene, one or two of these rolls are shown.

Sinnet is the favorite material for net making, but as it is costly, nets are often constructed of the hibiscus bark. Another material is a sort of creeper named *yaka*, which is steeped in water to dissolve the green matter, then scraped to clean the fibres, and, lastly, twisted into strings. It is remarkable that the netting needle and mesh are exactly similar to those which are employed by ourselves, and the same may be said of the mesh and needle of the Esquimaux.

The same ingenuity in plaiting which is expended in the making and rolling of sinnet asserts itself in various other manufactures, such as basket and fan making. In the latter art the Fijian excels, and, as the fan is almost as important to the Fijian as to the Japanese, much play of fancy is exhibited in fan making. Dissimilar as are these fans in shape, there is always a sort of character about them which denotes their origin to a practised eye.

I have a specimen in my collection, which is a very good type of the Fijian fan. It is two feet in length, and rather more than a foot broad in the widest part. The handle is made of cocoa-nut wood, and extends nearly to the end of the fan, so as to form a support through its entire length. It is fastened to the fan by double bands of the finest and most beautifully plaited sinnet. The material of which the fan is composed is cocoa-nut leaf, divided into doubled strips about the third of an inch in width near the base of the fan, and gradually decreasing toward its tip. A strong band of the same material runs round the edges of the fan, and the two ends of this band are secured to the handle by the same sinnet as has been just mentioned.

Such a fan as this is employed rather as a sunshade or parasol than a fan, and is held over the head when the owner happens to be seated in the sunshine. It is very light, and is really a much more efficient implement than its appearance intimates.

The form of the fan is exceedingly variable. Sometimes they are triangular, with the handle projecting from one of the angles, and sometimes they are square, but with the handle passing diagonally across them. Various modifications of the battledoor are in much favor, and there is one form which almost exactly resembles that of the Japanese handscreen.

It is rather remarkable that the aborigines of tropical America, such as the Caribs, the Accowais, and the like, make fans of precisely similar material and structure, except that the handle is not separately made of wood, but is formed from the ends of the leaf-strips of which the implement is made.

There is another curious article of manufacture which is properly Fijian, but extends through several of the Polynesian group. It is the orator's flapper, which the native holds in his hand while he speaks in council. An engraving showing its form is given on the 949th page. The handle is carved into various patterns, and mostly, though not invariably, is terminated by a rude representation of a couple of human figures seated back to back. Sometimes the entire handle is covered with sinnet, plaited in the most delicate patterns, as none but a Fijian can plait. The tuft at the end is formed of cocoa-nut fibre, which has first been soaked in water, next rolled round a small twig,

and then dried. When it is unwound from the stick, it has a crisp, wrinkled appearance, very like that of the Fijian's hair, and is probably intended to imitate it. In the specimens of my collection, some have sinnet-covered handles, and some carved handles, while some have the tuft black, and others sandy red, just as is the case with the hair of the natives.

In their basket making, the Fijians are equally lavish of their artistic powers, weaving them in patterns of such elaborate intricacy as to put the best European makers to shame, and then, as if not satisfied with the amount of work bestowed upon them, covering all the edges with sinnet, braided into really artistic patterns.

Indeed, the Fijians are born artists. Their work, although sometimes grotesque, is always artistic, because always appropriate. They carry this feeling of art into the material whose plasticity allows the greatest freedom of manipulation; namely, earthenware. Some of the vessels which are intended for cooking are quite plain, while others which are made for other purposes are of elegant shape, and covered with ornaments. Mr. Williams suggests, with much probability, that the cooking pots are made in imitation of the cells of a species of black bee which inhabits the Fiji group of islands.

Several specimens of Fijian pottery are in the British Museum. As examples of intuitive art they are far superior in outline and ornament to the generality of decorated earthenware in civilized countries. A conventional imitation of nature is the principle which is employed by the Fijian potters, who find their chief patterns in flowers, leaves, and fruits, thus obtaining the most graceful curves, joined to great certainty and precision of outline.

Rude as is the manipulation of the potter, and coarse as is the material, the design of the vessel is sure to be bold and vigorous, putting to shame the feeble prettiness with which we are too familiar in this country. Going to nature for their models, the Fijian potters display a wonderful power, fertility, and originality of design. In any country, an artist who really studies nature is sure to produce works that are fresh and original; and in a country like Fiji, which is within the tropics, and in which the magnificent vegetation of the tropics springs up in luxuriant profusion, it is likely that an artist, however rude he may be, who studies in such a school, will produce works of genuine merit.

The art of pottery is confined to the women, and is practically restricted to the wives and daughters of fishermen. The material employed by them is a red or blue clay mixed with sand, and their implements are merely an annular cushion, a flat stone, one or two wooden scrapers, a round stone to hold against the inside of the vessel, and

a sharp stick. They have no wheel: and yet, in spite of such disadvantages, they contrive to produce vessels so true in outline, that few persons, unless they are practically acquainted with pottery, could believe that they were merely rounded by the eye.

The shapes of nearly all the vessels are very elegant, as is likely to be the case from the models employed by the maker. They are often wonderfully elaborate specimens of workmanship. Permanently covered vessels, with a hole in the lid, are very common, and Mr. Williams saw one jar as large as a hog's head, that was furnished with four openings for the purpose of filling and emptying it rapidly. The most remarkable examples are the compound vessels, several being united together at the point where they touch, and further connected by arched handles. In some cases, even the handles are hollow, and have an opening at the top, so that the vessels can be filled or emptied through them. This compound form has lately been copied by Europeans.

Considering the amount of labor and artistic skill which is given to pottery, it is a pity that the natives are not better off for material and firing. The material is very coarse, and the very imperfect mode of baking fails to give to the vessels the hard and almost imperishable quality which distinguishes properly prepared earthenware.

After the vessels have been shaped, and the decorative patterns traced on them with a sharp stick, they are placed on the ground close together, but not touching each other, and covered with a quantity of dried leaves, grass, reeds, and similar materials. The pile is then lighted, and when it has burned itself out the baking is supposed to be finished. Those pots that are to be glazed are rubbed, while still hot, with kawri, the same resin which has already been mentioned in the account of New Zealand.

As may be expected in an island population, the Fijians are expert fishermen, and employ various means of securing their prey. Nets, weighted at one edge with shells and floated at the other with pieces of light wood, are much used; and so are the hook, the creel, and the weir. In some places a very remarkable net, or rather an imitation of a net, called the *rau*, is used. To the long, flexible stems of creepers are fastened a quantity of split cocoa-nut leaves, so as to make a fringe of considerable depth and very great length, one of these *raus* sometimes measuring nearly ten thousand feet from one end to the other.

When completed, the *rau* is taken out to sea and thrown into the water, the ends being attached to canoes, which stretch it to a straight line. They then make for a small bay, across which the *rau* can be drawn, and then capture all the fish by smaller nets or spears. Sometimes they do

not trouble themselves to return to the shore, but bring the net round in a circle, the fish being so afraid of the leafy fringe that they avoid it, and keep themselves in the middle of the toils.

The principal use of the net is, however, in turtle fishing, a sport which may be almost called an art. The turtle fishers supply themselves with sinnet nets, some ten feet in width, and one or two hundred yards in length. While the turtle are feeding upon the shore, the fishermen carry out the net and shoot it to seaward, so that when the turtle returns to the sea after feeding, it is sure to be intercepted by the net, which has large meshes, in order to entangle the flippers of the reptile.

When the fishermen feel that the turtle is fairly caught, they proceed to get it on board, a task of very great difficulty and some danger, inasmuch as the turtle is in its own element, and the men are obliged to dive and conduct their operations under water. The most active diver tries to seize the end of one of the fore-flippers, and pulls it violently downward, knowing that the instinctive desire to rid itself of the inconvenience will cause the reptile to rise. Of course the diver can only retain his hold for a limited time, but as soon as he rises to the surface for breath another takes his place. Should the turtle be a vicious one, as is often the case, one of the divers grasps it across the head, fixing his finger and thumb in the sockets of the eyes, so as to prevent the creature from doing mischief.

Finding itself thus hampered, the turtle rises to the surface, when it is seized by the other fishermen who are in the canoe, hauled on board, and laid on its back, in which position it is utterly helpless. The successful fishermen then blow loud blasts of triumph on their conch-shell trumpets, and bring their prize to land.

In consequence of the number of men who are employed in this pursuit, the men almost invariably fish in parties, who are engaged by some individual. Sometimes they are the servants of a chief, and fish on his account, all the captured turtles belonging to him, but the fishermen always receive a present of some kind when they have been successful. Should the fishers be free men, they hire themselves, their nets, and canoe to some one who will pay the regular price, for which they are bound to make ten expeditions. Should they be entirely unsuccessful, they get nothing, but each time that they bring a turtle ashore they receive a present from the hirer, who is obliged, after the completion of the fishing, to give the men a handsome present. Sometimes several turtles are taken in a single day; but the business is a very precarious one, even the best fishermen returning day after day without catching a single turtle.

Some of the modes of catching the turtle

are very ingenious. When the men have no net, they chase the reptile as they best can, keeping the shadow of the sail just behind it so as to frighten it, and keep it continually on the move. They will pursue it in this way for a long time, until the creature is so exhausted that it can be captured by a few divers without the aid of a net. When brought home, the turtles are kept in pens and killed as wanted.

Although the flesh of the turtle is highly esteemed, and the green fat is appreciated nearly as much as in England, the chief value of the turtle lies in its shell, the thirteen plates of which are called a "head," and sold to the traders by weight. A "head" weighing three pounds is a fair one, a head that weighs four pounds is exceptionally good, while one that exceeds five pounds is hardly ever seen.

The dangers that beset the turtle fishery are many. Chief among them is the shark, which is very plentiful on these coasts, and which is equally fond of men and turtle, so that when it sees a turtle entangled in the net it makes an attack, and is as likely to take off the limb of one of the divers as to seize the reptile. Another fertile source of danger lies in the structure of the coral reefs, which form the principal shores of these islands. They are full of hollows and crannies, and it sometimes happens that a diver becomes entangled in them, and is not able to extricate himself in time to save his life.

As the canoes return home after turtle fishing, the women come down to the shore and meet them. Should the expedition be successful, the men return with songs and shouts of triumph, as if they were bringing home the bodies of slain foes, on which occasion, as we shall presently see, a scene of horrid rejoicing takes place. Should they be unsuccessful, they return in sad silence.

In the former case, the women welcome the successful fishermen with songs and dances, and sometimes become rather rough in the exuberance of their delight. Mr. Williams once witnessed an amusing scene, in which the women brought a quantity of bitter oranges down to the shore, and when the fishermen were about to land, pelted them so mercilessly that the men were in self-defence obliged to drive their aggressors off the beach.

As the canoe has so often been mentioned in connection with fishing, it will be now described. In principle it resembles the form which prevails among the great Polynesian group, though in detail it differs from many of the ordinary vessels. All the canoes possess modifications of the outrigger, but the best example is the double canoe, where two boats are placed side by side in such a manner that one of them acts as the outrigger and the other as the canoe.

If the reader will refer to illustration No.

1, on the 924th page, he will be able to understand the general appearance of this curious vessel. The two canoes are covered over, so as to keep out the water, and are connected by a platform which projects over the outer edges of both boats. Hatchways are cut through the platform, so as to enable the sailors to pass into the interior of the canoes. In the illustration a man is seen emerging from the hatch of the outer canoe. Upon this platform is erected a sort of deck-house for the principal person on board, and on the top of the deck-house is a platform, on which stands the captain of the vessel, so that he may give his orders from this elevated position, like the captain of a steamboat on the paddle-box or bridge. This position also enables him to trace the course of the turtle, if they should be engaged in the profitable chase of that reptile.

The mode of managing the vessel is extremely ingenious. The short mast works on a pivot at the foot, and can be slacked over to either end of the vessel. When the canoe is about to get under way, the long yard is drawn up to the head of the mast, and the latter inclined, so that the mast, the yard, and the deck form a triangle. The halyards are then made fast, and act as stays. When the vessel is wanted to go about, the mast is slacked off to the other end, so that the stern becomes the bow, the tack and the sheet change places, and away goes the vessel on the other course.

It will be seen that such a canoe sails equally well in either direction, and, therefore, that it can be steered from either end. The rudder is a very large oar, some twenty feet in length, of which the blade occupies eight, and is sixteen inches wide. The leverage of such an oar is tremendous, and, in a stiff gale, several men are required to work it. In order to relieve them in some degree, rudder-bands are used; but even with this assistance the men have great difficulty in keeping the canoe to her course, and are nearly sure to receive some very sharp blows in the side from the handle of the steering oar. Sometimes a sudden gust of wind, or a large wave, will bring round the rudder with such violence that the handle strikes a man in the side and kills him. With all these drawbacks, canoe sailing is a favorite occupation with the Fijians, who are as merry as possible while on board, singing songs to encourage the steersman, watching the waves and giving notice of them, and adding to the joyous tumult by beating any drum that they may happen to have on board. Even when the wind fails, and the canoe has to be propelled by poling if she should be in shoal water, or by sculling if she should be too far out at sea for the poles, the crew do their work in gangs, which are relieved at regular intervals, those who are resting singing songs and encouraging those who are at work.

Sculling one of these large canoes is rather heavy work, the great paddles being worked from side to side in perfect unison, the men moving their feet in accordance with the rhythm of their comrades' song. As many as eight sculls are sometimes employed at the same time, should the canoe be a large one and the crew tolerably numerous. The sculling oars pass through holes in the deck, an equal number being out fore and aft.

The mode of building these canoes is so ingenious that I will try to describe it, though without a plentiful use of diagrams description is very difficult. Canoes of moderate size are cut out of single logs; and in these there is nothing particularly worthy of remark. But when the native ship-builder wishes to construct one of the great war canoes, he has to exercise all the skill of his craft.

Here it must be mentioned that the canoe makers form a sort of clan of their own, and have their own chief, who is always a man eminent for skill in his profession. The experienced Fijians know the workmanship of these men as well as our artists know the touch and style of a celebrated sculptor or painter, and contemplate both the man and his workmanship with respectful admiration.

The first process in canoe building is to lay the keel, which is made of several pieces of wood carefully "scarfed" together; and upon it the planking is fixed, without requiring ribs, as in our boats. The most ingenious part of boat building is the way that the planks are fastened, or rather tied together, without a vestige of the sinnet appearing on the outside. Along the inside edge of each plank runs a bold flange, through which a number of holes are bored downward at regular distances, so that when two planks are placed together, the holes in the flanges exactly coincide, and a cord can be run through them.

When a plank has been made, and all the flange holes bored, the edges are smeared with a sort of white pitch, upon which is laid a strip of fine masi. This of course covers the holes, which are reopened by means of a small fire-stick. The planks thus prepared are called "vonos." When the vono is ready, it is lifted to its place, and very carefully adjusted, so that all the holes exactly coincide. The best and strongest sinnet is next passed eight or ten times through the hole, drawn as tight as possible, and then tied. It will be seen, therefore, that all the tying is done inside the vessel. In order to tighten the sinnet still more, a number of little wedges are inserted under it in different directions, and are driven home with the mallet.

By this process the planks are brought so tightly together that, when the carpenter comes to smooth off the outside of the ves-

sel with his adze, he often has to look very closely before he can see the line of junction. Caulking is therefore needless, the white pitch and masi rendering the junction of the planks completely waterproof. The vonos are by no means equal in size, some being twenty feet in length, while others are barely thirty inches, but all are connected in exactly the same manner.

The gunwales, and other parts above the water mark, do not require so much care, and are fastened without flanges, a strip of wood or "bead" being laid upon the junction, and the sinnet bands passing over and over it and drawn tight with wedges, and the holes carefully caulked with fibre and pitch. When the canoe is completed, it is beautifully finished off, the whole of the outside being first carefully trimmed with the adze, and then polished with pumice stone, so that it looks as if it were made of one piece of wood.

Ornament is freely used in the best canoes, especially in the two projecting ends, which are carved in patterns, and frequently inlaid with white shells belonging to the genus *Ovulum* or egg shells. This form of canoe has gradually superseded the more clumsy forms that were once in use in Tonga and the neighboring islands. The Tongans often made voyages to Fiji, being better and bolder sailors, though their canoes were inferior; and, having been struck with the superiority of Fijian boat-building, have by degrees built their own vessels after Fijian models. Being also remarkably good carpenters, they have taken to boat building even in Fiji itself, and have in a great measure ousted the native builders, being able to work better and quicker, and for less pay.

In spite of their excellent canoes, and their skill in managing their vessels, the Fijians are not bold sailors; and, according to Mr. Williams, "none have yet taken their canoes beyond the boundaries of their own group." He knew one old man named *Toaleva* (Great Fowl) who had a fancy that he could make a profitable trading expedition westward, and who accordingly loaded his canoe with pottery and masi, and started off. After two or three days, however, he became frightened, and made the best of his way back again, only to become a standing warning to rash voyagers. Yet in waters which they know the Fijians are excellent sailors, and the women appear to be as bold and skillful as the men, assisting in steering, managing the sail, and even in the laborious task of sculling or poling.

Owing to their excellence in canoe building, the Fijians carry on a brisk trade with other islands, supplying them not only with the canoes, but with the masts, sails, sinnet, and other nautical appliances, receiving in exchange the whales' teeth, shells, weapons, and other valued commodities.

CHAPTER XCV.

FIJI—Continued.

GOVERNMENT AND SOCIAL LIFE.

A NATIVE LEGEND—THE RAT GOD, AND HIS MISHAPS ON A JOURNEY—EVASION OF A HUMILIATING CUSTOM—MODERN CHANGES OF GOVERNMENT—THE VARIOUS RANKS OF CHIEFS AND PEOPLE—THE SYSTEM OF VASU, OR NEPOTISM EXTRAORDINARY—SINGULAR POWER OF THE VASU—THE SYSTEM A HINDRANCE TO INDUSTRY—THE VASU AS AN AMBASSADOR—PAYMENT OF TAXES—PRESENTATION OF THE CANOE—TRIBUTE PAID IN KIND AND IN LABOR—THE TENURE OF LAND—A SINGULAR CUSTOM—ATTACHMENT TO THE SOIL—THE DISAPPOINTED PURCHASER—THE FAMILY THE TYPE OF FIJIAN GOVERNMENT—CODE OF ETIQUETTE AMONG THE FIJIANS—THE COURT LANGUAGE—THE “TAMA,” AND ITS MODIFICATIONS—MEETING A SUPERIOR—THE “BALEMURI” CUSTOM—THE POLITE NATIVE WHO DID NOT GET A MUSKET—HOW GREAT CHIEFS VISIT EACH OTHER—ORATORY, AND MODES OF GREETING—STRICTNESS OF THE CODE OF ETIQUETTE—THE YOUNG CHIEF AND THE GUANA’S TAIL—A FIJIAN FEAST—THE VAST OVENS, AND MODE OF MAKING THEM—PREPARATIONS FOR THE FEAST—ARRANGEMENTS FOR THE BANQUET—VARIETY OF DISHES—MODE OF DRINKING—HOW TO OPEN A COCOA-NUT—CANNIBALISM—THE KING THAKOMBAU—PRESUMED ORIGIN OF CANNIBALISM—NATIVE LEGEND—THE CANNIBAL FORKS—OPPORTUNITIES FOR HUMAN SACRIFICES—“TAKING DOWN THE MAST”—AN UNFORTUNATE MISTAKE.

OWING to the geographical nature of the Fiji group, which consists of seven groups of islands, some of them very large and some very small, the mode of government has never been monarchical, the country being ruled by a number of chiefs of greater or less importance, according to the amount of territory over which their sway extended. The various islands had in former days but little connection with each other. At the present time, more intercourse takes place, and in one instance the visit involves a singular and ludicrous ceremonial.

One of the gods belonging to Somo-somo, named Ng-gurai, went to visit Mbau a spot on the eastern coast of Viti Lemi, one of the greater islands, and to pay his respects to the god of that place. He was accompanied by a Vuna god named Vatu-Mundre, who gave him a bamboo by way of a vessel, and undertook to guide him on his journey. Ng-gurai then entered into the body of a rat, seated himself on the bamboo, and set off on his journey. After they had sailed for some time, Ng-gurai lost his way on account of wanting to call at every island which he passed, and at last, just as he arrived on the Mbau shore, he was washed

off the bamboo and nearly drowned in the surf.

From this fate he was rescued by a Mbau woman, who took him into the chief's house, and put him among the cooks on the hearth, where he sat shivering for four days. Meanwhile, Vatu-Mundre arrived at his destination, and was received in royal manner by the Mbau god, who tried in vain to induce him to become tributary to him.

After a proper interval, the Mbau god returned the visit of Vatu-Mundre, who had craftily greased the path, so that when his visitor became animated, his feet slipped, and he fell on his back. Vatu-Mundre then took advantage of his situation, and forced his visitor to become his tributary.

In consequence of this affair, the Mbau people pay a homage to the natives of Vuna, but indemnify themselves by exacting a most humiliating homage from the men of Somo-somo, though in fact Somo-somo is the acknowledged superior of Vuna.

Whenever a Somo-somo canoe goes to Mbau, the sail must be lowered at a certain distance from shore, and the crew must paddle in a sitting position. To keep up the sail or to paddle in the usual standing

position would cost them their lives. As soon as they come within hearing of the shore they have to shout the Tama, *i. e.* the reverential salutation of an inferior to a superior, and to reiterate it at short intervals.

Arrived on shore, they are not allowed to enter a house, but are kept in the open air for four days, during which time they are obliged to wear their worst dresses, move about in a stooping attitude, and to say the Tama in a low and trembling voice, in imitation of the shivering rat-god. After the four days have expired, they may enter houses and dress in better clothes, but are still obliged to walk in a half-bent attitude. When a Mbau man meets one of these crouching visitors, he cries out, "Ho! Ho!" in a jeering manner, and asks the Somo-somo man whether his god is yet at liberty. The unfortunate visitor is then obliged to place his hand on his heart, stoop half-way to the ground, and say humbly that Ng-gurai is allowed his liberty.

Naturally disliking this oppressive and humiliating custom, the people of Somo-somo have of late years managed to evade it by means of foreign vessels. The custom of lowering the sail and paddling while seated was not binding on people of other countries, and so they contrived to visit Mbau on board of Tongan canoes, or, better still, English ship-boats.

Of late years the government has assumed a feudal aspect, the chiefs of large districts being considered as kings, and having under them a number of inferior chiefs who are tributary to them, and bound to furnish men and arms when the king declares war. According to Mr. Williams, the Fijians may be ranked under six distinct orders. First come the kings, and next to them the chiefs of separate large islands or districts. Then come the chiefs of towns, the priests, and the Mata-ni-vanuas, or aides-de-camp of the great chiefs. Next to them come the chiefs of professions, such as canoe building and turtle fishing, and with them are ranked any distinguished warriors of low birth. The fifth rank includes all the commonalty, and the sixth consists of the slaves, who are always captives.

As is often the case in countries where polygamy is practised, the law of descent passes through the female line, the successor of the king or chief being always the son of a woman of high rank.

The oddest part of Fijian political economy is the system of Vasu, or nephew—a system which may be described as nepotism carried to the greatest possible extreme. Mr. Williams's description of the Vasu is very curious. "The word means a nephew, or niece, but becomes a title of office in the case of the male, who in some localities has the extraordinary privilege of appropriating whatever he chooses belonging to his uncle, or those under his uncle's power.

"Vasu are of three kinds: the *Vasu-taukei*, the *Vasu-levu* and the *Vasu*;—the last is a common name, belonging to any nephew whatever. *Vasu-taukei* is a term applied to any Vasu whose mother is a lady of the land in which he was born. The fact of Mbau being at the head of Fijian rank gives the Queen of Mbau a pre-eminence over all Fijian ladies, and her son a place nominally over all Vasus.

"No material difference exists between the power of a *Vasu-taukei* and a *Vasu-levu*, which latter title is given to every Vasu born of a woman of rank, and having a first-class chief for his father. A *Vasu-taukei* can claim anything belonging to a native of his mother's land, excepting the wives, home, and land of a chief. Vasu cannot be considered apart from the civil polity of the group, forming, as they do, one of its integral parts, and supplying the high-pressure power of Fijian despotism.

"In grasping at dominant influence, the chiefs have created a power, which ever and anon turns round and grips them with no gentle hand. However high a chief may rank, however powerful a king may be, if he has a nephew, he has a master, one who will not be content with the name, but who will exercise his prerogative to the full seizing whatever will take his fancy, regardless of its value or the owner's inconvenience in its loss. Resistance is not to be thought of, and objection is only offered in extreme cases. A striking instance of the power of the Vasu occurred in the case of Thokonauto, a Rewa chief, who, during a quarrel with an uncle, used the right of Vasu, and actually supplied himself with ammunition from his enemy's stores. . . .

"Descending in the social scale, the Vasu is a hindrance to industry, few being willing to labor unrewarded for another's benefit. One illustration will suffice. An industrious uncle builds a canoe in which he has not made half-a-dozen trips, when an idle nephew mounts the deck, sounds his trumpet-shell, and the blast announces to all within hearing that the canoe has that instant changed masters."

The Vasu of a king is necessarily a personage of very great importance; and when he acts as delegate for the king, he is invested for the time with royal dignity. He is sent, for example, to other places to collect property, which is handed over to his king as tribute; and were it not for a check which the king has over him, he might be tempted to enrich himself by exacting more from the people than they ought to give. In this case, however, the Vasu is held amenable to the king, and should he exceed his proper powers, is heavily fined.

Taxes, to which reference is here made, are paid in a manner differing materially from the mode adopted in more civilized countries. In Europe, for example, no one

pays a tax if he can possibly escape from it, and the visits of the tax-gatherer are looked upon as periodical vexations. In Fiji the case is different. People take a pride in paying taxes, and the days of payment are days of high festival.

On the appointed day the king prepares a great feast, and the people assemble in vast multitudes with their goods, such as rolls of sinnet, masi, whales' teeth, reeds, women's dresses — and often accompanied by their wearers — ornaments, weapons, and the like, and present themselves in turn before the king. Each man is clad in his very best raiment, is painted in the highest style of art, and displays the latest fashion in hair-dressing. With songs and dances the people approach their monarch, and lay their presents before him, returning to the banquet which he has prepared for them.

It is hardly possible to imagine a more animated scene than that which occurs when the tribute from a distant place is taken to the king, especially if, as is often the case, a valuable article, such as a large war canoe, is presented as part of the tribute. A fleet of canoes, containing several hundred people and great quantities of property, makes its appearance off the coast, and is received with great hospitality, as well may be the case. The king having seated himself on a large masi carpet, the principal chief of the tribute bearers comes before him, accompanied by his men bringing the presents with them in proper ceremonial, the chief himself carrying, in the folds of his robe, a whale's tooth, which is considered as the symbol of the canoe which is about to be presented, and which is called by the same name as the canoe which it represents.

Approaching the king with the prescribed gestures, the chief kneels before him, and first offers to his master all the property which has been deposited on the ground. He then takes from the folds of his voluminous dress, which, as the reader may remember, is often several hundred feet in length, the whale's tooth, and makes an appropriate speech. He compliments the king on the prosperity which is enjoyed by all districts under his sway, acknowledging their entire submission, and hoping that they may be allowed to live in order to build canoes for him. As an earnest of this wish, he presents the king with a new canoe, and, so saying, he gives the king the symbolical whale's tooth, calling it by the name of the vessel. On receiving the tooth, the king graciously gives them his permission to live, whereupon all present clap their hands and shout, the cry of the receivers being different from that which is employed by the givers.

In the following illustration one of these animated scenes is represented.

Nearly in the centre is the king seated on the masi carpet, having his back to the

spectator in order to show the mode in which the flowing robes of a great man are arranged. In front of him kneels the chief of the tax-paying expedition, who is in the act of offering to the king the symbolical whale's tooth. One or two similar teeth lie by his side, and form a part of the present. In the distance is the flotilla of canoes, in which the tax-paying party have come; and near the shore is the new war canoe, which forms the chief part of the offering.

In the foreground are seen the various articles of property which constitute taxes, such as yams, rolls of cloth and sinnet, baskets, articles of dress, and young women, the last being dressed in the finest of likus, and being decorated, not only with their ordinary ornaments, but with wreaths and garlands of flowers. Behind the offering chief are his followers, also kneeling as a mark of respect for the king; and on the left hand are the spectators of the ceremony, in front of whom sit their chiefs and leading men.

Tribute is not only paid in property, but in labor, those who accompany the tax-paying chief being required to give their labor for several weeks. They work in the fields, they thatch houses, they help in canoe building, they go on fishing expeditions, and at the end of the stipulated time they receive a present, and return to their homes.

Should the king take it into his head to go and fetch the taxes himself, his visit becomes terribly burdensome to those whom he honors with his presence. He will be accompanied by some twenty or thirty canoes, manned by a thousand men or so, and all those people have to be entertained by the chief whom he visits. It is true that he always makes a present when he concludes his visit, but the present is entirely inadequate to the cost of his entertainment.

The tenure of land is nearly as difficult a question in Fiji as in New Zealand. It is difficult enough when discussed between natives, but when the matter is complicated by a quarrel between natives and colonists, it becomes a very apple of discord. Neither party can quite understand the other. The European colonist who buys land from a native chief purchases, according to his ideas, a complete property in the land, and control over it. The native who sells it has never conceived such an idea as the total alienation of land, and, in consequence, if the purchaser should happen to leave any part of the land unoccupied, the natives will build their houses upon it, and till it as before. Then as in process of time the proprietor wants to use his ground for his own purposes, the natives refuse to be ejected, and there is a quarrel.

The state of the case is very well put by Dr. Pritchard: "Every inch of land in Fiji has its owner. Every parcel or tract of ground has a name, and the boundaries are defined and well-known. The proprietor-

PRESENTATION OF THE CANOE.

(See page 936.)

ship rests in families, the heads of families being the representatives of the title. Every member of the family can use the lands attaching to the family. Thus the heads of families are the nominal owners, the whole family are the actual occupiers. The family land maintains the whole family, and the members maintain the head of the family.

"A chief holds his lands under precisely the same tenure, as head of his family, and his *personal* rights attain only to the land pertaining to his family, in which right every member of his family shares so far as on any portion of the land. But the chief is also head of his tribe, and, as such, certain rights to the whole lands of the tribe appertain to him. The tribe is a family, and the chief is the head of the family.

"The families of a tribe maintain the chief. In war they give him their services, and follow him to the fight. In peace they supply him with food. In this way, the whole tribe attains a certain collective interest in all the lands held by each family; and every parcel of land alienated contracts the source whence the collective tribal support of the chief is drawn. From this complicated tenure it is clear that the alienation of land, however large or small the tract, can be made valid only by the collective act of the whole tribe, in the persons of the ruling chief and the heads of families. Random and reckless land transactions under these circumstances would be simply another seizure of Naboth's vineyard, for which the price of blood would inevitably have to be paid."

Another cause of misunderstanding lies in a peculiar attachment which the Fijian has to the soil. When he sells a piece of land, it is an understood thing between the buyer and seller that the latter shall have the exclusive right of working on the ground, that none but he shall be employed to till the ground, or build houses upon it. The white settlers who understand the customs of the natives have accepted the condition, and find that it answers tolerably well. Those who are unacquainted with native ideas have often suffered severely for their ignorance, and, when they have brought a gang of their own workmen to put up a house on the newly purchased land, have been fairly driven out by armed parties of natives.

Mr. Fritchard narrates an amusing anecdote, which illustrates the working of this principle. A missionary had purchased some land according to the code of laws which had been agreed upon by the native chiefs and the colonists; all the natives who belonged to the family having been consulted, and agreed to the purchase. As a matter of course, they expected that the work of clearing the ground and building the house would be given to them. Being ignorant of this custom, the purchaser took some of his own people, but was immediately surrounded by a body of armed savages, who flourished their

clubs and spears, and frightened him so much that he retreated to his boat, and made off. When he was well out of range, all those who had muskets fired them in the direction of the boat, as if to show that their intention was not to kill but merely to intimidate.

It will be seen from the foregoing passages, that the whole government of Fiji is a repetition of one principle, namely, that of the family. The head of a family is the nominal possessor of the land. All the members of the family use the land, and support their head, as a return for the use of the land. Districts again are considered as families, the chief being the head, and being supported by the district. The king, again, is considered as the father of all the chiefs, and the nominal owner of all the land in his dominions, and he is therefore entitled to be supported by the taxation which has been described. Practically, however, he has no more right to land than any other head of a family.

From the preceding observations the reader may see that a definite code of etiquette prevails among the Fiji islands. Indeed, there is no part of the world where etiquette is carried to a greater extent, or where it is more intimately interwoven with every action of ordinary life. If, for example, one man meets another on a path, both having, as usual, their clubs on their shoulders, as they approach each other they lower their clubs to their knees, as a token that they are at peace, and pass on. Retaining the club on the shoulder would be equivalent to a challenge to fight.

The leading characteristic of this code of etiquette is the reverence for the chief, a reverence which is carried to such a pitch that in battle a chief sometimes comes out unhurt simply because his opponents were so much awe-stricken by his rank that they did not dare to strike him. Each superior therefore partakes of the chiefly character as far as his inferiors are concerned, and expects the appropriate acknowledgments of rank.

This extraordinary reverence is carried so far that it has invented a language of etiquette, no one with any pretensions to good breeding speaking in ordinary language of a chief, of a chief's head or limbs, of a chief's dress, or indeed of any action performed by a chief, but supplying a paraphrastic and hyperbolic phraseology, of which our own court language is but a faint shadow. The Tama, which has before been mentioned, is the right of a chief, and is therefore uttered by men of inferior rank, not only when they meet the chief himself, but when they come within a certain distance of his village. So elaborate is this code of ceremony that, discourteous as it might be to omit the Tama when due, it would be thought doubly so to utter it on occasions when it was not due. For example, the Tama is not used toward

the close of the day, or when the chief is either making a sail or watching a sail maker at work; and if the Tama were uttered on any such occasion, it would be resented as an insult.

Passing a superior on the wrong side, and sailing by his canoe on the outrigger side, are considered as solecisms in manners, while passing *behind* a chief is so deadly an insult that the man who dared do such a deed would run the risk of getting his brains knocked out on the spot, or, if he were a rich man, would have to pay a very heavy fine, or "soro," by way of compensation. The reason of this rule is evident enough. The Fijian is apt to be treacherous, and when he attacks another always tries to take him unawares, and steals on him, if possible, from behind. It is therefore a rule, that any one passing behind a superior is looked upon as contemplating assassination, and makes himself liable to the appropriate penalty.

If a man should meet a chief, the inferior withdraws from the path, lays his club on the ground, and crouches in a bent position until the great man has passed by. If, however, the two men should be of tolerably equal rank, the inferior merely stands aside, bends his body slightly, and rubs the left arm with the right hand, or grasps his beard and keeps his eyes fixed on the ground.

The act of giving anything to the chief, touching him or his dress, or anything above his head, or receiving anything from him, or hearing a gracious message from him, is accompanied by a gentle clapping of the hands. Standing in the presence of a chief is not permitted. Any one who addresses him must kneel; and if they move about, must either do so on their knees, or at least in a crouching attitude.

In some cases the code of etiquette is carried to an extreme which appears to us exceedingly ludicrous. If a superior fall, or in any other way makes himself look awkward, all his inferiors who are present immediately do the same thing, and expect a fee as recognition of their politeness.

Mr. Williams narrates an amusing anecdote of this branch of etiquette, which is called *bale-muari* (pronounced bahleh-mooree), *i. e.* follow in falling. "One day I came to a long bridge formed of a single cocoa-nut tree, which was thrown across a rapid stream, the opposite bank of which was two or three feet lower, so that the declivity was too steep to be comfortable. The pole was also wet and slippery: and thus my crossing safely was very doubtful.

"Just as I commenced the experiment, a heathen said with much animation, 'to-day I shall have a musket.' I had, however, just then to heed my steps more than his words, and so succeeded in reaching the other side safely. When I asked him why

he spoke of a musket, the man replied, 'I felt certain you would fall in attempting to go over, and I should have fallen after you (that is, appeared to be equally clumsy); and as the bridge is high, the water rapid, and you a gentleman, you would not have thought of giving me less than a musket.'" Ludicrous as this custom appears, it is based upon a true sense of courtesy, a desire to spare the feelings of others.

When one person of rank visits another, a number of ceremonies are performed in regular order. Should the visit be paid in a canoe, as is mostly the case, a herald is sent a few days previously to give notice of his coming, so as to avoid taking the intended host by surprise. As soon as the canoe comes in sight, a herald is sent out to inquire the name and rank of the visitor, who is met on the shore by a deputation of petty chiefs, headed by one of the Matas, or aides-de-camp. If the visitor be a personage of very high rank, the Matas will go ten miles to meet him.

As soon as the visitor and his retinue have reached the house of their entertainer, they seat themselves, and the host, after clapping his hands gently in token of salutation, welcomes them in a set form of words, such as "Come with peace the chief from Mbau," or "Somo-somo," as the case may be.

A series of similar remarks is made by both parties, the main point being that Fijian oratory is the driest and dullest of performances, always broken up into short sentences, without any apparent connection between them, and further hindered by the attitude of courtesy which the speaker has to adopt. It is impossible for the finest orator in the world to make an effective speech if he has to deliver it in a kneeling position, with his body bent forward, his hands holding his beard, and his eyes directed to the ground. In some parts of Fiji etiquette requires that the orator's back should be toward the chief whom he is addressing. Nobody takes the trouble to listen to these speeches, or is expected to do so, the chiefs often talking over indifferent matters while the proper number of speeches are rehearsed.

The ceremonies on leave-taking are quite as long, as intricate, and as tedious; and, when the speeches are over, the two great men salute each other after the fashion of their country, by pressing their faces together, and drawing in the breath with a loud noise, as if smelling each other. A chief of inferior rank salutes his superior's hand, and not his face.

When the visitors start upon their return journey, the host accompanies them for a part of the way, the distance being regulated by their relative rank. If they should have come by sea, the proper etiquette is for the host to go on board, together with some of his chief men, and to accompany

his visitors to a certain distance from land, when they all jump into the sea and swim ashore.

As is the case in all countries, whether savage or civilized, the code of etiquette is rigidly enforced at meal-times. Even the greatest chief, if present at a banquet, behaves in as deferential a manner as the commonest man present. Though he may be in his own dominions, and though he may hold absolute sway over every man and woman within sight, he will not venture to taste a morsel of food until it has first been offered to him. Many years ago one chief did so, and, in consequence, the Fijians have hated his very name ever since.

So great would be the breach of manners by such a proceeding, that the life of the offender would be endangered by it. On one occasion it did cost the chief his life. He inadvertently ate a piece of cocoa-nut which had not been offered to him; and this insult so rankled in the mind of one of his officers, who was in attendance, that he ran away from his own chief, and joined another who was at war with him. A battle took place, the offending chief was worsted, and was running for his life, when he met the insulted officer, and asked for his assistance. The man was inclined to give it, but the insult could not be forgotten, and so, with an apology for the duty which he was called on to perform, he knocked out his former master's brains with his club.

A still more astonishing instance of this feeling is mentioned by Mr. Williams. A young chief and his father-in-law were about to dine together, and a baked guana was provided for each. The guana is a lizard which has a long and slender tail. In passing by his relative's guana, the young man accidentally broke off the end of its tail, which would necessarily be rendered brittle by cooking. This was held to be so gross an insult, that the offender paid for it with his life.

Etiquette is shown to its fullest extent when a king or principal chief gives a great banquet. As with the New Zealanders, such a feast is contemplated for many months previously; vegetables are planted expressly for it, and no one is allowed to kill pigs or gather fruit, lest there should not be a sufficient quantity of provisions.

Just before the day of festival, the final preparations are made. Messages are sent to all the neighboring tribes, or rather to the chiefs, who communicate them to the people. The turtle fishers bestir themselves to get their nets and canoes in order, and, as soon as they are ready, start off to sea. Yams and other root crops are dug up, the ovens made, and the fuel chopped and brought ready for use.

These ovens are of enormous size, as each is capable of cooking a number of pigs, turtles, and vast quantities of vegetables. With

all our skill in cooking, it is to be doubted whether we are not excelled by the Fijians in the art of cooking large quantities of meat at a time. The ovens are simply holes dug in the ground, some ten feet in depth and fifteen feet or so in diameter.

The mode of cooking is very simple. A small fire is made at the bottom of the pit, which is then filled with firewood, and as soon as the wood is thoroughly on fire, large stones are placed on it. When the wood has all burned away, the pigs, turtles, and vegetables are laid on the hot stones, some of which are introduced into the interior of each animal, so that it may be the more thoroughly cooked. The oven is then filled up with boughs and green leaves, and upon the leaves is placed a thick covering of earth. The oven regulates its own time of cooking, for as soon as steam rises through the earthy covering, the contents of the oven are known to be properly cooked.

For the two or three days preceding the feast, all the people are full of activity. They take a pride in the liberality of their chief, and each man brings as many pigs, yams, turtles, and other kinds of food as he can manage to put together. The king himself takes the direction of affairs, his orders being communicated to the people by his Matas, or aides-de-camp. Day and night go on the preparations, the pigs squealing as they are chased before being killed, the men hard at work digging the ovens, some loosening the earth with long pointed sticks, others carrying off the loosened soil in baskets, while the flames that blaze from the completed ovens enable the workmen to continue their labors throughout the night.

On these occasions the Fijians dispense with their ordinary feelings respecting cooking. In Fiji, as in New Zealand, cooking is despised, and the word "cook" is used as a term of reproach and derision. In consequence of this feeling, all cooking is performed by the slaves. But on the eve of a great feast this feeling is laid aside, and every man helps to cook the food. Even the king himself assists in feeding the ovens with fuel, arranging the pigs, stirring the contents of the cooking pots, and performing offices which, on the following day, none but a slave will perform.

By the time that the cooking is completed, the various tribes have assembled, and the ovens are then opened and the food taken out. It is then arranged in separate heaps, a layer of cocoa-nut leaves being placed on the ground by way of dish. On the leaves is placed a layer of cocoa-nuts, then come the yams and potatoes, then puddings, and at the top of all several pigs. The quantity of provisions thus brought together is enormous. Mr. Williams mentions that at one feast, at which he was present, two hundred men were employed for nearly six hours in piling up the food.

There were six heaps of food, and among their contents were about fifty tons of cooked yams and potatoes, fifteen tons of pudding, seventy turtles, and about two hundred tons of uncooked yams. There was one pudding which measured twenty-one feet in circumference.

Profusion is the rule upon these occasions, and the more food that a chief produces, the more honor he receives. One chief gained the honorable name of High Pork, because he once provided such vast quantities of food that before it could be finished decomposition had begun in the pork.

All being arranged, the distribution now begins, and is carried out with that precision of etiquette which pervades all society in Fiji. The various tribes and their chiefs being seated, the Tui-rara, or master of the ceremonies, orders the food to be divided into as many portions as there are tribes, regulating the amount by the importance of the tribe. He then takes the tribes in succession, and calls their names. As he calls each tribe, the people return their thanks, and a number of young men are sent to fetch the food. This goes on until the whole of the food has been given away, when a further distribution takes place among the tribes, each village first taking a share and then each family receiving its proper portion, which is handed to its head.

It is evident that the Tui-rara has no sinecure. He must possess the most intimate knowledge of all the tribes, and the ranks of their respective chiefs, and must at the same time be on the alert to distinguish any stranger that may make his appearance. Should he be a foreigner, he is considered a chief, and a chief's portion, i. e. a quantity sufficient for twenty Fijians or sixty Englishmen, is sent to him. Of course he gives the greater part away, but in so doing he acts the part of a chief. It is, in fact, the old story of Benjamin's mess translated into Fijian.

The men always eat their food in the open air, but send the women's portion to the houses to be eaten within doors.

The first illustration on the next page will give an idea of a Fijian feast. On the left hand is seen the master of the ceremonies, calling the name of a tribe, and in the centre are seen the young men running to fetch the food. In the foreground is the portion of their tribe, consisting of pigs, yams, turtles, and so forth. In front of them are some of the curious drums, which will be presently described, and in the distance are seen the members of the different tribes, some eating, and others waiting for their portion. The curious building in the background is one of the Burés, or temples, which will be presently described.

From the preceding description it will be seen that the Fijians are not bad cooks, and that the number of dishes which they pro-

duce is by no means small. The variety of the dishes is, however, much greater than has been mentioned. They eat many kinds of fish, together with almost every living creature that they find in the coral reefs. Some of their preparations very much resemble those to which we are accustomed in England. For example, a sort of shrimp sandwich is made by putting a layer of shrimps between two taro leaves. Several kinds of bread are known, and nearly thirty kinds of puddings. Turtle soup is in great favor, and so are various other soups.

The Fijians even make sauces to be eaten with various kinds of food, the sweet juice of the sugar-cane being much used for this purpose. They also have a sort of an imitation of tea, infusing sundry leaves and grasses in boiling water, and drinking it when it becomes sufficiently cool. Most of their food is cooked; but, like ourselves, they prefer some food in an uncooked state. Small fish, for example, are eaten alive, just as we eat oysters.

They mostly drink water, or the milk of the cocoa-nut. To drink water in native fashion is not very easy. They keep it in long bamboo tubes, so that when it is raised to the lips the greatest care is required lest it should suddenly deluge the face and body.

Cocoa-nuts are opened in rather a curious manner. A stout stick is sharpened at both ends, and one end driven firmly into the ground. Taking the nut in both hands, the native dashes it on the stick, which splits open the thick husk, and allows the nut to be extracted. With a stone, or even with another cocoa-nut in case a stone should not be at hand, the native hammers away round the pointed end, and contrives to knock off a small round lid, which is then removed, leaving a natural drinking-cup in his hand.

WE now come to the terrible subject of cannibalism, on which no more will be said than is necessary to illustrate the character of the people.

The Fijians are even more devoted to cannibalism than the New Zealanders, and their records are still more appalling. A New Zealander has sometimes the grace to feel ashamed of mentioning the subject in the hearing of an European, whereas it is impossible to make a Fijian really feel that in eating human flesh he has committed an unworthy act. He sees, indeed, that the white men exhibit great disgust at cannibalism, but in his heart he despises them for wasting such luxurious food as human flesh.

Even the Christianized natives have to be watched carefully lest they should be tempted by old habits, and revert to the custom which they had promised to abjure. For example, Thakombau, the King of Mbau, became a Christian, or at least pretended to

(1.) A FIJIAN FEAST. (See page 942.)

(2.) THE FATE OF THE BOASTER. (See page 952.)

do so. He was not a particularly creditable convert. Some time after he had announced himself to be a Christian, he went in his war canoe to one of the districts under his sway. He was received with the horribly barbarous ceremonial by which a very great chief is honored, conch-shell trumpets blowing before him, and the people shouting their songs of welcome. Thus accompanied, he walked through a double row of living victims — men, women, and children of all ages — suspended by their feet, and placed there to give the king his choice. The hopeful convert was pleased to accept the offering, touching with his club as he passed along those victims which seemed most to his taste.

The natives are clever enough at concealing the existence of cannibalism when they find that it shocks the white men. An European cotton-grower, who had tried unsuccessfully to introduce the culture of cotton into Fiji, found, after a tolerably long residence, that four or five human beings were killed and eaten weekly. There was plenty of food in the place, pigs were numerous, and fish, fruit, and vegetables abundant. But the people ate human bodies as often as they could get them, not from any superstitious motive, but simply because they preferred human flesh to pork.

Many of the people actually take a pride in the number of human bodies which they have eaten. One chief was looked upon with great respect on account of his feats of cannibalism, and the people gave him a title of honor. They called him the Turtle-pond, comparing his insatiable stomach to the pond in which turtles are kept; and so proud were they of his deeds, that they even gave a name of honor to the bodies brought for his consumption, calling them the "Contents of the Turtle-pond." This man was accustomed to eat a human body himself, suffering no one to share it with him. After his family were grown up, he bethought himself of registering his unholy meals by placing a stone on the ground as soon as he had finished the body. His son showed these stones to an English clergyman, who counted them, and found that there were very nearly nine hundred.

One man gained a great name among his people by an act of peculiar atrocity. He told his wife to build an oven, to fetch firewood for heating it, and to prepare a bamboo knife. As soon as she had concluded her labors her husband killed her, and baked her in the oven which her own hands had prepared, and afterward ate her. Sometimes a man has been known to take a victim, bind him hand and foot, cut slices from his arms and legs, and eat them before his eyes. Indeed, the Fijians are so inordinately vain, that they will do anything, no matter how horrible, in order to gain a name among their people; and Dr. Pritchard, who

knows them thoroughly, expresses his wonder that some chief did not eat slices from his own limbs.

Cannibalism is ingrained in the very nature of a Fijian, and extends through all classes of society. It is true that there are some persons who have never eaten flesh, but there is always a reason for it. Women, for example, are seldom permitted to eat "bakolo," as human flesh is termed, and there are a few men who have refrained from cannibalism through superstition. Every Fijian has his special god, who is supposed to have his residence in some animal. One god, for example, lives in a rat, as we have already seen; another in a shark; and so on. The worshipper of that god never eats the animal in which his divinity resides; and as some gods are supposed to reside in human bodies, their worshippers never eat the flesh of man.

According to the accounts of some of the older chiefs, whom we may believe or not, as we like, there was once a time when cannibalism did not exist. Many years ago, some strangers from a distant land were blown upon the shores of Fiji, and received hospitably by the islanders, who incorporated them into their own tribes, and made much of them. But, in process of time, these people became too powerful, killed the Fijian chiefs, took their wives and property, and usurped their office.

In this emergency the people consulted the priests, who said that the Fijians had brought their misfortunes upon themselves. They had allowed strangers to live, whereas "Fiji for the Fijians" was the golden rule, and from that time every male stranger was to be killed and eaten, and every woman taken as a wife.

Only one people was free from this law. The Tongans, instead of being killed and eaten, were always welcomed, and their visits encouraged, as they passed backward and forward in their canoes, and brought with them fine mats and other articles for barter. So much have these people intermingled, that in the eastern islands, which are nearest to those of Tonga, there is a decided mixture of Tongan blood. With this exception, however, the Fijians went on the same principle as the Ephesians of Shakespeare —

"If any Syracusan born
Come to the bay of Ephesus, he dies;"

save that, instead of merely putting to death those who came from one country, they only excepted one country from the universal law.

The reader may remember that a sort of respect is paid to a human body used for food. Educated people speak of it in the court language, and, instead of using any vulgar term, such as a human body, they

employ the metaphorical language, and call it the "long pig." As a general rule, the vessels in which human flesh is cooked are reserved expressly for that purpose, and both the vessel in which it is cooked and the dish from which it is eaten are held as tapu.

So highly is "bakolo" honored, that it is eaten, not with fingers, but with a fork, and the implement in question is handed down from father to son, like the *merais* and *tikis* of the New Zealander. These forks are quite unlike those which are used in England. They mostly have four prongs, but these prongs, instead of being set in a line, are generally arranged in a circle or triangle as the case may be. They are carved out of some very hard wood, and, when they have become venerable by reason of age or of the rank of their proprietor, they receive names of honor. For example, the cannibal chief who ate nearly nine hundred human bodies had a fork which was named "Undro-undro," the title signifying a small person carrying a great burden. The fork was a small object, but it had carried to the lips of its master the bodies of nearly nine hundred human beings.

As the Fijians set such a value on human flesh, it is to be expected that they will invent a variety of excuses for obtaining it. For example when a chief builds a house, he kills at least one human victim to celebrate the event. If he builds a large war canoe, a series of sacrifices takes place. A man is killed, for example, when the keel is laid, and, if the chief be a very powerful one, he will kill a victim as each plank is fixed in its place. Even when it is finished the slaughter is not over, as, in the first place, the planks of the new vessel have to be washed with human blood, and, in the next, the launch must be commemorated in the same way as the building. One chief gained some notoriety by binding a number of men, and laying them side by side along the shore to act as rollers over which the canoe was taken from the land into the sea. The weight of the canoe killed the men, who were afterward baked and eaten.

Even after the canoe is launched, excuses are found for carrying on the system of human butchery. Whenever it touches at a place for the first time, a man must be sacrificed in honor of taking down the mast, this being done to show that the vessel means to make some stay at the place. If a chief should arrive in a new canoe, and keep up his mast, the people understand the signal, and bring on board a newly-slain victim, so that the mast may be taken down.

On one occasion, when a war canoe had been built at Somo-somo, the missionaries exerted themselves so successfully that the canoe was launched without the sacrifice of a single life. Eventually, however, their

well-intentioned interference rather increased than diminished the number of victims. When the canoe arrived at Mbau, the chiefs were so vexed that it had reached them unhonored by human blood that they straightway attacked a village, killed some fourteen or fifteen men, and ate them in order to do honor to the ceremony of taking down the mast.

Sometimes, in order to secure a victim whenever one is wanted, the chiefs pick out secretly a certain number of men, and put them, so to speak, on the black list. Whenever a sacrifice is needed, all the executioners have to do is to find out how many victims are wanted, and then to go and kill the requisite number of the black-list men.

Whole towns are sometimes put on the black list, a curious example of which custom is given by Mr. Williams. "Vakambua, chief of Mbau, thus doomed Tavua, and gave a whale's tooth to a Nggara chief, that he might at a fitting time punish that place. Years passed away, and a reconciliation took place between Mbau and Tavua, but, unhappily, the Mbau chief failed to neutralize the engagement made with the Nggara. A day came when human bodies were wanted, and the thoughts of those who held the tooth were turned toward Tavua. They invited the people of that place to a friendly exchange of food, and slew twenty-three of their unsuspecting victims.

"When the treacherous Nggarans had gratified their own appetites by pieces of the flesh cut off and roasted on the spot, the bodies were taken to Vakambua, who was greatly astonished, expressed much regret that such a slaughter should have grown out of his carelessness, and then shared the bodies to be eaten."

The Fijian can seldom resist meat, and that he should resist "bakolo" could not be expected of him. In Mrs. Smythe's "Ten Months in the Fiji Islands," an amusing instance of this predilection is recorded. "A white man had shot and carried off a pig belonging to a Fijian, who, being a convert, went to a native teacher named Obadiah, and asked him to go to the delinquent and remonstrate with him. The teacher put on his black coat, went to the man's house, and with much earnestness pointed out to him the iniquity of the deed, asking him how he would have liked it had a Fijian killed one of his own pigs. The man listened very respectfully, and allowed the error of his ways, acknowledging that the teacher had put the matter in a new light. 'But,' said he 'the pig is now dead, and we cannot bring it to life again. Shall we throw it out and let it go to waste, or, as it is just baked, and you have not breakfasted, shall we not sit down, and you will ask a blessing?'

"Obadiah, taken by surprise by Q——'s

penitence, and the compliment paid to his own clerical functions, and swayed perhaps a little by the irresistible love of all Fijians for roast pork, bowed his head, and reverentially said a long prayer, after which the two set heartily to work on the pig." When the teacher went to the missionary to report his successful labors, he was quite astonished at being charged with complicity with the thief.

CHAPTER XCVI.

FIJI—*Continued.*

WAR AND AMUSEMENTS.

WEAPONS OF THE FIJIANS—THE SLING, AND MODE OF USING IT—THE CLUB, AND ITS VARIOUS MODIFICATIONS—GRADUAL DEVELOPMENT OF THE CLUB INTO THE PADDLE—MODE OF MAKING THE CLUBS, AND PREPARATION OF THE TREES—ORNAMENTS OF THE CLUBS, AND THEIR NAMES—FIJIAN SPEARS—THEIR TERRIBLE BARBS—OBJECTS OF WAR—THE REVIEW—THE FATE OF THE BOASTER—INGENIOUS ENGINEERING—CRUELTY TOWARD PRISONERS—"CONSECRATION" OF A WARRIOR, AND HIS NEW NAME—DOMESTIC LIFE—CEREMONIES AT BIRTH—TRAINING IN REVENGE—AMUSEMENTS—VARIOUS GAMES—RIRIKI—WOMEN AGAINST MEN—DANCES AND SONGS—MARRIAGE FESTIVITIES—WEDDING OF A CHIEF'S DAUGHTER—DOMESTIC DISCIPLINE—THE KING'S STAFF—FESTIVITIES AT HOUSE BUILDING—MODE OF THATCHING AND DECORATING THE HOUSES—A PRACTICAL JOKE.

IN accordance with the plan on which this work has been arranged, Fijian warfare will be described as it was before fire-arms were introduced, and had changed the ancient style of warfare.

The original weapons of the Fijian are the club, the axe (which, by the way, is little more than a modification of the club), the bow, the sling, and the spear. In most of these weapons is exhibited the fancifully artistic nature of the manufacturers. The sling is perhaps the only weapon from which ornament is almost wholly absent. Like the corresponding weapon of the New Caledonians, it carries stones of tolerable weight and great hardness, and, when wielded by a skilful hand, becomes no inefficient weapon even against fire-arms themselves. A stone hurled from a Fijian sling has been known to render a musket useless, the stone having struck the barrel, and bent and indented it as much as would have been done by a bullet.

The chief weapon of the Fijian is the club, and upon this he lavishes all the artistic power at his command, covering nearly the whole of it with the most intricate and delicately executed carvings. Some clubs are straight, like thick cudgels, others are curved. Those which are knobbed at the end have an infinite variety in the knob, as we shall presently see. Some are more or less flattened, while there are some which are so flat and so broad that it is not easy at first sight to determine whether they are clubs or paddles. Some are so large that

they require the whole exertion of a muscular man to wield them, while others are so short that they are kept stuck in the girdle, and used as missiles, precisely as the short knob-kerries are used by the South Africans. A Fijian will often carry two or more of these clubs in his girdle.

Some of the most characteristic forms of Fijian clubs are given on the following page, all being drawn from specimens in my collection. Fig. 1 represents a club, and is evidently modified from a gnarled and knotted branch, and by comparing a number of specimens together it is easy to trace the progress of manufacture. This form of club is also to be found among the Papuans of New Guinea, the natives of the Outanata district carrying it. With the exception of the deep transverse cuts, there is no attempt at ornament. It is tolerably heavy, though not very large, and requires two hands to be wielded properly.

Figure 2 represents one of the paddle-like clubs which have just been mentioned. The blade is not an inch in thickness in the middle, and it gradually slopes off to either side, so as to form a tolerably sharp edge. With the exception of the handle, it is entirely covered with carving; the dentated pattern, which seems common to nearly all savage art, being very conspicuous. It is extremely weighty, and, to an European, appears a very awkward instrument, except perhaps that the broad blade might be utilized as a shield.

SPEAR. (See page 952.)

(4.) FIJIAN CLUBS. (See page 948.)

Fig. 3 is a club, which may be considered as a sort of intermediate form between the two already mentioned. Like the last, it has a broad blade, but is evidently a club and not a paddle. The blade is strengthened by a bold ridge running along the centre. In order to show the mode in which it is flattened, a side view of the lower part is shown at fig. *a*, and a cross section of the blade is given at fig. *b*. This kind of club is modified in various ways, but is always made on the same principle, *i. e.* a round handle and a flattened paddle-like end, sometimes nearly plain, as in the above mentioned specimens, and sometimes furnished with knobs, teeth, and spikes projecting from the sides. In some cases it assumes the shape of a crescent, and looks, indeed, much like a cheese knife very much magnified.

Another very characteristic shape is given in fig. 4. As may be imagined from the illustration, it is very weighty, so that even to carry it about must be rather troublesome. It is covered with carvings in the most lavish manner, and such value has been set by the manufacturer upon the weapon, that he has even taken the trouble to invent different patterns for the opposite sides.

The peculiar form of this club is evidently due to the structure of the branch from which it was cut, the projecting portion being the base of another branch. Although in many specimens—my own among the number—the club has been carved from a great log of solid wood, the form has evidently been borrowed from the junction of two branches. The edge of the club is cut into slight teeth, and just within the edge are a number of round holes, set in a line. A tolerably bold ridge runs along the head of the club and follows its curve, and through this ridge are also bored a number of holes, apparently for the purpose of attaching bunches of feathers, or other ornaments, to the weapon.

The most characteristic club of Fiji is, however, that of which an example is given in fig. 5. It is made from the stem and part of the root of a young tree. In this part of the world there are certain trees which grow in a manner which to us seems very peculiar. As is the case with many trees, it sends a tap-root deeply into the earth, and is further supported by a number of smaller roots which diverge from it on all sides, and retain it in its upright position, just as a mast is upheld by the standing rigging.

While the tree is very young, it is drawn down nearly horizontally, and fixed in that position, so as to be bent nearly at right angles close to the earth. When it has grown to the thickness of a man's wrist, the top is cut off and the roots dug out of the ground. The tap-root is then scraped down to a point, and all the smaller roots are cut off to within an inch and a half of the tap-root,

so as to form a radiating mass of spikes, which are sharpened, and thus present the appearance shown in the illustration.

Such a club as this is an exceedingly valuable weapon, and the greatest care is taken in its manufacture. The spike at the end is scraped and rounded until it assumes a perfectly regular shape, and is then polished until it shines like a well-rubbed piece of mahogany. The radiating spikelets are each trimmed with the greatest nicety, so that, in whatever direction the weapon is viewed, they all radiate with exact regularity.

The handle is polished as carefully as the lower spike, and in most cases is adorned with elaborately carved patterns. In many clubs it is completely covered with black and white sinnet made expressly for this purpose, and plaited in patterns as elaborate as those which are carved. Some of the best clubs are further ornamented by having scarlet feathers worked in with sinnet. There are, indeed, scarcely any bounds to the decoration of clubs, many of which are inlaid with shell, or hogs' tusks, or whales' teeth, or even the teeth of men. These latter ornaments are chiefly reserved for the knobs of the small missile club.

Beside these, there is an infinite variety of forms, some of the clubs exactly resembling the steel maces of the days of chivalry, others being first squared and then cut into pyramidal form, while others look just like enormous mushrooms. Some of them have the handles completely covered with wicker-work; but, as a rule, these highly ornamental weapons are not for use but for show, like the court sword of the present day.

Some of the names given to these clubs are highly suggestive. For example, one was called "Weeping urges me to action," others "Disperser," "Smasher," and so forth. Those which belong to well-known chiefs or distinguished warriors are used much as cards among ourselves. If, for example, a great chief desires to pay a visit, he will send his club as an intimation that the owner will follow. Or, if one chief asks another for aid in war, the ordinary mode of showing that the application is favorably received is for the latter to send his club by the ambassador who brought the message.

There is as great variety of spears as of clubs. Spears are almost invariably of great length, some measuring fourteen or fifteen feet in length. They are made from hard wood and are almost invariably armed with a series of barbs. In the manufacture and arrangement of the barbs, the Fijians show wonderful ingenuity. Mostly, they are not from the same piece of wood as the spear itself, but in many weapons they are made of other materials. The sharp tail-bone of the sting-ray is a favorite material, both for the points and barbs of spears, probably because it is very hard, and so brittle that it is nearly sure to break off in the wound.

Other barbs are made of a wood which has the property of swelling up when moistened, and bursting in the wound, so that it can hardly be extracted. Such spears as this are called by a very ominous title, "The priest is too late." Some of the spears are not only carved in various patterns, but have the heads cut into a kind of bold open work pattern, which has a very elegant appearance, though it must detract greatly from the strength of the weapon. One of the ordinary Fijian spears is shown on page 949, and is taken from specimens in my collection, in which there are several others, but all of a similar character.

Many of the weapons have more than one point. In the specimens which I have, the points are rather more than a yard in length, and are made of separate pieces of wood, ingeniously dovetailed into the shaft of the spear, and held in their place by lashings of sinnet. In my specimen, the manufacturer has been so lavish of his labor, that he has not only woven the sinnet into elegant patterns, but has continued them along the whole of the shaft, covering it with a sort of mixture of the zigzag and the dentated patterns. There are also spears with several points, each point being barbed or deeply serrated on the inside cap. These are not for war, but for fishing purposes. As for the war in which these weapons are used, it is hardly deserving of the name.

When two chiefs have decided on going to war, messengers pass between them, and both sides beat up recruits for their armies and offer gifts to the gods. Whales' teeth and food form the chief part of these offerings, and the latter is often given in vast quantities. Independent chiefs often take advantage of war to increase their property. Such a chief, for example, though urged by both sides to join them, trims and hesitates, and bides his time. One party will then send him a bribe, and as soon as the other party hear of it, they send a larger bribe, in order to "press down" the former gift. The result usually is, that the recipient keeps both bribes, and eventually declines to fight on either side.

The forces are gathered by a series of reviews, held as the army marches. These reviews form the great charm of war, as any amount of boasting may be done without the slightest risk. Each warrior rushes up to the commanding chief, brandishes his weapons, and boasts of the great deeds which he is going to do; all the warriors being in their very best, with bodies covered with black powder, so as to contrast with the snow-white masi, and their faces painted as none but a Fijian can paint them, in order to look as martial as possible.

The chief often ridicules the pretensions of these men, insinuating that they will be more ready to run away than to fight; but this is only for the purpose of inciting them

to display their courage, and, by way of inducing them to fight well, large gifts are promised to those who distinguish themselves in battle.

Sometimes a warrior, carried away by the excitement of the moment, boasts that he will kill the enemy's chief, eat his flesh, and make a drinking-cup of his skull. This is generally a very foolish proceeding. The menaced chief is sure to hear of it, and to promise a large reward if the boaster be taken alive.

Should he be captured, his fate is certain. His hands are bound behind him, and a large bundle of dried cocoa-nut leaves is fastened tightly across his shoulders, projecting for several feet on either side. The ends of the leaves are then lighted, and the poor wretch is left to die, the spectators laughing and jeering at him as he runs about, maddened by the torment. This punishment is called by a name which signifies carrying fuel. The artist has represented in the lower engraving, on the 943d page, this frightful fate of the boaster.

The party that are attacked usually retire into a native fort, the structure of which often shows great engineering skill. The Fijians are very apt at selecting a spot which is difficult of access, and fortifying it in such a manner that two or three men could hold it against a thousand. Mr. Williams visited one of these forts, and found that the approach to it was not without danger, even in time of peace. The only path to the fort led through thick and tangled vegetation, and terminated on the edge of a precipice. The entrance to the fort was on the face of the precipice, several yards from the end of the path, and there was no mode of getting to it except by crawling along the perpendicular rock by means of little holes in which the toes and fingers could be inserted.

When the natives cannot find a place of such natural strength, they have a way of defending the entrance by a series of gates with traverses between them, so that any enemies who forced the first gate were obliged to go for some distance through a narrow passage which was pierced with loopholes, through which spears could be thrust and arrows shot. Even if they succeeded in passing the second gate, a similar gauntlet had to be run before they could reach the third. Thorny trees are in great request for the outer defences of these forts, the bare-skinned natives greatly dreading the prickly walls, which every year grow more dense and less penetrable.

Knowing the strength of the forts, the natives do not care about assaulting them, and, as they advance to the walls, avail themselves of every cover. They then yell and shout derisive taunts at the enemy, challenging them to come out and fight. Sometimes the challenge is answered, a

number of warriors issuing from the fort and each selecting an adversary; often, however, as soon as the besiegers see their challenge answered, they run away as fast as they can, the Fijian liking to come behind his enemy and knock him on the head stealthily better than to oppose him in open fight.

Should a fort be taken, the slaughter is dreadful, and is nothing but a massacre, the greater number being killed, and the rest reserved to be put to death by torture. One favorite mode of torture is to stun the unhappy captive with a club, and to throw him into a heated oven by way of bringing him back to his senses. The struggles of the unfortunate man as the fierce heat restores him to consciousness are greeted with laughter and jeers by the delighted spectators. Others are bound hand and foot and given to the sons of chiefs as subjects on which they can try their skill at torturing.

As these expeditions are nearly always made in canoes, the return of the war party is seen from a great distance, and all the population assemble on the beach to welcome the victorious warriors, the women dancing and singing songs of triumph in honor of the conquerors. A horrible scene then takes place, too horrible indeed to be described; the bodies of the dead are offered in the temples, the ovens are prepared, and for some days unbridled license reigns supreme.

In connexion with warfare must be mentioned a curious custom of giving a new name to men who have killed any of the enemy during the campaign. Whether the enemy be an armed warrior slain in fair fight, an unarmed man knocked down by stealth, a woman, or even a little child, signifies nothing. The warrior has clubbed an enemy, and has a right to his new name of honor. Should he have killed a chief, he takes the name of his victim, and sometimes his own chief honors him by calling the man his flag, his canoe, his comb, &c. Of the consecration ceremony, wherein the new name is given, Mr. Williams once saw a very excellent example at Somo-somo, the subject of consecration being a young chief.

"The king and leading men having taken their seats in the public square, fourteen mats were brought and spread out, and upon these were placed a bale of cloth and two whale's teeth. Near by was laid a sail mat, and on it several men's dresses. The young chief now made his appearance, bearing in one hand a large pine-apple club, and in the other a common reed, while his long train of masi dragged on the ground behind him.

"On his reaching the mats, an old man took the reed out of the hero's hand, and despatched a youth to deposit it carefully in the temple of the war god. The king then

ordered the young chief to stand upon the bale of cloth; and while he obeyed, a number of women came into the square, bringing small dishes of turmeric mixed with oil, which they placed before the youth, and retired with a song. The masi was now removed by the chief himself, an attendant substituting one much larger in its stead. The king's Mata (aide-de-camp) next selected several dishes of the colored oil, and anointed the warrior from the roots of the hair to his heels.

"At this stage of the proceedings one of the spectators stepped forward and exchanged clubs with the anointed, and soon another did the same. Then one left him a gun in place of the club, and many similar changes were effected, under a belief that the weapons thus passing through his hands derived some virtue.

"The mats were now removed, and a portion of them sent to the temple, some of the turmeric being sent after them. The king and old men, followed by the young man and two men sounding conchs, now proceeded to the seaside, where the anointed one passed through the ancients to the water's edge, returned, while the king and those with him counted one, two, three, four, five, and each then threw a stone into the sea. The whole company now went back to the town with blasts of the trumpet shells, and a peculiar hooting of the men.

"Custom requires that a hut should be built, in which the anointed man and his companions may pass the next three nights, during which time the newly named hero must not lie down, but sleep as he sits; he must not change his masi, or remove the turmeric, or enter a house in which there is a woman, until that period has elapsed. In the case now described, the hut had not been built, and the young chief was permitted to use the temple of the god of war instead.

"During the three days he was on an incessant march, followed by half a score lads reddened like himself. After three weeks he paid me a visit, on the first day of his being permitted to enter a house in which there was a female. He informed me his new name was *Kuila*, or Flag."

When a name of honor has thus been given to a man, the complimentary title of *Koroi*, or consecrated, is prefixed to it.

The battles of the Fijians are not, as a rule, remarkable for the slaughter that takes place. They are, in fact, little but a series of single combats. When a man falls, his friends try to get him off the ground to save his life, if possible, or to be able to bury the body if he should die; while the enemy use their best endeavors to secure the wounded man in order to bake and eat him. No dishonor is attached to the fact of a slain man being eaten. On the contrary, it is a proof of his courage, for none but those who die

bravely in battle are eaten in the feast which follows upon the victory, the bodies of slain cowards being contemptuously thrown into the bush.

WE now come to a more pleasing part of Fijian character, namely, the various incidents of domestic life.

As soon as the Fijian child comes into the world, it is taken from the mother, and given to another woman for three days, during which time she lies at her ease. The first clothing which the child receives is a thick coating of turmeric oil, and the first food which it knows is either the juice of sugar-cane or of cocoa-nut. A name is given to the child as soon as possible after its birth, and these names are generally significant of some event that has happened either to the child itself or to some member of its family.

Though the Fijian children spend the great part of their time in the open air, and are untrammelled by clothing, they are liable to a very unpleasant disease called the "thoko," which somewhat resembles the "yaws" of the negro tribes. The parents are rather glad than sorry to see their children afflicted with this disease, as they believe that it forms a necessary adjunct to infantile health, and that a child who escapes the thoko is sure to be sickly and feeble when it grows up.

The Fijian child receives no training, unless encouragement of every bad passion may be called by that name. Revenge is impressed upon the child's mind from its earliest infancy, and most horrible are the means which are sometimes employed for this purpose. In riper years the duty of revenge is kept always before his eyes. Should one man insult another, the offended individual keeps himself constantly reminded of the offence by placing some object in his sight, and not removing it until he has avenged himself.

Sometimes he will effect the same purpose by depriving himself of some luxury until he has had his revenge. One man, for example, will plait his hair in a particular manner, another will hang some article of dress in his house, while another will refuse to dance, or to eat of some particular kind of food. One chief, for example, hung a roll of tobacco on the roof of his house, with the intention of refusing to smoke until he had killed his enemy and could smoke that tobacco over the dead body. Another refrained from speaking, and would only answer by whistling.

The knowledge of this custom makes the Fijians a most nervous race. Should a strange canoe appear off the coast, the inhabitants of the villages are all in a stir, some escaping to the woods, and others concealing their food and other valuables in secret storehouses. They do not like to

walk alone in the evening. Mr. Williams mentions that he has seen a whole company disperse at the lifting of a telescope, and, more than once, when he was visited by natives and the door suddenly slammed with the wind, the whole of his visitors rushed tumultuously out of the windows. On one occasion, a number of men were dragging a large canoe into the sea, when one of them espied a slight crack on one side. He whispered his discovery to the man next him, he to the next, and so on, and in a few minutes every man had run away from the boat, fearing lest the owner should charge him with having done the damage.

The amusements of the Fijians are rather more varied than is usually the case among savages. Some of them are identical with many of our own children's games, such as "hide and seek," "blind man's buff," and a sort of "hop, skip, and jump." A sort of "pitch and toss," is also in vogue, the substitute for pence being the flat, circular fruit of a species of mimosa.

They have one game which bears some resemblance to that of the "kangaroo-rat" of Australia, which has been described on page 730. The players have a reed about four feet in length, at one end of which is an oval piece of hard and heavy wood some six inches in length. This instrument is held between the thumb and middle finger, the end of the forefinger being applied to its extremity. With a peculiar underhand jerk the player drives it horizontally, so that it glides over the ground for a considerable distance, the player who sends the missile farthest being the winner. In order that this favorite game may be constantly played, each village has attached to it a long strip of smooth sward, which is kept sedulously trimmed, so that the missile may skim along with as little resistance as possible.

Then there is the swing. This is made much like the New Zealand swing, but is used in a different manner. Instead of being held by the hands alone, the rope has a loop at the end, into which the swinger inserts his foot. Sometimes, it has a large knot, on which both feet can be supported. Drawing the rope to the top of a convenient bank, the swinger grasps it with his hands, leaps in the air, places his foot in the loop, and goes sweeping through an enormous arc, the radius of which often exceeds fifty feet. In some cases the swing is fixed by the water side, and the more daring of the performers loosen their grasp at the proper moment, and are hurled through the air into the water.

One favorite game, called Ririki, is played after the following fashion:—Close to the water's edge is fixed a stout post, and on this is laid the trunk of a tall cocoa-nut tree, so that its base rests on the ground, and the tip projects over the water. The game consists in running at full speed up this in-

clined tree, and jumping into the water one after the other, swimming ashore and repeating the process. This is a very lively game, the natives shouting and laughing the whole time, and plunging so rapidly in succession that the water beneath the end of the inclined tree is white with foam. The people are admirable swimmers, and, having been accustomed to swim as soon as they could walk, disport themselves in the water with as much ease as on land. They are fond of swimming out to sea in parties, and join in various aquatic games, such as trying to push each other under water, diving, racing, and so forth.

Some of their sports are rather rough. They have one game which bears a certain resemblance to snow-balling, except that the missiles are bitter oranges instead of snow-balls. In some places they jerk stones at each other by means of elastic bamboos, and do so with such force that considerable pain is caused when the missile strikes the bare skin.

Sometimes a sort of mock battle takes place. When food is brought to the men, the women suddenly rush upon them, try to drive them away, and to seize the food. Rough as the women may be, the men seldom retaliate, except by taking their assailants round the waists and throwing them on the ground. Mr. Williams mentions one instance when a woman actually shot a man dead with an arrow, turning the mock-fight into a sad reality. Several cases are known where the men have been so severely handled that they have afterward died of their wounds.

On certain occasions an amusing game is played by the young men. A thin earthenware vessel is filled with water and suspended from a bough, and a number of young men with their eyes blindfolded, try to break the vessel by striking at it with long sticks.

Music and dancing are greatly studied among the Fijians, and any one who knows a new dance is sure to earn plenty of goods by teaching it. Their musical instruments are very poor, consisting of drums, pipes, and trumpets. The first-mentioned instruments are nothing more than wooden cylinders, through one side of which a groove is cut about an inch or so in width. The pipes are of two kinds; namely, a sort of pandean pipe made of several strips of bamboo fastened together, and the flute. This latter instrument is played by placing the aperture close to one nostril, and breathing through it while the other is stopped with the thumb of the left hand. The trumpets are merely conch-shells blown through a hole in the side.

The dances are very carefully got up, and more resemble military movements than dances, the similitude being increased by the martial array of the dancers, who are all

dressed as if for war, their faces painted with scarlet, their bodies powdered with black, and their best clubs or spears in their hands. They execute intricate manœuvres, marching in various figures, wheeling, halting, and stamping their feet in exact time to the rhythm of the song and the beat of the drum. Sometimes several hundred men are engaged in the dance, while the musicians are twenty or thirty in number.

The scene at one of these dances is very picturesque, but it wants the furious energy which gives such fiery animation to the war dance of the New Zealanders, the movements, though correct in point of time, being comparatively dull and heavy. In order to enliven it a little more, a professional buffoon is usually introduced upon the scene, who performs sundry grotesque movements, and is usually applauded for his exertions.

Music and dancing are always used at the celebration of a marriage, and, as may be imagined from the punctilious nature of the Fijian, there is no lack of ceremony on the occasion.

Mostly, girls are betrothed when they are quite infants, no regard being paid to disparity of age between themselves and their intended husbands. The form of betrothal is rather curious, and consists in the mother of the child taking a small liku, or woman's girdle, and presenting it to the man, who from that moment takes her daughter under his protection until she is old enough to be married.

In those cases where a young man takes a liking to a young woman, he asks her of her father, making at the same time a small present as a matter of form. Should the application be successful, an interchange of presents then takes place between the friends of both parties, and in a few days follows the ceremony called "warming," which consists in conveying to the house of the bride some food prepared by the intended husband. In most parts of Fiji, the bride has a complete holiday for four days, sitting quietly at home, dressed in her finest apparel, and painted with turmeric and oil. At the expiration of the four days, she is taken by a number of married women to the sea, where they all join in fishing, and afterward cook the fish that they have taken. The cooking being completed, the bridegroom is sent for, and the betrothed couple eat together, each giving the other a portion of food.

After this ceremony comes a period during which the bridegroom is employed in building a house for his intended wife, and the girl undergoes the painful tattooing which marks her as having taken her place among women. During this time, she remains within the house so as to shield her complexion from the sun. The house being completed, all the friends of both families

are gathered together, and a great feast takes place, at which the givers make it a point of honor to be as lavish as possible. At the end of this feast, the girl is formally handed over to her husband, and exchanges her narrow *liku* for the broader garment befitting her new condition.

When the daughter of an important chief is married, her father always gives her a number of female attendants, sometimes as many as twelve or fifteen accompanying the bride to her home. They are placed under the charge of an elderly woman who acts as their superintendent, and are called by a name which signifies a pet servant. There is always a great scene at the departure of a bride to her home, all her relations and friends crowding round her, and kissing her until she is nearly smothered by their caresses.

An interesting description of the presentation of a bride is given by Mr. Williams, and the artist has reproduced the scene in the engraving No. 1, on the next page. "She was brought in at the principal entrance by the king's aunt and a few matrons, and then, led only by the old lady, approached the king. She was an interesting girl of fifteen, glistening with oil, wearing a new *liku*, and a necklace of curved ivory points, radiating from her neck, and turning upward. The king then received from his aunt the girl, with two whale's teeth, which she carried in her hand. When she was seated at his feet, his majesty repeated a list of their gods, and finished by praying that the girl might live, and bring forth male children.

"To her friends, two men who had come in at the back door, he gave a musket, begging them not to think hardly of his having taken their child, as the step was connected with the good of the land, in which their interests, as well as his own, were involved. The musket, which was about equivalent to the necklace, the men received with bent heads, muttering a short prayer, the close of which was exactly the same as they had offered for years, 'Death to Natawa.' Tui-kilakila then took off the girl's necklace and kissed her. The gayest moment of her life, as far as dress was concerned, was past; and I felt that the untying of that polished ornament from her neck was the first downward step to a dreary future. Perhaps her forebodings were like mine, for she wept, and the tears which glanced off her bosom and rested in distinct drops on her oily legs were seen by the king, who said, 'Do not weep. Are you going to leave your own land? You are but going a voyage, soon to return. Do not think it a hardship to go to Mbau. Here you have to work hard; there you will rest. Here you fare indifferently; there you will eat the best of food. Only do not weep to spoil yourself.' As he thus spoke, he played with her curly locks, complimenting her on her face and figure. She

reminded him of a sister of hers, who had been taken to Mbau in years past."

She had certainly reason for her tears, as the condition of Fijian wives is not a very enviable one. As is the case with most countries in which polygamy is practised, the wives are apt to be very jealous of each other, and to quarrel among themselves. Generally, their squabbles are treated with contemptuous indifference by the husband as long as they do not annoy him personally; but if he should feel himself angered, he speedily checks the tumult by belaboring all parties alike with a very sufficient stick which he keeps for the purpose. One chief had a cudgel as thick as a broomstick, in which he seemed to take no little pride, having carved and inlaid it with ivory.

Women are not held in any great estimation, whether they be single or married. A rather ludicrous example of the value set by Fijians upon women occurred in the course of traffic between Europeans and natives. A chief had bargained with the captain of a ship for a musket, the price of which was to be two pigs. The chief went off with his musket, but could only find one pig. So he honorably kept his bargain by sending the one pig and a young woman instead of the other.

In the description of the ceremonies attendant upon a wedding, mention was made of the custom of building a house for the bride. The form of Fijian houses varies according to locality. In some places they are sharp-ridged and gabled, like those which have already been described when treating of New Guinea. In others they are round, and in others conical. Some are built on posts, and others simply on the ground. As is the case throughout all Polynesia, the houses are made of a wooden framework lashed together, and covered with a thatch of reeds. Many of these houses are of great size, more than a hundred feet in length and about forty in width. A house that is meant to endure for any length of time is made of a wood called by the natives *vesti*, which is exactly similar to the greenheart of India, and a sort of sandal wood is also used for the same purpose.

The walls are generally made of reeds arranged in three layers, the middle layer being horizontal and the outer and inner layers perpendicular. They are tied or sewed together with sinnet, and it is the Fijian architect's pride to weave the sinnet into elegant patterns. Some men are celebrated for their skill in inserting and executing these patterns, and go about from place to place as they are wanted. Even the posts that support the edifice are often covered with reeds, bound together in the same ingenious manner. The door is always a small one, probably for the same reason that induces a Kaffir to make so low an en-

(1.) A FIJIAN WEDDING. (See page 956.)

(2.) HOUSE THATCHING. (See page 959.)

trance to his hut; namely, fear of enemies.

The thatch is sometimes of cocoa-nut or sugar-cane leaves, and sometimes of grass, while in a few of the best houses both are used. The leaves are doubled over reeds and sewed together, so as to form lengths of about five or six feet. Grass thatch is fixed almost exactly as straw is used in England being laid on the roof in bundles, and held down by long mangrove branches, and tied firmly with rattan.

House thatching is one of the most animated scenes that can be imagined. As soon as the roof is finished, notice is given that the thatchers are wanted, and then straightway assemble a gang of merry laborers, varying in number according to the size of the house, as many as three hundred sometimes uniting to thatch a very large house. Some bring the leaves and grass, others bind and sew them into the proper form, and others take them to the thatchers. Those who actually apply the reeds always arrange themselves in pairs on the roof, one outside and the other inside the building, so that one can take the end of the lashing as it is pushed through the thatch by his comrade, draw it tight, and return it to him. The reader may find house thatching represented in a spirited engraving, on the 957th page.

The noise that arises from a large house during the process of thatching is almost deafening. Naturally, the Fijian has a great genius for shouting, and on such occasions he fairly outdoes himself. Some call for more grass, leaves, mangrove rods and rattans; others from below shout in reply to them. Those who bring the materials must needs shout as they clamber to the roof, and every one throws in a few yells occasionally by way of encouragement to his companions.

The most characteristic part of a Fijian house is the ridge pole which runs along the top of the roof. It projects at either end for a considerable distance, and in first-class buildings is worked into a trumpet-like shape at the extremities. These projecting ends are mostly blackened, and decorated with large white cowrie shells. A sort of cable made of grass and bound with vine-stalks is generally laid on the ridge pole, and in many cases is finished off with a row of tassels, and nearly covered with patterns worked in sinnét.

Some, though not all, the houses have openings by way of windows, which can be closed by means of mats fastened over them like curtains. Within the house, and nearly in the centre, is the fireplace, which is sunk in the ground to a foot or so in depth, and surrounded by a sort of fender made of hard

wood. In very large houses, the fireplace is ten or twelve feet square, and is covered by a wooden framework of several tiers, on which cooking pots and similar utensils can be kept. There is no chimney, nor even a hole in the roof, so that all the smoke from the fireplace ascends to the roof, and finds its way out through the thatch as it best can. In nearly every case the doorway is furnished with a projecting roof.

In connection with roof thatching, a characteristic joke is recorded of the Mbau people. The short missile club is called *ula*, and the act of hurling it is called *ulanila*. The latter word, however, also signifies house thatching. By way of a practical joke, the people of Mbau sent to those of Tailevu, asking them to come and *ulanila*. The latter, taking the word in its ordinary sense, accepted the invitation, and came, expecting the usual scene of merriment, when to their surprise, they were saluted by a volley of *ulas* hurled at them by their entertainers.

The furniture of a Fijian house is simple. At one end is a raised dais, on which the master of the house sleeps by night and reclines by day. It is covered with mats, and over it are hung the sheets of thin masi which are used as mosquito curtains. On this dais are generally one or two pillows. These implements are not unlike those of the Kaffirs, being nothing more than cylindrical bars of wood supported on legs at either end. Some of them are from four to five feet in length. This form of pillow is used on account of the mop-like headdress of the natives, which would be pressed out of all shape were it laid on an ordinary pillow.

On the hearth are several large earthenware cooking pots, oval in shape, and each set on three stones. As the quantity of food in them diminishes, they are gradually tilted, so that when they contain but very little food they lie quite on their sides. Near the hearth lies the thick concave board on which bread is kneaded, and close to the board are the smooth round stones by which the operation of kneading is conducted. The small hand nets used for fishing are kept near the fire, together with the knives and other implements used in preparing food. Several earthen water jars are always placed near the fire. They may be distinguished by their glazed surfaces, and are placed carefully on a thick bed of grass. A few bamboo vessels containing salt and fresh water, are generally placed near the larger jars. Round the foot of the wall are ranged a series of bowls and jars, which contain the arrowroot and similar articles of food.

CHAPTER XCVII.

FIJI—Continued.

RELIGION AND FUNERAL RITES.

THE GODS AND THEIR ABODES—VISIT OF THE LAND CRAB—FIJIAN PRIESTS AND THEIR INSIGNIA—CONSULTING THE DEITY—VARIOUS MODES OF DIVINATION—THE DIFFICULT PASSAGE TO HEAVEN—NATIVE TEMPLES, THEIR STRUCTURE AND USES—FEASTS GIVEN TO THE GODS—SACRED STONES—MURDER OF THE AGED AND SICK—A STRANGE MARK OF AFFECTION—PROVIDING THE DEAD WITH ATTENDANTS—BURIAL OF A LIVING KING—A TERRIBLE SCENE—VOYAGE TO THE CEMETERY, AND THE FUNERAL—SIMILARITY BETWEEN THE CUSTOMS OF FIJI AND INDIA—MODE OF MOURNING—THE SUCCESSIVE RITES AFTER A FUNERAL—THE CUSTOM OF LOLOKU—TOMB OF A CHIEF'S WIFE.

THE religion, or rather the superstition, of the Fijians is much like that of other polytheists. The people acknowledge vast numbers of gods of greater or lesser power; most, if not all, of which are symbolized under some natural form, such as a hawk, a tree, or the like. Every Fijian considers himself under the protection of some especial god, and, as has been stated, will not eat the animal which is his symbol.

An amusing instance of the reverence paid to the symbols of the gods occurred at Tilioa. A very powerful god, who is worshipped at that place, resides in a land crab, but, as that crustacean is scarcely ever seen in the locality, there are but few opportunities of paying the proper worship. Whenever any one saw a land crab, he immediately ran to the priest, and forthwith the whole place was in a commotion. The people assembled to pay their respects to their deity, and a number of cocoa-nuts were gathered, strung together, and humbly presented to the crab deity in order to propitiate him, and to induce him to give them fair weather and a healthy season.

As to the particular doctrines of the Fijian religion, it is scarcely possible to learn much about them. In the first place, the people know nothing, and the priests, who know but little, dislike communicating their knowledge. Even the Christian converts can seldom be induced to speak on the subject with any degree of truth.

The priests are known by their official insignia, which consists of an oval frontlet of scarlet feathers, and a long-toothed comb made of separate pieces of wood ingeniously fastened together. Several of these combs are in my collection, and are excellent examples of the artistic capabilities of the makers. No two of them are alike, the delicate thread which fastens them together being woven in a singular variety of patterns. The threads are nearly as fine as hairs, and an additional beauty is given to the pattern by using alternately a deep black and a glittering yellow thread.

The priests communicate with their deities by throwing themselves into a sort of ecstatic state, technically called "shaking," in which the whole body is convulsed, and the utterances which come from the foaming lips are held to be the responses of the god. A vivid idea of this mode of consulting a deity is given by Mr. Williams in the valuable work to which reference has often been made.

"Nothing like regular worship or habitual reverence is found, and a principle of fear seems the only motive for religious observances; and this is fully practised on by the priests, through whom alone the people have access to the gods, when they wish to present petitions affecting their social or individual interest. When matters of importance are involved, the *soro* or offering consists of large quantities of food, together with

whales' teeth. In smaller affairs a tooth, club, mat, or spear, is enough. Young nuts covered with turmeric powder formed the meanest offering I have known. On one occasion, when Tuikilakila asked the help of the Somo-somo gods in war, he built the war god a large new temple, and presented a quantity of cooked food, with sixty turtles, beside whales' teeth.

"Part of the offering—the *sigana*—is set apart for the deity, the rest forming a feast of which all may partake. The portion devoted to the god is eaten by his priest and by old men, but to youths and women it is tapu.

"Strangers wishing to consult a god cut a quantity of fire wood for the temple. Sometimes only a dish of yams or a whale's tooth is presented. It is not absolutely necessary for the transaction to take place at a temple. I have known priests to become inspired in a private house or in the open air; indeed, in some parts of Fiji, the latter is usually the case.

"One who intends to consult the oracle dresses and oils himself, and, accompanied by a few others, goes to the priest, who, we will suppose, has been previously informed of the intended visit, and is lying near the sacred corner getting ready his response. When the party arrives, he rises and sits so that his back is near to the white cloth by which the god visits him, while the others occupy the opposite side of the Buré. The principal person presents a whale's tooth, states the purpose of his visit, and expresses a hope that the god will regard him with favor. Sometimes there is placed before the priest a dish of scented oil with which he anoints himself, and then receives the tooth, regarding it with deep and serious attention.

"Unbroken silence follows. The priest becomes absorbed in thought, and all eyes watch him with unblinking steadiness. In a few minutes he trembles; slight distortions are seen in his face, and twitching movements in his limbs. These increase to a violent muscular action, which spreads until the whole frame is strongly convulsed, and the man shivers as with a strong ague fit. In some islands this is accompanied with murmurs and sobs, the veins are greatly enlarged, and the circulation of the blood quickened.

"The priest is now possessed by his god, and all his words and actions are considered as no longer his own, but those of the deity who has entered into him. Shrill cries of 'Koi au! Koi au!' ('It is I! It is I!') fill the air, and the god is supposed thus to notify his approach. While giving the answer, the priest's eyes stand out and roll as if in a frenzy; his voice is unnatural, his face pale, his lips livid, his breathing depressed, and his entire appearance like that of a furious madman. The sweat runs from every pore, and

tears start from his strained eyes; after which the symptoms gradually disappear. The priest looks round with a vacant stare, and as the god says 'I depart,' announces his actual departure by violently flinging himself down on the mat, or by suddenly striking the ground with a club, when those at a distance are informed by blasts on the conch, or the firing of a musket, that the deity has returned into the world of spirits."

In many cases it is evident that the priests enact deliberate impositions, but it is also certain that in many others they are completely under the dominion of frenzy, and that they do not recollect afterward the words which they uttered while in their delirious state. "My own mind," said one of them, "departs from me, and then, when it is truly gone, my god speaks by me."

Various modes of divination are employed by the Fijian priests. They have, for example, divination by the leaf, by the reed, by the nut, and by water. The leaf is tested by taking it between the front teeth and biting it. If it be completely severed, the omen is good; if it hang together, even by a single fibre, the omen is unfavorable. One priest had a very strange mode of divination by the leaf. He had two magic leaves, which he placed on the sides of the applicant, and then left them. If the leaf on the right side stung the skin, the omen was good; but if any plots or treacheries were hatched, the leaf stung the man on the left side, and so warned him of the danger. Another mode of divination by the leaf is to bite it, and judge by the flavor whether the omen be adverse or the contrary.

The reed test is managed as follows. A number of short reeds are cut, and laid in a row on the ground, a name being given to each. The priest then holds his right foot over each, and the response is given by the trembling of the foot.

The water test is performed by holding the straightened arm slightly upward, and pouring a few drops of water on the wrist. If the water should run to the shoulder, the response is favorable; should it fall off at the elbow, the answer is adverse.

The next test is performed by laying a cocoa-nut on a small surface and spinning it. When it stops, the response is given by the direction in which the eye points.

According to Fijian notions, the passage to Buruto or heaven is a very difficult one, except for great chiefs, and the only plan by which a man of inferior rank can hope to obtain admission is by telling the god a lie, and proclaiming himself a chief with so much apparent truthfulness that he is believed, and allowed to pass. Taking on his shoulder his war club and a whale's tooth, the Fijian spirit goes to the end of the world, where grows a sacred pine, and throws the tooth at it. Should he miss it, he can go no further; but if he hit it, he travels on to a spot where

he awaits the arrival of the women who were murdered at his death.

Escorted by them, he proceeds until he is met and opposed by a god called Ravuyalo, whom he fights with his club. Should he fail, he is killed and eaten by the god, and there is an end of him. Should he conquer, he proceeds until he finds a canoe, into which he gets, and is conveyed to the lofty spot where the chief god, Ndengei, lives. Over the precipice extends the long steering oar of the god's canoe. He is then asked his name and rank, when he replies with a circumstantial account of his grandeur and magnificence, of the countries over which he has ruled, of the deeds which he did in war, and of the devastation which he caused. He is then told to take his seat on the blade of the oar. Should his story have been believed, he is conveyed to Buruto; but should Ndengei disbelieve his story, the oar is tilted up, and he is hurled down the precipice into the water below whence he never emerges.

It has been mentioned that the spirit has to wait for the escort of his wives. This is in order to prove that he is a married man, bachelors having no hope of admission into Buruto. Should a wifeless man start on his journey, he is confronted by a goddess, called the Great Woman, who has a special hatred of bachelors, and, as soon as she sees one, flies at him and tries to tear him in pieces. Sometimes she misses him in her eagerness; but, even in such a case, he has to deal with another god, who hides himself in the spirit path, and, as the soul of the bachelor passes by, he springs on the wretched being, and dashes him to atoms against a stone.

The Burés or temples of the gods abound in Fiji, at least one Buré being found in every village, and some of the villages having many of these buildings. They are made of the same material as the houses, but with much more care. Instead of being merely set on the ground, they are placed on the top of a mound of earth, sometimes only slightly elevated, and sometimes twenty feet or more in height.

The natives think no labor too great for the decoration of a Buré, and it is in those buildings that their marvellous skill in plaiting sinnet is best shown. Every beam, post, and pillar is entirely covered with sinnet plaited into the most beautiful patterns, black and red being the favorite colors; and even the reeds which line the window frames, and fill up the interstices between the pillars, are hidden in the plaited sinnet with which they are covered. So lavish are the natives of their work, that they are not content with covering the pillars and reeds with sinnet work, but they make large plaited cords of the same material, and hang them in festoons from the eaves.

It has already been mentioned that the best houses have the ends of the ridge-poles decorated with cowries, but those of the

Buré are adorned with long strings of cowries that sometimes reach the ground. Ordinary laths are thought too common to be used in thatching temples, and the beautifully carved spears of warriors are employed instead of simple wood. When the Buré is erected on a high mound, entrance is gained to it by means of a very thick plank cut into notched steps.

Although the Burés are considered as temples, and dedicated to the god, they are mostly used for secular purposes. Visitors from a distance are generally quartered in them, and in many instances the principal men of the village make the Buré their sleeping-place. Councils are held in the Burés, and entertainments are given in them, of which the offerings to the god form a large part. Sometimes, as has been mentioned, a chief who wishes to propitiate some deity offers a great quantity of food in his temple, and this food is consumed in a general feast. A certain portion is dedicated to the god, and may only be eaten by the priests and the old men, but the remainder may be eaten by any one.

None of the food is left to perish, the Fijians having a convenient belief which combines piety with self-indulgence. The god is supposed to be a great eater, but only to consume the soul of the provisions, so that when food is cooked and offered, the god eats the soul and the people the body. The chief god, Ndengei, used to be both greedy and dainty in his demands for food. He sometimes ate two hundred hogs and a hundred turtles at a single feast, and was continually insisting on human sacrifices. In order to procure these, no respect was paid to persons, and so infatuated were the people that, to keep up Ndengei's supplies of human food, chiefs were known to kill their own wives.

No regular worship is ever offered in the Burés, which, indeed, are often left to fall into decay until some one desires to consult or propitiate the god, when the building is repaired and cleaned for the occasion. As may be expected, during the building of the Buré several human sacrifices are offered.

If the reader will refer to the drawing of the Buré on the following page, he will see that in front of it are two oddly-shaped objects. These are examples of the sacred stones, several of which are to be found in various parts of Fiji. They are considered as the dwelling-place of certain gods, and are held to be either male or female, according to the sex of the deity who inhabits them. Should the god be of the female sex, the fact is known by a woman's apron or liku being tied round the stone. One such god is a very useful one, because he hates mosquitoes, and keeps them away from the spot in which he dwells. Food is prepared and offered to those sacred stones, the god, as usual, eating the spirit of the food, and the

(1.) A BURÉ, OR TEMPLE. (See page 962.)

priest and officers consuming its outward form.

WE now come to the funeral ceremonies of Fiji, taking those of the chiefs as types of the whole.

Among the Fijians a very singular superstition reigns. When men or women become infirm with age, they are considered to have lived their full time on earth, and preparations are made for their burial. So ingrained is this belief, that if a man finds himself becoming feeble with age or disease, he requests his sons to strangle him, and with this request they think themselves bound to comply. Indeed, if they think that he is too slow in making the request, they suggest to him that he has lived long enough, and ought to rest in the grave. Such conduct seems to imply that they are destitute of affection, but in reality it is their way of showing their love for their parent.

They are really a most affectionate race of people. A young chief has been seen to sob with overpowering emotion at parting from his father for a short time, and yet, were his parents to become ill or infirm, he would think it his duty to apply the fatal rope with his own hands. To be strangled by one's children, or to be buried alive by them, is considered the most honorable mode of death. The reason for this strange custom seems to be that the Fijians believe the condition of the spirit in the next world to be exactly the same as that of the individual when in life. Consequently, affectionate children are unwilling to allow their parents to pass into the next world in an infirm state of body, and therefore strangle them out of sheer kindness.

From a similar notion of kindness, they also strangle the favorite wives and attendants of the dead chief, so as to provide him with the followers to whom he has been accustomed. They also kill a powerful warrior, in order that he may go before his chief through the passage into the spirit land, and drive away the evil spirits who oppose the progress of a new comer. These victims go by the name of "grass," and are laid at the bottom of the grave; the warrior painted and dressed for battle, with his favorite club by his side, the women arranged in folds of the finest masi, and the servants with their implements in their hands; so that the inhabitants of the spirit world may see how great a chief has come among them.

All their preparations are carried on in a quiet and orderly manner, the victims never attempting to escape from their fate, but vying with each other for the honor of accompanying their chief. In some cases, when a chief has died young, his mother has insisted on sharing his grave. So deeply do the Fijians feel the necessity for this sacrifice that the custom has been a greater barrier against Christianity even than canni-

balism or polygamy, and even those natives who have been converted to Christianity are always uneasy on the subject. On one occasion a Christian chief was shot, and by the same volley a young man was killed. The Christian natives were delighted with the latter catastrophe, inasmuch as it provided an attendant for their slain chief.

The scene which takes place when a great chief is expected to die has been described by Mr. Williams with great power. The King of Somo-somo, a magnificent specimen of the savage, was becoming infirm through age, and toward the middle of August 1845 was unable to do more than walk about a little:—

"I visited him on the 21st, and was surprised to find him much better than he had been two days before. On being told, therefore, on the 24th that the king was dead, and that preparations were being made for his interment, I could scarcely credit the report. The ominous word *preparing* urged me to hasten without delay to the scene of action, but my utmost speed failed to bring me to Nasima—the king's house—in time. The moment I entered it was evident that, as far as concerned two of the women, I was too late to save their lives. The effect of that scene was overwhelming. Scores of deliberate murderers in the very act surrounded me: yet there was no confusion, and, except a word from him who presided, no noise, only an unearthly, horrid stillness. Nature seemed to lend her aid and to deepen the dread effect; there was not a breath stirring in the air, and the half-subdued light in that hall of death showed every object with unusual distinctness.

"All was motionless as sculpture, and a strange feeling came upon me, as though I was myself becoming a statue. To speak was impossible; I was unconscious that I breathed; and involuntarily, or rather against my will, I sunk to the floor, assuming the cowering posture of those who were actually engaged in murder. My arrival was during a hush, just at the crisis of death, and to that strange silence must be attributed my emotions; and I was but too familiar with murders of this kind, neither was there anything novel in the apparatus employed. Occupying the centre of that large room were two groups, the business of whom could not be mistaken.

"All sat on the floor; the middle figure of each group being held in a sitting posture by several females, and hidden by a large veil. On either side of each veiled figure was a company of eight or ten strong men, one company hauling against the other on a white cord which was passed twice round the neck of the doomed one, who thus in a few minutes ceased to live. As my self-command was returning to me the group furthest from me began to move; the men slackened their hold, and the attendant

women removed the large covering, making it into a couch for the victim.

"As that veil was lifted some of the men beheld the distorted features of a mother whom they had helped to murder, and smiled with satisfaction as the corpse was laid out for decoration. Convulsion strongly on the part of the poor creature near me showed that she still lived. She was a stout woman, and some of the executioners jocosely invited those who sat near to have pity and help them. At length a woman said, 'she is cold.' The fatal cord fell, and as the covering was raised I saw dead the oldest wife and unwearied attendant of the old king."

Leaving the house of murder, Mr. Williams went to the hut of the deceased king, determining to see his successor, and beg him to spare the lives of the intended victims.

To his horror and astonishment, he found that the king was still alive. He was lying on his couch, very feeble, but perfectly conscious, every now and then placing his hand to his side as he was racked by cough. The young king was full of grief. He embraced his visitor with much emotion, saying, "See, the father of us two is dead." It was useless to dispute the point. The poor old king certainly did move and speak and eat; but, according to the son's ideas, the movements were only mechanical, the spirit having left the body.

So the preparations for his funeral went on. His chief wife and an assistant employed themselves in covering his body with black powder, as if dressing him for the war dance, and fastening upon his arms and legs a number of long strips of white masi, tied in rosettes, with the ends streaming on the ground. They had already clad him in a new masi of immense size, the white folds of which were wrapped round his feet. In place of the usual masi turban, a scarlet handkerchief was bound on his hair with a circlet of white cowrie-shells, and strings of the same shells decorated his arms, while round his neck was an ivory necklace, made of long curved claw-like pieces of whale's teeth.

The reader may perhaps wonder that the chief wife of the king was suffered to live. The fact was that the young king would not allow her to be killed, because no executioner of sufficient rank could be found. She lamented her hard lot in being forbidden to accompany her husband to the spirit land, and begged to be strangled, but without success.

Presently the sound of two conch-shell trumpets was heard outside the house, this being the official intimation that the old king was dead, and the new king was then formally acknowledged by the chiefs who were present. He seemed overcome with grief, and, gazing on the body of his father's attendant, he exclaimed, "Alas, Moalevu! There lies a woman truly wearied, not only

in the day but in the night also; the fire consumed the fuel gathered by her hands. If we awoke in the still night, the sound of our feet reached her ears, and, if spoken to harshly, she continued to labor only. Moalevu! Alas, Moalevu!"

The bodies of the murdered women were then rolled up in mats, placed on a bier, and carried out of the door, but the old king was taken through a breach made in the wall of the house. The bodies were carried down to the seaside and placed in a canoe, the king being on the deck, attended by his wife and the Mata, who fanned him and kept off the insects.

When they arrived at Weilangi, the place of sepulture, they found the grave already dug, and lined with mats. The bodies of the women were laid side by side in the grave, and on them the dying king. The shell ornaments were then taken from him, and he was entirely enveloped in mats, after which the earth was filled in, and thus he was buried alive. The poor old man was even heard to cough after a quantity of earth had been heaped on him.

This final scene is represented in an illustration on the 980th page. In the foreground is seen the open grave, with the bodies of the murdered women lying in it as "grass." The still living king is being borne to the grave by the attendants, while his successor sits mournfully surveying a scene which he knows will be re-enacted in his own case, should he live to be old and infirm. Just above the grave are the rolls of fine mats with which the body of the king is to be covered before the earth is filled in; and in the background appears the mast of the canoe which brought the party to the burial-ground.

The reader cannot but notice the resemblance between this Fijian custom of strangling the wives and the well-known suttee of India. In both cases the women are the foremost to demand death, and for the same reason. Just as the Hindoo women arrange their own funeral pile, and light it with their own hands, the Fijian woman helps to dig her own grave, lines it with mats and then seats herself in it.

The fact is, that the woman has positively no choice in the matter; a wife who survives her husband is condemned to a life of neglect, suffering, and insult, so that the short agony of immediate death is preferable to such a fate, especially as by yielding to the national custom she believes that she shall secure a happy and honored life in the spirit land. Moreover, her relatives are bound by custom to insist upon her death, as, if they did not follow this custom, they would be accused of disrespect toward her husband and his family, and would run the risk of being clubbed in revenge.

In consequence of this horrid custom, the population of Fiji has been greatly checked,

for not only is there the direct sacrifice of life, but much indirect loss is occasioned. Many of the murdered women are mothers, whose children die for want of maternal care, so that, what with the perpetual feuds and continual murders, the custom of cannibalism, the sacrifice of wives with their husbands, the strangling of the old or sick, and the death of children by neglect, very few Fijians die from natural causes. Mr. Williams mentions that in a class of nine children under his charge, the parents had all been murdered with the exception of two, and these had been condemned to death, and only saved through the exertions of the missionaries.

After a king is buried, sundry ceremonies are observed. For twenty days or so, no one eats until the evening, the people shave their heads either partially or entirely, and the women cut off their fingers, which are inserted in split reeds, and stuck along the eaves of the royal house. Those who are nearly related to the dead king show their grief by refusing to wear their usual dress, and substituting rude garments of leaves. They often deny themselves the luxury of a mat to lie upon, and pass their nights on the grave of their friend. The coast is rendered tapu for a certain distance, no one being allowed to fish until the proper time has elapsed, and the cocoa-nut trees are placed under a similar restriction.

Various strange rites take place on certain days after the funeral. On the fourth day the friends assemble, and celebrate the melancholy ceremony called the "jumping of maggots," in which they symbolize the progress of corruption. Next evening is one of a directly opposite character, called the "causing to laugh," in which the immediate friends and relatives of the dead are entertained with comic games. On the tenth day the women have an amusing ceremony of their own. Arming themselves with whips, switches, or cords, they fall upon every man whom they meet, without respect to age or rank, the greatest chiefs only being exempt from this persecution. The men are not allowed to retaliate, except by flinging mud at their assailants, and those who have witnessed the scene say that nothing more ludicrous can be imagined than to see grave, elderly men running in all directions, pursued by the women with their whips and switches.

The last ceremony is the completion of some special work begun in honor of the dead. It may be the erection of a house, the

making of a huge ball of sinnet, a great bale of cloth, and, in any case, it bears the name of the person in whose honor it was undertaken. Building large canoes is a favorite form of this custom, and, during the whole time that the work is in progress, the canoe is put to sleep at night by the beating of drums, and awakened every morning in a similar manner, when the carpenters come to their work.

A curious ceremony takes place in Fiji when one of the principal chiefs has died. It is called the loloku of the sail, and is a sort of a signal of honor. Whenever a canoe approaches the coast for the first time since the death of the chief, the vessel is obliged to show the loloku. This is generally a long strip of masi tied to the head of the mast, and as soon as the canoe touches the land, both the sail and masi are thrown into the water. Sometimes, when the owner of the canoe is tolerably rich, he adds to the simple loloku a whale's tooth, which is flung from the mast-head into the water, when the people dive and scramble for it.

Should the chief perish at sea, or be killed in a warlike expedition, and be eaten by his enemies, the loloku is shown as carefully as if he had been buried on shore, and his relatives try to compensate him for his adverse fate, by killing an unusual number of women as his attendants. Nearly twenty women have thus been sacrificed on the death of a young chief who was drowned at sea.

The graves of chiefs and their wives are marked by tombs. These are sometimes nothing but stones at the head and foot of the grave, or large cairns of stones piled on the deceased. Sometimes they are roofs from three to six feet in height, decorated, after Fijian custom, with patterns worked in sinnet.

One tomb, that of a chief's wife, was a very remarkable one. Her husband had a large mound of earth thrown up, and faced with stones. On the top of the mound was a double canoe, forty feet in length, held firmly in its place by being imbedded in earth. Fine shingle was strewn on the deck, and mats were spread on the shingle for the reception of the body. Sand was then heaped over the canoe, and on the sand was laid the body of a little child of whom the deceased woman had been very fond. Over all was then built a large roof, made of mahogany, and adorned with white cowrie-shells.

CHAPTER XCVIII.

THE SOLOMON ISLANDS AND NEW HEBRIDES.

CHARACTER, DRESS, CUSTOMS.

POSITION OF THE SOLOMON ISLANDS—REASON FOR THE NAME OF THE GROUP—CHARACTER OF THE NATIVES—CANNIBALISM—DRESS AND ORNAMENTS—NEW IRELAND AND NEW BRITAIN—NOMAD CHARACTER OF THE NATIVES—CAVE HOUSES—THE ADMIRALTY ISLANDS—DISTINGUISHING MARKS OF THE CHIEFS, AND THEIR DOMINION OVER THE PEOPLE—THE BOUKA ISLAND—THE NEW HEBRIDES—MODE OF GOVERNMENT, AND DIVERSITY OF LANGUAGE—THE INHABITANTS OF VATÉ—CURIOUS DRESS OF THE WOMEN—ORNAMENTS OF THE HOUSES—TAUNA AND ERRUMANGA—TRADE IN SANDAL WOOD—ANEITEUM AND VANIKORO.

BETWEEN New Guinea and the Fiji group lie the Solomon (or Salomon) Islands. They were discovered, as far as we know, by Alvero de Mendana, who touched upon them in the year 1567. Being desirous of inducing his countrymen, who held in those days the chief place among sailors, to visit and colonize so fertile a land, he concocted a pious fraud, and called the group by the name of Solomon Islands, as being the Ophir from which Solomon's ships brought the vast quantities of gold with which he adorned the Temple and his own palace.

His scheme failed, inasmuch as, when he again went in search of the islands, he could not find them, the imperfect astronomical instruments of that day being far inferior to those of the present time, by means of which a competent observer can tell within a few yards his exact place on the earth.

The natives of the Solomon Islands are so fierce and treacherous, that comparatively little has as yet been learned about them. They have displayed a great genius for lulling voyagers into a fancied security, and then murdering and eating them; so that the Spaniards lost nothing by Mendana's inability to find the islands again. They contrived lately to entrap a gentleman who visited their islands in his yacht, and murdered him while he was on shore, shooting pigeons. They have committed so many murders on seamen, and even captured so many vessels, that the greatest precautions are now taken by those who visit their shores.

Perhaps the reader may wonder that any one should take the trouble of visiting so inhospitable a place; but the fact is that the hawk's-bill turtle, so valued as supplying the tortoise-shell of commerce, is plentiful on the coasts, and captured by the natives, who reserve the shell for barter with European ships.

When ships anchor off the coast, the natives put off in canoes; but only a certain number are allowed to approach, the hammock nettings being triced up so as to prevent the natives from boarding the vessel. Only the principal chief is allowed to come on board, and through him the bargains are made. These are very tedious, as the natives will insist on haggling separately over each piece of tortoise-shell, instead of selling the whole "head" at once, as is done at other places. The usual articles of merchandise are employed in the trade, such as glass bottles, beads, axes, cloth, knives, and similar objects.

The natives are very dark, and may even be called black, with thick and crisp hair. That they are cannibals has already been mentioned. They are such inordinate lovers of human flesh that, according to the accounts of some travellers, which may however have been exaggerated, they make it their customary diet. It is evident, however, that this statement must be somewhat overdrawn, as no people inhabiting a limited country could make human flesh the chief article of diet without gradual extermination. That they prefer it to all other food is likely enough, and in this they only

follow the example of the Papuans. Mendana mentions that the chief of one of the islands sent him a handsome present of a quarter of a boy, and that he gave great offence to the natives by burying instead of eating it.

They do certainly use great quantities of this horrible diet, and one traveller mentions that, in visiting their houses, he has seen human heads, legs, and arms hung from the rafters, just as joints of meat are hung in a larder. The houses bear token in other ways of the cannibalistic habits of the natives, being ornamented with skulls and similar relics of bygone feasts, together with other ornaments.

The Solomon Islanders are not handsome people, and do not add to their beauty by their modes of adornment. Their inveterate use of the betel-nut blackens their teeth, and their faces are disfigured with streaks and patches of white paint, which has a horribly ghastly appearance against the black skin. They are fond of wearing numerous ornaments in their ears, the lobes of which are perforated, and so distended that they can wear in them circular blocks of wood nine inches in circumference. Their chief ornament is, however, an armlet made from a large shell found on the reefs. Shells of sufficient size for this purpose are extremely rare, and are prized even more than whales' teeth among the Fijians and neighboring people. Wars are often caused by a struggle for the possession of a single armlet; while, in comparison with so valuable an article, human life is looked upon as utterly worthless. Very great chiefs and warriors wear several of these rings on their arms; but they do so with the full knowledge that their finery is as perilous as it is valuable, and that they are likely to be murdered merely for the sake of their ornaments.

The Solomon Islanders care little for clothing, their whole dress being simply a piece of matting tied round the waist; and it is rather a remarkable fact that they pursue the same art of staining the hair yellow, white, or red, or discharging all color out of it, that is practised by the Fijians.

Warlike as well as fierce, they possess a variety of weapons; such as clubs of different kinds, spears, bows and arrows. In order to guard themselves against the missile weapons, they carry shields made of rushes, woven so thickly and tightly together that they are able to resist the arrows and to render the spears almost harmless.

That they possess canoes may be inferred from the fact that they inhabit islands of such diminutive size. These canoes are made in a most ingenious manner, and are constructed in a mode that gives a clue to the peculiar shape which is so often seen among the islands of Polynesia. Both at the stem and stern the ends of the canoe are very

much raised. This structure is not only for ornament, though decoration is freely used in it, but is principally intended for defence. When the crew attack an enemy, or are attacked, they always take care to present the bow or stern of the canoe to the foe, and thus are in a great measure protected by the raised ends.

As is the case with most of these oceanic peoples, the inhabitants of the Solomon Islands profusely adorn the sides of their canoes with carvings, feathers, and inlayings. For the last-mentioned purpose white shells are liberally used, and tortoise-shell is also employed. Sometimes these portions of the canoe are carved so as to resemble the human face, the eyes being made of mother-of-pearl, the ears of tortoise-shell, and the chin furnished with a long beard.

In one of these canoes Captain Bouganville found a great quantity of weapons and implements, such as spears, bows and arrows, shields, and fishing nets. The shape of the shields was nearly oval, and the arrows were tipped with sharp fish bones. Various articles of food were also found in the boat, such as cocoa-nuts and other fruits, among which was the somewhat startling object of a human jaw-bone partially cooked.

AMONG the same group of islands are New Ireland and New Britain, both of which, by the way, seemed to have been named on the *lucus a non lucendo* principle, inasmuch as it is scarcely possible to find any part of the world less like Ireland or Britain in general than these little islands.

In their dress and ornaments the inhabitants differ but little from the Solomon Islanders, except that the chiefs wear circular ornaments of pearl almost exactly like the *dibbi-dibbi* of North Australia. Tortoise-shell is also used for the purpose.

These tribes seem to be continually on the move, the warriors being ordered by the chiefs from stations much like our own regiments at home, and being accompanied by their wives and families. In their various migrations the men are bound to look to the interests of their families; and if they neglect to do so, the case is brought before a council of chiefs, who investigate the matter. Should the accusation be proved, the delinquent is condemned to run the gauntlet, a punishment which is inflicted in exactly the same mode as has been employed in Europe.

All the inhabitants of the village, men, women, and children, are drawn up in a double line, and each is furnished with a bundle of twigs bound together like the birches of schools. The culprit is placed at one end of this line, and at a signal from the chief he is obliged to run through it a certain number of times, receiving a blow from every one as he passes. Sharp and se-

vere as is this law, it shows no small amount of political wisdom, and lifts the people in a degree from mere savage life. Among ordinary savages the man is everything and the women and children nothing, and that in these remote islands they should be placed under the protection of the government shows a considerable advance toward civilization. There is, moreover, an ingenious retributive justice in the mode of punishment. By deserting his family, the man throws the burden of their maintenance on the community, and it is, therefore, thought only fair that the punishment should also be left to the community.

The architecture of these people is good, and we shall presently see an example of it. When a new village is to be built a large space is cleared, in the middle of which is the council house, a large circular edifice, supported on red pillars, and distinguished by having on the roof a number of tall poles, each bearing on its point a human skull. The floor is carpeted with fine mats, colored with turmeric, and adorned with birds' feathers woven into it.

The dwelling-houses are made in a very different manner. The native architect begins by digging a large square hole in the ground some five feet deep, and over this pit he erects the house, which is rather low, in consequence of the depth gained in the basement. The thatch is of weeds, and is covered with a thick coating of clay, which serves the double purpose of rendering the hut fire-proof and of keeping the interior cool.

The weapons of the warriors are much the same as those of the other islands, but slings are also employed, and the spears are generally tipped with sharp flint. Like most of the Papuans, the victorious party eat the enemies whom they kill in battle.

Owing to the character of these islanders, little is known of their religion. That they have some form of worship is evident from the fact that they make great wooden idols, sometimes ten or more feet in height, and plant them in different parts of the country. The illustration No. 2, on the 949th page, represents one of these idols. To these idols offerings of food are constantly made; and, as such offerings are never taken away, the odor of decomposing figs, fowls, and fruit betrays the presence of the idol at a great distance. In one of the islands, called Ysabel, the natives are said to worship snakes, toads, and various reptiles.

THE most eastward of this group, San Christoval, is about seventy miles long and twenty wide. In No. 2, on page 963, is given a view taken in Makira harbor, in order to show the ingenious houses which the natives build for the protection of their canoes. As may be seen, the house is capable of accumulating a considerable number

of the beautifully carved vessels, and is elaborately adorned, after the native fashion, with idols in images, human skulls, tufts of feathers, and similar ornaments.

THE extremest of the group are those which are known by the name of the Admiralty Islands.

The natives of these islands make use of a sort of obsidian, which they split into fragments and use as we use steel. For example, they make razors of it, with which they shave every part of their bodies excepting the head, on which the hair is allowed to grow, and is tied up in a knot on the top of the head. The hair is often colored with red ochre and oil. They use the same material as heads to their spears, tying the head to the shaft with plaited string coated with gum. The clothing of the Admiralty Islanders is very simple, the women wearing a piece of matting tied round the waist, and the men nothing but a large white shell. They have bracelets and armlets made of plaited fibre, and a belt of similar material round the waist. Some of them make their bracelets of large sea-ear shells, grinding out the middle and rounding the edges; and ornaments of a similar character are hung in the ears, which are often dragged down to such an extent that the lower tips of the lobes almost rest on the shoulders. This enormous size is attained at the cost of much trouble, an elastic hoop being constantly kept in the aperture so as to keep it gradually distended. A few of the natives also have the septum of the nose pierced, and hang upon it a string, to the end of which are fastened teeth. The chiefs are distinguished by a double row of little shells on the forehead, and seem to exercise considerable authority over their inferiors.

When Captain D'Entrecasteaux visited the place, his boats approached the shore, whereon a number of natives were collected, and the captain made signs of peace. A chief, distinguished by the insignia of rank on his forehead, ordered one of the natives to swim to the boats with some cocoa-nuts. "The fear of approaching persons of whose intentions he was ignorant, made the islander, swimming and defenceless, hesitate a moment. But the chief, who doubtless was little accustomed to have his will disobeyed, did not allow him to reflect. Blows from a cudgel, which he held in his hand, immediately succeeded his order, and enforced instant obedience. . . .

"By way of comforting the poor fellow, our people gave him some bits of red stuff, a few nails, and a knife, with which he was greatly pleased. No sooner had he returned to the island, than curiosity collected all the rest around him, every one wishing to see our presents. Canoes were immediately launched, many natives took to the water and swam, and in a short time there was

a great concourse round our boats. We were surprised to see that neither the force of the surf nor of the breakers discouraged them from the attempt.

"There was another chief distinguished by the same ornaments as he who has been already mentioned, and also by the blows which he inflicted with his cudgel upon those to whom he gave his orders."

The canoes of these people are furnished with a double outrigger, only one touching the water, and the other projecting at an equal distance on the opposite side. They are connected by a platform, on which the commander stands when the sail is lowered and laid on the second outrigger. When the sail is hoisted, he stands on the place where it had been laid. Each outrigger projects about eight feet from the gunwale. The paddles are about six feet in length, and are furnished with a broad blade, which is made separately from the handle, and firmly lashed to it with cord.

The sail is made of matting, and about thirteen feet square. The mast is twenty feet in height, and when the canoe is to be pushed to its full speed, the sail is hoisted diagonally, with one angle projecting a yard above the top of the mast. When the natives desire to go slowly, they only hoist a few feet of the sail, the rest of it lying in the canoe; and by thus hoisting or lowering the sail they can regulate their speed much as they like. When the sail is hoisted to its fullest extent, the canoe can beat the swiftest sailing ships. The ordinary length of a canoe is about thirty-two feet, and the extreme breadth is only twenty-six inches.

The Admiralty Islanders chew the pepper leaf, with the addition of lime, which they keep in a little calabash, but do not seem to add the cocoa-nut. Only the chiefs appear to practise this habit, probably on account of the difficulty of obtaining the proper materials.

ONE of these islands, named BOUKA, was visited by Captain D'Entrecasteaux in 1792. The natives are black, tall, powerful, and quite naked. The face is rather broad and flat, the nose projects but little, the mouth is large, and the lips peculiarly thin. They pluck all the hair off the body, and only allow that of the head to grow, sometimes powdering it with red chalk. Red and white paint are freely used on their bodies, and their ears are pierced and loaded with large shells, which drag them nearly to the shoulders. Round the waist they wear a cord which passes round the body several times, and some of them have a custom of binding the upper arm in a similar manner, placing some flat pieces of wood between the arm and the ligature.

These people are good canoe men, and, when they man their large war canoes, exhibit a discipline which is hardly to be

expected among savages. Between every two paddlers on each side stands a warrior armed with bow and arrows, while intermediate parties of warriors stand with their faces toward the stern, so as to observe the enemy and fight during a retreat. Two of the crew are told off to bale out the water, which beats continually over the side of the canoe when the wind blows freshly.

The bow is remarkable for having the string coated with a sort of resinous substance in order to preserve it, the middle of the cord being skilfully wrapped with bark to guard it against injury from the nock of the arrow. The arrows are made of two pieces, the head being shaped from a hard and heavy wood, and the shaft being a reed. The place where they are joined is strengthened by a ligature of bark. The butt of the arrow is wrapped in the same manner to prevent it from being split by the string. They use these weapons with much skill, and, as was proved by Captain D'Entrecasteaux, are able to kill birds with them.

The natives were ready to part with their weapons in exchange for red stuff, biscuits, bottles, and other commodities, but were rather prone to cheat, agreeing to deliver a bow for a handkerchief, and, when they had got the handkerchief, pretending that the bargain was not made for a bow but for an arrow. The natives of Bouka Island, naked and savage as they are, have some sort of civilization among themselves, as is evident from the fact that they cultivate the cocoa-nut palm, large plantations of which useful tree extend to the water-side along a great portion of the coast.

FOLLOWING the line of the Solomon Islands in a south-easterly direction, we come upon another group of islands called the NEW HEBRIDES, extending for some four hundred miles, and containing a considerable number of islands of various sizes. They are perhaps best known from the fact that one of them, called Errumanga, was the place in which the celebrated missionary, John Williams, met with his death. These islands attained importance in a secular point of view from the fact that several of them produce sandal-wood, and therefore attract to them a great number of trading vessels of different countries, with whom a considerable commerce has been carried on.

The islands are mostly of a volcanic nature, and present the usual variations of such localities, some parts being rough, craggy, and bare, while others are fertile and prolific to a degree that can scarcely be conceived by those who have never seen tropical vegetation. As is often the case with islands of no great size and divided from each other by moderately wide channels, the tribes which inhabit them differ considerably in their language and manners, and

are in a chronic state of feud with each other. They are just far enough apart to have but rare and infrequent intercourse with each other, and so gradually diverge into different customs, and they are not far enough apart to isolate them, and confer upon them a nationality.

We find this feeling in every one of the innumerable groups of islands which stud the Pacific, and, as we shall soon see, it prevails even among those groups which preserve the same language and customs. In fact, among the Polynesians there is that very feeling of local jealousy which prevails even in civilized countries, and which is, though necessarily more limited, far more rancorous than the feelings of enmity which prevail between mighty nations.

One of the largest of these islands is VATÉ, sometimes called Sandwich Island. This latter term should not be used, as it tends to cause confusion between a single island of the New Hebrides and the great group of the Sandwich Islands, which are inhabited by a totally different race of men. To strangers Vaté is very unhealthy, but the causes which produce malaria also produce a wonderful fertility of vegetation. This island is about seventy miles in circumference, and is remarkable for the thick growth of forests upon its lower limits, and of verdure upon the higher portions which are not so well fitted for trees. The natives seem to give some time and trouble to agriculture.

The inhabitants are black of skin, but tall and well-formed, and their dress in many points reminds the observer of the costume of several African tribes. That of the men consists of a broad belt or wrapper of matting wrought in patterns colored with red, white, and black. The hair is generally gathered up into a bunch at the top of the head, stained yellow, and adorned with a plume of feathers.

As to ornaments, they are much like those which have already been mentioned as belonging to the Solomon Islanders. The lobes of the ears are always much distended, from the habit of wearing in them heavy ornaments cut from white shells, or similar materials. The septum of the nose is mostly pierced, and the aperture filled with a white stone. Raised scars are made in the arms and chest, and arranged in definite patterns. Armlets made of shells are used by these islanders. Their figure and costume are well represented in the engraving No. 1, on the 973d page.

The women are equally well made with the men, and the general fashion of the dress is much the same. They wear, however, a curious addition to the dress, which is very much like that of the Ovambo women of Africa. Passing round the waist is a belt some seven inches wide, made of plaited fibre woven into neat patterns. From this

belt depends in front a square apron of no great size, and behind is attached a broad strip of the same plaited matting as that which faces the belt. It descends half-way down the leg, and is finished off with a fan-like fringe of plaited grass, some eighteen inches long, and of proportionate width. The women, as well as the men, practise the custom of making raised scars on their bodies. They differ from the men in the mode of dressing the hair, keeping it cut closely to the head instead of allowing it to grow to its full length and tying it up in a bunch.

The weapons of these islanders are remarkable for the beauty of their finish, the barbs of the arrows being neatly carved, and the junction of the head and shaft being neatly ornamented with plaited grass and feathers. Indeed, the arrows have a curious resemblance to those made by some of the tribes of tropical America.

Like the Solomon Islanders, the inhabitants of the New Hebrides have large council chambers in their villages. Instead, however, of being circular, they are generally made of considerable length, sometimes measuring as much as a hundred feet from one end to the other. They are entirely open on one side. For some reason which seems rather obscure, they are adorned with bones of various animals, the particular species from which they are taken not seeming to be of any consequence. For example, in one of these houses may be seen bunches of bones taken indiscriminately from pigs, fowls, and fishes, while the shells of lobsters and other crustacea are mixed with them. It is believed that human bones are not used for this purpose.

A CURIOUS contrast to these tribes is presented by the inhabitants of another island called TANNA, who are certainly inferior to those of Vaté in stature and general appearance, and are thought to be so in point of intellect. They have a bad reputation, being said to be treacherous and cruel. That they are also reputed to be cannibals is no matter of wonder, inasmuch as they belong to the Papuan race. They are said to rival the Fans of Africa in one respect, and to dig up the bodies of the buried dead, in order to eat them.

The island is volcanic, and the subterranean fires seem to aid the already exuberant vegetation of the tropics, which in Tanna attains a development that is almost incredible.

The inhabitants of Tanna are as black as those of Vaté, but seem to have no other points of resemblance. The men appear to think that they are not black enough by nature, for they have a way of daubing their sable countenances with black lead, and painting upon the black groundwork sundry patterns in red ochre. The hair is frizzed

out after the ordinary Papuan type which is dyed a reddish dun color by means of lime.

WE come now to Errumanga. It has kept up its traditional ferocity. Not content with killing the first missionary who set his foot on their shores, the people many years afterward murdered another missionary and his wife. This second murder was owing to the priests, who persuaded the people that an epidemic which had done much damage among the natives was caused by the missionaries from a strange land. The ignorant people readily believed this statement, and, wild with the uncontrolled fury of the savage, they murdered both the accused persons. The deed was scarcely done before the people repented of it, and only the day after the murder, when the bodies were buried, the natives stood round the grave overwhelmed with grief, the most sincere mourner being the chief of the district.

The murder of these people, unfortunate as it may seem, really paved the way for others to follow in their footsteps; and, as is generally the case with persecution, the cause only gained additional strength by the attempts made to repress it by main force.

At one time the inhabitants were held in such dread that the natives were not allowed to come on board the ships, nor were the men permitted to land. A small trade was carried on in sandal-wood, which the natives carried to the boats by swimming through the surf, and being necessarily unarmed, could be allowed to make their bargains without suspicion of treachery. Although, therefore, the savage nature of the inhabitants has occasionally broken out and showed itself in bloodshed, the very fact that Europeans have been allowed to reside for any time on the island shows a great improvement in the character of the natives.

THE northernmost island of the group is ANEITEUM, one of the islands which produce sandal-wood in great plenty. The natural ferocity and suspicion of the natives has been overcome by the judicious establishment and introduction of a factory, to which the sandal-wood is taken by the natives, and from which it is sold to the ships, which find here a store of this valuable wood always ready for them. The chief market for the wood is found in China, where it is cut into various articles of luxury with the customary patience which characterizes the artists of that country. The success of this factory shows that the best way of dealing with savages is to treat them precisely as children are treated, and to employ in all dealings with them an equal mixture of kindness and firmness, making allowances for the different constitution of their minds

and the influence of savage habits upon their conduct; but at the same time to be firm almost to severity, and never to permit an encroachment. The safest maxim in dealing with savages is never to deceive and never to trust.

THE inhabitants of MALICOLO differ considerably from those of the islands which have been mentioned. While the natives of Vaté are tall and finely made, those of Errumanga scarcely inferior to them, and those of Tanna stout and powerful, though comparatively short of stature, the inhabitants of Malicolo are small, ill-proportioned people, ugly of face, and disfiguring themselves by wearing a belt round the waist, drawn so tight that it gives them an hour-glass or waspish aspect.

THE reader may perhaps be aware that, in the year 1788, the vessels *Boussole* and *Astrolabe*, commanded by the celebrated voyager La Pérouse, disappeared, and nothing more was heard of them. He was last seen at Botany Bay, where he had arrived from Tonga.

In 1791 an expedition, consisting of two vessels, the *Recherche* and the *Espérance*, was fitted out under the command of Captain D'Entrecasteaux, and sent out in search of the missing vessels. The expedition failed in its immediate object, though in the course of the explorations some valuable discoveries were made.

In 1792 D'Entrecasteaux's vessels got among the New Hebrides, and found themselves in the midst of coral reefs and shoals of which they knew nothing, and which caused no small alarm. In consequence of the danger of these reefs, the captain did not touch at all the islands which were seen, but contented himself with naming them, and marking their places on a chart. As it turned out, one of these islands, VANIKORO, or Recherche Island, as D'Entrecasteaux named it, was the place on which La Pérouse was wrecked, so that the expedition actually passed within sight of the very spot which was the object of their voyage. Indeed, D'Entrecasteaux practically completed the voyage which La Pérouse began, and his narrative furnishes a necessary supplement to that of the voyager in search of whom he sailed. It was not until some forty years afterward that the relics were discovered which proved beyond a doubt that Vanikoro was the place in which La Pérouse and his companions perished. Vanikoro is sometimes called Pitt's Island. An illustration is given on the 973d page, which represents a woman of Vanikoro, and her child, and is a type of the expression and features of these islanders.

CHAPTER XCIX.

TONGA.

GOVERNMENT AND GRADATIONS OF RANK.

FRIENDLY RELATIONS BETWEEN TONGA AND FIJI—THE ARMY OF OCCUPATION—GENERAL APPEARANCE OF THE TONGANS—THEIR DRESS—THE GNATOO, AND MODE OF WEARING IT—MAKING THE GNATOO—BEATING, JOINING, AND PRINTING THE PIECES—THE DISTINCTION BETWEEN GNATOO AND TAPPA—ORNAMENTS WORN BY THE TONGANS—WHALE'S TEETH, AND THE VALUE SET ON THEM—FINOW AND THE TEETH—DISTINCTIONS OF RANK—SECULAR AND RELIGIOUS RANK—THE TOOI-TONGA, HIS ORIGIN AND PRIVILEGES—THE VEACHI—THE HOW, OR KING, OFTEN INFERIOR IN RANK TO MANY OF HIS CHIEFS—THE EGI, OR NOBLES—THE MATABOOLLES, THEIR RANK AND DUTIES—THE MOOAS, OR GENTRY; AND THE TOOAS, OR COMMON PEOPLE—MATRIMONIAL ARRANGEMENTS BETWEEN PEOPLE OF DIFFERENT RANKS—TREATMENT OF WOMEN.

OUR readers may remember that, in the account of the Fiji Islands, it was mentioned that there was one nation which was held by the Fijians as free from their usual custom of killing and eating all visitors to their coast. These people are the inhabitants of the Tongan group, popularly known as the Friendly Islands. Owing to their courage in war and superior intellect, they have performed toward the Fijians the same part that has so often been played by more civilized people. On one or two occasions they found the Fijian chiefs hard pressed by rebellion, took the part of their hosts, crushed the rebel forces, and restored the chiefs to power.

A remarkable instance of this timely aid occurred as late as 1855. Thakombau, of whom we have already heard, was in danger of losing his life and throne together through a rebellion led by a chief named Mara. Fortunately, he had previously given a magnificent canoe to the Tongan king, who sailed over, according to custom, accompanied with a large fleet, in order to receive the royal present with due honor. He instantly led his forces against the rebels, stormed a fort called Kamba which was held by them, took it, and utterly dispersed the enemy, Mara himself only escaping by running over the sharp shells of the reef, thereby nearly cutting his feet to pieces, and swimming to a neighboring town on the coast.

After this exploit, the Tongan chief followed up his blow by sailing to the island of Taviuni, where another rebellion was raging in consequence of the murder of the chief by his sons. He put an end to this rebellion also, inquired which of the murdered chief's other sons had the best claim to his father's rank, and installed him formally. The vanquished rebels, finding that the Tongan leader was too strong for them, tried to entrap him in an ambuscade, but only succeeded in murdering one of his chiefs. The Tongans immediately landed on the island, and avenged the death of their friends in a most terrible manner. A large party of Tongan warriors was afterward left under the command of a chief named Maafu, a relation of the king, and by means of this force the rebels were effectually suppressed.

As might be expected, the Tongans took advantage of their situation, and enacted over again the fable of the deer, the horse, and the man. Some four hundred of them generally remain in Fiji, and domineer over the natives much like armies of occupation in other countries. A Tongan warrior has not the least scruple in going to a strange village, entering the house that pleases him best, and installing himself in the best place with the simple words: "This part of the house is mine." He takes the best of the food, and, if he builds a canoe, merely acts as foreman, making the Fijians do all the

hard work. There is nothing that the Tongans do, however, which so much incenses the natives as their careless habit of shaking the bread-fruit trees in order to procure the fruit, which ought always to be gathered by hand.

It is said, and perhaps with reason, that the Tongans contemplate the complete conquest of the Fijian group; and from their experience, courage, and discipline, and the fear which they have contrived to instil into the Fijians, there is little doubt that the attempt, if it were to be made, would be a successful one. The Fijian warrior fights on his own account, each man separately, while the Tongans act in unison; so that the Fijians who have fought against them compare them to the gods, against whom it is useless to struggle.

As may be gathered from these particulars, the Tongans are a superior race to the Fijian. They are, indeed, a different people altogether; the Fijians belonging to the Papuan race, whereas the Tongans belong to the Polynesian race, which does not possess the very crisp hair and rough skin of the Papuans; and, as a rule, is much lighter in skin, the complexions being often as white as that of many Europeans. They are, on the whole a singularly handsome set of people, the beauty not being limited to the men, as is the case with so many savage tribes, but possessed equally, if not to a superior extent, by the women. The portrait of a daughter of a Tongan chief, on the 973d page, will verify this statement.

The dress of both sexes is made of similar materials, but is differently arranged. The fabric is called in the Tongan language "gnatoo," and is almost identical with the Fijian masi. It is made from the bark of the same tree, and is beaten out in very similar fashion, except perhaps that the Tongan women are more particular than those of Fiji in the care and delicacy with which they beat out the bark with their grooved mallets. The gnatoo varies somewhat in quality according to the island in which it is made, that of Vavau being considered as the finest.

In putting on the gnatoo, there is nearly as much diversity as in the arrangement of a Scotch plaid, and the mode in which it is arranged serves to denote difference of rank. The most fashionable mode, which is practised by the chiefs, is to wrap a portion of it round the loins in such a manner that the folds allow fair play to the limbs, and then to pass the remainder round the waist like a broad belt, and tuck the ends under the belt in front of the body. The portion which forms the belt is so arranged that it can be loosened at any moment and thrown over the head and shoulder. This is always done when the wearer is obliged to be abroad in the night time.

The gnatoo of the men measures about

eight feet in length, by six in width. Under the gnatoo is a belt made of the same material. Women have a larger piece of gnatoo than the men, and arrange it in folds which are as graceful as those of antique art, and seem as likely to fall off the person. This, however, is never the case, and, even if the gnatoo were by any accident to slip, the women wear under it a small mat or petticoat about a foot in depth.

As this gnatoo plays so important a part in the clothing of the Polynesians, its manufacture will now be described, the account being taken from Mariner's valuable history of the Tongans:—"A circular incision being made round the tree near the root with a shell, deep enough to penetrate the bark, the tree is broken off at that point, which its slenderness readily admits of. When a number of them are thus laid on the ground, they are left in the sun a couple of days to become partially dry, so that the inner and outer bark may be stripped off together, without danger of leaving any of the fibres behind.

"The bark is then soaked in water for a day and a night, and scraped carefully with shells for the purpose of removing the outer bark or epidermis, which is thrown away. The inner bark is then rolled up lengthwise, and soaked in water for another day. It now swells, becomes tougher, and more capable of being beaten out into a fine texture.

"Being thus far prepared, the operation of *too-too*, or beating commences. This part of the work is performed by means of a mallet a foot long and two inches thick, in the form of a parallelepipedon, two opposite sides being grooved horizontally to the depth and breadth of about a line, with intervals of a quarter of an inch.

"The bark, which is from two to three feet long, and one to three inches broad, is then laid on a beam of wood about six feet long and nine inches in breadth and thickness, which is supported about an inch from the ground by pieces of wood at each end, so as to allow of a certain degree of vibration. Two or three women generally sit at the same beam; each places her bark transversely upon the beam immediately before her, and while she beats with her right hand, with her left she moves it slowly to and fro, so that every part becomes beaten alike. The grooved side of the mallet is used first, and the smooth side afterward.

"They generally beat alternately, and early in the morning, when the air is calm and still, the beating of gnatoo in all the plantations has a very pleasing effect. Some sounds being near at hand, and others almost lost by the distance,—some a little more acute, and others more grave,—and all with remarkable regularity, produce a remarkable effect that is very agreeable, and not a little heightened by the sing-

ing of the birds and the cheerful influence of the scene. When one hand is fatigued, the mallet is dexterously transferred to the other, without occasioning the smallest sensible delay.

"In the course of about half an hour, it is brought to a sufficient degree of thinness, being so much spread laterally as to be now nearly square when unfolded; for it must be observed that they double it several times during the process, by which means it spreads more equally and is prevented from breaking. The bark thus prepared is called *fetagi*, and is mostly put aside till they have a sufficient quantity to go on at a future time with the second part of the operation, which is called *cocanga*, or printing with *coca*.

"When this is to be done, a number employ themselves in gathering the berries of the *toe*, the pulp of which serves for paste (but the mucilaginous substance of the ma-hoá root is sometimes substituted for it); at the same time others are busy scraping off the soft bark of the cocoa tree and the *toodi-tooi* tree, either of which, when wrung out without water yields a reddish-brown juice, to be used as a dye.

"The stamp is made of the dried leaves of the *páoongo* sewed together so as to be of a sufficient size, and afterward embroidered, according to various devices, with the wiry fibre of the cocoa-nut husk. Making these stamps is another employment of the women, and mostly women of rank. They are generally about two feet long, and a foot and a half broad. They are tied on to the convex side of half cylinders of wood, usually about six or eight feet long, to admit two or three similar operations to go on at the same time.

"The stamp being thus fixed, with the embroidered side uppermost, a piece of the prepared bark is laid on it, and smeared over with a folded piece of gnatoo dipped in one of the reddish-brown liquids before mentioned, so that the whole surface of the prepared bark becomes stained, but particularly those parts raised by the design in the stamp. Another piece of gnatoo is now laid upon it, but not quite so broad, which adheres by virtue of the mucilaginous quality in the dye, and this in like manner is smeared over; then a third in the same way.

"The substance is now three layers in thickness. Others are then added to increase it in length and breadth by pasting the edges of these over the first, but not so as there shall be in any place more than three folds, which is easily managed, as the margin of one layer falls short of the margin of the one under it.

"During the whole process each layer is stamped separately, so that the pattern may be said to exist in the very substance of the gnatoo; and when one portion is thus

printed to the size of the stamp, the material being moved farther on, the next portion, either in length or breadth, becomes stamped, the pattern beginning close to the spot where the other ended. Thus they go on printing and enlarging it to about six feet in breadth, and generally about forty or fifty yards in length. It is then carefully folded up and baked under ground, which causes the dye to become rather dark, and more firmly fixed in the fibre; beside which it deprives it of a peculiar smoky smell which belongs to the *coca*.

"When it has been thus exposed to heat for a few hours, it is spread out on a grass plat, or on the sand of the seashore, and the finishing operation of *toogi-hea* commences, *i. e.* staining it in certain places with the juice of the *hea*, which constitutes a brilliant red varnish. This is done in straight lines along those places where the edges of the printed portions join each other, and serves to conceal the little irregularities there; also in sundry other places, in the form of round spots, about an inch and a quarter in diameter. After this the gnatoo is exposed one night to the dew, and the next day, being dried in the sun, it is packed up in bales to be used when required. When gnatoo is not printed or stained, it is called *tappa*."

Various ornaments are worn by both sexes among the Tongans, among which may be enumerated a kind of creeper, with flowers at intervals along the stem. This is passed round the neck or the waist, and has a singularly graceful and becoming appearance. The most valued ornament is, however, that which is made of the ivory of the whale's teeth, so cut as to resemble in miniature the tooth itself. They are of different sizes, varying from one inch to four inches in length, and strung together by a cord passing through a hole bored in their thick ends.

These teeth are even more valued in Tonga than in Fiji, and a common man would not dare to have one in his possession, knowing well that he would assuredly lose his life on the very first occasion that offered the slightest opportunity of an accusation. Once Finow, the King of Tonga, was told of a whale which had been stranded on a little island inhabited only by a man and his wife. When Finow reached the place he found that the teeth had been removed, and ordered the man and woman into custody on the charge of stealing them. Both denied that they had more than two teeth, which they gave up, whereupon the man was immediately killed with a club, and the woman threatened with a similar fate. Under fear of this threat she produced two more teeth which she had hidden, but, refusing to acknowledge that she knew of any others, met with the same fate as her husband. Many years afterward the missing

(See page 981.)

(2.) BURIAL OF A LIVING KING.

(See page 966.)

teeth were discovered, the woman having buried them in the ground. This anecdote shows the value in which whales' teeth are held, the king taking the trouble to go in person to claim them, and the woman allowing herself to be killed rather than part with her treasures.

A good idea of the appearance of a Tongan woman of rank may be obtained from the illustration No. 1, on the preceding page, which represents the interior of a chief's house, and part of his family.

In the foreground is one of the odd wooden pillows which are so much in vogue throughout Polynesia; while one of the most conspicuous objects is a roll of narrow matting, which is used for the purpose of surrounding men and women of high rank as they sit on the floor. Within it is seated the chief's wife, in the graceful attitude adopted by the Tongans, exhibiting the simple and really elegant folds of the gnattoo dress. The reader will observe the apparent looseness with which the dress is put on, the folds lying so loosely that they seem ready to slip every moment. They are, however, perfectly tight, and there is not the least danger of their slipping.

Within doors the children never wear any clothing until they are two years old; but when they go out, their parents always wrap round them a piece of gnattoo or tappa. The natives are exceedingly fastidious about their dress, criticising every fold with minute care, and spending a considerable time in arranging them. Even when bathing, they always array themselves in a slight dress made for such occasions, going aside for the purpose of exchanging the usual gnattoo for an apron of leaves or matting. So disrespectful is utter nudity reckoned among the Tongans, that if a man be obliged to undress near the spot where a chief is buried, the leaf apron is worn while the dress is changed.

WE now come to the various divisions of rank in Tonga, and the mode of government. Ranks may be divided into two distinct orders, namely, the religious and the civil. We must take them in this order, because among the Tongans religious takes the precedence of civil rank.

By far the greatest man in point of rank is the TOOI-TONGA. This word literally signifies Chief of Tonga, and is given because the man who bears it is the greatest man in Tonga, which is the chief of the whole group of islands. The word does not represent a name, but a rank, the family name being Fatagehi, and the rank passes downward by legitimate descent. So great a man is the Tooi-tonga, that in his presence no man may stand, but is obliged to sit down in the attitude of respect. Even the king is not exempt from this law; and if he should happen to meet the Tooi-tonga, he

would have to squat down humbly until the great man had passed by.

The Tooi-tonga stands alone in many particulars, and, according to our ideas, he has plenty of dignity, but very little comfort, leading a life somewhat like that of the spiritual Emperor of Japan. He has certainly one advantage over his fellows: he does not undergo the operation of tattooing, because there is no one of sufficiently high rank to draw the blood of so sacred a personage. He is married after a manner peculiar to himself, is buried in a peculiar manner, and is mourned in a peculiar manner. He is so sacred, that in speaking of him another language is used, many phrases being reserved expressly for the Tooi-tonga. These are probably relics of an ancient and nearly lost language, as is the case with the incantations of the New Zealand priests.

The reason for this extraordinary veneration is, that the Tooi-tonga is supposed to be a direct descendant of a chief god who was accustomed to visit the islands; but whether his female ancestor was a goddess or a native of earth is an open question with the Tongans. In spite of all the veneration which is shown to him, the Tooi-tonga has very little real power, and in this respect is far surpassed by the king, and equalled by many of the nobles.

There is another chief, the VEACHI, who is also supposed to have a divine origin, and is therefore held in higher veneration than any of the chiefs, but is inferior to the Tooi-tonga. It is true that in his presence the king has to sit on the ground in the attitude of humility, and that he is considered a being next in rank to the great Tooi-tonga himself; but the other marks of veneration, such as a separate language, and different modes of marriage, burial, and mourning, are not paid to him; and in power he is equalled by many of the chiefs.

Next in rank, but at a very great distance, come the priests. These men receive their name from their capability of being inspired by certain gods, and, except when actually inspired, have no special rank, and are paid no honor except such as may belong to them as private individuals. Mariner remarks that he never knew a case in which a priest was a chief. The king occasionally becomes inspired, because there is one god who cannot speak except by the royal mouth; but the king is not, in consequence, considered as a priest. Neither are the Tooi-tonga and Veachi considered as priests, nor is there any connexion between them and the priesthood.

Should, in an assembly, a priest become inspired, he is immediately held in the highest veneration as long as the inspiration lasts, because a god is supposed to be speaking through his lips. If, on such an occasion, the king should be present, he immediately leaves his place, and sits humbly

among the spectators. Even the great Tooi-tonga himself acts in the same manner, and, though the descendant of a god, he retires before the actual presence of a divinity.

So much for the spiritual rank, and we now pass to the temporal rank.

The highest man in a secular point of view is the How, or king, who is the most powerful of all the chiefs, and yet may be in point of rank inferior to the poorest of his nobles, or EGIS. Rank is measured in Tonga by relationship to the Tooi-tonga or Veachi, the relatives of the former being held superior to those of the latter. The consequence is, that the king may meet a poor man who has scarcely any power, and yet who is so high in rank above the king that the latter must sit down till his superior has passed. Should he not do so, or should he by any accident touch anything that belonged to his superior, the tapu would assume its sway, and he would not be permitted to feed himself with his own hands until he had gone to his superior, and saluted him by touching his feet.

In consequence of these customs, the king avoids associating with nobles who are his superior in rank, and they in their turn keep out of his way as far as possible, so as not to humiliate him by making him sit while they stand. Originally, the king was a descendant of the Tooi-tonga, and thus was equally high in spiritual and temporal rank. But when the throne was usurped by other families, the king still retained the temporal power, though he yielded in spiritual rank to others.

Next to the king come the EGIS, or nobles. These are all relations of the Tooi-tonga, the Veachi, or the king, kinship to the king being held as conferring rank because he holds the reins of power. Rank descends in Tonga, as in other Polynesian islands, through the female line, so that all the children of an Egi woman possess the rank of Egi, no matter who may be the father.

After the nobles come the MATABOOLES, or councillors, who are the companions and advisers of the chiefs, and take their rank from that of the chief to whom they are attached. They are always the heads of families, and are mostly men of mature age and experience, so that their advice is highly valued. The eldest son of a Mataboole is carefully trained to take his father's place when he dies, and is thoroughly versed in all the rites and ceremonies, the administration of laws, and the many points of etiquette about which the Tongans are so fastidious. He also learns all the traditionary records of his people, and by the time that he is thirty years old or so is perfectly acquainted with his profession. But until his father dies he has no rank, and is merely one of the ordinary gentry, who will now be described.

Last of all those who possess any rank are the gentry, or MOOAS. All the sons of Matabooles are Mooas, and act as assistants of the Matabooles, aiding on great ceremonies in managing the dances, distributing food, and so forth. Like their superiors, they attach themselves to the service of some chief, and derive their relative consequence from his rank. As a rule, the Mooas all profess some art, such as canoe building, ivory carving, and superintending funeral rites, in which three occupations the Matabooles also take part. They also preside over the makers of stone coffins, the makers of nets, the fishermen, and the architects, and all these employments are hereditary.

Just as the children and brothers of Matabooles take the next lowest rank, that of Mooa, so do those of Mooas take the next lowest rank, and are considered as TOOAS, or plebeians. In this case, however, the eldest son of a Mooa assumes the rank of his father after his death, and is therefore more respected than his brothers, who are regarded like younger sons among ourselves. The Tooas do all the menial work, and act as cooks, barbers, tattooers, club-carvers, and so forth. The two latter occupations, however, as requiring artistic skill, are also practised by Mooas.

It will be seen from this brief sketch how elaborate, and yet how intelligible, is this system of the Tongans, even when complicated with the double grades of spiritual and temporal rank. This respect for rank is carried even into the privacy of home. If, for example, an Egi woman marries a Mataboole, or a Mooa, she retains her original rank, which is shared by all her children, so that both she and her children are superior to the husband and father. He, on his part, has to play a double rôle. He is master in his own house, and his wife submits to him as implicitly as if he were of the same rank as herself. Yet he acknowledges the superior rank both of his wife and children, and, before he even ventures to feed himself with his own hands, he goes through the ceremony of touching the feet of his wife or either of his children, in order to free himself from the tapu.

When the case is reversed, and a man of high rank marries a woman of an inferior station, she does not rise to the rank of her husband, but retains her original station, which is inherited by her children, who, together with herself, have to touch the feet of the husband whenever they eat. They imagine that if they did not do so a terrible sickness would consume them. When Mariner lived among the Tongans, he did not trouble himself about the tapu, much to the horror of the natives, who expected that the offended gods would wreak their vengeance on him. Finding that he suffered no harm, they accounted for the phenomenon by the fact that he was a white man, and therefore

had nothing to do with the gods of the Tongans.

In consequence of the strictness of this system, Finow, who was king when Mariner lived among the Tongan islands, used to feel annoyed if even a child of superior rank were brought near him, and used angrily to order it to be taken away. Such conduct, however, would not be thought right unless both parties were nearly equal in rank; and if, for example, the Tooi-tonga's child had been brought near the king, he would at once have done homage after the customary fashion.

Some very curious modifications of this custom prevail throughout Tongan society. For example, any one may choose a foster-mother, even though his own mother be alive, and he may choose her from any rank. Generally her rank is inferior to that of her adopted son, but even this connection between them does not earn for her any particular respect. She would be much more honored as an attendant of a young chief than as his foster-mother.

So elaborate and yet simple a system implies a degree of refinement which we could hardly expect among savages. In consonance with this refinement is the treatment of women, who are by no means oppressed and hard-worked slaves, as is the case with most savage nations. Consequently the women possess a gentle freedom of demeanor and grace of form which are never found among those people where women are merely the drudges of the men. So long ago as 1777, Captain Cook noticed that the women were much more delicately formed than the men, that they were beautifully proportioned, and that the hands were so

small and soft that they would compare favorably with the finest examples in Europe and America. Hard and constant labor, such as is usually the lot of savage women, deteriorates the form greatly, as indeed we can see among ourselves, by comparing together a high-bred lady and a field laborer. The two hardly seem to belong to the same race, or scarcely to the same sex.

The Tongan women certainly do work, but they are not condemned to do it all, the men taking the hard labor on themselves, and leaving the women the lighter tasks, such as beating gnatoo, plaiting baskets, making crockery, and the like. At the great dances, the women are not only allowed to be present, but assist in them, taking as important a share as the men, and infusing into the dance a really cultivated grace which would not exist without them.

The light-colored hue of the skin, which has already been mentioned, is much more common among the women than the men, for the reason that the better class of women take more care of themselves than the men; and, though all classes live for the most part in the open air, the wives and daughters of powerful and wealthy men are careful not to expose themselves to the sun more than is absolutely necessary, so that many of them, instead of being brown, are of a clear olive tint, the effect of which is singularly beautiful when contrasted with their dark clustering hair, their gnatoo garments, and the leaves and flowers with which they adorn themselves, changing them several times daily. Altogether, a Tongan chief looks, and is, a gentleman, and his wife a lady.

CHAPTER C.

TONGA — *Continued.*

WAR AND CEREMONIES.

NATURAL MILDNESS OF THE TONGANS—BOASTING DISCOURAGED—WAR APPARENTLY LEARNED FROM THE FIJIANS—FINOW'S SPEECH TO HIS SOLDIERS, AND A NEW DISCIPLINE—FATE OF THE VANQUISHED—THE DROWNED CHIEFS—CEREMONIES—KAVA-DRINKING—STRICT CODE OF ETIQUETTE—PREPARATION OF THE KAVA—A GRACEFUL PERFORMANCE—DISTRIBUTION OF THE KAVA—POINTS OF CEREMONY—A TONGAN PLANTATION—SETTING THE YAMS—CEREMONY OF INACHI—THE POLE BEARERS AND THEIR BURDEN—THE YAM PILLARS—LIFTING THE PIGS—DISTRIBUTION OF PROVISIONS, AND CONCLUSION OF THE CEREMONY—TOW-TOW, AND ITS OBJECT—PRESENTATION OF THE OFFERING—A GRAND SCRAMBLE—BOXING AND WRESTLING MATCHES—GOOD-HUMORED COMBATANTS—FIGHTS WITH CLUBS—THE SAMOAN AND TONGAN RULES.

By nature the Tongans are gentle and kind-hearted, and present a most curious mixture of mildness and courage. To judge by many traits of character, they might be stigmatized as effeminate, while by others they are shown to possess real courage, not merely the dashing and boastful bravery which is, when analyzed, merely bravado, and which is only maintained by the hope of gaining applause. The Tongan never boasts of his own courage, nor applauds that of another. When he has performed a deed of arms which would set a Fijian boasting for the rest of his life, he retires quietly into the background and says nothing about it. His king or chief may acknowledge it if they like, but he will be silent on the subject, and never refer to it.

For the same reason, he will not openly applaud a deed of arms done by one of his fellows. He will regard the man with great respect, and show by his demeanor the honor in which he holds him, but he will not speak openly on the subject. Mariner relates an instance in which a young warrior named Hali Api Api, who seems to have been the very model of a gentleman, performed a notable deed of arms, equally remarkable for courage and high-minded generosity. During a council, the king called him out, and publicly thanked him for his conduct. The man blushed deeply, as if ashamed at this public recognition of his services, saluted the king, and retired to his

place without saying a word. Neither did he afterward refer either to his exploit or to the public recognition of it.

One warrior actually declared that he would go up to a loaded cannon and throw his spear into it. He fulfilled his promise to the letter. He ran up within ten or twelve yards of the gun, and, as the match was applied, threw himself on the ground, so that the shot passed over him. He then sprang up, and, in spite of the enemy's weapons, hurled his spear at the cannon, and struck it in the muzzle. Having performed this feat, he quietly retired, and was never heard to refer to so distinguished an act of courage, though he was greatly respected for it by his countrymen.

We need not wonder that such men should establish a moral influence over the boastful but not warlike Fijians, and that the small colony established in the Fiji group should virtually be its masters. Two hundred years ago, the Tongan appears to have been ignorant of weapons and warfare, and to have borrowed his first knowledge of both from Fiji. Consequently, the Tongan weapons are practically those of Fiji, modified somewhat according to the taste of the makers but evidently derived from the same source. Captain Cook, who visited the islands in 1777, remarks that the few clubs and spears which he saw among the Tongans were of Fiji manufacture, or at least made after the Fiji pattern. Yet by a sort of

poetical justice, the Tongan has turned the Fijian's weapons against himself, and, by his superior intellect and adventurous courage, has overcome the ferocious people of whom he was formerly in dread.

Since the introduction of fire-arms, the superiority of the Tongans has made itself even more manifest, the Fijians having no idea of fighting against men who did not run away when fired at, but rushed on in spite of the weapons opposed to them.

It is possible that the Tongans may have learned this mode of fighting from Mariner and his companions. When the king Finow was about to make war upon a neighboring island, he assembled the warriors and made them an address, telling them that the system of warfare which had been previously employed was a false one. He told them no longer to advance or retreat according as they met with success or repulse, but to press forward at all risks; and, even if a man saw the point of a spear at his breast, he was not to flinch like a coward, but to press forward, and at risk of his own life to kill his foe. He also instructed them in the art of receiving the onset of the enemy with calmness, instead of indulging in cries and gesticulations, telling them to seat themselves on the ground as the enemy approached, as if perfectly unconcerned, and not to stir until ordered, even if they threw spears or shot arrows. But as soon as they got the word to advance they were to leap to their feet, and charge without regard to consequences. The reader may remember that this is exactly the strategy which was employed in Africa by the great Kaffir chief Tchaka.

It may easily be imagined how such a course of conduct would disconcert their opponents, and the Fijians in particular, with whom boasting and challenging took the place of valor. Emboldened by the apparent weakness of the enemy, they would come on in great glee, expecting to make an easy conquest, and then, just when they raised the shout of victory, they found themselves suddenly attacked with a disciplined fury which they had never been accustomed to meet, and were consequently dispersed and almost annihilated before they could well realize their position.

Though tolerably mild toward their captives, the Tongans sometimes display an unexpected ferocity. On one occasion, some of Finow's men surprised and captured four of the enemy, whom they imagined to belong to a party who had annoyed them greatly by hanging on their track and cutting off the stragglers.

At first they wished to take the prisoners home and make an example of them, but the chief of the party suggested that they would have all the trouble of guarding them, and proposed to decapitate them, and take their heads home. One of them objected to

the proposal on the ground that they had no knives, but another man, fertile in expedients, picked up some oyster-shells that were lying about, and suggested that they would answer the purpose.

It was in vain that the victims protested their innocence, and begged that at least they might be clubbed before their heads were cut off. The conquerors coolly took off their dresses to prevent them being stained with blood, and deliberately sawed off the heads of the captives with their oyster-shells; beginning at the back of the neck, and working their way gradually round. The reason for this course of action seemed to be twofold — first, that they thought they might spoil the heads by the club; and secondly, that as the heads must be cut off at all events, clubbing the captives beforehand was taking needless trouble.

Indeed, the character of the Tongan presents a curious mixture of mildness and cruelty, the latter being probably as much due to thoughtlessness as to ferocity. Once when eighteen rebels had been captured, Finow ordered them to be drowned. This punishment is inflicted by taking the prisoners out to sea, bound hand and foot, and towing some worthless canoes. When they are far enough from land, the culprits are transferred to the canoes, which are then scuttled, and left to sink. Care is taken that the holes made in the canoes are small, so that they shall be as long as possible in sinking.

On that occasion twelve of the prisoners begged to be clubbed instead of drowned, and their request was granted. The young men divided the prisoners among themselves, being anxious to take a lesson in clubbing a human being, which would serve them when they came to make use of the club against an enemy. The twelve were, accordingly, despatched with the club, but the others, being tried warriors, scorned to ask a favor, and were drowned. The leading chief among them employed the short time which was left him in uttering maledictions against Finow and his chiefs, and even when the water came up to his mouth, he threw back his head for the purpose of uttering another curse.

WE will now pass to a more pleasant subject, namely, the various ceremonies in which the Tongan delights. Chief among these is the drinking of kava, which forms an important part of every public religious rite, and is often practised in private. Kava drinking is known throughout the greater part of Polynesia; but as the best and fullest account of it has been obtained from Mariner's residence in Tonga, a description of it has been reserved for the present occasion. It must first be premised that the kava is made from the root of a tree belonging to the pepper tribe, and known by the name of

Piper methysticum, i. e. the intoxicating pepper-tree. Disgusting as the preparation of the kava may be to Europeans, it is held in such high estimation by the Polynesians that it is never made or drunk without a complicated ceremony, which is the same whether the party be a large or a small one.

The people being assembled, the man of highest rank takes his place under the eaves of the house, sitting with his back to the house and his face toward the *marly*, or open space in front, and having a Mataboole on either side of him. Next to these Matabooles, who undertake the arrangement of the festival, sit the nobles or chiefs of highest rank, and next to them the lower chiefs, and so forth. They are not, however, very particular about the precise order in which they sit, distinctions of rank being marked by the order in which they are served.

This is the business of the presiding Matabooles, and as the distinctions of rank are most tenaciously observed, it is evident that the duties of a Mataboole are of a most difficult nature, and can only be learned by long and constant practice. If the men sat according to their rank, nothing would be easier than the task of serving them in order. But it often happens that a man of high rank happens to come late, and, as he is too polite to disturb those of lower rank who have already taken their places, he sits below them, knowing that his rank will be recognized at the proper time.

It mostly happens, however, that when one of the presiding Matabooles sees a man occupying a place much below that to which his rank entitles him, he makes some one surrender his place to him, or even turns out altogether a man who is seated in a high place, and puts the chief into it. The people thus gradually extend themselves into a ring, sometimes single, but often several ranks deep when the party is a large one, every one of the members being a man of some recognized rank. Behind those who form the bottom of the ring opposite the presiding chief, sit the general public, who may be several thousand in number. It is a remarkable fact, illustrating the rigid code of etiquette which prevails among the Tongans, that no one can sit in the inner ring if a superior relative be also in it; and, no matter how high may be his rank, he must leave his place, and sit in the outer circle, if his father or any superior relative enters the inner ring.

This ring, which constitutes the essential kava party, is formed mostly of the sons of chiefs and Matabooles, and it often happens that their fathers, even if they be chiefs of the highest rank, will sit in the outer ring, rather than disturb its arrangements. Even the son of the king often adopts this plan, and assists in preparing the kava like any of the other young men.

Exactly opposite to the king is placed the kava bowl, and behind it sits the man who is to prepare the drink. On either side of him sits an assistant, one of whom carries a fan wherewith to drive away the flies, and another takes charge of the water, which is kept in cocoa-nut shells. The rank of the preparer is of no consequence. Sometimes he is a Mooa or gentleman, and sometimes a mere cook; but, whoever he may be, he is known to be able to perform his difficult task with sufficient strength and elegance.

All being ready, one of the presiding Matabooles sends for the kava root, which is then scraped quite clean and cut up into small pieces. These are handed to the young men or even to the young women present, who masticate the root, contriving in some ingenious way to keep it quite dry during the process. It is then wrapped in a leaf, and passed to the preparer, who places it in the bowl, carefully lining the interior with the balls of chewed root, so that the exact quantity can be seen.

When all the kava has been chewed and deposited, the preparer tilts the bowl toward the presiding chief, who consults with his Matabooles, and if he thinks there is not enough, orders the bowl to be covered over, and sends for more kava, which is treated as before. Should he be satisfied, the preparer kneads all the kava together, and the Mataboole then calls for water, which is poured into the bowl until he orders the man to stop. Next comes the order to put in the *fo*. This is a bundle of very narrow strips of bark of a tree belonging to the genus *hibiscus*, and it has been compared to the willow shavings that are used in England to decorate fire-places in the summer time. The assistant takes a quantity of this material, and lays it on the water, spreading it carefully, so that it lies equally on the surface of the liquid. Now begins the important part of the proceeding which tests the power of the preparer.

"In the first place, he extends his left hand to the farther side of the bowl, with his fingers pointing downward and the palm toward himself; he sinks that hand carefully down the side of the bowl, carrying with it the edge of the *fo*; at the same time his right hand is performing a similar operation at the side next to him, the fingers pointing downward and the palm presenting outward. He does this slowly from side to side, gradually descending deeper and deeper till his fingers meet each other at the bottom, so that nearly the whole of the fibres of the root are by these means enclosed in the *fo*, forming as it were a roll of above two feet in length lying along the bottom from side to side, the edges of the *fo* meeting each other underneath.

"He now carefully rolls it over, so that the edges overlapping each other, or rather intermingling, come uppermost. He next

THE KAVA PARTY.

(See page 989.)

doubles in the two ends and rolls it carefully over again, endeavoring to reduce it to a narrower and firmer compass. He now brings it cautiously out of the fluid, taking firm hold of it by the two ends, one in each hand (the back of his hands being upward), and raising it breast high with his arms considerably extended, he brings his right hand toward his breast, moving it gradually onward; and whilst his left hand is coming round toward his right shoulder, his right hand partially twisting the *fow*, lays the end which it holds upon the left elbow, so that the *fow* lies thus extended upon that arm, one end being still grasped by the left hand.

"The right hand being at liberty is brought under the left fore-arm (which still remains in the same situation), and carried outwardly toward the left elbow, that it may again seize in that situation the end of the *fow*. The right hand then describes a bold curve outwardly from the chest, whilst the left comes across the chest, describing a curve nearer to him and in the opposite direction, till at length the left hand is extended from him and the right hand approaches to the left shoulder, gradually twisting the *fow* by the turn and flexures principally of that wrist: this double motion is then retraced, but in such a way (the left wrist now principally acting) that the *fow*, instead of being untwisted, is still more twisted, and is at length again placed on the left arm, while he takes a new and less constrained hold.

"Thus the hands and arms perform a variety of curves of the most graceful description: the muscles both of the arms and chest are seen rising as they are called into action, displaying what would be a fine and uncommon subject of study for the painter: for no combinations of animal action can develop the swell and play of the muscles with more grace and better effect.

"The degree of strength which he exerts when there is a large quantity is very great, and the dexterity with which he accomplishes the whole never fails to excite the attention and admiration of all present. Every tongue is mute, and every eye is upon him, watching each motion of his arms as they describe the various curvilinear lines essential to the success of the operation. Sometimes the fibres of the *fow* are heard to crack with the increasing tension, yet the mass is seen whole and entire, becoming more thin as it becomes more twisted, while the infusion drains from it in a regularly decreasing quantity till at length it denies a single drop."

The illustration on the preceding page represents this portion of the ceremony. On the right hand is seen the presiding chief seated under the eaves of the house, with a Mataboole on either side of him, and just beyond him extends a portion of the inner ring. In front of the chief sits

the performer, who is wringing out the kava, and is just about to change the grasp of his right hand, according to Mariner's description. On either side sit his assistants, both of whom are engaged in fanning away the flies.

Near them lie the cocoa-nut shells from which the water has been poured. Beyond the inner ring are seen the outer rings and the general population, who have come to witness the ceremony and get their chance of a stray cup of kava or some food.

When the *fow* ceases to give out any more fluid, a second and third are used in the same manner, so that not a particle of the root remains in the liquid. Should more *fow* or water be wanted, an order is given, and twenty or thirty men rush off for it, going and returning at full speed, as if running for their lives; and anything else that may be wanted is fetched in the same manner.

While the operator is going through his task, those who are in the outer circle and cannot properly see him occupy themselves in making cups from which the kava can be drunk. These cups are made of the unexpanded leaves of the banana tree, cut up into squares of about nine inches across. The cups are made in a most ingenious manner by plaiting up the two ends and tying them with a fibre drawn from the stem of the leaf. The Mataboole then orders provisions to be served out, which is done in an orderly manner. To the general assembly this is the most interesting part of the ceremony, for they have but little chance of getting any kava, and it is very likely that they will have a share of food, as the regular kava drinkers never eat more than a morsel or two at these entertainments.

The operator having done his part, now comes the test of the Mataboole's efficiency. The kava is to be distributed in precisely the proper order, a slip in this respect being sure to give deep offence. Should a visitor of rank be present, he gets the first cup, the presiding Mataboole the second, and the presiding chief the third. If, however, the kava be given by one of the guests, the donor always has the first cup, unless there should be a visitor of superior rank to himself, in which case the donor is ignored altogether, only having the kava according to his rank. No person is allowed to have two cups from the same bowl, but after all the inner circle and their relatives are served, the remainder is given out to the people as far as it will go, and a second bowl is prepared. It will be seen that, if the preparer be a man of low rank, he stands a chance of never tasting the liquid which he has so skilfully prepared.

The second bowl is prepared in precisely the same way as the first, except that the second presiding Mataboole gives the or-

ders; and, if a third or fourth bowl be ordered, they take the direction alternately. When the second bowl is prepared, the cups are filled and handed round in exactly the same order as before, so that those of high rank get three or four cups, and those of lower rank only one, or perhaps none at all.

It is a point of etiquette that no chief ever visits the kava party of an inferior chief, as in that case the latter would be obliged to retire from the presidency and sit in the outer ring. When the Tooi-tonga presides, no one presumes to sit within six feet of him; and if perchance an inspired priest be present, he takes the presidency, and the greatest chief, or even the king himself, is obliged to retire into the outer ring on such occasions. A priest always presides at religious ceremonies, and the kava party is held in front of the temple dedicated to the particular god which they are about to consult. But in some cases a god has no priest, and in those cases he is supposed to preside in person, though invisibly, the president's place being left vacant for him.

The reader will see from the foregoing account that kava is a luxury practically confined to the higher classes. The great chiefs and Matabooles drink it every day, either as presidents or members of the inner ring. Those of lower rank obtain it occasionally; while the Toos seldom taste this luxury, except by taking the kava after it has been wrung by the operator, and preparing it afresh.

As the reader will see, it is impossible to separate the secular and religious life of the Tongans. They are inextricably woven together, and therefore must be described together. There are a vast number of ceremonies in which these two elements are united, one or two of which will be described, by way of sample of the rest. The first is the festival of Ináchi, a feast of firstfruits, a ceremony which in principle is found throughout the whole earth, though the details necessarily differ. In the present case, the offering is made to the Tooi-tonga, as being at once the descendant and representative of the gods.

About the latter end of July the ordinary yams are planted in the ground; but those which are intended for the feast of Ináchi are of a different kind, coming to maturity earlier, and are planted about a month sooner. In an illustration on the next page we may see how the yams are set in the ground, and may get a good idea of a Tongan plantation. In the centre of the foreground is the chief to whom the plantation belongs, accompanied by his little boy. As is usual with men of rank in Tonga, he bears in his hand a short, many-barbed spear, which may either be used as a walking staff or as a weapon. The former is its normal use, but the chiefs sometimes

find the advantage of having with them a serviceable weapon. The point of the spear is frequently armed with the barbed tail-bone of the sting-ray. When Finow captured by craft the rebel chief whose death by drowning has already been described, his chief difficulty was the bone-tipped spear which the chief always carried with him, and of which he was temporarily deprived by a stratagem.

One of his laborers is talking to him, having in his hand the hoe with which he has been making holes in the ground for the reception of the yams. Behind him are more laborers, employed in cutting the yams in pieces, and planting them in the holes. Just beyond the yam plantation is a piece of ground stocked with sugar-canes; and beyond the sugar-canes is the house of the chief, known by the superiority of its architecture. The house is built near the sea-shore, and close to the beach a canoe is seen hauled up on its support.

The greater part of the illustration is occupied with the ingenious spiked fence within which the storehouses and dwellings for the Toos, or peasants, are placed. As may be seen, it has no doors, but at intervals the fence is only half the usual height and without spikes, and is crossed by means of stiles, two of which are given in the illustration, one to show the exterior and the other the interior of the fence. Close to the further stile is a young tree, surrounded with a fencing to the height of several feet, in order to guard it, while growing, from the attacks of pigs and children.

The open shed is one of the peasants' houses, under which are seated a number of women, employed in making mats; while some children are playing and fowls feeding by them. Toward the further end of the enclosure is shown one of the storehouses.

As soon as the yams are ripe, the king sends a message to the Tooi-tonga, asking him to fix a day for the ceremony, which is generally settled to be on the tenth day after the request is made, so that time may be given for notice to be sent to all the islands. The day before the ceremony of Ináchi, the yams are dug up and ornamented with scarlet streamers made of the inner membrane of the pandanus leaf. These are in long and narrow strips, and are woven spirally over the yams, first in one direction and then the other, so as to produce a neat checkered pattern, and having the ends hanging loose.

All through the night is heard the sound of the conch shell, and until midnight the men and women answered each other in a song, the men singing, "Rest, doing no work," and the women responding, "Thou shalt not work." About midnight the song ceases; but it is resumed at daybreak, and continues until about eight A. M., accompanied with plenty of conch blowing. The prohibition of work is so imperative, that the

(1.) TONGAN PLANTATION. (See page 990.)

(2.) CEREMONY OF INACHI. (See page 993.)

people are not even allowed to leave their houses, except for the purpose of assisting in the ceremony.

At eight A. M. the ceremony of Inachi really begins, the people crowding from different parts of the Tooi-tonga's island toward the capital town, and canoes approaching in all directions from other islands. All are in their very best, with new clothes and ribbons; while the men carry their most beautiful spears and clubs. Each party carries the yams in baskets, which are taken to the *marly*, or large central space of the village, and there laid down with great ceremony. In the *marly* are ready laid a number of poles, eight or nine feet in length, and four inches in diameter, and upon them the men sling the yams, only one yam being hung to the middle of each pole.

Meanwhile the great chiefs and Matabooles have gone to the grave of the last Tooi-tonga, should it happen to be on the island, or, should he have been buried on another island, the grave of any of his family answers the purpose. They sit there in a semicircle before the grave, their heads bowed and their hands clasped, waiting for the procession, which presently arrives.

First come two boys blowing conch shells, and advancing with a slow and solemn step; and behind them come a vast number of men with the yams. Each pole is carried by two men, one at each end, and, as they walk, they sink at every step, as if overcome with the weight of their burden. This is to signify that the yams are of such a size that the bearers can hardly carry them, and is a sort of symbolized thanksgiving to the gods for so fine a prospect of harvest. As the men come to the grave, they lay the poles and yams on it, and seat themselves in order before the grave, so that they form a line between the chiefs and the yams.

This part of the ceremony is shown in the lower illustration, on the 991st page. In the foreground are seated the chiefs and Matabooles, with their clubs and spears, while the procession of pole bearers is seen winding along from the far distance. Two of them have already laid their yams and poles before the grave, and have seated themselves between the grave and the circle of chiefs, while others are just depositing their burdens on the same sacred spot. Standing by them are the two boys who headed the procession, still blowing busily at their conch-shell trumpets. In the distance, and on the left hand of the illustration, may be seen the people seated in numbers on the ground.

One of the Tooi-tonga's Matabooles then sits between the pole bearers and the grave and makes an oration, in which he gives thanks to the gods for their bounty, and asks for a continuance of it to their offspring, the Tooi-tonga. He then retires to his former place, the men take up their poles, and after

marching several times round the grave, they return to the *marly* and again deposit their loads, this time untying the yams from the poles, but leaving the colored streamers upon them.

Here the whole of the people seat themselves in a large circle, at which the Tooi-tonga presides, even the king himself retiring, and sitting in the back ranks. Next the remainder of the offerings are brought forward, consisting of mats, gnatoo, dried fish, and various kinds of food. These are divided by one of the Tooi-tonga's Matabooles into four equal parts. One of these goes to the gods, and is at once taken away by the servants of the different priests, and the remainder is shared by the Tooi-tonga and the king, the latter, although of inferior rank, getting the larger portion, because he has four times as many dependents to feed. The proceedings are wound up with the kava drinking, which always accompanies such ceremonies. While the infusion is being prepared, the presiding Mataboole makes a speech to the people, explaining the right that has just been concluded, and advising them to pay due honor to the gods and their representative the Tooi-tonga.

WHEN this great potentate dies, there is a most extravagant feast, which often reduces the people to a state of semi-starvation for a long time, and sometimes threatens an actual famine. In such a case, the tapu is laid upon hogs, cocoa-nuts, and fowls for seven or eight months, or even longer, during which time none but the great chiefs are allowed to touch them. Two or three plantations are always exempted, so that there may be a supply for the great chiefs and for the various religious ceremonies. At the expiration of the stated period, if the crops look well, and the pigs and fowls have increased in due proportion, the tapu is taken off with very great ceremony.

One of these ceremonies was seen by Mariner at the Hapai Islands, and a very strange rite it turned out to be. It was held on two *marlies*, one belonging to the Tooi-tonga and the other to the king. As if to compensate for the limited diet of the previous month, food was piled in abundance. On the Tooi-tonga's *marly* were erected four square hollow pillars, about four feet in diameter, and made of four poles connected with matting. These were about fifty or sixty feet in height, and each of them was crowned with a baked hog.

The king's *marly*, which was about a quarter of a mile from the other, was equally well supplied with food, only in this case the yams were placed in wooden cars or sledges, and nearly four hundred half-baked hogs were laid on the ground. The king having arrived, and the signal given for beginning the proceedings, the young chiefs and warriors tried successively to lift the largest

hog, and at last, when all had failed, it was lifted by two men and taken to the other marly. "In the meantime the trial was going on with the second hog, which, being also found too heavy for one man, was carried away by two in like manner, and so on with the third, fourth, &c., the largest being carried away first, and the least last.

"The second, third, fourth, &c., afforded more sport than the others, as being a nearer counterbalance with a man's strength. Sometimes he had got it nearly upon his shoulder, when his greasy burden slipped through his arms, and, in his endeavor to save it, brought him down after it. It is an honor to attempt these things, and even the king sometimes puts his hand to it."

The next part of the proceedings was the carrying twenty of the largest hogs to the late Tooi-tonga's grave, and leaving them there, while the rest, together with the other provisions, were shared among the chiefs, who in their turn distributed them to their followers, until every man in the island gets a piece of pork and yam. The four great columns of yams were given, one to the king, another to the Tooi-tonga, the third to the Veachi and one or two of the very great chiefs, and the fourth to the gods. The Tooi-tonga also took the cars of yams as a matter of tacit though unacknowledged right. Kava drinking, dancing, and wrestling concluded the ceremony; and as soon as the circle broke up, the tapu was considered as annulled.

The twenty large hogs which were laid on the grave were left there for several days; but as soon as they showed signs of putridity, they were cut up, and divided among all who chose to apply for a share of the meat. By right they belonged to the chiefs, but as they were able to procure fresh pork for themselves, they preferred to forego their right, and divide the tainted meat among the people.

The ceremony of Mo'ee-mo'ee, or taking off the tapu contracted by touching a chief, has already been mentioned. The tapu is even contracted by eating in the presence of a superior relation; but there is a conventional way of getting rid of this tapu by simply turning the back upon the superior, who is then considered as not being ceremonially in the presence of the inferior. Should a man think that he may have contracted the tapu unwittingly, he will not dare to feed himself until he has gone to some chief, whose foot he takes and presses it against his stomach. This rite is called the *Fota*, or pressing. Any chief can take away the tapu contracted by touching an equal or inferior, but has no power over that of a superior. Consequently, no one but himself can take away the Tooi-tonga's tapu; and this proved so inconvenient that whenever the potentate went from his house, he left behind him a consecrated bowl as his repre-

sentative, and this was held to be equally powerful in removing the tapu. The Veachi adopted a similar plan. It is a remarkable fact that kava is exempt from all tapu, so that if even the Tooi-tonga has touched a piece of kava root, the lowest cook may chew it.

THERE is a ceremony which in principle somewhat resembles that of Ináchi, though it is conducted after a very different manner. Just as the Ináchi is an offering to the gods in general through the Tooi-tonga, so is this ceremony, which is called the *Towtow*, a special thanksgiving to Alo-Alo, the god of weather. It is begun in the early part of November, when the yams are ripe, and is continued for some three months, at intervals of eight or ten days.

All the islands of Tonga are divided into three distinct portions, namely, the northern division, or *Hahagi*, the southern division, or *Hihifo*, and the middle division, or *Mooa*. Each of these divisions has orders to prepare a certain amount of food, such as yams, cocoa-nuts, and the like, and to bring them to the marly. The correct mode of doing so is to bring them on sticks, so that each stick has upon it seven or eight yams, or a bunch of plantains, or a quantity of bananas. If sugar-canes form part of the offering, they are tied in bundles of three or four in each; and all the offerings, no matter what they may be, are piled up in three great heaps, one being erected by the people of each district.

This being done, and a few preliminary matches of boxing and wrestling played, after about three hours a small procession appears, composed of eight or ten men sent by the priest of Alo-Alo, and accompanied by a young girl about eight or nine years old, who represents the god's wife. She is always the daughter of a chief, and generally of one of the highest chiefs, and, during the eighty days of the ceremony, she resides at the temple of Alo-Alo. She has nothing particular to do, except presiding at one or two feasts and kava parties.

The men are all dressed in mats, and have green leaves tied round their necks. This is the dress of humility and sorrow, and is employed in times of mourning for the dead and supplication for mercy. When they have arrived, they seat themselves in a line, having in front of them a great drum, which is kept for this special purpose. They then offer their prayers to Alo-Alo, begging for propitious weather and good crops, and after these prayers are concluded two of the piles of provisions are carried off by the chiefs, and the third is set aside for the gods. Suddenly the great drum is beaten, on which a general dash is made at the pile of food, every one scrambling for the provisions, and getting as much as he can. There is not the least order in the scramble, and the

scene is a most exciting one, the yams being torn from the sticks, and the sticks smashed to pieces, while the sugar-canes are broken up into fragments. Thus the gods are fed vicariously.
