Part of the significance of ascriptions of individual style for the critical appreciation of particular works of art is said to be their bearing on the expressive and other meaningful properties rightly ascribable to a work. Wollheim (1980), refining a suggestion by Gombrich (1960), argues that it is only through one's grasp of an artist's style that one can determine the precise expressive significance of a configuration of elements in the artist's work, and Robinson (1981) suggests that the same holds for at least some representational and formal properties. But both Walton (1979) and Robinson (1985) insist that what is expressed through the style of a work is not determined by facts about the actual artist, but by facts about the mind or personality of what Walton (1979) terms the *apparent artist*—the mentality or personality the artist appears to have given the stylistic features of the work. However, as Walton recognizes, to ascribe such a role to the apparent artist rather than to the actual artist is far from unproblematic, since what one sees in a configuration of elements in an artistic manifold may reflect ulterior knowledge about the actual artist. One therefore stands in clear need of a principle to delimit when such knowledge is rightly brought to bear in determining the expressivity embodied in the stylistic properties of an artwork.

Even if one thinks of individual styles as ways of doing, it is still through manifest features of the products of those ways of doing that one is able to recognize artists' styles. One question to which one would therefore expect an answer from an adequate philosophical account of style is whether artistic styles admit a univocal characterization in terms of the kinds of manifest features or elements that enter into their expressions. Both Walton (1979) and Robinson (1981, 1984) insist that there can be no checklist of stylistically relevant elements for a given art, since what makes an element part of the expression of an individual style is that it has been used in a particular way in an artistic act that is characteristic of the artist. This allows for all manner of different elements to enter into the styles of different artists and explains why only some elements that figure in an artist's works are mentioned in a style description, why a given element may figure in the style description of one artist but not in that of another who works in the same medium, and why a given

element may have different stylistic significance in the works of different artists (Robinson 1985).

Nelson Goodman (1978) also rejects any attempt to distinguish stylistic from nonstylistic elements in terms of such dichotomies as expressive versus nonexpressive, form versus content, intrinsic versus extrinsic, or "the 'how' versus the 'what' of what is said," and so on. A feature of style may be a feature of what a work says, what it expresses, or of its formal or configurational elements. But, according to Goodman, what makes any such feature stylistic is both its contribution to the symbolic functioning of the work and its linking works together in ways that serve to advance appreciation and understanding, "[T]he style consists of those features of the symbolic functioning of a work that are characteristic of author, period, place, or school" (p. 35).

This suggests a way of reconnecting the two conceptions of style distinguished by Wollheim (1979), since both general and individual style might be connected to symbolic functioning in this way. It also suggests how one might bring into dialogue the stylistic interests of the historian and the critic. Goodman (1978) argues that style, as he conceives it, is of interest not only to the historian, who seeks to correctly attribute a history of making to an artwork, but also to the critic, who can use the attributions of the historian to discover further and subtler shared elements of symbolic functioning in the resulting groupings of works. Walton (1979) and Robinson (1985), however, will insist that one's interest in the individual style of works necessarily refers one back to distinctive features of the artistic acts that seem to result in entities capable of so functioning and that the interest of critics, unlike the interest of historians, is in how things appear to have been made rather than in how they were made. The complex relationships between the stylistic concerns of the historian and of the critic have been commented on by Walton (1979) and discussed at some length by Robinson (1981).

David Davies (2005)

ART, TRUTH IN

The question of artistic truth first arises with the ancients. In his *Republic*, Plato argues that fine art and poetry cannot impart truths because they do not give humankind access to the Forms. Just as a mirror can only deliver a reflection of the particulars that themselves are merely reflections of the Forms, so painting and poetry amount to little more than pale images of Platonic Ideas at a third remove. Aristotle, in contrast, defended poetry

as a means of obtaining general knowledge about probable courses of human events. One could learn from *Antigone*, for example, the likely turn of affairs when two strong-willed and unbending people, each convinced that he or she is in the right, disagree on matters of principle.

Though this topic is usually referred to in terms of "artistic truth," it is more precisely a concern with knowledge and the question of whether one can derive knowledge—or, even more broadly, cognitive value, from artworks. Truth, of course, comes into the picture, since it is one of the criteria of knowledge. Plato maintained that poets, like Homer, had no knowledge to teach and for that reason should not be esteemed as the educators of the Greeks. Aristotle, on the other hand, argued that poetry, especially tragedy, is akin to philosophy, since it has general truths about life to convey, namely universals about what is necessary or probable in the run of human events.

Throughout most of Western history, the view that art contributes to knowledge held sway. However, with the great advances of modern science and the empiricist philosophies that accompanied it, art began to look as though it had comparatively little, if anything, to offer by way of knowledge. Art, indeed, began to be treated by positivist philosophers as a primarily noncognitive enterprise.

Two types of arguments have been raised in order to challenge the cognitive credentials of art. The first group of arguments can be called epistemic. These allege that artworks cannot educate audiences because what artworks have to offer is not knowledge, properly so called; art is epistemically defective in various ways. The second group of arguments can be called aesthetic. They contend that it is inappropriate to expect artworks to function as sources of knowledge, even if for centuries in Western culture and others, art has been an object of respect for this very service.

EPISTEMIC ARGUMENTS

The epistemic arguments against the cognitive pretensions of art include: the banality argument, the no-evidence argument, and the no-argument argument. The banality argument takes a close look at the kinds of theses for which artworks are so often commended for teaching to their audiences. These are often truisms of the order of "crime doesn't pay" or "the prejudice of first impressions can be misleading." If this is knowledge, the skeptic observes, then it is nevertheless hardly something that we are taught by novels like *Crime and Punishment* or *Pride and Prejudice*. Rather, in order to understand such novels, we probably already need to have some version of

these commonplaces in our cognitive stock. According to the banality argument, there may be truths embodied in artworks, but they are rather paltry, bland, and known by nearly everyone before they encounter the artworks in question. So we cannot be said to learn them from artworks. Indeed, having access to these bromides is often a condition for comprehending the very artworks that contain them. But in any event, these truisms are in no way as revelatory as scientific discoveries are; if they constitute knowledge at all, it is common knowledge.

Whereas the banality argument concedes that there may be knowledge, albeit of a threadbare sort, to be had from artworks, the next two arguments deny this possibility. Of course, one can derive beliefs from artworks; but skeptics charge that it is impossible to gain knowledge from artworks. For knowledge involves not only beliefs, or even true beliefs; those beliefs must also be based upon something—either evidence or argument. And artworks, as a matter of form, it is charged, typically lack these sorts of accompanying justifications.

The no-evidence argument shows the influence of empiricism most clearly. Since Aristotle, it has been claimed that artworks, notably literature, give us knowledge of general truths concerning human life. But, the skeptic retorts, most artworks trade in particulars and one cannot justify a general claim on the basis of a single case. It is not adequate evidence, even if the case is as arresting as that of *Antigone* versus Creon. Moreover, a very great many of the case studies that are supposed to carry these generalizations about human life are fictional. No claim, general or otherwise, can be supported by a made-up story. Furthermore, most of these fabricated stories are invented precisely to corroborate the point the author wishes to promulgate. So not only is the evidence insufficient; it looks like it is tainted to boot. Thus, the skeptic surmises, artworks cannot be said to afford the kind of general knowledge for which they are so often applauded just because they are evidentially defective.

Of course, not every general claim needs to be supported by empirical evidence. Many philosophical generalizations are not. And the knowledge in which much art is said to traffic is philosophical, concerned, for example, with issues like free will. Since no amount of evidence is going to sway the free will debate one way or the other, the fact that artists do not back up their perspectives on free will with empirical evidence makes them no worse off than philosophers. The no-evidence argument, that is, does not cut against philosophical artworks.

But, the skeptic replies, genuine philosophical theses, even if unaccompanied by a body of empirical evidence,

are nevertheless advanced by means of argument and/or analysis. Yet that is something that artworks characteristically have not got. *Nausea* may assert that humans are free; the novel may even be said to illustrate the point. But there is *no argument* to that conclusion in the book. However, if there is no argument, then there is no philosophical knowledge to be had from the text. At best there is unsubstantiated belief.

Nor, the skeptic adds, do commentators on artworks—including even those commentators who speak as though artworks are involved in making philosophical knowledge claims—argue about the truth or falsity of the cognitive theses they excavate from artworks. This lack of concern with argumentation by critics, then, is thought to lend additional credence to the skeptical view that art is not in the knowledge business. If it were, there would be more explicit argumentation both inside the artworks and in the critical estate that surrounds them. The lack of argumentation implies that art is not about securing knowledge, and, be that as it may, sans argumentation it does not do so anyway.

AESTHETIC ARGUMENTS

The epistemic arguments against art propose that what artworks deliver is not worth being called knowledge—it is either too trivial or it is unjustified. As a matter of fact, art just is not a suitable vehicle for the communication of anything robust enough and defensible enough to be counted as knowledge. But another set of arguments worries that knowledge is just the wrong thing to expect from artworks. Even if some artworks could convey knowledge, knowledge is never something we should legitimately expect from artworks. These arguments may be regarded as aesthetic, rather than epistemic, in nature. Three of them are: the common denominator argument, the no-expertise argument, and the mistaken-belief argument.

The common denominator argument points out that even if some artworks appear to provide knowledge—as *Moby Dick* does concerning whaling—many other artworks, like a great many string quartets, do not. Therefore, the expectation that artworks afford knowledge or even that they suggest knowledge claims does not apply to all artworks. Knowledge is not a generic criterion of artistic excellence. Yet if something is a criterion of artistic excellence, it must be relevant to the evaluation of every artwork. Knowledge is not. Consequently, knowledge is an inappropriate expectation to bring to an artwork qua art.

Artists study their craft and the materials that comprise their art form. Painters learn perspective, poets mas-

ter prosody, musicians scales, and so on. Their expertise is with the tools of their trade. They are not psychologists or political scientists or sociologists. They have no special expertise that entitles them to float generalizations about human life. How would a studio-arts education prepare one to discourse on human affairs? This is one of the earliest charges lodged against the attempt to enlist art as a producer of knowledge. Perhaps Plato holds the copyright on the no-expertise argument; Socrates used it to demolish Ion and, by extension, Homer.

Another argument striving to demonstrate the irrelevance of the pursuit of knowledge by art stresses that many artworks have been committed to beliefs that we now regard as obsolete and mistaken, and yet we still esteem the works in question. Indeed, many classic artworks are committed to beliefs that are contradicted by the beliefs recommended by other classic artworks and still, despite these contradictions, we are happy to embrace works on both side of the debate (say free will versus determinism) as canonical. But, it is conjectured, this would not be possible if we thought that truth and knowledge were appropriate standards for art. In that case, artworks associated with false beliefs would have to be demoted in our estimation. That they are not implies that knowledge is not an appropriate concern when it comes to art.

RESPONDING TO THE SKEPTICS

These arguments against the cognitive status of art are longstanding and serious. However, they can also be challenged in various ways. As a group, the epistemic arguments presuppose that if art is cognitive, then it will transmit knowledge to its audiences and this knowledge will take the form of general truths that can be stated in propositional form. Consequently, commentators often seek to outflank the epistemic objections by refusing this presupposition and locating the cognitive contribution of art primarily elsewhere than in the presentation of innovative general truths that can be articulated in propositions.

There are a number of different—nonexclusive and nonexhaustive—alternative candidates here and each suggests a way in which art may be said to make a contribution to cognition, broadly construed. Against the banality argument, it may be said that though artworks often deal in commonplaces, these are commonplaces that we are apt to forget. The cognitive function of art in this regard is to recall to mind the kinds of truths—such as the dangers of indulging a hasty prejudice or refusing to bend when one right is on a collision course with

another—that are well known but oft forgot. Artworks, like *Pride and Prejudice* and *Antigone*, are vivid reminders of what we already know, but that of which we are prone to lose sight.

Indeed, artworks—engaging as they do the senses, feelings, emotions, imaginations, and cognitions of their audiences—are especially efficacious instruments for educating peoples in the ethos of their culture, because by mobilizing so many powers of a person at once, artworks deeply embed the common knowledge of a society in its participants in a way that makes it readily accessible for retrieval and use. Arguably, the multidimensional address of the artwork suits it as a means for educating a populace in its ethos in a fashion unrivaled by any other mode of communication.

Epistemic arguments appear to suppose that the only relevant sort of knowledge is *knowing that*. But in addition to propositional knowledge, there is also knowledge by acquaintance. Thus, defenders of the educative power of art maintain that art can provide knowledge by affording the opportunity for audiences to learn about certain experiences from the inside—to acquire, perhaps by simulation or empathy in the process of watching a film, a sense of or a feel for what it would be like, for example, to be a slave.

Moreover, in addition to knowledge by acquaintance, there is also know-how. Artworks can contribute know-how in many ways. For example, many of our concepts of virtue, vice, and other character traits are rather abstract, as are our moral principles. In order to learn how to apply these extremely abstract concepts and maxims, we need practice. Artworks, especially fictions, can provide the opportunity to hone our powers of judgment by giving us particulars, often subtly drawn, that enable us to deepen our faculties of judgment and our skill in deploying them. That is, artworks may enhance cognition by putting it to work in assessing fictional characters and actions in terms of concepts and principles—moral and otherwise (e.g., psychological, political, social)—that we possess abstractly, but which we need to exercise concretely in order to acquire a genuine command over them. Furthermore, inasmuch as a refined sensitivity toward the relevant concepts, like true heroism, plays a role in eliciting appropriate emotional responses, artworks facilitate the education of the emotions.

In addition, artworks may serve the cognitive purpose of orientation; they may help us map our world. Novels present us with crystallizations of various character types—often newly emerging ones, like the radical empiricist in Turgenev's *Fathers and Sons* or the gallery of

social tendencies inventoried in Balzac's *Comedie Humaine*, or the eponymous Sammy in *What Makes Sammy Run?* These character profiles—sembling a significant constellation of attributes—operate like concepts, supplying us with recognizable paradigms of social types which may even help us to navigate everyday life. Such paradigms are not true or false in the manner of a proposition, but apt or fitting. Nevertheless, aptness is as indispensable to cognition as propositional truth. Indeed, Nelson Goodman claims that the ultimate value of art is that it supplies us with apt models of the world.

Furthermore, art can tutor perception. Landscape painting and portraits can teach us how to look at the world. And Goodman has stressed the way in which even abstract paintings exercise and expand the viewer's ability to make fine perceptual distinctions.

One way to deal with the epistemic arguments, then, is to outflank them. But they can also be tackled head-on. Against the no-evidence argument, it is important to remind the skeptic that not all artworks are fictions and therefore cannot be uniformly dismissed as being evidentially empty for that reason. Nor is it only nonfiction literature with which the skeptic must contend. There is also photography, nonfiction motion pictures, and much installation art.

Moreover, even fictions can contain evidence. Thus, there is no grounds for summarily rejecting all fiction as incapable of proffering propositional knowledge. Michael Crichton's novel, *State of Fear*, about environmentalism, includes argumentative theses replete with footnotes to substantiate its case. Whether or not Crichton's book is correct is one question. Nevertheless, it is clear that a novel like it could be written that might succeed in proposing a series of true propositions supported by the appropriate documentary apparatus. This conjecture seems unobjectionable, furthermore, since, though many critics have complained about the quality of *State of Fear*, no one has denied that it is a novel.

Moreover, skeptics are wrong to contend that critics do not initiate charges of falsity accompanied by arguments against fictions. Presently secular humanists in the United States are waging a campaign against horror fictions for fostering superstitious beliefs. Likewise one can bet money that commentators sympathetic to the environmental movement will meet Crichton with the kinds of arguments they would unfurl against any scientist or politician who impugned their theories.

But we need not resort to Crichton to bridle at the no-evidence argument. We need only point out that it

sets the bar for communicating knowledge too high. No one denies that the journalism on the op-ed pages of newspapers can convey knowledge. But the beliefs advanced there typically come to us without the kind of evidence it would take to vindicate them in the highest courts of reason. Rather, the author leaves it to the reader to reflect upon her assertions, encouraging us to weigh them against our own experience and to search out further proof of their accuracy. Likewise it may be argued that artists generally play by comparable rules. A novel like *Bonfire of the Vanities* provides a sketch of the 1980s that we are invited to substantiate on our own. Hence, if the aforesaid journalist is allowed into the knowledge game, so should a certain kind of novelist be. Indeed, doesn't the communication of knowledge usually leave some of the work of corroboration up to the reader? Consequently, that artworks encourage readers to test the hypotheses they suggest in what Peter Kivy thinks of as the laboratories of their minds is not an epistemic deficit. It is a recurring feature of the communication of knowledge across the board.

Similar reservations can be brought to bear on the no-argument argument. Not all theses are defended by means of empirical evidence. Most philosophical claims are not. A leading form of argument in defense of philosophical conjectures is the thought experiment—characteristically a narrative fiction predicated upon engaging the mind of the listener in a process of reflective equilibrium leading to a certain conclusion. But if philosophers are entitled to thought experiments as a mode of argument and/or analysis, why should artists be denied equal logical rights?

Many artworks are narrative fictions. Some at least are arguably thought experiments designed to encourage the embrace of certain discoveries, such as insight into the true nature of courage or compassion. That is, artworks may not only enable us through practice to apply concepts with finesse; they may also invite reflection upon the grammar of the concept in question—either by foregrounding a heretofore unappreciated essential criterion of the concept or by reminding us of the kinds of considerations it pays to remember whenever applying the concept. That is, a narrative artwork, functioning as a thought experiment, can engage the mind of the audience in a process of reflective equilibrium that results in propositional knowledge concerning the concept under scrutiny. Moreover, where the artwork is operating as a thought experiment, it is not without argument; the thought experiment, rather, stages the argument in the minds of the audience.

The aesthetic arguments against artistic claims to knowledge are not more decisive than the epistemic ones. The common denominator argument correctly observes that not *all* artworks are such that it is appropriate to evaluate them in terms of the knowledge they impart. They are not all vehicles for communicating knowledge; that is not the kind of thing they all are. So if aesthetic evaluation is keyed to the kind of thing a work is, then knowledge is not the sort of thing to employ in the assessment of, for example, most string quartets.

This much is true. However, the aesthete's argument here is more ambitious; it is that knowledge is never an appropriate measure of an artwork. However, some artworks, given the kinds of things they are essentially, are justifiably expected to bequeath knowledge, even propositional knowledge, to their audiences. This is not only the case with certain nonfiction examples. For instance, realist novels are committed, in virtue of their genre, to the production of various insights including social, psychological and political ones. Fledgling realist authors are instructed to become astute observers just because they are expected to inform readers about psychology and social mores. Moreover, since that is the kind of thing a realist novel is—i.e. B; in effect, the genre to which it belongs—it follows that in such cases disclosing truths figure in artistic evaluation. That the expectation of knowledge is inapposite with respect to many genres does not entail that it is out of bounds for every genre. It is not true that a criterion of artistic excellence must apply globally. Many art forms and genres may possess local standards of excellence given the kinds of artworks they are—the realist novel being a case in point.

The realist novel also indicates what is wrong with the no-expertise argument. Some artists—like realist novelists—are expected to sharpen their powers of psychological and social observation as part of their job description. Furthermore, with many of the things that realist authors have expertise in isolating and explaining—such as the ways of the heart or the claims of social justice—it is not really clear who the better experts are. And, in any event, given the power of artworks to engage simultaneously the whole person—feeling, imagination, memory, perception, cognition, and so forth—it is not evident that there is any more effective way of instilling these truths in recipients than artworks.

Lastly, the mistaken-belief argument is a non-starter. To maintain that knowledge may be a virtue in artworks does not imply that it is the only virtue. Thus, it may be the case that works that contain mistaken, perhaps outmoded, beliefs nevertheless have other merits that dis-

pose us to keep them in the canon. That is also why we may be happy to welcome classics that contradict each other into our pantheon. One virtue that they may possess is that they articulate compellingly the mistaken beliefs they uphold as a work from an archaic culture might. Here, the work gives us knowledge of the past, albeit inadvertently. But at the same time if the work is designed formally in such a way that its theses, however false, are given their best face, then we can appreciate the work aesthetically, despite its cognitive shortcomings. Thus, the fact that palpably false artworks continue to hold our interest does not show that truth and knowledge may not be pertinent to our respect for some other artworks. At best it shows that they are not our only desideratum.

Noël Carroll (2005)

ART, VALUE IN

The question of the nature of art, what art is, has been much more widely discussed in philosophy than the question of its value, why art matters. The two issues cannot be completely disentangled, of course, since any account of what makes art art will inevitably isolate features of special importance. In fact, all the main theories of the nature of art have an implicit explanation of its value, but since the question of the value of art has social as well as philosophical significance, it is useful to make

these implicit accounts explicit, and thus expose them to critical scrutiny.

Four lines of thought have emerged as the principal ways in which philosophers and artists have explained the importance of art. These can be given convenient labels: hedonism, aestheticism, expressionism, and cognitivism. Briefly, the first holds that art is valuable for the pleasure derived from it; the second that art is valuable as a source of beauty; the third that art is valuable as a vehicle for expressing emotion; and the fourth that art is a source of knowledge and understanding equivalent to, but distinct from, science and philosophy.

Abstractly stated in this way, it unclear whether any of these theories construe the relationship between art and its value as intrinsic or instrumental. That is to say, is the value in question to be found in art itself, or is art simply a means to it? We might also wonder whether the value resides in the properties of art objects—books, sculptures, paintings, compositions, and so on—or in the experiences that these things give rise to in those who look or listen. These are issues that can be examined at a general level, but in fact the distinctions that they invoke—intrinsic/instrumental and object/experience—are more important in some explanations of the value of art than in others.

HEDONISM

The contention that art is valuable for the pleasure we derive from it is both longstanding and widespread. Indeed, most people, including those engaged in the arts, probably assume its truth without question. Yet as an explanation of the value and importance of art, it faces several difficulties. Before these can be considered directly, one point of clarification is required.

It is natural for people to describe their engagement with the arts in terms of enjoyment, and to express their artistic judgments in terms of liking and disliking. One result is that positive responses to art are usually construed as expressions of enjoyment obtained from encountering things we like. This then leads to the assumption that a favorable view of an artwork is an expression of pleasure. But in fact the conflation of pleasure and enjoyment is a mistake. Enjoyment can arise from other things besides pleasure. While the enjoyment of a good wine or a fine meal is largely, and sometimes exclusively, the result of gastronomic pleasure, a scientific lecture or a television documentary can be enjoyable for their intellectual content. They provide us with interesting material to think about, rather than a pleasurable experience to savor.

It might be replied that intellectual stimulation is a special kind of pleasure. The danger with this response is that it simply collapses the valuable into the pleasurable, and thus converts a substantial claim—that art is valuable *because* it is pleasurable—into an uninformative analytic claim—that to say art is valuable is *the same* as saying that it is pleasurable. In this way the claim about value and pleasure becomes true by definition. It follows that if hedonism about art is to be a substantial theory, we need to distinguish between enjoying something and getting pleasure from it. The fact that we derive pleasure from something is *one* reason for enjoying it and finding it valuable. But it is not the only possible reason.

In the light of this clarification we can now state the three main questions facing hedonism about art. First, is it generally true, as a matter of empirical fact, that the arts generate pleasurable experiences? Second, is it possible to discriminate between major and minor works of art in terms of pleasure? Third, if art is valuable because of the pleasure it gives us, would not other, better sources of pleasure make art redundant?

The first of these questions is a factual matter about which we have to be open-minded. Since probably the majority of people who philosophize about the value and importance of art are themselves art lovers, there is a tendency to assume that art does generally give pleasure. But the statistics of people attending classical concerts, reading serious literature, and making visits to art galleries do not bear this out. Considered solely in terms of the pleasure they give, soap operas, pop music, television shoot-'em-ups, and romantic pulp fiction almost certainly top grand opera, classical music, Shakespeare, and nineteenth-century Russian novels. Indeed, the position of the arts is worse than this. Far more people are bored by Shakespeare than are entertained by him, and to those same people, two hours of Bach or Beethoven is probably a dreadful prospect. Even artworks expressly created for entertaining can, with the passage to time, cease to provide much in the way of pleasure. For example, compared with modern television comedies like *Friends* or *Blackadder*, Restoration comedy is a very poor source of amusement.

The examples chosen to make this point can also be used to elaborate the second of the two difficulties outlined above. An enthusiast for classical music might insist that the principal value of concert going is indeed the pleasure we derive from it. While it is true that tastes differ, this pleasure, for those who find concert going pleasurable, is just as great or even greater than the pleasure of pop music, chiefly because high-quality music gives

pleasure repeatedly. A similar claim might be made on the part of all the arts, but even if we concede that the arts give great pleasure to those who like them, this does not give us any reason to rank them higher than more mundane sources of pleasure, like crossword puzzles, jigsaw puzzles, or board games.

This issue was expressly addressed by the utilitarian philosopher Jeremy Bentham (1748–1832), who was willing to argue that since pleasure is the ultimate source of all value, pushpin (a kind of board game) is as good as poetry. What Bentham did not observe, however, is that subscribing to hedonism raises not only a question about the comparative value of the aesthetic and the nonaesthetic but also a problem within the realm of the aesthetic itself. If the value of an artwork is derived from the pleasure it gives, then major works of art must give more pleasure than minor ones. But have we any reason to believe this? Can pleasure be correlated with estimations of aesthetic merit? Is a piece of music by a major composer like Beethoven, for example, guaranteed to give more pleasure than one by a minor composer like Luigi Boccherini?

This raises a contentious philosophical topic: whether pleasure can be measured or not. But even if it can, it would be difficult to show that the relative amounts of pleasure given by different works of art can be mapped onto the relative artistic merits customarily accorded to them. One suggested solution to this second difficulty is to be found in Bentham's utilitarian successor, John Stuart Mill (1806–1873), who tried to draw a distinction between higher and lower pleasures, a distinction that might be called upon to distinguish the relative merits of poetry over those of pushpin and the merits of Beethoven over those of Boccherini.

How are we to differentiate between higher and lower pleasures? According to Mill, this can only be done in terms of quantity or quality. The former, he thought, will not serve the purpose, since if the only difference between higher and lower pleasures is quantity, then any lower pleasure can equal the value of a higher pleasure provided there is more of it. Lots of pushpin will be equivalent to a little poetry. So the difference between the two must be qualitative. How is this difference in quality to be assessed? Mill's answer is that we should entrust the assessment to a competent judge, defined as someone who has experience of both the pleasures in question. The problem with this proposal is that the deliverances of such a judge cannot in principle be distinguished from mere preferences. Perhaps someone who declares opera to be a higher pleasure than soap opera does indeed

detect differing qualities of pleasure arising from each of them. But it could be that there is no more to this "judgment" than a personal preference for opera. And we have no way of telling which is the case.

In any event, there is a further difficulty. If the value of art lies in the pleasure we get from it, and if, as seems obviously true, there are other good sources of pleasure, sports for example, it follows that a world without art would be no worse off than a world with art, provided that it had other sources from which equally pleasurable experiences could be generated. This objection relates to an important distinction drawn at the start, the instrumental versus the intrinsic. Hedonism attributes instrumental value, rather than intrinsic value, to art, and thereby implies that art has no value in and of itself. It is chiefly on this point that an alternative theory of the value of art, aestheticism, is built.

AESTHETICISM

The slogan "Art for art's sake" is a familiar one, and it is intended to capture the thought that art has value that cannot be accessed or realized in any other way. What could this intrinsic value be? One obvious contender is beauty. Since ancient times it has been believed that an important function of the arts is to make beautiful things—paintings, poems, music, buildings, and so on—and that these are to be savored for their beauty alone. Aestheticism holds that, though beautiful things are indeed pleasing, it is in their beauty, and not in the pleasure they give us, that their value lies. Since this beauty is an intrinsic property of the object, it cannot be replaced or substituted for without loss, as the extrinsic effect of giving us pleasure can be.

Now while it is undoubtedly true that many artworks are very beautiful, and valued in large part for this reason, it does not seem plausible to make beauty the ultimate explanation of their value, for two reasons. First, beauty is to be found elsewhere than in art. Second, not all art is, or aims to be, beautiful.

The first point is established by the existence of natural beauty. From the time of the ancient Greeks, human bodies and faces have not only been admired for their beauty, but regarded as templates and standards by which the beauty of pictures and statues is to be measured. Since the eighteenth century, landscapes, skies, and seascapes have also been held up as striking instances of the beautiful. All of these things are natural, not manufactured, and are therefore not works of art (the issue of divine creation aside). But if beauty is all around us in natural forms, a world without art would not be a world without beauty,

and while this fact does not detract from artistic beauty, it does mean that beauty does not give art any special claim to value.

In any case, while some artworks are indeed beautiful, not all are. For some works of art, in fact, the concept of beauty seems hard to apply. There are beautiful speeches in Shakespeare's tragedies, but could *Lear* or *Othello* be called "beautiful" as a whole? Moreover, even in the visual arts and in music, many widely acclaimed works seem expressly to eschew beauty. In Picasso's famous painting *Les demoiselles d'Avignon*, the figures and faces are ugly—deliberately so, it seems. Many modern composers have written music that is harsh and disjointed rather than harmonious and melodic. The pre-Raphaelite painters and Romantic composers of the nineteenth century strove for visual and aural beauty, but the movements that followed them in the twentieth century strove equally vigorously to avoid it. In short, exclusive focus on beauty can at best explain the value only of some art, and even then not uniquely so.

EXPRESSIONISM

These two objections to aestheticism are overcome in a third theory: that the value of art lies in its being an expression of emotion. The difference between natural beauty and beauty in art is that the former is not an expression of anything, whereas the latter is. It is the expression of the artist's emotion or feeling. Conversely, though emotion can be expressed through beauty, it can be expressed in other ways too. What enables us to classify Titian and Picasso, Schubert and Schoenberg together under the label "art" is that these radically different styles are all equally modes of expression.

Expressionism as an explanation of the value of art is almost as widely held as hedonism. Among its best known advocates were the Italian philosopher Benedetto Croce (1866–1952) and the great Russian novelist Leo Tolstoy (1828–1910). But on closer inspection, it too encounters great difficulties. Three are specially important: Whose emotion is it that an artwork expresses? Why is the expression of emotion a good thing? What place does expressionism leave for imagination?

It might seem obvious to answer the first of these questions by saying that the emotion expressed is that of the creator (the author, painter, composer, and so on). But suppose we say of *Othello*, for example, that it is a dramatic expression of jealousy. What reason have we to say that it is *Shakespeare's* jealousy that is expressed? Since we know hardly anything about Shakespeare, still less about the circumstances in which he came to write this

play, we have no reason to say this. Something similar is true of a huge number of artworks. We do not know much, if anything, about the psychological or emotional history of their creators, and so we cannot say whether they ever felt the emotions expressed in their works.

An alternative would be to locate the emotion in the audience. Aristotle thought that dramatic works are "cathartic." That is to say, they become the vehicles by which audiences give vent to emotions that are often debilitating when discharged into ordinary life. His examples are fear and pity. By discharging these emotions on imaginary objects, we are less burdened by them in the business of day-to-day living. Aristotle only applied the theory of catharsis to drama, and it is unclear whether it could equally be applied to all the arts. But even if it can, there is this further question: What is so good about the expression of emotion as such? Imagine that a work enables those who watch, listen, or otherwise contemplate it, to give vent to ethnic feeling. Without the work, their racist emotions would never have had such clear definition or powerful expression. But why should that commend the work to us? It seems most plausible to hold that it is the powerful expression of *good* emotions that is to be valued, not the powerful expression of emotion per se. On the contrary, hurtful or destructive emotions ought not to be given powerful expression.

To identify the emotion expressed in a work of art as the audience's, then, carries no positive value; it could as easily be negative. To attribute it to the author means, in a very large number of cases, making unwarranted assumptions about the artist's psychological biography. But a further objection is that, by insisting that the origins of an artwork must lie in its creator's personal history, we seem thereby to deny any influence to the very faculty that seems central to artistic creativity, namely imagination. The great genius of such a major work of art as the novel *Middlemarch* lies in George Eliot's ability to rise above the confines of personal experience and imagine a world of people and events that the author never encountered. The most fundamental objection to expressionism is that it reduces acts of imagination to acts of reporting and recording.

COGNITIVISM

Some exponents of an expressionist account of art, notably R. G. Collingwood (1889–1943), have seen this difficulty and, in their efforts to avoid it, have effectively shifted the center of attention from feeling and expression to imagination and understanding. If there is any value in works that express or depict racist or other neg-

ative feelings, it lies not in the expression itself, but in the extent to which it gives us insight into the minds of those who have such feelings. This idea motivates the move from expressionism to cognitivism, the view that art should be valued as a form of understanding. On this view, the powerful expression of emotion we find in *Othello*, for example, should be valued for enabling us to understand and appreciate the mind of the intensely jealous. From this point of view, the play supplies its audience with material for thought rather than feeling, and it is of no consequence whether Shakespeare ever felt any of the same sort of rage as the character he invented. Indeed, it adds to the critical assessment of the play if he never did, since in that case the play stands as an even more impressive act of imagination.

Aesthetic cognitivism thus overcomes the most important objections to expressionism by construing artworks as acts of imagination rather than autobiography, and valuing them as such. By shifting the focus to imagination, it also circumvents some of the objections brought against aestheticism and hedonism. The products of the imagination can be beautiful, but this is not what makes them works of art. Artworks stand in contrast to natural beauty because natural beauty is not the outcome of imagination. The relative merits of major and minor works lie in the degree to which the understanding they offer us is more or less profound, and this is a judgment quite independent of the pleasure we do or do not derive from them. Relatively shallow works can be attractive and pleasing; much more profound ones rather taxing.

And yet aesthetic cognitivism faces difficulties of its own. First among these is the relation between imagination and reality. If we are to say that works of art enhance our understanding, this implies that they give us insight into the realities of human experience. But how can they do this if the people, places, and events that they depict are all products of the imagination? Must not understanding track how things really are, rather than how someone has imagined them to be? Second, while aesthetic cognitivism may seem plausible with respect to representative art, it seems more implausible when applied to abstract art. Great novels, films, and figurative paintings are easily thought of as giving us insight into life, but how can this be said of abstract painting, instrumental music, or architecture?

These are important questions, and it is by no means clear that they can be answered. But even if they can, there is a further issue. Does cognitivism about the arts not lead to their redundancy somewhat as hedonism

does? G. W. F. Hegel (1770–1831) was perhaps the greatest philosopher whose account of art can be broadly described as cognitivist, and he quite explicitly thought that because its value lies in its contribution to the development of human understanding, art must eventually be replaced by philosophy. Even at its best, we might say, art can only gesture toward the sort of understanding that philosophy makes explicit.

The most promising reply to this anxiety lies in stressing the sensuous nature of art, which enables it to enhance our felt experience. An artwork does not tell us about the nature of things, events, or people by formulating general statements about them. Rather, it depicts what has been called a “concrete universal,” products of the imagination that give us a sense of what it is like to be present and to undergo the experience of things, people, and events from a particular perspective. In other words, art illuminates the things around us rather than providing us with information about them in the way that science, history, and philosophy do.

Whether this response is ultimately satisfactory is a large topic, but cognitivism’s emphasis on the sensuous and on the imagination has the merit of being true to two central aspects of the arts. One further implication of cognitivism is that if the sensual is essential, the late-twentieth-century movement known as *conceptual* art may signal an acknowledgment of the end of art. This is an implication that some philosophers, notably Arthur C. Danto, have endorsed and even welcomed.

ARTIFICIAL AND NATURAL LANGUAGES

The only natural languages we know of are human. In addition to such human languages as English, Spanish, Russian, and Chinese, with which we are all familiar, there are many less well-known languages, many of them spoken by hundreds of people. The more marginalized languages are dying out at an alarming rate. Owing to lack of evidence, our information about their origin is limited, but it seems likely that they evolved out of communication systems similar to those used by animals for communication. Living human languages are learned as first languages by infants and are used for face-to-face communication and many other purposes.

Natural languages are influenced by a mixture of unconscious evolutionary factors and conscious innovation and policy making. In most cases, the historical record does not allow us to tell what role these factors played in the development of a given feature, but the difficulty of consciously controlling the language used by a large population suggests that unconscious causes predominate.

The term “artificial language” is often used for humanlike languages that are created either for amusement (like J. R. R. Tolkien’s Elvish) or for some practical purpose (Esperanto). Information on such projects can be found in Alan Libert’s work (2000).

Artificial languages of a quite different sort are created for scientific and technological reasons, and the

design of such languages is closely connected with logical theory. Logic originated with Aristotle in his *Prior Analytics*. Although Aristotle’s syllogistic theory used symbols for terms (such as “some,” “all,” “not”) that make up propositions, such symbols and the expressions made up out of them were not generally considered as part of a linguistic system until much later.

Modern logical theory and its connection with artificial languages owes much to the search for a universal language in the seventeenth century (Maat 1999). In Britain, George Dalgarno (1668 [1661]) and John Wilkins (2002 [1668]) promoted the idea of a philosophical language based on rational principles. In retrospect, their ideas seem to be more closely aligned with the goal of designing an improved human language than with the mainstream development of logic and were more concerned to facilitate clear expression of ideas than to serve as a framework for developing a theory of reasoning. Their projects stressed the need for basing a vocabulary on a rational ontology and are more closely connected with later attempts to develop taxonomies and thesauri than with logic per se.

At about the same time, however, G. W. Leibniz attempted to develop a “universal characteristic” based on several ideas central to the later development of logic and artificial-language design. In his “Dissertatio de Arte Combinatoria” (excerpts in Loemker 1956, pp. 117–133), written in 1666 when he was nineteen years old, Leibniz presents a logical program that, in its main proposals, informed his philosophy for the remainder of his life.

Like Dalgarno and Wilkins, Leibniz adopted the goal of a rationally ideal philosophical language, but he differs from them in the stress he lays on reasoning and in the degree to which his account of reasoning is inspired by mathematics. The leading ideas of his program—that truth can be discovered by analysis, or division of concepts into basic constituents; that such analytic reasoning is analogous to combinatory reasoning in mathematics; and that it is facilitated by a language with a clear syntactic structure reflecting the meanings of expressions—have furnished important insights for subsequent work in logic. The stress that Leibniz placed on calculation as part of the reasoning process gives him a well-deserved central place in the history of logic and computation.

The two weak points in Leibniz’s program are (1) the assumption that once analysis was achieved in an ideally rational language, testing a proposition for truth should be a relatively trivial matter, and (2) the idea that analysis is appropriate and possible across the entire range of rational inquiry. The first of these weaknesses was cor-

rected late in the nineteenth century, when Gottlob Frege developed a symbolic language for the representation of “pure” or mathematical thought. Frege’s “*Begriffsschrift*,” or conceptual calculus, achieves the goal prefigured by Leibniz of a language designed to facilitate reasoning by allowing the relations between concepts to be clearly and unambiguously displayed. And it conforms to the methodological ideal of being completely explicit more than any previous attempt to present an artificial language. Frege’s presentation of the *Begriffsschrift* makes it possible to test each constellation of symbols to tell whether it is a well-formed formula (an expression that conforms to the syntactic rules of the system). Although part of proving such a formula in Frege’s calculus is a matter of analysis, or the application of explicit definitions, the result of such analysis is a formula that must be proved using logical laws. These laws are explicitly formulated, so that it is also possible to tell whether or not a purported proof conforms to the rules of the system. But *whether there is a proof* of an analyzed proposition need not be a question that can be solved algorithmically. In fact, as the theory of the nature of reasoning systems has shown, we cannot in general expect to have an algorithmic criterion for whether a formula is provable.

The second weakness in Leibniz’s program is more difficult to deal with decisively. But many years of experience indicate that we have no reliable methodology for isolating universal atoms of human thought. In many extended attempts to make the rules of reasoning in some domain explicit, it seems more useful to deal with many primitives that are conceptually related by axioms rather than by definitions.

Alonzo Church summarized the results of more than seventy-five years of philosophical and mathematical development of Frege’s achievement in section 7, “The Logistic Method,” of his *Introduction to Mathematical Logic* (1956). In that and the subsequent two sections, Church sets out the methods logicians had established in the first half of the twentieth century for constructing artificial logical languages (or, to use the usual current term, *formal languages*) and theorizing about them. These methods have changed slightly in the subsequent forty-eight years, the most significant changes having to do with interest in applications other than the explication of deductive reasoning and in the widespread use of formal languages in digital computing. In the beginning of the twenty-first century, it is not essential for formal languages to have a deductive component, and in some cases it may be important to associate implemented computational procedures with a formal language.

What are the essential features of a formal language? First, a formal language must have a *syntax*, a precise definition not only of the vocabulary of the language but also of the strings of vocabulary items that count as well-formed formulas. If other types of complex expressions than formulas are important, for each such *syntactic type* there must be a precise definition of the set of strings belonging to that type. These definitions must be not only precise but *effective*; that is, questions concerning membership in syntactic types must be algorithmically decidable. These syntactic definitions are usually presented as inductive definitions; for instance, the simplest formulas are defined directly, and rules are presented for building up complex formulas from simpler ones. The set of well-formed formulas is not only decidable but usually belongs to a known restricted class of efficiently computable sets of strings. The *context-free* sets of strings are heavily used in computational applications, and are also capable of standing in for large parts of human languages.

Second, if proofs are associated with the language, these too must be precisely defined. Whether or not a list of formulas is a proof must be algorithmically decidable.

Third, the formal language must have a semantic interpretation, which associates *semantic values* or *denotations* with the well-formed expressions of the language. The importance of a semantic component was recognized by Alfred Tarski, who also provided a methodology for placing semantics on a sound mathematical basis and applying it to the analysis of mathematical theories.

A version of Tarskian semantics due to Alonzo Church (1940) starts with a domain of individuals (the objects that the language deals with) and a domain of truth-values (the two values True and False) and constructs possible denotations by taking functions from domains to domains. Sentences, for instance, denote truth-values, and one-place predicates (verblike expressions taking just one argument) denote functions from individuals to truth-values.

In a semantics for deductive reasoning, truth-values are essential. Once the legitimate interpretations (or *models*) of a language are given, the validity of an inference (say of formula *B* from formula *A*) can be defined as follows: The inference is valid if every model that assigns *A* the value True also assigns *B* the value True.

The theory of any language (natural or artificial) has to be stated in some language. When one language serves as a vehicle for formulating and theorizing about another language, the first is called the *metalinguage* for the sec-

ond, and the second is called an *object language* of the first. Nothing prevents a metalanguage itself from being formalized. When logicians wish to investigate theories of language, they may wish to formalize an object language and its metalanguage. The language in which the theory of both languages is stated would be a *meta-metalanguage*. Since formalization is a human endeavor, the whole enterprise is usually conducted in some human language (typically in some fairly regimented part of a human language, supplemented with mathematical notation), and this language serves as the metalanguage for all the languages developed in the course of the formalization project. In theory, a language can be its own metalanguage, but in such cases we have a situation that can easily lead to paradox.

The use of digital computers has led to the wholesale creation of special-purpose formal languages. Since computer scientists have borrowed the methods for presenting these languages from logic, computational formal languages usually conform to Church's recipe. Sometimes, however, a semantics is not provided. (For instance, mathematical tools for providing semantic interpretations for programming languages only became available years after such languages had been developed and used.) Often it is important to specify the crucial computational procedures associated with such a language. For example, a *query language*, intended to enable a user to present questions to a database, has to provide a procedure for computing an answer to each query that it allows. Sometimes a computational formal language is pointless unless procedures have been implemented to enable computers to process inputs formulated in the language. A programming language is useless without an implemented program that interprets it; a markup language like HTML (Hypertext Markup Language) is useless without browsers that implement procedures for displaying documents written in the language.

These are very natural additions to Church's logic method. Even in 1956 a semantic interpretation was thought to be desirable but not essential. The methods developed by logicians in the first half of the twentieth century for formalizing languages have not changed greatly since then and are likely to be with us for a long time.

The distinction between natural and formal languages is not the same as the distinction between naturally occurring and artificial languages. Rather, it is the distinction between naturally occurring languages and languages that are formalized, or precisely characterized along the lines suggested by Church. As far as the distinc-

tion goes, what prevents a natural language from being formalized is the difficulty (or perhaps impossibility) of actually formalizing a language like English or Swahili. Can natural languages be formalized? Can the grammar of naturally occurring languages be articulated as clearly as the syntax of an artificially constructed language? In assigning denotations to the expressions of a natural language, do we encounter problems that do not arise with artificial languages designed to capture mathematical reasoning?

In fact, there are difficulties. But logical work on formal languages has served as one of the most important sources of inspiration for theories of natural-language syntax, and is by far the most important source of inspiration for semantic theories of natural language. Both types of theories are now primarily pursued by linguists.

The ideal of syntax stated by Church derives from earlier work by David Hilbert, Rudolf Carnap, and other logicians. The essential ideas are an utterly precise description of the syntactic patterns of a language and algorithmic rules specifying how complex expressions are built up out of simpler ones. In essentials, this ideal is also the one that Noam Chomsky proposed in 1957 for the syntax of natural language. It has persisted through the evolution of the theories that Chomsky and his students have created and is also accepted by most of the leading rival approaches. Although there are methodological difficulties associated with the paradigm, they are no worse than the difficulties encountered by other sciences. The idea that natural-language syntax resembles that of formal languages has proved to be a fruitful paradigm for almost fifty years of syntactic research.

Semantics presents a more difficult challenge. Tarski's program addressed the semantics of specialized mathematical languages, and its success seems to depend essentially on certain features of these languages that are not shared by natural human languages: (1) Mathematical notation is designed to be neither ambiguous nor vague, whereas natural languages are both vague and ambiguous. (2) Natural languages have many sorts of *indexical* or context-sensitive expressions, like "I" and "today," whereas mathematical notations tend to use only one kind of indexical expression, variables. (3) *Intensional* constructions like "believe" are not found in mathematics, and they create other difficulties. The verb "believe" does not act semantically on the truth-value of the sentence it modifies. If you know that "Sacramento is the capitol of California" is true, this does not tell you whether "Jack believes that Sacramento is the capitol of California" is true. There are practical difficulties as well

as difficulties in principle. Natural languages are so complex that the task of formalizing them is open-ended and much too large for a single linguist or even for a single generation of linguists.

Richard Montague, a logician who taught at the University of California at Los Angeles until 1971, is primarily responsible for showing how to overcome obstacles that seemed to prevent a semantics for natural languages along the lines advocated by Tarski. His work began a program of research along these lines that is still being pursued. Montague's solution to the problem of ambiguity was to assign denotations to *disambiguated syntactic structures*. With a syntactic structure and a single reading for each word in a sentence, the sentence can have only one meaning. His solution to indexicality was to relativize interpretations to contexts. And his solution to the problem of intensionality, which followed earlier work by Rudolf Carnap, was systematically to assign linguistic phrases two denotations: an *intension* and an *extension*. Montague treated possible worlds as semantic primitives. Intensions, for him, were functions from possible worlds to appropriate extensions. The intension of a sentence, for instance, is a function from possible worlds to truth-values. Montague presented several formal "fragments" of English, the idea being to achieve rigor by focusing on a limited family of natural-language constructions. He also showed how to use higher-order logic to obtain a remarkably elegant and unified semantic interpretation.

This work on natural-language semantics leaves open a number of challenging questions concerning whether natural languages contain elements that somehow resist formalization. For one, Montague did not deal with vagueness, and there are difficulties with his accounts of intensionality and indexicality. These issues have been a major preoccupation of analytic philosophy since the 1970s. Although no philosopher has persuasively argued that the problems are unsolvable, they are certainly more difficult than many people imagined them to be in 1971. While the final question of whether natural languages can be completely formalized remains open, the assumption that this is possible has certainly inspired a fruitful paradigm of research.

ARTIFICIAL INTELLIGENCE

Artificial Intelligence (AI) tries to enable computers to do the things that minds can do. These things include seeing pathways, picking things up, learning categories from experience, and using emotions to schedule one's actions—which many animals can do, too. Thus, human intelligence is not the sole focus of AI. Even terrestrial psychology is not the sole focus, because some people use AI to explore the range of all possible minds.

There are four major AI methodologies: symbolic AI, connectionism, situated robotics, and evolutionary programming (Russell and Norvig 2003). AI artifacts are correspondingly varied. They include both programs (including neural networks) and robots, each of which may be either designed in detail or largely evolved. The field is closely related to artificial life (A-Life), which aims

to throw light on biology much as some AI aims to throw light on psychology.

AI researchers are inspired by two different intellectual motivations, and while some people have both, most favor one over the other. On the one hand, many AI researchers seek solutions to technological problems, not caring whether these resemble human (or animal) psychology. They often make use of ideas about how people do things. Programs designed to aid/replace human experts, for example, have been hugely influenced by knowledge engineering, in which programmers try to discover what, and how, human experts are thinking when they do the tasks being modeled. But if these technological AI workers can find a nonhuman method, or even a mere trick (a kludge) to increase the power of their program, they will gladly use it.

Technological AI has been hugely successful. It has entered administrative, financial, medical, and manufacturing practice at countless different points. It is largely invisible to the ordinary person, lying behind some deceptively simple human-computer interface or being hidden away inside a car or refrigerator. Many procedures taken for granted within current computer science were originated within AI (pattern-recognition and image-processing, for example).

On the other hand, AI researchers may have a scientific aim. They may want their programs or robots to help people understand how human (or animal) minds work. They may even ask how intelligence in general is possible, exploring the space of possible minds. The scientific approach—psychological AI—is the more relevant for philosophers (Boden 1990, Copeland 1993, Sloman 2002). It is also central to cognitive science, and to computationalism.

Considered as a whole, psychological AI has been less obviously successful than technological AI. This is partly because the tasks it tries to achieve are often more difficult. In addition, it is less clear—for philosophical as well as empirical reasons—what should be counted as success.

SYMBOLIC AI

Symbolic AI is also known as classical AI and as GOFAI—short for John Haugeland’s label “Good Old-Fashioned AI” (1985). It models mental processes as the step-by-step information processing of digital computers. Thinking is seen as symbol-manipulation, as (formal) computation over (formal) representations. Some GOFAI programs are explicitly hierarchical, consisting of procedures and subroutines specified at different levels. These define a

hierarchically structured search-space, which may be astronomical in size. Rules of thumb, or heuristics, are typically provided to guide the search—by excluding certain areas of possibility, and leading the program to focus on others. The earliest AI programs were like this, but the later methodology of object-oriented programming is similar.

Certain symbolic programs, namely production systems, are implicitly hierarchical. These consist of sets of logically separate if-then (condition-action) rules, or productions, defining what actions should be taken in response to specific conditions. An action or condition may be unitary or complex, in the latter case being defined by a conjunction of several mini-actions or mini-conditions. And a production may function wholly within computer memory (to set a goal, for instance, or to record a partial parsing) or outside it (via input/output devices such as cameras or keyboards).

Another symbolic technique, widely used in natural language processing (NLP) programs, involves augmented transition networks, or ATNs. These avoid explicit backtracking by using guidance at each decision-point to decide which question to ask and/or which path to take.

GOFAI methodology is used for developing a wide variety of language-using programs and problem-solvers. The more precisely and explicitly a problem-domain can be defined, the more likely it is that a symbolic program can be used to good effect. Often, folk-psychological categories and/or specific propositions are explicitly represented in the system. This type of AI, and the forms of computational psychology based on it, is defended by the philosopher Jerry Fodor (1988).

GOFAI models (whether technological or scientific) include robots, planning programs, theorem-provers, learning programs, question-answerers, data-mining systems, machine translators, expert systems of many different kinds, chess players, semantic networks, and analogy machines. In addition, a host of software agents—specialist mini-programs that can aid a human being to solve a problem—are implemented in this way. And an increasingly important area of research is distributed AI, in which cooperation occurs between many relatively simple individuals—which may be GOFAI agents (or neural-network units, or situated robots).

The symbolic approach is used also in modeling creativity in various domains (Boden 2004, Holland et al. 1986). These include musical composition and expressive performance, analogical thinking, line-drawing, painting,

architectural design, storytelling (rhetoric as well as plot), mathematics, and scientific discovery. In general, the relevant aesthetic/theoretical style must be specified clearly, so as to define a space of possibilities that can be fruitfully explored by the computer. To what extent the exploratory procedures can plausibly be seen as similar to those used by people varies from case to case.

CONNECTIONIST AI

Connectionist systems, which became widely visible in the mid-1980s, are different. They compute not by following step-by-step programs but by using large numbers of locally connected (associative) computational units, each one of which is simple. The processing is bottom-up rather than top-down.

Connectionism is sometimes said to be opposed to AI, although it has been part of AI since its beginnings in the 1940s (McCulloch and Pitts 1943, Pitts and McCulloch 1947). What connectionism is opposed to, rather, is symbolic AI. Yet even here, opposed is not quite the right word, since hybrid systems exist that combine both methodologies. Moreover, GOFAI devotees such as Fodor see connectionism as compatible with GOFAI, claiming that it concerns how symbolic computation can be implemented (Fodor and Pylyshyn 1988).

Two largely separate AI communities began to emerge in the late 1950s (Boden forthcoming). The symbolic school focused on logic and Turing-computation, whereas the connectionist school focused on associative, and often probabilistic, neural networks. (Most connectionist systems are connectionist virtual machines, implemented in von Neumann computers; only a few are built in dedicated connectionist hardware.) Many people remained sympathetic to both schools. But the two methodologies are so different in practice that most hands-on AI researchers use either one or the other.

There are different types of connectionist systems. Most philosophical interest, however, has focused on networks that do parallel distributed processing, or PDP (Clark 1989, Rumelhart and McClelland 1986). In essence, PDP systems are pattern recognizers. Unlike brittle GOFAI programs, which often produce nonsense if provided with incomplete or part-contradictory information, they show graceful degradation. That is, the input patterns can be recognized (up to a point) even if they are imperfect.

A PDP network is made up of subsymbolic units, whose semantic significance cannot easily be expressed in terms of familiar semantic content, still less propositions.

(Some GOFAI programs employ subsymbolic units, but most do not.) That is, no single unit codes for a recognizable concept, such as dog or cat. These concepts are represented, rather, by the pattern of activity distributed over the entire network.

Because the representation is not stored in a single unit but is distributed over the whole network, PDP systems can tolerate imperfect data. (Some GOFAI systems can do so too, but only if the imperfections are specifically foreseen and provided for by the programmer.) Moreover, a single subsymbolic unit may mean one thing in one input-context and another in another. What the network as a whole can represent depends on what significance the designer has decided to assign to the input-units. For instance, some input-units are sensitive to light (or to coded information about light), others to sound, others to triads of phonological categories ... and so on.

Most PDP systems can learn. In such cases, the weights on the links of PDP units in the hidden layer (between the input-layer and the output-layer) can be altered by experience, so that the network can learn a pattern merely by being shown many examples of it. (A GOFAI learning-program, in effect, has to be told what to look for beforehand, and how.) Broadly, the weight on an excitatory link is increased by every coactivation of the two units concerned: cells that fire together, wire together.

These two AI approaches have complementary strengths and weaknesses. For instance, symbolic AI is better at modeling hierarchy and strong constraints, whereas connectionism copes better with pattern recognition, especially if many conflicting—and perhaps incomplete—constraints are relevant. Despite having fervent philosophical champions on both sides, neither methodology is adequate for all of the tasks dealt with by AI scientists. Indeed, much research in connectionism has aimed to restore the lost logical strengths of GOFAI to neural networks—with only limited success by the beginning of the twenty-first century.

SITUATED ROBOTICS

Another, and more recently popular, AI methodology is situated robotics (Brooks 1991). Like connectionism, this was first explored in the 1950s. Situated robots are described by their designers as autonomous systems embedded in their environment (Heidegger is sometimes cited). Instead of planning their actions, as classical robots do, situated robots react directly to environmental cues. One might say that they are embodied production systems, whose if-then rules are engineered rather than programmed, and whose conditions lie in the external

environment, not inside computer memory. Although—unlike GOFAI robots—they contain no objective representations of the world, some of them do construct temporary, subject-centered (deictic) representations.

The main aim of situated roboticists in the mid-1980s, such as Rodney Brooks, was to solve/avoid the frame problem that had bedeviled GOFAI (Pylyshyn 1987). GOFAI planners and robots had to anticipate all possible contingencies, including the side effects of actions taken by the system itself, if they were not to be defeated by unexpected—perhaps seemingly irrelevant—events. This was one of the reasons given by Hubert Dreyfus (1992) in arguing that GOFAI could not possibly succeed: Intelligence, he said, is unformalizable. Several ways of implementing nonmonotonic logics in GOFAI were suggested, allowing a conclusion previously drawn by faultless reasoning to be negated by new evidence. But because the general nature of that new evidence had to be foreseen, the frame problem persisted.

Brooks argued that reasoning shouldn't be employed at all: the system should simply react appropriately, in a reflex fashion, to specific environmental cues. This, he said, is what insects do—and they are highly successful creatures. (Soon, situated robotics was being used, for instance, to model the six-legged movement of cockroaches.) Some people joked that AI stood for artificial insects, not artificial intelligence. But the joke carried a sting: Many argued that much human thinking needs objective representations, so the scope for situated robotics was strictly limited.

EVOLUTIONARY PROGRAMMING

In evolutionary programming, genetic algorithms (GAs) are used by a program to make random variations in its own rules. The initial rules, before evolution begins, either do not achieve the task in question or do so only inefficiently; sometimes, they are even chosen at random.

The variations allowed are broadly modeled on biological mutations and crossovers, although more unnatural types are sometimes employed. The most successful rules are automatically selected, and then varied again. This is more easily said than done: The breakthrough in GA methodology occurred when John Holland (1992) defined an automatic procedure for recognizing which rules, out of a large and simultaneously active set, were those most responsible for whatever level of success the evolving system had just achieved.

Selection is done by some specific fitness criterion, predefined in light of the task the programmer has in

mind. Unlike GOFAI systems, a GA program contains no explicit representation of what it is required to do: its task is implicit in the fitness criterion. (Similarly, living things have evolved to do what they do without knowing what that is.) After many generations, the GA system may be well-adapted to its task. For certain types of tasks, it can even find the optimal solution.

This AI method is used to develop both symbolic and connectionist AI systems. And it is applied both to abstract problem-solving (mathematical optimization, for instance, or the synthesis of new pharmaceutical molecules) and to evolutionary robotics—wherein the brain and/or sensorimotor anatomy of robots evolve within a specific task-environment.

It is also used for artistic purposes, in the composition of music or the generation of new visual forms. In these cases, evolution is usually interactive. That is, the variation is done automatically but the selection is done by a human being—who does not need to (and usually could not) define, or even name, the aesthetic fitness criteria being applied.

ARTIFICIAL LIFE

AI is a close cousin of A-Life (Boden 1996). This is a form of mathematical biology, which employs computer simulation and situated robotics to study the emergence of complexity in self-organizing, self-reproducing, adaptive systems. (A caveat: much as some AI is purely technological in aim, so is some A-Life; the research of most interest to philosophers is the scientifically oriented type.)

The key concepts of A-Life date back to the early 1950s. They originated in theoretical work on self-organizing systems of various kinds, including diffusion equations and cellular automata (by Alan Turing and John von Neumann respectively), and in early self-equilibrating machines and situated robots (built by W. Ross Ashby and W. Grey Walter). But A-Life did not flourish until the late 1980s, when computing power at last sufficed to explore these theoretical ideas in practice.

Much A-Life work focuses on specific biological phenomena, such as flocking, cooperation in ant colonies, or morphogenesis—from cell-differentiation to the formation of leopard spots or tiger stripes. But A-Life also studies general principles of self-organization in biology: evolution and coevolution, reproduction, and metabolism. In addition, it explores the nature of life as such—life as it could be, not merely life as it is.

A-Life workers do not all use the same methodology, but they do eschew the top-down methods of GOFAI. Sit-

uated and evolutionary robotics, and GA-generated neural networks, too, are prominent approaches within the field. But not all A-Life systems are evolutionary. Some demonstrate how a small number of fixed, and simple, rules can lead to self-organization of an apparently complex kind.

Many A-Lifers take pains to distance themselves from AI. But besides their close historical connections, AI and A-Life are philosophically related in virtue of the linkage between life and mind. It is known that psychological properties arise in living things, and some people argue (or assume) that they can arise only in living things. Accordingly, the whole of AI could be regarded as a sub-area of A-Life. Indeed, some people argue that success in AI (even in technological AI) must await, and build on, success in A-Life.

WHY AI IS A MISLEADING LABEL

Whichever of the two AI motivations—technological or psychological—is in question, the name of the field is misleading in three ways. First, the term *intelligence* is normally understood to cover only a subset of what AI workers are trying to do. Second, intelligence is often supposed to be distinct from emotion, so that AI is assumed to exclude work on that. And third, the name implies that a successful AI system would really be intelligent—a philosophically controversial claim that AI researchers do not have to endorse (though some do).

As for the first point, people do not normally regard vision or locomotion as examples of intelligence. Many people would say that speaking one's native language is not a case of intelligence either, except in comparison with nonhuman species; and common sense is sometimes contrasted with intelligence. The term is usually reserved for special cases of human thought that show exceptional creativity and subtlety, or which require many years of formal education. Medical diagnosis, scientific or legal reasoning, playing chess, and translating from one language to another are typically regarded as difficult, thus requiring intelligence. And these tasks were the main focus of research when AI began. Vision, for example, was assumed to be relatively straightforward—not least, because many nonhuman animals have it too. It gradually became clear, however, that everyday capacities such as vision and locomotion are vastly more complex than had been supposed. The early definition of AI as programming computers to do things that involve intelligence when done by people was recognized as misleading, and eventually dropped.

Similarly, intelligence is often opposed to emotion. Many people assume that AI could never model that. However, crude examples of such models existed in the early 1960s, and emotion was recognized by a high priest of AI, Herbert Simon, as being essential to any complex intelligence. Later, research in the computational philosophy (and modeling) of affect showed that emotions have evolved as scheduling mechanisms for systems with many different, and potentially conflicting, purposes (Minsky 1985, and Web site). When AI began, it was difficult enough to get a program to follow one goal (with its sub-goals) intelligently—any more than that was essentially impossible. For this reason, among others, AI modeling of emotion was put on the back burner for about thirty years. By the 1990s, however, it had become a popular focus of AI research, and of neuroscience and philosophy too.

The third point raises the difficult question—which many AI practitioners leave open, or even ignore—of whether intentionality can properly be ascribed to any conceivable program/robot (Newell 1980, Dennett 1987, Harnad 1991).

AI AND INTENTIONALITY

Could some NLP programs really understand the sentences they parse and the words they translate? Or can a visuo-motor circuit evolved within a robot's neural-network brain truly be said to represent the environmental feature to which it responds? If a program, in practice, could pass the Turing Test, could it truly be said to think? More generally, does it even make sense to say that AI may one day achieve artificially produced (but nonetheless genuine) intelligence?

For the many people in the field who adopt some form of functionalism, the answer in each case is: In principle, yes. This applies for those who favor the physical symbol system hypothesis or intentional systems theory. Others adopt connectionist analyses of concepts, and of their development from nonconceptual content. Functionalism is criticized by many writers expert in neuroscience, who claim that its core thesis of multiple realizability is mistaken. Others criticize it at an even deeper level: a growing minority (especially in A-Life) reject neo-Cartesian approaches in favor of philosophies of embodiment, such as phenomenology or autopoiesis.

Part of the reason why such questions are so difficult is that philosophers disagree about what intentionality is, even in the human case. Practitioners of psychological AI generally believe that semantic content, or intentionality,

can be naturalized. But they differ about how this can be done.

For instance, a few practitioners of AI regard computation and intentionality as metaphysically inseparable (Smith 1996). Others ascribe meaning only to computations with certain causal consequences and provenance, or grounding. John Searle argues that AI cannot capture intentionality, because—at base—it is concerned with the formal manipulation of formal symbols. And for those who accept some form of evolutionary semantics, only evolutionary robots could embody meaning (Searle, 1980).

Margaret A. Boden (1996, 2005)

ASCETICISM

There is a morbid fascination in any survey of the ascetic practices of humankind. Fasting, the virgin priestess, and the mutilation of the body are common features of ancient religions. In monastic Christianity the austere ideals of celibacy, obedience, and poverty have been both practiced and admired. Even today there are many who observe Lent and those for whom fasting and penance are seldom out of season. The most accomplished ascetics have been the wanderers (*sunnyasins*) of ancient India and the anchorites of fourth-century Egypt. One *sunnyasin* held his arms above his head with fists clenched until the muscles in his arms atrophied and the nails grew through his palms. It is said that the anchorite St. Simeon Stylites tied a rope tightly around himself until it ate into his body and his flesh became infested with worms. As the worms fell from his body he replaced them in his putrefied flesh, saying, "Eat what God has given you."

Behind such ascetic practices usually lies the philosophical theory of "asceticism," a theory that demands and justifies this unnatural way of life. Although the term *ascetic* was originally applied to any sort of moral disci-

pline, it has since acquired a narrower and more negative meaning. Asceticism may now be defined as the theory that one ought on principle to deny one's desires. Asceticism may be partial or complete. Partial asceticism is the theory that one ought to deny one's "lower desires," which are usually identified as sensuous, bodily, or worldly and are contrasted with more virtuous or spiritual desires. Complete asceticism is the theory that one ought to deny all desires without exception. Asceticism may also be moderate or extreme. Moderate asceticism is the theory that one ought to repress one's desires as far as is compatible with the necessities of this life. Extreme asceticism is the theory that one ought to annihilate one's desires totally.

HISTORY

The belief that austerities (*tapas*) burn away sin was a product of the non-Aryan tradition of ancient India. This belief persisted, and austerities were recommended by the yogis and the Jains. All orthodox systems of Indian philosophy agreed that the goal of life is liberation (*moksa*) from this world of suffering, and most maintained that the renunciation of worldly desires is necessary for liberation. Although the Buddha tried and rejected austerities, his principle that the cause of suffering is craving led later Buddhists to advocate renunciation and even to practice austerities. The Jains held that liberation is possible only when one has annihilated all passion, because passion attracts karma, believed by this sect to be a subtle form of matter that holds the soul in bondage.

Asceticism seems to have entered Western philosophy from the mystery religions that influenced Pythagoreanism about the end of the sixth century BCE. Although Greek ethics was predominantly naturalistic, Plato sometimes argued that one ought to repress the bodily desires in order to free the soul in its search for knowledge. Some Cynics renounced worldly desires in order to pursue virtue in independence. The early Stoics defined emotion as irrational desire and held up the ideal of the apathetic man in whom all emotions had been annihilated. Plotinus emphasized the ascetic side of Plato's philosophy and claimed that matter is the source of all evil.

This undercurrent of asceticism rose to the surface in medieval philosophy with its emphasis on religious otherworldliness. The foundations of this asceticism were laid by such theologians as St. Athanasius, St. Gregory of Nyssa, St. Ambrose, and even St. Augustine. They believed that the desires of the flesh should be repressed in order to achieve moral virtue and the contemplation of God.

Their view molded the monastic institutions that were established in the fourth century. Virtually unchallenged, this asceticism remained a potent influence on religious life until the Renaissance.

Of modern philosophers, only Arthur Schopenhauer has been an important advocate of asceticism; he would have one completely annihilate the will to live in all its manifestations. Jeremy Bentham and Friedrich Nietzsche have each criticized asceticism from very different standpoints.

ARGUMENTS FOR ASCETICISM

The arguments for asceticism fall into three main classes. First, there are those that attempt a direct justification of self-denial. Although some of these arguments might justify a complete asceticism, they have traditionally been used to support only a partial asceticism. (1) We know by some authority that one ought to deny one's lower desires. One authority is the Bible, in which we find both express ascetic commandments and examples like those of the Virgin Mary and the celibate Christ. (2) The sacrament of penance requires the denial of worldly desires. Although one is cleansed of original sin by baptism, subsequent sins must be expiated by penance; the best way to make penance more than a formal ritual is to express repentance in a life of self-denial. (3) By undergoing the suffering of self-denial, one is taking up the cross of Christ. Since Jesus came into this world as a model for all men, all men ought to share in his redemptive suffering. (4) People ought to deny their lower desires to prove their virtue, for the ascetic life is a test of devotion to God, and those who pass the test will win a heavenly reward. (5) The suffering of self-denial is required by our guilt. Since every person has sinned, the retributive theory of punishment requires that every person suffer. By inflicting pain upon oneself, one balances the scales of justice and lifts the guilt from one's soul. (6) Self-denial is valuable because it develops certain character traits such as persistence and self-discipline, which are essential to living well.

The second class of arguments attempts to justify denial indirectly through a criticism of the lower desires. Since these criticisms are aimed only at certain desires, they can support only a partial asceticism. (1) The lower desires cost too much to satisfy. Gratification must be purchased with great effort, and perhaps these desires are insatiable, so that no expenditure of effort will gratify them. (2) The lower desires are misguided, for their objects are really evils or, at best, indifferent things. In either case, no genuine value is realized by fulfilling one's

desires. (3) Although the objects of the lower desires are good, they are much less good than higher values like virtue, knowledge, or heaven. Since an individual's time and energy are limited, one ought not to allow these lower desires to distract from the pursuit of what really matters. (4) The lower desires are intrinsically evil. Since they turn people away from God and his commands toward earthly objects, they are infected with the sin of pride. (5) Although not sinful in themselves, the lower desires do motivate one to sinful actions. Thus greed may tempt a person to steal, and lust can lead to adultery. (6) These lower desires interfere with the pursuit of knowledge, which is essential for the good life. They interfere either by causing an agitation that destroys one's power of reasoning or by fixing one's attention on sensory objects that distract from the transcendent reality.

The third class of arguments also attempts to justify asceticism indirectly through a criticism of desire *per se*. Since these arguments are aimed at all desires, they support a complete asceticism. (1) Schopenhauer argued that desire, by its very nature, can yield nothing but suffering. Desire springs from a lack and consists in a dissatisfaction. When it meets with hindrances, it produces nothing but frustration, because it cannot attain its object; when it does attain its object, it produces nothing but boredom, because desire ceases with fulfillment and leaves one with an undesired object. Since desire necessarily involves dissatisfaction, frustration, and boredom, the only escape is by the annihilation of all desire. (2) The Buddhists and the Jains maintain that one ought to annihilate desire in order to achieve liberation from this world of pain. A person must destroy all desire because desire is the cause of rebirth into this world. For the Buddhist, desire causes rebirth because, being selfish, it causes selfish actions; these, by the moral law of karma, cause rebirth in painful forms. For the Jain, desire magnetizes the soul so that it attracts karmic matter which, by the physical laws of mechanics, weighs down the soul and causes it to be reborn into this lower world of pain.

ARGUMENTS AGAINST ASCETICISM

It is much harder to classify the traditional arguments against asceticism. Many of them attack some presupposition of the doctrine. (1) Many, but not all, forms of asceticism require a dualism of mind and body. The various philosophical difficulties with metaphysical dualism therefore tend to undercut asceticism. (2) Ascetic practices are often recommended as a means of freeing the soul from the body so that it can contemplate the truth. Actually these practices make knowledge in all its forms

impossible because self-denial produces frustration, uneasiness, and pain, which make clear thinking difficult, and self-mutilation destroys the bodily health that is the physiological basis of thought. (3) Asceticism usually assumes that desires are like little animals inside the self that grow when they are fed and wither when they are starved. Freudian psychology, however, reveals that one does not destroy a desire by suppressing it but that the desire continues to exist and to exert itself in new and usually devious ways. Hence ascetic practices may not be an effective means of annihilating or even of controlling desire. (4) Ascetic practices are often thought to be a means to, and even a guarantee of, moral goodness, but in fact they are no protection against vice. The ascetic may become complacent in his confidence in his ascetic practices; he may become proud of his ascetic achievements; and he may even despise others who are less accomplished in asceticism. (5) The religious arguments for asceticism frequently assume that God requires one to renounce available goods and even to inflict harm upon himself, but this is inconsistent with the benevolence of God. (6) There is also a religious argument against the view that bodily desires or worldly objects are essentially evil. Both this world and human nature must be good, because they are creatures of a Creator who is perfectly good.

Another group of arguments is pragmatic in nature. (1) As Bentham pointed out, asceticism cannot be consistently practiced because it runs counter to the basic motives in human nature. Since the function of morality is to guide conduct, asceticism is incapable of becoming a genuine moral standard. (2) To the limited extent that asceticism can be put into practice, its effects are harmful. It obviously increases the amount of suffering in the world. If Freudian psychology is correct, its attempt to suppress natural desires will result in various neuroses. Finally, it stultifies vitality, produces emotional excesses, and fosters the weakling at the expense of the strong man.

Then there are those arguments that attempt to refute asceticism by showing that it has unacceptable implications. (1) Asceticism condemns worldly concerns and natural impulses. This implies that one ought to abandon all social ties and mortify all family affection, which would be immoral. (2) If it is good for one to suffer, it should be better for everyone to suffer. This implies that a person has a duty to inflict pain on others, but not even the hardened ascetic will accept this. (3) If pleasure is really bad, it would seem that pain must be good. This implies the absurd conclusion that the best of all possible

worlds would be the one with the least pleasure and the most pain.

Finally, there is Nietzsche's *ad hominem* argument. Those who are incapable of living well disguise their impotence and fear by inverting morality in order to excuse their own moral sickness and to restrain the strong men who appear dangerous. Although the ascetic priest condemns the will to power, he uses ascetic ideals as a means of maintaining his own power over the sick herd. Thus an analysis of the psychological origin of asceticism reveals that it is far from a worthy ideal.

Asceticism is the doctrine that one ought to deny his desires. In practice, denial means refraining from the fulfillment of desires and sometimes mortifying the desire by inflicting upon oneself the very opposite of what is desired. This involves abstinence from genuine goods, the frustration of unfulfilled desires, and even self-inflicted pain. Unless one is prepared to accept the view that abstinence, frustration, and pain are intrinsically good, the ascetic life can hardly be defended as an end in itself.

If ascetic practices are to be recommended, they must be a necessary evil, a means to something better. One might regard the ascetic life as a means to liberation from this world of suffering. It would be unrealistic to deny that we all suffer from time to time and that there are those for whom life is mostly suffering. It would be equally unrealistic, however, to deny that for most of us the evils we experience are more than balanced by the genuine values we enjoy. Granted the existence of evil, the obvious expedient is to improve our world rather than to make it even worse by adding the sufferings involved in ascetic practices. If escape were desirable, there is no guarantee that the ascetic life would actually lead to freedom.

One might advocate the ascetic life as a means of pleasing God and winning the eternal bliss of heaven. Asceticism seems most plausible within a religious context. But are its theological presuppositions themselves plausible? Is there really an immortal soul to be rewarded or a God to do the rewarding? Even the believer may reject asceticism on religious grounds. A benevolent deity would hardly have created us with natural desires and then commanded us to deny these very desires and to suffer the consequent evils of frustration and pain.

The ascetic life might be urged as a means to that knowledge which in turn brings the good life. Ascetic practices are supposed to help by freeing the soul from the body. Still, no empiricist would admit that the body, which is the source of all experience, is a hindrance to

knowledge, and even a rationalist like Plato concedes that experience reminds reason of the truth. Unless reason is thought of as a disembodied spirit—in which case it is hard to see how the body hinders reason in the first place—it would seem that ascetic practices make one less, rather than more, capable of the clear and sustained reasoning that is required for attaining knowledge.

Finally, the ascetic life might be advanced as a means to virtue. It must be admitted that some desires sometimes cause one to act wickedly, but these same desires also cause one to act virtuously. The sexual desire that can lead to adultery more often leads to conjugal fidelity. Hence there is a double error in regarding sexual desire as evil. It does not always, or even usually, express itself in sinful action; and if adultery is a sin, that is because it does violence to the institution of marriage, which is itself an expression of sex. As this example shows, natural desires are in themselves morally neutral, and to deny desire is to forbid the virtuous act as well as the sin. Instead of being a means to virtue, self-denial is actually a vice. Virtue requires at least prudence and benevolence, but the ascetic is imprudent in abstaining from available goods and in even inflicting harm upon himself. By concentrating on the cultivation of his own soul through suffering, the ascetic tends to become callous toward the suffering of others and to ignore his obligation to work for their welfare.

The ascetic life is not good in itself, nor is it a means to liberation, divine reward, knowledge, or virtue. It does not follow that one must accept the advice of Callicles to attempt gratification of every desire without regard for temperance or justice. Self-discipline is a genuine virtue, but it denies desire only when this is necessary to achieve an inclusive and harmonious satisfaction. Asceticism goes beyond this point to advocate an unnecessary and pointless denial. The logical conclusion is that asceticism should be rejected.

ASTELL, MARY

(1666–1731)

Mary Astell was born November 12, 1666, in Newcastle-upon-Tyne, into a family of coal merchants. This fact itself is interesting, since it means that she was a member of the comfortable middle class. Her circumstances became considerably less comfortable when her father died in 1678, when Astell was twelve, leaving her without a dowry, and hence, without prospects. Around 1684, and following the death of her mother, Astell took what seems to be a rather startling step: She transferred herself from Newcastle to London, away from what family she had left, apparently to live alone in a town without family. Scholars are tantalizingly ignorant of the circumstances that prompted this move and of Astell's prospects in London.

While things do not seem to have gone well for her initially, by 1695 she had established herself in Chelsea, enjoying the patronage of Lady Catherine Jones (1672–1740), and surrounded by a circle of intellectually minded women. By this time, moreover, Astell seems to have put herself in a position to make her living by her pen. Scholars are equally ignorant of the circumstances that gave Astell sufficient intellectual confidence to embark on a course such as this. She had, of course, no formal education. A clergyman uncle, Ralph Astell, is often credited with tutoring her, and, since he was known to have attended Emmanuel College, Cambridge during the heyday of the Cambridge Platonists, he is also often assumed to have shaped Astell's philosophical interests. But since he died soon after the death of Astell's father, when she herself was thirteen, her uncle's influence would have had to have been on a very precocious child. That he was removed from his pulpit for drunkenness raises further doubts about his effectiveness as an educator of a young girl.

Astell recently has attracted attention due to the undoubted feminist nature of at least some of her work, on the basis of which she has been hailed as an early feminist. In *A Serious Proposal to the Ladies* (1694), she argues that women's indubitable possession of rational faculties means that they deserve an education, one that would enable them to develop their rational, moral capabilities and so to live a life devoted to the care of their souls. In *Some Reflections upon Marriage Occasion'd by the Duke and Duchess of Mazarine's Case, Which Is Also Consider'd* (1700), Astell develops this theme, arguing that a well-trained mind will enable women to lead a virtuous life, even in the face of a bad marriage.

Astell's interests, however, extended into a number of other areas beyond the defense of her sex. She is the author of several political pamphlets, in which she took up and discussed issues of contemporary moment from a conservative perspective. Her *magnum opus* is a work of Christian theology, *The Christian Religion, as profess'd by a daughter of the Church of England* (1705). In this lengthy work, Astell, critically reacting to an anonymous work called *The Ladies' Religion*, lays out an extensive examination, first of natural, then of revealed religion, and concludes with an examination of Christian practice, including our duty to god, our neighbor and ourselves. There is some interesting philosophical material contained here, most especially in the discussion of the debate between John Locke and Edward Stillingfleet on the possibility of thinking matter. Astell's works that are most predominantly philosophical in nature, however, include her published correspondence with John Norris, *Letters concerning the Love of God* (1695) and *A Serious Proposal to the Ladies, Part II: Wherein a Method is Offer'd for the Improvement of Their Minds* (1697).

Letters concerning the Love of God contains some of the most interesting and tightly argued of Astell's writing. Her role in this correspondence, however, is that of a questioner and a critic. It is not entirely possible, therefore, to derive from the *Letters* an account of Astell's own position on the matters she discusses. She raises two issues with Norris. The first is how to understand God's causal role with respect to pain. If God, as Norris claims, is the sole object of our love as the cause of pleasure, is He not as well the sole object of our aversion, as the cause of pain? While she is prepared to admit that corporeal pain may have a purpose that is good, she is concerned to secure the possibility of a class of evils, that, as sinful, must be the object of aversion. Astell's second worry concerns the consequences for human social relations if God is the only object of our love. While she initially appears

to accept Norris's distinction between loving creatures for our good but not as our good, in a final letter, she raises more substantive questions about Norris's occasionalism. She holds that if bodies are causally inefficacious and do not cause the sensations we have of them, then sensations are irrelevant and God must be said to have created in vain. It is not necessary to the thesis that God is the only object of our love, she points out, to suppose that God acts without instruments, for we never, when receiving a gift, feel gratitude towards the giver's instrument, rather than the giver.

In the second part of *A Serious Proposal*, Astell again adopts a position that reflects some of Norris's approach, while rejecting his occasionalism. The second part of *A Serious Proposal* has a somewhat different project than the first. By the time she wrote it, Astell, who had cherished hopes that she would receive funds to start the educational institution for which she had advocated, had come to realize that these funds would not be forthcoming. Therefore, the second part takes more of a self-help approach to the question of women's education, in which Astell outlines the methods by which a human understanding, as she describes it, may be improved. The argument in favor of improvement is the one she originally put forward, that human action, governed as it is by rationality, requires an informed understanding and a properly directed inclination.

In developing her account, Astell acknowledges a debt to Antoine Arnauld's *Art of Thinking* and to Rene Descartes's *Principles of Philosophy*. She argues that all human endeavor requires the application of right principles, and therefore that anyone, whether doctor or plowman, is concerned with knowledge and with the rules of right reason. These rules are to be induced from right practice, and are not a matter of formal structure. She takes the management of right inclination to be crucial to right conduct and follows Norris in holding that we ought to model our will on God's. She rejects his occasionalism, however, and instead insists that we need to recognize that our minds are united to our bodies. "For if we disregard the Body wholly," she writes, "we pretend to live like Angels whilst we are but Mortals and if we prefer or equal it to the Mind we degenerate into Brutes" (1997, p. 158). Our goal therefore is to harness the passions we feel to the proper goals for human happiness, as discovered by our rational nature, directed to eternal happiness.

ATHEISM

The words *atheist* and *godless* are still frequently used as terms of abuse. Nevertheless, there are relatively few people nowadays in whom the thought of atheism and atheists arouses unspeakable horror. It seems to be agreed that an atheist can be a good person whose oaths and promises are no less trustworthy than those of other people, and in most civilized lands atheists have the same or

nearly the same rights as anybody else. What is more, it appears to be generally realized that some of the world's foremost philosophers, scientists, and artists have been avowed atheists and that the increase in atheism has gone hand in hand with the spread of education. Even spokesmen of the most conservative religious groups in the mid-twentieth century conceded that atheism may well be a philosophical position that is adopted for the noblest of reasons. Thus, in "The Contemporary Status of Atheism" (1965), Jean-Marie Le Blond appealed to his fellow believers for a "truly human and mutually respectful dialogue" with atheists, insisting that a "life without God need not be ... bestial, unintelligent, or immoral" and that atheism can be "serene and deeply human." In the previous year Pope Paul VI, in his encyclical *Ecclesiam Suam*, had observed that some atheists were undoubtedly inspired by "greathearted dreams of justice and progress" as well as by "impatience with the mediocrity and self-seeking of so many contemporary social settings."

HOSTILITY TO ATHEISM

It was otherwise in earlier ages. One could fill many volumes with the abuse and calumny contained in the writings of Christian apologists, learned no less than popular. The tenor of these writings is not simply that atheism is mistaken but also that only a depraved person could adopt so hideous a position and that the spread of atheism would be a horrifying catastrophe for the human race. "No atheist as such," wrote Richard Bentley in *Eight Sermons* (1724), "can be a true friend, an affectionate relation, or a loyal subject." In the preface to his *The True Intellectual System of the World* (1678), Ralph Cudworth made it clear that he was addressing himself not to "downright and professed atheists" but to "weak, staggering and sceptical theists." Downright atheists were beyond the pale, for they had "sunk into so great a degree of sottishness" that they evidently could not be reached. Writing almost exactly two centuries later, the Protestant theologian Robert Flint, who readily admitted that he had met atheists of great courage and integrity, nevertheless expressed his extreme concern over the "strenuous propagation" of atheism, especially in the "periodical press." "The prevalence of atheism in any land," he wrote, "must bring with it national decay and disaster." The triumph of atheism in England would "bring with it hopeless national ruin." If once the workers of the large cities became atheists, "utter anarchy would be inevitable" (*Anti-Theistic Theories*, pp. 36–37). All these quotations are from British Protestants. Very similar and frequently more virulent remarks could be quoted from German,

French, Italian, and American believers of the same periods.

In France until the Revolution and in most other countries until some time later, it was illegal to publish works in defense of atheism, and in fact real or alleged atheists were subject to dire persecution throughout the times of Christian domination. Some of the world's greatest philosophers were among those who advocated and in some instances actively promoted this persecution. The story antedates Christianity, and persecution of atheists was already advocated in Plato's *Laws*. Plato divided atheists into several groups, all of which must be punished; but whereas the members of some groups required no more than "admonition and imprisonment," those belonging to others deserved punishment exceeding "one death ... or two." Thomas Aquinas (*Summa Theologiae*, II, 11, 3 and 4) had no doubt that unbelievers should be "shut off from the world by death." Such a course, he argued, is justified since it surely is "a much more serious matter to corrupt faith, through which comes the soul's life," than it is "to forge money, through which temporal life is afforded." If, as is just, forgers of money and other malefactors are straightaway put to death, it is all the more just that "heretics ... be not only excommunicated but also put to death."

John Locke, one of the great pioneers of religious toleration, explicitly exempted Roman Catholics and atheists from the application of the principles he advocated. "Promises, covenants, and oaths, which are the bonds of human society," he wrote, "can have no hold upon an atheist." Moreover, since atheism is not a religion but, on the contrary, a position that is out to "undermine and destroy all religion," it cannot come under the privilege of the toleration that is justly claimed by bona fide religions (*A Letter concerning Toleration*). It may be assumed that Locke did not advocate that atheists be shut off from the world, but that he was merely opposed to the free advocacy of atheism in writing and speech.

After Locke's time, the "shutting off" approach became infrequent, but atheists continued to be the victims of persecution and discrimination in various forms. To give some interesting and far from untypical illustrations: Baron d'Holbach's *The System of Nature* was falsely attributed in its first edition to Jean-Baptiste de Mirabaud, a former secretary of the French Academy who had been dead for ten years. Very shortly after its publication in 1770, it was condemned to be burned by the public hangman after a trial in which the public prosecutor expressed his regret that he could not lay his hands on the unknown real author, adding that the corruption of

morals evident in almost all sections of society was very probably due to the spread of ideas like those contained in the condemned book. When the poet Percy Bysshe Shelley was an undergraduate at Oxford, he published a short and very temperate pamphlet titled *The Necessity of Atheism*. This at once aroused a violent protest that resulted in the burning of all undistributed copies and in the expulsion of Shelley and his friend Thomas Hogg from the university. Some years later Shelley was judicially deprived of the custody of his children on the ground that he was “likely to inculcate the same [atheistic] principles upon them.” As late as 1877 Annie Besant, the noted social reformer, was judged to be unfit to take care of her children on the same ground, although the judge admitted that she had been a careful and affectionate mother. Until the passing of the Evidence Amendment Act of 1869, unbelievers in Great Britain were considered incompetent to give evidence in a court of law. Atheists were thus in effect unable to sue when they were the victims of fraud or slander. Charles Bradlaugh, whose efforts were largely responsible for the Act of 1869, was also the main figure in a prolonged battle to secure the right of avowed atheists to sit in the House of Commons. After Bradlaugh was elected, he was found unfit to take his seat. He won the resulting by-election and was again declared unfit to sit in the House, and this merry-go-round continued for several years, until a Conservative speaker found a legal way of securing Bradlaugh’s admission. In the United States there has not been similar legal discrimination against atheists, but there is perhaps to this day more de facto discrimination and prejudice than in any other Western country.

A comprehensive entry on atheism would, among other things, trace the history of the persecution of real and alleged atheists, of the changes in public attitudes, and of the gradual repeal of discriminatory legislation. It would also inquire into the psychological sources of the hatred of atheists that is sometimes found in otherwise apparently kindly and sensible men. Because of space limitations, the present entry will, however, be largely confined to what is undoubtedly the most interesting question for philosophers: Is atheism a logically tenable position? What are the arguments for it, what are the arguments against it, and how strong are these, respectively? It will not be possible to deal exhaustively even with these questions, but an attempt will be made to sketch the position of a philosophically sophisticated atheist and to explain why a view of this kind has appealed to many important thinkers in recent times.

DEFINITION OF ATHEISM

No definition of *atheism* could hope to be in accord with all uses of this term. However, it would be most confusing to adopt any of several definitions that can only be regarded as eccentric. These would result in classifying as believers many people who would not regard themselves as such (and who would not commonly be so regarded) and in classifying as atheists many people who have not usually been thought of in this way. Thus, Johann Gottlieb Fichte, in denying the charge of atheism, wrote in “Über den Grund unseres Glaubens an eine Göttliche Weltregierung” that the “true atheist” is the person who, instead of following the voice of conscience, always calculates consequences before acting in a moral situation. Friedrich Jodl, who was himself a positivist and an unbeliever, similarly remarked that “only the man without ideals is truly an atheist,” implying, no doubt, that, although he did not believe in God, he was not a “true” atheist (*Vom Lebenswege*, 2 vols., Stuttgart and Berlin, 1916–1917, Vol. II, p. 370.). In the twentieth century Paul Tillich defined *atheism* as the view that “life has no depth, that it is shallow.” Anybody who says this “in complete seriousness is an atheist”; otherwise, he is not (*Shaking of the Foundations*, New York, 1948, p. 63). Stephen Toulmin, in an article (“On Remaining an Agnostic,” *Listener*, October 17, 1957) in which he championed agnosticism as he understood it, distinguishes his own position from that of both believers and atheists in that, unlike them, he does not “find personal attitudes of any sort in Nature-at-large.” The believer, according to Toulmin, regards the Cosmic Powers as friendly to man, while the atheist regards the cosmos as indifferent or as “positively callous.”

Whatever the point of the definitions just quoted, their paradoxical consequences make them useless in the present context. For our purposes, definitions of *atheism* and corresponding definitions of *God* will be serviceable only if they preserve, at least roughly, the traditional battle lines. Whatever their differences, Augustine, Thomas Aquinas, Locke, George Berkeley, William Paley, Henry Longueville Mansel, J. S. Mill, William James, Paul Tillich, and John Hick should continue to be classified as believers; T. H. Huxley, Leslie Stephen, and Clarence Darrow as agnostics; and Holbach, Ludwig Büchner, Ludwig Feuerbach, Karl Marx, Arthur Schopenhauer, Friedrich Nietzsche, and Jean-Paul Sartre as atheists. The definition proposed in the present entry will, in taking account of certain complexities of the situation, depart in a significant respect from the one that is most popular, but it will not involve reclassification of any of the great philoso-

phers of the past. According to the most usual definition, an *atheist* is a person who maintains that there is no God, that is, that the sentence “God exists” expresses a false proposition. In contrast, an agnostic maintains that it is not known or cannot be known whether there is a God, that is, whether the sentence “God exists” expresses a true proposition. On our definition, an *atheist* is a person who rejects belief in God, regardless of whether or not the reason for the rejection is the claim that “God exists” expresses a false proposition. People frequently adopt an attitude of rejection toward a position for reasons other than that it is a false proposition. It is common among contemporary philosophers, and indeed it was not uncommon in earlier centuries, to reject positions on the ground that they are meaningless. Sometimes, too, a theory is rejected on such grounds as that it is sterile or redundant or capricious, and there are many other considerations that in certain contexts are generally agreed to constitute good grounds for rejecting an assertion. An atheist in the narrower, more popular sense, is ipso facto an atheist in our broader sense, but the converse does not hold.

THEISTIC POSITIONS. Before exploring the implications of our definition any further, something should be said about the different uses of the word *God* and the correspondingly different positions, all of which have been referred to as “belief in God.” For our purposes, it will be sufficient to distinguish three of these. All the believers in question have characterized God as a supreme personal being who is the creator or the ground of the universe and who, whatever his other attributes may be, is at the very least immensely powerful, highly intelligent, and very good, loving, and just. While some of them would maintain that the predicates just mentioned—“powerful,” “good,” and the rest—are used in a literal sense when applied to God, other believers insist that when applied to God, these, and indeed all or almost all, predicates must be employed in “metaphorical,” “symbolic,” or “analogical” senses. Let us, without implying anything derogatory, refer to the belief that predicates can be applied literally to God as the “anthropomorphic” conception of God and to the belief that predicates can only be applied analogically to God as the “metaphysical” conception of God.

Among professional philosophers, belief in the metaphysical God has been much more common than belief in the anthropomorphic God. This metaphysical position is at least as old as Thomas (and, it may be plausibly argued, as old as Plato). In the early eighteenth century it was championed by Peter Browne, bishop of Cork, who was trying to answer difficulties raised by the infidel John

Toland. In the nineteenth century this position was defended by Mansel in his Bampton Lectures, and in the twentieth century it was a key feature of Tillich’s philosophy. God, on Tillich’s view, “infinitely transcends every finite being”; between the finite and the infinite there is “an absolute break, an ‘infinite jump’”; there is here “no proportion and gradation.” When we say, for example, “God is Love,” or “God is Life,” the words *love* and *life* are used symbolically, not literally. They were originally introduced in connection with “segments of finite experience,” and when applied to God, they cannot have the same meaning that they have in ordinary human situations.

The anthropomorphic position is by no means confined to unsophisticated believers. It has commanded the support of several eminent philosophers, especially believers who were also empiricists or otherwise opposed to rationalism. Thus, Berkeley emphatically defended the anthropomorphic position against Bishop Browne. In *Alciphron* Berkeley attacked Browne’s procedure on the ground that unless “wise” and “good” are used in the same sense for God and man, “it is evident that every syllogism brought to prove those attributes, or (which is the same thing) to prove the being of a God, will be found to consist of four terms, and consequently can conclude nothing.” In the nineteenth century J. S. Mill championed anthropomorphic belief as opposed to the metaphysical theology of Hamilton and Mansel; more recently, Miguel de Unamuno y Jugo, who is perhaps best classified as a fideist, indicted the metaphysical God as a “Nothing-God” and a “dead thing.” In *The Tragic Sense of Life in Men and in Peoples* he wrote that such a fleshless abstraction cannot be the answer to the cravings of the human heart. Only the anthropomorphic God can ever be “the loving God,” the God to whom we come “by the way of love and of suffering.”

Among those who believe in an anthropomorphic God, there are two positions to be distinguished. First, there is the more traditional position that allows no limitations upon the extent to which God possesses the various admirable characteristics—on this view, God is all-powerful, all-loving, infinitely good, perfectly just, and so on. Second, there is the somewhat heretical position of those who, while maintaining that God possesses these characteristics to a high degree, allow that he is limited at least in his power or in his goodness. Mill, who believed in such a finite anthropomorphic deity, claimed that regardless of the official pronouncements of the various religions, in actual practice most Western believers adhered to a theory like his own.

Creation. A few words must be said about the possible meanings of *creation* when God is referred to as the creator (or ground) of the universe. Thomas Aquinas, in his *On the Eternity of the World* and elsewhere, makes a distinction between the temporal sense in which God is supposed to have made the universe at a certain moment in time, prior to which it did not exist, and the more sophisticated sense in which it is asserted that the universe is absolutely dependent on God so that it would cease to exist if God were not sustaining it. Thomas himself believed in God's creation of the universe in both senses, but it was only in the second sense that he regarded the theory of divine creation as susceptible of logical proof. Both these senses must be distinguished from the creative activity ascribed to the demiurge of Plato's *Timaeus* or to Mill's God. Here the deity is not, strictly, a creator but merely an arranger of preexisting material. For the purposes of this entry, a person will count as a believer in the creation of the universe by God if he or she makes any of three claims just distinguished.

THE BROADER SENSE OF ATHEISM. Let us now return to our definition of *atheism*. A person is an atheist in our sense who adopts an attitude of rejection toward all three theistic positions previously stated—belief in a metaphysical God, in an infinite anthropomorphic God, and in a finite anthropomorphic God. He or she will count as a believer in God if maintaining that “God exists” expresses a true proposition, where “God” is employed in one of the three ways described. A person will be an agnostic who does not accept any of these three claims but at the same time suspends judgment concerning at least one of them. It will be observed that on our way of drawing the lines, agnosticism and atheism remain distinct positions, since suspension of judgment and rejection are different attitudes.

The broader definition here adopted enables us to classify together philosophers whose attitudes toward belief in God are exceedingly similar, although their detailed reasons may not always coincide. Rudolf Carnap, for example, regards metaphysical theology as meaningless, while treating belief in an infinite as well as a finite anthropomorphic God as “mythology,” implying that both are false or probably false. In our sense, he can be classified as an atheist without further ado, and it is doubtful that believers would consider him less hostile than atheists in the narrower sense. It is also worth observing that our broader definition receives a good deal of backing from the actual writings of philosophers and others who regarded themselves as atheists. Many of them were by no means unaware of the fact that the word

God has a number of uses and that what may be a plausible justification for rejecting one kind of belief in God may be quite inappropriate in the case of another. Charles Bradlaugh, for example, made it very clear that in calling himself an atheist he did not simply maintain that there is no God. In his “Plea for Atheism,” he wrote:

The atheist does not say “there is no God,” but he says “I know not what you mean by God; I am without idea of God; the word ‘God’ is to me a sound conveying no clear or distinct affirmation.... The Bible God I deny; the Christian God I disbelieve in; but I am not rash enough to say there is no God as long as you tell me you are unprepared to define God to me.”

The writings of Jean Meslier, Holbach, and other eighteenth-century and nineteenth-century atheists, while certainly containing remarks to the effect that the sentence “God exists” expresses a false proposition, are also full of claims that once we critically examine the talk about a “pure spirit” that supposedly exists timelessly and without a body, we find that words have been used without any meaning. In any event, by using the word *atheism* in the broader sense, it will be possible to discuss certain antitheological considerations of great interest that would otherwise have to be excluded.

TRADITIONAL ATHEISTIC ARGUMENTS

In this section we shall discuss two of the arguments popular among atheistic writers of the eighteenth and nineteenth centuries. In later sections we shall present considerations commonly urged by Anglo-Saxon writers in more recent years. However, in a rudimentary form these more recent reflections are already present in the writings of earlier atheists, just as the older arguments continue to be pressed in current literature.

THE ETERNITY OF MATTER. The first of the two older atheistic arguments is based on the doctrine of the eternity of matter, or, to bring it more in accord with recent physical theory, the eternity of mass-energy. (As far as the basic issues here are concerned, it is not of any moment whether what is said to be eternal is matter or energy or mass-energy, and for the sake of convenience we shall speak only of the eternity of “matter.”) There are two steps in this argument. It is claimed, first, either as something self-evident or as a proposition proved by science, that matter is eternal; second, it is asserted that this claim rules out a God conceived as the creator of the material universe. If the physical universe had been created by

God, it would follow that there was a time when the quantity of matter was less than it is now, when it was in fact zero. But physics proves or presupposes that the quantity of matter has always been the same.

Since most ordinary people include “creator of the material universe” in their concept of God, and since they mean by *creation* a temporal act of making something out of nothing, the appeal to the eternity of matter is effective as a popular argument for atheism. A little reflection shows, however, that by itself the argument is of very limited significance. To begin with, regardless of any scientific evidence, the doctrine of the eternity of matter, in all its forms, would be challenged by anybody who accepts any of the causal varieties of the Cosmological Argument. Such a person would presumably argue that while conservation principles may accurately describe a certain feature of the material universe *ever since it began existing*, the material universe itself requires a nonmaterial cause. Hence, any atheistic conclusion in the present context would have to be accompanied by a refutation of the causal forms of the Cosmological Argument. But granting for the moment that the eternity of matter is fully established, this is not incompatible with the theory of divine creation in the sense in which it has been put forward by its philosophically more sophisticated adherents. The eternity of matter is no doubt incompatible with the existence of a God who made the material universe out of nothing and with the kind of activity in which the demiurge is supposed to engage (since bringing order into previously chaotic materials requires the addition of energy); but it is not incompatible with creation in the second of the two senses distinguished by Thomas, in which *creation* means “absolute dependence” and does not refer to any datable act. There may indeed be some difficulty in the notion of a nonphysical entity nonphysically sustaining the universe, and it is tempting to think that this is an intelligible doctrine simply because the words *sustain* and *depend* immediately call up certain pictures in one’s mind; but these difficulties raise rather different questions. Finally, in this connection it should be pointed out that the eternity of matter in all its forms is compatible with a belief in God or gods, like those of the Epicureans and Thomas Hobbes (if Hobbes was serious), who are physical beings, or in gods of any kind, as long as it is not claimed that these have created the universe or any aspect of it.

A few words should perhaps be added here about the claim of some writers that the doctrine of the eternity of matter in all its forms has now been refuted by physics and that physics even somehow proves the existence of

God. In this connection it should be mentioned, first, that the great majority of scientifically informed philosophers agree that the findings of recent physics do not affect the issues dividing believers and unbelievers, and, second, that even if the doctrine of the eternity of matter were now untenable in all its forms, this would undermine one of the arguments for atheism, but not atheism itself. If there was a time when matter did not exist (assuming this to be a meaningful assertion), it does not automatically follow that matter was created by God. To show that matter was created by God, an appeal to the Cosmological Argument (and not to physics) would be as necessary as ever. As for the theory of continuous creation, advocated by some cosmologists, it does indeed imply that the principle of the conservation of mass-energy is false. However, the basic assumption behind the theory of continuous creation is the so-called perfect cosmological principle, which is in effect an endorsement of the eternity of matter. This principle asserts that the large-scale aspects of the universe are the same at all times and in all places; and this, more specifically, means that the stars and galaxies have always been about as evenly distributed as they are at the present time.

EVIL AND OTHER IMPERFECTIONS. Among the traditional atheistic arguments a second type has generally been regarded as more formidable and still enjoys an undiminished popularity. This type of argument points to some imperfection or defect in the universe and argues that the defect is incompatible with the existence of God insofar as God is defined as a perfect being.

Among the imperfections or alleged imperfections, emphasis has frequently been placed on the enormous waste in nature, especially in matters of reproduction, and on the trial-and-error “method” of evolution. Referring to the process of evolution, G. H. Lewes remarked that “nothing could be more unworthy of a supreme intelligence than this inability to construct an organism at once, without making several tentative efforts, undoing today what was so carefully done yesterday, and repeating for centuries the same tentatives and the same corrections in the same succession.” And if the end of this entire process is man, it has been questioned whether it was worth all the pain and tribulations that preceded it. “If I were granted omnipotence, and millions of years to experiment in,” writes Bertrand Russell, “I should not think Man much to boast of as the final result of my efforts” (*Religion and Science*, p. 222). Again, it has been suggested by several writers, and not at all facetiously, that if there were a God, then surely he would have provided human beings with clearer evidence of his own existence.

If an omniscient and omnipotent God did not take care that his intentions should be understood by his creatures, asked Nietzsche, “could he be a God of goodness?” Would he not, rather, be a cruel god if, “being himself in possession of the truth, he could calmly contemplate mankind, in a state of miserable torment, worrying its mind as to what was truth?” (*Morgenröte*, Aphorism 91). If a God exists, then, in the words of Charles Bradlaugh, “he could have so convinced all men of the fact of his existence that doubt, disagreement, or disbelief would be impossible.”

The most widely discussed of all these arguments from the imperfections of the universe is the argument from evil, and it may be best to restrict our discussion to it. The following is a statement by Brand Blanshard:

We are told that with God all things are possible. If so, it was possible for him to create a world in which the vast mass of suffering that is morally pointless—the pain and misery of animals, the cancer and blindness of little children, the humiliations of senility and insanity—were avoided. These are ... apparently ... inflictions of the Creator himself. If you admit that, you deny his goodness; if you say he could not have done otherwise, you deny that with him all things are possible. (“Irrationalism in Theology,” in *Faith and the Philosophers*, edited by John Hick, London, 1964, p. 172)

It should be emphasized that the argument from evil, as here stated, is directed against the conclusion of the believer in an infinite anthropomorphic God and is not merely a criticism of his evidence. On occasions, for example in David Hume’s *Dialogues concerning Natural Religion*, the argument has been used for the milder purpose of showing that the Design Argument cannot succeed in establishing a maker of the universe who is both omnipotent and perfectly good. It argues from the nature of the world to the nature of its cause, and since the world is a mixture of good and evil, it cannot be established in this way that its creator is perfectly good. The form in which we are concerned with the argument from evil—what we may call its stronger sense—maintains that the evil in the world shows the theological claim to be false. The argument may be construed as comparing the theological assertion to a falsified scientific hypothesis: If the theory that the universe is the work of an all-powerful and all-good being were true, then the universe would not exhibit certain features; experience shows that it does exhibit these features, and hence the theory is false.

The argument from evil has no logical force against belief in a finite God. The evil in the world is perfectly

compatible with the existence of a God who is lacking either omnipotence or perfect goodness, or both. In fact, E. S. Brightman and the American personalists and other well-known champions of belief in a finite anthropomorphic God adopted their position precisely in order to reconcile belief in God with the existence of evil. There is also no obvious incompatibility between the existence of the metaphysical God and the evil in the world, since it is not claimed for the metaphysical God either that he is all-powerful or that he is perfectly good in the ordinary senses of these words. Mansel, for example, in *Limits of Religious Thought* openly acknowledged that in the light of the injustice and suffering we find in the world, the moral character of God cannot be represented “after the model of the highest human morality which we are capable of conceiving.” His position, Mansel insisted, unlike the position of anthropomorphic believers, to whom Mansel referred as “vulgar Rationalists” in this context, was immune from difficulties like the problem of evil. Substantially similar remarks are to be found in the writings of many other members of this tradition.

The most basic objections to metaphysical theology will be discussed in the next section, but perhaps it should be mentioned in passing that according to some critics, philosophers like Mansel have a tendency to revert to the view that God is good in the very same sense in which human beings are sometimes good and, more generally, to anthropomorphic theology. This is not at all surprising since, like other believers, they derive or wish to derive comfort and reassurance from their theology. Such comfort may be derivable from the view that the ultimate reality is good and just in the sense or one of the senses in which we use these terms when we praise good and just human beings. No comfort at all, on the other hand, seems derivable from the statement that God is good and just but that “the true nature and manner of all the divine operation of goodness,” in the words of Bishop Browne, “is utterly incomprehensible” or that they differ from human justice and goodness, as Mansel put it, “in kind,” not only in degree.

There is a long history of attempts by believers to show that the argument from evil does not really refute the assertion that an infinite anthropomorphic God exists. It has been maintained by some that evil is unreal; by others that, although real, it is of a “privative” rather than a “positive” character; that it is real and positive but that it is the consequence of man’s abuse of his gift of free will and that a universe without evil and without free will would be worse than one with both; that the argument is based on a narrow hedonistic conception of good and evil

and that, in any event, the theological position cannot be adequately judged unless it is viewed in conjunction with belief in an afterlife in which the wrongs of the present life will somehow be righted; and many more. Critics have come up with various answers to these rejoinders, and the discussion has been going on with unabated vigor in recent years. There would be little point in reviewing this debate here, but something should perhaps be said about two retorts by believers that have not been adequately discussed by the proponents of the argument from evil.

A Christian rejoinder. One rejoinder to the argument from evil seems to be of considerable value in showing that this argument does not by itself justify rejection of belief in an infinite anthropomorphic God. It has been argued (for example, by Arnold Lunn in his exchange of letters with C. E. M. Joad published in *Is Christianity True?*, London and Philadelphia, 1933) that although the existence of evil cannot be reconciled with the existence of an infinite anthropomorphic God, this is not too serious a problem in view of the powerful affirmative evidence for this position. In other areas too, Lunn reminds us, we do not abandon a well-supported theory just because we meet with some counterevidence. He is not in the least disturbed by “the fact that divine science, like natural science, brings us face to face with apparently insoluble contradictions.” This hardly disposes of the argument from evil, as Lunn seems to think. The comparison between the difficulty that a believer faces from the facts of evil and the difficulties besetting a scientific theory for which there is otherwise strong evidence is somewhat tenuous. There are indeed cases answering to this description in science, but they are invariably resolved by further inquiry. Either we come to see that the difficulty or exception was merely apparent or else the original theory is modified or abandoned. In the theological case, several millennia of experience and debate do not seem to have brought us any nearer a resolution. But, assuming that Lunn’s comparison fails as a defense of belief in an infinite anthropomorphic God, there can be no question that he would have made out a strong case in favor of agnosticism as opposed to atheism if there were in fact good evidence for the existence of the God in question. If, for example, the Cosmological Argument were, as far as we can judge, free from fallacious transitions, we would have a situation similar to the kind we frequently face in which there is significant and roughly equally impressive evidence both ways (for example, some apparently trustworthy witnesses implicating the defendant in a court case, while other equally trustworthy witnesses exonerate) and in which suspense of judgment is the

most rational attitude. The moral for our discussion is that an atheist cannot afford to neglect the arguments for the existence of God. Unless they can be demolished, the argument from evil will not by itself establish the atheist’s case, even if none of the answers mentioned earlier are in fact successful.

A fideistic rejoinder. Another rejoinder to the argument from evil has become extremely popular in recent years among existentialist believers and all who maintain that arguments for or against the existence of God are, as it is put, radically beside the point. We are told that one simply either has faith or one has not, one is either “open” to the presence of God or one is not. If one has faith, proofs and reasoning are not needed; if one lacks faith, they are of no avail. A person who has faith is not shaken by absence of evidence or by counterevidence; a person who has no faith will never become a true believer even if intellectually convinced by the arguments of rationalistic theology.

Systematic defenses by those who adopt such a position are exceedingly rare, but in 1964 an article appeared by an existentialist philosopher who seems familiar with contemporary analytic philosophy and whose answer to the argument from evil is representative of this entire approach. In his “On the Eclipse of God” (*Commentary*, June 1964, pp. 55–60), Emil Fackenheim insists that the essential mark of the faith of a person who is “primordially open to God” is certainty, or, specifically, “*the believer’s certainty of standing in relation to an unprovable and irrefutable God*” (Fackenheim’s italics). It is this “irrefutability” of his faith that, Fackenheim believes, enables him to circumvent the problem of evil. No conceivable experience, he insists, can possibly upset the true biblical faith. If there is good fortune, it “reveals the hand of God.” If the fortune is bad and if this cannot be explained as just punishment, the conclusion is that “God’s ways are unintelligible, not that there *are* no ways of God.” To put it “radically”: “*Religious faith can be, and is, empirically verifiable; but nothing empirical can possibly refute it*” (Fackenheim’s italics). Fackenheim cites the examples of Jeremiah, Job, and the Psalmist, all of whom encountered tragedy and disaster without losing their faith in the existence of God. Biblical faith, he observes in this connection, “is never destroyed by tragedy but only tested by it,” and in the course of such a test, it “conquers” tragedy. To underline the invulnerability of this position, Fackenheim adds that no amount of scientific evidence can “affect” biblical belief any more than “historical tragedy” or “an empty heart” can.

What is to be said in reply to all this, especially to the remarkable claim, made in all seriousness, that although faith is empirically verifiable, nothing can possibly refute it? The answer is surely that there is a confusion here between logical and psychological issues. Fackenheim may well have given an accurate account of faith as a psychological phenomenon, but this is totally irrelevant to the question at issue among believers, agnostics, and atheists—namely, which position is favored by the evidence or lack of evidence. All the words—*destroy*, *test*, *conquer*, *affect*, and *refute*—are used ambiguously in this as in countless similar discussions. They refer on the one hand to certain psychological effects (or their absence) and on the other to the relation between facts and a proposition for or against which these facts are (or fail to be) evidence. If the question at issue were whether tragedy and injustice can produce loss of belief in a person who has the “biblical faith,” the answer may well be in the negative, and Fackenheim’s examples support such an answer. They have not the slightest bearing, however, on the question of whether the tragedies and the injustices in the world disprove or make improbable or are any kind of evidence against the statement that the world is the work of an all-powerful and all-good God—the statement in which the believers have faith. The first question may be of great psychological and human interest, and if Fackenheim is right, then a person interested in dissuading “biblical” believers would be foolish even to try. It is the second question alone, however, that is of interest to philosophers, and it alone is at issue between believers and unbelievers. By telling his biblical stories, Fackenheim has done nothing whatsoever to circumvent the problem of evil or to show that what the believer has faith in is immune to criticism.

Before leaving this topic, a few words are in order about a certain concession, occasionally made by unbelievers, which does not appear to be warranted. Some atheists are willing to concede that whereas they can come to grips with rationalistic believers, they are powerless when faced with a fideist like Fackenheim. Thus, Ernest Nagel, in his “Defense of Atheism,” remarks that such a position is “impregnable to rational argument.” Now, if a proposition, *p*, is endorsed on the basis of faith and not on the basis of logical arguments, then indeed a critic cannot undermine any arguments supporting *p*, but may well be in a position to test (and falsify) *p* itself. If a fideist were to maintain, admitting from the outset that there is no evidence for the proposition and that it is based on faith alone, that the *New York Times* sells for 50 cents on weekdays, there is of course no evidence for the proposition that can be attacked, but this would not pre-

vent us from disproving the assertion. Any plea by the fideist there is no evidence or that no evidence can ever move him or her will not have the slightest bearing on the soundness of the refutation. A proponent of the argument from evil would similarly maintain that the assertion of the existence of an infinite anthropomorphic deity has certain publicly testable consequences—that there is no evil in the world or at least not certain kinds of evil—and that experience shows these to be false. It would be to the point to argue either that the assertion of the existence of such a deity does not really have the consequences in question or that experience does not really falsify them; but it is totally beside the point to maintain either that faith in an infinite anthropomorphic God is not, in the case of a particular believer, based on any evidence or that the believer will not abandon his or her position, come what may.

REJECTION OF METAPHYSICAL THEOLOGY

In presenting the case against metaphysical theology, we shall concentrate on the views of Tillich and his disciple, Bishop J. A. T. Robinson, whose *Honest to God* created such a stir among theologians when it was published in 1963. No defender of this position had as much influence in the mid-twentieth century as Tillich. Moreover, his statement of the position is radical and uncompromising and is thus easier to discuss than more qualified versions. At the same time it may well be the case that some of these more qualified versions are not open to quite the same objections. In particular, it might be claimed that the Thomistic doctrine of analogy enables its proponents to escape both the difficulties of straightforward anthropomorphic theology and those besetting Tillich’s position.

Tillich and Robinson entirely agree with atheists that belief in any anthropomorphic deity should be rejected. Traditional theism, Tillich writes, “has made God a heavenly, completely perfect person who resides above the world and mankind” (*Systematic Theology*, Vol. I, p. 271). Against such a highest person, he goes on, “the protest of atheism is correct.” Elsewhere Tillich repeatedly pours scorn on what he terms “monarchic monotheism” and the theology of the “cosmic policeman.” Following Tillich, Bishop Robinson tells us that we must now give up belief in God as somebody “out there,” just as Copernican astronomy made people abandon “the old man in the sky.” Most believers, he writes, are inclined to think of God as a kind of “visitor from outer space” (*Honest to God*, p. 50). Unlike the “old man in the sky” or the “visi-

tor from outer space,” the God of Tillich and Robinson is not another individual entity beside the familiar entities of experience, not even the “most powerful” or the “most perfect” one. He is “being-itself.” As such, God is not contingent but necessary, and arguments for his existence are not required. The idea of God, writes Tillich, is not the idea of “something or someone who might or might not exist” (*Systematic Theology*, Vol. I, p. 205). “In making God an object besides other objects, the existence and nature of which are matters of argument, theology supports the escape to atheism.... The first step to atheism is always a theology which drags God down to the level of doubtful things” (*Shaking of the Foundations*, p. 52).

It should be mentioned in passing that to some readers of Tillich and Robinson there appears to be a radical ambiguity in their entire position, specifically in the reasons they give for rejecting the anthropomorphic theory of the God “out there.” At times we are told that the old-fashioned believers are mistaken because God is really inside us—insofar as our lives have “depth,” insofar as we live “agapeistically.” This is what we may call the Feuerbachian tendency in Tillich and his followers. At other times anthropomorphic theology is denounced because God so radically transcends anything we ever experience that the picture of a glorified man cannot possibly do justice to the reality. In the former context, God must not be said to be “out there” because he is really “in here deep down,” in the latter context, because he is too removed to be even out there. In the former context, theological sentences become a species of very special psychological statements, and in the latter they are clearly items of transcendent metaphysics. There seems to be a constant oscillation between these two positions, so that at times traditional theology is denounced for not being sufficiently this-worldly, while at other times it is condemned for being too close to the world. The former position is of no interest to us, since it may rightly be dismissed as not being in any accepted sense a theological position at all—it is clearly quite compatible with the most thoroughgoing positivism and atheism. Our discussion will therefore be confined to the latter position exclusively.

As already explained in a previous section, Tillich (that is, Tillich the transcendent metaphysician) regards God as so vastly transcending any finite, familiar entity that predicates taken from ordinary experience cannot be employed in their literal senses when applied to God but must be used symbolically or metaphorically. There is just one statement that we can make about God in which all words are used “directly and properly,” namely, that “God as being-itself is the ground of the ontological

structure of being without being subject to the structure himself.” Tillich expands this statement as follows: “God is that structure; that is, he has the power of determining the structure of everything that has being” (*Systematic Theology*, Vol. I, p. 239). If anything is said beyond this “bare assertion,” Tillich insists it cannot be regarded any longer as a “direct and proper statement.” Although all other predicates must be used symbolically when applied to God, certain symbols are justified or appropriate, while others are unjustified or inappropriate, since the former “point” to aspects of the ultimate reality, while the latter do not. Thus, we are justified in speaking of God, symbolically, as “King,” “father,” and “healing.” These are “pointers to the “divine life.”

UNINTELLIGIBILITY OF METAPHYSICAL THEOLOGY. A philosophically sophisticated atheist would object to Tillich’s theology not on the ground that it is false or not proven but on the very different ground that it is unintelligible—that it consists of sentences that may be rich in pictorial associations and in expressive meaning but that fail to make any genuine assertions. Tillich’s position may indeed be immune to the difficulties of an anthropomorphic theology, but only at the expense of not saying anything about the world. This criticism would almost certainly be offered by anybody who accepts an empiricist criterion of meaning, but it is worth pointing out that it is an objection that has been endorsed, in substance if not in precisely these words, by numerous believers in an anthropomorphic God. Voltaire on occasion objected on such grounds to the theologians who claimed that we must not use words in their familiar senses when applying them to God, and it has already been mentioned that Unamuno dismissed the metaphysical God as a “Nothing” and a “dead thing.” Similarly, William James objected to the emptiness of the “universalistic” theology of the Hegelians of his day, preferring what he called a particularistic belief.

Untranslatable metaphors. This criticism might be backed up in the following way: While recognizing that he constantly uses words symbolically or metaphorically, Tillich does not appreciate the difference between translatable and untranslatable metaphors, and he does not see that his own metaphors are untranslatable. Very frequently indeed, especially in ordinary life, when words are used metaphorically, the context or certain special conventions make it clear what is asserted. Thus, the editor of an encyclopedia, when asked why he or she looks so troubled, may reply, “Too many cares are weighing down on me—the pressure is too great.” Obviously the words *weighing down* and *pressure* are here metaphorical, yet we

all understand what is being said. Why? Because the metaphorical expressions are translatable—because we can eliminate them, because we can specify in non-metaphorical terms what the sentence is used to assert. If the metaphors could not be eliminated, we would not have succeeded in making any assertion.

A critic would proceed to argue that Tillich's metaphors are of the untranslatable variety and that when he has offered what seem to him translations, he has really only substituted one metaphor for another. Tillich believed that in his basic statement, quoted earlier, all words are used literally, or "properly." But this is open to question. The word *ground*, for example, is surely not used in any of its literal senses when being-itself is said to be the ground of the ontological structure of being. It can hardly be used in the physical sense in which the floor or the grass underneath our feet could be regarded as a "ground," or in the logical sense in which the premises of an argument may be the ground for endorsing the conclusion. Similar remarks apply to the use of *structure*, *power*, and *determine*. Hence, when we are told that "God is personal" (which is acknowledged to be metaphorical) means "God is the ground of everything personal," or that "God lives" (which is also acknowledged to be metaphorical) means "God is the ground of life," one set of metaphors is exchanged for another, and literal significance is not achieved. Tillich's God, it should be remembered, is so transcendent that not even mystical experience acquaints us with him. "The idea of God," he writes, "transcends both mysticism and the person-to-person encounter" (*The Courage To Be*, p. 178). Consequently, he does not have at his disposal any statements in which God is literally characterized and that could serve as the translations of the metaphorical utterances. The absence of such statements literally characterizing being-itself equally prevent Tillich from justifying the employment of his set of "symbols" as appropriate and the rejection of other symbols as inappropriate.

Unfalsifiability of metaphysical theology. We noted earlier that a metaphysical theology like Tillich's avoids the troublesome problem of evil because it does not maintain that God is perfectly good or, indeed, omnipotent in any of the ordinary or literal senses of these words. This very immunity would, however, be invoked by some critics as a decisive objection and they would, by a somewhat different route, reach the same conclusion—namely, that Tillich's theological sentences do not amount to genuine assertions. The point in question may perhaps be most forcefully presented by contrasting Tillich's position with that of anthropomorphic believers such as John

Hick or A. C. Ewing. Hick and Ewing are (theoretically) very much concerned with the problem of evil. They argue that given the nature of man and a world with dependable sequences (or causal laws), evil of certain kinds is unavoidable, and furthermore that (though they do not, of course, claim to be able to prove this) in the next life there will be appropriate rewards and compensations. They admit or imply that their belief would be logically weakened, perhaps fatally so, if it could be shown that there is no afterlife or that in the afterlife injustice and misery, far from vanishing, will be even more oppressive than in the present life, or that the evils which, given the nature of man and a world of dependable sequences, they thought to be unavoidable, could in fact have been prevented by an omnipotent Creator. Tillich, however, need not be (theoretically) concerned about any such contingencies. Even if things in this life became vastly more horrible than they already are, or even if we had conclusive evidence that in the afterlife things are so bad that by comparison, Auschwitz and Belsen were kingdoms of joy and justice, Tillich's theology would be totally unaffected. Being-itself, as Tillich put it, would still be "actual": It is not "something or someone who might or might not exist." God, as Bishop Robinson puts it, is not a "problematic" entity, which might conceivably not have been there." This is true of the anthropomorphic deity, but not of what Tillich in one place terms "the God above God" (*Listener*, August 1961, pp. 169ff.).

In other words, unlike the position of Hick and Ewing, Tillich's theology is compatible with anything whatsoever in this life as well as in the next one; and it is the opinion of many contemporary philosophers, believers as well as unbelievers, that if a putative statement is compatible with anything whatsoever, if it excludes no conceivable state of affairs, then it is not a genuine assertion (it should be noted that "state of affairs" is not used in a narrow way so that much that positivists exclude, for example, happiness or suffering in the next world, could count as conceivable states of affairs). This criterion may, of course, be questioned, but if it is accepted, then Tillich's theology, unlike that of anthropomorphic believers, would have to be condemned as devoid of any assertive force.

We have not here considered other variants of metaphysical theology, but those opposed to Tillich's system for the reasons here outlined would maintain that other forms of this general outlook are bound to be open to some of the same objections: In every case, words would have to be used in a metaphorical way in crucial places, and these metaphors would turn out to be untranslatable;

in every case it would be impossible to justify the employment of one set of metaphors or symbols in preference to another, and in every case the author of the system would be unable to specify what conceivable state of affairs is excluded by his sentences or, if he did do so, the exclusion could be shown to be arbitrary in a way that would not be true of the statements of anthropomorphic believers.

ATHEISM OR AGNOSTICISM?

It is time to discuss a very common challenge to atheists. The challenge is usually issued by agnostics, but it would in general also be endorsed by fideistic believers. “It is admittedly impossible,” the critic would reason, “to prove the existence of God, but it is equally impossible to disprove his existence; hence, we must either suspend judgment or, if we embrace some position, we must do so on the basis of faith alone.” To avoid misleading associations of the words *prove* and *disprove*, the same point may be expressed by saying that we have no evidence either for or against God’s existence. Sometimes the reminder is added that the mere failure of the arguments for the existence of God does not show that there is no God. Anybody who supposed this would plainly be guilty of the fallacy of *argumentum ad ignorantiam*.

If certain of the considerations advanced by atheists that were discussed in previous sections are sound, this agnostic charge would be quite beside the point as far as belief in an infinite anthropomorphic or a metaphysical God is concerned. For in that event, the first theory can be shown to be false (with certain qualifications explained earlier), and the second can be rejected on the ground that it is unintelligible. In the case of an infinite anthropomorphic God, there is evidence against the position; in the case of a metaphysical God, we do not have a coherent position. However, when we turn to the question of a finite anthropomorphic God, the challenge does at first sight seem very plausible. As already pointed out, the argument from evil does not affect this position, and we may, at least provisionally, grant that belief in a finite anthropomorphic God is intelligible because the predicates used in expressing it are applied to this deity in their familiar senses. We shall see, before long, that there are difficulties in regard to the intelligibility of even this position, but waiving all considerations of this kind for the moment, let us inquire how an atheist could reply to this challenge. It is admitted by the challenger that there is no evidence for the existence of such a deity; where, he asks, is the evidence against its existence? If there is none, why should one be an atheist rather than an agnostic? Why is

atheism justified if we cannot be sure that there is no God in the sense under discussion?

GROUNDS FOR THE REJECTION OF THEORIES. In justifying his position, an atheist should perhaps begin by calling attention to the fact that the agnostics who suspend judgment concerning God are not also agnostics in relation to the gods of the Greeks or in relation to the devil and witches. Like the majority of other educated people, most agnostics reject and do not suspend judgment concerning the Olympian gods or the devil or witches. Assuming that rejection is the appropriate attitude in these cases, what justifies this rejection?

It will be instructive to look at a concrete example of such a belief that is rejected by agnostics and atheists alike and, incidentally, by most believers in God. Billy Graham is one of the few Protestant ministers who still believe in the devil. The devil is introduced by Dr. Graham as the only plausible explanatory principle of a great many phenomena. He is brought in to explain the constant defeat of the efforts of constructive and well-meaning people, the perverse choices of men who so commonly prefer what is degrading to what is “rich and beautiful and ennobling,” the speed with which lies and slander spread in all directions, and also the failure of the world’s diplomats. “Could men of education, intelligence, and honest intent,” asks Dr. Graham, “gather around a world conference table and fail so completely to understand each other’s needs and goals if their thinking was not being deliberately clouded and corrupted?” All such failures are “the works of the devil” and they show that he “is a creature of vastly superior intelligence, a mighty and gifted spirit of infinite resourcefulness.” The devil is no “bungling creature” but “a prince of lofty stature, of unlimited craft and cunning, able to take advantage of every opportunity that presents itself” (*Peace with God*, New York, 1954, pp. 59–63).

What reasons could or would be given for rejecting this explanation of diplomatic failures in terms of the devil’s cunning ways? Aside from possibly questioning some of Dr. Graham’s descriptions of what goes on in the world, that is, of the “facts” to be explained, our reasons would probably reduce to the following: First, we do not need to bring in the devil to explain the failure of diplomats to reach agreement on important international issues. We are confident, on the basis of past experience, that explanations of these failures in terms of human motives, in terms of human ignorance and miscalculation, are quite adequate, although in any particular case we may not be in the possession of such an explanation;

and, second, the devil hypothesis, granting it to be intelligible, is too vague to be of any use. It is hinted that the devil has a body, but what that body is like or where it lives and exactly how it operates, we are not told. If “devil” is construed on the analogy of the theoretical terms of the natural sciences, our complaint would be that no, or none but totally arbitrary, correspondence rules have been assigned to it.

It should be observed that the devil theory is rejected although it has not been tested and, hence, has not been falsified in the way in which certain exploded medical theories have been tested and falsified. There are, in other words, theories that we reject (and which agnostics, like others, believe they have good reason to reject), although they have not been falsified. It is important to distinguish here two very different reasons why a theory may not have been tested and, hence, why it cannot have been falsified. The theory may be sufficiently precise for us to know what would have to be done to test it, but we may be chronically or temporarily unable to carry out any of the relevant tests. This is to be sharply contrasted with the situation in which a theory is so vague that we do not know what we must do to subject it to a test. In the former case, suspension of judgment may well be the appropriate attitude; it does not follow that the same is true in the latter case, and in fact most of us regard rejection as the appropriate attitude in such a situation until and unless the theory is stated with more precision.

An atheist would maintain that we have just as good grounds for rejecting belief in a finite anthropomorphic deity of any sort as we have for rejecting belief in Zeus or in the devil or in witches. It should be noted that the believers in the finite anthropomorphic God usually advance their theory as a hypothesis that is the best available explanation of certain facts. Mill, for example, thought that the Design Argument, in the form in which he advocated it, affords “a large balance of probability in favor of creation by intelligence,” although he conceded that new evidence for the Darwinian theory would alter this balance of probability (*Three Essays on Religion*, New York, 1874, p. 174). An atheist would argue that we do not need a finite God to account for any facts any more than we need the devil theory; and, more important, that the theory is too vague to be of any explanatory value. Mill, for example, talks of “creation by intelligence,” but he does not tell us in any detail what the “Author of Nature” is like, where he can be found, how he works, and so on. Furthermore, because of its vagueness the theory is totally sterile. It does not lead to subsidiary hypotheses about celestial laboratories or factories in which eyes and

ears and other organs are produced. Nor does it help us to interpret fossils or other remains here on earth. It is tempting, but it would be misleading, to say that the accumulation of evidence for the Darwinian theory (or some modified version of it) since Mill wrote on the subject has put the design theory “out of court.” This would suggest that the theological explanation was at some time “in court,” in the way in which a falsified scientific explanation may once have been a serious contender. It is true, of course, as a matter of history, that informed people cease to bring in God as an explanation for a given set of phenomena once a satisfactory scientific or naturalistic explanation is available. In a more important sense, however, the theological explanations were never serious rivals, just as the devil explanation of diplomatic failures is not a serious rival to psychological explanations. The theological explanations never were serious rivals because of their excessive vagueness and their consequent sterility. We do not at present have anything like a satisfactory scientific explanation of cancer, but no theological theory would be treated as a genuine alternative by a cancer researcher, even a devoutly religious one.

It should be added to all this that believers who, unlike Mill, do not treat their theology as a kind of hypothesis, are not affected by the above objections. Indeed, quite a number of them have strenuously opposed any kind of “God of the gaps.” However, some of the very writers who insist that their theology must not be regarded as a scientific hypothesis elsewhere make statements that imply the opposite. They also frequently maintain that certain phenomena—for example, the universal hunger for God or the origin of life—can be explained only, or can be explained best, on the assumption that there is a God, and a God of a certain kind. Whatever they may say on other occasions, insofar as they propose their theology as the only possible, or as the best available, explanation of such phenomena, they are committed to the position that has been criticized in this section.

THE DEMAND FOR A COSMIC BRAIN

There was a good deal of discussion in the late nineteenth century of an antitheological argument that ought to be briefly mentioned here. To many persons, including unbelievers, the argument will seem to be merely grotesque; but in view of the revival in more recent years of several forms of extreme materialism, it deserves some discussion. Moreover, even if it is granted that the argument fails to prove its conclusion, the very grotesqueness of some of its formulations enables a more sophisticated

contemporary atheist to state a challenge in a particularly forceful way.

The two writers chiefly associated with this argument were the German physiologist Emil Du Bois–Reymond and the English mathematician W. K. Clifford, both of whom wrote extensively on philosophical subjects. However, the argument is really much older, and versions of it are found in Meslier and Holbach. The remark attributed to Pierre Simon de Laplace that “in scanning the heavens with a telescope he found no God” may be regarded as an argument belonging to the same family. “Can we regard the universe,” asked Clifford in his essay “Body and Mind,” “or that part of it which immediately surrounds us, as a vast brain, and therefore the reality which underlies it as a conscious mind? This question has been considered by the great naturalist, Du Bois–Reymond, and has received from him that negative answer which I think we also must give.” The student of nature, Du Bois–Reymond had written, before he can “allow a psychical principle to the universe,” will demand to be shown “somewhere within it, embedded in neurine and fed with warm arterial blood under proper pressure, a convolution of ganglionic globules and nerve-tubes proportioned in size to the faculties of such a mind” (*Über die Grenzen des Naturerkennens*, p. 37). But, in fact, no such gigantic ganglionic globules or nerve-tubes are discoverable, and, hence, we should not allow a “psychical principle” to the universe. The following would be a more systematic statement of the argument: Experience shows that thinking, volition, and other psychological phenomena do not and cannot occur without a certain physiological basis—more specifically, without a brain and nervous system. Our observations appear to indicate, although this is not a matter of which one can be certain, that no cosmic brain or nervous system exists. Hence, it is probable that no cosmic consciousness exists either.

This argument has been criticized on the ground that it assumes a certain view (or a certain group of views) about the relationship between body and mind that is not self-evidently true and that many believers would deny. It assumes that consciousness can exist only in conjunction with a nervous system and a brain. However, the objector would maintain, the actual evidence on the subject does not warrant such a claim. It is true that within our experience, conscious processes are found only in connection with a highly developed brain, but this does not prove that consciousness may not occur in conjunction with other physical structures or without any physical “attachments” whatsoever. This is a big question about which nothing very useful can be said in a few words. Perhaps all

we can do here is point out that if materialism of some kind is true, then the demand to be shown the bodily foundation or aspect of the divine consciousness is not misplaced, while if the opposite view that consciousness can exist independently of a physical structure is correct, the Du Bois–Reymond argument would have no force.

Quite aside from this objection, the argument probably seems to many people, believers and unbelievers alike, to rest on a total, one is almost inclined to say a willful, misunderstanding of the theological position. James Martineau, who replied at some length to Du Bois–Reymond, protested that the “demand for organic centralization” was “strangely inappropriate,” indeed quite irrelevant to the question at issue between the believer and the unbeliever. If Du Bois–Reymond himself, wrote Martineau, were “ever to alight on the portentous cerebrum which he imagines, I greatly doubt whether he would fulfill his promise and turn theist at the sight: that he had found the Cause of causes would be the last inference it would occur to him to draw: rather would he look round for some monstrous *creature*, some cosmic megatherium, born to float and pasture on the fields of space” (*Modern Materialism and Its Relation to Religion and Theology*, p. 184). Martineau then likened the argument to Laplace’s remark, mentioned earlier, that in looking at the heavens with his telescope, he could nowhere see God and to statements by certain physiologists that in opening the brain, they could not discover a soul. All such pronouncements Martineau regarded as absurd. Although the physiologist finds no soul when he opens up the brain, “we positively know” (by introspection) the existence of conscious thought. Similarly, that “the telescope misses all but the bodies of the universe and their light” has no tendency to prove “the absence of a Living Mind through all.” If you take the “wrong instruments” you will not find what you are looking for. “The test tube will not detect an insincerity,” nor will “the microscope analyse a grief”; but insincerity and grief are real for all that. The organism of nature, Martineau concludes, “like that of the brain, lies open, in its external features, to the scrutiny of science; but, on the inner side, the life of both is reserved for other modes of apprehension, of which the base is self-consciousness and the crown is religion.”

One is strongly inclined to agree with Martineau that there is something absurd in scanning the heavens for God. Étienne Borne, a French Catholic whose discussions are distinguished by fairness and sympathy for the opposition, refers to this approach as “a tritely positivist atheism” that “misses the point of the problem altogether” (*Modern Atheism*, p. 145). One must not expect to find

God or God's body in the heavens because God is not a huge man with huge arms, legs, arteries, nervous system, and brain. Only children think of God as a "king" sitting on his throne in Heaven. Educated grownups do not think of God in any such crude fashion. Du Bois–Reymond, Clifford, and Laplace are all guilty of an enormous *ignoratio elenchi*.

IS ANTHROPOMORPHIC THEOLOGY INTELLIGIBLE? Let us grant the force of Borne's objection. A critic may nevertheless raise the following questions: What is God like if he is not a grand consciousness tied to a grand body, if he is so completely nonphysical as to make any results of telescopic exploration antecedently irrelevant? If the telescope, as Martineau put it, is the "wrong instrument," what is the right instrument? More specifically, what does it mean to speak of a pure spirit, a disembodied mind, as infinitely (or finitely) powerful, wise, good, just, and all the rest? We can understand these words when they are applied to human beings who have bodies and whose behavior is publicly observable; we could undoubtedly understand these words when they are applied to some hypothetical superhuman beings who also have bodies and whose behavior is in principle observable; but what do they mean when they are applied to a pure spirit? Do they then mean anything at all? In recent years it has come to be widely questioned whether it makes any sense to talk about a disembodied consciousness. It is widely believed, in other words, that psychological predicates are logically tied to the behavior of organisms. This view, it should be pointed out, is not identical with reductive materialism. It does not, or at least does not necessarily, imply that the person is just a body, that there are no private experiences, or that feelings are simply ways of behaving. It makes the milder claim that however much more than a body a human being may be, one cannot sensibly talk about this "more" without presupposing (as part of what one means, and not as a mere contingent fact) a living organism. Anybody who has studied and felt the force of this thesis is not likely to dismiss as facetious or as "trite positivism" the question as to what words such as *wise*, *just*, and *powerful* can mean when they are applied to an entity that is supposedly devoid of a body. What would it be like to be, for example, just, without a body? To be just, a person has to act justly—to behave in certain ways. But how is it possible to perform these acts, to behave in the required ways, without a body? Similar remarks apply to the other divine attributes.

One may term this the "semantic" challenge to anthropomorphic theology, as distinct, for example, from

arguments like the one from evil or from the eternity of matter, which assume the meaningfulness of the position attacked. A proponent of this challenge does not flatly maintain that anthropomorphic theology is unintelligible. For the point—that the predicates in question lose their meaning when applied to a supposedly disembodied entity—would be accompanied by the observation that in fact most anthropomorphic believers do, in an important sense of the word, believe in a god with a body, whatever they may say or agree to in certain "theoretical" moments. If we judge the content of their belief not by what they say during these "theoretical" moments but by the images in terms of which their thinking is conducted, then it seems clear that in this sense or to this extent they believe in a god with a body. It is true that the images of most Western adults are not those of a big king on his heavenly throne, but it nevertheless seems to be the case that, when they think about God unself-consciously (and this is, incidentally, true of most unbelievers also), they vaguely think of him as possessing some kind of rather large body. The moment they assert or deny or question such statements as "God created the universe" or "God will be a just judge when we come before him," they introduce a body into the background, if not into the foreground, of their mental pictures. The difference between children and adults, according to this account, is that children have more vivid and definite images than adults.

This entire point may perhaps be brought out more clearly by comparing it with a similar "semantic" criticism of belief in human survival after death. The semantic critic would maintain that while a believer in reincarnation or the resurrection of the body may be immune from this objection, those who claim that human beings will continue to exist as disembodied minds are really using words without meaning. They do not see this because of the mental pictures accompanying or (partly) constituting their thoughts on the subject. Or, alternatively, they do not see this because, in spite of what they say in certain "theoretical" contexts, in practice they believe in the survival of the familiar *embodied* minds whom they know in this life. When they wonder whether their friends, enemies, certain historical personages, or, for that matter, anybody did or will go on existing after death, they think of them automatically in their familiar bodily "guises" or else in some ghostly "disguises," but still as bodily beings of some kind. If these images are eliminated on the ground that they are irrelevant or inappropriate because the subject of survival is a disembodied mind, it is not clear that an intelligible statement remains. What, for example, do such words as *love* and *hate* or *hap-*

piness and *misery* mean when they are predicated of a disembodied mind?

It will be seen from all this that the argument of Du Bois–Reymond and Clifford is not without some point. One may incorporate what is of value in their discussion into the following challenge to anthropomorphic theology: Insofar as the believer believes in a god with a body, what he or she says is intelligible; but in that case the available evidence indicates that there is no such body, and the remarks of Du Bois–Reymond and Clifford are to the point; if or insofar as God is declared to be a purely spiritual entity, the observations of Du Bois–Reymond and Clifford become irrelevant, but in that case the predicates applied to God have lost their meaning, and, hence, we no longer have an intelligible assertion.

SUMMARY OF THE ATHEIST’S POSITION. Let us summarize the atheist’s case as it has here been presented. A philosophically sophisticated atheist would begin by distinguishing three types of belief in God—what we have called the metaphysical God, the infinite anthropomorphic God, and the finite anthropomorphic God. He will then claim that he can give grounds for rejecting all three, although he does not claim that he can prove all of them to be false. He will try to show that metaphysical theology is incoherent or unintelligible, and, if he can do this, he will certainly have given a good ground for rejecting it. He will also question the intelligibility of anthropomorphic theology insofar as God is here said to be a purely spiritual entity. If and insofar as belief in an infinite anthropomorphic God is intelligible, he will maintain that it is shown to be false by the existence of evil. In the sense in which he will allow the existence of a finite anthropomorphic God to be an intelligible hypothesis, he will argue that it should be rejected because it is not needed to account for any phenomena and, further, because it is too vague to be of any explanatory value. We saw that some of these justifications, even if sound as far as they go, would not establish the atheist’s case unless they are accompanied by a demolition of the arguments for the existence of God.

SOME OBJECTIONS TO ATHEISM

If there were reason to believe that any of the arguments for the existence of God are sound or have at least some tendency to establish their conclusions, then they would of course constitute objections to atheism. Since these arguments are fully discussed elsewhere in this encyclopedia, we shall here confine ourselves to objections that are logically independent of them. Some of these objec-

tions have been put forward by writers who explicitly reject all the traditional proofs but nevertheless regard atheism as an untenable position.

THE MYSTERY OF THE UNIVERSE. It has been argued by several writers that whatever the objections to the different forms of theology may be, atheism is also unacceptable since it has no answer to the “ultimate question” about the origin of the universe. Thus, the nineteenth-century physicist John Tyndall, after endorsing a thoroughgoing naturalism, proceeded to reject atheism in favor of an agnostic position. In a paper titled “Force and Matter,” he tells the story of how Napoleon turned to the unbelieving scientists who had accompanied him to Egypt and asked them, pointing to the stars, “Who, gentlemen, made all these?” “That question,” Tyndall comments, “still remains unanswered, and science makes no attempt to answer it.” Later he adds that “the real mystery of this universe lies unsolved, and, as far as we are concerned, is incapable of solution” (*Fragments of Science*, pp. 92–93). In much the same vein, the celebrated American freethinker and social reformer Clarence Darrow, after pointing out the weaknesses of the First Cause Argument, observed that the position of the atheist is just as vulnerable. If, he wrote, the atheist answers the question “What is the origin of it all?” by saying that the universe always existed, he has the same difficulty to contend with as the believer has when he is asked the question “Who made God?” To say that “the universe was here last year, or millions of years ago, does not explain its origin. This is still a mystery. As to the question of the origin of things, man can only wonder and doubt and guess” (*Verdicts out of Court*, pp. 430–431).

A philosophically acute atheist could offer a twofold answer to arguments of this kind. First, he would maintain that the question about the “origin of the universe” or the “origin of it all” is improper and rests on the mistaken or doubtful assumption that there is a thing called “the universe.” It is tempting to suppose that there is such a thing because we have a tendency to think of the universe as a large container in which all things are located and, perhaps more important, because grammatically the expression functions analogously to expressions like “this dog” or “the Cathedral of Notre Dame,” which do denote certain things. Upon reflection, however, it becomes clear, the rejoinder would continue, that “the universe” is not a thing-denoting expression or, putting the point differently, that there is not a universe over and above the different things within the universe. While it makes sense to ask for the origin of any particular thing, there is not a further thing left over, called “the universe” or “it all,” into

whose origin one can sensibly inquire. The origin of a great many things is of course unknown to us, but this is something very different from “the ultimate mystery” that figures in the argument under discussion; and there is no reason to suppose that questions about the origin of any individual thing fall in principle outside the domain of scientific investigation.

Furthermore, even if it is granted both that the question concerning the origin of the universe is proper and that we do not and cannot discover the true answer, this is not by itself an argument against atheism. It may well be possible to know that a certain suggested answer to a question is false (or meaningless) without knowing the true answer. All kinds of crimes have never been solved, but this does not prevent us from knowing that certain people did not commit them. An atheist can quite consistently maintain “I have no idea how the origin of the universe is to be explained, but the theological theory cannot be the right answer in view of such facts as the existence of evil.” To support his position, the atheist must be able to justify his rejection of theological answers to the question “What is the origin of the universe?” He does not have to be able to answer that question.

ATHEISM PRESUPPOSES OMNISCIENCE. In the popular apologetic pronouncements of liberal believers, it is customary to contrast the agnostic, who is praised for his circumspection, with the atheist, who is accused of arrogant dogmatism and who, like the orthodox or conservative believer, claims to know what, from the nature of the case, no mere human being can possibly know. “The atheist,” in the words of Dr. W. D. Kring, a twentieth-century Unitarian, “can be just as closed-minded as the man who knows everything. The atheist just knows everything in a negative direction” (*New York Times*, March 22, 1965).

Reasoning of this kind figured prominently in several influential works by nineteenth-century Protestant theologians. Their favorite argument was the following *reductio ad absurdum*: Atheism could be known to be true only if the atheist knew everything; but this is of course impossible; hence, atheism cannot be known to be true. For a man to deny God, wrote Thomas Chalmers, “he must be a God himself. He must arrogate the ubiquity and omniscience of the Godhead.” Chalmers insists that the believer has a great initial polemical advantage over the atheist. For, he argues, some very limited segment of the universe may provide the believer with strong or even decisive evidence, with an “unequivocal token” of God’s existence. The atheist, on the other hand, would have to “walk the whole expanse of infinity” to make out

his case (*On Natural Theology*, Vol. I, Book I, Ch. 2). By what miracle, asks John Foster, can an atheist acquire the “immense intelligence” required for this task? Unless he is “omnipresent—unless he is at this moment at every place in the universe—he cannot know but there may be in some place manifestations of a Deity by which even *he* would be overpowered.” And what is true of space equally applies to “the immeasurable ages that are past” (*Essays*, 18th ed., p. 35). The atheist could not know that there is no God unless he had examined every part of the universe at every past moment to make sure that at no time was there a trace of divine activity.

According to Robert Flint, who endorsed and elaborated the arguments of Chalmers and Foster, the situation should be clear to anybody who reflects on the difficulty of “proving a negative.” If a man landed on an unknown island, any number of traces in almost any spot would be sufficient to show that a living creature had been there, but he would have to “traverse the whole island, examine every nook and corner, every object and every inch of space in it, before he was entitled to affirm that *no* living creature had been there” (*Anti-Theistic Theories*, pp. 9–11). The larger the territory in question, the more difficult it would become to show that it had not a single animal inhabitant. If, then, it is “proverbially difficult to prove a negative,” there can surely “be no negative so difficult to prove as that there is no God.” This is plain if we reflect that “before we can be sure that nothing testifies to His existence, we must know all things.” The territory in this case is “the universe in all its length and breadth.” To know that there is no trace of God anywhere in eternal time and boundless space, a man would have had to examine and to comprehend every object that ever existed. This would indeed require omnipresence and omniscience, and Chalmers was there perfectly right when he maintained that the atheist’s claim implies that “he is himself God.”

Whatever its rhetorical force, this argument is so patently invalid that it can be disposed of in just a few words. We have in preceding sections of this entry presented several of the most widely used arguments and considerations that have been advanced in support of atheism. These may or may not be logically compelling, but none of them in any way imply that the atheist must be omniscient if he is right. To establish that the existence of evil is incompatible with the view that the universe is the work of an all-powerful and all-good Creator, to show that a given theory is too vague to be of any explanatory value, or to call attention to the fact that certain words

have in a certain context lost their meaning—none of these require omniscience.

Writers like Chalmers, Foster, and Flint seem to labor under the impression that as far as its refutability is concerned, “God exists” is on par with a statement like “A hippogriff exists, existed, or will exist in some place at some time.” It may be plausible to maintain that our not having found any hippogriffs on earth is no conclusive evidence that such an animal does not exist in some other part of the universe to which we have no access. The same does not at all apply to the question of whether one is or can be entitled to reject the claims of believers in God. For, unlike the hippogriff, God is by some declared to be the all-powerful and all-good Creator of the universe; he is said by most believers to be a mind without a body; and it is asserted by some that predicates taken from ordinary experience can never be applied to God in their literal senses. These features of theological claims may make it possible to justify their rejection although one has not explored every “nook and cranny” of the universe.

ATHEISM, ZEAL, AND GLOOM

In the opening section of this entry we referred to the view, common in previous centuries, that atheism is bound or, at any rate, very likely to lead to immorality, to national ruin, and to other disasters. This warning is no longer taken very seriously among reputable thinkers, but certain other statements about the baleful consequences of unbelief in general and atheism in particular continue to be widely discussed. Thus, it is frequently maintained that if atheism were true or justified, life would be deprived of all meaning and purpose. Again, it has been held that without God the universe becomes “terrifying” and man’s life a lonely and gloomy affair. “Old age,” wrote William James in his *Varieties of Religious Experience* (New York and London, 1902), “has the last word: a purely naturalistic look at life, however enthusiastically it may begin, is sure to end in sadness.” Blaise Pascal, who was particularly concerned about the terror of a “silent universe” without God, observed in a similar vein that “the last act” is always tragic—“a little earth is thrown upon our head, and that is the end forever.”

James and Pascal were believers, but very similar statements have frequently come from unbelievers themselves. “I am not ashamed to confess,” wrote G. J. Romanes, a nineteenth-century biologist, at the end of his *A Candid Examination of Theism* (a work that was published anonymously in London in 1878 and which caused a commotion at the time), “that with this virtual

denial of God, the universe has lost to me its soul of loveliness.”

More recently, the anthropologist Bronislaw Malinowski spoke of the state of mind of an unbeliever like himself as “tragic and shattering.” Not only does the absence of God, in the opinion of these writers, make the universe “lonely,” “soulless,” and “tragic,” but it also deprives it of love. Only when we have become accustomed to a “loveless” as well as a “Godless universe,” in the words of Joseph Wood Krutch, shall “we realize what atheism really means.”

Finally, it has been claimed that atheism is fatal to what William James called the capacity of the strenuous mood. James himself had no doubt that the unbeliever is prevented from “getting out of the game of existence its keenest possibilities of zest.” Our attitude toward concrete evils, he asserted, “is entirely different in a world where we believe there are none but finite demanders, from what it is in one where we joyously face tragedy for an infinite demander’s sake.” Religious faith sets free every kind of energy, endurance, and courage in the believer and “on the battlefield of human history,” religion will for this reason always “drive irreligion to the wall” (*The Will to Believe*, pp. 213ff.)

Some of these claims seem a great deal more impressive than others. It is not easy to deal with the charge that atheism deprives life of its meaning, chiefly because the word *meaning* in this connection is both ambiguous and extremely vague. However, if what is meant is that an atheist cannot be attached to certain goals that give direction to his life, then the charge is quite plainly false. If what is meant is that although the atheist may, like other men, pursue certain goals, he will not be able to justify any of his activities, then it should be pointed out that most human beings, even believers in God, do not justify the great majority of their acts by reference to God’s will. Hence, the justification of these actions, if they ever are justified, could not be affected by the soundness of atheism. It is difficult to see how such activities as engaging in scientific research, assisting people who are in trouble, singing or dancing or making love or eating superb meals, if they ever were worthwhile, would cease to be so once belief in God is rejected. If what is meant by the charge is that the unbeliever will eventually have to fall back, in his justification, on one or more value judgments that he cannot justify by reference to anything more fundamental, this may be true, but it is not necessarily baleful, and it is not a consequence of atheism. Anybody who engages in the process of justifying anything will eventually reach a stage at which some proposition, principle, or

judgment will simply have to be accepted and not referred back to anything else. The unbeliever may, in justifying his acts, regard as fundamental such judgments as “happiness is intrinsically worthwhile” or “the increase of knowledge is good for its own sake,” whereas some believers may say that only service of God is intrinsically valuable. If it is a sign of irrationality, which in any normal sense of the word it is not, to accept a value judgment that is not based on another one, then the atheist is not one whit more irrational than the believer.

On the question of zest, it should be observed that neither James nor anybody else has ever offered empirical evidence for the assertion that unbelievers lead less active or strenuous lives than believers. What we know about human temperament suggests that the acceptance or rejection of a metaphysical position has, in the case of the vast majority of men, exceedingly little to do with whether they lead active or inactive lives. The Soviet cosmonauts, who were atheists (to take one relatively recent illustration), appeared to display the same courage and endurance as their American counterparts, who were believers. In general terms, a survey of the contributions of atheists and other unbelievers to science and social progress, often in conditions requiring unusual stamina and fortitude, would seem to indicate that James was in error. The *a priori* character of James’s views on this subject remind one of Locke’s conviction, mentioned earlier in this entry, that atheists, since they do not fear divine punishment, cannot be trusted to keep oaths and promises.

As for the “loveless universe” presented by atheism, it must of course be admitted that if there is no God who loves his creatures, there would be that much less love in the world. But this is perhaps all that an atheist would have to concede in this connection. Aside from certain mystics and their raptures, it may be questioned whether a biologically normal human being is capable of feeling any real or deep love for an unseen power; and it hardly seems credible to suppose that a person will cease to love other human beings and animals (if he ever loved them) just because he does not believe them to be the work of God. Perhaps one may hazard a guess that if more human beings grow up in an environment that is free from irrational taboos and repressions (and these, one may add, have not been altogether unconnected with religious belief in the past), there will be more, not less, love in the world—people will be more lovable and will also be more capable of giving love. As far as love is concerned, the record of theistic religions has not been particularly impressive.

The writers whose views we are discussing have probably been on stronger ground when they maintain that atheism is a gloomy or tragic philosophy, but here too some qualifications are in order. To begin with, if atheism implies that life is gloomy, it does so not by itself but in conjunction with the rejection of the belief in life after death. There have been atheists, of whom J. E. McTaggart is probably the most famous, who believed in immortality, and they would deny that their atheism had any gloomy implications. However, since the great majority of atheists undoubtedly reject any belief in survival, this does not go to the root of the matter. It cannot be denied that the thought of annihilation can be quite unendurable; but it may be questioned whether believers, whatever they may be expected to feel, do in fact find the thought of death any less distressing. In the opinion of some observers, this is due to the fact that regardless of his profession, the believer frequently does not really believe that death is the gate to an eternal life in the presence of God. “Almost inevitably some part of him,” in the words of Russell, is aware that beliefs of this kind are “myths and that he believes them only because they are comforting” (*Human Society in Ethics and Politics*, p. 207). Russell and Sigmund Freud regard belief in God and immortality as illusions that usually do not work, but they are quick to add that anybody who refuses to be the victim of unworthy fears would dispense with such illusions even if they did work. “There is something feeble and a little contemptible,” in Russell’s words, “about a man who cannot face the perils of life without the help of comfortable myths.” Some years earlier, in an essay titled “What I Believe,” Russell had put the point very bluntly:

I believe that when I die I shall rot, and nothing of my ego will survive. I am not young, and I love life. But I should scorn to shiver with terror at the thought of annihilation. Happiness is nonetheless true happiness because it must come to an end, nor do thought and love lose their value because they are not everlasting.... Even if the open windows of science at first make us shiver after the cozy indoor warmth of traditional humanizing myths, in the end the fresh air brings vigor, and the great spaces have a splendor of their own.

Bibliography

The only full-length history of atheism in existence is Fritz Mauthner's four-volume work, *Der Atheismus und seine Geschichte im Abendlande* (Stuttgart: Deutsche Verlagsanstalt, 1920–1923). Although this work contains much interesting information that cannot easily be obtained elsewhere, it is marred by extreme repetitiousness and by a curiously broad use of the word *atheism*, which allows Mauthner to speak of agnostic and even deistic atheists. Probably of greater value are the various works on the history of free thought by J. M. Robertson, chiefly his *A Short History of Free Thought* (New York: Russell and Russell, 1899). Accounts of the struggles of atheists in England in the nineteenth century will be found in H. Bradlaugh Bonner, *Charles Bradlaugh: A Record of His Life and Work* (London: Unwin, 1895); G. J. Holyoake's two-volume *Sixty Years of an Agitator's Life* (London: Unwin, 1892); and A. H. Nethercot, *The First Five Lives of Annie Besant* (London, 1961).

An early defense of atheism is found in Vol. II of Holbach's two-volume *The System of Nature*, translated by H. D. Robinson (Boston: Mendum, 1853) and in his briefer work *Common Sense*, translated by A. Knoop (New York, 1920). Shelley defended atheism in his essays *The Necessity of Atheism* and *A Refutation of Deism*, and in one of the Notes to Canto VII of *Queen Mab*, titled "There is no God." All of these are included in *Shelley's Prose*, edited by D. L. Clark (Albuquerque: University of New Mexico Press, 1954). Charles Bradlaugh's "A Plea for Atheism" was first published in 1864 and reprinted in the Centenary Volume, *Charles Bradlaugh: Champion of Liberty* (London, 1933). Although he rarely used the term *atheism*, Schopenhauer is usually and quite properly classified as an atheist. His fullest discussion of the reasons for rejecting belief in God are found in his "The Christian System" and in his "Religion: A Dialogue." Both of these are available in a translation by T. B. Saunders in *Complete Essays of Schopenhauer* (New York: Willey, 1942). Another nineteenth-century work defending atheism is Ludwig Feuerbach, *The Essence of Christianity* (1841), translated by George Eliot, with an introduction by Karl Barth (New York: Harper, 1957). Of early critical

works, special mention should be made of Ralph Cudworth's two-volume *The True Intellectual System of the World* (London, 1678), which is an enormously detailed onslaught on all forms of atheism known to the author, and of Voltaire's article "Atheism" in his *Philosophical Dictionary*, translated by Peter Gay (New York: Basic, 1962). Part II of Voltaire's article is an extended critique of *The System of Nature*.

In more recent years, atheism has been championed in R. Robinson, *An Atheist's Values* (Oxford: Clarendon Press, 1964); in Ernest Nagel, "A Defence of Atheism," which is available in *A Modern Introduction to Philosophy*, edited by Paul Edwards and Arthur Pap (New York: Free Press, 1965), and in Michael Scriven, *Primary Philosophy* (New York: McGraw-Hill, 1966). Rudolf Carnap's position, which is briefly mentioned in the present entry, is presented in his "The Elimination of Metaphysics through Logical Analysis of Language," which is available in a translation by Arthur Pap in *Logical Positivism*, edited by A. J. Ayer (Glencoe, IL: Free Press, 1959). A somewhat similar position is defended by Antony Flew in "Theology and Falsification." This paper is available in various anthologies, perhaps most conveniently in *The Existence of God*, edited by John Hick (New York: Macmillan, 1964). An interesting and unusual defense of theology against contemporary criticisms like those of Carnap and Flew is found in I. M. Crombie's "The Possibility of Theological Statements," in *Faith and Logic*, edited by Basil Mitchell (London: Allen and Unwin, 1957). The comments in the present entry about the attempts of fideists to circumvent the argument from evil and other difficulties are elaborated in Paul Edwards, "Is Fideistic Theology Irrefutable?" in *Rationalist Annual* (1966).

There is a kind of "ontological" argument for atheism proposed by J. N. Findlay in "Can God's Existence Be Disproved?"; this, together with various rejoinders, is reprinted in *New Essays in Philosophical Theology*, edited by Antony Flew and Alasdair MacIntyre (London: SCM Press, 1955). The view that belief in God is not false but self-contradictory and that, hence, atheism is necessarily true is advocated by Jean-Paul Sartre in his *Being and Nothingness*, translated by Hazel Barnes (New York: Philosophical Library, 1956). Bertrand Russell wavered between calling himself an atheist and an agnostic. Many of his publications may plausibly be regarded as defenses of atheism. In this connection special mention should be made of *The Scientific Outlook* (New York: Norton, 1931), *Religion and Science* (New York: Holt, 1935), and *Why I Am Not a Christian and Other Essays on Related Subjects* (New York: Simon and Schuster, 1957), which includes "What I Believe."

What we have been calling metaphysical theology is defended by H. L. Mansel in *The Limits of Religious Thought* (London: Murray, 1858). Mansel's views were vigorously attacked by John Stuart Mill in his *An Examination of Sir William Hamilton's Philosophy* (4th ed., London, 1872); and Mill in turn was answered by Mansel in *The Philosophy of the Conditioned* (London: Strahan, 1866). The version of metaphysical theology on which we concentrated in the present entry is expounded by Paul Tillich in Vol. I of his three-volume *Systematic Theology* (Chicago: University of Chicago Press, 1951–1963), in his *The Courage to Be* (New Haven, CT: Yale University Press, 1952), and in J. A. T. Robinson, *Honest to God* (London, 1963). This position is

criticized in great detail in Paul Edwards, “Professor Tillich’s Confusions,” in *Mind* 74 (1965): 192–214, and in Dorothy Emmet, “The Ground of Being,” in *Journal of Theological Studies* 15 (1964): 280–292. Various reactions to the views of Robinson are collected in *The Honest to God Debate*, edited by D. L. Edwards (London: SCM Press, 1963). The Thomistic doctrine of “analogical predication,” which was not discussed in the present entry, is expounded in the *Summa Theologiae*, I, 13, 5, and in the work by Thomas Cajetan available in *On the Analogy of Names and the Concept of Being*, translated by E. A. Bushinski and H. J. Koren (Pittsburgh, 1953). Contemporary expositions of it may be found in G. H. Joyce, *The Principles of Natural Theology* (London: Longmans Green, 1923), and in E. L. Mascall, *Existence and Analogy* (London, 1949). The theory is criticized in Frederick Ferré, *Language, Logic and God* (New York: Harper, 1961), and in W. T. Blackstone, *The Problem of Religious Knowledge* (Englewood Cliffs, NJ: Prentice-Hall, 1963). There is an interesting attempt to state the doctrine with great precision by using the tools of contemporary logic in I. M. Bochenski, “On Analogy,” in *Thomist* 11 (1948): 474–497. Tillich’s theory, as well as the Thomistic theory, is criticized in Sidney Hook, *The Quest for Being* (New York: St. Martin’s, 1960).

Thomas Aquinas’s views on the nature of creation and the possibility of proving that the material universe has not always existed are given in *On the Eternity of the World*, translated by Cyril Vollert (Milwaukee: Marquette Univ. Press, 1964), which also contains relevant extracts from the *Summa Theologiae* and the *Summa contra Gentiles*. The argument for atheism based on the eternity of matter is stated in Ludwig Büchner, *Force and Matter* (4th English ed., London 1884; reprinted New York, 1950). The question of whether contemporary theories in physical cosmology have any bearing on the question of the existence of God is discussed in William Bonnor, *The Mystery of the Expanding Universe* (New York: Macmillan, 1964); M. K. Munitz, *Space, Time and Creation* (Glencoe, IL: Free Press, 1957); E. L. Mascall, *Christian Theology and Natural Science* (London: Longmans Green, 1956); and Antony Flew, “Cosmology and Creation,” in *Humanist* 76 (May 1961): 34–35. All the writers just mentioned incline to the view that physical cosmology has no bearing on the question of the existence of God. The opposite position is supported by E. A. Milne in *Modern Cosmology and the Christian Idea of God* (Oxford: Clarendon Press, 1952).

The argument for atheism based on the premise that there is no “cosmic brain” is expounded in Emil Du Bois-Reymond, *Über die Grenzen des Naturerkennens* (Berlin, 1873), and by W. K. Clifford in an essay titled “Body and Mind,” which is available in Vol. II of Clifford’s two-volume *Lectures and Essays*, edited by F. Pollock (London and New York, 1879). It is criticized in James Martineau, *Modern Materialism and Its Relation to Religion and Theology* (London, 1876; New York, 1877). According to Mauthner, op. cit., Vol. III, pp. 439 ff., the remark that “in scanning the heavens with a telescope he found no God” has been falsely attributed to Laplace and occurs in fact in one of the writings of another distinguished astronomer of the same period, Joseph Jérôme de Lalande. Arguments by Indian philosophers, similar to those of Du Bois-Reymond and Clifford, are found in *Slovavartika*, Sec. I, verses 43–59, reprinted in *A Source Book*

in *Indian Philosophy*, edited by Sarvepalli Radhakrishnan and C. A. Moore (Princeton, NJ: Princeton University Press, 1957).

The essay by Tyndall in which he defends agnosticism in contrast to atheism is contained in his *Fragments of Science* (New York, 1871). A similar argument by Clarence Darrow occurs in his lecture “Why I Am an Agnostic,” which was first delivered in 1929 and is now available in *Clarence Darrow—Verdicts out of Court*, edited by A. Weinberg and L. Weinberg (Chicago, 1963). Agnosticism is criticized from an atheistic viewpoint in several of the writings of Friedrich Engels. There is a useful collection of all the main discussions of religion by Marx and Engels in Karl Marx and Friedrich Engels, *On Religion* (Moscow, 1957; New York: Schocken, 1964).

The argument that atheism must be untenable since, if it were true, the atheist himself would have to be omniscient, is advanced in Thomas Chalmers’s two-volume *On Natural Theology* (New York, 1836); in J. Foster, *Essays* (London, 1844); and in Robert Flint, *Anti-Theistic Theories* (London, 1878). There is a reply to Chalmers and Foster in G. J. Holyoake, *Trial of Theism* (London, 1858). A somewhat similar argument is contained in Paul Ziff, “About ‘God,’” in *Religious Experience and Truth*, edited by Sidney Hook (New York: New York University Press, 1961). There is a reply to this in Paul Edwards, “Some Notes on Anthropomorphic Theology,” in *Religious Experience and Truth*.

Pascal’s horror of a universe without God is expressed in numerous passages in his *Pensées*, translated by W. E. Trotter, with an introduction by T. S. Eliot (New York: Dover, 2003). William James’s claims that unbelief is fatal to “the strenuous mood” is contained in his essay “The Moral Philosopher and the Moral Life,” which is reprinted in his *The Will to Believe* (New York: Longmans Green, 1897). The view that atheism makes the universe “loveless” is defended by J. W. Krutch in his *The Modern Temper* (New York: Harcourt, Brace, 1929). Malinowski’s remarks about the “tragic” nature of life without God are found in his contribution to the BBC symposium *Science and Religion* (New York, 1931). The very different view that there is something liberating in the rejection of belief in God is advocated in J. M. Guyau, *The Non-Religion of the Future*, with an introduction from N. M. Glatzer (New York: Schocken, 1962); in Friedrich Nietzsche, *Die Fröhliche Wissenschaft*, in Vol. II of his three-volume *Werke*, edited by Karl Schlechta (Munich, 1954–1956); and in Sigmund Freud, *The Future of an Illusion*, translated by W. D. Robson-Scott (New York: Liveright, 1927).

In more recent years there have been numerous books and articles by religious thinkers in which the atheist’s position is treated with a certain amount of sympathy. The following writings are especially worth mentioning in this connection: James Collins, *God in Modern Philosophy* (Chicago: Regnery, 1959); Henri de Lubac, *The Drama of Atheist Humanism*, translated by E. M. Riley (New York: Sheed and Ward, 1950); Étienne Borne, *Atheism*, translated by S. J. Tester (New York, 1961); Ignace Lepp, *Atheism in Our Time*, translated by Bernard Murchlord (New York: Macmillan, 1963); W. A. Luijpen, *Phenomenology and Atheism*, translated by W. van de Putte (Pittsburgh: Duquesne University Press, 1964); Jacques Maritain, “The Meaning of

- Contemporary Atheism,” in *Listener* (March 1950): 427–432; Gabriel Marcel, “Philosophical Atheism,” in *International Philosophical Quarterly* 2 (1962): 501–514; and Jean-Marie Le Blond, “The Contemporary Status of Atheism,” in *International Philosophical Quarterly* 5 (1965): 37–55.

Paul Edwards (1967)

Bibliography updated by Christian B. Miller (2005)

ATHEISMUSSTREIT

Atheismusstreit, a famous controversy in Germany during the closing years of the eighteenth century, concerned the allegedly subversive philosophical views of Johann Gottlieb Fichte (1762–1814) and of the much less well-known Friedrich C. Forberg (1770–1848).

Fichte, who died as a pillar of respectability, had advanced various radical views in his earlier years, and on the nature and reality of God he never became fully orthodox. In 1793, while living as a private tutor in Zürich, Fichte published two political pamphlets titled “Reclamation of the Freedom of Thought from the

Princes of Europe” and “Contributions Designed to Correct the Judgment of the Public on the French Revolution” in which he enthusiastically supported the basic principles of the French Revolution, arguing for free expression of opinion as an inalienable human right and subjecting the privileges of the nobility and the church to trenchant criticism. Fichte was at that time already famous, largely as a result of his Kantian work, *Versuch einer Kritik aller Offenbarung* (Essay toward a Critique of All Revelation), which had been published anonymously in Königsberg in 1792. Some reviewers attributed the essay to Immanuel Kant, who thereupon revealed Fichte as the true author, at the same time bestowing high praise on his gifts. In spite of Fichte’s reputation as a political radical, he was appointed professor of philosophy at Jena in 1794.

For some time things went fairly smoothly at Jena. Fichte, who was a dynamic lecturer, made numerous converts among both his colleagues and the students, although there were some acrimonious exchanges with the psychologist C. C. E. Schmid and others distrustful of Fichte’s speculative bent. There were two violent controversies before the *Atheismusstreit* broke out. One of these concerned a series of public lectures that Fichte had scheduled on Sundays from ten to eleven in the morning. Local clergymen were outraged, and the Over-Consistory (of which no less a man than Johann Gottfried Herder was a member) appealed to the government at Weimar to intervene. One local journal called attention to Fichte’s revolutionary politics and asserted that he and his democratic followers were engaging in a deliberate attempt to substitute the worship of reason for the worship of God. The senate of the university and the government of Weimar decided in Fichte’s favor, but it was agreed to give the lectures at three in the afternoon. The other controversy involved the university fraternities, which Fichte regarded as unethical and corrupt and whose abolition he publicly recommended. On New Year’s Eve of 1795 students belonging to the fraternities attacked Fichte’s house, breaking windows and heaping insults upon him and his wife. In the early months of 1795 Fichte felt his life to be in danger and found it necessary to reside outside of Jena until the tempers of the fraternity members had calmed down.

THE OFFENDING ARTICLES

The *Atheismusstreit* itself began in 1798 with the publication in the *Philosophisches Journal*, a periodical of which Fichte was coeditor, of an essay by Forberg titled “The Evolution of the Nature of Religion.” Fichte’s conservative

English biographer, Robert Adamson, dismisses Forberg's position as an "exaggeration of the dismal rationalism into which the weaker Kantians had drifted." In fact, however, Forberg's paper shows a powerful and independent thinker at work and does not seem dated even now. (Interestingly enough, Hans Vaihinger called attention to the philosophical merits of Forberg's work after almost total neglect for a century, citing him as an early positivistic fictionalist and praising his unusually fine appreciation of the more radical aspects of Kant's philosophy of religion.)

What, Forberg asks, is the foundation of the belief in a moral world order? There are three possible sources—experience, speculation, and conscience. Experience certainly lends no support to such a belief; if anything, it shows an evil deity in conflict with, and more often than not triumphing over, a good one. As for speculation, Forberg briefly and very clearly repeats Kant's objections to the ontological, cosmological, and teleological arguments, adding some critical observations of his own. Accordingly, the foundation of religion must be sought in our conscience. Religion is "purely and solely the fruit of a morally good heart ...; it originates entirely from the wish of the good heart that the good in the world should triumph over the evil." To have "genuine religion" is not to have a belief in God; it is to be a partisan of the good, to act as if the kingdom of God, which for Forberg simply means a just and moral world, were attainable. Forberg himself evidently did not believe that such a world was attainable. This belief, however, is no more essential to true religion than is the belief in God. What is essential is the striving in the direction of a moral world whether or not one believes in its attainability. Forberg most emphatically insists that an atheist can be a religious person in his sense of religion. "Practical belief and theoretical unbelief on the one hand and theoretical belief and practical unbelief on the other may very well coexist."

At first sight this position may appear to be a kind of voluntaristic defense of traditional religion and an endorsement of Kant's moral argument, as this has frequently been interpreted. In fact, Forberg is very far removed from any such point of view. He is not saying that since there is no evidence either way, it is as well to believe in a just God or the attainability of a moral world. We are not, according to him, required to believe any such thing, and it does not really matter whether we do. We are required to *act as if we believed this*. Forberg was highly critical of the common interpretation of Kant's moral argument as providing cognitive support for belief in God. In his later defense of himself, *Friedrich Carl For-*

bergs Apologie seines angeblichen Atheismus (Gotha, 1799), he castigates the "usual, far too theoretical presentation of the notion of a practical belief," adding that it is "an unphilosophical conception which allows people to reintroduce through a back door every kind of nonsense of which theoretical philosophy has rid us with much effort."

In the same issue of the *Philosophisches Journal*, Fichte published an essay, "Concerning the Foundation of Our Belief in Divine Government of the World," which was intended to complement Forberg's paper. In a somewhat patronizing opening Fichte informs the reader that although he agrees with much in Forberg's piece, there are some important questions on which Forberg has not "quite reached" his, Fichte's, position and that since he had not previously had an opportunity to explain himself on these issues, he would do so now. Attempts to infer the existence of God from the world of sense objects, he proceeds, must inevitably fail. From the point of view of common sense and science, the world of sense objects is "absolute" and self-existing, and any attempt to go beyond it is "total nonsense." The assumption of a cosmic intelligence, moreover, would not explain anything, since it is quite unintelligible to talk about the creation of material things out of ideas. Considered from the transcendental viewpoint, the world of the senses is a "mere reflection of our own activity," and as a "nothing" it can hardly require an explanation outside itself.

Our belief in God can be grounded only in the supersensible world, which for Fichte is the only ultimately real world. This is the world of free moral agents, and unlike Forberg, Fichte teaches that the universe is, in fact, moral and just, that "every truly good act must succeed, that every evil one must surely fail, that for those who really love the good all things must turn out for the best." This does not mean that the good necessarily receive rewards in terms of pleasure but the world in which we experience pleasure is not the real world. The world of sense objects exists only as a "stage" on which free agents perform or fail to perform their duty. It has not "the slightest influence on morality or immorality, not the slightest power over our free nature." It is, in fact, nothing more than the "material objectification of our duty; our duty is what is ultimately real, what is the fundamental stuff of all phenomena."

God is identical with the moral world order. A person believes in God insofar as he does his duty "gaily and without concern," without doubts or fears about consequences. The "true atheist" is he who calculates the consequences instead of following the voice of his

conscience; he “raises his own counsel above the counsel of God and thus raises himself to God’s position.” He who does evil in order to produce good is godless. “You must not lie,” Fichte adds by way of illustration, “even if the world were to go to pieces as a consequence”; a moral agent knows, however, that the world could not go to pieces, since “the plan of its preservation could not possibly be based on a lie.” Both here and elsewhere Fichte argued that all cognition is based on the existence of the moral world order. The existence of God, which here, of course, simply means the moral world order, is therefore more certain than anything else. It is presupposed in any piece of valid reasoning, and hence it cannot be, nor does it need to be, proved. “It is the ground of all other certainty and the only absolutely valid objective reality.”

THE ANONYMOUS PAMPHLETS

Attention was drawn to these essays and their alleged subversion in a pamphlet published late in 1798 under the title “Letters from a Father to His Student-Son concerning the Atheism of Fichte and Forberg.” The pamphlet was signed G and was at first attributed to D. Gabler, a respectable theologian teaching at Altdorf. Gabler vehemently denied any connection with the pamphlet, however, and publicly expressed his high regard for Fichte. Fichte himself attributed it to one of his enemies at Jena, Gruner, but the authorship remains uncertain. The main argument of the pamphlet followed a simple, popular line: Belief in an ever present “witness and judge” is essential to the moral behavior of human beings; if people were not afraid of punishment in the next world, they would be certain to do evil whenever they expected to escape the secular penalties. As a high school teacher, Forberg in particular is regarded as a most dangerous man. How could such a rector give a “thorough religious education” to the students under his charge? “To sow the seeds of immorality among young people and make belief in God suspect is not a permissible game.” When compared to the protector of morality who hunted Bertrand Russell in New York City 150 years later, the attack was conducted with decorum and refinement; however, several later anonymous pamphlets were somewhat less refined. As usually happens in such cases, they contained slanderous comments about Fichte’s private life and “sexual philosophy.”

FICHTE’S DISMISSAL

The rest of the story does little credit to any of the parties except Fichte and Forberg. Moved by the “Father’s Letter,” the Saxon government, on November 19, 1798, published

a Rescript ordering the universities of Leipzig and Wittenberg to confiscate all copies of the *Philosophisches Journal* because of the atheistic articles contained in it. This was followed by a request to the neighboring German governments to take similar steps. The dukes of Saxe-Weimar were informed that Saxon students would not be allowed to enroll in Jena unless there was an immediate investigation into the conduct of the two offenders. The grand duke of Weimar, a ruler with a genuine respect for scholarship, was free from any trace of religious fanaticism; however, any attempt he might have made to hush up the case was prevented by Fichte’s public defenses of himself. In January 1799, Fichte wrote his “Appeal to the Public concerning the Accusation of the Expression of Atheistic Opinions,” a copy of which was promptly sent to the grand duke. In March 1799 he wrote the “Juridical Defense against the Accusation of Atheism,” which was primarily addressed to the university authorities but a copy of which was also forwarded to the grand duke. In these “defenses” Fichte contended, first, that his philosophical position, although far removed from the anthropomorphic popular religion, could not fairly be regarded as a form of atheism and was, in fact, “true Christianity” and, second, that any punishment inflicted on Forberg or himself would be a gross violation of academic freedom. The case, Fichte insisted, was one of great importance; since the accusation had been public, the verdict should also be public. Fichte’s friends regarded this as a most imprudent demand, and rumors were soon current that the Weimar government was about to impose a public censure on Fichte. In the hope of preventing this, Fichte wrote a letter to Privy Councilor Voigt in which he declared that he would under no circumstances submit to censure. In such an event, he said, he would instantly resign. He added that several distinguished members of the Jena faculty shared his opinion that censure would constitute infringement of their academic rights and that they would resign with him. Voigt was told that he was free to show the letter to others, including, presumably, the Weimar authorities, who were about to reach their verdict.

This letter turned out to be Fichte’s undoing at Jena. The Weimar government quite improperly treated it as a formal document. It avoided any censure of Fichte (or of his coeditor Niethammer) on the charge of atheism. Instead, both were rebuked in the mildest possible language for their “indiscretion” and advised to exercise greater caution in their selection of articles for the *Philosophisches Journal*. The journal itself was not proscribed, nor was there any mention of what teachers should or should not say in their classrooms. In a post-

script, however, reference was made to Fichte's letter to Voigt, and his threatened resignation in case of censure was noted and accepted. In effect, this amounted to Fichte's dismissal, and two petitions on his behalf by the Jena student body to the duke were of no avail. Johann Wolfgang von Goethe, who a few years earlier had been largely instrumental in securing the Jena chair for Fichte, was one of those in the Weimar council who demanded Fichte's ouster. Fichte's support of the French Revolution was apparently a minor thing, but the language used in the letter to Voigt was unforgivable. "For my own part," Goethe wrote in a letter a few months later, "I declare that I would have voted against my own son if he had permitted himself such language against a government." Forberg was mildly censured by his superiors and did not return to any writings on religion until shortly before his death, when he published his autobiography, in which there is a very full account of the entire episode and a reaffirmation of all his earlier convictions.

THE CHARGE OF ATHEISM

In his "Appeal to the Public," Fichte had vehemently denied the charge of atheism. Using language which is very similar to that employed in the twentieth century by Paul Tillich and Bishop J. A. T. Robinson, he inveighed against the popular "idol-worship" of God as a "substance," as another entity *in* the world, and against the vulgar "eudaemonistic" morality that makes God a giver of "sensuous" rewards for good deeds and "sensuous" punishments for evil deeds. Such a conception—or, indeed, any attribution of personal characteristics to God—constitutes a lowering and limiting of the deity and has to be opposed in the interests of true religion. There is no need to question Fichte's sincerity, and in more senses than one it may be granted that he was a religious man.

At the same time the charge of atheism does not appear to have been totally unjustified. People do not usually mean by God simply the moral world order, and the denial of God as an entity over and above the more familiar objects of experience (including moral human agents) is precisely what is ordinarily meant by atheism. On all these points Fichte had been very explicit in the original essay. "There can be no doubt," he had written, "that the notion of God as a separate substance is impossible and contradictory, and it is permitted to say this plainly." Again, "We need no other god [than the moral world order], and we cannot comprehend another one. There is no rational justification for going beyond the moral world order to a separate entity as its cause."

Granting that there was some basis for the charge of atheism against Fichte, this in no way excuses the behavior of the Weimar authorities or of Fichte's and Forberg's other detractors. Not one distinguished voice was raised anywhere in Germany in defense of the accused men. Kant himself, who was still alive, was moved to a statement in the *Allgemeine Literaturzeitung* (1799, No. 109) in which he emphatically dissociated his philosophy from Fichte's system. "When I compare the state of the German republic of letters of this period with the Enlightenment literature of France a generation earlier, I am overcome with the deepest shame," was the apt comment of the historian Fritz Mauthner.

ATOMIC THEORY IN INDIAN PHILOSOPHY

In classical Indian philosophy two Sanskrit words are used for the atom, the smallest impartite physical entity: "anu" and "paramānu." On the existence of such atoms,

the classical Indian philosophers were divided. Among the orthodox Brahmanic schools, the Nyāya-Vaiśeṣika philosophers were the preeminent defenders of atomism, with the Mīmāṃsā philosophers as allies. On the opposite side, the Vedāntins denied atomism. Among the non-Brahmanic schools, the Jainas were clearly atomists, as were the Hinayana Buddhists. Yogācāra Buddhism, however, was strongly critical of atomism, and so too was Madhyamaka Buddhism.

The division of opinion on the issue thus cuts across the division between the Brahmanic and non-Brahmanic schools. Instead, the range of views about atomism more closely reflects the different schools' commitment to realism. After all, atomism is usually associated with a realist view of the world, in which atoms are taken to be objective, mind-independent entities. Predictably enough, then, we find espousing atomism such staunch philosophical realists as the Naiyāyikas and Mīmāṃsakas, as well as such heterodox realists as the Ābhīdharmikas and the Jainas. In contrast, opposition to atomism is led by such antirealists as the Advaitins, the Mādhyamikas, and the Yogācārins.

ATOMISTS

The earliest Indian defenders of atomism may well be the Jainas, with texts defending atomism that date at least as far back as the third century CE. According to Jainism, everything in the world, save for souls and space, is produced from matter, and all matter consists of indivisible atoms (*paramāṇu*), each occupying a single point of space. Matter has two forms: a simple or atomic form and a compound (*skandha*) form. Perceivable material objects are compounds, composed of homogeneous atoms (there are no distinct kinds of atoms corresponding to the four kinds of elements). Impartite atoms are eternal, though this is obviously not true of the partite compounds. Indeed, atoms are supposed to be eternal precisely because they lack parts and are thus incapable of disintegration. But there is nonetheless a sense in which atoms, like compounds, are subject to qualitative change because, though all atoms are indistinguishable in substance, qualities present in an atom can be increased or decreased by many degrees.

To explain how atoms join as they do, the Jainas posit that some atoms are viscid and some dry, which permits aggregation of the two different kinds of atoms (much as particles of barley meal combine to form lumps when drops of water fall upon them). Moreover, they are viscid and dry in various degrees, with no aggregates combining

atoms with the lowest degrees of the two properties or equal degrees of the same property.

These Jaina speculations help to highlight three central questions for which the Indian philosophers expected atomic theories to provide answers: What evidence do we have for the existence of atoms? How is it possible for one atom to join with another? Why do atoms come together as they do?

With regard to the first question, the two main Indian arguments for the existence of atoms are both inferential. The first argument rests on the claim that there has to be a lower limit to the scale of diminishing minuteness. Gross objects clearly exist and are divisible. Yet the process of physical division must have a terminal point, and this terminal point to division must, by definition, be indivisible. The second argument attempts a *reductio ad absurdum* of the denial of such a terminal point: Unless the process of division comes to an end, everything must be equally composed of an infinite number of parts, and hence all comparative ascriptions of unequal magnitude to gross objects are undermined. The mountain and the mustard seed would have to be of equal size!

Of course, even if we are persuaded by these arguments that atoms do exist, any atomic theory still needs to address the second question and offer some explanation of how atoms combine to form partite entities. After all, atoms are supposedly impartite, and yet our only direct experience of conjunction involves partite things. But if we give up the thesis that atoms are truly impartite, we also have to give up one of the main arguments for the existence of atoms.

In reply, the Naiyāyikas utilize their distinctive mereological theory (theory of partition), according to which composite wholes are never reducible to their parts, though wholes inhere in parts. Hence a composite whole is a distinct entity, and not a mere collection of its conjoined parts. Moreover, since the whole is thus distinct from the sum of its parts, it can, unsurprisingly, have properties not possessed by any of its parts. This particular mereological theory, however, is unacceptable to both Buddhists and Advaitins, who object that the idea that wholes inhere in their parts would require a further relation to relate inherence to its relata, and so on *ad infinitum*. The Buddhists maintain instead that wholes are unreal, being mere conceptual constructions, and only parts are real. Thus for them, all conventional objects are mere aggregates of atoms. The Jaina response is different again: The composite whole is just the parts in a changed state.

Finally, even if we have reason to believe both that there are atoms and that they can combine, a viable atomic theory still needs to offer some sort of explanation of how atoms are brought together. The Jaina explanation in terms of a theory of varying degrees of viscosity and dryness builds on their view that all atoms are homogeneous, with the result that the division into the four elements is derived and secondary. The Nyāya-Vaiśeṣika school denies this, claiming instead that the four elements of earth, water, air, and fire involve four kinds of atoms sufficiently qualitatively different from each other so that the atoms of one element can give rise only to products of that element.

The elaborate Nyāya-Vaiśeṣika theory of how atoms combine to form compound entities seeks to address the issue of how atoms of infinitesimal magnitude can add together to produce a macroscopic object. Their explanation is that when two infinitesimal atoms combine into a dyad, there is a sort of quantum leap, and the new submolecule thus formed has a minute (*hrasva*) magnitude. Dyads then combine into perceptible molecules or triads (composed of three dyads), and there is another quantum leap in magnitude to a gross (*mahat*) quantum. The addition of gross quanta then straightforwardly accounts for the magnitude of macroscopic objects.

The point of this postulated double quantum jump from single atoms to dyads and then from dyads to triads is to insist that the finite magnitude of the triad arises from the infinitesimal atoms as a result of the *number* of the constituent atoms and not as a result of their magnitude, as in gross objects. Unsurprisingly, many Indian philosophers (both atomist and antiatomist) found this part of the Nyāya-Vaiśeṣika atomic theory unconvincing.

Moreover, all of this still leaves unexplained the initial conjunction of two atoms to produce a dyad. Later the Nyāya-Vaiśeṣika school invoked God's agency to help out here: Since all atoms are insentient, the process of combination must be guided by an intelligent divine agent. Other Indian philosophers disagreed, however, as to whether this amounts to a persuasive argument for the existence of God or to just an ad hoc addition to an already unsatisfactory atomic theory.

The Nyāya-Vaiśeṣika school took one advantage of its atomic theory to be that it can avoid the Buddhist theory of universal flux and can explain the identity of a substance through change in terms of the identity of unchanging, eternal atoms. A substance can undergo change without the constituent atoms changing because the qualities of a substance can change while the substance persists. However, consider what happens when we

fire a clay pot so that it changes color. The Vaiśeṣikas claimed both that the unfired pot as a whole is replaced by a new pot as a whole, and that the application of heat causes a change of qualities to occur at the level of the individual atoms. But in admitting that change at the level of gross objects involves change at the atomic level, the Vaiśeṣika theory risks collapsing into the Buddhist theory of universal flux. Hence the Nyāya atomic theorists denied that change occurs at the level of the individual atoms, claiming instead that the whole remains intact while the change occurs.

Common to the different atomic theories of both Jainism and Nyāya-Vaiśeṣika are the claims that the atoms are genuinely indivisible, infinitesimal, and eternal. Other Indian atomists deny some of these claims. The Mīmāṃsā school, for instance, is willing to admit that whether entities are gross or minute is only relative. They thus accept as atoms the dust motes visible in a sunbeam (these are triads in the Nyāya-Vaiśeṣika system, the smallest perceivable particles). Although the Mīmāṃsakas do not entirely rule out the Nyāya-Vaiśeṣika conception of an atom as impossible, they criticize it as an overly speculative thesis. Even if the dust mote is theoretically divisible and hence apparently nonatomic, Mīmāṃsakas are only willing to accept such atoms as are established by common experience. There is no purpose served by assuming any atoms beyond these.

In contrast, the Ābhīdharmika atomists affirm the existence of atoms smaller than dust motes but deny that they are eternal, since in Buddhism everything is taken to be impermanent. According to Buddhist atomic theory, although atoms are the smallest unit of matter, they never occur alone, but rather occur only as members of an aggregate of at least seven or eight atoms. Hence it is unsurprising that we do not experience individual atoms as separately perceptible. But we do nevertheless perceive the aggregates and, contrary to Nyāya-Vaiśeṣika claims, there are no aggregates distinct from the atoms themselves. Thus our perception that the atoms constituting an aggregate are gross is really an illusion due to the close and collective presence of a multitude of minute atoms.

ANTIATOMISTS

The Vedāntins and the Mahayana Buddhists were the chief representatives of Indian antiatomism, though their objections to atomism are frequently different and their own rival ontologies are significantly distinct. One specifically Vedāntin argument against atomism is that the Hindu scriptures nowhere affirm it. Clearly, this argument is not intended to persuade non-Brahmanic atom-

ists, but it is interesting to note that most Brahmanic atomists too do not feel obliged to respond to it. The mere absence of a Vedic sanction is apparently thought to be obviously insufficient grounds for rejecting a philosophical theory. (A notable exception to this general trend of indifference is the Naiyāyika philosopher Udayana [eleventh century, CE], who goes out of his way to argue that there is indeed a scriptural warrant for atomism.)

The Advaita Vedāntins offered a more straightforward philosophical objection to the Nyāya-Vaiśeṣika theory of atomic composition. They argued that ontological parsimony ought to make us reject the Naiyāyikas' posit of dyads as unnecessary, for why can we not just say instead that three atoms directly combine to form a triad, the smallest visible substance. The gross magnitude of the triad will then be explicable not in terms of the magnitude or aggregation of atoms, but in terms of the *number* of atoms.

The main Indian argument that some form of atomism is rationally necessary is, of course, that it is required to explain the existence of gross material objects, which are indisputably partite. Again and again the atomists defended the controversial details of their theories with an argument to the best explanation: that since all agree that there are composite physical objects, one needs to posit atoms to best explain their existence and nature. But this strategy presupposes a common commitment to realism about the external world. The Indian antiatomists did not share this general commitment.

This is particularly obvious when we attend to the antiatomist arguments of the Yogācārin philosopher Vasubandhu (fourth or fifth century CE). Vasubandhu began by explicitly affirming the idealist thesis that everything is mind only. But realism, of course, denies this thesis. Vasubandhu responded by arguing that realism is false because realism implies atomism and atomism is incoherent.

Like the Ābhīdharmikas, Vasubandhu rejected the Nyāya-Vaiśeṣika theory of organic wholes as unsupported by experience. But he also rejected the Abhidharma view that material wholes are mere aggregates of atoms, on the ground that for this to be so, the atoms would have to be joined. Such conjunction is either partial or total. If it is partial, the atoms must have parts in contact with one another; if it is total, all the atoms must collapse into the same atom-sized space. Either way, there cannot be a plurality of impartite atoms. Furthermore, an atom cannot be thought of as spatially extended without allowing that it has a front part different from its back part. But if

atoms are unextended, then aggregates of them cannot constitute extended gross objects. Thus atomism (and hence realism) is incoherent, and idealism is vindicated.

Yogācāra Buddhism is admittedly a rather peculiar kind of idealism, since it denies the existence of both the objects of consciousness and the subject of consciousness. Ultimately, all that exists is pure consciousness devoid of all subject/object duality. But whether or not Yogācāra thought is best classified as a variety of idealism, it is indubitably a variety of antirealism. Moreover, while other Indian antiatomists, such as the Mādhyamikas and the Advaitins, were certainly not idealists, they also in their various ways shared the Yogācāra thinkers' antirealist doubt of the commonsense assumption of an objective reality populated by ontologically independent entities. These Indian antiatomists are thus all equally unforgiving of the atomists' general strategy of attempting to excuse the anomalies in their various atomic theories by an appeal to atomism as the best explanation of gross external objects. In classical Indian philosophy, the avowed aim of philosophy is liberation (*mokṣa*). For the Indian antirealists, this goal is to be attained not by theorizing about the nature of a supposedly objective external world, but by transcending all such conceptions, including atomism and its presuppositions. In this sense, there is arguably a common antirealist motivation for Indian antiatomism, notwithstanding the very significant philosophical differences among the different antiatomist schools.

ATOMISM

Atomism is a doctrine that has a long history in both philosophy and science. For this reason it is not easy to define

its content in such a way as to comprehend all the historical variations and especially the historical development of the doctrine. In a very general sense, however, atomism may be defined as the doctrine that material reality is composed of simple and unchangeable minute particles, called atoms. It holds that all observable changes must be reduced to changes in the configuration of these particles. The multiplicity of visible forms in nature must likewise be based upon differences of configuration. The best way to discuss the variations of this general idea of atomism is to follow the historical development, which shows a gradual shift of emphasis from philosophical to scientific considerations. Consequently, the first part of this article, covering the period from the sixth century BCE to the seventeenth century, will be of a philosophical nature because in this period atomism was considered preponderantly from a philosophic point of view. The second part is concerned primarily with science, for it was in the period after the seventeenth century that atomism evolved in a scientific theory.

THE PHILOSOPHICAL PERIOD

In Greek philosophy we are already confronted with several types of atomism. Atomism in the strict sense, propounded by Leucippus and Democritus (fifth century BCE), should be looked upon as an attempt to reconcile the data of sense experience with Parmenides' thesis that matter is unchangeable. Parmenides rejected the possibility of change on rational grounds; change seemed to be unintelligible. He was convinced that reality must be one, that it must possess unity, and that, being *one* reality, it could not change. It may be remarked that this thesis of Parmenides is a presupposition for all rational science. Without fundamental unity, no universal laws are possible; without fundamental immutability, no laws covering past, present, and future can be valid. Yet, it is clear that Parmenides' approach is one-sided. Science may presuppose unity and immutability, but it also presupposes change. Only by studying changes is science able to discover the immutable laws of nature.

Democritus agreed with Parmenides on the unintelligibility and impossibility of qualitative change. He did not agree on the unintelligibility and impossibility of quantitative change. This type of change is subject to mathematical reasoning and therefore is possible. By the same token, Democritus denied qualitative multiplicity, but accepted multiplicity based on purely quantitative differences. Consequently, he accepted a numeric multitude of original beings, the atoms. These atoms did not differ qualitatively; only their sizes and figures differed.

The infinite variety of observable things could be explained by the different shapes and sizes of the atoms that constituted them and by the different ways in which the atoms were combined. Observable changes were based upon a change in combinations of the atoms. During such changes, however, the atoms themselves remained intrinsically unchanged. They did not change their nature, or even their size or figure; they were indivisible (hence their name *ἄτομος* or indivisible).

Other forms of Greek atomism differed from that conceived by Democritus mainly in two points. First, they did not restrict the differences between the atoms to purely quantitative ones, but also accepted differences in quality. There was even a system that assumed as many qualitatively different atoms as there are different observable substances (Anaxagoras, fifth century BCE). Usually, however, only a few kinds of atoms were assumed, based upon the famous doctrine of the four elements: earth, water, air, and fire (Empedocles, fifth century BCE).

The second point of difference concerned the indivisibility of atoms. It is evident that a system that does not accept the indivisibility of atoms cannot properly be called atomism, but since such systems have played an important role in the history of atomism, we must mention them. For Democritus, the indivisibility of atoms was an absolute indivisibility, being the consequence of an absolute immutability. There were systems, however, that considered the indivisibility and immutability as only relative. The "atoms" could be divided, but they then became "atoms" of another substance; they changed their nature. (Here again an exception must be made for atoms as conceived of by Anaxagoras. These could be divided, but remained of the same kind. Hence they received the name of *homoiomeric*s, possessing similar parts.) From the historical viewpoint, the most important system with qualitatively different atoms is that developed by the commentators on Aristotle—Alexander of Aphrodisias (second century CE), Themistius (fourth century) and John Philoponus (sixth century). In their system the atoms are called *elachista* (very small or smallest), the Greek equivalent of the Latin *minima*, which in medieval Latin writings indicates the smallest particles.

That these commentators on Aristotle combined the existence of "atoms" with the possibility of their changing their nature is not surprising. Aristotle was not satisfied by Democritus' atomism and was of the opinion that Democritus went only halfway. Atomism certainly opened up the possibility of explaining some changes that occur in nature, but not all. Nor did it account for all variety. Thus, the first task imposed upon Aristotle was a

careful and critical reexamination of Parmenides' thesis. The result was his matter-form doctrine, stating that every material being is composed of *primary matter* and *form of being*. This composition, however, is not chemical or physical; it goes deeper. The possibility of change presupposes a certain fundamental nonsimplicity, for otherwise it is not possible to account for both aspects that are present in change: the aspect of a certain permanence (matter) and the aspect of something that is really new (form). Matter in the Aristotelian sense is not a substance, but the capacity to receive "forms."

To a certain extent, Democritus followed the same line of thought. Democritus, however, "substantialized" the permanent aspect (the atoms), thus narrowing the possibility of change. For Aristotle the "atoms" too should be subject to change and therefore "composed." Aristotle, however, did not propound a corpuscular theory of his own. Only a few remarks that could have been the starting point are found in a passage (*Physics* I 4, 187B18–34) in which he criticizes Anaxagoras' theory about the infinite divisibility of material things. Somewhere there must be a limit to divisibility. This limit depends on the specific nature of a thing. It was left to Aristotle's Hellenistic, Arabian, and medieval commentators to develop the casual remarks of their master into the *minima naturalia* theory, stating that each kind of substance has its specific *minima naturalia*.

In Greek philosophy there were also transitional theories between qualitative and quantitative forms of atomism. Plato (427–347 BCE), for example, adhered to the doctrine of the four elements; but the differences between the atoms of the respective elements were quantitative. An atom of fire had the form of a tetrahedron; that of air, an octahedron; that of water, an icosahedron; and that of earth, a cube.

When evaluating the importance of Greek atomism in the light of modern atomic theories, it should be borne in mind that in Greek thought philosophy and science still formed a unity. Greek atomism, therefore, was as much inspired by the desire to find a solution to the problem of mutability and plurality in general as by the desire to provide scientific explanations for specific phenomena. Although we meet with some ideas that can rightly be considered as precursors of classical physics and chemistry, the main importance of the old atomistic doctrines to modern science does not lie in these rather primitive scientific anticipations. The greatest achievement of Greek atomism was its general view of nature. The multitude of phenomena must be based upon some unity, and the ever-changing aspects of the phenomena

are nevertheless aspects of a fundamentally unchanging world. To this view both the quantitative and the qualitative atomism have contributed—the latter by drawing attention to empirical aspects; the former, to the mathematical.

The history of the two forms of philosophical atomism until the birth of a scientific atomic theory has been rather different. This can easily be explained. Owing to the influence of Plato and Aristotle, Democritus' atomism did not gain preeminence in Greek, Arabian, and medieval thought. Yet that is not the only reason. Much more important is the fact that Democritus' atomism was more or less complete; and his followers, such as Epicurus (341–270 BCE) and the Latin poet Lucretius Carus (96–55 BCE), could confine themselves simply to taking over Democritus' doctrine.

The Aristotelian *minima* theory, however, existed only in an embryonic state. To Aristotle and his Hellenistic commentators the *minima naturalia* did not mean much more than a theoretical limit of divisibility; they were potentialities rather than actualities. With Averroes, however, we find an important development. According to him, the *minima* play an important role during chemical reactions. The Latin Averroists followed up this line of thought. Whereas most of the Latin commentators on Aristotle restricted themselves to a more or less systematic treatment of the *minima* as theoretical limits of divisibility, such Averroists as Agostino Nifo (1473–1538) attributed to the *minima* a kind of independent actual existence. The *minima* were considered as actual building stones of reality. The increase or decrease of a quantity of a substance amounts to the addition or subtraction of a certain number of *minima*. A chemical reaction takes place among the *minima*.

The fundamental importance of this view to science will be clear. Because the *minima* had acquired more physical reality, it became necessary to examine how their properties could be reconciled with the specific sensible properties of different substances. A first attempt to do so is found in Julius Caesar Scaliger (1484–1558). Some properties of matter, such as fineness and coarseness, depend on the *minima* themselves, while others depend on the manner in which the *minima* configured. Rain, snow, and hail are composed of the same *minima*; but their densities are different because the *minima* of these three substances are at smaller or greater distances from one another. As to the chemical reaction, Scaliger remarked: "Chemical composition is the motion of the *minima* towards mutual contact so that union is effected" (*Exercitationes*, p. 345). Like Aristotle, he was convinced

that Democritus was wrong. In a chemical compound the particles are not just lying close together; they form a real unity. Scaliger, however, was also convinced that the minima play a role in effecting the composition; and for that reason he was not satisfied with the Aristotelian definition of chemical composition as “the union of the reagents,” in which the minima are not mentioned.

To sum up our survey of the development of the minima doctrine, and to prove that the opinions of Nifo and Scaliger were no exceptions, we may quote Francis Toletus (1532–1596), one of the best-known sixteenth-century commentators on Aristotle: “Concerning the manner of chemical composition, the opinions of authors vary, but they all agree in this: the reagent substances are divided into minima. In this division the separated minima of one substance come alongside the minima of the other and act upon each other till a third substance, having the substantial form of the compound is generated” (*De Generatione et corruptione* I, 10, 19).

THE SCIENTIFIC PERIOD

The seventeenth century is an important period in the history of atomism. Not only did atomism come to occupy a central position in philosophical discussion, but it also became an inspiring idea for the spiritual fathers of modern science. The philosophic differences between the atomic systems were soon pushed into the background, while the more scientific aspects that were held in common came to the foreground. Daniel Sennert (1572–1657) offers a clear example of this tendency. Basically, his corpuscular theories were derived from the doctrine of *minima naturalia*, but they also contain typically Democritean ideas. In a sense the same could be said of Scaliger; but the difference is that Scaliger discussed the philosophical controversies between Aristotle and Democritus, whereas Sennert showed a pronounced eclectic tendency. He was interested mainly in a chemical theory, and he found that from a chemical point of view the two theories really amount to the same thing. In order to support this opinion, Sennert refused to accept the interpretation that Democritus meant to deny the qualitative differences of atoms. As a chemist, Sennert was convinced that elementary atoms differ qualitatively. His main contribution to the corpuscular theory lies in the clear distinction that he made between elementary atoms and atoms of compounds (*prima mista*). This distinction forced itself upon Sennert through chemical experience. Each chemical substance, elementary or compound, must have its own atoms.

Contrary to Sennert, Pierre Gassendi (1592–1655) faithfully copied Epicurus and therefore Democritus as well. His own contribution consisted of a number of annotations designed to make the original atomic doctrine acceptable to his contemporaries. In order to effect this purpose, two things were necessary. First of all, the atomic system had to be divested of the materialistic interpretation with which it was hereditarily connected. Second, Gassendi had to “adapt” the original atomic theory to the science of his time. Science had reached the stage at which certain definite physical and chemical properties were attributed to the atoms—i.e., the atoms must possess definite natures; they could not be qualitatively equal. For this reason Gassendi stated that from the original atoms certain molecules were formed first; these differed from each other and were the seeds of different things.

While Gassendi’s system is basically without any trace of originality, the corpuscular theory of René Descartes (1596–1650) is original in outline and execution. According to Descartes, matter and extension are identical. This thesis of course excludes the idea of indivisible atoms, but not of smallest particles. To the question of how such particles are separate and distinct from each other, Descartes answered that when a quantity of matter moves together, that quantity forms a unit, distinct from other units that have different motions. Along these lines, Descartes succeeded in devising a corpuscular theory in which the corpuscles were characterized by differences in mass, in amount of motion, and other properties that could be expressed in physical terms and treated mathematically. Descartes’s corpuscles were endowed with exactly those properties that could be used in contemporaneous mechanics. As we have seen with Sennert, the seventeenth century was less interested in philosophical considerations than in scientifically fruitful ideas. Therefore, a corpuscular theory was judged, first of all, by this standard; and underlying philosophical discrepancies did not much interest the scientist. This explains why, to their contemporaries, Gassendi and Descartes could stand fraternally united as the renovators of the atomic theory.

Robert Boyle (1627–1691), for example, repeatedly confessed how much both Descartes and Gassendi had inspired him. On the other hand, Boyle was too much a chemist to be satisfied with a general idea of atoms or even with atoms endowed only with mechanical properties. Boyle looked for specific chemical properties. In contrast with mechanics, however, chemistry was not yet sufficiently developed to provide the theoretical frame-

work necessary for a satisfactory chemical atomic theory. Boyle was keenly aware of this situation, as his *The Sceptical Chymist* (Oxford, 1661) proves. Neither the traditional theory of four elements nor the three-principle theory current among chemists could be of any use to him. Yet he was convinced that the distinction between elements and compounds was a sound one. This distinction therefore governed his own atomic theory. Theoretically, he adhered to the atoms of Democritus; practically, he did not use them. He was convinced that atoms were associated into so-called primary concretions, “which were not easily dissipable into such particles as composed them.” Thus the primary concretions were corpuscles with definite qualities; they corresponded to the smallest particles of elements, and consequently Boyle treated them as such. The primary concretions could combine to form compounds of a higher order that may be compared with Sennert’s *prima mista*. Although Sennert’s corpuscular theory was based more on the minima theory and Boyle’s theory more on the ideas of Gassendi and Descartes, in practice their theories were not very different. Both theories recognized atoms of compounds that are composed of atoms of elements. For Sennert the latter were elements, both theoretically and practically. For Boyle, theoretically they were not elements, but practically they were, because in chemical and physical processes primary concretions are not dissolved.

By combining the relative merits of the minima theory (qualitative atoms) and of Democritus’ atomism (open to quantitative treatment), the seventeenth century laid the foundations for the scientific atomic theory of the nineteenth century. The further development of the seventeenth-century atomic theory, however, required better chemical insights, and especially a method of distinguishing elementary from compound substances. This method was found by Antoine Lavoisier (1743–1794), who postulated the conservation of weight as the guiding principle in chemical analysis. For the first time in history, a list of chemical elements could be given, based upon the results of chemical analysis.

The outstanding achievement of John Dalton (1766–1844) was that he connected these chemical results with the atomic theory. His atoms were no longer smallest particles with some general and rather vague physical properties, but atoms endowed with the properties of chemical elements. Dalton himself in *A New System of Chemical Philosophy* stressed the great importance of “ascertaining the relative weights of the ultimate particles, both of simple and compound bodies, the number of simple elementary particles which constitute one com-

pound particle, and the number of less compound particles which enter into the formation of one more compound particle” (2nd ed., p. 213).

The fact that Dalton’s theory is primarily a chemical theory does not mean that it has no philosophical implications. It is interesting to note that Dalton conceived the union of atoms in a compound as their simple juxtaposition without their undergoing any internal change. On this point the founder of the chemical atomic theory did not differ from the Democritean tradition. On another point, however, he followed the minima tradition. Dalton’s atoms were specifically different for every kind of substance. He did not even think of building these atoms from particles without qualities, as Gassendi and Boyle had done.

After Dalton, the development of the atomic theory was very rapid. Jöns Jakob Berzelius (1779–1848) determined the relative atomic weights with surprising accuracy, guided by the hypothesis that under the same pressure and at the same temperature the number of atoms in all gaseous substances is the same. Since hydrogen and oxygen combine in the constant volume proportion of two to one, Berzelius concluded correctly that two atoms of hydrogen combine with one atom of oxygen. Berzelius also gave to chemistry its modern symbols. Amedeo Avogadro (1776–1856) completed the atomic theory by assuming that compound atoms, or molecules, do not necessarily have to be formed out of atoms of different elements; molecules of elements (H_2 ; O_2) also exist. According to Avogadro, the law that postulated an equal number of atoms in equal volumes of gas had to be understood as applying to an equal number of molecules. In a short time, the framework for classical chemistry was completed on the basis of Dalton’s atomic theory. Chemical reactions were conceived of as a reshuffling of atoms and described by such chemical equations as $2 H_2 + O_2 \rightarrow 2 H_2O$.

An important contribution to the development of the atomic-molecular theory came from physics in the form of the kinetic theory of gases. With the aid of the calculus of probability, James Maxwell and Ludwig Boltzmann succeeded in deriving the behavior of gases, as described in the empirical laws of Boyle and Joseph-Louis Gay-Lussac, from the motions of the molecules.

The discovery of the electron, the electric atom, paved the way for a new theory about the nature of chemical compounds and chemical reactions. According to the new theory, a molecule such as NaCl did not consist of an Na atom and a Cl atom, but of an Na ion and a Cl ion; the Na ion was an Na atom minus an electron, and the Cl ion

was a Cl atom plus an electron. Thus the so-called ionic theory revealed the nature of the forces of attraction between the various atoms of a molecule. The Na ion with its positive electric charge was attracted by the Cl ion with its negative charge. As a result of the connection that the theory of electricity established between physics and chemistry, theoretical and experimental materials were available at the beginning of the twentieth century. They led to a new development of the atomic theory that would endeavor to penetrate into the interior of Dalton's atoms.

The atomic model of Niels Bohr (1913) considered every atom as built of a positively charged nucleus around which circled, in fixed orbits as many electrons as were indicated by the charge of the nucleus. This charge corresponded to the place of the element in the periodic system. Bohr's model could explain not only the fundamental chemical properties of the elements, but also such physical properties as the spectrum that is characteristic of each element when it is emitting or absorbing light. Nevertheless, there were also serious difficulties with this model. According to electrodynamics, the moving electrons would ceaselessly emit electromagnetic waves. The atom would not be stable, but would always be losing energy. Hence, the motion of the electrons would gradually decrease and finally cease entirely. In order to save his model, Bohr postulated that emission of energy occurs only when an electron "jumps" from one orbit to another. In other words, the emission of energy is discontinuous. The emitted energy could be only a whole multiple of an elementary quantity of energy.

Thus, following the work of Max Planck, the idea of minima of energy was added to the idea of minima of matter, the traditional basis of atomism. Even light seemed to show an atomistic structure (photon theory). This would have meant a complete victory for the atomistic view if there had not been a complication. This complication was that the reasons which had formerly settled the dispute about the nature of light in favor of Christian Huygens's wave theory against Isaac Newton's corpuscular theory still retained their value. Light showed a dual character. In 1924, it occurred to Louis de Broglie that the same dualism might very well apply to the particles of matter. On the basis of this hypothesis, he could readily explain Bohr's postulate. This resulted in quantum mechanics, a new theory propounded by Erwin Schrödinger and Werner C. Heisenberg, which showed that both the atomic theory and the wave theory were only approximate models and not adequate representations of material reality.

The evolution of the atomic theory in the twentieth century was not limited to these rather startling new theoretical developments; it also gave rise to a new branch of physical science, nuclear physics, which studies the changes that the atomic nucleus is subject to. The first work in this area was in connection with the study of natural radioactivity. It had been observed that through radiation the nucleus of one element changes in charge and mass and thus becomes the nucleus of another element. In 1919 Ernest Rutherford succeeded in effecting an "artificial" transmutation; many others followed. The atoms of chemical elements appeared to be composed like the molecules of chemical compounds. Through nuclear processes a confusingly great number of new elementary particles has been discovered, all of which are subject to transformation under certain conditions. Particles can be changed into other particles and even into radiation. With such transmutations enormous amounts of energy are released.

Thus, twentieth-century science revolutionized many fundamental ideas of the nineteenth century; the atom is not only much more complex than Dalton thought; it is also much more dynamic. Yet Dalton is far from antiquated. Modern chemistry still works along the lines drawn by Dalton and his contemporaries. Can the same be said in relation to his forerunners in the philosophical period of atomism? The answer to this question can be found in the fact that the main mistake of Dalton and other advocates of essentially mechanistic theories lay in the conviction that atoms did not undergo any internal change. Science showed that this assumption was erroneous, but this should not be a *de facto* statement only. For if we think of the nature of science as experimental, then it is clear that unchangeable atoms would not offer any possibility of being investigated by experimental means. Without change, matter could not respond to experimental questions. Classical science could overlook this simple truth by assuming that it already knew all the relevant features of atoms. This assumption followed from the mechanistic doctrine that, from the seventeenth century onward, formed the philosophical background of the atomic theory and of classical science in general. The mechanistic doctrine points up the fact that classical science originated in a rationalistic climate. The idea of an unchangeable atom endowed with mechanical properties seemed to be in accordance with what an element should be. It satisfied both the imagination and the intellect. The program of science seemed to consist in explaining the forms of nature on the basis of component elements that were already known.

With the development of science, however, increasing knowledge of chemical compounds affected our understanding of elements. The elements, too, became the object of experimental investigation. From this it may be concluded that the mechanistic doctrine was not a real presupposition of the scientific method. In using the experimental method, science presupposed a much more fundamental mutability in nature than traditional mechanism could account for, and the scientific method implied a much more refined view of material reality than the mechanistic interpretations of science suggested. For this reason, the less orthodox forms of atomism were as important to the origin of the scientific atomic theory as were the orthodox. From the point of view of twentieth- and twenty-first-century science, the Greek philosophical discussions about the nature of change remain amazingly modern.

AUGUSTINE, ST.

(354–430)

St. Augustine, also known as Aurelius Augustinus, was one of the key figures in the transition from classical antiquity to the Middle Ages. He was born at Thagaste, in north Africa, and died as the invading Vandals were closing in on his episcopal city, Hippo. He lived through nearly eighty years of the social transformation, political upheavals, and military disasters that are often referred to as the "decline of the Roman Empire." His life also spanned one of the most important phases in the transition from Roman paganism to Christianity. The old Roman pagan tradition was by no means dead, although the Roman emperors had been Christians since Constantine's conversion some forty years before Augustine was born. Augustine's youth saw the brief rule of Julian the Apostate as well as the last great pagan reaction in the empire, which broke out in the 390s. Nevertheless, it was during this period that the Roman state adopted Christianity as the official state religion. Medieval Europe began to take shape within the framework of the Roman Empire.

Augustine belonged to the world of late Roman antiquity, and its cultural and educational system had a decisive and lasting role in shaping his mind. His education, following the standard pattern of the time, was almost entirely literary, with great stress on rhetoric. Its aim was to enable its recipients to imitate the great literary masterpieces of the past. It tended, inevitably, to encourage a conservative literary antiquarianism. The culture it produced rarely rose above the level of the ster-

ile cult of “polite letters” and generally had little contact with the deeper forces at work in contemporary society. There were many creative minds still at work; but even at their best, their thought was largely derivative. This is especially true of the philosophy of the period. Its stock of learning was in large part contained in compendia, though works of Cicero were still widely read, and those of the Neoplatonist thinkers gave inspiration to both pagans and Christians.

This culture and its educational system were the two sources that supplied the initial impulse for Augustine’s thinking. His search for truth and wisdom began with his reading at the age of eighteen of a now lost dialogue by Cicero, the *Hortensius*. The work made an impact that Augustine could not forget and that he often mentions in his later writings. When he recounts the experience in the *Confessions* (III, 4, 7), written in his forties, he tells us that it was this work that changed his interests and gave his life a new direction and purpose: the search for wisdom. The search led him far afield; but looking back on it, Augustine could interpret its start as the beginning of the journey that was finally to bring him back to God.

PHILOSOPHY AND CHRISTIANITY

It was not until 386 that Augustine was converted to Christianity; he was baptized the following year. Meanwhile, his career as a teacher of rhetoric took him from his native Africa to Italy, first to Rome and then to Milan. During this period he was under the spell of the Manichaean religion. Its teachings appeared for a time to offer Augustine the wisdom for which he had been searching, but he became increasingly dissatisfied with it and finally broke with the sect through the influence of his new friends in Milan, Bishop Ambrose and the circle of Christian Neoplatonists around him. In Milan he learned the answers to the questions that had worried him about Manichaean doctrine, and there he encountered a more satisfying interpretation of Christianity than he had previously found in the simple, unintellectual faith of his mother, Monica. There was no deep gulf between the Christianity of these men and the atmosphere of Neoplatonic thought of the time. At this stage of his life Augustine saw no need to disentangle exactly what belonged to Christian and what to Neoplatonic teaching: What struck him most forcibly was how much the two bodies of thought had in common. The blend of Neoplatonism and Christian belief won his adherence, and the moral conflict recounted in his *Confessions* (Books VI–VIII) ended with his baptism.

Even in 400, when he wrote his *Confessions*, he spoke of the teachings of the “Platonists” as preparing his way to Christianity. In a famous passage (VIII, 9, 13–14) he describes Neoplatonism as containing the distinctive Christian doctrines about God and his Word, the creation of the world, and the presence of the divine light; all these he had encountered in the books of “the Platonists” before reading of them in the Scriptures. What he had failed to find anticipated in Neoplatonism were the beliefs in the Incarnation and the Gospel account of the life and death of Jesus Christ. Later in life Augustine came gradually to see a deeper cleavage between philosophy and Christian faith; but he never ceased to regard much of philosophy, especially that of the Neoplatonists, as containing a large measure of truth and hence as capable of serving as a preparation for Christianity.

From Milan he returned to north Africa and retired to live a kind of monastic life with like-minded friends until he was ordained, under popular pressure, to assist the aged bishop of Hippo as a priest. Within four years, in 395, he became bishop of Hippo. From the 390s onward, all of Augustine’s work was devoted to the service of his church. Preaching, administration, travel, and an extensive correspondence took much of his time. He continued to lead a quasi-monastic life with his clergy, however, and the doctrinal conflicts with Manichaeans, Donatists, Pelagians, and even with paganism provoked an extensive literary output. Despite this multifarious activity, Augustine never ceased to be a thinker and scholar, but his gifts and accomplishments were turned increasingly to pastoral uses and to the service of his people. The Scriptures took a deeper hold on his mind, eclipsing the strong philosophical interests of the years immediately preceding and following his conversion.

Augustine did not, however, renounce his philosophical interests. He shared with all his contemporaries the belief that it was the business of philosophy to discover the way to wisdom and thereby to show people the way to happiness or blessedness (*beatitudo*). The chief difference between Christianity and the pagan philosophies was that Christianity considered this way as having been provided in Jesus Christ. Christianity could still be thought of as a philosophy, however, in that its aim was the same as that of other philosophic schools. The ultimate source of the saving truths taught by Christianity was the Scriptures, which for Augustine had supplanted the teachings of the philosophers as the gateway to truth. Hence, authority rather than reasoning, faith rather than understanding, came to be the emphasis of “Christian philosophy.” For although the pagan philosophers had discovered much of

the truth proclaimed by the Christian Gospel, what their abstract speculation had not, and could not have, reached was the kernel of the Christian faith: the belief in the contingent historical facts that constitute the history of salvation—the Gospel narrative of the earthly life, death, and resurrection of Jesus.

BELIEF AND UNDERSTANDING

Belief in the above facts was the essential first step along the way to saving truth and blessedness, but it was only a first step. Faith, while required of a Christian, was not in itself sufficient for a full realization of the potential rationality of man. For Augustine, an act of faith, or belief, was an act of rational thinking, but of an imperfect and rudimentary kind. In a late work he defined “to believe” as “to think with assent” (*De Praedest. Sanct.* 2, 5). The act of believing is, therefore, itself an act of thinking and part of a context of thought. What distinguishes it from understanding or knowledge is best brought out by Augustine in passages where he contrasts believing with “seeing.” By “seeing” Augustine meant either vision, literally, or, metaphorically, the kind of knowledge to which its object is clear and transparent. This kind of knowledge could be acquired only through direct experience or through logical demonstration, such as is possible in mathematics and other forms of rigorous reasoning. Believing, though a necessary and ubiquitous state of mind without which everyday life would be impossible, is therefore a form of knowledge inferior to understanding. Its object remains distant and obscure to the mind, and it is not intellectually satisfying. Faith demands completion in understanding.

In this emphasis on the priority of belief and its incompleteness without understanding, we may see a reflection of Augustine’s own intellectual pilgrimage. His tortuous quest for wisdom, with its false trails, had ultimately led him to consider the Christian faith as the object of his search. But this faith offered no resting place, for Augustine never lost his passion for further intellectual inquiry. His faith was only the first step on the way to understanding. He never ceased to regard mere faith as only a beginning; he often returned to one of his most characteristic exhortations: “Believe in order that you may understand; Unless you shall believe, you shall not understand.” The understanding he had in mind could be fully achieved only in the vision of God face to face in the life of blessedness; but even in this life, faith could be—and had to be—intensified in the mind by seeking a deeper insight into it. Progress in understanding, founded on faith and proceeding within its framework,

was part of the growth of faith itself. After his conversion, then, reasoning and understanding were for Augustine no longer an independent, alternative route to faith. They still had their work, but now within a new setting and on a new foundation.

Some things, like contingent historical truths, could be the objects only of belief; others could be the objects of either belief or understanding (understanding means having an awareness of grounds and logical necessity). For instance, a mathematical theorem can be believed before it is understood. With understanding, however, belief inevitably follows. God, Augustine thought, belongs among the objects that are first believed and subsequently understood. In the process of gaining this understanding, the ordinary human endowments of rational thought, culture, and philosophy have a part to play. They form the equipment of which a Christian may avail himself in the work of seeking deeper insight into the meaning of his faith.

In his *De Doctrina Christiana* Augustine discusses the ways in which the various intellectual disciplines may serve to assist the Christian in understanding the faith he derives from scriptural sources. Philosophy, along with the other branches of learning, is here seen as subordinated to the service of a purpose outside it, that of nourishing and deepening faith; it is no longer to be pursued for its own sake, as an independent avenue to truth. It is also in *De Doctrina Christiana* that Augustine uses the image of the children of Israel, on their way to the Promised Land, spoiling the Egyptians of their treasures at God’s bidding: In the same way, Christians are bidden to take from the pagans whatever is serviceable in understanding and preaching the Gospel. Again, we may see here a reflection of Augustine’s narrowing of interests and the growing dominance of pastoral concerns in his mind. The theoretical statement of his subordination of secular learning and culture and their consecration to the service of preaching the Gospel (in its widest sense) is contained in the program laid down in the *De Doctrina Christiana*.

Therefore, Augustine is not interested in philosophy, in the modern sense of the word. Philosophical concepts and arguments play a subordinate role in his work; and where they occur, they are usually employed to help in the elucidation of some aspect of Christian doctrine. Typical examples are his use of Aristotle’s *Categories* in an attempt to elucidate the notions of substance and relation in the context of Trinitarian theology, especially in his great work *De Trinitate*; his subtle inquiries into human knowledge and emotions, in the second half of the same work, with a view to discovering in man’s mind an image

of God's three-in-oneness; and his analysis of the temporal relations "before" and "after," undertaken to elucidate the nature of time in order to solve some of the puzzles presented by the scriptural doctrine of the creation of the world. In all these cases and many more, his purpose would be described today as theological. In Augustine's day the distinction between theology and philosophy did not exist, and "philosophy" could be—and often was—used in a sense so wide as to include what we should call theology.

To study Augustine's thought *as philosophy* is in a sense, to do violence to it: It is to isolate from their purpose and context what he would have regarded as mere techniques and instruments. To focus attention on what Augustine would have regarded as belonging to the sphere of means, however, allows us to see something more than a mere agglomeration of philosophical commonplaces derived, in large measure, from Neoplatonism. Augustine's originality lies not only in his determination to use his inherited philosophical equipment but also in the often slight, but sometimes profound, modification it underwent at his hands. And in the service of Augustine's purpose, many old ideas received new coherence and new power to move. Through his "spoiling of the Egyptians" much of the heritage of late antiquity received a new life in the European Middle Ages.

THE MIND AND KNOWLEDGE

At an early stage of Augustine's intellectual development, the skepticism of the Academic tradition of philosophy appears to have presented him with a serious challenge. His early philosophical dialogues, written in the period immediately after his conversion, are full of attempts to satisfy himself that there are at least some inescapable certainties in human knowledge on which we may absolutely rely. The basic facts of being alive, of thinking, or of simply existing are disclosed in one's immediate awareness of oneself. But Augustine did not limit the range of what was indubitably reliable in one's experience; nor did he seek to build an entire structure of indubitable knowledge on the basis of the absolute certainties of immediate awareness and its strict logical consequences, as René Descartes was to do. He tried instead to vindicate the whole range of human knowledge as being capable of arriving at truth, though also liable to err.

His vindication proceeds on two fronts, according to the fundamental duality of knowledge and of the objects corresponding to it. This duality, like much in his theory of knowledge, is of Platonic origin. Plato is the source of

his belief that "there are two worlds, an intelligible world where truth itself dwells, and this sensible world which we perceive by sight and touch" (*C. Acad.* III, 17, 37); and of its corollary, that things can be divided into those "which the mind knows through the bodily senses" and those "which it perceives through itself" (*De Trin.* XV, 12, 21). Although he never departed from this dualistic theory of knowledge, Augustine also always insisted that all knowledge, of either kind, is a function of the mind, or the soul.

He defines the soul as "a substance endowed with reason and fitted to rule a body" (*De Quant. Anim.* 13, 22). Augustine's use of the conceptual framework of the Platonic tradition made it difficult for him to treat man as a single, substantial whole. He did, nevertheless, attempt to stress the unity of body and soul in man as far as his inherited conceptual framework allowed. In a characteristically Platonic formula he defines man as "a rational soul using a mortal and material body" (*De Mor. Eccles.* I, 27, 52). The soul is one of two elements in the composite, but it is clearly the dominant partner: The relation between it and its body is conceived on the model of ruler and ruled, or of user and tool. This conception gave Augustine considerable trouble in his attempt to work out a theory of sense knowledge.

SENSE AND IMAGINATION. It was a basic axiom of Augustine's view of soul and body that while the soul can act on the body, the body cannot act on the soul. This is a consequence of the user-tool model in terms of which he understood their relation. The tool cannot wield its user; the inferior in nature has no power to effect or induce any modification in the higher. Augustine could not, therefore, elaborate a theory of sense knowledge in which the bodily affections would in any way cause or give rise to modifications in the soul; nevertheless, he insisted that even sense perception was a function of the soul, one that it carried out through the bodily sense organs. The mere modification of a sense organ is not in itself sense experience, unless it is in some way noticed by the mind. Augustine's problem was to explain this correlation between the mind's awareness and the modification of the organ without allowing the latter to cause or to give rise to the former.

In an early discussion of this problem, Augustine tried to explain the process of seeing as a kind of manipulation by the mind of its sense organs, much like a blind man's manipulation of a stick to explore the surface of an object (*De Quant. Anim.* 23, 41–32, 69). This is very much in line with his general conception of the relation of the body to the mind as that of an instrument to its user, but

its inadequacy as an explanation of sense perception may have been apparent to Augustine. At any rate, he later came to prefer an account constructed in quite different terms. This account (elaborated in *De Genesi ad Litteram*, Book XII and generally underlying his later views, for instance, those stated in *De Trinitate*) is based on a distinction between “corporeal” and “spiritual” sight. Corporeal sight is the modification undergone by the eyes in the process of seeing and is the result of their encounter with the object seen. Spiritual sight is the mental process that accompanies corporeal sight, in the absence of which the physical process cannot be reckoned as sense experience (since all experience is a function of mind). Spiritual seeing is not, however, caused by corporeal seeing, since the body cannot affect the mind. Indeed, spiritual sight is a separate process that may take place in the mind spontaneously, in the absence of its corporeal counterpart—for instance, in dreaming or imagining. The mental processes involved in sight and in dreaming and imagination are identical; what is before the mind is, in all these cases, of the same nature. What the mind sees in each case is not the object outside it, but the image within it. The difference between sensation and imagination is that in sensation a process of corporeal seeing accompanies the mental process; this is absent in imagination.

Augustine never quite answers the question of how we may know the difference between perception and imagination. The part, however, which he attributes to attention in the process of sense perception is important and gives a clue: It is attention that directs the mind’s gaze, and it appears that it is attention that checks the free play of imagery in the mind. Thus, perception and imagination can be distinguished in experience by adverting to the presence of attention; its presence immobilizes the creative imagination and ensures that the content of the mind has some sort of rapport with the bodily senses and their world. It is difficult to escape the impression that under the guise of “attention” Augustine has introduced what he had begun by excluding—mental process as responsive to bodily change. This is the peculiar difficulty that his two-level theory of man never quite allowed him to escape.

Augustine also speaks of a third kind of sight, one that he calls intellectual. This, the highest kind of sight, is the work of the mind whereby it interprets, judges, or corrects “messages” from the lower kinds of sight. The type of activity Augustine has in mind here is exemplified by any act of judgment on the content of sense perception; for instance, the judgment that an oar partly submerged in water is not actually bent, even though it looks

bent. This activity of interpretation and judgment brings us to the second kind of knowledge, that which the mind has independently of sense experience.

REASON AND ILLUMINATION. In his account of sense knowledge, Augustine’s Platonic inheritance was a source of difficulty. In the elaboration of his views on reason and intelligence, the reverse is the case: Augustine’s account of these is largely an adaptation of the fundamental tenets of the Platonic tradition. Typical instances of knowledge that the mind has independently of sense experience are the truths of mathematics. Here Augustine discovered the universality, necessity, and immutability that he saw as the hallmarks of truth. Although he did not believe that knowledge obtained through the senses possessed these characteristics, Augustine widened the scope of truth considerably beyond the necessary truths of mathematics and logic. He thought that our moral judgments and judgments of value, at least of the more fundamental kind, also shared the character of truth. He did not, however, trace this universality and necessity of such propositions to their logical form or to the nature of the definitions and logical operations involved in them. (He wrote fourteen centuries before Immanuel Kant’s distinction between analytic and synthetic judgments.)

Like all his predecessors and contemporaries, Augustine thought that this kind of knowledge was just as empirical as sense experience, and that it differed from the latter only in having objects that were themselves superior to the physical objects of sense experience by being immutable and eternal, and therefore capable of being known with superior clarity and certainty. The knowledge open to the mind without the mediation of the senses was conceived as analogous to sight; indeed, Augustine often speaks of it as sight, sometimes qualifying it as “intellectual sight.” Its objects are public, “out there,” and independent of the mind that knows them, just as are those of physical sight. In its knowing, the mind discovers the objects; it does not create them any more than the eyes create the physical objects seen by them. Together, the truths accessible to this kind of knowledge form a realm that Augustine, following the whole Platonic tradition of thought, often calls the intelligible world. This he identifies with the “Divine Mind” containing the archetypal ideas of all things. He was not, however, the first to take this step; this identification was the key to all forms of Christian Platonism.

Before Augustine, Plato had already used the analogy between sight and understanding. Its details are worked out in the analogy of the sun in the *Republic*. Here the

intellectual “light” that belongs to the world of intelligible forms is analogous to the visible light of the material world. Like the latter, it renders “visible” the objects seen by illuminating both them and the organ of perception—in this case, the mind. All understanding is a function of illumination by this light. The intellectual light that illuminates the mind and thus brings about understanding is spoken of in various ways by Augustine. Since it is a part of the intelligible world, it is naturally conceived as a kind of emanation from the divine mind or as an illumination of the human mind by the divine. Augustine also refers to it as the human mind’s participation in the Word of God, as God’s interior presence to the mind, or even as Christ dwelling in the mind and teaching it from within.

Plato had tried to account for the mind’s knowledge of the forms in the theory, expressed in the language of myth, that this knowledge was left behind in the mind as a memory of its life among the forms before it was enclosed in an earthly body. After some early flirtation with this theory of reminiscence, Augustine came to reject it; to hold that the mind’s knowledge derived from a premundane existence would have raised serious theological difficulties. Therefore, instead of tracing this knowledge to a residue of a past experience, he accounted for it in terms of present experience; it was the result of continual discovery in the divine light always present to the mind. For this reason, too, his conception of *memoria* became so widened as to lose the reference to past experience that *memory* necessarily implies in English. Augustine’s *memoria* included what we should call memory; in it, he thought, were preserved traces of past experience, as in a kind of storehouse or a stomach. But *memoria* included very much more than this. He speaks of our a priori mathematical ideas, numbers and their relations, as being contained in it; and in the course of the tenth book of the *Confessions*, in which he devotes a long discussion to the subject, the scope is so widened as to extend to our knowledge of moral and other values, of all truths of reason, of ourselves, and of God. It is, in effect, identified with all the latent potentialities of the mind for knowledge.

Memoria and divine illumination are alternative ways of expressing the basis of Augustine’s theory of knowledge. The theory is, in its essence, the belief that God is always intimately present to the mind, whether this presence is acknowledged or not. His presence pervades everything and is operative in everything that happens. To this metaphysical principle the human mind is no exception. The only difference between the human mind, in respect to the divine presence within it, and

other things is that unlike these other things, the human mind is able to turn freely toward the light and to acknowledge its presence, or to turn away from it and to “forget” it. Whether the mind is present to the divine light or not, however, the light is present to the mind; on this presence is founded all the mind’s ability to know.

The manner of operation of this illumination in the mind and what exactly it produces in the mind have been the subject of much debate. This uncertainty is due partly to the enormous variety of expressions used by Augustine to describe the divine light, but it is also partly the result of approaching Augustine’s views with questions formulated in terms of concepts between which he would not have made a distinction. It is clear, at any rate, that Augustine did not think that the divine light in the mind gave the mind any kind of direct access to an immediate knowledge of God. This kind of knowledge was, to him, the result of understanding, a goal to be reached only at the end of a long process—and not this side of the grave. If, however, we ask further what exactly he thought illumination did reveal to the mind, the answer is more difficult. In particular, if we ask whether he conceived illumination primarily as a source of ideas in the mind or, alternatively, as providing the mind with its rules for judgment, the answer is not at all clear. He did not distinguish as sharply as one might wish between the making of judgments and the formation of concepts; he often speaks of both activities in the same breath or in similar contexts, or passes without the least hesitation from one to the other in the course of discussion. Sometimes he speaks of illumination as implanting in the mind an “impressed notion” (*notio impressa*), whether it be of number, unity, wisdom, blessedness, or goodness. Such passages suggest that Augustine thought of illumination primarily as a source of ideas, as providing “impressed notions.” It is clear, however, that such “impressed notions” were also to serve as the yardsticks for judging all imperfect participations in individual instances of these notions. And in other passages, again, illumination is spoken of not as supplying any ideas or notions but simply as providing a criterion of the truth or falsity of our judgments.

It was very easy to pass from ideas to judgments in Augustine’s way of speaking of illumination. In addition, Augustine’s language when he speaks of the mind’s judgment made in the light of divine illumination often has further overtones; the judgment he speaks of appears as a kind of foreshadowing of the ultimate divine judgment on all human life and action. The basic reason why Augustine had found Platonic metaphysics so congenial

was that it harmonized so easily with the moral bearings of his own views; and its theories, especially in some of their more imaginative and dramatic expressions, allowed themselves to be exploited to serve Augustine's interests as a moralist. In his discussion of knowledge, as in his discussion of the relation of mind and body, ethical considerations very often play the major part. The central theories of Platonic thought buttressed views held by Augustine primarily on account of their moral bearings.

WILL, ACTION, AND VIRTUE

Morality lies at the center of Augustine's thought. There are many reasons for this, the most noteworthy being his conception of philosophy. As we have seen, philosophy was for Augustine far from being an exclusively theoretical study; and morality itself belonged to its substance more intimately than the discussion and analysis of moral concepts and judgments. Philosophy was a quest for wisdom, its aim being to achieve man's happiness; and this depended on right living as much as on true thinking. Hence the practical orientation of Augustine's thought—an orientation that it shared with most contemporary forms of thinking.

On human conduct and human destiny Augustine's thinking was, of course, molded very largely by the New Testament and by the Christian church's tradition in understanding its conceptions of divine law and commandment, of grace, of God's will, of sin, and of love. Much of this, being specifically theological in interest, lies outside the scope of this presentation of Augustine's thought. What is remarkable is the extent to which Augustine was prepared to read back the characteristic teaching of the Christian church into the works of the philosophers, Plato in particular. Thus he held that Plato had asserted that the supreme good, possession of which alone gives man blessedness, is God. "And therefore," Augustine concluded, Plato "thought that to be a philosopher is to be a lover of God" (*De Civ. Dei* VIII, 8). Rapprochements of this kind helped to reconcile the Christian and the Platonic teachings to each other; in Augustine's treatment of ethical topics the characteristically Christian themes and distinctively Platonic concepts are so closely interwoven that they are often inseparable.

Augustine is able, therefore, to define blessedness itself in terms that make no reference to any distinctively Christian teaching, for instance, when he says that man is blessed when all his actions are in harmony with reason and truth (*cum omnes motus eius rationi veritatisque consentiunt*—*De Gen. C. Man.* I, 20, 31). Blessedness, according to this view, does not consist simply in the total

satisfaction of all desires. In another discussion Augustine makes this more explicit: While blessedness is incompatible with unsatisfied desires, the satisfaction of evil or perverse desires gives no ultimate happiness; hence blessedness cannot be identified simply with total satisfaction. "No one is happy unless he has all he wants and wants nothing that is evil" (*De Trin.* XIII, 5, 8; for the entire discussion, see *ibid.* XIII, 3, 6–9, 12). The only element in all this that is specifically Christian is the insistence that this happiness cannot be attained by man except with the aid of the way revealed by Christ and of God's grace given to men to enable them to follow it.

The dramatic account, given in his *Confessions*, of his own turning to God, though steeped in the language of the Bible and throbbing with the intensity of Augustine's feelings, is, at the same time, an illustration of a central theme in Greek metaphysics. The book opens with a powerful evocation of his coming to rest in God; it ends with a prayer for this rest, peace, and fulfillment. This central theme of longing and satisfaction is a commonplace of Greek thought from Plato's *Symposium* onward. Man, according to the cosmology implicit in this picture, illustrates in his being the forces that are at work in nature in general. Man, like everything else, is conceived as part of a vast nexus of interrelated things within an ordered hierarchy of beings that together form the cosmos. But it is an order in which the components are not stationary but are in dynamic rapport; they are all pursuing their own ends and come to rest only in attaining these ends. Their striving for rest, for completion or satisfaction, is the motive power that drives all things toward their purposes, just as weight, according to this image, causes things to move to the places proper to them in the cosmos—the heavy things downward, the light upward. Augustine thought of the forces that move men as analogous to weight and called them, collectively, love or loves. In a famous passage he wrote, "My weight is my love; by it am I carried wheresoever I am carried" (... *eo feror quocumque feror*—*Conf.* XIII, 9, 10).

LOVE, LAW, AND THE MORAL ORDER. Man, however, differs from other things in nature in that the forces that move him, his "loves," are very much more complex. Within him there are a great many desires and drives, impulses and inclinations—some of them conscious, others not. The satisfaction of some often involves the frustration of others, and the harmonious satisfaction that forms the goal of human activity appears to be a very distant and scarcely realizable purpose. The reason for this is not only the multiplicity of elements that go into the making of human nature; a further reason is the fact

that these elements have been disordered and deprived of their original state of harmony. Augustine interpreted this aspect of the human condition as a consequence of the sin of Adam and the fall of man.

There is, however, a further respect in which man differs from other things in the way his activity is determined. This lies in the fact that even with his disordered impulses, he is not—at least not entirely—at the mercy of the conflicting forces within him. His activity is not, so to speak, a resultant of them: He is, in some degree, capable of selecting among them, deciding which to resist, which to follow. In this capacity for choice Augustine saw the possibility of what he called voluntary action as distinguished from natural or necessary behavior. He called this human capacity “will.” It is a source of some confusion that he used the term *love*, or its plural, *loves*, to designate the sum total of forces that determine a man’s actions, whether they are “natural” or “voluntary.” As a collective name for natural impulses, “love” is therefore morally neutral; only insofar as the will endorses or approves love of this kind is love morally praiseworthy or blameworthy. Augustine expresses this graphically by distinguishing between loves that ought to be loved and loves that ought not to be loved; and he defines man’s moral task in terms of sorting out these commendable and reprehensible loves in himself and putting his loves in their right order.

Augustine’s favorite definition of virtue is “rightly ordered love” (as in *De Civ. Dei* XV, 22). This consists in setting things in their right order of priority, valuing them according to their true worth, and in following this right order of value in one’s inclinations and actions. The idea of order is central to Augustine’s reflections on morals. Before becoming a Christian, he had believed with the Manichaeans that the existence of good and of evil in the world was accounted for by their different origins, respectively from a good and an evil deity. The Neoplatonism of his Christian friends in Milan helped Augustine find an alternative explanation, one that was more in keeping with the Christian doctrine of one world created by one God. According to this theory, evil had no independent, substantial existence in its own right; it existed as a privation, as a distortion or damage within the good. All evil was thus in some sense a breach of the right relation of parts within a whole, a breach of order of some kind. Hence the great emphasis on order in Augustine’s thought, from the time of his conversion to the writing of his last works.

Augustine calls the pattern to which human activity must conform “law.” Law is, in the first place, the arche-

typal order according to which people are required to shape their actions and by which their actions are to be judged. Augustine makes it clear that by “law” he means very much more than the actual legal enactments of public authorities. These “human laws” deal only with a part, greater or lesser, of human conduct; they vary from place to place and from time to time; they depend on the vagaries of individual legislators. The true “eternal law” by which all human behavior is judged leaves no aspect of man’s life out of its purview; it is the same everywhere and at all times. It is not quite clear how Augustine conceived the relation between divine and human, eternal and temporal, law. His terminology is variable, and although he thought that human law ought to seek to approach the divine, or at least not to contradict it, he does not appear to have denied its claim to being law even when it failed to reflect the eternal law. Also, as we shall see, he appears to have changed his views on this matter in the course of his life.

The “eternal,” or “divine,” law is in effect the intelligible world or the divine mind (see discussion of reason and illumination above) insofar as it is considered as the pattern that should regulate activity. The language in which Augustine speaks about the divine law is the same as that which he uses in speaking of the eternal truth, and he believed that the achievement of wisdom consisted in pursuing this truth by understanding and then embodying in oneself the order understood. It is clear that there is no significant difference between “eternal law” and “eternal truth”; the two are identical: Eternal law is eternal truth considered under its aspect as a standard of moral judgment. Thus, the problem of how the eternal law is known to men is the same as the problem discussed above of how the eternal truth is known. Here, too, he speaks of the eternal law as being “transcribed” into the human mind or of its “notion” as being impressed on the mind. The deliverance of conscience or reason as manifested in moral judgment is thus no less and no more than the human mind’s illumination by the eternal law, or its participation in it; Augustine describes conscience as “an interior law, written in the heart itself” (*lex intima, in ipso ... corde conscripta—En. in Ps. 57, 1*). He refers to this law, inscribed in man’s heart or known to him by reason, as “natural.” He can thus speak of law (eternal or natural), reason, and order interchangeably when discussing the ordering of human action to bring about its virtuous disposition.

In defining this order of priority in value, the following of which constitutes virtue, Augustine makes a fundamental distinction between “use” and “enjoyment.” These

two forms of behavior correspond to the twofold classification of things according to whether they are valuable for their own sake or as means, for the sake of something else. Things valued for themselves are to be “enjoyed,” things valued as means are to be “used”; the inversion of the relation between use and enjoyment is the fundamental perversion of the order of virtue. To seek to use what is to be enjoyed or to enjoy what is to be used is to confuse means with ends. The only object fit for enjoyment, in this sense, is God; he alone is to be loved for his own sake, and all other things are to be referred to this love. In elaborating this theory, Augustine was expressing the traditional view that it behooves people to journey through their lives on Earth as pilgrims and not to regard any earthly goal as a fit resting place. This did not, of course, imply, to Augustine’s mind, that nothing but God was a fit object of love; on the contrary, it was a way of stressing the need to put loves in their right order and to love each thing with the kind and degree of love appropriate to it. Although he clearly conceived of love as capable of an endless series of gradations, Augustine is usually content to speak of two kinds of love, which he contrasts: charity (*caritas*) and cupidity (*cupiditas*). The basic distinction is between upright, well-ordered, and God-centered love and perverse, disordered, and self-centered love. A great deal of Augustine’s thinking and writing hinges on this distinction.

The individual virtues interested Augustine less than the concept of love. He was content to take over the classical enumeration of the four cardinal virtues. But his own characteristic thoughts on the moral life are always developed in terms of love rather than of any of the virtues. Indeed, as we have seen, he defined virtue in terms of love; similarly, he liked to define the individual cardinal virtues as different aspects of the love of God. This tendency is one of the most important links between what we would distinguish as the theological and philosophical sides of his thought.

THE WORLD AND GOD

Order is a key idea in Augustine’s reflections on the morality of human behavior. It also plays a large part in his reflection on the physical universe in its relation to God. The world of nature was not in itself an object of particular interest to Augustine. In cosmological thinking of the kind to be found in Aristotle’s *Physics*, for instance, he had little interest. The physical world concerned him only insofar as it was related either to man or to God. Order, then, for Augustine was the expression of rationality. In human action this was something that men should

seek to embody in their conduct; in the world of physical and animate nature, which did not share the freedom of human activity, order expressed the divine rationality at work in all natural happenings. To human eyes, however, this order was often glimpsed only in isolated instances, while a great deal of disorder was manifest in the misery, disease, and suffering with which the world is shot through. In part these frustrations of order were held to be due, ultimately, to the initiative of human sin; in part they were held to be merely apparent and capable of being resolved within a perspective larger than that of finite human vision.

Behind the world order stands its author and sovereign ruler, God. All things testify to his presence; the world is full of his “traces” (*vestigia*). God’s presence in and behind his creation was, for Augustine, not so much something to be established by argument as it was the premise, taken for granted, of a further argument. This argument, to which Augustine returned on a number of occasions, is particularly well expressed in a chapter of his *Confessions* (X, 6, 9, and 10). He there speaks of putting things to the question in order to allow them to reveal themselves as dependent on their creator. It is clear that what primarily interested Augustine was the questioner’s moral attitude: The point of his argument is not so much that the order and beauty of things imply the existence of God, but rather that since God had created them, we must so discipline ourselves as to see things for what they are—his handiwork—and to value them at their true worth and worship only him, their creator—not his handiwork. Again, the moral concern is uppermost in Augustine’s mind.

This is not the case with the discussion of the problem of time, in Book XI of the *Confessions*. The problem was forced on Augustine’s attention by the scriptural doctrine of creation, but it is clear that it fascinated him and that he pursued it simply because he was interested in it. Manichaeian objectors to the Christian doctrine of creation from nothing had raised difficulties about speaking of an absolute beginning. These critics had pointed out that in our ordinary language there is no room for an absolute beginning of the kind envisaged by adherents of the doctrine; we can always ask what happened before something else, even if this was the first of all happenings. Questions of this kind revealed the arbitrariness and absurdity of the belief that God made the world out of nothing: What was God doing before the creation? Why did he create the world when he did and not sooner, or later?

In answer to these difficulties Augustine in effect undertook a critique of the conception of time that underlay them. Such difficulties arise from the fact that time is thought of as having the same kind of being as the events and happenings going on in time; the question “What happened before time?” was thought to be of the same logical form as questions about what happened before any particular events. Augustine denied this assumed logical similarity behind the grammatical similarity of the questions. He pointed out that whereas it makes sense to ask what happened before any particular event, it does not make sense to ask what happened before all events, because time is the field of the relationships of temporal events, and there could be nothing before the first temporal event. In this argument Augustine in effect rejected the conception of time according to which time has a substantial reality of its own, and he adopted a theory according to which time is the field of temporal relations between temporal events.

He did, however, go further in his reflections on time. Neoplatonic thought had always treated time in close relation to the soul, and Augustine could scarcely avoid discussing this topic. The reality of the past and of the future puzzled him: Can what is not yet but will be, and what is no longer but has been, be said to *be*? If not, then only the present has any reality. But if only the present is real, then reality shrinks to a dimensionless point at which the future is becoming the past. Augustine resolved the whole problem by locating time in the mind and adopting at the end of his discussion, though with hesitation, a definition of time as “extension [*distentio*], I am not sure of what, probably of the mind itself” (*Confessions* XI, 26, 33).

Another question that the doctrine of creation raised for Augustine concerns the natural activity, functioning, and development of creatures. This problem arose from the need to harmonize the story of the creation of the world in seven days or, according to an alternative version, at once, with the fact that some things came into existence only after the creation took place. Augustine’s solution of this problem lay essentially in asserting that God created different things in different conditions; some left his hands complete and ready-made, others in a potential or latent state, awaiting the right conditions and environment for their full development. The latter are analogous to seeds, which are thought of as containing in themselves the fully developed plant in potency; and on this analogy, and using the traditional vocabulary, Augustine called these potentialities for later development “seminal reasons” (*rationes seminales*, or *causales*).

Apart from helping him to resolve the apparent contradiction between the belief in a primordial creation and the concept of continued development as a process of natural causality, this theory of “seminal reasons” also prompted Augustine at least to begin to feel his way toward some conception of nature and natural causality. At times, he comes very close to the later medieval distinction between the “First Cause” and the whole range of “second causes,” the distinction according to which things depend in different senses both on God (the First Cause) and on their own immediate or distant created causes. Augustine, too, tried to endow the world of created causes with a specific reality of its own, one distinct from the causal activity of God in the world. In this he did not quite succeed. His failure becomes apparent in his treatment of miracles. He did not treat these—as the Scholastics later did as effects of the First Cause (God) produced without the instrumentality of second causes. He allowed the distinction between the two orders of causality (which he had never clearly formulated and which is hinted at, rather than stated, in his writings) to disintegrate during his discussion of miracles. In this context the very idea of “nature” is so widened as to include the miraculous within its scope. Miracles do not contradict the order of nature; they contradict only our idea of this order, an idea based on our restricted view and limited experience. They are not against nature, since nature is God’s will; they are only against nature as it is known to us. The distinction between nature and miracle vanishes here, and in his well-known chapter in *The City of God* (X, 12) they become synonymous to the extent that nature itself and man, its crown, become the greatest miracles of all.

INDIVIDUALS IN SOCIETY

Society was not one of the subjects that loomed large in Augustine’s earlier thought. Such hints as he gives us of his conception of society in his earlier works (those written before the mid-390s) suggest that he thought that organized human society and the state were part of the worldly dispensation whereby man is assisted to fulfill his destiny. A properly ordered society, like a properly ordered moral life, is a stage on the way to man’s ultimate destination in eternity; and as far as Augustine’s hints enable us to tell, he expected a properly ordered society to reflect, particularly by means of its legal institutions, the perfection of the eternal, intelligible world.

In step with his theological development, however, his views on human society underwent profound changes, and by the time that society became an impor-

tant theme in his reflection, especially in his great work *The City of God* (written 413–427), these views had been radically transformed. An important factor in the course of this transformation was the increasing stress Augustine had come to lay on the power of sin in human life and in all earthly institutions, on man's need for redemption through Christ, and on his need for grace. In the most general terms Augustine came to see man's destiny and his realization of it more in terms of the scriptural pattern of a redemption-history and less in terms of the Neoplatonic theme of the ascent of the soul. Accordingly, human society came to be understood more in terms of its horizontal, historical relationships within the divine plan for men's salvation and less in terms of what we might call its vertical relationship to the intelligible world.

The first event in the course of the biblical redemption-history, man's fall from grace through Adam's sin, is of decisive importance for Augustine's changed attitude to organized human society. To live in society, according to Augustine, was natural to humans; without society they would not be able to realize fully their human potentialities, and the company of their fellow human beings was necessary to them. This, he held, was as true before man's fall as after; even in his state of primal innocence, in full possession of his nature prior to its distortion by sin, man was a social animal by nature; even the life of the blessed in heaven is a social life. But although Augustine believed that man's nature is social, he did not agree with Aristotle that it is also political. Politically organized society—the machinery of authority, government, and coercion—is, in Augustine's view, not natural to man. It was a useful and necessary arrangement for man in his fallen condition, and indeed the purpose of political society was to remedy at least some of the evils attendant upon man's fallen state. Its function was to check the social disorder and disintegration that followed from the general loss of order at the Fall. The institutions of government, the subjection of governed to government, and the coercive power of political authority over its subjects are thus but one instance of the subjection of man to man, and this was something that, Augustine held, did not exist in man's primal state of innocence. No slavery, servitude, or subjection could exist in that state of natural integrity; these things make sense only if understood as God's punishment for the sin that incurred the loss of integrity and, at the same time, as his dispensation for coping with the needs of man's condition in his new, fallen state.

Augustine used the traditional language of Christian theology to state his view of political society. For reasons

to be considered below, he never drew out, at least not explicitly, the full implications of this view. In this view of society, however, the legitimate functions of the state are very much more restricted in scope than in theories according to which man is by nature a political animal. In Augustine's view, the state's sphere is confined to the requirements of social order and welfare; the individual's ultimate welfare and eternal destiny lie outside its realm of competence, whereas they are very much a part of the state's interest if the state is thought of as an ordinance of nature, as an indispensable means of man's realizing his ultimate destiny. In Augustine's estimate, the task of the state in the economy of salvation would be rather to establish the conditions in which men may work out their own salvation in relative peace and security than actively to promote their individual salvation through legislation and coercion.

The state was, for Augustine, synonymous with the Roman Empire; and having revised his ideas on the state in terms of the large categories of the scriptural redemption-history, he had inevitably to take the measure of the state he knew in this same perspective. Here his ideas make sense only if seen as a rejection of views of the empire generally current among Christians during the fourth century, after the adoption of Christianity by the emperors. The empire, represented as eternal ever since Vergil's day, was now widely regarded among Christians as an essential instrument of divine purpose in history, bound up with the possibility of salvation and destined to last until the end of time. It had been taken up into the dimension of the biblical redemption-history. The sack of Rome by the Visigoths in 410 gave a profound shock to this mentality. It led Augustine, whose mind had already moved a long way from the popular picture, to devote his greatest work, *The City of God*, to a reappraisal of the empire's place in the divine providential plan. The upshot was that the empire was no longer allowed an eternal destiny and was removed from the dimension of the redemption-history; the possibility of salvation was not necessarily bound up with it as a means of God's grace. It was simply one of a series of empirical, historic societies. The eternal categories of sin and holiness, of salvation and reprobation, did not apply to it or, indeed, to any other human assembly; they were embodied only in what Augustine called the earthly city and the heavenly city.

The two "cities" consist, respectively, of those predestined to eternal glory and those predestined to eternal torment or, as Augustine also defined them (clearly intending the various definitions to be equivalent), of those who live according to God and those who live

according to man, of the altruistic and the selfish, of those whose love is upright and those whose love is perverse, and so forth. In none of these senses, however, have the two “cities” any discernible reality as communities until their final separation at the Last Judgment. In all discernible human communities they are inextricably intertwined. Here again we may see Augustine’s modest estimate of the state’s function, for when he discusses it in this context, the realm of the state is identified with the sphere in which the concerns of the two cities overlap. Its task is to secure the temporal peace: the order, security, and material welfare that both the wicked and the righteous cities require during their earthly careers. Its concern is with specifically communal, public matters affecting all its members. Citizens of the heavenly city will not, of course, be content with the welfare and peace thus secured: They will use these things but refer their use to the ultimate enjoyment of a peace beyond the terrestrial.

The general tendency of these views of Augustine’s was to undermine the extremely close links that had come to exist between the empire and the Christian church, especially during his own lifetime. He was clearly ill at ease with the current representations of this relationship; but there were considerable pressures working on the minds of his contemporaries to keep them active, and Augustine himself was not exempt from their operation. In the course of the struggle with the Donatist movement in north Africa, a dissenting movement increasingly repressed by the imperial authorities, he came gradually and reluctantly to give his consent to the coercive measures that were being brought into use against the movement. His endorsement of these means of repression ran counter to the most fundamental direction of his thought. Although his endorsement must be regarded as a development in his practical, pastoral, and political attitudes rather than as a reversal of his basic views on the nature of political society, it left deep marks on those views. In later centuries his use of the Gospel phrase “Compel them to come in” (*Coge intrare*—Luke 19:23) and its consecration of repression, persecution, and coercion paved the way to much tragedy. It also helped to obscure the most profound and most original of his contributions to Christian political thinking.

See also Neoplatonism.

Bibliography

The most complete and generally reliable Latin edition of Augustine’s works is the edition by the Benedictines of Saint-Maur (1679–1700). It supersedes all earlier editions and was reprinted in J. P. Migne’s *Patrologia Latina*, Vols.

32–46 (Paris, 1841–1842), with some unfortunate variants and errors. It is also the basis of the texts of the works now being published in *Bibliothèque augustiniennne* (with French translation and useful notes). Modern critical editions of many works exist, mainly in *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna) and *Corpus Christianorum*. Details are in E. Dekkers, “Clavis Patrum Latinorum,” in *Sacris Erudiri* 3 (1962).

English translations of many works appear in various series, such as Loeb Classical Library, Library of the Fathers, Select Library of Nicene and Post-Nicene Fathers of the Christian Church, Library of Christian Classics, The Fathers of the Church, Ancient Christian Writers, and the Catholic University of America Patristic Studies. A detailed, convenient, and fairly up-to-date list of translations is included in the bibliography by J. J. O’Meara appended to Marrou’s *Saint Augustine*.

Of short introductory works, the best is H. I. Marrou, *Saint Augustine* (London: Longmans, 1957), translated from the French in the series Men of Wisdom. It contains a brief biography and a discerning characterization of Augustine’s thought by a great scholar, as well as a selection of illustrative texts in translation. R. W. Battenhouse et al., *A Companion to the Study of St. Augustine* (New York: Oxford University Press, 1955), has been superseded by G. Bonner, *St. Augustine of Hippo: Life and Controversies* (London: SCM Press, 1963), as a survey and guide to Augustine’s career and literary output. An essential to understanding Augustine in the setting of contemporary education and culture is H. I. Marrou, *Saint Augustine et la fin de la culture antique* (Paris, 1938), completed by his *Retractatio* (Paris, 1949). On Augustine as a bishop, see F. van der Meer, *Augustine the Bishop* (London: Sheed and Ward, 1962).

Among the many books on Augustine’s intellectual development and his conversion, P. Alfarcic, *L’évolution intellectuelle de saint Augustin* (Paris: Nourry, 1918), stands behind much of the subsequent controversy; C. Boyer, *Christianisme et néo-Platonisme dans la formation de saint Augustin* (Paris: Beauchesne, 1920), is one of the best-balanced replies provoked by it. P. Courcelle, *Recherches sur les Confessions de Saint Augustin* (Paris, 1950), has put the problem on new footing altogether; it is further pursued, with qualifications, by J. J. O’Meara, *The Young Augustine* (London: Longmans Green, 1954).

Of the philosophical aspects of Augustine’s thought, the best general account is E. Gilson, *The Christian Philosophy of Saint Augustine*, translated by L. E. M. Lynch (New York: Random House, 1960). See also the survey by R. A. Markus in *Critical History of Western Philosophy*, edited by D. J. O’Connor (New York: Free Press of Glencoe, 1964).

On particular aspects, see C. Boyer, *L’idée de vérité dans la philosophie de saint Augustin* (Paris, 1941); J. Guitton, *Le temps et l’éternité chez Plotin et saint Augustin*, 2nd ed. (Paris, 1955); and E. Dinkler, *Die Anthropologie Augustins* (Stuttgart, 1934), on the topics named in their titles. M. Schmaus, *Die psychologische Trinitätslehre des heiligen Augustinus* (Münster, 1907), is the classic work on Augustine’s theory of mind and the Trinitarian speculations based on it. Also valuable on his theory of knowledge are J. Hessen, *Augustins Metaphysik der Erkenntnis*, 2nd printing (Berlin, 1960), and R. Jolivet, *Dieu soleil des esprits* (Paris: Desclée, de Brouwer, 1934).

On ethical topics, see J. Mausbach, *Die Ethik des heiligen Augustins* (Freiburg, 1909); T. Deman, *Le traitement scientifique de la morale chrétienne selon saint Augustin* (Paris, 1957); J. Burnaby, *Amor Dei* (London: Hodder and Stoughton, 1938); and R. Holte, *Béatitude et sagesse: Saint Augustin et le problème de la fin de l'homme dans la philosophie ancienne* (Paris, 1962). On the state and society the least unsatisfactory accounts are Herbert A. Deane, *The Political and Social Ideas of Saint Augustine* (New York: Columbia University Press, 1963) and the short treatment by N. H. Baynes, *The Political Ideas of St. Augustine's De Civitate Dei* (London: G. Bell, 1936).

Many of the most important recent articles on Augustine are to be found in one of the following collections: *Augustinus Magister: Communications et actes du Congrès international augustinienn* (Paris: Études Augustiniennes, 1954); *Recherches augustiniennes*, Vols. I and II (Paris: Études Augustiniennes, 1958–1963); *Studia Patristica*, Vol. VI, edited by F. L. Cross; *Texte und Untersuchungen zur Geschichte der altchristlichen Literatur* 81 (1962); and in the quarterly journal *Revue des études augustiniennes*.

The most up-to-date and best-selected bibliography is *Bibliographia Augustiniana*, appended to C. Andresen, ed., *Zum Augustin-Gespräch der Gegenwart* (Darmstadt, 1962), which is Vol. V in the series *Wege der Forschung*. Gilson's book (see above), in which the classified selection of the original is replaced by an alphabetical list in the English translation; B. Altaner, *Patrologie*, 5th printing (1958); and O. Bardenhewer, *Geschichte der altchristlichen Literatur*, Vol. IV (Freiburg, 1924; reprinted 1962), also have good bibliographies. Current literature is surveyed in the bibliographical supplements to *Revue des études augustiniennes*.

R. A. Markus (1967)

AUGUSTINE, ST. [ADDENDUM 1]

St. Augustine continues to elicit scholarly discussions of theological issues, but there is an ever-growing number of studies devoted to historical and philosophical issues in their own right. Recent philosophical work has concentrated on deepening our understanding of his arguments, assessing the adequacy of his positions, and contextualizing them in a historically informed way.

P. Brown, *Augustine of Hippo: A Biography* (London: Faber, 1967), is a masterful work that situates Augustine in his social and historical surroundings. Accessible overviews of Augustine's life and thought are provided in J. J. O'Donnell, *Augustine* (Boston, 1985), and H. Chadwick, *Augustine* (Oxford: Oxford University Press, 1986). Our understanding of Augustine's autobiography has been greatly advanced by the fine commentary given in J.

J. O'Donnell, *Augustine: Confessions* (3 vols., Oxford, 1992).

Augustine is seen against the background of classical philosophy in J. Rist, *Augustine: Ancient Thought Baptized* (Cambridge, U.K.: Cambridge University Press., 1994), which provides a guide to Augustine's philosophical views. Another introduction to Augustine as a philosopher is C. Kirwan, *Augustine* (London: Routledge, 1989), which takes up selected topics in detail. The bibliographies of both these works should be consulted as a guide to the literature. Articles on a variety of topics are usefully collected in R. A. Markus (ed.), *Augustine: A Collection of Critical Essays* (London, 1972); there has been no anthology for philosophers as of this writing.

Turning now to particular aspects of Augustine's philosophy, G. J. P. O'Daly, *Augustine's Philosophy of Mind* (London, 1987), and G. Matthews, *Thought's Ego in Augustine and Descartes* (Ithaca, NY: Cornell University Press, 1992), deal with his philosophical psychology. Epistemology and the theory of illumination are the primary focus of R. H. Nash, *The Light of the Mind: St. Augustine's Theory of Knowledge* (Lexington: University Press of Kentucky, 1969); B. Bubacz, *St. Augustine's Theory of Knowledge: A Contemporary Analysis* (New York: E. Mellen Press, 1981); U. Wienbruch, *Erleuchtete Einsicht: Zur Erkenntnislehre Augustins* (Bonn: Bouvier, 1989). Metaphysical problems as well as the issue of Augustine's indebtedness to Plotinus are treated in R. J. O'Connell, *The Origin of the Soul in St. Augustine's Later Works* (New York: Fordham University Press, 1987). Augustine's account of time is analyzed in R. Sorabji, *Time, Creation, and the Continuum* (Ithaca, NY: Cornell University Press, 1983), and subjected to a wide-ranging examination in J. Pelikan, *The Mystery of Continuity: Time and History, Memory and Eternity in the Thought of Saint Augustine* (Charlottesville: University Press of Virginia, 1986). Philosophy of language is discussed by M. Burnyeat, "Wittgenstein and Augustine *de Magistro*," in *Proceedings of the Aristotelian Society* (1987, supp. vol.). Augustine's ethical theory is the subject of J. Wetzel, *Augustine and the Limits of Virtue* (Cambridge, U.K.: Cambridge University Press, 1992), and discussed in G. R. Evans, *Augustine on Evil* (Cambridge, U.K.: Cambridge University Press, 1982). A recent philosophical study of Augustine's views on freedom, weakness of will, and voluntary action is T. Chappell, *Aristotle and Augustine on Freedom* (New York: St. Martin's Press, 1995). R. Coles, *Self/Power/Other: Political Theory and Dialogical Ethics* (Ithaca, NY: Cornell University Press, 1992), offers a Foucaultian account of Augustine's political philosophy.

A bibliography of works through 1970 is provided in C. Andresen, *Bibliographia Augustiniana* (Darmstadt: Wissenschaftliche Buchgesellschaft, 1973); the next decade of Augustinian studies is covered in T. Miethé, *Augustinian Bibliography, 1970–1980* (Westport, CT: Greenwood Press, 1982).

Peter King (1996)

AUGUSTINE, ST. [ADDENDUM2]

Augustine thought that what pleases people in beauty is design: “And in design, dimensions; and in dimensions, number” (*De Ordine* ch. 15). Beauty is ultimately a matter of numerical proportion. Rhythm, too, is based on numerical proportions (*De Musica* Book 6). Augustine sees numeric proportions as eternal and divine, yet at the same time he hints that the soul itself may be “the very number by which all things are numbered” (*De Ordine* ch. 15). If so, then he locates the source of all Beauty within the human soul, and this inner Beauty could be one of God’s traces in the world.

Paul Thom (2005)

AUGUSTINIANISM

“Augustinianism” may be described as that complex of philosophical ideas that reflected to a greater or lesser degree the philosophy of Augustine. Many of the philosophers who came after Augustine not only restated his leading ideas but also frequently modified them with their own interpretations. Such interpretations were often the result of the impact of other schools of thought, notably the Avicennian and the Aristotelian. Occasionally doctrines that were only implicit in Augustine—for instance, the plurality of forms and universal hylomorphism—were made explicit and assumed considerable importance. Thus there originated in the medieval period

what has been termed the Augustinian tradition, which in the later years of its development was closely identified with the Franciscan order. Such a tradition dominated medieval thought to the time of Thomas Aquinas. After Thomas it gradually disintegrated owing to the impact of Thomism and a resurgent Aristotelianism, and no longer represented a distinctive school or tradition. It continued, however, to be influential to the extent that it inspired or characterized in varying degrees later medieval and modern philosophers. The principal theses of Augustinianism will be discussed under seven headings.

FAITH AND UNDERSTANDING

The relationship between faith and understanding (or reason), with the implications of such a relationship for philosophy and theology, and the conception of Christian wisdom and Christian mysticism are central in the structure of Augustinian philosophy. One of the most influential and significant expressions of the relation between faith and understanding in Augustinian thought is summarized in the famous maxim of Anselm: *Credo ut intelligam* (I believe in order to understand). Peter Abelard similarly expressed the idea of the primacy of faith over understanding in his comments on the function of philosophy: “I do not want to be a philosopher if it is necessary to deny Paul. I do not want to be Aristotle if it is necessary to be separated from Christ. ‘For there is no other name under heaven given to men, whereby we must be saved.’” With Roger Bacon the relationship of philosophy and theology is profoundly Augustinian. A conservative theologian despite his enthusiasm for scientific method and experimentation, he was convinced that the highest wisdom is found in Scripture and that philosophy exists only to explicate that wisdom. A similar theme is developed by Bonaventure in his *De Reductione Artium ad Theologiam*. He declared that all the sciences and philosophy should be subordinated to theology, which in turn must be subordinated to faith and the love of God; for faith alone enables man to avoid error and attain a union with God. Other philosophers of the Middle Ages who accepted this primacy of faith over reason and the complete subordination of philosophy to theology were Alexander of Hales, John of La Rochelle, Matthew of Aquasparta, and Roger Marston.

PSYCHOLOGY

The Augustinian psychology is characterized by the definition of man as a soul using a body and the implication of this definition for the relation of soul and body. The soul is regarded as an image of the Trinity and is said to

have a direct knowledge of itself. Hugh of St. Victor is notably Augustinian, not only in his mysticism but also in his identification of the soul with man and his belief that we have a direct knowledge of the soul and its spirituality. The union of soul and body he described as one of “apposition” rather than composition. Similarly, William of Auvergne is Augustinian in his account of man as a soul using the body, his affirmation of the presence of the soul in all parts of the body, and his statement that: “No knowledge is more natural to the soul than the knowledge of its own self.” The mysticism of Bonaventure is characterized by the notion of the journey of the soul to God, the presence of the Trinity in the soul of man, and the direct knowledge the soul has of itself. This principle that the soul has a direct knowledge of itself is characteristic of both the Augustinian psychology and the Augustinian theory of knowledge. It has been termed the “principle of interiorization.” Augustine expressed it: “For what is so present to knowledge as that which is present to mind? Or what is so present to the mind as the mind itself?” In modern philosophy the principle of interiority was to have significant influence upon writers like René Descartes, Blaise Pascal, Tommaso Campanella, and Maurice Blondel.

EPISTEMOLOGY

The Augustinian theory of knowledge had an extensive influence upon medieval philosophers, but it was frequently compromised with Aristotelianism. This was particularly true with respect to the Augustinian theory that sensation is essentially an act of the soul. However, the theory of the divine illumination, in conjunction with the doctrine of exemplary ideas, and the concept of truth as identified with God and present to, but superior to, all minds had a much stronger influence; but it, too, was often qualified with an Aristotelian theory of knowledge. Anselm held that truth is based on the Divine Ideas that are one with God. William of Auvergne accepted the doctrine of divine illumination but interpreted it as giving us an intuitive knowledge of the intelligible forms. Robert Grosseteste combined the Augustinian theory of the divine illumination with an empirical approach in science; he regarded truth as the conformity of a thing with its divine exemplar. Roger Bacon considered divine illumination as an inspiration, and he compared the divine action in illumination to that of the active intellect. Alexander of Hales combined the theory of divine illumination with an Aristotelian theory of abstraction. John of La Rochelle also combined the two theories of knowledge, especially the notion of the active intellect and the

divine illumination. Bonaventure and Matthew of Aquasparta also modified the Augustinian theory of knowledge. The former accepted an Aristotelian account of sense knowledge and abstraction, of the existence of a possible and an active intellect, as well as the Augustinian concept of the necessity of the divine illumination for the attainment of truth. Matthew modified the Augustinian theory of sensation. On the other hand, Roger Marston and Peter Olivi followed closely Augustine’s theory of knowledge. Among modern philosophers, the Augustinian doctrine of divine illumination was particularly influential with such philosophers as Nicolas Malebranche, Antonio Rosmini-Serbati, and Vincenzo Gioberti.

RATIONES SEMINALES

The conception of the *rationes seminales* (physical powers or “seeds”) that Augustine postulated as potentially present in matter in order to explain the origin of creatures after the creation of the six days reappeared most markedly in the philosophical systems of the Augustinians of the thirteenth century.

HYLOMORPHISM AND PLURALITY OF FORMS

Hylomorphism and plurality of forms were doctrines that were developed from the thought of Augustine. The latter is said to have appeared first in Grosseteste’s metaphysics of light and his analysis of bodies as possessing a number of different forms—for instance, the forms of elements, plants, animals. The highest form possessed by any body he held to be light, which was designated as the “form of corporeity.” This notion of a plurality of forms was widely accepted by Augustinians after Grosseteste and is particularly prominent in the philosophies of Bonaventure, Raymond Lull, and John Duns Scotus. Generally it appears with its corollary universal hylomorphism, which states that all creatures are composed of matter and form. Thus angelic beings and human souls were said to be composed of a form and a spiritual matter. These doctrines enabled philosophers like Bonaventure and Duns Scotus to maintain more effectively their conception of the completeness of the substantial character of the human soul apart from the body. The Franciscan school strongly supported both doctrines. Robert Kilwardby and John Peckham in particular appealed to the plurality of forms in their vigorous opposition to the Thomistic doctrine of the oneness of man’s substantial form.

THE MEANING OF HISTORY

Augustine rejected emphatically the cyclical conception of history as expressed in the Christian revelation and the doctrines of the Incarnation and salvation. History is a part of the divine plan and providence, and reflects the presence of the divine reason. The divine dispensation of grace gives hope to humankind and makes it possible for him to attain his eternal beatitude in the City of God after his pilgrimage in the earthly city. Few medieval philosophers escaped the influence of this Augustinian conception. It is particularly noticeable in the work of Dante Alighieri and in Roger Bacon's idea of a Christian republic. It influenced such later philosophers as Campanella, Jacques Bossuet, and Gottfried Wilhelm Leibniz. And it is indirectly represented in modern secularized versions of the idea of progress and social utopias.

ETHICS OF CHARITY AND SUPERIORITY OF THE WILL

The ethics of charity and the principle of the superiority of the will over the intellect in man as formulated by Augustine were important in the development of religious thought. The former, with its correlative doctrines of grace, election, and predestination, is essentially a religious ethic. It found universal acceptance within the Franciscan school and exerted considerable influence on all medieval theology and ethics. It affected such later thinkers as Martin Luther and John Calvin. The principle of the primacy of the will is reflected in Bonaventure insistence upon the need for moral as well as intellectual illumination. Richard of Middleton held that the will is a faculty that determines itself without being determined by any other faculty. Duns Scotus asserted that the will is free, whereas the intellect is determined by that which is known. The will is the nobler of the two faculties and commands the intellect.

AUREOL, PETER

See Peter Aureol

AUSTIN, JOHN

(1790–1859)

John Austin, the most influential English legal philosopher of the analytical school, was born in London; at the age of sixteen he enlisted in the army and served five years, resigning his commission to study law. He was called to the bar in 1818. The following year he married Sarah Taylor, a woman of great intelligence and beauty, to whom many distinguished men of the age were deeply devoted.

The Austins became neighbors of Jeremy Bentham and the Millses and for twelve years remained closely associated with individuals in the Benthamite circle. The practice of law held little appeal for Austin, whose interests were primarily scholarly and theoretical; and after seven years he gave it up. In 1826, on the founding of the

University of London by the Benthamites with whom he had been closely associated for years, he was offered its chair in jurisprudence. He accepted with enthusiasm and immediately began to prepare himself by establishing his family in Bonn, where he taught himself German and studied the newly discovered *Institutes of Gaius*; the *Pandects*; and the works of Gustav Hugo, Anton Friedrich Justus Thibaut, and Friedrich Karl von Savigny. Some of the finest young minds in England—John Stuart Mill, George Cornewall Lewis, Sir John Romilly, and Sir William Erie among them—attended the first series of lectures at London. *The Province of Jurisprudence Determined*, published in 1832, is an expanded version of the first part of these lectures. Apart from this work, Austin published in his lifetime only two articles and a pamphlet attacking reform, *A Plea for the Constitution*. Austin, who once remarked, “I was born out of my time and place—I ought to have been a schoolman of the twelfth century—or a German professor,” never again reached the high point of his first year at London. Student interest declined, and the chair, which had been supported by student fees, was given up by Austin in 1832 for financial reasons. His wife tells us that this was “the real and irremediable calamity of his life—the blow from which he never recovered.” Plagued by illness and self-distrust, he served a brief and frustrating period, beginning in 1833, on the Criminal Law Commission; and later, with more satisfaction, he served as royal commissioner of Malta. During his remaining twenty years Austin spent some time on the Continent and a final period in Weybridge, not far from London, which proved to be the quietest and most contented part of his life. The second edition of the *The Province* was published in 1861, two years after his death. The first complete edition of *The Lectures on Jurisprudence or The Philosophy of Positive Law*, reconstructed from his notes by his wife, was published in 1863.

Both the nature and the results of Austin’s inquiry deserve attention. What are the characteristics of his inquiry? First, his aim was to keep rigorously separate two questions that had formerly been confused, with much practical harm resulting: What is law? And what ought the law to be? Austin wished to lay a solid foundation for answering the second question by clarifying the first. His answer to the second question was along strictly utilitarian lines. Second, his inquiry was analytical rather than empirical. He was concerned with the analysis of concepts, not, for example, with historical or sociological questions. Finally, connected with the preceding analysis, he hoped to provide a general theory of law—“General jurisprudence”—whose concepts would permit us to

grasp the essential features of any legal system without describing any particular system; this task of description was reserved for “particular jurisprudence.”

What were the results of Austin’s inquiry into the nature of law? The province of jurisprudence, the subject matter selected for study, is law “strictly so-called,” or positive law, as contrasted, for example, with divine law (related to it by analogy) or physical laws of nature (related to it by metaphor). Positive law is a rule set for subjects by a sovereign in a politically independent society. A major part of *The Province* consists of analyses of the concepts in this explanatory definition. A rule is a species of command; it is a command that obliges the performance of a class of actions. A command is an expression or intimation of a wish that another do or forbear from doing some act, coupled with the ability and intention to inflict harm in case of noncompliance. The command concept, the key to the science of jurisprudence for Austin, encompasses the concept of a sanction (the evil that will probably be incurred in case of noncompliance), the concept of superiority (the power of forcing compliance with one’s wishes), and the concept of obligation or duty (sometimes, for Austin, one is “obliged” because one fears the sanction, sometimes when one is “liable” to the sanction). A sovereign is that person or group of persons receiving habitual obedience from most members of a given society but not in turn having a like habit of obedience to a superior. An independent political society is one in which most members of the society have a habit of obedience to some person or group of persons who have no such habit of obedience to another.

Austin addressed his first class at London in these words: “Frankness is the highest compliment ... I therefore entreat you, as the greatest favour you can do me, to demand explanation and ply me with objections—turn me inside out.” Legal philosophers have paid him this compliment. His method and his results have come in for severe and often valid criticism. The inadequacies of Austin’s theory result mainly from his selecting as basic tools of analysis the concepts of a command and habitual obedience. The former cannot account for certain commonly accepted features of law. It fails, first, to explain the varied content of laws, for if we view all law as an order or command backed by threats, we neglect those many laws that do not impose duties but, rather, function in a variety of ways. It also fails to account for the range of persons to whom laws are normally applicable, for orders are addressed to others, whereas most laws bind those who have enacted them as well as those who have not. Next,

orders are deliberate datable events; only with much stretching of meaning and introduction of fictions (the sovereign commands what he permits) can they account for the legal status of customary law and the decisions of the courts. Finally, the concept of a command leads Austin to the erroneous claim that one has a legal obligation because one fears the sanction.

The peculiar deficiency of a concept that links the law to habitual obedience is that serious difficulties are encountered in accounting for either the continuity of legal authority or the persistence of law. With the concept of habitual obedience alone, we should be unable to explain the common legal phenomena of one person's succeeding another in the authority to legislate or of laws that remain obligatory long after the legislator and those who habitually obeyed him are dead. Finally, focusing on coercion as the essence of law prevented Austin from developing sufficiently the connections that law has with morality, connections that make understandable one's moral obligation to obey the law.

In addition to these criticisms, Austin has been charged with lack of originality, even in his fundamental mistakes, for identical views may be found in Thomas Hobbes and Bentham. Bryce commented, "Bentham ... drops plenty of good things as he goes along. Austin is barren." It is understandable that we should wonder at Austin's great influence, and his reputation as a great legal philosopher.

First, Austin's positivism, his insistence on separating questions of fact and value, has made legal philosophers sensitive to how easily these questions may be confused and how we may, as a result, delude ourselves into thinking we have answered one of these questions when we have, in fact, answered the other. Even more important, Austin's failures, all associated in some way with his imperativism, have been helpful. He was not alone in feeling the grip of a certain idea, the idea that law is simply the impressing of the will of the stronger upon the weaker. Austin's chief virtue was that he systematically developed, defended, and refined this idea, stripping it of excess philosophical baggage. In doing this he enabled us to focus with greater precision on those features of law that connect it with coercion. More than this, his model presses us to remark upon its limitations, the respects in which viewing law as coercion obscures its complicated role in our lives. After Austin, we understand better what there is in law that connects it with coercion and what there is in law that does not. This is his principal legacy. He provides one more instance in philosophy of our

gaining something from a false statement that we might not have gained from a true one.

AUSTIN, JOHN LANGSHAW (1911–1960)

John Langshaw Austin was White's professor of moral philosophy at Oxford from 1952 until his death in 1960. Educated at Shrewsbury School and Balliol College, Oxford, he became a fellow of All Souls College in 1933; in 1935 he moved to Magdalen College, where he taught with conspicuous success until elected to the White's chair. During World War II he served with distinction in the British Intelligence Corps; he attained the rank of lieutenant-colonel and was awarded the OBE and the Croix de Guerre, as well as being made an officer of the Legion of Merit.

In the years before the war Austin devoted a great deal of his time and energy to philosophical scholarship. He made himself an expert in the philosophy of Gottfried Wilhelm Leibniz and also did much work on Greek philosophy, especially Aristotle's ethical works. At this period his own thought, although notably acute and already dis-

tinctive in style, was largely critical and altogether lacked the positive approach that distinguished his postwar work. His one published paper belonging to this early period, "Are There *A Priori* Concepts?" very fairly represents the astringent style and outlook that gave him the reputation of being a rather terrifying person. According to Austin's own statements, it was not until the beginning of the war that he began to develop the outlook on philosophy and method of philosophizing that marked his mature work, and it is of this work alone that an account will be given.

AIMS AND METHODS

The practical exigencies of lecturing and the traditions of paper reading (especially in symposia, to which some of his important papers were contributions) prevented some of the most characteristic features of Austin's preferred methods and aims from being clearly and fully exemplified in his written work. Lecturing is essentially a solo effort, whereas Austin believed that the best way of doing philosophy was in a group, and papers, especially in symposia, are almost inevitably on topics of traditional philosophical interest, whereas Austin preferred to keep the traditional problems of philosophy in the background. We shall therefore start by giving some account of the method and aims that Austin always advocated and practiced, most notably in meetings held regularly on Saturday mornings in the Oxford term with a group of like-minded Oxford philosophers.

LANGUAGE. Austin did not present his aims and methods as the only proper ones for a philosopher; whatever one or two uncautious remarks in his British Academy lecture "Ifs and Cans" may suggest to the contrary, he did not claim more than that his procedures led to definite results and were a necessary preliminary for anyone who wished to undertake other kinds of philosophical investigation. But he certainly considered them so valuable and interesting in their results, and so suited to his own linguistically trained capabilities and tastes, that he never felt it necessary to investigate for himself what else a philosopher might usefully do. What he conceived of as the central task, the careful elucidation of the forms and concepts of ordinary language (as opposed to the language of philosophers, not to that of poets, scientists, or preachers) was, as Austin himself was well aware, not new but characteristic of countless philosophers from Socrates to G. E. Moore. Nor were the grounds for this activity especially novel. First, he claimed, it was only common prudence for anyone embarking on any kind of philosophical investigation, even one that might eventu-

ally involve the creation of a special technical vocabulary, to begin with an examination of the resources of the terminology already at one's disposal; clarification of ordinary language was thus the "begin-all," if not the "end-all," of any philosophical investigation. Second, he thought that the institution of language was in itself of sufficient interest to make it worthy of the closest study. Third, he believed that in general a clear insight into the many subtle distinctions that are enshrined in ordinary language and have survived in a lengthy struggle for existence with competing distinctions could hardly fail to be also an insight into important distinctions to be observed in the world around us—distinctions of an interest unlikely to be shared by any we might think up on our own unaided initiative in our professional armchairs.

It is not too soon to remove at this stage some common misconceptions about Austin's aims and methods. First, although he was not concerned with studying the technical terminology of philosophers, he had no objection in principle to such terms; he thought that many such technical terms had been introduced inappropriately and uncritically, as is clear from his discussion, in *Sense and Sensibilia*, of the sense-datum terminology, but he used much of the traditional technical vocabulary of philosophy and added many technical terms of his own invention—as almost any page of *How to Do Things with Words* will bear witness. Second, Austin did not think that ordinary language was sacrosanct; he certainly thought it unlikely that hopelessly muddled uses of languages would survive very long and felt that they were more likely to occur in rather specialized and infrequently used areas of our vocabulary, but there was never any suggestion that language as we found it was incapable of improvement; all he asked was that we be clear about what it is like before we try to improve it.

TECHNIQUE. We have seen that there was nothing essentially novel in Austin's philosophical aims; what was new was the skill, the rigor, and the patience with which he pursued these aims. Here we are dealing with Austin's own personal gifts, which cannot be philosophically dissected. Nor did Austin have any theory of philosophical method; what he had was a systematic way of setting to work, something on a par with a laboratory technique rather than with a scientific methodology. This technique, unlike the skill with which he followed it, was quite public and one that he was willing and eager to employ in joint investigations with others, so we can easily give an account of it.

A philosopher or, preferably, a group of philosophers using this technique begins by choosing an area of discourse in which it is interested, often one germane to some great philosophical issue. The vocabulary of this area of discourse is then collected, first by thinking of and listing all the words belonging to it that one can—not just the most discussed words or those that at first sight seem most important—then by looking up synonyms and synonyms of synonyms in dictionaries, by reading the non-philosophical literature of the field, and so on. Alongside the activity of collecting the vocabulary one notes expressions within which the vocabulary can legitimately occur and, still more important, expressions including the vocabulary that seem to be a priori plausible but that can nonetheless be recognized as unusable.

The next stage is to make up “stories” in which the legitimate words and phrases occur; in particular, one makes up stories in which it is clear that one can appropriately use one dictionary “synonym” but not another; such stories can also be found ready made in documents. In the light of these data one can then proceed to attempt to give some account of the meaning of the terms and their interrelationships that will explain the data. A particularly crucial point, which is a touchstone of success, is whether one’s account of the matter will adequately explain why we cannot say the things that we have noted as “plausible” yet that in fact we would not say. At this stage, but not earlier, it becomes profitable to examine what other philosophers and grammarians have said about the same region of discourse. Throughout (and this is why Austin so much preferred to work in a group) the test to be employed of what can and what cannot be said is a reasonable consensus among the participants that this is so. Such a consensus, Austin found, could be obtained in an open-minded group most of the time; where such agreement cannot be obtained the fact should be noted as of possible significance. Austin regarded this method as empirical and scientific, one that could lead to definitely established results, but he admitted that “like most sciences, it is an art,” and that a suitably fertile imagination was all important for success.

It was the lack of thoroughness, of sufficient research before generalization, in previous investigations of language, whether by those who called themselves grammarians or by those who called themselves philosophers, that Austin most deplored. He seriously hoped that a new science might emerge from the kind of investigations he undertook, a new kind of linguistics incorporating workers from both the existing linguistic and the philosophical fields. He pointed to other “new” sciences, such as

logic and psychology, both formerly parts of philosophy, as analogues and was indifferent about whether what he was doing “was really philosophy.”

So much must suffice as an account of the method of work that Austin advocated. It has been based on a set of notes for an informal talk, characteristically titled “Something about One Way of Possibly Doing One Part of Philosophy.” As Austin admitted in those notes, he had said most of this in his papers “A Plea for Excuses” and “Ifs and Cans,” and to all who worked with him it was familiar from his practice. Although inevitably, as we have noted, this method could not be followed in writings (it is in any case a method of discovery and not of presentation), its use underlies and can be discerned in his published work. Thus, before writing “Words and Deeds” or *How to Do Things with Words* he went right through the dictionary making a list, which still survives, of all verbs that might be classed as “performative” in his terminology. The art of telling “your story” is amusingly illustrated over and over again in his paper “Pretending” and, indeed, in all his other published writings. His insistence that it is a mistake to dwell only on a few well-examined notions in a field of discourse is illustrated by his concentration on such notions as “mistake,” “accident,” and “inadvertence” (in “A Plea for Excuses”) and on the use of “I can if I choose” (in “Ifs and Cans”), rather than on “responsibility” and “freedom,” in his papers that have a bearing on the free-will problem. Similarly, when his Saturday morning group turned its attention to aesthetics Austin betrayed far more interest in the notions of dainty and dumpy milk jugs than in that of a beautiful picture.

WORK

It is not possible to give a systematic account of Austin’s “philosophy,” for he had none. His technique lent itself rather to a set of quite independent inquiries, the conclusions of none of which could serve as premises for a further inquiry; his discussions of the language of perception (in *Sense and Sensibilia*), the concept of pretending, the notion of truth, and the terminology of excuses were all based on the study of speech in those fields and not on any general principles or theories. Nor would it serve any useful purpose to attempt to summarize his various investigations one by one, since they depend so much for their interest and force on the detailed observations about language that they contain. It will be more useful to discuss, first, what he thought of as his main constructive work—the doctrine of illocutionary forces that arose out of his earlier distinction of performative and constative utterances, contained in *How to*

Do Things with Words—and, second, the application of his technique to the criticism of some traditional theories about perception as found in his *Sense and Sensibilia*.

THEORY OF ILLOCUTIONARY FORCES. Austin's theory of illocutionary forces arose from his observation that a considerable number of utterances, even those in the indicative mood, were such that in at least some contexts it would be impossible to characterize them as being true or false. Examples are "I name this ship the Saucy Sue" (which is part of the christening of a ship, and not a statement about the christening of a ship), "I promise to meet you at two o'clock" (which is the making of a promise and not the report of a promise or a statement about what will happen), and "I guarantee these eggs to be new-laid" (which is the giving of a guarantee and not a report of a guarantee). These utterances Austin called "performative," to indicate that they are the performance of some act and not the report of its performance; he did not speak as some do who purport to discuss his views, of "performative verbs," for the verb *promise* can well occur in reports—for example, "I promised to meet him." To provide the necessary contrast, Austin coined the technical term *constative* to apply to all those utterances that are naturally called true or false; he thought that *statement* and similar words often used by philosophers roughly as he used *constative* had in ordinary use too narrow a meaning to serve the purpose.

For a time Austin appears to have been fairly satisfied with this distinction, which he gave in print in his "Other Minds" article in 1946, using it to illuminate some features of utterances beginning "I know...." But although the distinction is clearly useful at a certain level, Austin began to doubt whether it was ultimately satisfactory. He found it impossible to give satisfactory criteria for distinguishing the performative from other utterances. The first person of the present indicative, which occurs in the three examples given above, is clearly not a necessary feature; "Passengers are warned to cross the tracks only by the bridge" is an act of warning as much as "I warn you to cross...." Further, in a suitable context "Don't cross the tracks except by the bridge" may also be an act of warning (as in another context it might be an act of commanding); this makes it necessary to distinguish the primitive performative from the explicit performative, the latter, but not the former, making clear what act was being performed in its formulation.

Still more important, the constative seemed to collapse into the performative. Let us consider the four utterances "I warn you that a train is coming," "I guess

that a train is coming," "I state that a train is coming," and "A train is coming." The first of these is an act of warning, the second is surely one of guessing, the third apparently one of stating, while the fourth may be any of these as determined by context. Thus, the various forms of constatives—stating, reporting, asserting, and the rest—seem to be merely a subgroup of performatives. It might seem that still one crucial difference remains, that while performative utterances may be in various ways unhappy (I may say "I promise to give you my watch" when I have not got a watch, or am speaking to an animal, or have no intention of handing the watch over), the characteristic and distinctive happiness or unhappiness of constatives is truth and falsehood, to which the other performatives are not liable.

In a brilliant, if not always immediately convincing, discussion (Lecture XI of *How to Do Things with Words*) Austin tried to break down even this distinction. First, we cannot contrast doing with saying, since (in addition to the trivial point that in stating one is performing the act of uttering words or the like) in constative utterances one is stating, describing, affirming, etc., and these acts are on a par with warning, promising, and so on. Second, all constatives are liable to all those kinds of infelicity that have been taken to be characteristic of performatives. Just as I should not promise to do something if I do not intend to do it, so I should not state that something is the case unless I believe it to be so; just as my act of selling an object is null and void if I do not possess it, so my act of stating that the king of France is bald is null and void if there is no king of France; just as I cannot order you to do something unless I am in a position to do so, so I cannot state what I am not in a position to state (I cannot *state*, though I can hazard a guess about, what you will do next year). Further, even if we grant that "true" and "false" are assessments specific to constatives, is not their truth and falsity closely parallel to the rightness and wrongness of estimates, the correctness and incorrectness of findings, and so on? Is the rightness of a verdict very different from the truth of a statement? Further, to speak of inferring *validly*, arguing *soundly*, or judging *fairly*, is to make an assessment belonging to the same class as truth and falsehood. Moreover, it is only a legend that "true" and "false" can always be appropriately predicated of constatives; "France is hexagonal" is a rough description of France, not a true or false one, and "Lord Raglan won the battle of Alma" (since Alma was a soldiers' battle in which Lord Raglan's orders were not properly transmitted) is exaggerated—it is pointless to ask whether it is true or false. It was on the basis of such considerations as these that

Austin felt himself obliged to abandon the distinction between the performative and the constative.

To replace the unsatisfactory distinction of performatives and constatives Austin introduced the theory of illocutionary forces. Whenever someone says anything he performs a number of distinguishable acts, for example, the *phonetic* act of making certain noises and the *phatic* act of uttering words in conformity with grammar. Austin went on to distinguish three other kinds of acts that we may perform when we say something: First, the *locutionary* act of using an utterance with a more or less definite sense and reference, for example, saying “The door is open” as an English sentence with reference to a particular door; second, the *illocutionary* act, which is the act I may perform in performing the locutionary act; third, the *perlocutionary* act, which is the act I may succeed in performing by means of my illocutionary act. Thus, in performing the locutionary act of saying that a door is open I may be performing an illocutionary act of stating, or hinting, or exclaiming; by performing the illocutionary act of hinting I may succeed in performing the perlocutionary act of getting you to shut it. In the same way, by performing the locutionary act of saying “Down with the monarchy” I may succeed in the perlocutionary act of bringing about a revolution, whereas in performing the locutionary act I would be inciting to revolution (successfully or unsuccessfully).

We now see that the constatives, along with performatives, can be construed as members of one particular subclass of illocutionary forces. Thus, in his provisional classification of illocutionary forces Austin had a subclass of *expositives*, which included the “constative” acts. In performing a locutionary act we may be affirming, denying, stating, describing, reporting, agreeing, testifying, rejoining, etc., but in performing a locutionary act we may also perform an act with *commissive* force, as when we promise, bet, vow, adopt, or consent; with *verdictive* force, as when we acquit, assess, or diagnose; with *exercitive* force, as when we appoint, demote, sentence, or veto; or with *habitative* force, as when we apologize, thank, or curse.

Such is the crude outline of Austin’s theory of illocutionary forces. Though his own exposition is of course much more full and rewarding, he said of it (*How to Do Things with Words*, p. 163): “I have purposely not embroiled the general theory with philosophical problems (some of which are complex enough almost to merit their celebrity); this should not be taken to mean that I am unaware of them.” We may be permitted to illustrate the philosophical importance of bearing in mind the dis-

tinctions Austin made with one example of our own. Very often in recent years philosophers have set out to explain the meaning of the word *good* or of sentences containing the word *good*. Some of them have done so by saying that in such sentences the speaker expresses his own feelings (attitudes) and evokes similar feelings (attitudes in others). It might well seem that here they have set out to give an account relevant to locutionary force and that they have instead given one possible illocutionary force (“In saying that it was good I was expressing my favorable attitude toward it”) and, alongside it, one possible perlocutionary force (“By saying that it was good I evoked in him a favorable attitude”). It should be clear in the light of Austin’s work that such an account will not do. But Austin said very little about locutionary force in detail, and one of the most pressing general questions that arise from his work is that of the relationship between illocutionary force and locutionary force; while recognizing that they are different, and that locutionary force is in some way prior, can we, for example, conclude that the locutionary force of utterances containing the word *promise* can be explained without reference to the typical illocutionary force of “I promise”? This is far from clear.

CRITICISM OF TRADITIONAL PHILOSOPHY. We have examined in outline an example of Austin’s work on a piece of clarification of language without any reference, save incidental, to the traditional problems of philosophy. We shall now turn to *Sense and Sensibilia*, which is emphatically a polemical discussion of one of the central problems of epistemology. But we shall find the essential features of Austin’s method still present, the presentation only being different. Austin had recommended that when the method is used as one of inquiry the vocabulary and phrases, natural and odd, that occur to us should be studied and conclusions drawn *before* the conclusions of traditional philosophy are compared with them. Here, however, when he presents results he at each stage presents first the traditional philosophical theses and then shows their errors by confronting them with the actual facts, linguistic and otherwise.

In *Sense and Sensibilia*, Austin examines the doctrine that we never directly perceive material things but only sense data (or ideas, or sense contents, etc.), insofar as that doctrine is based upon the so-called argument from illusion. He maintains that it is largely based on an obsession with a few words “the uses of which are oversimplified, not really understood or carefully studied or correctly described” (*Sense and Sensibilia*, p. 3). With special reference to A. J. Ayer and Price, he shows how illusions are traditionally confused with delusions, are

defined in terms of belief that one sees a material thing when in fact one does not (whereas some illusions, such as one hatched line appearing to be longer than another of equal length, involve nothing of the sort), and are taken to include such phenomena as sticks looking bent in water, which are not illusions at all. A portion of the argument that clearly exhibits his method at work is where he contrasts the actual complexities and differences in our use of “looks,” “appears,” and “seems” with the traditional confusion of these terms in traditional philosophy. Especially interesting is the discussion of the traditional accounts of “reality”; these he contrasts with the multifarious uses of the word *real*, which takes its significance only from the implied contrast in context with *artificial*, *fake*, *bogus*, *toy*, *synthetic*, and so on, as well as with *illusory* and *apparent*.

But it is perhaps more important now for us to notice another element in the argument that is very characteristic but that we have as yet given little notice, which is Austin’s care to avoid oversimplification and hasty generalization of nonlinguistic, as well as linguistic, fact. The ordinary man does not, as is so often stated or implied in accounts of the argument from illusion, believe that he always sees material things; he knows perfectly well that he sees shadows, mirror images, rainbows, and the like. The number of kinds of things that we see is large and to be settled by scientific investigation, not by philosophy; the question whether the invariable object of perception is a material thing or a sense datum is thus absurd. Again, it is not true that a straight stick in water normally looks like a bent stick out of water, for we can see the water; an afterimage does not look like a colored patch on a wall; a dream is distinguished by the dreamlike quality that occasionally, but only occasionally, we attribute to some waking experience. Again, he points out that situations in which our perception is queer may arise because of defects in sense organs or peculiarities of the medium or because we put a wrong construction on what we (quite normally) see, and it is a mistake to attempt to give a single account of all perceptual error. None of these are linguistic points, and Austin had no purist, theoretical notion that he was prohibited as a philosopher from any attention to nonconceptual issues; he thought that philosophical error did arise from empirical error.

Once again, it would be pointless to attempt to reconstruct the whole argument of *Sense and Sensibilia* here; we must be content with noticing the few points made that perhaps have some bearing on a general understanding of his general position. But it should perhaps be stressed that Austin in these lectures discussed

only one theory of perception as based on one particular kind of argument; although one may expect to get help from it in study of other problems in the field of perception, it would be a mistake to suppose that the book contains a full study of all problems of perception or to criticize it because it leaves many difficult problems unanswered.

It is hardly imaginable that anyone would ever deny that Austin displayed a very great talent in the kind of work he chose to do. Some have criticized him on the ground that there are more important things for philosophers to do than this; on that point Austin always refused to argue, simply saying that those who preferred to work otherwise should do so and asking only that they not do what he did in the traditional slipshod way. To those who said that philosophers should work with an improved scientific language he replied flatly that the distinctions of ordinary language were of interest in their own right and that one should not modify what one does not fully understand, but he offered no theoretical objections to such projects. He was content to work in a way which he felt he understood and found rewarding. As for the assertion sometimes made, that Austin’s kind of work is private to his own peculiar gifts and that it was therefore a mistake for him to recommend the method to others, time alone can decide.

A final word should be said about Austin’s relation to other philosophers. He greatly admired G. E. Moore, but it is a mistake to view his work as an offshoot of Cambridge philosophy. Moore, like Austin and unlike most Cambridge philosophers, had a linguistic and classical background rather than a scientific one. Austin owed no special debt to Bertrand Russell and was far more unlike Wittgenstein than is sometimes recognized. For Ludwig Wittgenstein an understanding of ordinary language was important because he believed that the traditional problems of philosophy arose from misunderstandings of it, but Wittgenstein had in mind gross category mistakes, and he wished to study ordinary language only so far as was essential for eliminating these. Austin was interested in fine distinctions for their own sake and saw the application of his results to the traditional problems of philosophy as only a by-product. He was uninterested in the party conflicts of philosophy, following always his individual bent.

AUTHENTICITY REGARDING THE ARTIST AND THE ARTWORK

See *Art, Authenticity in*

AUTHORITY

Three topics have dominated philosophical discussion of authority: the *nature* of authority, the *point* of authority, and the *sources* of authority.

THE NATURE OF AUTHORITY

In providing an account of the nature of authority, the focus in this entry will be on de jure practical authority, though the differences between de facto and de jure authority and between theoretical and practical authority will also be briefly considered at the end of this section.

What is authority? Authority is a relational matter: A has authority over B with respect to some domain D. What follows is first a consideration of items A, B, and D that enter into this relationship, and then of the nature of the relationship among them.

With respect to A: while A need not be a person, it must be something that can have a say-so—that is, it must be the sort of thing about which one can truly assert “A says that B must ϕ .” So, A can be a natural person, or a corporate person, or an institution, or a text. With respect to B: while B need not be a natural person, B must be the sort of thing that exhibits agency. B must, that is, be able to act on reasons: B must be capable of ϕ -ing because B has good reason to ϕ . In a relationship of practical authority, then, the authority-bearer must be a speaker, and the person under authority must be an agent.

With respect to D: Authority relationships are characteristically limited to a specific context and are characteristically limited by certain constraints within that context. An employer may have authority over an employee with respect to job-related matters, but may have no authority at all outside that context. And, further, it is not as if an employer has unlimited authority over an employee within the domain of job-related matters: if the employer told the employee to work until the employee dies of exhaustion, one would not take that to be within the range of the employer's authority. With each purported authority relationship there is assumed a domain for that authority, even though that domain is often poorly defined.

What, then, is the relationship between speaker A and agent B that makes for practical authority within a given domain D? Surely it is at least that the speaker has some control over the agent's reasons for action, and control of a specific kind: A's say-so makes a difference to the reasons that the agent B has by giving B a good reason to act a certain way. This good reason is, either in whole or in part, A's say-so—A's say-so produces a reason for

action for B not merely causally but constitutively. So if A has authority over B, then A's telling B to ϕ is itself a reason for B to ϕ . If, for example, parents have authority over their children with respect to household chores, then a parent's telling the child to clean his or her room is itself a reason for the child to clean the room. By telling the child to clean the room, the parent has added to the child's reasons to clean the room; aside from the fact that the current condition of the room may be aesthetically displeasing—and even a health risk to the child—one reason for the child to clean the room is that the parent told him or her to do so.

In *de jure* practical authority a speaker has constitutive control over an agent's reasons for action. But it is not enough for authority simply that the speaker's say-so constitutes a reason for action for the agent; the speaker's say-so must constitute a particular kind of reason. Reasons of authority play a certain role in the proper decision making of the agent under authority: where there is practical authority, and in the domain in which that authority is effective, the authority's say-so is decisive with respect to the agent's rational action. Authoritative dictates have the function of bringing deliberation to a close by fixing the action selected by the authoritative dictate as the reasonable choice to make.

One prominent way of expressing this idea has been offered by Joseph Raz, whose work has been the most important in explicating the nature and justification of authority. Raz says that the way that authoritative norms fulfill this function is by providing what he calls "protected reasons" (Raz 1979, p. 29). A protected reason to ϕ is both a reason to ϕ and a reason to disregard reasons not to ϕ . Raz claims that the way that authoritative norms fulfill their function of decisively terminating deliberation is not by providing enormously weighty reasons, reasons that compete with and always best any reasons that militate in favor of rival options; rather, authoritative dictates fulfill their function by giving reasons that insulate a course of action from competition. When an authority tells one to ϕ , that is a reason not only to ϕ but also to disregard in deliberation courses of action that preclude ϕ -ing. One might dispute Raz's claim that authoritative norms are always protected reasons, but the more fundamental point is that where there is authority, there is a speaker whose say-so the agent has reason to treat as setting the rationally preferable course of action within some domain.

In sum: if A is a genuine practical authority over B in some domain, then in that domain A's telling B to ϕ is a decisive reason for B to ϕ . Whereas in *practical* authority,

speakers have authority over what agents do, in *theoretical* authority, speakers have authority over what agents believe. There are, nonetheless, striking similarities between genuine practical authority and genuine theoretical authority. If A has theoretical authority over B in some domain, then A must be a speaker and B must be one who can believe things for reasons; and if A tells B that it is the case that p, then A's telling B that it is the case that p is a reason to B to believe that p, a reason that is decisive from B's point of view. If an accomplished chef tells a novice that this is not the best way to make a roux, then the novice has decisive reason to believe that this is not the best way to make a roux. Practical authority, being concerned with reasons for action, is an object of investigation within the province of moral philosophy (and political and legal philosophy as well); theoretical authority, being concerned with reasons for belief, is an object of investigation within the province of epistemology.

One can also distinguish between *de facto* and *de jure* authority. People often ascribe authority (practical and theoretical) to speakers even without holding that their assertions or commands are reasons for believing or doing anything. Authority is sometimes used as a term of classification and explanation in both the social sciences and in everyday talk without any attempt to evaluate the claims of these putative authorities to give reasons for action. Authority in this sense is *de facto*, as opposed to *de jure*, authority. But there is nevertheless a tight connection between them: no speaker can be correctly described as a *de facto* authority without that speaker's either claiming to be or being widely regarded as a *de jure* authority.

Here is why. Suppose that one wants to argue that A is a *de facto* authority over some group simply because as a matter of observable behavior, if A tells members of that group to ϕ , then members of that group, by and large, ϕ . But that would surely be an insufficient basis for ascribing *de facto* authority; if it were a mere accident that the behavior of the group fell in line with the commands issued by A, one would not say that A bears *de facto* authority. One might try to complete the case for *de facto* authority by adding a causal condition: that it is A's commanding the members of that group to ϕ that results in those members' ϕ -ing. But this addition would be insufficient; if it were simply a quirky feature of the individual psychologies of the group's members that believing that A told them to ϕ caused them to ϕ , then one would ascribe a nervous disorder to the group members rather than *de facto* authority to A. The moral here is that if one wants to appeal to agents' responses to a speaker to establish

that the speaker is a *de facto* authority, one will have to argue that those agents act in accordance with A's say-so because they take A's say-so to be a reason for them to comply—that is, because they believe A to be a *de jure* authority.

One can make a similar argument from the side of the speaker: it is not sufficient to treat a speaker as a *de facto* authority that the speaker can (for example) have people locked up if they fail to obey. What makes the difference between effective kidnappers and *de facto* state authorities is, *inter alia*, that only the latter claim that their commands are binding standards, the violation of which justify locking people up—that is, that they are *de jure* practical authorities. Although there is no doubt a difference between *de jure* and *de facto* practical authority, *de facto* practical authority must be understood in terms of *de jure* practical authority.

The remainder of the entry will focus on genuine, *de jure* practical authority. Under what circumstances is it desirable for authority relationships of this sort to exist? And how are such authority relationships to be explained?

THE POINT OF AUTHORITY

What is the point of authority? Is there anything of value realized through such relationships?

Raz has written that the normal way of justifying authority is to show that those subject to it act better on their other reasons for action under authority than they would in the absence of authority. He calls this the “normal justification thesis.” Practical authority provides a service—that is, the service of enabling persons to act more reasonably (Raz 1986).

There are several distinct contexts in which practical authority might provide this service. Practical authority might enable one to act more in accordance with what reason—prior to and apart from any authoritative imposition—determinately requires. It may be that a certain regimen of drug treatment is necessary for a person to regain her health. This is just a fact about the world, and given the value of this person's health, it would be unreasonable for her not to follow that regimen. But even if it is perfectly clear to her that this is the regimen to follow—because her doctor prescribes it, and her doctor's views are in line with the consensus of the medical community—she may fail to be motivated adequately by the doctor's theoretical authority alone. She might do better in acting in accordance with what reason requires if she had further reason to go along with the doctor's prescrip-

tion—perhaps by placing herself under the doctor's authority. Some people do this sort of thing with personal trainers (or career mentors, or spiritual directors): they treat the trainer's (or mentor's or director's) prescriptions not as pieces of advice but as authoritative dictates, and they better reach their health- (or career-, or sanctification-) related goals by having trainers (or mentors or directors) that are not merely dispensers of advice but practical authorities.

Another context in which practical authorities can help persons to act on their other reasons for action is that in which their reasons for action require actions that are, to a significant degree, vague or otherwise indeterminate. The most pressing of such cases are those in which persons need to act in a coordinated way. The standard example is the rule of the road: While there is strong reason for persons to drive on the same side of the road, it is indeterminate which side they should drive on. Although a solution may be reached through trial and error, it would be helpful if there were a party that could set the rule of the road in a clear and determinate way prior to the disasters that can occur on the way to a convention established by trial and error.

There are several ways in which such indeterminacy presents itself. In some cases, there are a number of instrumental means to a single well-defined goal—for example, keeping people from driving into each other—and practical authority's job is to select one such means as a common plan of action. In some cases, there are a number of ways to fill in a vague rule. For example: one should not drive an automobile if one is intoxicated. But: What counts as “intoxicated”? Is it to be fixed by actual level of impairment? By blood alcohol level? And, in either case, at what levels? This is a matter that can be resolved by authoritative imposition: a practical authority can set what counts as intoxication, thus helping persons act in a coordinated way both with respect to their driving behavior and with respect to the claims that they make on one another with respect to their driving behavior. For the rule about drunk driving matters not only when one is deciding whether to drive; it is also important both in deciding whether to make claims on another for the damages that the other has done while driving with alcohol in his or her system and in deciding whether to accept claims made on one by others for damages that one has done while driving with alcohol in one's system.

Raz's normal justification thesis brings out the points that practical authority calls for justification (and thus can fail with respect to this call) and that the usual way that practical authority is justified is by showing that

our other reasons are better served by adding reasons of authority into the mix. Whereas this may indeed be the normal way of establishing the point of authority, it is not the only way. Here is another: Practical authority is not just an ability to change others' reasons for action, it is also a (typically) positive status. Because practical authority is a (typically) positive status, placing someone in a position of practical authority can be a way to honor that person, or a way to give that person what he or she deserves. So one justification for practical authority might make reference not to the ways in which those subject to authority are served by it but by reference to the way that the bearer of authority is appropriately honored or rewarded by it. There may, for example, be in some group no particularly pressing reason to institute structures of authority for decision making, but in light of the need to honor a person who has made great contributions to that group's aims, it would make sense to confer authority on that person.

There are also more tedious reasons for being in an authority relationship. Employers often have limited authority over their employees, and employees enter those authority relationships by contract. From the employer's point of view, the salient reason for the authority relationship is to bind the employee to performance of duties; from the employee's point of view, the salient reason for the authority relationship is that, unless he or she is willing to enter it, he or she will have no job, and no paycheck. This is a far cry from authority's helping an agent to act on his or her preexisting reasons or from authority's being conferred on someone in order to do him or her honor, but it cannot be denied that a number of more-or-less limited authority relationships in which people find themselves are justified in this way.

It is important to note, though, that practical authority has its drawbacks. Recall that what distinguishes the reasons of practical authority is their decisive role in deliberation. If reasons of authority are absent, then something else will have to fill the role that brings deliberation to its conclusion in these cases—often, the agent's own free, rationally underdetermined decision. If one takes the making of free, underdetermined decisions to be a good, then there is something lost by persons who are under practical authority (see Wolff 1970). So it is not as if practical authority is costless. And, furthermore, it should be noted that there may be bad psychological tendencies associated with certain sorts of otherwise worthwhile authority relationships, at least in certain classes of people. Even if practical authority is, properly circumscribed, necessary and valuable, there may be broad types

of person who tend to act worse when placed either in such positions of authority or under such authority (see Milgram 1974).

THE SOURCES OF AUTHORITY

Suppose that person X claims to have practical authority over person Y, and Y is rightly curious about the correctness of this claim. When Y challenges X, X's response is: "You are under my authority because I am I, and you are you. You are under my authority because I am X, and you are not." X's case is poor; not only is it unconvincing, but it borders on incoherent. It borders on incoherence because authority relationships are normative matters, and whether a normative fact obtains depends not on irreducibly particular facts but on general ones. So just as claims about one's duties and rights are correct not in virtue of the particular identity of the person to whom those duties and rights are ascribed but in virtue of the general properties instantiated by that person, claims about who holds authority depend on the general properties instantiated by that person. It might fundamentally matter with respect to the presence of authority whether one is a parent, or is morally good, or is powerful, or has a loud voice; it cannot fundamentally matter whether one is Bill Clinton, Bob Dylan, or Bozo the Clown.

How, then, does it come to be the case that one individual is a practical authority over another individual, given that it is not simply as that individual that one is an authority bearer or a person under authority? There are two ways to try to answer this question. The first is to begin with general practical principles, and to show that in certain circumstances those practical principles imply that one party has authority over another. It is crucial that one select a practical principle that stands a chance of generating the crucial features of authority, that is, that at least under some possible set of circumstances it implies that one party's say-so is in some domain a decisive reason for action for another party.

Here is one principle that has been invoked in a number of contexts to explain practical authority: the principle of promising. The principle of promising, stated loosely, is that if one promises to perform an act of ϕ -ing, then one is morally bound to ϕ . One's valid promise is, in standard cases, a reason for the promisor to perform the action promised, and it is a reason of a certain kind: that one validly promised to perform an action is characteristically decisive, again, at least in standard cases. But one can promise to act in accordance with another party's commands: one can promise to obey the personal trainer's commands with respect to one's exercise regi-

men, or to follow the policies of one's immediate superior in the performance of job duties, or to do the bidding of the king. If one has validly promised to act on another person's commands in some domain, then it seems that there is good reason to suppose that authority has been generated.

This way of accounting for practical authority can be called the "top-down" approach. It begins with practical principles of broader application and proceeds to show that in some circumstances the application of that general principle yields a relationship that bears all of the defining conditions of genuine authority. A rival approach, the "bottom-up" approach, takes authority relationships as basic, not to be explained as implications of other practical principles. The guiding idea of this way of proceeding is that relationships of practical authority are no less familiar than—and perhaps may be more familiar than—the general practical principles that users of the top-down approach have employed. The task for the user of the bottom-up approach is simply to describe the general features of the various relationships of genuine practical authority with which we are familiar, and so far as possible to exhibit the unity among them (either the precise features they share, or analogies between them). So, the bottom-up theorist might note (for example) that people commonsensically accept that parents have authority over children, and thus take his or her task to be to define more precisely what counts as the parent/child relationship in which authority exists (is it biological? social? legal? some combination of these?) and what defines the scope of the parent's practical authority (is it over all domestic matters? does it extend beyond that? does the size of its domain remain constant, or not?). He or she may wish to answer similar questions about the authority of the state and of God, and to draw the appropriate connections and disanalogies between these cases of authority.

There are potential drawbacks to both of these approaches. The bottom-up approach seems to be extremely deferential to *de facto* authorities, offering them the presumption of *de jure* status. As such, employment of the bottom-up approach is unable to ease the suspicions of the authority skeptic, who is concerned either in particular cases or in a more global way about the existence of *de jure* practical authority. The top-down approach, by contrast, runs the real risk of failing to hook up with *de facto* authority relationships in any straightforward way. If there is a clear lesson to be drawn from the history of uses of the top-down approach in investigating questions of practical authority—most attention

has been paid to parental, political, and divine authority—it is that it is extraordinarily difficult to generate plausible accounts of the *de jure* authority of common social institutions from standard applications of widely held general practical principles.

PARENTAL AUTHORITY It is commonly thought, especially among parents, that parents are practical authorities over their children. But employing the top-down approach to explain parents' status as authorities over their children has proven to be a difficult undertaking.

A preliminary difficulty for this undertaking is specifying the window in which this authority is supposed to obtain: at what age does a parent's authority over children begin (babies are not under authority, as they cannot yet act for reasons), and at what age does it cease? Suppose, though, that the time frame in which parents are to be authoritative over children is settled; how is one to explain why parents are authoritative during this stretch of time? A child's requirement of obedience to his or her parents cannot be a matter of voluntary undertaking, as Hobbes erroneously (and even inconsistently with his own view) supposed it to be (Hobbes 1651, ch. 20). So no principles of moral obligation founded on consent or voluntary acceptance of benefits will do. One might appeal to the requirements of gratitude, but this suggestion is rife with difficulties: Why does gratitude, which typically does not require obedience, generate such a requirement in this case? If it is a parent's duty to care for children, why is gratitude owed as a consequence of a mere doing of one's duty? Isn't gratitude characteristically conditioned on free acceptance of benefits, whereas children are typically not free to refuse such benefits from their parents or to seek the benefits elsewhere?

Locke argues, plausibly, that a parent's authority over children is due to the child's deficiencies in reason and choice, and it is only so long as those deficiencies remain that the parent has authority, for it is as a help to remedying those deficiencies that the parent has authority (Locke 1690, §55). These claims seem to be true, but this argument concerns the point, or value, of parental authority, not the explanation of how parents come to be authoritative over children. These are distinct questions. Even those who grant the value of parental authority can find its existence and explanation mysterious indeed. Little progress has been made in providing a top-down account of the authority of parents over their children.

POLITICAL AUTHORITY Political authority—its desirability, its scope, and its explanation—is one of the few

truly perennial problems of political philosophy. The most familiar explanation for political authority is the consent account. On this view, most fully elaborated during the early modern period, citizens characteristically make an agreement, either explicitly or tacitly (Hobbes 1651, ch. 18; Locke 1690, §119; Rousseau 1762, bk. 4, ch. 2), to obey their rulers. It is in virtue of this original agreement that subjects are duty-bound to obey their political authorities. Whereas this view has been tremendously popular, it is subject to overwhelming objections, which are catalogued in David Hume's influential "Of the Original Contract" (1753). Hume convincingly argues that there is little evidence that explicit agreements have generally taken place, and that the tacit agreements that consent theorists find themselves forced to posit to explain state authority are in fact no more than a myth.

Hume's recommended account of political authority is a utilitarian one—that is, that it is simply in virtue of the public benefit brought about by having a political authority in place that the *de jure* authority of the state is established. As Hume puts it, public authority is necessary for the public good, and public authority cannot be sustained unless subjects pay "exact obedience" to their rulers. But this is unpersuasive: states maintain *de facto* authority in the face of quite a bit of disobedience, and so Hume has not explained why the need for *de facto* authority yields the conclusion that states have *de jure* authority over their subjects.

During the latter half of the twentieth century there was a revival of attempts to provide an account of state authority. Some were attempts to retrieve the old consent view, offering new accounts of the tacit consent that was necessary to bind that vast majority of persons who never explicitly consent. Some were attempts to revive Hume's utilitarian-style argument. H. L. A. Hart (1955) and John Rawls (1964) offered arguments from fairness, holding that the authority of law is based on the fact that those who accept the benefits of legally ordered cooperation would be unfairly free riding on the efforts of others were they not to obey as well. Others appealed to an argument that appears as early as Plato's *Crito*—the idea that citizens owe a debt of gratitude to their political authorities for the goods that they receive through them, and this debt is to be repaid through obedience.

Despite the ingenuity of writers attempting to provide top-down accounts of political authority, the most important writers on political authority at the end of the twentieth century were "philosophical anarchists"—they held, that is, that none of these attempts to account for genuine, *de jure* political authority is successful, and thus

people have reason to reject the view that modern states are genuinely authoritative. Some of these writers, such as Robert Paul Wolff (1970), hold that this is a necessary truth: there cannot be a genuinely authoritative state. But most of them—most prominently, A. John Simmons (1979), Joseph Raz (1979), and Leslie Green (1990)—argue simply that under current political conditions no state holds the wide-ranging authority that it claims for itself.

DIVINE AUTHORITY Recent scholarship employing the top-down approach has had difficulty exhibiting the sources of authority of the two likeliest bearers of wide-ranging authority: parents and political institutions. One might think that even if such human institutions were bound to fall short in this respect, surely divine authority would be an easier matter. After all, whereas God's existence remains a philosophically controverted matter, it is widely accepted by both theists and nontheists that if there is such a being as God then that being is practically authoritative over human beings.

It turns out that accounting for divine authority using a top-down approach raises difficulties that are just as pressing as the difficulties that attend accounting for parental or political authority in the top-down way. One might think that being a practical authority is a logical consequence of traditional divine attributes, such as omniscience, omnipotence, or perfect moral goodness, but this is wrong: omniscience and perfect moral goodness give us reasons only to think of God as a theoretical authority, not a practical authority; and whereas omnipotence of course enables God to control the circumstances in which our reasons for action have application, it does not of itself entail that God's commands constitute reasons for action for humans. One might think that traditional moral principles concerning gratitude for benefits or property in what one has created would yield a moral obligation to obey God, but it turns out that there are severe difficulties in demonstrating that the conditions of application for these principles generate such an obligation of obedience (Murphy 2002). The top-down approach has fared no better in the case of divine authority than in the cases of parental and political authority.

It is unclear what moral should be drawn from the failure of top-down philosophical investigation to generate plausible accounts of parental, political, and divine authority. On the one hand, one might take it simply to be an indication that, given the nature of authority, it is bound to be hard to show that one party has genuine authority over another in nonstylized contexts—that is,

contexts that are not created for the purpose of generating authority relationships (e.g., employer-employee contracts). On the other hand, one might take it to be a *reductio ad absurdum* of reliance on the top-down approach. One might claim that among people's sturdiest considered moral judgments are the judgments that these authority relationships are genuine. To the extent that distinct general moral principles fail to illuminate the authority present there, this failure gives people reason not to jettison the view that these authority relationships are genuine but only to insist on a bottom-up approach, taking practical authority as a basic feature of the moral world.

Bibliography

For considerations of the nature and justification of authority, see Joseph Raz, *The Authority of Law* (Oxford, U.K.: Oxford University Press, 1979) and *The Morality of Freedom* (Oxford, U.K.: Oxford University Press, 1986). Several important discussions are collected in *Authority*, edited by Joseph Raz (Oxford, U.K.: Blackwell, 1990). For philosophical skepticism concerning the possibility of *de jure* authority, see Robert Paul Wolff, *In Defense of Anarchism* (New York: Harper & Row, 1970). For some discussion of the deleterious effects of submission to authority, see Stanley Milgram, *Obedience to Authority: An Experimental View* (New York: Harper & Row, 1974). There is a vast literature on the sources of *de jure* authority, almost all of it focused on political authority. The classic contract account may be found in Hobbes, *Leviathan*, edited by Edwin Curley (Indianapolis, IN: Hackett, 1994; first published 1651), John Locke, *Second Treatise of Government* (1690), reprinted in *Two Treatises of Government*, edited by Peter Laslett (Cambridge, U.K.; Cambridge University Press, 1988), and Jean-Jacques Rousseau, *On the Social Contract*, in *The Basic Political Writings*, translated by Donald Cress (Indianapolis, IN: Hackett, 1987; first published 1762). David Hume's skeptical treatment of contract views may be found in his "Of the Original Contract" (1753), reprinted in *Political Essays*, and edited by Knud Haakonssen (Cambridge, U.K.: Cambridge University Press, 1994). Accounts justifying political authority in terms of fair distribution of the benefits and burdens of rule following are to be found in H. L. A. Hart, "Are There Any Natural Rights?" (*Philosophical Review* 64 (1955): 175–191), and John Rawls, "Legal Obligation and the Duty of Fair Play," in *Law and Philosophy*, edited by Sidney Hook (New York: New York University Press, 1964). A gratitude view is suggested in Plato's *Crito*, in *The Trial and Death of Socrates*, translated by G. M. A. Grube (Indianapolis, IN: Hackett, 1975). Recent accounts skeptical of all extant theories of political authority may be found in A. John Simmons, *Moral Principles and Political Obligations* (Princeton, NJ: Princeton University Press, 1979), Raz's *The Authority of Law* and Leslie Green, *The Authority of the State* (Oxford, U.K.: Oxford University

Press, 1990). There has been less recent work on parental and divine authority. For a discussion of parental authority, see Michael Slote, "Obedience and Illusions," in *Having Children*, edited by Onora O'Neill and William Ruddick (New York: Oxford University Press, 1979); for a discussion of divine authority, see Mark C. Murphy, *An Essay on Divine Authority* (Ithaca, NY: Cornell University Press, 2002).

AVENARIUS, RICHARD

(1843–1896)

Richard Avenarius, the German positivist philosopher, was born in Paris. He studied at the University of Leipzig, where he became a *Privatdozent* in philosophy in 1876. The following year he was appointed professor of philosophy at Zürich, where he taught until his death. His most influential work was the two-volume *Kritik der reinen Erfahrung* (1888–1890), which won him such followers as Joseph Petzoldt and such opponents as Vladimir Il'ich Lenin.

Avenarius was the founder of empiriocriticism, an epistemological theory according to which the task of philosophy is to develop a "natural concept of the world" based on "pure experience." To obtain such a coherent, consistent view of the world requires a positivistic restriction to that which is directly given by pure perception, together with the elimination of all metaphysical ingredients which man, through introjection, imports into experience in the act of knowing.

There is a close kinship between the ideas of Avenarius and those of Ernst Mach, especially as set forth in Mach's *Analyse der Empfindungen*. The two men never became personally acquainted, and they developed their points of view quite independently of one another; hence, it was only gradually that they became convinced of the profound agreement of their basic conceptions. They held the same fundamental view on the relationship between physical and mental phenomena, as well as on the significance of the principle of the "economy of thought." Above all, both were persuaded that pure experience must be recognized as the sole admissible—and thoroughly adequate—source of knowledge. Thus, the elimination of introjection by Avenarius is only a special

form of that total elimination of the metaphysical which Mach sought.

In addition to Petzoldt and Lenin, others who dealt at length with the philosophy of Avenarius were Wilhelm Schuppe and Wilhelm Wundt. While Schuppe, the philosopher of immanence, agreed with Avenarius on essential points, Wundt criticized the scholastic character of Avenarius's expositions and sought to point out internal contradictions in his doctrines.

COGNITION

The two presuppositions of empiriocriticism are the empiriocritical axiom of the contents of cognition and the axiom of the forms of cognition. The first axiom states that the cognitive contents of all philosophical views of the world are merely modifications of the original assumption that every human being initially assumes himself to be confronted with an environment and with other human beings who make assertions and are dependent on the environment. The second axiom holds that scientific knowledge does not possess any forms and means essentially different from those of prescientific knowledge and that all the forms and means of knowledge in the special sciences are extensions of the prescientific (*Kritik der reinen Erfahrung*, Vol. I, Preface).

Especially characteristic of Avenarius' theory of human cognition was his biological approach. From this biological point of view, every process of knowledge is to be interpreted as a vital function, and only as such can it be understood. Avenarius' interest was directed chiefly to the pervasive relations of dependency between individuals and their surroundings, and he described these relations in an original terminology involving many symbols.

The point of departure for his investigations was the "natural" assumption of a "principal coordination" between self and environment, in consequence of which each individual finds himself facing both an environment with various component parts and other individuals who make assertions about this environment which also express a "finding." The initial principal coordination thus consists in the existence of a "central term" (the individual) and "opposite terms" about which he makes assertions. The encountering individual is represented and centralized in system *C* (the central nervous system, the cerebrum), the basic biological processes of which are nourishment and work.

System *C* is exposed to change in two ways; changes in it are dependent on two "partial-systematic factors": variations in the environment (*R*) or stimuli from the

external world (whatever can, as a stimulus, excite a nerve), and fluctuations in metabolism (*S*), or absorption of food (whatever in the environment of system *C* conditions and constitutes its metabolism). System *C* constantly strives for a vital maximum conservation of its strength (*V*), a state of rest in which the mutually opposed processes $f(R)$ and $f(S)$ —that is, the variations of system *C* as functions of *R* and *S*—cancel each other out, and the two variations maintain an equilibrium ($f(R) + f(S) = 0$, or $\Sigma f(R) + \Sigma f(S) = 0$). If $f(R) + f(S) > 0$, then there arises in the state of rest or equilibrium state of system *C* a disturbance, a relationship of tension, "a vital difference." The system strives to diminish or cancel out and equalize this disturbance by passing over spontaneously to secondary reactions in order to reestablish its original state (the conservation maximum, or *V*). These secondary reactions to deviations from *V* or to physiological fluctuations in system *C* are the so-called independent vital sequences (the vital functions in system *C*, the physiological processes in the brain), which run their course in three phases: the initial segment (appearance of the vital difference), the middle segment, and the final segment (reappearance of the earlier state). The canceling out of a vital difference is possible, of course, only in the manner and to the extent that system *C* exhibits a readiness for it. Among the changes preparatory to achieving readiness are hereditary dispositions, developmental factors, pathological variations, practice or exercise, and the like. The "dependent vital sequences" (experiences, or *E*-values) are functionally conditioned by the independent vital sequences. The dependent vital sequences, which, like the independent, proceed in three stages (pressure, work, release), are the conscious processes and cognitions ("assertions about contents"). For example, an instance of knowledge is present if in the initial segment the characterization reads "unknown" and in the final segment it reads "known."

Avenarius sought to explain the rise and disappearance of problems in general as follows. A disparity can arise between the stimulation from the environment and the energy at the disposal of the individual either (*a*) because the stimulation is strengthened as a result of the individual's having found anomalies, exceptions, or contradictions in the given, or (*b*) because an excess of energy is present. In the first case, problems arise that can, under favorable circumstances, be solved by knowledge; in the second case, practical-idealist goals arise. The latter are the positing of ideals and values (for example, ethical or aesthetic ideals and values), the testing of them (that is, the forming of new ones), and through them the alteration of the given.

The *E*-values, which depend on the fluctuations in the energy of system *C*, fall into two classes. The first are “elements,” or simple contents of assertions—contents of sensation, such as green, hot, and sour, which depend on the objects of sensation or stimuli (whereby the “things” of experience are understood as nothing more than “complexes of elements”). The second are “characters,” the subjective reactions to sensations, or the feelinglike modes of apprehension. Three groups of basic characters (kinds of awareness) are distinguished: the “affective,” the “adaptive,” and the “prevailing.” Among the affective characters are the feelings proper (the “affectional,” pleasure and aversion) and the feelings in a figurative sense (the “coaffectional,” such as anxiety and relief, and the “virtual,” such as feelings of movement). The adaptive characters include the “identical” (sameness or “tautote,” difference or “heterote”); that is, the “fidential,” the “existential” (being, appearance, nonbeing), the “secural” (certainty, uncertainty), and the “notal” (the being known, the being unknown), together with many modifications of these. For example, modifications of the “identical” include, among others, generality, law, whole, and part.

PURE EXPERIENCE AND THE WORLD

Avenarius constructed the concept of pure experience and related it to his theory of the natural concept of the world on the basis of his views on the biology and psychology of knowledge. The ideal of a natural concept of the world of pure experience is fulfilled in the complete elimination of metaphysical categories and of dualistic interpretations of reality, by means of his exclusion of introjection. The basic prerequisite for this is first to acknowledge the fundamental equivalence of everything that is encountered and that can be grasped, regardless of whether it is given through external or internal experience. As a consequence of the empiriocritical principal coordination between self and environment, individuals and environment are encountered in the same fashion, without distinction. “With respect to givenness, I and the environment are on completely the same footing. I come to know the environment in exactly the same sense that I come to know myself—as members of a single experience; and in every experience that is realized the two experience-values, the self and the environment, are in principle coordinated to each other and equivalent” (*Der menschliche Weltbegriff*).

Likewise, the difference between *R*-values and *E*-values is conditional upon the mode of apprehension. Both values are equally accessible to description. They differ only in that the former are interpreted as constituents of

the environment, while the latter are conceived of as the content of an assertion of another human individual. In the same way, there is no ontological distinction between the mental and the physical; rather, there is a logical functional relation between them. A process is mental insofar as it is dependent on a change in system *C* and has more than mechanical significance, that is, insofar as it signifies an experience. Psychology has no separate subject matter at its disposal; it is nothing other than the study of experience insofar as experience is dependent on system *C*. Avenarius rejected the usual interpretation of and distinction between mind and body. He recognized neither the mental nor the physical but only a single kind of being.

ECONOMY OF THOUGHT

Of particular importance for the realization of the cognitive ideal of pure experience and for the notion of the natural concept of the world is the principle of the economy of thought. In the same way that thinking in conformity with the principle of least exertion is the root of the theoretical process of abstraction, so knowledge generally orients itself by the degree of exertion required to fulfill experience. Hence, one should exclude all elements of the mental image that are not contained in the given, in order to think about that which is encountered in experience with the least possible expenditure of energy, and thus to arrive at a pure experience. Experience, “cleansed of all adulterating additions,” contains nothing but constituents of experience that presuppose constituents of the environment only. Whatever is not pure experience, and thus is not the content of an assertion (an *E*-value) subject to the environment itself, is to be eliminated. What we term “experience” (or “existing things”) stands in a certain relationship of dependence to system *C* and to the environment; and experience is pure when it is cleansed of all those contents of assertions that do not depend on the environment.

A world concept relates to the “sum total of the constituents of the environment” and is dependent on the final character of the *C*-system. It is natural if it avoids the error of introjection and is not falsified by animistic “insertions.” Introjection transfers the perceptual object into the perceiving person. It splits our natural world into inner and outer, subject and object, mind and matter. This is the origin of metaphysical problems (like immortality and the mind-body problem) and metaphysical categories (like substance). All of these must therefore be eliminated. Introjection, with its unwarranted duplication of reality, must be replaced by the empiriocritical

principal coordination and the natural concept of the world that rests on it. Thus, at the end of its development the world concept returns to that natural form with which it began: a purely descriptive comprehension of the world, with the least expenditure of energy.

AVERROES

(c. 1126–c. 1198)

Averroes, or ibn Rushd, was the foremost figure in Islamic philosophy's period of highest development (700–1200). His preeminence is due to his own immense philosophical acuity and power and to his enormous influence in certain phases of Latin thought from 1200 to 1650.

Averroes ("ibn Rushd" is a more exact transliteration of the Arabic, while "Averroes" is the medieval Latin version) was born in Córdoba into a family of prominent

judges and lawyers; his grandfather, bearing the same name, served as the chief *qādī* (judge) of Córdoba, and there is a tradition that his father carried out the same duties. (In Muslim society a *qādī*'s professional concepts and practical duties were simultaneously civil and religious. Thus, a "lawyer" had expert knowledge of divine law.)

There are, however, few other specific details about his life and career. Ernest Renan and Salomon Munk mention that he studied under the most learned teachers in theology and law (in the Muslim world the two disciplines are effectively the same). It has been suggested that he studied with such scientists and philosophers as ibn Ṭufayl (d. 1185) and ibn Bajja (or Avempace, d. 1138), but the tenuous evidence would indicate that he became acquainted with the former only when he was past forty and that the death of the latter occurred when Averroes was only eleven or twelve years of age. Thus, significant pedagogical influence by these personalities upon Averroes is doubtful.

There remain, nevertheless, scattered pieces of evidence and suggestions of dates delineating his career. Averroes himself mentions that he was in Marrakech in 1153, on which occasion he observed the star Canope, not visible in Spain at that time. This sighting confirmed for him the truth of Aristotle's claim that the world was round. Some years later he seems to have been associated with the family of the Ibn Zuhr, traditionally physicians and scholars of medicine. He is reported to have been well acquainted with Abū Marwān ibn-Zuhr, perhaps the most outstanding member of the family, and when Averroes composed his medical handbook titled *Kulliyat* (literally, "generalities," which became latinized to *Colliget*), he encouraged Abū Marwān to write a companion text concerned with the details of specific ailments.

Tradition next reports that Averroes came into the favor of the sultan of Marrakech, a notable patron of scholarship and research, through the personal recommendation of his friend and presumed mentor, ibn Ṭufayl. His ready intelligence seems to have pleased the *cālif*, who, according to a student of Averroes, subsequently encouraged the vast series of commentaries on Aristotle that became known in the West around 1200. It is generally conjectured that the association among ibn Ṭufayl, the *cālif*, and Averroes can be dated between 1153 and 1169.

Through the *cālif*'s offices, Averroes was appointed *qādī* of Seville in 1169, and he began his array of commentaries on Aristotle about that time. In 1171 he returned to Córdoba, probably as *qādī*, and eventually

became chief *qādī*. He was, however, continually traveling to Seville and to Marrakech, as the colophons of various of his writings attest. In 1182 he became physician to the *cālīf* of Marrakech, continuing as a court favorite until about 1195. At that time he is supposed to have retired, possibly under a cloud as the result of religious controversy, or perhaps to be protected from conservative theologians, to a village outside Seville; details are not available. In any case, he soon returned to Marrakech, where he died.

His death coincided with the virtual disappearance of the dynamic speculative tradition evidenced in Arabic thinking for the several centuries after 700. Interestingly, it also coincided with the bursting forth of a similarly active tradition in the Latin West, which was greatly stimulated by the translations of Aristotle and Greek science from Arabic and Hebrew manuscripts. All these events—the death of Averroes, the abrupt decline of Arab intellectual dynamism, the translation into Latin of Aristotle (notably the *Metaphysics* and *De Anima* about 1200), and the exponential acceleration of Western philosophizing—occurred virtually within two decades. These are perhaps neither radically causative nor dependent events, but their close association is historically remarkable.

WRITINGS

During the course of his active professional life as *qādī*, physician, scientist, and philosopher, Averroes found time to compose an impressive number of scientific, philosophical, and religious writings. It is possible that some of his appointments may have been, in part, preferments for the purpose of sustaining scholarship. Certainly in the medieval Latin West, many a Sorbonne scholar formally designated “canon of Rheims,” for example, could rarely be found at Rheims fulfilling his canonic responsibilities.

Most of Averroes’s writings that can be dated fall between 1159 and 1195. There is the medical encyclopedia *Kulliyat* (composed before 1162), along with expositions of and commentaries on such medical writers as the Greek Galen and the Eastern Islamic *ibn Sīnā* (normally latinized as Avicenna). There are writings on astronomy. In religious philosophy there is the famous reply to the philosopher Muhammad al-Ghazālī’s attack on the pretensions of rationalism in matters of divine law (*The Incoherence of the Philosophers*); Averroes’s response is titled *The Incoherence of the Incoherence*, in which he strongly affirms the solid adequacy of natural reason in all domains of intellectual investigation. There are many lesser writings, on problems of divine law, on logic, on natural philosophy, and on medicine. Finally, there is the

massive set of commentaries on the Aristotelian corpus, which profoundly affected medieval Latin thought—sometimes with official ecclesiastical approbation, sometimes not.

COMMENTARIES ON ARISTOTLE. The commentaries on Aristotle are of three kinds: short, often called paraphrases or epitomes; intermediate; and long, usually meticulous and detailed explications. These different versions may well correspond to stages in the educational curriculum.

The commentaries survive in many forms. For some writings of Aristotle, all three commentaries are available, for some two, and for some only one. Since Aristotle’s *Politics* was not accessible to him, Averroes wrote a commentary on Plato’s *Republic*, under the assumption that Greek thought constituted a coherent philosophical whole. He believed that the *Republic* contributed to this total philosophical construction. In still a further attempt to complete the presumed integrity of all Greek natural philosophy, Averroes supplemented Aristotle’s *Physics* and *De Caelo* with a treatise of his own titled *De Substantia Orbis*.

In supplementing Aristotle in this fashion, Averroes did violence to the original methodology of the Stagirite. For Aristotle the *Physics* and *De Caelo* investigated motions and processes according to two different perspectives—*Physics*, motion as such; *De Caelo*, motion in the particular context of the activities of the heavenly bodies. These investigations were not conceived as standing in any hierarchical order, reflecting any vertical order of being or reality; they were simply different investigations and must not be taken, as did many ancient and medieval commentators, in terms of category and subcategory. Averroes, with methodological dispositions akin to the Platonic, did take them in this way, and thus eventually he found it necessary to provide an all-comprehensive celestial physics—hence, the *De Substantia Orbis*.

TEXTUAL TRADITION. The actual textual tradition of Averroes’s works is extremely complex. Some of the commentaries remain in Arabic versions, some in Hebrew translations from the Arabic, some in Arabic texts recorded in Hebrew script, and many in Latin translations. These categories are not mutually exclusive. Beginning in 1472 there appeared numerous printed editions of some, but by no means all, of the commentaries; the format usually consists of a paragraph of Aristotelian text followed immediately by Averroes’s comments on and interpretation of that text. This was no doubt an appa-

tus designed for the practical needs of the teaching of natural philosophy in the Western Latin universities, for it is clear that Averroes's analyses had become influential by the first quarter of the thirteenth century, accompanying as they did the translations of Aristotle, and they remained influential in the traditions of the universities well into the seventeenth century.

AVERROES'S PHILOSOPHY

Averroes's own philosophical position can best be characterized as Aristotle warped onto a Platonic frame. He inherited Greek thought as a literary corpus and, like his Islamic philosophical predecessors, viewed this corpus as an intellectually integrated totality. Aristotle, his commentators (such as Alexander of Aphrodisias and Simplicius) and such thinkers as Plotinus and Proclus were all understood as parts dovetailing into a single coherent philosophical system. Al-Fārābī (d. c. 950) is an eminent example of this syncretism: he composed a work titled *The Harmony between Plato and Aristotle*, and Averroes himself, lacking Aristotle's *Politics*, found little difficulty in incorporating Plato's *Republic* within his compass of speculation.

RELIANCE ON NEOPLATONISM. The doctrinal positions of Greek and Alexandrian thinkers were, in fact, often quite divergent and even incompatible, and to complete the final union of their philosophies into a single intellectual system the Arab philosophers made use of a writing called the *Theology*. Late ancient tradition attributed this treatise to Aristotle, but modern scholarship has established that the *Theology* is fundamentally a compendium based on Plotinus's writings. This work was taken uncritically by Arabic philosophers as the capstone of all Greek speculative thought and, as such, was employed by them to effect the unity of ancient philosophy.

"Mystical" knowledge. There were at least two reasons for the eager Islamic approval of the *Theology*. First, it strongly reflected the Neoplatonic emphasis especially evident in Plotinus' *Enneads*, on the culminating "mystical" experience at the apex of human knowledge. This experience involved a passing from a condition of ordinary logical ratiocination over into a condition of nondiscursive (although quasi-rational) grasp of ultimate reality. Such an attitude is strongly sympathetic to the Islamic conception of ultimate religious experience, in which there is an analogous passing from individuality into an impersonal fusion with a Whole or Divine Essence.

Hierarchy of reality. Correlative to its reflection of Neoplatonic "mystical" knowledge, the *Theology* reflected the Neoplatonic methodological conception that is ordered in an organic hierarchy, with interlocking levels indicating superordinate and subordinate dependency. Such relationships involve levels of being and, concomitantly, sources and receivers of being. Such an intellectual structure might be visualized as a series of pyramids successively superimposed, with the preeminent pyramid pointing to an ultimate One that simultaneously comprehends being as such and is the culmination of human reflective experience. This structure is, moreover, dynamic and not static, with a continuing flow of creativity downward and a continuing activity of noetic discovery upward.

ANALYSIS OF THE SOUL. The general methodology described above is evident in many specific places in Averroes's philosophy. In his analysis of the soul, for example, Aristotle's original doctrine undergoes a transformation. Whereas Aristotle's insistence on the physical principle that every form separate from matter is one in species leads to a presumption against the possibility of individual immortality, Averroes takes the obverse: Separate forms or substances can subsist in the general hierarchy of being, and thus immortality, in a purely impersonal sense, is possible.

SCIENTIFIC KNOWLEDGE. The case in natural science is similar to that of the soul. In Aristotle the various sciences are diverse and not necessarily reducible to one another in any formal sense: the *Physics* views natural behavior from one perspective and in accordance with one set of working principles, while the *De Caelo*, in contrast, uses another perspective and another set of principles. Aristotle's natural sciences are irrefragably diversified. In the *Metaphysics* he goes so far as to say that similar terminology is employed in the several sciences; however, this apparent unity of the sciences is qualified by his insistence that the use of the most general metaphysical language is, in disparate domains, only analogous and not semantically equivalent. The particular subject matter that a science encompasses controls the precise significance of the terms and logic used in the analysis and description of that science; the term "being" as it is used in the *Physics* does not possess the same meaning as "being" used in *De Anima*.

For Averroes, however, such differentiations among the sciences were not the case. "Being" had a univocal significance, not equivocal, as it had for Aristotle; and Averroes viewed nature and reality as exhibiting a single

coordinated and coherent structure, proceeding in orderly hierarchical fashion from levels that are lesser (both metaphysically and noetically) to greater and richer levels of being. Aristotle's horizontal and discrete conglomeration of sciences became a harmonious order of vertically structured science with dependent and causative relationships.

ACTIVE AND PASSIVE INTELLECTS. From Aristotle, Averroes understood that the knowing process in man comprised a passive aspect—adumbrant concepts capable of being fully activated—and an active aspect—a power of dynamically activating such concepts. This power, termed during the medieval period the “active intellect,” was taken to operate against a “passive intellect” to actualize concepts and thus constituted the thinking activity; and the resulting fusion of function was termed the “acquired intellect.” This terminology applicable to the noetic process was based on Aristotle's *De Anima*, and appears, with minor variations, in Greek and Arabic thought down to the time of Averroes. God, as the First Intelligence, provides through the next subordinate level of intelligences—the celestial bodies, upon which he exercises immediate control—activating power for the active intellect controlling man's thought.

The active intellect is not personalized, however, because it is Aristotelian form, and each such form is a species and never an individual. Nor is the passive intellect, in its nonnoetic status apart from participation in the acquired intellect—a further pressing of Aristotle impelled by Platonic dispositions. In Averroes's philosophy, consonant with Muslim theology, it is thus a domain of reality that looks upward to God for its sustaining power and with which individual souls strive to fuse impersonally, in knowledge and ultimately in immortality. Thus Averroes, and certainly his medieval interpreters, believed in the unlikelihood of individual immortality—the active intellect with which man hopes to unite at death being a single undifferentiated form—and the soul, as individuated in this life, cannot subsist without the body.

METAPHYSICS, NATURAL PHILOSOPHY, SCIENCE. Averroes's metaphysics, natural philosophy, and science can be classified as a moderate Platonism, tempered with a profound appreciation of Aristotle. Unlike many of his Islamic predecessors, Averroes accepted Aristotle's rigorous rationalism wholeheartedly, although at various crucial points his renderings of Aristotle's laconic texts are governed by his own Platonic methodological predispositions. Against the latter, he held the principle of the uni-

vocality of being, flowing downward from a Supreme Principle. God's existence is established from the *Physics*, in that the eternity of motion demands an unmoved mover, which is in itself pure form. In addition to being the source of motion, such pure form is also Intelligence as such, operating not only as the source of the celestial bodies and all subordinate motions but also as the creative originator and sustaining force behind all lesser intelligences.

THEOLOGY AND NATURAL PHILOSOPHY. In the Christian intellectual environment of the thirteenth century, apparent conflicts between argumentation in natural philosophy and argumentation in matters of theological doctrine became exceptionally acute. The newly introduced writings from the ancients—Greek philosophy and science, accompanied by Arabic and Hebrew commentary—rigorously set forth propositions alien to fundamental dicta of Christian faith: for example, the eternity of the world, the impossibility of individual immortality, and the radical noncontingency of existence as such. Averroes's rendering of the Aristotelian writings contributed heavily to these conflicts. Aristotle was read in the medieval faculties of arts as the staple of natural philosophy and science, and Averroes was read as his primary interpretive adjunct. In fact, in later medieval writings Averroes is merely referred to as “the Commentator.” Thus, since he put forward analyses understanding Aristotle to deny the creation of the world in time, personal immortality, and the contingency of existence, such views attained wide currency among masters of arts.

The response from the theological side was early and direct. “Arabic” commentary was forbidden to be read in 1210 and 1215, and permitted only with censoring in 1231, at the University of Paris. Albert the Great published a treatise, *Contra Averroistas*, and Thomas Aquinas wrote about 1269, at a time of great intellectual controversy at Paris, a *Tractatus de Unitate Intellectus Contra Averroistas*.

“Double-truth” doctrine. The replies to Averroes were reasoned and moderate, but they seem to have been accompanied by many contemporary declarations that the “Averroists” were actually maintaining a doctrine of “double truth,” according to which conclusions in natural philosophy were said to be true, while simultaneously conclusions affirming the contrary in theological argument were held true—presumably an intolerable intellectual situation. Thus there were official condemnations of “unorthodox” doctrines at the University of Paris in 1270 and 1277, including specific injunctions against two stan-

dards of truth. It is not, however, clear that any philosophers in the thirteenth century explicitly held such a theory of “double truth”; in the writings that survive, philosophers faced with these conflicts take great pains to concede truth itself to the declarations of faith and say of Aristotelian writings only that they have been properly arrived at according to Aristotle’s methods.

Averroes himself composed the short treatise *On the Harmony between Religion and Philosophy*; his main effort in this work was to establish that there is but one truth to which there are several modes of access—the rhetorical, open to any man through the persuasions of teachers; the dialectical, available for some to explore the probability of truths of divine law; and the philosophical, to be used only by those few capable of exercising pure ratiocination with the fullest competence. Such a variety of methods ensures for each man, depending on his individual capability, the possibility of grasping ultimate realities. The fact that in this work Averroes distinguishes between such modes of access to truth has, by many historians, been taken to adumbrate the theory of the “double truth,” as attributed to many thinkers in the thirteenth century, but this is not probable. First, this work of Averroes was not available to medieval Latin scholars and thus obviously cannot have been directly influential; second, the doctrine of alternative modes of access to truth is hardly the same as that of maintaining incompatible truths in disparate domains.

Thus, the attribution of a doctrine of “double truth” to medievals cannot be sustained by any writings of Aristotle accompanied by Averroistic commentaries, nor can it be justified explicitly from any Christian medieval master. The oppositions between Aristotelian-Averroist argument and basic Christian doctrine constituted a fundamental intellectual dilemma within Christian speculation—one never resolved by the masters of arts in an explicit proclamation of a logical contradiction between two domains of reflection but always by an absolute accession of truth to faith. Averroes did not contribute specifically to the discussion arising from this dilemma, except insofar as his rigorous analysis of Aristotle made necessary certain conclusions in natural philosophy.

Averroes stands as a philosopher in his own right, but his influence was felt essentially in Western Latin philosophy from 1200 to 1650. His commentaries on Aristotle, an integral part of the educational curriculum in the faculties of arts of western European universities, shaped several centuries of Latin philosophy and science. Despite institutional criticism and even formal condemnation, his powerful statements of Aristotelian doctrine were sus-

tained among Latin scholars and thinkers well into the mid-seventeenth century.

Bibliography

The most important general references are Ernest Renan, *Averroès et l'averroïsme* (Paris: A. Durand, 1852; modern ed., Paris, 1949); Salomon Munk, *Mélanges de philosophie juive et arabe* (Paris: A. Franck, 1859), pp. 418–458; Léon Gauthier, *Ibn Rochd* (Paris: Presses universitaires de France, 1948); and G. Quadri, *La philosophie arabe dans l'Europe médiévale* (Paris: Payot, 1947), pp. 198–340. The last two of these studies depend heavily on the first two, which are the unsuperseded (except in occasional detail) classics in the literature on Averroes, although Gauthier properly views some of the indirect traditions with caution. For Averroes’s predecessors, mentors, and contemporaries, see George Sarton, *Introduction to the History of Science*, Vol. I (Baltimore: Carnegie Institution of Washington, Williams and Wilkins, 1927) and Vol. II (Baltimore: Carnegie Institution of Washington, Williams and Wilkins, 1931), *passim*. Significant recent interpretations, with varying emphases, can be found in Étienne Gilson, *History of Christian Philosophy in the Middle Ages* (New York: Random House, 1955); A. A. Maurer, *Medieval Philosophy* (New York: Random House, 1962); and D. Knowles, *Evolution of Medieval Thought* (Baltimore: Helicon Press, 1962).

For a detailed catalog of Averroes’s writings, see George Sarton, *Introduction to the History of Science*, Vol. II, Part 2, pp. 356–360. Also see Léon Gauthier, *Ibn Rochd*, pp. 12–16, and M. Bouyges, *Notes sur les philosophes arabes connus de Latins au moyen âge*, Vol. IV, *Inventaires des textes arabes d'Averroès* (Beirut, 1922). The latter, a monograph, is in the *Mélanges de l'Université Saint-Joseph* (Beirut: Catholique, 1922), Vol. VIII, Fascicle 1. H. A. Wolfson has meticulously stated the ambitious program for preparing and publishing modern editions of the Aristotelian commentaries in “Plan for the Publication of a Corpus Commentariorum Averrois in Aristotelem,” in *Speculum* 6 (1931): 412–427, and “Revised Plan for the Publication of a Corpus Commentariorum Averrois in Aristotelem,” in *Speculum* 38 (1963): 88–104. The latter article provides the most reliable listing of the surviving writings. There are other modern editions and translations of some works: for instance, E. I. J. Rosenthal, *Averroës' Commentary on Plato's Republic* (Cambridge, U.K.: Cambridge University Press, 1966); G. F. Hourani, *Averroës on the Harmony of Religion and Philosophy* (London: Luzac, 1961); and Simon Van den Bergh’s translation of *The Incoherence of the Incoherence* (London: Luzac, 1954).

Stuart MacClintock (1967)

AVERROES [ADDENDUM]

At the time that Ibn Rushd was working, the philosophical curriculum was largely Neoplatonic, and this is because the Greek tradition of philosophy was transmitted to the Islamic world via the Neoplatonic tradition. But some thinkers like Ibn Rushd were perceptive enough to realize that there were discrepancies between Aristotle—very much his hero—and the Neoplatonists, who were represented at the time by the thought of Ibn Sīnā. In his defense of philosophy in the *Tahāfut al-Tahāfut*, for instance, Ibn Rushd not only seeks to refute al-Ghazālī's attack on philosophy, but he also tries to argue with Ibn Sīnā's particular Neoplatonic philosophy. In fact, he manages to link al-Ghazālī, the critic of philosophy, with Ibn Sīnā, its main representative. Al-Ghazālī argues that causality is nothing more than the way in which people interpret God's bringing things into existence, and therefore they should not think of causal connections as being necessary. Ibn Sīnā does identify necessity and causality, but also, for him, something has to actualize essences. Ibn Rushd criticizes both of these views; he argued that existence is linked with essence—that is, what is meant by cotton is something that bursts into flames when it is touched by fire (other things being equal). The properties of cotton are not just an incidental feature of the cotton; they are an essential aspect of it.

The views of Ibn Rushd came to have a radicalizing influence on European thought when they were translated into Hebrew and Latin. They were often taken to imply that philosophical and religious truths could be in opposition to each other, and yet still both be true. This is not what Ibn Rushd himself argued; he was too good of a thinker to believe that contradictory propositions could both be true. However, he did argue that there are different routes to the truth—routes that are appropriate to different audiences. For those capable of understanding rigorous logical arguments there is philosophy, and for those disinclined or unable to appreciate such arguments there are argument forms of lesser rigor. Ibn Rushd sees the syllogism as being the basis of all uses of language. Thus while the philosopher employs the demonstrative syllogism, the politician will use rhetoric and sophistry, the prophet sometimes uses poetry, and the theologian dialectic. All of these are reasoning processes, but only demonstration—according to Ibn Rushd—reaches the highest standards of reason.

That does not mean, however, that there is anything wrong with the other methods of reasoning; they simply are not so secure as demonstration. The other methods

may, nonetheless, be able to express what philosophers can discover through demonstration in ways that are accessible to more people. Because God made everyone different, Ibn Rushd believes it is appropriate that God make everyone capable of understanding some method of argument—although not everyone should be expected to employ the same method.

It is worth pointing to the radical nature of this doctrine. For one thing, Ibn Rushd's doctrine suggests that the philosophers as a group are the best able to understand the language of any text, even difficult scriptural passages. After all, philosophers can operate at the level of demonstration and so are skilled in working with the highest levels of reason. The theologians and lawyers are only used to dialectic, in which they start with propositions that are generally accepted as true, but might not be. Ibn Rushd disparages their efforts as compared with those of the philosophers. Ordinary people are in an even worse position. On the one hand they have to rely on language and on arguments that rely on imagery and persuasion, and thus they are a long way from demonstrative rigor. On the other hand, what they believe is perfectly valid because there is a demonstrative proof for it, but not a proof they themselves can grasp. They do not believe anything false, but they do not appreciate the entire basis of their beliefs. Ibn Rushd gives the analogy of going to a physician or a lawyer with a problem. He suggests that if a person had the expertise of the lawyer and the physician, there would be no need to consult them (even though when lawyer and physician are consulted, what they suggest may not be understood by client or patient). If the advice were understood, there would be no need for the doctor or lawyer in the first place. And yet, there is nothing wrong with people's reliance upon doctors and lawyers because it is assumed that they understand why they make the suggestions they do—and thus if people are wise they will accept and follow those suggestions.

This approach is not a doctrine of double truth, but it is a radical doctrine that relegates religion to a relatively lowly role in the hierarchy of human pursuits. Religion is certainly inferior to reason as a way of finding out truth, because religious language is to be understood primarily by examining it philosophically. One of the features of Ibn Rushd's thought that differentiates him from other Islamic philosophers is his supreme indifference to mysticism. Mysticism, or *taṣawwuf*, was of overriding significance for most of his contemporaries and predecessors—and indeed successors—but not for him. For Ibn Rushd, the meaning of the world is firmly in the world, and not something behind it. In this way he sought to

establish a purified form of Aristotelianism shorn as far as possible from its Neoplatonic accessories and excesses.

It is not surprising that Averroism came to be regarded as a challenging doctrine in the Middle Ages and beyond, and it may well have played a role in displacing traditional religion from its established role in intellectual and social life. Within the Islamic world, Ibn Rushd's views largely disappeared until the Islamic Renaissance, when they reemerged to argue for a division between religious and rational language. In modern times, Averroism has once again been used in the Arab world to argue for a new and enhanced respect for reason as compared with religion. It still appears to be a philosophy for the intellectual elite rather than the religious masses.

AVERROISM

As a designation applicable to a tradition or mode of philosophizing, "Averroism" cannot be used in any account of Arabic thought after the death of Averroes (c. 1198). After that, in a most unusual intellectual situation, Averroes's influence is to be found not in Muslim thought but in Western Latin philosophy between 1200 and 1650, for the dynamic speculative activity vital for five centuries in the Arabic tradition, which was founded in large part on Greek writings in philosophy and science (Aristotle's in particular), disappears after 1200, reappearing almost immediately in Western Latin thought. Throughout the century 1150–1250 a vast number of translations of most of Greek and Alexandrian philosophy and science were made from Arabic and Hebrew into Latin. This literary corpus, which had made its way around the Mediterranean littoral translated from Greek into Syriac and thence into Arabic and Hebrew, caught the attention of Latin scholars and such patrons of scholarship as King Frederick II of Sicily and Archbishop Raymond of Toledo. As a consequence, by about 1200 the indefatigable efforts of many translators working in many locations had made Greek thought, especially that of Aristotle, available to Latin thinkers. The impact of this solid and integrated corpus of natural science on the Western intellectual world was enormous, coming as it did into a climate where for centuries scholars eager for knowledge had had to content themselves with thirdhand encyclopedic compilations of inadequately developed science and scientific methodology.

AVERROES'S COMMENTARIES

The translations of the Greek writings were normally accompanied by many Greek and Arabic commentaries. Commentaries by Alexander of Aphrodisias and by Simplicius were frequent, but those by the Arab Averroes on the Aristotelian works were ultimately the most influential. During a long and varied career as judge, teacher, philosophical and medical adviser to several Muslim rulers, Averroes found time to compose a series of glosses and commentaries on Aristotle's works. These fall into three categories—short (often called epitomes), interme-

diate or middle, and long, a differentiation which probably corresponds to stages in the academic curriculum. The particular argumentation of certain passages of Aristotle presented by Averroes in the mass of commentary had strong appeal for many Western Latin thinkers, and the reflection of his interpretations in their own philosophical analyses gave rise to attitudes which were first termed (by Christian scholars suspicious of their novelties) Arabic and later more specifically called Averroist.

INITIAL IMPACT IN THE WEST. Upon translation the Greek writings, with their attendant commentaries, were rather quickly absorbed into Western Latin scholarship, but not without some formal opposition. These writings were banned at the University of Paris in 1210 and 1215, deemed usable only if corrected in 1231, and not officially introduced into the curriculum until 1255. This literature was nevertheless being intensively read during these years; the philosophical writings of Albertus Magnus (active at least as early as 1230), William of Auvergne (d. 1249), and Alexander of Hales (d. 1245), to name only three prominent examples, reveal an intimate acquaintance with the recently acquired corpus of Greek science. Similarly, in England the philosophy of Robert Grosseteste (bishop of Lincoln, died 1253) shows strong influences derived directly from the newly inherited Greek literature. In Italy, too, the Greek tradition was rapidly assimilated into the scholarly milieu, but the Italian intellectual atmosphere was either medical, as it had been at the University of Salerno for several centuries, or else legal, as at Bologna. There do not appear proscriptions by Italian ecclesiastical authorities as stringent as those made at the University of Paris throughout the thirteenth century, and the possible intellectual conflicts raised by the introduction of these writings into a context of Christian philosophy do not seem to have been seriously felt.

Intellectual conflicts became extremely explicit, however, when the Aristotelian writings were conceived to be in direct confrontation with doctrines of Christian faith. Aristotle asserted, for example, the eternity of the world, the unlikelihood of individual immortality, the possibility of man's attaining ethical perfection in this life, and other theses incompatible with tenets of Christian belief. The appearance of such philosophical conclusions, apparently well reasoned and buttressed by Arabic commentary, occasioned some severe crises for Western Christian philosophy.

The chief agents presenting these, as well as other, renderings of Aristotle were the commentaries of Averroes. For centuries he was called simply the "Commenta-

tor" in Latin writings, and his expositions of the Aristotelian corpus were read into the seventeenth century. Cesare Cremonini (d. 1631), the last of the self-proclaimed Averroists, used these commentaries, and even at that late date he was considered unorthodox enough to be included in an array of formal proceedings along with Galileo Galilei himself. Unorthodoxy makes strange bedfellows when the resolute claimant of Aristotelianism and the architect of a scientific rupture with Aristotelian Scholasticism are included in the same condemnatory document.

LATIN AVERROISM

Historically, *Averroism* is a designation applied to certain interpretations of Aristotelian doctrine by Western Latin thinkers. (There are medieval Jewish philosophers holding positions close to these, but the epithet itself does not seem to have been applied to them.) It was originally a term of opprobrium; no one called himself Averroist until possibly John of Jandun (c. 1286–c. 1328), who was followed by Urban of Bologna (fl. 1334) and Paul of Venice (d. 1428). During the thirteenth century Averroists were the object of violent philosophical attack and severe authoritarian action.

Averroes insisted upon, and many scholars in the Western faculties of arts concurred in, the reliable logic of Aristotle's argumentation. Thus, there was clearly the necessity of the purely rational acceptance, given Aristotle's premises, of such "unorthodox" conclusions as have been mentioned. Acceptance is, however, intolerable for serious Christian thinkers, and so such conclusions were taken to be erroneous and thus subversive when pronounced in the schools. When thirteenth-century arts masters taught Aristotle in this fashion, they were awarded (by their opponents) the pejorative title Averroist, and official action often resulted. Siger of Brabant, Boethius of Dacia, and Bernier of Nivelles, masters in the faculty of arts at Paris, were all named in condemnations of the 1270s. This special mention seems to have had limited effectiveness; although these particular masters disappeared from the intellectual scene, countless commentaries on Aristotle dating from the last quarter of the thirteenth century offer similar interpretations and similar caveats as to the logical validity, if not truth, of these interpretations. No recorded disapprovals have been found.

Incidentally, this represents another aspect of the history of intellectual conflict. Explicit authoritarian condemnations were more often the result of a refusal to accept organizational discipline than of a genuine

philosophical error or ideological heresy. This can be illustrated in the careers of Gottschalk (d. c. 868), Peter Abelard (1079–1142), and Roger Bacon (c. 1214/1220–1292), all of whom were subjected to ecclesiastical punishment although little of their thinking was drastically at variance with established or recommended philosophical systems.

THE “DOUBLE TRUTH” PROBLEM

Every exposition of Averroism must examine the problem, arising in the thirteenth century, of the “double truth.” The masters of arts, reading Aristotle and following his rigorous logic to conclusions incompatible with certain propositions held by faith, tried to resolve apparent contradictions by including in their commentaries reservations of this nature: “Although this conclusion has been reached according to the method of Aristotle and the Commentator, nevertheless faith and truth declare otherwise.” While proclaiming logical rigor and precise validity for Aristotelian arguments, they conceded the final determination of truth itself to the Christian faith.

In this historical context it has often been maintained, both in the thirteenth century and in contemporary scholarship, that such thinkers were actually practicing a system of “double truth,” in which a proposition can be true in natural philosophy but contradict a proposition true in theology and conversely. But, as Étienne Gilson and other scholars have convincingly pointed out, no master of arts has yet been found explicitly holding such a radical position. Regardless of the apparent persuasiveness of Aristotelian argument, the truth itself was always the dominant prerogative of Christian faith. In the face of such overwhelming requirements, the limitations and inadequacies of natural reason were recognized by the arts masters.

ATTEMPTED SOLUTIONS

Thus, an intellectual crisis of the first magnitude appeared in Western scholarship in the early thirteenth century. The attempts to deal with this conflict between important arguments in Greco-Arab philosophies and Christian-oriented intellectual systems fall into several main categories.

REASON NOT APODICTIC. First, the masters of arts, whose primary professional obligation was teaching natural philosophy, the core of which was Aristotle and his commentators, resorted to the attitude that although such science was orderly and rigorous, the unreliability of reason and the merely probable nature of its results sug-

gested that conclusions based on such unaided reason must always yield, with respect to truth, to the apodictic proclamations of the faith. Such masters never claimed “truth” for a proposition of natural philosophy in conflict with a proposition of faith; they insisted on its logical validity, however, and conceded the determination of truth-value to faith. In this manner they endeavored to handle an intractable intellectual dilemma and at the same time to avoid subjecting themselves to overt charges of intellectual and ideological inconsistency.

AUGUSTINIANS. Second, masters of theology—for example, Bonaventure, Peter John Olivi, and, in the first decade of the fourteenth century, John Duns Scotus—employed a methodology often termed Augustinian. Their attempt to resolve the difficulties entailed, essentially, an assimilation of Aristotelian natural philosophy into a hierarchical scheme of knowledge. Such a resolution provided a coherent and orderly vertical relation among the several sciences, proceeding from the less perfect to the more perfect, from the less well known to the more surely known, from the less exact to the more exact. Such a structure, culminating in God himself, the ultimate source of perfection, knowledge, and precision, could be coherent and consistent and could accommodate both Christian doctrine and a qualified, because essentially incomplete, natural philosophy. But the achievement of this coherence was purchased at the cost of Aristotle himself, for his scheme of the sciences does not envisage a vertical, or hierarchical, ordering, whereby lesser sciences derive their logic, meaning, and reality from superior sciences. His sciences are basically ordered horizontally, diversified methodologically, and irreducible to any single set of common and univocally meaningful fundamental principles.

THOMAS AQUINAS. Third, the preeminent theologian St. Thomas Aquinas (1224?–1274) attempted a massive resolution maintaining the logical integrity and autonomy of Aristotelian natural philosophy while setting forth a supplementary and compatible structure of Christian theology. The two disciplines run in parallel courses, with differences based on distinctive premises and arguments, but there are many points where the propositions in each discipline are the same and are concluded to be true in both domains. These points were taken by Thomas to ensure the compatibility of Aristotelian natural philosophy and Christian theology, and by this means Thomas sought to sustain a consistent intellectual whole comprehending Greek philosophy and Christian truth.

The carefully poised system of Thomas was not, however, influential in his own time, and most of his immediate successors in the theological faculties preferred to continue in the Augustinian methodology. By the early fourteenth century, moreover, both approaches—the Augustinian assimilative technique and Thomas's sophisticated and delicately poised structure of complementary systems—were abandoned. This becomes explicit in the philosophy of William of Ockham, in whose thought natural science and systematic theology are totally independent domains.

Insofar, then, as the masters of arts, reading Averroes in close conjunction with Aristotle, tended to bring forward the incompatibilities between the two systems, it is possible to affirm the judgment of Gilson that “the rupture of Christianity is from this moment an accomplished fact.”

ITALIAN AVERROISM

As a designation Averroism disappeared in the intellectual history of the University of Paris after the first quarter of the fourteenth century, although there are many manuscripts making explicit these crucial difficulties; however, their overt dependence on and acknowledgment of Averroes's commentaries diminish. From about 1300 to 1650 the term *Averroism*—assumed favorably by some thinkers and in a derogatory fashion by others—is found associated with philosophical activity in the Italian universities, Bologna and especially Padua.

Renan wished to establish a dichotomy between Averroist and Alexandrist Aristotelianism in Italy at this time. This distinction was based on alternative interpretations of Aristotle's *De Anima*. The Averroist view emphasized that personal, individual immortality could not be established in Aristotle's writings. In this interpretation the soul, when separated from the body, loses all individuality—a conception congenial to the Muslim doctrine of complete impersonal fusion at the apex of noetic experience. In purely Aristotelian terminology this is known as the theory of the unity of the active intellect—that is, that any form distinct from matter is one in species and never individuated. The Alexandrist analysis likewise denied the possibility of individual immortality but argued against the separate subsistence of the soul under any conditions whatsoever; when the soul-body composite dissolves, nothing remains.

This distinction is an oversimplification of the complexities of Italian Aristotelianism between 1300 and 1650, but it was employed by the scholars themselves and may thus be used with appropriate reservations. How-

ever, whether or not these thinkers were designated Averroist or Alexandrist, they all did agree in affirming the logical integrity of Aristotelian natural philosophy, even though some conclusions reached in this philosophy appeared in radical contradiction to dicta of Christian faith.

Although it would be misleading to speak crudely of an Alexandrist tradition in the later Middle Ages, there were eminent philosophers who, though thoroughly convinced of the logical autonomy of Aristotelian thought as such, did not adhere to the letter of Averroes's rather Platonic or Augustinian interpretation. Jean Buridan (d. c. 1358) at Paris and Pietro Pomponazzi (d. 1525) and Jacopo Zabarella (d. 1589), both at Padua, can be taken to fall within the non-Averroist but still naturalistic method of Aristotelian natural philosophy.

Averroism as a term designating a tradition, type, or method of philosophizing is difficult to make precise. Thinkers of varied methodological persuasions—for instance, Siger of Brabant and John of Jandun—have been called Averroist. Averroism can, however, be solidly connected with Latin Aristotelianism where Latin Aristotelianism is taken to include philosophies that agree on the logical rigor and systematic autonomy of natural philosophy as exemplified in Aristotle's writings. Since such arguments appear to lead to conclusions inconsistent with truths of Christian faith, Averroism in its earliest usage was pejoratively employed. But the demands of reason, working with the Aristotelian corpus, were insistent, and by the middle of the fourteenth century philosophers began to proclaim themselves openly Averroist. Gilson has suggested that Averroism was essentially conservative and sterile, but it is clear that it was an integral part of the tradition of Aristotelian scholasticism and that its disappearance in the seventeenth century coincided with the demise of medieval Scholasticism itself.

ARABIC ARISTOTELIANISM

The major figures of Arabic Aristotelianism are al-Kīndī (d. 873), al-Farābī (d. 950), ibn-Sīnā (Latinized Avicenna, d. 1037), and Ibn-Bajja (Latinized Avempace, d. 1138). See *The Cambridge Companion to Arabic Philosophy*, edited by Peter Adamson and Richard C. Taylor (Cambridge: CUP, 2005); *Storia della filosofia nell'Islam medievale*, edited by Cristina D'Ancona Costa (Torino: Einaudi, 2005). These important works provide references to many other valuable and supplementary studies. For a reader, see *Medieval Islamic Philosophical Writings*, edited by Muhammad Ali Khalidi (Cambridge: CUP, 2005). For al-Ghazzali's *Incoherence of the Philosophers* see *The Incoherence of the Philosophers: English Translation of Imam Ghazali's Tahafut al-Falasifa*, translated by Michael E. Marmura (Brigham Young University's Islamic Translation Series), (Brigham Young University Press: 2000). For Averroes' reply, see his *Incoherence of the Incoherence*, translated by Simon Van Den Bergh (Gibb Memorial Trust, 1978). In this debate the term *philosophers* is a translation of the Arabic *falasifa*, which is in turn a transliteration of the Greek *philosophoi*. *Falasifa* thus has the special meaning of "thinkers following the Greek tradition" and not the general sense of philosophers as such.

AVERROISM IN MODERN ISLAMIC PHILOSOPHY

Averroes (Ibn Rushd) largely disappeared from the Islamic world after his death in 1198, but returned through the influence of Ernest Renan, who in the nineteenth century presented Averroes as a hero of rationalism and antireligious skepticism. Many Arab intellectuals were educated in France and came into contact with Renan's views, and they played a large part in the Islamic renaissance movement (*al-Nahḍa*). This was designed to combine adherence to religion with a commitment to reason, something that Ibn Rushd was regarded as exemplifying in his life and work. His work has been used to oppose the forces of conservatism and traditionalism in the Arab world. Averroes was in his life also opposed by the local religious authorities, as are his modern supporters in the Arab world.

The *tanwīr*—or enlightenment movement—is more radical than the *Nahḍa* because it often is highly critical of the influence of established religion. Its central text is *Falsafat Ibn Rushd* by Faruḥ Antūn, as well as the books of al-ʿĀṭif al-ʿIrāqī on Averroes. Although of limited influence in the Arab world as a whole, and even in Egypt where it has some presence in the universities of Cairo, this movement has created considerable intellectual discussion among Arab philosophers. Its critics regard it as too aligned with the West and too antagonistic to Islam, but proponents of the *tanwīr* movement argue that only a radical separation of faith and politics can initiate an appropriate degree of modernity into the Arab world.

AVICENNA

(980–1037)

Avicenna, whose full name was Abū ‘Alī al-Ḥusayn ibn ‘Abd-Allāh ibn Sīnā, was the most renowned and influential philosopher of medieval Islam. He was a Persian, born near Bukhara, then the capital of the Persian Samānid dynasty. His father was a partisan of the heterodox Ismā‘īlī sect, whose theology drew on current popularized Neoplatonism. As a boy, Avicenna was exposed to Ismā‘īlī doctrine but found it intellectually lacking. He received some of the basic Islamic religious education, then studied logic, mathematics, the natural sciences, philosophy, and medicine, mastering these subjects by the age of eighteen. A certain al-Nātīlī introduced him to logic, geometry, and astronomy, but Avicenna was largely self-taught. He records that he was able to fathom Aristotle’s *Metaphysics* only after a chance discovery of a commentary on it by al-Fārābī (Alfarabi). Appointed physician at the Samānid court, he intensified his studies at its excellent library. Thereafter, he states, he added little to his stock of learning but deepened his understanding of what he had acquired.

In 999 Samānid rule disintegrated with the onslaught of the Turkish Ghaznawid dynasty. Avicenna left Bukhara to roam the cities of Transoxania and Iran, serving local warring princes. Between 1015 and 1022 he acted as both vizier and physician to the ruler of Hamadan; after the latter’s death he was imprisoned but was released four months later when ‘Alā al-Dawla, the ruler of Isfahan, temporarily occupied the city. Soon afterward, disguised as a dervish, Avicenna left Hamadan for Isfahan, where he spent the rest of his life as physician to ‘Alā al-Dawla. This was a relatively peaceful period of his life, during which he undertook astronomical investigations. A serious interruption occurred in 1030, when the Ghaznawids sacked Isfahan and some of Avicenna’s works were pillaged and lost. He died in Hamadan while accompanying his patron on a campaign against that city.

Over a hundred of Avicenna’s works have survived, ranging from encyclopedic treatments to short treatises and covering, apart from philosophy and science, religious, linguistic, and literary matters. He wrote some works in Persian, of which the *Dānishnāma-yi ‘Alā’ī* (“The Book of Science Dedicated to ‘Alā al-Dawla”) is the most important. Most of his works, however, are in Arabic. His chief medical work is *al-Qanūn fī al-Tibb* (“The Canon of Medicine”), a synthesis of Greek and Arabic medicine which also includes his own clinical observations and views on scientific method. The most detailed

philosophical work is the voluminous *al-Shifā’* (“The Healing”). *Al-Najāṭ* (“The Deliverance”) is largely a summary of *al-Shifā’*, although there are some deviations. *Al-Ishārāt wa al-Tanbīhāt* (“The Directives and Remarks”) gives the quintessence of Avicenna’s philosophy, sometimes in an aphoristic style, and concludes with an expression of his mystical esoteric views, a part that relates to certain symbolic narratives which he also wrote.

PHILOSOPHY

Avicenna forged a comprehensive philosophical system that owed a great deal to Aristotle, but his system cannot be strictly called Aristotelian. In both his epistemology and his metaphysics he adopted Neoplatonic doctrines but formulated them in his own special way. There were other Greek influences: Plato on his political philosophy; Galen on his psychology; the Stoics on his logic. Nearer home was the influence of Islamic theology and philosophy. The theologians had stressed the contingent nature of things, subjecting Aristotelian causal theory to severe logical and empirical criticism. Avicenna undertook to meet this criticism and attacked the theologians’ formulation of the notion of contingency, but he nonetheless was influenced by it. The Islamic philosopher who influenced him most was al-Fārābī; Avicenna adopted al-Fārābī’s concept of the identity of divine essence and existence, and developed his dyadic emanative system into a triadic scheme. As both metaphysician and political thinker, Avicenna interpreted the Islamic religion in terms of his own system. Whether this religion remains “Islamic” when so interpreted is a debatable point, but it conditioned the way Avicenna formulated his philosophy.

METAPHYSICS. Although Avicenna’s system rests on his conception of the Necessary Existent, God, he held that the subject matter of metaphysics is broader than theology. As distinct from physics, which considers moving things “inasmuch as they move,” metaphysics is concerned with the existent “inasmuch as it exists.” We arrive at the Necessary Existent by first examining the attributes of the existents. Avicenna undertook such examination in detail, drawing those distinctions which greatly influenced Latin scholastic thought. One such distinction is that between a universal like “horse,” by definition predicable of many instances, and a universal like “horseness,” in itself outside the category of such predication; considered in itself, horseness is simply horseness, neither one nor many. Related to this is the fundamental distinction between essence and existence.

If we examine any existing species, we find nothing in its essence to account for its existence. In itself, such an existent is only possible: it can exist or not exist. From *what* it is, we cannot infer *that* it exists, although in fact it exists. Something has “specified” it with existence; and this something, argued Avicenna, must be its necessitating cause. If it were not—if it were a cause that may or may not produce its effect—we would have to suppose another cause; and if this cause were not necessitating, yet another; and so on ad infinitum. But an infinity of such causes—even if allowed—would not specify the possible with existence. Hence, such an existent must be necessitated by another, by which Avicenna meant that its existence is the consequence of the essence of another existent. The theory involved here is that of essential causality, where causal action is a necessary attribute of a thing’s essential nature and where cause and effect coexist. Existents form a chain of such essential causes; and since these coexist, the chain must be finite. Otherwise it would constitute an actual infinite, which Avicenna deemed impossible. The chain must proceed from an existing essence that does not derive its existence externally. This is God, the Necessary Existent, who, Avicenna attempted to demonstrate, must be eternal, one, and simple, devoid of all multiplicity. Since God, the necessitating cause of all the existents, is eternal, his effect, the world, is necessarily eternal.

The world emanates from God as the consequence of his self-knowledge. Self-knowledge, however, does not imply multiplicity in the knower; nor does multiplicity proceed from God directly. God’s act of self-knowledge necessitates the existence of one intellect. Multiplicity proceeds from this intellect which undergoes three acts of awareness, corresponding to the three facts of existence it encounters: (1) God’s existence as necessary in itself; (2) the intellect’s own existence as necessitated; (3) the intellect’s own existence as only possible in itself. These three acts of awareness necessitate the existence of three things—another intellect, a soul, and the first heaven, respectively. The second intellect, in turn, undergoes a similar cognitive process, necessitating another triad; the third intellect, yet another; and so on down to the sphere of the moon. The last intellect thus generated is the Active Intelligence, whose acts of cognition necessitate the world of generation and corruption.

Avicenna’s cosmology was oriented toward the Ptolemaic system as modified by some of the Islamic astronomers, who, in order to explain the precession of the equinoxes, added another heavenly sphere beyond that of the fixed stars, and Avicenna inclined toward

regarding the number of intellects as ten. He was not dogmatic on this point, however, leaving the question of the number of intellects adjustable to changes in astronomical and cosmological theory. What he insisted on was that the number of intellects should be at least equal to the number of heavens.

In this scheme Avicenna attempted to make precise the relation of the celestial intellects to God, something left uncertain in Aristotle. According to Avicenna, the intellects derive their existence from God and are arranged in an ontological and normative hierarchy corresponding to their proximity to God. God, for him, is not only the prime mover but also the cause of existence. The celestial intellects, in turn, although deriving their existence from God, cause other existents and act as teleological causes. Thus, in each of the triads the heavenly body is moved by its soul through the soul’s desire for the intellect. The souls differ from the intellects in that they have a material aspect enabling them to have direct influence over the particulars in the sublunar world and to know them in their particularity. Neither God nor the celestial intellects have this direct influence and know these particulars only “in a universal way.”

THE HUMAN SOUL. According to Avicenna, both the human soul and the rational knowledge it acquires are emanations from the Active Intelligence. As such, the body “receives” the soul and the soul “receives” rational knowledge. Certain combinations of formed matter induce the reception from the Active Intelligence of the vegetative soul. Other combinations induce, in addition to this, the reception of the animal soul; and others, in addition to these two, induce the reception of the rational soul, with its practical and theoretical aspects. The human rational soul is an individual, indivisible, and immaterial substance that does not exist as an individual prior to the body—Avicenna denied the theory of transmigration. Further, it is created *with* the body, not “imprinted” on it. The body is no more than the soul’s instrument, which the soul must use for perfecting itself through the attainment of theoretical knowledge; this involves complete control of the animal passions. Souls inherently incapable of attaining theoretical knowledge can still control the body and live pure lives by adhering to the commands of the revealed law. With the body’s corruption (death), the soul separates to exist eternally as an individual. Souls that have led pure lives and have actualized their potentialities continue in eternal bliss, contemplating the celestial principles. The imperfect souls, tarnished by the body, continue in eternal torment,

vainly seeking their bodies, which once were the instruments of their perfection.

Avicenna denied bodily resurrection but insisted on the Soul's individual immortality. To begin with, he held that the immaterial is incorruptible. Moreover, he was convinced not only of the soul's immateriality but also of its individuality. He argued for both these points simultaneously: When one refers to himself as "I," this cannot be a reference to his body. If a man were to come into being fully mature and rational but suspended in space so that he was totally unaware of his physical circumstances, he would still be certain of one thing—his own existence as an individual self.

Theoretical knowledge consists in the reception of the intelligibles from the Active Intelligence. The primary intelligibles, the self-evident logical truths, are received by men directly, without the need of the soul's preparatory activities on the sensory level. The secondary intelligibles, concepts and logical inferences, whose reception is limited to people capable of demonstrative knowledge, normally require preparatory activities involving the external and internal senses—sensation, memory, imagination, estimation, and cogitation, or imaged thinking. Avicenna assigned special faculties and physiological places to these activities. The human intellect undergoes various stages in its acquisition of the intelligibles. At first it is a material intellect, a pure potentiality analogous to prime matter, ready for the reception of the intelligibles. With the reception of the first intelligibles it becomes the intellect with positive disposition. When it is *in the act* of receiving the secondary intelligibles, it becomes the acquired intellect. When an intellect that receives the secondary intelligibles is not engaged in the act of reception, it is termed "the actual intellect."

POLITICAL AND RELIGIOUS PHILOSOPHY. Avicenna followed al-Fārābī in holding that revealed religion gives the same truths as philosophy but in the symbolic, particular, imaged language that the masses can understand. According to Avicenna, some prophets receive this particular symbolic knowledge directly from the celestial souls. Such reception involves the prophet's imaginative faculty. In a higher form of prophecy that is intellectual, the prophet receives from the celestial intellects not only the first intelligibles, without the need of the soul's preparatory activities, but also the second. Prophetic reception of knowledge thus differs from the philosophical "in manner." It also differs "in quantity." Avicenna suggested that the prophet receives all or most of the intelligibles from the Active Intelligence "all at once." This intellectual reve-

lation is then translated into the language of imagery and divulged to the public. It includes the basic commands of the revealed law, without which man as a political animal cannot survive. Hence, divine goodness must reveal the law at certain moments of discussion through prophets. Prophecy is thus necessary in the sense that it is required for the survival of civilized society and in the sense that it is necessitated by the divine nature. Having argued for the necessity of prophecy, Avicenna proceeded to accommodate Islamic institutions within his philosophical framework.

The high point of Avicenna's religious philosophy is his discussion of mysticism in the *Ishārāt*. In this work he adopted the language of Islamic mysticism (*sufism*) to describe the mystic's spiritual journey to God: Beginning with faith and motivated by desire and love, the mystic undertakes spiritual exercises that first bring him to interrupted glimmerings "of the light of the Truth." These experiences become progressively more frequent and durable until the stage of "arrival" is reached, in which the mystic has a direct and an uninterrupted vision of God. According to Avicenna, there are further stages beyond this, but he declined to discuss them. He also ascribed some of the prophetic qualities to mystics, without implying that all mystics are law-revealing prophets. On the other hand, his language suggests that he held that all prophets are mystics.

LOGIC AND DEMONSTRATIVE METHOD. Avicenna inherited the Aristotelian and Stoic logical tradition as expounded by al-Fārābī and the Baghdadi school of logicians but treated his subject more independently. He found the then current classification of syllogisms into "attributive" (categorical) and "conditional" too narrow. Instead, he classified them as "connective" and "exceptional." Connective syllogisms have the *form* of the categorical, but their premises may consist of combinations of attributive and conditional statements. Similarly, exceptional syllogisms have the form of one of the two types of conditional syllogisms—the conjunctive, corresponding to the *modus ponens* and the *modus tollens*, and the disjunctive in which the logical relation is exclusive—but their premises may consist of attributive statements conditionally related, or combinations of conditional and attributive statements. He attempted the quantification of both conjunctive and disjunctive premises, discussed the temporal aspects of quantification in general, and treated the modality of premises and arguments at length.

Although Avicenna held logic to be merely a tool of knowledge and strove to treat it as distinct from philoso-

phy, his discussion of the epistemic status of premises (which carried him considerably beyond anything in Aristotle) rendered his logic philosophically committed; his discussion of demonstrative premises was committed to his epistemology and metaphysics of causality. He followed Aristotle in his treatment of demonstrative inference, distinguishing between demonstrations that give the reasoned fact and those that give the fact. The former involve inference from cause to effect; the latter, inference from effect to cause. He also included in the latter class inferences from one effect to another. This is possible when it has been established that a single cause necessitates two effects; Avicenna gave a medical example of a disease that has two symptoms.

Avicenna's endorsement of the *Posterior Analytics* extended to much of the *Physics*. He rejected, however, Aristotle's account of falling bodies, substituting for it a theory of acquired force that was a forerunner of the theory of momentum.

Although some Jewish and Islamic philosophers (Maimonides, ibn Bājja [Avempace], Averroes) showed a preference for al-Fārābī, Avicenna's influence overshadowed the latter's in the Islamic world. The mystical side of his philosophy was elaborated in the illuminationist thought of the philosophers of Persia. The orthodox Ash'arite theologians who condemned his metaphysics adopted his logic, and his medical works continued to dominate the Islamic world until the emergence of the modern university.

In the Latin West his emanative metaphysics and epistemology blended with the Augustinianism of the Franciscan schools as a basic ingredient of their thought. His influence on Thomas Aquinas was considerable, notwithstanding Thomas's rejection of many Avicennian doctrines. He also greatly influenced the development of logic and science, his *Canon of Medicine* remaining an authoritative medical text into the seventeenth century.

Bibliography

There is no collected edition of Avicenna's works in the original. The closest thing to a collection of Persian works consists of Volumes X–XXV of the series *Silsila-i Intishārāt-i Anjuman-i Āthāri Millī* (Publications of the Society of National Monuments). These volumes, published by the University of Teheran, appeared in 1951 on the occasion of Avicenna's millenary.

Critical editions of parts of the *al-Shifā'*, in the original Arabic have been appearing in a series sponsored by the Egyptian ministry of education and supervised by Dr. Ibrahim Madkūr. The following volumes have appeared: *Al-Madkhal* ("Isagoge," Cairo, 1952); *Al-Khaṭaba* ("Rhetoric," Cairo, 1954); *Al-Burhān* ("Demonstration," Cairo, 1955); *Jawami 'ilm al-Mūsīqā* ("Music," Cairo, 1956); *Al-Safsata* ("Sophistic," Cairo, 1958); *Al-Maqūlāt* ("Categories," Cairo, 1959); *Al-Ilāhīyāt* ("Metaphysics," 2 vols., Cairo, 1960); and *Al-Qiyās* ("Syllogism," Cairo, 1964).

Translations of Avicenna's works include *Avicenna on Theology*, translated by A. J. Arberry (London, 1951); *A Treatise on the Canon of Medicine*, translated by O. Cameron Gruner (London: Luzac, 1930); *Avicennae de Congelatione et Conglutinatione Lapidum*, translated by E. J. Holmyard and D. C. Mandeville (Paris: P. Guethner, 1927); *Die Metaphysik Avicennas*, translated by Max Horten (New York: R. Haupt, 1907); *La métaphysique du Shifā'*, translated by M. M. Anawati, mimeographed ed. (Quebec, 1952); *Le livre de science*, translated by Mohammad Achena and Henri Massé, 2 vols. (Paris: Société d'édition "Les Belles Lettres," 1955); *Le livre des directives et remarques*, translated by A. M. Goichon (Paris, 1955); *Psychologie d'Ibn Sīnā (Avicenne) d'après son oeuvre Aš-šifā'*, edited and translated by Jan Bakoš (Prague: Editions de l'Académie tchécoslovaque des Sciences, 1956); Ralph Lerner and Muhsin Mahdi, eds., *Medieval Political Philosophy: A Source Book* (New York: Free Press of Glencoe, 1963), pp. 95–121; and *Avicenna's Psychology*, translated by Fazlur Rahman (London: Oxford University Press, 1952).

AVICENNA [ADDENDUM]

Avicenna played an important role in Islamic aesthetics. Poetry relies on imagination, he argues, but that does not mean it is entirely without logical structure. On the contrary, one can only understand poetry if it is analyzed in terms of the syllogism. The premises of such a reasoning are statements produced by writers to bring about emotional states in the reader or hearer. This only works if there is some reason to connect the use of words with the emotion, and that reason has precisely to be a logical reason. The conclusion is the pleasure one feels at the bold and striking use of language, and because one is not the only person who can enjoy that use of language, the conclusion is also available to others. It then becomes a general conclusion rather like the conclusion of a strictly demonstrative syllogism. Avicenna follows a similar strategy in discussing music, in that at the end of the reasoning process one undergoes when listening to it, a conclusion is drawn in terms of a pleasure that one can expect others to share.

AYER, ALFRED JULES

(1910–1989)

Alfred Jules Ayer, the British philosopher, received his education at Eton, where he was a king's scholar, and at Christ Church, Oxford. After graduating in 1932, he spent some time at the University of Vienna familiarizing himself with the logical positivist movement, then little known among English-speaking philosophers. He returned to Oxford in 1933 as a lecturer in philosophy at Christ Church and in 1935 became a research fellow of the college. Army service in World War II kept him from philosophy until 1945, when he went back to university teaching as fellow and dean of Wadham College, Oxford. In the following year he became Grote professor of the philosophy of mind and logic at University College, London, where he remained until his return to Oxford as Wykeham professor of logic in 1959.

Ayer's first book, *Language, Truth and Logic*, was published in 1936. Its combination of lucidity, elegance, and vigor with an uncompromisingly revolutionary position has made it one of the most influential philosophical books of the century. As Ayer explains in the preface, the views he advocates derive from Bertrand Russell and Ludwig Wittgenstein among modern philosophers and from the earlier empiricism of George Berkeley and David Hume and have much in common with the logical positivism of the Vienna circle. But he accepts none of these influences uncritically and clearly puts his own stamp on the position he outlines. He adopts Hume's division of genuine statements into logical and empirical, together with a principle of verification that requires that an empirical statement shall not be counted as meaningful unless some observation is relevant to its truth or falsity. This starting point has drastic and far-reaching results. Metaphysical statements, since they purport to express neither logical truths nor empirical hypotheses, must accordingly be reckoned to be without meaning. Theology is a special case of metaphysics; affirmations of divine

existence are not even false, they are without sense. For the same reason, value statements in ethics or aesthetics fail to attain the status of genuine statements and are exposed as expressions of emotion with imperative overtones. The a priori statements of logic and mathematics are empty of factual content and are true in virtue of the conventions that govern the use of the words that compose them. The tasks left for philosophy after this withdrawal from its traditional boundaries are those of solving by clarification the problems left untouched by the advance of the sciences. Philosophy is an activity of analysis and is seen, in the end, to be identical with the logic of science.

The second edition of the book (1946) contains an introduction that modifies, though it does not retract, the main theses of the first edition. Ayer's attention here is directed chiefly to giving a precise formulation of the principle of verification. His original version is replaced by a much more elaborate and carefully worded formula. Both versions have, however, been shown to be faulty in admitting as meaningful metaphysical statements of precisely the kind that the principle is designed to outlaw. Indeed, there seems to be a weakness of the principle in that, it appears plausible only when its expression is left uncomfortably vague.

The Foundations of Empirical Knowledge (1940) is concerned with two groups of problems, those of perception and those of "the ego-centric predicament" (privacy and publicity in language and in sense experience and the problem of other minds). The most interesting and original feature of the book is Ayer's treatment of the terminology of sense data as a language in which the problems of perception can be most appropriately dealt with rather than as a thesis embodying a discovery about the facts of sense experience. *Thinking and Meaning* (1947) was Ayer's inaugural lecture in the University of London. It is a trenchant application of Ockham's razor to the problems of intentionality and the relations between minds, thinking objects, words, and meaning. This short, powerful essay has so far received less than its due of critical attention. *Philosophical Essays* (1954) is a collection of papers ranging over philosophical logic, the theory of knowledge, and moral philosophy. Half the papers are carefully argued treatments of problems raised in Ayer's first two books; in particular, "The Analysis of Moral Judgements" is a moderate and persuasive restatement of the hints on ethics thrown out in *Language, Truth and Logic*.

In 1956 Ayer published *The Problem of Knowledge*, his most important book since his first was published in

1936. It is a sympathetic and constructive treatment of the various problems of philosophical skepticism. After a short discussion of philosophical method and the nature of knowledge, he discusses at length the pattern of skeptical arguments. He then examines three problems familiar from his earlier work—perception, memory, and other minds—as instances of skepticism at work. It may be that no statement is immune from doubt, but this does not entail that no statement can be known to be true. Where statements cannot, even in principle, be justified, we may conclude not that they are to be rejected but rather that no justification is called for.

The Concept of a Person (1963) is a collection of essays. The most striking, the one that gives the book its title, is a notable survey of some aspects of the problems of body, mind, and personal identity. The outcome can be roughly summarized as follows: To say that I own a mental state *M* is to say that there is a physical body *B* by which I am identified and that a state of *B* causes *M*.

Ayer's Shearman Lectures at the University of London in 1964 were on induction and probability. This was a new field of interest for Ayer, although it was foreshadowed in two papers in *The Concept of a Person*.

Ayer's work is very much of a piece, both in style and attitude. He became more catholic in interest and more cautious and temperate in expression than in his earlier writings. But his arguments were informed by the same principles and set out with the same grace and clarity. He leaned perhaps too heavily on Hume's dichotomy of statements into logical and factual, and he has not so far set himself seriously to meet contemporary criticisms (particularly those of W. V. O. Quine) that have been made of this famous distinction. This is at once a weakness of his present position and, perhaps, a presage of its future development.

Ayer died on June 29, 1989. He was professionally active virtually until the time of his death. In recognition of his accomplishments and public service, Ayer was Knighted in 1968. The following year he published both *Metaphysics and Common Sense*, a set of essays on diverse topics, and also *The Origins of Pragmatism*, an account of the philosophies of William James and Charles Sanders Peirce. In 1970 Ayer presented the William James lectures at Harvard in which he discussed the thought of G. E. Moore and Bertrand Russell. In that same year he gave the John Dewey lectures at Columbia University in which he revisited induction and probability, the topic of his 1964 Shearman lectures at the University of London. Ayer's *The Central Questions of Philosophy* (1974) is regarded by some as a new and refined version of his clas-

sic work *Language, Truth and Logic*. After serving for almost twenty years as Wykeham professor of logic at Oxford, Ayer retired from the position in 1978. Shortly thereafter a festschrift *Perception and Identity* was published in his honor, which contained essays by prominent thinkers and Ayer's replies to them. In 1982 Ayer offered his *Philosophy in the Twentieth Century* as a possible sequel to Bertrand Russell's *History of Western Philosophy*. He published interpretations of Ludwig Wittgenstein in 1985, Voltaire in 1986, and Thomas Paine in 1988. He also wrote two autobiographical volumes: *Part of My Life* (1977) and *More of My Life* (1984). His rather lengthy obituary in *The Times* of London concludes with these words: "Ayer was not a major philosopher like Russell or Wittgenstein, or even, perhaps like Popper and Ryle. But he was a very able philosopher indeed, endowed with particularly sparkling intellectual gifts, an admirable if slightly chilly prose style and unflagging energy. As a philosophical teacher and influence there is no one to compare with him since Russell and Moore."

BAADER, FRANZ XAVIER
VON
(1765–1841)

Franz Xavier von Baader, the German philosopher and theologian, was born in Munich. He studied medicine at Ingolstadt and Vienna and practiced for a short time, but soon abandoned this career. While he was in England from 1792 to 1796 studying mineralogy and engineering, he became interested in philosophy and theology. On his return to Germany he formed friendships with Friedrich Heinrich Jacobi and Friedrich Wilhelm Joseph von Schelling. Although Baader later broke with Schelling, the three philosophers continued to exert strong influence on one another. Baader was appointed superintendent of the Bavarian mines and won a prize from the Austrian government for inventing a new method of glass manufacture. He retired in 1820 to devote himself to philosophy.

Baader's two major works are *Fermenta Cognitionis* (Vols. I–IV, Berlin, 1822–1824; Vol. V, Munich, 1825) and *Spekulative Dogmatik* (5 fascicles, Munich, 1827–1828). He was appointed professor of philosophy and speculative theology at the new University of Munich in 1826. He stopped lecturing on theology in 1838, when the Catholic bishop banned the public discussion of theology by lay-

men, but he continued to lecture on philosophy until his death.

Baader's philosophy is couched in aphorisms, symbols, and analogies, and it is therefore difficult to summarize. He detested David Hume's empiricism, William Godwin's radicalism, and Immanuel Kant's rationalism. He turned the critical method he had learned from Kant against criticism itself, calling for a return to the mystical tradition of Jakob Boehme, Paracelsus, Meister Eckhart, the Cabala, the Neoplatonists, and the Gnostics. He believed that since God is in all things, all knowledge is partly knowledge of God. God is not an abstract being but an eternal process, eternally becoming. As God creates himself, he comes to know himself. The relation between his will and his self-consciousness is the Holy Spirit. The Trinity is an eternal possibility in God and only becomes actual in nature, which is the principle of selfhood eternally produced by God. Nature is God alienated from himself—his shadow, his desire, his want. The purpose of the existence of nature is to afford an opportunity for the redemption of humanity.

Morality is not a matter of inner law, as Kant believed, but apprehension of, and obedience to, God's will. Salvation depends on prayer, faith, and the sacraments as well as on morality and good works. Humans are social

beings under the law of the state, and the subjects owe total subservience to their ruler. But the state is under the law of the church. Any departure from this divinely ordained order leads to the twin modern evils of despotism and liberalism.

Baader sought a theistic, Catholic philosophy reconciling nature and spirit, science and religion, the individual and society. He believed that philosophy had to go back to its sources, from which it had been separated since the time of Descartes. Baader was thus a precursor of the neoscholastic revival, but his own teachings, close to heresy, have no important place in the movement.

Bibliography

The collected works of Franz von Baader were published as *Sämtliche Werke*, 16 vols. (Leipzig: H. Bethmann, 1851–1860). Vol. XV contains a biography; Vol. XVI, a systematic exposition of Baader's ideas.

Works on Baader are D. Baumgardt, *Franz von Baader und die philosophische Romantik* (Halle: Salle, M. Niemeyer, 1927); J. Claasen, *Franz von Baaders Leben und theosophische Werke*, 2 vols. (Stuttgart, 1886–1887), and *Franz von Baaders Gedanken über Staat und Gesellschaft* (Gütersloh, Germany, 1890); and Kuno Fischer, *Zur hundert jährigen Geburtsstagsfeier Baaders* (Erlangen, Germany, 1865).

Adam Margoshes (1967)

BACHELARD, GASTON

(1884–1962)

Gaston Bachelard, the French epistemologist and philosopher of science, was born at Bar-sur-Aube. He was a postal employee until 1913, when he gained his *licence* in mathematics and science and became a teacher of physics and chemistry at the Collège of Bar-sur-Aube. In 1927 he received his doctorate of letters and in 1930 became professor of philosophy at the University of Dijon. From 1940 to 1954 he held the chair of history and philosophy of science at the University of Paris.

Bachelard expounded a dialectical rationalism, or “dialogue” between reason and experience. His philosophy was a departure from the view of rational discovery as a process whereby new knowledge is assimilated into a system that changes only insofar as it grows. He rejected the Cartesian conception of scientific truths as

immutable elements of a total truth that is in process of being put together like a jigsaw puzzle.

According to Bachelard, experiment and mathematical formulation are mutually complementary. Mathematics is not merely a means of expressing physical laws, nor is it a static realm of ideas; it is “committed.” In this context Bachelard talked of “applied rationalism.” Bachelard held that the empirical world is not utterly discontinuous and absurd; the confrontation of an isolated, rational human mind with an indifferent and meaningless world postulated by some existentialists is naive. Scientific hypotheses, and even scientific facts, do not present themselves passively to the patient investigator but are created by him. The investigator's reasoning and the natural world on which it operates together constitute a second nature over and above the crudely empirical one.

Bachelard described his conception of this two-way process in which rational organization and experiment are in constant cooperation as a “philosophy of saying no” (*philosophie du non*). It involves negation because the scientific attitude is necessarily “open” or “available” (*disponible*), and the scientist may be obliged at any time to recast his formulation of reality by facts which fail to fit into the old formulation. Since it is frequently mathematical, the reformulation may not necessarily involve the adoption of a new model, but it will often be analogous to a change of structure. At the same time, there will be no jettisoning of truths: The *philosophie du non* destroys nothing, Bachelard held; it consolidates what it supersedes. The framework may be recast and the picture of reality transformed, but only in such a way that the new phenomenon might have been foreseen.

Bachelard did not confine himself to an exclusively rationalist philosophy of science. He saw both technological and imaginative thinking as issuing from reverie and emotion into practical expression. His works on the psychological significance of the four elements, earth, air, fire, and water, illustrate this. He rejected, for example, the common account of the discovery of fire in the rubbing together of two sticks, seeing it rather as the outcome of a kind of symbolical representation of sexual intercourse. Thus passion is no more metaphorical fire than fire is metaphorical passion. Our science and our poetry have a common origin accessible only to psychoanalysis. There is a unity in Bachelard's studies on reason and imagination. In both cases he stressed the projective or creative role of the mind; in art “the subject projects his dream upon things,” and in modern science, “above

the *subject*, beyond the immediate object ... is the *project*.”

Colin Smith (1967)

BACHOFEN, JOHANN JAKOB (1815–1887)

Johann Jakob Bachofen, Swiss jurist, cultural anthropologist, and philosopher of history, studied philology, history, and law at the universities of Basel, Berlin (under Friedrich Karl von Savigny), and Göttingen. After taking his doctorate in 1839 in Roman law, he spent two years at the universities of Oxford, Cambridge, and Paris. In 1841, Bachofen was offered the chair in Roman law at the Uni-

versity of Basel, and a year later he was appointed a judge of the criminal court at Basel. In 1844 he resigned his professorship to devote himself to legal and anthropological research. In 1866 he also gave up his position as a judge. He traveled widely and lived for long periods in Greece, Italy, and Spain.

Bachofen's major works were in the fields of ancient Roman law and Greek antiquity. The work for which he is best known is *Das Mutterrecht. Eine Untersuchung über die Gynäkokratie der alten Welt nach ihrer religiösen und rechtlichen Natur* (Stuttgart, 1861). Following up Herodotus's description of a matriarchal system among the Lycians, Bachofen investigated diverse ancient myths and concluded that both matrilineal descent and matriarchal rule developed out of a state of unregulated promiscuity (*Hetärismus*) by virtue of the difficulty of ascertaining paternity under such conditions. He maintained that the dominant role of the mother in both the economic and political spheres was a phenomenon common to all primitive societies and that this role was inseparably linked to religious beliefs that established the secular primacy of woman on the basis of the cult of a female deity.

There is no element of evolution in Bachofen's theory. His main interest lay in tracing the transmission of social cultures, not in the biological characteristics attending heredity. Bachofen likewise rejected interpretations of myths in terms of individual psychology. The elements that constituted for him the essential ingredients of historical traditions—myths, cults and rituals, customs, law, and folklore—were *shared* characteristics and hence, in his view, objective factors. They embodied a people's collective "spirit," or *Volksgeist*, which, though a persistent continuum in social development, nonetheless operated at a nonrational and subconscious level. According to Bachofen it was the function of the woman and mother to preserve and uphold these nonrational historical forces and thus to exercise a uniting influence, whereas man, representing the progressive and rational forces, exercised a dividing influence over the development of humankind. The historical process consisted in a continuous striving for reconciliation between these opposing tendencies.

Das Mutterrecht encountered considerable skepticism, if not hostility, among contemporary anthropologists. Bachofen was charged with introducing rather fanciful and value-loaded notions into his theory and with confusing matrilineal descent with a matriarchate. But even though some of his theses have been disproved and others continue to be challenged, many of his suggestions have led to fruitful further research into the fam-

ily customs of primitive peoples. Increasingly, too, Bachofen's works have been appraised as a major contribution to the philosophy of history.

Bachofen stressed the continuity of historical sequences and, above all, the close interpenetration of myth and history. In opposition to Georg Wilhelm Friedrich Hegel, Bachofen attached decisive importance to myths and symbols in the shaping of human history, since he accorded to them a far greater and more lasting emotive power than he did to rational concepts. In his stress on the irrational elements in history, as also in his insistence on regarding history as a continuous organic growth, Bachofen shared some of the basic premises of romantic thought. Yet, like Johann Gottfried Herder, the great precursor of romanticism, he never regarded himself as a romantic. Indeed, he explicitly repudiated the nostalgic sentimentality with which a number of romantics approached the study of the past.

Bachofen's political views show an undeniable affinity for the conservatism of the political romantics, but here also he was more directly influenced by Edmund Burke, whom he had assiduously studied during his stay in England. Paradoxically enough, Bachofen has often been associated with L. H. Morgan as one of the founders of a socialist philosophy of history. Bachofen did stipulate a "communist" origin of humankind in that he denied the existence of private property among primitive communities. He also prophesied an ultimate return to communism, understood in this sense. But he viewed such a return as a regression, not as "progress." Bachofen saw in socialism and democracy portents of social and political decay, for he held them to be inherently inimical to harmonious community life. Social and political harmony presupposed, in his view, the willing acceptance of the principle of subordination, for he regarded this principle as the prime source of a naturally and divinely ordered historical process.

Bachofen may have gone too far in the political application of his tradition-centered historicism, just as he probably overstated the role of woman in the development of religion, morals, law, and customs. But he did advance a functional conception of social development, in which social structures are seen as elements of a historical continuum and as constituents of an "idea-system" of nonrational and nonlogical beliefs and symbols, and in so doing he substantially contributed to the understanding of both ancient communities and societies of the modern world.

Bibliography

WORKS BY BACHOFEN

Collections

- J. J. Bachofens gesammelte Werk.* Edited by Karl Meuli. 10 vols. Basel: B. Schwabe, 1943–.
- Der Mythos von Orient und Occident.* Edited by Manfred Schroeter. 2nd ed. Munich: Beck, 1956. Contains a selection of Bachofen's works, with an introduction by Alfred Baeumler and a bibliography of Bachofen's published works.

Individual Works

- Das Naturrecht und das geschichtliche Recht in ihren Gegensätzen.* Basel, 1841.
- Das römische Pfandrecht.* Basel: Schweighauser, 1847.
- Ausgewählte Lehren des römischen Civilrechts.* Bonn: A. Marcus, 1848.
- Versuch über die Gräbersymbolik der Alten.* Basel, 1859; 2nd ed., Basel: Helbing and Lichtenhahn, 1925.
- Das Mutterrecht.* Stuttgart: Kraiss and Hoffmann, 1861.
- Die Unsterblichkeitslehre der orphischen Theologie.* Basel, 1867.
- Die Sage von Tanaquil.* Heidelberg: J.C.B. Mohr, 1870.
- Antiquarische Briefe,* 2 vols. Strassburg: K.J. Trübner, 1880, 1886.
- Römische Grablampen.* Basel, 1890.

WORKS ON BACHOFEN

- Bernoulli, C. A. J. *J. J. Bachofen als Religionsforscher.* Leipzig, 1924.
- Bernoulli, C. A. J. *J. J. Bachofen und das Natursymbol.* Basel: B. Schwabe, 1924.
- Burckhardt, Max. *J. J. Bachofen und die Politik.* Basel, 1943.
- Kerenyi, K. *Bachofen und die Zukunft des Humanismus.* Zürich: Rascher, 1945.
- Klages, Ludwig, *Der Kosmogonischen Eros.* Munich, 1922.

Frederick M. Barnard (1967)

BACON, FRANCIS (1561–1626)

Francis Bacon, Baron Verulam, Viscount St. Albans, gained renown both as an English statesman and a natural philosopher. Bacon was instrumental in the replacement of Aristotelian natural philosophy, effecting a major shift to thinking about the natural world in exclusively empirical and experimental terms, although he remained

entrenched in Aristotelian thought to a significant degree. His achievement was twofold: First, he transformed the discipline of philosophy from something contemplative that focused above all on moral questions into something practical that focused centrally on questions in natural philosophy (what is now called science). Second, his work in the natural sciences resulted in the formulation of precepts that are now regarded as foundation stones of the inductive modern scientific method: moving inferentially from observable effects to deeper underlying causes and eliminating various possible explanations by testing their consequences against experiment or observation.

LIFE

Bacon was born on January, 22, 1561, the eldest son of Sir Nicholas Bacon, lord keeper of the Great Seal, and Ann, second daughter of Sir Anthony Coke, known for her strong Protestant sympathies. Bacon attended Trinity College, Cambridge, from 1573 to 1575, but moved to Gray's Inn in 1575, traveling to France—where he came into contact with Italian republican ideas—in 1576 and remaining there until his father's death in 1579. From that time onward he began a career in law and politics that took him from his first parliamentary seat (1581), admission to the bar (1582), deputy chief steward of the Duchy of Lancaster (1594), solicitor general (1607), attorney general (1613), member of the Privy Council (1616), lord keeper of the Great Seal (1617), to his being created viscount of St. Albans in 1621. In that same year he was impeached and spent the rest of his life in comparative isolation from the court society he had enjoyed for the previous fifteen years. He died on April 9, 1626. His death has traditionally been attributed to his contracting pneumonia as a result of leaving his carriage to test the preserving effects of cold on a chicken, but it is more likely that he died of an overdose of inhaled niter or opiates, self-prescribed to cure a long-running illness.

His intellectual career falls into three stages. From 1592 to 1602, his main concern was the reform of English law. From 1602 to around 1620, he worked on a very ambitious project in natural philosophy, advocating a form of atomism and setting out a new method of inquiry in natural philosophy, as well as investigating a huge number of topics in natural history. Around 1620 he began to publish parts of his grand scheme on a systematic basis, although Bacon could never be called a systematic philosopher. His plans for the reform of natural philosophy were not taken seriously by his English contemporaries during his lifetime, but within a few years of

his death, critics of contemporary natural philosophy and founders of scientific academies in Italy, France, and England took him as their model, and by the beginning of the eighteenth century his name was linked with Newton's among the founders of modern science.

LAW AND RHETORIC

Bacon's first attempts at reform were in the area of law rather than natural philosophy. The law offered guidance on three questions that would subsequently make it a model for his proposed reform of natural philosophy: the reliability of testimony, what should be concluded from particular testimonies, and how one decided the relevance of particular laws to the case. It was the third of these that he saw most in need of reform, and he set out to investigate how the law might be systematized, how regular records and reviews of legal decisions might be provided, and whether some firm foundations for legal practice might be discovered. What is at issue here is what was referred to as the "discovery" of law. It was a shared premise that the law was structured in accord with reason and that this structure enabled one, in cases where the laws did not give a clear indication of infringements, to appeal to the implicit message of the common law. On the assumption that the law covered every eventuality, the task was to find one's way through its rational structure. The questions to which Bacon directed himself particularly were whether there was an optimal procedure by which to discover that rational structure and what the ultimate source of authority was in the case of dispute.

Bacon's emphasis on the role for discovery in the legal thinking reflects a concern with rhetoric, which plays a crucial role in both his proposed reform of the law and that of natural philosophy. The task of rhetoric was the formulation, organization, and expression of one's ideas in a coherent and compelling way. It was designed to help one find one's way around the comprehensive body of learning built up from antiquity, to recognize where appropriate evidence and arguments might be found, and to provide models that were designed to give one a sense of what was needed if a particular question was to be investigated, or a particular position defended, models that would be shared with those to whom one was expounding or defending one's case. Rhetoric, in Bacon's view, should help to focus the mental powers, to organize one's thoughts in the most economical fashion, and even (in writers like Quintilian) to provide vivid images or representations of situations that enabled one to convince oneself of a case (important especially in acting and in legal argument). It was designed to provide models to

show one how particular kinds of case were best defended, depending on such facts as the availability of and complexity of the evidence and the knowledge, opinions, or prejudices of the audience toward which one was directing one's arguments.

At a general level, rhetoric was deemed to be indifferent to subject matter because comprehensive procedures were recommended that would aid a case or investigation, scientific or a legal, although there would be similarities or analogies (as regards the standing of various kinds of evidence, for example) and dissimilarities (as regards the means of evidence collection, for example) between legal cases and those in natural philosophy. The law, taken in a broad sense, was seen as a paradigm case for rhetorical writers: Rhetorical treatises were often explicitly directed toward lawyers and legislators, and examples were geared to the kinds of problems that arose in law. In light of this, it is only to be expected that using a rhetorical model for knowledge—that is, a model that gives direction on how to collect and assess evidence for a view, how to make a judgment on the basis of that evidence, and how to establish the correctness of judgment, using precepts derived from the study of rhetoric—is in many respects using a legal model.

Rhetoric provided a theoretical foundation for the law, something which, at a practical level, worked with elaborate procedures for the gathering, assessing, and testing of evidence. This was exactly the kind of thing that Bacon had in mind for natural philosophy. What was unusual about his application of precepts learned from rhetoric and law to natural philosophy was that he used them to propose a fundamental reform of philosophy. While Bacon started from a consideration of the law, however, law did not act as a model in its own right. Its importance arose from the fact that (especially once it had been reformed along Baconian lines) it exemplified a rhetorically motivated account of discovery. This holds the key to Bacon's enterprise.

The best way to understand this reform is in terms of the pervasive Renaissance contrast, often drawn in classical terms, between the life of contemplation (*otium*) and the life of practical, productive activity (*negotium*). There had been a decisive shift in favor of the latter in sixteenth-century England. In particular, there was a stress on practical questions and the practical uses of learning; and philosophy—above all Scholastic philosophy—was widely regarded as a useless discipline that fostered argument for its own sake, never getting anywhere and never producing anything of value. Moreover, morality was widely seen as the key philosophical topic (following the

Ciceronian model current in Renaissance Europe), and a number of Elizabethan thinkers, most notably the poet Sir Philip Sidney, were arguing that poetry was superior to philosophy because philosophy could only discourse on the nature of goodness, whereas poetry could actually move people to goodness, which was the point of the exercise.

Bacon did two things: He shifted philosophy from *otium* to *negotium*, and he made natural philosophy replace moral philosophy as the center of the philosophical enterprise. The combination of these two (and they are intimately connected) is a radical move that marks a decisive break not only with earlier conceptions of philosophy but also with earlier understandings of the task of the philosopher.

Natural philosophy existed in a number of forms in the sixteenth and seventeenth centuries, and there were two extreme forms. The first was exemplified by alchemy, an esoteric but practical discipline that had little connection with traditional philosophical practice and that suffered, in Bacon's view, from a lack of structure that produced few results, with most of that paucity attributable to chance. At the other extreme was Scholastic natural philosophy, an intensely theoretical discipline that, in Bacon's view, produced nothing at all; despite its great sophistication, it turned out to be almost exclusively verbal.

Bacon wanted something that could deliver the advantages of each of these without any of the disadvantages. He wanted something that would provide a detailed theoretical overview of the natural realm such that natural processes could not only be understood but, more importantly, also transformed on the basis of this understanding; this is the context of his famous dictum "knowledge is power." The ultimate aim was to transform natural processes for the common good (to be decided by the sovereign, on Bacon's view), and it was this, rather than some contemplative understanding of nature, that provided the rationale for natural philosophy and, by extension, philosophy *per se*.

Bacon himself formulated his project in terms of a politico-religious restoration of human dominion over the natural world, something lost with Adam's expulsion from Eden. Natural philosophy thereby gained a religious imperative, albeit one with little connection with traditional theology.

THE DOCTRINE OF IDOLS

If rhetoric is the first ingredient in Bacon's account of method, the second is a distinctive understanding of why

the need for method arises. Here Bacon's stress on a psychological dimension of knowledge is important: Questions of presentation of knowledge are not only recognized to be important but also have to be understood, where such an understanding is not supplementary to epistemology but actually part of it. At one level, there is nothing new in this, for it is simply part of a long tradition that begins in earnest with the Roman rhetoricians; but although it borrows from Greek writers, it is rather different from the approach to epistemological questions that we find in the classical Greek and Hellenistic philosophers. When one thinks of Bacon's general project in this context, it becomes clear that there is something novel here. For natural philosophy had generally been the preserve of Greek philosophy and had been pursued in a similar way by Scholastic philosophers. The Roman tradition, with the exception of Lucretius, had typically not concerned itself with speculative natural-philosophical questions, dealing instead with practical moral, political, and legal questions. In thinking of persuasion in terms of a psychological theory, of psychological theory as part of epistemology, and of epistemology as being directed primarily toward natural philosophy, Bacon was able to provide himself with some of the resources to recast natural philosophy not as a speculative but as a practical discipline.

This psychological dimension of epistemology is brought out fully in Bacon's doctrine of the "idols of the mind." These idols "do not deceive in particulars, as the others do, by clouding and snaring the judgment; but by a corrupt and ill-ordered predisposition of the mind, which as it were perverts and infects all the anticipations of the intellect." The second part of the "Great Instauration," which aims at the renewal of learning, is devoted to the "invention of knowledge" and has two components, one aiming to rid the mind of preconceptions, the other to guide the mind in a productive direction. These components are interconnected, for until we understand the nature of the mind's preconceptions, we do not know in what direction we need to lead its thinking. In other words, various natural inclinations of the mind must be purged before the new procedure can be set in place. Bacon's approach here is genuinely different from that of his predecessors, as he realizes. Logic or method in themselves cannot simply be introduced to replace bad habits of thought because it is not simply a question of replacement. The simple application of logic to one's mental processes is insufficient.

In his doctrine of the four idols of the mind, Bacon provides an account of the systematic forms of error to

which the mind is subject, and this is a crucial part of his epistemology. It is in his treatment of internal impediments, the "idols," that the question is raised of what psychological or cognitive state we must be in to be able to pursue natural philosophy in the first place. Bacon believes an understanding of nature of a kind that had never been achieved since the Fall is possible in his own time because the distinctive obstacles that have held up all previous attempts have been identified, in what is in many respects a novel theory of what might traditionally have been treated under a theory of the passions, one directed specifically at natural-philosophical practice.

The "idols of the tribe" derive from human nature itself, above all from "the homogeneity of the substance of the human mind, or from its preoccupation, or from its narrowness, or from its restless motion, or from an infusion of the affections, or from the incompetence of the senses, or from the mode of impression." (*Works* 1857–1874, vol. 4, p. 58–59). The idols of the tribe affect everyone equally and are manifested in an eagerness to suppose that there is more order and regularity in nature than there actually is; in the tendency to neglect or ignore counterexamples to one's theories; in the tendency to extrapolate from striking cases with which one is familiar to all other cases; in the restlessness of the human mind, which means it is not satisfied with perfectly good fundamental explanations, mistakenly and constantly seeking some more fundamental cause ad infinitum; and in the tendency to believe true what one would like to be true.

The "idols of the cave," we are told, "take their rise in the peculiar constitution, mental or bodily, of each individual; and also in education, habit, and accident" (*Works* 1857–1874, vol. 4, p. 59). They include fascination with a particular subject, which leads to overhasty generalization; the readiness of some minds to focus on differences, and some to focus on similarities and resemblances, while a balance is difficult to attain naturally; and the fact that some minds are overly attracted to antiquity and some to novelty. Finally, there are those who are concerned wholly with material constitution at the expense of structure (the ancient atomists) and those who are concerned wholly with structure at the expense of material constitution.

These examples bring to light a very significant difference between the idols of the tribe and idols of the cave. There seems to be a set of routine procedures one can go through to remedy the situation in the latter case, procedures provided by the positive part of Bacon's doctrine—eliminative induction—whereas the case of idols

of the tribe is, in most cases, much more difficult to remedy.

The third kind of idols, those of the marketplace derive from the fact that we have to express and communicate our thoughts by means of language, which contains systematic deficiencies. One kind of problem with language lies in the fact that words “are commonly framed and applied according to the capacity of the vulgar, and follow those lines of division which are most obvious to the vulgar understanding. And whenever an understanding of greater acuteness or a more diligent observation would alter those lines to suit the true divisions of nature, words stand in the way and resist the change” (*Works* 1857–1874, vol. 4, p. 61). This leads to two kinds of linguistically induced deficiencies. First, language provides names that refer to things that do not exist, such as “Fortune, Prime Mover, Planetary Orbits, Element of Fire, and like fictions that owe their origin to false and idle theories” (*Works* 1857–1874, vol. 4, p. 61). The solution here is simply to get rid of the theories that give rise to these fictitious entities.

The second kind of case is not so straightforward. It arises because words have multiple and/or ill-defined meanings, and this is especially so in the case of terms such as *humid* that have been abstracted from observation. Bacon discerns a gradation in the “degrees of distortion and error” (*Works* 1857–1874, vol. 4, p. 62) of terms, beginning with names of substances, where the degree of distortion is low, proceeding through the names of actions, and finally reaching the names of qualities—he gives the examples of “heavy, light, rare, dense” (*Works* 1857–1874, vol. 4, p. 62)—where the degree of distortion is high.

Finally, the fourth kinds of impediment, the idols of the theater, are innate neither in the mind nor in language but are acquired from a corrupt philosophical culture and its perverse rules of demonstration. Here a general remedy is available, namely following Bacon’s positive methodological prescriptions: “The course I propose for the discovery of sciences is such as leaves but little to the acuteness and strength of wits, but places all wits and understandings nearly on a level. For as in the drawing of a straight lines or a perfect circle, much depends on the steadiness and practice of the hand, but if with the aid of a rule or compass, little or nothing; so is it exactly with my plan” (*Works* 1857–1874, vol. 4, p. 62–63).

One of the great values of Bacon’s account of the idols is that it allows him to make the case for method in a particularly compelling way. Indeed, never has the need for method been set out more forcefully, for Bacon’s

advocacy of method is not simply an aid to discovery. He argues that we pursue natural philosophy with seriously deficient natural faculties, we operate with a severely inadequate means of communication, and we rely on a hopelessly corrupt philosophical culture. In many respects, these are beyond remedy. The practitioners of natural philosophy certainly need to reform their behavior, overcome their natural inclinations and passions, but not so that, in doing this, they might aspire to a natural, prelapsarian state in which they might know things as they are with an unmediated knowledge. This they will never achieve. Rather, the reform of behavior is a discipline to which they must subject themselves if they are to be able to follow a procedure which is, in many respects, quite contrary to their natural inclinations, which is at odds with traditional conceptions of the natural philosopher, and which is indeed subversive of their individuality.

ELIMINATIVE INDUCTION

What Bacon is seeking from a method of discovery is something that modern philosophers would deem impossibly strong: the discovery of causes that are both necessary and sufficient for their effects. Why place such strong constraints on causation, so that we call something a cause only when the effect always occurs in the presence of this thing and never in its absence? What Bacon (like Aristotle before him) is after are the ultimate explanations of things, and it is natural to assume that ultimate explanations are unique. Bacon’s method is designed to provide a route to such explanations, and the route takes us through a number of proposed causal accounts, which are refined at each stage. The procedure he elaborates, eliminative induction, is one in which various possibly contributory factors are isolated and examined in turn, to see whether they do in fact make a contribution to the effect. Those that do not are rejected, and the result is a convergence on those factors that are truly relevant. The kind of “relevance” that Bacon is after is, in effect, a set of necessary conditions: the procedure is supposed to enable us to weed out those factors that are not necessary for the production of the effect, so that we are left only with those that are necessary.

Bacon provides an example of how the method works in the case of color. We take, as our starting point, some combination of substances that produces whiteness—that is, we start with what are sufficient conditions for the production of whiteness, and then we remove from these anything not necessary for the color. First, we note that if air and water are mixed together in small por-

tions, the result is white, as in snow or waves. Here we have the sufficient conditions for whiteness, but not the necessary conditions, so next we increase the scope, substituting any transparent uncolored substance for water, whence we find that glass or crystal, on being ground, become white, and albumen, which is initially a watery transparent substance, on having air beaten into it, becomes white. Third, we further increase the scope and ask what happens in the case of colored substances. Amber and sapphire become white on being ground, and wine and beer become white when brought to a froth.

The substances considered up to this stage have all been “more grossly transparent than air.” Bacon next considers flame, which is less grossly transparent than air, and argues that the mixture of the fire and air makes the flame whiter. The upshot of this is that water is sufficient for whiteness but not necessary for it. He continues in the same vein, asking next whether air is necessary for whiteness. He notes that a mixture of water and oil is white, even when the air has been evaporated from it, so air is not necessary for whiteness; but is a transparent substance necessary? Bacon does not continue with the chain of questions after this point but sets out some conclusions, namely that bodies whose parts are unequal but in simple proportion are white, those whose parts are in equal proportions are transparent, those whose parts are proportionately unequal are colors, and those whose parts are absolutely unequal are black. In other words, this is the conclusion that might be expected of the method of sifting out what is necessary for the phenomenon and what is not, although Bacon himself does not provide the route to this conclusion here.

This being the case, one can ask what his confidence in his conclusion derives from if he has not been able to complete the “induction” himself. The answer is that it derives from the consequences he can draw from his account. There are two ways in which the justification for the conclusions can be assessed: by the procedure of eliminative induction that he has just set out and by the consequences of those conclusions generated by it. In other words, there is a two-way process, from empirical phenomena to first principles, and then from first principles to empirical phenomena. This is a classic Aristotelian procedure. Where Bacon’s version of it differs is in how the first step is carried out, and the difference turns on the use of eliminative induction.

Bacon’s treatment of heat in *Novum Organum* follows essentially the same route, albeit in a more elaborate way. The first thing to do, he tells us, is to list “instances agreeing in the nature of heat,” that is, a list of those cases

in which heat is present: the rays of the sun, reflected rays, meteors, thunderbolts, volcanic eruptions, flame, burning solids, natural warm-baths, boiling liquids, hot vapors and fumes, fine cloudless days, air confined underground, wool and down, bodies held near a fire, sparks, rubbed bodies, confined vegetable matter, quick lime sprinkled with water, metals dissolved in acids or alkalis, the insides of animals, horse dung, strong oil of sulfur and of vitriol (i.e. sulphuric acid), oil of marjoram, rectified spirit of wine, aromatic herbs (which are hot to the palate), strong vinegar and acids (which burn those parts of the body where there is no epidermis, such as the surface of the eye), and, finally, intense cold, which can produce a burning effect (*Works* 1857–1874, vol. 4, p. 127–129).

The list makes no claims to completeness, of course, but presumably it does aim to give us some idea of the range of phenomena we have to deal with. Because, on Bacon’s view, a cause should not only be present when the effect is present but also absent when the effect is absent, the next step ideally would be to list those cases where the effect was absent, but this is clearly an impossible task, for the list would be infinite. So what Bacon does is to list, in some detail, counterinstances to the items of the first list: cases when heat is absent or at least where there is some doubt. So, for example, the rays of the sun are hot, but those of the moon and the stars are not; the reflections of the sun’s rays are usually hot but not in the polar regions; the presence of comets (counting these as a type of meteor) does not result in warmer weather; and so on. The point of this exercise is not simply to record known counterinstances, however, but also to suggest experiments that need to be carried out to discover whether there are counterinstances—for example, in the case of lenses and “burning mirrors,” in connection with which he makes several suggestions.

Instances and counterinstances of heat are absolute questions, but we can also discover something of the nature of heat by comparative means, by making a comparison either of its increase and decrease in the same subject, or of its amount in different subjects, as compared one with another. For since the Form of a thing is the very thing itself, and the thing does not differ from the Form except in the way that the apparent differs from the real, or the external from the internal, or the thing in reference to man from the thing in reference to the universe, it necessarily follows that no nature can be taken as the true Form unless it always decreases when the nature in question decreases, and in like manner always

increases when the nature in question increases. (*Works* 1857–1874, vol. 4, p. 137)

This procedure for discovery requires the compilation of a “table of degrees or comparison,” in which the instances previously listed are examined in respect of changes in heat. Putrefaction always “contains” heat, for example; inanimate things are not hot to the touch; the heat of lower animals such as insects is barely perceptible, but higher animals are hot to the touch; the heat in animals increases as a result of motion; the heat of celestial bodies is never sufficient to set fire to things on Earth; the sun and the planets give more heat in perigee than in apogee; and so on.

It is at this point that induction comes into play. The various instances must be reviewed with a view to eliminating those natures that can be absent while heat is still found, those natures that are present even though heat is absent, and those where the heat increases or decreases without a corresponding increase or decrease in the nature. Examples of the exclusions are as follows: Because the rays of the sun sometimes warm and sometimes do not, reject the nature of the elements as the explanation for heat; because of ordinary fire and subterranean fires, reject the nature of celestial bodies; because of boiling water, reject light or brightness; and so on. This process is less reliable than it might seem, for the exclusion of some simple natures and the narrowing down to others presupposes that we know what simple natures are, whereas in fact we do not know this; but the procedures followed this far, Bacon believes, do allow us to advance finally to the interpretation of nature, or at least to the first version of that interpretation, which he refers to as “the first vintage.”

It is a premise of Bacon’s account that the Form that causes an effect must be present in every instance and absent in every counterinstance, but he also points out that it is more evident in some instances than in others. This is particularly so in the case of heat: The tables show that hot things—such as flames and boiling water—are characteristically in rapid motion and that compression puts out a fire. The tables of results show, moreover, that bodies are destroyed or changed radically by heat, indicating that heat causes a change in the internal parts of the body and perceptibly causes its dissolution. Bacon concludes that heat is a species of the general genus of motion, but before examining what marks it out from other species of motion, he removes some ambiguities from the idea of heat. Sensible heat, for example, which is relative to individuals, not to the universe, is not heat properly speaking but the effect of heat upon the animal

spirits. Moreover, the communication of heat from one body to another is not to be confused with the Form of heat, for heat itself and the action of heating are two different things. Nor is fire to be confused with the Form of heat, for fire is a combination of heat and brightness.

Having removed these ambiguities, Bacon turns to heat proper. A number of things mark it out as a distinctive species of motion. First, heat is a motion that causes bodies to expand or dilate “towards the circumference”—that is, in all directions—as is evident in the case of vapors or air, liquids such as boiling water, and metals such as iron, which expand when heated. Cold has the opposite effect in all cases. The second distinctive feature is that heat, aside from being a motion to the circumference, is also a motion upward. To determine whether the contrary holds in the case of cold, Bacon proposes an experiment in which a sponge soaked with cold water is placed at the bottom of one heated rod and at the top of another to determine whether one cools faster than the other. He further suggests that the one with the sponge at the top will cool the other end of the rod more quickly.

The third characteristic is that heat comprises a variety of nonuniform motion, whereby small parts of a body are moved in different ways, some motions being checked and others proceeding freely, with the result that the body experiences a constantly subsiding quivering and swelling motion. This third characteristic is evident in flames and in boiling water. Moreover, where the motion is of the whole, such as a gas escaping from confinement at great pressure, we find no heat. Bacon maintains that cooling proceeds like heating, in a nonuniform way, although the absence of great cold on the Earth makes this phenomenon less evident. Finally, the fourth characteristic of heat as a species of motion is that it acts rapidly, for comparison with the effects of age or time on the corruption of bodies shows a similar result, corruption or dissolution of bodies, and the difference must lie in the rate at which the parts of the body are penetrated. The case of cold is not mentioned here, and, unlike the first three characteristics, it is not clear just what Bacon would want to establish in the case of cold. He sums up by drawing two kinds of conclusions from this “first vintage:”

The Form or true definition of heat ... [is that] heat is a motion, expansive, restrained, and acting in its strife upon the smaller particles of bodies. But the expansion is thus modified; while it expands all ways, it has at the same time an inclination upwards. And the struggle in the particles is modified also; it is not sluggish, but hurried and with violence. Viewed with refer-

ence to operation it is the same thing. For the direction is this: If in any natural body you can excite a dilating or expanding motion, and can so repress this motion and turn it back upon itself, so that the dilation does not proceed equably, but can have its way in one part and is counteracted in another, you will undoubtedly generate heat. (*Works* 1857–1874, vol. 4, p. 155)

This process is only the first stage in induction for Bacon, but it is the one that is both most novel and most problematic. In particular, it is appropriate to ask just how far the process of eliminative induction gets us. After all, to go back to the case of color, it is giant leap, indeed a qualitative leap, from noting that a mixture of oil and water is white to the conclusion that Bacon seeks, namely that those bodies whose parts are in simple proportion are white. Is it plausible to suppose that the continuation of the procedure would in fact get us to the conclusion? More particularly, the “directions” that have been followed to this stage remain wholly at the macroscopic level, yet their continued application is supposed to guide us to the particular microcorpuseular internal structure of a body that makes that body white. This issue prompts two questions: whether eliminative induction generates explanations and whether it genuinely involves a process that converges to a single cause or explanation.

On the first question Aristotelians would have resisted the demand that, in seeking an explanation for a physical phenomenon, they sift through all the possibilities until they have found *the* cause. The question turns on the relation between explanations and causes. Although the Greeks generally did not separate questions of causality and explanation, disputes did arise about which should be given priority. Cause would be given priority if one were seeking to determine or ascribe responsibility for something. Explanation would be given priority if one were trying to provide an account of all the relevant factors concerning how something came about, without necessarily wishing to apportion blame or responsibility. It makes a considerable difference which of these views we take. The Stoics, for example, maintained that the most important thing was to determine responsibility and, as a consequence, they viewed causes as being necessarily active. This view was supported by an analogy with the law, where the person deemed responsible for an offense is the person who had done whatever it was that resulted in the offense being committed.

The physical analogue here is a body: a cause is a body that does something to affect another body in some way. On this construal, an explanation is simply a state-

ment of a cause: cause is prior to explanation. The alternative is to make explanation prior to cause, in which case we might say that a cause is whatever figures in the explanation of an event. Take the legal analogy: if we were seeking an explanation of why an offense occurred rather than simply trying to find out who was to blame, we might look at all kinds of factors, such as the conditions under which offenses of this kind usually occur, whether preventive measures had been taken, what kinds of things motivated people to commit offenses of this kind, and so on. In natural philosophy, Aristotle makes explanations prior to causes. His famous “four causes” are, in fact, four kinds of explanation, the combination of which is designed to yield a complete understanding of the phenomenon. If we know what something is, what it is made from, how it was made, and for what end it was made, we have a complete understanding of the phenomenon. To restrict oneself effectively to efficient causes, as Bacon does, will not yield such an understanding. So Aristotelians might well resist the notion that Bacon’s procedure is going to lead to explanations.

Someone who is committed to making explanations prior to causes will argue that there are as many causes of something as there are explanations of that thing, for what will count as a cause will be determined by the kind of explanation one is seeking. Bacon has little in reply to this kind of move. In *Valerius Terminus*, he sets out the error of seeking the causes of particular things, which are “infinite and transitory,” as opposed to “abstract natures, which are few and pertinent.” Such criticism seems most appropriately leveled against alchemists and others, whom Bacon criticizes for their piecemeal approach, rather than Scholastic natural philosophers, who would agree with his stricture here. But, in fact, Bacon has the Scholastics in mind, telling us that, despite appearances, on closer examination they do not seek abstract natures. This somewhat surprising criticism is possible only because of the very restrictive interpretation he places on “abstract natures,” which he compares to “the alphabet or simple letters, whereof the variety of things consisteth; or as the colors mingled in the painter’s shell, wherewith he is able to make infinite variety of faces or shapes” (*Works* 1857–1874, vol. 3, p. 243). Clearly, what he really wants is an atomist account of the “abstract natures” of things, something that can be only defended on substantive natural-philosophical grounds. The kind of explanation he is seeking, namely an atomist/corpuseularian one, is without doubt guiding what is going to count as a satisfactory argument here.

This issue brings us to the second question. Is eliminative induction suitable as a method of discovering efficient causes? It is hard to see how it could not help in such a process, but it is far from clear that in itself it could generate an account of such causes. Indeed, it is impossible to see how Bacon's examples of whiteness and heat can be pursued further by eliminative induction to generate a conclusion of the kind he wants. One might admit some degree of convergence, but there is nothing like convergence to a point: things become squared off well before that stage.

TRUTH

Closely tied up with Bacon's account of method is his treatment of the question of truth. Bacon goes through a number of what he considers to be inadequate criteria that have been used to establish truth. He rejects criteria depending on antiquity or authority, those deriving from commonly held views, and those relying upon the internal consistency or the capacity for internal reduction of theories, presumably on the grounds that such criteria do not bear on the question of whether there is any correspondence between the theory and reality. He also rejects "inductions without instances contradictory" that is, inductions that restrict themselves to confirming a theory, as well as "the report of the senses." None of these, he tells us, are "absolute and infallible evidence of truth, and bring no security sufficient for effects and operations." That he ties in evidence for the truth of a theory and its usefulness here is no accident, for these are intimately connected, telling us in *Valerius Terminus* that

That the discovery of new works and active directions not known before, is the only trial to be accepted of; and yet not that neither, in case where one particular giveth light to another; but where particulars induce an axiom or observation, which axiom found out discovereth and designeth new particulars. That the nature of this trial is not only upon the point, whether the knowledge be profitable or no; not because you may always conclude that the Axiom which discovereth new instances be true, but contrariwise you may safely conclude that if it discover not any new instance it is in vain and untrue. (*Works*, vol. 3, p. 242)

It is unclear here whether Bacon is providing a gloss on truth, maintaining that it has been misconstrued, or saying that something is true, in the ordinary accepted sense, only if it is useful. Whichever, it is a very strong claim on Bacon's part. For there are certainly useless truths, just as

there are falsehoods that have practical applications. It is not simply that false premises may lead to true conclusions, but there are cases where approximations, although false, may have more practical value than the truths of which they are the approximation.

The solution becomes clear when we consider that, since antiquity, debates on methods of generating truths had hinged on the question of generating informative truths, the aim being to discover something we did not already know. In particular, there was a concern among Aristotle and his Renaissance followers to show that formal modes of reasoning such as the syllogism were not trivial or circular because, at the start of the inferential process, we have knowledge *that* something is the case, whereas at the end of it we have knowledge *why* it is the case. In particular what they sought to show was that the kind of knowledge of an observed phenomenon we have through sensation is qualitatively different from and inferior to the kind of knowledge we have of that phenomenon when we grasp it in terms of its causes.

This latter kind of knowledge is also what Bacon was seeking. If we think in terms of "informative truths," Bacon's position makes more sense. He is saying that the only way in which we can judge whether something is informatively true is to determine whether it is productive, whether it yields something tangible and useful. And if something does consistently yield something tangible and useful, then it is informatively true. The case of approximations can perhaps be dealt with by saying that these derive their usefulness not from their falsity but from their proximity to the truth, although the cases where the approximation is more useful than the true account cannot be handled so easily.

The question of the practicality of truth turns on how informative it is, but there is another dimension to this question that, although not explicitly mentioned by Bacon, is of importance in understanding his general orientation. In the humanist thought that makes up the source from which Bacon derives much of his inspiration, moral philosophy figures prominently. Now in this philosophy, being virtuous and acting virtuously are the same thing: There is no separate practical dimension to morality. This is all the more interesting because moral philosophy is a cognitive enterprise, one in which the practical outcome is constitutive of the discipline, a point Bacon stresses the *Advancement of Learning*. If moral philosophy is the model for natural philosophy, a natural enough conclusion for a humanist and one that is reinforced in the shift from *otium* to *negotium*, then we may

be able to make a little more sense of the idea that truth is not truth unless it is informative and productive.

If we think of Bacon's project as transforming moral philosophers into natural philosophers, then we might expect some carryover from conceptions of the moral philosopher. Notions that were quite appropriate in moral philosophy but not (at least outside Epicureanism) in natural philosophy remain in the transformation process. And this is exactly what we do find, most strikingly in the idea of truth as productive and informative. For Bacon, the truth of natural philosophy hinges as much on its being informative and productive of works as does the truth of moral philosophy in its way. "In religion," he tells us in *Redargutio Philosophiarum*, "we are warned that faith is to be shown by works" (*Works*, vol. 3, p. 576). And he proposes that the same test that is applied in religion be applied in philosophy: if it produces nothing at all, or, worse, if, "instead of the fruits of the grape or olive, it bear the thistles and thorns of disputes and contentions," then we can reject it.

BACON'S LEGACY

In the early modern era, there emerged in the West a style of doing natural philosophy, a way of thinking about the place of natural philosophy in culture generally, and a way of thinking about oneself as a natural philosopher. Bacon played a key role in this development. He inaugurated the transformation of philosophy into science, for even though the ideas of "science" and "scientist" in their modern sense were only really established in the nineteenth century, their genealogy goes back to Bacon's attempt to effect a fundamental reform of philosophy from a contemplative discipline, exemplified in the individual persona of the moral philosopher, to a communal, if centrally directed, enterprise exemplified in the persona of the experimental natural philosopher. Thanks in large measure to Bacon's exertions, observation and experiment were lifted out of the purview of the arcane and the esoteric and planted firmly in the public realm. As a result, science was transformed: Its tradition of irregular fits of progress alternating with long periods of stagnation gave way to the uninterrupted and cumulative growth that has characterized Western science since then.

In defending natural philosophy, Bacon reshaped it; his establishment of its autonomy, legitimacy, and central cultural role are on a par with Plato's defense of the autonomy and centrality of the "quiet" virtues, such as justice and moderation. Both irreversibly changed the cultures in which they lived and those that followed—above all our own.

Stephen Gaukroger (2005)

BACON, ROGER

(between 1214 and 1220?–1292)

Roger Bacon, English philosopher and scientist, known as *Doctor Mirabilis*, was probably born between 1214 and 1220 and died in 1292, probably at Oxford. Bacon wrote in 1267 that he had learned the alphabet some forty years before and that his once wealthy brother had been ruined by his support of King Henry III during the barons' revolt. He studied arts at Oxford and then at Paris, where as regent master (c. 1237) he was among the first to lecture on the forbidden books of Aristotle when the ban was lifted. Here he wrote his *Summa Grammatica*, *Summulae Dialectices*, *Summa de Sophismatibus et Distinctionibus*, his *Quaestiones* on Aristotle's *Physics*, *Metaphysics*, and *De Sensu et Sensibili*, and on the pseudo-Aristotelian *De Plantis* and *Liber de Causis*; he also wrote commentaries, now lost, on *De Anima*, *De Generatione et Corruptione*, *De Caelo et Mundo*, and *De Animalibus*.

These early lectures reveal a philosopher, immature but of unusual ability, conversant with the new literature of Aristotle and his Arabic commentators. They are of some historical interest, since Bacon was representative of the new breed of masters at Paris who prided themselves on being pure Aristotelians. In fact, however, like Avicenna and Gundissalinus before them, they were still strongly influenced by other traditions (especially Neoplatonism) that dominated such apocryphal works as the *Liber de Causis* and, in Bacon's case, the popular *Secret of Secrets*. This latter work, thought to be Aristotle's esoteric instructions to Alexander the Great, is a study in kingcraft which, in addition to advocating a sound, practical philosophy, gives much astrological advice and hints at the magical virtues of herbs and gems and the occult properties of numbers. From his glosses on the book, it seems that Bacon was most impressed by its vision of a universal science of great practical import that included all the secrets of nature. This unified science, revealed by God to the Hebrews, who passed it on through the Chaldeans and Egyptians to Aristotle, was concealed in figurative

and enigmatic language but might be rediscovered by one morally worthy and mentally qualified to receive it. Where the pagans failed, Bacon held, a Christian might succeed. Therefore, around 1247 he left Paris, where he had been pursuing a mastership in theology, and returned to Oxford, where Adam Marsh, Robert Grosseteste's Franciscan associate, introduced him to that great man's work. For two decades, Bacon writes, he studied languages and the sciences, training assistants, cultivating the fellowship of savants, and spending more than £2,000 on "secret books," instruments, and tables.

Sometime during the latter half of this period he must have joined the Franciscans, to whom Grosseteste bequeathed his library. Neither his impoverished brother nor the mendicant friars could provide the experimental equipment Bacon longed to have; nor did the majority of the friars share his views on the importance of his work. Resenting the preference shown to the more orthodox theologians, Bacon became embittered and vented his spite in cutting and often unjust criticisms of some of the best minds of the age. Worse, his childlike credulity with regard to the apocalyptic literature of the times led him to side with the extremist followers of Joachim of Floris. This made his views suspect; he was sent to Paris and forbidden to circulate his writings outside the order. But Pope Clement IV, learning of Bacon's proposed encyclopedia of unified science in the service of theology and unaware that the work was largely in the planning stage, wrote for a secret copy on June 22, 1266. Hoping for papal aid to complete the project, Bacon, in the short space of eighteen months, composed as a preliminary draft his *Opus Maius* (synopsized and implemented by the *Opus Minus* and *Opus Tertium*, the latter rich in biographical detail). With the *Opus Maius*, Bacon sent the pope a copy of his *Multiplicatio Specierum*, a concave lens "made at great expense," and "a precious map of the world." Unfortunately, Clement died in November 1268, before the last of the *opera* arrived.

Bacon probably returned to Oxford; he completed his *Communia Mathematica* and *Communia Naturalium* (two of his most mature works) and wrote Greek and Hebrew grammars and his *Compendium Studii Philosophiae*. The last, intended as a general introduction to his principal writings, degenerated into an emotional diatribe against the evils of the age; these were, according to Bacon, especially manifest in the universities where the two teaching orders (Dominicans and Franciscans) were neglecting his favorite subjects. It also revealed a revival of Joachite interests (Bacon referred to the ridicule his

“logical proof” of the imminence of the Antichrist provoked among the friars).

According to the *Chronicle of the Twenty-four Generals*, written in 1370, the Franciscan minister general, Jerome of Ascoli (later Pope Nicholas IV), imprisoned him for “suspected novelties.” This account has been questioned, primarily because nothing could be found in Bacon’s scientific or astrological views that had not been endorsed by many reputable theologians of the day, such as Albertus Magnus. More likely, it was a political move to silence the irascible friar, whose caustic views on the morals of the secular masters would do little to ease the strained relations between them and the friars (whose orthodoxy had been seriously compromised by the fanatical Joachite fringe). At any rate, Bacon’s confinement could hardly have been rigorous or long enough to inhibit his penchant for frank expression; in 1292 he was writing in the *Compendium Studii Theologiae* on his favorite topics with all his old verve and biting invective. He died, however, before this work was completed.

THOUGHT

The strength and the weakness of Bacon’s erratic genius are nowhere more apparent than in the *Opus Maius*, his most characteristic and distinctive work. Both a plea and a plan for educational reform along the study lines pursued by Bacon himself, it is divided into seven parts—the causes of error, philosophy, the study of languages, mathematics, optics, experimental science, and moral philosophy. The first part describes four barriers blocking the road to truth: submission to unworthy authority (for example, crediting living theologians with a prestige due only to the Church Fathers or the Scriptures), the influence of custom, popular prejudice, and concealment of one’s ignorance with a technical show of wisdom. Although by far the greatest portion of the book is devoted to mathematics, optics, and moral philosophy (to which, Bacon claimed, all speculative science should be ordered), Bacon’s fame until recently rested on this first part and the relatively short section on experimental science. The belief that experimental science was the keystone of Bacon’s reform was in part based on the misleading evidence of Samuel Jebb’s 1733 edition of the *Opus Maius*, which omitted Part VII. By *scientia experimentalis*, however, Bacon meant any knowledge through experience as opposed to inferential or reasoned knowledge. When he said that nothing can be known with certainty without experience, his use of the term *experience* was twofold. One aspect of experience is based on sense perception and is called human or philosophical; the other aspect is

interior and is derived from an illumination of the mind by God (whom Bacon identified with Aristotle’s agent intellect). Thus, although sense perception is necessary to knowledge, certainty cannot be attained without divine illumination. Interior experience admits of seven degrees, beginning with that required for certitude in mathematics or the natural sciences and culminating in such mystical or ecstatic states as St. Paul’s vision of heaven.

Bacon devoted the most attention, however, to what humans can know about the wonders of nature by sense perception and the first degree of illumination. From the examples cited in Part VI and throughout the work, Bacon seems to have been less an original experimenter and more a propagandist for scientists such as Peter of Maricourt. His contributions to scientific theory, like his empirical research, were confined largely to optics. With the aid of new source material from Alhazen and Abū-Yūsuf Ya‘qūb ibn Ishāq al-Kindī, he was able to develop significantly many of Grosseteste’s views concerning the tides, heat, and double refraction and to give the most mature expression to Grosseteste’s theory that light (and all physical force generally) is transmitted in pulses like sound waves. Since this “multiplication of species” requires a medium, Bacon argued, the transmission cannot be instantaneous, even though the time interval is imperceptible. His application of the theory to vision and the working of the eye was one of the most important studies done on this subject during the Middle Ages and became the point of departure for developments in the seventeenth century. Bacon seems to have surpassed his teachers both in his knowledge of convex lenses and parabolic mirrors and in his ability to foresee such applications of science as automobiles, motorboats, and aircraft.

If, by continuing the Oxford tradition begun by Grosseteste, Bacon was in advance of his contemporaries, he was also incredibly naive in some of his other views. His uncritical acceptance of what others claimed to have observed is often in violation of his own canons for avoiding error. Much of his stress on the importance of language studies came from his conviction that all knowledge can be found in the Scriptures and “secret books,” whose full meaning God reveals by interior illumination only to those whose lives are pure. He held that because of men’s sins, God’s scientific revelations were obscured by errors—which is one reason for testing empirically what the ancient sages say. Bacon seems to have had little use for abstract reasoning or speculation for its own sake. His interest in mathematics and logic, like his interest in astrology and alchemy, was purely practical. If all physical force, like light, is propagated rectilinearly, it is subject to

geometric analysis. This, together with his conviction that the movement of the planets influences all terrestrial events except free will itself, was his reason for thinking that mathematics is the key to all natural sciences.

Not only was his faith in astrology unwarranted, but his ideas of theology belonged to a bygone age. Even prior to 1250, the Paris Franciscans, impressed by the Euclidean-Aristotelian ideal of a deductive science, were exploring how far the concepts of theology might be analyzed with greater logical rigor and theological propositions formalized in terms of axioms (first principles of reason and philosophy), postulates (the articles of faith), and theses (theological conclusions). Despite his sporadic attendance at theological lectures, Bacon seems to have had no comprehension of what the avant-garde theologians were doing. Perhaps this, more than any insistence on scientific values or the need for experimentation, brought him into conflict with his educated confreres, who apparently considered him, for all his flashes of brilliance and his scientific lore, something of a crank.

Bibliography

Fr. Rogeri Bacon Opera Quaedam Hactenus Inedita, edited by J. S. Brewer (London: Longman, Green, Longman and Roberts, 1859), contains *Opus Tertium*, *Opus Minus*, *Compendium Studii Philosophiae*, and *Epistola de Secretis Operibus et de Nullitate Magiae*. For supplements to *Opus Tertium*, see Pierre Duhem, *Un Fragment inédit de l'Opus tertium de R. Bacon* (Quaracchi: Ad Claras Aquas, 1909), and A. G. Little, *Part of the Opus Tertium of Roger Bacon* (Aberdeen: University Press, 1912). Also see J. H. Bridges, ed., *Opus Majus*, 3 vols. (Oxford: Clarendon Press, 1897–1900; reprinted Frankfurt am Main: Minerva, 1964), Vol. II of which contains *Multiplicatio Specierum* as an appendix. For the complete text of Part VII, which is incomplete in Bridges, see F. Delorme and E. Massa, *Rogeri Baconis Moralis Philosophia* (Zürich, 1953).

Other writings by Bacon may be found in F. A. Gasquet, "An Unpublished Fragment of a Work by Roger Bacon," in *English Historical Review* 12 (1897): 494–517, a prefatory letter to the *Opus Maius* or *Opus Minus* or both; E. Nolan and S. A. Hirsch, *The Greek Grammar of Roger Bacon and a Fragment of His Hebrew Grammar* (Cambridge, U.K.: Cambridge University Press, 1902); and H. Rashdall, ed., *Fratris Rogeri Bacon Compendium Studii Theologiae* (Aberdeen: Typis Academicis, 1911). Most of Bacon's remaining works have been published by R. Steele (with individual volumes by F. M. Delorme, A. G. Little, and E. Withington) in *Opera Hactenus Inedita Fratris Rogeri Baconis*, 16 fascicles (Oxford: Clarendon Press, 1905–1940). The *Compotus* (Fasc. 6), ascribed to Bacon, is, however, the work of Giles of Lessines. See also S. H. Thomson, "An

Unnoticed Treatise by Roger Bacon on Time and Motion," in *Isis* 27 (1937): 219–224, and F. M. Delorme, "Le Prologue de R. Bacon à son traité *De influentiis agentium*," in *Antonianum* 18 (1943): 81–90.

English translations of Bacon's work are R. B. Burke, *The "Opus Majus" of Roger Bacon*, 2 vols. (Philadelphia: University of Pennsylvania Press, 1928; reprinted, New York, 1962), and T. L. Davis, *Roger Bacon's Letter concerning the Marvelous Power of Art and Nature and concerning the Nullity of Magic* (Easton, PA: Chemical Publishing, 1923). For a bibliography of Bacon's works, see F. Alessio, "Un secolo di studi su Ruggero Bacone (1848–1957)," in *Rivista critica di storia della filosofia* 14 (1959): 81–108.

A discussion of the life and works of Roger Bacon appears in the introduction and appendix of A. G. Little, *Roger Bacon Essays, Contributed by Various Authors on the Occasion of the Commemoration of the Seventh Centenary of His Birth* (Oxford: Clarendon Press, 1914). Also see S. C. Easton, *Roger Bacon and His Search for a Universal Science* (New York: Columbia University Press, 1952), which contains an extensive and annotated bibliography. For a discussion of Bacon's philosophy, see T. Crowley, *Roger Bacon, the Problem of the Soul in His Philosophical Commentaries* (Louvain and Dublin: Éditions de l'Institut supérieur de philosophie, 1950), a good account of hylomorphic theory; D. Sharp, *Franciscan Philosophy at Oxford* (Oxford: Oxford University Press, 1930); and E. Heck, *Roger Bacon. Ein mittelalterlicher Versuch einer historischen und systematischen Religionswissenschaft* (Bonn, 1957). For Bacon's contributions to science, see Lynn Thorndike, *A History of Magic and Experimental Science* (New York: Macmillan, 1929), Vol. II, pp. 616–691, which minimizes Bacon's contributions (a reaction to earlier exaggerations); and A. C. Crombie, *Robert Grosseteste and the Origins of Experimental Science 1100–1700* (Oxford: Clarendon Press, 1953), pp. 139–162, a more balanced account.

Allan B. Wolter, O.F.M. (1967)

BACON, ROGER [ADDENDUM]

Twentieth-century research on Roger Bacon requires some changes to the account above. It is clear that Richard Rufus, and not Bacon, was the first to lecture on the new Aristotle at Paris circa 1235. Bacon responded to the ideas of Rufus in his Parisian *Quaestiones* (c. 1240s). He returned to these topics in his last work *Compendium of the Study of Theology* (1292).

Sometime around 1247, Bacon departed from his teaching at the University of Paris. For the next twenty years he devoted his time to a study of the following works: Ibn al-Haytham *Optics*, the Pseudo-Aristotelian *Secretum secretorum* on statecraft, the *Centiloquium*, the *Commentary on the Centiloquium*, and numerous works on astrology. Most important here was the work of Abu'

mashar (Albumassar). The *Communia mathematica*, the *Communia naturalium*, and the *Compendium studii philosophiae* were most probably written in Paris.

Research on Bacon since the mid-twentieth century has yielded the following results:

- 1) Bacon plays a significant role in the history of logic, semantics, and semiotics. Bacon's originality stands out in regard to semiotics, philosophical grammar, quantification, theory of natural sense, univocity, and supposition.
- 2) The new editions of the *De multiplicatione specierum* (1266) and the *Perspectiva* (1266) have placed these two texts in their proper context as important works in natural philosophy and philosophy of mind.
- 3) Scholars have gained a greater understanding of Bacon's aims in his knowledge of mathematics, astronomy-astrology, music, experimental science, alchemy, and medicine. Bacon presents himself as an advocate for the experimental science of others such as Petrus Peregrinus of Maricourt. Nevertheless, his account of *Perspectiva* as a model of an "experimental science" is fundamentally important for the later development of optics, perspective, and philosophy of mind, and for methodology in science.
- 4) Bacon's treatise on *Moralis philosophia* develops proto-humanist concerns. Overall, in his later post-1266 philosophy, Bacon subordinates his earlier Aristotelianism to a Stoic division of philosophy and to mainly Platonic concerns.

BAD FAITH

The most common form of inauthenticity in the existentialism of Jean-Paul Sartre, "bad faith" is paradoxically a lie to oneself. For such self-deception to be possible, the human being must be divided against itself, one level or aspect concealing from the other what it in some sense "knows." The paradox arises from the condition that this operation occurs within the unity of a single consciousness.

The root of Sartrean bad faith is a twofold dividedness of the human being, psychological and ontological. As conscious, humans are prereflectively aware of what they may not reflectively know. Such prereflective awareness or "comprehension," as he will later call it, functions in Sartre's psychology in a manner similar to Sigmund Freud's unconscious, a concept that Sartre notoriously rejected. The project of bad faith—to keep oneself in the dark about certain matters—is itself in bad faith since prereflective consciousness "chooses" not to acknowledge on reflection what it is concealing from reflective consciousness.

There can be an entire Weltanschauung of bad faith: the habits, practices, objects, and institutions that one employs to maintain oneself in a state of "perpetual distraction." Sartre's analysis of Second Empire French society in his work on Gustave Flaubert is a study in collective

bad faith. But the root of the moral responsibility that this term carries lies in the self-translucency of prereflective consciousness: individuals, alone or together, are pre-reflectively aware of more than they reflectively allow themselves to know.

The ontological basis of bad faith is the dividedness of the human situation. Every human exists in-situation. Situation is an ambiguous mix of facticity (the given) and transcendence (the surpassing of the given by our projects). Bad faith is our way of fleeing the anguish that this ambiguity causes either by collapsing our transcendence into facticity (as in various forms of determinism) or by volatilizing our facticity into transcendence (like the dreamer who refuses to acknowledge the facts of his or her life). Though the details of bad faith are as singular as our self-defining choices, its moral significance is the same in each instance. Bad faith is basically flight from our freedom-in-situation.

As Sartre's concept of situation expanded to include and even place a premium on socioeconomic conditions, the relation between bad faith and class struggle became more pronounced. He later argued that good faith, which in *Being and Nothingness* he dismissed as a form of bad faith, was fostered by socioeconomic equality and that scarcity of material goods made bad faith almost inevitable. The anti-Semite was in bad faith, but so too was his or her liberal assimilationist defender; likewise the neocolonialist and the industrial capitalist, both of whom fled their responsibility for subscribing to and sustaining a system that made exploitation of others "necessary."

Only in his posthumously published *Notebooks for an Ethics* does Sartre discuss the nature and possibility of good faith at any length. This presumes a "conversion" in which one chooses to live one's anguished dividedness while fostering via generous cooperation a situation that enables others to do likewise.

BAHRDT, CARL FRIEDRICH

(1740 or 1741–1792)

Carl Friedrich Bahrtdt, probably the most widely read German theologian except for Martin Luther, was born in Bischofswerda in the electorate of Saxony. He held professorships and lectureships of theology, biblical studies, Christian ethics, classical languages, and many other subjects at the universities of Leipzig, Erfurt, Giessen, and Halle. He was the headmaster of a boys school, or *Philanthropinum*, in Marschlins in Switzerland and established his own *Philanthropinum* in Heidesheim while he was at the same time *Superintendent* (the highest ecclesiastical official) in the domains of Count Carl of Leiningen-Dachsburg. In his last years, he was an innkeeper near Halle. He died at Halle.

Bahrtdt was always at the center of a controversy. In his early days he wrote in a fiery orthodox vein, but very soon he seems to have been started on the road to "enlightenment" by suddenly learning that the language of I John 5:7, did not, when subjected to philological scrutiny, constitute proof of the doctrine of the Trinity. He was still further dismayed to learn that the passage was considered by some excellent scholars to be an interpolation. Bahrtdt then set out to find undoubted philological support for the orthodox Lutheran system of theology, and instead found that his doubts continued to increase, until by the end of his life he had arrived at a fully rationalistic concept of natural religion.

The high points in Bahrtdt's "Rationalist's Progress" are his four-volume paraphrase of the New Testament, *Neueste Offenbarungen Gottes* (Riga, 1773–1774), his

confession of faith, *Glaubensbekenntnis, veranlasst durch ein Kaiserliches Reichshofratsconclusum* (1779), and his fictionalized life of Jesus, *Briefe über die Bibel im Volkston* (Halle, 1782–1783) and *Ausführung des Plans und Zweckes Jesu* (Berlin, 1783–1785). Bahrđt's New Testament paraphrase was up-to-date, intelligible, fluent, and coherent, but it was also a propagandistic vehicle for his heretical views. His enemies were thus enabled to secure, in 1778, a decree barring him from all ecclesiastical offices in the Holy Roman Empire and adjuring him to recant. Bahrđt immediately published his confession of faith, stating in clear and succinct language what he did and did not believe. Through discarding beliefs that he felt could not endure the acid test of rational examination, Bahrđt was left with a Jesus who was a mere product of his life and time. In this almost completely naturalistic view, the teasing question was, "In what way did Jesus obtain his amazing wisdom?" In order to give a hypothetical answer to this question, Bahrđt produced his fictional life of Jesus, the culmination of his development and the first work of its kind. It took the form of a series of weekly letters about the Bible, written in a popular vein, and tried to demonstrate how Jesus might have learned and built up his teachings from the writings of Greek sages, which Providence could have put into his hands through his association with Hellenistic Jews. These first letters were continued in a series on the execution of Jesus' plan and purpose, in which Bahrđt advanced the theory that Jesus founded a kind of Freemasonry to aid him in his purpose to destroy superstition, eliminate all positive religion, restore reason to its rightful rule, and unite people in a rational faith in God, Providence, and Immortality.

BAḤYĀ BEN JOSEPH IBN PAQŪDA

(fl. 11th century)

Baḥyā ben Joseph ibn Paqūda, the Jewish Neoplatonist, was the author of the first systematic philosophic work on ethics in the Jewish tradition. Beyond the fact that he served as a judge (*dayyan*) of the rabbinical court in Saragossa, details of his life are unknown. About 1040 he wrote in Arabic *Al-Hidaja ila Faraid al-Qulub* (Guide to the duties of the heart). This work, as translated into Hebrew about 1160 by Judah ibn Tibbon, under the title *Hoboth Ha-Lebaboḥ* (*Duties of the Heart*), has achieved great popularity, both in full text and in abridged versions.

Baḥyā's work cites Arabic as well as Jewish philosophers and contains many fine quotations from Arabic literature. There are considerable similarities between his general philosophic orientation and that of the Arabic school of encyclopedists known as the Brothers of Purity. If this relationship is accepted, there is no need to search further for the sources of the somewhat mystical, somewhat ascetic Neoplatonism that moderates the generally Aristotelian character of his position. It has also been suggested that Baḥyā fell under the influence of the Sufi mystics of Islam, chiefly because of his emphasis on the cultivation of self-renunciation and indifference to the goods of the world in the last three books of *Duties of the Heart*.

The distinction between outward and inward obligation, "duties of the limbs" and "duties of the heart," which accounts for the title of the treatise, is a familiar distinction in both Arabic and Hindu religious literature. Baḥyā used the theme to suggest that the rabbis, the leaders of the Jewish community, were overly concerned with the external obligations of men, rather than with the duties of the heart, and that, because of the rabbis' insistence on the duties of the limbs, the masses of the Jewish people remained totally unconcerned about all religious obligations. He tried to correct this deficiency by presenting Judaism as a message of great spiritual vitality and force, directed to the human heart and resting on the threefold base of reason, revelation, and tradition. The fundamental principle upon which the whole structure of Baḥyā's work is based is the wholehearted conviction of God's existence and unity, the subject of the first book of *Duties of the Heart*. From this, he moves to the necessity for apprehending the wisdom, power, and goodness of God by careful study of the larger world in which we live and the smaller world of our own human nature. In this latter

study there emerge the duties of the heart: service of God, trust in God, wholehearted devotion to God, humility in God's presence, repentance, self-communion, and renunciation. In this way, humanity reaches the height of the religious life, the love of God. Despite the superficially rational structure of the book, Baḥyā was not truly a rationalist; rather, he used the techniques of reason to subserve the ends of a contemplative view of life whose method was moral intuition, and whose goal was piety.

An Arabic treatise, *Ma'ani al-Nafs* (The attributes of the soul), known only in manuscript until its publication in the early twentieth century, bears the name of Baḥyā on its title page, but this is now generally conceded not to be his work. No other works of Baḥyā are known.

BAḤYĀ BEN JOSEPH IBN PAQŪDA [ADDENDUM]

Although Baḥyā ben Joseph ibn Paqūda follows the major categories of Sufism in his exploration of human motivation, he also manages to find a social justification for many aspects of Judaism. For example, one of the virtues he discusses is restraint or abstemiousness, the need to resist our desires. He argues that we can pursue this socially by our attitude to others by acquiring a cheerful and calm attitude toward others. A means of being disposed to act thus is the Torah and its laws, for these have the effect of training ourselves to restrain our desires and bring them under the rule of law. For Baḥyā the very private and personal moral rules that we adopt to bring us closer to God have a significant public element. The highest virtue is love of God, and to acquire this we need to practice personal asceticism, together with justice, good

manners, and justice. Although the aim of his book on the duties of the heart is to show that Judaism is not only about external actions but has an inner spiritual dimension as well, he does not go to the extreme of denying the significance of law and prayer. On the contrary, he argues that the private and the public aspects of religion complement each other. His book also provides a detailed account of how that works in the case of Judaism.

BAIER, ANNETTE (1929–)

Annette Baier was born in New Zealand in 1929. She received her bachelor of arts and master of arts degrees from the University of Otago, and, in 1954, her bachelor of philosophy degree from Oxford, writing a thesis on precision in poetry under J. L. Austin. After teaching in the United Kingdom, New Zealand, and Australia, Baier moved to the United States, teaching first at Carnegie Mellon and then at the University of Pittsburgh from 1973 until her retirement as Distinguished Service Professor in 1997.

Baier's primary commitment is to naturalism: Human beings are evolved animals and we must under-

stand our capacities, both intellectual and moral, in the light of this natural history. Baier finds philosophers guilty of a kind of willful forgetting of the facts of our embodied existence. We are social animals who experience long periods of dependency in infancy and childhood, and even the more or less symmetric dependencies of maturity are liable to become asymmetric with age or, in some cases, illness. Baier's work charts the implications of our interdependency for epistemology, ethics, and action theory.

Epistemology is a social enterprise. In David Hume, Baier finds the resources to develop a feminist epistemology that recognizes the positive contribution of emotions to knowledge, and that recognizes that all inquiry is fallible and situated, beginning, as it must, from the "prejudices" of tradition and custom. Beliefs, attitudes, and practices that withstand reflective scrutiny merit continued allegiance; those that do not must be abandoned. Baier's account of reflection is distinctive for both its anti-intellectualism and anti-individualism. Reflection is carried out by a *community* of inquirers embracing many differing perspectives and, rather than being the sole province of intellect, reflection uses *all* the capacities of the human mind, including affective capacities such as sympathy. These capacities are capable of being turned on themselves and on our habits and customs and we can come to achieve "reflective self-acceptance, agreement with ourselves" (1994b, p. 277). Reflection reveals the importance of *judgment*. Rules are of limited use in guiding either practical or theoretical judgment; hence Baier's anti-theory stance. In ethics, this anti-theory stance takes the form of suspicion about the possibility of capturing morality in a set of rules. Such systemizing drives are to be replaced by careful exploration of the capacities that enable virtuous action.

In keeping with her emphasis on reflection, Baier proposes a reflective test for evaluating moralities: "a decent morality will *not* depend for its stability on forces to which it gives no moral recognition. Its account books should be open to scrutiny and there should be no unpaid debts, no loans with no prospect of repayment" (1994a, p. 8). Baier argues that liberal morality, with its focus on contractual relations and voluntarily assumed obligations, takes as paradigmatic the interactions between equals or near-equals and so is unable to pass this test. It depends on the unacknowledged moral labor of those producing future moral agents, a labor it cannot itself theorize. Had ethical theory begun from the perspective of those, chiefly women, engaged in such labor, relations

between unequals would have come into focus, thus revealing the importance of trust.

Baier's work is largely responsible for the recent upsurge of interest in trust, not just among philosophers, but also among social scientists. She finds trust to bridge the traditional divisions between the cognitive, affective and conative: Trust has a distinctive feel, typically involves a tacit belief in the other's goodwill and competence, and explains the truster's willingness to let others get dangerously near things she cares about. According to Baier, trust, though instrumental to many human goods and a constitutive part of others (for example, friendship), is not a virtue. Nor is untrustworthiness always a vice: Mistrust enables exploitation and abuse and sometimes trust is best responded to with judicious betrayals of trust.

Our interdependence also has implications for our understanding of persons and their actions. We are inducted into the "arts of personhood" by others: "Persons essentially are *second* persons who grow up with other persons" (1985, p. 84). It is through being addressed and addressing other second persons—through, that is, coming to master the pronoun "you"—that we come to have self-consciousness. Baier rejects as reductive moves to identify bodily movements or volitions as "basic actions" (actions that are directly done rather than done by doing anything else) and argues that actions can be identified as intentional only given background assumptions of culturally dependent competences. She finds accounts of personhood that focus on a narrow range of properties such as autonomy, dignity, and the capacity to make evaluative judgments guilty of wilfully forgetting our biological nature. She substitutes in their stead a conception of ourselves as "intelligent, talkative, playful mammals" (1991, p. 13) whose personhood comprises many capacities, both cognitive and affective. All these capacities are to be recruited in doing philosophy, which, following Hume, is to use "*all* the capacities of the human mind: memory, passion and sentiment as well as a chastened intellect" (1994b, p. 1). Her own writing style, with its rich use of anecdote, association, playfulness, and irony, enacts as well as argues for a philosophy informed by passion and experience.

BAIER, KURT

(1917–)

Kurt Baier was born in Vienna, Austria, in 1917. He had to abandon his law studies at the University of Vienna in 1938, when he went as a refugee to Britain. There he was interned as a “friendly enemy alien” and sent to Australia. He began his study of philosophy in earnest in the internment camp and continued after the war ended. He received his BA (1944) and MA (1947) from the University of Melbourne, and his DPhil (1952) from Oxford University. He taught at the University of Melbourne, the Australian National University, and the University of Pittsburgh. He was a visiting professor at Cornell University, the University of Illinois, the University of Florida, and the University of Otago (New Zealand). He was president of the Eastern Division and chairman of the National Board of Officers of the American Philosophical Association. Annette Baier, whom he married in 1958, was also president of the Eastern Division. After they retired, they moved to New Zealand, which is Annette’s native country. They may be the most distinguished philosophical couple in American philosophy, although neither was born in America. Both gave the Paul Carus Lectures, and both were invited to be members of the American Academy of Arts and Sciences. In 2001 Kurt was awarded an Honorary Doctorate of Jurisprudence from the Karl Franzen University of Graz, at a ceremony hosted by the University of Otago.

Baier was one of the most influential philosophers in the field of moral philosophy in the second half of the twentieth century. He is one of the philosophers primarily responsible for returning the field of moral philosophy from an obsession with the language of moral judgments to its traditional concern with describing and justifying guides to moral behavior.

Baier claims that moral rules are meant for everybody. They must be universally teachable, that is, they cannot involve beliefs or concepts not known to all normal adult humans. They cannot be self-frustrating, self-defeating, or morally impossible, that is, impossible or pointless if universally taught. Many moral philosophers after Baier have used these features as necessary conditions for a guide to conduct to count as a morality.

Baier recognizes that these features are merely formal and that moral rules must also have a particular kind of content. Baier describes this content by saying that moral rules must be for the good of everyone alike. However, when he gives examples of these rules (e.g., rules prohibiting killing, cruelty, inflicting pain, maiming, torturing, deceiving, cheating, rape, and adultery), it is quite clear that he means that these rules prohibit causing harm to anyone. He was prescient in recognizing, against both deontologists and utilitarians, that morality does not require doing the optimific act (the act having the best consequences), no matter how one determines what that optimific act is.

Like Thomas Hobbes, whom he acknowledges as a strong influence on his views, Baier put forward the principle of reversibility (a negative version of the Golden Rule), “Do not do unto others as you would not have them do unto you,” as summarizing the moral guide to life. Although he does not use the language of natural-law theories, Baier also follows Hobbes in holding that morality has to be known by all those who are held morally responsible for their behavior, that is, moral rules apply to all who can understand the rules and can guide their behavior accordingly.

Baier argues, “It is the very meaning of ‘a morality’ that it should contain a body of moral convictions which can be true or false, that is, a body of rules or precepts for which there are certain tests” (Baier 1965, p. 89). Baier claims that these tests must involve what he calls “the moral point of view.” Although Baier’s description of this point of view is not universally accepted, it is acknowledged by all that moral rules must stem from a point of view based on universally shared beliefs and desires.

In addition to providing a plausible and influential account of morality, Baier also put forward an account of rationality that is more acceptable than the standard instrumentalist accounts. He recognizes that it is irrational “when, for no reason at all, we set our hands on fire or cut off our toes one by one” (Baier 1965, p. 158). Unlike many contemporary philosophers, he is aware that there are irrational desires, and hence that it cannot be correct to define a rational action as one that maximizes the satisfaction of a person’s desires.

Baier’s attempt to use his analyses of the concepts of rationality and morality to arrive at substantive moral conclusions marked the end, in ethics, of a concern with the language of morals that claimed to be morally neutral. By making a distinction between moral judgments and other value judgments, he showed that the terms “right,” “ought,” “good,” and “bad” are primarily related to values, not morality. Recognizing that we offer reasons for choosing and doing many things in addition to those related to morality, Baier convinced many that concentrating on the use of these terms is not likely to be of much help in determining what morality is. Although many contemporary moral philosophers, especially consequentialists, continue to talk of good and bad, right and wrong, it is now generally recognized that these concepts are not identical to the concepts of morally good and morally bad, morally right and morally wrong.

Throughout his work Baier has attempted to show that reason supports acting morally. In his earlier work he distinguished between self-interested reasons, altruistic reasons, and moral reasons; and argued that although self-interested reasons were stronger than altruistic reasons, moral reasons were stronger than self-interested reasons. He showed that anyone picking worlds to live in would pick a world that had this ordering. In his later work, he distinguished between self-interested reasons, self-anchored reasons, and society-anchored reasons, and showed that if a society is to function, its members must accept that society-anchored reasons, particularly moral reasons, overrule both self-interested and self-anchored reasons. Although there is considerable doubt about whether Baier has shown that reason supports morality as he argues for it, his arguments for this view contain many valuable points. Failure to appreciate his distinction between altruistic reasons and moral reasons explains why some people find it difficult to accept that lying to protect a guilty colleague is immoral.

Largely because of Baier’s work, moral philosophy no longer is dominated by concerns about the language of ethics. At the beginning of the twenty-first century, moral

philosophers are now more likely to put forward substantive ethical views, be they Hobbesian, Kantian, or utilitarian, than they are to view their accounts of morality as having no normative implications. The distinction between concern with analyzing the terms or concepts involved in moral discourse and concern with substantive moral problems has largely disappeared. Even those concerned with analyses of ethical concepts now hold that analyses of these moral concepts may yield substantive moral conclusions. Baier is also primarily responsible for the fact that the central problem of moral philosophy is now showing the relationship between rationality and morality. The mark of a great philosopher is generally thought to lie not in the answers he gives but in the questions he raises. There is no question that on this view Kurt Baier is a great philosopher.

BAIN, ALEXANDER (1818–1903)

Alexander Bain, the Scottish philosopher and psychologist, was the son of a weaver. He was mainly self-educated but managed to attend Marischal College, in his native city of Aberdeen. After graduating he assisted the philosophy professor there from 1841 to 1844. A confirmed radical, Bain established close contacts with utilitarian circles in London, helping John Stuart Mill in the revisions of his unpublished *System of Logic* in 1842 and helping Edwin Chadwick with his sanitation reforms from 1848 to 1850. During the next decade, supporting himself

by journalism, he produced his magnum opus in two installments, titled *The Senses and the Intellect* (London, 1855) and *The Emotions and the Will* (London, 1859). Appointed professor of logic and rhetoric at Aberdeen in 1860, he published his *Manual of Rhetoric* (London, 1864) and his *Logic, Deductive and Inductive* (London and New York, 1870). On the proceeds of these and other textbooks he founded *Mind* in 1876, choosing his disciple George Croome Robertson as editor. After Bain's death his *Autobiography* (London, 1904), which gives his personal background and a useful criticism of his own books, was published.

CRITICISM OF ASSOCIATIONISM

Bain was not simply a pedestrian disciple of the two Mills. Fundamentally loyal to associationism, he was as discontented as J. S. Mill with its tenets but more systematic in his criticisms of them. What apparently made Bain uneasy was the narrow combination of introspection and emphasis on facts that characterized the associationistic science of mind. He was attracted by the physiologists' contemporary program of studying mind by a method uniting emphasis on facts with observation rather than introspection. At the same time Bain was interested in the recent efforts of the epistemologists to found a science that, while still introspective, was concerned not with empirical facts but with necessary truths. He had contacts with William Sharpey among the physiologists and James Ferrier among the epistemologists. Physiology and epistemology were interests alien to Mill.

THE WILL

The fusion of diverse tendencies in Bain's philosophy is best seen in the final section of his chief work—the discussion of the will—and especially its last hundred pages, which contain Bain's spirited defense of determinism, his justly famous theory of belief, and his equally interesting, though less known, analysis of consciousness. For Bain the central problem of the will apparently is the question of how I exercise voluntary control over my limbs. From the traditionalist standpoint it seemed an insoluble mystery how the mind knows just what motor nerves to activate when, for instance, expecting a blinding light to be switched on, it causes the eyes to close in advance. Bain's theory swept aside the traditional analogy with the case of first getting information about what is ahead and then operating a lever. The limbs are not inert like levers but possess an inherent spontaneity, and this spontaneity means that the expectation of the painful glare is inseparably associated with preparations to close the eye. The

idea is that theory and practice are one. This doctrine of spontaneity, a direct ancestor of pragmatism, Bain rightly considered to be his most original contribution to philosophy, and he both discussed it effectively at the animal level and struggled honestly, in his discussion of effort, with the difficulty of applying it at the human level.

BELIEF

Bain's doctrine of belief arose in the context of his view of will. When he spoke of belief as being inseparable from "a preparation to act," he was envisaging as basic a situation in which one seriously expects alleviation of a present pain from something that is visible but out of reach. In the ensuing action of trying to grasp this thing, the belief is inevitably put to the test: "We believe first and prove or disprove afterwards." The essence of the human situation was thus for Bain a kind of circle of activity in which we inevitably acquire new nonrational beliefs as a direct consequence of practically and experimentally testing those we start with. The point is apparently that our actions have unforeseen consequences.

CONSCIOUSNESS

By an ingenious turn Bain used the pragmatist analysis of belief as a basis for a theory of consciousness inspired by William Hamilton's doctrine of the inverse ratio of sensation and perception. In Bain's version of the theory, a sharp contrast is drawn between the emotive pole of consciousness, where absorption in one's pains or pleasures prevents the objective assessment of one's situation, and the cognitive pole, where pleasures and pains are forgotten in the business of mapping one's world and where emotion appears only in the shock of scientific discovery, as a feeling that, like boredom, is outside the pleasure-pain sphere. The movement from feeling to knowledge in consciousness is linked with the same facts that give human life the character of a passage from belief to self-criticism.

But what, then, is this consciousness that underlies both the emotional side and the intellectual? Inspired by Hamilton and Ferrier, Bain made two points. First, we are unconscious of the undifferentiated. "A constant impression is to the mind a blank"—if temperature were unvarying we would not notice it. Second, we are conscious of the constant only in the midst of variety and difference. The essence of consciousness is thus to be discriminative, and Bain pointed out that of the discriminations involved in consciousness, the most liable to be misunderstood is that implicit in the problem of the external world. Bain argued that although Berkeley was

right in denouncing as meaningless the notion of material objects independent of experience, he overlooked an important point—that a distinction can be drawn within experience between the person sensing and the sensation sensed. Thus Bain, unlike J. S. Mill, conveyed a profound sense of the complexity of the problem of the external world.

Bain was aware that his philosophy was far removed from ordinary associationism. Above all, in the important Note F to the third edition of *The Senses and the Intellect*, he made it clear that for him association presupposed disassociation.

Bain progressively broke away from the heritage of the Mills, in logic as well as in psychology (he ultimately gave up Mill's view of logic for Augustus De Morgan's). At the same time there always survived in him certain tracts of unredeemed associationism. Thus, he retained to the last Mill's peculiar doctrine about the dependence of sight on muscular sense. So, too, his discussions of sympathy and of our knowledge of other minds are very crude examples of associationism.

These weaknesses in Bain have been too much stressed by his critics to the neglect of his merits. Thus, in dealing with the emotions the important role he gave to pure malice, or sadism, as a human motive contrasts refreshingly with the more commonplace views of such critics as Francis Herbert Bradley. Nevertheless, the only part of Bain's work that has been justly appreciated in our time is not his philosophy but his contribution to rhetoric.

BAKER, LYNNE RUDDER

(1944–)

Lynne Rudder Baker was born in Atlanta, Georgia, received her PhD in philosophy from Vanderbilt University in 1972, and teaches at the University of Massachusetts at Amherst.

Her philosophical work provides a powerful critique of reductive accounts of minds, persons, and artifacts. Her writings in the philosophy of mind are directed against three distinct but related views. The first is that one's meaning something specific by a symbol can be naturalized, that is, reductively explained, in terms of some set of nonsemantic, nonmental, causal properties lawfully instantiated in nature. The second view is that folk psychology is, at best, a second-class prototheory of human behavior that only has instrumental value or, at worst, a discredited theory whose mental posits do not exist. The third view, what Baker calls "the Standard View," shared by dualists, materialists, and functionalists, says that beliefs are states of some proper part of persons, be it material (the brain) or immaterial (the soul).

All three views share two themes. First, we think of ourselves as sentient, sapient agents endowed with states that have referential content and causal efficacy. Second, if this conception is to be correct, it must reductively fit with our best scientific theories of nature, which have the right story (or much of it, at any rate) about things; otherwise, it must be rejected as false or treated as a useful but quaint myth. Baker accepts the first claim but rejects the second in *Saving Belief* (1987) and in *Explaining Attitudes* (1995). In the latter work, she defends practical realism, the view that beliefs are global states of a whole person, not of any proper part of the person. Although beliefs are not entities, they are real (contra eliminative materialists), since they make a genuine causal difference in the world in virtue of their contents (contra epiphenomenalists). Beliefs have an explanatory role, but not in virtue of their being identical to, constituted by, or supervening on brain states, since beliefs do not stand in those relations to any brain state. Rather, their explanatory role is grounded in our shared practice of causally explaining and rationalizing our actions. Baker's practical realism places her squarely in the company of American pragmatists (from William James to Hilary Putnam) and neo-Wittgensteinians.

Baker's third book, *Persons and Bodies* (2000), connects her early writings in the philosophy of mind with her more recent work in metaphysics. In that book she defends the constitution view of human persons, the view

that a human person is a person in virtue of having a first-person perspective and is human in virtue of being constituted by a human body. To have the first-person perspective is to have the ability to think of oneself as oneself in an irreducibly direct way without the mediation of any name or description. Constitution, in turn, is a ubiquitous relation that holds whenever new kinds of things come into existence (e.g., statues, persons), with new causal powers in virtue of other kinds of things (e.g., slabs of marble, human bodies), existing in certain types of circumstances (e.g., the art world, social institutions, and social practices). The things that constitute and the things they constitute have different persistence conditions and natures; hence, they are numerically distinct. Both share many of the same properties and causal powers, although the source of their shared properties and powers may lie with the thing that constitutes and not with the constituted thing, or vice versa. Thus, contrary to immaterialism, human persons are material beings, because they are constituted by their human bodies. However, contrary to animalism, human persons are not identical to the bodies that constitute them.

On Baker's view, although persons are constituted by their bodies and cannot exist without being materially constituted in some way, their identity over time does not depend on the particular bodies that constitute them. Nor does personal identity depend on soul identity, brain identity, or (nonbranching) psychological continuity. Rather, it depends solely on one's having a first-person perspective over time. Facts about one's first-person perspective are not reducible to any nonpersonal fact. Thus, for Baker, one's identity over time is a simple irreducible fact about oneself.

Reinaldo Elugardo (2005)

BAKHTIN, MIKHAIL MIKHAILOVICH

(1895–1975)

Mikhail Mikhailovich Bakhtin was a Russian philosopher, philologist, and historian of culture. In opposition to rationalism and, in general, to the modern European (monologic) epistemology, he grounded a personalistic understanding of being as the co-being (event) of interrelations of "I" and the "other" (thou) and developed a corresponding dialogic (and/or polyphonic) approach in the capacity of the uniquely adequate method of the particular humanitarian sciences and—more broadly—of philosophical thought.

THE WORKS

Bakhtin wrote his main works in the period from the 1920s to the beginning of the 1950s, but because of the political conditions of the time, biographical reasons, and the peculiarities of the texts themselves (some of them consisting of unfinished archival manuscripts), they were published (except in one case) either in the final years of the author's life or after his death.

Bakhtin was born in Orel, south of Moscow, and in the second decade of the twentieth century he studied at the historico-philological and philosophy departments first at Novorossisk University and then at Petersburg University. After the Communist Revolution of 1917 he lived in Nevel and Vitebsk, where a circle of like-minded intellectuals was formed (M. I. Kagan, L. V. Pumpiansky, V. N. Voloshinov, P. N. Medvedev et al.). Here, at the beginning of the 1920s, Bakhtin wrote early drafts of philosophical works that remained unfinished, including "*K filosofii postupka*" (Toward a philosophy of the act), first published in 1986, and "*Avtor i geroi v esteticheskoi deiatel'nosti*" (The author and the hero in aesthetic activity), first published in 1979. In 1924 Bakhtin returned to Leningrad, and that same year he wrote the antiformalist essay "*K voprosam metodologii estetiki slovesnogo tvorchestva*" ("On Questions of the methodology of the aesthetics of verbal creation"), first published in 1975.

Bakhtin's first published book (and until the beginning of the 1960s it remained his only published book) was *Problemy tvorchestva Dostoevskogo* (Problems of Dostoevsky's creative works), which appeared in 1929. There exists the assumption (not shared by all scholars or not shared by scholars to an equal degree) that certain other books and essays published in the 1920s and attributed to other authors were to some degree written by Bakhtin. These works include *Freidizm: Kriticheskii ocherk* (Freud-

ism: A critical essay), published in 1927, and *Marksizm i filosofiiia iazyka* (Marxism and the philosophy of language), published in 1929, both attributed to V. N. Voloshinov, as well as P. N. Medvedev's *Formal'ni method v literaturovedenii* (Formal method in the study of literature), 1928.

In 1928 Bakhtin was arrested in connection with the affair of the illegal religious organization "Voskresenie." He was sentenced to five years in a concentration camp, but owing to the state of his health this sentence was replaced by a five-year exile in Kazakhstan. (Bakhtin suffered from chronic osteomyelitis, which in 1938 necessitated the amputation of one of his legs.) In accordance with this sentence, after returning from exile, he was prohibited from residing in large cities; and he was thus compelled to move from place to place. In 1945 he obtained a position in Saransk, at the Mordovia Pedagogical Institute, where he first worked as an instructor and then as department chairman. In the 1930s and 1940s he wrote a large study of Rabelais (which in 1946 he defended as his doctoral dissertation). In those years he also wrote a large cycle of works, published only in the 1970s, on the specific characteristics and genesis of the genre of the novel.

Bakhtin retired in 1961. By the middle of the 1960s his name could again be found in official scholarly publications. The second, revised edition of his book on Dostoevsky, *Problemy poetiki Dostoevskogo* (Problems of Dostoevsky's poetics) appeared in 1963; and the book based on his dissertation, *Tvorchestvo Fransua Rable i narodnaia kul'tura srednevekov'ia i Rennansa* (The work of Francois Rabelais and folk culture of the Middle Ages and Renaissance), appeared in 1965. Bakhtin's ideas become known, particularly in Europe and the United States—first primarily among structuralists, and then, as the archive was published, among scholars with diverse philosophical and philological orientations. At the end of the 1960s Bakhtin moved first to a suburb of Moscow, and then at the beginning of the 1970s to Moscow itself, where he resided until his death.

THE INFLUENCE OF BAKHTIN

Bakhtin was initially subject to the diverse influences, on the one hand, of the development of the problem of the interrelations of "I" and the "other" in German philosophy (Feuerbach, Kierkegaard, Nietzsche, the neo-Kantians Cohen and Natorp) and on the other hand of Russian symbolism (in the version favored by Viacheslav Ivanov, who interpreted the interrelation of "I" and the "other" as a reduced transformation of the interrelations of "I" and "Thou" in the religious mysticism of commun-

ion with God). From the status of significant but particular problems of transcendental ethics and aesthetics or positivistic psychology and sociology, Bakhtin translated the interrelation between "I" and the "other" into a fundamental ontological structure of universal character, which determines both the forms of life's being and the forms of thought, language, and cultural meaning as such. In parallel with the legitimate goal, given such an approach, of identifying the universal archetypal forms of the interrelation of "I" and the "other," Bakhtin also posed the problem of exposing the various kinds of distortions of these archetypal forms in the historical types of culture.

Bakhtin did not leave an integral and consistently developed conception. Instead, he formulated several particular theories that are linked by a single personalistic-dialogic teleology but which are sometimes divergent in their outer conceptual contours (in particular, the conceptions of polyphony and carnival). In his early unfinished work "Toward a Philosophy of the Act," Bakhtin sketches out the project of a moral philosophy in which he grounds the constitutive role of the interrelations of "I" and the "other" for the structure of being. (Being is understood here as the co-being of two personal consciousnesses—as the minimum of the "co-being of being"; in order to accomplish the true co-being of the being of "I," which admits the validity of the ethical imperative, one must, according to this project, subject oneself to absolute self-exclusion from the values of the currently given being in favor of imparting these values to the "other.")

In "The Author and the Hero in Aesthetic Activity," Bakhtin gives a typology of different historical forms of the interrelations between author and hero, interpreted as aesthetic transformations of life-interrelations between "I" and the "other" (the author suppresses the hero and the hero suppresses the author; the crisis of the author, the revolt of the hero, etc.). In analyzing the historical types of culture, Bakhtin sees in the majority of them diverse forms of mutual overcoming and suppression of "I" and the "other," which replace their simultaneous mutual outside-locatedness and connectedness in one co-being by surrogates either of their illusory mutual isolation or of their just as illusory unity (physiological, psychological, ideological, national, social). Bakhtin attributed the disharmony of the interrelations between "I" and the "other" to the predominant orientation of the corresponding types of culture toward a unified and universal consciousness (the rationalistic gnoseologism, or monologism, of the modern period). The crisis of the

position of the author shaping the aesthetic co-being of being is advanced as the central aesthetic problem.

In *Problems of Dostoevsky's Poetics*, Bakhtin develops a theory of polyphony as a particular variant (created by Dostoevsky) of the genre of the novel with a specific authorial position that overcomes the crisis, a position that presupposes polyphonic dialogic intersections of the voices of the characters in the absence of the domination of the author's voice (including the narrator and all his other functional variants), which enters into fully equal dialogic relations with the voices of the characters. In the cycle of essays about the novel written in the 1930s and 1940s, Bakhtin complements the polyphonic conception with a general theory of the language of the novel as based on a word with two voices (on the intersection of two personal voices in a formally single utterance); he expounds the theory of the chronotope: the ambivalent relation of the temporal and spatial characteristics of meaning as the inalienable premise of its artistic representation and reception. When united with the spatial-temporal characteristics of the axiological dimension, the chronotope grows for Bakhtin into the analogue of any (not only artistic) point of view concerning meaning in the capacity of a position determined with respect to co-being and person.

In the essay "*Problema rechevykh zhanrov*" (Problem of speech genres) and in the second, revised edition of the book on Dostoevsky, Bakhtin develops a conception of metalinguistics, extending the theory of two voices beyond the word of the novel into the entire sphere of the life of language. In the book on Rabelais, he develops the conception of carnival as a reflection of the ambivalence of the archetypal foundation of folk-comic culture (the fusion without mutual neutralization of serious and comic myths) and, genetically connected with this conception, the conception of cultural meaning that is always constituted by antinomic or, in one respect or another, opposed relations, including dialogic ones.

Bakhtin's fundamental works have been translated into many European and Oriental languages. International conferences devoted to Bakhtin are held regularly, and monographs, collections of articles, and issues of journals devoted to his work are regularly published. Bakhtin's ideas generate much discussion and controversy.

Ludmila Gogotishvili (2005)

Translated by Boris Jakim

BAKHTIN, MIKHAIL MIKHAILOVICH [ADDENDUM]

By the time his boom and cult had passed, Mikhail Bakhtin had become a twentieth-century classic and the beneficiary of a huge research industry. Accordingly, the most exciting work shifted from literary or political applications of his famous terms—dialogue, carnival, chronotope—and toward the finer, and far more interesting, arts of historical recuperation: Bakhtin’s intellectual debts, and his social and philosophical contexts (see Brandist 2002). For Bakhtin Studies, 1990 was something of a watershed year. It marked, of course, the beginning of the end of Soviet Communism, which made it possible for Russians to pursue pluralistic and de-ideologized scholarship throughout the humanities. For English speakers it was also the year that Bakhtin’s writings from the 1920s (combining Kantianism and phenomenology in a distinctive moral philosophy) were published in the excellent Liapunov annotated translations.

It took several years for these difficult early texts to be assimilated, for the received image of Bakhtin in the 1970s and 1980s could not easily be fit back into them. That image, based on several widely (and quickly) translated texts from his middle-to-late period, was polarized between those who wished to see in Bakhtin a pragmatic, systems-shunning liberal humanist and those who preferred a more radical and subversive message. Neither variant had firm documentation (the liberal least of all). The question of Bakhtin’s Marxism and his authorship of the “disputed texts” had ended in a draw. Left-wing cultural theorists were faulting “dialogism” for its fascination with process at the expense of justice and for its indifference to power. Bakhtinian ideas permeated every possible discipline (sociology, cultural studies, therapeutic psychoanalysis, history of science, theories of education) but as yet we lacked the luminous renderings of Bakhtin as a spiritual thinker and aesthete. The biography was still awash in rumor, and influences on him largely conjectural.

By the mid-1990s several Bakhtin scholars, most prominently in Britain and Russia, began to suspect that Bakhtin’s ideas were so shockingly famous because we had forgotten, or too thinly investigated, the richness of the historical period of which they were an organic part: the German and then Russian philosophical debates of the 1910s and 1920s. With the appearance of the first volumes of the collected works, *M. M. Bakhtin: Sobranie sochinenii* (Moscow, 1996–) and, in English, of the work

of Galin Tihanov, Brian Poole, Ken Hirschkop, David Shepherd, and especially Craig Brandist (2002), it became clear that the “trademark” concepts, painstakingly restored to their appropriate contexts, would have to be retranslated and critically rethought.

To be sure, these concepts had been under revision for some time. *Dialogue*, which insists upon the addressivity, reciprocity, and open-endedness of all relations, had long been reproached for political naiveté, for flattening the epic, for undervaluing poetry (with its tolerance for repetition, symmetry, and formal constraints), and for denying a stable core to the self. Novelistic *polyphony*, which Bakhtin saw exemplified in Dostoevsky, was also controversial. The idea (of surprising appeal to primary authors) that created characters that can act and speak alongside their creators as “equally weighted” consciousnesses has been dismissed by drier and more disciplined critics as a fantasy, as an illusion of the author—or of the readers—who project their own ideas and words on to the text.

Carnival was the term most indiscriminately applied. It had come to mean little more than sassiness, rebellion, or transgression, and as such was applied to every social practice, text, or body that revealed a disruptive, subversive, inverting, or comically grotesque aspect. Sobriety set in here too. Not only was Bakhtin’s sunny carnivalesque shown to bear little relation to real, drunken, violent carnival rituals and bodies, but the literary masterwork Bakhtin used to illustrate his theory, Rabelais’s *Gargantua et Pantagruel*, was served only partially and rather poorly by so crudely binary and folkloric a filter. Trivially oppositional readings of dialogue and of carnival reinforced each other: The double-voiced word was deployed more often to subvert a perspective than to supplement or enrich it. Of all Bakhtin’s famous terms, the *chronotope* proved to be the least contentious. It was also the most “philosophical” of Bakhtin’s constructs, a creative extension to narrative of the Kantian time-space matrix.

Thus the age of “applied Bakhtin” gave way to a study of “Bakhtin the philosopher.” Problems remained, but they became deeper and more productive. Researchers took seriously Bakhtin’s claim that his life’s work aimed to present an integrated philosophical worldview rather than to further a strictly “philological” enterprise—that is, a series of literary readings designed to explicate or serve the interests of their respective literary authors. The starting point was Kant and his successors among the German Romantics, a powerful collage of thinkers united by their inquiry into the possibility of human freedom. The end point, arrived at with ample help from Ernst

Cassirer, Max Scheler, Matvei Kagan (1889–1937), and Bakhtin’s peer intellectuals of his own circle, was an understanding of freedom not as agency or as initiated deed but as *response*: individuated, concrete, identity-bestowing, and in principle unfinalizable. This mandate applied not only to human responsibility but to thought itself. As Bakhtin’s mentor Matvei Kagan wrote in his fragment “Philosophy and Life” (1918–1920), philosophy is a sort of immortal organism, not mechanically logical but also not subject to the constraints of “biologism.” Most importantly, philosophy was not obliged to begin with nonbeing. It was always materialized and concrete. “The world is not dying, not being annihilated,” Kagan wrote, astonishingly, at the end of the Great War; “*it has not yet completely come to life, but is doing so.*” There is no absolute nonbeing, only not-yet-Being, and this “incomplete being is on a constant path of new becoming” (Kagan 2004, p. 311).

This philosophical reorientation promises further shifts and revised shapes for Bakhtin’s ideas. The dialogic novel has already begun to be seen as the model site for the “relational self”—cocreated, but not for that reason any less coherent, unified, and authentic (de Peuter in Bell and Gardiner 1998, pp. 30–48). Inspiration for carnival and the grotesque body is being sought in areas as diverse as Ivan Kanaev’s research on the regenerative capabilities of the freshwater polyp (Taylor in *The Bakhtin Circle* 2004, pp. 150–166) and in Trinitarian paradigms of Russian Orthodox thought (Mihailovic 1997). Bakhtin’s ideas of genre and chronotope, and more recently of “answerability,” have been immensely influential on the vast industry of college-level pedagogy in the United States, specifically on the theory of teaching English composition (Halasek 1999, Farmer 2001). And finally, attention is being paid to Bakhtin’s fragmentary, somewhat dated, but still robust thoughts on the humanities as the realm of depth and reciprocity over time rather than of scientific precision, the realm of experience rather than experiment. As communication is increasingly pressured to default to the values of speed, here, now, and simultaneity without reflection, the historical embeddedness of Bakhtin’s ideas will provide a welcome corrective and relief.

BAKHTIN CIRCLE, THE

The Bakhtin Circle was a group of Soviet scholars, including the cultural theorist Mikhail Mikhailovich Bakhtin (1895–1975), the linguist Valentin Nikolaevich Voloshinov (1895–1936), and the literary scholar Pavel Nikolaevich Medvedev (1891–1938). Drawing on a variety of philosophical positions, the group developed a philosophy of the human sciences, language, literary production, and history, and a wide-ranging cultural theory. The group's work combined, in various ways, the neo-Kantianism of the Marburg School (especially Ernst Cassirer), phenomenology (especially Max Scheler and Karl Bühler), Russian Formalism (especially Lev Iakubinskii), Hegelianism, and various types of Marxism current within Soviet scholarship (especially Georg Lukács and "Marrism").

In *K filosofii postupka* (Toward a philosophy of the act; 1993 [written in the mid-1920s]), Bakhtin combines a neo-Kantian idealism, in which ethics is the foundation of the human sciences and jurisprudence its "mathematics," with the phenomenological notion of intentionality to develop an ethics based on the acts of the responsible subject. *Avtor i geroi v esteticheskoi deiatel'nosti* (Author and hero in aesthetic activity; 1990 [written in the mid-to late-1920s]) is a phenomenological investigation into relations between author and hero in narrative fiction based to a considerable extent on the account of intersubjectivity found in Scheler's *The Nature and Forms of Sympathy* (Poole 2001).

Medvedev and Voloshinov had meanwhile been working on developing a sociological approach to poetics and discursive interaction, respectively. Both sought to bring about a meeting of contemporary philosophical trends with the sociological ideas championed by Russian Marxists at the time, particularly Nikolai Bukharin. In his essay *Formal'nyi metod v literaturovedenii* (The formal method in literary scholarship; 1978 [1928]), Medvedev argues that sociological factors shape literature from within and without and that exploration of the category of genre should precede analyses of individual literary

devices. In *Marksizm i filosofiia iazyka* (Marxism and the philosophy of language; 1973 [1929]), Voloshinov contends that language is a product of social interaction, emerging in and through dialogue, and, following Bühler, that the utterance constitutes the primary unit of language *in actu*. This phenomenology of social interaction in language is given a sociological form, so that specific styles of language use are the discursive embodiments of the worldviews of specific social groups. Modalities of authorship are also reworked into an analysis of various forms of reported speech in literature whereas literary and extraliterary forms of discourse are all held to have generic characteristics. Bakhtin himself accepted this reworking in his now famous *Problemy tvorchestva Dostoevskogo* (Problems of Dostoevsky's poetics; 1984 [1929, 1963]), where the novelist is held to have produced a "polyphonic" form in which all languages, including that of the narrator, interact on an equal and, indeed, democratic basis.

Whereas the Circle ceased to function as a group after Joseph Stalin's consolidation of power at the end of the 1920s, Bakhtin's own most important work was produced in subsequent years. In a series of essays written in the 1930s and 1940s, Bakhtin drew on the work of, among others, Cassirer and Lukács to develop a radical re-reading of literary history and the place of the novel therein. Recasting Cassirer's idealist dialectic of mythical and critical symbolic forms, Bakhtin argues that the novel has roots in popular and skeptical discursive forms that exploit the social stratification of language (heteroglossia) to undermine the truth claims of official, poetic discourse. This skepticism operates through laughter that, following Cassirer and Henri Bergson, Bakhtin sees as deflating discursive pretension and revealing that knowledge of the empirical world is impossible. In a typically Hegelian move, Bakhtin argues that it is in and through the novel that culture, the totality of discursively embodied perspectives (heteroglossia), becomes aware of itself as its own object. The dogmatic and authoritarian attitude toward another's discourse is termed "monologic" whereas a critical and democratic attitude is termed "dialogic." These essays began to be published in the 1970s and appeared in English under the title *The Dialogic Imagination* (1981).

At the end of the 1930s, Bakhtin develops a theory that the rise of the critical forces of culture represents the reappearance of semantic forms that have survived from preclass society. This theory builds on the theory of "semantic paleontology" developed by the now discredited Soviet archaeologist and linguist Nikolai Marr, who

argued that all languages develop from a primordial gesture language in primitive communism. Marr's position had been reworked and applied to literary material by the classicist Ol'ga Freidenberg, who identified certain primordial "semantic clusters" that reappear in various ways throughout cultural history. In Bakhtin's hands this model became the now-famous theory of carnival, in which forms associated with the popular culture of laughter come to permeate and structure literary works. Symbolic inversions, collective festivity, and mockery relativize the dominant culture, parading its conventionality, pomposity, and claims to discursive adequacy. Carnival on the streets is a licensed and limited rebellion against the ruling symbolic order, but once its features enter "great literature," the critical spirit that motivates it restructures the relationship between official and popular culture, democratizing the former and breaking the isolation of the latter. Bakhtin finds such features throughout the literature of the Renaissance, but he gives special attention to the work of the French novelist François Rabelais in *Tvorchestvo Fransua Rable i narodnaia kul'tura srednevekov'ia i Renessansa* (Rabelais and his world; 1984 [1965]) written at the end of the 1930s. This work was originally Bakhtin's doctoral (*kandidatskaia*) dissertation.

As part of his project dealing with the rise of modern critical culture, Bakhtin also writes important articles on the spatiotemporal characteristics of particular genres, or *chronotopes*, and a special work on the generic features of Johann Goethe's *Bildungsroman* the surviving part of which is known as *Roman vospitaniia vistorii realizma* (The Bildungsroman and its significance in the history of realism, written in the late 1930s). Bakhtin argues that it is in the work of the polymath Goethe that the Renaissance *demythification* of the world reaches its highest point. Following Stalin's denunciation of Marr in 1950, Bakhtin also sought to distinguish between a *human* science of discursive or speech (*rechevoi*) genres and a *natural* science of linguistic structures. In Bakhtin's posthumously published final works, translated as *Speech Genres and Other Late Essays* (1986), this neo-Kantian concern with demarcating the natural and human sciences becomes his central focus. The natural sciences, which adopt a *monologic* approach to their *voiceless* object, deal with questions of causality and determination whereas the human sciences, eschewing all such considerations, are based on a *dialogic* methodology and pursue an ethics of intersubjectivity.

BAKUNIN, MICHAEL

See *Bakunin, Mikhail Aleksandrovich*

BAKUNIN, MIKHAIL ALEKSANDROVICH (1814–1876)

Mikhail Aleksandrovich Bakunin, the anarchist writer and revolutionary leader, was born on the estate of Premukhino in the Russian province of Tver'. His family were hereditary noblemen of liberal political inclinations. His father had been in Paris during the French Revolution and had taken his doctorate of philosophy at Padua. His mother was a member of the Murav'av family; three of her cousins were involved in the earliest Russian revolution, the December rising of constitutionalists in 1825. Bakunin was carefully educated under the supervision of his father, who regarded himself as a disciple of Jean-Jacques Rousseau; later he was sent to the Artillery School in St. Petersburg. He received his commission and went on garrison duty in Lithuania. An awakening taste for literature made him discontent with military life, and in 1835 he obtained his discharge from the army and went to Moscow to study philosophy. There he joined the discussion circle centered on Nicolai Stankevich, which concentrated on contemporary German philosophy.

HEGELIANISM AND REVOLUTION

Bakunin was first influenced by Johann Gottlieb Fichte; his earliest literary task was the translation of that philosopher's writings for Vissarion Belinskii's periodical, the *Teleskop* (The Telescope). Later he transferred his allegiance to G. W. F. Hegel, and he advocated the Hegelian doctrine in its most conservative form with such enthusiasm that when Stankevich left for western Europe, Bakunin became the leader of the Hegelian school in Moscow and challenged the liberalism of the rival group associated with Alexander Herzen, who propagated the ideas of Charles Fourier, Comte de Saint-Simon, and Pierre-Joseph Proudhon.

Bakunin left Russia in 1840 to study German philosophy in Berlin. He still wished to become a professor of philosophy, and assiduously attended the lectures for some time; in his leisure hours he frequented the literary salons in the company of Ivan Turgenev, who used him as a model for the hero of his first novel, *Rudin*.

In 1842 Bakunin moved to Dresden, an intellectual as well as a physical journey. He had made the acquaintance of Arnold Ruge, leader of the Young Hegelians, whose contention that Hegel's dialectical method could be used more convincingly to support revolution than reaction was to influence almost every school of socialist philosophy in mid-nineteenth-century Europe. Bakunin's

meeting with Ruge, combined with his reading of Lorenz von Stein's writings on Fourier and Proudhon, effected a change of his viewpoint that had all the strength of religious conversion.

The first manifestation of this change was the essay "Reaction in Germany—A Fragment by a Frenchman," which Bakunin published under the nom de plume of Jules Elysard in Ruge's *Deutsche Jahrbücher für Wissenschaft und Kunst* (October 1842). It puts forward a Young Hegelian view of revolution; before it succeeds, revolution is a negative force, but when it triumphs, it will, by a dialectical miracle, immediately become positive. However, the most striking feature of the essay is the apocalyptic tone in which Bakunin introduces the theme—recurrent in his writings—of destruction as a necessary element in the process of social transformation. "Let us put our trust in the eternal spirit which destroys and annihilates only because it is the unsearchable and eternally creative source of all life. The urge to destroy is also a creative urge."

"Reaction in Germany," with its glorification of the idea of perpetual revolt, was the first step toward Bakunin's later anarchism, but he went through many stages before he reached that destination. At first, in Switzerland, he associated with the German revolutionary communist, Wilhelm Weitling. This drew the attention of the Russian authorities to Bakunin's awakening radicalism, and he was condemned in absentia to indefinite exile with hard labor in Siberia.

PAN-SLAVISM

Meanwhile, Bakunin moved to Paris, where he associated with Karl Marx, Robert de Lamennais, George Sand, and, most important, Proudhon. Only in later years did these discussions bear fruit, when Bakunin became Marx's great enemy and Proudhon's great disciple; for the time being, he was concerned with the liberation of the Poles and other Slav peoples. For his speeches against the Russian government he was expelled to Belgium; he returned to Paris with the February Revolution of 1848. The years of the revolutions in Europe—1848–1849—were the most dramatic period of Bakunin's life. He was an enthusiastic partisan of the uprising in France; later in 1848 he fought on the barricades of Prague, and in March 1849, he took a leading part, with Richard Wagner, in the Dresden revolution. He was captured there and, after periods in Saxon and Austrian prisons and twice being sentenced to death and reprieved, he was handed over to the Russian authorities, who imprisoned him in the Peter and Paul Fortress. Six years there ruined his health. In 1857 he

was sent to exile in Siberia, and in 1861 he escaped, via Japan and the United States, to western Europe.

During the years of action and imprisonment Bakunin produced two important works, the *Appeal to the Slavs*, written in the interval between the Prague and Dresden revolutions, and the *Confession*, which he wrote in prison at the request of Tsar Nicholas II and which was published after the Russian Revolution. The *Appeal to the Slavs* is much more than a statement of Bakunin's Pan-Slavism; in many ways it anticipates his later anarchist attitudes. The social revolution, he declares, must take precedence over the political revolution and, on moral grounds, he claims that the social revolution must be total. "We must first of all purify our atmosphere and transform completely the surroundings in which we live, for they corrupt our instincts and our wills.... Therefore the social question appears first of all as the overthrow of society," by which Bakunin evidently means the overthrow of the contemporary social order. Bakunin further maintains that liberty is indivisible and thus implies the rejection of individualism in favor of the collectivism that becomes explicit in the later development of his anarchist doctrine. The *Confession* is important principally for its account of the early development of Bakunin's revolutionary philosophy.

After his escape to western Europe in 1861, Bakunin resumed the course of Pan-Slavism he had been forced to abandon in 1849 but, after taking part in an abortive Polish attempt to invade Lithuania in 1863, he went to Italy.

ANARCHISM

In 1865 Bakunin founded the International Brotherhood in Naples. Its program—embodied in Bakunin's *Revolutionary Catechism*—was anarchism without the name; it rejected the state and organized religion, advocated communal autonomy within a federal structure, and maintained that labor "must be the sole base of human right and of the economic organization of the state." In keeping with the cult of violence that was part of the romantic revolutionary tradition, Bakunin insisted that the social revolution could not be achieved by peaceful means.

The International Brotherhood was a conspiratorial organization, for Bakunin never outlived his taste for the dark and the secret. Nevertheless, in 1867 he emerged into public life as a figurehead of the short-lived League for Peace and Freedom. This was mainly a body of pacifistic liberals, within which Bakunin led the left wing.

Bakunin was not a systematic writer. He admitted that he had no sense of "literary architecture" and saw himself primarily as a man of action, although his action was rarely successful and his life was punctuated by abortive revolutions. His writings were intended to provoke action; they were topical in inspiration, if not always in content, and it is in pamphlets on current events and in reports written for congresses and organizations that his opinions are scattered. One such report, prepared for the benefit of the central committee of the League for Peace and Freedom, was eventually published as *Federalism, Socialism and Anti-Theologism*. More than any other work, it contains the gist of Bakunin's anarchism.

Bakunin was not a great theoretical originator. The influences in his writings are obvious—Hegel, Auguste Comte, Proudhon, Ruge, Charles Darwin, and even Marx. Original in Bakunin are his insight into contemporary events (he prophesied with uncanny exactitude the way in which a Marxist state would operate) and his power to create a synthesis of borrowed ideas around which the early anarchist movement could crystallize. In *Federalism, Socialism and Anti-Theologism* the view of the structure of a desirable society is almost completely derived from Proudhon's federalism. In one vital respect, however, Bakunin's view differs from Proudhon's: While he follows Proudhon in measuring the consumer's right to goods by the quantity of his labor, he also advocates the collectivization of the means of production under public ownership; Proudhon and his mutualist followers wished to retain individual possession of land and tools by peasants and artisans as far as possible, in order to create a guarantee of personal independence. This difference was regarded as so important that Bakunin's followers were actually described as "collectivists" and did not assume the name of "anarchists" until the 1870s.

In 1868 Bakunin left the League for Peace and Freedom to found the International Alliance of Social Democracy, which was dissolved when he and his followers entered the International Workingmen's Association in 1869. Within the International, Bakunin and the southern European federations challenged the power of Marx. The dispute centered on disagreement over political methods. Marx and his followers held that socialists must seize the state and usher in a transitional dictatorship of the proletariat. Bakunin argued that power seized by workers was no less evil than power in other hands, and a communist state would magnify the evil of other states; he called for the earliest possible destruction of the state and the avoidance of political means toward that end. The workers must win their own liberation by eco-

nomie and insurrectional means. The dispute came to a head at The Hague Congress of the International in 1872, when Bakunin was expelled. The southern federations and those of the Low Countries seceded to form their own federation, and Marx's remnant faded away.

Meanwhile, Bakunin's health declined rapidly. He took part in the Lyons rebellion of 1870 and in the abortive Bologna uprising of 1874. He died, exhausted, two years later at Bern. After his death, the anarchist communism of Pëtr Alekseevich Kropotkin superseded his collectivist anarchism, except in Spain, where the large anarchist movement held his ideas in their purity until 1939.

BALFOUR, ARTHUR JAMES

(1848–1930)

Arthur James Balfour, the first earl of Balfour, was born at Whittingehame, Haddington, East Lothian. He was the son of a Scottish landowning family and was connected, through his mother, with the aristocratic house of Cecil. After an education at Eton and Trinity College, Cambridge, where he came under the influence of Henry Sidgwick (later his brother-in-law), he became a Conservative M.P. in 1874 and, despite an early reputation for indolence and frivolity, soon rose, by a combination of influence and ability, to ministerial rank. Having made his name as a courageous and enlightened chief secretary for Ireland during the turbulent period from 1887 to 1891, he became leader of the House of Commons in 1891 and in 1902 succeeded his uncle, Lord Salisbury, as prime minister. Beset by dissensions over tariff reform, his administration fell in 1905; but he remained leader of the Opposition until 1911. He resumed office in the wartime coalition as first lord of the admiralty, later becoming foreign secretary and lord president of the council. In these capacities he played a major part in the postwar negotiations at Versailles and Washington and, by the Balfour Declaration of 1917, in the eventual establishment of the state of Israel. He received the Order of Merit in 1916 and a Garter knighthood, followed by an earldom, in 1922. Among many other distinctions, he was chancellor of both Cambridge and Edinburgh universities, fellow of the Royal Society, president of the British Academy, the British Association, and the Aristotelian Society, and one of the founders of the Scots Philosophical Club. As an elder statesman whose disinterested sagacity was equally valued by both parties, Balfour in his later years enjoyed a unique position in British political life. He died, unmarried, at Woking.

Balfour's intelligence, versatility, and charm were at the service of many causes besides politics. Science and education were among his keenest interests; with his sister, Mrs. Sidgwick, he was a leading figure in the Society for Psychical Research. His leisure was divided equally between the arts and society, on the one hand, and tennis and golf on the other. Philosophy, however, was his main pursuit in private life, and in this sphere also—like his fellow statesman Richard Burton Haldane—he made a definite, if temporary, mark. Aside from having considerable literary merits, his writings are chiefly notable as a vigorous and independent contribution to the literature of the perennial conflict between science and religion.

Balfour had a strong distaste for the evolutionary naturalism of his younger days, and made repeated attempts to expose its pretensions as a prelude to stating the case for a “higher Reason” and the acceptance of Christian belief. To this end he employs skeptical weapons of a type forged by George Berkeley and David Hume and subsequently wielded by Henry Longueville Mansel, while his own defenses owe more than a little to Edmund Burke. If the would-be scientific answers to the problems of knowledge and human existence turn out, on examination, to be at once ungrounded and inconsistent, they supersede neither the time-honored beliefs of common sense nor the equally cherished, albeit unprovable, convictions of religion. Balfour’s first book, *A Defence of Philosophic Doubt* (London, 1879), argues derivatively against the claims of any prevailing system of thought to justify, let alone criticize, the natural and “inevitable” beliefs in the external world, in the uniformity of nature and, to a lesser extent, in theism. His second book, the widely read *Foundations of Belief* (London, 1895), renews the polemic against John Stuart Mill and Herbert Spencer, dwelling on their inability to account either for the facts of perception or for the appearance of natural law, and still less for the data of ethical and aesthetic experience. So far from being rational, they degrade reason to the status of an evolutionary by-product and ignore the importance of belief. The latter, it is argued in a famous chapter, is founded, not on induction, but on the more enduring basis of “authority”—the climate of traditional opinion, by which all reasonable men live. Where nothing is certain and everything rests on belief, science not only cannot dictate to religion, but even presupposes theism as the basis for its own claims to rationality.

If Balfour’s strictures on naturalism were not infrequently mistaken by his opponents for a Tory attack upon science, his defense of the faith tended equally to unnerve the faithful who distrusted its appearances of skepticism. So far as these misunderstandings resulted from his own rather casual employment of such terms as *naturalism*, *rationalism*, *theism*, *reason*, *authority*, and the like, they were clarified, in part, by his two sets of Gifford Lectures, *Theism and Humanism* (London, 1915) and *Theism and Thought* (London, 1923). These works, however, though readable enough as a restatement of his position, are essentially products of a bygone phase of controversy and have little to add that is new.

See also Berkeley, George; Burke, Edmund; Hume, David; Mansel, Henry Longueville; Mill, John Stuart; Naturalism; Sidgwick, Henry.

Bibliography

Balfour’s minor writings are represented in *Essays and Addresses* (London, 1905) and *Essays, Speculative and Political* (London: Hodder and Stoughton, 1920). See also an anthology by his secretary, W. M. Short, *A. J. Balfour as Philosopher and Thinker* (London: Longmans, Green, 1912). The leading biographies are Mrs. Dugdale (his niece), *Arthur James Balfour*, 2 vols. (London: Hutchinson, 1936), and K. Young, *Arthur James Balfour* (London: G. Bell, 1963). The former has an appraisal of his philosophy by A. Seth Pringle-Pattison, an old friend, whose *Man’s Place in the Cosmos* (London: Blackwood, 1897) also contains a useful appreciation of Balfour’s earlier point of view.

P. L. Heath (1967)

BALGUY, JOHN

(1686–1748)

John Balguy, the English theologian and moral philosopher, was born in Sheffield and educated at the Sheffield grammar school and at St. John’s College, Cambridge. He was admitted to the B.A. in 1706, ordained in the established church in 1710, and granted the living of Lamesley and Tanfield in Durham in 1711. Later he was made a prebendary of Salisbury (1727) and finally vicar of Northallerton, York (1729). He was an associate of Bishop Benjamin Hoadley and was the bishop’s defender in the Bangorian controversy. Hoadley was the close friend of Samuel Clarke.

Balguy’s first piece of moral philosophy was an attack on the philosophy of Shaftesbury, titled *A Letter to a Deist concerning the Beauty and Excellency of Moral Virtue, and the Support Which It Receives from the Christian Religion* (London, 1726). His most important work was *The Foundation of Moral Goodness* (Part I first published in London in 1728, Part II in 1729). Part I is a criticism of the moral philosophy of Francis Hutcheson and an exposition of Balguy’s own views, much influenced by Samuel Clarke. Part II is a set of critical queries with Balguy’s answers. A Lord Darcy, an admirer of Hutcheson’s philosophy, is said to have proposed the queries.

Hutcheson claimed that we distinguish between virtue and vice by means of the perceptions of a moral sense. These perceptions are kinds of pleasure and uneasiness, and they are invoked to account for our approval of virtue and our abhorrence of vice, as well as our obligation to behave virtuously and to avoid viciousness. Hutcheson believed that our moral sense has been determined by God to operate as it does and that we are

naturally endowed with a benevolence toward our fellow creatures.

Balguy agreed that God has endowed our minds with benevolent affections toward others, but these affections are only helps or incentives to virtue and not the true ground or foundation of it. By making virtuous behavior flow from divinely founded instincts, Hutcheson had made virtue arbitrary. It is compatible with Hutcheson's view that God might have made us different from what we are, even inverting virtue and vice if he pleased. What is more, if God had not given us an instinct for benevolence, it appears that we should be altogether incapable of virtue; and this would be so even if we were possessed of reason and liberty.

Balguy argued that there is something in actions absolutely good (or bad) that is antecedent to both affections and laws. If this were not so, no reason could be given for God's preferring us to act benevolently and disposing us accordingly. For an action to be virtuous, there must be a perception or a consciousness of its reasonableness, or we would have to admit that beasts can be virtuous. Genuine goodness consists in our being determined to do a good action merely by the reason and the right of the thing. This is the purest and most perfect virtue of which any agent is capable. The obligation to perform a virtuous act is to be found in its reasonableness, and for a rational creature to refuse to be reasonable is unthinkable.

Balguy's elucidation of "reasonable" is found in his account of our knowledge of virtue. He argued that our understanding is altogether sufficient for the perception of virtue. Virtue is the conformity of our moral actions to the reasons of things; vice is the contrary. Moral actions are actions directed toward some intelligent being, and Balguy called them moral to distinguish them from other kinds of action. By a moral action's conformity to reason, Balguy meant the agreeableness of the action to the nature and circumstances of the persons concerned and the relations existing between them. Gratitude is an example of what he meant by conformity to reason: "We find ... that some actions are agreeable, others disagreeable, to the nature and circumstances of the agent and the object, and the relations interceding between them. Thus, for instance, we find an agreement between the gratitude of A and the kindness of B; and a disagreement between the ingratitude of C and the bounty of D. These agreements and disagreements are visible to every intelligent observer, who attends to the several ideas" (*The Foundation of Moral Goodness*). He likens our perception of such

an agreement to our perception of the agreement between the three angles of a triangle and two right ones, or our perception of the agreement between twice three and six. Since we do not require an intellectual sense superadded to our understanding in order to perceive these mathematical agreements, then clearly we do not require a moral sense to perceive the agreement of A's gratitude and B's kindness.

There are difficulties in Balguy's account of virtue as conformity to reason. The agreement between twice three and six is an equality, which is logically necessary. But the agreement of A's gratitude and B's kindness is not a defined equality. How, then, does the agreement come about? One of Balguy's synonyms for "agreement" is "fitting," and it appears to let the proponents of the moral sense in at the back door. For why is gratitude a fitting response to kindness and a lack of gratitude unfitting? What can we say but that we feel gratitude to be fitting and the lack of gratitude unfitting? "Fitting" and "unfitting" are normative terms, and while one can learn such a rule as "Gratitude is the fitting response to kindness," the rule must originally have been given life by someone's feeling that gratitude is the fitting response to kindness. Balguy would treat the rule as an end in itself, because he believed it exhibits some inherent self-consistency. The proponents of the moral sense would argue that the consistency of gratitude and kindness lies not in them but in us who find them to be consistent.

Balguy would agree, of course, that it is we who find gratitude to be the fitting response to kindness. The dispute is only over how we find it to be fitting, and we find it so not by a moral sense as by using our reason or understanding. The final defense for this contention is Balguy's assessment of reason as the noblest of our faculties, superior to any sense. Therefore, reason must be the arbiter of virtue and vice. The question of what faculty assesses the relative superiority of our faculties is never asked.

Balguy also wrote *Divine Rectitude: or a Brief Inquiry concerning the Moral Perfections of the Deity, Particularly in Respect of Creation and Providence* (London, 1730). He argued that God's goodness follows from a regard for a real and absolute order, beauty, and harmony.

BÁÑEZ, DOMINIC

(1528–1604)

Dominic Báñez, the Spanish theologian, was born at Valladolid and died at Medina del Campo. He studied at the University of Salamanca, where he entered the Dominican order. He first taught courses in philosophy and theology in various houses of study of his order in Spain (Salamanca, Ávila, Alcalá de Henares, Valladolid) and then became a professor at the University of Salamanca, teaching philosophy from 1577 and theology from 1581. He was noted for his role as the spiritual director of St. Teresa of Ávila and for his bitter controversy with the Jesuit Luis de Molina concerning divine grace. Báñez's view on grace and human liberty is called "physical pre-determination," which means that man's will is unable to act unless empowered and applied to action by an ultimate principal cause, which is God. Apart from a commentary on Aristotle's treatise *On Generation and Corruption* (1585), Báñez's philosophy is found in his theological work *Scholastica Commentaria in Primam Partem Angelici Doctoris* (Commentary on the first part of the summa of theology; 2 vols., Salamanca, 1584–1588). As a philosopher, Báñez was at his best in interpreting the metaphysics of St. Thomas. Unlike most of his contemporaries, he saw the importance of the act of being (*esse*) as constituting every nature in existence (see L. Urbano, ed., *Scholastica Commentaria*, I, p. 141). In this he anticipated the existential view of Thomistic metaphysics now favored by such thinkers as Jacques Maritain and Étienne Gilson. On the other hand, Báñez interpreted the real distinction of essence and existence as the difference between two individual things (*res*) and then rejected this notion. Moreover, he regarded the limitation of the act of existing by the essence that receives it as an indication that essence may, in this sense, be more noble than existence.

BANFI, ANTONIO

(1886–1957)

Antonio Banfi, the Italian philosopher, was born in Milan and studied at the Academy of Science and Letters there and at the University of Berlin. Banfi enjoyed a long acquaintance with Edmund Husserl, who influenced Banfi's thought along with the Marburg Neo-Kantians. Banfi taught at the universities of Florence, Genoa, and Milan. In 1940 he founded the review *Studi filosofici*, which played an important part in the Italian revolt against idealism. Banfi participated actively in political life. In 1925 he adhered to the manifesto of the antifascist intellectuals prepared by Benedetto Croce. After World War II he sat in the Italian Senate as a Communist.

German rather than Italian influences are apparent in Banfi's major work, *Principi di una teoria della ragione* (Principles of a theory of reason; Milan, 1926). According to Banfi philosophical inquiry does not spring from an immediate spontaneity of thought but arises as critical reflection on the cultural heritage of the speculative tradition. By studying the structures of knowledge, reflection grasps the function of reason. Reason is to be understood neither in a psychological sense nor in the metaphysical sense of Hegelianism. Reason, according to Banfi, is the indefinite law of the process of organization or of coordination of experience.

The task of science, Banfi held, is to study experience and resolve it into functional relations or laws. Philosophy continues the work of science in its own manner. It clarifies experience in terms of dialectical antitheses (reality and appearance, matter and form, necessity and liberty, and so on); it resolves the opposition of the antitheses in the unity of an idea; and in the phenomenological conclusion it discloses the rational structure progressively attained in the ordering of experience.

In subsequent works Banfi sought to emphasize the problematic nature of reason as an open system and as the self-ordering of experience. He saw in dialectical materialism the elimination of the mythical moment of knowledge, the affirmation of the unending development of reason, and the liberative function of reason.

See also Croce, Benedetto; Dialectical Materialism; Experience; Hegelianism; Husserl, Edmund; Idealism; Neo-Kantianism; Reason.

Bibliography

Banfi's *L'uomo copernicano* was published in Milan in 1950.

His two-volume *La ricerca della realtà* was published in Florence in 1959.

Translated by Robert M. Connolly

BARTH, KARL

(1886–1968)

Karl Barth, the Swiss theologian, was born in Basel in 1886. He held professorships at Göttingen, Münster, Bonn, and Basel. His impact on the theological world dates from 1921, with the substantially revised second edition of his *Der Römerbrief* (the first edition was published in 1919). Herein he attacked the prevalent “subjectivism” of Protestant theology, in which he perceived the attempt to fit the Christian revelation into the mold of human preconceptions. After that, though Barth changed and developed many of his ideas, a single main concern ran through all his writings: namely, how to prevent theology from becoming an ideology, that is, a creation of human culture. This was the reason for his early violent attacks on the then fashionable liberal theology, as expounded, for instance, by Adolf von Harnack. According to Barth, the danger of such attempts to formulate a “reasonable” Christianity is threefold: intellectual, ethical, and soteriological. First, there is the danger of identifying human conclusions with the Word of God and thus of destroying the validity of the concept of revelation, which is God's self-manifestation and owes nothing to human initiatives. Second, there is the danger that the church will simply reflect the social and cultural situation, thus losing its power of criticism and its prophetic function. Barth was deeply disturbed by the support given to the kaiser by

a number of his liberal theologian teachers in 1914. It is notable that, while at Bonn, he threw his support behind the Confessing church in its opposition to the Nazis, an action that cost him his chair. Third, salvation comes from God alone, and the attempt to identify a human Weltanschauung with God's Word is an instance of the refusal to accept that the only justification is by grace. As Barth wrote: “This secret identification of ourselves with God carries with it our isolation from him.”

The principle that theological exposition should be basically independent of human speculations (except insofar as historical and linguistic investigations, etc. are a necessary part of understanding Scripture) was reinforced by Barth's interpretation of the Fall. Not only is the human will vitiated by the Fall, but reason also, in such a way that it is impossible for men to discover the truth about God through their own efforts. Only if God manifests himself can there be any revelation. Thus Barth rejected the whole of natural theology as expounded by, for instance, Aquinas, and in particular its basis in the doctrine of the analogy of being (*analogia entis*), on the ground that it implies some similarity between creatures and God. A strong motif in Barth's theology, therefore, is the transcendence of God (in the sense of his distance from creatures—“the great Calvinist distance between heaven and earth”). Methodologically, all this implies that interpretation of the Bible should not betray the genuine meaning of the text by explaining away or avoiding those hard sayings that are supposedly scandals to modern thought. Nevertheless, Barth is no fundamentalist: The Word of God is not to be identified with the witness to it found in the Bible, and there is no question of using the latter as a “paper pope.”

Der Römerbrief was critical rather than constructive, and during the 1920s Barth's theology had the character of being dialectical (to use a term that he later came to reject), that is, it called in question human preconceptions about God, often by denying them in the sharpest terms; but since theology is designed to proclaim what is God-given, it is always necessary to reach out beyond such denials. In this way, there is a constant dialectic between grace and man's religion. The concept that religion itself is under divine judgment, and is a human rather than strictly a divine phenomenon, has had great influence, culminating in Dietrich Bonhoeffer's idea of a “religionless Christianity.”

In the late 1920s Barth started on the second main phase of his theological writing, and after what he called his “well-known false start,” with the *Prolegomena to a Christian Dogmatics* (*Christliche Dogmatik im Entwurf*,

1927), he began on his many-volumed *Church Dogmatics* (*Die kirchliche Dogmatik*, 1932 and onward). Herein he was influenced by his study of Anselm (expressed in *Fides Quaerens Intellectum*, 1931). The heart of the Ontological Argument is the recognition that theology does not need any metaphysical substructure; it contains within itself its own rationale, namely the unfolding of the inner form of God's Word. Thus dogmatics is systematic in that it presents the material in an orderly way and in that it aims exhaustively to touch on all areas of human concern, but it is not a deduction from some principle or set of principles.

The *Church Dogmatics* is a rich work, though not altogether a consistent one, since Barth's thought was developing in the course of his writing. Its main emphasis is Christocentric. God's revelation is essentially seen in the Christ-event, and Christ is God's Word. However, the God so revealed is trinitarian: "the work of the Son of God includes the work of the Father as its presupposition and the work of the Holy Spirit as its consequence." The first article, the work of the Father, is "to a certain extent the source, the third article, the work of the Holy Spirit, the goal of our path. But the second article, the work of the Son, is the Way upon which we find ourselves in faith. From that vantage we may review the entire fullness of the acts of God." Consequently, such doctrines as creation must be seen from this perspective. The Bible presents no cosmology, but it does contain an anthropology; and thus God's relation to the natural world can only be understood by analogy with his saving revelation to human beings. Notions of a First Cause and Necessary Being, as explaining the existence of the cosmos, are thus beside the point, for they make no use of the concepts of grace and personality as ascribed to God. By contrast, the biblical saga of creation makes it continuous with God's covenant relationship with Israel.

Barth's exposition is controlled throughout by two considerations. First, dogmatics is necessarily church dogmatics, that is, it is an activity that must be carried on within the church, as the place where the preaching or proclamation of the Word occurs. Thus the theologian's continuous concern is to test the doctrine and preaching of the church, which, because it is carried on through human beings, is liable to go astray. Second, the standpoint from which the proclamation is tested is that of Scripture, which is "the document of the manifestation of the Word in Jesus Christ." Dogmatics would become irrelevant if it sacrificed this standard.

The implications of Barth's thesis for the relationship between philosophy and theology are clear. Insofar as philosophy is metaphysical, in the sense of saying some-

thing about God or some such substitute as the Absolute, it collides with theology; and it is the theologian's proper task to show how metaphysics has here gone beyond its legitimate limits. Philosophy, as logic, philosophy of science, and so on, is a proper inquiry, but one that is quite separate from theology. Barth does, however, allow (in his *Fides Quaerens Intellectum* and elsewhere) that philosophical concepts may be used in exegesis, so long as they are kept strictly subordinate to the Word of God. But Barth remains insistent that theologians should not make concessions to secular thought; indeed, he holds that such concessions are a principal reason for the contempt that many philosophers have had for "philosophical" theologians. Thus traditional forms of apologetic are ruled out.

Two issues arising from Barth's whole approach are crucial. First, how is one to know that the revelation in Christ is the true one? Or more particularly, how is one to know that the whole doctrine of God as expounded by Barth is true? Second, how can these propositions about God be meaningful if the similarity or analogy between God and human persons is denied? For Barth, the first question is one that virtually does not arise. The Bible, for instance, does not set out to prove God's existence or attributes, rather, it witnesses to his acts. The task of the preacher or theologian is to proclaim this revelation. Theology must be a rational inquiry that is appropriate to its subject matter, namely God's gracious self-revelation; and any attempt to establish the truth of doctrine upon grounds that are extraneous to its subject matter is both irrelevant and dangerous. Thus the Christian message is not to be seen as a religious teaching amid rival teachings, for all religious and metaphysical revelations and conclusions are projections of human wishes (here the influence of Ludwig Feuerbach is apparent). It by no means follows, however, that any particular statement of theology that is consistent with these presuppositions as to the nature of theological inquiry is correct. Barth holds that dogmatics is a continuing process within the church, and it is, of course, a human activity suffering from the defects of human reason. It is therefore necessary to consider the criteria of the worth of a system of dogmatics. These criteria are necessarily derived internally from God's self-revelation (by the former arguments). Barth singles out two. First, theological thinking must be humble: this is a practical test of whether it is refraining from establishing its own claim to truth, i.e., its being in effect an ideology. Second, it must express the doctrine of predestination, which encapsulates the whole of the revelational approach—what man "achieves" in relation to God is due to God. Because of the element of paradox in the first cri-

terion (for the Thomist can be humble in his approach), Barth is at times inclined to speak in a syncretistic way. Imagining a conversation in heaven, he says: “Yes, dear Schleiermacher, I understand you now. You were right, except on some points!” (*Karl Barth’s Table Talk*). Further, the notion that theology is dialectical, so that a statement can be balanced by affirming its apparent contradictory, has rendered Barth less rigid than many of the Barthians.

As to the problem of the meaning of theological utterances, Barth holds that revelation is a relational concept, and thus God does not, so to say, reveal himself independently of the human apprehension of his self-manifestation. Consequently, the knowledge of God is itself given by God, through grace. Thus, the *analogia entis* is replaced by the *analogia fidei* (the analogy of faith); faith gives us understanding of the nature of God and is God-given. Thus God is the cause of true theological assertions, as well as their ground.

Barth’s influence has been great. This is partly because he has provided the outline of a theology that is powerfully biblical without being fundamentalist and, therefore, can escape the charge of being irrational by being nonrational. The most eminent Europeans who stand close to Barth are Emil Brunner and Oscar Cullmann. The former entered into controversy with Barth in the early 1930s over the question of the fallen character of human reason. Brunner held that in some areas this thesis was obviously false, for example, in the natural sciences; but, nevertheless, in relation to knowledge of God, men are capable of only the most shadowy awareness on their own. One of the most important attempts to apply Barth’s theology has been Hendrik Kraemer’s *The Christian Message in a Non-Christian World* (1938), which aims to show that all religions, including empirical Christianity, are under the judgment of the revelation in Christ. Thus there is no need to argue for Christianity as an empirical phenomenon as against other religions. But the question remains: If there is no correspondence between the Gospel and empirical Christianity, the church is a sham; and if there is, then the comparison and contrast between empirical Christianity and other faiths is possible, and apologetics unavoidable. This is one illustration of the central problem posed by Barth’s theology.

Bibliography

There is a useful bibliography of Barth’s works in T. F. Torrance’s *Karl Barth, an Introduction to His Early Theology, 1910–1931* (London: SCM Press, 1962). The main works translated into English are *The Epistle to the Romans* (London: Oxford University Press, 1933); *Church Dogmatics*, edited by G. W. Bromiley and T. F. Torrance (London: T. and T. Clark, 1936; Edinburgh, 1956 onward), 4 vols., comprising 11 separately published sections, one of which is *Church Dogmatics: A Selection with Introduction*, edited by H. Gollwitzer and translated by G. W. Bromiley (Edinburgh: T. & T. Clark, 1961). An outline, by Barth himself, of the thought in this work is *Dogmatics in Outline* (London: Philosophical Library, 1949). Later works include *The Humanity of God* (Richmond, VA: John Knox Press, 1960); and *Anselm: Fides Quaerens Intellectum* (Richmond, VA: John Knox Press, 1960); and *Evangelical Theology: an Introduction* (New York: Holt, Rinehart and Winston, 1963). See also *Karl Barth’s Table Talk*, recorded and edited by John D. Godsey (Edinburgh, 1963).

Works expressing related thought are E. Brunner, *Dogmatics*, 2 vols. (London, 1949; 1952); Oscar Cullmann, *Christ and Time* (London, 1951); and H. Kraemer, *The Christian Message in a Non-Christian World* (London: Edinburgh House Press for the International Missionary Council, 1938). Philosophical criticisms of Barth’s position can be found in H. D. Lewis, *Morals and Revelation* (London: Allen and Unwin, 1951) and Ronald W. Hepburn, *Christianity and Paradox* (London: Watts, 1958), Ch. 5.

Ninian Smart (1967)

BARTH, KARL [ADDENDUM]

Since his death in 1968, time and distance have provided scholars with space to understand Karl Barth in a larger intellectual and cultural context. He has emerged as one of the most important Christian theologians of the twentieth century—perhaps the most important—while his massive theological oeuvre and the changing shape of his thought have generated a host of alternative interpretations, notably in respect to his understanding of and relationship to Western philosophy. Contemporary theologians have sought to appropriate Barth in several directions, exploring his thought in connection with various post-modern positions.

Barth consistently held that philosophy should not hold sway over theology. In a 1960 essay written in honor of his brother, who was a philosopher, Barth allows that theology and philosophy can coexist in harmony, but he also spells out the important differences between these disciplines. The Christian theologian must be held captive to the Word of God, he contends, for only God’s revelation in Christ provides us with the key to under-

standing divinity; biblical theology, not philosophical reasoning, is the basis for Christian theology.

At the same time, Barth's thinking was influenced by European philosophers. The influence of existentialist thinkers (especially Kierkegaard) on Barth has long been acknowledged, even by Barth himself. Barth also read and responded to Heidegger in his own way. In recent years the importance of the Marburg school of Neo-Kantian philosophy has become more clear, especially in Barth's early development. Thus Barth's appreciation for philosophy is more expansive than had been acknowledged in earlier scholarship.

Contemporary scholarship has fruitfully engaged Barth's thought with larger philosophical concerns, bringing him into a larger orbit. Much of this research has brought to light Barth's critique of modernity and his ambivalence toward language as a vehicle for theology. Several so-called postliberal theologians have appropriated Barth as a narrative theologian who sought to read the rest of the world in terms of the biblical story. Here Barth is sometime brought into conversation with the later Wittgenstein, both in terms of an understanding of language and a critique of enlightenment rationalism. Most recently scholars have developed some of the parallels between Barth and postmodern philosophers, especially Derrida. This school seeks to appropriate Barth for postmodern theology, a move roundly criticized by more traditional Barth experts. Thus Barth remains at the center of contemporary theological debate.

Alan G. Padgett (2005)

BARTHES, ROLAND

(1915–1980)

Ronald Barthes was a French writer most widely known for declaring “the death of the author.” It is ironic, then, in a way Barthes would surely appreciate, that his *Œuvres complètes* fill nearly 6,000 pages with the unmistakable observations, distinct voice, and style that shaped the form and content of what came to be known as “cultural studies.” He was sixty-five years old in 1980 when a laundry truck struck him down in a street in front of the Colège de France. He died of his injuries four weeks later.

Barthes was born in November 1915, in Cherbourg. His father died before his first birthday, and he was raised by his mother and paternal grandparents in coastal Bayonne. Normal progress to a university degree was blocked by the onset of tuberculosis. Over the course of ten years convalescing in and out of sanatoria, Barthes earned advanced degrees in Greek and Latin, performed in the Ancient Theater Group, and taught French in Romania and in Egypt where A. J. Greimas introduced him to linguistics. He gained his first regular academic post at the *Écoles pratique des haute études* in 1962 on the basis of his publications *Le degré zéro de l'écriture* (1953), *Michelet par lui-même* (1954), and *Mythologies* (1957). He gained wider public notice with the publication of *Le plaisir du texte* (1973), a critical erotics of reading pleasures, and *Roland Barthes par Roland Barthes* (1975), an autobiography prefaced, as it were, on the page ordinarily reserved for a dedication with the handwritten remark, “It must all be considered as if spoken by a character in a novel.” He was appointed Chair of Literary Semiotics at the College de France in 1976 where he lectured until his death.

Barthes's contributions to philosophy fall under four headings defined, in each case, by pairs of opposed terms: mythology (nature/culture), semeiology (*langue/parole*), structuralism (reading/writing), and hedonism (*plaisir/jouissance*).

MYTHOLOGY

Myth today, according to Barthes, is found in a conflation of nature and culture or, more specifically, in the production and consumption of culture as nature. In his most famous example, it is no accident that the scurrilous

competitor in a professional wrestling match is bested by the fair play of his adversary: his foul play (as the “fairness” of the victor) is fabricated to stage the “natural” and inevitable triumph of “good” over “evil.” Again, in Parisian striptease, the *artiste* sheds layers of patently cultural trappings—feathers, furs, and exotic costumes—to reveal her naked body as the “natural” state of woman unnaturally desexualized, in this act, to forgive the voyeur and the culture that condones his voyeurism for their sins. In modern myths, an apparently natural meaning contains the form of a cultural signification whose content discloses the artifice of what is “natural” in appearance only. “Demythologization” was the name given to the critical practice of exposing these myths.

SEMEIOLOGY

Barthes’s literary semeiology follows Ferdinand de Saussure’s distinction between *la langue*, the syntactic and semantic paradigms that define the language one learns, and *parole*, the series of signifying acts that compose the language one speaks. On this model, meaning is the product of a system of distinctions and conventions, found in *la langue*, which anchor otherwise unruly syntagms of signifying units, articulated as *parole*. The meaning of this sentence, for example, depends on identifying the parts of speech in it and the rules governing their use that define the linguistic system in which the sentence is uttered. Reversing Saussure, semeiology was, for Barthes, a subset of linguistics, a science of the signifying function of language. In his studies of advertising, gastronomy, fashion and Japan, Barthes consistently emphasized the multiplicity and variability of the signifier over the system that governed its significations.

STRUCTURALISM

As Barthes defined it, structuralism studies the rules, norms, and organizing structures that make meaning possible. These structures are the products of cultural practices, which the structuralist uncovers beneath the singular meaning attributed to an image, an artifact, or a text. It is Author who could authorize a Single meaning (the capital letters standing for the “theological” authority supposed by such a concept of signification) who dies in Barthes’s analysis of the rules, norms, and organizing structures, of the narrative and social and moral codes that govern the writing (literal and figurative) of a text or any other cultural artifact. In addition, this writing is governed by the rules, norms and structures of reading. So that writing, *écriture*, arranges a meeting of the structures and codes that have formed a writer and a reader and

stages the multiplication of meanings sustained by the text a writer and reader share. Barthes calls a text “writerly” which invites the reader to write meanings into it and “readerly” when the text insists on a single authorial intention.

HEDONISM

Our pleasures, in Barthes’s writing, are divided along the same lines. There is, on the one hand, *plaisir*, the warmth of sensation that opposes cold abstraction, the contentment, euphoria and delectation that relieve the method, commitment and science of the intellect. It is found in texts of and on pleasure (Gustave Flaubert and Marquis de Sade, for example) and connected to a reading practice that is comfortable and continuous with the culture of the reader and the text. There is, on the other hand, the ecstatic pleasure of *jouissance*, a feeling of enjoyment characterized by a state of loss. It is not centered in the heart (as opposed to the head) but spread sensuously across the entire surface of the body. *Jouissance* is found in a reading practice that “cruises” the text, skipping passages anticipated as “boring,” looking up distractedly to consider ideas associated with the body and dissociated from the culture of the reader or the text. *Jouissance* is found in distinctly “writerly” readings and texts that multiply meanings for the sheer pleasure of it.

There is, finally, a distinctive normative orientation in Barthes’s writings. While he did not author or advocate an alternative, single meaning of culture, Barthes did license and exhort readers to take ecstatic pleasure in multiplying the meanings of culture and in rewriting the authority of its hegemonic codes.

BASEDOW, JOHANN
BERNHARD
(1724–1790)

Johann Bernhard Basedow, the German philosopher, theologian, and educational theorist, was born in Hamburg into the family of a poor wigmaker, whose name, more properly, was Bassedau. A benefactor financed his studies, first at Hamburg under H. S. Reimarus. In 1746 he entered the faculty of theology at Leipzig University, where he studied philosophy under the Pietist philosopher C. A. Crusius. In 1749 he became a private tutor in the family of Herr von Quaalen in Holstein. His experiences as a tutor turned his attention to educational problems, which were the subject of his master's thesis at Kiel University in 1752. On Friedrich Gottlieb Klopstock's recommendation, he was appointed professor of philosophy and rhetoric at the Knightly Academy at Sorø, Denmark. A heterodox work, *Praktische Philosophie für alle Stände* (Practical philosophy for all states; Copenhagen, 1758), led to his dismissal. In 1761 he moved to the gymnasium at Altona, but again lost his position, and his writings were prohibited. He left theology and, supported by his benefactor, published his *Vorstellung an Menschenfreunde für Schulen, nebst dem Plan eines Elementarbuches der menschlichen Erkenntnisse* (Appeal to the friends of mankind about schools, with a plan for an elementary book on human knowledge; Hamburg, 1768), his first significant work on education, which met with a tremendous response. With financial help from several influential people, he published during the following years several textbooks, the most important being his *Methodenbuch für Väter und Mütter der Familien und Völker* (Methodology for fathers and mothers of families and nations; Leipzig, 1770; edited by T. Fritzsche, Leipzig, 1913). Prince Franz Leopold Friedrich of Dessau invited him to organize an experimental school in Dessau. Basedow accepted, and the school, called the *Philanthropin*, opened in 1774.

It was soon imitated by a number of similar institutions in Germany and Switzerland.

By 1776 Basedow had returned to theology, living in Dessau, Leipzig, Halle, and Magdeburg. During this period he published his *Examen in der alten natürlichsten Religion* (Examination of the old most natural religion), which he considered his masterpiece. Basedow's theological ideas, inspired by the English and French deists, aimed at a natural religion, rational and practical, refraining from dogmas and rejecting every kind of orthodox Christianity.

Basedow was one of the "popular philosophers" (*Popularphilosophen*), but his importance as a theoretical philosopher has been underrated by modern historians. His work on theory of knowledge and metaphysics, *Philalethie* (Lübeck, 1764), inspired by Crusius, David Hume, and the French *philosophes*, was one of the most significant books on methodology of its time and influenced Immanuel Kant, Johann Nicolaus Tetens, and others. He supported a moderate skepticism based on common sense and denied the possibility of reaching absolute demonstrative truth in natural philosophy (out of skepticism concerning causation), in rational psychology, or in theology.

Basedow's chief importance lies in his educational theories, which are based on John Amos Comenius, John Locke, and Jean-Jacques Rousseau. He claimed that education should be cosmopolitan, free from any confessional imprint, equal for all classes, and aimed at enabling men to live useful and happy lives as good citizens. Instruction should appeal to the child's sensibility rather than to his understanding and should be encouraged by games and colloquial intercourse. Images (*Zeichen*) are more effective than words.

BASIC STATEMENTS

Any statement of fact is true or false in virtue of some existing state of affairs in the world. In many cases the truth-value of a statement is determined by appealing to the truth-values of certain other statements, but this process must terminate somewhere if the truth-value of any statement of fact is to be assessed at all. An epistemological view according to which the process of verification or falsification terminates with statements of a logically distinct kind is a view to the effect that there is a distinct class of *basic statements*. The principal questions that have been considered are (1) Is there such a class of statements? (2) If there is, what is the relation between these statements and certain nonverbal occurrences called experiences? (3) Are basic statements descriptions of the private experiences of the speaker or of publicly observable events? (4) Are these statements either incorrigible (that is, of such a character that they cannot be false, or cannot be shown to be false) or indubitable (that is, such that they cannot rationally be doubted)? These questions have been much discussed by modern empiricists, especially in connection with the verifiability criterion of meaning. The problems concerning basic statements are not, however, essentially confined to empiricist theories of meaning and truth; they are fundamental in any theory of knowledge.

WITTGENSTEIN

The thesis that there is a class of basic or elementary propositions is powerfully presented in Ludwig Wittgenstein's *Tractatus Logico-Philosophicus* (1921; first English translation, 1922). Wittgenstein argues that if a proposition contains expressions standing for complexes, the sense of the proposition will depend upon the truth of other propositions describing those complexes. This will again be the case if any one of those other propositions contains expressions standing for complexes. Thus, the

determinateness of the sense of the original proposition requires that its analysis should terminate in elementary propositions consisting only of names of simple things (see 2.0211–2.0212, 3.23). An elementary proposition is an arrangement of names that represents a possible arrangement of simple things; it is a logical picture of an elementary state of affairs. Wittgenstein gave no explicit interpretation of “simple things,” “names,” or “elementary propositions.” He is reported as saying that at the time he wrote the *Tractatus* he thought it was not his business, as a logician, to give examples of simple things, this being a purely empirical matter; the *Tractatus* view is that the application of logic decides what elementary propositions there are (5.557).

SCHLICK

Moritz Schlick and some other members of the Vienna circle gave an empiricist interpretation to Wittgenstein's theory. In “Über das Fundament der Erkenntnis” (1934) and other articles, Schlick inquired whether there is a class of statements which provide an “unshakeable, indubitable foundation” of all knowledge. This kind of incorrigibility, he argued (against Otto Neurath and Rudolf Carnap), cannot depend simply upon the coherence of a statement with the existing system of science, nor simply upon someone's decision to accept a statement as true. It is possessed only by the statements a person makes about his own experiences. Schlick called such statements *Konstatierungen* “confirmations” and contrasted these with the “protocol sentences” described by Neurath and Carnap.

Konstatierungen have the following characteristics: (1) They have the form “here, now, so and so”; examples are “here two black points coincide,” “Here yellow borders on blue,” “Here now pain.” (2) In the case of other synthetic statements, understanding their meaning is quite distinct from the actual process of verifying them, and their meaning does not determine their truth-value; but in the case of a *Konstatierung* (since “‘this here’ has meaning only in connection with a gesture ... one must somehow point to reality”), the occasion of understanding it is the same as that of verifying it. Therefore a (significant) *Konstatierung* cannot be false. (3) Unlike “protocol sentences,” these statements cannot be written down or recorded at all because of the fleeting reference of the demonstratives that occur in them; but they provide the occasions for the formation of protocol sentences. (4) They are the only empirical statements that are not hypotheses. (5) They are not the starting points of science in either a temporal or a logical sense, but simply the

momentary consummations of the scientific process; they are the means by which all scientific hypotheses are confirmed.

The first and most obvious objection to the view that there are *Konstatierungen* (in Schlick's sense) is that it results immediately in a radical form of solipsism. It may also be objected that *Konstatierungen* are either genuine contingent statements, in which case they cannot be of such a nature that they cannot be false, or they are purely demonstrative, in which case they are not statements. Following Wittgenstein's later work, many philosophers would deny the possibility of the essentially private use of demonstratives and descriptions that are supposed to occur in *Konstatierungen*. Further, no adequate account is given of the relation between these private statements and the public protocol sentences to which they give rise. Moreover, if the *Konstatierungen* are meaningful only at the moment at which they are verified, they cannot occur in predictions, and hence it cannot be through them that scientific hypotheses are confirmed.

CARNAP

Rudolf Carnap, in “Die physikalische Sprache als Universalsprache der Wissenschaft” (1931; translated as *The Unity of Science*, 1934) and elsewhere, had at first held that science is a system of statements based upon sentences describing the experiences of scientific observers. These “primitive protocol sentences,” Carnap supposed, contain no inferential or theoretical additions; they describe only what is directly given, and hence they stand in no need of any further justification. At this time Carnap left it an open question whether protocol sentences describe the simplest sensations and feelings of the observer (for example, “here now red,” “joy now”), or partial or complete *gestalts* of single sensory fields (for example, “red circle now”), or the total experience of the observer during an instant, or macroscopic material things (for example, “A red cube is on the table”). Later, however, in *Logische Syntax der Sprache* (1934) and other publications, due mainly to the criticisms of Neurath, Carnap held that the question of what protocol sentences describe is not a factual but a linguistic question and that we are free to choose whatever form of language is most convenient for reporting observations in science.

NEURATH

Otto Neurath, in “Soziologie im Physikalismus” (1931/1932; English translation, 1959) and other articles, had argued that sentences cannot be compared with the private experiences of the observer, nor with public mate-

rial things, but only with other sentences. Some sentences are reports of acts of observation, in the sense of being behavioral responses to those acts, and such protocol sentences may have whatever form we find most convenient. In “Protokollsätze” (1932/1933), Neurath maintained that for the purposes of science it must be possible to incorporate the protocol sentences expressed at one time in those expressed at another time, and that comparison of protocols, even with one’s own past protocols, requires an intersubjective language. Neurath remarks, “every language *as such* is inter-subjective.” Carnap later agreed that if protocol sentences were regarded as describing the observer’s private experiences, they could be understood, if at all, only solipsistically. Neurath suggested that a convenient form for protocol sentences would be one which contained a name or description of an observer and some words recording an act of observation; he gives as an example “Otto’s protocol at 3:17 o’clock [Otto’s word-thought at 3:16: (In the room at 3:15 was a table perceived by Otto)].” In this example, it is supposed that the entire sentence is written down by Otto at 3:17, simply as an overt verbal response; the sentence in brackets is Otto’s response at 3:16, and the sentence in parentheses is his response at 3:15. The word “Otto” is repeated, instead of using “my” and “me,” in order that the components of the protocol may be independently tested, for example, by being found in the protocols of other observers. The protocols of different observers or of the same observer may conflict, and when this happens, one or more of them is to be rejected.

According to Neurath, Carnap, and also Carl Gustav Hempel in “On The Logical Positivists’ Theory of Truth” (1934/1935) it is a matter of convenience and decision which of the conflicting protocols should be rejected; hence, no protocol is incorrigible. The aim of science is to build up a coherent system of sentences, but no sentence at any level is sacrosanct; every sentence in science is in the end accepted or rejected by a decision made in the interests of coherence and utility. This view was strenuously opposed—by Schlick, Bertrand Russell, and A. J. Ayer, among others, who argued that (1) on this account protocol sentences are distinguished from others only in respect of their syntactical form; (2) a purely syntactical criterion of truth cannot do the work required of it; and (3) the Neurath–Carnap doctrine is a complete abandonment of empiricism.

RUSSELL

According to Bertrand Russell’s early doctrine of knowledge by acquaintance and knowledge by description,

“every proposition we can understand must be composed wholly of constituents with which we are acquainted.” A person is acquainted with those objects that are directly presented to his mind, and Russell held that sense data and universals are so presented. Later, in *The Analysis of Mind* (1921), Russell maintained that it is not possible to make a distinction between sensation and sense datum and that a sensation is not itself a cognition, although it is a cause of cognitions. This view led to the account of basic propositions that Russell gives in *An Inquiry into Meaning and Truth* (1940). In epistemology, he says, we can arrange our propositions about matters of fact in a certain order such that those that come later are known, if they are known, because of those that come earlier. At the beginning of such an ordering there will be “basic propositions”—those which “on reflection appear credible independently of any argument in their favour.”

A basic proposition is one whose utterance is caused as immediately as possible by a perceptual experience. It is known independently of inference but not independently of evidence, since the perceptual experience that causes it to be expressed also gives the reason for believing it. The perceptual experience in question provides the strongest possible evidence for the basic proposition; no previous or subsequent occurrence and no experiences of others can prove that the proposition is false. Nevertheless, according to Russell, a basic proposition is not incorrigible; it cannot be disproved, but it may be false. Since one of the aims of epistemology is to show that all empirical knowledge is based upon these propositions, it is desirable that they should be given a logical form which makes contradiction between them impossible. Russell therefore defines a basic proposition as one “which arises on the occasion of a perception, which is the evidence for its truth, and . . . has a form such that no two propositions having this form can be mutually inconsistent if derived from different percepts” (*Inquiry into Meaning and Truth*, p. 139). Examples are “there is a canoid (shaped) patch of color,” “I am hot,” “that is red.” Alternatively, “we can consider the whole body of empirical knowledge and define ‘basic propositions’ as those of its logically indemonstrable propositions which are themselves empirical” (*ibid.*). Russell believes that this logical definition is extensionally equivalent to his epistemological definition.

AYER

Whether basic propositions are incorrigible or indubitable, and if so in what sense, has been considered at length by A. J. Ayer. In “Basic Propositions” (1950) he defends the view that if a sentence is a direct description

of a private experience, it may be verbally incorrect, but it cannot express a proposition about which the speaker can be factually mistaken. He explains this in the following way. Many descriptive sentences, for example, "That is a table," may be used correctly (that is, in accordance with the rules of the language and on occasions generally agreed to be appropriate for their use), and yet the propositions they express may turn out to be false. But in the case of a sentence which directly describes a present experience, if the sentence is used correctly (that is, in accordance with the speaker's rules), the proposition it expresses cannot turn out to be false. Thus, "the sense in which statements like 'This is green,' 'I feel a headache,' 'I seem to remember—' can be said to be indubitable is that, when they are understood to refer only to some immediate experience, their truth or falsehood is conclusively determined by a meaning rule of the language in which they are expressed" ("Basic Propositions," p. 72).

Later, in *The Problem of Knowledge* (1956) and elsewhere, Ayer argues that language rules may be essentially private and that basic statements may be expressed in a sense-datum terminology, provided that this terminology is translatable into a terminology of seeming. Incorrigibility is not a property belonging to statements as such; "the sentences 'He has a headache,' when used by someone else to refer to me, 'I shall have a headache,' used by me in the past with reference to this moment, and 'I have a headache' all express the same statement; but the third of these sentences alone is used in such conditions as make it reasonable for me to claim that the statement is incorrigibly known" (*The Problem of Knowledge*, p. 58). But Ayer here allows that if he were asked, regarding two lines in his visual field, which looked to him to be the longer, he might very well be uncertain how to answer; and this uncertainty would not be about the meaning of the expression "looks longer than" but about a matter of fact. If anyone can have doubt about such matters of fact, he can presumably come to the wrong decision, that is, he can judge that one of the lines looks to him longer than the other when in fact it does not. No direct test of such a mistake is possible, but there may be various kinds of indirect evidence to show that it has occurred; hence, Ayer concludes, there is no class of descriptive statements which are incorrigible.

POPPER

The requirements made upon basic statements are very often governed by the general nature of the theory of knowledge held by a philosopher. Thus, according to Karl Popper, our experiences cannot justify or establish the

truth of any statement; the question for epistemology is not "on what does our *knowledge* rest? ... or more exactly, how can I, having had the *experience* S, justify my description of it and defend it against doubt," but rather "how do we test scientific statements by their deductive consequences ... *what kind* of consequences can we select for this purpose if they in their turn are to be intersubjectively testable?" (*The Logic of Scientific Discovery*, p. 98). Popper requires a class of basic statements by reference to which it can be decided whether a theory or hypothesis in science is falsifiable. Evidently a theory can be falsified by a basic statement only if the negation of the latter is derivable from the theory. Popper finds that his requirements are met by taking singular existential statements of the form "There is a so-and-so in space-time region *k*" as basic. It follows that the negation of a basic statement is not itself a basic statement (Popper allows some simple exceptions to this in *Conjectures and Refutations*, Addenda, p. 386); it also follows that any conjunction of basic statements which is not a logical contradiction is a basic statement and that the conjunction of a nonbasic and a basic statement may be a basic statement (for example, the conjunction of "There is no pointer in motion at *k*" with "There is a pointer at *k*," which is equivalent to "There is a pointer at rest at *k*"). Given a theory *t* conjoined with a statement of initial conditions *r*, from which a prediction *p* can be derived, it follows that $r \sim p$ will be a falsifier of *t* and a basic statement—since if $(t \cdot r) \rightarrow p$, then $t \rightarrow (r \rightarrow p)$, that is, $t \rightarrow \sim (r \sim p)$.

Popper also stipulates that the event referred to in a basic statement should be observable, that is, a basic statement must be intersubjectively testable by observation. He claims that the concept of an observable event can be elucidated either in terms of the experiences of an observer or in terms of macroscopic physical bodies, and hence that his account is neutral regarding the issue between psychologism and physicalism. In Popper's theory, the expression "observable event" is introduced "as an undefined term which becomes sufficiently precise in use: as a primitive concept whose use the epistemologist has to learn." According to Popper, "a science needs points of view and theoretical problems"; hence, in the practice of science we should not accept stray basic statements but only those which occur in the course of testing theories. Every test of a theory must terminate with some basic statement, but every basic statement can itself be subjected to further tests. There are no logical grounds for stopping at any particular basic statement. It is a matter for agreement and decision among those engaged in testing a theory; the process of corroboration or falsification

terminates at the point at which they are satisfied for the time being.

From the preceding selection of views, held by recent and contemporary philosophers, it will be seen that there is no consensus concerning basic statements. The questions listed at the beginning of this article can be answered only in relation to a more general semantic and epistemological theory. Many such theories allow that there is a distinct class of basic statements. It seems that the relation between these statements and certain “experiences” of the speakers who express them must be partly semantic, and perhaps also partly causal, but the correct analysis of this relation is a matter of great difficulty. Many philosophers at the present time deny that there can be a class of statements that describe the *private* experiences of the speaker, on the grounds that there cannot be a language that is essentially private; but this latter view is also strongly contested. Finally, although on some views basic statements are indubitable, it seems that these statements cannot be incorrigible, at least in any sense that implies that they cannot be false. For if basic statements are to play the role assigned to them—namely, of being the terminating points of empirical verification—they must be genuine contingent statements; and a contingent statement is one whose negation is significant and could, as far as logic is concerned, be true.

BATAILLE, GEORGES

(1897–1962)

Georges Bataille is a pivotal thinker in the history of twentieth-century thought, in a literal sense. His work serves as a pivot between any number of significant early twentieth-century trends, and later movements such as postmodernism and deconstruction.

The extremely eclectic Bataille was first, and perhaps most deeply, influenced by the Marquis de Sade. This scandalous thinker had an enormous impact on avant-garde French thought of the post-World War I period, most notably among the surrealists and their followers. Bataille, loosely associated with and against the surrealists, appropriated from Sade the notion of a violent, merciless natural order, and of man as a mimic of the destructive (and hence reconstructive) power of nature through the boundless expression of destructive sexual impulses. Bataille, like Sade, while a proclaimed atheist, nevertheless linked man's necessary violence to the blaspheming of God; in this way God, though denied, is in a strange way revived through the necessity of his transgression. (See early texts by Bataille, such as "The Solar Anus" [1927], and "The Use Value of D. A. F. de Sade [An Open Letter to My Current Comrades]" in *Visions of Excess* [1985]).

Bataille went on in the early 1930s to link Sade with the contemporary French anthropological theories of Marcel Mauss and Emile Durkheim. Both of these early twentieth-century thinkers hoped to find in primitive thought the kind of energy (social effervescence) whose absence led to the anomie, the rootlessness and pointlessness, of modern life. For Durkheim this energy was to be found in *mana*, the enthusiasm of crowds coming together; for Mauss, it was found in the rituals of gift-giving and ritualized destructions (such as the potlatch festivals of Northwest American Indians) of traditional societies. Both thinkers held that the basis for this social ritual was fundamentally rational: the energy of crowds and collective festivals was ultimately based on the peaceful tendency of people to recognize themselves as human. Mauss held that gift-giving, implemented as a major feature of modern economies, could counter the alienating tendencies of self-centered bourgeois economies. Bataille

took this model and radicalized it to the extent that he held that gift-giving, crowds, and ritual destruction were energizing to the extent that they were irrational: A person's fundamental tendency was to expend (*dépenser*), and this urge, while making possible the full social experience, nevertheless put in question the stability and comfort of human life, not to mention the sacred integrity of the human person (so beloved by Durkheim). Expenditure, in this sense, was the affirmation of life to the point of the risk of death, and the Sadean affirmation of a "general economy" based not on saving and reinvestment, but on the extravagant squandering of wealth. (See "The Notion of Expenditure" [1932] in *Visions of Excess*, and *The Accursed Share* [1949]).

Throughout the 1930s and 1940s Bataille was at the vanguard of the French reception of Friedrich Nietzsche and G. W. F. Hegel. From Nietzsche, Bataille took the assertion of the death of God as a radical embrace of death, an apocalyptic, erotic moment. Nietzsche for Bataille is a lighthearted leap into the moment when God affirms his own nonexistence: the point at which the sacred is an affirmation not of conservation and reuse (the eternity of divinity), but the night of sacrificial oblivion. Out of this "left-hand" sacred, Bataille evolves a practice of mystical meditation based not on a communion with an ever-present God, but on the ecstatic horror of his definitive absence. For Bataille, this mystical practice is inseparable from the impossible task of writing it: this results in such fragmentary works as *Inner Experience* (1943), *Guilty* (1944) and *On Nietzsche* (1945).

Bataille's reading of Hegel is similarly unusual and arguably mistaken: following and rewriting Alexandre Kojève's Hegel, Bataille's version posits the end of history as a moment in which absolute knowledge turns and tries to incorporate the radical negativity on which it depends (through exclusion) in order to be complete. Rational, recoverable negativity can only be determined as recoverable in opposition to a more fundamental negativity that refuses all use, all constructive effort, all knowledge. Yet to be truly posthistorical, this negativity must finally be (impossibly) appropriated. To be Hegel all the way, one must recognize a negativity that by definition is unrecognizable: what Bataille called "not-knowing." Without this gesture one has not fully attained the "end of History"; with it, one is condemned to a circular agitation in which one's knowledge is incessantly lost in the oblivion of not-knowing. Negativity now, at the end, is a toxic form of *dépense*; at the same time, Hegel is nevertheless maintained to the extent that his philosophy is followed through, mimed, and not so much negated as always-

again affirmed in its loss, its madness (Bataille believed Hegel became mad at the moment he fully realized the consequences of the “end of History”). On this topic, see the “Hegel” section of *Inner Experience* (1943), and Bataille’s short novel *Madame Edwarda* (1941).

Finally, in Bataille’s writings on eroticism, he comes to see the expenditure of human limits in erotic contact; this “communication,” as he called it, entails a community (of lovers) through the risk of the limits of the self. In this way Bataille revised the radical sexualized selfishness put forward by Sade: for Bataille “communication” is above all an act of generosity, if not a moral act. (See *Eroticism*, 1957).

Bataille’s eclectic rewriting of these major strands of French thought—moving in genres as diverse as sociological essays, mystical meditations, pornographic novels, and economic treatises—has had an enormous influence on French thought of the post-existentialist period. Two examples: Derrida’s method of deconstruction, which involves not the refutation of a given work but rather the close following of that work and its steady disarticulation, all the while recognizing that the work of metaphysics cannot be escaped, but only endlessly repeated and deconstructed, owes much to the Bataillean reading of Hegel—indeed Derrida’s reading of Bataille’s Hegel may be seen as the model of the deconstructive project. Similarly, Foucault’s affirmation of a “counter-discourse” in which a full, coherent discourse is destabilized by the discourse it must violently expel in order to constitute itself, clearly owes much to Bataille. Bataille, however, surpasses his recent avatars in his insistence on a political implementation of *dépense*; whereas Derrida, for example, is happy to rewrite Bataille’s “general economy” as a “general writing”—thereby shifting the debate to an analysis of largely textual questions—Bataille insists on the need to rethink the future of society in ways that foresee a future economy based not on the profit motive but on the implementation of a global and orgiastic “spending without return.”

BATTEUX, ABBÉ CHARLES

(1713–1780)

In the history of aesthetic ideas, the abbot Charles Batteux was less of an innovator than an apt synthesizer of prevailing ideas and a late defender of the classical theory of imitation in the new field of taste and aesthetic experience. Nonetheless, *Les beaux-arts réduits à un même principe* (The fine arts reduced to a single principle; 1746/1969) is generally thought to have provided the first modern classification of the fine arts. In all of his undertakings, Batteux sought to submit the fine arts—as opposed to the practical arts, which seek to fulfill various needs—to a single principle, “both simple and wide-reaching” (Foreword, *Les beaux-arts réduits à un même principe*), that could explain all varieties of art. In keeping with the classical theory of poetry and art, this principle is that art should imitate *la belle nature* (beautiful nature, including human actions and passions) to produce aesthetic pleasure. In other words, the *goal* of the fine arts is *pleasure*, their *essential characteristic* is *imitation*, and

their *subject* is *la belle nature*. The *manner* in which this imitation is done makes for the *particular differences* of the various art forms: poetry, painting, sculpture, dance, and music. On this basis, Batteux divided the inquiry conducted in *Les beaux-arts* into three parts. First, he identified the nature of all art forms and their essential differences. Second, he examined the nature of taste as a way of evaluating *la belle nature*. Third, to verify his theory by practice, he proposed a detailed typology of the fine arts.

Batteux first tried to clarify what it means for the fine arts to imitate *la belle nature*. Three aspects of this process deserve to be highlighted: imitation as such, the process of idealization that presides over the production of *la belle nature* in art, and the function of genius in producing works of art. First, art, as the product of genius's activity, works by imitating. Yet all imitation finds its *raison d'être* and its limits in the model that goes before it. Poetic and artistic invention is therefore not creating *per se* but rather reproducing what already exists. The function of art is to re-present its subject in a medium. Imitations must nevertheless *appear* to be nature. Perfection in the arts being based on resemblance, falling back on the purely formal (or purely aesthetic) properties of the aesthetic medium seems inadmissible for Batteux.

Second, in the Aristotelian tradition to which Batteux was explicitly connected, what the fine arts imitate is not nature as it truly is, but *la belle nature*, or nature as it *should be* as a result of idealization. In contrast with history, which simply presents the facts and strives to speak the truth, the fine arts present the ideal and strive for verisimilitude. They aspire, through selective representation of the real, to the perfection of the type. Painting and poetry are born with history, but the invention that is their own aims at drawing human actions together in a new and more coherent totality that brings out their meaning.

Third, only an artist of genius in a state of enthusiasm can produce true imitation of *la belle nature*. Far from being an occult faculty, enthusiasm, for Batteux, complements the spirit of observation. It designates the moment when the artist's spirit warms up at the sight of a vivid representation stemming from his imagination.

Although his theory of the imitation of *la belle nature* anchors Batteux's thought in the classical tradition, his theory of taste tends to bring together newer aesthetic tendencies that were forming during his era. Artistic genius is subject not to predetermined rules but to taste, which he defined as the "faculty of appreciating the good, the bad, and the mediocre, and of distinguish-

ing among them" (Batteux [1746] 1969). Far from opposing the intelligence at work in the sciences, taste (which in its largest sense is essentially moral) always presupposes knowledge, to which feeling is added to motivate action or give rise to desire. In strictly artistic taste, sentiment, preceded by a knowledge of the qualities of an object, "tells us if the *la belle Nature* is well or poorly imitated" (Batteux [1746] 1969).

We can see to what extent ethics and aesthetics are intertwined: On the one hand, *la belle nature* that art imitates conforms to principles of taste to move individuals (in other words, it is directly connected with our general moral interests as human beings). On the other hand, it conforms to our cognitive nature, providing our minds with an exercise and movement that widens our sphere of ideas. Batteux considers the spectacle of human actions and human passions to be the primary subject of *la belle nature* represented, or rather engendered, by art. The ideal of artistic imitation associates the good (which corresponds with our universal moral interests), the beautiful (which satisfies our cognitive expectations of variety, uniformity, and novelty in the artistic representation), and the perfection of formal aspects of the work itself.

BAUDRILLARD, JEAN

(1929–)

Jean Baudrillard was born in the cathedral town of Reims, France. His grandparents were peasants, his parents became civil servants, and he was the first member of his family to pursue an advanced education. In 1956, he began working as a professor of secondary education in a French high school (Lycée) and in the early 1960s did editorial work for the French publisher Seuil. Trained as a Germanist, Baudrillard translated German literary works—including Bertolt Brecht and Peter Weiss—

although he turned to the study of sociology and for some decades was a sociology professor at Nanterre.

Baudrillard became renowned for his theorizations of developments in contemporary society, including the trajectories of the consumer society, media and technology, cyberspace and the information society, and biotechnology. He claimed that cumulatively these forces had produced a postmodern rupture with modern culture and society. Whereas modern societies for Baudrillard were organized around production and political economy, postmodern societies were organized around technology and generated new forms of culture, experience, and subjectivities.

Baudrillard's work is extremely hard to categorize because he combines social theory, cultural and political commentary, philosophy, and literary stylistics in his work, crossing boundaries between academic disciplines and fields. Yet in an interview in *Forgetting Foucault* (1987, p. 84) he confessed: "Well, let's be frank here. If I ever dabbled in anything in my theoretical infancy, it was philosophy more than sociology. I don't think at all in those terms. My point of view is completely metaphysical. If anything, I'm a metaphysician, perhaps a moralist, but certainly not a sociologist. The only 'sociological' work I can claim is my effort to put an end to the social, to the concept of the social."

Indeed, beginning in the 1980s, more philosophical themes emerged in his work, although in a highly ironical and paradoxical form. Baudrillard's proliferating metaphysical speculations are evident in *Fatal Strategies* (1990), which can be seen as a turning to a sort of idiosyncratic philosophical musings. This text presented a bizarre metaphysical scenario concerning the triumph of objects over subjects within the obscene proliferation of an object world so completely out of control that it surpasses all attempts to understand, conceptualize, and control it. His scenario concerns the proliferation and growing supremacy of objects over subjects and the eventual triumph of the object.

For Baudrillard, the subject—the darling of modern philosophy—is defeated in his metaphysical scenario and the object triumphs, a stunning end to the dialectic of subject and object that had been the framework of modern philosophy. In *Fatal Strategies* and succeeding writings, Baudrillard seems to be taking theory into the realm of metaphysics, but it is a specific type of metaphysics deeply inspired by the pataphysics developed by Alfred Jarry in "What is Pataphysics" as "the science of the realm beyond metaphysics. ... It will study the laws which govern exceptions and will explain the universe supplemen-

tary to this one; or, less ambitiously, it will describe a universe which one can see—must see perhaps—instead of the traditional one. ..." (1963, p. 131ff.)

Like the universe in Jarry's play *Ubu Roi*, *The Gestures and Opinions of Doctor Faustroll*, and other literary texts, Baudrillard's is a totally absurd universe where objects rule in mysterious ways, and people and events are governed by absurd and ultimately unknowable interconnections and predestination. (The French playwright Eugene Ionesco is another good source of entry to this universe.) Like Jarry's pataphysics, Baudrillard's universe is ruled by surprise, reversal, hallucination, blasphemy, obscenity, and a desire to shock and outrage.

Thus, in view of the growing supremacy of the object, Baudrillard recommends abandoning the subject and siding with the object. Pataphysics aside, it seems that Baudrillard is trying to end the philosophy of subjectivity that has controlled French thought since Descartes by going over to the other side. Descartes's *malin genie*, his evil genius, was a ruse of the subject that tried to seduce him into accepting what was not clear and distinct, but over which he was ultimately able to prevail. Baudrillard's "evil genius" is the object itself that is much more malign than the merely epistemological deceptions of the subject faced by Descartes and which constitutes a "fatal destiny" that demands the end of the philosophy of subjectivity. Henceforth, for Baudrillard, people live in the era of the reign of the object.

Examples of the paradoxical and ironic style of Baudrillard's philosophical musings abound in *The Perfect Crime* (1996). Baudrillard claims that the negation of a higher and transcendent reality in the current media and technological society is a "perfect crime" that involves the destruction of the real. In a world of appearance, image, and illusion, Baudrillard suggests, reality disappears although its traces continue to nourish an illusion of the real. Driven toward virtualization in a high-tech society, all the imperfections of human life and the world are eliminated in virtual reality, but this is the elimination of reality itself, the Perfect Crime. This "post-critical" and "catastrophic" state of affairs render our previous conceptual world irrelevant, Baudrillard suggests, urging criticism to turn ironic and transform the demise of the real into an art form.

Baudrillard has entered a world of thought far from academic philosophy, one that puts in question traditional modes of thought and discourse. His search for new philosophical perspectives has won him a loyal global audience, but also criticism for his excessive irony, word play, and philosophical games. Yet his work stands

as a provocation to traditional and contemporary philosophy that challenges thinkers to address old philosophical problems such as truth and reality in new ways in the contemporary world.

BAUER, BRUNO

(1809–1882)

Bruno Bauer, the German theologian and historian, studied theology under P. H. Marheineke in Berlin, at the height of Georg Wilhelm Friedrich Hegel's influence there. When Bauer became a docent at the University of Berlin in 1834, he joined Marheineke on the Hegelian right wing. When he transferred to the University of Bonn in 1839, however, he was already reacting theologically against right-wing Hegelianism. D. F. Strauss's *Life of Jesus* (1835–1836) rocked the theological world, but it seemed to Bauer not sufficiently critical, and helped to spur him on to his own investigations of the Gospels.

Bauer began with literary criticism of the Gospel texts themselves, without making any assumptions about the historical life of Jesus or the early church. The fourth Gospel was simply a work of reflective Christian art dominated by Philo's logos concept, impressive as such, but without historical basis (*Kritik der evangelischen Geschichte des Johannes*, Bremen, 1840). The situation was the same with regard to the Synoptic Gospels, except that they were based on the conception of the Messiah (*Kritik*

der evangelischen Geschichte der Synoptiker, 3 vols. Leipzig, 1841–1842.) Bauer adopted the conclusion of C. H. Weisse and C. Wilke that only Mark's Gospel was original, but argued further that there was no reason to assume any historical tradition behind this single literary source. Incongruities in Mark's text suggested that Mark had invented the events he related. Mark's story was accepted because it answered the spiritual needs of his age. Jesus was the man in whose consciousness the antitheses between heaven and earth, God and man, were reconciled. His character evoked the Messiah concept, into which his life was absorbed by Mark. Bauer's view seemed to undercut the historical basis of Christianity so sharply that the theological faculties of the Prussian universities were polled (with mixed results) as to whether Bauer should be dismissed from Bonn. Bauer sealed his fate with the article "Theological Shamelessness" (1814), in which he denounced the Christian faith as the source of lies and servile hypocrisy; he was dismissed in March 1842. Ultimately, Bauer denied the historicity of Jesus altogether, holding that Christianity was an amalgam of Stoic and Gnostic ideas in Jewish dress.

Meanwhile, Bauer had written his anonymous *Die Posaune des jüngsten Gerichts über Hegel den Atheisten und Antichristen* (Trumpet of the last judgment on Hegel the atheist and Antichrist, Leipzig, 1841), ostensibly from the standpoint of faith, attempting to show that the real result of Hegelian philosophy was neither the pantheism of Strauss nor the humanism of Ludwig Feuerbach—much less a defense of the Gospel—but Bauer's own out-and-out atheism.

At that time living on a small estate in Rixdorf, near Berlin, Bauer gathered around himself a circle of "free spirits" (including his brother Edgar) who frequented Berlin cafes. Bauer wrote brilliantly ironical "critiques" of recent historical developments in which he announced the downfall of Western philosophy and culture. For a time he collaborated with Arnold Ruge and with other left-wing Hegelians. But Bauer was as contemptuous of their revolutionary programs as he was of the bourgeois establishment. He attacked the inconsistencies and misconceptions of both groups; special class interests, he argued, are blindly one-sided, and the masses are so much dead matter, and inimical to the spirit. Only criticism, without presupposition, reservation, or special pleading, can be pure, can replace blindness with true conceptions, and can bring about the fundamental change in human consciousness that would really be liberating. History will, by its own "logic," bring about the transformation which no deliberate program can institute: what criticism

has destroyed in thought today, history will destroy in fact tomorrow. Bauer justified these views by means of a metaphysic of consciousness, according to which the world is the projection of the ego. Matter is the as yet unclarified aspect of the world; evil social conditions are the product of uncritical and self-alienated principles. Christianity, for example, freed the ego from its thrall-dom to the material world, but only through an alienation of spirit from matter that had in its turn created a new burden. But Bauer held that once Christianity's historical roots are exposed, its self-alienating power is broken; hence the importance of criticism. The same must be done with other forms of human bondage: revolutionary programs which do not reach to the roots of consciousness are futile.

Accordingly, Bauer attacked various reform movements as insufficiently radical. Jewish agitation for political rights, for example, was based on the separate religious identity of the Jew, and could never be defended on those grounds against those whose religious prejudices took a different form; the Jew could become free only by ceasing to be religious. Karl Marx answered this argument in his essay "On the Jewish Problem" (1844), and attacked Bauer as "St. Bruno" in *The Holy Family: Critique of the Critical Critic, against Bruno Bauer and Consorts* (1845). The real problem, according to Marx, was economic class behavior, and not the religious projections of that behavior. Bauer's view that social conditions could be changed by changing men's minds was a vestige of idealist-theological error, and the practical result of Bauer's theoretical radicalism would be political reactionism.

Bauer did in fact become a defender of Prussian conservatism, on the radical grounds that limited reform movements seemed to him to do more harm than good. But after 1850 his influence waned; though he continued to write prodigiously, his views were generally too eccentric to be relevant.

BAUMGARTEN, ALEXANDER GOTTLIEB (1714–1762)

Alexander Gottlieb Baumgarten, the German Wolffian philosopher and aesthetician, was born in Berlin. He was the son of an assistant to the Pietist theologian and pedagogue August Hermann Francke; his brother was the famous divine and church historian Sigmund Jakob. Baumgarten studied philosophy and theology at Halle. After receiving a master's degree in 1735, he was appointed a teacher at Halle and in 1738 became extraordinary professor. While teaching there, Baumgarten, in reaction against the Pietism dominant at Halle after the expulsion of Christian Wolff in 1723, reintroduced Wolffian philosophy. In 1740 he was appointed full professor at Frankfurt an der Oder, where he remained until his death.

Baumgarten's Latin handbooks on metaphysics, ethics, and practical philosophy were widely used in German universities both in his time and after his death, and his influence was extraordinary. Kant considered him to be one of the greatest metaphysicians of his time and adopted his *Metaphysics* and *Practical Philosophy* as textbooks for his own lectures at Königsberg. With the exception of his works on aesthetics, Baumgarten in general kept very close to Wolff's teachings, although he dissented

from Wolff on several special points. For instance, he adopted a middle position in the controversy over the problem of the interaction of substances by reconciling Wolff's theory of the "preestablished harmony" of the soul and body with the theory of physical influence supported by the Pietists. Baumgarten, as a supporter of Leibnizian panpsychism, applied his solution to the connections among all substances. Wolff, to the contrary, distinguished very sharply between spiritual and material substances. Baumgarten was thus less Leibnizian than Wolff in accepting physical influence and more Leibnizian in his panpsychism.

Baumgarten made his most important contributions in the field of aesthetics, expanding a subject that had been summarily treated by Wolff and going far beyond Wolff in developing it. In this field he collaborated so closely with his pupil G. F. Meier (1718–1777) that it is difficult to establish the real authorship of many doctrines. There is a very close connection between Baumgarten's *Meditationes Philosophicae de Nonnullis ad Poema Pertinentibus* and his unfinished *Aesthetica* and Meier's *Anfangsgründe aller schönen Künste und Wissenschaften* (3 vols., Halle, 1748–1750). Baumgarten introduced the term *aesthetics* to designate that section of empirical psychology which treats of the inferior faculty, that is, the faculty of sensible knowledge. The problem of beauty was only one part of this subject. Even in Kant, *aesthetics* referred both to sensible knowledge in general and to knowledge of beauty and the sublime in particular. Only later was it restricted to the field of beauty and sublimity. Aesthetics and logic together composed, in Baumgarten's view, a science that he called *gnoseology*, or theory of knowledge.

According to Baumgarten, the foundations of poetry and the fine arts are "sensitive (*sensitivae*) representations," which are not simply "sensual" (*sensuales*), but are connected with feeling (and therefore are pertinent both to the faculty of knowledge and to that of will). A beautiful poem is a "perfect sensitive discourse," that is, a discourse that awakens a lively feeling. This requires a high degree of "extensive clarity," which is different from "intensive (or intellectual) clarity." This means that an aesthetic representation must have many "characteristics," that is, it must be characterized by many different traits or particular elements, rather than by a few well-differentiated characters. Beauty must be "confused" and, therefore, excludes "distinctness," the main property of intellectual representations. Distinctness is reached by rendering clearly each of the characteristics of the characteristics of a representation. Establishing these charac-

teristics presupposes intensive clarity and leads to a further abstraction of the concept of representations. This abstraction is obnoxious to aesthetic liveliness and leads to pedantry.

The artist is not an imitator of nature in the sense that he copies it: He must add feeling to reality, and thereby he imitates nature in the process of creating a world or a whole. This whole is unified by the artist through a coherent "theme," which is the focus of the representation.

This does not mean that the artist should prefer fiction to truth; on the contrary, knowledge of the beautiful is, at its best, sensible knowledge of truth made perfectly lively. This is a main point of divergence between Wolff and Baumgarten. Baumgarten held that, since rational knowledge of several orders of facts or of many facts in general is impossible, it must be replaced or supplemented by "beautiful knowledge," that is, reliable sensible knowledge of things that cannot be known rationally; such knowledge is as reliable as rational knowledge; typical aesthetic elements of the cognitive process are inductions and examples. By stressing the importance and relative independence of the inferior faculty (which Wolff held to be only an imperfect stage of knowledge, to be superseded by intellect and reason), Baumgarten foreshadowed Immanuel Kant's doctrine of the peculiar and independent function of sensibility in knowledge.

BAYES, BAYES' THEOREM, BAYESIAN APPROACH TO PHILOSOPHY OF SCIENCE

The posthumous publication, in 1763, of Thomas Bayes's "Essay Towards Solving a Problem in the Doctrine of Chances" inaugurated a revolution in the understanding of the confirmation of scientific hypotheses—two hundred years later. Such a long period of neglect, followed by such a sweeping revival, ensured that it was the inhabitants of the latter half of the twentieth century above all who determined what it was to take a "Bayesian approach" to scientific reasoning.

Like most confirmation theorists, Bayesians alternate between a descriptive and a prescriptive tone in their teachings: They aim both to describe how scientific evidence is assessed and to prescribe how it ought to be assessed. This double message will be made explicit at some points, but passed over quietly elsewhere.

SUBJECTIVE PROBABILITY

The first of the three fundamental tenets of Bayesianism is that the scientist's epistemic attitude to any scientifically significant proposition is, or ought to be, exhausted by the subjective probability the scientist assigns to the proposition. A subjective probability is a number between zero and one that reflects in some sense the scientist's confidence that the proposition is true. (Subjective probabilities are sometimes called degrees of belief or credences.)

A scientist's subjective probability for a proposition is then more a psychological fact about the scientist than an observer-independent fact about the proposition. Roughly, it is not a matter of how likely the truth of the proposition actually is, but about how likely the scientist thinks it to be. Thus *subjective*—though in hindsight, *psychological* might have been a better term.

Unlike every other approach to confirmation theory, Bayesianism has no use for the notion of theory acceptance: There is no amount of evidence sufficient to induce a qualitative shift in a Bayesian's epistemic attitude from not accepting to accepting a theory. Learning from the evidence is always a matter of a quantitative adjustment, of changing your subjective probability for a hypothesis to reflect the latest evidence. At any time, the most favored theories are simply those with the highest subjective probabilities.

To found its first tenet Bayesianism must establish that it is plausible to suppose or reasonable to require that scientists have a subjective probability for every proposition that figures in their inquiry. Ramsey proposed that to have a subjective probability for a proposition is to have a certain complex disposition to act, a disposition that can be measured at least tolerably well in many cases by assessing betting behavior, as follows. The higher your subjective probability for a proposition, the lower the odds, all other things being equal, you will be prepared to accept in betting on the truth of that proposition. To be precise, given a subjective probability p for the proposition, you will accept odds of up to p : $(1 - p)$ on its truth—you will avoid just those bets, in other words, where you have to pay in more than p for every dollar you stand to win, so that for example if your subjective probability for the proposition is 0.3 then you will pay no more than \$3 to play per game in which you win \$10 just in case the proposition is true. Ramsey thought it likely that we have appropriately stable behavioral dispositions of this sort, accessible to measurement using the betting test, with respect to just about any proposition we understand, and so that we have subjective probabilities for all these propositions.

The Bayesian's principal tool is mathematical argument, and the mathematics in question is the probability calculus—the standard mathematics of probability—to which all subjective probabilities are assumed to conform. Conformance to the axioms is Bayesianism's second fundamental tenet.

Here the Bayesian argument tends to take a prescriptive turn. Having established that scientists have, as a matter of psychological fact, subjective probabilities for

all propositions that matter, the next step is to show that scientists ought to—whether they do or not—arrange their probabilities so as to satisfy the axioms of the probability calculus.

Typically this is done by way of a Dutch Book argument, an argument that shows that, if you do not adhere to the calculus, there is a certain set of bets on the truth of various propositions that you are committed in principle to accepting, but that will lead to a certain loss however things turn out. The details of the argument are beyond the scope of this entry, but an example may help. The first axiom of the probability calculus requires that the probability of a proposition and that of its negation sum to one. Suppose you violate this axiom by assigning a probability of 0.8 both to a certain proposition h and to its negation. Then you are committed in principle to accepting odds of 4 : 1 on both h and $\neg h$, which means a commitment to playing, at the same time, two games, in one of which you pay \$8 and win \$10 (i.e., your original \$8 plus \$2 “profit”) if h is true, and in one of which you pay \$8 and win \$10 if h is false. Whether h is true or false you pay \$16 but win only \$10—a certain loss. To play such a game is irrational; thus you should conform your subjective probabilities to the probability calculus. Objections to the Dutch Book argument typically turn on the vagueness of the idea that you are “committed in principle” to accepting the bets in question; replies to these objections attempt to make the nature of the commitment more precise without leavening its evident undesirability.

BAYESIAN CONDITIONALIZATION

The third of Bayesianism's three fundamental tenets is Bayes' conditionalization rule, which instructs you on how to update your subjective probabilities as the evidence arrives. There are four steps to Bayes' rule. The first step is to define prior and posterior subjective probability. These notions are relative to your receipt of a piece of evidence: Your prior probability for a hypothesis is your subjective probability for the hypothesis immediately before the evidence comes in; your posterior probability for the hypothesis is your subjective probability immediately after the evidence (and nothing else) comes in. Bayes' rule gives you a formula for calculating your posterior probabilities for every hypothesis given your prior probabilities and the nature of the evidence. In so doing it offers itself as the complete story as to how to take evidence into account. In what follows, prior subjective probabilities are written as $C(\cdot)$, and posterior subjective probabilities as $C^+(\cdot)$.

The second step towards Bayes' rule is the introduction of the notion of conditional probability, a standard notion in probability mathematics. An example of a conditional probability is the probability of obtaining a four on a die roll, given that an even number is obtained. This probability is $\frac{1}{2}$, since there are three equally probable ways for a die roll to be even, one of which is a four. Formally the probability of a proposition h conditional on another proposition g is written $C(h|g)$; it is usually defined to be $C(hg)/C(g)$. (Alternatively conditional probability may be taken as a primitive, as explained in the entry on Probability and Chance.)

The third step is to make the following simple posit about conditionalization: when you receive a piece of evidence e , you should update your probability for any given hypothesis h so that it is equal to your prior probability for h given e . That is, on learning that e is true, you should set your posterior probability $C^+(h)$ equal to your prior probability $C(h|e)$. This is Bayes' rule in its simplest form, but one further step will produce a more familiar, and revealing, version of the rule.

The fourth and final step is to notice a simple mathematical consequence of the definition of conditional probability, confusingly called Bayes' theorem (confusing because Bayes' theorem and Bayes' rule are two quite different propositions). According to Bayes' theorem,

$$C(h|e) = \frac{C(e|h)}{C(e)} C(h).$$

Combine Bayes' theorem and the simple form of Bayes' rule and you obtain the more familiar version of Bayes' rule:

$$C^+(h) = \frac{C(e|h)}{C(e)} C(h).$$

The effect of the application of Bayes' rule then—or as philosophers usually say, the effect of Bayesian conditionalization—is, on receipt of e , to multiply the old probability for h by the factor $C(e|h)/C(e)$. Call this factor the Bayesian multiplier.

What justification can be offered for Bayesian conditionalization? Since the notion of conditional probability is introduced by definition, and Bayes' theorem is a simple consequence of the definition, this amounts to the question why you ought, on learning e , to set your posterior probability for a hypothesis h equal to the prior probability $C(h|e)$.

Various arguments for conditionalizing in this way exist in the literature, often based on Dutch book considerations that invoke the notion of a conditional bet. The consensus is that none is entirely convincing. It is important to note that mathematics alone cannot settle the question: The probability calculus relates only different probabilities that are part of the same overall distribution, whereas Bayes' rule relates probabilities from two quite different distributions, the prior and posterior distributions.

Two further remarks on Bayesian conditionalization. First Bayes' rule assumes that the subjective probability of the evidence e goes to one when it is acquired, therefore that when evidence arrives, its content is exhausted by a proposition that comes to be known for sure. A natural extension of the rule, called Jeffrey conditionalization, relaxes this assumption. Second you may wonder whether background knowledge must be taken into account when conditionalizing. In fact it is automatically taken into account: Background knowledge has subjective probability one, and for any proposition k with probability one, $C(h|k) = C(h)$; thus, your subjective probability distribution always has your background knowledge in every respect "built in."

Now to discuss the implications of Bayesianism for confirmation. (Further implications will be considered below.)

The impact of evidence e on a hypothesis h is determined, recall, by the Bayesian multiplier, $C(e|h)/C(e)$, which when multiplied by the prior for h yields its posterior. You do not need any great mathematical expertise to see that, when $C(e|h)$ is greater than $C(e)$, the probability of h will increase on receipt of e , while when it is $C(e)$ that is greater, the probability of h will decrease.

When the receipt of e causes the probability of h to increase, e is said to confirm h . When it causes the probability of h to decrease, it is said to disconfirm h . This may look like a definition, but it is in fact a substantive philosophical thesis: The Bayesian claims that the preexisting notions of confirmation and disconfirmation can be given a satisfactory Bayesian analysis. (Or at least the Bayesian usually makes this claim: They also have the option of interpreting their definition as a piece of revisionism, not intended to capture our actual notion of confirmation but to replace it with something better.)

Two remarks. First to say that a hypothesis is confirmed is only to say that its probability has received some kind of upward bump. The bump may be small, and the resulting posterior probability, though higher than that

prior, may be almost as small. The term *confirmed* has, in philosophical usage, a different sense from a term such as *verified*.

Second since whether or not a piece of evidence confirms a hypothesis depends on a subjective probability distribution, confirmation is in the first instance a relative matter. More on this in *The Subjectivity of Bayesian Confirmation* below.

One further definition: The quantity $C(e|h)$ is called a likelihood, specifically the likelihood of h on e (not to be confused with the probability of h given e , though there is a close relationship between the two, spelled out by Bayes' theorem).

The significance of the Bayesian multiplier can now be stated in natural language: A piece of evidence confirms a hypothesis relative to a particular subjective probability distribution just in case the likelihood of the hypothesis on the evidence is greater than the subjective probability for the evidence.

Consider a special case, that in which a hypothesis h entails the evidence e . By a theorem of the probability calculus the likelihood of h on e , that is, $C(e|h)$, is in any such case equal to one. Suppose that e is observed to be true. Assuming that $C(e)$ is less than one (which will be true unless all viable hypotheses predict e), then the likelihood will be greater than $C(e)$, and so h will be confirmed. Ignoring the parenthetical qualification, a hypothesis is always confirmed by its predictions. Further the more surprising the prediction, in a sense—the lower the prior probability of e —the more h will be confirmed if e is in fact observed.

The significance of this observation is limited in two ways. First some hypotheses predict evidence only with a certain probability less than one. Second hypotheses tend to make observable predictions only in conjunction with other, "auxiliary" hypotheses. The Bayesian response will be considered in the next section.

THE BAYESIAN MACHINE

Suppose you want to know whether a certain coin is fair, that is, biased neither towards "heads" nor "tails." You toss the coin ten times, obtaining exactly five "heads" and five "tails." How to conditionalize on this evidence? You will need three subjective probabilities: The prior probability for the hypothesis h that the coin is fair, the prior probability for the evidence e , and the likelihood of h on e . A good Bayesian is committed to adopting definite values for these subjective probabilities one way or another. If necessary, they will be set "by hand," that is, by some sort

of reflective process that is constrained only by the axioms of the probability calculus. But a great part of the appeal of Bayesianism is that the vast majority of subjective probabilities can be set “mechanically,” that is, that they will have their values fully determined once a few special probabilities are set by hand. In the case of the coin, once the prior probability for h and its rivals is set by hand, a little philosophy and mathematics of probability will take care of everything else, mechanically fixing the likelihood and the probability for the evidence.

Begin with the likelihood, the probability of getting exactly five “heads” in ten tosses given that the coin is fair. Since the fairness of the coin entails (suppose) both a physical probability for “heads” of 0.5 and the independence of the tosses, the hypothesis that the coin is fair assigns a definite physical probability to your observed outcome of five “heads”—a probability of about 0.25, as it happens. Intuitively it seems right to take this as the likelihood—to set your subjective probability $C(e|h)$, that is, equal to the physical probability that h assigns to e . In its sophisticated form this intuition is what is sometimes known as Miller’s Principle or the Principal Principle; call it the Probability Coordination Principle or PCP for short. Bayesians normally take PCP on board, thus relieving you of the effort of setting a value by hand for the likelihood in a case such as this.

Now consider the probability of the evidence. A theorem of the probability calculus, the total probability theorem, looks (in one of its forms) like this:

$$C(e) = C(e|h_1)C(h_1) + C(e|h_2)C(h_2) + \dots$$

where the hypotheses h_1, h_2, \dots form a mutually exclusive, exhaustive set, in the sense that one and only one of them must be true. In many cases the set of hypotheses among which you are trying, with the help of e , to decide form such a set (though see below). Thus if you have set values for the likelihoods $C(e|h_i)$ and prior probabilities $C(h_i)$ for all your rival hypotheses, the probability calculus gives you a unique correct subjective probability to assign to e .

To sum up: If your rival hypotheses assign definite physical probabilities to the evidence e and form a mutually exclusive, exhaustive set then by an independent principle of rationality, PCP, and a theorem of the probability calculus, total probability, the Bayesian multipliers for all of the hypotheses are completely determined once their prior probabilities are fixed.

As a consequence, you need only assign subjective probabilities by hand to a relatively small set of propositions, and only once in your life: At the beginning, before any evidence comes in, you will assign subjective proba-

bilities to every possible scientific hypothesis. These assignments made, everything you need for Bayesian conditionalization is decided for you by PCP and the probability axioms. In this sense, Bayesian confirmation runs like a well-conditioned machine: You flip the on switch, by assigning initial prior probabilities to the different hypotheses that interest you, and then sit back and enjoy the evidential ride. (Conditionalization is also machine-like without PCP and total probability, but in that case flipping the on switch involves assigning values to $C(e|h_i)$ and $C(e)$ for every possible piece of evidence e .)

There are two obstacles to the smooth functioning of the Bayesian machine. First it may be that some or all of the rival hypotheses do not, on their own, assign a determinate physical probability to the evidence. In such cases the likelihood must either be fixed by hand, without the help of PCP or (more usually in the quantitative sciences) by supplementing the hypothesis with an auxiliary hypothesis in conjunction with which it does fix a physical probability for the evidence. In the latter case, PCP can be applied but complications arise when, as is typical, the truth of the auxiliary hypothesis is itself not known for sure. The conjunction of original and auxiliary hypothesis may be confirmed or disconfirmed mechanically, but the implication for the original hypothesis on its own—whether it is confirmed, and if so by how much—will continue to depend on handcrafted likelihoods such as $C(e|h)$. This is the Bayesian’s version of confirmation theory’s QuineDuhem problem. Strevens offers a partial solution to the problem. (The application of PCP will also fall through if the evidence is “inadmissible.”)

Second, even when the likelihoods are fixed mechanically, the theorem of total probability may not apply if the rival hypotheses are either not mutually exclusive or not exhaustive. Lack of exhaustiveness is the more pressing worry, as it would seem to be the norm: Exhaustiveness implies that you have thought of every possible theory that predicts e to any extent—an unlikely feat. A simple fix is to include a residual hypothesis in your set to the effect that none of the other hypotheses is correct. Such a hypothesis will not however determine a definite physical probability for the evidence, so its likelihood and therefore the probability for the evidence will after all have to be fixed by hand.

BAYESIANISM AND THE PROBLEM OF INDUCTION

Does the Bayesian theory of confirmation solve the problem of induction? The case for an affirmative answer: Adherence to the tenets of Bayesianism can be justified a

priori (by Dutch book arguments and the like, or so some philosophers believe). And this adherence alone is sufficient to turn you into an inductive reasoner: Once you have settled on priors for all the hypotheses, the Bayesian machinery tells you what sort of things to expect in the future given your experience of the past.

Suppose for example that you wish to predict the color of the next raven. You have various theses about raven color: All ravens are blue; ravens are green with 50% probability, otherwise black; all ravens are black, and so on. In your life to date you have observed a number of ravens, all of them black. This evidence rules out altogether some of the raven color theses, such as the thesis that all ravens are blue. (The likelihood of the blue thesis on this evidence is zero, so the multiplier is zero: Observation of a black raven therefore causes your subjective probability for the blue thesis to drop to zero.)

Other theses have their probability shifted around by the evidence in other ways. The more they probabilify the evidence, the greater their likelihoods on the evidence and so the higher their Bayesian multipliers. Observing many black ravens has the effect then of moving your subjective probability away from hypotheses that do not probabilify blackness and towards theses that do. As a result, the observation of many black ravens in the past increases your subjective probability that the next raven will be black. Thus you have an a priori argument—the argument for accepting Bayesianism—that justifies inductive behavior.

The case for a negative answer as to whether Bayesianism solves the problem of induction can be made in two ways: By arguing that the a priori arguments for adopting the Bayesian apparatus fall through, or by arguing that Bayesianism does not, after all, underwrite inductive behavior. The second approach is the more illuminating.

Return to the ravens. The theses listed above have the uniformity of nature as a consequence: If any is true then the future will be, with respect to raven color, like the past. Once some non-uniform theses are thrown into the mix, everything changes. Consider for example the following thesis, reminiscent of Goodman's grue puzzle: All ravens observed until now are black, the rest green. The Bayesian multipliers for this thesis and the thesis that all ravens are black remain the same as long as all observed ravens are black, which is to say, up until this point in time. Just as probability has been flowing to the latter hypothesis, it will have been flowing to the former. It turns out then that the probability flow is not only towards theses that predict blackness for future ravens

but also toward many others. Since the multipliers for these theses have been the same until now, your predictions about the color of ravens will favor blackness only if your initial prior probabilities—the probabilities you assigned to the different theses before any evidence came in—already favored the thesis that all ravens are black over the grue-like thesis, which is to say, only if you yourself already favored uniformity over diversity.

Many Bayesians have made their peace with Bayesianism's open-minded policy on natural uniformity. Howson argues for example that the Bayesian approach should not be considered so much a positive theory of confirmation—of how evidence bears on hypotheses—as a framework for implementing any theory of confirmation you like.

THE SUBJECTIVITY OF BAYESIAN CONFIRMATION

Suppose that the Bayesian machine is in good working order: You choose your prior probabilities for the rival hypotheses and then let the evidence, in conjunction with PCP and the total probability theorem, do the rest. Even then, with your personal input limited to no more than an assessment of the initial plausibility of the rival hypotheses, there is an unsettling element of subjectivity to the process of Bayesian confirmation, which is perhaps best brought out by the following observation: Two scientists who agree on the physical probabilities that a hypothesis h assigns to evidence e , and who follow PCP, so assigning the same value to the likelihood $C(e|h)$, may disagree on whether e confirms or disconfirms h .

To see why: e confirms h if the Bayesian multiplier is greater than one, and disconfirms it if the multiplier is less than one. The question then is whether $C(e|h)$ is greater than or less than $C(e)$. The scientists agree on $C(e|h)$, but they may have different values for $C(e)$: A scientist who assigns higher prior probabilities to hypotheses that assign higher physical probabilities to e will have a higher value for $C(e)$. It is quite possible for the two scientists' priors for e to fall on either side of $C(e|h)$, in which case one will take e to confirm, the other to disconfirm, h .

A radical personalist denies that this is a problem: Why should two scientists agree on the significance of the evidence when one was expecting the evidence much more than the other? In the extreme, personalism of this sort approaches the view that Bayesian confirmation theory provides no guidance at all on assessing the significance of evidence, other than by establishing a standard of consistency; see also the discussion of induction above.

There is some objectivity underlying Bayesianism's subjectivity, however. The two scientists above will, because they agree on the likelihoods, agree on the ordering of the Bayesian multipliers. That is they will agree on which of any two hypotheses has the higher Bayesian multiplier, even though they may disagree on the size of the multipliers.

An important consequence of this agreement is a result about the convergence of opinion. When hypotheses assign physical probabilities to the evidence, as assumed here, it can be shown that as time goes on, the subjective probability distributions of any two scientists will with very high physical probability converge on the truth, or rather to the class of hypotheses empirically equivalent to the truth. (Even when the likelihoods are purely subjective, or at least only as objective as the probability calculus requires, a convergence result, albeit more limited, can be proved.)

Many Bayesians regard this convergence as ameliorating, in every important way, the subjective aspect of Bayesianism, since any disagreements among Bayesian scientists are ephemeral, while agreement lasts forever. Indeed, that Bayesianism makes some, but not too much, room for scientific dissent may not unreasonably be seen as an advantage, in both a descriptive and a prescriptive light.

Now consider a contrary view: While dissent has its place in science, it has no place in scientific inference. It is fine for scientists to disagree, at least for a time, on the plausibility of various hypotheses, but it is not at all fine that they disagree on the impact of the evidence on the hypotheses—agreement on the import of the evidence being the *sine qua non* of science. In Bayesian terms scientists may disagree on the priors for the rival hypotheses, but they had better not disagree on the Bayesian multipliers. But this is, for a Bayesian, impossible: The priors help to determine the multipliers. The usual conclusion is that there is no acceptable Bayesian theory of confirmation.

A less usual conclusion is that Bayesianism is still viable, but only if some further principle of rationality is used to constrain the prior probabilities in such a way as to determine uniquely correct values for the Bayesian multipliers. This is objectivist Bayesianism. Just as PCP is used to determine definite, objective values for the likelihoods, the objectivists suggest, so another rule might be used to determine definite, objective values for the prior probabilities of the hypotheses themselves, that is, for the subjective probabilities $C(h)$.

What principle of rationality could possibly tell you, before you have any empirical evidence whatsoever, exactly how plausible you ought to find some given scientific hypothesis? Objectivists look to the principle of indifference for the answer. That principle, discussed more fully in the entry on Probability and Chance, is in one of its guises intended to specify a unique probability distribution over a set of propositions, such as hypotheses, that reflects complete ignorance as to which of the set is true. Thus the fact that you have no evidence is itself taken to commit you to a particular assignment of prior probabilities—typically, a probability distribution that is uniform in some sense. Jaynes (1983) has done the most to develop this view.

The objectivist envisages all Bayesian reasoners marching in lock-step: They start with precisely the same priors; they apply (thanks to PCP and total probability) precisely the same Bayesian multipliers; thus they have the same subjective probabilities at all times for everything.

There are various powerful objections to the most general forms of the principle of indifference. Even its most enthusiastic supporters would shy away from claiming that it determines a uniquely correct prior for absolutely any scientific hypothesis. Thus the lock-step picture of Bayesian inference is offered more as an ideal than as a realistic prospect. To be a modern objectivist is to argue that parts of science, at least, ought to come close to realizing the ideal.

THE PROBLEM OF OLD EVIDENCE

Among the many achievements of Newton's theory of gravitation was its prediction of the tides and their relation to the lunar orbit. Presumably the success of this prediction confirmed Newton's theory, or in Bayesian terms, the observable facts about the tides e raised the probability of Newton's theory h .

But the Bayesian it turns out can make no such claim. Because the facts about the tides were already known when Newton's theory was formulated, the probability for e was equal to one. It follows immediately that both $C(e)$ and $C(e|h)$ are equal to one (the latter for any choice of h). But then the Bayesian multiplier is also one, so Newton's theory does not receive any probability boost from its prediction of the tides. As either a description of actual scientific practice, or a prescription for ideal scientific practice, this is surely wrong.

The problem generalizes to any case of "old evidence": If the evidence e is received before a hypothesis h

is formulated then e is incapable of boosting the probability of h by way of conditionalization. As is often remarked, the problem of old evidence might just as well be called the problem of new theories, since there would be no difficulty if there were no new theories, that is, if all theories were on the table before the evidence began to arrive. Whatever you call it, the problem is now considered by most Bayesians to be in urgent need of a solution. A number of approaches have been suggested, none of them entirely satisfactory.

A recap of the problem: If a new theory is discovered midway through an inquiry, a prior must be assigned to that theory. You would think that, having assigned a prior on non-empirical grounds, you would then proceed to conditionalize on all the evidence received up until that point. But because old evidence has probability one, such conditionalization will have no effect. The Bayesian machinery is silent on the significance of the old evidence for the new theory.

The first and most conservative solution to the problem is to take the old evidence into account in setting your prior for the new theory. In doing this you are entirely on your own: You cannot use conditionalization or any other aspect of the Bayesian apparatus to weigh the evidence in a principled way. But because you are free to choose whatever prior you like, you are free to do so in part on the basis of the old evidence.

A second solution requires a radical revision of Bayesian conditionalization, so as to allow conditionalization using not the actual probability of the old evidence, but using a (now) counterfactual probability such as your prior for the evidence immediately before you learned it. This provides a natural way to use conditionalization to weigh the old evidence, but the difficulties involved in choosing an appropriate counterfactual prior and in justifying conditionalization on the false prior, rather than the actual prior, have not unreasonably scared most Bayesians away.

The third and perhaps most popular solution suggests that, although conditionalization on old evidence e has no effect on the prior probability of a new theory h , conditionalizing on the fact that h predicts e (for simplicity's sake, assume that it entails e) may have an effect. The idea: Until you formulate h , you do not know that it entails e . Once h is formulated and assigned a prior, you may conditionalize on the fact of the entailment; learning that h entails e will have much the same impact on the probability of h , it is supposed, as learning e would have had if it were not already known.

There are two difficulties with this suggestion. The first is that facts about entailment (either of e itself, or of a physical probability for e) are logical truths, which ought according to the probability calculus to be assigned probability one at all times—making the logical facts as “old” as the evidence itself. Proponents of the present approach to old evidence argue not unreasonably that a sophisticated Bayesianism ought to allow for logical learning, so that it is the requirement that subjective probabilities conform to the probability calculus in every respect that is at fault here, for imposing an unreasonably strict demand on flesh-and-blood inquirers.

The second (and related) difficulty is that the theory of conditionalization on logical facts is not nearly so nicely developed as the theory of orthodox Bayesian conditionalization. A case can be made that conditionalizing on h 's entailment of old evidence will increase the probability of h , but the details are complicated and controversial.

BAYESIANISM ACCESSORIZED

Two notable additions to the Bayesian apparatus are ever under consideration. First is a theory of acceptance, that is, a theory that dictates, given your subjective probabilities, which hypotheses you ought to “accept.” Conventional Bayesianism has no need of acceptance: Your subjective probabilities are taken to exhaust your epistemic attitudes to the hypotheses, and also to determine, along with your preferences in the usual decision-theoretical way, the practical significance of these attitudes.

Some philosophers argue that there is, nevertheless, work for a notion of acceptance to do, and hold either a simple view on which hypotheses with high subjective probability are to be accepted, or a more sophisticated view on which not only probability but the consequences for science, good and bad, of acceptance must be taken into account.

Second is a theory of confirmational relevance, that is, a theory that dictates, given your subjective probabilities, to what degree a given piece of evidence confirms a given hypothesis. Conventional Bayesianism has no need of confirmational relevance: Your subjective probabilities are taken to exhaust your epistemic attitudes to the hypotheses, and so the dynamics of confirmation are exhausted by the facts about the way in which the subjective probabilities change, which are themselves fully determined, through conditionalization, by the values of the subjective probabilities themselves. Nothing is added to the dynamics of probability change—nothing could be added—by finding a standard by which to judge whether

certain evidence has a “large” or “small” impact on the hypotheses; however you talk about probability change, it is the change that it is. (A pure-hearted Bayesian need not even define *confirms* and *disconfirms*.)

Many different measures of relevance have, nevertheless, been proposed. The simple difference measure equates the relevance of e to h with the difference between the prior and posterior probabilities of h after conditionalization on e , or equivalently, with $C(h|e) - C(h)$. The likelihood measure equates the relevance of e to h with $C(e|h)/C(e|-h)$. It should be noted that all popular Bayesian measures render relevance relative to background knowledge.

There is no doubt that scientists sometimes talk about accepting theories and about the strength of the evidence—and that they do not talk very much about subjective probability. The degree to which you see this as a problem for unadorned Bayesian confirmation theory itself measures, perhaps, your position on the spectrum between prescriptive and descriptive.

BAYLE, PIERRE

(1647–1706)

Pierre Bayle, the most important and most influential skeptic of the late seventeenth century, was born in Carla (now Carla-Bayle), a French village near the Spanish frontier, where his father was the Protestant pastor. He grew up during the religious persecutions under Louis XIV that culminated in the revocation of the Edict of Nantes (1685) and the outlawing of Protestantism in France. Bayle was sent first to a Calvinist school and then to a Jesuit college at Toulouse, where after studying the controversial literature and hearing the dialectical arguments of some of the professors, he converted to Catholicism. The intellectual considerations that led him to Catholicism, after further examination, soon led him back to Calvinism. He became technically a *relaps*, a person who has returned to heresy after having abjured it, and under French law he was therefore subject to severe penalties.

He left France for Geneva, where he completed his philosophical and theological studies. In 1674 he returned to France incognito and became a tutor in Paris and Rouen. The next year he obtained the philosophy professorship at the Protestant academy of Sedan as the protégé of Pierre Jurieu, a superorthodox theologian who was to become Bayle’s greatest enemy. Bayle taught at Sedan until the school was closed in 1681. He and Jurieu went to Holland; they became members of the *École illustre* of Rotterdam and of the French Reformed church there. Bayle brought with him his first work, a letter concerning the comet of 1680, which he published under a pseudonym. This volume, like many of those to follow, attacked superstition, intolerance, and poor philosophy and history. The work was immediately successful and was soon followed by others, including an answer to Father Maimbourg’s history of Calvinism and a collection of defenses of Cartesianism.

During these early years in Rotterdam, Bayle apparently made some fundamental personal decisions that affected the rest of his life. The first was not to marry but to devote himself to the solitary life of the dedicated scholar seeking truth. The second was to refuse any important professorship to carry on his work in Rotterdam (where he lived almost continuously for the rest of his life). Lastly, after his father and his brothers died in France as a result of the religious persecutions, Bayle apparently committed himself to both the cause of Calvinism and the cause of toleration.

From 1684 until 1687 he edited the *Nouvelles de la république des lettres*, one of the first learned journals of modern times, in which he reviewed works in many fields. His critical appraisals soon made him a major figure in the learned world and brought him in contact with the leading lights of his day, among them Antoine Arnauld, Robert Boyle, Gottfried Wilhelm Leibniz, John Locke, and Nicolas Malebranche.

TOLERATION

In 1686 Bayle published in Amsterdam his *Commentaire philosophique sur ces paroles de Jésus-Christ "Constrains-les d'entrer"* (Philosophical commentary on the words of Jesus "constrain them to come in"), a brilliant argument for complete religious toleration. Starting with the problem raised by Louis XIV's persecutions, Bayle developed a defense of toleration for Jews, Moslems, Socinians (Unitarians), Catholics, and even atheists, extending its scope far beyond Locke's not yet published *Essay on Toleration*.

Enmity had begun to develop between Bayle and Jurieu, who conceived of himself as the chief spokesman for Calvinist orthodoxy, opposed all kinds of deviation as heresy and atheism, and advocated political victory over Louis XIV. As Jurieu became a violent political radical and religious bigot, Bayle drifted away from the views and company of his former mentor. According to Jurieu the disaffection reached the breaking point with the publication of Bayle's "Philosophical Commentary." Bayle had tried to hide his authorship, but Jurieu soon guessed the truth and realized that they disagreed completely about almost everything. He saw his colleague as a menace to true religion and a secret atheist. Bayle intensified the quarrel by ridiculing Jurieu, attacking his intolerance and his political plans. Throughout the quarrel, Bayle insisted that he was a true follower of John Calvin and that he had imbibed his orthodoxy from Jurieu's antirational theology.

When Bayle began to publish his views, the Protestant liberals thought that he was on their side. But Bayle quickly employed his dialectical and critical skill to decimate their contentions and to show that there was no way of making the rational and scientific world compatible with the basic claims of Christianity, as they in part believed it to be. As a result, various liberal Protestants spent years defending themselves against Bayle's sharp criticisms, while Bayle alternately joined them in attacking Jurieu and Jurieu in attacking them.

Between 1690 and 1692 the argument between Bayle and Jurieu reached fever pitch, especially concerning whether or not Bayle was the author of the notorious

"Advice to the French Refugees," a work criticizing the romantic optimism and hopes of the Protestant exiles. (Bayle so confused the evidence that even present-day scholars are unwilling to state positively that he did write it.) These controversies with Jurieu led in 1693 to Bayle's dismissal from his teaching post, an event that allowed him time to carry on his many controversies and to complete his great *Dictionnaire historique et critique* (A general dictionary, historical and critical; first published in two volumes in Rotterdam in 1695 and 1697), a work in which Jurieu is constantly attacked.

HISTORY AND COMPOSITION OF THE DICTIONARY

Bayle had conceived the basic idea of the *Dictionary* long before its composition. For many years he had been assembling collections of errors uncovered in various historical works. As early as 1675, Bayle's letters show, he was actively interested in skeptical thought. In the lectures Bayle gave at Rotterdam he criticized every possible theory. The *Dictionary* brought his critical and skeptical sides together. Originally, Bayle planned only to write a dictionary that would list the mistakes in all other dictionaries and in particular the one by Louis Moréri. A sample portion of this project was printed in 1692 to test public interest. The negative reaction led to a change of plan; the dictionary became a historical and critical one, dealing principally with persons and mainly with those who were not treated fully or at all (usually because of their obscurity or insignificance) in Moréri's opus. The result was two folio volumes full of articles on little-known or totally unknown figures, omitting significant figures like Plato, Michel Eyquem de Montaigne, and Cardinal Richelieu.

The *Dictionary* was composed in Talmudic style. Relatively brief biographical articles appeared at the top of the page, while all sorts of digressive notes on factual, philosophical, religious, or other matters appeared below, with notes on notes appearing in the margins. The biography of some extremely little-known personage, like Rorarius, would provide the stage for profound discussions of the nature of man and beasts, the mind-body problem, and the new metaphysical theory of Leibniz. Other subjects would provide forums for discussing the problem of evil; the immorality of great figures, especially Old Testament ones; the irrationality of Christianity; the problems of Locke's, Isaac Newton's, Malebranche's, Aristotle's, or anyone else's philosophy; or some salacious tale about a famous theologian, Catholic or Protestant, or a famous political figure of almost any age. There was little

relation between the official subject of an article and its real content. But there were several major themes and threads that ran through many or most of the articles, themes that amounted to a massive onslaught against almost any religious, philosophical, moral, scientific, or historical view that anyone held. (Once Bayle explained that he was a Protestant in the true sense of the term and that he opposed everything that was said and everything that was done.)

The *Dictionary* was an instant success and immediately led to criticism and condemnation, both by the French Reformed church of Rotterdam and by the French Catholic church. The latter group banned the work, while the former demanded that the author revise or explain his views about the good moral character of atheists, the inability of Christians to answer the Manichaean views about the nature of evil, the strength of Pyrrhonian skepticism, the immoral character of King David, and why so many obscenities appeared in the work.

Bayle promised the congregation of the French Reformed church that he would revise the article “David” and would offer explanations of the other matters. Almost as soon as the first edition of the *Dictionary* appeared, he began work on the second, revising the article “David” and adding many additional articles, plus a set of clarifications. This final edition appeared in Rotterdam in 1702 and consisted of 7 to 8 million words. After this monumental effort, the rest of Bayle’s career was devoted to carrying on various controversies, defending some of the claims in the *Dictionary*, and fighting a growing list of opponents. He died on December 28, 1706, while completing his *Entretiens de Maxime et de Thémiste* (Conversations between Maxime and Themiste; Rotterdam, 1707), a final reply to the liberal Protestants.

Replies to Bayle kept appearing, written by such figures as Leibniz, Bishop William King, and Jean-Pierre Crousaz; and the avant-garde spirits of the Enlightenment found much ammunition in Bayle’s folio columns with which to attack the ideological and theological ancien régime. François-Marie Arouet de Voltaire, David Hume, Edward Gibbon, Denis Diderot, and many others found intellectual nutrition in Bayle’s skeptical and critical efforts. Thomas Jefferson recommended the *Dictionary* as one of the hundred basic books with which to start the Congressional Library. Poets and writers of fiction like Alexander Pope, Henry Fielding, and Herman Melville found inspiration and plots in some of Bayle’s spicy tales. Ludwig Feuerbach (1967), in the nineteenth century, saw Bayle as a major figure in the rise of modern thought and devoted a whole volume to him.

The *Dictionary* was enormously influential during the eighteenth century, both for its spirit and for its wealth of information. Though it was written in the form of a reference work, its lopsided contents, overloaded with lives of obscure theologians and figures of French political history, made it difficult for the *Dictionary* to maintain its character as a guide to research and scholarship. Efforts to improve it by adding and updating articles were only temporarily successful. The editors of the 1734–1741 English edition put in hundreds of articles on English and Arab figures, plus some “correctives” to what they regarded as outlandish in Bayle’s original. In 1740 Jacques-Georges de Chauffepié translated many of the English articles into French, adding a great many more on Bayle’s opponents, and put out a four-volume folio supplement. However, the type of critical and careful research Bayle had fostered gave birth to projects that would forever make his *Dictionary* obsolete as a reference work. *La Grande Encyclopédie* and the *Encyclopaedia Britannica*, which replaced it, were continuing team efforts, rather than one man’s appraisal of the whole intellectual world. Thus, Bayle’s work became a victim of its own offspring. It gradually disappeared as an important element in the intellectual world and was superseded by the works of leaders of the Enlightenment who had imbibed at least part of Bayle’s spirit.

PHILOSOPHICAL ASPECTS OF THE DICTIONARY

The discussions in the *Dictionary* that had the greatest philosophical impact were those dealing with the problem of evil, with the independence of morality from religion, and with the unintelligible nature of the physical and mental world, especially when analyzed in terms of the categories of the “new science” and the “new philosophy.” With a dialectical skill unknown to earlier skeptics Bayle dissected every theory and showed that it was unsatisfactory. Instead of merely utilizing the classical epistemological arguments of Sextus Empiricus, slightly modernized by the Montaignians, Bayle employed primarily the method of one of his heroes, the “subtle Arriaga” (Roderigo Arriaga, the last of the Spanish scholastics, who died in 1667), a method that Bayle had probably learned from the Jesuits at Toulouse.

The technique consisted in exposing the weakness of every rational attempt to make sense of some aspect of human experience. Bayle, like Arriaga before him, repeatedly exhibited man’s sorry intellectual plight. All human rational efforts are always their own undoing and terminate in theories that are “big with contradiction and

absurdity.” Bayle concentrated on a few shocking illustrations of this thesis. In a series of articles, “Manichaeans,” “Marcionites,” “Paulicians,” and “Rufinus,” he contended that the Manichaean or dualistic theory of two gods, one good and one evil, could not be refuted by orthodox Christian theology, that it was a better explanation of human experience of evil, but that it was ultimately repugnant to sound reasoning. (Leibniz’s *Theodicy* was largely an attempt to refute Bayle on Manichaeism and the problem of evil.)

RELIGION AND MORALITY

Throughout his writings, from his letter on the comet to the *Dictionary* and its various defenses, Bayle argued the then scandalous thesis that a society of atheists could be moral and a society of Christians immoral. He tried to show that people’s moral behavior is not a consequence of their beliefs but is rather the result of many irrational factors, such as education, custom, passion, ignorance, and the trace of God. In the article “Jupiter” he pointed out that Greek mythology was absurd and immoral, but the Greeks lived moral lives nonetheless. In his “Clarification on Atheism” he stated that he could find no case of a classical atheist, or a modern one like Benedict (Baruch) de Spinoza, who lived a wretched, morally degenerate life. Instead, the cases he found all seemed to be ones of highly moral people, who also happened to be atheists.

Additionally, Bayle knew of myriad cases—from a biblical one to leading Catholic and Protestant clergy of his day—of religious heroes who were immoral and whose behavior seemed to have been influenced by the most irreligious factors. Among many articles dealing with the sexual aberrations of different religious fanatics, early reformers, and Renaissance popes, the long one on “David” brought this point out most forcefully. David was introduced as the most holy figure in the Old Testament, and a series of notes outlined and analyzed his immoral conduct. This massive assault on any alleged rational or necessary connection between religious belief and moral behavior greatly influenced the Third Earl of Shaftesbury (Anthony Ashley Cooper; who lived and argued with Bayle for a while), and Bernard Mandeville (who was apparently one of Bayle’s students at Rotterdam), and through them many of the eighteenth-century British moralists.

METAPHYSICS

In metaphysics Bayle employed his dialectical skill to show that theories about the nature of matter, space, time, motion, mind, and mind-body relationships, when

thoroughly analyzed, are contradictory, inadequate, and absurd. Starting with Zeno of Elea’s paradoxes and the sections in Sextus against metaphysics, Bayle attacked all sorts of ancient and modern forms of atomism, Platonism, and Aristotelianism, as well as the modern substitutes offered by René Descartes, Thomas Hobbes, Spinoza, Malebranche, Leibniz, Locke, Newton, and many others. He showed the weird, incredible conclusions that would follow from each of these theories. (Bayle’s article “Rorarius” was the first public examination of, and attack on, Leibniz’s theories of preestablished harmony and of monads.) In the articles “Pyrrho” and “Zeno of Elea” (which greatly influence George Berkeley and Hume) Bayle brilliantly challenged the distinction between primary and secondary qualities, so fundamental in the theories about reality of all the “new philosophers.”

SKEPTICISM

Bayle repeatedly showed that the many attempts by human beings to explain or understand their world were all just “highroads to Pyrrhonism,” since they only made every supposition more perplexing, absurd, and dubious. Rational activity, no matter what problem it is directed at, leads to complete skepticism, since reason invariably leads one astray. In the article “Acosta” Bayle compared reason to a corrosive powder that first eats up errors, but then goes on to eat up truths, “When it is left on its own, it goes so far that it no longer knows where it is, and can find no stopping place.”

FAITH

Each time Bayle reached this point he would proclaim that in view of the inability of reason to arrive at any complete and adequate conclusion about anything, man should abandon the rational world and seek a different guide: faith. This claim was forcefully stated in the articles “Bunel, Pierre,” “Charron,” “Manichaeans,” “Pomponazzi,” “Pyrrho,” and the “Clarification on the Pyrrhonians.” Bayle’s dwelling on the theme that reason makes men perplexed and so requires that they look for another guide suggests, perhaps, that his purpose was something like that of Maimonides in *The Guide of the Perplexed*, one of Bayle’s favorite works.

REVELATION

In various discussions (such as the articles “Pyrrho,” “Simonides,” and the “Clarification on the Pyrrhonians”) Bayle insisted that the rational and the revealed worlds are in complete conflict, because the latter is based on

claims that are in direct opposition to the principles that appear most evident to reason. Starting with the first line of Genesis, the world of faith contains claims that are rationally unintelligible and unacceptable. According to Bayle the principle that reason finds the most evident and certain is that nothing comes from nothing, whereas faith reveals that God created the world *ex nihilo*. Similarly, the most acceptable rational moral principles are at complete variance with the revealed accounts of the behavior of the heroes of the faith, the leading figures of the Old Testament. In this total opposition between reason and revelation, faith is man's only refuge. Bayle insisted that his irrational fideism was the traditional orthodox position from St. Paul and Quintus Septimius Florens Tertullian down to Calvin and Jurieu. (In fact, some passages of Bayle sound like Søren Aabye Kierkegaard and other more fideistic theologians.)

BAYLE'S RELIGIOUS POSITION

No matter how often Bayle claimed that he was advocating the faith and was merely restating what orthodox Christians had always said, his opponents, especially Jurieu and some of the liberals, insisted that Bayle was actually an unbeliever trying to destroy the faith by making it sound as ridiculous and irrational as possible. Certainly, some of Bayle's passages have such a ring. And none of his statements of the fideistic message have the anguish of Blaise Pascal or Kierkegaard, or even the despair of the truth seeker unable to find satisfaction in either the rational world or in revealed truths.

However, this may not necessarily be a sign that Bayle was insincere. Bayle himself offered an alternative possibility in a discussion in the longest article in the *Dictionary*, that on Spinoza. In note M Bayle described two kinds of people, those who have religion in their minds, but not in their hearts, and those who have religion in their hearts, but not in their minds. The first kind are convinced of the truth of religion, but their consciences are not affected by the love of God. The second kind lose sight of religion when they seek it by rational means and are lost in the wilderness of the pros and cons; but when they listen only to their feelings, conscience, or education, they find that they are convinced of religion and regulate their lives accordingly, within the limits of human frailties. If Bayle had religion in the heart in this sense (rather than Pascal's), it was an emotionless religion, which became confused and perplexing whenever he tried to explain or comprehend it. When he abandoned the attempt to be rational about it, then it became a calm guide for a life of pious study.

In the article "Bunel, Pierre" Bayle presented this fervorless religion as almost a testimonial of faith. Bunel, an obscure Renaissance pedant from Toulouse (who accidentally had an enormous influence on the development of modern skepticism by giving Raimond Sebond's *Natural Theology* to Montaigne's father) is one of the few genuine heroes of Bayle's *Dictionary*. He was pictured as a perfect Christian, in contrast to myriad imperfect ones (including Jurieu), because he rejected all worldly goals and devoted himself solely to the life of the pure scholar, harming no one and seeking truth. Bayle's own life was much like Bunel's. Beyond this, Bayle's religion seems to have had little or no content, though he always claimed to be a Calvinist Christian.

The lack of content in Bayle's religion may account for his important doctrine of toleration of the rights of the erring conscience. In many works Bayle insisted that man's ultimate appeal for justification of his beliefs and actions was his own conscience and that man had no further ultimate standard to employ to determine if his conscience was correct. Therefore, each man could act only as he saw fit, and no one was justified in trying to compel another to act contrary to the dictates of his conscience, erring or otherwise.

Though Bayle continually presented his appeal to faith, and his own faith, in tranquil and colorless terms, a fundamental problem remains of determining what Bayle did in fact believe and what his arsenal of doubts was intended to achieve. Shaftesbury, who knew Bayle well, called him "one of the best of Christians." Jurieu was sure he was an atheist. The Enlightenment leaders saw him as one of them, perhaps a deist, but definitely a scoffer at all historical religions. The biographical data would suggest that, barring some strange private joke, Bayle was committed to some aspects of the French Reformed church. He persisted in belonging to it, attending it, and proclaiming his sincere adherence to it, no matter how much he was abused by Jurieu and others. He could have lived and prospered in Holland either in a more liberal church or as a complete independent. In tolerant Holland it was extremely unlikely that he would have been punished or have had his works censored, no matter what he said or believed.

Coming from a family that suffered inordinately from persecution for its Calvinism, Bayle may have felt a need and desire to maintain his original tradition. His last message to a friend as he knew his life was ending was, "I am dying as a Christian philosopher, convinced of and pierced by the bounties and mercy of God, and I wish you a perfect happiness." Elisabeth Labrousse (1963) points

out that this is a most minimal Christian testament, since Jesus is not mentioned, nor any Christian doctrine, nor anything about Bayle's church. In his writings Bayle rarely discussed religion without making Manichaeism or Judaism seem either more plausible or more significant than Christianity; and he occasionally (as in the article "Takiddim") even called Judaism the true religion. Bayle may have been either a Christian in his own sense or actually a Manichaean or Judaizer or both, working out an enormous defense of his cause by undermining the rational and moral foundations of other possibilities.

Until it is possible to ascertain Bayle's actual beliefs, it will remain extremely difficult to determine his aims and whether the impact he had was the intended one. Bayle undermined all the philosophical positions of the great seventeenth-century metaphysicians and posed basic problems that Berkeley, Hume, Voltaire, and others were to use to establish other approaches and alternatives. He provided an enormous amount of argument and ridicule for the Enlightenment to use in destroying the intellectual ancien régime and in launching the Age of Reason. But even Voltaire and Hume were aware that Bayle was much more given to doubt and destructive criticism than they considered themselves to be. At times, they believed they had found new ways of overcoming Bayle's doubts. Perhaps they were both too far removed from Bayle's calm religious haven to be able to entertain his complete doubt about everything without utter dismay and horror.

Bayle seems to have lived in a different world from that of the Enlightenment that he helped produce. Though he may not have been "the greatest master of the art of reasoning," as Voltaire called him, he was one of the best. He was a genius at seeing how to attack and destroy theories about almost anything and a master at determining what the facts in the case were. Bayle would turn his attacks against everyone and everything, modern, ancient, scientific, rationalistic, or religious. He did not, apparently, see a new and better world emerging from his critique, nor see the need for one. The havoc he was wreaking seemed to leave him completely tranquil. It was for subsequent generations to discover the problem of living in a world in which all is in doubt and in which the solution proffered by Bayle seems meaningless or unattainable.

Some scholarship focuses on Bayle's last writings after the *Dictionary*. Gianluca Mori (1999) and others believe that they have found that Bayle was evolving more positive views in his last few years.

Bibliography

WORKS BY BAYLE

- Oeuvres diverses*. 4 vols. The Hague: n.p., 1727. A collection of Bayle's writings other than the *Dictionary*.
- A General Dictionary, Historical and Critical*. 10 vol. Translated by John Peter Bernard, Thomas Birch, and John Lockman. London: J. Bettenham, 1734–1741. This was published in French under the title *Dictionnaire historique et critique* in 1740.
- Historical and Critical Dictionary, Selections*. Translated by Richard H. Popkin, with Craig Brush. Indianapolis, IN: Bobbs-Merrill, 1965. Contains selections from forty articles, plus Bayle's clarifications.
- Correspondance de Pierre Bayle*, edited and annotated by Elisabeth Labrousse et al. Oxford, U.K.: Voltaire Foundation, 1999–2004.
- Bayle: Political Writings*, edited by Sally L. Jenkinson. New York: Cambridge University Press, 2000.

WORKS ON BAYLE

- Barber, W. H. "Bayle: Faith and Reason." In *The French Mind: Studies in Honour of Gustav Rudler*, edited by Will Moore, Rhoda Sutherland, and Enid Starkie, 109–125. Oxford, U.K.: Clarendon Press, 1952. Suggests that Bayle was sincerely religious.
- Bracken, Harry M. "Bayle Not a Sceptic?" *Journal of the History of Ideas* 25 (1964): 169–180. Attempts to clarify the sense in which Bayle was a skeptic and a fideist.
- Bracken, Harry M. "Pierre Jurieu: The Politics of Prophecy." In *Millenarianism and Messianism in Early Modern European Culture. Vol. 4: Continental Millenarians: Protestants, Catholics, Heretics*, edited by John Christian Laursen and Richard H. Popkin, 85–94. Boston: Kluwer Academic, 2001.
- Courtines, Léo. *Bayle's Relation with England and the English*. New York: Columbia University Press, 1938. Deals with Bayle's contacts with and influence on English philosophers, theologians, and writers, including Berkeley and Hume.
- Dibon, Paul, ed. *Pierre Bayle, le philosophe de Rotterdam*. Amsterdam: Elsevier, 1959. An important collection of articles in French and English reevaluating Bayle's views.

- Feuerbach, Ludwig. *Pierre Bayle: Ein Beitrag zur Geschichte der Philosophie und Menschheit*. Berlin: Akademie-Verlag, 1967. Bayle seen as caught between rationalism and the irrationality of Christianity.
- Hasse, Erich. *Einführung in die Literatur des Refuge*. Berlin: 1959. A monumental study of the French Protestant refugees. Places Bayle in the context of this group.
- Hazard, Paul. *The European Mind, 1680–1715*. Translated by J. Lewis May. London: Hollis and Carter, 1953. Originally published in French under the title *La Crise de la conscience européenne, 1680–1715* in 1935. The intellectual climate of Bayle's time.
- James, E. D. "Scepticism and Fideism in Bayle's Dictionnaire." *French Studies* 16 (1962): 307–324. Challenges the views of Popkin and others regarding Bayle's religious views.
- Kemp Smith, Norman. *The Philosophy of David Hume: A Critical Study of Its Origins and Central Doctrines*. London: Macmillan, 1941. Contains analyses of sections in Bayle that influenced Hume, especially in his *Treatise of Human Nature*.
- Labrousse, Elisabeth. *Pierre Bayle. Vol. 1: Du pays de foix à la cité d'Erasmus*. The Hague: Nijhoff, 1963. First biography of Bayle in recent times, based on monumental researches.
- Labrousse, Elisabeth. *Pierre Bayle. Vol. 2: Hétérodoxie et rigorisme*. The Hague: Nijhoff, 1964. A study of Bayle's theology by the leading authority today. Contains a massive bibliography.
- Laursen, John Christian. "Bayle's Anti-millenarianism: The Dangers of Those Who Claim to Know the Future." In *Millenarianism and Messianism in Early Modern European Culture. Vol. 4: Continental Millenarians: Protestants, Catholics, Heretics*, edited by John Christian Laursen and Richard H. Popkin, 95–106. Boston: Kluwer Academic, 2001.
- Mason, H. T. *Pierre Bayle and Voltaire*. London: Oxford University Press, 1963. A comparison, with an attempt to assess what Voltaire borrowed from Bayle.
- Mason, H. T. "Pierre Bayle's Religious Views." *French Studies* 17 (1963): 205–217. Defends interpretation of Bayle as an irreligious thinker.
- Mori, Gianluca. *Bayle philosophe*. Paris: Champion, 1999.
- Norton, David. "Leibniz and Bayle: Manicheism and Dialectic." *Journal of the History of Philosophy* 2 (1964): 23–36. An attempt to see how Bayle might have dealt with Leibniz's *Theodicy* and a new analysis of Bayle's dialectic.
- Paganini, Gianni, ed. *The Return of Scepticism from Hobbes and Descartes to Bayle*. Dordrecht, Netherlands: Kluwer Academic, 2003. Includes several articles on Bayle and eighteenth-century skepticism.
- Popkin, Richard H. *The High Road to Pyrrhonism* edited by Richard A. Watson and James E. Force. San Diego, CA: Austin Hill Press, 1980. Contains articles on Bayle in the context of the late seventeenth century and on his legacy for the eighteenth century.
- Rétat, Pierre. *Le "Dictionnaire" de Bayle et la lutte philosophique au XVIIIe siècle*. Paris: Les Belles Lettres, 1971.
- Rex, Walter. *Essays on Pierre Bayle and Religious Controversy*. The Hague: Nijhoff, 1965.
- Sandberg, K. C. "Pierre Bayle's Sincerity in His Views on Faith and Reason." *Studies in Philology* 61 (1) (1964): 74–84. Interprets Bayle as a sincere Calvinist. Shows Bayle had no need to fear censorship.

Whalen, Ruth. *The Anatomy of Superstition: A Study of the Historical Theory and Practice of Pierre Bayle*. Oxford, U.K.: Voltaire Foundation, 1989.

Richard Popkin (1967, 2005)

BEARDSLEY, MONROE (1915–1985)

Monroe C. Beardsley published in several areas of philosophy but is best known as an aesthetician. He is arguably the most important figure of twentieth-century analytic aesthetics. His *Aesthetics: Problems in the Philosophy of Criticism* (1958) was a watershed book, furnishing an organization aesthetics had lacked. Beardsley's careful discussions of almost all of the field's questions provided an aesthetic education for his and succeeding generations.

Two ideas shaped all Beardsley's work: his view of the philosophy of art criticism (called "metacriticism") and his aestheticism. Metacriticism's task is the analysis of art criticism's central concepts. Aestheticism is the view that aesthetic characteristics (e.g., unity, delicacy) alone are the proper objects of art criticism; thus, aesthetic features become the sole focus of criticism and the basis for artistic value. Beardsley acknowledged that artwork can have nonaesthetic, referential characteristics, and he does not deny that these features are important. He does, however, deny that referential features are relevant to aesthetic experience and, thus, to artistic value.

Aesthetics begins with the metacritical task of discussing objects of criticism, designating them "aesthetic objects"; a hard-and-fast connection is, thus, forged at the book's beginning between metacriticism and aestheticism with the contents of the objects of criticism identified as aesthetic features. This identification sets the stage for Beardsley's view of artistic value. He claims that artworks are instrumentally valuable because their aesthetic characteristics can produce (valuable) aesthetic experience. Aesthetic experience, as he conceives of it, is the foundational notion of Beardsley's book.

John Dewey is the primary source of Beardsley's notion of aesthetic experience. Dewey conceived of aesthetic experience as an experience that coheres to such an extent that it is set off, although not detached, from the flow of experience. Beardsley, however, was also influenced by aesthetic-attitude theorists. Consequently, unlike Dewey, he claimed aesthetic experience is detached from ordinary experience. But whereas the aesthetic-attitude theorists claim various mental mechanisms—

such as “psychical distancing”—detach aesthetic experience from ordinary life, Beardsley maintained that aesthetic experience’s internal coherence detaches it from the flow of experience. And it is the detachedness of aesthetic experience that blocks artworks’ referential characteristics (names, descriptions, portrayals, etc.) from referring to anything outside of ongoing aesthetic experience of artworks. On his view, only aesthetic, nonreferential characteristics of an artwork can cause aesthetic experience and, thereby, be the focus of artistic criticism and the basis for artistic value.

Beardsley argued that artistic value is an instrumental value (an objective value) because it can cause valuable aesthetic experience. To provide an objective basis for the value of aesthetic experience, Beardsley contended that aesthetic experience is in turn instrumentally valuable, being productive of human welfare. As an aspect of his account of artistic value, Beardsley argued that there are principles of art criticism involving the potential of three aesthetic features (unity, intensity, and complexity) for producing aesthetic experience, thus, opposing the conventional wisdom that there are no such principles. Present-day accounts of critical principles have their beginnings in Beardsley’s work.

Throughout his career Beardsley continued to defend aestheticism and the inherent detachment of the aesthetic from ordinary life. In 1978 he argued against Nelson Goodman’s view that artworks’ referential features produce artistic value. In the second edition of *Aesthetics*, Beardsley wrote, “I think distance or detachment—withdrawal from practical engagement—in some form ... is a factor in aesthetic character” (1981, p. lxii).

The only major question not discussed in *Aesthetics* is the nature of art. Finally in 1979, responding to the art theories that developed in the wake of Arthur Danto’s “The Artworld” (1964), Beardsley sketched a theory of art in the midst of discussing aesthetic value; he wrote, “... an artwork can be usefully defined as an intentional arrangement of conditions for affording experiences with marked aesthetic character” (1979, p. 729). Beardsley’s theory of art was determined by his aestheticism.

In 1946 Beardsley and William Wimsatt had co-authored “The Intentional Fallacy” and initiated a polarizing debate by arguing that artists’ intentions are irrelevant to the interpretation and evaluation of their artworks. Beardsley also defended anti-intentionalism in *Aesthetics*, “The Authority of the Text” in *The Possibility of Criticism* (1970), and “Intentions and Interpretations: A Fallacy Revived” in *The Aesthetic Point of View* (1982). On

his anti-intentionalist account, artworks are severed from their creators’ actions when they are objects of criticism and of aesthetic experience. According to both his anti-intentionalism and his aestheticism, artworks as objects of aesthetic experience and criticism are detached—on the one hand, from their creators and, on the other, from their referents. Thus, in an aesthetic experience, audiences and critics savor only the aesthetic features of artworks.

Anti-intentionalism has been debated on grounds other than those used in *Aesthetics*, making use of arguments from the philosophy of language. Beardsley himself participated in this later controversy and produced additional arguments against intentionalism in “The Authority of the Text” and in “Intentions and Interpretations: A Fallacy Revived.” In the first article, he argued that three different kinds of texts created without any authorial intent have specific meanings, namely, some randomly generated computer texts, some poetic lines with a word that has come to have a different meaning than it had at the time it was composed, and texts that reveal meanings of which their authors were unconscious. Unfortunately, Beardsley’s argument merely contradicts the intentionalists’ claim that such texts cannot have meaning and, therefore, will not persuade them.

In the second article, Beardsley applies J. L. Austin’s distinction between locutionary and illocutionary acts to fictional discourse, claiming that illocutionary acts in fiction are *representations* of illocutionary acts and thus not actual illocutionary action of the text’s author. Unfortunately, this argument is limited to fiction and the dispute is about texts generally, not just fiction. Furthermore, the dispute is really about locutionary meaning rather than illocutionary meaning.

The controversy over intentionalism continues.

BEATTIE, JAMES

(1735–1803)

James Beattie was born in Laurencekirk, Scotland, on October 25, 1735. He received an MA at Marischal College, Aberdeen, in 1753, became schoolmaster at the For-doun Parish Church, and in 1760 was appointed Professor of Moral Philosophy and Logic at Marischal College. He was a member of the Aberdeen Philosophical Society with Thomas Reid and other notable Scottish writers. Beattie was known internationally as both a philosopher and poet. His principal philosophical contribution is *An Essay on the Nature and Immutability of Truth* (1770), for which he was awarded a yearly pension of £200 by King George III. His relentless attacks on David Hume in that work sparked a controversy that permanently linked his name with Hume's. He was ill much of his life and endured the progressive insanity of his wife and the early death of his children. He died on August 18, 1803.

Beattie's *Essay* is an interesting critique of modern metaphysics as well as an important assault on Hume. The crux of his position is this: Truth is that which common sense "determines me to believe," and skeptical metaphysicians have erred by ignoring commonsense intuitions. He discusses eight types of human reasoning that are grounded in common sense: mathematics, external sensation, internal sensation such as moral approval and personal identity, memory, causality, induction, analogy, and testimony. He acknowledges that merely having a commonsense belief does not guarantee that such a belief is true, since one can never be in a privileged position to compare one's commonsense beliefs to absolute reality. Like René Descartes, though, Beattie argues that one can trust that God has not deceived one in giving one faulty commonsense intuitions (2000). He argues further that denying the truth of common sense leads to absurd consequences.

Beattie takes issue with the skeptical trend of modern philosophers since Descartes who begin, he holds, with a few presumably factual general principles and deduce from these a range of noncommonsensical conclusions

that call into doubt one's senses, the external world, free will, memory, and any of the previously mentioned eight types of reasoning. Skeptical metaphysics, he argues, is loathsome and harmful to normal affairs of life. About one-fourth of the *Essay* is a criticism of Hume's views of personal identity, ideas and impressions, necessary connection, the broad scope of the virtues, the natural inferiority of blacks, and other issues. His rhetoric against Hume is harsh, and in a 1771 postscript to the *Essay* he states that this treatment is necessary for placing the absurdity of skeptics' views in perspective and to combat the danger that skeptics pose to morality. He writes, "Let opinions then be combated by reason, and let ridicule be employed to expose nonsense."

In addition to his polemical *Essay* Beattie published *Dissertations Moral and Critical* (1783) on the subjects of memory, imagination, and language, *Evidences of the Christian Religion* (1786), and a collection of his philosophy lectures titled *Elements of Moral Science* (1790–1793). One of his more provocative pieces is the allegorical short story "The Castle of Scepticism," which he circulated among friends but that remained unpublished for almost 200 years. It describes how, after falling asleep, he was led on a journey to a surreal land of skeptics who defied commonsense beliefs. During and shortly after his life, Beattie's *Essay* was defended by Thomas Blacklock (1720–1791) and Dugald Stewart, and criticized by Joseph Priestley, James Steuart (1712–1790), and Thomas Cogan (1736–1818), in writings all of which are reprinted in *Early Responses to Reid, Oswald, Beattie, and Stewart* (2000).

BEAUTY

Until the eighteenth century, “beauty” was the single most important idea in the history of aesthetics. One of the earliest works in the literature of aesthetics, the *Hippias Major* (probably by Plato), was addressed to the question, “What is beauty?” Around this question most of later thought revolves. The treatment of the other major concept, *art*, when it is not ancillary to that of beauty, lacks comparable generality, for it is often restricted to a single artistic form or genre, or its theoretical status is equivocal, because art is taken as identical with craft or skill. The modern notion of the *fine arts* did not appear until the eighteenth century and, more important, it was then too that the concept of *aesthetic experience* was first formulated systematically. As a consequence, beauty lost its traditional centrality in aesthetic theory and has never since regained it.

Our survey of these historical developments will be selective. Specific theories will be singled out because they are paradigms of the major kinds of theory of beauty. Thus, where beauty is taken to be a property, we will be less concerned with what, on some particular proposal, this property is, more with the logical relations of beauty, so construed, to the other properties of beautiful things and to the conditions of its apprehension. Where it is not so construed, the chief alternative meanings for beauty will be illustrated. *Beautiful* is used to esteem or commend and therefore to make a claim that is honored in the processes of criticism. Throughout this article, accordingly, the implications of the major kinds of theory for evaluation of the object will be traced.

CLASSICAL AESTHETICS

The concluding section of Plato’s *Philebus* is the prototype of the dominant ways of thinking about beauty prior to the eighteenth century. This will be shown by unpacking its major theses, which, whether they were taken over or whether they became the focuses of dispute, made up the framework of classical theory and defined its preoccupations.

The discussion of beauty in the *Philebus*, as in other dialogues, arises in the course of discussion of a larger question not itself aesthetic, namely, whether pleasure or knowledge is the supreme good for humankind. Socrates

wished to distinguish “pure” from “mixed” pleasures, and among the examples that he gives of the former are the pleasures evoked by objects that are “beautiful intrinsically.” He cited simple geometrical shapes, single colors, and musical notes (50E–52B).

The first thing to see is that Plato took beauty to be a property ingredient in things. It is nonrelational twice over, for its existence is not dependent upon, or affected by, perceiving it; and whereas “relative” beauty exists only by virtue of comparison with things that are of a lesser degree of beauty or simply ugly, “intrinsic” beauty does not. This view can be specified in two different ways, both of which appear to be suggested by Plato: Either the property of beauty is identified with, and defined by, certain properties of the object, here the determinate ordering or “measure” of the whole (64E), or beauty is itself indefinable, but supervenes upon a further, distinct property, the internal unity of the parts, which is the condition of its existence (66B).

On the former theory, whether a thing is beautiful is decided just by finding whether it does or does not possess the salient property. In the *Philebus*, the success of such inquiry, even on Plato’s rigorous conception of knowledge, is assured by the markedly intellectualist character of measure. It is a formal or structural property and therefore cognate with the nature of intelligence (59B–C, 65D), unlike matter which is opaque to mind. It is no accident that, having illustrated intrinsic beauty by objects produced by the “carpenter’s rule and square,” Socrates later eulogized carpentering for its cognitive exactness (55D–56E). This insistence on the clarity and knowability of beauty (shared by Aristotle in *Metaphysics* 1078b) is also reflected in the choice of sight and hearing, the senses most appropriate to rational cognition, as the sole avenues of the perception of beauty (cf. *Phaedrus* 250D).

The nondefinitist theory is, for the reasons to be cited in later philosophers, more plausible but considerably more complicated. This theory is that, given unity in variety in a thing, beauty is also necessarily present. It will still be true that whether a thing is beautiful can be decided by showing that it possesses internal unity if—but this proviso is crucial—we can be certain that the two properties do, in all instances, exist together. Hence we must be able to apprehend beauty in its own right. Yet to say that beauty is indefinable is to say that what it is cannot be identified conceptually and therefore in commonly understandable terms. The cognitive assurance and stability of definitist theory may be lost as a result. Plato was amply aware of the possibility of uncertainty and dis-

agreement among judgments of beauty (*Laws* Bk. II). The account of intrinsic beauty in the *Philebus* guards against these dangers. Things are beautiful intrinsically precisely because they are “always beautiful in their very nature” (51C–D). Though the objects cited by Socrates are empirical—“the surfaces and solids which a lathe, or a carpenter’s rule and square, produces from the straight and the round”—they nevertheless enjoy the self-identity, unaffected by adventitious or contextual factors, that is also characteristic of the Platonic Ideas. Unlike objects of relative beauty, they resemble the ideal beauty described in the *Symposium* (211–212), which cannot be “fair in one point of view and foul in another” (cf. *Republic* 479). Socrates held that they will necessarily arouse in the beholder a kind of pleasure that is peculiar to intrinsic beauty (51D). That the apprehension of such beauty will be veridical is further assured in the *Philebus* by the notion of “pure” pleasures, that is, those unmixed with pain. Pain warps or falsifies judgment (36C et seq.), but it is never present in the appreciation of intrinsic beauty. The related concepts of the *intrinsic* and the *pure* are used to guarantee the stability of the experience of beauty. They lead, however, to a severe delimitation of the class of beautiful objects. Paintings and living creatures are excluded as relative, tragedy and comedy (50A–B) because they are impure. Human significances are hostile to beauty because they encourage error and diversity in our responses to it.

In its analysis of the concrete phenomena of beauty, the *Philebus* is distinguished from the mythic and metaphysical approaches of the *Phaedrus* and *Symposium* and the social moralism of the *Republic* and *Laws*. Even here, however, the beautiful does not constitute a distinct and autonomous subject matter. It is treated as a “form” or mode of goodness in general, and the term *beautiful* is used, as it was by the Greeks generally, interchangeably with *excellent*, *perfect*, and *satisfying*. It is also worthy of note that the concept of art enters in hardly at all. Painting and literature are mentioned only so that they may be excluded. By contrast, Aristotle’s *Poetics* devotes itself to a single art form, tragedy, making only a casual reference to beauty—measure is a necessary condition (VII). Later treatments of beauty and art are even less congenial to our modern conception of aesthetics, which led the historian Bernard Bosanquet to speak of a centuries-long “intermission” in aesthetics between the Greco-Roman and the modern eras. The metaphysics of Plotinus, which derived from Plato, is spiritualist and Idealist; and here, as in later philosophy, the bias of such thought is to encourage regard for, and insight into, the experience of beauty. The soul is said to strive toward beauty, which is a mani-

festation of the spiritual force that animates all of reality. It is just because of the vitality and moving appeal of beauty that Plotinus rejected the identification of beauty with a merely formal property. The living face and the dead face are equally symmetrical, but only the former stirs us. Hence “beauty is that which irradiates symmetry rather than symmetry itself” (*Enneads* VI; VII, 22). Further, some simple, sensory objects lacking internal structure are beautiful, and, finally, symmetry is present in some ugly things as well (I; VI, 1). Plotinus’s critique of formalism effectively made the larger point that beauty cannot be identified with any single element of the object, form or any other. It is the total object, the whole of form and expressiveness and what the form is of, that possesses beauty. If, on the other hand, beauty is thought to be a global quality that “irradiates” this object and moves us, it is difficult or impossible, in a definition, to specify conceptually the nature of this quality. Moreover, Plotinus’s argument cast doubt on the possibility of finding even the conditions of beauty. A formal property such as symmetry is the most likely candidate, because it can be shared by objects that are otherwise highly diverse, artistic or natural, abstract or representational, sensory or mathematical. Yet if the negative instances cited by Plotinus show that this property is not even a universal concomitant of beauty, then a fortiori it cannot be the necessitating ground of beauty.

Still, the effort to enunciate a set of conditions for beauty is persistent in Western thought, because it answers to the desire for a criticism whose verdicts will be certifiable and authoritative. The high noon of such criticism was the neoclassical period, particularly the sixteenth and seventeenth centuries, when the conditions were detailed and formalized, and endowed with the institutional sanctions of the new “Academies.” A multiplicity of treatises were devoted to particular arts or genres, each of which was taken to be subject to “rules,” inherent in its specific nature and function, which can be rationally known (e.g., Castelvetro, Palladio). The treatises borrowed heavily from their Greek and Roman antecedents—Aristotle, Horace, Vitruvius. The “lawmakers of Parnassus” thereby invested their claims to speak on behalf of “reason” and “nature” with the authority of antiquity. Given that beauty is an objective property, attainable artistically and knowable critically, by reference to the rules, the question of the percipient’s response to it was scanted. As in the *Philebus*, beauty can be expected to arouse the appropriate response, which was referred to briefly and loosely as “pleasure,” or “delight.”

THE EIGHTEENTH CENTURY

The rebellion against the rules, in the name of the spectator's felt response—"the taste is not to conform to the art, but the art to the taste" (Addison)—intimates, in art criticism, the larger and more profound reconstruction of thought that took place in aesthetic theory. In the eighteenth century, indeed, aesthetics first established itself as an autonomous philosophical discipline. It defined a subject matter that is not explicable in terms of any of the other disciplines and is therefore taken out of the metaphysical and moral context of much traditional aesthetics, to be studied in its own right. The pioneer work is to be found in the prolific and assiduous writings of the British who, throughout the century, carried out the inquiry that Addison, at its beginning, justly described as "entirely new."

The century was a Copernican revolution, for instead of looking outward to the properties of beauty or the art object, it first examined the experience of the percipient, to determine the conditions under which beauty and art are appreciated. The decisive condition is disinterestedness, that is, perception directed upon an object without, as in practical or cognitive activity, any purpose ulterior to the act of perception itself. In aesthetic theory so conceived, beauty is no longer the central concept. It now stands for just one kind of aesthetic experience among others, and it can be defined and analyzed only by reference to the logically more basic concept of *aesthetic perception*.

The introspective examination of our "ideas," stimulated by John Locke's *Essay*, discloses experiences that differ significantly, in their felt quality, from that of beauty. This century distinguished a great many other "species" of aesthetic response, but the most important was that of sublimity. Sublimity is profoundly unlike beauty, for whereas the latter arouses "joy" and "cheerfulness," the feeling of the sublime is "amazement" and awe. Still, most of the British hold that the two can coexist and that the experience of both is pleasurable. The most drastic distinction was drawn by Edmund Burke (1757), who argued that beauty and sublimity are, conceptually, mutually exclusive and, existentially, antithetical. He at the same time limited the range of beauty severely and pushed back the boundaries of the aesthetic to include a radically different kind of experience, which cannot be accommodated in the traditional category. Indeed Burke clearly considered the experience of sublimity to be the more valuable of the two. Both Moses Mendelssohn and Immanuel Kant read Burke and were greatly affected by him, and through their influence Burke's critique of

beauty made a lasting impression on Continental thought.

Burke granted that a beautiful object arouses pleasure, but he argued that a sublime object, that is, one that is "terrible," even though it is apprehended disinterestedly, arouses "some degree of horror." Beauty "relaxes," but the experience of sublimity is of great emotional intensity. The two experiences are therefore incompatible with each other. Moreover, the properties that Burke attributed to sublime objects are just the opposites of those that the *Philebus* had enshrined in the classical conception of aesthetic value. Against clarity and lucidity, Burke urged that we are moved most greatly by what is "dark, uncertain, confused." In place of formal ordering, Burke eulogized what is "vast" and "infinite." The sublime therefore renders beauty "dead and unoperative." When beauty had been taken as the sole value category, ugliness, its contradictory, had necessarily been excluded from aesthetic value. Burke went so far as to suggest that even the ugly can be an object of aesthetic appreciation. In all this, he is pointing the way to the nineteenth-century and twentieth-century concept of *expression*, which, more catholic by far than classical beauty, admits a limitless diversity of subject matter, treatment, and form, if only the work of art be moving and powerful.

A comparable challenge to the classical values of order and serenity came from another direction. The historical study of art, pioneered by Johann Joachim Winckelmann (1764), disclosed that these values are found only in relatively limited epochs and styles, even, indeed, of Greek art itself. Later research emboldened the protest against the once unchallenged arbiters of classical and neoclassical criticism that they had identified selected stylistic properties of Greek and High Renaissance art with what is beautiful "naturally" and universally.

In the eighteenth century, also, the "logic" of beauty underwent a profound sea change. Francis Hutcheson (1725) announced a new locus for beauty: "Let it be observed, that in the following papers, the word *beauty* is taken for *the idea raised in us*." It follows that any object whatever that does in fact excite this idea must be judged to be beautiful. But this invites the possibility of diverse and conflicting judgments that, if subjective response is the sole and decisive test, must all be accepted as equally valid. Are there, however, any properties peculiar to beautiful objects, which can be pointed to, to legitimate certain judgments and whose absence will show others to be mistaken? Hutcheson thought that there was—the classical property of "uniformity in variety." Yet to be consistent with the definition of beauty with which he began, he

had to guarantee that things possessing this property would uniquely and universally arouse the appropriate idea. It can be said summarily that he failed to do so, and his failure is instructive. It points up the tension between the old and the new ways of thinking, between taking beauty to be an inherent, nonrelational property and using *beauty* to refer to the capacity of things to evoke a certain experience. A capacity is not, however, an observable property in things like uniformity. It must be interpreted as either a very different sort of property or else it is not a property at all. David Hume drew out the radical implications of Hutcheson's initial meaning for beauty with the acute remark that Euclid described all of the properties of a circle, but beauty is not among them ("The Sceptic").

In general, the later British aestheticians did not take *beautiful* to denote a property. Necessarily, therefore, the logical status of the properties that they attribute to beautiful objects—proportion, utility, and so on—is correspondingly altered. Such properties are no longer, as in the *Philebus*, either identical with, or the conditions of, a property of beauty. They are, rather, causes of the experience of beauty. Even so considered, however, the traditional formulas of beauty were brought under fire throughout the eighteenth century. Since the attribution of causes can be justified only by the evidence of their effects in experience, the British, arguing from the things that people do in fact find beautiful, showed that none of these properties are shared by all these things. There was also the more subtle and damning criticism that the traditional formula of "unity in variety" is simply devoid of meaning, because it applies indiscriminately to any object whatever. By the close of the century, Alison (1790) concluded that any attempt to find properties common and peculiar to beautiful objects is "altogether impossible." Finally it was suggested that "beautiful" is just "a general term of approbation" (Payne Knight, 1805).

The British thereby generated the problem that is central to Kant's *Critique of Judgment* (1790): How, if the aesthetic judgment arises from subjective feeling and predicates nothing of the object, can it claim to be more than an autobiographical report and can, indeed, claim to be universally binding?

THE NINETEENTH AND TWENTIETH CENTURIES

The most novel development in this period has been the attempt at a scientific approach to aesthetics. This has taken two forms, generally, and the status of beauty in each is worth noting. Psychological aesthetics applies

experimental methods to aesthetic experience in an effort to work out "laws" of appreciation. These are to be derived from the consensus of pleasure and displeasure reported by the laboratory subject in the face of various objects. When beauty is used at all in speaking of these objects, as it was by Gustav Theodor Fechner (1876), it is a loose, omnium-gatherum term. The objectivist-formalist connotations of the word have made it increasingly unsatisfactory to later psychologists. Either they have stipulated that it refers to certain psychological responses (e.g., O. Külpe, 1921), or they have abandoned it in favor of the more apt "liberal and comprehensive" (E. Bullough, 1907) concept of "aesthetic value." The last decades of the nineteenth century also saw the rise of *Kunstwissenschaft*, which may be rendered as "the sciences of art," for it comprises historical, anthropological, and other empirical studies of art as a cultural product. One of the impulses to the development of this field was a pervasive dissatisfaction with beauty, either because it is too limited, if interpreted on the classical model, and cannot therefore encompass, for example, primitive art, or too vague, if it is not. Art, by contrast, is a concrete, institutional phenomenon that is tractable to science. Thus *Kunstwissenschaft*, which is at present one of the most thriving and fruitful branches of aesthetics, defines itself by opposition to the concept of beauty.

The distinction between the meaning of beauty when it is synonymous with aesthetic value generally and when it stands for one class or kind of such value has been commonly remarked in recent aesthetics. In the former sense, it is often used to signalize the characteristic excellence of a work of art or an aesthetic object. Thus *beautiful* does not denote a property such as symmetry but also it is more than just a "term of approbation." It makes a claim on behalf of the object, which must be supported by appealing to the relevant value criteria. These criteria need not, however, be the same for two different artistic media or even for two works in the same medium. They are, perhaps indefinitely, plural; they are of different weight in different cases, and no one of them can be said to be a necessary condition for the use of *beautiful*. Their relevance is determined by the unique character of each work. In its second meaning, *beauty* generally connotes a relatively high degree of value, in contrast to, for example, the *pretty*, a fairly orthodox style or genre, pleasure unmingled with pain and the absence of bizarre or discordant elements. But this is just why so much of recent aesthetics and ordinary discourse finds the word awkward or even irrelevant for evaluation. It will do for Wolfgang Amadeus Mozart, but not the later Ludwig van Beethoven, for Raphael, but not Francisco de Goya. In the

Philebus, Socrates had, for his own purposes, narrowed the range of beauty severely, but it was just this narrowness that made it impossible for later thought to preserve *beauty* as the sole, or perhaps even the major, concept of aesthetic value.

BEAUVOIR, SIMONE DE (1908–1986)

Simone de Beauvoir, French existentialist feminist, was born in Paris in 1908 and died in 1986, after a prolific career as a philosopher, essayist, novelist, and political activist. Her writings were, by her own accounts, heavily influenced by the philosophy of Jean-Paul Sartre, her intellectual companion for half a century—a fact that led some critics to dismiss her as philosophically unoriginal. Even de Beauvoir, in a 1979 interview, said that she did not consider herself to be a philosopher. In her view, however, “a philosopher is someone like Spinoza, Hegel, or like Sartre, someone who builds a grand system” (quoted in Simons, 1986, p. 168), a definition that would exclude most contemporary professional philosophers. Furthermore, as several recent commentators have argued, de Beauvoir seems to have underestimated her

influence on philosophy in general and on Sartre in particular. While she incorporated Sartre's ideas, such as his existentialist conception of freedom, in her ethical and political writings, her critiques of Sartre's work in progress also helped shape his philosophy, which she then extended and transformed in significant ways.

In *The Ethics of Ambiguity* (1948), de Beauvoir attempted to develop an existentialist ethics out of the ontological categories in Sartre's *Being and Nothingness*. In Sartre's view, there is no God and therefore no God-given human nature. Nor is human nature determined by biological, psychological, economic, cultural, or other factors. People are "condemned to be free," and in the course of existing and making choices, they construct their own natures (which are continually revisable). Although human consciousness is being-for-itself (the being of free and transcendent subjects), it vainly tries to turn itself into being-in-itself (the being of objects, things trapped in their immanence). De Beauvoir called this doomed attempt to synthesize the for-itself and the in-itself the "ambiguity" of the human condition, and she argued that ethics is both possible and required because of this inability of human beings to "coincide with" themselves. She attempted to ground ethics in individual freedom, asserting, "To will oneself free is also to will others free" (1948, p. 73), but her defense of this claim appears to slip Kantian and Hegelian presuppositions about human nature into a philosophy that denies that there is such a thing as human nature.

In *The Ethics of Ambiguity*, de Beauvoir moved beyond Sartrean existentialism in acknowledging certain constraints on freedom, including political oppression and early socialization, that Sartre did not recognize until much later. In her memoirs (1962), de Beauvoir recalled conversations she had with Sartre in 1940 about his account of freedom as an active transcendence of one's situation. She maintained that not every situation offered the same scope for freedom: "What sort of transcendence could a woman shut up in a harem achieve?" Sartre had insisted that even such a limiting situation could be lived in a variety of ways, but de Beauvoir was not persuaded. To defend her view, though, she would "have had to abandon the plane of individual, and therefore idealistic, morality," from which Sartre and de Beauvoir developed their philosophies (1962, p. 346).

In *The Second Sex* (1953) de Beauvoir continued to move away from a purely metaphysical view of freedom in developing an account of how the oppression of women limits their freedom. In arguing, "One is not born, but rather becomes, a woman," de Beauvoir applied

the existentialist tenet that "existence precedes essence" to the situation of women, but she was also influenced by Marxist accounts of the material constraints on our freedom to create ourselves. In addition, she described how the socialization of girls and the cultural representations of women perpetuate the view of woman as other, thereby limiting women's potential for transcendence.

Critics of de Beauvoir's feminism have pointed out tensions between her existentialist premises and her account of the relation between embodiment and oppression. Although, according to existentialism, anatomy is not destiny (nor is anything else), de Beauvoir's discussion of female sexuality at times suggests that women's reproductive capacities are less conducive than men's to achieving transcendence. De Beauvoir has also been criticized for advocating in 1949 (1953) that women assume men's place in society, although in interviews in the 1970s and 1980s she urged a transformation of both men's and women's roles.

Even de Beauvoir's critics acknowledge her enormous impact on contemporary feminism. Her analysis of what has become known as the sex/gender distinction set the stage for all subsequent discussions. In drawing on philosophy, psychology, sociology, biology, history, and literature in *The Second Sex* and other essays, she anticipated the interdisciplinary field of women's studies. Her concern with autobiography, with self-revelation as "illuminating the lives of others" (1962, p. 8), prefigured the preoccupation of feminism with the personal as political. She also drew on a philosophical tradition as old as Socrates; her relentless scrutiny of herself and others exemplified, to an extent unmatched by any other twentieth-century philosopher, the maxim that "the unexamined life is not worth living."

In her fiction as well as in her essays and memoirs, de Beauvoir discussed numerous philosophical themes—for example, freedom, choice, responsibility, and the other—and she also explored the political issues and conflicts of the day, so much so that she has been described as "witness to a century." But she was more than a mere chronicler of events; she was a powerful social critic and an internationally known "public intellectual," whose influence will continue to be felt for a long time.

BECCARIA, CESARE BONESANA (1738–1794)

Cesare Bonesana Beccaria, the Italian criminologist and economist, was born in Milan of aristocratic parents. His formal education began at the Jesuit college in Parma and ended with his graduation from the University of Pavia in 1758. After graduation Beccaria came under the intellectual influence of two brothers, Pietro and Alessandro Verri, who had gathered around themselves the young Milanese intelligentsia to form a society known as the "academy of fists," committed to promoting reforms in political, economic, and administrative affairs.

Beccaria was prompted by Pietro Verri to read the then prominent philosophies of the Baron de Montesquieu, Claude-Adrian Helvétius, Denis Diderot, David Hume, and the Comte de Buffon. At the suggestion of his friends, Beccaria wrote and published his first treatise, *Del disordine e de' rimedi delle monete nello Stato di Milano nell'anno 1762* (Lucca, 1762). It was also through the encouragement of the Verri brothers that Beccaria composed his most important work, *Dei delitti e delle pene* (translated by H. Paolucci as *On Crimes and Punishments*, New York, 1963). Through Alessandro Verri, who was an official of the prison in Milan, Beccaria visited that institution and saw the conditions that furnished information and moral stimulus for his writing. Pietro, who had already begun writing a history of torture, in many conversations on the errors of criminal law and administration provided Beccaria with new arguments and insights for the treatise. In the end, the work was almost a collaboration by the three men, for Beccaria until that time had been relatively uninformed about crime and punishment. Begun in March 1763 and completed in January 1764, the book was published anonymously at Livorno out of fear of reprisals because of its devastating attack on the legal and judicial system then in operation. But anonymity was soon dropped when it became clear that the Milanese authorities were receptive and when the essay drew the attention and respect of the Parisian intelligentsia.

Beccaria held a chair in political economy in the Palatine School of Milan from 1768 to 1770, and his lec-

tures during this period were published posthumously in 1804 under the title *Elementi di economia pubblica*. His economic ideas on the division of labor and the determination of wages have been compared to those of Adam Smith (who wrote the *Wealth of Nations* seven years after publication of Beccaria's economic views). In economics Beccaria espoused a form of mercantilism based on some of the ideas of the physiocrats, expressed the belief that agriculture was the most productive enterprise, advocated commercial freedom within a nation and the abolition of guilds, and displayed a Malthusian concern with the relation of population growth to the means of subsistence. He also held a series of minor public offices through which he aided his friends in securing reforms in taxation, currency, and the corn trade.

On Crimes and Punishments was a protest against the use of torture to obtain confessions, secret accusations, the arbitrary discretionary power of judges, the inconsistency and inequality of sentencing, the influence of power and status in obtaining leniency, the lack of distinction in treatment of the accused and the convicted, and the use of capital punishment for serious and even minor offenses.

The concepts that Beccaria employed—rationalism, the social contract, utility, and hedonism—were current among the intellectuals of his time. The application of these ideas to crime and punishment, and the style of writing, were his own. Building upon Rousseau's social-contract philosophy, he argued that each person willingly sacrifices to the political community only so much of his liberty as "suffices to induce others to defend it." Laws are only the necessary conditions of this contract, and punishments under the law should have no other purpose than to defend the sum of these sacrificed shares of liberty "against private usurpations by individuals." Punishments for any other reason are unnecessary and unjust.

Beccaria declared that the law should be clear in defining crimes and that judges should not interpret the law but simply ascertain whether a person has or has not violated the law. He also held that punishment should be adjusted in severity to the seriousness of the crime. The primary purpose of punishment, Beccaria argued, is to ensure the existence of society, and the seriousness of the crime, therefore, varies according to the degree to which the transgressor's act endangers that existence. Treason and other acts against the state are most harmful, followed by injuries to the security of person and property and finally, by acts which are disruptive of public harmony and peace, such as rioting or inciting to disorder.

To ensure the continuance of society, punishment should aim at deterrence, that is, at preventing offenders from doing additional harm and others from committing crimes. To be effective as a deterrent to crime, punishment should be swift and certain; it is the certainty rather than the severity of punishment that deters. Life imprisonment is sufficient to deter: The death penalty is not necessary, nor is it legitimate, for individuals did not under the social contract relinquish the right to their lives. Corporal punishment is bad, and torture as part of a criminal investigation makes the suffering of pain rather than evidence the test of truth. Crimes against property should be punished by fines or, when fines cannot be paid, by imprisonment.

Beccaria's classic conclusion—the principles of which were adopted almost in their entirety by the revolutionary National Assembly of France in 1789 as Article VIII of the "Declaration of the Rights of Man and of the Citizen"—read in part as follows: "In order for punishment not to be, in every instance, an act of violence of one or of many against a private citizen, it must be essentially public, prompt, necessary, the least possible in the given circumstances, proportionate to the crimes, dictated by the laws."

Beccaria's essay became famous almost overnight. It was translated into French in 1766 by the Abbé Morellet, passed through six editions within eighteen months, one of which was embellished by a laudatory comment by Voltaire, and was thereafter translated into every important language. The Church of Rome placed the treatise on the Index in 1766, but the Austrian government, which controlled Milan, defended and honored Beccaria. Maria Theresa of Austria, Leopold II, grand duke of Tuscany, and Catherine the Great of Russia announced their intentions to be guided by Beccaria's principle in the reformation of their laws. The essay both paved the way for, and was the guiding force in, the major penal reforms that took place for two centuries afterward.

BECK, JAKOB SIGISMUND (1761–1840)

Jakob Sigismund Beck, the German Kantian philosopher, was born in Marienburg. He studied mathematics and philosophy in Königsberg with P. Krause and Immanuel Kant, completing his studies in 1783. In 1791 he became a teacher at the gymnasium in Halle and, in 1796, extraordinary professor of philosophy at Halle University. He was called to Rostock as professor of metaphysics in 1799 and remained there until his death.

Purporting to defend the "true" Kantian position against "dogmatic" misinterpretations, Beck called attention to problems concerning the role of the thing-in-itself in Kant's theory of perception. Beck rejected any positive role for the thing-in-itself and argued that the object affecting our senses must be phenomenal. Kant's theory of affection is to be understood not in the transcendent sense, as the working of an unknowable thing-in-itself on an unobservable "I"-in-itself, but only in the empirical sense: A phenomenal body in phenomenal space affects the "I" of inner sense.

But this "I" and this body, according to Beck, are themselves the products of an original activity of the understanding. The synthetic activity of "representing" (*vorstellen*) is presupposed by our viewing sense data as given by something objectively outside ourselves. Beck therefore objected to Kant's definition of sensibility as an immediate relation to an affecting object. The intuitions of sense say nothing about their own objectivity or source. Not until they are subjected to the categories of the understanding do they become objective, for only then can we invoke the notion of external objects and speak of intuitions as given to our senses by such objects.

The order of exposition of the *Critique of Pure Reason* is therefore misleading. One ought not to begin with sensibility, but with the synthetic unity or "original activity" (*ursprüngliche Beilegung*) of the understanding, the unique a priori act of combination (*Zusammensetzung*).

In philosophy of religion, Beck held that God is a symbol created by man, a symbol of man's ethical conscience. Piety consists simply in obedience to the commands of conscience.

In letters to Beck (1792) Kant complimented him for investigating "what is just the hardest thing in the *Critique*," approved Beck's reorganization of the Critical Philosophy, and said that he himself planned to write a work on metaphysics that would utilize the order of exposition that Beck had suggested. Kant's *Opus Postumum* shows the extent of Beck's influence, particularly in Kant's manuscript on the progress of metaphysics since Gottfried Wilhelm Leibniz and Christian Wolff.

Some of Kant's followers classed Beck with Johann Gottlieb Fichte and accused Beck of making the understanding the creator of objects. Beck did write: "Reality is itself the original act of representing, from which the concept of objects subsequently derives." But although he spoke of the original act as object-generating, he told Kant that he did not mean that the understanding *creates* objects. Beck granted the existence and importance of the given in knowledge while he attempted to bridge the dualism of sense and intellect and to insist that neither the given nor the notion of "things" could be taken as epistemologically primary.

BEHAVIORISM

Traditional notions of the mind have tended to treat mental states as "private" and "subjective," not accessible to the public and objective methods of science. With the failure of an "introspectionist" psychology in the early twentieth century, the only recourse seemed to be either to deny that mental states had any role to play in any serious science, or to try to find a way to understand talk of mental states that was entirely objective. The first option is called the "eliminativist" strategy, and *Radical behaviorism* was a monumental effort to realize it. The eliminativist strategy proposed to explain all human and animal behavior in terms of physically specified stimuli, responses, and reinforcements. It is to be distinguished from the second, "reductionist" strategy, which attempts not to *eliminate* mental phenomena, but rather to *save* mental phenomena by identifying them with some or other existing physical phenomena. *Analytical behaviorism* was the specific reductionist view that mental phenomena could be identified in one way or another with dispositions to overt behavior. Both Radical behaviorism and Analytical behaviorism dominated Anglo-American philosophy, and especially psychology, from roughly 1920 through 1970.

Although the two views are similarly motivated, they are independent. As will be seen in section one, Radical behaviorism is a specific scientific hypothesis, to be assessed according to the usual scientific criteria of how well it predicts and explains its intended range of phenomena. Analytical behaviorism is essentially a semantic, or philosophical hypothesis, to be assessed according to how well it captures the mental notions it purports to analyze (sec. 2). A person could subscribe to one and reject the other: Strict radical behaviorists might be skeptical of semantic proposals of analytical behaviorists; and many analytical behaviorists might reject the scientific proposals of Radical behaviorism.

There is also a third view, *methodological behaviorism*, according to which the only *evidence* for any mental phenomena must be behavioral. As a claim about evidence, this is actually independent of both the other views, although it often accompanied them. Indeed, one of the lasting positive contributions of the entire behaviorist movement was a much higher standard of evidence than had been observed previously, discouraging the kind of reliance on empathic intuitions that was characteristic, for example, of clinical psychotherapeutic claims. Unlike Radical behaviorism and Analytical behaviorism, methodological behaviorism survives in some quarters to this day, although some problems for methodological behaviorism are raised at the conclusion of section three.

RADICAL BEHAVIORISM

THE LAW OF EFFECT. Since this is a philosophical encyclopedia, the treatment of Radical behaviorism will perforce be brief (for a more thorough discussion in which references can be found to the experiments cited here see Gleitman et al. 2004, Gallistel 1990, and Rey 1997). However, the treatment of Radical behaviorism is not philosophically irrelevant since a substantial number of twentieth-century philosophical views often relied on it, most famously those of the American philosopher W. V. Quine.

Radical behaviorism emerged from the work of the Edward Thorndike (1874–1949), John Watson (1878–1958), and Ivan Pavlov (1849–1936), receiving its most energetic development in the work of B. F. Skinner (1904–1990) and attaining considerable precision in the work of Clark Hull (1884–1952). It has its source in traditional empiricist theories of the mind, according to which the mind at birth is a *tabula rasa*, or blank tablet on which experience forms sensory impressions. Ideas are derived from experience and are welded together to form complex ideas by a process of association, which closely tracks the presentation of those experiences in reality. Thus, certain sights, sounds, and tactile sensations become associated in experience to form the idea of a material object, and certain associations of "contiguity, succession and constant conjunction" form the idea of causation (Hume 1734).

This traditional suggestion, though regarded by radical behaviorists as right in spirit, suffered from a major defect—namely, a reliance upon peculiar private entities, ideas, and impressions, which did not seem to radical behaviorists to be proper objects of scientific inquiry. To remedy this situation, they proposed studying not associations among ideas but among physically characterizable

stimuli to sense organs and responses of the motor system. The specific law that linked stimuli and responses was Thorndike's Law of Effect, which for purposes of this entry may be stated thus:

The Law of Effect: *The probability of a response R following a stimulus S is increased/decreased if pairs (R,S) have been followed by positive/negative reinforcements, E, in certain patterns (e.g., intermittently) in the past.*

For example, should a particular movement like pressing a paw on a lever (=R) when a light is on (=S) be followed intermittently by the presentation to a hungry animal of a food pellet (=F), then the probability of the animal pressing its paw on the lever when the light is on in the future will be increased. Such are rewards. Negative reinforcements are either the absence of positive reinforcements, or actual punishments, which also reinforce, but in the opposite direction: the probability of the R given S is reduced if pairs of S and R have been followed by punishment in the past. Radical behaviorism is essentially the bold hypothesis that all intelligent human and animal behavior can be explained by the Law of Effect.

As Skinner frequently stressed, the Law of Effect is nearly the biological principle of natural selection, extended now beyond the persistence of traits that are genetically inherited to the persistence of acquired behaviors in individual animals. Just as from a random generation of genetic mutations certain ones are selected by virtue of meeting an environmental test of "survival of the fittest," so from an essentially random generation of responses in an animal certain ones are selected by virtue of being reinforced when they occur after certain stimuli. The responses that are selected in this way Skinner (1938) called "operants," since they involved ways that an animal "operated" on an environment that secured reinforcement. This process of "operant conditioning" was Skinner's distinctive contribution over "classical conditioning," where the response was *elicited* (e.g., salivation by hunger in Pavlov's dogs), rather than being spontaneously *emitted*.

How could such a simple law as the Law of Effect possibly stand a chance of explaining the full range of animal behavior? The central idea was an extension of the associationist strategy of building complex ideas from simpler ones, only now it was a matter of building not complex ideas, but complex responses. These could be built up out of simpler responses by "response chaining," whereby stimuli associated with a reward themselves become ("secondary") reinforcers, and so available for the conditioning of further responses. Thus, a pigeon

conditioned to peck a lever on hearing a bell could now be conditioned by the sound of the bell itself to produce further responses given further stimuli, say, doing a little dance on seeing a red light, which is then followed by the bell, which is then followed by food if the pigeon pecks again at the lever. Discrimination of complex stimuli would similarly be built from discrimination of simpler stimuli, through either a chain of discriminations of simpler stimuli, or by "stimulus generalization," whereby novel stimuli are treated as "of the same kind" as earlier ones.

The Law of Effect is likely true of some animal behavior. Skinner achieved remarkable successes using it to train animals to engage in all manner of curious behavior: for example, rats to run mazes, pigeons to play Ping-Pong, and pigs to push shopping carts around supermarkets. And the Law of Effect seems to play a role in explaining a variety of persistent behavioral patterns, such as gambling and drug addiction, as well as in extinguishing them, as in "behavior modification therapy." For the purposes of this entry, the issue is not whether such applications occur or are a good idea, but whether they offer a theoretically adequate paradigm for understanding the full range of intelligent animal behavior.

INADEQUACIES OF THE LAW OF EFFECT. Problems with the Law of Effect emerge in the first instance from the radical behaviorist experiments themselves. Contrary to popular belief, it is not only human behavior that resists radical behavioristic explanation; the theory does not even really work for the rats. The main problem is that the probability of a response can be increased in ways other than by the Law of Effect. There are at least four classes of phenomena that the law has trouble explaining: latent learning, passive learning, spontaneous alteration, and improvisation.

Latent learning occurs when an animal learns without reinforcement. Rats that were well sated with, for example, food and water were allowed to run around in a maze for ten days without any reward, sometimes being placed in the maze at arbitrarily different points. Subsequently, when they were hungry again they were introduced into the maze and were able to find the food much faster than rats not previously exposed. Similarly, Harry Harlow showed that monkeys presented with a complex hinge, requiring the undoing of several pins and bolts to free it, learned to undo it with no special reward other than "the fun of it." Further, indigo buntings learn something about the position of the stars while still in the nest, despite not using this information for navigation (and so,

a fortiori, not for any reward) until they are much older. In all of these cases the probability of the animal producing the appropriate response was greater than that of animals that had not been previously exposed to such stimuli, but without any history of reinforcement. In a related vein, passive learning occurs when an animal learns without antecedently producing the requisite response. Thus, rats can learn a maze merely by being pulled through it in a transparent trolley car, not executing anything like the responses that will take them through the maze when they are tested later.

Not only can rats learn without reinforcement or response, they can sometimes respond in ways that defy their conditioning history. In “spontaneous alteration,” an animal actually avoids emitting the response that has recently been reinforced. After having found food at a particular location, for example, hummingbirds will go somewhere else to find more food. Rats presented with a number of paths of equal length to a goal will vary their routes, although invariably in ways that advance their approach to the goal. The phenomenon is most dramatically displayed by rats in a “radial maze,” consisting of eight pathways radiating out in all directions from a central location, with baits placed at the end of each arm. The Law of Effect should predict that the rats should return to an arm in which they have found food. What they do instead, however, is to *avoid* an arm they have already visited until they had—at random—visited all the others. That is (as we might put it mentalistically), they seem not to be matching responses to stimuli, but “keeping track” of “where the baits are,” and, knowing they had consumed one, no longer “expected” it to be there. The Law of Effect seems not only inadequate to account for such cases; it actually seems to be disconfirmed by them.

Animals also produce appropriate behaviors that have not even previously been produced, much less reinforced. Thus, rats trained to take a circuitous route to a goal box will immediately take a shortcut if it is made available. Indeed, animals apparently refuse to be tied to specific physical responses: Rats will swim a flooded maze after being taught to run it, and—moving to the wild, outside the confines of a structured maze—desert ants will forage in a winding path up to one hundred meters from their nests, and then, once they find food, will take a beeline home.

Passing beyond issues of navigation, it has been noted with regard to latent learning that monkeys presented with a novel, complex hinge, figure out how to undo several pins and bolts to free it. Köhler demonstrated even more remarkable improvisation in chim-

panzees: They would use sticks as rakes to secure food that was outside a fence; they would then use these sticks as poles, which they would climb up in order to snatch food that was out of reach, grasping the food just as the stick toppled over. In all of these cases, the responses—that is, the sequence of muscular motions required to execute the acts—are by no means physically type-identical between prior and test trials. So the animals must have learned something other than merely to repeat certain physically typed responses.

Of course, these inadequacies with the Law of Effect become even more glaring in the human case. Picking up on an example of Skinner’s (1957, p. 38), Daniel Dennett (1975) provides an apt and amusing discussion of the difficulties besetting a radical behaviorist attempting to explain why someone mugged in New York hands over his wallet: Why doesn’t the person instead do any number of things that were more likely to have been previously reinforced with the stimulus “Your money or your life,” such as giggling, or yawning? Of course, it is not impossible that there is a story of prior threat stimuli and responses of the requisite sort. But the burden is squarely on the radical behaviorist to supply it.

Radical behaviorists, of course, did not take challenges to the inadequacies of the Law of Effect lying down. They often made ingenious replies to them involving elaborate emendations of the theory—for example, by Clark Hull (1943). But these emendations were then subject to further tests, showing animals to be more ingenious than the Law of Effect allowed. A consensus began to emerge that what animals learn is not any mere sequence of responses to stimuli, but rather to the development of what Edward Tolman called an “internal map” (1948). Such talk of “insight” and “maps” of course, begins to imperil any eliminativist ambitions of Radical behaviorism: such a map would be an inner representation, involving an internal mental state.

STRUCTURED RESPONSES AND LANGUAGE. An important problem in principle for Radical behaviorism was raised by Karl Lashley (1951): Serial responses like those involved in tying shoes or riding a bicycle seemed to be *structured* in a way that it did not seem possible to explain by local response-chaining alone. A domain of behavior that exhibits particularly striking structure is *language*. Skinner (1957) tried to sketch an account of linguistic behavior, but it was soon subject to a devastating review by the then young linguist Noam Chomsky (1964). Among other things, he pointed out:

- (i) along lines indicated by Lashley, language is *structured* in units that cannot be captured by response chaining. For example, a sentence of the form “Either ... or ...,” or “If ... then ...” can involve waiting indefinitely for novel items to be inserted in the blanks;
- (ii) language is *creative*: most of the sentences people encounter and produce are constantly *novel*—it is why people bother to converse, read, and write—all contrary to the Law of Effect’s commitment to a prior history with the stimuli and responses;
- (iii) language is *productive*: in grasping a grammar, even small children know how to produce a potential infinity of novel, structured sentences, as in “This is the house that Jack built,” “This is the rat that lived in the house ...,” “This is the cat that chased the rat ...,” without any history of conditioning each component in this way; indeed:
- (iv) the complex set of rules that constitute the grammar is acquired effortlessly by practically all human children by the age of three, without (and sometimes despite) any efforts at explicit instruction.

(For more detailed discussion see Chomsky 1972 and Pinker 1994).

Although Chomsky’s review was (to many minds) a definitive blow by itself, what really led to the end of Radical behaviorism was the spectacular positive research program that he and others (e.g., Fodor 1968, 1975) had begun to develop, what has come to be called the *cognitive revolution*, associated with computational-representational theories of mental processes.

Often recognizing the difficulty of avoiding mentalisms in the explanation of animal behavior, radical behaviorists sometimes allowed mentalisms to creep into their explanations, postulating “exploratory” and “curiosity” drives, or “drives to perceive” or “know.” Of course, if the theory was to remain true to its goal to avoid reference to subjective mental states that it regarded as unscientific, it would be obliged to define these postulations in terms of overt behavior. It was in this way that Radical behaviorism invited Analytical behaviorism, to which we now turn.

ANALYTICAL BEHAVIORISM

Analytical behaviorism was motivated by two related philosophical trends of the twentieth century that persist into the twenty-first century: the well-known *verifiability*

theory of meaning (or *verificationism*) and the less well-known doctrine that might be called *irreferentialism*. Because the latter serves as something of a background for the former, it will be considered first.

IRREFERENTIALISM. Irreferentialism is a novel suggestion that arose from Bertrand Russell’s (1905) famous theory of definite descriptions, according to which expressions like “the present king of France” should not be construed as *referring* to any (in this case) nonexistent entity, but as rather shorthand for some logically complex expression, only some of the most basic parts of which manage to refer. Perhaps the most obvious deployment of such a strategy is the in the case of a sentence such as “The average American family has 2.5 children,” which, of course, does not entail that there is some family somewhere in America that has a half of a child. A proper analysis of the grammar of the claim reveals that it is simply a way of expressing the ratio between American families and their children.

The view begins to be applied as a claim about mental expressions in the work of the later Wittgenstein (1953) and Gilbert Ryle (1949). They argued that philosophers too often think about the phenomena that people introspect in their “inner mental worlds” on the model of the objects in the familiar “outer” one. The temptation to this analogy arose, Wittgenstein and Ryle claimed, from an excessively referential conception of the functioning of the human mental vocabulary, treating words like “belief,” “thought,” and “sensation” as referring to “inner,” “private” objects, in the way that words like “cat” and “rock” refer to outer, public ones. It is not that, like “Zeus,” they do not *happen* to refer to anything; rather, like “the average American,” they do not even *purport* to refer to anything. The view is perhaps best known from Ryle’s attack on the idea of the “ghost in the machine”: A mind is not some sort of *thing* that *could* be a ghost, or any other *thing*. Not surprisingly, this irreferentialism was often associated with an antipathy one finds in Wittgenstein (1953) and Ryle (1949) toward a psychology that suggests a “promise of hidden discoveries yet to be made of the hidden causes of our actions and reactions” (Ryle 1949, p. 325).

Irreferentialism is an essentially negative thesis about the analysis of mental terms. Understandably, many people might want to hear something more positive: if the analysis of mental terms does not involve the postulation of mental entities, what does it involve? For Wittgenstein and his followers, in particular, this question (like, in their view, most philosophical questions) was the wrong one to

ask: it exhibited a somehow inappropriate “craving for generality” about the nature of thought and language. That may in the end be so, but many wanted to see a greater effort made toward some systematic account than he and his followers provided. The use of mental language does not seem entirely capricious and chaotic, and, if it is not, then it is not unreasonable at least to ask what the principles might be that guide its use.

VERIFICATIONISM. According to verificationism, the meaning of a claim consists in the method by which it could be tested (see Ayer 1952 for a classic statement). For example, claims about something’s being an acid might be defined in terms of its turning litmus paper red. Or claims about the existence of material objects might be analyzed as logical construction of claims about those sense experiences that people ordinarily take to confirm such claims (e.g., that people would have certain experiences of color, shape, and resistance to touch). Hypotheses such as those of the possibility of human lives being a dream, or other people having radically different mental lives were to be ruled out as “meaningless” if there really were in fact no evidence in principle that could make a difference to their truth or falsity.

There are myriad problems with verificationism: It is by no means obvious how to apply it to the claims of logic, mathematics, ethics, or aesthetics, or even to itself (what is the test for assessing where it is true?). Even in the supposed parade cases of natural science verificationism did not fare well: Scientists often do not know how to seriously test a hypothesis (as in contemporary string theory in physics) and often change their tests as their theories evolve (as new tests are devised for a disease). But the most serious problem is *confirmation holism*, or the fairly obvious observation that claims are not tested by experiment individually, but only as parts of whole theories (see Quine 1960). As will be seen, Analytical behaviorism offered a vivid case in point.

ANALYTICAL BEHAVIORIST PROPOSALS. Analytical behaviorism was largely motivated by verificationism and the observation that the vast majority of human mentalistic claims are tested by observing overt behavior (of course, this does not seem to be true in the case of first-person reports, which were always a problem for Analytical behaviorism, although these represented a small minority of claims). Moreover, it did seem that those ascriptions were by and large indifferent discoveries that might be made about the actual physical aetiology of mental life. If one were to open up the heads of familiar people and discover that they were empty or full of saw-

dust, one would not conclude that these familiar people did not have the mental states that seem to be constituted by the familiar behavior observed. Consequently, it seemed reasonable to suppose that mental claims should be understood as equivalent to various sorts of dispositional or conditional claims about how an agent would behave if she were in such and such circumstances. One particular model that impressed behaviorists was that of *dispositional* claims that arise elsewhere: “Salt is soluble” presumably means something like, “If salt is put into water in certain normal conditions, then it dissolves”; “Glass is fragile,” something like, “If struck in normal circumstances, it breaks.” Analogously, *wanting* something should be taken to mean something like “*trying to get it, if the occasion were to arise.*”

Successfully spelling out the appropriate dispositions in the case of mental terms turned out, however, to be none too easy. Ryle was never precise, but he offered a strategy, exemplified by the following characterization of belief:

To believe that the ice is dangerously thin is to be unhesitant in telling oneself and others that it is thin, in acquiescing in other people’s assertions to that effect, in objecting to statements to the contrary, in drawing consequences from the original proposition, and so forth. (Ryle 1949, 134–135)

ACTION VS. “COLORLESS MOVEMENT.” A formidable problem arises, however, as soon as one considers the “behavior” on which people normally rely, namely of distinguishing *actions* from *mere movement*: To take a famous example from Wittgenstein, it is the difference between raising one’s arm and one’s arm rising. The rising of an arm might occur as a result of, say, some machine moving the arm up and down; it is only the raising of an arm if it was the result of the person whose arm it is *intending* to raise it. Ryle may think that he is describing mere behavior in talking about someone being “unhesitant” and “acquiescing,” “objecting” to certain “assertions,” but a moment’s reflection reveals these as only slightly covert mentalisms: *hesitation*, *acquiescence*, and the possible involvement of any of an indefinite variety of bodily movements (or none); all that is crucial is that whatever the agent does or does not do is a result of a certain psychological attitude.

This point was often most seriously missed by the radical behaviorists who, as has been noted already, often resorted to mentalisms to deal with the apparent counterexamples to their Law of Effect. Thus, Skinner wrote:

The artist ... is reinforced by the effects his works have upon ... others ... [his] verbal behavior ... reach[ing] over centuries or to thousands of listeners or readers at the same time. The writer may not be reinforced often or immediately, but the reinforcement may be great. (Skinner 1957, pp. 206, 224)

But, as Chomsky (1964) noted, the term *reinforcement* here has degenerated to only a ritual function, being used as a cover term for “X wants Y,” “X likes Y,” “and X wishes that Y were the case.”

INSUPERABLE PROBLEMS. For every thought experiment arguing for Analytical behaviorism there are compelling ones against it as well. Consider not only people with sawdust heads, but people who turn out to be robots cleverly controlled by radio waves produced by some ingenious scientists at MIT: Such creatures would seem to have no more of a mental life than do marionettes. Or consider a race of “Super-Spartans” who, as matter of training and principle, refuse to flinch or complain in response to even the most excruciating pain and are inarticulate about an enormous range of their psychological repertoire (Putnam 1975). Surely it is possible that these Super-Spartans have by and large the full range of psychological states of the more expressive and articulate.

All of these objections become more evident when one considers an underlying technical difficulty noticed by Roderick Chisholm (1957): Every effort to define most mental states by behavior seems to require citation of other mental states. Typically, any particular mental state causes a particular behavior only in conjunction with (an often large number of) other mental states. Beliefs, hopes, and expectations issue in behavior only in conjunction with (at least) desires; desires issue in behavior only in conjunction (at least) with beliefs and expectations. To take a proposed example from Tolman, suppose a person tried to define a rat’s expectation that there is food at L in terms of the rat’s moving toward L: This only if the rat *wants* food; and the rat’s *wanting* food can be defined in terms of its moving toward L only if it *expects* there is food at L. Insofar as this is true, the prospects of a definition of a single informational or single directional state in terms of behavior seem dim. This problem is an instance of the aforementioned confirmation holism emphasized by Quine. Indeed, a philosophically influential (and disconcerting) way of understanding this and related difficulties with Analytical behaviorism is provided by Quine’s (1960, ch. 2) “thesis of the indeterminacy of translation,” according to which there is no fact of the

matter about the content of mental states, a thesis that has influenced later philosophers such as Donald Davidson, David Lewis, and Dennett.

METHODOLOGICAL BEHAVIORISM

In the twenty-first century few, if any, philosophers or psychologists would be prepared to defend either Radical behaviorism or Analytical behaviorism. However, there is a weaker view that survives, called “methodological behaviorism,” according to which the only permissible evidence for a psychological claim can be behavioral. It is not, like Radical behaviorism, an explanatory scientific hypothesis, but neither does it, like Analytical behaviorism, offer analyses of mental terms, although it is motivated by vaguely verificationist concerns like those that motivated Analytical behaviorism. Methodological behaviorism is perhaps best expressed by Wittgenstein’s famous dictum, “An inner process stands in need of outward criteria,” (1953, sec. 580) but without any of the analytical behaviorist commitment to defining an inner process in terms of some specific criteria. It has most recently been defended by Dennett (1993), who describes its motivation as not a “village” but an “urbane verificationism” that is merely trying to avoid “epiphenomenalism, zombies, conscious teddy bears, [and] self-conscious spiders” (1993, p. 461). Indeed he “unhesitatingly endorse[s] the claim that necessarily, if two organisms are behaviorally exactly alike, they are psychologically exactly alike” (1993, p. 922).

For all methodological behaviorism’s urbanity, however, it is hard to find a convincing argument for it. Why shouldn’t psychologists avail themselves of evidence that may go beyond ordinary overt behavior, as they indeed seem increasingly to do when they investigate the finer structure of the brain? Consider, for example, the nice case Dennett (1991, pp. 395–396) discusses of the familiar plight of the adult beer-drinker who wonders whether in coming to like it since childhood, it is his *experiences* or his *preferences* that have changed. It can seem obscure what further considerations should settle the matter, and it is not implausible to suppose that current behavioral discriminations or even introspection would not suffice. Dennett concludes that that there is in such a case “no fact of the matter” about “the way the beer tastes” to such a person.

But suppose it turns out that children have more taste buds than adults. One might have independent evidence that both children and adults have the same preferences for bitter titillation, but that consequently children reach a painful threshold sooner with the same quantity

of a bitter substance. It tastes differently because, arguably, more intense sensation is caused by their tongues and/or gustation subsystems. However, such cases would clearly transcend mere behavioral evidence.

So, in the end, even methodological behaviorism seems problematic given the increasingly rich conceptual and evidential resources of cognitive science, and especially of a computational/representational theory of thought. Behaviorism in all its forms seems a heroic theory that was ultimately defeated by the high standards of theory and experimentation that it encouraged. Eliminativist strategies survive in ambitions to replace mental talk by neurophysiological descriptions, and reductionist strategies abound, along either neurophysiological lines or computational ones. But the effort to replace mental talk with behavioral talk, or reduce it to it, can safely be said to have passed with the twentieth century, in which it first appeared.

Georges Rey (2005)

BEING

Philosophy proceeds in part by the asking of large, imprecise, and overgeneral questions. In the attempt to answer them, the questions themselves come to be reformulated with greater clarity, and one large question often comes to be replaced by several smaller ones. The history of pre-Socratic philosophy is the best example of this process, and Being first appeared on the philosophical scene as part of it. To the question “What is Being?” the Parmenidean answer that there is Being and nothing else besides Being appears to have the merit of truth, even if it is tautological truth. What is, is; and what is not, is not. But what Parmenides’ question in fact contains is a non-tautological demand for the characteristics of what is, to which the answer that Being is one, unchanging, and eternal is appropriate. Since the objects we perceive are many, changing, and transient, they do not belong to the realm of Being. Parmenides thus fathered in broad outline a doctrine of Being from which philosophers as diverse as Aristotle, Georg Wilhelm Friedrich Hegel, and John Dewey have tried to rescue us. This is the doctrine that Being is a name.

“BEING” AS A NAME

“Being” may be thought to name a property possessed by everything that is. Or it may be thought to name an object or a realm beyond, above, or behind the objects of the physical world; in this case, physical objects somehow exist by virtue of their relationship to “Being.” Or again, “Being” may be the name of the genus to which everything that is belongs in virtue of the possession of the property of Being or of standing in relation to Being. The doctrine that “Being” is a name implies some kind of dualism, according to which the realm of Being is contrasted with that of the merely phenomenal. Variations on this doctrine are general enough to be put to a number of different uses in the attempt to solve quite different problems. Nevertheless, the basic doctrine is founded on a false assumption, for it obscures the facts that the verb “to be” has a number of different uses and that in its central and commonest use it does not ascribe a property, a relation, or class membership in any way. “Being” is normally a participle, not a noun. To break with normal usage without special justification is to be gratuitously liable to confusion. We can investigate the type of confusion generated by the acceptance of “Being” as a name, and also the type of clarification that came to be needed, by considering what Plato and Aristotle make of Being.

PLATO AND ARISTOTLE

Plato was anxious to mark the distinction between properties and objects that possess properties. He located the former in the realm of Being and the latter in the realm of the transient. One reason for this distinction was that Plato accepted the identification of Being with the unchanging (in this case, the unchanging meanings of predicate, the Forms). As a consequence, he was forced to deny that physical objects “are”—they belong to a stage intermediate between Being and Not-Being, that of becoming. This is not the only paradox in Plato’s analysis of the subject: The Form of the Good, which exists at a higher level than that of the other Forms, cannot just “be,” either; it must exist “beyond being.”

Thus, we can see in Plato one of the characteristic results of treating Being as either a special kind of object or a special kind of attribute, namely, that all sorts of ordinary uses of the verb “to be” must be qualified or rewritten. The outcome of the attempt to make what is mystifying clear is to make what was clear mystifying. The author who first attacked this kind of mystification was, of course, Plato himself. In the *Sophist*, the problem of negative judgment is handled in such a way that it is no longer possible to make Parmenides’ mistake of supposing that when one speaks of what is not, one is speaking of what does not exist. Moreover, it is scarcely proper to speak casually of confusion and mistake at this stage in the development of philosophy. The first steps toward producing a logical grammar of the verb “to be” perhaps necessarily involved assimilating the different senses and uses of the words, and of consequently becoming caught up in paradox and learning how to free oneself. When Aristotle, in Book I of the *Metaphysics*, clarified earlier errors, he was able to do so only because he had learned from the efforts and missteps of Parmenides and Plato.

Aristotle made three crucial points about the study of Being as Being. The first is that the special sciences may make use of the concept of Being and of other similar fundamental concepts, but these concepts are not the objects of their inquiries—only philosophy has such fundamental concepts as the proper object of its studies. The second point is that to inquire about Being as Being is to attempt to isolate the unifying strand of meaning in the multifarious senses in which the word “is” is used. The third point is that this inquiry can be carried on only as an inquiry into a whole range of closely related fundamental concepts, in which the different species of cause and the notions of unity and plurality are foremost.

Aristotle recognized that we use “is” to deny as well as to affirm, and to ascribe properties as well as to ascribe

existence; and in various passages he makes use of these distinctions to clarify conceptual points. He recognized, as did the Scholastics, that in ascribing properties to a subject we sometimes imply the existence of that subject and we sometimes do not. But in his willingness to recognize the diversity of uses of “is,” Aristotle almost too easily accepted the view that we can speak of abstract entities as well as of physical objects without allowing the former “separate” existence. Aristotle said very little, in fact, about the common thread that binds together the various uses of “is.”

SCHOLASTIC PHILOSOPHERS

The non-Aristotelian medieval writers who insisted on a single meaning for “is” unintentionally provided a *reductio ad absurdum* proof of the correctness of the Aristotelian approach. Both nominalists and realists, at least in their extreme and consistent versions, asserted that properties and objects exist in the same way: properties for the nominalists were merely collections of objects, and objects for the realists were merely properties of properties. For the nominalist Eric of Auxerre, “Being” was simply the collective name of all the individuals that exist taken together and was logically equivalent to “this and this and this ...,” while for the realist Odo of Tournai, individuals were accidents of properties that are substances, and the realm of Being was a realm only of properties.

Abelard to some extent reasserted the Aristotelian distinctions (and suggested some new ones of his own), but it was Thomas Aquinas who returned to the pure Aristotelian tradition. Thomas refuted once again the view that Being can be either a genus or a property.

In his Commentary on Aristotle’s *Metaphysics*, Thomas diagnosed Parmenides’ mistake and applied his conceptual insights to related problems, notably in his refutation of Anselm’s Ontological Argument. But Thomas’s position necessarily has a complexity lacking in some other writers who have been equally careful, for although he could not accept Anselm’s view that to know what God is is to know that he is, he also could not reject the identification of God’s Being with his essence. According to Thomas, with all finite creatures it is the case that what they are—their essence—is one thing, and that they are—their existence—is another. But God simply is Being—*Esse Ipsum Subsistens*. Because this is so, Thomas was obliged to agree with Anselm that *if* God exists, he exists necessarily. But from this it does not follow that God does exist. That there is such a being, who *is* Being, is shown, according to Thomas, by a posteriori

proofs. And of course in Thomist terms it is improper to think of God as just *a* being, one entity among others. The difficulty here, however, is derived from difficulties that are implicit in the notion of the God of monotheism and not from difficulties in the notion of Being itself.

CENTRAL QUESTIONS

We are now in a position to discriminate different kinds of questions about Being raised by the Greeks and the Scholastics.

IS EXISTENCE A PREDICATE? How should we characterize the difference between ascribing existence to a subject and ascribing a property to a subject? Is “is” ever a predicate? If it is, what sort of predicate? Later writers who have discussed this problem include René Descartes, in his version of the Ontological Proof; Gottlob Frege, with his clarification of the nature of predicates; G. E. Moore, with his argument that “existence” is not a predicate because we cannot, for example, significantly replace “growl” with “exist” in all the quantified and negated forms of “Tame tigers growl”; and W. V. Quine, with his analysis of Being as “to be is to be the value of a variable.” This list of names points up the fact that these questions are susceptible of solution only within the philosophy of logic, and the solution depends upon an adequate characterization of names, predicates, variables, functions, and so on. It is also clear that it is of primary importance to discriminate the metaphysically noncommittal “is,” formalizable by means of the existential quantifier, from other uses of the verb “to be” that are far more committed in their implications. Noncommittal uses of the verb appear in ordinary language in such expressions as “There is a prime number between six and eight,” “There are three basic colors,” “There is a mountain more than 29,000 feet high.” Other uses of the verb “to be,” however, are far more committed. For example, in the statement “Rachel wept for her children because they were not,” “to be” is equivalent to “to be alive.” Clearly, however, if I say “There is such-and-such a prime number,” there is no such implication; hence, this sense of “there is” must be different.

One finds that all analyses of existential assertions that treat them as predicative are generally unsatisfactory. Briefly, the reason for this is that predicates refer to properties, and properties are what discriminate individuals from each other and enable us to pick out similarities and dissimilarities, and hence to classify. But Being cannot be a property in this sense, for it is not something that it is logically possible for two objects either to have or not to

have in common. Two objects cannot be said to resemble each other in virtue of their both being, and since existence is not a shared property, it cannot characterize a class of objects. For this reason, Being can be neither a property nor a genus.

Of course some philosophers—Gottfried Wilhelm Leibniz, for example—have talked as though Being were a property shared by actual objects but not possessed by *possibilia*. There is no objection to talking like this, provided that it is noticed that the word *property* is not now being used to refer to distinguishable characteristics of real things. Hence, the assertion by such philosophers that Being is a property is not compatible with the Thomas Aquinas–Moore view that it is not, given the two different senses in which the word is used.

ABSTRACT ENTITIES. How do we characterize the status of abstract entities, numbers, possibilities, fictions? These are all different problems, each of them complex. They are envisaged as part of the problem of Being, partly because of our ordinary use of “There is/are” in, for example, “There are two possibilities” or “There is a prime number between six and eight,” and partly because of a misunderstanding involved in describing certain possibilities by such terms as “real.” When we apply the adjective “real” both to possible states of affairs and to actual states, we suggest that there is a realm of reality wider than the merely existent. This is one source of the belief that there is a genus Being, of which the existent and the nonexistent (such as the possible) are species. Everything called real belongs to the realm of Being. The mistake lies in not seeing the difference between the way in which “real” functions as an adjective and the way in which “reality” functions as a noun. If I call a dollar bill real, I contrast “real” with “counterfeit.” If I call a painting “a real Vermeer,” I contrast it with a copy. But I do not ascribe to dollar bill and painting the common property of “being real,” in virtue of which they belong to the same realm, that of “reality.” To say that there is a kind of Being in which both what exists and what does not exist can share is obviously to commit the same mistake. But at this point we have returned to the question of whether Existence and Being can be properties, which belongs to our first group of questions.

THE CHARACTERIZATION OF BEING-AS-SUCH. Can we find any characteristic that belongs to everything that is and that may therefore be said to characterize Being-as-such, rather than individual objects? Here again, one must distinguish two kinds of questions. Aristotle pointed out that of any object whose existence I affirm, I

shall also be able to say that it is *one*, that it is *an* object. That is, by picking out something for the purpose of saying that it is, or that it is such and such, I pick it out as an individual. But just because this is so, individuality or unity is not something that it is logically possible for a given object to possess or not to possess any more than existence is; hence, they are not properties any more than existence is. The Aristotelian question of what concepts must be applicable to anything that exists must not, therefore, be identified with the question of whether there are any properties that belong to everything that exists.

There might, of course, have been some property that belonged to everything that existed just as a matter of contingent fact. The world might have been such that everything was green or cubic, or made of blancmange. But this would be philosophically uninteresting (quite apart from the fact that in most such worlds there would be no philosophers). It has been held, however, that it is necessary on, for example, metaphysically epistemological grounds that everything that is shall be of a certain character. Hence Plato’s view in his middle period that only Forms exist, and hence Leibniz’s view that there are only monads, and George Berkeley’s view that to be is always either to be percipient or to be perceived.

ABSOLUTE BEING. Is there a being who exists without the limitations of finite beings and who may therefore just be said to be? This is the question of God’s existence.

REALM OF BEING-AS-SUCH. Is there—beyond, over, and above the being of individual objects—a realm of Being-as-such? If so, what is its character? The belief that there is such a realm has always haunted metaphysics. The notion that Aristotle held such a belief has pervaded the history of metaphysics. This misinterpretation of Aristotle has similarly been foisted upon Thomas, and a neo-Thomist myth of the history of philosophy has been constructed in which the four questions that have already been distinguished, all of which are genuine questions, are merged into this fifth question, whose character is much more dubious. It then becomes possible to suggest that there is a single problem: “What is Being?” to which different philosophers have given rival answers. The kind of metaphysics to which reference is being made can be found in Jacques Maritain’s *Preface to Metaphysics*, where Maritain is ostensibly expounding Thomas. In order to treat Being as a subject matter, however, Maritain invokes what he calls the intuition of Being, a notion that cannot be found anywhere in Thomas. Thomas, as we have already seen, never treated “Being” as the name of an

independent subject matter and thus had no reason to suggest any means of becoming aware of the existence of such a subject matter.

The kind of history of metaphysics to which reference is being made can be found in D. A. Drennan's *A Modern Introduction to Metaphysics*, which asserts that to the question "What is Being?" Parmenides replied that it was One; Plato, that it was One and Many; Aristotle, that it was Substance; Descartes, that it was Substance in the modes of thought and extension; and so on. Nevertheless, an awareness of the nonexistence of the single question of Being rids us of the misleading idea that we have here a set of competing answers to a single question.

The temptation to see the history of metaphysics in this light seems often to be provoked by an espousal of the metaphysics that makes "Being" a name. We can illustrate this point by considering two sequences in the history of modern philosophy. Hegel argued that Being is the most fundamental of concepts because the most elementary forms of judgment must involve some assertion of existence, no matter how bare. But, he continued, the notion of Being by itself is the emptiest of all notions. Merely to say of something that it is, is to say nothing at all about it; hence, the notion of Being merges into that of its apparent opposite, Nothing. It is not necessary to follow through the Hegelian scheme of categories to see that Hegel is, in fact, extremely cautious at this point. His extreme antidualism always led him to assert that there is nothing else beyond what we confront in experience. The Hegelian Absolute is the rational culmination of historical experience, not a power beyond and outside it. Similarly, for Hegel, Being is a concept expressed in our judgments of experience at a certain level, not the name of a realm beyond all judgments about experience.

In Nicolai Hartmann's philosophy, however, we find a misreading of Hegel parallel to the neo-Scholastic misreading of Thomas and Aristotle. In *Grundzüge einer Metaphysik der Erkenntnis*, Hartmann begins by stating a set of antinomies between, for example, the nature of consciousness as consciousness of what is other than itself and the nature of consciousness as self-contained, so that whatever consciousness is aware of is part of consciousness. That is, Hartmann describes consciousness in two ways that appear incompatible and then inquires how he may reconcile these two descriptions. Instead of asking whether the incompatibility is perhaps only apparent, however, he suggests that the problem arises, and is soluble, because both the knowing, conscious subject and the known object exemplify modes of Being, although different modes. Clearly, it is true that both

knower and known *are*, but equally clearly—for reasons given earlier—this is not a property that is open to further study and that has strange characteristics that enable us to resolve antinomies. This, however, was Hartmann's conclusion, and he attributed it to Hegel. He merged Hegel's classification of different subject matters and his scheme of concepts in order to read him as a metaphysician who understood Being as having different grades and modes.

Just as Maritain misreads Thomas and Hartmann misreads Hegel, so Martin Heidegger has misread the pre-Socratics. Heidegger's own views have a mixed ancestry. Søren Kierkegaard, one of the important influences on him, in the *Concept of Dread* writes of dread as an experience whose object is Nothing. Usually in Kierkegaard this sort of statement appears to be a dramatically effective and logically innocent way of characterizing dread as objectless, but at times it seems as if Kierkegaard is no longer saying that dread has no object. Rather, he gives it a particular object whose name is "Nothing," thus making—but not as a joke—the mistake of the Red King in *Through the Looking-Glass*, who thought that if Nobody had passed the messenger on the road, Nobody should have arrived first. To treat "Nothing" as a name is like treating "Something" as a name and easily becomes a counterpart to treating "Being" as a name, as it does with Heidegger. Heidegger takes up Leibniz's question, "Why is there something rather than nothing?" He objects that this question does not take seriously the fact that Being and Nothing necessarily exist together as contrasted and opposed powers. Heidegger allows that he is using "Being" and "Nothing" as names and is therefore involved in treating "Nothing" as if it were the name of something. He even allows that this is "unscientific," but he concludes that this is so much the worse for science and so much the better for philosophy and poetry. Being and Nothing are not objects, and Being is indeed sharply contrasted with beings. Logic presupposes Being and Nothing, but they lie beyond the grasp of logic. Heidegger treats what others have written of the indeterminateness of the concepts as evidence of the elusiveness of Being and Nothing.

Heidegger extends his metaphysics into the history of philosophy by finding his views anticipated in the thought of Heraclitus and Parmenides. The evidence for this claim depends partly on a set of unreliable etymologies that Heidegger thinks he has found for key Greek words, but even when Heidegger is plausible in his interpretation at the linguistic level, he is at the least anachronistic in his view of the kind of problem the pre-Socratics

confronted. They progressively recognized as paradoxical, and therefore as needing reformulation, those very forms of utterance that to Heidegger are and remain fundamental.

If the philosophy of Being has bred not merely rival doctrines but rival views of the history of philosophy, it has also bred rival diagnoses of the errors involved in treating “Being” as a noun. A. J. Ayer has suggested that a misuse of the verb “to be” is the root of the error. This would imply, however, that standard forms of grammar embodied in ordinary usage are somehow philosophically normative—and this appears to get matters upside down. Linguistic distortion is certainly liable to breed confusion, but there is, in fact, nothing grammatically wrong with forming a verbal noun such as “Being” as an analogy with, for example, “riding.” “Riding” is used as the name of an activity; why, then, should “Being” not be made into a name? It is surely because of the logical and metaphysical confusion involved that we want to criticize the linguistic construction and not because the linguistic construction itself is an error.

John Dewey diagnosed a twofold root of errors about Being. They are partly a survival from religious modes of thought, the retention of belief in a realm free from change and decay and separate from the realm of sense perception. This is explained by the fact that although mythological thought has been discredited, the impulses behind it still need satisfaction. Also, belief in changeless Being is a consequence of man’s habit of abstracting truths from the contexts of practice and activity in which they were acquired (and where alone they have meaning) and treating them instead as belonging to a timeless realm in which they wait upon our apprehension. Dewey’s diagnosis, however, while it may explain how we come to hold and retain confused views of Being, does not embody an explanation of why the views are confused, except perhaps to those who are already convinced in general of the truth of Dewey’s pragmatism.

In order to clarify the issue, we must, in fact, make the sort of analysis of concepts that Aristotle used in the *Metaphysics*. We may expect any analysis of the concept of Being to vary with the general framework of concepts within which it is considered. Aristotelians, Hegelians, and Quineans will not all agree, but any analysis that fails to discriminate the different questions involved, and that fails to identify the confusion that results from merging them into a single question, will be doomed to conceptual error and very likely to a misreading of the history of philosophy as well.

BELIEF

Beliefs are a species of propositional attitude distinguished by their having the mind-to-world direction of fit.

Propositional attitudes are psychological states characterized by a psychological mode, Ψ , and a propositional content, P , schematically: $\Psi(P)$. My belief that the earth moves has *belief* as its psychological mode, and *that the earth moves* as its propositional content. A desire that the earth move has the same propositional content, but a different psychological mode, *desire*. Within a psychological mode, propositional attitudes are distinguished by their contents. I could not have two beliefs with the content that the earth moves. Many, though not all, propositional attitudes admit of a bivalent evaluation. Beliefs are true or false. Desires are satisfied or unsatisfied. Intentions are carried out or not carried out. Propositional attitudes with a bivalent evaluation have either the mind-to-world direction of fit or the world-to-mind direction of fit (Searle 1983, chapter 1). Its direction of fit expresses the basic function of a propositional attitude in our mental economy. Beliefs aim to represent how the world is independently. They aim at truth. The belief that Solomon was wise is true if and only if (iff) its content matches the world, that is, iff Solomon was wise. Belief's aim to repre-

sent how the world is independently is reflected in its being irrational to retain a belief when one sees that it does not match the world. Thus, beliefs have the mind-to-world direction of fit. A desire, in contrast, seeks not to match how the world is independently, but for the world to come to match its content. Desires seek satisfaction. The desire that a toothache go away is satisfied iff the world comes to match its content, that is, iff the toothache goes away. It is not irrational to retain desires known to be unsatisfied, for seeking satisfaction gives them their point. Desires thus have the world-to-mind direction of fit. Beliefs and desires, in virtue of their opposite directions of fit, have an interlocking role in the production and explanation of action.

BELIEF, SENSATION, EXPERIENCE, AND CONCEPT

Beliefs (and other propositional attitudes) must be distinguished from sensations, sensory images, and experience, on the one hand, and concepts, on the other. The classical British empiricists of the seventeenth and eighteenth centuries—John Locke (1632–1704), George Berkeley (1685–1753), and David Hume (1711–1776)—were unable to provide an adequate account of belief because they assimilated all of these to sensations or sensory images, like the taste of apple or a toothache. But sensations are not an adequate model for belief, or for other propositional attitudes. Sensations are not true or false, or satisfied or unsatisfied. They do not admit of a bivalent evaluation, as propositional attitudes do. They do not have propositional contents. Their differences are differences of qualitative feel. These differences are not variations in psychological function, as are the psychological modes of belief and desire. In particular, propositional contents are required to make sense of the logical relations that obtain between beliefs, and which are crucial to understanding the role of beliefs in reasoning and action. For example, understanding the validity of the inference from the belief that gold is a metal, and the belief that this ring is gold, to the belief that this ring is metal, requires seeing the logical connections between the propositional contents of the first two beliefs and the last, and their shared elements. Similarly, as explained below, the logical relations between the contents of belief and desire are crucial to understanding rational action (see the discussion of the practical syllogism below). Since sensations lack propositional contents, treating beliefs as a subclass of sensations obliterates distinctions needed to understand the role of beliefs in thought and action.

Perceptual experiences, unlike sensations, can be veridical or nonveridical. A hallucination of a rhinoceros on the sofa is a nonveridical perceptual experience. It represents what is not so. Perceptual experiences are like beliefs in admitting of bivalent evaluation and having the mind-to-world direction of fit. But though many beliefs are based on perceptual experience, they are a different coin. Perceptual experience is a fieldlike representational medium and makes use of the qualitative features of modes of consciousness associated with different sensory modalities (visual, auditory, tactile, etc.) to represent how things are around us. Beliefs, in contrast, do not in the same way make use of qualitative features of modes of consciousness to represent. Their mode of representation is purely propositional. Beliefs are to perceptual experiences as statements are to maps. Perceptual beliefs, those based directly on perceptual experience, in effect abstract from the richer representational content of perceptual experience.

Just as beliefs, sensations, and experiences must be distinguished from each other, they must also be distinguished from the shared elements, concepts, in different attitude contents. The concept of gold, for example, is shared between the belief that gold is a metal and the belief that this ring is gold. It is a constituent of both contents. Concepts are neither true nor false, though they apply or fail to apply to things. Sensations neither have such constituents nor are identical with them, for belief contents do not have sensations or images as constituents. Experiences involve concepts, much as beliefs do. A visual experience *as of* a baseball represents a spherical object as a baseball. The experience is distinct from the concept of a baseball, but represents something visually presented as falling under the concept. Without the concept, there could be no such visual experience.

Someone who believes that gold is a metal *possesses* the concept of gold and the concept of metal. Possessing a concept requires having beliefs expressing the simplest conceptual connections that the concept enters into. For example, someone who possesses the concept of a gun must believe that guns are weapons, that they are physical objects, that they can be aimed, and the like. Perhaps no precise set of beliefs is required, but if a person lacks a network of beliefs articulating the connections of a concept with other concepts, he does not possess the concept. This shows that we can make sense of attributing a belief to someone only by locating it in a pattern of beliefs, and that the other propositional attitudes and perceptual experience presuppose belief.

BELIEFS AND THE EXPLANATION OF ACTIONS

Beliefs, because they aim at truth, play a central role in theoretical reasoning (reasoning about what is so), and hence in practical reasoning (reasoning about what to do).

Theoretical reasoning is central to practical reasoning because we get what we want by doing something that promotes it. We therefore need to know what we can do, and how what we can do is related to what we want. When seeking knowledge of these things, we seek true beliefs about them. Thus, what we do is conditioned by what we believe, whether our aim at truth hits the mark or not. Accordingly, when one explains an action, it is not enough to cite a desire that the action satisfies. One must also cite a belief that the action increased the likelihood of satisfying the desire. If I want my rival to come to grief and an idle comment of mine leads to his downfall, my desire that he come to grief does not help explain my bringing about his downfall if I did not think that my idle comment would have that as a consequence.

An action explanation provides the materials for a practical syllogism that justifies the action from the point of view of the agent. Suppose that I lifted my finger because I wanted to signal you and believed that my lifting my finger, *F*, would constitute signaling you. One can construct the following argument in favor of this action, drawing the evaluative premise from the desire and the factual premise from the belief:

My signaling you is desirable (has a desirable aspect).
F, being lifting of my finger, is a signaling of you.

F is desirable (has a desirable aspect).

This does not show that the action is desirable all things considered, but only that it has a desirable aspect. Actions have many consequences and properties, some of which one may want and others of which one may not. In deciding all things considered what to do, the agent must rank his desires and take into account his degrees of confidence in desired outcomes attending certain actions, or, in a common phrase, his degrees of belief in outcomes, given the actions. Candidate actions are evaluated on the basis of the value of their results and one's degree of confidence in their having those results. If the chance is low but the value great, the undertaking may still be judged best overall. The notion of degree of belief in a proposition is often treated as a generalization of the ordinary notion of belief. Typically, on buying a ticket, one does not believe that one will win the lottery, though one does

have a nonzero degree of belief that one will. However, it may be that degrees of belief in a proposition can be assimilated to beliefs about its probability.

BEHAVIORIST THEORIES OF BELIEF

Logical behaviorism, a form of materialism, holds that ascribing beliefs and desires and other mental states to an agent is just a compendious way of describing a complex pattern of his actual and potential behavior. On this view, there are no inner mental states or events—no “ghost in the machine,” in Gilbert Ryle’s memorable phrase. If logical behaviorism is true, action explanation is not causal explanation, but rather functions by locating some particular behavior in a broader pattern of behavior. Logical behaviorism was championed by the logical positivists of the 1930s (see Ayer), and in more subtle forms by Ryle and Ludwig Wittgenstein in the 1940s and 1950s. A central motivation for the logical positivists was their verificationist criterion of meaning, according to which the meaning of a statement should be sought in the conditions that verify or falsify it.

Logical behaviorism fell from fashion after the Second World War (Block). One reason was disenchantment with the verificationist criterion of meaning. A second was the failure to provide necessary or sufficient conditions for attributing psychological states in purely behavioral terms. This failure is connected with the interlocking roles of belief and desire in explaining behavior, and carries an important lesson about the relation of belief (and other propositional attitudes) to behavior.

Let us try to say what behavior is characteristic of the belief that there is an apple pie in the pantry. It is clear that what behavior we expect will depend on what the agent wants and what else she believes. If she is not hungry, we expect no tendency to investigate the pantry. If she likes apple pie but wants to save it for the guests more than to indulge herself, we expect a delayed advance on the pantry. If she believes it is poisoned, we expect her to dispose of it. And so on. The important point is that the behavior we expect from someone who has a particular attitude is conditioned by the other psychological states that we think he has. This makes it impossible to state, in purely behavioral terms, what it is to believe, for example, that there is a pie in the pantry.

Once one understands the role of desire, in particular, in action, one can see that it will play the spoiler for any behaviorist program. For desires can be about behavior usually taken to be a sign of a given sort of psychological state. In particular, one may want to exhibit

misleading behavior. One can pretend to believe or want things one does not, and one can suppress behavior that expresses what one wants. It seems plausible, as Hilary Putnam argued in “Brains and Behavior,” that the limited deceptions with which we are familiar could take forms that would preclude any behavioral expression of some of an agent’s psychological states throughout his life.

BELIEFS AS CAUSES OF BEHAVIOR

The moral is that beliefs issue in behavior only in conjunction with appropriate other propositional attitudes. Desires motivate behavior, but beliefs guide it. Each is impotent without the other. To vary a phrase of Kant’s, desire without belief is blind; belief without desire is empty. We cannot read back from behavior to the motivating belief and desire, because any given behavior may issue from different sets of beliefs and desires. Behavior is related to belief and desire as symptoms to a disease. The symptoms may be expressed in the absence of the disease, and the disease may be present without being expressed by any symptoms, or by the usual symptoms. The reason is that the disease is a cause of the symptoms. Its giving rise to the usual symptoms depends on the usual background conditions being present. This analogy suggests that, as with disease and background conditions, beliefs and desires are interlocking causes of behavior. This would explain the failure of the behaviorist programs, since, as Putnam put it, “*causes* are not logical constructions out of their *effects*” (p. 27).

This conclusion is bolstered by an argument by Donald Davidson in his seminal paper “Actions, Reasons, and Causes.” We sometimes have multiple reasons (belief and desire pairs that potentially explain an action) for doing something, but we act on only one of them. I may believe that if I do not obey the speed limit when driving, I will likely receive a ticket, and I may wish to avoid receiving a ticket. I may believe also that obeying the speed limit is the right thing to do, and wish to do the right thing. I may obey the speed limit for the first reason rather than the second, or for the second rather than the first. In either case, each reason would justify what I do, but only one would explain it. We can make sense of this being so if we hold that the reasons for which I act are those that cause my action.

VOLUNTARISM ABOUT BELIEF

Beliefs play a role in guiding and explaining action, but can they be the products of actions? Can one come to believe something by choosing or deciding to believe it? According to voluntarism about belief, the answer is yes.

René Descartes (1596–1650), “the father of modern philosophy,” apparently endorsed belief voluntarism. In his explanation in the *Meditations* (pp. 37–43) of how we fall into error despite God’s supreme benevolence, he assumed that when one lacks adequate evidence one can choose to believe something and hence fall into error through the exercise of free will, and thereby absolve God of responsibility for the error. With his famous wager in *Pensées* (pp. 151–153), Blaise Pascal (1623–1662) argued that the infinite utility that attaches to believing truly that God exists means that no matter how small the probability, one is rationally compelled to believe. This argument likewise seems to assume belief voluntarism. In “The Will to Believe,” William James (1842–1910), like Pascal, argued that it is not only possible but sometimes rationally required that we make decisions about belief when evidence underdetermines choice.

One may, of course, bring oneself to believe something indirectly. I may pay another to brainwash me. I may adopt the outer forms of religious faith in the hope that inner conviction will follow. But the issue is not whether I can bring myself to believe something by doing something else that brings it about, but whether I can do this without doing anything else to bring it about.

This seems not to be something that is typically within our power. I cannot just decide now to believe that I do not have hands or a head, or that I am flying, or fabulously wealthy. Religious belief, which is less engaged with the practical, is a more difficult case and has historically been the focus of the debate about belief voluntarism. One can try to inculcate religious belief indirectly, but can one simply decide to believe that God exists, while also believing one lacks adequate evidence? One might answer yes because it can be reasonable to continue to believe that God exists in the face of doubts. But this falls short of what is required. For this is not deciding to believe, but rather deciding not to give up a belief one already has.

Still, we are sometimes faced with an unavoidable practical choice where evidence bearing on a crucial fact leaves the fact, and hence the choice, undetermined. Must we not then make a choice about what to believe despite not having reasons to believe one way or the other? No. We must make the practical choice about what to do. But this does not imply belief. When some action is better than none, we take a chance and hope for the best, without belief.

Is the situation arguably different when a belief itself has a practical value? It is dubious that a belief itself having a practical value makes it easier to conceive of choos-

ing to believe. If someone were to offer me a million dollars to believe that there is life on the Sun, I might wish to do so, but I would be baffled about how to comply.

The purpose of belief is to represent the world accurately. Therefore, belief serves its role only if the formation, retention, and revision of belief are sensitive to what one takes to be one’s evidence. This does not mean that we always believe in proportion to our evidence. We make mistakes of assessment and reasoning; we are lazy; we fail to attend to evidence we have. Nor does it mean that what we take to be evidence is evidence, or that all our opinions were entrenched with the spade of reason. Further, it does not mean that belief is never influenced by desire. Otherwise, wishful thinking—believing what one wants to be true—would not be possible. Rather, it means that belief, by its nature, aims at truth, that its function is undermined if one lets belief formation be sensitive to anything other than what one takes to be evidence. Where there is uncertainty, one may be conservative and persist in a belief. But not to give up a belief in the face of strong contrary evidence is irrational. Worse still is to believe where no evidence bears, as in the case of wishful thinking. Even when belief has a practical benefit—as when believing one will win a race increases one’s chances, but not enough to warrant the belief—rationality is at best at war with itself. Belief voluntarism thus seems to be something that can occur, at best, only on the fringes of rationality—in the shadow regions of self-deception.

BELIEF ATTRIBUTIONS

"Belief attributions" are uses of sentences of the form *N* believes that *s* (where *N* is a noun phrase, *s* a sentence). Their semantic and logical properties have been debated under the assumption that an account of "believes" will carry over to other propositional attitudes such as desire, knowledge, and fear. Most of the debate focuses on two issues: Does "believe" pick out a relation, and how do so-called *de re* and *de dicto* attributions differ?

IS "BELIEVES" RELATIONAL?

The obvious hypothesis is that in

- (1) Maggie believes that Twain lives.

"believes" has the semantic status of a transitive verb, picking out a relation between a believer and something (a proposition) provided by the verb's complement,

- (2) that Twain lives.

Grammatical evidence suggests this: "believes" can be followed by names and demonstratives ("I believe Church's thesis," "she believes that") as well as expressions that behave like (nominal) variables ("whenever the pope says something I believe it").

Gottlob Frege and Bertrand Russell, whose work inspires most subsequent debate about belief attribution, agreed on the obvious hypothesis. Frege held that expressions embedded within "believes that" shift their reference to a way of thinking, or sense, of what they refer to unembedded. Russell held that no such semantic shift occurs; the proposition "that *s*" is determined by what *s*'s parts pick out when used unembedded.

Since "Twain" and "Clemens" refer to the same author, the Russellian approach seems committed to the identity of

the propositions, that Twain lives and that Clemens does, and thus to (1)'s implying

- (3) Maggie believes that Clemens lives.

Russell would avoid this by saying that "Twain" and "Clemens" typically function as truncated definite descriptions. This last suggestion is widely thought to have been discredited by Saul Kripke.

One problem Fregean views face is that sense is idiosyncratic: Different people associate with a name different ways of thinking of the referent. It is implausible that when I utter (1) I speak truly only if Maggie thinks of Twain as do I. But if (2) in (1) named Maggie's sense for "Twain lives," the argument "Maggie believes that Twain lives; Seth believes what Maggie does; so Seth believes that Twain lives" would be invalid.

Contemporary Russellians such as Nathan Salmon and Scott Soames hold that to believe a proposition involves grasping or representing it and its constituents; thus, belief is a three-place relation among a believer, a Russellian content, and a representation. Salmon and Soames nonetheless hold that (1) tells us only that Maggie believes ("under some representation") the Russellian proposition that Twain lives; the appearance that (1) and (3) may disagree in truth value results from mistaking a conversational or pragmatic implicature, about the representation under which a belief is held, for part of what a belief attribution, strictly speaking, says.

John Perry and Mark Crimmins have suggested that a belief attribution involves implicit reference to the Russellian's representations or modes of grasping: the complement of "believes" determines a Russellian proposition, but the verb has an "implicit argument place" for representations. A use of (1) makes a claim along the lines of "Maggie believes the Russellian proposition that Twain lives under representation *r*," with the representation referred to differing across occasions of use. A problem with this view is that it renders the argument mentioned two paragraphs above invalid.

Some think belief attributions implicitly quotational. The simplest version of such a view sees *that s* as a quotation name of *s*, "believes" naming a relation to sentence types. To this it may be objected that different uses of "Seth thinks I am sad" may have different truth values. Another view sees a "that" clause as picking out a fusion of linguistic items with their interpretations—for example, the result of combining a sentence with the semantic values of its expressions.

Mark Richard's version of this view has *that s* pick out a fusion of the sentence *s* and its Russellian content.

In belief attribution, such fusions are offered as “translations” of the believer’s thoughts, where a thought is the result of combining a representation that realizes a belief with its Russellian content: (1) is true if the “that” clause provides a translation of a thought of Maggie’s. Standards of translation shift from context to context: “Twain” may represent a representation of Maggie’s in some but not all contexts. Thus, on this view, the truth of (1) does not demand that of (3).

Donald Davidson denies that (2) is a semantically significant part of (1). “Believes” is a predicate whose second argument is the demonstrative “that”; its referent is the ensuing utterance of “Twain lives.” The overall force of (1) is roughly some belief state of Maggie’s agrees in content with that utterance. (Davidson made such a proposal for “says” but clearly intended to generalize.) Yet more radical views deny that “believes” is a predicate. Arthur N. Prior took “believes” to combine with a name and sentence to form a more complex sentence; W. V. O. Quine has entertained the idea that “believes that Twain lives” is a predicate without semantically significant structure. A problem for Quine is to explain how infinitely many (semantically unstructured) belief predicates acquire their meanings; Prior thought little useful could be said on such issues.

DE RE AND DE DICTO

There seem to be two ways of interpreting such sentences as

- (4) Sam believes that Melinda’s husband is unmarried. Sam believes that some Frenchman is not French.

One interpretation attributes to Sam necessarily false beliefs; the other, suggested by

- (4′) Of Melinda’s husband, Sam believes he is unmarried.

Of some Frenchman, Sam believes he is not French, does not. Note that (4′) ascribes to Sam beliefs in some sense about particular individuals, while this is not true of the interpretation of (4).

The interpretations seem to correspond to different scopes that may be assigned to the quantifier phrases “Melinda’s husband” and “some Frenchman.” In a *de re* attribution, an expression functioning as a variable within the scope of “believes” is bound by a quantifier outside its scope (and the scopes of other verbs of propositional attitudes). Interpreting the sentences in (4) as in (4′) is *de re* attribution: “he” and “she” are bound to

“Melinda’s husband” and “some women,” which are not in the scope of “believes.” An attribution that is not *de re* is *de dicto*. If we accept a relational account of “believes,” we will say that a *de dicto* interpretation of “*N* believes that *s*” attributes to *N* a belief in the proposition expressed by *s*. (An attribution might also count as *de re* if it has a term anaphoric on a name outside of the attribution, as in the natural understanding of

- (5) Twain was an author, but Seth believes that he was president.)

Not everyone would characterize the *de re–de dicto* distinction as above. Quine held that it is impossible for a quantifier to bind a variable that occurs opaquely—that is, inside a construction, like “believes,” which causes failures to substitutivity. If Quine were correct, some other account of the two understandings of (4) is needed. (Quine himself suggested that “believes” is ambiguous.) Quine’s view is not widely shared. (See Kaplan, 1986, for discussion.)

The relations between *de re* and *de dicto* attributions are of interest in good part because *de re* attributions are anomalous on some views. A *de re* attribution identifies a belief in terms of the objects it is about, not in terms of how those objects are conceptualized. For a Russellian this is the norm: All there is to belief attribution is identifying the state of affairs believed to obtain. For a Fregean, (4′) is at best an aberration, lacking information about sense, which belief attribution is supposed to convey. *De re* belief attributions provide a focus for the debates among Russellians, Fregeans, and others.

BELINSKII, VISSARION GRIGOR'EVICH (1811–1848)

Vissarion Grigor'evich Belinskii (Belinsky), the Russian literary critic, was an early leader of the Russian intelligentsia and a major representative of German Absolute Idealism, as well as of the subsequent reaction against it, in nineteenth-century Russian philosophy.

Belinskii was born in Sveaborg, Russia (now Finland), the son of a provincial physician. He entered the University of Moscow in 1829 but was expelled after three years, perhaps for the radical criticism of serfdom in a romantic drama he wrote; his subsequent education was self-acquired. He began a journalistic career in 1833 and soon became the chief critic for a succession of literary journals in Moscow and (after 1839) in St. Petersburg, principally *Otechestvennyye Zapiski* (Annals of the Fatherland). His brilliant, philosophically oriented critical essays, including perceptive early appreciations of Nikolay Gogol, Mikhail Lermontov, and Feodor Dostoevsky, won him great renown but little material reward; he died in St. Petersburg after a short life filled with poverty and illness.

Belinskii's intellectual development typifies that of the early Russian "Westernizers," or admirers of Western progressive ideas and institutions, whose leader he became: He passed from the romantic extremes of German Absolute Idealism through G. W. F. Hegel to a mature position representing the influence of the French socialists and Ludwig Feuerbach. In Belinskii's case, the doctrinal changes were magnified and accelerated by a

mercurial personality, while their expression was often clouded by the pressures of journalistic writing under tsarist censorship. Belinskii published no systematic theoretical works, and his voluminous critical essays and private correspondence leave room for divergent interpretations of his views.

Belinskii's earliest writings (1831–1836) show the clear influence of Friedrich Schiller and Friedrich von Schelling. Basing his views on Schelling's nature philosophy and philosophy of art, Belinskii glorified art and the creative process, and emphasized man's inner aesthetic and moral experience in rising above empirical reality to the "eternal Idea."

In 1837, after a brief enthusiasm for Johann Gottlieb Fichte, Belinskii was introduced by his friend and mentor, Mikhail Bakunin, to the thought of Hegel. Belinskii found in the Hegelian formula "all that is real is rational" a summons to a "reconciliation with reality" that turned his attention from man's subjective world to the objective reality around him and led him to praise Russian autocracy, to view the state as sacred, and to regard society as metaphysically and ethically superior to the individual. He expressed a Hegelian conception of art as "thinking in images" and as reproducing rational reality.

Belinskii's Hegelianism, however, did not extinguish the regard for human individuality that in some degree had always marked his thinking and had been manifested most explicitly during his brief Fichtean period. By 1841 he repudiated Hegel's subordination of the individual and thenceforth turned from Absolute Idealism to an ethical personalism that emphasized the supreme value of the individual personality. At the same time, he abandoned the attempt to show the rationality of the tsarist order: He became acquainted with the writings of Comte de Saint-Simon and other French socialists, and called increasingly for radical social reforms in the direction of democracy and socialism. His mature view of art stressed art's moral and political functions in expressing socially progressive ideas, for which reason he is generally regarded as the founder of the dominant tradition of social or "civic" criticism in Russia.

Belinskii's socialism remained individualistic in inspiration, and there is evidence that toward the end of his life he moved to a more moderate liberal position, advocating the development of a middle class in Russia. His reformist enthusiasm and generally enlightened outlook were well expressed in a famous "Letter to Gogol" (1847), which set a moral tone for the Russian intelligentsia for generations. The "Letter" illustrates the anticlericalism and positivist leanings of Belinskii's final

period, if not the outright atheism and materialism attributed to him by Soviet interpreters.

BELL, JOHN, AND BELL'S THEOREM

John Stewart Bell (1928–1990), a truly deep and serious thinker, was one of the leading physicists of the twentieth century. He became famous for his discovery that quantum mechanics implies that nature is nonlocal, that is, that there are physical influences between events that propagate faster than light.

From 1960 until his death Bell worked at the Conseil Européen pour la Recherche Nucléaire (CERN; European Laboratory for Particle Physics) in Geneva, Switzerland, on the physics of particle accelerators, making a number of important contributions to high-energy physics and quantum field theory. Noteworthy was his discovery in 1969, together with Roman W. Jackiw, of the so-called “Bell-Jackiw-Adler” anomaly (discovered independently by Stephen Adler), a mechanism explaining physical effects such as neutral pion decay (which are unexplainable on the basis of the symmetries of the classical field Lagrangian), in terms of an “anomalous” term arising from the renormalization of quantum field theory. Since

then this mechanism has become an important cornerstone of quantum field theory. Another important contribution was the argument he gave in 1967 for why weak interactions should be described using a gauge theory.

John Bell was one of the leading experts—perhaps *the* leading expert—on the foundations of quantum mechanics. The book collecting his articles on this subject, *Speakable and Unsayable in Quantum Mechanics* (1987), is unsurpassed for clarity and depth and it is still the best reference for whoever wishes to learn about the field.

Bell strongly opposed the “Copenhagen interpretation” of quantum physics, according to which macroscopic objects, such as chairs and planets, do exist out there, but electrons and other microscopic particles do not. According to the Copenhagen view, the world is divided into two realms, macro and micro, “classical” and “quantum,” logical and contradictory—or, as Bell put it in one of his essays, into “sayable” and “unsayable.” Along with Albert Einstein, Erwin Schrödinger, Louis de Broglie, and David Bohm, Bell was one of the few physicists compelled by his conscience to reject the Copenhagen interpretation.

Bell emphasized that the empirical facts of quantum physics do not at all force us to renounce realism. There is, in fact, a realist theory (Bohmian mechanics, also known as the de Broglie–Bohm theory) that accounts—insofar as the nonrelativistic theory is concerned—for all of these facts in a most elegant way. This theory describes a world in which electrons, quarks, and the like are point particles, always having positions that move in a manner dictated by the wave function. It should be taught to students, Bell insisted, as a legitimate alternative to the prevailing orthodoxy. After GianCarlo Ghirardi, Alberto Rimini, and Tullio Weber succeeded in formulating in 1986 a second kind of realist theory, Bell encouraged the further development of this theory as well (1987). He thought that such a theory contained the seeds of a reconciliation of quantum mechanics with fundamental Lorentz invariance, and thus a resolution of the tension between quantum mechanics and relativity that arose from his own work on quantum nonlocality.

In 1964, Bell proved that any serious version of quantum theory (regardless of whether or not it is based on microscopic realism) must violate locality. He showed that if nature is governed by the predictions of quantum theory, the “locality principle,” precluding any sort of instantaneous (or superluminal) action-at-a-distance, is simply wrong, and the world is nonlocal. The theoretical

analysis leading to such a conclusion is commonly known as *Bell's theorem*.

Bell's theorem involves two parts. The first part is the Einstein-Podolsky-Rosen (1935) argument applied to the simplified version considered by David Bohm (1951), the EPRB experiment: a pair of spin one-half particles, prepared in a spin-singlet state, are moving freely in opposite directions. Measurements are made, say by Stern-Gerlach magnets, on selected components of the spins of the two particles. The spin-singlet state has the following property: whenever the component of the spin σ_1 in any direction α is measured for one of the two particles, a measurement of the same component of the spin σ_2 of the other particle will give with certainty the opposite value. For such a state the assumption of locality implies the existence of what are often called noncontextual hidden variables. More precisely, it implies, for the spin-singlet state, the existence of random variables $Z_\alpha^i (=Z_{\alpha,\sigma_i})$, $i = 1, 2$, which can be regarded as corresponding to preexisting values of all possible spin components of the two particles. In particular, focusing on components in only three directions a, b , and c for each particle, locality implies the existence of six random variables Z_α^i , $i = 1, 2, \alpha = a, b, c$ such that

$$(1) \quad Z_\alpha^i = \pm 1$$

$$(2) \quad Z_\alpha^1 = -Z_\alpha^2$$

and, more generally,

$$(3) \quad \text{Prob}(Z_\alpha^1 \neq Z_\beta^2) = q_{\alpha\beta},$$

where the $q_{\alpha\beta} = (1 + \alpha \cdot \beta)/2 = \cos^2(\theta/2)$ are the corresponding quantum mechanical probabilities, with θ the angle between α and β .

The argument for this conclusion can be expressed as follows: The existence of such random variables amounts to the idea that measurements of the spin components reveal preexisting values (the Z_α^i). Assuming locality, this is implied by the perfect quantum mechanical anticorrelations:

Now we make the hypothesis, and it seems one at least worth considering, that if the two measurements are made at places remote from one another the orientation of one magnet does not influence the result obtained with the other. Since we can predict in advance the result of measuring any chosen component of σ_2 , by previously measuring the same component of σ_1 , it follows that the result of any such measurement

must actually be predetermined. (Bell 1964, p. 195; reprinted in Bell 1987, p. 14)

Otherwise, the result would have, at least in part, been produced by the remote measurement, just the sort of influence that Bell's locality hypothesis precludes. One may also note that if the results had not been predetermined, the widely separated correlated residual innovations thereby implied would be an instance of nonlocality.

Observe that, given locality, the existence of such variables is a consequence rather than an assumption of Bell's analysis. In his writing, Bell repeatedly stressed this point (by determinism Bell here means the existence of the preexisting values that would determine the results of the corresponding measurements):

It is important to note that to the limited degree to which *determinism* plays a role in the EPR argument, it is not assumed but *inferred*. What is held sacred is the principle of "local causality"—or "no action at a distance." ...

It is remarkably difficult to get this point across, that determinism is not a *presupposition* of the analysis (1987, p. 143).

and

Despite my insistence that the determinism was inferred rather than assumed, you might still suspect somehow that it is a preoccupation with determinism that creates the problem. Note well then that the following argument makes no mention whatever of determinism.... Finally you might suspect that the very notion of particle, and particle orbit ... has somehow led us astray. ... So the following argument will not mention particles, nor indeed fields, nor any other particular picture of what goes on at the microscopic level. Nor will it involve any use of the words "quantum mechanical system," which can have an unfortunate effect on the discussion. The difficulty is not created by any such picture or any such terminology. It is created by the predictions about the correlations in the visible outputs of certain conceivable experimental set-ups (1987, p. 150).

The second part of the analysis, which unfolds the "difficulty ... created by the ... correlations," involves only very elementary mathematics. Clearly,

$$\text{Prob}(\{Z_a^1 = Z_b^1\} \cup \{Z_b^1 = Z_c^1\} \cup \{Z_c^1 = Z_a^1\}) = 1$$

since at least two of the three (2-valued) variables Z_α^1 must have the same value. Hence, by elementary probability theory,

$$\text{Prob}(Z_a^1 = Z_b^1) + \text{Prob}(Z_b^1 = Z_c^1) + \text{Prob}(Z_c^1 = Z_a^1) \geq 1,$$

and using the perfect anticorrelations (2) one has that

(4)

$$\text{Prob}(Z_a^1 = -Z_b^2) + \text{Prob}(Z_b^1 = -Z_c^2) + \text{Prob}(Z_c^1 = -Z_a^2) \geq 1.$$

(4) is equivalent to the celebrated *Bell's inequality*. It is incompatible with (3). For example, when the angles between a , b , and c are 120° , the three relevant quantum correlations $q_{\alpha\beta}$ are all $\frac{1}{4}$, implying a value of $\frac{3}{4}$ for the left hand side of (4).

Let P be the hypothesis of the existence of noncontextual hidden variables for the EPRB experiment, that is, of preexisting values Z_α^i for the spin components relevant to this experiment. Then Bell's nonlocality argument, just described, has the following structure:

(5) Part 1: quantum mechanics + locality $\Rightarrow P$

(6) Part 2: quantum mechanics \Rightarrow not P

(7) Conclusion: quantum mechanics \Rightarrow not locality

For this argument, what is relevant about "quantum mechanics" is merely the predictions concerning experimental outcomes corresponding to (1–3) (with Part 1 using in fact only (2)). To fully grasp the argument it is important to appreciate that the content of P —what it actually expresses, namely the existence of the noncontextual hidden variables—is of little substantive importance for the argument. What is important is the fact that P is incompatible with the predictions of quantum theory.

The content of P is, however, of great historical significance: It is responsible for the misconception that Bell proved that (i) hidden variables are impossible, a belief until recently almost universally shared by physicists, and, more recently, for the view that Bell proved that (ii) hidden variables, while perhaps possible, must be nonlocal. Statement (i) is plainly wrong, since a hidden-variables theory exists and works, as mentioned earlier. Statement (ii) is correct, significant, but nonetheless rather misleading. It follows from (5) and (6) that *any* account of quantum phenomena must be nonlocal, not just any hidden-variables account. Bell's argument shows that nonlocality is implied by the predictions of standard quantum theory itself. Thus, if nature is governed by

these predictions, then *nature is nonlocal*. (That nature is so governed, even in the crucial EPRB-correlation experiments, has by now been established by a great many experiments, the most conclusive of which is perhaps that of Alain Aspect, Jean Dalibard, and Gérard Roger [1982].)

Concerning the wrongness of statement (i), some historical facts should be recalled. John von Neumann, one of the greatest mathematicians of the twentieth century, claimed to have mathematically proven that Einstein's dream, of a deterministic completion or reinterpretation of quantum theory (i.e., a hidden-variables theory), was mathematically impossible. Von Neumann's claim was almost universally accepted among physicists and philosophers of science. But Bohmian mechanics is a counterexample, so something had to be wrong with von Neumann's argument. Precisely what was wrong was elucidated by Bell in 1966. Nonetheless, many physicists continued to rely on von Neumann's proof and in recent years more commonly on Bell's inequality to support their rejection of the possibility of hidden variables.

The following is how Bell himself reacted upon learning of Bohmian mechanics:

But in 1952 I saw the impossible done. It was in papers by David Bohm. Bohm showed explicitly how parameters could indeed be introduced, into nonrelativistic wave mechanics, with the help of which the indeterministic description could be transformed into a deterministic one. More importantly, in my opinion, the subjectivity of the orthodox version, the necessary reference to the "observer," could be eliminated. ...

But why then had Born not told me of this "pilot wave"? If only to point out what was wrong with it? Why did von Neumann not consider it? More extraordinarily, why did people go on producing "impossibility" proofs, after 1952, and as recently as 1978? ... Why is the pilot wave picture ignored in textbooks? Should it not be taught, not as the only way, but as an antidote to the prevailing complacency? To show us that vagueness, subjectivity, and indeterminism, are not forced on us by experimental facts, but by deliberate theoretical choice? (1987, p. 160)

In fact, Bell's examination of Bohmian mechanics led him to his nonlocality analysis. In the course of his investigation of Bohmian mechanics, he observed that

... in this theory an explicit causal mechanism exists whereby the disposition of one piece of

apparatus affects the results obtained with a distant piece. ...

Bohm of course was well aware of these features of his scheme, and has given them much attention. However, it must be stressed that, to the present writer's knowledge, there is no *proof* that *any* hidden variable account of quantum mechanics *must* have this extraordinary character. It would therefore be interesting, perhaps, to pursue some further "impossibility proofs," replacing the arbitrary axioms objected to above by some condition of locality, or of separability of distant systems. (1966, p. 452; reprinted in Bell 1987, p. 11)

In a footnote, Bell added that "Since the completion of this paper such a proof has been found." This proof was presented in his 1964 EPR-nonlocality paper discussed here. (The 1966 paper was in fact written before the 1964 paper, but its publication was delayed.)

Physicists' misconceptions notwithstanding, Bell did not establish the impossibility of a deterministic reformulation of quantum theory, nor did he ever claim to have done so. On the contrary, over the course of several decades, until his untimely death in 1990, Bell was the prime proponent, for a good part of this period almost the sole proponent, of the very theory, Bohmian mechanics, that he is supposed to have demolished.

BELLARMINE, ST. ROBERT

(1542–1621)

St. Robert Bellarmine, an Italian cardinal and controversialist, was born at Montepulciano in Tuscany and died at Rome. Educated in the Jesuit order, of which he became a member, he taught philosophy and theology at the University of Louvain (1570–1576), then at the Roman (Jesuit) College, where he later served as rector. After Bellarmine was created a cardinal in 1599, much of his time was devoted to the administrative and diplomatic affairs of the Roman Catholic Church, in which he is now venerated as a saint. His chief published work is the *Disputations on Controversial Matters (Disputationes de Controversiis)*, in which Book III (*De Laicis*) treats questions of political and social philosophy. Another treatise in political philosophy is the *Defense of His Reply to King James I of England (Apologia Bellarmini pro Responsione Sua ad Librum Jacobi Magnae Britanniae Regis)*, reprinted in Giacón's *Scritti politici*, concerning the theory of the divine right of kings.

In general, Bellarmine's philosophic thought is Thomistic. His lectures at Louvain covered all of Thomas Aquinas's *Summa Theologiae* and are now preserved in the Vatican Archives, though they have not been printed. As a result, little is known of his metaphysical and psychological views, except for occasional explanations given in his more practical writings. It is assumed that he had a very sound understanding of the speculative thought of Thomas Aquinas, however, and the publication of the Louvain lectures is a desideratum. In ethics and philosophy of law, Bellarmine is a strong opponent of the view that the source of justice is the will of God; instead, he argues that man's awareness of moral law derives from his understanding of the nature of man and his environment, and that ultimately the command (*imperium*) of God's law is intellectual, stemming from the divine wisdom. Thus, he is opposed to voluntarism and defends intellectualism in morals and jurisprudence.

Bellarmino's political theories developed in part from opposition to King James's claim that both spiritual and temporal power belong to the civil monarch. In defending the autonomy of ecclesiastical authority, Bellarmine strongly supported the distinction and separation of the powers of church and state. In chapter 13 of the *Apologia*, he argued that, though the ultimate source of both powers is divine, the civil power is conferred on rulers, *mediately*, through the people as a medium. Thus, with Francisco Suárez, Bellarmine is one of the most

prominent Catholic advocates of the “translation theory” of political sovereignty.

Bellarmino was firmly convinced of the importance of the individual citizen and the dignity of every person. His social and political thinking is reminiscent of the fourteenth-century views of Marsilius of Padua. There is a possibility that Bellarmine’s arguments influenced British antimonarchist thinking and, through John Locke, the founders of American democracy. He also recognized something of the investment value of money and helped to modify the older Catholic theory that all taking of interest on loans was to be condemned as usury. In a treatise on the power of the pope (*De Summo Pontifice*, I, 9), Bellarmine favored the idea of a world state but admitted that a plurality of national states regulated by international law might be more practical.

About Bellarmine’s role in the prosecution of Galileo Galilei it is hard to be precise; in 1616 he seems to have warned Galileo to discuss the Copernican theory merely as a “mathematical supposition,” but he almost certainly did not enjoin him from “teaching or discussing Copernicanism in any way,” as was charged after Bellarmine’s death. Galileo’s publication of the *Dialogue of the Two Chief World Systems*, in 1632, caused him to be prosecuted for heresy on the grounds that he had thereby violated the supposed stricter warning.

BENEKE, FRIEDRICH EDUARD

(1798–1854)

Friedrich Eduard Beneke, the German philosopher and psychologist, was born in Berlin and after his gymnasium education studied theology and philosophy, first at Halle and then at Berlin. He became university lecturer (*Privatdozent*) at the University of Berlin in 1820 and, despite Georg Wilhelm Friedrich Hegel’s power and official connections, managed to have a considerable number of students.

His first books were *Erkenntnislehre nach dem Bewusstsein der reinen Vernunft* (Theory of knowledge according to the consciousness of pure reason) and *Erfahrungsseelenlehre als Grundlage alles Wissens* (Experiential theory of the soul as foundation of all knowledge). Both were published in Jena in 1820. Two years later, he published in Berlin *Grundlegung zur Physik der Sitten* (Foundations of the physics of morals), a work that found disfavor among the entrenched Absolute Idealists and resulted in his being forbidden to lecture. Beneke was accused of Epicureanism, although the objections given by Minister von Altenstein, a Hegelian who opposed Beneke’s attempted application of science to ethics, were that the book was not so much wrong on particular points as that it was *unphilosophisch* in its totality because it did not attempt to derive everything from the Absolute. Beneke’s anti-Hegelian position led to further difficulties. An offer of a position at the University of Jena was overruled by the authorities in Berlin, who managed to find a state law to support this move. Beneke moved to Göttingen, where his reception was more cordial, and remained there until 1827, when he received permission to resume his lectures in Berlin. After Hegel’s death, Beneke managed to advance to the rank of “extraordinary professor.” Although he was active in teaching and writing, his later years were plagued by illness. In 1854, under unexplained circumstances, his body was found in a Berlin canal.

Along with Johann Friedrich Herbart and some others, Beneke represented a reaction against the Fichte-Schelling-Hegel phase of German philosophy. He insisted that psychology, which ought to be established inductively, is the necessary presupposition of all disciplines in philosophy. Logic, ethics, metaphysics, and especially the philosophy of religion should be based on it. Beneke's psychology is a form of associationism, and shows the influence of both Immanuel Kant and the British empiricists, especially John Locke, whose disciple Beneke claimed to be. The senses give us only a mediated knowledge of the external world and of ourselves. Nevertheless, we can obtain an immediate, fully adequate knowledge of our own mental acts by means of inner perception. Starting from this perception, we infer the inner nature of other beings by analogy with our own. The result of this inference is a picture of reality as containing an uninterrupted series of minds or "faculties of representation" (*Vorstellungsfähigkeit*), extending downward from man. The soul consists of a system of powers or forces; it is a "bundle" but, contrary to Hume, not a bundle of perceptions.

Beneke used the language of faculty psychology, although he did not intend "powers" or "faculties" to be viewed as hypostatized concepts. All psychological processes, he claimed, can be traced back to four basic ones: (1) the process of stimulus appropriation (*Reizaneignung*), in which the mind creates sensations and perceptions out of externally caused impressions; (2) the process of formation of new "elementary faculties" (*Urvermögen*) by means of the assimilation of received stimuli; (3) the process of transmission (*Übertragung*) and equalization (*Ausgleichung*) of stimuli and powers, whereby a systematic connection is formed between our becoming conscious of one idea and our becoming unconscious of another idea; (4) the process of mutual attraction and "blending" (*Verschmelzung*) of ideas of the same sort.

Beneke's attempt to explain the mind's activities in terms of their genesis is reminiscent of Herbart. Unlike the latter, however, he assumed that philosophy must proceed from what is immediately given in consciousness. We have no alternative to this starting with inner experience, he believed, because our own soul is the only thing that we know as it is in itself. We recognize it as a non-spatial and therefore an immaterial entity. At least we have no reason to suppose it to be material, since it is not perceived through outer sense. The soul, however, cannot be simple, as Herbart had maintained. It has, as we have noted, specific powers or capacities for receiving and

organizing stimuli; these powers must be underivative, since stimuli of different kinds can be received even at the outset of our experience. Each of our senses is supposed to include several of these *Urvermögen*. But the soul must also be capable of forming new *Urvermögen*, in order to be receptive to new sorts of stimuli.

Beneke thus conceived the mental life as compounded of active impulses (*Triebe*) that are activated by external stimuli. The seemingly substantial unity of mind is explained by the persistence of traces (*Spuren*) of ideas that have become unconscious and by the mutual adjustment of faculties that produce new impulses.

BENJAMIN, WALTER

(1892–1940)

Walter Benjamin, philosopher, literary and social critic, and aesthetic theorist of the modernist period, was born to a liberal, middle-class Jewish family on July 15, 1892, in Berlin. He died in 1940 by suicide, having failed to cross the border from France to Spain. Many of his writings were published posthumously. He lived mainly in Germany, but spent his last years in exile in Paris barely surviving as an independent writer. Although close friends such as Gershom Scholem and Theodor W. Adorno encouraged him to move to Israel or to New York, he chose fatefully to stay in Europe.

Benjamin had a seminal impact, especially after the 1960s, on critical theory, art history, and aesthetics; on political philosophy and the philosophy of language and history (in the continental vein); on linguistics, literature, and criticism; on communications, technology, and mass media; even, later, on anthropology, cultural studies, and postcolonial and feminist theory.

Benjamin developed his central concept of *critique* from his extensive reading in philosophy, poetry, and literature, especially of Immanuel Kant, Johann von Goethe, Friedrich Hölderlin, and Friedrich Schlegel. Critique was a concept or, better, a philosophical approach to establishing the parameters of knowledge and experience (*Erfahrung*). Lifelong, Benjamin attempted to move beyond the limits that he saw the neo-Kantians to have imposed far more dogmatically than Kant himself. He saw in the Enlightenment concept of experience the gradual movement toward “scientism” and with this toward an ever more severe limitation and impoverishment of its promise. Experience, he argued, ought not to be reduced to the “object realm” of science.

His earliest work on educational reform was influenced by Gustav Wyneken’s Youth Movement. Again, as that movement became more dogmatic, the more Benjamin distanced himself from it. He resisted partisan thinking all his life, given his unwillingness to compromise either “the life of the spirit” or the claims of the early Karl Marx’s historical materialism. Similarly, though instructed by well-known professors, he showed himself to be as anti-academic and anti-programmatic as he was anti-partisan. He was wary of any well-trodden path or anything that smacked of matter-of-factness.

Benjamin became not only a philosophical thinker but also a writer who would sharply oppose those who aimed in thought and language simply to stipulate the principles of method. He wondered how a writer could

release the truth in a world that acts as if it would rather have a “higher,” “absolute,” or “certain” truth imposed upon it. He thought about how one writes “against the grain” or how one writes oneself out of restrictions by which one, as a writer, is historically and socially conditioned. He wrote against the dominant positivist idea or myth of progress which, he maintained, far more concealed than brought truth to appearance.

Benjamin was wary of traditional forms of philosophical argument. He used literary and visual images to develop a language he regarded as more appropriate or truthful for modern times. He wrote sometimes in fragments, sometimes with quotations or aphorisms, in part to demonstrate his interest in what he called constellations or dialectical images. He experimented with both the long and the short form of the (literary) essay. He was particularly interested in story-telling as still historically able to transmit genuine experience.

In his “On Language as Such and on the Language of Mankind” (1916), he argued against the idea that writing was either transparent or merely a vehicle for the communication of an independently existing meaning. Meaning was, rather, contained and usually concealed within language, a view that necessitated entirely rethinking the task of translation. Given a secularized Messianic myth of the fall of humanity and of humanity’s entry into history, Benjamin maintained that the more a society misuses its language the more the language (like society) falls into decay. The aim of critique was double-sided: to describe language’s decay or the loss of meaning under present social or historical conditions at the same time that one seeks to bring that meaning back to presence. Critique as retrieval was no straightforward matter: It demanded different modes of extreme and explosive, but also fragile and experimental, thought.

Although influenced both by classicism and early romanticism, he explored in modernist terms the complex relations between the truth and deception of language, sign, and image. Between 1919 and 1920 he completed his doctorate in Switzerland with “The Concept of Criticism in German Romanticism.” In 1928 the University of Frankfurt refused him his *Habilitation* for his *Origin of German Tragic Drama*. This dissertation, written largely through quotation and focused on a distinction between allegory and symbol, explored the modern form of tragedy. Benjamin often described modernity in terms of ruins: to modernity he liked to attach the terms of meaninglessness, mortification, and fragmentation. Allegory, as one critic has put it, was “a poetic response to the degradation that language undergoes

in the instrumental conception that modernity gives to it” (Rochlitz 1996, p. 99). However, though Benjamin so described modernity, he did not engage merely in a conservative lament about how the world once was. Instead, through allegory, he sought the redemptory, and at times also the revolutionary, promise of the new languages, images, and cultural forms as given from the temporal perspective of the “here and now.” Benjamin’s work on allegory later proved most influential on the thinking of Jacques Derrida and Paul de Man.

Benjamin refused to treat works of art, literature, or philosophy as if one were attending a funeral, as if the works were situated merely in the monumentalized context of a dead past. As he argued in his “Theses” on the philosophy of history, so he argued in his work on literary criticism, that the critic should aim to keep works alive by showing how their meaning, described as belonging to the past, was still present or available to us albeit in enigmatic or allegorical form.

In his writing on history, he argued against the dominant teleological, progressivist and perfectibility visions which saw the world as ordered, rational, and, purposive. He rather presented a view of the past as radically fragmented and of history as something that narrates a story far less of victory and inclusion and far more of failure and exclusion. Inspired by a painting of Paul Klee, he pictured the historian as an angel (the “angel of history”) who, though propelled by progressive forces toward the future, would prefer rather to look backward. He described the historian as a guardian of the past, as one who desires to subvert future catastrophe by awakening the dead in an attempt to make whole again what has been destroyed.

Comparably, in his literary criticism, he argued that meaning does not reside in works as if fixed, saturated, or completed; it exists rather as possibility or as a suggestion still flickering in the flames of the coherence the world once had. To retrieve the meaning present in a work is to retrieve that which critics of antiquarian tendency have allowed to fall into oblivion. For Benjamin, art cannot do without this act of retrieval, as he demonstrated in his early mammoth essay on Goethe’s *Elective Affinities*. Here, Benjamin distinguished critique from commentary. Whereas the latter focuses on *material content*, the realities more immediately apparent to the eye, the former focuses on the concealed, but historically gradually to be revealed, *ideal- or truth-content* of the work; his point was always to demonstrate the intricate relation between the two.

Increasingly influenced by Baudelaire, Benjamin exposed the contradictory or antagonistic structures of modernist, urban, bourgeois or capitalist life in the metropolis: Berlin, Moscow, Paris. In his late and unfinished *Arcades Project*, he traced the allegorical significance of advertising slogans and neon signs attached to the aging architectural structures of the Parisian Arcades. He looked at the postures of prostitutes, mannequins, and gamblers, and at the movements of the trains and the stock exchange. He looked at the speed of pedestrian traffic and at the exhibition in the shoppers of their boredom, idleness, desire, and satisfaction. Stamps, toys, newspaper headlines revealed the city in its smallest details. No detail and no commodity were treated as trivial or insignificant.

Influenced by the Parisian surrealists, he described fantasies and dreams as collective forms of social experience; he experimented with opium to gain access to new forms of experience. He wrote about dialectical images, which, while structured by capitalist relations of production, nonetheless contained a redemptory potential that would appear to the viewer in momentary or disoriented experiences. He investigated the psychical processes (influenced by art, writing, and drugs) that would crack habitual forms of life or break through the apparent fixity of social forms. To interpret the world was to reorder (change) the world through profane illumination. With André Breton, it was to release the world from its chains or to allow the uncanny dimensions of experience, suppressed under the social construction of ordered appearance, to emerge.

Benjamin’s work is often distinguished by earlier and later periods, by decisive transitions from his more esoteric and elitist interest, inspired by Jewish Messianic thought, to his late, often Bertold Brecht–inspired, more revolutionary work in (Marxist) historical materialism. As, however, his last writings on history and art show, there are significant continuities across these transitions. In perhaps his best-known essay, “The Work of Art in the Age of its Technological Reproducibility,” he argued that how we receive or view art is changed not only by radical alteration in conditions of production, but also, more esoterically, by how the art, in its experimentation, may surrealise (transform or shatter through creative disorientation) how we think and feel. He showed how the mediation in art between aesthetic concepts and technological conditions matters both for the sake of art and for that of politics.

Crudely, to speak of the “aestheticization of the political” was to speak with the Fascists or the totalitarian

thinkers, of how new forms of technology were being regressively employed to sustain outdated aesthetic concepts. He described how concepts of aura and aesthetic absorption had come increasingly to be employed to produce political rather than merely artistic forms, hence, the use of aesthetic concepts and artistic techniques in modern war and propaganda. Contrarily, to speak of the “politicization of art” encouraged a production of art that would more truthfully adapt to currently existing conditions, a production that would rather help liberate a people, so Benjamin argued at his most committed revolutionary moment, than be used to promote knowingly false political illusions.

Benjamin juxtaposed his concrete and diverse reflections on mass art, film, photography, epic theater, and spectatorship with reflections on violence, war, and militarism. In turn, his reflections on violence and fragility were inseparable from his own thinking and writing on the modern condition and possibility of experience.

Lydia Goehr (2005)

BENN, GOTTFRIED (1886–1956)

Gottfried Benn, the German poet and critic, was born in Mansfeld in Westprignitz, of mixed Prussian and Swiss-French parentage. After studying philosophy and philology at the universities of Marburg and Berlin, he received a military scholarship to the Kaiser Wilhelm Academy of Berlin, from which he was graduated as doctor of medicine in 1912. Commissioned as a medical officer in the German Imperial Army, he served briefly in 1912 and then again after the outbreak of the war in 1914. A close friendship with the poet Else Lasker-Schüler ended in 1913, and in July 1914 he married the actress Eva Brandt. From 1917 to 1935 he practiced in Berlin as a specialist in venereal and skin diseases. After his wife's sudden death in 1922, he befriended Ellen Overgaard, a Danish woman, who adopted his daughter.

Benn collaborated with Paul Hindemith on the oratorio *Das Unaufhörliche*, which was performed in 1931. Extensive contact with representative writers of the Weimar Republic led to his election, in 1932, into the German Academy of Arts (whose president, Heinrich Mann, the brother of Thomas, Benn had eulogized in an essay in 1931). A somewhat sordid period of jockeying for positions in the new Reich ended in 1935 with Benn's los-

ing the post of municipal medical specialist, and in 1938 all his writings were banned. He rejoined the army in 1935, coining for this move the much-publicized term *innere Emigration*, in contrast to the actual emigration of his former friends. In 1938 he married his secretary, Herte von Wedemeyer; she committed suicide in 1945, when the Russian armies were approaching the village to which she had been evacuated. After the war Benn's writings were banned, but the publication of *Statische Gedichte* in Switzerland (1948) marked the beginning of a new creative phase. In 1946 he married Ilse Kaul, a young dentist. Benn gave up his medical practice in 1953. Through his decision to remain in Berlin, he became something of a spokesman for the intelligentsia of the city. At his death he was hailed as the greatest German poet since Rainer Maria Rilke; his influence on the styles and themes of contemporary German poetry, certainly, is second to none.

Benn always insisted on the hermetic nature of his poetry and prose; nevertheless, his work faithfully reflects both the historical events and the intellectual turmoil of his age. His first collection of poems, *Morgue* (1912), achieved notoriety and success because of its ruthless exploitation of the phenomena of physical decay and disease. The stark naturalism of such a poem as "Man and Woman Walking through a Cancer Ward" lies both in its rhythmically weak form and in the direction of its argument, typical of much of Benn's later work: the poem attempts to designate some bedrock of "reality" that will withstand contemporary skepticism. The "reality" that emerges from behind the clinical details is a representation of life as impersonal, merely physical or biological, and bereft of all spirit.

The major German poets of the twentieth century have expressed an acute consciousness of their historical situation, a consciousness that derives from Friedrich Nietzsche's critique of the historical imagination and from Oswald Spengler's *Decline of the West*. Benn, in the wake of these works, described the age after the defeat of 1918 as "postnihilistic." In the face of national collapse he set out to formulate an "absolute aesthetic," the aim of which was to "transcend" the actual situation by means of the idea of a "pure poem," the poem of "absolute expressiveness" (as opposed to the poem of communication or opinion with didactic intent). In Benn's poetry, however, there are elements of self-disclosure that seem not to be consistent with his concept of the "pure poem." And his doctrine that art should be exclusively concerned with "style, not truth," raises more questions than it answers.

Benn's ideas on the role of art in life varied. He was able to speak of art as "historically ineffective, without practical consequences," but also to define it (in the wake of Nietzsche) as "the only valid vindication of life." The "biologism" of Benn's earlier poetry had been morally indifferent, and he had nothing but contempt for every form of social organization and democratic politics, especially those of the Weimar Republic. It is therefore not surprising that after March 1933 he emerged as the most important of those German poets who convinced themselves that national socialism offered an answer to their search for a valid artistic ideology—or, rather, for valid poetic symbols. Benn discerned in Adolf Hitler's regime the rule of "a new biological type ... [and] the victory of the national idea, the victory of genuine human values, in perfect harmony with the logic of history." His courtship with national socialism was brief, yet even in 1950 (in his embarrassing autobiographical apologia, *Doppelleben*) his main criticism of the Hitler regime was that it "lacked style." "Style" was for Benn the product and the justification of an image-making faculty that conforms to certain "absolute" laws; these laws are "autonomous" in the sense of being indifferent to the demands of personal experience and social reality alike. Questions of personal expediency apart, Benn's astonishing expectations for Hitler's regime seem to have sprung from that contemptuous disregard of political realities that had been characteristic of an important section of the German cultural scene for many years. He saw no contradiction in asserting the hermetic nature of poetry while claiming that the heroic virtues of the new regime would be more propitious for its creation. The historicism he cultivated served Benn (as it did Martin Heidegger in 1933) as justification for his collaboration, but it did not lead him to a clear understanding of the total claim of Hitler's dictatorship.

Benn is the only major German poet who felt, albeit briefly, that his vision was realized in the National Socialist ideology, even though his poems soon proved to be incompatible with the party line in art. The elements that form his best poems derive from the cosmopolitan expressionist school that flourished in Germany in the 1920s as much as from French and Italian imagism; even his invocation of chthonic and instinctual values (in his praise of "Quaternary man" and his values) has its parallels in Ezra Pound, T. E. Hulme, and Julian Benda. His poetic style is clipped, paratactic, full of laconic allusions to the natural sciences. Memories are imaged by means of strong and complex sense perceptions; striking physical details are selected, often for their sound values; all mention of "you" and "we" is rhetorical, the solipsistic circle

hardly ever being breached; and the situations invoked are almost always related to a self whose isolation is, if anything, underlined by an appeal to primordial memories.

BENNETT, JONATHAN

(1930–)

Born in 1930 and educated in New Zealand and at the University of Oxford, Jonathan Bennett taught philosophy at the University of Cambridge for twelve years before taking up professorial positions in Canada (at the University of British Columbia) and the United States (at Syracuse University). He is a Fellow of the American Academy of Arts and Sciences and of the British Academy. Now retired, he continues to write from his home on an island near Vancouver, British Columbia.

Bennett’s work covers a wide range of issues in analytic philosophy and the history of philosophy, especially the early modern period. His first book, *Rationality* (1964), explored the differences between human intelli-

gence and the intellectual capacities of other animals, and the role of language in these differences. Subsequently influenced by Paul Grice’s seminal work on meaning and communicative intentions, he significantly modified his views about such matters in a later book, *Linguistic Behaviour* (1976), which incorporates an account of convention building on but also differs in certain respects from David Lewis’s ground-breaking theory.

Bennett’s interest in the nature of intentional behavior connects his work in philosophical psychology and the philosophy of language with his work in the metaphysics of actions and events. His major contribution to the latter topic is *Events and their Names* (1988), in which he explores the distinction between events and facts through an examination of the semantics of everyday language, focusing on the differences between two kinds of sentence nominals, exemplified by the pair *Quisling’s betrayal of Norway/Quisling’s betraying Norway*. In this book Bennett addresses the important question of whether facts or events should properly be regarded as the things related by causal relations; he contends that both may be but that fact-causation statements and event-causation statements require different kinds of analysis, whether in terms of counterfactual conditionals or in terms of causal laws. Bennett concludes, however, that the language of event-causation, though useful, is impoverished compared with that of fact-causation and that the former must be analysed in terms of the latter. He also offers an analysis of the “by” locution employed in action sentences of the form *S did such-and-such by doing so-and-so*.

In a later book on the theme of agency, *The Act Itself* (1995), Bennett discusses in depth the moral dimension of human action, including the thorny question of whether a morally significant distinction can be drawn between doing something and letting something happen: for example, between killing someone and letting someone die. He makes it clear, early in the book, that he is a moral nonrealist, denying that moral judgements are answerable to independent moral facts and hence denying that they have, in that sense, truth values.

Closely connected with Bennett’s work on actions and events is his important contribution, over a period of more than thirty years, to philosophical debate on the semantics of conditional statements. This work culminated in his book *A Philosophical Guide to Conditionals* (2003), perhaps the most comprehensive and authoritative treatment of the subject available. On a number of key issues in this debate, Bennett has shifted his position over the years, notably on the question of whether there

is a significant distinction to be drawn between counterfactual and indicative conditionals. Reversing his earlier opinion, formed under the influence of the work of V. H. Dudman, he now thinks that there is and that these two classes of conditionals demand radically different analyses: the former a possible-worlds analysis along the lines proposed by David Lewis and the latter a probabilistic analysis of the sort pioneered by Ernest Adams. As a consequence, he holds that indicative conditionals, unlike counterfactuals, lack truth conditions and hence truth values. At the same time, he tries to explain why, despite their radically different analyses, there are close similarities between the logics of the two kinds of conditionals and why it is often correct to move from asserting an indicative conditional at one time to asserting a corresponding counterfactual at a later time.

Bennett's work in the history of philosophy has centred on the core texts of the British Empiricists—Locke, Berkeley and Hume—and those of certain eminent continental philosophers of the seventeenth and eighteenth centuries, especially Spinoza and Kant. *Kant's Analytic* (1966) was followed eight years later by its sequel, *Kant's Dialectic* (1974), with *Locke, Berkeley, Hume: Central Themes* (1971) appearing in between. Bennett's next major project of this kind was *A Study of Spinoza's Ethics* (1984); at about the same time he collaborated with Peter Remnant to produce an important new edition and translation of *Leibniz's New Essays on Human Understanding* (1981).

The culminating synthesis of Bennett's thoughts about the major philosophers of the early modern period is provided by his magisterial two-volume magnum opus, *Learning from Six Philosophers* (2001). The first volume treats Descartes, Spinoza, and Leibniz and the second Locke, Berkeley, and Hume. Bennett has always been clear about his own approach to the writings of the great philosophers of the past: although he does not ignore their historical context, he is concerned chiefly with the ideas and arguments to be found in them—not merely as illustrative of the philosophical thought of their times, but for their own sake and for the light that they can shed on present-day philosophical debate. Inevitably, this sort of approach has attracted criticism from certain quarters, especially from historians of philosophy who are skeptical about the very notion of *philosophia perennis*—the idea that there are perennial philosophical problems and arguments that transcend cultural and historical boundaries. But whatever the rights and wrongs of this dispute might be, it is manifest that Bennett's approach is motivated not least by his concern, as a teacher of philosophy,

to keep the seminal texts of past philosophers alive for succeeding generations of students.

E. J. Lowe (2005)

BENTHAM, JEREMY

(1748–1832)

Jeremy Bentham, English philosopher and reformer, was born in Houndsditch, London, on February 15, 1748. His father was a solicitor, with wealthy and important clients in the City of London. Of his siblings, only one younger brother, Samuel (1757–1831), survived into adulthood, becoming a prominent naval architect and engineer. His mother died on January 6, 1759. In 1760 his father entered him, at the age of twelve, into the University of Oxford, where he attended the lectures of William Blackstone (later published as *Commentaries on the Laws of England*, 1765–1769). He graduated in 1764, having been obliged to subscribe to the Thirty-nine Articles of the Church of England, the statement of its dogma and discipline.

Having entered Lincoln's Inn in 1763, he was admitted to the bar in 1769. He did not, as his father wished, practice law, but decided instead to devote himself to its reform. Bentham thought of himself as “the Newton of

legislation” (Milne 1981, p. 169); just as Isaac Newton (1642–1727) had brought order to the physical sciences, so would he to the moral sciences. Bentham adopted the principle of utility (an action was judged to be morally right to the extent that that it promoted the greatest happiness of the greatest number) as a critical standard by which to test the value of existing practices, laws, and institutions, and to suggest reform and improvement. He set about composing a comprehensive penal code, to which his best-known work, *An Introduction to the Principles of Morals and Legislation* (abbreviated as *IPML*), which was printed in 1780 and published in 1789, was intended to form a preface.

After returning from a visit to his brother in Russia from 1785 to 1788, his career was dominated by his attempt to build a panopticon prison in London. When the scheme effectively collapsed in 1803 Bentham was left embittered by what he regarded as the bad faith of successive ministries, and he became increasingly committed to political radicalism. In 1809 he began to write on parliamentary reform, and in 1822 he embarked on *Constitutional Code*, in which he advocated the establishment of a representative democracy. Having lived in Lincoln’s Inn from 1769 to 1792, he had then inherited his father’s home in Queen’s Square Place, Westminster, where he died on June 6, 1832.

Bentham’s contemporary reputation was founded on the five recensions of his works produced in elegant French between 1802 and 1828 by his Genevan translator and editor, Étienne Dumont (1759–1829). Bentham met Dumont in or around 1788, when both were members of the Bowood Circle that gathered at the country house of William Petty (1737–1805), second Earl of Shelburne and first Marquis of Lansdowne. Dumont’s recensions were not literal translations of Bentham’s writings, but lucid distillations of his central ideas. The first and most influential was *Traité de législation civile et pénale* (The Theory of Legislation; 1802). To those who wished to introduce political and legal reform, but who faced resistance from entrenched interests such as the privileged nobility and the church, the rational, secular, reforming programme offered by Bentham carried great appeal. While profoundly critical of the legal institutions and practices that he found in existence, he was at the same time optimistic about what could be achieved by law. As he had announced in *IPML*, his enterprise was “to rear the fabric of felicity by the hands of reason and of law” (Burns 1970, p. 11). Bentham’s vision of the law as an instrument of reform and improvement had considerable

impact in an age that viewed ignorance, prejudice, and superstition as the main barrier to human progress.

BENTHAM’S ACHIEVEMENTS

Bentham’s achievements, only some of which are noticed in detail here, were immense. He was the founder of classical utilitarianism, which inspired the movement known as philosophic radicalism in which the young John Stuart Mill (1806–1873) played a leading role, and which has remained one of the most influential doctrines in political philosophy. His method of calculating the potential utility of actions forms the basis of cost benefit analysis in economics. Distinguishing sharply between law as it is and law as it ought to be, he inspired the proponents of the doctrine of legal positivism. In his extensive and detailed writings on judicial procedure, he produced the most comprehensive theory of evidence in the Anglo-American tradition. He developed a theory of punishment and reward which emphasized deterrence, proportionality, and rehabilitation of the offender, and which went far beyond, in terms of rigor and coherence, that associated with Cesare Beccaria (1738–1794).

In politics he produced, in 1789, the earliest utilitarian defense of political equality (at one point even advocating women’s suffrage), and later, in *Constitutional Code*, produced a sophisticated and detailed blueprint for representative democracy. His essay on *Political Tactics* was the first systematic treatise on the organization of a political assembly. He put forward a scheme to promote peace between nations, advocating an international court of arbitration and a proportional reduction of armed forces. Indeed, the word “international” was coined by Bentham. His proposals for dealing with poverty provided the intellectual basis for the Poor Law Amendment Act of 1834, and for the welfare state more generally. His educational ideas, based on “useful learning” and access for all regardless of religion or gender (in contrast to the Universities of Oxford and Cambridge, where students had to be Anglican and male) inspired the founders of the University of London in the mid-1820s.

LANGUAGE

The starting point for Bentham’s thought was his understanding of the way in which the human mind perceived the physical world, and the way in which language was used to describe that world. The fundamental distinction in language was between the names of real entities, which represented objects existing in the physical world (e.g., an apple), and the names of fictitious entities, objects that were spoken about as if they did exist, and about which it

made sense to talk as though they existed, but to which it was not intended to ascribe physical existence (e.g., the property of a physical object, such as the sweetness of an apple, or an abstraction, such as a law). In order to make sense, language had to refer, either directly or indirectly, to physical objects. The difficulty lay in finding a method by which the names of fictitious entities could be related to their “real source” in the physical world. The names of fictitious entities were not capable of exposition by means of representation, where a specific object was produced and its assigned name pronounced, for there was no such object to produce. Nor was it possible to define a fictitious entity by means of the Aristotelian method of definition *per genus et differentiam*. Definition by this means was possible where the object belonged to a nest of aggregates, and was not the highest object in the nest, but was not possible where the word had no superior genus.

Bentham’s solution consisted in the complementary techniques of paraphrasis and phraseoplerosis. The operation of phraseoplerosis, the filling up of the phrase, was logically prior to that of paraphrasis. Discourse often contained ellipses, which needed to be “filled in” by inserting the omitted words. Thereupon, the operation of paraphrasis could be undertaken, whereby a sentence in which the name of the fictitious entity appeared was translated into another sentence in which the words were either real entities, or were more nearly related to real entities. Take the word “duty.” A person (X) had a legal duty when someone else (Y) had a right to have him (X) made to perform it, in which case X had a duty toward Y, and Y a right against X; what Y had a legal right to have X be made to do was that for which X was legally liable, upon a requisition made on Y’s behalf, to be punished for not doing. The definition or exposition had “resolved” the notion of duty into its simple, or more simple, elements: namely the prospect of suffering a punishment (a term which itself would require further exposition), upon the forbearance to perform some action, when required to do so by the person invested with the corresponding right. However, if an exposition by paraphrasis proved to be impossible, then the fictitious entity in question belonged to the class of nonentities, the noun substantive by which it was represented was merely a sound, and any proposition in which it occurred was nonsensical.

PRINCIPLE OF UTILITY

Bentham’s critical standard, the principle of utility, was a fictitious entity, and had to be expounded by relating it to the physical entities that formed its “real source.” As Bentham explained in *IPML*, the “real source” in question

consisted in the sensations of pain and pleasure: “Nature has placed mankind under the governance of two sovereign masters, *pain* and *pleasure*. It is for them alone to point out what we ought to do, as well as to determine what we shall do.” The “sovereign masters” of pain and pleasure not only accounted for human motivation, “govern[ing] us in all we do, in all we say, in all we think,” but also provided “the standard of right and wrong” (p. 11). Psychology and ethics were both founded on, and therefore linked by, their relation to pleasure and pain.

In relation to psychology, the desire for pleasure and the aversion to pain formed the basis for all motivation, both in humans and sentient creatures generally. An individual had a motive to perform an action—or put another way, had an interest in performing an action—if he or she expected to gain some pleasure or avert some pain from doing so; and the greater or more valuable the pleasure experienced or pain averted, the stronger the motive or greater the interest. The value of a pleasure or pain was determined by its quantity, which, in the case of a single individual, was a product of its intensity, duration, certainty or uncertainty, and propinquity or remoteness. Where the value of a pleasure or pain was considered in relation to more than one person, then in addition to these circumstances, the circumstance of extent, that is the number of persons affected by it, had also to be taken into account. At this point, a statement of psychological fact has become a statement of moral science. An act was morally good if, after calculating all the pains or pleasures produced in the instance of every individual affected, the balance was on the side of pleasure, and morally evil if on the side of pain. Bentham’s method of determining the value of pleasure and pain is known as the “felicific calculus,” though this was not a phrase that he appears to have used himself.

An adherent of the principle of utility would approve of any action that increased the overall happiness (understood in terms of a balance of pleasure over pain) of all the individuals affected by the action in question, where more than one individual was affected. An adherent of the principle of utility would likewise approve of any action that increased the happiness of a particular individual where no other individual was affected by the action in question. In the former instance the extent was equal to the total number of individuals in question, and in the latter instance to one. It was only when extent was taken into account that an action could be judged to be ethically right or wrong. The question of right and wrong was a question of fact—an account of the value, understood in terms of quantity, of the pleasures and pains that

had been brought into existence by the act in question. In order for the utilitarian legislator to accomplish his objective of promoting the greatest happiness of the greatest number, he had to use sanctions (punishments and rewards), themselves composed of pain and pleasure, to discourage actions detrimental to the happiness of the community, and (to a lesser extent) to encourage those that were beneficial.

NATURAL LAW

Bentham's adoption of the principle of utility—with its “real source” in the feelings of pain and pleasure experienced by sentient creatures—as a critical standard of morality led him to distinguish between “law as it is” and “law as it ought to be.” This distinction provided the basis both for his strategy of reform, and for his attack on natural law. In *A Fragment on Government* (1776), which took Blackstone's *Commentaries* for its target, Bentham distinguished two approaches that the legal commentator might adopt: the first was that of the expositor, whose task was to describe what had been done by legislators and judges (law as it is); the second was that of the censor, whose task to show what they ought to do in future (law as it ought to be).

Blackstone, by not only describing but also attempting to justify the laws of England, had confounded the two approaches. He had, moreover, failed to adopt the principle of utility as his standard of morality, but had appealed to the doctrine of natural law, claiming that human (positive) law was valid insofar as it did not contradict the natural law. Bentham condemned Blackstone both for linking the validity of positive law to a particular substantive content, and for thinking that the natural law could supply the content in question. The natural law did not exist (it was a nonentity), hence any appeal to the law of nature in order to validate a positive law was nonsense, and in practice reflected the mere subjective approval of the supporter of the positive law in question. Blackstone had stated that where there was law, there was some superior who made it. Bentham drew out the corollary: if there was no maker, there was no law. The same problem of nonexistence bedevilled a further device adopted by Blackstone, the original contract. Having accepted the criticisms of the doctrine made by David Hume (1711–1776), Bentham went on to argue that, even if one assumed its historical existence, the original contract, like any promise, had binding force only if adherence to it would promote utility. The original contract was, therefore, superfluous, since the question as to whether to obey

or resist government should be based directly on considerations of utility.

NATURAL RIGHTS

Bentham deployed similar arguments against a doctrine closely related to that of natural law, namely the doctrine of natural rights. In the French Declaration of Rights of 1789 it was asserted that the end of every political association was the preservation of the natural and imprescriptible rights of man, and that these natural rights could not be abrogated by government. The purpose of establishing government was to protect preexisting natural rights, and any government that failed to do so lacked legitimacy. In “Nonsense upon Stilts” (known as “Anarchical Fallacies” until the publication of the authoritative text in *Rights, Representation, and Reform* [Schofield, Pease-Watkin, and Cyprian Blamires 2002, pp. 317–401]) Bentham argued that there were “no such things as natural rights—no such things as rights anterior to the establishment of government—no such things as natural rights opposed to, in contradistinction to, legal” (p. 329). The notion of a state of nature, where men lived without government, was perfectly comprehensible, but in such a state there were no rights, and consequently no property and no security. Such rights might be desirable, but it was fallacious to assume that because a certain thing was desirable, that the thing in question existed. Furthermore, if natural rights did not exist, they could not be abrogated. To say that they were imprescriptible was to mount one nonsensical statement upon another: “Natural rights is simple nonsense: natural and imprescriptible rights, rhetorical nonsense, nonsense upon stilts” (p. 330). The purpose of declaring the existence of imprescriptible rights was to incite resistance to law and insurrection against government. To claim that no government could abrogate natural rights was “Terrorist language,” whereas those who spoke the “language of reason and plain sense” judged whether a right should or should not be established or abrogated on the basis of whether or not it was for the advantage of society to do so (p. 330).

In *A Fragment on Government* Bentham's concern was with the distinction between the censor and the expositor, while in “Nonsense upon Stilts” it was with that between the censor and the anarchist. The anarchy that Bentham associated with the French Revolution was closely related to the conservatism he associated with Blackstone. The latter had claimed to be describing the laws of England, but had attempted to justify those laws on no other ground than that they existed. His approach confused what existed with what ought to exist. A similar

confusion characterized the anarchist, who, in claiming to describe natural rights, was making prescriptions. The difference was that while Blackstone assumed that existing law was consistent with the natural law, and therefore valid, the anarchist assumed that existing law was inconsistent with natural rights, and therefore invalid. To the extent that both were appealing to a nonexistent standard in justification of their respective claims, both were talking nonsense.

In Bentham's view, only the principle of utility provided any rational ground for resolving moral, political, and legal disputes, while talk of justice, right reason, natural rights, or moral sense was merely a cover to give respectability to, or to endow with persuasive force, the likes and dislikes of the speaker. The doctrines of natural law and natural rights were grounded on the delusive properties of language, and in particular the confusion involved in taking the name of a fictitious entity to be the name of a real entity. The use of the noun-substantive "rights" had given rise to the opinion that rights as such did actually exist. Now to talk of rights established by law did make sense, since they might be shown to have their "real source" in the will of a sovereign legislature. To talk of natural rights, with their source in natural law or a supernatural being, was to talk nonsense. The techniques of exposition that Bentham had developed in his theory of language were at the root of his attacks on natural law and natural rights.

CODIFICATION OF THE LAW

In the early 1780s Bentham concluded that the most effective means of promoting the happiness of the community would be through the introduction of a complete code of laws, or a "pannomion." Bentham's commitment to codification arose from a profound dissatisfaction with the English common law, which he characterized as corrupt, unknowable, incomplete, and arbitrary. It could not perform the minimum purpose for which law was instituted, namely to guide conduct. Still less was it able to afford protection to those basic interests of the individual—his person, property, reputation, and condition in life—which constituted his security, and hence a major component of his well-being. Security was closely related to the notion of expectations, for it involved both the present possession and the future expectation of possessing the property or other subject-matter in question. Without security, and thus the confidence to project oneself and one's plans into the future, there could be no civilized life. Security was a product of law, resulting from the imposition of rules on conduct. To an extent it did

not matter which set of rules were imposed, so long as some set of rules were imposed, and these rules were known and certain. The crux of the problem with the common law was that those subject to it did not, and could not, know what it ordained, and this created insecurity. Expectations could either not be formed or were constantly liable to be disappointed.

The solution lay in codification. In his writings on the subject in the 1810s and 1820s Bentham explained that the pannomion should be "all-comprehensive" and "rationalized." This meant that the law would be logically complete, in that all legal terms would be defined consistently and related to some superior genus (where one existed), and that each provision would be followed by the reasons that justified it. At the apex of the pannomion was the civil code, concerned with the distribution of rights and duties. The purpose of the civil law was to maximize the four sub-ends of utility—namely subsistence, abundance, security, and equality. The purpose of the penal law was to give effect to the civil law, by means of attaching punishment to certain actions which, on account of their tendency to diminish the greatest happiness, were classified as offenses.

The constitutional code was also, at least in part, distributive in character, being concerned with the powers, rights, and duties of public officials, and their modes of appointment and dismissal. As with the civil law, the penal law would give effect to the relevant parts of the constitutional law. The penal, civil, and constitutional law together formed the substantive law, which was itself given effect by the adjective law, or the law of judicial procedure. The chain was completed by the law of the judicial establishment, the purpose of which was to give effect to the adjective law, and thence to the substantive law. In other words, the civil code, and to some extent the constitutional code, would contain the "directive rules" by which rights and duties were distributed, while the penal code would contain the sanctions which would enforce observance. For instance, the penal code would forbid and sanction interference with property without title, while the civil code would explain what events constituted a valid claim to title.

Bentham offered his services as a codifier to a variety of countries, including Scotland in 1808, the United States in 1811, and Russia in 1814. In April 1822 he received the invitation for which he had been longing: the Portuguese Cortes formally accepted his offer to draw up civil, penal, and constitutional codes. He immediately began to compose *Constitutional Code*, but long before even the first volume of this work had been printed in

1827, the liberal regime that had accepted Bentham's offer had been swept away. In the 1820s Bentham also devoted time and attention to Spain, Tripoli, Greece, and the emerging states of Latin America, as well as becoming fully involved in the movement to reform and codify English law. By this time he enjoyed an international reputation as the doyen of liberal legal philosophers and political reformers. José del Valle (1776–1834), for instance, the Guatemalan lawyer, economist, and politician, wrote to Bentham hailing him as “the legislator of the world.”

PANOPTICON

The panopticon design was the brainchild of Bentham's brother Samuel, when employed in the 1780s on the estates of Prince Grigoriy Aleksandrovich Potemkin (1724–1791) at Krichev, in Russia. He found that by organizing his workforce in a circular building, with himself at the center, he could supervise its activities more effectively. Visiting his brother and seeing the design, Bentham immediately appreciated its potential. Enshrining the principle of inspection, the design was applicable to mental asylums, hospitals, schools, poor houses, factories, and, of course, prisons.

The prison building would be circular, with the cells, occupying several stories one above the other, placed around the circumference. At the center of the building would be the inspector's lodge, with an open space between the lodge and the cells. Each cell would have a window to the outside of the building, which would, from the perspective of the lodge, backlight the cell in daytime, while lamps, placed outside the lodge with a reflector behind them, would light the cells at night. The lodge would be so constructed, with appropriate partitions and blinds, that the inspector would always be capable of seeing into the cells, while the prisoners would be unable to see whether they were being watched. The activities of the prisoners would be transparent to the inspector; his actions, insofar as the prisoners were concerned, were hid behind a veil of secrecy. On the other hand, it was a cardinal feature of the design that the activities of the inspector and his officials should be laid open to the general scrutiny of the public, who would be encouraged to visit the prison. Bentham did not succeed in building a panopticon in London, despite gaining parliamentary approval in 1794, and the scheme was effectively quashed in 1803 (a half-hearted attempt to revive it in 1811–1812 failed). Several so-called panopticons have since been built, but none which has been particularly faithful to Bentham's own vision.

Michel Foucault in *Discipline and Punish* (1977) has described Bentham's panopticon as a paradigm of the modern state, hence placing Bentham at the center of debates about what it means to be modern. What Foucault overlooked in Bentham's case (whatever might be the case with the modern state) is that Bentham was concerned not only with the ability of officials to gain knowledge of the community subject to them (which was, of course, critical if they were to rule well), but also with the ability of the people to monitor the conduct of their rulers. The panopticon prison would be open to inspection from the public at large, just as the actions of officials would be under *Constitutional Code*. Publicity was the means of securing responsibility, and the most effective antidote against corruption.

POLITICAL REFORM

By the 1820s Bentham was convinced that the only regime with an interest in enacting good legislation was a representative democracy. Scholars disagree over precisely when Bentham committed himself to political radicalism. One view is that Bentham was a political radical from the time of the French Revolution, when, for a short period in late 1789, he advocated democracy for France. Another view, which is based on a coincidence of dates, is that Bentham became a political radical in 1808–1809, having come into contact with James Mill (1773–1836). The most plausible view, however, is that the crucial development took place around 1804 with the emergence in Bentham's thought of the notion of sinister interests, that is the systematic development of the insight that rulers wished to promote not the happiness of the community, but their own happiness. There was no point in showing rulers what the best course of legislation might be unless they had an interest in adopting it. Only a legislature elected by a democratic suffrage had such an interest.

If the key episode is the emergence of sinister interests, then the panopticon prison becomes significant. Bentham devoted many years of his life, large sums of his money (which he eventually recovered in a compensation settlement), and considerable energy, on the scheme. He was never so bitter or so despondent as when the plan was quashed in 1803. He became convinced that nothing worthwhile could be achieved through the existing political structure in Britain, or through similar regimes elsewhere. Having concentrated on questions of law reform from 1803, he was in the summer of 1809 prompted to compose material on political reform, eventually bearing fruit in *Plan of Parliamentary Reform* (1817).

In this work Bentham called for universal manhood suffrage (subject to a literacy test), annual parliaments, equal electoral districts, payment of members of parliament, and the secret ballot. Bentham then went a stage further and drew up a blueprint for representative democracy that would have abolished the monarchy, the House of Lords and any other second chamber, and all artificial titles of honor, and would have rendered government entirely open and, he hoped, fully accountable. These proposals were developed in astonishing detail in the magisterial *Constitutional Code*, the work he began in 1822 upon learning that the Portuguese Cortes had accepted his codification offer.

For Bentham the key principle of constitutional design was to ensure the dependence of rulers on subjects. Instead of the traditional theory of the separation of powers, he proposed lines of subordination, based on the ability of the superior to appoint and dismiss (in Bentham's terminology to locate and dislocate) the inferior, and to subject the inferior to punishment and other forms of vexation. The supreme power or sovereignty in the state would be vested in the people, who held the constitutive power. Immediately subordinate to the people would be the legislature, elected by universal manhood suffrage, and subordinate to the legislature would be the administrative (i.e., the executive) and judicial powers. The system of representative democracy was not an end in itself—the end was the greatest happiness—but was an indispensable means to that end, in that it was only under such a constitution that effective measures could be implemented to secure the good behavior (appropriate aptitude) of officials and minimize the expense of government. The securities for official aptitude, otherwise termed securities against misrule, included the exclusion of factitious dignities (titles of honor), the economical auction (whereby officials made bids for the salary attached to the office), subjection to punishment at the hands of the legal tribunals of the state, the requirement to pass an examination, and, most importantly, publicity.

Bentham went to great lengths to ensure that government would be open to public scrutiny, and thence subject to the force of the moral or popular sanction operating through the public opinion tribunal, which consisted in all those who commented on political matters, and of whom newspaper editors were the most important. Bentham saw the freedom of the press as a vital bulwark against misrule: hence his proposal to encourage the diffusion of literacy by making the suffrage dependent on a literacy test. These measures were intended to ensure that rulers would be so situated that

the only way they could promote their own interest was by promoting the interest of the community.

RELIGION

Bentham offered a secular vision of society, where the standard of rectitude would be founded not on theology, or natural law, or right reason, or precedent, or sheer prejudice, but on observation and experience. Knowledge of society (and of the individuals who composed it) enshrined in a "political science" (for Bentham's use of the term see, for instance, *Official Aptitude Maximized* [Schofield 1993, p. 191]) would be the basis for the art of legislation, the practical measures that an enlightened legislator would introduce in order to promote the greatest happiness of the community. Bentham was committed to freedom of expression in religion, as in other areas. While it may be too quick to conclude that he was an atheist, he did ally himself from an early period in his life with those who were sceptical, if not of religious belief, certainly of organized religion, and he never wavered in his outright opposition to religious establishments. As early as the mid-1770s, he drew attention to the potential mischiefs associated with what he termed the religious sanction. The expectation of a future state amounted to the expectation of the distribution of pains and pleasures, but did not in itself entail any rules specifying in what way such pains and pleasures would be distributed. If this distribution was to be random, then the expectation of them could not have any influence in encouraging good conduct or restraining bad. Given that the idea of God might provide motives, but could not provide direction, it was better that the moralist and legislator had nothing to do with it.

In the 1810s Bentham launched a sustained attack against established religion. He argued that religious belief was used to further the particular and sinister interest of the priesthood and those linked with it. The Anglican Church was an instrument in the hands of rulers to oppress and extort resources from subjects. It extracted large sums of money from the population generally, in order to provide income for rulers, without providing any useful service in return. The state supported the Church with its coercive force, while the Church manufactured delusive arguments in support of the state. Indeed, the scale of abuse in the Church was not only greater than that in the political and legal establishments, but acted as a bulwark against reform elsewhere. Bentham was particularly critical of the role of the Church in education, both in schools and in the Universities of Oxford and Cambridge. In relation to the poor, its policy was to exclude

from the benefits of education those unwilling to declare their belief in Anglican doctrine, and to pervert the morals and intellects of those who were willing.

Bentham's resentment at being forced to subscribe to the Thirty-nine Articles while at Oxford led him to insist that the provision of education should be divorced from the profession of belief. He recommended the "euthanasia" of the Anglican Church, whereby, as livings and other offices became vacant, they would be abolished. The present possessors would retain their incomes and thereby not suffer the pain of disappointment, while the expense of the religious establishment to the state, and thus to the people generally, would gradually diminish, and the additional income derived would be used to reduce taxation. Those people who wished to receive religious instruction could continue to do so at their own expense.

AUTO-ICON

Bentham was not buried, but his body transformed into what he termed an auto-icon. He had left instructions in his will that his body should be used in a series of anatomical lectures, and thereafter his skeleton "put together in such manner as that the whole figure may be seated in a Chair usually occupied by me when living in the attitude in which I am sitting when engaged in thought" (Crimmins 2002, p. 8). The operation was entrusted to Bentham's surgeon, Thomas Southwood Smith (1788–1861), who created the auto-icon—the combination of skeleton, wax head, clothes, and stuffing—which now resides in University College London.

Bibliography

WORKS BY JEREMY BENTHAM

The Bentham Project, University College London, is preparing a new authoritative edition of *The Collected Works of Jeremy Bentham*, which, it is estimated, will run to sixty-eight volumes. The twenty-fifth appeared in March 2002. The new edition is based on two main sources: first, texts printed during Bentham's lifetime; and second, Bentham's original manuscripts, of which around 55,000 folios are deposited in University College London Library, and around 10,000 in the British Library. Of the volumes in *The Collected Works*, the following have been most extensively drawn on for the entry above, and in-text citations correspond to these editions:

An Introduction to the Principles of Morals and Legislation, edited by J. H. Burns and H. L. A. Hart. London: Athlone Press, 1970.

A Comment on the Commentaries and A Fragment on Government, edited by J. H. Burns and H. L. A. Hart. London: Athlone Press, 1977.

Constitutional Code, Vol., edited by F. Rosen and J. H. Burns. Oxford: Clarendon Press, 1983.

The Correspondence of Jeremy Bentham. Vol. 4, *October 1788 to December 1793* edited by A. T. Milne. London: Athlone Press, 1981.

First Principles Preparatory to Constitutional Code, edited by Philip Schofield. Oxford: Clarendon Press, 1989.

Official Aptitude Maximized; Expense Minimized, edited by Philip Schofield. Oxford: Clarendon Press, 1993.

"Legislator of the World": Writings on Codification, Law, and Education, edited by Philip Schofield and Jonathan Harris. Oxford: Clarendon Press, 1998.

Rights, Representation, and Reform. Nonsense upon Stilts and Other Writings on the French Revolution, edited by Philip Schofield, Catherine Pease-Watkin, and Cyprian Blamires. Oxford: Clarendon Press, 2002.

Where works have not appeared in *The Collected Works*, the standard source is the so-called Bowring edition: *The Works of Jeremy Bentham*, published under the superintendence of his executor, John Bowring. 11 vols. Edinburgh: William Tait, 1843. For Bentham's economic thought see *Jeremy Bentham's Economic Writings*. 3 vols., edited by Werner Stark. London: George Allen & Unwin, 1952–1954.

There are two convenient collections of essays on Bentham: *Jeremy Bentham: Critical Assessments*. 4 vols., edited by Bhikhu Parekh. London: Routledge, 1993; and *Bentham: Moral, Political, and Legal Philosophy*. 2 vols., edited by Gerald J. Postema. Aldershot: Ashgate, 2002.

Philip Schofield (2005)

BERDYAEV, NIKOLAI ALEKSANDROVICH (1874–1948)

Nikolai Aleksandrovich Berdyaev, a Russian religious philosopher, was born in Kiev in a family of the old nobility. He attended the Kiev military school. In 1894 he enrolled in St. Vladimir's University of Kiev as a natural sciences student, but after a year transferred to the department of law. Infatuation with Marxism and participation in the social-democratic movement led to his arrest, exclusion from the university (in 1898), and a three-year exile to Vologda. This represented a break with the aristocratic environment to which he had been accustomed, a break that he later called a fundamental fact of his biography, not only of his external biography but also of his inner one.

Berdyaev's Marxist period did not last long; in a short period of time he underwent an evolution that was characteristic for many Russian thinkers of the beginning of the twentieth century—from Marxism to idealism to the search for God. Berdyaev was one of the initiators of three collections of essays that became famous and provoked much heated argument: *Problemy idealizma* (Problems of idealism; 1902), *Vekhi* (Landmarks; 1909), and *Iz glubiny* (De Profundis, Out of the depths; 1918). Berdyaev greeted the fall of the monarchy in February 1917 with great enthusiasm, but he assessed the October Revolution differently—as the triumph of the destructive principle in the Russian revolution. He participated in the work of the Vladimir Sergeevich Solov'ev (Solovyov) Religious-Philosophical Society and was the founder of the Free Academy of Spiritual Culture (1918–1922), which became a non-Marxist spiritual center and continued the traditions of the Russian Silver Age after the Bolshevik coup. In 1919 Berdyaev was elected as a professor of Moscow University. Despite the fact that Berdyaev was remote from actual political struggle, in 1922 he and other outstanding figures of Russian culture were forcibly deported from Soviet Russia to Germany.

In 1922 Berdyaev founded the Religious-Philosophical Academy in Berlin, and in 1923 he became the dean of the Russian Scholarly Institute, established in Berlin to educate the Russian émigré youth. Also in 1923 he

became a member of the council of the Russian Student Christian Movement, in which he participated until 1936. In 1924 he moved to France, where he edited the religious-philosophical journal *Put'* (The way; 1925–1940). The Religious-Philosophical Academy that he had founded also moved to Paris, and there he read lecture courses on “The Problems of Christianity,” “The Fate of Culture,” “Man, the World, and God,” and so on. Berdyaev was one of the few Russian émigré thinkers who did not confine himself in the émigré milieu. During his lifetime he wrote a great many books that were published not only in Russian but also in other languages. His religious existentialism found a response among a number of West European thinkers; his philosophical ideas were esteemed highly by such figures as Jacques Maritain, Gabriel Marcel, Ernst Bloch, and Karl Barth. Berdyaev had a particular influence on the philosophical circles gathered around the journal *Esprit*, which was founded by Emmanuel Mounier in 1932 and inaugurated French personalism. In 1947 Cambridge University awarded Berdyaev the title “Honoris causa.” Berdyaev died in 1948 in a suburb of Paris.

METAPHYSICS OF FREEDOM

Berdyaev's religious-philosophical doctrine was greatly influenced by the ideas of Solov'ev, Immanuel Kant, Fëdor Mikhailovich Dostoevsky, and the seventeenth-century German mystic Jakob Boehme. According to Berdyaev the distinguishing characteristic of philosophy consists in the fact that it is not reducible to a system of concepts, but that it rather represents a knowledge that speaks in the language of symbols and myths. In his own philosophy the central role belonged to freedom and creativity. Berdyaev (like Boehme) bestowed an ontological status on freedom; he believed that freedom has primacy in relation to natural and human being and that it is independent of God's being. Berdyaev often used Boehme's term *Ungrund* (groundlessness or bottomlessness) to describe such pre-ontic freedom. God expresses only the light or radiant side of this freedom, and the world created by him could also be radiant and good. But God cannot compel the world to be good, and one's free choice is not always in favor of the good (such was Berdyaev's interpretation of the biblical myth of the fall of man). That is how evil arises in the world. One has difficulty understanding why God did not create a world without sin, sicknesses, children's tears, and suffering. The answer is simple: Such a world would not have freedom, which lies at the foundation of the universe and which God does wish to limit and cannot limit.

Berdyaev traced the paradoxical and tragic dialectic of the good and freedom: on the one hand, it is obvious that one cannot be compelled to be good, but on the other hand, the freedom of the good also presupposes the freedom of evil in the world. Like Dostoevsky, Berdyaev rebelled against compulsory harmony imposed on human beings from outside. Without the freedom of sin, evil, trial, and suffering, one cannot understand harmony or the kingdom of God. Because of this tragic dialectic the world has to undergo the “trial by freedom” so that its choice in favor of the good will be free; and the fate of the world coincides, in the final analysis, with the fate of freedom in the world. The thesis that freedom has an uncreated and pre-ontic character is foundational for Berdyaev's philosophy, for if one supposes that freedom was created character, then God himself would turn out to be responsible for the evil of the world. However, for Berdyaev, God is revealed to humans, and humans, through their freely followed destiny, are revealed to God; and Revelation is thus a mutual process.

Berdyaev's Christianity was tragic and not fully orthodox. He had an acute sense of the presence of evil in the world and the substantiality of evil. This led him to pose the problem of theodicy, to attempt to understand the causes why evil is permitted in the world. If the first stage of Berdyaev's spiritual evolution was Marxist and the second idealistic in character, the third stage begins precisely with posing the problem of theodicy. It can be described as Berdyaev's Christian period.

PERSONALISM

In Berdyaev's worldview freedom and spirit are opposed to unfreedom and necessity, to the material “world of objects.” For him these are two kinds of realities, interacting with each other. The world in which one lives is fallen precisely because it is dominated not by freedom but by necessity. In the reality that surrounds one, all things are regulated by law and unfree. (Here, Berdyaev's position converges with that of the other existentialists.) Reason and rational knowledge cannot help one free oneself from the necessity externally imposed on one, since reason and rational knowledge signify only adaptation to the world of objects.

Free people find themselves in a world dominated by necessity. And naturally they strive to escape from the power of the lower reality, where all things are regulated by law and are predictable. But they can escape only through creative activity, which is always a free expression

of their selves. In a creative act people once again feel themselves to be a godlike being, not constrained by the laws of the material world. People are called to creative activity, to the continuation of the creation of the world, for the world is fundamentally unfinished. The primacy of freedom over being also determines the meaning of human life: the goal of people is not salvation, but creative activity; the creative act has intrinsic value.

Berdyaev proclaimed that the purpose of creative activity is not to accumulate cultural values, but to bring to an end the fallen world of necessity. For Berdyaev the social reality is only an objectification (symbolization or materialization) of the subjective personal spirit. He reinterprets Kant in his own manner, concurring with Kant's recognition of another reality that is more profound and hidden behind the objectified world.

For Berdyaev, social problems (e.g., hunger, poverty, and inequality) are secondary in comparison with spiritual problems. The elimination of hunger and poverty will not liberate people from the mystery of death, love, and creative activity. Furthermore, the conflicts between the individual and society, humans and the cosmos, history and eternity are only made more acute in the case of a more rationally ordered society. People are called to creative activity, but all creative activity is inevitably a failure, since the results of such activity are objectified and participate in the enslavement of man. "The ardent creative spirit" cannot recognize itself in works of art, books, or theories—in its products. The results of creative activity are alienated from the creator. According to Berdyaev creative activity is "ascent out of the world," but a total break with the world is impossible; and this constitutes the tragic character of human existence.

HISTORIOSOPHY

According to Berdyaev every person lives not in one time, but in at least three times: Since people are simultaneously natural, social, and spiritual beings, there also exist three times for them: cosmic, historical, and existential. Berdyaev uses geometrical figures to describe these three times: the circle, the line, and the point. Cosmic time follows the natural and regular logic of circular motion; this time operates not with days and years but with epochs and millennia. By contrast, historical time follows a straight line and operates with smaller temporal categories. However, the most significant events occur in existential time; it is precisely in the latter that creative acts and free choice take place. For existential time the duration of an event is relative: sometimes for a person a day is longer and more significant than a decade, whereas sometimes a year slips

by imperceptibly. A person's earthly time itself is only a phase, a period within eternity; it is rooted in eternity. The eternal is made incarnate in time; it invades time (just as heavenly history invades earthly history), and history becomes the history of the battle of the eternal against the temporal. But the forces are not equal. The eternal will triumph over all that is corruptible and fleeting: The objectified world will perish. All creative activity represents an escape from the chain of cause and effect, which is why every creative act shakes the foundations of cosmic necessity. Berdyaev's vantage point is an eschatological one; he believes that the meaning of history is in its end, in the triumph of the free spirit over objectification. Earthly history is the path to the other world; this history is too narrow and limited for the incarnation of the ideal; the problem of history can be solved only beyond the limits of earthly history, in eternity.

In trying to understand the tragic experience of the Russian revolution and the tendencies of European development, Berdyaev proclaimed that the areligious, humanistic epoch had reached its completion and that humankind had entered the sacral epoch of new Middle Ages, characterized by a religious renaissance and religious conflicts. Berdyaev claimed that, in the twentieth century, all significant ideas inevitably acquired a religious meaning. This goes also for communist ideology: using Soviet Russia as an example, he showed that this country had entered the epoch of new Middle Ages, for he considered Russian Marxism to be a type of religious faith with its savior (the proletariat), prophets (Marx, Friedrich Engels, and Vladimir Il'ich Lenin), "doctrine of man's fall" (the history of the emergence of private property), paradise (communism), and so on. Russia was at the leading edge of the historical process, as it were; and after the revolution the Russian idea had acquired a universal significance.

Berdyaev identified six fundamental stages of world history. The first stage was that of antiquity, when people were submerged in the depths of natural necessity. Berdyaev associated the second stage with the fate of the Jewish nation, with its messianic consciousness, thanks to which the static ancient was replaced by the historical approach to reality. The third stage was that of the overcoming of the two preceding stages by Christianity, which introduced the idea of eschatology into the human consciousness. The fourth stage was the epoch of the Renaissance, when humanism was born and people's falling away from God began. The reaction to this was the Reformation, the fifth stage, when, in counterweight to the Renaissance spirit, people's independence was denied and

their total dependence on divine providence was proclaimed. The sixth stage, according to Berdyaev's conception, was associated with socialism, with the attempt to realize the kingdom of God on earth.

By the will of the fates, Russia, without having experienced some of these historical stages, became humanity's testing ground for the realization of the totalitarian-socialistic ideal. But, in Berdyaev's opinion, Russian socialism also became the sign of the transition to the seventh stage, to the new Middle Ages, a period of religious-social synthesis. Berdyaev proposed his own version of socialism, which resembled its Marxist counterpart in only one thing: a fundamental antibourgeois attitude. For Berdyaev, socialism has a dual nature: it can create either a new free society or a new slavery. Berdyaev himself was a proponent of personalistic Christian socialism.

BERGMANN, GUSTAV

(1906–1987)

Gustav Bergmann came to the United States in 1938 from Vienna, Austria, where he had earned a JD and a PhD in mathematics. He had also been a junior member of the Vienna Circle.

In 1939 he became a faculty member at the University of Iowa, retiring in 1976. He held a joint appointment in the Departments of Philosophy and Psychology. He regularly taught a course on the history and philosophy of psychology. Bergmann became well known as an apologist for behaviorism. Significantly, he distinguished between methodological and metaphysical behaviorism, embracing the former and rejecting the latter. Bergmann never wavered in his ontological commitment to the mental.

Bergmann also published in mathematics, the philosophy of physics, the history of philosophy, and the philosophy of law. His *Philosophy of Science* (1957) is an elegant and still useful work. He was, however, first and foremost a philosopher, an ontologist to be exact. The central question is what exists. His method for answering that question, the ideal-language method, was to design a formalism into which one could transcribe all empirical statements of the natural language and which formalism could be used to account for the difference between the necessary and the contingent statements of the natural language. The ontology of the world would be revealed by the difference in the kinds of basic, undefined sign of the formalism.

The necessary-contingent distinction was relatively easy to handle. What is necessary and contingent is a given. One needs merely to transcribe the necessary statements into sentences of the formalism, the truth values of which sentences are a matter of form, and the contingent ones to sentences the truth values of which are not a matter of form. The idea is a classical one; the only difference being that the classical philosophers spoke of thoughts as truth bearers whereas the ideal-language philosophers spoke of sentences of the formal language as truth bearers. Relatedly, for the classical philosophers the truth makers were either features of the thought or of something beyond, the thought, whereas for the formalist the truth bearers were either features of sentences or something beyond the sentence.

Determining what kinds of signs are basic was difficult to handle. Bergmann began as a positivist: The only existents were the entities stood for by the subjects and predicates of atomic sentences, entities with which one

had to be acquainted. He was, then, a phenomenalist. In time, he acknowledged that the operators were not eliminable; they had to stand for entities that had ontological status. A distinction was thus made between existents and subsistents. Logical entities subsist; empirical, sensuous ones exist. The latter presented their own problems. Each entity was of a kind, particular or universal. Thus, a simple entity was a complex of sorts, a form and a content. Unlike the early Ludwig Josef Johann Wittgenstein, Bergmann insisted on according the forms ontological status. Forms subsist. That put pressure on the use of the Principle of Acquaintance, sufficient pressure to force Bergmann to replace it with a Principle of Presentation, a principle that cast a wide net indeed.

In his last phase Bergmann became sensitive to the criticism that he was a mere formalist and that all his ontological claims were transcendental ones, his talk of acquaintance and presentation being mere talk. His last work, *New Foundations of Ontology* (1992), published posthumously, is rich in talk about “phenomenological bedrock.” Bergmann’s fate was a curious one. His commitment to particulars, universals, forms, and whatever else was dictated by the needs of the formalism and by his conception of the difference between eliminable and ineliminable terms rather than by the need to solve such problems as that of individuation and universals. The issue of whether the basic entities are “experienced” was an afterthought, a most nettlesome one.

Bergmann’s devotion to the method was never shaken; and in the context of the method he made two brilliant moves. First, in the mid-1950s he found a way to render in the formalism an analysis of mental acts. As act was a particular with two properties, one for the kind of act it was (a remembering, a doubting, or whatever) the other for the content of the act (that the moon is blue, that the ball is red, or whatever). (One would benefit from comparing Bergmann’s analysis with René Descartes’s third-meditation discussion of the use of the term *idea*.) Regarding the content-carrying property, Bergmann ran into a problem. He wanted it to be simple but had to have it complex, the reason being that the property had to serve as a truth bearer and for that need to be satisfied the property had to have within it a mark that would indicate the truth maker for it. The alternative would be to introduce an objectionable state of affairs that would show that the content property was related to a possibility that itself would contain a mark of its truth maker. The move, brilliant though it was, failed; but its failure provides one with something deeply instructive about the “make true” talk.

Second, ontology is about the kinds of entity that exist. Most formalisms need to give significance to the order of the signs in a relational sentence. There is an important difference between, say, Othello loving Desdemona and Desdemona loving Othello. The order of the terms flanking the relation sign contributes to the meaning of the sentences. Bergmann’s last work was in part an attempt, as he liked to express it, to delinearize the language. He introduced dyads, a dyad being a pair of entities combined by a nexus that is other than exemplification, the tie that tied, say, two particulars and a relation into a fact. Accordingly, “aRb” was replaced by “aR{ab},” and “bRa” by “bR{ab}.” Order makes no difference. The two relational facts are different in virtue of different entities. The disposing of order comes with a heavy price: nonsimple entities that are not facts require a tie, cannot exist independently of facts, and are treated by the syntax as if they were simple terms. Again, a brilliant move fails; and for a reason rather like the reason for the first failure. A nonfact complex is needed where one wants desperately to have a simple one.

Notwithstanding the failures, Bergmann’s philosophical work is deep and probing and unfailingly illuminating. It has much to teach about not only the use of formalisms in doing ontology but also about the classical tradition.

BERGSON, HENRI

(1859–1941)

Henri Bergson, the French philosopher of evolution, was born in Paris of Anglo-Polish parentage. During a lifetime of teaching, lecturing, and writing, he gained an international reputation as the author of a new and distinctive philosophical outlook presented in a succession of books whose fluent, nontechnical style gave them a wide appeal. In 1900 Bergson became professor of philosophy at the Collège de France, a post he held until 1921, when ill health obliged him to retire. He received many honors, including election to the French Academy and in 1927 the Nobel Prize for literature. After World War I, Bergson devoted much attention to international affairs, in the hope of promoting peace and cooperation among nations. But World War II had begun and France had been occupied by the armies of Nazi Germany at the time of his death.

Despite the novelty of his outlook, Bergson owed much to his predecessors in the European, and especially in the French, philosophical tradition, primarily to thinkers whose ideas supported his opposition to materialism and mechanism; he was convinced that neither of these doctrines is philosophically tenable. Thus, he was influenced by the idea of Maine de Biran that we sense the “flow” of life as a primary inner experience; by the contentions of Felix Ravaisson that philosophic thought should be focused on the directly intuited, concrete individual, and that mechanism is the external form of an inner spiritual activity; by the contention of Alfred Fouillée that there is an intrinsic freedom in human action; and by the teaching of Émile Boutroux that there exists a radical contingency in nature. His obligation to ancient thought was chiefly to Plotinus, whose mysticism became increasingly congenial to Bergson in the later years of his life. The theory of biological evolution, in both Charles Darwin’s scientific formulation and Herbert Spencer’s speculative formulation deeply influenced him. He was once “very much attached to the philosophy of Spencer” (*The Creative Mind*, p. 93), but broke away because of its unsatisfactory treatment of evolution and of time.

TWO KINDS OF TIME

Of central importance in Bergson’s outlook is his distinction between the time that occurs in the theories of natural science and the time that we directly experience. Scientific time is a mathematical conception, symbolized in physical theory by the letter *t* and measured by clocks and chronometers. Because these measuring instruments are spatial bodies, scientific time is represented as an extended, homogeneous medium, composed of standard units (years, hours, seconds). Most of man’s practical life in society is dominated by these units. But time thus represented neither “flows” nor “acts.” It exists passively, like a line drawn on a surface. When we turn to our direct experience, Bergson urged, we find nothing that corresponds to this mathematical conception. What we find, on the contrary, is a flowing, irreversible succession of states that melt into each other to form an indivisible process. This process is not homogeneous but heterogeneous. It is not abstract but concrete. In short, it is “pure time” or “real duration” (*durée réelle*), something immediately experienced as active and ongoing. If we try to represent it by a spatial image, such as a line, we only generate abstract, mathematical time, which is at bottom an illusion. The great weakness of mechanistic modes of thought is that they consider this illusion to be a reality.

DETERMINISM AND FREEDOM

In *Time and Free Will* Bergson undertook to show that the recognition of real duration provides a basis for vindicating human freedom and disposing of determinism. The determinist, according to Bergson, holds that freedom of choice does not exist. He supports his view by picturing the situation in which one confronts an ostensible choice as being like arriving at a point on a line where a branching occurs, and taking one of the branches. The determinist then contends that the particular branch taken could not *not* have been taken. He further holds that, given full knowledge of the antecedent states of mind of the agent, the branch taken could have been predicted beforehand.

The force of this argument, according to Bergson, derives from misrepresenting the situation of choice by using an abstract, spatialized conception of time. At best the determinist’s image of the line symbolizes the choice already made, not the choice in the making. In acting we do not move along a path through time. Deliberating about a choice is not like being at a point on a line and oscillating in space between various courses confronting us. Deliberation and choice are temporal, not spatial, acts. Moreover, the determinist makes the associationist’s mis-

take of supposing that the mind of the agent consists of a succession of atomic states that determine how he will act. The associationist's mechanistic interpretation of the mind produced a fallacious picture upon which determinism was superimposed.

Freedom of action, according to Bergson, is something directly experienced. Man feels himself to be free as he acts, even though he may be unable to explain the nature of his freedom. Nevertheless, we are free only when our act springs spontaneously from our *whole* personality as it has evolved up to the moment of action. If this spontaneity is absent, our actions will be simply stereotyped or mechanical responses. In such cases we behave like automata. Hence, freedom is far from being absolute. Indeed, for most people free acts are the exception, not the rule. To this extent the determinists are right.

BODY AND MIND

Direct experience not only establishes the reality of time and of freedom; it also testifies that each of us is a body, subject to the same laws as all other bits of matter. Bergson's dualism emerges clearly in *Matter and Memory*. Bodies are there interpreted as "images"; that is, objects perceived in space. Among these images is one that I know from the outside by perception and from the inside by sensation or affection. This is my own body, which I also know to be a center of action.

What is the relation between the body and the mind? Materialism holds that mind, or consciousness, is either identical with brain activity or existentially dependent on brain activity. Bergson rejected both positions because, he claimed, there is vastly more in a given occasion of consciousness than in the corresponding brain state. The attempt to substantiate this claim led him to reject the doctrine that a parallelism exists between the series of conscious states and the series of brain states. The considerations to which he appealed came mainly from an examination of memory.

TWO KINDS OF MEMORY

Living organisms, unlike nonliving objects, retain their past in the present. This phenomenon is manifested, according to Bergson, in two kinds of memory. One kind consists of sensory-motor mechanisms or "habits" fixed in the body of the organism and designed to ensure adaptation to a present situation. When an appropriate stimulus arises, one of these mechanisms "unwinds" as a response. The other kind of memory, which humans alone possess, records in the form of memory images all the events of daily life as they occur in time. These images

provide the content of occasions of recalling. This is "pure" memory, which is wholly spiritual. "Consciousness signifies, before everything, memory."

To defend his view of pure memory, Bergson argued against any correlation of memory images with hypothetical memory traces stored in the brain. Physiologically, the brain consists of a vast number of neurons, synapsing with each other and with afferent and efferent nerves. It resembles a telephone exchange, not a storage device. There is no evidence that memories are located spatially within it. Moreover, if a visual recollection of an object were dependent on a brain trace, there would have to be thousands of traces, corresponding to all the variations due to different points of view from which the object has been perceived. But what we actually have in each case is one practically invariable memory image of an object, not a large class of different images. This, Bergson thought, constitutes proof that something quite distinct from mechanical registration is involved. Finally, there are facts associated with loss of word memory and its restoration which point to the conclusion that the recollective process is independent of brain traces. It follows that materialism and psychoneural parallelism are untenable doctrines.

How, then, is pure memory related to the brain? Bergson's answer is derived from his contention that pure memory retains the whole of our past. If this is the case, something must prevent all our memories from being simultaneously present to consciousness, since we do in fact recall only one or two things at a time. The brain must therefore act as a filter for our memories, allowing only those that are practically useful to emerge on a given occasion. In other words, the brain is a mechanism invented by nature to canalize and direct our attention toward what is about to happen, in order to assist our actions. It is designed not so much to promote remembering as to promote forgetting. By bringing pure memory into contact with practical actions, it also establishes a link with habit memory, since most of our everyday actions tend to be habitual and routine. In this way the two kinds of memory are united.

Although he would not countenance the idea that memory traces are stored in the brain, Bergson allowed for the storage of images in pure memory. He asserted that pure memory retains all our conscious states "in the order in which they occur." This view led him to accept the conclusion that part of the mind is unconscious or subconscious. It is erroneous to suppose that the existence of psychical states depends on their apprehension by consciousness. To suppose this is to vitiate the concept

of mind by casting an artificial obscurity over the idea of the unconscious. The significance of pure memory can be understood only by supposing that past psychological states have a real, though unconscious, existence.

It is now possible to explain the relation between the body and the mind. Here, as elsewhere, there has been a strong temptation to think in spatial terms, envisaging two separate substances that have to be connected. But the relation between body and mind must be understood in temporal, not spatial, terms. The point becomes clear when we unite the insight derived from our consciousness of real duration with the recognition that the body is a center of action, for on an occasion of action, body and mind are related by a convergence in time. No spatial representation of this convergence can be adequate. It can be grasped only by noting what takes place whenever we act. A familiar example is our perception of the external world.

PERCEPTION AND THE EXTERNAL WORLD

The discussion of this question forms an integral part of *Matter and Memory*. In considering perception, traditional realism and idealism have, according to Bergson, made two unjustified assumptions. First, they have assumed that perception is a kind of photographic process that yields a picture of what is perceived. The mind is envisaged as a *camera obscura* inside which images are generated. Second, they have regarded perception as a cognitive function whose aim is to provide pure knowledge. Bergson contended that perception cannot possibly be a photographic process, for images are not inside the mind but are part of the spatially extended world. Moreover, perception does not generate images, but selects those images that have a possible bearing on actions. Nothing remotely akin to pure knowledge is involved at the perceptual level. Once these assumptions are discarded, the dispute between realism and idealism can be resolved.

In supporting this idea Bergson used biological considerations. Biologists are agreed that there has been an evolution of the structure and the functions of the central nervous system in living organisms. This evolution has proceeded from relatively simple types of organization toward greater and greater complexity, through a series of minute, adaptively significant changes. In simple organisms the rudiments of perception are to be found in mechanical responses to external stimulation. Direct contact with bodies, such as we experience in tactile perception, belongs to this stage. The role of the rudimentary

nervous system is to facilitate action. What occurs is a reflex activity, not a “representation” of things. The sole difference between this stage and much later ones is that voluntary action became possible as a result of the evolution of the higher brain centers. But the difference is not one of kind, but only one of complication. Accordingly, since the nervous system is constructed from one end of the evolutionary scale to the other as a utilitarian device, we must conclude that perception, whose evolution is regulated by the evolution of the nervous system, is also directed toward action, not toward knowledge.

If that is so, why is human perception a conscious process, and why does everything happen as if consciousness were a product of brain activity? The reason is that human perception is normally “impregnated with memory images.” It is possible to form a metaphysical concept of “pure perception” free from any admixture of memory. It is even possible, Bergson thought, to have such a pure perception, which he spoke of as an “intuition.” But most of the time our perceptions are interlaced with memories; conversely, a memory becomes actual by being embodied in some perception. The convergence that takes place accounts for the fact that perceptual images (objects perceived) have a “subjectivity.” We become conscious of them. This phenomenon has a biological significance, for in humans, and in higher organisms generally, perception is predominantly directed toward distant objects spread over a wide field. These objects have a great many potential effects on action. One way an organism has of adapting to this situation is to anticipate the effects by “reflecting” possible lines of action from its body to the distant objects. This gives the organism a biological advantage by putting it in a position where it can select a course of action that will serve its needs. Thus the world is consciously perceived by us; but it is not a different world from the one that antedated our perception. It is the same world related to our needs and intentions.

Body and mind, then, are united in the selective act of perception. The body contributes perceptive centers that respond to the influences of environing bodies. The mind contributes appropriate memory images that give to what is perceived a completed, meaningful form. There is no “constructing” of the external world out of subjective impressions; no “inferring” of the existence of that world from ideas in the mind; no positing of things in themselves that are beyond the limits of possible experience. By interpreting physical things as images, Bergson was able to regard the material world as directly perceivable. Traditional idealism was therefore repudiated. Yet a partial concession to idealism was made by calling things

“images.” This term implies a rejection of the realist’s view that things consist only of material particles, or of primary qualities, or of some hidden substance. Things have all the qualities they are perceived to have. A partial concession to realism was made by admitting that the totality of perceived things, past, present and future, must always be a small fragment of material reality. The upshot is a doctrine, intermediate between idealism and realism, that combines, Bergson contends, what is sound in each and discards what is unsound.

Body and mind are above all united in real duration, for perception is an event in the concrete present, and the present is no geometrical point or “knife edge” separating past from future. It is a continuous flowing, an “invisible progress of the past gnawing into the future.” Perceptual acts are intrinsically temporal and dynamic. Yet the world we come to know by means of them is not a flux. It has a relative stability. Our concepts often refer to things that remain much the same for long periods. These things may have fixed position, sharp outlines, and clearly marked qualities. In view of what has been said about perception, how are such facts accounted for? The reply involves Bergson’s conception of the intellect and its functioning.

THE INTELLECT AND THINGS

The evolution of the human species gave rise to the capacity for conceptual or rational thought. This capacity is traditionally referred to as the intellect. Its origin, Bergson contended, was conditioned by several circumstances. First, man is one of the social animals, and effective action in human societies requires some use of rational thought. Second, man is a tool-using and tool-making animal. These activities could not advance far without fostering conceptualization. Third, man is an animal who invents and uses language. This powerful instrument of communication stimulated the development of intellect, and was in turn profoundly influenced by it. Here again the aim was to promote community of action. Thus, both in origin and in function, the intellect is a practical capacity. It is no more speculative than is perception.

By using his intellect, civilized man has produced a vast body of knowledge about the world. Is not much of this knowledge speculative, in the sense of being a cognitive reflection of the world as it really is? Bergson held that this is not so. Since the intellect is practical, its products must be instrumental to action, not mirrorlike reflections. Concepts, even when they belong to advanced theories in the sciences, are still pragmatic devices. For

scientific knowledge is directed toward prediction and control of events, being in this respect an extension of commonsense knowledge. The technological triumphs of modern man provide the clue to the proper understanding of his intellectual powers.

Because of its practical orientation, the intellect functions in a characteristic way. It treats whatever it deals with in spatial terms, as if the latter were a three-dimensional body. Ordinary language is pervaded by spatial metaphors; and scientific theories, especially those of physics, make great use of geometrical models. The operations of our intellect, especially in science, “tend to geometry, as to the goal where they find their perfect fulfilment” (*Creative Mind*, Introduction II). Again, the intellect has an inherent tendency to break up whatever it deals with into homogeneous units. A whole can be understood only by analyzing it in terms of uniform parts. This tendency is reflected in the predominance of measuring operations and instruments, such as clocks, scales, and yardsticks, in civilized societies. Furthermore, the intellect is at home only when dealing with what is static, fixed, immobile.

Hence, in seeking to understand the phenomenon of motion, the intellect has recourse to immobile units, such as points of space or instants of time, out of which motion is reconstructed. Bergson spoke of “the cinematographical method” of the intellect, likening it to a movie camera that translates motion into a series of static “frames.” An important consequence of this is that the intellect is committed to the use of formal logic and mathematics, both of which supply unchanging structures for thought. Finally, when something comes into existence or ceases to exist, the intellect interprets what happens as a rearranging of constituent elements. This means that the arising of something absolutely new, the creation of novelty, cannot be admitted by rational thought. Even growth and evolution must be understood as new arrangements of old parts.

It is now possible to explain why the world external to us consists of relatively stable, discrete things. The intellect, functioning in its characteristic way, is responsible. It “breaks up,” “cuts up,” or “carves up” matter into distinct and separate objects so as to promote the interests of action. Presumably, the operation requires the collaboration of perception, although Bergson did not make the point clear. He also failed to make clear whether the intellect is perfectly free in carving out individual things, or whether it has to follow certain lines of cleavage in the intrinsic structure of matter. Sometimes he talked as if the external world of things had been “fabricated” by the

intellect's imposing form on a featureless, material flux. At other times, he implied that the intellect "carves nature at the joints," following "the lines which mark out the boundaries of real bodies or of their real elements." In one place he even stated that "matter is primarily what brings division and precision" into things; but this can hardly be construed as an acceptance of the doctrine that matter is the principle of individuation. Despite these obscurities, Bergson's position entails that the intellect is necessary, if not sufficient, for the "individuating" of things in space.

This requirement is relevant, of course, only to things of which we have conceptual knowledge. What is its bearing on the knowledge each of us has of his own body? Here a further obscurity arises. Bergson declared that we know our body in two ways, externally by perception and internally by affection. But since at the level of affection the intellect is not involved, it would appear to follow that the object known cannot be a separate, individual thing. Nevertheless, Bergson did speak of the central image, "distinct from all others," that each of us identifies as his body. What determines its distinct individuality? In *Matter and Memory* he remarked that "our needs ... carve out, within this continuity [of the perceptible world], a body which is to be their own." This is a puzzling remark, because often the body is what has the needs, and hence it can scarcely be "carved out" by them. It may be that the living human body, unlike inanimate bodies, has an individuality that does not depend on the functioning of the intellect. Or it may be that the obscurity here originates in Bergson's doctrine about what the intellect knows and what can be known only by intuition.

INTUITION AND INTELLECT

Alongside the capacity for conceptual thought, there exists in humans a capacity that Bergson called "intuition." Both capacities are the result of evolution, but the second is derived from instinct, the type of biological activity most elaborately manifested in the social insects. Instinctive activity has consciousness "slumbering" within it, and evolution has awakened the consciousness in humankind. Intuition for Bergson is "instinct that has become disinterested, self-conscious, capable of reflecting upon its object and of enlarging it indefinitely." Since it is disinterested, the capacity is detached from the demands of action and of social life. It is like a painter's power of seeing the world just as it is presented to him in pure perception. But instead of yielding an aesthetic experience, intuition yields knowledge. Hence, it is of profound importance for the philosopher.

In his *Introduction to Metaphysics*, Bergson emphasized the immediate, nonconceptual character of intuition, envisaging it as a direct participation in, or identification with, what is intuited. In the case of the external world, intuition is an act "by which one is transported into the interior of an object in order to coincide with what there is unique and consequently inexpressible about it." In the case of the self, intuition is an immersion in the indivisible flow of consciousness, a grasping of pure becoming and real duration. The result is "knowledge which is contact and even coincidence." Unlike the intellect, which remains outside what it knows, requires symbols, and produces knowledge that is always relative to some viewpoint, intuition enters into what it knows, dispenses with symbols, and produces knowledge that is absolute.

Bergson subsequently modified this doctrine in certain respects. He came to emphasize the cogitative character of intuition instead of its immediacy, and even spoke of it as a mode of thinking. As such, it is not a spontaneous flash of insight but an act that is engendered by mental effort. To achieve an intuition, we must turn our attention away from its natural concern with action. This act demands concentration of thought. Even when we are successful, the results are impermanent. Yet the intellect can effect a partial communication of the results by using "concrete ideas," supplemented by images. "Comparisons and metaphors will here suggest what cannot be expressed." Consequently, the knowledge attained by intuition is not altogether ineffable. Nor is it, in the strict sense, absolute, for intuition is a progressive activity that can widen and deepen its scope indefinitely. Its limits cannot be fixed a priori. These modifications were related to changes in Bergson's conception of the roles of metaphysics and the natural sciences.

THE NATURAL SCIENCES AND METAPHYSICS

The natural sciences are for Bergson a typical achievement of the intellect, and they therefore reflect a limitation in the intellect's functioning. This limitation emerges when the sciences form their conceptions of time and motion. In each case a static abstraction is produced. Time is conceived as what clocks measure in spatially discrete units. Motion is conceived as a succession of fixed positions on a linear path. Both abstractions are practically useful, but they falsify the nature of time and motion as concretely experienced by ignoring the crucial element of becoming. This falsification is inherent in the intellect's way of working. By its very nature, the intellect

is equipped to handle only what is repetitive and routine; real becoming baffles it. Hence the sciences have a severe disability built into them. Moreover, as the ancient philosopher Zeno of Elea first pointed out, conceptual thought runs into contradictions or “paradoxes” whenever it tries to give a thorough analysis of motion. These paradoxes, although designed by Zeno for a different purpose, show, according to Bergson, that the scientific concept of motion is basically incoherent. The conclusion must be that the sciences can never provide a complete and adequate account of the universe. They need to be supplemented by some other discipline.

An obvious choice would seem to be metaphysics, but classical metaphysics is equally a creation of the intellect and suffers from the same disability as the sciences. Metaphysicians, with a few exceptions like Heraclitus, have misconstrued change and failed to give it the priority it actually has in the world. They have regarded being as ultimate, and becoming as derivative. Accordingly, metaphysical theories have been based on such concepts as the indestructible atoms of Democritus, the eternal forms of Plato, or the fixed categories of Immanuel Kant. These concepts illustrate the intellect’s addiction to unchanging units that are mechanically combined or separated according to the rules of logic. Neither time nor change can be understood when so approached. The constructions of metaphysics are as inadequate here as those of science, without the latter’s usefulness.

Classical metaphysics has also mistakenly supposed that an all-embracing “system” can be constructed, bringing within its scope not only what is actual but also what is possible. This idea rests on a fallacious assumption that there is a “realm of possibility” over and above the realm of actuality. The belief in possibles that would be realized by acquiring existence is an illusion of the intellect, designed to exclude the notion of absolute novelty. “Let us have done,” Bergson urged, “with great metaphysical systems embracing all the possible and sometimes even the impossible!”

By following this course, we shall automatically get rid of a number of pseudo problems that classical metaphysicians have generated. They have asked, for instance, why something exists rather than nothing. This has seemed a sensible question because they could always add, “There could be nothing.” Bergson replied that the sentence “There could be nothing” has no meaning. “‘Nothing’ is a term in ordinary language which can only have meaning in the sphere proper to man, of action and fabrication.” The term designates the absence of what we are seeking in the world around us. It can be properly

used only because many things already exist. To oppose “nothing” in an absolute sense to existence is to embrace a pseudo idea and engender pseudo problems.

These criticisms do not imply that metaphysics is to be rejected, for Bergson proposed to redefine metaphysics and provide it with a new method. Instead of employing the intellect, it is to employ intuition. This is the theme of the *Introduction to Metaphysics*. In elaborating it, Bergson sometimes seemed to be saying that since intuition alone provides knowledge of the real, the intellect is restricted to knowledge of appearances. It would follow from this that metaphysics is a discipline superior to the natural sciences. Indeed, from a philosophical standpoint the sciences are cognitively worthless because they can say nothing about reality. The impression was thus created that Bergson’s outlook was “antiscientific.” In later writings he endeavored to correct this impression by urging that metaphysics and the sciences must be coordinate and equal in value. Both are concerned with the real, the sciences with the domain of matter, metaphysics with the domain of spirit. Moreover, the knowledge that each gains is capable of indefinite expansion, and can approach completeness as an ideal limit. It was in this connection that Bergson seems to have revised his doctrine of intuition, closing the gap between it and the intellect without obliterating the distinction between the two. His objective was to formulate a philosophy that would submit to the control of science and that could in turn enable science to progress. The disciplines would then have a common frontier. In adopting the method of intuition, metaphysics is able to supplement the sciences by giving a true account of duration, of becoming, and even of evolution.

MECHANISTIC AND CREATIVE EVOLUTION

Bergson was born in the same year that *The Origin of Species* was published, and the revolutionary implications of this work permanently affected his thought. He accepted the historical reality of evolution, but rejected attempts to explain it in mechanistic or materialistic terms. Hence he criticized Darwin’s explanation, and also the less influential explanations of the Chevalier de Lamarck, Theodor Eimer, and Spencer. In place of them he advanced a doctrine that owed much to the tradition of European and especially French vitalism, and at the same time drew inspiration from Plotinus. The result was a vision of the cosmos going far beyond the facts of biology, though purportedly based on them. These matters

were presented in *Creative Evolution*, Bergson's most famous book.

Darwin explained the evolutionary process by supposing that in every population of organisms there occur random variations that have different degrees of adaptive value. The variations having maximum value for the survival and reproduction of the organisms are "naturally selected"; that is, they are preserved and transmitted to subsequent generations, while the other variations are eliminated.

Bergson argued that this explanation failed to account for a number of facts. A multicellular animal, or an organ like the vertebrate eye, is a functional whole made up of coordinated parts. If just one or a few of the parts happened to vary independently of the rest, the functioning of the whole would be impaired. Since evolution has occurred, we must suppose that at each stage all the parts of an animal and of its complex organs have varied contemporaneously so that effective functioning was preserved. But it is utterly implausible to suppose, as Darwin did, that such coadapted variations could have been random, for then their coadaptation would remain a mystery. Some agency other than natural selection must have been at work to maintain continuity of functioning through successive alterations of form.

Another fact that Darwinism failed to explain is why living things have evolved in the direction of greater and greater complexity. The earliest living things were simple in character and well adapted to their environments. Why did the evolutionary process not stop at this stage? Why did life continue to complicate itself "more and more dangerously"? To appeal to the mechanism of selection for an answer was, Bergson thought, insufficient. Something must have driven life on to higher and higher levels of organization, despite the risks involved.

Darwin's predecessor Lamarck avoided the idea of random variations by supposing that variations were caused by the "effort" exerted by individuals in adapting to the environment. Bergson considered this a more adequate explanation than the Darwinian. Yet it involved accepting the principle that acquired characteristics are transmitted from one generation to the next, and empirical evidence is heavily against this. Furthermore, the Lamarckian notion of a conscious "effort" is too limited to serve as an explanatory device. It could perhaps operate in the case of animals but hardly in the case of plants or microorganisms. To make the notion work, it must be broadened and deepened. Similarly, Eimer's appeal to orthogenesis; that is, to an inner principle that directs the course of evolution, has merit if interpreted nonmecha-

nistically, but not if interpreted, as Eimer did, in physico-chemical terms.

The synthetic philosophy of Spencer also had merit in so far as it sought to extend the evolutionary conception to the universe at large. Yet because Spencer relied exclusively on the intellect, and because he subscribed to the false idea that philosophy can be a super science, Spencer failed to do justice to real duration and to the creation of novelty. He held that evolution is due to combinations of matter and motion. This makes his philosophy a thinly disguised version of mechanical materialism, which reconstructs evolution "with fragments of the evolved."

To obtain a true understanding of the evolutionary process, the findings of biology must be supplemented, Bergson thought, by the findings of metaphysics. The chief clue is found in what intuition reveals of our own inner nature as living beings; we are typical constituents of the universe, and the forces that work in us also work in all things. When we focus upon what intuition discloses of ourselves, we find not only continuous becoming and real duration, but also a consciousness of a vital impetus (*élan vital*), of our own evolution in time. We are thus led to the idea of "an *original impetus* of life" (*un élan original de la vie*) that pervades the whole evolutionary process and accounts for its dominant features. Accordingly, the history of life is to be understood in creative, not mechanistic, terms.

THE VITAL IMPETUS AND EVOLUTION

Bergson's doctrine of the vital impetus is speculative, although often formulated as if it were a report of an established fact. The impetus is declared to be "a current of consciousness" that has penetrated matter, given rise to living bodies, and determined the course of their evolution. The current passes from one generation to the next by way of reproduction—in bisexual organisms, by way of the reproductive cells. The vital impetus is the cause of variations that accumulate and produce new species. It coordinates the appearance of variations so as to preserve continuity of functioning in evolving structures. And it carries life toward ever higher complexity of organization. Strictly speaking, the impetus does not generate energy of its own, over and above that already present in matter. What it does is "to engraft on to the necessity of physical forces the largest possible amount of indetermination." This indetermination is evident in the contingency and creativity that have characterized the history of life. At every stage the impetus has been limited by recalcitrant matter. Hence, it is always seeking to transcend the

stage it has reached and always remains inadequate to what it tries to produce.

The earliest living things were physicochemical systems into which the vital impetus “insinuated itself.” Its potentialities could be realized only minimally in these systems. Consequently, it divided so that life moved forward in several quite different directions. One direction was taken by the plants, another by the insects, and a third by the vertebrates. The three directions illustrate respectively the predominance of stability, instinct, and intelligence. No predetermined plan or purpose was involved in all this. Bergson expressed as much opposition to the doctrine of radical finalism as he did to mechanism. Both doctrines deny that there has been an unforeseeable creation of forms, that these forms involve discontinuous “leaps,” and that real duration is a cumulative, irreversible flow. Yet although the vital impetus is not finalistic, it does engender progress. A perfecting of functions has occurred through successive stages. An increasing realization of consciousness has also occurred.

This last contention made it difficult for Bergson to maintain an opposition to finalism, for it is in man that consciousness has been most fully realized. Here the vital impetus has found its most adequate expression as intelligence. It has likewise achieved genuine freedom by at last making matter its instrument. There was in fact “a sudden leap from the animal to man.” Hence in *Creative Evolution* Bergson said that man might be considered the reason for the existence of the entire organization of life on our planet. He immediately qualified this statement by adding that it is “only a manner of speaking.” We should not think that humanity was “prefigured” in the evolutionary process from the beginning.

By the time he wrote the essay that became the “Second Introduction” to *The Creative Mind*, Bergson was more forthright. He there stated categorically that the appearance of humans is the *raison d'être* of life on the earth. In *The Two Sources of Morality and Religion* he also contended that it is humankind, “or some other being of like significance, which is the purpose of the entire process of evolution.” This contention seems very close to finalism. Nevertheless, Bergson continued to insist that the appearance of man was in no sense predetermined, though “it was not accidental, either.” Terrestrial evolution might have produced some other being “of the same essence.” Such beings have doubtless arisen elsewhere, for Bergson thought that the vital impetus animates innumerable planets in the universe. The impetus is thus not limited to the earth; creative evolution is a cosmic process.

This contention is not argued for in any detail. As so often in his writings, Bergson tried to make the contention acceptable by means of analogies. He likened the vital impetus to steam escaping at high pressure through the cracks in a container. Jets gush out unceasingly, the steam condenses into drops of water, and the drops fall back to the source. Each jet and its drops represent a world of matter animated by life. A small part of the jet remains uncondensed for an instant, and makes an effort to raise the drops that are falling. But it succeeds at most in retarding their fall. So the vital impetus achieves a moment of freedom at its highest point, in humans. It might be inferred from this analogy that matter is not something *sui generis*, but is rather the lowest form assumed by the outpouring of spirit. Matter and spirit, however, were repeatedly described by Bergson as coexistent and interdependent.

GOD AND THE MYSTICS

The religious aspect of Bergson's outlook became increasingly pronounced toward the close of his life. Even in *Creative Evolution* he had spoken of the vital impetus as a “supra-consciousness” to which the name “God” might be attached. But this is very different from the conception of traditional Western theology. For if God is identical with the vital impetus, then he is pure activity, limited by the material world in which he is struggling to manifest himself. He is neither omnipotent nor omniscient. God “has nothing of the already made,” but is ceaselessly changing. In *The Two Sources of Morality and Religion*, Bergson moved somewhat closer to the Christian position; he affirmed that God is love and the object of love. There is also a divine purpose in the evolutionary process. Evolution is nothing less than God's “undertaking to create creators, that He may have, besides Himself, beings worthy of His love.”

The discovery of this purpose and of the reality of God cannot be made by the intellect. It can be made only by the sort of intuition that is the mystical experience. For the vital impetus, Bergson contended, is communicated “in its entirety” to exceptional persons. These are the mystics who achieve contact and partial coincidence with the creative effort that “is of God, if it is not God Himself.” This experience does not terminate in passivity, but leads to intense activity. The mystics participate in God's love for humankind. They are therefore impelled to advance the divine purpose by helping to complete the development of man. They want to make of humanity what it would straightway have become if humanity had been able to reach its final form without the aid of humans

themselves. The spirit of the mystics must become universal in order to ensure man's future evolution.

Bergson acknowledged that the biggest obstacle to the spread of the mystical spirit is the ceaseless struggle that most people must wage against the material conditions of life. Yet he did not believe that these conditions could be ameliorated by programs of political and economic reform devised by the intellect. Consequently, the most we can hope for at present is that the spirit of the mystics will be kept alive by small groups of privileged souls, "until such time as a profound change in the material conditions imposed on humanity by nature should permit, in spiritual matters, of a profound transformation." The mystics, through their experience of love, will keep open a trail along which the whole of humanity can eventually pass.

CLOSED AND OPEN SOCIETIES

Since man is a social animal, his future evolution will be accelerated or retarded by the sort of group in which he lives. Bergson discussed this question in *The Two Sources of Morality and Religion*, where he drew a distinction between a society that is "closed" and one that is "open," describing in each case corresponding types of religion and of morality.

A closed society is one dominated by the routine and mechanical. It is resistant to change, conservative, and authoritarian. Its stability is achieved by increasing its self-centeredness. Hence, conflict with other self-centered groups, often involving war, is a condition of its preservation. Internal cohesiveness is secured by a closed morality and a closed religion. Bergson's analysis was influenced by the sociological doctrines of Émile Durkheim. Closed morality is static and absolutistic; closed religion is ritualistic and dogmatic. Both institutions exert pressure on individuals to accept the standard practices of the community. Spontaneity and freedom are reduced to a minimum. Conformity becomes the prime duty of the citizen. There is an obvious analogy between such a society and the repetitive mechanisms dealt with by the intellect. Indeed, Bergson regarded closed societies as in large measure the intellect's products.

The existence of a multiplicity of closed societies on the earth is an obstacle to human evolution. Accordingly, the next development in humankind requires the establishment of an open society. Instead of being limited, it will embrace all humankind; instead of being static, it will be progressive; instead of demanding conformity, it will encourage the maximum diversity among individuals. Its moral and religious beliefs will be equally flexible and

subject to growth. Religion will replace the stereotyped dogmas elaborated by the intellect with the intuition and illumination now achieved by the mystics. The spread of the mystical spirit must ultimately create an open society whose freedom and spontaneity will express the divine élan which pervades the universe.

Bergson's outlook had a marked influence on the thought and literature of Europe. His gifts as a writer, his ingenuity in constructing vivid analogies, and his flair for describing the subtleties of immediate experience—"true empiricism," as he called it—contributed to the popularity of his work, as did the impressive use that he made of the biological and psychological ideas of his time. On the other hand, critics have contended that many of his doctrines are vague and ill-supported by arguments. Too often, it is said, rhapsodic formulations are offered where there ought to be sustained logical analysis. There is, for instance, no clear statement of how real duration, the flow of consciousness, and the vital impetus are related. Are these separate processes, or just distinguishable aspects of one process? Does matter have an independent status, or is it simply a "devitalized" form of the *élan vital*? Such questions are difficult, if not impossible, to answer. Many critics have also deplored the encouragement that Bergson's doctrine of the intellect gave to the advocates of irrationalism and the cruder versions of pragmatism. Yet when all these criticisms have been made, the Bergsonian heritage remains an important element in twenty-first-century philosophy.

BERKELEY, GEORGE

(1685–1753)

George Berkeley, the Irish philosopher of English ancestry, and Anglican bishop of Cloyne, was born at Kilkenny, Ireland. He entered Trinity College, Dublin in 1700 and became a fellow in 1707. In 1709 he published his first important book, *An Essay towards a New Theory of Vision*. This was well received, and a second edition appeared in the same year. The following year *A Treatise concerning the Principles of Human Knowledge*, Part 1, was published. This is the work in which Berkeley first published his immaterialist philosophy, and although it made him known to some of the foremost writers of the day, its conclusions were not taken very seriously by them. In 1713 Berkeley went to London and there published the *Three Dialogues between Hylas and Philonous*, a more popular statement of the doctrines of the *Principles*. While in London, Berkeley became acquainted with Joseph Addison, Jonathan Swift, Alexander Pope, and Richard Steele and contributed articles to Steele's *Guardian*, attacking the theories of the freethinkers. He traveled on the Continent in 1713–1714 (when he probably met and conversed with Nicolas Malebranche) and again from 1716 to 1720. During this tour he lost the manuscript of the second part of the *Principles*, which he never rewrote. Toward the end of the tour, he wrote a short essay, in Latin, titled *De Motu*, published in London in 1721, criticizing Isaac Newton's philosophy of nature and Gottfried Wilhelm Leibniz's theory of force. In 1724 Berkeley was made dean of Derry.

About this time, Berkeley began to prepare a project for establishing a college in Bermuda, at which not only the sons of American colonists but also Indians and Negroes were to receive a thorough education and be trained for the Christian ministry. Having obtained promises of subscriptions from many prominent people, Berkeley promoted a bill, which was passed by Parliament, providing for considerable financial help from the government. In 1728, before the money was forthcoming, Berkeley, who had just married, left for Rhode Island, where he intended to establish farms for supplying food for the college. He settled in Newport, but the grant never came; and in 1731, when it was clear that the government was diverting the money for other purposes, Berkeley had to return home. While in Newport, however, Berkeley had met and corresponded with the Samuel Johnson who later became the first president of King's College, New York (now Columbia University). Johnson was one of the few philosophers of the time to give close attention to Berkeley's philosophical views, and the correspondence between him and Berkeley is of considerable philosophi-

cal interest. While he was in Newport, Berkeley also wrote *Alciphron*, a series of dialogues in part developed from the articles he had written for the *Guardian*, directed against the "minute philosophers," or freethinkers. This was published in 1732.

Berkeley was in London from 1732 to 1734 and there wrote *The Analyst* (1734), a criticism of Newton's doctrine of fluxions and addressed to "an infidel mathematician." This and *A Defence of Free-Thinking in Mathematics* (1735) aimed at showing that the mathematicians so admired by freethinkers worked with concepts that could not withstand close scrutiny, so that the confidence given to them by "the philomathematical infidels of these times" was unjustified. It is not surprising that Berkeley was made bishop of Cloyne, Ireland, in 1734.

Berkeley carried out his episcopal duties with vigor and humanity. His diocese was in a remote and poor part of the country, and the problems he encountered there led him to reflect on economic problems. The result was *The Querist* (1735–1737), in which he made proposals for dealing with the prevailing idleness and poverty by means of public works and education. He also concerned himself with the health of the people and became convinced of the medicinal value of tar water. In 1744 he published *A Chain of Philosophical Reflexions and Inquiries concerning the Virtues of Tar-Water, and divers other Subjects connected together and arising from one another*. When the second edition appeared in the same year, the title *Siris*, by which the book is now known, was added. Much of the book is concerned with the merits of tar water, but Berkeley passed from this subject to the causes of physical phenomena, which, he held, cannot be discovered in the phenomena themselves but must be sought for in the Divine activity. This is in line with his earlier views, but some readers, on the basis of his admiring references to Plato and the Neoplatonists, have considered that by this time he had considerably modified his original system. The *Siris* was Berkeley's last philosophical work. He died suddenly in Oxford nine years later.

An account of Berkeley's life and writings would be inadequate without some reference to his *Philosophical Commentaries*. A. C. Fraser discovered a series of notes by Berkeley on all the main topics of Berkeley's philosophy and published them in 1871 in his edition of Berkeley's works, under the title of *Commonplace Book of Occasional Metaphysical Thoughts*. It was later noticed that these notes had been bound together in the wrong order, and it has now been shown that they were written by Berkeley, probably in 1707–1708, while he was thinking out his *New Theory of Vision* and *Principles*. This work makes it

clear that Berkeley was already convinced of the truth of immaterialism before he published the *New Theory of Vision*, in which that view is not mentioned. The *Philosophical Commentaries* throw valuable light upon Berkeley's sources, bugbears, prejudices, and arguments.

MAIN THEMES OF BERKELEY'S PHILOSOPHY

Since the word *idealism* came into use in the eighteenth century, Berkeley has been known as a leading exponent of idealism, and even as its founder. He himself referred to his main view as "the immaterialist hypothesis," meaning by this that he denied the very possibility of inert, mindless, material substance. This description has some advantage over idealism in that it brings out Berkeley's radical opposition to materialism; whereas the opposite of idealism is realism, and there are grounds for doubting whether Berkeley intended to deny the realist contention that in perception people become directly aware of objects that persist unchanged when they cease to be perceived. Berkeley's fundamental view was that for something to exist it must either be perceived or else be the active being that does the perceiving. Things that are perceived he called "sensible things" or "sensible qualities," or, in the terminology he had borrowed from John Locke, "ideas." Sensible things or ideas, he held, cannot exist except as the passive objects of minds or spirits, active beings that perceive and will. As he put it in the *Philosophical Commentaries*, "Existence is *percipi* or *percipere*," and he added "or *velle* i.e. *agere*"—existence is to be perceived or to perceive or to will, that is, to be active. Thus there can be nothing except active spirits on the one hand and passive sensible things on the other, and the latter cannot exist except as perceived by the former. This is Berkeley's idealism or immaterialism.

CRITICISM OF CONTEMPORARY SCIENCE. The above account of Berkeley's writings emphasizes their apologetic intent, an intent that can be seen in the subtitles of his major writings—that of the *Principles* is typical: *Wherein the chief causes of error and difficulty in the sciences, with the grounds of scepticism, atheism and irreligion, are inquired into.* It will be seen that "the chief causes of difficulty in the sciences" are also prominent. Berkeley considered that in the mathematics and natural sciences of his day insufficient attention was given to what experience reveals to us. Apart from Newton, the mathematicians were, he wrote in the *Philosophical Commentaries*, "mere triflers, mere Nihilarians." For example, they conceived of lines as infinitely divisible, but this is not only

absurd, it could be maintained only by men who "despised sense." Thus Berkeley regarded himself as protesting against the excesses of uncontrolled rationalism. Hence he put forward a most antirationalistic view of geometry, although he never developed its implications very far. Similarly he thought that the natural philosophers deluded themselves with words when they tried to explain the physical world in terms of attractions, forces, and powers. Natural science, as he understood it, was descriptive rather than explanatory and was concerned with correlations rather than with causes. He thus sketched out a view of science that was revived and developed by nineteenth-century and twentieth-century positivists.

SENSIBLE QUALITIES ARE THE SIGNS OF GOD'S PURPOSE. Berkeley's positivism, however, was confined to his account of natural science. The order of phenomena, he held, was willed by God for the good of created spirits. In deciphering the conjunctions and sequences of our sense experience we are learning what God has decreed. Thus sensible qualities are the language in which God speaks to us. In the third and fourth editions (1732) of the *New Theory of Vision* Berkeley said that the objects of sight are a divine visual language by which God teaches us what things are good for us and what things are harmful to us. In the *Alciphron*, published that same year, he argued that "the great Mover and Author of Nature constantly explaineth Himself to the eyes of men by the sensible intervention of arbitrary signs, which have no similitude or connexion with the things signified." We learn that certain visual ideas are signs of certain tactual ones, certain smells signs of certain colors, and so on. There is no necessity about this, any more than things necessarily have the names that convention assigns to them. Just as some sensible qualities are signs of others, so sensible qualities as a whole are signs of the purposes of God who "daily speaks to our senses in a manifest and clear dialect."

Thus, taken as a whole, Berkeley's philosophy is a form of immaterialism combined with an extreme antirationalist theory of science. The regularities between phenomena are regarded as evidence for, and as signs of, God's purposes. Just as a man's words reveal his thoughts and intentions by means of the conventional signs of language, so the sensible order reveals God's will in phenomena that could have been ordered quite differently if he had so decided.

THE NEW THEORY OF VISION

Although Berkeley did not mention his immaterialism in *An Essay towards a New Theory of Vision*, this work throws important light upon his quarrel with the mathematicians and his rejection of the rationalist point of view. It contains, too, an interesting statement of what Berkeley then thought about geometry. Furthermore, the *Essay* helps us to see, from what Berkeley said about the objects of vision, how he came to the view that sensible qualities cannot exist “without the mind.” Among the main contentions of the book is the claim that distance or “outness” is not immediately perceived by sight; it is “suggested” in part by the sensations we get in moving our eyes but mainly by association with the ideas of touch. According to Berkeley, we see the distance (and size) of things only in the sense in which we see a man’s shame and anger. We see his face, and the expression on it suggests to us how he is feeling. In themselves, shame and anger are invisible. Similarly, we see shapes and colors, which are signs of what we would touch if we were to stretch out our hands, but distance itself is no more seen than anger is. In expounding this view, Berkeley developed the thesis that the objects of sight and touch are utterly disparate, so that no feature of the one can have more than a contingent connection with any feature of the other.

DESCARTES’S THEORY OF THE PERCEPTION OF DISTANCE. Consideration should first be given to Berkeley’s criticisms of an important geometrical account of how distance is perceived and assessed, the account given by René Descartes in his *Dioptrics* (1637). In this work Descartes referred to six “qualities we perceive in the objects of sight,” namely, light, color, shape, distance, magnitude, and situation. Descartes argued that one of the ways in which men ascertain the distance of objects is by means of the angles formed by straight lines running from each of their eyes and converging at the object seen. He illustrated this by reference to a blind man with a stick (the length of which he does not know) held in each hand. When he brings the points of the sticks together at the object, he forms a triangle with one hand at each end of the base, and if he knows how far apart his hands are, and what angles the sticks make with his body, he can, “by a kind of geometry innate in all men” know how far away the object is. The same geometry would apply, Descartes argued, if the observer’s eyes are regarded as ends of the base of a triangle, and straight lines from them are regarded as converging at the object. The more obtuse the base angles formed by the lines running from this base and converging at the object, the farther away the object

must be; the more acute these angles, the nearer the object must be. Berkeley put the matter somewhat differently from Descartes, pointing out that according to the latter’s view the more acute the angle formed at the object by the lines converging from the eyes, the farther away it must be; the more obtuse this angle, the nearer the object must be. It is important to notice that this “must” is the “must” of mathematical necessity. From what Descartes said, it is necessarily the case that the more acute this angle is, the farther away the object is; the more obtuse the angle, the nearer the object. “Nearer” and “farther” logically depend upon the obtuseness or acuteness of the angle. In criticizing this view, therefore, Berkeley was criticizing the view that distance is known a priori by the principles of an innate geometry according to which we know that the distance of the object must vary in accordance with the angle made at the object by straight lines converging there from the eyes of the observer.

BERKELEY’S CRITICISM OF DESCARTES. Against Descartes’s view Berkeley brought a complex argument that for purposes of exposition, is here broken up into three parts. The first is that people who know nothing of the geometry of the matter can nevertheless notice the relative distance of things from them. This is not very convincing, for Descartes obviously thought that the geometry he regarded as “innate in all men” might be employed by them without their having reflected on it. The second argument used by Berkeley is that the lines and angles referred to by Descartes “have no real existence in nature, being only an hypothesis framed by the mathematicians.” This argument is of interest in showing how Berkeley thought that mathematicians were inclined to deal in fictitious entities, but it is unlikely that Descartes was deceived by them in this way.

Berkeley’s third and main argument was based upon a theory that he expressed in the words, “distance, of itself and immediately, cannot be seen.” William Molyneux, from whose *Dioptrics* (1692) Berkeley borrowed this theory, had supported it by the argument that since distance is a line or length directed endwise from the object seen to the eye, it can reach the eye at only one point, which must necessarily remain the same however near or far away the object is. If this argument is accepted, then distance could not possibly be seen, and could only be judged or, as Berkeley believed, “suggested.”

DISTANCE IS SUGGESTED BY WHAT IS SEEN. What, then, according to Berkeley, is seen? The answer is not altogether clear, but it would seem that he thought that the immediate object of vision is two-dimensional, con-

taining relations of above and below and of one side and the other, with no necessary connection with a third dimension. Hence the relation between what is immediately seen on the one hand and the distance of objects on the other must be contingent and cannot be necessary. Distance, then, must be ascertained by means of something that has only a contingent relationship with what is seen. Berkeley mentioned the sensations we have when we adjust our eyes, the greater confusedness of objects as they come very close to the eyes, and the sensations of strain as we try to see what is very near. But he mainly relied on the associations between what a man has touched and what he now sees. For example, when a man now sees something faint and dim, he may, from past experience, expect that if he approaches and touches it he will find it bright and hard. When he sees something at a distance, he is really seeing certain shapes and colors, which suggest to him what tangible ideas he would have if he were near enough to touch it. Just as one does not hear a man's thoughts, which are suggested by the sounds he makes, so one does not directly see distance, which is suggested by what is seen.

SIGHT AND TOUCH. Berkeley's view that distance is not immediately perceived by sight is rejected by some writers, for instance by H. H. Price, in his *Perception* (1932), on the ground that it is plainly contradicted by experience. We just do see visual depth, it is held, so that it is idle to deny this fact on the basis of an argument purporting to prove that we cannot. Again, some critics, such as T. K. Abbott in *Sight and Touch* (1864) have argued not only that we do get our idea of distance from sight, but also that touch is vague and uninformative by comparison with sight, and hence less effective in giving knowledge of the material world. This discussion need not be developed, however, since, although he said in the *Essay* that by touch we get knowledge of objects that exist "without the mind" (§55), Berkeley's real view was that no sensible thing could so exist. It cannot be denied that on occasion Berkeley's language was imprecise. A crucial example of this occurs in his discussion of the question of whether a man born blind would, on receiving his sight, see things at a distance from him. According to Berkeley, of course, he would not; but to such a man, the most distant objects "would all seem to be in his eye, or rather in his mind" and would appear "(as in truth they are) no other than a new set of thoughts or sensations, each whereof is as near to him as the perceptions of pain or pleasure, or the most inward passions of his soul" (*Essay*, §41). It will be noticed how readily Berkeley passed from "in his eye" to "in his mind," and how he assimilated such very different

things as sensations and thoughts. Indeed it is hard not to conclude that he thought that whatever was not seen at a distance must appear to be in the mind. If this is true, then one of the objects of the *Essay* was to show that the immediate objects of vision must be in the mind because they are not seen at a distance.

GEOMETRIES OF SIGHT AND OF TOUCH. As already seen, an extremely important thesis of the *Essay* is that the objects of sight and the objects of touch are radically different from one another. We see visible objects and we touch tangible objects, and it is absurd to suppose that we can touch what we see or see what we touch. According to Berkeley, it follows from this that tangible shape and visible shape have no necessary connection with one another. Geometers certainly supposed themselves to be concerned with shapes in abstraction from their being seen or touched, but Berkeley did not allow that this is possible. A purely visual geometry would necessarily be confined to two dimensions, so that the three-dimensional geometry that we have must be fundamentally a geometry of touch. He reinforced this strangely pragmatic view with the observation that a sighted but disembodied being that could not touch or manipulate things would be unable to understand even plane geometry, since without a body it would not understand the handling of rulers and compasses and the drawing of lines and the placing of shapes against one another.

ARGUMENTS FOR IMMATERIALISM

The arguments now to be considered are set out in the *Principles* and in the *Three Dialogues*. They are largely concerned with what Berkeley called "ideas," "ideas or sensations," "sensible things," or "sensible qualities." The very use of the word *idea* itself and, even more, its use in apposition with *sensation* had the purpose of indicating something that does not exist apart from the perception of it. Pains and itches are typical sensations, and no one supposes that they could exist apart from a being that experiences them. Rocks do not suffer, and water does not itch. When, therefore, sensible things such as colors, sounds, tangible shapes, tastes, and smells are called ideas, they are assimilated with sensations and hence relate to the perceiving beings that have them. It is now necessary, therefore, to examine the arguments with which Berkeley justified this.

SEVENTEENTH-CENTURY MATERIALISM. Berkeley's arguments for immaterialism can be understood only if we first consider the sort of view it was intended to refute. When Berkeley was forming his views, the natural sci-

ences had been so far advanced by the work of such men as Galileo Galilei, Andreas Vesalius, William Harvey, Robert Boyle, and Newton as to have given rise to a scientific view of the world. Such a view had been elaborated, in its philosophical aspects, by Locke in his *Essay concerning Human Understanding* (1690). Space and time were, so to say, the containers within which material things were situated. The movements and relations of material things could be explored by experiments and characterized in mathematical formulae.

Explanation in terms of particles in motion. The features of the world, thus revealed as fundamental, were those of place, shape, size, movement, weight, and the like; and it was in terms of these that heat and cold and color and sound found their explanation. Heat was thought to be due to the rapid movement of atomic particles, color to the transmission of particles or to the spreading of waves, and sound to the movement of the air between the emitting object and the ear. Whereas solid, shaped, moving objects, and the air and space within which they existed, were regarded as basic features of nature, the colors we see, the heat we feel, and the sounds we hear were held to be the effects that substances possessing only the basic characteristics produced in creatures with sense organs. If all creatures with sense organs and consciousness were removed from the world, there would no longer be any experienced sounds, but only pulsations in the air; particles would increase or decrease their speed of movement, but no one would feel hot or cold; light would be radiated, but there would be no colors as we know them. In such a world colors and sounds, heat and cold, would exist, as Boyle put it, in his *Origins of Forms and Qualities* (Oxford, 1666), only “dispositively,” that is, those primary things would be there that would have given rise to the secondary ones if creatures with the requisite sense organs and minds had been there too.

Primary and secondary qualities. In this way a distinction was made between the primary qualities of things, which are essential and absolute, and their secondary qualities, which are those among the primary ones that give or would give rise to heard sounds, seen colors, and felt heat. It was an important element of this view that nothing could be perceived unless it acted upon the sense organs of the percipient and produced in his mind an idea. What was immediately perceived was not the external object but an idea representative of it. Locke had made people familiar with this theory, and had maintained that whereas the ideas we have of heat and cold and of color and sound correspond to nothing like them-

selves in the external world; for all that exists in the external world are solid bodies at rest or in movement, the ideas we have of the solid, shaped, moving bodies, that is, our ideas of primary qualities are like their sources or archetypes outside us. According to the view, then, that Berkeley was considering, material objects are perceived mediately or indirectly by means of ideas, some of which, the ideas of primary qualities, are like their originals; others, the ideas of secondary qualities, are relative to percipients and are unlike anything that exists in the external world.

MATERIALISM LEADS TO SKEPTICISM. Berkeley had two objections to the view that material objects are perceived mediately by means of ideas. One is that since it is held that we never perceive material things directly, but only through the medium of ideas, then we can never know whether any of our ideas are like the qualities of material substances since we can never compare our ideas with them; for to do so we should require direct or immediate acquaintance with them (*Principles*, §18). Indeed, if we accept Locke’s position, then the very existence of material substances is in doubt, and we are constantly under the threat of skepticism (*Principles*, §86). Thus Berkeley argued that Locke’s theory was in fact, although not by intention, skeptical, and that it could be remedied only by the elimination of material substances that could never be directly apprehended.

DISTINCTION BETWEEN PRIMARY AND SECONDARY QUALITIES UNTENABLE. Berkeley’s second objection is that there can be no distinction between ideas of primary qualities and ideas of secondary qualities such as to make secondary qualities relative to the mind in a way in which primary qualities are not. In the *Three Dialogues* Berkeley elaborated the arguments, already used by Locke, to show that the ideas we have of secondary qualities are relative to the percipient and are what they are by reason of his condition and constitution. Things have no color in the dark; the same water can feel hot or cold to different hands, one of which has been in cold water and the other in hot; heat and cold are inseparably bound up with pain and pleasure, which can only exist in perceiving beings; and so on. But Berkeley then went on to argue that just as heat, for example, is inseparably bound up with pleasure and pain, and can therefore, no more than they can, exist “without the mind,” so extension is bound up with color, speed of movement with a standard of estimation, solidity with touch, and size and shape with position and point of view (*Principles*, §§10–15). Thus Berkeley’s argument is that nothing can have the primary

qualities without having the secondary qualities, so that if the latter cannot exist “without the mind,” the former cannot so exist either.

ALL SENSIBLE QUALITIES MUST BE EITHER PERCEIVED OR PERCEPTIBLE. The preceding argument, however, is only a hypothetical one to the effect that if secondary qualities cannot exist “without the mind,” primary qualities are in like case. What must now be considered are the reasons for holding that secondary qualities and, indeed, all sensible qualities can exist only in the mind so that their being is to be perceived. Berkeley, as already indicated, stated and elaborated well-known arguments to show that heat and cold, tastes, sounds, and the rest are relative to the percipient. Perhaps the most persuasive of these are those that purport to establish an indissoluble connection between heat, taste, and smell on the one hand, and pain or pleasure or displeasure on the other. Since no one denies that pain and pleasure can exist only if felt, then this applies to heat so intense as to be painful and to lesser degrees of heat as well. But in the *Principles*, his systematic treatise on the subject, Berkeley did not make use of these arguments, but said that “an intuitive knowledge may be obtained of this, by any one that shall attend to what is meant by the term *exist* when applied to sensible things” (§3). His view here is that “sensible things” are by their very nature perceived or perceivable. He supported this by asserting that to say there was an odor is to say that it was smelled, to say that there was a sound is to say that it was heard, to say that there was a color or shape is to say that it was seen or touched. According to Berkeley, unsmelled odors, sounds unheard, colors unseen, and shapes unseen or untouched are absurdities or impossibilities; brown leaves could not rustle on a withered tree in a world where life was extinct and God was dead. The very notion is absurd or impossible. Can more light be shed on the matter than is provided by the assertion that we have “intuitive knowledge” of it?

It must be remembered, in the first place, that Berkeley was contrasting the sounds we hear, for example, with the movements in the air, which men of science sometimes call sounds. Sounds in the latter sense, he said, “may possibly be *seen* or *felt*, but never *heard*” (*Three Dialogues*, 1). From this it may be seen that Berkeley looked upon sensible qualities as each the object of its own mode of perception, so that sounds are heard but not seen or touched, colors seen but not heard, heat felt but not seen, and so on. Hence colors require a viewer, sounds a hearer, and heat someone who feels it; and this is one reason why the being of sensible things is held to be their being perceived. The various modalities of sense are distinguished

from one another by the mode of perception peculiar to each one, and in making these distinctions it is implied that perception is essential to them all. It is well known, of course, that Berkeley’s critics accuse him of failing to distinguish between the object perceived and the perceiving of it. The perceiving of it, they say, can only be an act of a percipient without whom it could not exist, but the perceived object, whether it be a sound or a color or a shape, is distinct from the perceiving and could conceivably exist apart from it.

Whatever may be thought of this argument, it should not be used against Berkeley as if he had not thought of it. In fact he put it into the mouth of Hylas in the first of the *Three Dialogues* and rejected it on the ground that in perception we are passive and so are not exerting an act or activity of any kind. It should also be noticed that when Berkeley discussed sensation in detail he stated that sensible things or sensible qualities are perceived *immediately*, that is, without suggestion, association, or inference. We say that we hear vehicles and that we hear sounds. According to Berkeley, we hear sounds immediately, but vehicles, if they are out of sight, are suggested by or inferred from what we do hear, and so are heard only mediately or by means of the sounds immediately heard. Thus the sound we hear immediately is neither suggested nor inferred, but is heard just as it is. For this to be so, it must be before the mind; for if it were not before the mind, it would have to be inferred or suggested. Thus sensible qualities, as immediately perceived, must be objects of perception; their being is to be perceived.

Inconceivability of a sensible object existing unperceived. A very famous argument is now to be considered: It is inconceivable that anything should exist apart from, or independent of, mind. This argument was put forward by Berkeley in similar terms both in the *Principles* (§§22, 23) and in the *Three Dialogues* (1) and takes the form of a challenge to the reader to conceive of something—e.g., a book or a tree—existing absolutely unperceived. Berkeley argued that the attempt is impossible of fulfillment, since in order to conceive of a tree existing unperceived we who conceive of it, by the very fact of doing so, bring it into relation to our conception and hence to ourselves. As Hylas admits, in recognizing the failure of his attempt, “It is a pleasant mistake enough. As I was thinking of a tree in a solitary place, where no one was present to see it, me-thought that was to conceive a tree as existing unperceived or unthought of, not considering that I myself conceived it all the while.” This is an argument that was later accepted as fundamental by idealists of such different persuasions as Johann Gottlieb Fichte and Francis

Herbert Bradley, who held that it shows that mind or experience is essential to the universe.

Sensible objects are complex ideas. Berkeley's example of a tree makes it necessary to consider how trees and other things in nature are related to ideas, sensible qualities, sounds, colors, shapes, and so on. According to Berkeley, such things as trees, books, and mountains are groups of ideas or sensible qualities and are hence as much within the mind as the latter are. Indeed, in his view, books, trees, and mountains are ideas, though complex ones. He admitted (*Principles*, §38) that this use of the word *idea* for what is ordinarily called a *thing* is somewhat odd, but held that, the facts being as they are, *idea* is better than *thing*. A tree is a group of ideas touched, seen, and smelled; a cherry, a group of ideas touched, seen, smelled, and tasted. The sensible qualities or ideas, without which we should have no conception of a tree or cherry, do not belong to some unseen, untouched, untasted substance or substratum, for the very conception of such a "something I know not what" (as Locke had called it) is incoherent, and rests upon the false view that we can conceive something in complete abstraction from ideas of sense.

Sensible objects, as ideas, are perceived directly. Berkeley therefore concluded that it is his theory that conforms with common sense, not that of the materialists or the dualists. For according to Berkeley we perceive trees and cherries directly by seeing, touching, and tasting them, just as the plain man thinks we do, whereas his opponents regard them as perpetually hidden from us by a screen of intermediaries that may be always deceiving us. Berkeley considered that by this view he had refuted skepticism of the senses, for, according to his theory, the objects of the senses are the things in the world: the trees, houses, and mountains we live among. But trees, houses, and mountains, as compounded of sensible qualities or ideas, cannot exist "without the mind."

SENSIBLE OBJECTS NOT COPIES OF MATERIAL ARCHETYPES. Berkeley's arguments showing that all sensible qualities or ideas exist only as perceived and that, therefore, things in nature, being groups of such ideas, cannot exist "without the mind" have now been expounded. It is now necessary to complete this account of Berkeley's arguments for immaterialism with his argument to show that not only must sensible qualities or ideas exist in the mind, but also that nothing like them can exist outside it. For anyone reluctant to accept immaterialism is likely to fall back on the view that our ideas, although in our minds, are copies of material archetypes.

Berkeley's objection to this in the *Principles* (§8) is that "an idea can be like nothing but an idea," which he illustrated by saying that a color or shape can only be like another color or shape. In the *Three Dialogues* (1) he expanded the argument in two ways. Ideas, he said, are regarded by some as the perceived representatives of imperceptible originals, but "Can a real thing in itself *invisible* be like a color; or a real thing which is not *audible*, be like a *sound*?" His other reason for holding that ideas cannot be like any supposed external originals is that ideas are "perpetually fleeting and variable," and "continually changing upon every alteration in the distance, medium or instruments of sensation," while their supposed originals are thought to remain fixed and constant throughout all changes in the percipient's organs and position. But something that is fleeting and relative cannot be like what is stable and absolute, any more than what is incapable of being perceived can be like what is essentially perceptible.

SUMMARY. The following are Berkeley's central arguments in favor of immaterialism. They arose out of his exposure of the weaknesses and inconsistencies in the then current scientific view of the world, with its distinction between primary and secondary qualities and its theory of representative perception. According to Berkeley, since primary qualities cannot exist apart from secondary qualities, and since secondary qualities, and indeed all sensible qualities, cannot exist "without the mind," the independent material world of the then current scientific view was a conceptual absurdity. This was supported by the argument that our ideas cannot be likenesses of an external material world, since there is nothing conceivable they could be likenesses of except mind-dependent existences of their own type. The theory of representative perception was held to be essentially skeptical, and Berkeley claimed that his own theory, according to which we directly perceive ideas and groups of ideas that exist only as perceived, eliminates skepticism and accords with common sense.

METAPHYSICS AND THEOLOGY

In section 3 of the *Principles*, where Berkeley stated that we have intuitive knowledge of the fact that for sensible qualities to exist they must be perceived, he also stated that when we say that the table is in the room that we have left we mean that if we were to return there we could perceive it "or that some other spirit actually does perceive it." This shows that Berkeley was concerned with the problem of giving an account, within the terms of his immaterialism, of the continued existence of things that

are not being perceived by any human being. It also shows that he considered two ways of dealing with this problem. One way was to extend the doctrine that the existence of sensible things is their being perceived into the doctrine that the existence of sensible things is their being perceptible. The other way was to argue that when sensible things are not being perceived by human beings they must be perceived by “some other spirit.”

BERKELEY NOT A PHENOMENALIST. The first way points in the direction of the modern theory of phenomenalism, the theory according to which, in John Stuart Mill’s happily chosen words, material objects are “permanent possibilities of sensation.” But might not anything, even material substances possessing only primary qualities, be perceptible, even if not actually being perceived? Some twentieth-century upholders of phenomenalism argued that the world was perceptible before there was any life or mind, in the sense that if there had been gods or human beings they would have perceived it. This could not be possible on Berkeley’s theory, however, since, as we have seen, he held that only ideas or sensible things can be *like* ideas or sensible things, so that what is perceptible is limited by what is perceived.

PERCEPTIBLE OBJECTS PERCEIVED BY GOD. The perceptible, therefore, is limited to the mind-dependent, and, for Berkeley, the very notion of something that might be perceived, but is not, is unacceptable. Thus it seems that Berkeley was forced to supplement his phenomenalist account of unperceived objects with the view that whatever is not being actually perceived by human beings, but is only perceptible by them, must be an object of perception by “some other spirit.” He used this same expression in section 48 of the *Principles*, where he denied that “bodies are annihilated and created every moment, or exist not at all during the intervals between our perception of them.” In the *Three Dialogues* (2) he argued that since sensible things do not depend on the thought of human beings and exist independently of them “*there must be some other mind wherein they exist.*” This other mind is God; and thus, according to Berkeley, the existence of sensible things when not being perceived by finite spirits is a proof of the existence of an infinite spirit who perceives them always. Indeed, Berkeley considered it a merit of immaterialism that it enables this brief and, as he thought, conclusive proof to be formulated.

OUR IDEAS COME FROM GOD. In the *Principles* Berkeley put forward another proof of the existence of God, this time a proof based upon God as the cause of our

ideas. As has been shown, Berkeley held that ideas are passive and that the only active beings are minds or spirits. Now some of our ideas, namely, ideas of imagination, we ourselves produce, but others, the ideas of sense, come to us without our willing them. “There is therefore some other will or spirit that produces them” (*Principles*, §29). That this is God may be concluded from the regular order in which these ideas come to us. The knowledge we have of God is analogous to the knowledge we have of other men. Since people are active spirits, we do not have ideas of them, but only of their expressions, words, and bodily movements. Through these we recognize them as possessors of minds and wills like those we know ourselves to have. Similarly, God reveals himself to us in the order of nature: “every thing we see, hear, feel, or in any wise perceive by sense, being a sign or effect of the Power of God.”

ACTIVE SPIRITS AND PASSIVE IDEAS. These, then, are the elements of Berkeley’s metaphysics. There are active spirits on the one hand and passive ideas on the other. The latter could not exist apart from the former, but the ideas in the minds of human beings are caused in them by God and sustained by him when they are not perceiving them. Regularly recurring groups of ideas are called bodies, and the ideas that form them are arbitrarily connected together and might have been connected quite differently. Thus there is no natural necessity or internal reason about the laws of nature, but the regular sequences of ideas reveal to us a single infinite being who orders things for our benefit. Active spirits and passive ideas are of different natures. The mind is not blue because the idea of blue is in it, nor is the mind extended because it has an idea of extension. Ideas are neither parts nor properties of minds. Berkeley seems to have thought that the relationship is *sui generis*, for he said that sensible qualities are in the mind “only as they are perceived by it, that is, not by way of *mode* or *attribute*, but only by way of *idea*” (*Principles*, §49).

GOD’S IDEAS AND OUR IDEAS. As already seen, Berkeley held that God was both the cause of the ideas in the minds of embodied finite spirits and also the Mind in which these ideas continued to exist when embodied finite spirits were not perceiving them. Berkeley was thus faced with the problem of how the ideas in finite minds are related to the ideas in God’s mind. If we recall Berkeley’s claim that he was on the side of common sense against the skeptics, then we should expect the ideas that continue to exist in God’s mind to be identical with those that had been in the minds of the embodied finite spirits who had formerly perceived them.

However, he found that there were difficulties in this view. Humans perceive ideas of sense by means of sense organs, and their ideas vary in accordance with their position and condition, but God does not have sense organs. Furthermore, some ideas—for example, those of heat and cold, and sensations of smell and taste—are inseparable from sensations of pain and pleasure, but God is impassible, that is, not subject to feeling or emotion; hence he cannot be supposed to perceive ideas of this nature. In the *Three Dialogues* (3), therefore, Berkeley concluded that “God knows or hath ideas; but his ideas are not conveyed to Him by sense, as ours are.” From this it is natural to conclude that the ideas that God perceives are not identical with the ideas that embodied finite spirits perceive. Berkeley was obviously thinking along these lines when, in the same *Dialogue*, he said that the things that one perceives, “they or their archetypes,” must, since one does not cause them, have an existence outside one’s mind. Elsewhere in this *Dialogue* he distinguished between what is “ectypal or natural” and what is “archetypal and eternal.” Thus Berkeley’s arguments and the language he used combine to suggest that the ideas in God’s mind are not the same ideas as those in the minds of embodied percipients.

This point was taken up by the Samuel Johnson referred to earlier, in his correspondence with Berkeley. Johnson suggested that Berkeley’s view is that “the real original and permanent existence of things is archetypal, being ideas *in mente Divina*, and that our ideas are copies of them.” Johnson was too polite to press the point, but it follows that what we directly perceive are copies or representatives of divine originals, so that Berkeley’s claim to have reinstated the direct, unmediated perception of common sense, in place of the representative and skeptical theory of the philosophers and scientists, cannot be substantiated. In his reply, Berkeley hardly met this point when he stated that material substance is an impossibility because it is held to exist apart from mind, whereas the archetypes in the divine mind are obviously inseparable from God’s knowledge of them.

PHILOSOPHY OF NATURE

Berkeley carried on a persistent battle against the tendency to suppose that mere abstractions are real things. In the *New Theory of Vision* he denied the possibility of “extension in abstract,” saying “A line or surface which is neither black, nor white, nor blue, nor yellow, etc., nor long, nor short, nor rough, nor smooth, nor square, nor round, etc., is perfectly incomprehensible” (§ 123). In the introduction to the *Principles*, his most explicit discus-

sion of the matter, he quoted Locke’s account of the abstract idea of a triangle “which is neither oblique nor rectangle, neither equilateral, equicrural, nor scalenon, but all and none of these at once,” and pointed out that any actual triangle must be one of these types and cannot possibly be “all and none” of them. What makes any idea general, he held, is not any abstract feature that may be alleged to belong to it, but rather its being used to represent all other ideas that are like it in the relevant respects. Thus if something that is true of a triangle of one of these types is not true of it because it is of that one type, then it is true of all triangles whatever. Nothing exists but what is particular, and particular ideas become general by being used as representatives of others like them. Generality, we might say, is a symbolic device, not a metaphysical status. Thus Berkeley’s attack on abstractions is based on two principles: (1) that nothing exists but what is particular, and (2) that nothing can exist on its own except what can be sensed or imagined on its own. If we accept the first principle, then abstract objects and Platonic forms are rejected, and if we accept the second, then possibility is limited to the sensible or imaginable.

SPACE, TIME, AND MOTION. We have already seen how Berkeley applied the above two principles to the abstract conception of unperceived existence, and to the abstract conception of bodies with only the primary qualities. It must now be shown how he applied them to some of the other elements in the scientific worldview he was so intent on discrediting. Chief among these were the current conceptions of absolute space, absolute time, and absolute motion. According to Berkeley, all these are abstractions, not realities. It is impossible, he held, to form an idea of pure space apart from the bodies in it. We find that we are hindered from moving our bodies in some directions and can move them freely in others. Where there are hindrances to our movement there are other bodies to obstruct us, and where we can move unrestrictedly we say there is space. It follows that our idea of space is inseparable from our ideas of movement and of body (*Principles*, §116).

So too our conception of time is inseparable from the succession of ideas in our minds and from the “particular actions and ideas that diversify the day”; hence Newton’s conception of absolute time flowing uniformly must be rejected (*Principles*, §§97, 98).

Newton had also upheld absolute motion, but this too, according to Berkeley, is a hypostatized abstraction. If there were only one body in existence there could be no idea of motion, for motion is the change of position of

two bodies relative to one another. Thus sensible qualities, without which there could be no bodies, are essential to the very conception of movement. Furthermore, since sensible qualities are passive existences, and hence bodies are too, movement cannot have its source in body; and as we know what it is to move our own bodies, we know that the source of motion must be found in mind. Created spirits are responsible for only a small part of the movement in the world, and therefore God, the infinite spirit, must be its prime source. “And so natural philosophy either presupposes the knowledge of God or borrows it from some superior science” (*De Motu*, §34).

CAUSATION AND EXPLANATION. The thesis that God is the ultimate source of motion is a special case of the principle that the only real causes are spirits. This principle has the general consequence, of course, that inanimate bodies cannot act causally upon one another. Berkeley concluded from this that what are called natural causes are really signs of what follows them. Fire does not cause heat, but is so regularly followed by it that it is a reliable sign of it as long as “the Author of Nature always operates uniformly” (*Principles*, §107). Thus Berkeley held that natural laws describe but do not explain, for real explanations must be by reference to the aims and purposes of spirits, that is, in terms of final causes. For this reason, he maintained that mechanical explanations of movements in terms of attraction were misleading, unless it was recognized that they merely recorded the rates at which bodies in fact approach one another (*Principles*, §103). Similar arguments apply to gravity or to force when these are regarded as explanations of the movements of bodies (*De Motu*, §6). This is not to deny the importance of Newton’s laws, for Newton did not regard gravity “as a true physical quality, but only as a mathematical hypothesis” (*De Motu*, §17). In general, explanations in terms of forces or attractions are mathematical hypotheses having no stable being in the nature of things but depending upon the definitions given to them (*De Motu*, §67). Their acceptability depends upon the extent to which they enable calculations to be made, resulting in conclusions that are borne out by what in fact occurs. According to Berkeley, forces and attractions are not found in nature but are useful constructions in the formulation of theories from which deductions can be made about what is found in nature, that is, sensible qualities or ideas (*De Motu*, §§34–41).

PHILOSOPHY OF MATHEMATICS

We have already seen that when he wrote the *New Theory of Vision*, Berkeley thought that geometry was primarily

concerned with tangible extension, since visual extension does not have three dimensions, and visible shapes must be formed by hands that grasp and instruments that move. He later modified this view, an important feature of which has already been referred to in the account of Berkeley’s discussion of Locke’s account of the abstract idea of a triangle. A particular triangle, imagined or drawn, is regarded as representative of all other triangles, so that what is proved of it is proved of all others like it in the relevant respects. This, he pointed out later in the *Principles* (§126), applies particularly to size. If the length of the line is irrelevant to the proof, what is true of a line one inch long is true of a line one mile long. The line we use in our proof is a representative sign of all other lines. But it must have a finite number of parts, for if it is a visible line it must be divisible into visible parts, and these must be finite in length. A line one inch long cannot be divided into 10,000 parts because no such part could possibly be seen. But since a line one mile long can be divided into 10,000 parts, we imagine that the short line could be divided likewise. “After this manner the properties of the lines signified are (by a very usual figure) transferred to the sign, and thence through mistake thought to appertain to it considered in its own nature.” Thus it was Berkeley’s view that infinitesimals should be “pared off” from mathematics (*Principles*, §131). In the *Analyst* (1734), he brought these and other considerations to bear in refuting Newton’s theory of fluxions. In this book Berkeley seemed to suggest that the object of geometry is “to measure finite assignable extension” (§50, Q.2).

Berkeley’s account of arithmetic was even more revolutionary than his account of geometry. In geometry, he held, one particular shape is regarded as representative of all those like it, but in arithmetic we are concerned with purely arbitrary signs invented by men to help them in their operations of counting. Number, he said, is “entirely the creature of the mind” (*Principles*, §12). He argued, furthermore, that there are no units and no numbers in nature apart from the devices that men have invented to count and measure. The same length, for example, may be regarded as one yard, if it is measured in that unit, or three feet or thirty-six inches, if it is measured in those units. Arithmetic, he went on, is a language in which the names for the numbers from zero to nine play a part analogous to that of nouns in ordinary speech (*Principles*, §121). Berkeley did not develop this part of his theory. However, later in the eighteenth century, in various works, Étienne Bonnot de Condillac argued in detail for the thesis that mathematics is a language, and this view is, of course, widely held today.

CONCLUDING COMMENTS

Berkeley's immaterialism is a strange and unstable combination of theses that most other philosophers have thought do not belong together. Thus he upheld both extreme empiricism and idealism, both immaterialism and common sense, and both subjectivism (as it would seem) and epistemological realism (as it would also seem). Are these mere skillful polemical devices in the war against the freethinkers, or can they be regarded as elements in a distinctive and reasonably coherent metaphysics?

It is odd that Berkeley had so much to say about the relativity of each particular sense and so little to say about our perception of the physical world. He referred to perspectival distortions and the like in the course of defending his view that the existence of sensible qualities is their being perceived, but he did not seem to realize the difficulties they made for his view that perception is direct. Indeed, when, in the *Three Dialogues* (3) he mentioned the case of the oar that looks bent in the water when in fact it is straight, he said that we go wrong only if we mistakenly infer that it will look bent when out of the water. There is something seen to be straight, something else seen to be crooked, and something else again felt to be straight. We go wrong only when we expect that when we see something crooked we shall feel something crooked. But this implies that our perceptions of such things as oars, as distinct from our perceptions of colors and pressures, are not direct as common sense supposes. This reinforces the criticism we have already mentioned, that the ideas perceived by finite spirits with sense organs are different from, and representative of, the ideas in the mind of God. Berkeley was farther from common sense and closer to the views that he was criticizing than he was ready to admit.

It is obvious enough that Berkeley's immaterialism is not in accord with common sense. What place, then, must be given to his empiricism? He certainly rejected the Cartesian conception of a natural world that deceives the senses and is apprehended by the reason. He denied that mathematics reveals the ultimate necessities of things and anticipated to some extent the linguistic theory of mathematics. In arguing that causes are not to be found in nature, and in maintaining that the sciences of nature are primarily concerned with predicting human experiences, he formulated views that Ernst Mach and his modern-day followers have advocated. Furthermore, although he did not himself adopt it, he briefly formulated the theory of the physical world known as phenomenalism, the theory that consistent empiricists have adopted in order to avoid

postulating objects that transcend sense experience. But, in spite of all this, Berkeley was an idealist rather than an empiricist. He held that sensible qualities or ideas are not independent or substantial existences and that minds or spirits are. On this most important matter, he was in agreement with his great contemporary, Leibniz. Furthermore, Berkeley's antiabstractionism, as we may call it, was constantly leading him toward the conclusion that the universe is a concrete unity in which an infinite mind is manifesting itself. If we look at his writings as a continuing and developing critique of abstraction, then we shall see that the *Siris* is not an aberration or a recantation but, as Henri Bergson said in his lectures on Berkeley, 1908–1909, a natural continuation of Berkeley's earlier views (*Écrits et paroles*, 2, p. 309).

H. B. Acton (1967)

BERKELEY, GEORGE [ADDENDUM]

George Berkeley believed that there are only minds and ideas. The existence of minds (or spirits or souls), Berke-

ley contended, consists in perceiving whereas the existence of ideas (including sensations) consists in being perceived. Minds, which are the only substances, are active, and ideas are passive. The existence of physical objects consists in their being perceived. This is so because such objects consist of their qualities, and qualities are sensations. Thus Berkeley endorsed the idealist view that the physical world is kept in existence by being perceived. It depends upon the mind and cannot exist apart from perception. Consequently there is no need to presuppose material substance. Indeed, the very concept of material substance is incoherent. God is the source of our sensations. Hence we are in intimate contact with God, and we ought therefore always to be assured of God's existence and to be thankful to God.

The foregoing claims are central to Berkeley's thought. However, questions remain about the meaning and implications of some of these claims and about other aspects of his philosophy.

IDEAS AND OBJECTS

Berkeley sometimes espouses the view that physical objects are just collections or families of sensations that are produced by God in the minds of finite perceivers. But he explains the continued existence of objects that are not currently perceived by us by appealing to God's perceptions and to God's volitions. In addition he says that the ideas we perceive exist apart from the minds of finite perceivers at all times at which they exist. But if physical objects can exist qua divine ideas or volitions, or if they have any sort of existence independent of our sense perception, then such objects are not just collections of sensations in our minds.

Further, God perceives a great deal more than we perceive. For example, God presumably perceives all perceivable objects. Perhaps God perceives all such objects from all angles at once and perceives the interiors of physical objects whose surfaces alone we can see. Moreover, whatever form God's perception may take, it is not limited to the few senses that are our lot. Hence, if objects consist of our ideas along with God's ideas, our ideas are in danger of being second-class counterparts of God's. Our sensations seem to be relatively insignificant constituents of the familiar objects of our experience. It would not follow that the real objects are solely in God's mind. What would follow is that each object is largely in God's mind.

Nor would it follow that our perception of objects is indirect or lacking immediacy. If objects consist, or even partly consist, of ideas of sense, we can perceive them

immediately and directly by perceiving our ideas of sense that are among their constituents. We perceive physical objects by perceiving them in part.

THE EXISTENCE OF GOD

Berkeley thought that we can know that God exists because our sensations both come to us from an external source and display a coherence, beauty, scale, and variety that bespeak a wise and benevolent source. He also thought that because some physical objects continue to exist while unperceived by us, there must be some other mind that perceives them while we do not perceive them. And Berkeley also presents this line of thought as the basis of a case for God's existence. Further, he thought that either the ideas we perceive or their archetypes exist independent of our perception in some other mind that exhibits them to us. Hence there must be such a mind.

Does Berkeley intend to offer three distinct arguments for God's existence (one that appeals to the source of our ideas, a second that appeals to the continued existence of unperceived objects, and a third that appeals to the independent existence of our ideas or their archetypes) or are these best understood as three strands in a single argument? However he may have conceived of the connections among these lines of thought, a case can be made for regarding the appeal to continuity as subsidiary to the appeal to the independent existence of our ideas or their archetypes. For if, at all times at which they exist, the objects we perceive by sense exist in another mind, by whom they are exhibited to us, then the fact that they exist when we do not perceive them seems fairly incidental. That is, their existence at times when we are not perceiving them is just a function of the fact that they have an independent existence, an existence that they have both while we perceive them and at times at which we do not perceive them but during which they exist.

Yet another argument for God's existence derives from Berkeley's thought that visual sensations are a language—for example, they tell us what other sensations we may receive, and our sensations are often combined in complex patterns. The use of a language requires a mind.

MINDS AND BODIES

How did Berkeley conceive of the relationship between the mind and the body? A human body, like any other physical object, is—at least in part—a set of sensations. If the sensations that constitute, or partly constitute, physical objects are bestowed on finite minds by God, then when, say, I perceive your arm moving, one set of ideas produced in me by God is followed by another such

set. Yet Berkeley says that we move our own limbs and that on this issue he differs from Malebranche. But how can he account for our moving our limbs or for our being able to move anything else by moving our limbs, or in any other way? Motion is always motion of some sensible body: it is inseparably united with other sensible qualities. There seems to be little room in Berkeley's theory for an account of motion without sensations. And if he is unable to account for our being able to move our limbs, on what basis does he think that one finite mind may reasonably conclude that there are other such minds?

Perhaps the claim that we are able to move our limbs is to be reduced to the view that certain volitions or non-sensory ideas that we produce serve as the occasion for God to grant us certain sensations. Or perhaps this claim is to be reduced to the view that certain sensations (such as those that constitute, or partially constitute, states of affairs that we wish to obtain) can be thought of as being produced by us, without any suggestion that this is indeed the case.

On these readings Berkeley would be “speaking with the vulgar and thinking with the learned” on the various occasions on which he says that we are able to move our limbs. However, he gives no indication that this is so. His treatment of this issue is quite different from that of physical causation. In the latter case, unlike the former, he is willing to say that fire heats and that all manner of causal connections obtain in the world even though, strictly speaking, he believes that this is not so.

One alternative reading is that we are able to produce some sensations. If God provides us with sensations on a great and wonderful scale, can we do so on a small scale? If the coherence, regularity, and so forth, of nature as a whole is good reason to conclude that God is its source, then perhaps the presence of discrete portions of the whole that manifest their own coherence and regularity is good reason to conclude that finite beings with limited powers are the sources of some of the sensations we receive.

If, in order to make a difference to the sensations you receive, I have to make a change in a mind-independent object, the suggestion that I should directly affect the sensations you receive without changing the world, including my body, seems absurd. If, on the other hand, as Berkeley avers, your sensations (and the sensations of all perceivers) constitute (or partly constitute) the physical world, to say that I can directly affect your sensations is just to say that I can make (or contribute to making) a change in the physical world.

IDEAS AND THE PERCEPTION OF IDEAS

How did Berkeley conceive of the relationship between ideas and their perception? Are there two things, an object and an act, that stand in a certain relationship to each other? Are there, at any rate, an object and a process in the mind to be related? For Berkeley says that in sense perception the mind is passive, which incidentally is a view that needs to be reconciled with his idea of the mind as an active, indivisible entity. Berkeley says that the existence of an idea is identical with its being perceived. His model for the relation between an idea and its perception is the relation between a pain and its perception. That relation is one of numerical identity. If an idea is identical with its being perceived, and if the perception of an idea is a private event in the mental life of an individual, it follows that an idea is something private to the mind in which it occurs.

At the same time it is natural to think of the qualities of objects, such as the redness of an apple, as something public that different people can perceive. Berkeley would want to preserve this commonsense belief. Yet if qualities are ideas, and an idea is identical with its being perceived, how can different perceivers perceive the same quality? Perhaps Berkeley should say that different people may perceive numerically the same quality even though they may not perceive numerically the same idea, thereby abandoning his identification of ideas and qualities.

ABSTRACTION

Berkeley devotes most of the Introduction of *A Treatise concerning the Principles of Human Knowledge*, Part 1, to a refutation of the Lockean belief in abstract ideas. Berkeley believed himself to have shown that abstract ideas are impossible. For any abstract idea would contain at least one inconsistency. Consider the abstract idea of man. This is supposed to contain only what is common to all men and to leave out what is distinctive of each. Yet, being the idea of a man, it must have some determinate human features. For example, it must be of a man with a particular size and shape. So an abstract idea of man must both lack and have such features. Again, since it must contain only what is common to all motion, the abstract idea of motion can't be of fast or slow, straight or curved motion. Yet being an idea of motion it must be of motion that is either fast or slow, either straight or curved. Therefore there can be no such idea.

Berkeley denies the possibility of a certain sort of precision or mental separation that allegedly gives rise to abstract ideas. He considers it to be impossible to separate

mentally from our perception of an object that has color, extension, and motion an idea that consists of, say, extension alone or motion alone. Motion cannot exist except in something moving and we cannot separate mentally what can not exist separately. Moreover, he thought that, having noticed that particular motions have something in common, namely their motion, it is impossible for us to separate mentally what they have in common, thereby forming, once again, an idea that consists of motion alone.

In addition to being both incoherent and the alleged product of a process that actually is nonexistent, abstract ideas are quite unnecessary. General terms have meaning without signifying any such idea. For example, *triangle* has meaning in virtue of signifying indifferently a vast number of ideas of particular triangles.

ABSTRACTION AND IMMATERIALISM

Berkeley apparently understood his case against abstraction to be central to his case for thinking that physical objects cannot exist apart from perception. This is suggested by the fact that he devoted the introduction of what is probably his most important work to opposing abstract ideas. Indeed he says that the belief in abstraction has led to numerous errors and difficulties in nearly every area of inquiry, including the error of distinguishing the existence of sensible things from their being perceived. But it is not immediately obvious how he conceived of the connections between exposing the bogus character of abstract ideas and arguing that sensible objects can not exist unperceived.

One strand in his thinking may be this: It is impossible to believe to exist apart things that are incapable of existing apart. Physical objects are incapable of existing apart from perception. Hence it is impossible to believe them to do so. Or perhaps the point is that we cannot conceive of, or have an idea of, *a* and *b* as existing apart if *a* and *b* are incapable of existing apart; and since there cannot be existence apart from perception, we are unable to conceive of, or have an idea of, existence without perception.

On neither of these very similar readings does the case against abstraction contribute to the argument against mind-independent existence. Instead it has to be shown independently that there cannot be existence apart from perception. At most the case against abstraction illuminates the sort of error that is involved in believing that there are unperceived objects. Or at least it is a diagnosis of the sort of error involved in thinking that one is believing in mind-independent existence, because we are

told that it is impossible to so believe. But that believing in mind-independent existence actually involves this error is something that has to be established independently. Indeed, if the idea of unperceived existence is contradictory, as Berkeley insists, then even if there were abstract ideas, we would still be incapable of conceiving of existence apart from perception, just as we would still be incapable of conceiving of married bachelors or round squares or any other manifestly contradictory concepts.

Perhaps the focus should instead be on the idea of a material substratum and on an argument along the following lines. The idea, or rather alleged idea, of a material substratum involves the idea of being in general. The idea of being in general would be an abstract idea. And because there are no abstract ideas, there is no idea of being in general. Hence the very idea of a material substratum is unthinkable.

BERKELEY'S PHILOSOPHY OF LANGUAGE

We have already mentioned the central aspect of how general terms get their meaning: They signify a range of particular ideas. Berkeley makes some additional comments that bear on this topic, but the connections between the various themes he pursues are not always clear.

One question concerns the relationship between, on the one hand, thinking that *triangle* may be used to signify indifferently any and every idea of a triangle and, on the other hand, having in mind when one talks of triangles the idea of a particular triangle that stands proxy for other triangles, the latter being another theme that Berkeley mentions. Berkeley says that ideas, like terms, become general while remaining particular by fulfilling a general function. The latter of the two themes just mentioned is a matter of a general term getting its meaning by signifying a general idea. But the former seems rather different.

Another question concerns the role of selective attention. Berkeley says that we can consider a triangle solely as a triangle, ignoring all of its other features. It is not clear exactly what this involves. For example, if I selectively attend to the color of the red apple before me, do I concentrate on its redness while also being aware of its other properties, or perhaps while merely being aware that it has other properties? Whatever exactly selective attention may amount to, it—or something like it—is presupposed by the idea of one particular standing proxy for others that resemble it. For there will be some crucial respect in which those other things resemble it, and the

idea that stands proxy for those other things will emphasize or single out in some way that crucial aspect.

Berkeley's account of what is involved in meaningful use of language has additional aspects. Words, whether they are particular or general, are sometimes used without the ideas they signify being brought to mind. Once the meaning of a term has been fixed by habitual association with one or more ideas, we often use it meaningfully without bringing those ideas to mind. Thus we can talk meaningfully about triangles without having any idea of a triangle in mind. We also become habituated to the association between certain terms or expressions and the arousal of passions such as fear, love, hatred, or admiration. Originally this process of arousal required an intervening stage at which ideas would render the relevant use of language meaningful, with the ideas in turn giving rise to various passions. But when the path is well trodden and the connections have become familiar, the mediating stage is omitted. This point about arousing passions exemplifies an important theme for Berkeley, namely that language has a number of uses. It can be used to communicate ideas to others. It can also be used to influence others—for example, by causing them to feel a certain way or by leading them to behave in a certain way.

So in virtue of the prior establishment of a word-idea connection, language can come to be used meaningfully without our having the relevant ideas before our minds. This assumes that, at least initially, a word is rendered meaningful by signifying one or more ideas. Berkeley may have held that there are also uses of language that are meaningful in the complete absence of all word-idea connections. At the very least the connection with ideas is further weakened. He seems to have thought this to be so in theology, in science, and indeed in some everyday parlance.

There are scriptural passages that are largely beyond our grasp but that we must nevertheless accept on faith. And Christians ought to believe in, value, and pursue eternal happiness in heaven even though they lack any determinate ideas of the pleasures of heaven. Theological terms such as *grace* and *original sin* derive much of their significance from their influence on our passions and conduct, perhaps eliciting in us hope or gratitude or charity and in turn the actions that bespeak these attitudes.

Likewise, scientific terms such as force and gravity are convenient theoretical fictions that can help us to make accurate predictions and hence have practical value even though we lack a distinctive idea in each case. And there are many everyday terms (*myself*, *will*, *memory*, *love*,

and *hate*, for example) that we understand perfectly well but that do not suggest any distinct ideas to us. Also we talk meaningfully of minds even though these, being active, are not such that there could be an idea of them.

It is not clear in some of these cases whether Berkeley thought that we have no idea rather than no distinct and precise idea. If the latter were the case we might still have a vague and imprecise idea. Indeed, sometimes he seems to aim to show only that we have no relevant *abstract* idea.

Robert McKim (1996, 2005)

BERLIN, ISAIAH (1909–1997)

Latvian born, English educated, and a cosmopolitan in the world of ideas, Isaiah Berlin was both a prolific public intellectual and a distinguished academic, concluding his career as Oxford University's Chichele Professor of Social and Political Theory. After publishing some early essays in analytical philosophy, Berlin soon turned to more historical studies. While favoring the essay form, he published an important book-length study of Marx (1939) that was critical of Marx's historical determinism in ways that anticipated his later critiques of theories of historical inevitability. During the Second World War, Berlin worked for the British government in the United States, after which he returned to teaching at Oxford University, with occasional sojourns in London and the United States. His practical political involvements lent a spirit of engagement to his writings, whatever the subject.

Berlin championed political theory at a time when it was distinctly unfashionable in professional philosophy. To dismiss political reflection because of its rough-hewn character, he maintained, is to misconstrue the nature of the subject and leave oneself at the mercy of uncriticized

political prejudices. But Berlin's major importance as a political thinker rests in the vision of liberalism that he articulated in the post–World War II decades. In his seminal essay “Two Concepts of Liberty,” he developed an influential distinction between negative freedom (to act without interference) and positive freedom (to be one's own master), and expressed special concern about the totalitarian dangers lurking in the latter.

While Berlin clearly privileged negative freedom over positive freedom, his distinction is more nuanced than is often acknowledged. He made no fetish of liberty, and reminded readers that communities in conditions of dire poverty cannot give much thought to formal freedoms. What he most bemoaned in positive freedom was the ideal of self mastery projected onto classes, peoples, or the whole of mankind. His championing the liberal commitment to rights, as demarcating individual spheres of autonomy, has had a deep impact on all subsequent liberal theory, including John Rawls's political liberalism and Richard Rorty's pragmatic liberalism. He wrote, “There are frontiers, not artificially drawn, within which men should be inviolable,” frontiers so secure that their observance “enters into the very conception of what it means to be a human being” (1969, 165).

Berlin also argued for identifying liberalism with an ethic of pluralism, for which ultimate good as postulated by determinist views of historical development, does not exist. “To assume that all values can be graded on one scale ... seems to me to falsify our knowledge that men are free agents” (1969, p. 171). Liberal society is one in which values are always in conflict, and such conflicts cannot be resolved by metaphysical fiat but must instead be addressed by the arduous patient work of practical negotiation. Thus conceived, the liberal outlook is intrinsically opposed to the totalitarian impulse in all its forms. It rests on the acceptance of moral uncertainty as our epistemological fate, and tolerance as our political imperative.

Of his many contributions to the history of ideas, Berlin's studies of Giambattista Vico, Johann Gottfried Herder, Johann Georg Hamann, and Romanticism were of special importance to philosophy. His discussions of Romantic “expressivism” were instrumental to the English-language revival of studies in the philosophy of Georg Wilhelm Friedrich Hegel, starting in the 1970s. They helped shape the understanding of the Romantic background that Hegel both appropriated and criticized. Berlin's writings on Romanticism intertwined with his long interest in modern nationalism, which he regarded more sympathetically than many other post–World War

II liberals. Berlin also wrote widely on Russian novelists and thinking, translating Ivan Turgenev (1818–1883) and other classic writers into English.

Berlin wrote for popular as well as academic audiences and received much acclaim throughout his long life. He was awarded the Jerusalem Prize, the Erasmus Prize, the Angelli Prize, and the Lippincott Prize, among others. He was knighted in 1957 and received the Order of Merit in 1971. He died in Oxford, U.K., at the age of 88, having once remarked, “I don't mind death. ... but I find dying a nuisance” (*New York Times*, November 7, 1997).

BERNARD, CLAUDE (1813–1878)

Claude Bernard, French physiologist, was born in Saint-Julien (Rhône). He received his M.D. in 1843 and became a professor at the Sorbonne in 1852, taking the new chair in physiology in 1854. The following year he was appointed professor of experimental medicine at the Col-

lège de France and in 1868 became professor of general physiology at the Museum of Natural History in Paris. He was elected a member of the Academy of Sciences in 1854 and of the Académie Française in 1868; in 1869 he became a senator.

Bernard early gave up any idea of clinical practice in favor of experimental physiology. He made a number of important contributions in this field (on the chemistry of digestion, the production of sugar in animals, the nervous system, poisons, and anesthetics), many of which were awarded scientific prizes. After a period of ill health, while not ceasing laboratory work, he turned to more general and programmatic questions of scientific method and published, in particular, his famous *Introduction à l'étude de la médecine expérimentale* (Paris, 1865; translated by H. C. Green as *An Introduction to the Study of Experimental Medicine*, New York, 1927).

In the *Introduction*, Bernard based his conclusions as much as possible on his own scientific experiences, since he believed that proper procedure cannot be legislated for scientists from without but must be developed from the nature and needs of science itself. He distinguished the mature experimental method from empiricism, which is merely its first step. Bernard identified crude empiricism, which observes and experiments at random, not only with his own teacher, François Magendie, but also, mistakenly, with Francis Bacon, regarding himself rather in the tradition of Descartes, despite the fact that he insisted on constant laboratory experimentation and criticism and had a low opinion of the application of mathematics to biological problems. His hostility to the use of statistical methods in biology derived from the one article of faith he regarded as necessary to any scientist: belief in the operation of a determinism without exceptions, such that a set of conditions (a cause) will invariably produce the same phenomenon (an effect). This determinism he called an absolute principle, in contrast to theories and hypotheses, which are always provisional and subject to revision or abandonment because of the discovery of incompatible facts. But theories and hypotheses, the products of human reason, are on the other hand the necessary guides for rational experimentation.

Bernard saw no difference in principle between scientific method as applied to living beings and to inorganic matter, although results were more difficult to achieve in physiology because of the far greater complexity of the phenomena. He believed in a fundamental unity among all forms of life, the higher forms being distinguished by their greater independence of the external environment and a correspondingly greater dependence

on their "internal environment" (above all, the blood). He also held that the phenomena taking place in living beings are ultimately reducible to physicochemical processes. Efforts to enlist Bernard in the cause of vitalism are wide of the mark. Equally mistaken is the attempt to affix a positivist label. He strenuously advocated scientific doubt and self-criticism, and was opposed to all philosophical systems, including the positivist, while not denying the usefulness of the work of philosophers in their own sphere. Bernard's critical method was closer to twentieth-century methods based on the principle of falsifiability, used by Karl Popper and others, than to those of many of his contemporaries.

See also Bacon, Francis; Descartes, René; Empiricism; Popper, Karl Raimund; Positivism; Scientific Method; Vitalism.

Bibliography

Bernard's general works also include *La science expérimentale* (Paris: J. B. Baillière, 1878) and *Principes de médecine expérimentale* (Paris: Presses universitaires de France, 1947). BERNARD OF CHARTRES

(*died c. 1124–1130*)

Bernard of Chartres, a Breton and elder brother of Theodoric of Chartres, was a master at Chartres at periods during the second and third decades of the twelfth century and became chancellor at least by 1119. He is no longer to be confused with Bernard Silvestris of Tours. To Bernard of Chartres belongs much of the credit for bringing the intellectual life of Chartres to its apogee, and his pupils included Gilbert of Poitiers, William of Conches, and Richard the Bishop. No complete writing by Bernard has survived, although he is known to have written philosophical verse and to have expounded Porphyry's *Isagoge*. Nevertheless, John of Salisbury learned of the character of Bernard's literary and philosophical teaching through William and Richard, and in John's writings we find a sympathetic portrait of Bernard as a real lover of learning and a leading grammarian, the most abounding spring of letters and the most finished Platonist of those days. John

eulogizes the “old Chartrain” as an excellent teacher of Latin language and literature, whose aim was to produce well-lettered and well-spoken students by means of an unhurried, cultured, humanist education, firmly based upon a groundwork of grammar. Bernard’s love of the ancients was expressed in a famous simile of the moderns as dwarfs who can see farther than the ancients because they are perched upon the shoulders of giants.

Bernard was a philosopher with a taste for speculative grammar and for Platonism. He held opinions that the more Aristotelian John did not entirely share. We know only one of Bernard’s grammatical speculations, namely, that the relationship of a quality-word (e.g., whiteness) to its derivatives (e.g., to whiten, white) resembles the relationship of the Platonic Ideas to the things in which they participate. As a Platonist, Bernard held that true reality is found in the eternal Ideas, which are the models of all perishable things. Particular sensible things, being unstable and ephemeral, cannot properly be said to be. Bernard’s contribution to the disputes of his time over the nature of universals was to equate universals with Ideas; hence universals, in his view, were real beings. Guided by Boethius, Bernard and his school also labored to reconcile the differences between Plato and Aristotle.

Under the influence of the ninth-century thinker John Scotus Erigena, Bernard also sought to reconcile the teaching of Plato’s *Timaeus* with that of the Bible by reexamining the relationships between the three categories of true being: God, matter, and the Ideas. He adhered to patristic teaching in accepting the view that matter was created by God. He also held that the eternal Ideas are in some way posterior to God. The Ideas are assimilated with God’s mind or the divine providence; but although they are immanent in the mind of God, they are also a created effect. They are eternal, but not, in Bernard’s view, coeternal with God. Only the three persons of the Trinity are both coequal and coeternal.

On the other hand, Bernard also attempted to show that the Ideas were not directly mixed with sensible objects. He distinguished between Ideas that subsist in the mind of God and the copies of these Ideas that are concreated with matter. To the latter Ideas he gave, under Boethian influence, the name of native forms (*formae nativae*).

Essentially, Bernard sought to affirm the transcendence of God over the Ideas and to avoid pantheism by the theory of native forms, which allowed no confusion of God with creation. Insofar as we can judge his motives, Bernard was adapting the Platonism that he knew to

Christianity, just as he modified this Platonism in the light of Aristotelianism. His teaching was promoted by other Chartrains, especially by Gilbert of Poitiers.

BERNARD OF CLAIRVAUX, ST.

(1090–1153)

St. Bernard of Clairvaux, the monastic reformer and theologian, was born of a noble family at Fontaine, France, near Dijon. He became a Cistercian at Cîteaux in 1112 and founding abbot of Clairvaux in 1115. Throughout his life he was a tireless founder, reformer, preacher, and writer who, as friend or opponent, made contact with almost every notable in western Europe. His influence as a simple abbot on high ecclesiastical affairs is without parallel in the history of the Western church, and his spiritual teaching has been a living force to the present day. Though he was a professed enemy of secular culture (he

“raided” the schools of Paris on a celebrated occasion in 1140) and was lacking in scholastic training, Bernard was a literary genius of the first order, and no mean theologian. His treatises *De Diligendo Deo* (On the love of God; 1126) and *De Gratia et Libero Arbitrio* (On grace and free will; 1127), though based on St. Augustine, also show the influence of Origen, Gregory of Nyssa, and the Pseudo-Dionysius, as do also some of his longer letters. In the history of thought he is remembered for his controversies with Peter Abelard and Gilbert de La Porrée. He distrusted contemporary dialectic, partly because of a justified apprehension of the dangers in the formulas of both his opponents, but most of all because his approach to theological truth was by way of meditation and intuitive penetration, whereas theirs was by way of logical expression and analysis. His influence restrained theological improvisation and methodical virtuosity, and left the field clear for the great scholastics of the next century.

His most valuable contribution to thought was in the realm of mystical theology. He was a medieval pioneer of the analysis and explanation of mystical experience. His teaching, ostensibly based on St. Augustine, was in many respects new, and was followed by that of the Victorines and others, though later rivaled and eclipsed by the Dionysian-Thomist school of Rhineland Dominicans. Bernard’s mysticism was one of love. Man, by recognizing his own nothingness, turns to God with humility and love, and man’s will, with divine help, can reach perfect accord with the divine will. The divine Word can then teach him (infused knowledge) and move him (infused love) in an intimate union sometimes momentarily experienced as ecstasy. Thus Bernard differs, in expression at least, from the intellectual mysticism of Neoplatonism reflected in both Augustine and Dionysius. In his *Sermons on the Canticle*, Bernard was also a pioneer in the clear description of his own mystical experience, which in many ways resembled that of St. Teresa of Ávila.

Bibliography

Works by Bernard are to be found in *Patrologiae Cursus Completus, Series Latina*. Edited by J. P. Migne, Vols. 182–185 (Paris, 1844–1864).

For biography, see E. Vacandard, *Vie de saint Bernard*, 2 vols. (Paris, 1895), often reprinted. Also useful are articles on Bernard by E. Vacandard in *Dictionnaire de théologie catholique* (Paris, 1910) and by J. Canivez in *Dictionnaire d’histoire et de géographie ecclésiastique* (Paris, 1935).

For Bernard’s contribution to mystical theology, see Étienne Gilson, *Théologie mystique de saint Bernard* (Paris: J. Vrin, 1934), translated by A. H. C. Downes as *The Mystical Theology of Saint Bernard* (London: Sheed and Ward, 1940), C. Butler, *Western Mysticism: The Teaching of SS. Augustine, Gregory and Bernard on Contemplation and the Contemplative Life*, 2nd ed. (London: Constable, 1951). Dom J. Leclercq is preparing a critical edition of St. Bernard’s works.

David Knowles (1967)

BERNARD OF TOURS

(d. after 1167)

Bernard of Tours was a humanist who taught at Tours and was known as Bernardus Silvestris. He is uncertainly identified with Bernard, chancellor of Chartres circa 1156 and bishop of Quimper from 1159 to 1167. Very little else is known of his life except that he taught the art of writing and wrote an *Ars Versificatoria*, which has not been found. He also wrote a moralizing allegorical commentary on part of Vergil’s *Aeneid* that displays leanings toward a naturalistic ethic. He translated into Latin an Arabic treatise on geomancy, the *Experimentarius*, and, inspired by Quintilian, composed the *Mathematicus*, a poem about an astrological prediction.

His most famous work, dedicated to Theodoric of Chartres in about 1150, is the *De Mundi Universitate*, an allegory in prose and verse on the origin of the world and man. The theme is Nature’s appeal to Nous (mind), the providence of God, to end the chaos of *hylē* (matter), the primordial matter of the megacosmos. In Nous exist the exemplary forms of creation. Nous separates four elements out of *hylē* and informs the world with a soul (“entelechy,” the Aristotelian *εντελεχεια*). Nous next sends Nature to find Urania and Physis. Urania, queen of the stars, and Physis, in the lower world, use the remains of the four elements, in collaboration with Nature, to form man (the microcosmos). The sources of Bernard’s inspiration were the Latin version of Plato’s *Timaeus* with the commentary of Chalcidius, and also Ovid, Claudian, Macrobius, Boethius, and Augustine. There is, in addition, a marked biblical and a Hermetic influence.

The humanism of this work is more profane than Christian; the world is that of the *Timaeus* rather than that of Genesis. But the paganism, even unorthodoxy, of Bernard should not be exaggerated. Thus, Bernard was silent about a divine creation of matter, but his concern was to depict the organization of matter into the universe. There is no consistent dualism of God and matter;

hylē is preexistent to the ordering work of *Nous*, but the problem of its eternity is not broached. One should not conclude from the emanation of a world soul from *Nous* that Bernard was a pantheist. We cannot, in fact, extract from this often nebulous work a unified view of Bernard's thought. Bernard's purpose was imaginative rather than strictly philosophical. Nonetheless, Bernard reflects the speculative interests of his time, particularly those of the Chartres; he reflects their desire for a more rational explanation of the universe and of biblical cosmology with the aid of Greek ideas.

BERTALANFFY, LUDWIG VON (1901–1972)

Ludwig von Bertalanffy, one of the chief exponents of the "organismic" standpoint in theoretical biology, was born in Austria in 1901 and educated at the universities of Innsbruck and Vienna. Until 1948 he taught at the Uni-

versity of Vienna, first as an instructor and later as professor of biology in the medical school. He emigrated to Canada in 1949 and held academic posts at the University of Ottawa and the University of Alberta, where he was appointed professor of theoretical biology in 1962. Von Bertalanffy's writings are voluminous, amounting to more than two hundred items. These include scientific papers in such fields as animal growth, cell physiology, experimental embryology, and cancer research. His two best-known books on philosophical biology are *Kritische Theorie der Formbildung* (Berlin, 1928; translated by J. H. Woodger as *Modern Theories of Development*, London, 1933) and *Das biologische Weltbild* (Bern, 1949; translated by the author as *Problems of Life*, New York, 1960). Since 1950 he had been active in promoting an interdisciplinary field called "General System Theory." The society associated with this enterprise has issued several year-books.

Von Bertalanffy contended that neither classical mechanism nor vitalism provides an adequate model for understanding organic phenomena. Vitalism is intellectually sterile because it appeals to a mysterious *élan vital*, *entelechy*, or *psychoid* to account for the properties of living things. Mechanism, von Bertalanffy declared, involves three mistaken conceptions: (1) the "analytical and summative" conception, according to which the goal of biological inquiry is the analysis of organisms into fundamental units and the explaining of organic properties by a simple adding up of these units; (2) the "machine-theoretical" conception, which regards the basis of vital order as a set of preestablished structures or "mechanisms" of a physicochemical kind; and (3) the "reaction-theoretical" conception, according to which organisms are automata, reacting only when subjected to stimulation and otherwise quiescent. These conceptions, von Bertalanffy argued, cannot yield a well-grounded explanatory theory of life.

In place of them he proposed an organismic model on which such a theory can be built. The model represents organisms as wholes or systems that have unique system properties and conform to irreducible system laws. Organic structures result from a continuous flow of processes combining to produce patterns of immense intricacy. Far from being passive automata, living things are centers of activity with a high degree of autonomy. Biological systems are stratified. There is a hierarchy of levels of organization from living molecules to multicellular individuals and supra-individual aggregates. The whole of nature is "a tremendous architecture in which

subordinate systems are united at successive levels into ever higher and larger systems.”

Von Bertalanffy sought to show that this conception illuminates such matters as embryonic development, genetic processes, growth, self-regulation, metabolism, and evolution. Thus, in embryology it is no longer necessary to take sides in the old contest between preformationism and epigenesis, if we adopt the hypothesis that a fertilized ovum is a system whose development is determined by internal system conditions. Similarly, the ostensible purposefulness manifested by this development is an illustration of the unique property of “equifinality,” which marks the behavior of organisms as “open” systems. These systems differ in important respects from the closed systems dealt with by physics. The thermodynamic principles that apply to the two cases are by no means the same. Nevertheless, von Bertalanffy believed that “there are general principles holding for all systems, irrespective of their component elements and of the relations or forces between them.” These principles, he thought, can be studied through General System Theory, whose function is to bring about the unity of science.

The organismic conception of life is presented by its author as an intellectual breakthrough that “may well be set beside the great revolutions in human thought.” Critics have found this claim extravagant in view of the sketchy and programmatic character of von Bertalanffy’s presentation. They contend that the organismic conception has no right to be called “revolutionary” until its merits have been shown in detailed and extensive biological analysis. Nevertheless, von Bertalanffy has called attention to issues of major importance for the future of theoretical biology.

BIEL, GABRIEL

(c. 1410–1495)

Gabriel Biel, the Ockhamist philosopher and theologian, was born at Speyer, Germany, and died at Einsiedel (Schönbuch). He studied philosophy and theology at Heidelberg and Erfurt, joined the Brethren of the Common Life, and became a professor of theology (1484) at the newly founded University of Tübingen, where he taught the “modern way,” that is, according to the nominalist position of William of Ockham. Biel’s “Commentary on the Sentences” (*Epithoma Pariter et Collectorium Circa IV Sententiarum Libros*, Tübingen, 1495) is a skillful summary of Ockham and a collection of the views of other medieval thinkers from Anselm to John Duns Scotus. Widely read in the German universities, Biel exerted a strong influence on Martin Luther (see P. Vignaux, *Luther, Commentateur des Sentences*, Paris, 1935).

As a philosopher, Biel was quite ready to criticize and to offer his own developments of Ockham’s nominalism. Basically a theory of knowledge, his thought had some influence in ethics and political philosophy. For Biel formal logic displaced metaphysics because he considered universals to be but names (*nomina*) arbitrarily applied to classes; he considered all existents to be completely individual in character. Essence and existence are not really distinct principles in things but are merely distinguished in thought.

Biel’s psychology was, like Ockham’s, close to Augustinianism: the powers of the soul are not distinct faculties; intellect is the soul understanding, will is the soul desiring and loving. Biel was a psychological voluntarist; for him the most important psychic activity of man was will-

ing. He taught that all man's conscious activities entailed some use of will. Man was viewed as a volitional rather than rational animal.

In practical philosophy, he considered moral goodness to consist in volitional conformity to God's will. The obligatory force of law has no basis in the nature of created things but is solely due to the fact that God has willed a certain action to be right. This is moral and legal voluntarism. "God could command that a man deceive another through a lie," wrote Biel, "and he would not sin" (*Epithoma*, II, 38, q. 1, G).

BILFINGER, GEORG BERNHARD

(1693–1750)

Georg Bernhard Bilfinger was the German philosopher who coined the expression Leibniz-Wolffian philosophy for the view he expounded. Bilfinger, whose family name was also spelled Buelffinger, was born in Kannstadt, Württemberg. He studied theology at Tübingen, and mathematics and philosophy at Halle under Christian Wolff. He was appointed extraordinary professor of philosophy at Tübingen in 1721, but after Wolff's expulsion from Halle in 1723, Bilfinger was accused of atheism and deprived of his positions. On Wolff's recommendation he was appointed professor of philosophy and academician in St. Petersburg. His growing reputation as a natural philosopher caused Duke Eberhard Ludwig of Württemberg to recall him to Tübingen as professor of theology. In 1735 the new Duke Karl Alexander of Württemberg called Bilfinger to his capital, Stuttgart, as a member of the privy council. Bilfinger became president of the Con-

sistorium, a council for ecclesiastical and educational affairs, and in this capacity permitted Pietism to be taught in Württemberg.

Although Bilfinger's doctrines are quite close to Wolff's, he showed a certain originality, discussing Wolff's doctrines critically and frequently accepting them only with reservations. In an early work he held, against John Locke, the view that there are innate ideas in the human mind, identifying them with axioms. In psychology he did not accept the distinction, introduced by Wolff, between empirical and rational psychology, but proceeded in a more traditional manner. In his later writings, Bilfinger referred less frequently to Wolff.

The most independent part of Bilfinger's system was his theory of possibility, expounded in his main work, *Dilucidationes Philosophicae de Deo, Anima Humana, Mundo et Generabilis Rerum Affectionibus* (Tübingen, 1725). He asserted that the notion of possibility is more fundamental than the principles of identity and contradiction. Possible things are not absolute beings in an independent realm of ideas, but they depend for their existence on God's understanding (not on his will). It is a part of God's essence to think possible things as they are, but they are, only insofar as God thinks them.

Giorgio Tonelli (1967)

BINET, ALFRED

(1857–1911)

Alfred Binet, the French psychologist, was born at Nice. The son of a doctor and an artist, Binet studied at the Sorbonne, qualifying in 1878 in both law and science. He embarked immediately on a doctorate under Edouard Balbiani, embryologist and professor at the Collège de France, whose daughter Binet married in 1884. In the same year he submitted an article on the fusion of images to *La revue philosophique*. The editor, Théodule Ribot, persuaded him in due course to devote his energies to psychology. Through Charles Féré, Binet came to work with Jean Charcot at the Salpêtrière hospital.

Binet is known mainly for his work, with his younger colleague Théodore Simon, in devising tests for assessing children's intelligence. The Binet-Simon scale, published in 1905 and revised in 1908 and 1911, constituted the first systematic, effective, and widely accepted attempt to devise sets of simple verbal and nonverbal tasks, performance on which could be quantified with a fair degree of objectivity, and on which norms for different age groups in the school population were carefully worked out. The principal American versions were produced, revised, and restandardized by L. M. Terman and his colleagues at Stanford University in 1916 and 1937. It was, however, Binet and Simon's careful studies that showed the necessity of valid data to ascertain the intellectual skills and concepts normally to be expected of children at each age before any assessment of a child's retardation can fairly be made. The revised tests are still employed for research and clinical purposes, although increasing use is now being made of the Wechsler tests.

Binet himself was well aware that cultural factors have a bearing on test performance and that interestingly different patterns of results on various subtests might be shown by children achieving similar overall scores. Hence, the conception of an intelligence quotient (IQ) as

$$\frac{\text{mental age}}{\text{chronological age}} \times 100$$

popularly linked with Binet's name, in fact runs counter to his stress on studying and appreciating individual differences.

The practical utility of the Binet-Simon scale has overshadowed to a large extent the rich background of inquiries from which the tests were developed. A man of wide theoretical and practical interests, Binet wrote in lucid and lively French a dozen books and some 250 arti-

cles, many of which appeared in *La revue philosophique* and in *L'année psychologique*, of which he was the editor. Seven of his books and a few articles appeared in English, which Binet wrote and spoke fluently. The *Psychologie des grands calculateurs et joueurs d'échec* (Paris, 1894), and *L'étude expérimentale de l'intelligence* (Paris, 1903), the latter reporting studies of his own children, remain neglected classics of French psychology. Both works provided evidence of individual differences in imagery and evidence that images could be less important in thinking than the associationists supposed. Furthermore, these studies, especially the former, showed that the subsequent line of thought was affected by the nature and presentation of the problem a thinker was asked to solve, by the mental set induced by that problem, and by his attitudes in other respects. The studies of his young daughters illustrate Binet's patient, systematic mode of inquiry into children's thought processes, and they enhance understanding of the developmental approach to psychology to which Jean Piaget was the heir.

Chronological scrutiny of his writing shows Binet's work on intelligence to have been the practical outcome of prolonged theoretical and experimental study of the nature of thought processes—subnormal, normal, outstanding, and abnormal. These investigations were carried out in hospitals, notably the Salpêtrière, in schools, and in the psychological laboratory at the Sorbonne, of which Binet became director. Influenced by Hippolyte Taine in France and by the British empirical tradition (including J. S. Mill, Alexander Bain, and Francis Galton), Binet had started as a narrowly orthodox associationist. His evidence for conceptual processes not involving visual imagery anticipated some of the Würzburg experimental findings on "imageless thought." This evidence and that found by Binet and his collaborators for central factors, for unconscious processes, and for attitudes influencing a train of thought led Binet slowly to change his standpoint. In doing so, he moved from treating thinking by analogy with visual inspection to emphasizing the affinities of thought and action and to stressing the importance of developmental studies. Such an approach has proved more acceptable in the 1960s than when Binet died, unfortunately leaving his own research and theory incomplete.

BINSWANGER, LUDWIG (1881–1966)

Ludwig Binswanger, the Swiss psychiatrist whose school of *Daseinsanalyse*, or existential analysis, is the most extensive attempt to relate the philosophies of Edmund Husserl and Martin Heidegger to the field of psychiatry, was born in Kreuzlingen, Thurgau, Switzerland, into a family line of eminent physicians and psychiatrists. After attending the universities of Lausanne, Heidelberg, and Zürich, he received his medical degree from Zürich in 1907. In 1910 he succeeded his father, Dr. Robert Binswanger, as chief medical director of the Sanatorium Bellevue, an institution founded by his grandfather at Kreuzlingen. He relinquished his directorship in 1956.

Daseinsanalyse is an original amalgam of phenomenology, Heideggerian existentialism, and psychoanalysis, the goal of which is to counter the tendency of scientific psychology to view man’s being as solely that of a natural object. However, the school does not seek spheres of human existence that argue against the explanatory power of psychoanalysis. Binswanger complained of the overreductionism of natural science as applied to humankind, but in doing so he was not questioning sci-

ence’s ability to explain; he was, rather, urging that that which is being explained be kept in mind in its full phenomenal reality. Binswanger is a phenomenologist in that he demands a presuppositionless discipline in which the investigator can apprehend the world of the patient as it is experienced by the patient. To this end he limits his analysis to that which is actually present (or immanent) in the patient’s consciousness. He seeks the essential structure of these phenomena without relying on reductive theory, his aim being to allow the phenomena to speak for themselves. As an existentialist he views the essential structures that the phenomena reveal on their own terms as “universals with power.” That is, he sees them as the matrix within which the individual’s world and self—his essence—are determined. He seeks in each patient a general context of meaning within which the patient exists. He calls this meaning-context the transcendental category of that patient’s world design.

This notion of a general existential meaning-context must be understood as that which expresses with equal validity all aspects of the patient’s life and world. The criterion of a complete expression is based on Heidegger’s ontology of man and includes his orientation in space, his mode of being in time, his relation to his bodily life and to his fellow man, his way of thinking, and his fears and anxieties. For example, a universal such as continuity is equally understandable and expressive in reference to time (continuity of events versus the sudden and unexpected), space (contiguity), relationships with others (for example, oedipal ties or bonds), and the individual’s own world (“inner” continuity, continuity of feelings or of affections). But such explanatory categories as aggression or libidinal energy emphasize one aspect of man’s being as most real and are therefore rooted in a one-sided ontology of human existence.

What psychoanalysis takes as conditioning factors—such as instinct or childhood sensations—are regarded by Binswanger as already being representations of a basic world design. It is not that Binswanger wants to push back the causal chain beyond instincts or childhood sensations, but rather that the causal chain itself, as described in scientific depth analysis, must be viewed as a whole, without any a priori privileged reference point in terms of which all else is to be explained. Explanation in terms of a privileged reference point presupposes a theory, and a theory assumes a world outlook—in this case the world outlook of natural science. Binswanger does not, therefore, use the past to account for the present. He sees the past of a patient as existing in the present in that the entire world design—within which a particular event in

the past “conditioned” a present neurosis—is the patient. Therefore, the present, or the conscious, or the manifest content of dreams and the manifest verbal expressions, all point to a unity or category(ies) that is the basis of the patient’s world. In other words, because the self cannot experience a “pure” event outside of a meaning-context, even if the self be that of a child, it is that source meaning-context which Binswanger seeks to apprehend.

Binswanger does not offer his approach as a substitute for psychoanalysis; insofar as the goal of psychiatry is intervention in the patient’s life—manipulation of or change in it—only a scientific approach, such as psychoanalysis or clinical psychiatry, is adequate. For Binswanger, phenomenology and reductive explanation are two complementary aspects of the *Geisteswissenschaften*, including psychology. Phenomenology can provide us with an essential description of the data, and phenomenological existentialism can provide a full dynamic understanding of the individual’s life on his own terms. But if we are willing and find it necessary to transform and control phenomena, natural science is at present our major tool. However, whereas in the natural sciences we confer meanings, in the *Geisteswissenschaften* the phenomena under investigation are themselves meanings to a self, and it becomes necessary phenomenologically to receive these meanings on their own terms.

BIOETHICS

Bioethics is an interdisciplinary field of study dealing with practical ethical issues roughly at the intersection of morality, medicine, and the life sciences. Within philosophy, bioethics is one of several different areas of applied ethics, a domain within general normative ethics. The term “bioethics” was coined in 1970, but the development of bioethics as a discipline may be dated to the late 1960s or early 1970s, depending on which historical markers are used.

The scope of bioethics as a discipline is not entirely fixed, it is important to note. At least three competing visions are available. On the most restricted view, bioethics simply reduces to biomedical ethics, which encompasses ethical issues relating to the practice of medicine broadly understood and the pursuit of medical research. Even on this restricted view of bioethics, the scope extends to the ethics of our use of nonhuman animals in biomedical research, for example. On the second understanding, bioethics encompasses, in addition to biomedical ethics, ethical issues related to the life sciences and technologies. On this understanding, also included is consideration of environmental issues, for example, issues such as genetic modification of plants or the use of cloning technologies to revive extinct species of animals or plants. According to the widest view, bioethics includes the biological aspects of environmental ethics, issues related to nonhuman-animal use, and biomedical ethics. On this understanding, the ethical dimensions of vegetarianism and how global warming affects biotic communi-

ties are also bioethical issues. Interestingly, this widest understanding of the term is closest to the meaning given by biochemist Van Rensselaer Potter, who originally coined the term. However, it also offers the least common understanding of the term within the discipline. The second sense probably offers the most common understanding within the discipline, while most people working in the field of bioethics work on issues in biomedical ethics, the first sense. This entry will explore issues related to all three senses of bioethics.

LOCATING BIOETHICS WITHIN PHILOSOPHICAL ETHICS

Ethics is the philosophical study of morality. It is to be distinguished from the empirical study of moral norms and practices. This second area of investigation is sometimes also called simply “ethics,” but to distinguish it from philosophical ethics, it may more felicitously be called descriptive ethics. As a philosophical discipline, ethics may be further divided into metaethics, general normative ethics, and various areas of applied ethics. Metaethics is concerned primarily with reflections on ethics itself. Some issues within metaethics include the meaning of moral terms like “ought,” “right,” and “virtue”; the metaphysical status of moral norms; the proper grounds for justifying moral claims; and the nature of moral knowledge.

Normative ethics, by contrast is concerned in general with positive guidance to living morally. Normative ethics concerns questions about how to act, what kind of character to develop, and what values to live by. Within normative ethics generally, various ethical theories have been developed as guides in answering these questions. Normative moral theories lay out the structure for particular fundamental sources of normative moral value. Examples include utilitarianism (a type of consequence-based ethics), deontology (a duty-based ethics), and virtue ethics (a character-based ethics). However, normative ethics may also proceed without any particular theoretical structure and may engage directly with the various issues at stake in practical moral living.

Applied ethics is normative ethics at the level of engagement with various specific topics in practical moral life. As such, applied ethics may proceed by following some more general normative theory, by following some methodology or theory particular to the area of study, or without following any specific theoretical or methodological underpinning. The term “*applied* ethics” implies that general normative theories are simply interpreted in light of specific moral problems to generate

practical moral answers; however, this is seldom actually the case. A better term might be “practical ethics.”

Bioethics, then, is a type of practical ethics. It is on the same philosophical level as business ethics, environmental ethics generally (unless understood as a subset of bioethics), cyberethics, and a host of other specific fields dealing with particular areas of complex lived morality. The division into areas of practical ethics may not be particularly neat. As already discussed, bioethics may be understood as distinct from, or inclusive of, environmental ethics. Other areas of practical ethics, such as professional ethics, overlap with various other fields (for example, business ethics, legal ethics, and medical ethics).

HISTORY AND SOCIAL CONTEXT

Many of the specific issues addressed in bioethics have historical roots. The issue of physician-patient confidentiality was addressed in the Hippocratic oath. The bioethics of how we treat animals has roots in the work of such historical figures as Porphyry (232–309) in his treatise *On Abstinence from Animal Food* (discussed in Sorabji 1993). More recently, the requirement that human subjects voluntarily consent to medical research was spelled out in the Nuremberg Code (International Military Tribunal 1949), following the “doctors trial” for atrocities committed as part of the holocaust.

Despite these and multiple other sources of historical precedence, the discipline of bioethics coalesced only in the very late 1960s to early 1970s. The social forces behind this formation into a specific disciplinary field include a growing social awareness of issues of medical paternalism and some unethical practices in medical experimentation; the consumer, feminist, and civil rights movements; the increased institutionalization of health care and with it a growing concern for issues of allocation; advances in biotechnology and biomedicine; growing awareness of issues of sustainable economic growth and environmental impact; and rising awareness of the conditions of animals in newly evolving factory farms.

Since its inception, bioethics has taken deep root in academia, professional education, public policy, the law, and public deliberation. Bioethics courses are offered to undergraduates as part of humanities and science curricula and to medical and other health-professional students. A variety of centers for bioethics research have been established, and numerous government commissions dealing with bioethical issues have been formed and have had varying impact on public policy. A U.S. commission of high impact was the National Commission for the Protection of Human Subjects of Biomedical and

Behavioral Research, the source for the *Belmont Report* (1979), spelling out the ethical principles guiding experimentation on human subjects. Those working in bioethics have extensively scrutinized legal cases, such as the 1989 U.S. Supreme Court case regarding Nancy Beth Cruzan, whose parents sought to withdraw life support after Ms. Cruzan fell into a persistent vegetative state. The law has also been influenced by bioethical analysis, for example by the inclusion of those working in bioethics as expert witnesses in trials. Finally, as biomedical ethical issues and advances in the life sciences have received more attention by the mass media, public arenas for debate over these issues has also grown.

THE DISCIPLINE

Bioethics as a discipline crosses over other disciplinary boundaries, both within and outside of philosophy. Here the focus is on the philosophical aspects of the discipline. Nonetheless, some general remarks about the discipline as a whole are necessary in order to view the philosophical area of bioethics in context. This is important also because there is controversy within the field of bioethics, as has been seen, about what counts as bioethics, but also about the extent to which it is a unified discipline, and about exactly which general methodologies and areas of expertise are relevant.

It is uncontroversial that moral philosophy plays a central role within bioethics, and also that other areas of philosophical study are implicated by the topics relevant to bioethics. For example, political philosophy is central to issues of distributive justice in access to health care and to public-health measures affecting human health, as well as in adjudicating questions of public, institutional, and governmental decision-making about controversial bioethical issues such as use of stem cells and cloning of human somatic cells. In addition to addressing general issues of the relationship between the law and practical morality, philosophy of law is also relevant to determining how case law and legislative law relate to ethical decision making. Finally, although the connection is less widely recognized, philosophy of science is crucial to the investigation of some central conceptual issues in bioethics, for example, the nature of the scientific facts that often play a central role in practical ethical decisions and the meaning of the concept of human health often invoked in such ethical distinctions as that between using genetic technologies for enhancements versus using them therapeutically. Even the question of what counts as a biological kind or species is central in determining whether legitimate ethical distinctions can be made

between human beings and other nonhuman animals for how we treat them, and in dealing with ethical issues related to the transhuman movement for improved humans.

While philosophy is the right place to look for expertise in clarifying the issues involved in answering moral questions and for theoretical structures intended in part to answer those questions, it is not clear that philosophy is the right place to look for positive answers to specific practical moral questions. We might then delineate two kinds of ethics expert: academic and directive. The broader issue is whether expertise in academic bioethics provides any expertise in directive ethics. There is no clear consensus within the discipline on this issue.

Outside of philosophy, disciplines relevant to bioethics include the social sciences, law, and medicine, as well as those within what has been termed the medical humanities. With such a wide range of participants, it is not surprising that there are disagreements over the scope of bioethics, the relevance of different fields to the discipline, the training necessary to qualify as a member of the discipline, the kind of expertise that such members have, and the legitimacy of the very term “discipline” in describing this diverse range of fields, methodologies, and topics of interest. What is certain, however, is that enough overlapping consensus exists to create a discipline identifiable to its members and to the general public.

METHODS IN BIOETHICS

How do moral philosophers and others working in bioethics go about dealing with the complex moral issues at the heart of many bioethical issues? The answer to this question is quite complex. Three basic approaches are available. The first approach applies established general normative theories to particular issues in bioethics. The second embraces one or several methodologies specifically developed for bioethical issues. The third method either avoids or rejects outright specific methodologies outside of basic philosophical and critical-thinking skills. These methods will be discussed in turn.

GENERAL NORMATIVE THEORIES

Perhaps surprisingly, the least common approach to bioethics is the approach of applied ethics, that is, the application of general normative theories to specific moral problems in bioethics. Nevertheless, there is some substantial work in bioethics that proceeds roughly along these lines. Examples include Peter Singer’s utilitarian approach to the ethics of how we treat animals (2002), Tom Regan’s deontological approach to that same issue

(1983), and Rosalind Hursthouse's essay on abortion from a virtue-ethical perspective (1991). Of work that follows this general model, the most commonly appealed-to theories are the three just mentioned: utilitarianism, deontology, and virtue ethics. These theories are actually umbrella categories under which fall a number of specific theories.

Even the work in bioethics that falls into this first category is not really simply straightforward application of normative theories to particular bioethical problems. Rather, some particular vision of a general theoretical structure is rendered, and the bioethical problem is interpreted in light of that theoretical structure. This might involve, among other things, modifying the theory to fit the issue and arguing for some particular interpretation of the practical implications of the theory over others.

Some theories lend themselves more readily than others to application to specific moral problems. However, even the application of these theories requires extensive interpretation. For example, according to hedonistic act utilitarianism, the right action is the one that maximizes pleasure (or minimizes pain) for all those affected. In principle, then, the answer to the question "Which action is right?" is a matter of calculation of hedonistic utility output. Yet we still need to know which outcomes count as pleasures and pains, of what strength and type, and for what range of beings. (Does the calculation include sentient nonhuman animals? Future persons?)

Despite the term "applied ethics," then, normative moral theories are at a level of abstraction not conducive to straightforward application to particular moral problems. Making matters more difficult, normative theories conflict with one another, sometimes in ways that imply different practical recommendations. In such cases one has to decide which theoretical approach is the best before tackling the moral problem at hand. Moral theories are still helpful in making practical moral decisions, since they provide essential analysis of basic moral values, coherent frameworks for understanding moral issues, and general justificatory strategies for particular approaches to morality. Yet it is not even clear that a proper goal of normative moral theory is to generate specific moral directives. On a virtue-ethical view, for example, moral guidance in specific practical contexts flows from a virtuous character, not from abstract theoretical principles.

METHODS SPECIFIC TO BIOETHICS

In part because of the problems associated with the application of general normative theories of morality to prob-

lems in bioethics, a number of methodologies specific to bioethics have been developed since the inception of the discipline. It is important to note at the outset that these methods have been developed largely for biomedical ethics rather than for bioethics in the broader sense embraced in this entry. Among these methods, the most well known is the principles-based approach developed largely by Tom Beauchamp and James Childress in successive editions of *Principles of Biomedical Ethics* (2001) but also inspired by the more general approach to ethics favored by earlier philosophical figures such as W. D. Ross (1930). The principles approach relies on a variety of prima facie norms, the most prominent of which are four principles: beneficence, nonmaleficence, justice, and respect for autonomy. The source of these principles is supposedly common morality. No single principle is a trump principle, since each may be overridden by considerations deriving from the others in specific contexts. How the principles are spelled out in specific situations and which one(s) hold sway in case of conflict is determined by a process of specification and balancing.

Another influential approach is the casuistic approach revitalized from ancient and medieval roots by Albert Johnson and Stephen Toulmin in *The Abuse of Casuistry: A History of Moral Reasoning* (1988). For casuists, general ethical principles stem only from the analysis of paradigm cases. These paradigm cases offer clear moral outcomes and create a set of initial presumptions about how to resolve other cases. These presumptions hold sway unless we come across exceptional circumstances. When such exceptional circumstances arise, we must go through a process of analogical reasoning, which includes identifying the ethical values at issue, the alternate courses of action, the morally relevant ways in which cases of the sort at issue can differ (the casuistic factors), and the relevant paradigm case(s) (Strong 2000).

A third approach, narrative bioethics, is a relative newcomer but has close ties to antitheoretic trends in normative moral philosophy generally. Insofar as narrative bioethics is not a single approach, it is hard to specify exactly what it amounts to methodologically. However, a couple of themes can be drawn out to give a flavor for this type of approach. First is the ethical significance of the various narrative voices involved in ethically complex situations. In opposition to casuistry, which relies on some single paradigm case and thereby a neutral voice, narrative bioethics focuses on telling the story from the viewpoints of all the participants. In this way we can see that the neutral voice in the paradigm cases (the physicians, lawyers, and/or judges) may in fact be the most powerful

voice. Further, narrative bioethics focuses not on principles as a way of solving ethical quandaries, but rather on the different ways of telling the story and the comparative choices supported by these ways. Thus the stories themselves have normative impact.

While none of these approaches offers a general normative theory for bioethics, the principles-based approach comes closest, whereas the narrative and casuist approaches offer methods to deal with bioethical issues but eschew theory. A final approach offers a general theory of practical morality with particular focus on bioethics issues. This is the theory offered by Bernard Gert, Charles Culver, and K. Danner Clouser in *Bioethics: A Return to Fundamentals* (1997). On their view, morality is a public system whose purpose is to minimize the amount of evil suffered by those protected by it. In opposition to the principles-based view of bioethics, this view has more specific moral rules as fundamental touchstones.

Despite the availability of these various methods, much work in bioethics actually proceeds without a specified method or by a piecemeal approach. This kind of no-method method can be criticized for its ad hoc nature and for its lack of any specific justificatory framework. Even without specific appeal to some particular methodological framework, bioethical analysis at its best avails itself of a number of useful tools in approaching areas of ethical conflict, including gathering and sifting through morally relevant factual information; providing conceptual clarity on the moral concepts at issue; engaging in casuistic reasoning (without necessarily embracing casuistry as a methodology); and offering analysis, critique, construction, and revision of moral arguments.

THEMES IN BIOETHICS

As already discussed, bioethics as understood here includes at least biomedical ethics and ethical issues related to advances in the life sciences and life-science technologies, but may be broadened to include environmental ethics and ethics related to our treatment of non-human animals generally. The specific topics in bioethics are numerous and change in character and focus over time as the field advances. Each anthology of bioethics lists and groups the topics somewhat differently. A small sampling of these topics from four well-known anthologies includes justice in access to health care, mother-fetus relations, research involving human subjects, reproductive technologies, eugenics, genetics, health-care policy, physician-assisted suicide and euthanasia, medical confidentiality, the physician-patient relationship, informed

consent, research involving animal subjects, definitions of death, human cloning and stem-cell research, and organ donation. Most of these topics include subtopics and may also be subsumed under more general headings. Developing any additional list of specific topics in bioethics here would be unhelpful; more useful is to focus on a few general philosophical issues at the overlap of a variety of topics in bioethics.

MORAL STATUS

A key issue in several central topics in bioethics is the moral status of various animal species, the environment, and human beings in various life stages. The issue of moral status is in part a question about how far the moral community extends, that is, what the scope is of those entities considered to have direct moral value. An answer to the scope question does not resolve the issue entirely, since there may be different degrees of moral status. For example, we might think that both pigs and adult human beings have some direct moral status, but still that the adult human being has more moral status.

One way in which the issue of moral status has been addressed is through the concept of personhood. This concept introduces a normative category for those kinds of beings with full moral status, namely persons. In the philosophical debate, persons are not simply all and only human beings. Rather, it is normally assumed that some capacities are required to attain the status of a person. These capacities must be judged by their moral relevance, and not simply along species lines. Some morally relevant capacities might be the ability to feel pain and to have pleasure, the ability to engage emotionally with others, the ability to act intentionally, and the ability to make rational choices. If the level of capacity required for personhood is drawn at the more basic abilities, then the category of persons will include many animals and most human beings. Alternately, if the line is drawn at the higher abilities, for example at the capacity for autonomous actions and choices, then many human beings and most animals will not be persons.

Within biomedical ethics, the issue of moral status is of crucial significance for topics such as abortion and for issues at the beginning and end of life, for example, issues of the moral acceptability of discontinuing life support for severely impaired newborns or humans in persistent vegetative states. For those wanting to extend full moral status to fetuses and severely impaired postnatal human beings, a problem arises of how to ground that moral status. If it is grounded in the particular capacities or potential capacities of those beings, then a relevant question is

whether the same moral status should also be extended to some nonhuman animals.

A central question in environmental ethics is the moral status of the environment in general and of particular ecosystems or other entities. Do two-hundred-year-old oak trees have sufficient moral status that it is wrong to cut them down independently of their effect on human beings or animals with moral status? Establishing the source of such moral status has been a source of difficulty within the field. Yet reflecting on questions like this may bring to light some of the limitations of a capacities-based approach to moral status. Moreover, even if oak trees, nonhuman animals, and human fetuses do not have individual moral status, it does not follow that we can ignore their well-being. Indeed, through such ethical resources as virtuous habits of character, the relationships of persons to other beings, and the effects of our treatment of such beings on other persons, we can establish a wide range of protections for nonpersons.

DISTRIBUTIVE JUSTICE

A very different core topic within bioethics focuses on questions of distributive justice, that is, what the proper distribution is of social resources and burdens. Looking more closely at this issue gives a sense of the different types of theoretical resources brought to bear in bioethics and also shows how the discipline has developed. Issues of distributive justice are usually approached not from the perspective of general normative moral theory, although they may be, but from theories in political philosophy. Examples of theories constructed to deal generally with issues of distributive justice are John Rawls's *A Theory of Justice* (1971) and the libertarian theory found in Robert Nozick's *Anarchy, State, and Utopia* (1974). However, as with normative moral theories, these general approaches to the distribution of social resources and burdens are often not well suited to the specific practical issues involved in bioethics.

To deal with issues of distributive justice at a level directly relevant to bioethics, a number of specific views have been developed. Many of these are varieties of egalitarianism, a general view in distributive justice focusing on the moral foundations for an equal distribution of social goods and resources. A major question for egalitarian theories in bioethics is what should be equally distributed: health care, health outcomes, satisfaction with health? Other views of the ethically proper way to allocate health care rely on formal mechanisms, such as cost-effectiveness analysis, which has theoretical roots in utilitarianism. The least common approach to issues of

distributive justice in bioethics is libertarianism, although this view has had some supporters.

The evolution of the particular topics involved in distributive justice in bioethics gives a sense of how the discipline has changed over time. Initially, there was little focus on issues of distributive justice except for the discussion of the just distribution of the burdens of research on human subjects. While the issue of research on human subjects has retained significance, with the growth of patient activism and the perception of promising new interventions the distributive focus shifted from protection from the burdens of research to assurance of equitable access to research protocols. As the ramifications of institutionally centered health care and various health-insurance mechanisms grew, issues of distributive justice in health care became focused on questions of access. Such questions as whether there is a right to health care came to the fore. These questions have remained significant, particularly in the United States, where the number of uninsured persons continues to rise along with the costs of health care.

To complicate matters further, an additional twist has been added into the mix, which is that health inequalities appear to be tied less to health-care access than to relative social and economic status. While providing equitable access to health care may retain moral significance as a matter of distributive justice, providing such access may make a relatively small dent in the problem of health inequality.

OTHER THEMES

In addition to the problem of moral status and topics in distributive justice, a number of other philosophical issues lie at the core of various specific topics in bioethics. While it is impossible to discuss all these topics here, several significant questions should be noted. One set of issues focuses on the science side of bioethics. First, what is the role of scientific facts in moral decision making? In this area, relevant questions might be, "How significant is an understanding of the biological developmental stages of human fetuses to the morality of abortion?" And, "What difference does it make to issues of distributive justice whether some genetic predispositions to disease significantly lower some persons' life expectancies?" Second, how do advances in the life sciences affect ethical issues? In this area the main issue is whether advances in the life sciences actually create the need for new ethical concepts and models or whether they simply create an opportunity to reinterpret established ethical debates. Fields where this question is especially relevant include

human-somatic-cell cloning and assisted-reproduction technologies. A general underlying question with regard to these and other issues at the overlap of science and ethics is the moral relevance of naturalness.

Another set of core issues has to do with the development of role ethics as a way of understanding the specific obligations of physicians, other health-care workers, researchers, and scientists to particular populations. Here the main philosophical issue is whether individuals incur some obligations simply by occupying particular social roles or whether all obligations are versions of more general social obligations. The question is not whether physicians, for example, have a specific duty to protect the privacy of some medical information. All agree that this is the case, in addition to agreeing on a number of other specific duties that physicians have to their patients. The question is rather whether this duty is the product simply of occupying a specified social role or whether it is a duty that anyone with the requisite expertise in the particular relationship would also have. If there are obligations that are completely role dependent, then one can expect that some of these may conflict with other moral obligations, thus creating the potential for moral dilemmas. By contrast, if role obligations are contextual renderings of general moral obligations, then no such conflict can be expected.

Bioethics is a relatively young discipline that has already had a dramatic impact on academic curricula, public policy, public awareness of ethical issues, health care practices, and health sciences research. Continued advances in the life and health sciences on the one hand and continued disparities in health and health care on the other hand make it likely that bioethics as a discipline will continue both to grow as a field and to evolve in focus and methodology.

See *Philosophy of Biology*

BLACK, MAX

(1909–1988)

The American analytic philosopher Max Black was born in Baku, Russia (now Baky, Azerbaijan). He read mathematics at Cambridge and, after he earned his BA in 1930, received a fellowship for research at Göttingen, Germany, where he wrote *The Nature of Mathematics* (1933). Returning to Britain, he was awarded a doctorate by the University of London for his dissertation *Theories of Logical Positivism* (1939) and held the position of lecturer and tutor in its Institute of Education from 1936 to 1940. After he emigrated to the United States in 1940, he was appointed to the faculty at the University of Illinois. In 1946 he moved to Cornell University, in Ithaca, New York, where, in 1954, he became Susan Linn Sage Professor and later helped found both the Society for the Humanities and the Program on Science, Technology, and Society. He was president of the Eastern Division of the American Philosophical Association; president of the International Institute of Philosophy; Tarner Lecturer at Trinity College (Cambridge), Guggenheim Fellow; Fulbright Fellow; and visiting fellow at Oxford, Cambridge, Princeton, Palo Alto, and Canberra. He also lectured on contemporary American philosophy in Japan (1957) and India (1962). He died in Ithaca in 1988.

Black’s early years in Cambridge—where he attended classes of G. E. Moore, Frank Ramsey, Susan Stebbing, and Ludwig Wittgenstein—influenced his later teaching and writings. Along with his analytic orientation of C. D. Broad and Ramsey, Black retained a wide range of scientific and humanistic interests and a careful regard for the

commonsensical approach that marked the writings of Moore and Stebbing; but the influence of Wittgenstein was the most profound. Black’s first work, *The Nature of Mathematics*, was an exposition of the logicist, formalist, and intuitionist conceptions of mathematics; it paralleled Wittgenstein in declining to embrace any of the three theories or to propose a new one, and his subsequent doctoral study of logical positivism required coming to grips with Wittgenstein’s *Tractatus*. His abiding interest in that work culminated in *A Companion to Wittgenstein’s Tractatus* (Cambridge and Ithaca, 1964), a work some six times as long as the text it analyzed; it was posthumously reprinted, and admired—even imitated—for its astute and engaging combination of exegesis, explication of sources, and critical comment.

Black’s commitment to philosophical analysis involved constructive work on small, well-defined problems with expository and critical discussion; hence the bulk of Black’s contributions are essays rather than books. The exceptions are the two noteworthy books already mentioned and a logic text, *Critical Thinking* (1951). Other volumes were published, to be sure, but they are collections of essays rather than treatises. Black published some twenty books (including those edited and/or translated) and more than 200 essays and reviews.

Many of Black’s essays take up problems or themes from Wittgenstein’s later works, generally concentrating on the issues, especially meaning, rather than on Wittgenstein’s texts. Black did not fret about the metaphysical status of meanings, since (as for the later Wittgenstein) explanations of meanings are explanations of how words are used, and it is a mistake to suppose that there are “such things as meanings to be categorized.” One aspect of explanations of meaning involves formulating rules for the use of words, and Black (again following Wittgenstein) shows how seemingly necessary propositions often serve as surrogates for rule formulations. Black is aware that a certain vagueness or “looseness” pervades these rules governing ordinary usage, and he explores this dimension in several essays. One of his conclusions is that we normally presuppose that the looseness does not matter. This calling attention to presuppositions of linguistic acts is characteristic of Black. In other essays he calls attention to the contrasting presuppositions of definitions and assertions, and he gives a detailed comparison of presupposition and implication, with special reference to controversies about denoting phrases.

Black’s conception of philosophy emphasizes the everyday practicality of linguistic analysis: “philosophical clarification of meaning is ... as practical as slum clear-

ance and as empirical as medicine”—hence the title essay of one of his last books: “The Prevalence of Humbug.” This all-too-prevalent humbug consists not only in logical fallacies but also in overvaluing speculation, ignoring or minimizing induction, and, at times, misplaced logical rigor. Therefore Black deplures not only broad-brush dismissals of rationality and science but also the excesses of pettifogging rationalism and scientism; he lacks sympathy with Hume’s criticism of induction and philosophical complaints about vagueness. Here we see Black’s respect for common sense, which he learned in part from Moore. The vagueness of ordinary language works partly because normal usage has roots in truth: “To say that a word is correctly used in accordance with normal usage, in certain circumstances, is to say that a certain sentence containing the word is, in those circumstances, true.” This remark works in defense of the much-criticized paradigm-case argument, because the circumstances envisaged will be a paradigm case for that word. In other essays, Black augments references to paradigm cases by discussing models and metaphors, both of which also occur in ordinary language but exemplify different sorts of justified vagueness. One later essay, “Reasoning with Loose Concepts,” (1963) argues that we can be sure of clear cases without knowing at what point cases cease to be clear. Paradigm cases, however, do not provide a road from language to metaphysics: “The conception of language as a mirror of reality is radically mistaken.”

As an undergraduate, Black heard Moore deliver the Turner Lectures at Trinity College in 1929, so he was delighted to receive an invitation to deliver them in 1978. His topic, “Models of Rationality,” conformed to his customary piecemeal pattern of output in yielding not in a book but a series of essays that were incorporated into several later publications. One theme running through the lectures is that models of rationality cannot eliminate the need for judgment; hence formal schemes, such as those employed by economists in decision theory and choice theory, are bound to remain heuristic rather than definitive.

Black’s interests had an Enlightenment breadth; the topics of his essays range from formal logic to poetry. In the philosophy of science, he argued eloquently and persuasively for induction and commented on perception, cosmology, decision theory, aesthetics, and sociology, all while retaining his early interest in mathematics. His work in philosophy of language included reviews of the work of many of his contemporaries, including Russell, Dewey, Wittgenstein, Korzybski, Carnap, Tarski, Morris, Whorf, Chomsky, and Skinner. His writing is remarkably

free of specialized terminology or jargon. The range and the freshness of his writing help to account, no doubt, for his continuing appeal and relevance.

F.; Stebbing, Lizzie Susan; Tarski, Alfred; Wittgenstein, Ludwig Josef Johann.

Bibliography

In addition to the works mentioned, Black’s publications include eight volumes of essays: *Language and Philosophy* (Ithaca, NY: Cornell University Press, 1949), *Problems of Analysis* (Ithaca, NY: Cornell University Press, 1954), *Models and Metaphors* (Ithaca, NY: Cornell University Press, 1962), *Margins of Precision* (Ithaca, NY: Cornell University Press, 1970), *The Labyrinth of Language* (New York: Praeger, 1968), *Caveats and Critiques* (Ithaca, NY, 1975), *The Prevalence of Humbug and Other Essays* (Ithaca, NY: Cornell University Press, 1983), and *Perplexities* (Ithaca, NY: Cornell University Press, 1990).

Volumes translated or edited include *R. Carnap, The Unity of Science* (London, 1934), *Philosophical Analysis* (Ithaca, NY, 1950), *Translations from the Philosophical Writings of Gottlob Frege* (with P. T. Geach; Oxford, 1960), *The Social Theories of Talcott Parsons* (Englewood Cliffs, NJ: Prentice-Hall, 1961), *The Importance of Language* (Englewood Cliffs, NJ: Prentice-Hall, 1962), *Philosophy in America* (Ithaca, NY: Cornell University Press, 1965), *The Morality of Scholarship* (Ithaca, NY: Cornell University Press, 1967), and *Problems of Choice and Decision* (Ithaca, NY: The Program, 1975).

A reasonably complete bibliography to 1985 is appended to Black’s autobiographical sketch in Volume 12 of *Philosophers on Their Own Work* (Bern/Frankfurt/New York: H. Lang, 1985), pp. 9–41.

Newton Garver (1967, 2005)

BLACK HOLES

A black hole (the term was coined by John Archibald Wheeler in 1967) is a closed surface through which gravity prevents light from propagating. Insofar as relativity prohibits anything from traveling faster than light, it follows that nothing can escape through the surface of a relativistic black hole. That said, in general relativity the notion of energy is problematic, and energy and hence mass can be extracted by classical and quantum processes. Classically the interior of a black hole contains a *singularity*: Along certain paths physical quantities

become ill-behaved (e.g., the gravitational field may become infinite). While nothing can pass back through the surface of a black hole, it is possible in certain models to travel into other universes. All of these properties have philosophically disturbing implications that have strongly influenced the development of physics, especially since there are solid theoretical and experimental reasons to believe that black holes are not merely hypothetical, but actually exist.

HISTORY

Black holes (henceforth BHs) arise in the general theory of relativity (GTR). However something similar is possible in Newtonian physics. John Michell (1784) and Pierre Simon Laplace (1796) pointed out that, as a ball thrown upwards with insufficient speed will eventually fall back to Earth, if a star of a given mass were smaller than a certain size (in modern parlance, its *critical radius*) then even light corpuscles, emitted from the surface at the speed of light, would eventually be pulled back to its surface. If such a star were a sufficient distance away it would not be directly visible (though faster or accelerating bodies could escape).

Karl Schwarzschild discovered the first exact solution of GTR in 1916, before the Einstein field equations of the theory were cast in their final form. The model has a point mass M at its center and in radial co-ordinates (two angles, θ and Φ , giving the latitude and longitude of a point, its distance r from the center and time t) the line element (the distance between two infinitesimally separated points) is:

$$ds^2 = -(1 - 2GM/c^2r)dt^2 + \frac{dr^2}{1 - 2GM/c^2r} + r^2(d\theta^2 + \sin^2\theta d\phi^2)$$

where G is Newton's gravitational constant and c the speed of light. The idea in GTR is that M determines ds^2 , which determines the geometry of spacetime, which explains the effect of gravity. Inspection of the second and first terms reveals ds^2 diverges at $r = 2GM/c^2$ —the “Schwarzschild radius”—and $r = 0$ —the location of the point mass, respectively. The singularity at $r = 0$ is genuine, though one would suspect (wrongly) that it would not occur if it were not for the idealization of a point mass—see below. The divergence at $r = 2GM/c^2$ is not physical, but merely an artifact of the co-ordinates used to describe the solution, a point that was not properly appreciated until the late 1930s. By way of analogy, if we used $x'=1/(x-1)$, $y'=y$ as co-ordinates for the x-y plane,

then $ds^2 = dx'^2 + dy'^2$. Along $x'=1$ the plane is perfectly smooth but ds^2 is singular since $x'=\infty$, a reflection of the “poor” choice of co-ordinates.

In the Schwarzschild solution the singularity reflects not a geometric irregularity but the existence of a sphere of radius $2GM/c^2$ (named the “horizon” by Wolfgang Rindler in the 1950s) from which no light can escape (a point first made by Johannes Droste in 1916). Clearly if a body is smaller than $2GM/c^2$ then light cannot escape its horizon, so a star's Schwarzschild radius is its critical radius: The horizon forms a BH around any star smaller than its Schwarzschild radius. Other solutions for BHs were discovered by Hans Reissner (1916) and Gunnar Nordström (1918) for a charged BH, by Roy Kerr (1964) for a spinning BH, and by Ted Newman (1965) for a charged and spinning BH. It is important to emphasize that the nature of the horizon and hence of the BH (and hence of the early solutions) was not properly understood until the mid-1960s. Remarkably a so-called “No Hair Theorem” shows that the exterior (but not the interior) of any BH is completely characterized by its mass, charge, and spin and not on any other details of its composition or formation: The exterior of every possible BH is described by one of the four models mentioned here.

The Schwarzschild solution was quickly accepted as the description of gravity outside a (stationary) star, where the mass could be treated as located at the star's center—that is, providing that the star was larger than its Schwarzschild radius (18.5km for the Sun). The early pioneers of GTR did not properly understand the horizon (they worried about its possible singular nature and the fact that bodies approaching it would apparently take bodies an infinite time to reach it) and tried to argue that they could not occur in nature. However the question arose of what would happen to a star after it exhausted its fuel supply and began to cool and contract. By 1925 it was apparent that such stars could shrink under their own gravity to form *white dwarfs* 1,000s of times denser than the Sun, but in the early 1930s Subrahmanyan Chandrasekhar showed that white dwarfs of masses more than 1.5 the mass of the Sun (M_\odot) were not stable against gravity. In 1933 Walter Baade and Fritz Zwicky proposed that stars could further implode to form *neutron stars* as dense as atomic nuclei (the gravitational energy released by the implosion explaining supernovae), but in 1938 Robert Oppenheimer and George Volkoff argued that neutron stars heavier than a few times M_\odot (the contemporary value is $2M_\odot$) would be unable to resist their own gravity, and in 1956 Wheeler and Masami Wakano demonstrated that there were no denser stable objects than neutron

stars. In 1939 Oppenheimer and Hartland Snyder provided the first model of a star collapsing through its Schwarzschild radius, a model vindicated in the early 1960s by simulations based on hydrogen bomb research (subsequent models show that stars below around $20M_{\odot}$ will eject sufficient matter during implosion to avoid complete collapse). In other words, it became clear not only that BHs were quite possible but also that their formation was likely. One philosophically significant aspect of this scientific revolution is how it was affected by physicists' changing intuitions about what mathematical models were physically realistic.

In the first years of the twenty-first century the astronomical evidence for BHs was strong and rapidly evolving; as of this writing, there are some fifty known candidates, half of them strong candidates. One class of candidates occurs in binary systems in which a star orbits a heavy body that strips material from it. The speed of the star can be calculated from the Doppler shift of its emission spectrum and the mass of the heavy body derived from that: If it is above $2M_{\odot}$ it is too heavy to be a neutron star and is presumably a BH. Typical BHs of this type have $5\text{--}15M_{\odot}$. A second kind of BH candidate is the *super-massive* BH, thought to occur at the center of galaxies. For instance it is believed that a BH over $3 \times 10^6 M_{\odot}$ lies at the heart of our galaxy in the constellation Sagittarius. Observational work has been done to verify that these candidates are not some unknown, denser objects, for example by looking for nuclear reactions that can occur only on material surfaces and not on horizons.

BH INTERIOR

When objections to the physical possibility of a horizon were overcome, the question became whether real BHs, like the known solutions, contained singularities. According to Oppenheimer and Snyder's model, stellar matter collapses to a point to form a singularity, but their work was not definitive because it assumed an unrealistically symmetric distribution of collapsing matter. However in the late 1960s Roger Penrose and then Steven Hawking proved Singularity Theorems showing that singularities must arise under very general conditions, including those believed to hold in BH formation, while in 1969 Vladimir Belinsky, Isaac Khalatnikov, and Evgeny Lifshitz found a singularity that would form if stellar collapse was only approximately symmetric.

Ordinarily a singularity in a function means that it diverges somewhere in its domain. The situation is more complicated in GTR because space has no existence separately from the fields: GTR is the theory of the metric

field (the coefficients of ds^2), which describes the geometry of space. Intuitively speaking, when the fields of GTR become singular the very notion of spatial points fails, and space can contain a singularity even though the fields do not diverge anywhere. Singularities potentially raise several philosophically interesting issues. One is that singularities are associated with failures of determinism: The problem is roughly analogous to that of calculating the propagation of an electromagnetic wave in a space with a hole removed. Another is that Physicists have thus postulated various forms of *Cosmic Censorship*: That singularities cause at most localized failures of determinism (e.g., only inside a BH).

One may be struck by the similar (mistaken) initial reaction to the horizon (also by the "transcendental" nature of this move—without censorship and determinism, physics of a certain kind is impossible), though censorship has been shown in a range of cases. If uncensored "naked singularities" are possible, then it would be possible to use them to complete "supertasks" in a finite time relative to a distant observer. Important to remember is that our discussion so far has been in the context of classical GTR (utilizing some quantum properties of matter), but around a singularity, quantum gravitational effects likely become important. Physicists generally expect that singularities will not occur in a quantized version of GTR. If so, classical singularities may offer no philosophically important lessons after all. However John Earman's *Bangs, Crunches, Whimpers, and Shrieks* argues that classical singularities may pose no physical problem, so physicists need not demand that quantum gravity banish them.

Everything that enters the Schwarzschild BH eventually reaches its singularity, but in the other models it is possible to avoid the singularity altogether and travel on to a flat region of spacetime: The other BHs contain "worm holes" or "Einstein-Rosen bridges" to a "new" universe or to a region of space far from the BH (in the latter case spacetime would contain "closed timelike curves," paths that allow one to travel to one's past). However even in classical GTR the models assume unrealistic symmetries, and so the interior parts cannot be trusted: As of this writing, while it has not been shown that more realistic classical BHs do not contain worm holes, it is widely assumed that they do not. The situation in quantum gravity is even less clear, though Lee Smolin (1992) has speculated that a new universe is created inside whenever a BH forms, with laws of nature that vary in a small, random way from their parent universe, so that all possible physics eventually comes into existence.

BLACKNESS

Consider what would happen as an astronaut entered the horizon of a BH while he was watched from the outside. It is useful to think of the region around the BH as analogous to a deep, sloped, hole in the ground: As one gets nearer the center, the distance up the walls and along the ground to the outside grows rapidly. Analogously, as the BH is approached, light has to travel up ever steeper “walls” of curved spacetime to escape: Since the speed of light is constant, it follows that light takes an increasingly long time to reach the outside. Just as showing movie frames at increasing intervals makes a scene appear to slow, so the astronaut will appear to decelerate. In a BH, however, the time for light to reach the outside becomes infinite at the horizon (though space there is perfectly smooth). The effect is that the astronaut appears to decelerate indefinitely and from the outside can never be seen to enter the BH, as if the movie were slowed until frozen on a single frame. It is crucial to appreciate that this phenomenon is entirely optical: The astronaut himself measures only a finite amount of time until he is inside the BH. (That a collapsed massive star would thus be seen frozen at its horizon was an impediment to understanding BH formation.)

Just as it would take light infinitely long to escape from the horizon of a BH, nothing localized inside the horizon can pass through it (ignoring subtleties concerning the speed of light as a cosmic speed limit): The BH is opaque to its exterior. However it is theoretically possible to extract energy and hence mass, via the relativistic equivalence of mass and energy, from a spinning BH by classical processes that slow the spin. It is rather surprising that this extraction is achieved by throwing matter into the hole, but not surprising that a BH stores energy in its rotation. In other words part of the BH’s mass arises from its interaction with the spacetime outside it, so no energy has to leave the interior. More surprisingly, Hawking (1974) showed quantum effects mean that even a non-spinning BH would radiate energy (and mass) with a temperature inversely proportional to its mass.

This effect is philosophically important for two reasons. First it confirmed Jacob Bekenstein’s (1972) speculation that BHs obeyed the laws of thermodynamics and hence possessed entropy; among other things BHs are relevant to an arrow time based on the Second Law of thermodynamics. Second what happens when the mass of the BH “evaporates” to zero? One issue is the possibility of a naked singularity. Another is the “loss of information paradox”: Physical theories typically allow an earlier state to be retrodicted from a later one, so that no information

about the earlier state is lost over time. However, in Hawking’s calculation, radiation carries no information about how a BH was formed, so that information remains inside the BH and is lost: Once a BH evaporates, retrodiction is impossible. For these reasons BH radiation became an important issue since theories of “quantum gravity” can be judged according to how they treat BH entropy and the loss of information paradox. In particular, BH entropy is connected to the powerful idea of “holography,” which connects the physics of any region to the physics of the surface bounding it.

Nick Huggett (2005)

BLAKE, WILLIAM (1757–1827)

William Blake was an English poet, painter, and engraver. He was born in London, the second of five children in the

family of a retail hosier. His social status precluded university education, and he was apprenticed to an engraver. Apart from that training and a few months at the Royal Academy, Blake was self-educated. Most of his pictorial work took the form of illustrations for books, biblical subjects forming the largest group. His painting and engraving were thus primarily related to literature, and the interdependence of poetry and painting is a central principle of all his work. He lived in London nearly all his life, very frugally, sometimes in poverty, and constantly dependent on patrons. He met William Wordsworth, Samuel Taylor Coleridge, and Charles Lamb, and was admired by the last two; but he died practically unknown as a poet, although he had been writing poetry since the age of twelve. After one volume of juvenile verse (*Poetical Sketches*, 1783) was published through the efforts of friends, Blake determined to produce his poetry by engraving the text himself and accompanying it with illustrations. Practically all his later poetry, except what was left in manuscript, took the form of a text and designs etched on copper, stamped on paper, and then colored by hand. Most of his lyrics are in two collections: *Songs of Innocence* (first engraved in 1789) and *Songs of Experience* (1794). Others are longer poems, generally called prophecies, which are sequences of plates. The “prophecies” include *The Book of Thel* (1789), *The Marriage of Heaven and Hell* (1793), *America* (1793), *Europe* (1794), *Milton* (about 1808, in 50 plates) and *Jerusalem* (about 1818, in 100 plates).

THOUGHT

The prophecies are symbolic poems in which the characters are states or attitudes of human life. This means that these poems embody religious and philosophical concepts as well as poetic imagery. These concepts are mainly concerned with Blake’s sense of the relevance and importance of the arts and of the creative faculty of man, and seem to have been derived mainly from a negative reaction to the British empirical tradition of thought. He tells us that he had read John Locke and Francis Bacon in his youth and had decided that they mocked inspiration and vision. Blake’s attitude would be better understood if it were thought of as anti-Cartesian, although he is unlikely to have read René Descartes, and his attitude embodies many elements that would now be called existential.

IMAGINATION. According to Blake, man is a working or constructing imagination—the creative artist is normative man. In this context there is no difference between human essence and human existence, for the imagination is the human existence itself and is also essential human

nature. Works of art are neither intellectual nor emotional, motivated neither by desire nor by reason, neither free nor compelled: all such antitheses become unities in them. Even more important, the imagination destroys the antithesis of subject and object. Man starts out as an isolated intelligence in an alien nature, but the imagination creates a world in its own image, the world of cities and gardens and human communities and domesticated animals.

INTERPRETATION OF THE BIBLE. For Blake, the Bible is a definitive parable of human existence, as it tells how man finds himself in an unsatisfactory world and tries to build a better one—one which eventually takes the form of a splendid golden city, the symbol of the imaginative and creative human community. God in Blake’s work is the creative power in man (here Blake shows the influence of Emanuel Swedenborg, with his emphasis on the unity of divine and human natures in Jesus), and human power is divine because it is infinite and eternal. These two words do not mean endless in time and spaces; they mean the genuine experience of the central points of time and space, the now and the here. Many features of Blake’s anti-Lockean position remind us of George Berkeley, especially his insistence that “mental things are alone real”; but this doctrine of God takes Blake far beyond the subjective idealism and nominalism of Berkeley.

In Blake’s reading of the Bible, “the creation”—the alien and stupid nature that man now lives in—is part of “the fall” and is the world man struggles to transcend. The objective world is the anticreation, the enemy to be destroyed. Blake says that man has no body distinct from his soul. He does oppose mind and body, but as contrasting attitudes to nature, not as separate essential principles. The “corporeal understanding,” or perverted human activity, contemplates nature as it is (as a vast, objective, subhuman body) and tries to overcome the alienation of the subject by identifying the subject with nature as it sees nature. Nature is controlled, apparently, by automatic laws like the law of gravitation and by a struggle to survive in which force and cunning are more important than love or intelligence. Perverted human life imitates nature by continually waging war and by maintaining a parasitic class. Perverted religion, or natural religion, as Blake calls it, invents harsh and tyrannical gods on the analogy of nature. Perverted thought exposes itself passively to impressions from the external world and then evolves abstract principles out of these impressions that attempt to formulate the general laws of nature. These are the operations known as sensation and reflection in Locke. The abstracting tendency is perverted because it is not a

genuine effort to understand nature, but is a step toward imitating the automatism of nature by imposing a conforming morality on human life. The principle of this conformity is the acceptance of injustice and exploitation as inescapable elements of existence. The end of this perverted process is hatred and contempt of life, as expressed in the deliberate efforts at self-annihilation that Blake saw as beginning with the Napoleonic wars in his own time.

PROPHETIC BOOKS. The action in Blake's prophecies is concerned with the conflict of these creative and perverted states in human life. The sense of conservatism, of accepting things as they are, is symbolized by Urizen, who is associated with old age and the sky. When conservatism deepens into hatred of life itself, Urizen is replaced by Satan. The force that struggles against Urizen is the revolutionary impulse in man, called Orc or Luvah, who is associated with youth and sexual desire. Orc cannot achieve a permanent deliverance from Urizen; that is possible only for the creative power itself, called Los. The central theme of the prophecies is the effort of humanity, called Albion, to achieve through Los the kind of civilization that is symbolized in the Bible as Jerusalem and thus to reach the integration of human and divine powers represented in Christianity by Jesus.

Bibliography

The most convenient edition of Blake's literary work is the one-volume *The Poetry and Prose of William Blake*, edited by Geoffrey Keynes (London: Random House, 1927).

Works on Blake include Bernard Blackstone, *English Blake* (Cambridge, U.K.: Cambridge University Press, 1949); Foster S. Damon, *William Blake: His Philosophy and Symbols* (Boston: Houghton Mifflin, 1924); David V. Erdman, *Blake: Prophet against Empire* (Princeton, NJ: Princeton University Press, 1954); Northrop Frye, *Fearful Symmetry: A Study of William Blake* (Princeton, NJ: Princeton University Press, 1947); and Mark Schorer, *William Blake: The Politics of Vision* (New York: Henry Holt, 1946).

Northrop Frye (1967)

BLANCHOT, MAURICE (1907–2003)

Maurice Blanchot was first and foremost a literary theorist, and his work included a number of essay collections,

among them *The Space of Literature* (1982), *The Book to Come* (2003), and *Friendship* (1997). He also wrote powerful but rather hermetic novels such as *Thomas the Obscure* (1973), *Death Sentence* (1978), *Aminadab* (2002), and *The Most High* (1996), in addition to aphoristic works such as *The Writing of the Disaster* (1986). Blanchot's work has profound implications for the practice of philosophy. His influence therefore stretches from practitioners of the New Novel to philosophers such as Jacques Derrida and Michel Foucault.

Blanchot's strategy, which is meant to reconceive literature and to carry out a thoroughgoing critique of the possibility of language, is in major part derived from a critique of the Hegelian notion of the sign, by way of Martin Heidegger. In Blanchot's version of Hegel—as seen in his essays “The Experience of Mallarmé” and “Literature and the Right to Death”—the word, by isolating things and representing them in their absence, “gives me the being, but it gives it to me deprived of being”; or, put another way, the word makes the world appear and disappear in a moment (Blanchot, 1995, p. 322). The givenness of the thing (or person) in and through the word is also its radical removal, its distance from simple subjectivity or objectivity, its mortality. That one's words represent a thing that—or person who is—absent means that it or she or he can be absent (can be removed, destroyed, can be dead). The word thus represents things or persons in the act of constituting them and indicating their disappearance, their death. This is a negation that has nothing to do with the patient work of the dialectic; it is of the instant, an instant that cannot be recaptured in any constructive movement. Named things—people—are always already dead, and their life is an infinitely repetitious death. “Pure language,” as Blanchot calls it, entails a nomination where this “neutral” action of language is recognized; this (impossible) recognition in turn characterizes true literature (Blanchot, 1995). Put another way, the world of work recognizes and uses the negating power of the word; true literature, however, recognizes this negation as so thorough that it penetrates and radically negates beings and things—including, of course, literature itself—in the moment of their constitution. Blanchot in fact compares literature to the Terror, where beings are called forth in a repetitious movement that both constitutes them as revolutionary subjects and kills them. Thus Blanchot can write, as he did in “The Experience of Mallarmé,” that “the fulfillment [*accomplissement*] of language coincides with its disappearance” (1982). This fulfillment is literature.

This “neuter” (*le neutre*) of Blanchot bears an obvious connection with the Heideggerian *Dasein* or the Levinasian *Il y a*. But there are crucial differences. The work of death is so thorough for Blanchot that it is hard to see how any notion of authenticity or foundational ethics could be carried out through it. This incessant, unproductive constituting and destroying death erodes all philosophical systems, all coherent models of subjectivity (Descartes), all constructive movements of negation in time, and all doctrines based on force and power. As Gerald Bruns puts it, “The ‘nocturnal’ experience of words, in which the cognitive or speaking subjectivity is deprived of its sovereignty and its power, reduced to the passivity of its fascination, is one of the most important events in Blanchot’s thinking” (1997, p. 77). One could add that the sovereignty of space and time are emptied out as well, because the subject moving in them and making the world is not making a coherent entity but rather is caught up in the emptying out of the possibility of all relation, all mediation between (dead) self and (dead) world.

Blanchot narrativizes this nocturnal relation in myths and fictions. “The Gaze of Orpheus” provides an excellent example: Orpheus would bring Eurydice from death to a realm of the disclosure of truth and beauty. But halfway through the journey he must see her as she is, as death, as radical concealment. This demand, to see and to speak “the most certain masterpiece,” is inevitably fatal to Orpheus’s aesthetic and philosophical hopes. Seeing constitutes, but it is also inseparable from, radical loss, “the movement of writing” (1982, pp. 103–104). Truth and beauty can be grasped, but only in the night in which such certainties are immediately and incessantly lost. The strangeness of the Heideggerian “thing” is rewritten as an impossible interpersonal relation, between man and woman, that is also an allegory of the necessity and impossibility of language at its limit (literature).

Many of Blanchot’s fictions work out this interpersonal relation between man and woman, or self and other, in the mode of the radical death of both the subject and signification. The Blanchotian hero is thus a figure obsessed with a negativity that pervades all things, a personage for whom the only relation is a repetitive recognition of the impossibility of the recognition of a stable relation, as in *Death Sentence* and *The Most High*.

Blanchot’s conception of language is literary in that its radicality is seen to characterize literature at the highest level. Blanchot, however, does not limit its implications exclusively to what is conventionally conceived as the literary realm. Language as understood by Blanchot invests philosophy, making its movement possible and at

the same time undermining every one of its certainties. In this way Blanchot’s version of literary language and of language in general clearly anticipates Jacques Derrida’s analyses of writing. But language also conditions Blanchot’s version of the community.

The problem of the enthusiastic community, so central to French social thought since (at least) the Revolution, is rewritten by Blanchot in *The Unavowable Community* as the fundamental relation of those who have “nothing in common,” an inescapable and unmediated relation of reading in which nothing is knowable, nothing endures, a moment that constitutes nothing in a coherent movement of time. Similarly, in *The Writing of the Disaster*, the Holocaust is seen as a “disaster” in the Blanchotian sense. Not a “word, not the name of anything ... but always an entire complex or simple sentence, where the infinitude of language ... seeks ... to fall outside language—without, however, ceasing to belong to it” (1986, p. 84). From writing on literature and literary language, then, Blanchot has moved to a larger conception of the word, and language. Essential language leads nowhere, guarantees nothing, and only has “its end in itself” (“The Experience of Mallarmé” 1982), yet its negativity is fundamental to an understanding of society and its limit term, the moment in which it grasps itself as the radically ungraspable: the Holocaust. “Literature,” in Blanchot’s sense, therefore resists any easy containment.

BLANSHARD, BRAND

(1892–1987)

Brand Blanshard was an American philosopher whose task is best described in his own words as the “vindication of reason against recent philosophical attacks.” Blanshard was thus a critic—a critic of all those who, he alleged, reject rationality—but at the same time he tried to exhibit the credentials that reason can show in its own right.

Blanshard was educated at the University of Michigan, Columbia, Oxford, and Harvard—where he received his PhD. He taught at the University of Michigan, at Swarthmore College, and at Yale—where he was Sterling professor of philosophy and chairman of the department. The multitude of honors he received during his career precludes their enumeration here.

Blanshard’s first major work was *The Nature of Thought* (London, 1939), in two volumes, each divided into two books. The first volume is largely concerned with a subject matter common to both philosophy and psychology. The stated goal is to discover a theory of perception (Book I) and a theory of ideas (Book II) that will simultaneously satisfy the psychologist, who views percepts and ideas as contents of the mind, and the philosopher, who views them as potential items of knowledge. Various theories are examined and rejected—most notably the traditional empiricist approach—and it is finally argued that only a theory along the lines developed by Francis Herbert Bradley, Bernard Bosanquet, and

Josiah Royce is able to meet this double demand. The universal, Blanshard maintained, is present in all thought, even in the most rudimentary forms of perception; and it is the presence of the universal that is the most important feature of thought. This conclusion exhibits a theme that recurs throughout both volumes: the use of doctrines drawn from the idealist tradition in dealing with contemporary problems.

In the second volume of *The Nature of Thought*, the subject matter becomes more specifically philosophical. The main task of Book III (titled “The Movement of Reflection”) is to answer the epistemological problem: What is the test and the nature of truth? Once more, after examining and rejecting alternatives, Blanshard turns to the idealist tradition for his answer, adopting a version of the coherence theory of truth. His exposition of the coherence theory has a number of distinctive features. Foremost is the clarity, rigor, and persuasiveness of the presentation; in this respect Blanshard has only Royce as a rival. Furthermore, he develops the theory independently of metaphysical doctrines that are for the most part now repudiated. Finally, he develops the theory in full cognizance of contemporary criticisms and attempts to offer direct answer to them.

In Book IV (titled “The Goal of Thought”) Blanshard moves from epistemology into metaphysics. Still operating within the framework of idealism, he accepts the connected notions of internal relations, concrete universality, and concrete necessity. But he does not, as do most idealists, give these doctrines a gratuitous theological turn, nor does he attempt to secure the foundation of the entire system through an a priori proof that the completed, fully articulated system must exist. He does introduce the conception of a transcendent end for thought, which he considers a necessary postulate for knowledge, but he admits that it is possible (though unlikely) that this postulate is mistaken.

Some two decades after the publication of *The Nature of Thought*, and upon retirement from Yale, Blanshard began a projected three-volume sequence that would bring together material originally presented in his Carus and Gifford lectures. *Reason and Analysis* (London, 1962), the second of the three volumes, is his most polemical work. It is in large measure a systematic and unremitting attack upon the analytic tradition as it emerged in various forms during the twentieth century. Some of the arguments presented are refinements of those used in *The Nature of Thought*, but *Reason and Analysis* is not a mere echo of the earlier work. On the constructive side, many of the earlier idealistic doctrines,

although not silenced, seem decidedly muted. If philosophies are to bear labels, this later position might better be called rationalism than idealism.

The first work in the sequence, *Reason and Goodness* (London, 1961), introduces another aspect of Blanshard's thought. In this work he traces out the dialectical interplay between the demands of reason and the demands of feeling throughout the history of ethical theory. Not surprisingly, Blanshard rejects any theory that will not provide a place for reason in the account of human values, and he thus offers elaborate critiques of subjectivism, emotivism, and related theories.

In developing his own ethical position Blanshard does not turn, at least primarily, to the idealist tradition but rather to the works of Henry Sidgwick, G. E. Moore, H. A. Prichard, and W. D. Ross. Throughout his career Blanshard favored teleology in ethics, and for a time he was attracted by Moore's ideal utilitarianism. He came to reject this position largely because of the difficulties associated with Moore's conception of nonnatural properties. In *Reason and Goodness* Blanshard rejects Moore's critique of naturalism and argues that goodness is characterized by the joint properties of satisfaction and fulfillment. The idea of fulfillment is associated with the idealist tradition, but as Blanshard uses it, it carries no suggestion of loss of individuality and is thus quite different from the idea of fulfillment as employed by Bradley and most other idealists. By including both satisfaction and fulfillment in the definition of goodness, Blanshard hopes to provide for feeling on one hand and reason on the other and, in this way, to resolve the dialectical tension outlined earlier in the work.

Reason and Belief was not yet published as of this writing, but from Blanshard's lectures it may be assumed that in this work he will challenge the religious irrationalism that is currently fashionable in some quarters. What positive doctrines he will espouse is more a matter of speculation.

BLOCH, ERNST

(1885–1977)

Ernst Bloch, the German Marxist philosopher, was born at Ludwigshafen. Influenced by late German expressionism and by the atmosphere of Munich after World War I, Bloch's style and thought reveal contradictory and uncertain trends. He began his career at the University of Leipzig by publishing *Von Geist der Utopie* in 1918. This work was followed in 1922 by a study of Thomas Münzer in which mystical and eschatological ideas blend with dialectic elements of Marxist-Hegelian origin. *Spuren* followed in 1930 and *Erbschaft dieser Zeit* in 1933. In the latter work the various elements of Bloch's thoughts are for the first time clearly placed within a Marxist framework showing revisionist tendencies.

In 1933 Bloch left Germany, eventually reaching the United States, where he created his major work, *Das Prinzip Hoffnung*, a huge work that has been called "a monstrous essence of his thoughts." After World War II Bloch, like Bertolt Brecht, went to East Germany, where from 1948 until his retirement in 1957 he was professor at the University of Leipzig. At first, Bloch's political and intellectual influence in East Germany was limited, but nevertheless, he was never fully appreciated by party authorities. His winning the *Nationalpreis* of the German Democratic Republic in 1955 stirred controversy, and Bloch's views had changed considerably during his sojourn there. His ideas, which were carefully watched by party authorities, became the center of many discussions. In 1953, after the publication of *Subjekt-Objekt, Erläuterung zur Hegel* and *Avicenna und die Aristotelische Linke*, Bloch became editor of the *Deutsche Zeitschrift für Philosophie*. But the journal's comparative independence led to a series of arrests and trials of its collaborators and editors. Wolfgang Harich, Günther Zehm, and Manfred Hertwig were sentenced to prison, and Richard Lorenz and Gerhard Zwerenz fled to the Federal Republic. Although Bloch was only slightly involved, he was forbidden to publish, and in 1957 his works were officially condemned. When Bloch tardily made a declaration of loyalty, it was vague and noncommittal.

Although he was finally permitted to publish the third volume of his *Das Prinzip Hoffnung* in 1959, Bloch asked for political asylum during a visit to the Federal Republic in 1961, where he became a visiting professor at the University of Tübingen. Bloch is generally known in the West as a major Marxist philosopher, but he drew on a far wider heritage that includes classical German thought, Christian and Jewish mysticism, Neoplatonism, and even the esoteric speculation of the *Zohar*. His major work, *Das Prinzip Hoffnung*, gives the impression that Bloch, although claiming that the economic element is fundamental, relegates it to a secondary level and focuses his attention on what Marxist theory regards as only a superstructure, the problem of intellectual culture.

According to Bloch, all reality is “mediation,” or the subject-object relation, a dynamic relation that tends ultimately toward the final goal (*Endziel*) of the reunion of subject and object. The *Urgrund*, the primordial stuff prior to the distinction between subject and object, matter and spirit, is moved by an obscure immediate cosmic impulse, which Bloch terms “hunger” and contrasts with Sigmund Freud’s libido. After subject and object have been distinguished, Bloch claims, this hunger remains essential to both subject and object. Thus the reality of both subject and object is in the future, and the category of possibility comes to play a central role in his thought.

SUBJECT

In humans, the primordial hunger becomes desire, or hope. Hope presents itself as utopia, as a vision of a possibility that might be realized. Hope is tension toward the future, toward the new. It moves from a mere state of mind (*Stimmung*) to a representation, and then to knowledge. Although hope is founded on the will, in order to be hope that understands (*begriffene Hoffnung, docta spes*), it must draw strength from something real that will survive even when hope itself is completely satisfied. This residue makes hope something more than a project of reason and puts it in relation to what is objectively possible. The future possibility is not just a dream, even if it is heralded in dreams.

POSSIBILITY

The relations between subject, object, reality, and possibility are complex. The nature of the real is a tendency toward, or anticipation of, the future, and thus its reality is the reality of something in the future. But the future is already real as objective possibility. Bloch distinguishes between objective possibility, which (because the object as object is not real) is merely theoretical, and real possi-

bility, which is practically connected with the future. What is really possible is concretely connected with utopia. Reality always contains elements of possible change, possibilities not yet actually existing. Utopias are concerned with these possibilities and thus have an essential function in human consciousness. On the other hand, these possibilities must have a foundation in the object because thought can represent in imagination infinitely many possible objects in infinitely many relationships.

If an event were completely conditioned, it would be “unconditionally certain.” Therefore, what can possibly come into existence is possible only insofar as it is not conditioned. What is objectively possible, therefore, is so only insofar as it is not constrained by predetermined conditions. Bloch distinguishes between two senses of objective possibility. One sense concerns the thing and is the thing’s “behavior,” or the appearance of the thing as an object of knowledge. The other sense concerns our knowledge of the thing. The objectivity (*Sachlichkeit*) of the thing concerns only our knowledge of it, while its factuality (*Sachhaftigkeit*) concerns only the object of knowledge.

MATTER

The distinction between objectivity and factuality leads Bloch to claim that Marxism is only a partial outlook on reality and needs completion, even though the reconciliation of the real and the possible is achieved in historical materialism, which retains, in its complete immanentism, an element akin to the doctrine of salvation of the great religions. According to Marxism, historical changes arise out of precise historical socioeconomic conditions, and physical movement arises out of contradiction, the clash of opposites. But just as Bloch supplements the claims of historical materialism with his concept of hope, so he supplements the claims of dialectical materialism. In the object, or matter, the primordial hunger becomes a motive force (*agens*). But even though Bloch affirms that this force is completely immanent in matter, it is doubtful whether his view is still materialistic. His hostility toward all forms of mechanism and his inclination toward organic solutions weaken the materialistic features of Marxism to the point of nonexistence. The innate drive that he ascribes to matter has meaning only from the point of view of the final goal. Matter is not predetermined, since it has the capacity not only to express itself in existence but also to do so in forms that are always new. Nevertheless, the teleological doctrine of a final goal for the entire world process is not an extension of a psychological category or historical principle to nature. Rather,

it is the cosmic unity of the subject process and object process when being finally becomes thinking and thinking finally becomes being. The historical process of society is thus related to the world process and ultimately to matter.

Thus Bloch identifies dialectical matter with real possibility, but its being in process is not material and contradicts the fundamental Marxist tenet that matter is an independent reality that cannot enter into a relation with anything. Several critics have remarked that Bloch's conception of matter has its sources in the romantic *Naturphilosophie* of G. W. F. Hegel and Friedrich von Schelling; on this view, Bloch belongs among the idealist critics of natural science.

UTOPIA

The reconciliation of subject and object comes through utopia. In utopia, romantic *Sehnsucht*—the nostalgic regret that our dream of rationally conquering the world is blocked by a limit that we try unceasingly but perhaps vainly to overcome—is united with messianic expectancy. Utopia foresees the “kingdom of the children of God” of Thomas Münzer, the kingdom of freedom in which the exploitation of man by man ceases. At this time will come that unification, the identification of subject and object, which Bloch claims Karl Marx foresaw when he spoke of the future historicization of nature and naturalization of man. It is thus from man that the world expects its realization, and the realization of the world process coincides with the self-realization of humankind. The Marxist epistemological theory of reflection will no longer be needed, since knowledge itself will be overcome by hope and the object as object will disappear; it will no longer be the having-become (*Gewordenes*) but rather pure process, the becoming (*Werdendes*), the not-yet (*noch nicht*).

Bloch's thought is very far from Marx's historical outlook and perhaps not too far from the early views of Georg Lukács. In his conflict with the schematicism and dogmatism of orthodox Marxism, Bloch belongs with such idealist and existentialist revisionists as Lukács, Antonio Gramsci, and Jean-Paul Sartre. Bloch's attempt to save Marxist theory from ossifying has wider implications than their attempts, however, for it is related to the problem of how Marxism is to make use of a cultural heritage, especially the heritage of classical German philosophy and, at least for Bloch, the heritage of the great religions of salvation. Bloch's solution has been to develop one vast comprehensive vision of reality, combining the original intuitions of the Old Testament and apocalyptic literature with the dynamic and messianic

elements in Marxism. Bloch's very language reveals this mixture of ancient and modern. Difficult and intense, it echoes both recent expressionism and the language of the Bible and of mystical literature. The past is for Bloch not something fixed in an unreachable dimension, its cultural wealth to be discarded in order to start anew, but a dynamic field of research still of use to man.

BLONDEL, MAURICE (1861–1949)

Maurice Blondel is considered one of the foremost French Catholic philosophers of the twentieth century. Blondel was born at Dijon. He studied at the local *lycée*, and in 1881 entered the École Normale Supérieure, where he was taught by Léon Ollé-Laprune. Because of pragmatic tendencies in his thought, Blondel's name was associated for a time with the modernist movement. He was, however, essentially orthodox, and his work has been increasingly influential among those Catholic thinkers who look for an alternative to Thomism.

Through Ollé-Laprune, Blondel was influenced by John Henry Newman's theory that belief is a matter of will as well as of logical demonstration. Blondel was far from being a thoroughgoing pragmatist or vitalist and showed none of the naturalism of thinkers like Henri Bergson and James, yet he held that truth is to be reached not only through the intellect but through the whole range of experience, and to this extent he departed from the emphasis on rational demonstration found in traditional Catholic philosophy. Most of Blondel's teaching was done at the University of Aix-en-Provence, where he taught from 1896 until his death.

THOUGHT

An extended statement of Blondel's philosophy is found in the book *L'Action*, first published in 1893 and revised near the end of his life. This book should not be confused with another of the same title, published in 1937.

The claim of Blondel's early work is that philosophy must take its impetus from action rather than from pure

thought. The expression “action” is used in a wide sense to refer to the whole of our life, thinking, feeling, willing. Blondel tells us that it is to the whole man in his concreteness that philosophy must look in its quest for truth. One must turn from abstract thought to actual experience in all its fullness and richness. It is indeed this experience itself that motivates the philosophical quest, for man by his nature must act, and then he cannot help questioning the meaning of his action. Blondel anticipated the ideas later developed in existentialism when he pointed out that although we have not chosen to live and know neither whence we come nor even who we are, we are continually taking action and engaging ourselves in chosen policies.

Blondel rejected any nihilistic attempt to set aside the question of the meaning of action, and he had an ingenious argument to show that we cannot be content to say that action has no meaning. He claimed that to affirm nothing is really to affirm being. The very idea of nothing can be formed only by conceiving something positive and then denying it. There is something positive and affirmative underlying the denials of the nihilist, and even from his pessimistic view of life he derives a certain satisfaction. Blondel argued that the nihilist’s nothing is his all. The very extent of what he denies reveals the greatness of what he wishes, for he cannot prevent affirmative ideas and aspirations from asserting themselves in the midst of his denials. Therefore, Blondel claimed, the problem of action and of its meaning must have a positive solution.

This solution is to be sought by means of a kind of phenomenology of action, though a phenomenology that is meant to show that we must pass beyond the phenomena to the discovery of the “supraphenomenal.” We are impelled to this solution by reason of an immanent dialectic in action itself, made clear by a phenomenological description.

The basis of the dialectic is the gap between action and its realization. Man cannot in his action equal what he himself demands, and so there is in life a permanent dissatisfaction set up by the contrast between action and the realization at which it aims. This impels man to further action, and in the effort to close the gap, Blondel visualized the expansion of action in terms of an ever-wider outreach. Self-regarding action passes over into various forms of social action, and these in turn come to their limit in the highest type of moral action—that which aims at the good of all humankind.

But although this process partially overcomes the contrast between action and its realization, it never does so completely, and the gap reappears at each stage. There

is no immanent solution to the problem of action. But we have seen already that an affirmative solution is demanded, and Blondel claimed that the demands of action itself point us from the immanent to the transcendent or supraphenomenal. The Catholic dimensions of Blondel’s philosophy become fully apparent at this point, for it is essentially a philosophy of grace. God is immanent within man, in the sense that human action is already directed beyond the phenomenal order. To will all that we do will is already to have the action of God within us. Yet this quest for realization would be a frustrating one were it not that God in turn moves toward us in his transcendence, and human action is supported and supplemented by divine grace.

Since action is concrete, the beliefs that arise out of action and the experience of acting are not abstract formulations. It is in action that we apprehend God, but if we try to imprison him in a proposition or prove his existence by a logical demonstration, he escapes us.

In *La pensée* and subsequent writings, Blondel gave a more prominent place to thought and modified some of the anti-intellectualist tendencies that characterized his earlier period. At the same time, he reduced the differences that had separated him from traditional Catholic philosophy. But it must not be supposed that he departed in any essential respect from his philosophy of action. Thought and action were never rival principles for Blondel, but were at all times to be taken together. Action is no blind drive, but always includes thought; thought can attain its philosophical goals only as it remains closely associated with action. Thus, in his later phase, when he reconsidered the rational proofs of theism, he claimed that these proofs are possible only on the basis of a prior affirmation of God that has arisen out of our experience as active beings.

BLOUNT, CHARLES

(1654–1693)

Charles Blount was an English deist, freethinker, and controversial writer on religion and politics. He was born at Upper Holloway, and was educated under the supervision of his father, Sir Henry Blount, traveler and author of *Voyage to the Levant* (1636). A disciple of Lord Herbert of Cherbury (“father of English deism”) and of Thomas Hobbes, Blount is commonly regarded as the second English deist. Although not particularly original, he was the first popularizer of deistic thought. By artful writing—associating himself not only with Lord Herbert and Hobbes but also with John Dryden, Dr. Thomas Sydenham, Bishop Thomas Burnet, and Sir Thomas Browne—and by family influence, Blount was able to steer clear of prosecution under the Licensing Act and the blasphemy laws.

In 1679 Blount began a career of publication with *Anima Mundi: or an Historical Narration of The Opinions of the Ancients concerning Man's Soul after this Life: According to Unenlightened Nature*, a collection from pagan writers concerning disbelief in immortality. This was shortly followed by *The Last Sayings, or Dying Legacy of Mr. Thomas Hobbs of Malmsbury, who departed this Life on Thursday, December 4th, 1679* (1680). This work is a compilation of some of Hobbes's rationalistic (deistic) passages on religion: For example, “To say he [man] speaks by supernatural inspiration, is to say he finds an ardent desire to speak, or some strong opinion of himself, for the which he can alledge no natural reason”; “He that believes a thing only because it may be so, may as well doubt of it, because it may be otherwise.”

Also in 1680 Blount published an oblique attack on priestcraft in *Great Is Diana of the Ephesians, or the Original of Idolatry, Together with the Politick Institution of the Gentiles Sacrifices*. In the same year there appeared his ironic survey of a sham pagan miracle-maker in *The Two First Books of Philostratus concerning the Life of Apollonius Tyaneus, written originally in Greek, with philological notes*

upon each chapter. In 1683 Blount published *Religio Laici*, “Written in a Letter to John Dryden, Esq.,” whose poem of the same name had appeared the previous year. Blount's work, long supposed to have been derived from Lord Herbert's prose tract of 1645 also titled *Religio Laici*, is now known to be much more closely related to a similarly titled manuscript of Lord Herbert's, unpublished until 1933. In his tract, Blount, under the guise of defending universal or natural religion, attacked by indirection the whole concept of a particular revelation. Attributed to Blount (by Antony a Wood) was the free translation (1683) of Chapter VI of Benedict de Spinoza's *Tractatus Theologico-Politicus* (in Latin, 1670; in English, 1689), under the title of *Miracles No Violations of the Laws of Nature*, which emphasized the Spinozistic interpretation of biblical miracles as natural phenomena or metaphorical or exaggerated language.

The appearance of Bishop Thomas Burnet's *Archaeologiae Philosophicae* (Latin and English versions in 1692) gave Blount the welcome opportunity to “vindicate” the pseudoscientific and allegorical attempts of the writer to explain certain delicate problems in the early chapters of Genesis. Writing in the form of a letter to Charles Gildon, Blount cited the authority of Sir Thomas Browne that “there are in Scripture stories that do exceed the Fables of Poets” and proceeded to ridicule Burnet's amiable rendition of the conversation between Eve and the Serpent, and his handling of such questions as “how out of only one rib a woman's whole body could be built” and “what language Adam spoke in the first hour of his nativity in naming the animals.” This work, edited by Gildon, appeared in 1693, the year of Blount's death, in *The Oracles of Reason*. Another letter in the same collection from Blount to Dr. Thomas Sydenham is prefixed to *A Summary Account of the Deist's Religion*, wherein the worship of God by means of images and sacrifices or through a mediator is impugned and worship by imitation of God's perfections is upheld.

Blount, a Whig, was also active on the political front. Derived from John Milton's *Areopagitica*, his *A Just Vindication of Learning, And the Liberty of the Press, and Reasons humbly offered for the Liberty of Unlicensed Printing* were published in 1693. A third work of the same year, written under the pseudonym “Junius Brutus,” was a master stroke demonstrating the futility of licensing. It was titled *King William and Queen Mary Conquerors: Or, A Discourse Endeavouring to prove that their Majesties have on Their Side, against the Late King, the Principal Reasons that make Conquest a Good Title*, and Blount duped the Tory licenser, Edmund Bohun, into granting

permission to publish. By order of the House of Commons the work was burnt by the common hangman, and Bohun was dismissed in disgrace (Thomas Macaulay makes much of the incident in Chapter 19 of his *History of England*).

In this year of triumph Blount let emotionalism get the better of rationalism and committed suicide over hopeless love for his deceased wife's sister, who would not agree to a marriage deemed illegal by the Church of England.

See also Deism.

Bibliography

The nearest approach to a collection of Blount's works is *Miscellaneous Works* (London, 1695), edited by Charles Gildon with a life of Blount and a justification of his suicide. But see J. S. L. Gilmour, "Some Uncollected Authors XVII: Charles Blount," in *Book Collector* 7 (1958): 182–187.

Modern studies of Blount include Harold R. Hutcherson, "Lord Herbert and the Deists," in *Journal of Philosophy* 43 (1946): 219–221; Eugene R. Purpus, "Some Notes on a Deistical Essay Attributed to Dryden," in *Philological Quarterly* 30 (1950): 342–349; George F. Sensabaugh, "Adaptations of *Areopagitica*," in *Huntington Library Quarterly* 13 (1950): 201–205; J. A. Redwood, "Charles Blount (1654–93), Deism, and English Free Thought," in *Journal of the History of Ideas* 35 (1974): 490–498.

BODIN, JEAN (1530–1596)

Jean Bodin, the French philosopher, statesman, and early writer on economics, is known chiefly for four major systematic works: *Method for the Easy Comprehension of History* (*Methodus ad Facilem Historiarum Cognitionem*, Paris, 1566); *Six Books of the Republic* (*Six Livres de la république*, Paris, 1576); *Universae Naturae Theatrum* (*The Theater of Nature*; Lyons, 1596); and *Heptaplomeres Sive Colloquium de Abditis Rerum Sublimium Arcanus* (*Dialogue of Seven Wise Men*; Schwerin, 1857).

Although Bodin's life is only imperfectly known, he was probably born in Anjou into a Catholic family who sought social promotion through service to the king and in clerical charges. Through the help of his bishop, Bodin was admitted at an early age to the Carmelite friars of Angers, who sent him to their school in Paris. While in Paris he probably later studied under the *lecteurs royaux*

instituted by Francis I, who personified for Bodin the ideal sovereign. Bodin was probably imprisoned for some time, but later released, on charges of professing Lutheran views. He later studied in Toulouse and was an assistant in the faculty of law there. He participated enthusiastically in the Renaissance ferment at Toulouse, which at that time was a great center of international learning, in close contact with Germany, Switzerland, Italy, Spain, and the papacy at Avignon. Bodin kept in touch with all foreign publications on religion and history, which benefited his lectures on the *Pandects*. He envisaged for a short time the career of a humanist historian in the capacity of headmaster of the Collège de l'Esquille, to which idea we owe a superb discourse of 1559, *Oratio de Institutenda in Republica Juventate*. In addition to a panoramic picture of the French Renaissance inspired by Francis I, the discourse presents a complete humanist pedagogical system.

The failure of his local ambitions and the expectation that the approaching religious wars would engulf Toulouse induced Bodin to leave for Paris, where he found a position as advocate of the Parliament of Paris, a favorable post for receiving any nomination of significance in the king's service. In his work in parliament, Bodin found a type of practical law far superior to the exegesis of ancient texts. He broke with the writers of such exegeses in the preface to his first systematic work, the *Method of History*. The history of the title is the history of knowledge and is similar in conception to that which René Descartes later presented in the preface to his *Principles*. For Bodin the three main branches of knowledge are human history, or anthropology; natural history, or physics; and divine history—theology or religion. The *Method* is a general outline of Bodin's whole system; his other three major works are each devoted to one of the three branches. The *Method* itself, though it outlines the entire system, covers in detail only Bodin's anthropology and discusses nearly all of the topics of the later *Republic*.

SOCIAL THEORY

The *Republic* itself, though it partly owes its genesis to Bodin's entire scheme, is also an outcome of a serious French political crisis of the period, which engaged Bodin's attention for many years. The book is a defense of the theory of the French monarchy, as Bodin conceived it, against Machiavellians in the Court and against various rebellious groups. The book seeks to demonstrate that monarchy, and the French monarchy in particular, is the best of all possible regimes.

The state, the republic, is a lawful government of the several households comprising it. The state arises when

each head of a household, each *pater familias*, acts in concert with the others. These men are the citizens of the republic. Private property is an inalienable right of the family. At the head of this group of households is the sovereign, the administrator of the republic, whose task is the proper government of the households composing the state.

SOVEREIGNTY. Bodin's whole political philosophy rests on the doctrine of sovereignty. Sovereignty is defined in the *Republic* as "the absolute and perpetual power of a Republic, that is to say the active form and personification of the great body of a modern State."

In Bodin's conception of sovereignty two different traditions, that of Roman law and that of French monarchy, converge. The former brought with it the notion of *majestas*, which gave supreme authority established above all magistrates, however important they might be, to an absolute power of which they were but a reflection. The tradition of French monarchy, in order to demonstrate the autonomy of the French king in relation to the emperor, had been concerned chiefly with cataloguing the privileges acknowledged as the king's by the pope; these were regarded as so many proofs of the king's sovereign authority. Of these *insignia pecularia*, one list contains no fewer than 208 items.

Bodin reinterprets this twofold juridical trend and attempts to synthesize it. In the *Method* he therefore retains only five marks of sovereignty: the power of appointing higher magistrates and delineating their offices, the power of promulgating or repealing laws, the power of declaring war and concluding peace, the power of judicial review, and the power of life or death even when the law requires death.

When he wrote the *Republic*, Bodin had realized that the essential mark of sovereignty was that of making and repealing laws and that the others were dependent on this right. This right of the sovereign cannot be restricted by custom; the sovereign sanctions customary law by allowing it to continue in force. "Thus, all the force of civil laws and custom lies in the power of the Sovereign Prince." All legislative and judicial power is concentrated in the sovereign, but the sovereign is conceived as the incarnation of a principle and cannot be regarded as having a personal will at variance with the interests of the state. Against the medieval theory, reaffirmed in France in Bodin's day, of the *Politie*—a state in which supreme authority was shared among the prince, an aristocracy based on birth and office, and the representatives of the people—Bodin contends that, if sovereignty is absolute, it

is therefore indivisible, wherever it resides. There can be monarchies, aristocracies, or democracies, but never a mixed state.

In a given system of government, different modes of rule are possible. An aristocracy may be governed monarchically, as in Germany, or more or less democratically, as in Venice. But a monarchy, in which the king guarantees all liberty, is the best of regimes.

The state that Bodin depicts—a complex of families and of corporations, classes, and heterogeneous provinces—is enriched by the differences and interactions of its components. They all obey the sovereign, their sole arbiter and the personification of a public weal that is also the weal of its parts. Thus the absolute power of the sovereign transcends that of the *paterfamilias*, but is conceived in the latter's image. Though the authority of the sovereign is absolute with respect to the other elements of the state, the source of this authority lies in social law, as is clear from the long history of the French state, with its hereditary monarchy subject to a higher law. Though sovereignty is not limited by custom, it is limited by the requirements of justice: Authority is acknowledged as belonging only to a just government—a regime that gives every person, even the wicked, his chance. Sovereignty is also limited externally through the recognition of the legitimacy of other sovereignties, even of conflicting types. The sovereign is further obliged to collaborate with neighboring countries, so that M. J. Basdevant was enabled to see in Bodin one of the founders of modern international law. Bodin's thought is very close to the concept of peaceful coexistence that today forms one of the norms of international law.

THE THEORY OF CLIMATES. Besides outlining the structure of his ideal republic, a monarchy, Bodin also examines the diversity of states offered by experience. On the one hand he follows the pattern of the Greek philosophers, tracing historically the degradation of this ideal prototype and the manner in which are successively engendered the various forms, sound and pathological, of political organization—tyranny, democracy, aristocracy, and so on. But Bodin also studies the modes of a state's adaptation to its territory. In this investigation, which is known as the theory of climates from a later similar exposition by Montesquieu, Bodin seeks to define more precisely the ways through which geography influences human societies: "the nature of Northern and Southern peoples as well as that of the Eastern and Western ones, then, the influence of the various places, either mountainous, marshy, windswept or sheltered" (*Method of His-*

tory, Ch. 5). He gives a rather circumstantial account agreeing in many respects with modern human geography and ethnic psychology. He describes northerners as unequaled in wars and industry and southerners as unequaled in the contemplative sciences, but the inhabitants of the median region are in a particularly fit position for the blossoming of arts and laws.

In the *Method*, Bodin uses anthropogeography as a critical weapon to detect errors committed by outstanding historians in their assessment of facts, and to build a solid framework relating human history to natural history. In the *Republic* his point of view becomes more dogmatic, though his individual observations are more perspicacious. And he makes the important observation that, whatever the ontological superiority of monarchy over other forms of government may be, for a given state the most appropriate regime is the one that answers best to the people and the geography of the place. "One of the greatest and perhaps the chief foundation of Republics is to adapt the state to the citizens' nature, and the edicts and ordinances to the character of places, persons, and times."

Bodin's defense of the French monarchy in the *Method* and his vast culture and philosophical wisdom won him the confidence of the royal family, and in 1571 he entered the service of the duke of Alençon, the brother of the future Henri III, who, after his coronation in 1574, befriended Bodin. But in 1576, at a meeting of the States-General, Bodin delivered a speech in which he succeeded in defeating the king's request for the financial means necessary to suppress the French Protestants. By this speech Bodin temporarily diverted the civil war, but lost the king's favor and was relegated to a humble post in Laon, where he took advantage of the relative calm to write in 1578 the Latin version of the *Republic* (published Paris, 1586) and the *Demonomanie des sorciers* (Paris, 1580). The latter work, which went through some ten editions, advocates the repression of witchcraft and contains as well a complete demonology, in great part taken from the Bible.

NATURAL HISTORY

Upon his return to Laon from trips to the Court of Queen Elizabeth I and to Belgium on missions with the duke of Alençon, Bodin returned to work on the second part of his system, his physics. The *Amphiteatrum Naturae* is in the form of a dialogue in which a "mystagogue" expounds to a "theoretician" a complex and obscure philosophy that attempts to reconcile Neoplatonic idealism with Aristotelian naturalism and also with important religious

attitudes derived from the Hebrew tradition. Living beings are explained in terms of Platonic forms, but the nature of the explanation and of the forms remains obscure. The soul is corporeal and is the form of the body. It is separable from the body both in life and at death. It possesses unity, and its function is to vivify the extended matter of the body. The powers of the soul, including sensation and appetite, are seen as modeled on the will: They act directly upon the body with no need of an intermediary. Angels, too, are material, and the human soul is inhabited not only by a good angel and a bad angel, but also by a large number of spirits, each in charge of a special gift. But Bodin is constrained from scrutinizing too closely the mysteries of nature by his awareness of the abyss that separates the Creator from the world of creatures. The *Amphiteatrum Naturae* thus fails, in the end, on a level where Bodin's contemporaries could not question its failure, the religious level.

THEOLOGY. A similar failure is evident in the *Heptaplomeres Sive Colloquium de Abditis Rerum Sublimium Arcanus*, a work composed during the last years of Bodin's life and published in part in 1841 and completely in 1857. This work is on the third of Bodin's three branches of knowledge, theology. The seven sages of the title represent three branches of Christianity, Judaism, Islam, natural religion, and skeptical materialism. Despite fertile discussion and a generous courtesy to one another, they cannot arrive at a common foundation for religious matters. In the progress of the discussion, it becomes apparent that in almost every instance the majority agrees with the doctrine of the Jews and that all might accept the Decalogue, looked upon as a spiritualization of the natural law and as embodying such fundamental principles. (Bodin had in an earlier work made a comparative study of the institutions of the most diverse countries, from the ancient empires to the recently discovered nations of Africa and America. From this study he had conceived the idea of replacing Roman law with a synthetic and universal law that allowed for different modes of application depending on the place, the era, and the geographic or economic conditions.)

But from the historical standpoint, which is so significant for Bodin, only the Christian faiths can contend for victory. Among these, the discussion goes badly for the Protestants, who cannot rationally justify their conservatism, their innovations, or their contradictions. The Catholic Church, since it possesses the most elaborate body of doctrine, is subjected to the most criticism; but the fact that the Catholic Church remains the religion of the state, and is relatively stable in the midst of uncer-

tainty, is for Bodin to some degree a vindication of the faith of its partisans. The book proposes, therefore, that the church is to be believed, as the Catholic prelate has held successfully throughout the dialogue.

This justification of the Catholic Church is in line with Bodin's support of the Catholic League during his last years, a support that was not dictated simply by the instinct of self-preservation. But Bodin was not fully trusted by the members of the League and was more or less confined to his house, where he spent most of his time in contemplation and the education of children, for whom he wrote a catechism in the spirit of the *Amphiteatrum Naturae*. Bodin died as a Christian and was buried in the choir of a church.

Bodin's work enjoyed outstanding renown until the middle of the seventeenth century but was totally disregarded in the eighteenth, and without a famous article in Pierre Bayle's *Dictionary*, it would never have recovered from this neglect. Bodin's work was restored to favor in 1853 through Henri Baudrillard's *Jean Bodin et son temps*, and in the twentieth century he resumed his place among the acknowledged great political philosophers of all time. Bodin also merits consideration as one of the most representative spirits of the Renaissance, and one of the first to formulate historical laws in each of the three realms—divine, natural, and human—that he considered.

BODY-MIND PROBLEM

See *Mind-Body Problem*

BOEHME, JAKOB

(1575–1624)

Jakob Boehme, the Lutheran contemplative, was born at Alt Seidelberg near Görlitz in Silesia and lived there nearly all his life, working chiefly as a cobbler. Among his mystical experiences, the seminal one occurred in 1600, when he glanced at a pewter dish that reflected the sunlight and in a rapt state saw “the Being of Beings, the Byss and the Abyss, the eternal generation of the Trinity, the origin and descent of this world, and of all creatures through the Divine Wisdom” (*Second Epistle*, §6). Though not formally educated, Boehme read rather widely and was influenced by, among others, Paracelsus (1493–1541) and Valentin Weigel (1538–1588), the Lutheran mystic. The above quotation, however, hints at most of the main features of Boehme’s *Weltanschauung*, which he first expressed in his *Aurora, oder die Morgenröte im Aufgang* (1612) and then in other works (from 1618 onward—he did not write in the intervening period because of ecclesiastical pressure). The “Abyss” is God considered as the *Ungrund*—the undifferentiated Absolute that is ineffable and neither light nor darkness, neither love nor wrath. The “eternal generation of the Trinity” occurs because the *Ungrund* contains a will to self-intuition. This will (identified with the Father) finds itself as the “heart” (the Son). Emanating from these is the “moving life” (the Spirit). This eternal process toward self-knowledge and outgoing dynamic activity generates the inner spiritual world, which is the prototype of the visible universe. With differentiation, conflict of wills becomes possible; and Satan, in severing himself from the “heart,” falls. Sometimes Boehme writes as if evil were necessary, at others as though it were a contingent spoiling of the cosmic harmony. Indeed, Boehme in general shifted his position, and no single metaphysical theory fits all his writings.

This was partly because, in addition to his doctrine of the Trinity considered in itself, Boehme also enunciated a theory of seven qualities or energies in nature; and the fluidity of his metaphysics results from different ways of coordinating these two main aspects of his thought. The seven qualities divide into two triads, a higher and a lower, between which there is the crucial energy he called “the flash” (*Blitz*). The lower triad is (1) contraction (whereby substances become individuated), (2) diffusion (whereby things gravitate to one another), and (3) rotation or oscillation (the tension produced by the interplay of the forces of contraction and diffusion). The higher triad is in effect the lower triad transformed: It is (1) love, (2) expression, and (3) eternal nature or the Kingdom of

God, through which there is achieved a harmony between the material and spiritual worlds.

The meaning of this evolutionary scheme is that the Trinity considered in itself is merely formal or ideal. The abyssal will needs a real object to arouse self-knowledge. Thus the Father differentiates himself through the first (lower) triad into material nature. An obstacle is thereby created to the abyssal will, which can be overcome, not by abolition, but only by transformation. The flash is the collision, as it were, between the absolute will and nature. Herein the Spirit reveals in its light the higher triad, identified with the Son as the incarnation of spirit in matter. This is the goal of the divine operation, whereby the opposition is overcome and made into a harmony.

Psychologically, the flash reveals to man his choices. He can remain at the level of anguish implicit in the welter of sensation represented by the oscillation of nature; or he can “die” unto self, and identify himself with the abyssal will—which also has to negate itself in order to achieve victory. Thus the mystical life is an imitation of Christ’s suffering and triumph.

Boehme’s doctrines brought him into conflict with church authorities. He was critical of the bibliolatry he detected in contemporary Protestantism, of a formalistic doctrine of election, and of crude notions of heaven (for Boehme, heaven is not a place). In England, William Law and the Behmenists (Boehme’s disciples), who merged with the Quakers, were strongly influenced by him. And German Romanticism owed something to him—especially Friedrich von Schelling, notably in his later writings.

BOETHIUS, ANICIUS MANLIUS SEVERINUS (c. 480–524)

Anicius Manlius Severinus Boethius, late Roman statesman and philosopher, was born into the ancient Anician family in Rome, the son of a distinguished father who was consul in 487 and twice prefect of the city. Carefully educated in the liberal arts and philosophy—possibly in Athens—and precocious in genius, he entered public life at an early age under Theodoric the Ostrogoth, the Arian king of Italy from 493 to 526, who made use of Romans and the traditional administrative methods in his government.

Boethius became consul in 510 and for many years was Theodoric’s principal minister (*magister officiorum*). In 522 his two sons became consuls; shortly thereafter Boethius was arrested on a charge of treason that cannot now be defined but that he denounced as a calumny. It has been suggested that he wished to exalt the Roman senate and to negotiate with Byzantium; it is also possible that as a Catholic he was distasteful to Theodoric. Condemned to exile and then to death, he was imprisoned for a year at Pavia and executed in 524. His father-in-law Symmachus and Pope John II were similarly put to death in 525 and 526.

Boethius’s cult at Pavia, apparently resting on a confusion with Severinus of Cologne, won him popular canonization as a martyr. In recent centuries, however, his Christian allegiance has been questioned because of the absence of religious themes in his *De Consolatione* and

the doubtful authenticity of his theological writings. The question was settled when definite proof of his authorship of these pieces was provided by H. Usener in 1877. Many readers have felt it strange that Boethius, faced with death, should have found his principal stay in Stoic and Neoplatonist philosophy, but such an attitude is not without parallels in the cultured circles of late Roman society. We may note that the readers of Boethius in the ages of faith seem to have felt no uneasiness on this count.

WRITINGS

The literary fecundity of Boethius is astonishing, especially in view of his family life and exacting official duties. He wrote on education, science, philosophy, and theology, but he was above all a logician, a translator, and a commentator. His *Elements of Arithmetic*, *Elements of Music*, and *Elements of Geometry* (written 500–510) all summarize existing works by Nicomachus of Gerasa and by Euclid. Of theological works attributed to him, four are now recognized as authentic: *On the Trinity* and *On the Person and Two Natures in Christ*, *Against Eutyches and Nestorius*, and two smaller tracts. The treatise *On the Catholic Faith* is of doubtful authenticity.

In philosophy Boethius set himself the task of translating and commenting upon all the works of Plato and Aristotle, with a view to a final harmonization of their teachings.

TRANSLATIONS. As part of his ambitious program, Boethius produced the following translations: the *Introduction (Isagoge)* of Porphyry and the *Categories* of Aristotle (the so-called old logic); the *Prior Analytics* and *Posterior Analytics*, the *Sophistic Arguments* and the *Topics* of Aristotle (the so-called new logic). It is questionable whether the Boethian translations are still extant among the various primitive translations that were supplanted by versions by Gerald of Cremona and others.

COMMENTARIES. Boethius produced two commentaries on the *Introduction* of Porphyry, one for beginners and the other, his chief philosophical work, for advanced students (composed 507–509); one on the *Categories* (510); on Victorinus’s translation of the *Introduction* (before 505); and on the *Topics* of Cicero. In addition, he wrote several short treatises on logic.

Finally, there is Boethius’s masterpiece, *On the Consolation of Philosophy*, written while he was in prison at Pavia, a dialogue in prose and verse between the writer and Philosophy personified, in which the just man unjustly suffering is confirmed in his conviction that hap-

pinness and fortitude may be found in adversity. The arguments used are in part Stoic and in part Neoplatonic, but the sentiment throughout is religious, though not explicitly Christian.

Boethius lived during a period of considerable intellectual activity in Rome. Cassiodorus was his colleague, and among his elder contemporaries were the great popes Gelasius I and Hormisdas, and the canonist and chronologist Denis the Little. By his early death he escaped the disasters that befell Italy during Justinian's attempt to recapture the peninsula for the Byzantine Empire and the ravages of the Goths.

The sack and evacuation of Rome in 546 may with some assurance be taken as the dividing line in Italy between the ancient and the medieval cultures. Standing thus at the very end of a civilization, Boethius may rightly be called an eminent founder of the Middle Ages and a figure of supreme importance in the history of Western thought. Himself one of the "last of the Romans," he was also the last Western thinker to whom the works of Plato and Aristotle were familiar in Greek and to whom ancient thought in all its fullness was still comprehensible. His translations and commentaries, though neglected for centuries, stimulated and fed the minds of those who brought about the revival of dialectic in the eleventh century, and gave to medieval speculation the dialectical bent and the Aristotelian color that it never lost. Moreover, his approach to theological issues, though consciously reflecting the procedure of Augustine, was in fact more technical and dialectical in method than that of any of his predecessors. He professedly used the human power of reasoning to penetrate and explain the dogmas of Christianity and regarded the effort of reason (*ratio*) to support and discuss authority (*auctoritas*) as a principal means in the elucidation of revealed truth. On the technical level of a translator he had a genius second only to that of Cicero for exact reproduction of terms of art in his native language. Many of these terms became current coin in the Middle Ages, and a number of his definitions—those of nature, substance, person, eternity, providence, and beatitude—were accepted and stereotyped by Aquinas and others.

Boethius's influence upon the thinkers of the early scholastic period (1000–1150) can scarcely be exaggerated. It was the Boethian age as surely as the next age was Aristotelian. It was his commentary on Porphyry, in which he gave the answers of Plato and Aristotle to the "problem of universals" that initiated the great controversy on universals in the eleventh century. The early Scholastics' concentration of interest upon logic gave to

the whole fabric of medieval thought from Roscelin to William of Ockham, and to the form and content of academic teaching, that preoccupation with method rather than with matter which characterized Scholastic thought, giving it accuracy and subtlety but also tending to divorce it from life and to substitute logic for discovery.

THE "CONSOLATION"

In another realm, the *Consolation of Philosophy* was one of the two or three books of universal appeal throughout the Middle Ages. Philosophically it is notable for containing a long discussion of the eternity of God, defined as the full and perfect possession of endless life always present in its entirety, and the "aeviternity" of the created universe, without beginning or end but existing in the ever-changing succession of time. On the basis of this definition, Boethius tried to solve the problem raised by God's prevision of free human acts. God in eternity has a simultaneous *vision* of all temporal reality, and he sees free acts as free. Here Boethius also made the valuable and influential distinction between that which is (*id quod est*)—for instance, the totality of parts of an individual compound substance—and that by which a substance is what it is, its being (*quo est, esse*). He identified the latter with the "form" of the whole, an important metaphysical declaration rendered classical by Thomas Aquinas. Boethius, who was engaged in distinguishing God from all other things, went on to remark that in creatures the form (*esse*) is mentally separable from the substance (*id quod est*), whereas in God his being is identical with "that which is." This is not, as has sometimes been stated, a first enunciation of the celebrated Thomist distinction between essence and existence—it is, rather, the distinction between a substance and its metaphysical cause—but it was a step on the journey, inviting further progress. The mingled melancholy, resignation to divine providence, and sense of the supreme value of the good in life in the *Consolation* appealed powerfully to the experience of those confronting the risks and disasters of medieval life, and it was to them, rather than to monks or theologians, that the work of Boethius brought comfort. It was translated into Anglo-Saxon by King Alfred the Great (c. 890), into German by Notker (c. 1000), and into French by Jean de Meung (c. 1300). It was favorite reading of Dante Alighieri, Giovanni Boccaccio, and Geoffrey Chaucer, and inspired numerous imitators.

BOETHIUS, ANICIUS MANLIUS SEVERINUS [ADDENDUM]

Boethius's position in the history of philosophy is curious. He is at best a competent representative of the Neoplatonic commentary tradition of late antiquity. His decision, however, to make that tradition available in Latin led to his having a deep and lasting influence on the development of philosophy.

It was Boethius's answer to the question left open by Porphyry that provided the basic material for later disputes over universals. Boethius argues that no extramental thing can be present entire in each of many individuals. He offers, without apparently noticing a difference, two accounts of universal concepts that are not obviously compatible. In one he maintains that mind is able to separate, or abstract, from an individual that which makes it the kind of thing it is: its species. In the other, inductive, account, he claims that the mind collects "likenesses" from many individuals to obtain their species. On either account the result is a universal. Boethius concludes that species and genera are incorporeal things that are universal in the mind and singular in sensible individuals. He does not, however, explain how this multiplied singularity is to be reconciled with his own argument against an extramental unity common to many and so leaves open to medievals the full range of positions on universals from extreme antirealism to extreme realism.

In his commentary on Porphyry's *Isagoge*, Boethius develops a distinction made there between separable accidents, such as being asleep, which a subject can cease to have without ceasing to exist, and "inseparable" accidents such as the blackness of crows, which, he claims, can be mentally but not actually separated—we can conceive of a crow that is not black but one cannot exist.

A related distinction is made by Aristotle between numerical separability and separability in account, or definition. Features included in the definition of something are conceptually inseparable from it. Inseparable accidents and properties are conceptually but not actually separable. This distinction seems to be invoked by Boethius in *De hypotheticis syllogismis*, in which he allows that we may suppose to be so what is actually impossible in order to see what follows. An example of such a nonreductive hypothesizing of an impossibility is found in his theological treatise *Quomodo substantiae*. There Boethius

posits the impossibility that god does not exist in order to explore the nature of the goodness of created things. Similar thought experiments are found in Philoponus and, through Boethius, were transmitted to the Middle Ages, during which they played a crucial role in theology and were formalized in logic textbooks as the *obligatio* of impossible *positio*.

In *Quomodo substantiae* Boethius proposes to derive his conclusion about the goodness of created beings from a set of principles that, he claims, are recognized as true by everyone or at least by the learned. These principles provided a terminology for the description of the ontological structure of created beings and God that became the standard one in Middle Ages. Boethius characterizes here as “*id quod est*” (that which is) what he refers to in his commentaries on Porphyry and Aristotle as a substance. That which makes a creature the kind of thing that it is is, according to *Quomodo substantiae*, its *esse* (being). For creatures *id quod est* and *esse* are distinct, but for God they are one and the same.

In another of the *Theological Treatises*, *Contra Eutychen*, Boethius makes a different but historically equally important distinction. Here *esse* refers to any kind of being, that is to individuals and their species and genera in the Aristotelian category of substance or any of the accidental categories. Subsistences (*subsistentia*) are beings that are not accidents and do not require accidents in order to exist—that is to say, individuals and species from the category of substance. Finally substances are the individuals but not the species in this category because, according to Boethius, a substance is a being which is the subject of accidents.

Probably the most influential of Boethius’s definitions, however, was that which he gave in *Contra Eutychen* of a person as an individual substance with a rational nature. The problem that Boethius began to tackle here and that exercised theologians for rest of the Middle Ages was that of showing how God may be three persons without at the same time being three distinct substances.

In *De hypotheticis syllogismis* Boethius distinguishes two sorts of conditional propositions. Accidental conditionals such as “*If fire is hot, then the heavens are spherical*” hold merely because it is impossible for the antecedent to be true when the consequent is false. The condition is also satisfied by natural conditionals, such as “*If something is human, then its an animal*,” but in these there is a connection between the antecedent and consequent.

The distinction between two forms of conditional was identified in the twelfth century with that between actual inseparability and inseparability in account and for reasoning about impossibilities only the latter were allowed. It provided the basis for Peter Abaelard’s development of a unified theory of inference from Boethius’s remarks on topical inference in *De differentiis topicis* and on the conditional in *De hypotheticis syllogismis*.

Boethius’s own account of the hypothetical syllogism did not survive long into the twelfth century because he had no understanding of propositional negation. He thus allows inferences such as “*If (if it’s an A, it’s a B), then it’s a C, but its not a C; therefore if it’s an A, then its not a B*,” which later logicians, possessing the notion of propositional negation, were able to make little sense of.

The treatment of the reconciliation of divine foreknowledge and human freedom in Books 4 and 5 of the *Consolation of Philosophy* provided the Middle Ages with one of its standard solutions. Boethius makes a distinction between absolute necessity—such as that in virtue of which a human being is an animal—and conditioned necessity—the necessity, for example, that Socrates is sitting given that he is known to be sitting. This latter necessity, he claims, is compatible with Socrates freely having chosen to sit.

Boethius argues that God’s knowledge of the past, present, and future history of the world determines it only with conditioned necessity and so is compatible with human freedom. What he does not offer, however, is an account of the possibility, corresponding to that of Socrates’ not choosing to sit, of the history of the world being other than it will be. Rather, he maintains, it is the expression, as fate, of the divine providential plan. Again medieval thinkers were left with a problem as much as with a solution. Of Boethius’s works on the quadrivium, only two—*De institutione arithmetica* and *de Institutione Musica*—survived into the twelfth century, but they became textbooks for the rest of the Middle Ages.

Christopher J. Martin (2005)

BOETIUS OF DACIA

(c. 13th century)

Boetius of Dacia was an Aristotelian and Averroist philosopher of the thirteenth century, sometimes called Boetius of Sweden, after the country of his birth. Born during the first half of the century, he was probably a sec-

ular cleric and canon of the diocese of Linköping. He was an associate of Siger of Brabant as a teacher of philosophy in the faculty of arts at Paris and, as a leader of the Averroist movement, condemned in 1277 by Stephen Tempier, bishop of Paris. With Siger, Boetius fled the city after the condemnation and appealed to the pope. After detention at the pontifical curia at Orvieto, Boetius joined the Dominican order as a member of the province of Dacia. The date of his death is unknown.

Boetius wrote works on logic, natural philosophy, metaphysics, and ethics. Some of these are lost; only a few have been edited. A complete edition of his extant works is now in progress.

Boetius philosophized in a rationalistic spirit, defending his right as a philosopher to discuss any subject falling within the competence of reason and to come to whatever conclusions reason dictated, even though they might contradict Christian faith. He taught, for example, that philosophizing is the most excellent human activity, that philosophers alone are the wise men of this world, that creation ex nihilo is impossible, that the world and the human species are eternal, and that there can be no resurrection of the dead. His treatise *On the Highest Good, or On the Life of the Philosopher* contains one of the most glowing and optimistic descriptions of the life of pure reason written in the Middle Ages. Setting aside the teachings of faith, Boetius inquires what reason tells us about the ultimate purpose of human life. Following Aristotle, he defines man's supreme good as the philosophical contemplation of truth and virtuous living according to the norms of nature. The philosopher alone, he concludes, lives rightly and achieves the ultimate end of human life.

Despite his rationalism, Boetius did not abandon his Christian faith but sought an ultimate reconciliation with it. Philosophy, in his view, is the work of human reason investigating the natural causes and principles of the universe, whereas the Christian religion rests on supernatural revelation and miracles of God. Because the teachings of faith have a higher source than those of philosophy, in cases of conflict the latter must give way to the former. Human reason is fallible and often comes to only probable conclusions. Even when its conclusions seem necessary, if they are contrary to revealed doctrine they are not true. In these cases truth is on the side of revelation and not on the side of reason. For example, the philosophical conclusion that the world is eternal must give way to the revealed truth that the world was created in time.

Boetius was condemned for speaking as though there were a double truth, one of faith and another of philoso-

phy. But he carefully avoided calling true a philosophical conclusion contrary to faith.

BOHM, DAVID

(1917–1992)

David Bohm was a major twentieth-century physicist, and one of the world's leading authorities on quantum theory and its conceptual foundations. He was born in Wilkes-Barre, Pennsylvania, on December 20, 1917, and died on October 27, 1992, in London.

A student of J. Robert Oppenheimer, Bohm received his doctorate from the University of California at Berkeley in 1943. While still a graduate student, he discovered a particular collective movement of electrons in a plasma, now called Bohm-diffusion. At Princeton University in 1950, he completed the first of his six scientific books, *Quantum Theory*, which became the definitive exposition of the orthodox (Copenhagen) interpretation of quantum mechanics, the development of which was led by the Danish physicist Niels Bohr between 1925 and 1930. Here

Bohm presented his reformulation of the paradox of Albert Einstein, Boris Podolsky, and Nathan Rosen (EPR) concerning the possibility of simultaneous values of position and momentum for a pair of separated particles.

Bohm's version of the EPR analysis, involving components of spin in place of position and momentum, has been the basis of the enormous expansion of research on the foundations of quantum theory, focusing on nonlocality and the possible incompleteness of the quantum description (the question of "hidden variables"), that has occurred during the past several decades. Bohm and Yakir Aharonov, in 1957, made the first major step in this research when they demonstrated the existence of a "rather strange kind of correlations in the properties of distant things" (p.1072). This work was a forerunner of the seminal work of John Bell on quantum nonlocality (Bell's theorem).

In 1951 Bohm accomplished what physicists at the time regarded as impossible: He constructed, as an alternative to the prevailing observer-oriented Copenhagen interpretation of quantum theory, an objective, fully deterministic account of nonrelativistic quantum phenomena in terms of a theory describing a motion of particles under an evolution choreographed by the wave function (Bohmian mechanics). The theory Bohm proposed was in fact a rediscovery of Louis de Broglie's 1927 pilot-wave model, of which Bohm had been unaware. However, unlike de Broglie, Bohm fully appreciated the significance of the model. In particular, he showed how the predictions of the quantum measurement formalism, involving a non-noncommutative algebra of operators as observables, could be entirely explained.

In 1959 at Bristol, England, Bohm again collaborated with Aharonov, this time on a paper concerned with a very different sort of nonlocality. The result was the Aharonov-Bohm effect: In quantum mechanics a magnetic field can influence the behavior of electrons confined far away from the field, a phenomenon incompatible not only with classical physics but with the spirit of the Copenhagen interpretation of quantum theory as well. The Aharonov-Bohm effect remains, some four decades after its discovery, a subject of intense research.

Bohm was a person of extraordinary commitment to principle, both moral and scientific. He refused in 1951 to testify against colleagues before the House Un-American Activities Committee, an act that led to his indictment for contempt of Congress and his banishment from Princeton and, indeed, from all of American academia. During most of his last forty years he was engaged in an often

lonely pursuit of scientific truth, showing little regard for prevailing fashion or orthodoxy.

Bohm's interests were not confined to physics. In particular, he was profoundly concerned with philosophical issues, ranging from the philosophy of science and the philosophy of mind to ethics and moral philosophy. Late in his life he was also inspired by mysticism. He saw an all-encompassing unity in the world and thought that quantum physics was but a manifestation of a deeper underlying wholeness of nature, an idea that he developed in his 1980 book *Wholeness and the Implicate Order*.

Shortly after his death Bohm's last book, *The Undivided Universe*, was published. Written in collaboration with Basil J. Hiley, his long-time colleague at London's Birkbeck College, where Bohm had for three decades been a professor, the book provided an exposition of his 1951 pilot-wave theory, together with later developments including his thoughts on the implicate order.

Bohmian mechanics in the early twenty-first century is an area of increasingly active research. However, very few scientists working in this field see an operational connection between Bohmian mechanics and Bohm's ideas on the implicate order. Nonetheless, these ideas remain an inspiration for many others.

BOHMIAN MECHANICS

While quantum mechanics as presented in physics textbooks provides us with a formalism, it does not attempt to provide a description of reality. The formalism is a set of rules for computing the probability distribution of the outcome of essentially any experiment (within the realm

of quantum mechanics). A description of reality, by contrast, would tell us what processes take place on the microscopic level that lead to the random outcomes that we observe and would thus explain the formalism. While the correctness of the formalism is almost universally agreed upon, the description of the reality behind the formalism is controversial. It has also been doubted whether a description of reality needs to conform to ordinary standards of logical consistency, and whether to have such a description is desirable at all. Indeed it has often been claimed that quantum theory forces us to reject the reality of an external world that exists objectively, independently of the human mind.

BOHMIAN MECHANICS AND QUANTUM MECHANICS

Bohmian mechanics, which is also called the de Broglie-Bohm theory, the pilot-wave model, and the causal interpretation of quantum mechanics, is a version of quantum theory discovered by Louis de Broglie in 1927 (de Broglie 1928) and rediscovered by David Bohm in 1951 (Bohm 1952). It is a theory providing a description of reality, compatible with all of the quantum formalism and all of ordinary logic. In Bohmian mechanics a system of particles is described in part by its wave function, evolving according to Schrödinger's equation, the central equation of quantum theory. However the wave function provides only a partial description of the system. This description is completed by the specification of the actual positions of the particles. The latter evolve according to the "guiding equation," which expresses the velocities of the particles in terms of the wave function. Thus in Bohmian mechanics the configuration of a system of particles evolves via a deterministic motion choreographed by the wave function. In particular, when a particle is sent into a two-slit apparatus, the slit through which it passes and where it later arrives on a screen are completely determined by its initial position and wave function.

As such, Bohmian mechanics is a counterexample to the claim that quantum theory is incompatible with the reality of an objective external world. It is a "realistic quantum theory," and, since its formulation makes no reference to observers, it is also a "quantum theory without observers." For historical reasons it has been called a "hidden-variables theory." The existence of Bohmian mechanics shows that many of the radical epistemological consequences usually drawn from quantum mechanics by physicists and philosophers alike are unfounded. It shows that there is no need for contradictory notions such as "complementarity," that there is no need to imag-

ine a particle as somehow being in two places at the same time or physical quantities as having unsharp values, and that there is no need to assume that human consciousness intervenes in physical processes (by, e.g., collapsing wave functions). Bohmian mechanics resolves all of the paradoxes of quantum mechanics, eliminating its weirdness and mystery.

THE MEASUREMENT PROBLEM

The most commonly cited of the conceptual difficulties that plague quantum mechanics is the measurement problem or, what amounts to more or less the same thing, the paradox of Schrödinger's cat. The problem is as follows: Suppose that the wave function of any individual system provides a complete description of that system. When we analyze the process of measurement in quantum mechanical terms we find that the after-measurement wave function for system and apparatus arising from Schrödinger's equation for the composite system typically involves a superposition over terms corresponding to what we would like to regard as the various possible results of the measurement—for example different pointer orientations. It is difficult to discern in this description of the after-measurement situation the actual result of the measurement—for example some specific pointer orientation. By contrast if, like Einstein, one regards the description provided by the wave function as incomplete, the measurement problem vanishes: With a theory or interpretation like Bohmian mechanics, in which the description of the after-measurement situation includes, in addition to the wave function, at least the values of the variables that register the result, there is no measurement problem. In Bohmian mechanics pointers always point.

THE EQUATIONS OF BOHMIAN MECHANICS

Bohmian mechanics is the minimal completion of Schrödinger's equation, for a nonrelativistic system of particles, to a theory describing a genuine motion of particles. For Bohmian mechanics the state of a system of N particles is described by its wave function $\psi = \psi(\mathbf{q}_1, \dots, \mathbf{q}_N) = \psi(q)$, a complex- (or spinor-) valued function on the space of possible configurations q of the system, together with its actual configuration Q defined by the actual positions $\mathbf{Q}_1, \dots, \mathbf{Q}_N$ of its particles. The theory is then defined by two evolution equations: *Schrödinger's equation*

$$i\hbar \frac{\partial \psi}{\partial t} = H\psi$$

for $\psi = \psi_t$, the wave function at time t , where H is the nonrelativistic (Schrödinger) Hamiltonian, containing the masses of the particles and a potential energy term, and a first-order evolution equation, *the guiding equation*

$$\frac{d\mathbf{Q}_j}{dt} = \frac{\hbar}{m_j} \operatorname{Im} \frac{\psi^* \nabla_j \psi}{\psi^* \psi} (\mathbf{Q}_1, \dots, \mathbf{Q}_N),$$

for $Q = Q(t)$, the configuration at time t , the simplest first-order evolution equation for the positions of the particles that is compatible with the Galilean (and time-reversal) covariance of the Schrödinger evolution. Here \hbar is Planck's constant divided by 2π , m_j is the mass of the j -th particle, and ∇_j is the gradient with respect to the coordinates of the j -th particle. If ψ is spinor-valued, the products in the numerator and denominator should be understood as scalar products. If external magnetic fields are present, the gradient should be understood as the covariant derivative, involving the vector potential. For an N -particle system these two equations (together with the detailed specification of the Hamiltonian, including all interactions contributing to the potential energy) completely define the Bohmian mechanics.

It is perhaps worth noting that the guiding equation is intimately connected with the de Broglie relation $\mathbf{p} = \hbar\mathbf{k}$, proposed by de Broglie in late 1923, the consideration of which quickly led Schrödinger to the discovery of his wave equation in late 1925 and early 1926. The de Broglie relation connects a particle property, momentum $\mathbf{p} = m\mathbf{v}$, to a wave property, the wave vector \mathbf{k} of a plane wave $\psi(\mathbf{q}) = e^{i\mathbf{k}\cdot\mathbf{q}}$. From this one can easily guess the guiding equation as the simplest possibility for an equation of motion for Q for the case of a general wave function ψ .

Bohmian mechanics inherits and makes explicit the nonlocality implicit in the notion, common to just about all formulations and interpretations of quantum theory, of a wave function on the configuration space of a many-particle system. It accounts for all of the phenomena governed by nonrelativistic quantum mechanics, from spectral lines and scattering theory to superconductivity and quantum computing. In particular the usual measurement postulates of quantum theory, including collapse of the wave function, probabilities given by the absolute square of probability amplitudes constructed from the wave function, and the role of self-adjoint operators as observables emerge from an analysis of the two equations of motion—Schrödinger's equation and the guiding equation.

QUANTUM RANDOMNESS

The statistical significance of the wave function was first recognized in 1926 by Max Born, just after Schrödinger discovered his famous wave equation. Born postulated that the configuration Q of a quantum system is random, with probability distribution given by the density $|\psi(q)|^2$. Under the influence of the developing consensus in favor of the Copenhagen interpretation, $|\psi(q)|^2$ came to be regarded as giving the probability of *finding* the configuration Q were this to be measured, rather than of the configuration actually *being* Q , a notion that was supposed to be meaningless. In accord with these quantum probabilities, quantum measurements performed on a system with definite wave function ψ typically yield random results.

For Bohmian mechanics the $|\psi(q)|^2$ -distribution has a particularly distinguished status. As an elementary consequence of Schrödinger's equation and the guiding equation, it is *equivariant*, in the sense that these equations are compatible with respect to the $|\psi(q)|^2$ -distribution. More precisely this means that if, at some time t , the configuration $Q(t)$ of a Bohmian system were random, with distribution given by $|\psi_t(q)|^2$, then this would also be true for any other time. This distribution is thus called the *quantum equilibrium distribution*.

A Bohmian universe, though deterministic, evolves in such a manner that an *appearance* of randomness emerges, precisely as described by the quantum formalism. To understand how this comes about one must first appreciate that in a world governed by Bohmian mechanics, measurement apparatuses too are made of Bohmian particles. In a Bohmian universe tables, chairs, and other objects of our everyday experience are simply agglomerates of particles, described by their positions in physical space and whose evolution is governed by Bohmian mechanics.

Then, for the analysis of quantum measurements, the following observation is crucial: To the extent that the result of any quantum measurement is registered configurationally, at least potentially, the predictions of Bohmian mechanics for the result must agree with those of orthodox quantum theory (assuming the same Schrödinger equation for both) provided that the configuration Q (of the largest system required for the analysis of the measurement, with wave function ψ) is random, with probability density in fact given by the quantum equilibrium distribution, the quantum mechanical prediction for the distribution of Q .

To justify this quantum equilibrium hypothesis is a rather delicate matter, one that has been explored in con-

siderable detail (Dürr, Goldstein, and Zanghì 1992). It can be shown that the probabilities for positions given by the quantum equilibrium distribution $|\psi(q)|^2$ emerge naturally from an analysis of “equilibrium” for the deterministic dynamical system defined by Bohmian mechanics, in much the same way that the Maxwellian velocity distribution emerges from an analysis of classical thermodynamic equilibrium.

TYPICALITY

Thus, with Bohmian mechanics, the statistical description in quantum theory indeed takes, as Einstein anticipated, “an approximately analogous position to the statistical mechanics within the framework of classical mechanics” (1949, p.672). A key ingredient for appreciating the status and origin of such a statistical description is the notion of *typicality*, a notion that, historically, goes back to Ludwig Boltzmann’s mechanical analysis of the second law of thermodynamics. In Bohmian mechanics, a property P is typical if it holds true for the overwhelming majority of histories $Q(t)$ of a Bohmian universe. More precisely, suppose that Ψ_t is the wave function of a universe governed by Bohmian mechanics; a property P , which a solution $Q(t)$ of the guiding equation for the entire universe can have or not have, is called *typical* if the set $S_0(P)$ of all initial configurations $Q(0)$ leading to a history $Q(t)$ with the property P has size very close to one,

$$\int_{S_0(P)} |\Psi_0(q)|^2 dq = 1 - \varepsilon \quad 0 \leq \varepsilon \ll 1,$$

with “size” understood relative to the $|\Psi_0|^2$ distribution on the configuration space of the universe. For instance, think of P as the property that a particular sequence of experiments yields results that look random (accepted by a suitable statistical test), governed by the appropriate quantum distribution. One can show, using the *law of large numbers*, that P is a typical property; see Dürr, Goldstein, and Zanghì (1992) for a thorough discussion.

OPERATORS AS OBSERVABLES

It would appear that because orthodox quantum theory supplies us with probabilities for a huge class of quantum observables and not merely for positions, it is a much richer theory than Bohmian mechanics, which seems exclusively concerned with positions. In this regard, as with so much else in the foundations of quantum mechanics, the crucial remark was made by Bell (1987 p. 666): “[I]n physics the only observations we must consider are position observations, if only the positions of

instrument pointers. It is a great merit of the de Broglie-Bohm picture to force us to consider this fact. If you make axioms, rather than definitions and theorems, about the ‘measurement’ of anything else, then you commit redundancy and risk inconsistency.”

In Bohmian mechanics, the standard quantum observables, represented by self-adjoint operators, indeed arise from an analysis of quantum experiments, as “definitions and theorems”: For any quantum experiment, take as the relevant Bohmian system the combined system that includes the system upon which the experiment is performed as well as all the measuring instruments and other devices used in performing the experiment (together with all other systems with which these have significant interaction over the course of the experiment). The initial configuration is then transformed via the guiding equation for the big system into the final configuration at the conclusion of the experiment. With the quantum equilibrium hypothesis, that is, regarding the initial configuration of this big system as random in the usual quantum mechanical way, with distribution given by $|\psi|^2$, the final configuration of the big system, including in particular the orientation of instrument pointers, will be distributed according to $|\psi|^2$ at the final time.

If the experiment happens to be “measurement-like,” and the outcomes of the experiment are calibrated by an assignment of numerical values to the different pointer orientations, then the induced probability distributions of these results will be given by the familiar quantum measurement postulates—that is, by the spectral measure, relative to the wave function of the system upon which the experiment is performed, of a self-adjoint operator A associated with the experiment (Dürr, Goldstein, and Zanghì 2004), in which case we speak, in orthodox quantum theory, of a “measurement of A .”

The Stern-Gerlach experiment provides an illuminating example: By means of a suitable interaction (with a magnetic field), the parts of the wave function that lie in different eigenspaces of the relevant spin operator become spatially separated, and the result (“up” or “down”) is thus a function of the final, detected position of the particle, concerning which we can only predict that it is random and distributed according to $|\psi|^2$ at the final time. By calibrating the outcomes of the experiment with numerical values, e.g., +1 for upper detection, and –1 for lower detection, it is not difficult to see that the probability distribution for these values can be conveniently expressed in terms of the quantum mechanical spin operators—for a spin-1/2 particle given by the Pauli spin matrices.

CONTEXTUALITY AND NAÏVE REALISM ABOUT OPERATORS

Since the result of a Stern-Gerlach experiment depends upon, not just the initial position and the initial wave function of the particle, but also on a choice among several magnetic fields that could be used to perform a Stern-Gerlach measurement of the same spin operator, this experiment is not a genuine measurement in the literal sense, that is, it does not reveal a preexisting value associated with the spin operator itself. In fact there is nothing the least bit mysterious or even nonclassical about the nonexistence of such values associated with operators. Thus the widespread idea that in a realistic quantum theory all quantum observables should possess actual values, which is in fact impossible by the Kochen-Specker theorem, was from the outset not as reasonable as it may have appeared but rather was based on taking operators as observables too seriously—an attitude, almost implicit in the word “observable,” that can be called “naïve realism about operators.”

Another consequence concerns *contextuality*, the notion that the result of an experiment depends not just on “what observable the experiment measures” but on more detailed information that conveys the “context” of the experiment. Contextuality is often regarded as deep, mysterious, and even close to Bohr’s complementarity. However in Bohmian mechanics it boils down to the trivial insight that the result of an experiment depends on the experiment.

COLLAPSE OF THE WAVE FUNCTION

According to the quantum formalism, performing an ideal quantum measurement on a quantum system causes a random jump or “collapse” of its wave function into an eigenstate of the observable measured. But while in orthodox quantum theory the collapse is merely superimposed upon the unitary evolution of the wave function, without a precise specification of the circumstances under which it may legitimately be invoked—and this ambiguity is nothing but another facet of the measurement problem—Bohmian mechanics consistently embodies both the unitarity evolution and the collapse of the wave function as appropriate. Concerning the evolution of the wave function Bohmian mechanics is indeed formulated in terms of Schrödinger’s equation alone. However, since observation implies interaction, a system under observation cannot be a closed system but rather must be a subsystem of a larger system that is closed, for example, the entire universe. And there is no reason a priori why a subsystem of a Bohmian universe should itself

be a Bohmian system, even if the subsystem happens to be “closed.” Indeed, it is not even clear a priori what should be meant by the wave function of a subsystem of a Bohmian universe.

The configuration Q of this larger system, this universe, naturally splits into X , the configuration of the subsystem, and Y , the configuration of its environment. Suppose the universe has wave function $\Psi = \Psi(q) = \Psi(x, y)$. According to Bohmian mechanics, this universe is then completely described by Ψ , evolving according to Schrödinger’s equation, together with X and Y . Thus there is a rather obvious choice for what should be regarded as the wave function of the subsystem, namely the *conditional wave function* $\psi(x) = \Psi(x, Y)$, obtained by plugging the actual configuration of the environment into the wave function of the universe. Moreover, taking into account the way that the conditional wave function $\psi_t(x) = \Psi_t(x, Y(t))$ depends upon time, it is not difficult to see that it obeys Schrödinger’s equation for the subsystem when that system is suitably decoupled from its environment and, using the quantum equilibrium hypothesis, that it randomly collapses according to the usual quantum mechanical rules under precisely those conditions on the interaction between the subsystem and its environment that define an ideal quantum measurement.

UNCERTAINTY

It follows from the quantum equilibrium hypothesis and the definition of the conditional wave function that when the (conditional) wave function of a subsystem is ψ , its configuration must be random, with distribution $|\psi(x)|^2$, even if its full microscopic environment Y —itself grossly more than what we could conceivably have access to—were taken into account. In other words, the (conditional) wave function ψ of a subsystem represents maximal information about its configuration X . Thus, in a universe governed by Bohmian mechanics there are sharp, precise, and irreducible limitations on the possibility of obtaining knowledge, limitations which can in no way be diminished through technological progress leading to better means of measurement. This *absolute uncertainty* is in precise agreement with Heisenberg’s uncertainty principle. The fact that knowledge of the configuration of a system must be mediated by its (conditional) wave function may partially account, from a Bohmian perspective, for how orthodox physicists could identify the state of a quantum system—its complete description—with its (collapsed) wave function without encountering any practical difficulties.

OBJECTIONS

A great many objections have been and continue to be raised against Bohmian mechanics. Most of these objections have little or no merit. The most serious is that Bohmian mechanics does not account for phenomena such as pair creation and annihilation characteristic of quantum field theory. However this is not an objection to Bohmian mechanics per se but merely a recognition that quantum field theory explains a great deal more than does nonrelativistic quantum mechanics, whether in orthodox or Bohmian form. It does however underline the need to find an adequate, if not compelling, Bohmian version of quantum field theory, and of gauge theories in particular, a problem that is pretty much wide open.

A related objection is that Bohmian mechanics cannot be made Lorentz invariant, by which it is presumably meant that no Bohmian theory—no theory that could be regarded somehow as a natural extension of Bohmian mechanics—can be found that is Lorentz invariant. The main reason for this belief is the manifest nonlocality of Bohmian mechanics. But nonlocality, as John Bell has argued and the experiments have shown, is a fact of nature. Moreover, concerning the widespread belief that standard quantum theories have no difficulty incorporating relativity while Bohmian mechanics does, there is much less here than meets the eye. On the one hand, one should keep in mind that the empirical import of orthodox quantum mechanics relies on both the unitary evolution of the state vector (or the equivalent unitary evolution of the operators in the Heisenberg representation) and the collapse or reduction of the state vector (or any other equivalent device that incorporates the effect of observation or measurement). But the Lorentz invariance of this part of the theory has rarely been considered in a serious way—most of the empirical import of standard relativistic quantum mechanics is in the so-called “scattering regime.” But if this were done, arguably, the tension between Lorentz invariance and quantum nonlocality would soon become manifest. On the other hand, a variety of approaches to the construction of a Lorentz invariant Bohmian theory have in fact been proposed, and some toy models formulated.

WHAT IS A BOHMIAN THEORY?

Finding a satisfactory relativistic version of Bohmian mechanics and extending Bohmian mechanics to quantum field theory are topics of ongoing research and we shall not attempt to give an overview here. (Some remarks, however, are given in the next section.) Rather we shall briefly sketch what we consider to be the general

traits of any theory that could be regarded as a natural extension of Bohmian mechanics. Three requirements seem essential to us: 1. The theory should be based upon a clear ontology, the *primitive ontology* representing what the theory is fundamentally about—the basic kinds of entities (such as the particles in Bohmian mechanics) that are to be the building blocks of everything else, including tables, chairs, and measurement apparatuses. 2. There should be a quantum state vector, a wave function, that evolves according to the unitary quantum evolution and whose role is to somehow generate the motion for the variables describing the primitive ontology. 3. The predictions should agree (at least approximately) with those of orthodox quantum theory—at least to the extent that the latter are unambiguous. Note that we do not regard as essential either the deterministic character of the dynamics of the primitive ontology or that the latter should be given by particles described by their positions in physical three-dimensional space—a field ontology, or a string ontology would do just as well.

In short a “Bohmian theory” is merely a quantum theory with a coherent ontology. But when the theory is regarded in these very general terms, an interesting philosophical lesson emerges: In the structure of a Bohmian theory one can recognize some general features that are indeed common to all “quantum theories without observers,” that is, to all precise formulations of quantum theory not based on such vague and imprecise notions as “measurement” or “observer”—such as Ghirardi-Rimini-Weber-Pearle’s “dynamical reduction” models or Gell-Mann and Hartle’s “decoherent histories” approach. One essential feature is the primitive ontology of the theory—what the theory is fundamentally about. The other very general and crucial feature is the sort of explanation of physical phenomena the theory should provide: an *explanation based on typicality*. Not just for a Bohmian theory, but for any physical theory with probabilistic content, the physical import of the theory must arise from its provision of a notion of typical space-time histories, specified for example via a probability distribution on the set of all possible histories of the primitive ontology of the theory.

HISTORY AND PRESENT STATUS

In 1951 Bohm rediscovered de Broglie’s 1927 pilot-wave model and showed that the quantum measurement formalism, based on non-commuting operators as observables, emerged from the basic principles of de Broglie’s theory. Since then Bohmian mechanics has been developed and refined: Noteworthy are Bell’s clarification of the axioms of the theory and the analysis of the status of

probability and the role of typicality (Bell 1987; Dürr, Goldstein, and Zanghì 1992), as well as the investigations of quantum non-equilibrium (Valentini 2002). Several ways of extending Bohmian mechanics to quantum field theory have been proposed. One (Bohm 1952) for bosons (i.e., force fields) is based on an actual field configuration on physical three-dimensional space that is guided by a wave functional according to an infinite-dimensional analogue of the guiding equation (see also Bohm and Hiley 1993; Holland 1993). Another proposal (Dürr, Goldstein, Tumulka, and Zanghì 2004) relies on seminal work by Bell (1987 p. 173) and ascribes trajectories to the electrons or whatever sort of particles the quantum field theory is about; however, in contrast to the original Bohmian mechanics, this proposal involves a stochastic dynamics, according to which particles can be created and annihilated.

BOHR, NIELS

(1885–1962)

Quantum physics is often credited with far-reaching metaphysical and epistemological implications, including the denial of causality and determinism and the existence of strict limits on what can be known about natural systems. One of the main figures whose work has been used—and often misused—in support of such conclusions is the Danish physicist Niels Bohr. Bohr is rightfully viewed as one of the major figures in the history of quantum physics and is widely known both for his extraordinary contributions to the development of quantum theory and for his philosophically oriented work, which focused on the task of interpreting the quantum mechanics. Bohr's interpretation centers on his notion of complementarity, which he developed in 1927, two years after the development of quantum mechanics by Heisenberg, Born, Jordan, and Schrödinger and shortly after the publication of Heisenberg's famous uncertainty paper.

Bohr's interpretive approach attracted many followers but also many critics. Most notable among the latter was Einstein, whose public critique of quantum mechanics and Bohr's interpretation began in 1927 and culminated with his 1935 "EPR" paper, written with Podolsky and Rosen. Bohr's response to Einstein's criticisms, and part of his general interpretive approach, was that quantum mechanics is a complete theory the statistical indeterminacies of which neither need be nor could be overcome with a more foundational theory.

While Bohr is most philosophical after the introduction of complementarity, the overarching theme of much of his earlier work was also associated with certain clear philosophical ideas about the nature of physical theories and the appropriate method for developing a theory in a new realm, and complementarity can be seen as an application of these ideas to the new quantum mechanical formalism.

QUANTUM THEORY

Bohr's famous 1913 model of the hydrogen atom, with which he explained the hydrogen spectrum, marks the beginning of the quantum theory of the atom. Because classical electrodynamics had dictated that the oscillation of electrons is accompanied by the emission of electromagnetic radiation, the theory could account neither for the stability of the atom nor for the discreteness of the spectrum of frequencies emitted by excited hydrogen gas. Bohr's model solved this puzzle by suggesting that the electron orbits the nucleus in stable stationary states and

that the emission of radiation occurs not during that orbit but rather in sudden transitions between the states; the radiation carries the difference in energy between the states according to a quantum frequency rule (based on work by Planck and Einstein) that correlates energy with frequency. Bohr eventually presented the rationale for his model in terms of the quantization of angular momentum, and that is how it is often presented in texts. However, Bohr's original rationale, and arguably the one closest to his actual approach to physics in the years afterwards, is that he read the existence of independent stationary states off the Balmer formula of the hydrogen spectrum by interpreting the spectrum with the quantum-frequency rule. That is, the discrete stationary states were not hypothesized but rather were inferred from an empirical generalization.

THE CORRESPONDENCE PRINCIPLE

Bohr eventually expanded this general approach of inferring atomic properties from empirical generalizations or phenomena with the development of his correspondence principle. The principle, first implicitly used in a general form in 1918 and named as a specific principle by Bohr in 1920, is a claim about the relationship between classical and quantum theory, and in particular about classical descriptions of empirical evidence and quantum models of the atom. As Bohr sometimes stated it—the way in which it is most often quoted—the new quantum theory ought to recapture classical electrodynamics in some limit—that is, the old theory ought to be shown to be an approximation that in retrospect is roughly accurate in the realms where quantum effects are negligible. In the hydrogen atom, according to Bohr's principle, that will occur when the quantum number is high, where the difference in energy between stationary states becomes small in comparison with the energies of the states themselves.

While it is tempting to understand the correspondence principle as a requirement for the rationality of the progression of theories, that is at best only one aspect of Bohr's approach with the principle. For Bohr, the correspondence principle was an intratheory claim, not an intertheory one, and it was important because the developing quantum theory had no account of the relation between the motions of the electrons within their orbits and the empirical phenomena of the atomic spectra, whereas classical theory had had such an account. Bohr consistently insisted that we need a stable description of observations from which we can infer atomic properties, and he emphasized that generalizations about atomic spectra—about the frequencies of radiation emitted or

absorbed by atoms—are essentially claims about wave phenomena, because measurements of radiation frequencies with spectroscopy equipment unavoidably assume wave theory. Thus, even though the quantum theory might seem to call into question the wave nature of electromagnetic radiation (at least according to the light-quantum concept implied by the photoelectric effect, and later by the Compton effect), scientists still must use wave electrodynamics to provide evidence about atomic properties, so a link or coordination between the theories is needed.

The agreement in the limit between the theories was therefore not the goal of the correspondence principle but only a means of allowing the linkage of claims within the new theory. In particular, it let Bohr relate periodic motion within the atom to periodic aspects of the radiation in the spectrum. This principle both gave empirical content to parts of the model that previously had had none and allowed the inference of properties of certain atomic processes—for example, selection rules for quantum transitions—for which there was no other method of determination. For Bohr the principle was a way to relate observable, empirical phenomena with the quantum mechanisms (such as they were) “behind” the empirical phenomena.

Two related aspects of the correspondence principle were very important for Bohr's work after the development of quantum mechanics. First, although Bohr had been able to apply it only imprecisely and often only qualitatively, it inspired Heisenberg's approach in developing what was to become quantum mechanics, and Bohr claimed that quantum mechanics embodied the correspondence principle. Second, the general approach of incorporating independent, classically based descriptions of empirical phenomena within quantum theory became the foundation for his own interpretation of that quantum mechanics.

COMPLEMENTARITY AND THE INTERPRETATION OF QUANTUM MECHANICS

Bohr's interpretation is notoriously difficult to pin down, but the core ideas are that our descriptions of the properties of quantum systems must be based on classical concepts, that these concepts are restricted in scope to a particular experimental context, that different concepts are appropriate for different contexts, that the different contexts make the use of certain pairs of mutually exclusive concepts, and that those concepts do not fully capture the nature of quantum systems. Bohr used the word

“complementarity” to describe this complex of ideas that together were meant to address interpretive problems posed by quantum mechanics.

Quantum mechanics, especially in Heisenberg’s formulation, had retained some aspects of the old quantum theory but had abandoned the definite electron orbits of that theory and had substituted abstract, formal methods for calculating “observable” properties. Heisenberg’s uncertainty paper had given a further argument for thinking in these terms by deriving equations that described a reciprocal relationship between the precisions with which certain pairs of properties (for example, position and momentum) could be measured. Although there is some indication in Heisenberg’s paper that he might have thought of the tradeoffs in precision in terms of disturbance (every measurement of one property disturbs a specific other one in a way that prevents us from knowing simultaneously both properties to arbitrary precision), Bohr associated the uncertainty relations with his notion of complementarity and claimed that the uncertainty or indeterminacy described by the relations reflect not merely a lack of knowledge of the values of metaphysically definite properties of a system, but rather a degree to which our concepts just do not and cannot be made to apply to the system. Complementarity claims that, although we cannot simultaneously give both normal space-time and causal descriptions of the same quantum phenomenon and although neither description fully captures the nature of the phenomenon, we nevertheless have no other way to describe phenomena besides through these causal and spatiotemporal pictures.

Although Bohr’s philosophy is sometimes called the Copenhagen interpretation, there are important distinctions between Bohr’s actual views and what is often meant by that name. The name is sometimes used to describe what might better be called the standard interpretation, which is perhaps inspired by Bohr but is really based on von Neumann’s work and includes the collapse of the wave packet, which had no part in Bohr’s philosophy. Otherwise, it is used to describe a set of views held by Bohr and a number of his former students and associates from Copenhagen, especially Heisenberg and Pauli, but there are disputes regarding how much their views really had in common.

Central to Bohr’s interpretation is a sort of holism that we can now understand in terms of entanglement. This holism is clear in Bohr’s work starting in 1929 and certainly by 1935. Bohr then explicitly states that it is misleading to think that observation disturbs properties because that would imply the existence of preexisting

complete sets of properties. Bohr emphasized that the novel and interpretively challenging aspect of quantum effects is not the discreteness of, say, the exchange of energy but rather the apparent mathematical and theoretical fact that quantum mechanical processes generally cannot be broken down in a way that allows us accurately to describe them in terms of an interaction between component systems such as a measuring instrument and a measured system. In order to describe or analyze an experiment, scientists nevertheless must treat measurement in this way, and the consequence is that descriptions of measured properties of subsystems of a larger whole system at best misconstrue the true quantum mechanical state or phenomenon. And it is precisely in this misconstrual that the statistical nature of quantum mechanical predictions arise.

Though not all interpreters of Bohr agree, this explicit emphasis in his later work did not represent a drastic change in his interpretation. Indeed, it is plausible to argue that complementarity is and was always for Bohr a conclusion based on his correspondence approach and the discovery of noncommutativity and the holism of entanglement. Bohr thought that although one can give an abstract mathematical representation of a quantum mechanical system independent of classical conceptualizations of the phenomena, the symbols used to represent quantum properties have empirical meaning only when they can be associated or put into correspondence with observable phenomena. Doing this requires first establishing independent theoretical descriptions of the observations, and for this it is necessary to use classical concepts to describe the measurement context. Complementarity is, then, an expression of the limitations that noncommutativity places on the degree to which different quantum symbols can be given empirical meaning.

Although Bohr was a realist about the entities described by quantum mechanics and he seems to have believed that quantum mechanics does describe the true nature of quantum-mechanical systems, the foregoing features of his work suggest certain antirealist aspects to his interpretation, especially with respect to the way the meaning and applicability of our concepts about quantum properties depend somehow on the context in which those properties are measured.

This tension is evident in Bohr’s response to the EPR paper. That paper questioned the completeness of quantum mechanics precisely on the grounds of the quantum relations of entangled systems; EPR claimed that the ability to predict the properties of one of an entangled pair of particles after the measurement of the other, over dis-

tances and within times that preclude a causal interaction on relativistic grounds, indicates that quantum mechanics must assume that the prediction concerns a real, pre-existing property that is independent of the other measurement. Bohr's response does not explicitly deny realism but says that any descriptive account of quantum reality is good only within the conditions of applicability of the concepts used in measurement and prediction and that the effect on the distant particle is not a causal, physical one but rather an effect on those conditions; this suggests, perhaps, that disentanglement is only conceptual.

Although in later years Bohr began to discuss complementarity in increasingly broad terms and as applied to other fields, especially biology, it is his philosophical work closest to physics that has had the greatest impact in both philosophy and physics. In the early twenty-first century theorems about the impossibility of certain kinds of hidden variable theories can be seen as a vindication of many of the intuitions in that work, intuitions that remain evident in the pragmatic approach to quantum mechanics assumed by many working physicists.

BOILEAU, NICOLAS (1636–1711)

Nicolas Boileau, also known as Boileau-Despréaux, has retrospectively been raised to the rank of emblematic figure of French classicism. He has been described as the "lawgiver of Parnassus" (a reference to his being an arbiter of taste), the champion of poetic rationalism, and a chief apologist for the ancients in their quarrel with the moderns. At the beginning of the twenty-first century, specialists of the era consider the truth about Boileau to be more nuanced. Boileau was first and foremost a poet engaged in the literary life of his time. After having written his *Satires*, a vigorous denunciation of the faults and mistakes commonly made in the literary world of his days, he attempted, in his *Art poétique* (1674), to determine the rules that should govern the creation and reception of art in most literary genres.

Published during the same year, his translation of Longinus's *Peri hypsous* (*On the Sublime*, first cent.) contributed to popularizing this work all over Europe. In 1677 he became, along with Jean Racine, the historiographer of Louis XIV. This noticeably slowed down his literary production. From 1687 on, as defender of the

ancients, he was Charles Perrault's main adversary in the first of two disputes between the ancients and the moderns that divided the field of classical aesthetics in France. His nine *Réflexions critiques sur quelques passages du rhéteur Longin* (Critical reflections on several passages of the orator Longinus; 1694) are explicit arguments in favor of the advocates of the ancients.

Boileau's position was not simply the result of a general nostalgic or conservative attitude, but rather followed from his very strict conception of literature. His aim is to look at the ancients' masterworks in order to find examples of perfection to stimulate the creativity and imagination of contemporaries, and models to provide the distance necessary to avoid the relativist pitfalls, not to mention the conceit, that threatened modernist partisans. According to Boileau, the criterion by which one can attest to the merit of the great artworks of the past is that they have passed the test of time. Far from being an illegitimate prejudice, imitation of the ancients is the source of the true rules of art, which reason can use as its guide.

Two aspects of Boileau's thought are of interest to the historian of philosophical aesthetics. First, there is his formulation of classical doctrine, of which *Art poétique* provides a synthesis. Far from displaying the merely theoretical attitude of an arbiter, Boileau reflects the aesthetic consensus obtained during the decades from 1630 to 1670 on the basis of a precarious balance between reason and sentiment, freedom and norms. Second, there is his clarification of the role of the sublime in poetry. In discussing the sublime, Boileau tried to cast light on the causes of the legitimate and enduring admiration we have for authors of merit, whether ancient or modern.

Art poétique, where Boileau provided a synthesis of classical doctrine, explicitly draws from the tradition inherited from Aristotle and Horace. It is divided into four cantos written in verse. The first canto gives authors general advice on poetry. The second canto deals with minor genres: the eclogue, sonnet, ode, satire, elegy, epigram, and the like. The third canto tackles major genres: tragedy, comedy, and epic. The fourth canto gives rules for writing, insisting on the edifying function of poetry, on the writer's disinterestedness, and on the need for the writer to surround himself with friends whose sound judgment will help him improve himself.

In the course of the four cantos, Boileau simply reaffirmed, without ever analyzing, all the principles of classical aesthetics. If genius, as a natural gift, is necessary to write poetry, only art, polishing of the work under the guidance of reason and judgment, can lead to perfection. Thus, although it is not a source of inspiration, the light

of reason must nonetheless accompany the conception of thoughts, their arrangement, and their expression. As far as tragedy is concerned, Boileau reinforced the classical interpretation of the Aristotelian theory held by his contemporaries. Tragic art was said to provide an idealizing imitation of the terrifying in which pain is transformed into pleasure. The purpose of tragedy is to please and move the spectator by producing a "pleasant terror" and a "delightful pity." To produce such effects, however, reason must be respected.

Thus Boileau advocated absolute respect for the three unities of action, time, and place, even though Aristotle confined himself to the unity of action. Also, the representation ought to be submitted to the principle of *verisimilitude*, since what is historically true but not credible will not produce any emotion in the spectator. Verisimilitude also requires the writer to respect the rules of propriety (Horace's decorum), whether from an external point of view (agreement between the represented action and the public's expectations and customs) or from an internal one (internal coherence among characters and the language ascribed to them).

For Boileau, the sublime constitutes the supreme perfection of poetic discourse. He saw a nonrhetorical conception of the sublime at work in Longinus's treatise, one that makes possible the distinction between the really sublime (what "strikes us in a discourse, elevates, ravishes and transports us" (*On the Sublime*, first cent) and the sublime *style* (the lofty style that traditional rhetoric thought best adapted to the expression of noble ideas). The sublime can thus be found in a single thought or turn of phrase, an excellent example being God's command "Let there be light," in Genesis. The sublime reconciles grandeur and conciseness in accordance with the demands of simplicity and naturalness imposed by the aesthetics of classicism.

In his last three reflections on Longinus, published posthumously in 1713, Boileau added that the perfectly sublime—that which has the property of elevating the soul and making us participate in the greatness that we perceive—unites the grandeur of the thought with the nobility of the sentiment driving the person expressing it, the splendor of the words, and the harmony of the expression. The sublime is, paradoxically, the summit of Boileau's aesthetics. On the one hand, the "energetic littleness of the words" (*Réflexions* X) manifests the sublime in the density of meaning sought by classicism. On the other hand, favoring the sublime introduces tension in a system of thought governed by the ideal of reason and clarity. The significant role of the sublime sufficiently demon-

strates that classicism, far from being a sterile formalism, is in fact a constantly renewed demand for equilibrium between judgment and inspiration, lucidity and emotion, conciseness and grandeur.

BOLINGBROKE, HENRY ST. JOHN

(1678–1751)

Henry St. John Bolingbroke, the English Tory statesman, orator, man of letters, friend of the Augustan wits, libertine, and deist, was born at Battersea, the son of Sir Henry St. John and Lady Mary Rich, daughter of the second earl of Warwick. After early schooling by his paternal grandmother, he was educated at Eton and, putatively, at Christ Church, Oxford, for in 1702 he was made an honorary doctor of Oxford. He had made the customary dissipated grand tour, 1698–1699, but he also mastered several languages and studied the history and customs of the lands he visited. In 1701 he became M.P. for the family borough of Wootton Bassett in Wiltshire. His eloquence and brilliance soon made him a leader of the Tory party. With the help of Robert Harley, he became secretary at war in 1704, but resigned in protest over the dismissal of Harley in 1708. The growing unpopularity of the "Whiggish" War of the Spanish Succession brought Harley back into power in 1710, and Bolingbroke joined the new Tory ministry as secretary of state. Two years later he was created Viscount Bolingbroke and was one of the negotiators of the Treaty of Utrecht signed in 1713. Following the accession of George I in 1714, Bolingbroke and the other

Tory ministers were dismissed from office. In 1715 he fled to France to take political asylum for alleged Jacobitism. In 1723 he was pardoned, and he spent the remainder of his life living variously in England and in France.

WORKS

Some of Bolingbroke's political writings appeared in the Tory periodical the *Craftsman* between 1726 and 1736; but most others, including the philosophical, were published posthumously in 1754 by David Mallet in an edition of five quarto volumes. This publication elicited Dr. Johnson's famous attack on this "blunderbuss against religion and morality." David Hume's reaction is less well known but more pertinent:

Lord Bolingbroke's posthumous Productions have at last convinc'd the whole World, that he ow'd his Character chiefly to his being a man of Quality, & to the Prevalence of Faction. Never were so many Volumes, containing so little Variety & Instruction: so much Arrogance & Declamation. The Clergy are all enrag'd against him; but they have no Reason. Were they never attack'd by more forcible Weapons than his, they might for ever keep Possession of their Authority.

POLITICAL AND HISTORICAL WORKS. Bolingbroke's contributions to the *Craftsman* exhibit much vigorous political writing, including *Remarks on the History of England* and *Dissertation on Parties*. Other tracts, political and historical, are *On the True Use of Retirement and Study*, *On the Spirit of Patriotism*, and *Letters on the Study and Use of History*, the last of which made famous the maxim, "History is philosophy teaching by examples." *The Idea of a Patriot King* also became famous because of its use in the education of the future George III. Matthew Arnold was to lament that Bolingbroke's historical writings were unduly neglected. Unfortunately, the neglect of his philosophical writings is less to be regretted.

PHILOSOPHICAL WRITINGS. Bolingbroke made much of the antithesis between nature and art; that is, the alleged superiority of a pure state of nature over the evils of civil society. Edmund Burke, who wrote his *Vindication of Natural Society* (1756) as an imitation of Bolingbroke's style and as an ironic refutation of this antithesis, asked rhetorically in *Reflections on the Revolution in France* (1790): "Who now reads Bolingbroke? Who ever read him through?" The long-held myth of Voltaire's great indebtedness to Bolingbroke has been completely disproved by N. L. Torrey. A similar claim of Alexander

Pope's great indebtedness has been vigorously challenged by Maynard Mack, who presents evidence that Bolingbroke's *Fragments or Minutes of Essays* were composed later than the *Essay on Man*. There is, however, no question that Pope discussed many matters with his "Guide, Philosopher, and Friend." With the single exception of Peter Annet, Bolingbroke was the last of the distinguished group of English deists beginning with Lord Herbert of Cherbury; but he proves somewhat of a disappointment to students of the history of ideas. Scrappy and unsystematic in his presentations, he is replete with contradictions. Despite recent attempts, especially by D. G. James and W. McMerrill, to take Bolingbroke's philosophy more seriously than has been customary, candor demands the conclusion that, although his style is more eloquent than that of most other deists, he contributed little or nothing original to the movement. This is not, however, to accuse him of plagiarism; for his ideas were part and parcel of the Augustan climate of opinion.

Despite frequent use of the name of John Locke (a device used by many deists), Bolingbroke was an unmitigated but curiously inconsistent rationalist. At one moment he asserts that the existence of Deity can and must be proved empirically, and at the next he asserts that only Right Reason can demonstrate the existence of Deity. He wrote *Reflections concerning Innate Moral Principles* to prove that compassion or benevolence is founded on reason alone. Unlike many of the deists, he was a metaphysical optimist, explaining away the evils of the universe and arguing that it is for man the best of all possible worlds despite the sufferings of individuals. He did not, however, believe that immortality and a future state of rewards and punishments can be proved by reason; and, although he accepted God as spirit, he was a materialist insofar as man is concerned.

He believed that there is no separation between soul and body and that at death man is annihilated; even in life, there is no communication between divine spirit and human matter.

Bolingbroke's concept of Natural Religion was essentially the same as the Common Notions of Lord Herbert of Cherbury. Yet with all his insistence on a priori reason, he lamented time and again that reason is fallible and must be corrected by a return to the primitive religions, particularly those of China and Egypt. Like all the deists, he was contemptuous of priestcraft and, despite his rationalism, of metaphysics. His criticism of Christian revelation is much like Matthew Tindal's, and the insinuation is that any revelation that is not universal is unnecessary.

In sum, Bolingbroke was more the orator than the philosopher. There is, however, considerable truth in his statement that "There is no reason . . . to banish eloquence out of philosophy; and truth and reason are no enemies to the purity, nor to the ornaments of language." He considered Plato, Nicolas Malebranche, and George Berkeley as poets, not philosophers, and his own best defense is the eloquence he admired.

BOLTZMANN, LUDWIG

(1844–1906)

Ludwig Boltzmann was born in Vienna, where he received his education. Boltzmann's major contribution to physics and, indirectly, to philosophy, was his profound work in the theory that grounded the phenomenological theory of heat, temperature, and the transformations of internal energy at the macroscopic level—that is to say thermodynamics—in the theoretical description of the underlying mechanical behavior of the basic constituents of a system, such as the molecules of a gas. Boltzmann also contributed directly to the ongoing philosophical discussions about the nature of scientific theories as a member of the group of outstanding physicist-philosophers concerned with such issues in the latter half of the nineteenth century, a group including Pierre Duhem, Ernst Mach, Wilhelm Ostwald, and Heinrich Hertz. During his career he held chairs at Graz, Munich, and Vienna.

After a long career as distinguished researcher and teacher whose influence through popularizing works extended beyond the narrow confines of academic scientists, Boltzmann tragically fell into a terminal depression ending in his suicide.

PHILOSOPHY OF SCIENCE

It would probably be a mistake to seek for a single, coherent, and fully developed account of the nature of scientific theories in Boltzmann's work. One must extract his views from a large number of short discussions, marginal remarks, and views expressed in correspondence with his colleagues. Nonetheless, certain themes are constant and clear and one can gain some understanding of what Boltzmann was after when one considers the scientific and philosophical context in which his remarks on the nature of theories were made.

Boltzmann's central scientific work posits that a macroscopic piece of matter, such as the volume of gas in a box, is composed of innumerable components—the molecules of the gas—too small to be observed in any direct manner. Following a long development from John Bernoulli, John Herpath, John Waterston, August Krönig, and Rudolf Clausius, and working in parallel with James Clerk Maxwell, Boltzmann developed the kinetic theory of heat in which the dynamics of molecules moving more or less independently of one another—except for collisions and short-range interactions with one another and with the walls of a confining box—was

used to explain the well-known laws of macroscopic thermodynamics.

It is important to understand just how indirect the evidence was for the genuine existence of molecules at this time. Their existence had been hypothesized in a resurrection of ancient atomic theory by chemists such as John Dalton to explain the combining laws of weight and volume in chemistry. The partial success of kinetic theory also provided indirect evidence of their existence. But the kinds of rich and more direct evidence available now for this particulate view of matter was then nonexistent.

A kind of radical empiricism was popular among the physicist-philosophers with whom Boltzmann associated. Duhem, Mach, and Ostwald shared the view that the aim of science was the production of simple and elegant lawlike regularities among the observable features of matter. They also shared deep skepticism toward any science that hypothesized unobservable entities as real explanatory components of the world. This skepticism included a negative attitude toward any theory positing “unobservable” molecules or atoms. Naturally such a position would be uncongenial to Boltzmann.

Boltzmann sought a view about theories that would legitimate inference to the existence of molecules, but that would not fall prey to empiricist skepticism about any scientific belief that rests upon “mere hypothesis” and that leaps beyond the observable features of the world to the postulation of unobservable entities and properties. Boltzmann's position seems close to that adopted by Hertz.

Theoretical beliefs do, indeed, rest upon hypotheses. New concepts for describing the world arise out of the scientist's imagination and are not all presented to one's direct sensory experience. There is no certainty in theoretical beliefs; they are certainly not derivable by any a priori reasoning, nor can they be established by “induction” from experience. They are hypotheses, guesses, invoked by humans to explain the observable phenomena. Such explanations consist in deductions of the observable phenomena from the hypothesized theory.

Only theories built on such hypotheses and invoking the unobservable will provide truly useful explanations in science. There is no hope of reconstructing science as a set of regularities that range only over the directly observable features of the world. But one must always remember that such hypothesized theories are merely pictures (*Bilder*) constructed by humans to fit the observable order into a coherent, deductive scheme. And one must always contemplate the possibility that alternative

schemes—alternative pictures—may be available. These may present a different picture of the unobservable world, but insofar as they are as empirically adequate as the theories people have adopted, they are equally satisfactory from a scientific point of view.

That the deepest theories rest upon idealization is another reason—in addition to the belief in these theories resting only upon hypothesis—for Boltzmann to retreat from a fully realist position with regard to fundamental physical theories.

Boltzmann's views may perhaps be best understood as a kind of instrumentalism and pragmatism with regard to theories, but with the insistence that physics could not do without such hypothesized theories in its attempts to account for the observable data. Although people must be wary of taking theoretical inferences too realistically, they must not put any of their hopes in a reconstructed physics that eschews the use of concepts and laws invoking the unobservable altogether.

THEORETICAL PHYSICS

Boltzmann's great contribution to physics was in kinetic theory and the beginnings of what later was called statistical mechanics. Here his work paralleled that of Maxwell. The two great scientists often came up with similar results independently, but each also found great inspiration in the work of the other.

Maxwell had found a velocity distribution for the molecules of a gas at equilibrium by a curious argument that utilized results from the theory of errors. Boltzmann generalized this distribution to allow for external forces acting on the molecules. In studying the problem of approach to equilibrium, Maxwell derived his so-called “transfer equations.” Independently Boltzmann derived his kinetic equation of how the velocity distribution changes with molecular collisions, the famous Boltzmann Equation.

It was easy to show that the Maxwell-Boltzmann equilibrium distribution would be a stationary solution of this equation, hence appropriate for equilibrium that is an unchanging thermodynamic state. To show that this was the only possible such state, Boltzmann invented a quantity “*H*” as a function of the distribution. He showed that according to his equation this quantity must decrease unless the distribution is the standard equilibrium distribution. Hence the standard distribution is the only one possible for equilibrium.

Boltzmann developed a new method of thinking about the equilibrium as well. Divide a space in which

points represent the position and momentum of a single molecule into boxes macroscopically small but in which one expects to find many molecular states. Boltzmann considered all of the ways in which molecules could be permuted among these boxes. He then showed that the combination (number of molecules in specific boxes) corresponding to the largest number of possible ways of permuting the molecules among the boxes (subject to conservation of total energy of the molecules) was that corresponding to the standard equilibrium distribution. One could then think of the numbers of permutations corresponding to a combination as the “probability” of that combination and argue that equilibrium was the overwhelmingly most probable state of the gas. And one could identify thermodynamic entropy as a measure of such probabilities.

Considerations of these results by Maxwell, Boltzmann, and such critics as Samuel Burbury, Edward Culverwell, and later Ernst Zermelo, led Boltzmann to a long process of reinterpretation of his work. Maxwell, considering the possibilities of mechanisms that would molecule-by-molecule subvert the approach to equilibrium (Maxwell's Demon) spoke of the kinetic equation as only describing probable changes in the gas. Considerations of the dynamical reversibility of the system at the molecular level, and of recurrence results for dynamical systems discovered by Henri Poincaré, also forced Boltzmann to modify the initial view of the equation as describing the inevitable behavior of a system.

Reflection revealed that in deriving his equation Boltzmann had used a time-asymmetric hypothesis about the numbers of collisions of molecules of specified kinds that would occur over a given time interval (the *Stosszahlansatz*). Both Maxwell and Boltzmann began to frequently invoke probabilistic language in their interpretations of their results. What were such “probabilities”? Boltzmann expressed the view that whereas Maxwell thought of them as frequencies with which states would occur in a large collection of similarly prepared systems, he, Boltzmann, thought of them as frequencies with which states would occur over long periods of time for an individual system.

Maxwell and Boltzmann also discovered another approach to calculating equilibrium values, in which these values could be calculated as average values of functions of the microscopic dynamical state of the system in question, where one used (1) a collection of all possible such microscopic states compatible with the macroscopic constraints, and (2) an easily discovered probability distribution over these states, to calculate the mean values.

Both Maxwell and Boltzmann introduced dynamical postulates (the Ergodic Hypotheses) to justify this method. The nature of this justification was made much clearer later by the work of Paul and Tatiana Ehrenfest. Although one can show the Ergodic Hypothesis in its Ehrenfest version false, this work led to later, sounder formulations of this approach by means of correct ergodic theorems and important work on the specific dynamics of idealized molecular systems.

Boltzmann, pushed by insightful criticism, realized that invoking probability by itself would not solve all his interpretive problems. His kinetic equation was time asymmetric, but the underlying dynamics was time symmetric. Because for each molecular motion going from nonequilibrium to equilibrium there was one going from equilibrium to nonequilibrium, it was hard to see how one could argue that the equation even characterized “most probable” evolutions of systems. (Although there are current interpretations of the Boltzmann equation that revert to this way of thinking.)

Boltzmann’s later interpretation of the whole scheme resorted to cosmological considerations. One thinks of probabilities of states as given by Boltzmann’s method. Equilibrium is then the overwhelmingly most probable state. Why is the world in nonequilibrium then? Boltzmann’s assistant Dr. Schuetz suggested that maybe the cosmos is in equilibrium overall, but that humans live in a “small” part of it temporarily in a nonequilibrium fluctuational condition. Boltzmann added to this the “anthropic” argument that people must find themselves in such a region because equilibrium regions could not support life-forms. Finally Boltzmann added the argument that what is meant by the “future” direction of time is just the direction of time in which entropy is increasing in this local, nonequilibrium patch of the universe. He draws a deep analogy here with the fact that what people take as “down” is just the local spatial direction of the gravitational force. In equilibrium regions of the cosmos there would be two time directions, but neither could be thought of a “past” or as “future,” just as in gravitation-free regions there is no “up” and no “down.”

The Ehrenfests later provided a deep interpretation of the kinetic equation and its solutions consonant with this later Boltzmannian interpretation. The solutions to the equation describe neither the inevitable nor the most probable behavior of a system, but rather the “concentration curve” that describes the state of most of the systems of a collective of systems started in common nonequilib-

rium at any later moment of time. But at different times different members of the original collection are making up this majority that is approaching equilibrium.

BOLTZMANN’S CONTINUED INFLUENCE

Boltzmann’s methodological thoughts about theories remain provocative and worthy of reflection when one reflects now on the still problematic status of foundational physical theories. His introduction of probabilistic reasoning into physics was seminal. His work on kinetic theory and statistical mechanics is a rich source of problems for the philosopher of physics interested in probabilistic explanation in physics and in the relationship between phenomenological macroscopic theories and their microscopic, atomistic underpinnings. Boltzmann’s invocation of cosmology (still done in current theories of statistical mechanics but within an entirely different cosmological background) also opens up a wide range of important questions for methodologists concerned with how people can construct their fundamental physical explanations. And his views on the “direction of time” remain fundamental for anyone discussing the origin and nature of ideas of the asymmetric nature of past and future.

BOLZANO, BERNARD

(1781–1848)

Bernard Bolzano, a philosopher, theologian, logician, and mathematician, was born in Prague, where his father, an Italian art dealer, had settled; his mother was a German merchant's daughter. Bolzano studied mathematics, philosophy, and theology in Prague and defended his doctor's thesis in mathematics in 1804; he was ordained a Roman Catholic priest the following year. Shortly thereafter he was appointed to a temporary professorship in the science of religion at Karlova University in Prague and two years later was given a newly established chair in this field. Some time later he was accused of religious and political heresy and was removed from his teaching position in December 1819. Bolzano spent much of his time thereafter with the family of his friend and benefactor, A. Hoffmann, at their estate in southern Bohemia. He had difficulty getting his later publications through the Metternich censorship. Some of his books were put on the Index, and many appeared only posthumously. Some manuscripts are yet to be published; the most important of these are in the National Museum and the University Library in Prague, others are in the Österreichische Nationalbibliothek in Vienna. In December 1848, Bolzano died of a respiratory disease from which he had suffered for most of his life.

MATHEMATICS

Bolzano's mathematical teachings were not quite understood by his contemporaries, and most of his deep insights into the foundations of mathematical analysis long remained unrecognized. A famous theorem in the early stages of a modern presentation of the calculus is known as the Bolzano-Weierstrass theorem, but another masterful anticipation (by more than forty years) of Karl Theodor Wilhelm Weierstrass's discovery that there exist functions that are everywhere continuous but nowhere differentiable remained buried in manuscripts until the 1920s. But perhaps more important than Bolzano's actual discoveries of new theorems was the meticulousness with which he endeavored to lay new foundations for the *Größenlehre*, the science of quantity—which was how Bolzano, using a very broad interpretation of “quantity,” designated mathematics. In particular, his insistence that no appeal to any intuition of space and time should be acknowledged for this purpose and that only “purely analytical” methods were to be recognized put him in opposition to the then current Kantian ways of thinking and back into the Leibnizian tradition.

Bolzano's most famous posthumously published work is *Paradoxien des Unendlichen* (F. Prihonsky, ed., Leipzig, 1851; translated by D. A. Steele as *The Paradoxes of the Infinite*, London, 1950), in which he anticipated certain basic ideas of set theory, developed only a generation later by Georg Cantor, who fully acknowledged his indebtedness to Bolzano in this respect. This anticipation should, however, not be overrated. Bolzano was not quite able to rid himself of all the prejudices of his time and was, therefore, unable to reach a clear and fruitful conception of equivalence between infinite sets.

ETHICS AND PHILOSOPHY OF RELIGION

Bolzano was, in his time, much more influential as a theologian and social moralist than as a mathematician. An advocate of the Bohemian Catholic enlightenment, he lectured on religion and moral philosophy with strong pacifistic and socialistic overtones. He used the pulpit to proclaim before hundreds of impressed students a kind of utopian socialism. In his sermons he tried to prove the essential equality of all human beings, attacked private property obtained without work, and exhorted his listeners to sacrifice everything in their struggle for human rights. These sermons served him as a preparation for what he regarded as his most important book, *Von dem besten Staate*, which he finished in 1837 but was unable to publish. It first appeared in Prague in 1932.

Bolzano's philosophy of religion is presented in the books *Athanasia oder Gründe für die Unsterblichkeit der Seele* (Sulzbach, 1827) and *Lehrbuch der Religionswissenschaft* (4 vols., Sulzbach, 1834), the latter being a revised version of his lectures at the Prague university. He tried to prove that Catholicism is in full harmony with common sense. To this end he either disregarded or interpreted allegorically all mystical elements of Catholicism.

Bolzano derived his utilitarian ethics from a “highest ethical principle”: “Of all actions possible to you, choose always the one which, weighing all consequences, will most further the good of the totality, in all its parts” (*Lehrbuch der Religionswissenschaft*, Vol. I, Sec. 87). This reminds one, of course, of Jeremy Bentham. “The most important idea of mankind” Bolzano took to be the “essential” equality of all human beings, which he tried to prove from historical, rational, and ethical considerations.

LOGIC AND EPISTEMOLOGY

It is as logician, methodologist, and epistemologist that Bolzano, after a long period of neglect, regained philosophical attention in the twentieth century. Mainly in order to combat radical skepticism, he found it necessary to base his teachings in these fields on certain ontological conceptions. He was convinced that there exist truths-in-themselves (*Wahrheiten an sich*) prior to and independent of language and man. These truths he carefully distinguished from truths expressed in words and conceived truths. The set of truths-in-themselves is a subset of the set of propositions (in-themselves) (*Sätze an sich*), again to be distinguished from propositions expressed in words and conceived propositions. Propositions consist of terms (ideas-in-themselves, *Vorstellungen an sich*). These are likewise to be distinguished, on the one hand, from the words or word sequences by which they are denoted and, on the other, from subjective ideas that occur in our mind. Although linguistic entities and conceived entities exist concretely, terms, propositions, and truths do not. Terms were equally carefully distinguished from their objects, whether or not these objects themselves existed concretely. Though Bolzano was a Platonist (in the modern sense), his ontology was rather remote from that of Plato or, for that matter, from that of Immanuel Kant, in spite of the common *an sich* terminology.

Beyond these negative determinations, Bolzano had little positive to say on the ontological status of terms and propositions except that they are the matter (*Stoff*) or sense (*Sinn*) of their correlates in language and thought.

Terms can be either simple or complex and either empty (*gegenstandslos*) or nonempty (*gegenständlich*); if nonempty, they are either singular or general. Examples of empty terms are -1 , 0 , Nothing, Round Square, Green Virtue, and Golden Mountain; absolutely simple terms are Not, Some, Have, Be, and Ought, but Bolzano was uncertain about others. Simple, singular terms he called intuitions (*Anschauungen*).

Propositions are composed of terms and are perhaps best regarded as ordered sequences of terms, while the content (*Inhalt*) of a proposition is the (unordered) set of the simple terms out of which the terms constituting the proposition are composed. The content of a complex term is similarly defined. The terms 3^5 and 5^3 are different, though they have the same content. The terms 2^4 and 4^2 are different, though they have not only the same content but even the same object. With this conception of content, the traditional doctrine of the reciprocity between the extension of a term (the set of objects falling

under it) and the content of a term can easily be seen to be invalid.

Among Bolzano's many idiosyncratic convictions, perhaps the most interesting, but also the most strange to the modern mind, was his belief that each branch of science has a unique, strictly scientific presentation, which for him meant not only a unique finite axiom system (a belief he shared with many) but also an essentially unique entailment (*Abfolge*) of each theorem of this science by the axioms, a belief which might well be unique to Bolzano.

This relationship of entailment, as presented by Bolzano, is very peculiar and obscure. Bolzano was never quite sure that he understood it himself, though he was convinced that there objectively must exist some such relationship, that each science must have its basic truths (*Grundwahrheiten*) to which all other truths of that science stand in the peculiar relation of consequence (*Folge*) to ground (*Grund*). Bolzano was constantly struggling to differentiate this relation of entailment from the relation of derivability (*Ableitbarkeit*), which was the basic relation of his logic. Though he did not succeed in putting his theory of entailment into consistent and fruitful shape—and could not possibly have done so, in view of the chimerical character of his goal—his acumen, mastery of the contemporary logical and methodological literature, intellectual honesty, and lifelong self-criticism more than made up for his numerous shortcomings. Bolzano remains a towering figure in the epistemology, logic, and methodology of the first half of the nineteenth century.

Bibliography

ADDITIONAL WORKS BY BOLZANO

Bolzano's masterwork is his *Wissenschaftslehre*, 4 vols. (Sulzbach, 1837; edited by Wolfgang Schultz, Leipzig: F. Meiner, 1929–1931). *Grundlegung der Logik* (Hamburg, 1964) is a very useful selection by Friedrich Kambartel from the first two volumes of the *Wissenschaftslehre*, with summaries of omitted portions, an excellent introduction, and a good index.

WORKS ON BOLZANO

Bolzano's philosophical work was virtually disregarded until Edmund Husserl called attention to it at the start of the twentieth century. Hugo Bergmann's monograph, *Das philosophische Werk Bernard Bolzanos* (Halle: M. Niemeyer, 1909), increased the revived interest in Bolzano's ideas. Heinrich Scholz's articles, especially "Die Wissenschaftslehre Bolzanos," in *Abhandlungen des Fries'schen Schule*, n.s., 6

(1937): 399–472, reprinted in *Mathesis Universalis*, pp. 219–267 (Basel: B. Schwabe, 1961), presented Bolzano's contributions to logic, semantics, and the methodology of the deductive sciences in a modernized form. The best recent study in English of Bolzano as a logician is J. Berg's *Bolzano's Logic* (Stockholm: Almqvist and Wiksell, 1962). D. A. Steele's historical introduction to his translation of Bolzano's *Paradoxien des Unendlichen* is useful. Among other secondary works the most important are Eduard Winter's *Bernard Bolzano und sein Kreis* (Leipzig: J. Hegner, 1933), Günter Buhl's *Ableitbarkeit und Abfolge in der Wissenschaftstheorie Bolzanos* (Cologne: Cologne University Press, 1961), and (from a Marxist viewpoint) A. Kolman's *Bernard Bolzano* (in Russian, Moscow, 1955; in Czech, Prague, 1957; and in German, Berlin, 1963).

BONALD, LOUIS GABRIEL AMBROISE, VICOMTE DE (1754–1840)

Louis Gabriel Ambroise, Vicomte de Bonald, the French publicist and philosopher, was born in the château of Le Monna, near Millau (Aveyron). He emigrated in 1791, during the Revolution, to Heidelberg, moving later to Constance, and joined the circle of royalist writers who in 1796 published a number of books attacking the Revolutionary Party and defending the monarchy. His own contribution to the propaganda was his famous *Théorie du pouvoir politique et religieux* (3 vols., Constance, 1796), the first of a long series of volumes expressing the ultramontane position, the political supremacy of the papacy, absolute monarchy, and traditionalism.

The basic premise of Bonald, as far as his philosophy was concerned, was the identity of thought and language. Against the usual eighteenth-century idea that language was a human invention, he revived Jean-Jacques Rousseau's argument that since an invention requires thought and thought is internal speech, language could not have been invented. Consequently, he argued, it must have been put into the soul of man at creation. By means of certain philological investigations, Bonald was able to convince himself that there was a basic identity in all languages, as indeed there is in the Indo-European.

But language is a social, not an individual, phenomenon. It binds individuals together into groups and expresses an interpersonal set of ideas. These ideas are tradition. The unity of tradition may be disrupted, as it was during the Revolution, but nevertheless humankind will have to return to it if they have any hope of regaining social health. When this return occurs, people will coop-

erate in a single political system and a single set of religious beliefs. The former will be absolute monarchy, the latter Roman Catholicism, both having single and omniscient heads. Thus, just as the universe is created and governed by one God, so both the church and state must preserve administrative unity. But since the church is the direct channel of communication between God and his creatures, the state and its subjects must be governed in moral affairs by the church.

The ultramontanism of Bonald was as extreme as logically possible. He maintained that the arts, for instance, flourished only in an absolute monarchy, and hence saw nothing to praise in Greek art. In fact, he had nothing good to say about anything Greek, since Greece was given to democracy, though he made an exception of the Spartans. He was opposed to the legalization of divorce and to equal rights for women. He accepted capital punishment, since God would see to it that the innocent would not suffer in the afterlife. He supported general censorship and denounced freedom of the press. And since he was a man of Stoic morals, he did not worry much about human dissatisfaction or unhappiness.

Bonald was a philosopher who never changed his views. In each of his numerous works he repeated the same fundamental theses. His influence was restricted to men of the extreme right, in spite of his ingenuity in argument and logical rigor. His ideas survived in France in *L'action française* and even in the nonpolitical writings of Charles Maurras, through whom they passed in diluted form to T. S. Eliot.

BONATELLI, FRANCESCO

(1830–1911)

Francesco Bonatelli, an Italian spiritualist philosopher, was born in Iseo, Brescia. He studied at the University of Vienna and taught philosophy at the universities of Bologna (1861–1867) and Padua (1867–1911). Bonatelli belonged to the tradition of Catholic spiritualism. He was one of the principal editors of *Filosofia delle scuole italiane*, a review founded in 1870 by Terenzio Mamiani to defend a Platonizing position, but he resigned in 1874 when the Platonist Giovanni Maria Bertini published criticisms of Catholicism that Bonatelli considered too bold. Bonatelli introduced the analytic method of German psychological research into Italy.

Bonatelli attempted to distinguish consistently between the unity of the ego and the multiplicity of psychic events. In his first work, *Pensiero e conoscenza* (Thought and consciousness; Bologna, 1864), Bonatelli distinguished two ways of life for the soul, one that is subject to the laws of fate and another that, although it recognizes these laws, is able to rise above them and use them as tools.

The conscious subject can be aware of other things only if it is capable at one and the same time of being modified and of remaining identical with itself, or inalterable. The solution of this apparent contradiction might lie in distinguishing between consciousness, understood as thought or pure mentality, and sensibility. In his most important work, *La coscienza e il meccanismo interiore* (Consciousness and the internal mechanism; Padua, 1872), Bonatelli insisted that consciousness neither is changed by the object nor changes it. The act of consciousness detaches the psychic event from its matrix in reality and thinks its possible essence or its "possibility or quiddity or whatever you wish to call it." Bonatelli investigated both consciousness itself and the relation between the psychic mechanism external to consciousness and consciousness, between the existing object and the object thought in its "quiddity."

He regarded consciousness as thought turned back upon itself and almost creating itself, but also as freely accepting the "yoke of logic." If consciousness were not of

this nature, it would be reduced to a "logical machine," whereas it is free reflection on itself, grasping itself by directing itself toward objects. However, although the distinctive essence of consciousness is its infinite turning back upon itself (*la riflessione infinita degli atti*, "the infinite reflection of acts"), this reflection is not an infinite succession in which consciousness would lose itself in an endless postponement but rather a completed penetration of self, the fullness and richness of the activity of thought.

Eugenio Garin (1967)

Translated by Tessa Byck

BONAVENTURE, ST.

(c. 1217–1274)

St. Bonaventure, the Italian Scholastic philosopher, was known as the Seraphic Doctor. Bonaventure, whose real name was John of Fidenza, was born in Bagnorea, in Tuscany. After obtaining a master of arts degree at Paris, Bonaventure joined the Franciscan friars (probably in 1243) and studied theology under their masters, Alexander of Hales and John of La Rochelle. After their deaths in 1245, he continued his studies under Eudes Rigaud and William of Meliton. He also came under the influence of the Dominican Guerric of Saint-Quentin and the secular master Guiard of Laon. In 1248 as a bachelor of Scripture he began lecturing on the Gospel of St. Luke and then on other books of Scripture (not all of these commentaries have survived). His monumental "Commentary on the *Sentences* of Peter Lombard," perhaps the most perfect example of this form of medieval literature, was composed between 1250 and 1252.

In 1253 he was licensed by the chancellor of the University of Paris and functioned as regent master of theology until 1257. During this time he composed four sets of *Quaestiones Disputatae*, of which the *De Scientia Christi* (On Christ's knowledge) is important for his theory of illumination; *De Mysterio Trinitatis* (On the mystery of the Trinity) contains the best exposition of his proofs of God's existence; and *De Caritate et de Novissimis* (On charity and the last things) contains sections taken over literally by Thomas Aquinas.

Bonaventure's formal reception into the masters' guild was delayed until October 1257 by the controversy between the mendicant friars and the secular masters. By that time, however, he was no longer actively teaching; in February 1257 he had been elected minister general of the Franciscan order and had resigned his chair at the university to devote himself to the administration of that post. Although often absent on business for the order or church, he continued to make Paris his general headquarters and was largely responsible for the friars' being so active in academic pursuits. He himself preached frequently at the university, touching on many of the religious and philosophical troubles that disturbed faculty and students.

It was during these years that he composed the *Breviloquium* (1257), or brief compendium of speculative theology, which was a departure from the usual scholastic method of presentation; *De Reductione Artium ad Theologiam* (On the reduction of the arts to theology), whose exact date of composition is unknown; and *Itinerarium Mentis in Deum* (The journey of the mind to god; 1259). All of these are important for understanding his general system of thought and the particular role of philosophy in it. Even more important in this connection are the three sets of *Collationes*—a series of informal evening conferences given during Lent to the faculty members and students in the Paris friary—including *De Decem Praeceptis* (On the ten commandments; 1267), *De Septem Donis Spiritus Sancti* (On the seven gifts of the Holy Spirit; 1268), and *In Hexaemeron Sive Illuminationes Ecclesiae* (On the six Days of creation or enlightenments of the church; 1273). All of these reflect the Averroistic tendencies in the arts faculty and Bonaventure's reaction to them. The last of these *Collationes* was left unfinished when Bonaventure was called from Paris and made cardinal bishop of Albano by Pope Gregory X, with whom he worked in organizing the Second Ecumenical Council of Lyons. He died shortly before the council closed and was buried there in the presence of the pope.

SPIRIT OF BONAVENTURE'S PHILOSOPHY

Bonaventure's fame rests primarily on his reputation as a theologian rather than as a philosopher. In both Dante Alighieri's *Paradiso* and Raphael's "Disputa" he appears as the equal of St. Thomas, and in the field of mystical theology he has been considered without peer. It is more difficult, however, to isolate the philosophical components of his system. This is partly due to the fact that all Bonaventure's extant works postdate his entrance into the Franciscan order and the beginning of his career as a theologian and ascetical writer. The chief reason, however, for the prevalence of theological interests in all of his writings was his understandable reaction against the rationalism rampant in the arts faculty at Paris that threatened the very *raison d'être* of speculative theology and led to the condemnations of 1270 and 1277 by Stephen Tempier, bishop of Paris. Among the 219 items listed as theological errors in the second of these condemnations, for example, are such statements as

- (a) The most exalted of all vocations is that of the philosopher.
- (b) There is no subject he is not competent to discuss and settle.
- (c) One gains nothing in the way of knowledge by knowing theology.
- (d) Only the philosophers deserve to be called wise; the speech of the theologian is founded on fables.

In the face of such views, it is understandable why Bonaventure, who believed in the validity of Christian revelation, should have stressed the inability of philosophers in general and of Aristotle in particular to learn the full truth about man's existential situation. Conversely, Bonaventure tried to show the continuity between the aims of philosophy and those of theology. He maintained that philosophy has a genuine, albeit limited, autonomy; the knowledge it yields is a stage in the overall ascent of the human mind to true wisdom, the culmination of which in this life is found in quasi-experiential knowledge of God, achieved by such mystics as Francis of Assisi.

Part of the great literary charm of Bonaventure's style is his ability to play upon words. Throughout his later works, particularly his sermons and *Collationes*, he continually gives a deliberately theological twist to technical philosophic terms, with the result that he has frequently been unjustly accused of confusing theology with philosophy either in principle or in practice. The truth of the matter is that while he was eminently able to conduct a purely philosophical discussion and often did so in his

university lectures, he preferred to limit himself to particular topics. He never formed a complete system from his philosophical analyses, but he put them into the service of his overall theological synthesis.

BONAVENTURE'S METAPHYSICS

Bonaventure's linguistic sophistication and his idea of the continuity between philosophy and theology are perhaps best represented in his discussion of metaphysics in the *In Hexaemeron*. Christ, the Son of God, not Aristotle, is the "metaphysician" par excellence.

As the Son said: "I came forth from the Father and have come into the world; again I leave the world and go to the Father" [John 16:28], so anyone may say: "Lord, I came forth from you, the All High; I go to you, the All High, and by means of you, the All High." Here is the metaphysical medium leading us back. And this is the whole of our metaphysics: it concerns emanation, exemplarity, and consummation [that is, being illumined by spiritual rays and led back to the All High]. It is in this way you become a true metaphysician. (*Collatio* I, No. 17; in *Opera*, Vol. V, p. 332)

EMANATION. Bonaventure uses the term *emanation* to designate the general theory of how creation proceeds from God. With its Plotinian overtones, however, "emanation" suggested more specifically the thesis of al-Fārābī, Avicenna, and Averroes that all creatures, by an inevitable and eternal process, spring from the creative mind of God through a chain of intermediary causes of continually diminishing perfection. This thesis was designed to reconcile Aristotle's eternal world with the creation concept of the Qur'an. Bonaventure, however, wished to reconcile "emanation" with Christian theology. His counterthesis is summarized in the *Breviloquium*: "The whole of the cosmic machine was produced in time and from nothing, by one principle only who is supreme and whose power, though immense, still arranges all according to a certain weight, number and measure" (Book II, Part 1, in *Opera*, Vol. V, p. 219). It is to be noted that he rejects the concepts of the eternity of the world, of the eternity of matter, of a dual principle of good and evil, and of the existence of intermediary causes.

His description of the supreme principle implies that a perfect power must be free to create varying degrees of perfection, in contrast with the Arab belief that direct creation by a perfect power could only result in perfect effects. Also, the use of Augustine's triad of weight, num-

ber, and measure suggests the seal of the Blessed Trinity stamped on every creature. This becomes clearer if we consider the next and most characteristic feature of Bonaventure's metaphysics.

EXEMPLARISM. Emanation concerns natural philosophy as much as metaphysics. God, as final cause and ultimate goal of man's quest for happiness, is the concern of the moral philosopher as well as the metaphysician. But only the metaphysician can understand God as exemplar cause. And it is in analyzing this aspect of the science of causes and first principles that man is most truly a metaphysician.

Though this metaphysical pursuit begins with reason, it can be successfully terminated only by a person with faith. Comparing the two greatest pagan philosophers, Aristotle and Plato, Bonaventure maintained that Plato, the master of wisdom, erred in looking only upward to the realm of eternal values, of the immutable ideas, while Aristotle, the master of natural science, looked only earthward to the everyday sensible world that Plato neglected. But Aristotle's was the greater sin, for in rejecting the Platonic ideas in toto, he closed the door to a full understanding of the universe in terms of its causes. Bonaventure saw Augustine as the model of Christian wisdom because he combined the science of Aristotle with Plato's wisdom (*Christus Unus Omnium Magister*, Nos. 18–19, in *Opera*, Vol. V, p. 572). As a Christian he could complete what Plato could only begin. Not only did he demonstrate that Plato's archetypal Ideas are the exemplar causes or models that God used in creating the universe, a point that a philosopher alone could establish, but he also showed further that these Ideas are associated in a special way with the second person of the Trinity, an insight only divine revelation could help one discover. Bonaventure, following Augustine, explained that since the Father begets the Son by an eternal act of self-knowledge, the Son may also be called the wisdom of the Father and expresses in his person all of God's creative possibilities. As such, the Son is the Word or Logos adumbrated in the writings of the philosophers but fully revealed only at the beginning of the Gospel of John, where he appears as the one through whom all things are made (that is, as exemplar cause) and who "enlightens every man who comes into the world" (an allusion to Augustine's theory that only some illumination by divine ideas can account for man's knowing immutable truths). "From his [magisterial] chair in heaven Christ teaches us interiorly," wrote Bonaventure. "If as the Philosopher [Aristotle] says, the knowable qua knowable is eternal, nothing can be known except through that Truth which is

unshaken, immutable and without limit" (*In Hexaemeron, Collatio I*, No. 13; in *Opera*, Vol. V, p. 331).

Averroes had written of Aristotle: "I believe this man to be nature's model, the exemplar which nature found to reveal the ultimate in human perfection" (*De Anima* III, 2). Bonaventure maintained that Christ, not Aristotle, is God's model for humanity. The Word is not only God but also a perfect man. He gives us "the power of becoming the sons of God," and he is the "one master of all the sciences" (*Sermo IV*; in *Opera*, Vol. V, p. 567); to know him fully is to know all that can be known.

Bonaventure held that Plato's theory of Ideas was a first philosophical approximation to this theological insight, and Aristotle's rejection of this view led to his errors about God. For if God lacked the exemplar ideas, he would know only himself and nothing of the world. He would be, as Aristotle claimed, related to the world only as final cause and not as creator. Moreover, in Aristotle's world, since chance clearly does not explain the cyclic changes of the cosmos, the universe must be ruled by determinism, as the Arabic commentators claim. But then man would no longer be a responsible agent; he would deserve neither reward nor punishment, and divine providence would be a myth.

With the recognition of exemplarism, on the other hand, the whole of creation takes on a sacramental character—that is, it becomes a material means of bringing the soul to God. Nature becomes the "mirror of God," reflecting his perfections in varying degrees. Although we see only a shadowy likeness (*umbra*) or trace (*vestigium*) of the creator in inorganic substances and the lower forms of life, the soul of man is God's image (*imago*) and the angel his similitude (*similitudo*).

The recognition of God in nature begins in philosophy, but it is continued and perfected in theology. In *De Mysterio Trinitatis* Bonaventure argued that philosophers know that secondary beings imply a first; dependent beings imply an independent being; contingent things imply some necessary being; the relative implies an absolute; the imperfect, something perfect; Plato's participated beings imply one unparticipated being; if there are potential beings, then pure act must also exist; composite things imply the existence of something simple; the changeable can only coexist with the unchangeable. Pagan philosophers, knowing that these ten self-evident conditionals have their antecedents verified in the corporeal world, learned much about God (*De Mysterio Trinitatis* I, 1; in *Opera*, Vol. V, pp. 46–47).

More can be learned, however, by the soul reflecting upon itself. In his other works Bonaventure went on to suggest that the soul, possessed of memory, intelligence, and will, is an image of God, not only mirroring his spiritual nature but adumbrating the Trinity itself. Memory, which creates its own thought objects, resembles the Father who begets the Son or Logos (intelligence) as an intellectual reflection of himself, and the two through their mutual love (will—the active principle of "spiration") breathe forth the Holy Spirit. But although a philosopher can discover a spiritual God as the ultimate object of the soul's search for truth and happiness, only a man of faith like Augustine can find the Trinity manifest throughout creation.

CONSUMMATION OR ENLIGHTENED RETURN. The third aspect of Bonaventure's metaphysics concerns a creature's fulfillment of its destiny by returning to God. This return (called technically a *reductio*) in the case of the lower creation is achieved in and through man (who praises God for and through subhuman creation). Man's return is made possible in turn by Christ. For man returns to God by living an upright life—that is, by being rightly aligned with God—and this can be accomplished only through the grace of Christ. Man's mind is right (*rectus*) when it has found truth, and above all, eternal truth. His will is right when it loves what is really good, his exercise of power is right when it is a continuation of God's ruling power. Through original sin or the Fall, man lost this triple righteousness. His intellect, lured by vain curiosity, has enmeshed itself in interminable doubts and futile controversies; his will is ruled by greed and concupiscence; in his exercise of power he seeks autonomy. But although man lost the state of original justice, he still hungers for it. This longing for the infinite good is revealed in his ceaseless quest for pleasures. Through faith and love (grace), man can find his way back.

Since knowledge is involved at every stage of the return, *reductio* is also a quest for wisdom and hence, in an extended theological sense, it is metaphysical. It is an enlightened return, because every branch of learning is a gift from above, from the "Father of lights" (Epistle of St. James, 1. 17), and can be put into the service of theology (this is the theme of Bonaventure's *De Reductione Artium*). Although man's return begins with the natural light of reason reflecting first on the external world and then turning inward in an analysis of the soul, it is perfected initially by a natural illumination of the divine ideas and then by varying additional degrees of supernatural illumination which culminate in the experiential cognition of God through mystical union (the theme of

the *Itinerarium*). This experience is not the same as the clear vision of the blessed in heaven but is the “learned ignorance” referred to by the mystical writers—a union of the soul with God in darkness, granted to saints like Francis before death.

OTHER DOCTRINES

The elements of Bonaventure’s philosophy are woven into his religiously oriented system. Like all the Parisian thinkers of this period, Bonaventure developed a basically Aristotelian philosophy, but he included a larger admixture of Neoplatonic and Augustinian elements than we find in St. Thomas, for instance, who studied Aristotle somewhat later and more thoroughly under Albert the Great.

THEORY OF KNOWLEDGE. Bonaventure believed that the mind has no innate ideas, not even in the sense postulated by the authors of the *Summa Theologica* (ascribed to Alexander of Hales), who argued that ideas are latent in the agent intellect but are actually acquired only when the light of the agent intellect illumines the possible intellect. Bonaventure rejected this, holding with Aristotle that the mind at birth is a *tabula rasa*. It needs sensory stimulation before it can acquire any notions about the external world of objects. However, Bonaventure did use the Augustinian theory of illumination to explain how the mind passes judgment on sensible things in terms of their values. For when the mind judges something to be, for example, good or beautiful, there must be an implicit awareness of what beauty and goodness are in themselves; and this requires that the human mind have some knowledge of the divine ideas. Obviously this is not a clear or intuitive knowledge of God such as the angels or the blessed in paradise possess. Yet just as one can see by sunlight without looking into the sun itself, so one can have knowledge of the divine ideas. At the same time, Bonaventure rejected the interpretation (also found in the *Summa* of Alexander) that we attain these ideas only in terms of the residual effects of the divine action—effects which remain in the soul like habitual or buried memories. Bonaventure claimed that in some mysterious way (which he called *contuition* but which he never fully explained), when we know a created object, our mind is simultaneously enlightened so that it is moved to judge correctly about the object and is hence in accord with God’s own mind on the subject.

Although Bonaventure agreed with Aristotle that our knowledge of the external world is sense-dependent, he did not fully subscribe to Aristotle’s principle that “noth-

ing is in the intellect that was not first in the senses.” He held that the intellect can turn inward, reflecting on the soul and its tendencies. In analyzing the precise nature of the object of these tendencies, the mind discovers God and itself as his image. The reasoning process involved is neither deductive nor inductive in the usual meaning of these terms, but is called technically a “reduction” and seems to resemble in some respects the “abduction” of Charles S. Peirce. Reasoning proceeds by progressively deepening insights into what the desire for truth and perfect happiness involve. If the reduction remains imperfect and does not go on to completion, God is not discovered and one may err about his nature or even his existence. Although at times Bonaventure, following the authority of John of Damascus, Ancius Manlius Severinus Boethius, or Augustine, spoke of the existence of God as a truth implanted by nature in the human mind, he meant this to be interpreted as referring immediately to man’s natural desire for knowledge, truth, happiness, or goodness—all of which need explication before man realizes they have God as their ultimate object (*De Mysteriorum Trinitatis*, I, 1; in *Opera*, Vol. V, p. 49).

COSMOLOGY. In his analysis of material creation, Bonaventure introduced extraneous elements into Aristotle’s theory of matter and form. Thus, for instance, he adopted Avicbron’s theory of the hylomorphic composition of spiritual as well as corporeal creatures. The argument here is that since creatures have some measure of potentiality (only God is pure actuality), they must have some kind of matter, for according to Aristotle matter is the principle and source of potentiality. This spiritual matter, found both in the angel and in the human soul, is never separable from its spiritual form; hence, such spiritual substances are not subject to change—they cannot die or disintegrate like terrestrial bodies, nor can they be perfected by a hierarchy of forms, as can corporeal matter.

In *Breviloquium*, Book II, Bonaventure, in explaining the visible universe, made use of the theories of light developed by Robert Grosseteste and the Oxford school. He distinguished light (*lux*), luminosity (*lumen*), and color. The first is the most basic of substantial forms; it enables both terrestrial and celestial bodies to subsist and is the root source of whatever internal dynamism they possess. *Lumen* is the invisible radiation which has its origin especially in celestial bodies like the sun but exists in the intervening transparent medium. It is described by Bonaventure as being both an active power (*virtus activa*) and something substantial in itself but only accidentally related to the transmitting medium through which it

flows continually and instantaneously by a self-generative process called multiplication. Being neither an accidental nor a substantial form properly speaking, it is not educed from the potentialities of matter as are other corporeal forms, with the exception of *lux*. Yet it requires some material medium or body and coexists with such without changing it substantially. Not only does it penetrate the bowels of the earth, where it governs the formation of minerals, but in virtue of its purity and similarity to the spiritual, this substantial radiation disposes bodies to receive the life form and acts as a sort of intermediary between soul and body. It is active in the reproduction of animals, functioning as one of the external agents that educes the higher forms from the matter where they exist as “seminal reasons.”

This theory of seminal reasons was adopted on the authority of Augustine, but Bonaventure interpreted it within the framework of the general Aristotelian formula that forms are educed from the potency of matter. Unlike St. Thomas, Bonaventure interpreted these “potencies” as active powers rather than passive potentialities. They are really latent forms existing in matter in an inchoate or germinal state. External agents only cooperate with these powers, in much the way that a gardener cultivates a rose-bush or a seedbed so that it bears flowers or germinates (*Commentarium in Librum II Sententiarum*, Dist. 7, in *Opera*, Vol. II, p. 198). All forms, except the primary light form and the human soul, which are directly created by God, arise through the cooperation of seminal powers and external agents, under the influence of light.

Bonaventure, unlike Thomas, believed that creation in time (in contrast with Aristotle’s belief in the eternity of the world) is demonstrable from reason, using Aristotle’s own principles (*Commentarium in Librum I Sententiarum*, Dist. 1, in *Opera*, Vol. II, pp. 20–22). His arguments, although interesting, are based on a medieval concept of number and infinity and on the presupposition that the immortality of the human soul is a purely rational truth.

As his name implies, Bonaventure’s character seems to have represented all that the medieval Christian regarded as ideal. Born at a critical period in the history of his church, his order, and of speculative theology, he saw himself cast in a mediating role. As a bachelor of theology, trained in the arts, he sought to put the new philosophy into the service of theology. As a master of theology he tried not only to defend the new mendicant orders against the attacks of the secular masters but also to heal their differences. As minister general he took a middle position between the extreme factions of the

Franciscan order, who differed on the subjects of evangelical poverty and the pursuit of studies. Bonaventure’s works, such as *De Reductione Artium ad Theologiam* and *Itinerarium Mentis in Deum* were not only theoretical expressions of his gift for synthesis but also served the practical purpose of silencing the anti-intellectual friars who claimed that the academic life was incompatible with the ascetical aims of a follower of St. Francis. As cardinal, Bonaventure played a major role at the Council of Lyons in healing the rift between Greek and Latin Christendom. Under the aegis of Augustine, he consolidated theological opposition to the cult of Aristotle and Averroistic rationalism. Although this led eventually to the Parisian condemnations of 1270 and 1277, in which even theses of St. Thomas were included, it also bore fruit in a renewed interest in Augustine’s contributions to philosophy by Matthew of Acquasparta, Roger Marston, John Peckham, and others of the Augustinian school.

Bibliography

The collected Latin works of St. Bonaventure were published as *S. Bonaventurae Opera Omnia*. 10 vols. (Quaracchi, 1882–1902). The two works not contained in that collection are *Questions disputées “De Caritate,” “De Novissimis,”* edited by P. Glorieux (Paris, 1950), and a second redaction of *Collationes in Hexaemeron*, edited by F. Delorme (Quaracchi, 1934). *Commentary on the Sentences* has been reprinted in 4 vols. (Quaracchi, 1934–1949) without the critical notes. Also see *Tria Opuscula*, 5th ed. (Quaracchi, 1938), which includes *Breviloquium*, *Itinerarium Mentis in Deum*, and *De Reductione Artium ad Theologiam*.

English translations of Bonaventure’s work include *St. Bonaventure’s De Reductione Artium ad Theologiam*, translated by E. T. Healy (St. Bonaventure, NY, 1955), in Latin and English; *St. Bonaventure’s Itinerarium Mentis in Deum*, translated by Philotheus Boehner (St. Bonaventure, NY, 1956), in Latin and English; *Breviloquium* by *St. Bonaventure*, translated by E. E. Nemmers (St. Louis and London: Herder, 1946); J. de Vinck, *The Work of Bonaventure* (Paterson, NJ: St. Anthony Guild Press, 1960–1970); and four questions from the “Commentary on the Sentences” in *Selections from Medieval Philosophers*, edited by Richard McKeon (New York: Scribners, 1930), Vol. II, pp. 118–148.

A Latin and Spanish translation is L. Amoros, B. Aperribay, M. Oromi, and M. Oltra, eds., *Obras de S. Buenaventura*, 6 vols. (Madrid, 1945–1949), Vol. I of which contains an extensive bibliography and new data on authentic works not in *Opera Omnia*.

General bibliographies for Bonaventure can be found in F. Ueberweg and B. Geyer, *Grundriss der Geschichte der Philosophie*, 12th ed. reprint (Basel, 1951), Vol. II, pp. 735–738, and Étienne Gilson, *History of Christian Philosophy in the Middle Ages* (New York: Random House, 1955), pp. 685–686. For studies after 1953, see the annotated *Bibliographia Franciscana* (Rome: Istituto Storico dei Cappuccini, 1962–), Vol. XI ff. The classic introduction to Bonaventure's thought is Étienne Gilson, *La philosophie de saint Bonaventure*. 2nd ed. (Paris, 1953; English translation of 1st ed., London: Sheed and Ward, 1938). Critical evaluations of this and alternate views are B. A. Gendreau, "The Quest for Certainty in St. Bonaventure," in *Franciscan Studies* 21 (1961): 104–227, and J. G. Bugarol, *Introduction à l'étude de S. Bonaventure* (Paris, 1961). Bonaventuran themes in Raphael are discussed in H. B. Gutman, "The Medieval Content of Raphael's 'School of Athens,'" in *Journal of the History of Ideas* 2 (1941): 420–429, and "Raphael's 'Disputa,'" in *Franciscan Studies* 2 (1942): 35–48. For Bonaventure's own theory of art, see E. J. M. Spargo, *The Category of the Aesthetic in the Philosophy of St. Bonaventure* (St. Bonaventure, NY, 1953). Also see R. P. Prentice, *The Psychology of Love according to St. Bonaventure*, 2nd ed. (St. Bonaventure, NY, 1957), which is a comparison of Bonaventure and Max Scheler, and A. Schaefer, "The Position and Function of Man in the Created World according to St. Bonaventure," in *Franciscan Studies* 20 (1960): 261–316; and 21 (1961): 233–382.

Allan B. Wolter, O.F.M. (1967)

BONHOEFFER, DIETRICH (1906–1945)

Dietrich Bonhoeffer was a German theologian and religious leader during the period when National Socialism dominated. He was active in the resistance to Hitler; and his anti-Nazi activities led to his death in a concentration camp. The heroism of his end served to call attention to his life and thought, but by itself the drama of his life does not account for the continuing interest Bonhoeffer has aroused in twenty-first century theological circles. He has been read eagerly for the substance of his thought, his example of resistance to oppression, and his provocative portrayal of the secular settings that provide the context for much theological inquiry. The Nazi milieu prevented Bonhoeffer from making a sustained impact on the academic world during his lifetime; he was then recognized chiefly for his involvement in the nascent ecumenical movement, for his leadership of a clandestine seminary at Finkenwalde and, of course, for his part in the resistance

to Hitler. (Thanks to the work of theologians such as John de Gruchy, Bonhoeffer's thought inspired much South African resistance to apartheid, and he has been invoked elsewhere by critics of oppressive political orders.)

PHILOSOPHY AND THEOLOGY

Only one of Bonhoeffer's works, *Akt und Sein*, is wholly devoted to formal questions concerning the relation of philosophy to theology. *Akt und Sein* was his inaugural dissertation, and it is marked by a certain pretentiousness and heavy-handed systematic theological concern. At times its jargon obscures the author's line of thought. It is doubtful whether the work possesses any great worth in isolation from Bonhoeffer's life. However, because it anticipates many of the themes that he later elaborated without explicit philosophical reference, it is of interest.

In *Akt und Sein* Bonhoeffer carried on a veiled polemic, on the one hand, against those who wished to reduce Christianity either to a philosophy of transcendence (*Akt*) or of being (*Sein*), and on the other hand against those who believed that Christian theology could be expressed independently of philosophical concerns. His own interests were in many ways synthetic. Critical of philosophical attempts to account for or exhaust the meaning of Christian revelation, Bonhoeffer admitted the general necessity of relating theology and philosophy. He appreciated the Kantian *Akt*-philosophy, which stresses the thinker or the knower "in relation to" the known, but he criticized its lack of interest in the problem of the known, as in the mundane world. He turned with some interest to the *Sein*-philosophies, which focus on God as the known but which may lack a proper corollary interest in the concrete historical events in which believers find God to be revealed. These philosophies Bonhoeffer categorized repeatedly throughout his career as "theologies of glory" that seek to explicate the nature of the Divine on a philosophical basis. He advocated mainly what in his Lutheran theological lineage has always been called "a theology of the Cross" because it accented an event in history, specifically in the crucifixion of Jesus Christ.

If the corpus of Bonhoeffer's most important literary work is to be related to philosophy, it must be categorized as a philosophy of history. In all his writings he shows an active and positive interest in the concrete character of Divine revelation. He often voiced an agnostic position on the possibility of making meaningful statements about God apart from revelation in Jesus Christ. In lectures on Christology delivered in 1932 and available in the form of published classroom notes, he concentrated consistently on the historical, concrete, and conditioned

character of revelation in Jesus Christ and the church over against philosophies of transcendence.

ETHICS

Bonhoeffer's *Ethics* is his most systematic work (although it survives only in fragments from the concentration camp years). Whereas it profits from philosophical debate, *Ethics* is largely a rejection of philosophical ethics. In this book Bonhoeffer takes a negative view of Roman Catholic ontological ethics, which moves from general abstract ethical statements to specific Christian principles. He was more closely identified with existentialism, but he regarded that philosophy also as an abstraction from revelatory events in Jesus Christ. Bonhoeffer has been accused, along with his teacher Karl Barth, of presenting an overly Christological philosophy and ethic, a critique that would not have disturbed him at all.

LATER THOUGHT

During his final imprisonment before his execution, Bonhoeffer's thought took a surprising—some would say a radical—turn. Pondering the collapse of continental humanist traditions at the hands of Nazis and other totalitarians, he focused on the blithe ways many of his contemporaries shrugged off inherited traditions of piety, even though some remained Christian. In his eyes, they joined free-spirited nonbelievers as they left behind pre-occupations with guilt and modes he associated with conventional religion. He has come to be best remembered for his interpretation of modern history, developed on the basis of these observations and his study of the Bible during his imprisonment. From the Christian point of view he regarded secularization as a largely positive process. In a celebrated historical analysis he perceived that the “god of explanation” was gradually disappearing from European history; and disappearing with it was what he called “the religious *a priori*” (Bonhoeffer 1953). By this term he referred to the idea that a person must adopt a specific metaphysics, a specialized view of transcendence, or a particular form of piety and churchly existence before becoming a Christian. All of these, Bonhoeffer claimed, belonged to the spiritual adolescence of humans.

Contemporary humans, Bonhoeffer thought, reckoned less and less with a transcendent and hypothetical deity located outside the circle of the empirical. He cherished those Biblical texts and those aspects of theological tradition that spoke of transcendence located in the center of human affairs, particularly in the history of Jesus Christ. In this historical context, Bonhoeffer pointed out,

the role of philosophy had become increasingly secularized as it focused on human autonomy (Bonhoeffer 1953).

In his eyes, René Descartes had begun to see the world as a mechanism. Benedict de Spinoza was a pantheist. Immanuel Kant, in Bonhoeffer's view, was close to the deists in his reluctance to deal philosophically with God as the known, in his revelation in history. He commented on the ways in which Johann Gottlieb Fichte and Georg Hegel had also developed brands of pantheism that drew them away from the historical involvement of God with the secular world.

All of these developments, he claimed in letters he wrote from prison, revealed the “growing tendency to assert the autonomy of man and the world” (*Prisoner for God*, Bonhoeffer 1954, p. 163). He came to be seen as a forerunner of a school of antimetaphysical theologians who insisted that Christian life and language were most free when they were not based on a philosophy of being or the expression of transcendence. Some of their writings became best-sellers in the 1960s and 1970s, when elements of Bonhoeffer's thought appeared in the controversial *Honest to God* (1963) by Bishop John A. T. Robinson and in a number of radical theological works, some of them momentarily associated with the concept of “the death of God.”

Subsequently, cultural changes in Europe, wherein non-Christians and many Christians came to rediscover the potency of myths and symbols, which Bonhoeffer had earlier come to minimize, found significant figures resorting to new languages touting spirituality. In this context, a later generation of those influenced by Bonhoeffer reexplored those sources in his thought that were not exhausted by his witness to a “world come of age” and to the existence of a Christian church that was engaged, in almost carefree ways, with secular philosophies.

Part of this reexploration led some theologians to revisit the long-overlooked influence of Martin Heidegger on the young Bonhoeffer who wrote *Akt und Sein*. In that work, only Martin Luther was referenced more frequently than Heidegger. The most elaborate statement of this engagement was written by the American Charles Marsh in *Reclaiming Dietrich Bonhoeffer* (1994). Recognizing that Heidegger, a devotee of National Socialism, and Bonhoeffer, who was to give his life opposing it, were poles apart in politics, and that Bonhoeffer seldom quoted Heidegger after that early work, Marsh did discern some revisitations of the themes of transcendence that showed the influence of the philosopher. In Marsh's terms: “In an attempt to shape reflection in a way that is

not determined by the totality of the self-reflective subject but emerges from a source prior to and external to the individual, Bonhoeffer finds certain themes in Heidegger's fundamental ontology congenial to his theological purposes. Bonhoeffer subjects these themes to Christological redescription," and so does not stay with existential analysis (1994, p. 112). Nonetheless, Marsh argued, "Heidegger's notions of potentiality-for-being, authenticity, and being-with others push[ed] Bonhoeffer in his thinking about human selfhood and sociality to recognize specific social-ontological distinctions and concepts critical to his developing Christology" (Marsh 1994, p. 112).

Needless to say, such a view of connections and influence does not go unchallenged. Thus German theologian Ernst Feil presented anew what Marsh called "the conventional wisdom." In it, Heidegger's "concept of existence, derived from the human and not from revelation, was, for Bonhoeffer, theologically unusable" (1985, p. 31) agrees that Bonhoeffer finally did reject Heidegger's fundamental ontology on theological grounds, but awareness of this rejection "should not obscure Bonhoeffer's admiration for Heidegger's *Being and Time's* attempt to 'destrue' or destructure the history of ontology," which captured Bonhoeffer's imagination in a decisive way (1994, p. 31). Yet even this self-described "reclamation" project by thinkers such as Marsh, while showing early dependence on Heidegger, does not serve to limit the imagination with which Bonhoeffer "revisited" Christological themes in a milieu he described as "a world come of age" (Bonhoeffer 1953, p. 327).

BONNET, CHARLES

(1720–1793)

Charles Bonnet, the Swiss naturalist, "religious cosmologist," and philosopher, was born and died in Geneva. An original if eccentric thinker, Bonnet was widely read and influential. He was early attracted to natural history, and especially to entomology, by René Réaumur's work and by the Abbé Pluche's apologetic, *Spectacle de la nature* (1732). At the age of twenty, he discovered that the aphid can reproduce for several generations without mating, and that animals other than the "polyp" (hydra) can regenerate themselves. He treated these and other matters in his *Traité d'insectologie* (1745). When his eyesight became severely weakened from microscopic work, he turned to botany and philosophy. In *Recherches sur l'usage des feuilles dans les plantes* (1754), he outlined a vitalistic concept of plant behavior in relation to physical environment. In the *Essai de psychologie* (1754) and the *Essai analytique sur les facultés de l'âme* (1760), he followed Étienne Bonnot de Condillac by using the device of the imaginary statue to illustrate the genetic method of explaining the development of the personality. The personality arises from memory, which grows out of sensations. Especially concerned with the body-mind relation, Bonnet accepted David Hartley's theory of association of ideas. He defined freedom as the power of the soul to follow necessary motives; but in granting man a substantial mind, he denied mechanical determinism. He held that the relation between mind and body indicates that the mind must operate in a physical organism, but survives it—an idea that was to be developed in his cosmic speculations.

With the *Considérations sur les corps organisés* (1762) and the popular *Contemplation de la nature* (1764–1765), Bonnet approached the general problems that were crucial in the biology of his time. In the *Considérations* he espoused the preformation theory (which he also needed for his cosmological speculations), using the work of

Albrecht von Haller and Lazzaro Spallanzani. In the *Contemplation*, he developed the traditional idea of the chain of beings, temporalizing it as a process rather than as a static creation. Bonnet's cosmic philosophy received full development in his *Palingénésie philosophique, ou Idées sur l'état passé et sur l'état futur des êtres vivants* (1770), a work that Arthur O. Lovejoy termed "one of the most extraordinary speculative compounds to be found in the history of either science or philosophy." Bonnet looked to biology as a support for his religious beliefs, and used both biology and religion to build a view of cosmic evolution.

Bonnet's theory held, essentially, that the immortal soul ("the ethereal machine") is a "subtle matter" (as distinguished from "gross matter") in the pineal gland. The ethereal machine is the germ of the resurrected body. All possible beings, all individuals, were created at once, according to the principle of plenitude. They exist in germ until released by the death of other individual organisms. The lower souls of animals are perfectible, and the universe is one in which all things tend to perfection. The principal changes occur as the result of catastrophes. Earth has passed through a series of epochs, each terminated by a cataclysm that destroyed all organic life except the immortal germs, allowing the germs to take on different forms, all foreseen in the original creation and all ascending to higher levels. Ontogenesis is a proof of this. Thus, every germ will reappear in a succession of higher embodiments, the soul of each waiting until the proper state of Earth evokes its next and higher incarnation. The entire creation is moving upward; man will become angel, and apes and elephants will take man's place. There is also life on other worlds, more or less advanced in perfection than on Earth.

This theory cannot be called one of organic evolution (as is sometimes erroneously affirmed), since species, according to Bonnet, have no natural history within a single world epoch. Species do not evolve from lower forms in the way modern biology conceives this process; their history is predetermined and fully inscribed in the germ at the moment of the original creation. The germ bears the form of all it will ever be. Nevertheless, Bonnet's universe is self-differentiating and progressive.

Bonnet considered finalism in organisms an incontrovertible argument against atheism. An optimist, he maintained there is greater good than evil in the universe, and that created things necessarily have a lesser degree of perfection than their creator. Man is superior to animals in his sensual apparatus, brain, and speech organs; but he is part of the general, unfolding order of nature. Man

knows a Natural Law that is virtual in him but develops by experience; however, he is moved by self-love and by passions, which may be beneficent or may be destructive and cruel. In considering the inherited organization more determining than education (experience), Bonnet was closer to the "man-machine" school of Julien Offray de La Mettrie than to the sensationist theories of Claude-Adrien Helvétius.

BOOLE, GEORGE

(1815–1864)

George Boole, an English mathematician and logician, is regarded by many logicians as the founder of mathematical logic. He could be called the Galileo of logic in that he definitively established the mathematical nature of logic—assuming that it was Galileo Galilei who did this for physics, rather than, say, Archimedes. He is considered to be among the five greatest logicians, the others being the Greek philosopher Aristotle, the German mathemati-

cian Gottlob Frege, the Austrian mathematician Kurt Gödel, and the Polish mathematician Alfred Tarski.

Like Aristotle, he never had the opportunity to take a course in logic. His parents' economic circumstances precluded the usual formal education. He never took a college course and, thus, never received a bachelor's degree. Nevertheless, he taught many college courses as a professor of mathematics and he received honorary doctoral degrees from such distinguished institutions as Trinity College of Dublin and Oxford University. These are among the many surprises, ironies, and paradoxes surrounding Boole's life and work.

His ambition, energy, originality, and dedication were evident even when he was a boy. By the age of twenty-six he had published the first of many articles in mathematics journals. By twenty-nine, for his 1844 article "On a General Method in Analysis," he had won the Royal Society's gold medal first prize recognizing "the most significant contribution to mathematics" submitted between 1840 and 1844. At thirty-four he was appointed Professor of Mathematics at Queen's University. In 1864, when he died tragically just before the age of fifty, he was one of the most celebrated figures on the British intellectual scene.

In his lifetime he was known almost exclusively for his work in mathematical analysis, a specialty that includes traditional algebra, differential equations, the calculus of finite differences, and, of course, differential and integral calculus. In this field he wrote several articles and two books, both still in print: *Treatise on Differential Equations* (1859) and *Treatise on the Calculus of Finite Differences* (1860). During his lifetime few knew his logic at all, and of them few appreciated it. Today, his work in mathematical analysis is largely unknown; his fame rests entirely on his logic. Boolean algebra, the branch of modern mathematics named in his honor, derives from Boole's logic, not from his other mathematics.

REVOLUTIONARY LOGICIAN WHO NEVER INTENDED TO REVOLUTIONIZE LOGIC

His work in logic still retains a vigor and freshness; it continues to be read and enjoyed by many people including professional mathematicians and logicians. In 2003 Prometheus Books brought out a new reprint edition of his most mature and influential book: *An Investigation of the Laws of Thought on Which Are Founded the Mathematical Theories of Logic and Probabilities*—better known by its shortened title *Laws of Thought*—which was origi-

nally published at his own expense in 1854. The non-mathematical passages in this book are lucid and unusually well written—a testament to Boole's humanistic learning, to his confidence in his own theories, and to his desire to contribute to the advancement of knowledge. Besides the logic, Boole's 1854 book applies logic to probability theory.

Unlike other revolutionary logical innovators, Boole's greatness as a logician was recognized almost immediately. In 1865, hardly a decade after his 1854 *Laws of Thought* and not even a year after his death, his logic was the subject of the Harvard University lecture "Boole's Calculus of Logic" by Charles Sanders Peirce, America's most creative native logician. Peirce opened his lecture with these prophetic words: "Perhaps the most extraordinary view of logic which has ever been developed with success is that of the late Professor Boole. His book ... *Laws of Thought* ... is destined to mark a great epoch in logic; it contains a conception which in point of fruitfulness will rival that of Aristotle's *Organon*" (Peirce, pp. 223f.).

Even though Boole is thought of today as the initiator of a radical revolution that conclusively and irrevocably overthrew the Aristotelian paradigm then reigning in the domain of logic, he never thought of himself as opposing Aristotle. He admired Aristotle's logic—as far as it went. He never criticized any of the positive features that Aristotle instituted; he accepted as valid every argument that was valid according to Aristotle—including those with "existential import," deducing existential conclusions from universal premises. On the contrary, Boole's goals included revealing the mathematical nature of Aristotle's logic, something that he felt Aristotle had failed to clarify, broadening Aristotle's logic by showing that it could be made to do much more than was envisaged by Aristotle's followers, and deepening it by penetrating beyond Aristotle's analysis to the "ultimate" fine structure of the reasoning process—thereby providing it with what he called a mathematical foundation and showing that it had much more in common with mathematics than had previously been thought and thus justifying it. From Boole's point of view Aristotle's faults were all faults of omission, not of commission. Ironically, Boole's unquestioning acceptance of certain details of Aristotle's system, for example, existential import, may have been one of the things that led to Boole's unfortunate mistaken implementation of his own sound ideas.

BOOLE'S FULLY SYMBOLIC LOGIC

In the process of extending and deepening Aristotle's logic Boole brought many radical ideas into logic. Where Aristotle had represented propositions by a kind of formalized phonetic Greek, Boole represented them by purely ideographic algebraic equations—giving rise to the first successful formalized language in the modern sense. Where Aristotle's propositions were limited to exactly two basic nonlogical elements, one being the “subject” and one the “predicate,” Boole's propositions had no limitation of that kind—they could involve any finite number of basic elements, which Boole represented with the letters familiar from algebra: x , y , z , and so on. In fact, by introducing for the first time in history the two logical elements—1 for “everything” or the universe of discourse and 0 for “nothing” or the empty class—he was able to express propositions of pure logic that were devoid of nonlogical elements, another historical first. It was Boole who coined the expression “universe of discourse,” which is ubiquitous in modern logic, and it was Boole who first suggested the possibility of reinterpreting a formal language by changing the universe of discourse and the meanings of the nonlogical symbols.

Where for Aristotle the elements were represented by the Greek words having fixed meanings—for *human*, *animal*, and other substantives, Boole's letters were reinterpretable. Each of Aristotle's formal sentences expressed exactly one proposition whether true or false, but for Boole any single formal sentence was capable of expressing indefinitely many propositions not necessarily all true (as $x(1-x) = 0$) or all false (as $x(1-x) = 1$). Those that expressed only truths he said were “true in virtue of form,” perhaps coining this expression also. This innovation was eventually to play a crucial role in modern logic. For example, with the multiplication sign or juxtaposition representing “logical term-conjunction” (the Boolean “and”), with x for *human* and y for *animal*, Boole thought he had expressed Aristotle's “Every human is an animal” by $xy = x$.

SOLVING LOGICAL EQUATIONS, DISCOVERING PROPOSITIONAL LOGIC, TRANSFORMING AN ORGAN INTO AN AXIOMATIC SCIENCE

These innovations opened the way to Boole's most radical, totally unexpected and unprecedented insight: that a fully interpreted equation expressing a proposition, whether true or false, could be considered as an equation with one element regarded as an “unknown” to be solved for in terms of the others. Where Aristotle's focus in for-

mal logic had been exclusively with determining logical validity and invalidity of premise-conclusion arguments, that is, with what has been called formal epistemology, Boole's broader focus included, besides a much expanded formal epistemology, several new concerns, two of which were his wholly new theory of logical equation-solving and his formal ontology concerned with axiomatizing logical truths, which he called by the expression “laws of thought.” Moreover, Boole explicitly recognized, as Aristotle had not, that “class logic,” even in its expanded form, could not treat the arguments now dealt with in truth-functional proposition logic. To meet this deficiency, he proposed an ingenious reinterpretation of his “class logic” that, in his view, transformed it into a propositional logic. In the process he discovered the key ideas now incorporated into laws of modern truth-function logic, establishing himself as the first modern figure in any history of propositional logic.

Before Boole, logic had been thought of as an *organon* or general instrument necessarily presupposed by any axiomatic science, not as an axiomatic science; Boole proposed regarding logic itself as subject to axiomatic treatment. Boole believed that his logic transcended, included, explained, and thus replaced Aristotle's in much the way that Isaac Newton's mechanics transcended, included, explained, and thus replaced Johannes Kepler's.

BOSANQUET, BERNARD

(1848–1923)

Bernard Bosanquet, the English philosopher, was born at Altwick and educated at Harrow and at Balliol College, Oxford. He taught ancient history and some philosophy at Oxford from 1871 to 1881, when he left Oxford for London. In London he edited translations of Rudolf Hermann Lotze's *Logic* and *Metaphysics*, played an active part in the London Ethical Society, worked with the Charity Organisation Society, and did some teaching in the adult education movement. In 1895 he married Helen Dendy, who had been employed by the Charity Organisation Society and who later wrote much on social problems and became a member of the important Royal Commission on the Poor Law of 1909. From 1903 to 1908 he held the chair of moral philosophy at St. Andrews. He died in London.

Bosanquet's first important philosophical work is an essay titled "Logic as the Science of Knowledge" in *Essays in Philosophical Criticism* (A. Seth and R. B. Haldane, eds., London, 1883), a collection of papers in memory of T. H. Green. In *Knowledge and Reality* (London, 1885) he criticized F. H. Bradley's *Principles of Logic* for divergences from the central and, as Bosanquet thought, correct course charted in that book. In 1888 Bosanquet's *Logic or the Morphology of Knowledge* (2 vols., London) was published. Bosanquet had earlier translated the introduction to G. W. F. Hegel's *Philosophy of Fine Art* (London, 1886), and his own *History of Aesthetics* appeared in London and New York in 1892. His Gifford lectures were published as

The Principle of Individuality and Value (London, 1912) and *The Value and Destiny of the Individual* (London, 1913). Bosanquet was a prolific writer who contributed to discussion in all branches of philosophy and also took part in some social controversy. He was two years younger than Bradley and, like him, came to the Idealist point of view partly through the influence of T. H. Green and partly through reading Hegel. Bradley's *Ethical Studies* influenced him, but Bradley, in his turn, learned from Bosanquet's writings, especially from those on logic. Although both were Idealists, and both were called Absolutists, Bosanquet was more Hegelian and less of a skeptic than Bradley.

LOGIC

In the essay "Logic as the Science of Knowledge," which appeared in the same year as Bradley's *Logic* and seems to be independent of it, Bosanquet set out the main lines of his 1888 *Logic*. In this preliminary essay he argued that truth is comprehensible only within systems of knowledge, and that although truth is correspondence with fact, such correspondence is conceivable only within systems because "the facts by which we test conclusions are not simply given from without," and they are not available for judgment until they are "organised into knowledge." He also argued that judgment and inference are not fundamentally distinct, but that judgment is inference not yet made explicit and inference is explicit judgment. A further feature of this striking essay is that in it the forms of judgment are not regarded as fixed and rigid but as "elastic" in their application, so that a form of sentence best suited to express one form of judgment can in fact be used to express many others.

In *Knowledge and Reality* Bosanquet suggested that Bradley had, in spite of his "essential and original conceptions" as to the general nature of judgment and inference and their connection with each other, fallen into some of the errors of "reactionary logic." Bradley said, for example, that categorical judgments state facts, whereas hypothetical judgments (and with them universal ones) do not. By an ingenious choice of examples, Bosanquet shows that such a contrast cannot be sustained and that there is no contrast between being a fact and being a universal. Bosanquet's method is to cite intermediate cases that make impossible the acceptance of sharp distinctions between forms of judgment. He thinks that Bradley was inclined to isolate his examples from their contexts and to lose sight of the subtleties and complexities of language. An instance of this part of Bosanquet's argument is his discussion of Bradley's example "the sea-serpent exists."

Bosanquet points out that it is far from clear what this means in the abstract and that “‘exist’ is a formal predicate which receives material interpretation from context.”

In *Logic or the Morphology of Knowledge* these views are worked out in systematic form. The first volume is concerned with judgment and the second with inference, but the two parts are very closely linked. Bosanquet did not think that, in actual and advancing thought, form and subject matter could be separated. Thus he regarded formal logic not as the standard of thought but as a highly specialized and idealized, and somewhat subsidiary, type of thinking. The forms of judgment and inference with which he concerns himself, therefore, are those that he regards as operative in the actual advancement of knowledge. Judgment is concerned with truth, and mere interjections do not claim to be true; but there are rudimentary judgments of quasi-interjectional type, such as “How ugly!” or “Oh, horrible!” Such impersonal judgments as “It rains” take us still further along the road of developing thought, and demonstratives take us still further. “This” is always so by relation to “that,” so that demonstratives lead on to comparison; and as comparison is made more exact, it leads on to proportion and measurement.

At this point, according to Bosanquet, the series diverges, one route being that taken by what he calls “the concrete or categorical series” and the other by what he calls “the abstract or hypothetical series.” Along the first route there are singular judgments and those he calls generic judgments, in which a kind is regarded as real, as when we say “Man is mortal” or “Water boils at 212 degrees Fahrenheit.” Along the second line of development there are the various types of abstract judgment, such as “Heat is a mode of motion” or “ $7 + 5 = 12$,” in which the emphasis is on necessary connection rather than on concreteness. The two series converge again in the hypothetical judgment, and the whole culminates in the disjunctive judgment, which Bosanquet regards as the most adequate form. His reason for this is that it combines the concreteness of the categorical series with the necessity of the hypothetical series. The various disjuncts, in this view, reveal a system in which every member has its distinct place.

Bosanquet illustrates this by such examples as “The triangle is either scalene, isosceles, or equilateral.” In the *Essentials of Logic* (London and New York, 1895), he refers to functions within a social order of the sort which, if an individual exercises one of them he does not and cannot exercise any of the others: if a person is king, he is not subject; if he is judge, he is not prosecutor. In his account

of inference, Bosanquet also lays great stress on intermediate and transitional forms. Furthermore, just as he minimizes the difference between judgment and inference, so he minimizes the difference between deduction and induction. He holds that knowledge advances neither by generalization from particulars nor by the elimination of hypotheses. Inference, in his view, depends upon the existence of systematic connections, and neither mere counting nor mere discarding can reveal these to us. What is needed is “depth and complexity of insight into a sub-system of the world,” and the word “induction” is used when our points of contact with the real world are “isolated perceptions, occurrences or qualities.” But the aim of all inquiry is to break down this isolation and to show how the elements of a system must be what they are. Thus, as knowledge advances, the aspect of contingency is less prominent, mere facts or mere observations play a vanishing part, and we come to see that things must be as they are.

METAPHYSICS

For Bosanquet, as for Hegel, there is no sharp division between logic on the one hand and epistemology and metaphysics on the other. Indeed, although logic is concerned with the forms of judgment and inference, the study of these forms leads to the conclusion that reality is systematic. If facts were distinct and isolated, it would be impossible to infer from one to another. Since inferences can be made, facts are not isolated but are “implicated” with one another and “transcend” themselves. The possibility of inference points to the metaphysical fact of “self-transcendence.”

Bosanquet’s metaphysical system is outlined in his *Principles of Individuality and Value* and given more detailed application in *The Value and Destiny of the Individual*. These titles indicate Bosanquet’s concern with individuality and individuals. His view is that individuals are concrete universals. He contrasts (as Bradley had done) abstract universals, such as redness, with concrete universals, such as Julius Caesar. Abstract universality is the repetition of an identical quality in many instances, whereas concrete universality is the realization of the same individual in its various interrelated acts or manifestations. The many red things are extremely diverse, whereas the actions of an individual are more or less systematically connected with one another. According to Bosanquet, “there can be only one individual, and that, *the individual, the Absolute.*” When people are called individuals, it is in a “secondary sense,” insofar as they are regarded as relatively independent, stable, and unique.

But this uniqueness is not some internal, private, inaccessible feature of them. The “inwardness” of persons is not something private, not “the banishment of all that seems outward, but the solution of the outward in the circulation of the total life.”

McTaggart complained that everything Bosanquet says about mind and body “might have been written by a complete materialist,” and Bosanquet himself in *Knowledge and Reality* had written that “a consistent materialist and a thorough idealist hold positions that are distinguishable only in name.” Bosanquet rejects both psychophysical interactionism and the view that mind is an effect of matter. He holds that mind is a perfection of the organism and that an organism possesses more or less of it as the organism selects from, and adapts itself to, the circumstances of its world. He rejects the possibility of a mind independent of matter, and draws ethical conclusions from this. Without things, he says, there would be no problems for men. If there were nothing but disembodied persons, there would be nothing to do.

In bringing these general principles to bear upon aspects of experience, Bosanquet comes to some surprising conclusions. His view of individuals as concrete universals might have been expected to lead to a respect for historical knowledge, as it has done with other Idealists. But, according to Bosanquet, history is “a hybrid form of experience,” “the doubtful story of successive events.” His view is that the spatiotemporal contingencies of human life must, as knowledge grows, become absorbed into a fuller understanding of society, art, philosophy, and religion. These, he says, are “concrete and necessary living worlds.” Bosanquet also rejects the view, advocated by Thomas Carlyle, James Anthony Froude, and Bradley, that human conduct and discovery cannot be predicted. He argues that this thesis depends upon the false assumption that individuals cannot overlap, and he holds that such facts as “anticipatory” inventions that have to be “reinvented” are evidence to the contrary. Thus, in *The Value and Destiny of the Individual* he concluded that “intelligences must overlap” and stigmatized as “the pathos and bathos of sentimentalism” the view that selves are essentially withdrawn and alone.

SOCIAL PHILOSOPHY

From what has already been said about Bosanquet’s metaphysics, it follows that societies are individuals to a fuller degree than individuals can be. In the *Philosophical Theory of the State*, he treats the relation between the individual and the state as that of microcosm to macrocosm. The individual world and the social world are held to be

correlated with one another in such a way that for every element in the one there is some corresponding element in the other. Like Aristotle and Jean-Jacques Rousseau, he emphasizes the civilizing influence of the state on the individual. He rejects the commonsense, pluralistic metaphysics that he thinks misdirects the social philosophy of Jeremy Bentham and John Stuart Mill. “All individuals,” he writes, “are continually reinforced and carried on, beyond their average immediate consciousness, by the knowledge, resources, and energy which surround them in the social order.” “The common self or moral person of society,” he holds, “is more real than the apparent individual.”

Hence, like Rousseau, he regards coercion by the state as coercion exercised by the social aspect of the individual upon the recalcitrant and less real aspects of his being. According to classical liberalism, the individual is free when he is left alone to do what he wants. According to Bosanquet, this is a metaphysical as well as a practical impossibility, so he develops the conception of freedom as self-mastery. But since selves are not exclusive atoms, self-mastery, social control, and freedom are held to coincide. Bosanquet accepts T. H. Green’s view that action under compulsion has less value than action freely willed, thus recognizing that state enforcement can lead to mere external conformity. But just as he regarded nature as the necessary complement of mind, so he regarded force, habit, and tradition as the necessary complements of creative choice. Thus, although punishment acts on the “lower self” by means of threats, it can also stimulate the “higher self” by producing a shock that forces attention to legitimate social demands. Still, the function of the state is forcibly to “hinder hindrances to the best life or common good,” and the very notion of promoting morality by force is “an absolute self-contradiction.”

Thus, although Bosanquet minimizes and even denies the reality of individual men, he does not advocate totalitarian or even socialistic measures. Indeed, just as Bastiat, the publicist of laissez-faire, considered that society as a whole was moved by an impersonal reason, so Bosanquet believed that intelligence is manifested in society to a greater degree than it ever could be in any particular person. He has been criticized for failing to distinguish between society and the state and for suggesting that the state can do no wrong. There is justice in the former criticism, even though we may agree that force is inevitable if developed societies are to continue in existence. As to the second, Bosanquet’s main philosophical point was that theft, murder, and such are concepts that apply to people within a society, and that war, conquest,

confiscation, and such are concepts of a different type, applying to beings of a different type.

Bosanquet's account of what makes them different types is very complex. He points out that many crimes committed on behalf of the state result from the desire of some individual agent of the state to take a short cut or to save trouble and hence are not imputable to it. Furthermore, the state cannot commit wrongs of the sort that are the consequences of individual selfishness or sensuality. On the other hand, a state that ordered the killing of a hostile statesman would rightly be criticized, not on the ground of murder but "by the degree of its failure to cope with the duties of a state." Bosanquet seems to mean that when a state is rightly criticized, it is compared with more adequate specimens of its own type but is not blamed or punished as are individuals who break the law. Bosanquet holds that states are morally responsible beings, but that they cannot do wrong in the way that individual persons can and do. States fall short rather than do wrong. Furthermore, he repudiates the idea that individuals are guilty of murder when a state wages war or of theft when it annexes or confiscates; any moral criticism, he holds, should be directed against the morally responsible agent, the state itself, and such criticism must relate to the general level of life it sustains and promotes. At the end of World War I Bosanquet opposed such popular appeals as "Hang the Kaiser" and "Punish the Germans," and although he said that the League of Nations was "the hope and refuge of mankind," he believed that individual members should no more submit themselves unreservedly to this organization than individual men should submit themselves unreservedly to their own governments.

Bibliography updated by Michael J. Farmer (2005)

BOSCOVICH, ROGER JOSEPH (1711–1787)

Roger Joseph Boscovich (or Rudjer Josip Bošković) was a Jesuit scientist whose originality and advanced views have only recently been appreciated. A natural philosopher, mathematician, physicist, astronomer, geodesist, engineer, and poet, Boscovich was, in the words of the physicist John Henry Poynting, "amongst the boldest minds humanity has produced." Boscovich published about one hundred books and papers, most of them in Latin. These works display an unusual combination of enthusiasm and logic as well as a passionate conviction that simple fundamental assumptions and precise reasoning can lead

to the understanding of natural phenomena. The French astronomer Joseph Jérôme Le Français de Lalande said that in each of these works there are ideas worthy of a man of genius.

Boscovich was born at Ragusa (now Dubrovnik, Croatia) of Serb and Italian parentage. He entered the novitiate of the Society of Jesus in Rome in 1725 and the Collegium Romanum in 1727. At the Collegium stress was laid on clear logical thought and on the development of a way of thinking that combined religious convictions with the results of science. Boscovich devoted himself chiefly to mathematics and physics and published his first scientific paper in 1736. He became professor of mathematics at the Collegium in 1740, and in 1744 he took his vows as a priest. Since his gifts were scientific, Boscovich was left free to apply himself to teaching, research, and tasks designated by the religious authorities. In 1734 Pope Benedict XIV appointed him, with others, as a technical adviser concerned with cracks in the dome of St. Peter's, and in 1750 commissioned him with Christopher Maire, an English Jesuit, to measure an arc of the meridian through Rome. Later, Boscovich was designated to arbitrate a dispute between the Republic of Lucca and Austrian Tuscany over the drainage of a lake. This task took him to Vienna, where he already enjoyed a high reputation as a scholar and a diplomat. From 1759 on, Boscovich was engaged in extensive travels as far away as Constantinople. In 1760 he met Benjamin Franklin and many other leading personalities in London and Cambridge, and he was elected a fellow of the Royal Society in 1761. He became professor of mathematics at Pavia in 1765, but his health was failing and he grew restless. A chair was created for him at Milan in 1769, and he pursued studies at the Brera observatory. In 1775 Boscovich was appointed director of naval optics for the French navy and went to Paris, where he was made a subject of France by Louis XV. He returned to Italy in 1783. During his last years he suffered from melancholia.

Despite these activities Boscovich continued to publish. Each of his numerous works in pure and applied mathematics presented either a new method for or a survey of some branch of mathematical inquiry. Among the topics he discussed were spherical trigonometry, the cycloid, conic sections, infinitely great and infinitely small quantities, the accuracy of astronomical observations, the telescope, sunspots, eclipses, the determination of the sun's rotation and of the orbits of planets and comets, the aurora borealis, the transit of Mercury, the shape of Earth, the variation of gravity, the center of gravity, and optical problems. His last major publication was a five-

volume work on optics and astronomy, *Opera Pertinentia ad Opticam et Astronomiam*, published at Venice in 1785.

Boscovich's masterpiece, and his work of greatest interest to philosophers, is *Philosophiae Naturalis Theoria Redacta ad Unicam Legem Virium in Natura Existentium* (A theory of natural philosophy reduced to a single law of the actions existing in nature), published in Vienna in 1758 and, in an improved edition, at Venice in 1763. In this work Boscovich presented an atomic theory on which he had been working for fifteen years. The importance of this theory was widely recognized, especially in Britain, where the *Encyclopaedia Britannica* devoted fourteen pages to it in 1801. Boscovich had been the first supporter in Italy of Isaac Newton's theory of gravitation, and the *Theoria* was looked upon in Britain as an interesting speculative extension of the Newtonian system.

Boscovich's atomic theory arose, as he himself stated, from an attempt to build a comprehensive physics based on the ideas of Newton and Gottfried Wilhelm Leibniz but going beyond both to obtain new results. Boscovich developed the idea that all phenomena arise from the spatial patterns of identical point particles (*puncta*) interacting in pairs according to an oscillatory law that determines their relative acceleration. This view of matter is akin to that of recent physics in that it is relational, structural, and kinematic. It contains three original features:

(1) Material permanence without spatial extension: Quasi-material point-centers of action are substituted for the rigid finite units of matter of earlier atomists.

(2) Spatial relations without absolute space: Internal spatial coordinates (the distances between the two members of pairs of *puncta*) are used instead of external coordinates.

(3) Kinematic action without Newtonian forces: In modern dimensional terms, Boscovich's theory is kinematic rather than dynamical. It uses only two-dimensional quantities (length and time) rather than the three (mass, length, and time) used by Newton. Since all particles are identical, the number of particles in a system, which is an integral pure number obtained by counting, is employed in place of Newtonian mass.

Although all of these features are of interest, the first is most important, for by it Boscovich helped emancipate physics from naive atomism's uncritical assumption that the ultimate units of matter are small, individual, rigid pieces possessing shape, size, weight, and other properties. The alternative point atomism assumes that the ultimate units are persistent quasi-material points, all identical, which form stable patterns or interact to pro-

duce changes of pattern and relative motion. Between 1710 and 1760 such other thinkers as Giambattista Vico, Leibniz (whose theory of monads and relational conception of space influenced Boscovich), Emanuel Swedenborg, John Michell, and Immanuel Kant had produced atomic theories based on points, but Boscovich was the first scientist to develop a general physical theory using point particles.

Boscovich preferred the concept of *puncta* to that of rigid pieces of matter because they were simpler and, since they avoided the awkward discontinuity at the surface of a piece of matter, were better adapted to mathematical treatment. His law of oscillatory change from attraction to repulsion enabled him to posit points of stable equilibrium at finite distances and thus to account for the finite extension of gross matter, as Kant did also. The complexity of the world, according to Boscovich, arises from two factors: the varied arrangement of different numbers of particles, and the parameters determining the law of oscillation.

To a modern reader, the impressive feature of the *Theoria* is Boscovich's interpretation of the universe as a three-dimensional structure of patterns in equilibrium or change determined by points and their mutual distances. There is no distinction between occupied and empty space, for space is only the relation between *puncta*. Space, time, and motion are all relative; the *puncta* form a vast variety of stable patterns; the laws of the universe are simple, but their consequences are complex; the laws contain several natural units of length, as do the laws of modern physics since the introduction of Planck's constant; there is a pervasive continuity in nature permitting inference from the macroworld to the microworld; geometry is in part a creation of the human mind and can to some extent be chosen at will; the ability of atomism to account for the forms and processes of the natural universe is unlimited, and even organic forms are easy to understand, because complex patterns of particles will adhere to one another in figures of certain shapes.

As a speculative vision of a universe of changing structure supported by an appropriate philosophy of physics, Boscovich's system is brilliant, but as a scientific theory it is incorrect because it does not allow for the highly complex properties of the wave-particles of present-day physics. No data concerning the atomic world were available to provide a quantitative basis for Boscovich's theory, and he was able to give only a qualitative description of simple mechanical and physical properties. The physical world is more complex than the world Boscovich created from his imagination. Nevertheless, his

philosophy of physics was in some respects near the truth, for he predicted—a century and a half before the facts were known—that matter is penetrable by high-speed particles and that relative motion affects the measurement of space and time. Moreover, these predictions were necessary consequences of his mathematical conception of three-dimensional structure. Boscovich's standard of simplicity remains a challenge to physics, and only a future, fully unified, particle theory will be able to show precisely where his assumptions were mistaken. Boscovich postulated that there is only one fundamental particle; we do not yet know how many must be assumed. Modern conceptions of molecular structure have much in common with Boscovich's ideas, but since the development of the physical concept of a field, it can be seen that the Boscovichian particle is inadequate even to account for electromagnetic processes.

It is not certain how far the *Theoria* influenced the development of atomic theory. It was widely studied, and Michael Faraday, Sir William Hamilton, James Clerk Maxwell, and Lord Kelvin (to mention only English scientists) stressed the theoretical advantages of the Boscovichian atom over rigid atoms. In any case, Boscovich's work marked an important stage in the history of our ideas about the universe, and his system will remain the paradigm of the theory of point particles.

BOSSUET, JACQUES BÉNIGNE (1627–1704)

Jacques Bénigne Bossuet was born in Dijon, the son of a lawyer. At the age of thirteen he was a boy canon of Metz. After a period in Paris, where he became known in the salons and distinguished himself as a theologian, he was ordained priest in 1652 (having been prepared by Vincent de Paul) and began his ministry at Metz. Friends in high places secured his recall to Paris in 1659, and he soon established a reputation as preacher and spiritual director. Contemporaries agree that he had the ability, and presumably the desire, to please everyone; and his early reputation for moderation may reflect tactics more than convictions. Winning favor at Court, he was rewarded in 1669 with the see of Condom and was appointed tutor to the dauphin, Louis XIV's son, in 1670. He is most famous for the series of funeral orations he delivered as Court preacher (1666–1687), of which the last and finest commemorates the great Condé. Besides these set (and published) pieces, he preached numerous sermons for all occasions, often using the feast of a particular saint for an exposition of his own views on a contemporary question, such as the relations between church and state, lucidly discussed in the panegyric of St. Thomas of Canterbury (Becket). Some 200 sermons survive, mostly as notes on which he usually improvised, and it is easier to establish his main ideas than to reconstruct his mastery of the spoken word.

On completion of the tutorial task, he was transferred in 1681 to Meaux, conveniently near Paris, where he remained until his death. His influence at Court gave him more effective power than his hierarchical superiors, and in 1682 he composed and presented the Gallican Articles as spokesman for the whole French church. His last years were marred by quarrels, especially with his former protégé François Fénelon, whose condemnation for quietism he secured only by resorting to methods so ignoble that formal victory was bought at the cost of moral defeat. Despised at Court and broken in health, he ended his life among relatives of notoriously unedifying character.

All Bossuet's thinking was deeply influenced by St. Augustine and characterized by a peculiar emphasis on authority. In his eyes, obedience and discipline are the highest virtues. The supreme authority of the church and the divine right of kings are inseparable and constantly recurrent themes in his work. In the *Politique tirée de l'écriture sainte* (Politics Drawn from Scripture), written for

the dauphin, he is heavily in favor of the absolute monarch, chosen by God and responsible to him alone (distinguished, however, from the arbitrary monarch, a tyrant who merely gratifies his own whims). The *Traité de la connaissance de Dieu et de soi-même* (Treatise concerning the Knowledge of God and Oneself) combines Thomist and other standard teaching with a marked sympathy for the reassuringly authoritarian side of Cartesianism, with its insistence on order and certainty, although Bossuet elsewhere denounced the dangers of encouraging individual reason and inquiry. The unfinished *Discours sur l'histoire universelle* (Discourse on Universal History) was intended to teach the dauphin not so much what had happened as why. Though later editions made some concessions to currently changing views on the chronology of ancient times, history was primarily interpreted as showing the ways of God to man, especially as revealed in the Bible. In tracing the fortunes of empires down to Charlemagne (and to Louis XIV, if he had completed his plan), Bossuet emphasized moral and religious development, regarding freedom as a prime cause of decadence.

Similarly, the *Histoire des variations des églises protestantes* (History of the Variations of the Protestant Churches) attributes to Protestant reliance on individual liberty of conscience a disunity amounting to near anarchy. Bossuet naturally regarded heresy and sedition as twinned evils; and in his orations on Henrietta Maria and Henrietta Anne (widow and daughter of Charles I), he adduces the recent revolution in England to prove his contention that social equality is an impious chimera. He was curiously ambivalent in his relations with Protestants, converting many individuals (including the vicomte de Turenne) and courteously corresponding with Gottfried Wilhelm Leibniz in an attempt to effect a reconciliation, while greeting the revocation of the Edict of Nantes, followed as it was by brutal persecution, with an embarrassingly effusive eulogy of Louis's piety.

Bossuet earns his place in history above all as a public figure, "the eagle of Meaux." In the *grand siècle* Bossuet was the church, just as Louis was the state.

BOSTRÖM, CHRISTOPHER JACOB (1797–1866)

Christopher Jacob Boström, an Swedish Idealist philosopher, studied and also taught at Uppsala University, where he was assistant professor of “practical philosophy” (the philosophy of morals, law, and religion) from 1828 to 1833. After an interlude as tutor to the royal princes in Stockholm from 1833 to 1837, he resumed his academic teaching, and from 1842 to 1863 he held the chair in practical philosophy. His “rational idealism” is a spiritualistic metaphysics, combining traits from Plato’s theory of ideas, Gottfried Wilhelm Leibniz’s monadology, and George Berkeley’s immaterialism. With arguments, some of which are reminiscent of Berkeley’s, he tried to show that nothing but minds and their perceptions exist.

Two of his more original, though hardly very convincing, arguments were these: (1) Truth means agreement between the perception and the perceived object. Perfect truth, therefore, is perfect agreement; and perfect agreement is the same as identity. Hence, the object of any perfectly true perception is identical with that perception; in other words, any object, when perceived with perfect truth, is itself a perception. (2) “Outside” has a meaning only when it refers to space. Since a mind is not in space, nothing can be outside a mind. Hence, everything exists inside a mind.

Particular minds and particular perceptions are forms of “self-consciousness,” which can be likened to “a substance or stuff of which everything ultimately consists.” With this spiritualistic position Boström combined the Leibnizian-Kantian distinction between a thing as it is

in itself (essence) and a thing as it appears to us (phenomenon). The spatiotemporal world of experience is merely phenomenal. Or, more correctly, the spatiotemporal world of a person’s experience is merely the way in which the things-in-themselves appear to that person because of the imperfection of his particular perceptive faculty. The things-in-themselves, which underlie the appearances, are purely rational minds whose existence is nonspatial and nontemporal. Boström usually called them “ideas,” the word being borrowed from Plato rather than from British empiricism. These ideas form a series that, according to him, is similar to the series of natural numbers—except that it contains a maximal idea, God. In this series each idea contains and perceives all the preceding, but none of the succeeding, ones. On this point, however, he was apparently not quite consistent. Simultaneously he asserted that every idea perceives the entire system of ideas but with varying perfection and clarity. God alone has a perfect perception of the whole system. Because every idea that is not God perceives the system imperfectly, the system presents a phenomenal appearance to that idea.

Boström’s system contains several other apparent inconsistencies. Although each mind is a purely rational, nonspatial, and nontemporal idea, Boström also taught that each mind other than God has a double existence. Besides existing as a rational idea, it also exists as a temporal mind with a mixed rational and sensual nature. Each mind even has a whole (temporal?) sequence of such mixed and temporal manifestations. (Boström himself points to the analogy between this doctrine and the Hindu belief in reincarnation.) He was thinking primarily of human beings in this context, but the doctrine of double existence is also supposed to apply to such “moral personalities” as the state, the “people,” and each one of the four estates.

Boström was aware of the nonintellectual motives that attracted him to this view of the world and once asserted that no philosopher would ever embrace a system that was repugnant to his feelings. Simultaneously, however, he made excessive claims concerning the provability of his own doctrine, to which he attributed the same kind of certainty that has traditionally been ascribed to mathematics.

From the vantage point of his rather fantastic metaphysics, Boström took an active part in public debate in Sweden. In religious questions he was, on the whole, a liberal, vigorously attacking many of the dogmas of Lutheran orthodoxy, especially the dogma of eternal damnation. On political questions, on the other hand, he

took an ultraconservative stand. He was one of the staunchest opponents of the parliamentary reform that took place in 1866, soon after his death, and that replaced the four estates by a two-chamber system. His metaphysics might seem to indicate a mystical strain, but his very systematic, precise, and dry mode of writing does not corroborate this impression. The dominant traits in his philosophic temperament would seem to be a strong, puritanical, moral pathos, an unorthodox but firm religious belief, a love of neat systematics, and a rather naive private dogmatism. Boström's philosophy represents the culmination of the idealistic tradition that dominated Swedish philosophy through the entire nineteenth century. In the 1860s, 1870s, and 1880s, Boströmianism and Hegelianism reigned supreme in Swedish academic philosophy. At the turn of the twentieth century a strong neo-Kantian current set in.

BOULAINVILLIERS, HENRI, COMTE DE (1658–1722)

The historian, philosopher, astrologer, and savant Henri, Comte de Boulainvilliers, or Henry, Comte de Boulainviller, as he preferred to spell his name, was born at Saint-Saire, Normandy. From 1669 to 1674 he was educated at the Oratorian school at the College of Juilly, where Richard Simon taught rhetoric and philosophy. Boulainvilliers took up military service, as befitted a member of an old aristocratic family, proud of his lineage. After leaving the army, he developed an interest in history, first studying his own family tree and then the social and political institutions of the Middle Ages. He approved of feudalism, which he envisaged as a kind of federal republic governed by distant and independent aristocratic families, whom he considered to be the inheritors of the Franks who had conquered the Gauls. He deplored the increase in the power of the central authority—the king—and in the liberties of the people as encroachments on the rights of the nobles. He favored a patriarchal society. Many of his reforms, submitted to the regent, recommended the fostering of trade, proportional taxation, the suppression of tax collectors, and the calling of the États Généraux. The count had access to Court circles; he was connected with d'Argenson, president of the council of finance, to whom it is thought he passed on a number of clandestine philosophical tracts. He also frequented the home of the maréchal, duc de Noailles, where he met César Dumarsais, a disciple of Bernard Le Bovier de Fontenelle, future author of articles for the *Encyclopédie* and probable author of *La religion chrétienne analysée* and *Examen de la religion*; Nicolas Fréret, a devotee of Pierre Bayle; and Jean-Baptiste de Mirabaud, the *secrétaire perpétuel* of the *Académie Française*.

For a time Boulainvilliers was the center of much intellectual activity, and in the history of free thought his coterie antedates by fifty years the better-known *côterie holbachique*. Voltaire in his *Dîner du comte de Boulainvilliers* (1767) has given us an insight into this milieu, which certainly disseminated a surprisingly large number of clandestine manuscripts and seems to have provided the only organized center for the compiling, copying, and distribution of philosophical tracts. Boulainvilliers is best known as the probable author of parts of the *Essai de métaphysique*, which was published in 1731 under the title *Réfutation des erreurs de Benoît de Spinoza*. He became interested in Benedict de Spinoza through reading the *Tractatus Theologico-Politicus*, which he annotated copiously, and also the *Ethics*, which he read in 1704. The first part, or *Vie de Spinoza*, of the *Essai de métaphysique* has been attributed to J. M. Lucas. The second part, or *Esprit de Spinoza*, has been attributed by I. O. Wade and others to Boulainvilliers. Both parts are commonly coupled together in the manuscripts and in the editions under the title *La vie et l'esprit de Spinoza*. Boulainvilliers correctly presents Spinoza's doctrine that God and the universality of things are one and the same, then proceeds to argue that Spinoza's "attributes" are in fact "modes"; that is, "modes" of something he terms existence.

In this work, he has evolved an original philosophy. Starting from the Cartesian principle that he knows himself to be a thinking being, he infers that other beings exist, some endowed with thought, others only with feeling, and others without feeling or thought. All beings, whether living or nonliving, thinking, feeling, or merely extended, have one property in common: existence. From such premises, he proceeds to a universal Idea or Being more all-embracing than matter. He stresses the degrees of being, and claims that sensations are the source of all experience. He concludes by asserting that at death the body returns to universal matter while the soul remains as an idea in the infinite mind and is, therefore, capable of being restored to the body. It is clear that Boulainvilliers's exposition of Spinoza is curiously based on the Cartesian assertions and incorporates ideas borrowed from John Locke.

He strove to harmonize the notion of a single substance with a sensationalist psychology and a naturalistic ethics. He believed in a "chain of being," in the capacity of animals to think, and in evidence (as opposed to judgment) as the only criterion of truth; he also helped to discredit Christian revelation. In an *Abrégé d'histoire ancienne* he expressed his belief in the primacy of natural laws, denying the possibility of miracles. These points

were later taken up by Denis Diderot in the article "Certitude" of the *Encyclopédie*.

DE TRIBUS IMPOSTORIBUS

Figuring as part of the *Essai de métaphysique*, sometimes titled *L'esprit de Spinoza*, is to be found a treatise commonly known as the *Traité des trois imposteurs*, under which title it was published in 1719 (2nd ed., 1721; numerous others throughout the century). Since printed copies were commonly impounded and consequently hard to find, manuscript copies continued to circulate both before and after publication. Polemic and concise, it provided freethinkers with valuable ammunition. Its aggressive title helped to ensure its success and may have been chosen by the Dutch printers as the last and profitable stage of an elaborate hoax. It is an allusion to a lost treatise, *De Tribus Impostoribus* (1230), supposedly written by Frederick II for the edification of his friend Othon. Interest in this Latin work, evidenced in *Theophrastus Redivivus* (1659), had been revived at the close of the seventeenth century and the beginning of the eighteenth.

The author of the *Traité des trois imposteurs*, believed by Voltaire to be Boulainvilliers, launched a virulent attack on the prophets and apostles; he expressed his disbelief in heaven or hell, rewards or punishments, his faith in natural law as enshrined in the hearts of men, and in the soul as the expression of the principle of life. The system of religion is, according to him, the work of false legislators, among whom are Moses, Christ, and Muhammad. Moses was nothing more than a magician and a charlatan; Christ, who may be likened to Genghis Khan, was a casuist in his discussions with the Philistines and in claiming to be the son of a god; his religion owes much to Greek mythology and his ethics compare unfavorably with those of Epictetus and Epicurus. Muhammad differs from the other two impostors in having recourse to violence in the establishment of his kingdom. Voltaire, among others, seized on these points to bolster his polemics against the church. He, too, saw the advantage of an oblique attack on the church by an onslaught against Islamic fanaticism, coupled with the claim that all religions are equal. The treatise marks an early, if crude, attempt to consider religion from the comparative standpoint.

Boulainvilliers is best remembered as a confirmed "spinoziste," and his views on the subject of nature and matter, the relationship of matter and thought, and the origin and nature of government won him a place as a forerunner of the philosophes.

See also Clandestine Philosophical Literature in France; Spinozism.

BOWNE, BORDEN PARKER (1847–1910)

Borden Parker Bowne, an American Personalist philosopher, spent his scholarly life, that is, from 1876 to 1910, at Boston University, where he taught in the liberal arts col-

lege and the school of theology, and where he became the first dean of the graduate school. In many articles and in seventeen books, Bowne expounded his Personalism, or Personalistic Idealism, which held that the Creator-Person, God, and created persons constitute the real.

Bowne was constantly concerned with taking full account of every dimension of human experience, be it the logical, the emotional, the moral, or the religious. Each dimension should be given full value and not be arbitrarily explained away by pontifical claims made in the name of such doctrines as Christian supernaturalism, psychological associationism and materialism, or ethical utilitarianism. For Bowne, reason is the criterion of truth. This means that for him reasoning discovers the real by interweaving and interpreting the different dimensions of experience.

The presupposition of thought and action is a unified, thinking self, or person. Were the person unable to will freely (granted limitations) and to choose in accordance with moral and intellectual ideals, there could be no trustworthy science or philosophy and no significance to moral and religious living. It is in the nature and experience of this self-identical, thinking, willing, and feeling person, who may not be reduced either to a mode of matter or to a mode of divinity, that Bowne finds his clue to, and his model of, reality.

Persons, however, do not create themselves, or each other. They could not communicate with each other were they not bound by the same laws of reason and subject to a common world. Each knower is bombarded by a flux of discontinuous sense impressions and responds as constructively as possible in accordance with his or her own dynamic categories, such as time, space, quality, quantity, cause, substance, and purpose. Thus the "common world" is the phenomenal world as organized by knowers who interact with, and ultimately depend upon, the structure of the real world independent of them. The phenomenal world is not a mask of the real world; it is the real world as related to the cognitive nature and purposes of finite knowers.

Bowne argues that the real world is neither nonmental nor independent of persons. For in knowing, and in interacting with an order other than itself, the mind must meet not only the conditions of its own nature but those of some agency or agencies independent of it. Since knowledge exists, and yet is not imported into a passive mind, the realist's contention that the real is unaffected by knowing is unintelligible. The fact must stand that minds, in following their own natures, can know with reasonable assurance the reality in which they live and can construct

a common world of thought and action, even though they are not identical with the real in knowing.

Furthermore, minds in their theoretical and practical action are clearly alien neither to each other nor to the reality that is the source of their experiences. The world as known is the world persons construct, following the nature of their own theoretical interests, on the basis of the reality beyond their thought. Why, then, hold that any reality beyond finite things is nonmental if such cooperative interaction is possible?

Bowne granted that the case against nonmental "material being" is not proved beyond a shadow of a doubt. But he argued that what we do know about the relation of mind to nature is more economically explained if we think of nature as the energizing of a cosmic Person. Nature is God willing in accordance with rational principles, hence nature dependably supports the orderly common world our finite reasons construct in response to it. God, however, is not identical with the natural world. He is transcendent as well as immanent in relation to it. He is the unified, dynamic ground of nature, and he uses it for his purposes, inclusive of his interaction with finite persons.

How, then, are finite persons related to God? Finite persons are created by God and have relative, delegated autonomy. The real world, whose structure maintains and guides the constructive cognitive adjustments of persons, does not force their moral and appreciative responses. But when persons do not treat each other as persons in a realm that is morally purposeful, they fall short of what their own natures in God's world can be. God created man free, to work out the content of his freedom in a world order that at once limits and gives him opportunity for fulfillment. Human freedom could effect nothing in a world without order, for persons do not create the rational or moral principles by which they guide their thought and action in the given ultimate order.

For Bowne, then, the natural world as known by persons is the objectification of the orderly interaction between finite wills and cosmic Will. The ethical world is the objectification of the orderly, chosen, interaction among free, finite persons in the natural world God makes possible. Bowne's universe is not (like Benedict de Spinoza's) a unity with many finite modes. It is a realm of persons united both by God's purposive action in nature and by the further moral unity created as persons freely respond to the reason, will, and love of the cosmic Person.

Bibliography

Among the most interesting philosophical works by Borden Parker Bowne are *The Theory of Thought and Knowledge* (New York: Harper, 1897); *Metaphysics* (New York: Harper, 1898); *Theism* (New York: American, 1902); and *Personalism* (Boston: Houghton, Mifflin, 1908).

Works about Bowne include E. S. Brightman, "Personalism and the Influence of Bowne," in *Proceedings of the Sixth International Congress of Philosophy*, edited by E. S. Brightman (New York: Longmans, Green, 1927); and A. C. Knudson, *The Philosophy of Personalism* (New York: Abingdon Press, 1927).

For bibliography, see F. J. McConnell, *Borden Parker Bowne* (New York: Abingdon Press, 1929).

Peter A. Bertocci (1967)

BOYLE, ROBERT

(1627–1691)

Robert Boyle, the English natural philosopher, was the fourteenth child of Richard Boyle, the first earl of Cork, who by judicious marriages and land purchases had made himself the most influential man in Ireland and the richest in England. The political and financial fortunes of the earl of Cork fluctuated considerably during his son's lifetime, but ultimately Robert Boyle inherited a considerable income, which greatly facilitated his scientific researches.

In October 1635, Boyle entered Eton, which with Sir Henry Wotton as provost was a notable center of culture and learning. As a result of a change of teachers, Boyle left Eton in 1638 to be privately tutored. In 1639 he went to Geneva, where he studied mathematics; his devotion to religion, so he tells us in his fragment of an autobiography, *An Account of Philaretus during His Minority*, dates from this same period. A visit to Florence in 1641–1642 introduced him to Galileo Galilei's ideas and confirmed him in his hostility to Roman Catholicism. His return to England was delayed by a crisis in his father's affairs. When Boyle was free to return to England in 1644, his father was dead and he had inherited the manor of Stalbridge in Dorsetshire.

Boyle stayed at first in London with his favorite sister, Lady Ranelagh, whose house was a center of intellectual life. There he met Samuel Hartlib (d. 1670?), an enthusiastic educator and intellectual middleman, through whom Boyle was brought in touch with the burgeoning scientific activities of London. In Boyle's correspondence with Hartlib there are several references to their membership in an "Invisible College"; this has generally been identified by biographers with the Gresham's

College group out of which the Royal Society was to develop. The “Invisible College” Boyle referred to, however, would seem rather to have been an independent group centering on Hartlib and having an interest in social and educational reform as well as in science.

From 1645 until 1652 Boyle lived in retirement at Stalbridge, remote from the political upheavals of the times. He was still essentially a dilettante, interesting himself—but not too seriously—in chemistry, writing theological tracts of a highly moral character, and composing what was perhaps the first religious novel, *Seraphic Love* (1648). In 1652–1653 he visited his Irish estates; unable to obtain materials for chemical experiments, he studied anatomy under William Petty. The interest in biological processes thus engendered remained with him. In bad health from early manhood, he was particularly interested in the application of chemical methods to the cure of disease and was a diligent collector of prescriptions.

The Commonwealth had appointed a number of London scientists to posts at Oxford; in 1654 Boyle accepted an invitation from John Wilkins to make his home there. Now his serious career as a scientist began. He built a laboratory and employed a number of research assistants, in particular Robert Hooke (1635–1703), later to be curator of experiments at the Royal Society. With Hooke’s help, Boyle constructed a greatly improved air pump, experiments with which provided the groundwork for Boyle’s first and most important scientific work: *New Experiments Physico-Mechanical touching the Spring of the Air and Its Effects* (1660). Following up the work of Galileo and Evangelista Torricelli, Boyle demonstrated that air has both weight and elasticity and that the phenomena that had traditionally been ascribed to an anthropomorphically conceived “horror of a vacuum” were, in fact, a product of the air’s elasticity.

His conclusions created an immediate stir but were not universally accepted. Boyle was criticized on philosophical grounds by Thomas Hobbes, Henry More, and the Jesuit Franciscus Linus (1595–1675), to all of whom he replied in detail. In the course of his reply to Linus, Boyle formulated what is known as Boyle’s law. (On the Continent it is called Mariotte’s law, Mariotte having confirmed it in 1676.) In the years that followed, Boyle took part in the meetings of the embryonic Royal Society at Oxford, conducted and published a great many experiments, corresponded voluminously with most of the leading thinkers of Europe, studied Oriental languages, actively supported the distribution of the Bible in foreign parts—becoming for that purpose a governor of the Corporation for the Spread of the Gospel to New England

and a director of the East India Company—and wrote a considerable number of scientific, philosophic, and theological treatises. After the Restoration most of his scientific friends returned to London; Boyle left Oxford for London in 1668 and lived in Lady Ranelagh’s household until her death. He died a week later.

SCIENCE AND PHILOSOPHY

Boyle was profoundly influenced by Francis Bacon’s conception of science; much of his published work consists of what Bacon called “histories”—systematic accounts of such qualities as color, firmness, and coldness as they appear under a variety of circumstances. His *Spring of the Air* was the first scientific paper of the modern type. He encouraged scientists to write relatively brief experimental “essays” rather than general treatises. His *Animadversions upon Mr. Hobbes’ Problemata de Vacuo* (published in Boyle’s *Tracts*, 1674) emphasized the fruitlessness of a priori philosophical reasoning—what Boyle called “book philosophy”—about issues that could be settled only by experiment.

But it is wrong to suppose that Boyle was an opponent of theorizing. He discusses the place of theory in science in his proemial essay to *Certain Physiological Essays and other Tracts* (1661). Scientists, he says, should “set themselves diligently to make experiments and collect observations, without being over forward to establish principles and axioms.” Theories ought never to be taken as final; they should be thought of as “the best we have but capable of improvement.” Nevertheless, it is the scientist’s task to develop theories that are as clear, as simple, and as comprehensive as possible—a point that particularly emerges in Boyle’s essay “About the Grounds of the Mechanical Hypothesis” (published in *The Excellency of Theology*, 1674).

Indeed, it was Boyle’s main object “to beget a good understanding between the chemists and the mechanical philosophers, who have hitherto been too little acquainted with each other’s learning.” The corpuscular theory, which Pierre Gassendi had revived, suffered, Boyle thought, in the eyes of practical chemical experimentalists because so little had been done to test it. Theorists had been accustomed to illustrate their theories rather than to test them. On the other side, the work of the chemists had been ignored by physical theorists, largely because it had been associated with theories of a totally inadequate kind.

DOCTRINE OF MATTER

Boyle's *The Sceptical Chemist* (1661) is mainly concerned with demonstrating the unsatisfactory character of the standard chemical theories. It is written in the form of a dialogue in which the main speaker, Carneades, attacks not only the traditional theory of elements but also the alchemical theories that had been proposed by Paracelsus and Jan van Helmont. None of these theories, Boyle argued, can be reconciled with experiment, unless they are interpreted in so vague and symbolic a manner as to make them scientifically worthless. As an alternative, he set up the corpuscular theory. It is sometimes said that he also so redefined "elements" as to prepare the way for the modern doctrine of elements; but that is a mistaken interpretation. Indeed, what his chemistry lacked was precisely this modern conception of elements. That is why he was still able to believe in the possibility of alchemical transmutations. In 1689 he secured the repeal of Henry IV's statute against "multiplying gold."

In a sense, however, Boyle's work was too advanced theoretically. Not enough was known about chemical substances to enable the corpuscular theory to be effectively applied in chemistry. Although, in trying to bring together physics and chemistry and chemistry and biology, Boyle anticipated the long-range development of science, the program that he laid down for chemistry was one that for the moment no one knew how to fulfill; the immediate effect may well have been to hold back the development of chemistry. Boyle conceded, it is true, that explanations referring to perceptible properties rather than to the behavior of corpuscles are, at a certain level, perfectly satisfactory; but the general effect of his work was to discourage explanations of the only sort that chemists were actually in a position to offer. His own writings abound in interesting theoretical suggestions—in his *General History of the Air* (1692), for example, he anticipated the kinetic theory of gases—but for a very long time they had to remain no more than suggestions. Although Boyle's actual contributions to science are very few in number, the range of his anticipations is remarkable. He had set out to make chemistry respectable; he had succeeded, many chemists thought, only at the cost of turning it into physics.

PRIMARY AND SECONDARY QUALITIES

Boyle exerted an important influence on philosophy by lending the authority of a practicing scientist to the corpuscular theory of matter and the associated doctrine of primary and secondary qualities. In *The Experimental*

History of Colours (1663), Boyle sets out to demonstrate that color is a "secondary quality" (his own terminology). Objects give rise to sensations of color, he tries to show, not because they are themselves colored but because the structure of their corpuscles modifies light in a special way. The word *color* is most properly applied, he argues, to the modified light that "strikes upon the organ of sight and so causes that sensation we call colour"; if we say that bodies themselves are colored, this can mean no more than that, by virtue of "a certain disposition of the superficial particles," they are capable of refracting or reflecting light.

This thesis is generalized in *The Origin of Forms and Qualities according to the Corpuscular Philosophy* (1666), in which the theory of qualities, which John Locke was to rely upon in his *Essay concerning Human Understanding*, is set forth in detail and contrasted with the Scholastic doctrine of substantial forms. The qualities of a material object, Boyle argues, consist of "the size, shape and motion or rest of its component particles, together with that texture of the whole which results from their being so contrived as they are." These primary qualities of objects, operating upon the "peculiar texture" of a sensory organ, "occasion ideas in us."

SCIENCE AND RELIGION

The corpuscular philosophy had generally been associated with atheism. Boyle sets out to show that "by being addicted to experimental philosophy a man is rather assisted than indisposed to be a good Christian" (*The Christian Virtuoso*, 1690). His views about the relation between God and Nature, however, are by no means clear. In "An Hydrostatical Discourse Occasioned by Some Objections of Dr. Henry More," included in *Tracts* (1672), Boyle strongly opposes More's view that mechanical principles cannot explain the phenomena of pressure or any other physical phenomena. We do not need, he says, to have recourse to More's "incorporeal creatures"; mechanism is enough. Yet, at the same time, in *Forms and Qualities* he argues against René Descartes that we cannot account for the behavior of living organisms by supposing that they consist of particles on which God bestowed motion. We have to suppose, Boyle says, that the Creator not only set the world moving but also introduced into it "seminal seeds" that are responsible for the growth and propagation of animal organisms.

Again, in *A Disquisition about the Final Causes of Natural Things* (1688), he expresses his disagreement with those who would reject final causes completely, although he also argues that the scientist, in his day-to-

day work, need pay no attention to anything except the size, shape, texture, and motion of particles. At times, indeed, as in *The Excellency of Theology, or the Pre-eminence of the Study of Divinity above That of Natural Philosophy*, Boyle's anxiety about the contemporary tendency to abandon theology in favor of scientific inquiries leads him into a skepticism about science. If theology has its obscurities, he argues, they are as nothing to the obscurities inherent in the scientific account of continuity or of the relation between mind and body. Revelation can tell us far more about the place of man in nature than can science. But the example of Boyle the scientist was more influential than the precepts of Boyle the theologian. His last gesture in favor of Christianity was to leave in his will a sum sufficient to endow lectures for the defense of Christianity against its opponents; his intellectual legacy, however, was the mechanical interpretation of the world that deism took as its starting point.

Bibliography

For a bibliography of Boyle's voluminous works, see John Farquhar Fulton, *A Bibliography of the Honourable Robert Boyle*, rev. 2nd ed. (Oxford: Clarendon Press, 1961). The only complete collected edition of Boyle's *Works*, edited by Thomas Birch, and with a still useful life by Birch that incorporates Boyle's *Account of Philaretus*, was published in London in five volumes in 1744 and in six volumes in 1772. *The Sceptical Chemist* is in the Everyman Library (London, 1911), and *The Weight and Spring of the Air* is in Vol. I of *Harvard Case Histories in Experimental Science* (Cambridge, MA: Harvard University Press, 1957), an anthology edited by James B. Conant.

For works on Boyle, see Edwin A. Burt, *The Metaphysical Foundations of Modern Physical Science* (London: K. Paul, Trench, Trubner, 1925; rev. ed., 1932), Ch. 6, "Gilbert and Boyle"; Louis T. More, *The Life and Works of the Hon. Robert Boyle* (New York and London: Oxford University Press, 1944); Mitchell S. Fisher, *Robert Boyle, Devout Naturalist* (Philadelphia: Oshiver Studio Press, 1945); Marie Boas, *Robert Boyle and Seventeenth Century Chemistry* (Cambridge, U.K.: Cambridge University Press, 1958)—an excellent book; Richard S. Westfall, "Unpublished Boyle Papers relating to Scientific Method," in *Annals of Science* 12 (1) (March 1956): 63–73, and 12 (2) (June 1956): 103–117.

John Passmore (1967)

BRADLEY, FRANCIS HERBERT (1846–1924)

The English idealist philosopher Francis Herbert Bradley was born in Clapham and educated at University College, Oxford; in 1870 he was elected to a fellowship at Merton College, Oxford, terminable on marriage. Since he never married and the terms of the fellowship did not require him to teach, he was able to devote himself entirely to philosophical writing. His first published work was a pamphlet titled *The Presuppositions of Critical History* (Oxford, 1874). There followed *Ethical Studies* (London, 1876), *Principles of Logic* (London, 1883), and *Appearance and Reality* (London, 1893), as well as many articles in philosophical journals, some of which were published in *Essays on Truth and Reality* (Oxford, 1914) and others in *Collected Essays* (Oxford, 1935).

Like Bernard Bosanquet, Bradley was influenced by T. H. Green. Like Bosanquet, too, he read and admired G. W. F. Hegel, but was less in sympathy with Hegelianism than Bosanquet was. Bosanquet was active in social reform, as Green had been, whereas Bradley was a Tory who hated liberalism and sometimes thought along the lines of Thomas Carlyle's later writings. Bradley was, and intended to be, a highly polemical writer. His *Ethical Studies* and *Principles of Logic* are a sustained attack on the utilitarianism and empiricism of John Stuart Mill and his followers and upon the positivist outlook of the times. Later in his career, Bradley crossed swords with William James (who, however, greatly influenced Bradley's views on existence and reality) and with Bertrand Russell. His views were at their maximum influence during the first decade of the twentieth century, and the philosophical analysis of Russell and G. E. Moore arose largely in the attempt to refute them. Bradley's literary style has been much admired, notably by T. S. Eliot, who, as a graduate student at Harvard, studied Bradley in detail and wrote a thesis about him. Few if any other works on logic have been written with the verve, eloquence, and exuberant clarity of Bradley's *Principles*, but *Appearance and Reality* is less varied, and, from a stylistic point of view, much less successful.

ETHICS

Bradley's *Ethical Studies* is the most Hegelian of his writings. There is much criticism in it of Mill and some criticism of Immanuel Kant. There are amusing skirmishes with Matthew Arnold and with Frederick Harrison, the English positivist. Running through the book is the idea

that it is not for the moral philosopher to tell people what to do, but rather to dispel false views of the nature of morality and to provide an analysis of morality that can stand up to philosophical criticism. Thus he starts with an analysis of the moral concepts of the plain man, which, he holds, are not consistent with utilitarian views on punishment and responsibility. He goes on to criticize hedonism, largely on the ground that since pleasure is an "infinite perishing series," it cannot be the object of a rational pursuit. (The influence of Hegel's doctrine of the False Infinite is apparent here.) As to utilitarianism, Bradley holds that in the light of the Greatest Happiness Principle *any* course of conduct *might* conceivably be right, and "this is to make possible, to justify, and even to encourage, an incessant practical casuistry; and that, it need scarcely be added, is the death of morality."

Like Hegel, Bradley considered Kantian ethics to be formal and abstract, and, again like Hegel, he endeavored to supplement Kant's theories by a more concretely social view of ethics. In the study "My Station and its Duties" he developed the concept that Hegel had called "social morality" (*Sittlichkeit*). According to this view, duties are determined by the agent's place and functions in society. Bradley argued, furthermore, that men themselves are what they are because the society in which they are born and bred is what it is. The "individuals" of liberal and utilitarian social theory do not exist. The community is not, as the liberals assumed, a mere collection of individuals who are logically prior to it, but is a real being "and can be regarded (if we mean to keep to facts) only as the one in the many."

This language shows that Bradley regarded communities as both real and as concrete universals, and individual men as factually and logically dependent upon them, a view that was to achieve logical status in the *Principles of Logic*. Bradley wrote of morality as "self-realization," and some writers have therefore classed him as an ethical egoist. But the self that realizes itself is, according to Bradley, a socialized self that expresses and develops itself in making its contribution to the whole. It should be noted (and here again he is following Hegel) that Bradley did not regard "my station and its duties" as the culmination of morality. He held that on the basis of social morality other forms are developed. In pursuing science or in producing works of art, people are not confined to any particular station, and they also set themselves ideals that go beyond what mere duty would require of them. Perhaps humankind is the beneficiary in such cases, but humankind is not a being or community (this is in criticism of the positivists) in the way that a state or a nation

is. Thus, on the basis of "the objective world of my station and its duties" ideals of social and of nonsocial perfection are constituted. These various spheres and duties often clash with one another, but the moral philosopher cannot formulate rules (as the utilitarians thought they could) that would enable the clashes to be avoided or settled. Conflict and failure are inseparable from morality, which could not exist without them.

The *Ethical Studies* are impressive today by virtue of the anticipations in them of twentieth-century views on socialization and the formation of conscience. But Bradley's position is different from that of present-day sociologists in that he thought that the plain man's views on responsibility are superior to any utilitarian reformulation of them and that they presuppose a nonatomistic metaphysics. The facts of moral judgment and of moral action, he held, force the philosopher to a monistic view of social life and to a metaphysics of the self as a being that can be itself only by transcending itself.

LOGIC

In his *Principles of Logic*, Bradley endeavored to refute false views of the subject without going thoroughly into questions of epistemology and metaphysics. The main objects of his attack were: the traditional subject-predicate, syllogistic, formal logic; the inductive logic with which, since the appearance of Mill's *Logic*, this traditional logic had been supplemented; and the confusion he claimed to see in the current empiricist logic between logical and psychological problems.

Bradley thought that the traditional logic was inadequate and incomplete. For example, in treating all judgments as of the subject-predicate form it omitted relational judgments, and the doctrine of the syllogism failed to take account of relational arguments. He maintained, too, that universal affirmative judgments are not categorical but hypothetical, since they do not necessarily assert that there are members of the subject class. These are theses that subsequent logicians have accepted.

Bradley denied that the advance of knowledge was from particulars to universals, or from particulars to particulars as Mill had suggested. Hence he denied the existence of induction as understood by Mill and the writers of textbooks who followed him. The great mistake of the empiricists, Bradley argued, was to suppose that thought could possibly get started with knowledge of separate and independent particulars. Such particulars, in his view, could be known only after a preceding condition of vagueness, ambiguity, and generality. This, however, is a historical, not a logical, consideration. Bradley's main

argument is that inference is possible only on the basis of universals and hence cannot be a procession from particulars to particulars or from particulars to universal. Inference presupposes judgments and ideal contents, and these, in their turn, presuppose generality and universality. It is only legitimate to argue from some to all if it is known or surmised that the particulars share some universal character. Bradley supported this by a detailed examination of Mill's inductive methods, an examination that owes something, as Bradley acknowledged, to William Whewell's criticism of them in his *Philosophy of Discovery*. The main point is that the facts or particulars from which the induction is alleged to start must already be ordered and defined in terms of some sort of theory, and hence in terms of a universal, if they are to give rise to an advance in knowledge. Both premises and conclusion must be organized around the central concept in a system of related concepts.

The empiricists subordinated logic to psychology. David Hume's account of thought was in terms of ideas that, by the very fact of being described as "fainter" than impressions, were regarded as a sort of mental image. Based on Hume's views, there had grown up a theory that knowledge advanced by the association of ideas. Bradley set out to refute this view, which today is known as psychologism. He argued that logicians are not concerned with ideas as psychical facts, but with ideas as meanings. As meanings, ideas do not have dates and histories, but are "ideal contents" and hence abstract. The real distinction between subject and predicate, he argued, is not to be found in the relation of one ideal content to another but in the relation of a complex ideal content to the reality to which it is referred.

In judgment, therefore, an ideal content is referred to a reality existing beyond the act of judgment. The real subject of a judgment is thus often quite different from the grammatical subject of the sentence, as can be seen in such an example as "A four-cornered circle is an impossibility," where the real subject is not a four-cornered circle, for there could be no such reality, but the nature of space. (This distinction between the grammatical form and the logical form was later to play an important part in analytic and linguistic philosophy.) If this view is accepted, then psychological accounts of inference fare no better than psychological accounts of judgment, since it is meanings, not psychical occurrences, that are relevant. There could not be any association between particular mental occurrences since they perish as they pass, and past ones would have somehow to be revived or re-created if they were to be associated with those existing in

the present. Thus similarity and reproduction presuppose universals, just as inference itself does.

We have said that in his *Logic* Bradley tried to avoid being drawn into epistemological and metaphysical discussions. It is not surprising that he failed in this. Part of his attack on the "School of Experience" consisted in his bringing to light the untenable atomistic metaphysics that he regarded as basic to it. This is a parallel operation to his assault on utilitarianism. The claim that scientific knowledge is based on a prior knowledge of facts or particulars he rejected on the ground that from atomistic particulars no inference could be made. No inference could be valid apart from identities or universals linking one fact with another. It is clear, therefore, that Bradley thought that the fact of inference invalidated metaphysical pluralism, as the facts of morality went against it too. At this point Bradley has some important things to say about universals. He takes the view that what is essential to universality is identity in difference. Identity in difference can take two main forms. It can be abstract, as with such adjectives as "red" or "hard," which require substances in which to inhere. Or it can be concrete, as with an individual man, who is identical throughout his many actions, or a community, which persists through many generations of inhabitants. Abstract universals, therefore, are dependent, insubstantial, unreal, whereas concrete universals are (relatively) independent, substantial, and real. If what is real is individual, then concrete universals are individuals. Bradley ends this part of the discussion with the words: "It might be urged that if you press the enquiry, you will be left alone with but a single individual. An individual which is finite or relative turns out to be no individual; individual and infinite are inseparable characters." He does not pursue this in the *Logic*, but says that such a "revision" (an interesting choice of words) "must be left to metaphysics." So it is to his metaphysics that we now turn.

METAPHYSICS

Bradley's metaphysics, apart from the glimpses of it given in the *Ethical Studies* and the *Logic*, is set out in *Appearance and Reality* and in *Essays on Truth and Reality*. The main argument of *Appearance and Reality* is quite simple. It is divided into two books. The first and shorter one is titled "Appearance" and is about the contradictory character of mere appearances. Book II is titled "Reality" and is about the Absolute.

In Book I, certain commonsense concepts, such as relation, cause, space, time, thing, and self, and certain philosophical concepts, such as the thing-in-itself and the

distinction between primary and secondary qualities, are declared to be self-contradictory and are in consequence “degraded to the rank of mere appearances.” In Chapters 2 and 3 of Book I, titled, respectively, “Substantive and Adjective” and “Relation and Quality,” Bradley argues that the very notion of a relation is self-contradictory and that this inconsistency is alone sufficient to condemn “the great mass of phenomena,” since space, time, causation, the self, all imply relations.

In Chapter 2, in considering the suggestion that all things are groups of related attributes, Bradley argues that if *A* and *B* stand in relation to *C*, then *C* must be related to *A* and *B* by another relation *D*, and this by a third relation *E*, and so on indefinitely. In Chapter 3 he argues that if simple qualities are to be conceived, they must be conceived as related to one another; but if *A* is related to *B*, then there must be the independent aspect of *A* and the aspect in which it is related to *B*, and hence it cannot be simple; but if *A* is not simple, then the independent aspect and the aspect in which it is related to *B* must be related to one another, so that there is set up in each of them a further plurality of aspects generating what Bradley calls “a principle of fission which conducts us to no end.”

In Book II, it is argued that if it is being self-contradictory that degrades mere appearances, then reality must at least be not self-contradictory, but consistent and harmonious. Furthermore, reality must also be of the nature of experience, for what is not experience cannot be conceived of without self-contradiction. Finally, it is clear that reality must be comprehensive and include all that is. If reality is a consistent and harmonious and all-inclusive experience, then it cannot be a plurality of independent reals, for whatever is related to anything else must be to some extent dependent on it. “Plurality and relatedness are but features and aspects of a unity.” Furthermore, the sort of unity that reality or the Absolute must have may be understood by analogy with feeling or immediate experience, for here there is diversity without relatedness.

According to Bradley, our experience of related things arises out of a prior immediate experience in which there are felt differences but no distinct qualities, and therefore no conception of things with different qualities in relation with one another. In passing from the primitive harmonious vagueness to a knowledge of related things, we pass from what might be called the state of precognitive innocence to the flawed world of contradiction. Wherever there is thought, there is the distinction between the what and the that, between ideal content and reality, between adjective and substantive; and hence

wherever there is thought, there is contradiction. Thus reality, or the Absolute, must transcend thought, and thought always points beyond itself to something in which “mere thinking is absorbed.” The Absolute must be conceived as analogous to immediate experience but transcending thought rather than falling short of it.

It is clear that contradiction, error, and evil are not harmonious and hence are not real, but it is equally clear that they are not nothing. How then must they be considered in the light of the Absolute? To this question Bradley gives a very interesting answer. He says that although error and evil are discordant and hence not real, it is possible that they contribute to the harmony of the whole, and if this is possible then we must conclude that it is so even though we do not know how it is possible. “For what is *possible*,” he says, “and what a general principle compels us to say *must be*, that certainly *is*” (*Appearance and Reality*, Ch. 16). In this way, he protects himself against demands to show exactly how appearances are self-contradictory, unreal, not nothing, and yet are elements in the total harmony. Even so, he does make some attempts to show how all this is possible. In Book I, for example, time is condemned as self-contradictory, but in Book II Bradley says that although it is not real it nevertheless exists.

In explaining what he means by existence, he says it consists in being an event in time, in being a fact, in being directly perceived. In a later essay he says that what exists is what is continuous with our waking body. Existence, therefore, is the mode of being of the phenomenal world. But this would seem to bring us back to the point from which we started. Bradley also says that the real, the Absolute, must appear in what exists, that it cannot remain unmanifested. But he also attempts to mitigate the dualism between harmonious reality and self-contradictory appearance-existence by sketching a scheme in which reality permits of degrees. At the bottom of the scale, there are sheer contradictions and the abstract being of lifeless matter. Organic matter has more reality and is higher in the scale, and mind is higher still, for in mind the whole is immanent in its manifestations and the manifestations express the whole.

It is in mind that we see how the real must appear. But insofar as mind is thought, it suffers the disruption into the what and the that, which we have already considered. Perhaps, then, reality is to be found in mind as practical. This is rejected on the ground that practice essentially contains the distinction between reality as it is and reality as it will be when altered. Reality cannot be found in aesthetic experience either, for art entails pleas-

ure, pleasure is an experience of selves, and selves, Bradley has argued, cannot be ultimately real. “The Absolute,” Bradley concludes, “is not personal, nor is it moral, nor is it beautiful or true.” Yet in spite of all this he ends *Appearance and Reality* with the words: “... the more that anything is spiritual, the more is it veritably real.”

The weakest part of *Appearance and Reality* is Book I. The amount of space and care given in it to the task of discrediting the whole of common sense and much of the philosophy of the past is trifling compared with the magnitude of the desired result. Bradley seems almost to take the reader’s agreement for granted and to hasten on to the more congenial, yet only slightly more constructive, task of showing what the Absolute must be. A good part of the argument of Book I assumes that predication is identity, in accordance with “the old puzzle how to justify the attributing to a subject something other than itself.” After all, Bradley had refuted this view of predication in his *Logic*. Perhaps then he is arguing dialectically, in order to bring out the unhappy consequences of working with this “logic of identity.” But if this were so, then relation, space, time, the self, etc. would only be self-contradictory if looked at in the light of a false logic, and might be reinstated if the true logic were brought to bear on them. The doctrine of degrees of reality goes some way towards meeting this difficulty. But in Book I there is no indication that the self is more real or less self-contradictory than space and time. As A. S. Pringle-Pattison put it in his review of *Appearance and Reality*: “Mr. Bradley has the aim of swallowing at a gulp in Book II what he had choked over in the successive chapters of Book I.”

As to Book II there are two main defects. One is that the Absolute described in it seems to be without any definite features but is an amorphous refuge into which appearances are “fused,” “transformed,” “transmuted,” or “dissolved.” The other is that in the course of developing the doctrine of degrees of reality Bradley unwittingly reverts on occasion to the arguments of Book I, as when he says that aesthetic experience cannot be or reveal the Absolute since it involves pleasure and selves and selves are self-contradictory. Bradley here seems to be reverting to the logic of identity that in Book II he had been moderating. On the other hand, there is much excellent discussion of details. The account of time is particularly good. Bradley holds that we should not think in terms of one time series only, but in terms of several or many. Just as the events of one fiction are not temporally related to the events in another fiction, so there may be various time series in which what is past in one may be yet to come in another.

What Bradley said about time and about existence and reality greatly exercised G. E. Moore who, in various writings, notably “The Conception of Reality” (1917–1918), endeavored to make clear what it is to say that something exists. Moore argued that Bradley’s view that time, although unreal, must exist, depended upon his assuming that whatever can be thought of must somehow exist in order to be thought of. But Moore rejected this assumption. Bradley, he thought, was deceived into making it because he did not notice that although “unicorns are objects of thought” is of the same *grammatical* form as “lions are objects of the chase,” it is of quite a different *logical* form. Moore’s reason for this was that if lions are to be hunted there must be lions, whereas unicorns can be thought of although there are no unicorns. Thus Moore used against Bradley the distinction between logical and grammatical form that Bradley had formulated in 1883. A weapon that Bradley had himself devised was employed against him by a philosopher who had improved its range and sophistication.

Bibliography

Bradley’s main writings and the dates of publication have been indicated in the body of the article. A second edition of *Ethical Studies* (Oxford: Clarendon Press, 1927) contains corrections and additional notes that Bradley left at his death. A second edition of *Principles of Logic* (London: Oxford University Press, 1922) contains the original unaltered text with an extensive commentary, which owes much to Bosanquet, at the end of each chapter and a set of “Terminal Essays” at the end of the book. The second edition of *Appearance and Reality* (London, 1897) contains an appendix occasioned by criticisms of the first edition. See also *Aphorisms* (Oxford: Clarendon Press, 1930), a few of which appeared in the preface to *Appearance and Reality*. Collections of his works include *Collected Essays* (Freeport, NY: Books for Libraries Press, 1967) and *Essays on Truth and Reality* (Oxford: Clarendon Press, 1968).

For a detailed critical study of Bradley’s philosophy, see Richard Wollheim, *F. H. Bradley* (Harmondsworth, U.K.: Penguin, 1959). This contains further bibliographical references. See also C. A. Campbell, *Scepticism and Construction* (London: Allen and Unwin, 1931); R. W.

Church, *Bradley's Dialectic* (London: Allen and Unwin, 1942); and T. S. Eliot, *Knowledge and Experience in the Philosophy of F. H. Bradley* (New York: Farrar, Straus, 1964), the thesis mentioned above.

A. S. Pringle-Pattison, "A New Theory of the Absolute," reprinted in *Man's Place in the Cosmos* (Edinburgh and London: Blackwood, 1897, 1902), is probably the best criticism of Bradley's metaphysics. G. E. Moore, *Some Main Problems of Philosophy* (London: Allen and Unwin, 1953), Chs. 11, 12, 16, contains a detailed discussion of parts of Bradley's metaphysics.

Criticism of Bradley's view that the notion of relation is self-contradictory is contained in J. Cook Wilson, *Statement and Inference* (Oxford: Clarendon Press, 1926), Vol. I, p. 255, Vol. II, pp. 692–695. See also W. H. Walsh, "F. H. Bradley," in *A Critical History of Western Philosophy*, edited by D. J. O'Connor (New York: Free Press of Glencoe, 1964).

BRADWARDINE, THOMAS

(c. 1300–1349)

Thomas Bradwardine studied arts at Balliol College and theology at Merton College, Oxford. In September 1337, he was appointed chancellor of Saint Paul's in London. From 1346 to 1348, as a king's clerk, he enjoyed a prominent position in the household of Edward III. In June 1349 he was elected archbishop of Canterbury; soon afterwards, in October, he died of the Black Death.

Like many Mertonians, Bradwardine was a logician and a mathematician. He wrote a treatise *De insolubilibus*

(an *insolubileis* is a self-referential sentence, such as the "liar paradox"), a *Geometria speculativa*, and a treatise *De continuo*. In his *Tractatus de proportionibus velocitatum in motibus* (1328) he attempted to introduce mathematic functions into Aristotelian physics. His masterpiece, however, is a voluminous theological and philosophical work, *De causa Dei contra Pelagium*, divided into three books (1344). It originates from lectures he had given in Oxford and London and, more radically, from a deep spiritual change he had experienced in his youth: "When I was applying myself to philosophy ... Pelagius's opinion seemed to me nearer to truth.... But afterwards (I was not yet a theological student) ... I thought I saw from afar the grace of God preceeding all merits in time and in nature, in the same way that in all movements He is the first Mover." (bk. I, ch. 35, p. 308). This conversion induced Bradwardine to fight for God's cause against "the new Pelagians," a group of post-ockhamists theologians that included Richard Fitzralph, Adam Wodeham, and Robert Holcot.

To these thinkers the issues of chief concern were grace and merit, future contingents, prescience, and predestination. On the first point, Bradwardine, as an ardent Augustinian, strongly reasserts that grace is a mere gift, not a retribution: in no way man can merit it, and, moreover, without God's special help man cannot act right.

Concerning future contingents, the new Pelagians' opinion stressed the contrast between the necessity—that is, the fixity—of the past and the contingency of the future. This view could hardly be reconciled with the idea of an immutable and truthful God: If God or a prophet were to reveal a future event, is it possible that it would not happen? If it is possible, then God can deceive and lie. Countering this opinion, which he had first rejected in his question, *De futuris contingentibus*, Bradwardine closely examines the notions of contingency and necessity; he argues they are founded on the power of the will. Aristotle wrote, "What is, necessarily is, when it is. (*De interpretatione*, ch. 9). But Duns Scotus observed that when man wills A at time *t*, he has the power not to will A, not only before or after *t*, but also at time *t*. Therefore a kind of necessity, the "consequent" necessity of present, is compatible with contingency. Regarding God, Bradwardine extends this conclusion to all times: For God, past, present, and future are equally contingent and equally necessary. Consequently He can undo any past event (in an improper meaning of *undo*), not because He could alter it (this would be a contradiction), but because at each instant of time He is yet freely willing the past event. In this way, there is no longer antinomy between the necessity of the prophecy and the contingency of the future event.

The same argument about contingent causality clears up the most famous tenet of Bradwardine's teaching, the assertion of "antecedent necessity": Since God's will is the first cause of everything and cannot be thwarted, everything happens by necessity in relation to His will. That is the proper definition of theological determinism. But again, according to Bradwardine, when man is willing something, though his act is determined by God, he does not lose the power to do the opposite act at the same time. So it seems there is in Bradwardine's doctrine an original attempt to conciliate God's predetermination and human freedom of will.

BRAHMAN

The origin and meaning of the term *brahmanare* shrouded in mystery. Using the verbal root $\sqrt{bṛh}$, Western

Indological scholars derive such meanings as "sacred magical power" (Hermann Oldenberg), "form, formulation" (Paul Thieme), "priestly utterance," "energy that is expressed in paradoxical terms" (Louis Renou), and "the live connection that holds the cosmos together" (Jan Hesterman) The meanings of *brahman* in the ancient "heard texts" (*śrutis*) and later Indian philosophical systems are not unrelated to these meanings. For example, the Vedic understanding of the *brahman* survives in Bhartrhari's concept of the "*śabda brahman*." Likewise, the ideas of power, energy, and cosmic unity among opposites are taken up in the Vedāntic notion of the *brahman* as absolute reality. The notion of the *brahman* as the sacred power within a priest may have contributed to an identification of the *brahman* with the inner spirit (*ātman*). This transformation of a much older notion into a discursively idealized philosophical concept resembles the way the concept of *logos* was transformed into "logic" "*Vernunft*," and "language."

Etymologically, the word *brahman* has two constituent components: the verbal root $\sqrt{bṛh}$ and the suffix *matup*. The verbal root $\sqrt{bṛh}$ means "to grow" and "the great," and together with the suffix provides two allied meanings: "the greatest" and "the root of all things." In the Vedic hymns the term *brahman* not only refers to the power contained in the words recited but also to the mysterious power present in the utterances of the Vedic hymns. Though the idea of *brahman* as the ground of all things is not entirely absent in the Vedas, the primary goal was to search for the power connecting the microcosm with the macrocosm.

BRAHMAN IN THE UPANIṢADS

This sense of power continues in the Upaniṣads (e.g., *Kaṭha Upaniṣad*), which say that the various *devas* (gods; literally, "the shining ones") each carry out their respective jobs for fear of the *brahman* (6.3); *Kena Upaniṣad* states that the various *devas* have no power outside the power of *brahman* residing in them. The *brahman* of the Upaniṣads is much more than a power; it is the cause of the origination, sustenance, and destruction of the world (*Taittīya Upaniṣad*, 3.1.1). In the *Bṛhadāraṇyaka Upaniṣad*, when Yājñavalkya is questioned about the number of gods, he initially responds by saying that 3,306 gods were simply manifestations of thirty-three gods, and then successively reduces the number to six, three, two, one and a half, and then one. This god is none other than the *brahman*, and all other gods of the Vedas, the senses, and the mind are said to be the various powers of *brahman* (*Bṛhadāraṇyaka Upaniṣad*, 3.9.1–10). The central

question in the Upaniṣads is framed as follows: “What is that by knowing which all else becomes known?” (*Muṇḍaka Upaniṣad*, 1.13) The answer given is “*brahman*.” If *brahman* is the source of everything, then *brahman* is also the core of each individual being, and this core is called *ātman*. In many places in the Upaniṣads the two terms *brahman* and *ātman* are used synonymously. The *Chāndogya Upaniṣad* asks: “What is *ātman*? What is *brahman*?” (5.11.1, *ko nu ātmā, kiṃ brahmeti?*) When the inquiry pertains to the source of the universe, the word *ātman* is used, and in other cases when the inquiry is regarding the true self of a human being the word *brahman* is used. To the Upaniṣadic seers the *brahman* and the *ātman* signified the same reality, one within, and the other without.

The Upaniṣads describe *brahman* both negatively and positively. It is described as neither gross, nor subtle, nor short, nor long, nor red, nor adhesive, without shadow, darkness, air, space, attachment, taste, smell, eyes, ears, speech, mind, light, breath, mouth, and measure, and without inside and outside (*Bṛhadāraṇyaka Upaniṣad*, 3.8.8), and that who consists of mind, whose body is life, whose form is light, whose conception is truth, whose soul is space, containing all works, desires, odors, and tastes, and encompassing the whole world, the speechless and the calm (*Chāndogya Upaniṣad*, 3.14.2).

BRAHMAN IN VEDĀNTA

The exegetical effort to construe these different groups of sentences to resolve any apparent contradiction shaped the understanding of *brahman* in the Upaniṣadic schools. Two hermeneutic principles were applied: accord priority and finality to the positive texts, or since negation implies a prior affirmation that is then negated, the final import of the Upaniṣads may be taken to be expressed in the negative texts, the positive ones simply preparing the ground for it. The latter hermeneutical principle is adopted by Śaṅkara, the most well-known exponent and defender of the school known as Advaita Vedānta (nondualistic Vedānta); and the former by Rāmānuja, the founder of Viśiṣṭādvaita (qualified nondualism), and Madhva in his Dvaita Vedānta.

ADVAITA VEDĀNTA

From the perspective of Śaṅkara’s nondualistic Vedānta, *brahman* is one without a second; the world is false (*māyā*, in a rather technical sense of “presented appearance”) and the finite individual and the *brahman* are nondifferent. The *brahman* can neither be comprehended by rational minds, nor be expressed or literally referred to

in the language, nor be an object of knowledge. It does not have qualities (because all determination is negation), and so it cannot be described or defined. While using language to refer to *brahman* is natural, it does not achieve its goal. Language refers to an object either by its direct power of meaning (*abhidhā*), or as its suggested meaning (*lakṣaṇā*). Normally, the suggested meaning is sustained and supported by its relationship to the literal meanings, but in the case of language referring to the *brahman*, the meaning may be said to be “only the meaning function, but not an actual meaning” (Bhattacharyya 1930). There is a pointing, as one points to something with one’s finger, toward a small, almost invisible star, accompanied by a series of descriptions each one of which is then canceled, leading the listener to identify, even in the absence of an identifying description of, what is being pointed at. *Brahman* is described as *saccidānanda*, that is, as *sat* (existence), *cit* (consciousness), and *ānanda* (bliss), with reference to its essence (*svaūpa lakṣaṇā*), whereas *brahman* as the cause, sustainer of the universe, and so on with reference to its accidental attributes (*taṭastha lakṣaṇā*).

It is important to keep in mind that from a strictly Advaita point of view no positive description can be intrinsic when the thing being described lacks any positively determining qualities. Nevertheless, Advaita Vedānta describes the *brahman* as existence, pure consciousness, and bliss. These three are not qualities or qualifying attributes of the *brahman*. Advaita Vedānta holds that these familiar terms must be understood in their negative implications, not as referring to what *brahman* is, but rather as pointing to what the *brahman* is not. *Sat* points to the fact that the *brahman* is not *asat* (non-existent); *cit* suggests that the *brahman* is not *acit*, that is, *jaḍa* (insentient matter); and *ānanda* points to that, in the experience of the *brahman*, there is no *duḥkha*, no unsatisfied desire. The negative statements in this regard more closely approach the intrinsic nature of the *brahman*. In this light one can say that in Advaita Vedānta, Benedict (Baruch) de Spinoza’s principle “all determination is negation” holds good of the infinite: no determination of it is possible. Underlying this account are a theory of meaning and a theory of language that are of particular importance, and, that possibly, found their first systematic exposition in the Buddhist theory of *apoha* (the negative theory of meaning).

The thesis of Advaita Vedānta is logically substantiated (1) by a critique of difference (*bheda nirodha*) and (2) hermeneutically by an exegesis of the *śrutis*. To these one may add (3) a phenomenological and experiential

dimension that would consist in showing that in its search for freedom from all suffering, human subjectivity passes through levels of ordinary experience: the waking-bodily, the dreaming-psychic, and the dreamless sleep (the seemingly total inaction and quietude). Finally, there is the experience of the *brahman*, which goes beyond the distinction of the subject and the object and which is articulated in such famous *mahāvākyas* (great sentences) of the Upaniṣads as “I am he” and “thou art that.” Knowing the *brahman*, according to the tradition of Advaita Vedānta, is to become the *brahman*. It is not knowing an object, however large and great in its dignity, that stands over against one as another; rather, it is an experience in which all otherness is canceled, and one discovers that within oneself nothing else remains to be achieved. When there is no duality between the subject and the object, there is no *duḥkha* or fear. A modern account of the phenomenological stages of a path to freedom is found in Krishna Chandra Bhattacharyya’s *The Subject as Freedom* (1930).

VIŚIṢṬĀDVAITA VEDĀNTA

In his Viśiṣṭādvaita, that is, “one reality (*brahman*) with qualifications,” Rāmānuja holds that all knowledge necessarily involves distinctions and differentiations. It is impossible to know an object in its undifferentiated form; therefore, both pure identity and pure difference are false. The *brahman* as God possesses *cit* (matter) and *acit* (self); all three are real (*brahman*, *cit*, and *acit*). Though real, the last two are dependent on the *brahman*. Consciousness presupposes the self of which it is an essential attribute (*dharmabhūta jñāna*). Perhaps the most original aspect of Rāmānuja’s philosophy is the rejection of the principle that to be real means to be independent. Although soul and matter are substances in themselves, in relation to the *brahman* they are attributes. They are God’s body and he is their soul. The self is substance and quality, an organ and organism of the *brahman*. Rāmānuja’s theory of *aprthaksiddhi viśeṣaṇa*, that is, the adjectival theory of inseparability, explains this relation. Just as qualities are real and cannot exist apart from the substances in which they subsist, similarly matter and soul are parts of the *brahman* and cannot exist without the *brahman*.

Rāmānuja used the same Upaniṣadic texts that Śaṅkara used, but arrived at a different conception of the *brahman*. Rāmānuja holds that the Upaniṣadic texts such as *neha nānā asti kiṃcena* (there is no multiplicity here) do not really deny the multiplicity of objects, names, and forms, but asserts that these objects do not have any existence apart from the *brahman*. Thus, all negative texts of

the Upaniṣads, which assert that none of this is the *brahman*, are construed to mean that none of it in its presumed independence is the *brahman*. However, the positive sentences, for example, “all this is the *brahman*,” mean that everything belongs to the *brahman* as the ultimate totality. Whereas for Śaṅkara the *brahman* is pure consciousness devoid of any distinctions, a pure identity without any difference (*nirguṇa*), Rāmānuja’s *brahman* is identity-in-difference. The *brahman* creates the world out of *acit* by an act of will, so creation is a real act of will. Ignorance (*māyā* or *avidyā*) in this system is no longer creative of illusory world, and the finite individuals are not illusory. It is indeed true, Rāmānuja concedes, that some Upaniṣadic texts articulate the *brahman* as wielder of a magical power (*māyā*). However, *māyā* for Rāmānuja properly understood is the unique power of God by which God creates the wonderful world of objects. He vehemently criticizes Śaṅkara’s theory of the world as false appearance. The created world, for Rāmānuja, is as wonderful as the *brahman* himself.

If someone were to ask how the one contains the many, Rāmānuja would respond with the grammatical principle of *sāmānādhikāṇya* (coordination). According to this rule, the words in a sentence with different meanings can denote one and the same thing. Rāmānuja’s interpretation of the classical text “this is that Devadattaḥ” explains this rule clearly. For Rāmānuja, Devadattaḥ of the past and the Devadattaḥ of the present cannot be entirely identical, because the person seen at the present and the person seen in the past are different, have different meanings, and yet both refer to the same person. Similarly, unity and diversity, the one and the many, can coexist; they are not contradictions and they can be reconciled in a synthetic unity. Thus, he does not deny the many: the many, on the contrary, characterizes the one. *Mokṣa* comes about with the knowledge of the *brahman* together with devotion (*bhakti*).

DVAITA VEDĀNTA

Madhva carries much further the protest against the nondualism of Śaṅkara than Rāmānuja. Whereas for Śaṅkara the texts teaching difference have a practical value in that they steer one in the right direction and lead one to the real teaching of the Upaniṣads, that is, the teaching of nondifference, for Madhva the texts teaching difference convey the true import of the Upaniṣads. Substance is one of the ten categories that Madhva accepts. Out of the twenty substances that Madhva enumerates, he accepts, like Rāmānuja, three as the most important: *brahman* or God, matter, and selves.

Bheda (difference) is the central category in Madhva's philosophy. This is another way of saying that each object is unique; each object possesses its own nature, which accounts for one object's difference from another object. The *brahman* or God is the only independent reality. God has a divine body and is transcendent. However, since God is the inner controller of all souls, he is also immanent. God creates the world by his will and brings into existence the world of objects and selves. Objects and selves, though real, eternal, and irreducible to each other, are dependent on the first. At the time of the dissolution of the world, God transforms material objects into undifferentiated matter and selves into disembodied intelligences. It is important to note in this context that even in the state of dissolution God, matter, and selves remain distinct. Unlike Rāmānuja, for Madhva no two souls are alike. Thus, whereas Rāmānuja advocates qualitative monism and quantitative pluralism of souls, Madhva advocates both qualitative and quantitative pluralism of souls. Since the immediate cause of bondage is ignorance of the real nature of the *brahman* or God, the soul must acquire the knowledge of the real nature of God to attain mokṣa. It is important to remember in this context that knowledge by itself does not and cannot remove ignorance; knowledge is only a qualification for release, which in the final analysis depends on God's will. No matter how hard an aspirant may try, he or she cannot gain such an immediate knowledge, unless God chooses to reveal himself to him or her.

ŚAIVISM

Finally, apart from the previously discussed classical understandings of the *brahman*, there is another nondualistic school known as Śaiva Siddhānta. Of its many representative schools and thinkers, Kāshmir Śaivism of Abhinavagupta is the most well known. In his nondualism Abhinavagupta argues that *brahman* alone *is*. He painstakingly attempts to bridge the gulf between the one and its many phenomenal differences by positing many levels of consciousness, descending from the one to the many. *Māyā* or *avidyā* is now construed as a *śakti* or the power of the *brahman*-consciousness; consciousness is not a mere *prakāśa* (illumination) but also *śakti* (force). Indeed, the two in their difference are also one. While, on the one hand, Abhinavagupta wishes to preserve both the one and the many in the being of *brahman*, he makes it a graded dynamic process instead of using a static set of categories like the part and the whole. The one *brahman*-consciousness or pure *cit* objectifies itself into "I," and this

power of self-objectification is called *vimarśa śakti* (the reflective power), from which arises the power of referring to intentional objects that lie concealed within it. This process yields a domain of seemingly independent objects. Kāshmir Śaivism has been a major influence in the shaping of the concept of the "integral *brahman*" of Sri Aurobindo's philosophy.

Other systems of Indian philosophy do not advance a concept of the *brahman*. Although Sāṃkhya-Yoga seems to have had a theistic form in addition to the better-known atheistic form, it does not develop a concept of the *brahman*, nor do the Nyāya-Vaiśeṣika schools. The latter systems come perhaps closest to such a project when they substantiate their concept of God as an infinite self, all knowing, omnipresent, which is called *Īśvara* in the school. Despite the fact that the authors may cite many texts of the Upaniṣads in support of their theism, one misses in these schools any attempt to take into account the *śruti* texts in their totality.

To sum up: The *brahman* is the absolute reality in the school of Vedānta. The relationships of the one with the many preoccupied its thinkers, leading them to postulate a fundamental category to explain the connection. These categories range from pure identity (*tādātmya* having that as its self), *apṛthakasiddhi* (the relation of no separate existence), pure difference, and a progressive self-differentiation through self-objectification and intentionality. In the nondualistic Vedānta, the *brahman*, in the words of Georg Wilhelm Friedrich Hegel, is (Spinozistic) "the substance becoming spirit," bringing together two different concepts of monism into one, resulting in the position that the only reality is the spirit. The following crucial issues remained: How does the one spirit become many? How to understand self-differentiation? Where to locate the power of creativity? Does it belong to the *cit* or consciousness as an inalienable aspect, or is it an "other" to consciousness? In the latter case, the basic otherness is not a product of ignorance. However, can one escape this problem by saying as nondualist Vedānta says, that ignorance is not a real other and not a nonreal other? Is not this nonreality itself a creation of ignorance? Thus, dialectic of one and many seems to have had an interminable hold on Indian metaphysical theories.

BRAITHWAITE, RICHARD BEVAN (1900–1990)

Richard Bevan Braithwaite, an English philosopher, was educated at King's College, Cambridge, where he studied physics and mathematics before turning to philosophy. Braithwaite was Knightbridge Professor of Moral Philosophy at Cambridge University. He served as the president of the Mind Association (1946) and of the Aristotelian Society (1946–1947). In the philosophy of science he made significant contributions on the nature of scientific theories and explanation, theoretical terms, models, foundations of probability and statistics, the justification

of induction, and teleological explanations. He also wrote on subjects in moral and religious philosophy.

SCIENTIFIC THEORIES

Braithwaite defended the view that a scientific theory consists of a set of initial hypotheses, with empirically testable generalizations that follow deductively. To explain a generalization is to show that it is implied by higher level generalizations in the theory. Often, especially in the physical sciences, the initial postulates will contain so-called theoretical terms, such as *electron* or *field*, that refer to items not directly observable. To understand the meaning of such terms, as well as the logical structure of the theory, one must begin by considering the theory as a formal calculus; that is, as a set of uninterpreted formulas. A calculus designed to represent a specific theory will have to be interpreted, but not all at once and not completely: Meanings are directly given only to those formulas representing the lower order empirical generalizations, rather than to initial formulas containing theoretical terms. The latter are indirectly and partially interpreted by the former.

Braithwaite's major contribution here consisted in the detailed attention he devoted to the nature of the initial or "theoretical" postulates. He divided these postulates into Campbellian hypotheses, which contain only theoretical terms, and dictionary axioms, which relate theoretical terms to observational ones. The latter include identificatory axioms, which identify single observational terms with theoretical terms—for example, a color word with expressions referring to wavelengths of light. Braithwaite argued that the advantage of systems containing theoretical terms over those whose initial postulates are entirely observational is that the former can more readily be extended to new situations than can the latter. However, Braithwaite held there is no special advantage to Campbellian hypotheses, because, at least for certain systems, the same testable consequences can be derived from identificatory axioms.

Scientific models are to be construed as alternative interpretations of a theory's calculus where the theoretical concepts in the original theory (such as molecules) are interpreted as designating more familiar and intelligible items (such as billiard balls). Accordingly, the theory and the model are to be distinguished; and while a model is not essential, it can sometimes be of help in extending a theory and clarifying its concepts.

PROBABILITY AND INDUCTION

Braithwaite proposed a novel finite-frequency theory of probability. Consider the statement (P), “The probability of a child being born a boy is 0.51,” and the observed data that among 1,000 children 503 are boys. Such a situation is to be understood by imagining 1,000 sets of children, each containing 100 children of whom 51 are boys, and a selection of 1 child from each of the 1,000 sets, of whom 503 are boys. Since P is logically consistent with any observed data, the problem is to decide when to reject P. For this purpose it is necessary to have a rule specifying that a probability statement is to be rejected if the observed relative frequency differs from the probability postulated by more than a specified amount. This amount is determined by extralogical considerations involving the purpose for which the hypothesis is to be used and the value attached to possible consequences of its adoption. Such a rejection rule, Braithwaite claimed, is what gives empirical meaning to probability statements considered as constituents of theoretical systems. But suppose there are alternative probability hypotheses not rejected by the evidence in accordance with this rule. How is one to choose among them? Here again considerations of value must be invoked, and Braithwaite outlined a “prudential policy” of choosing the probability hypothesis that maximizes the minimum mathematical expectation of value.

Braithwaite also provided an original defense of Charles Sanders Peirce’s solution to the problem of justifying induction. The problem was formulated by Braithwaite as follows: What warrant does one have for adopting the policy of accepting a hypothesis on the basis of many positive instances (the policy of “induction by simple enumeration”)? The proposed answer consists of the following argument (where π is the principle of induction by simple enumeration): The policy of using π has been effective in many instances in the past; therefore (using π as the rule of inference) π will continue to be effective. Such an argument was traditionally dismissed as viciously circular, and Braithwaite undertook to prove this charge unjustified. The argument can be deemed valid and hence free from circularity, he claimed, because it enables one to pass from a mere belief in the general effectiveness of using π as a rule of inference, with a reasonable belief in π ’s past effectiveness, to a reasonable belief in π ’s general effectiveness. It would be viciously circular only if one were required to have an initial reasonable belief in π ’s general effectiveness. Since this requirement is unnecessary, the argument is not invalidated.

MORAL AND RELIGIOUS PHILOSOPHY

Many of the conclusions and techniques of the philosophy of science were applied by Braithwaite in areas of moral and religious philosophy. Thus, just as one can defend the adoption of a particular scientific hypothesis by appeal to an inductive policy, so one can justify a particular action, such as returning a book, by reference to a moral policy, such as promise-keeping. Both sorts of policies are in turn justified by reference to the ends they subserve. Braithwaite showed how the mathematical theory of games, which he invoked in his discussion of hypothesis selection, can also be used to shed light on such notions as prudence and justice in situations involving human choices and cooperation between individuals. Finally, just as a moral assertion is to be construed as an expression of an intention to act in accordance with a certain policy, so a religious assertion must be understood, according to Braithwaite, as a declaration of adherence to a system of moral principles governing “inner life” as well as external behavior. The major difference between religious and moral assertions is that the former, being associated with empirical narratives, have a propositional element lacking in the latter.

BRANDT, R. B.

(1910–1997)

Richard Booker Brandt was born on October 17, 1910, in Wilmington, Ohio. He graduated from Denison University in 1930 and received a second BA from Trinity College in Cambridge, U.K. After receiving a PhD in philosophy at Yale University in 1936, Brandt taught at Swarthmore College and then at the University of Michigan, where he was named Roy Wood Sellars Distinguished College Professor of Philosophy. Brandt was a fellow of the Guggenheim Foundation and of the Center for Advanced Studies in the Behavioral Sciences at Stanford University; he was also a senior fellow of the National Endowment for the Humanities and a member of the American Academy of Arts and Sciences.

For more than fifty years, Brandt addressed a broad spectrum of theoretical and applied issues in ethics, drawing on the natural and social sciences to enrich our understanding of morality. His empiricist orientation displayed itself early on in his *Hopi Ethics* (1954), which recorded his own anthropological studies undertaken during three summers spent on a Hopi reservation in the 1940s. It found full expression in *A Theory of the Good and the Right* (1979), which presented his mature metaethical ideas and reflected his close study of work in behavioral psychology.

Brandt was a prominent exponent of utilitarianism, the view that morally correct action is action that maximizes utility. His ideas about what utility is changed over the years. In *Ethical Theory* (1959), he adopted a pluralistic view that included pleasure, knowledge, virtue, and equality of welfare as intrinsic values. Soon, however, he came to see happiness and desire-satisfaction theories as the real contenders. He briefly defended a desire theory,

but by the time he wrote *A Theory of the Good and the Right*, he had evidently come to favor a happiness theory.

Brandt’s most important contribution to normative ethics was his formulation and defense of an ideal rule utilitarianism, or “ideal moral code” theory. According to ideal rule utilitarianism, an act is right if and only if it would not be prohibited by the ideal moral code for a society. By an “ideal moral code,” Brandt meant a code, the currency of which in a society would produce at least as much welfare or good per person as that of any other code. A moral code has currency in a society when a high proportion of adults in that society subscribe to its rules and recognize that those rules are accepted. The rules an ideal code comprises must be ones that people can learn and apply, so they cannot be too complex or too numerous. And because any set of rules will exact costs—in training, in guilt for noncompliance, and in restrictions on freedom—the rules should pertain only to important matters. Brandt recognized that the institutional rules of a society can give rise to obligations, even when existing institutions are less than optimal, and so institutional setting partly determines which moral code would produce the most good in the long run.

Brandt argued that ideal rule utilitarianism was distinct from act utilitarianism, because it need contain no higher-order rule prescribing that people maximize utility when lower-level rules conflict. So the two theories will differ in at least some of their implications. He also argued that whereas act utilitarianism seemingly implies that various immoral acts, like murdering one’s aged parent, would be permissible if they could be kept secret, a moral code that sanctioned secret murders, say, would not maximize utility. Finally, because an ideal moral code would contain rules akin to W. D. Ross’s prima facie duties, ideal rule utilitarianism can capture the personal character of morality, which Ross alleged that act utilitarianism misses.

Critics have questioned whether Brandt’s ideal rule utilitarianism escapes the standard problems for rule utilitarianism, among them, that it is internally inconsistent, that it collapses into act utilitarianism, and that it cannot handle cases where others are not behaving as they ought. Critics have also questioned whether Brandt’s theory can allow for moral appraisal of unique situations not covered by the rules, and whether moral rules lacking actual currency can plausibly provide the criterion of right acts. But at least one defender of an ideal-code consequentialism, Brad Hooker (2000), argues that a properly formulated theory can withstand such objections.

Later in his career, Brandt famously worked to resuscitate the metaethical theory known as ethical naturalism. He advocated a “method of reforming definitions,” which involves redefining our ordinary vague ethical words in terms sufficiently clear and precise to render the traditional questions of moral philosophy empirically tractable. Following his proposed method, Brandt defined “rational” to refer to desires, actions, and moral systems that would survive maximal criticism and correction by facts and logic. He defined “good” to mean rationally desired, treating rational desires as those that would survive or be produced by “cognitive psychotherapy,” a process in which persons represent to themselves repeatedly, in an ideally vivid way and at the appropriate time, all available relevant information. He defined “morally wrong” and “morally right” relative to the idea of a moral code that all fully rational persons would tend to support for a society in which they expected to spend a lifetime. Brandt argued that fully rational persons would opt for a broadly welfare-maximizing moral code, and that fully rational persons, insofar as they are benevolent, would seek to maximize not desire satisfaction but net lifetime enjoyment or happiness.

Brandt’s critics have argued that his definitions foreclose important normative questions, such as whether it is rational to smoke even when the desire to smoke survives cognitive psychotherapy. They have questioned the coherence and empirical adequacy of appeals to full information, though such appeals remain common. They have also argued that his method begs the question against moral realism, and that his theory, like earlier forms of ethical naturalism, fails to capture the normativity of ethics. Ethicists continue to debate whether naturalism and moral realism are tenable. Whatever one concludes about Brandt’s own views, his work played a crucial part in the late-twentieth-century revival of metaethics.

BRENTANO, FRANZ

(1838–1917)

Franz Brentano, a German philosopher and psychologist, was the nephew of the poet Clemens Brentano and of the author Bettina von Arnim. He taught at Würzburg and at the University of Vienna. As a teacher he exerted extraordinary influence upon his students, among whom were Alexius Meinong, Edmund Husserl, Kasimierz Twardowski, Carl Stumpf, Tomas Masaryk, Anton Marty, Christian Ehrenfels, and Franz Hillebrand. Brentano became a Roman Catholic priest in 1864, was involved in the controversy over the doctrine of papal infallibility, and left the church in 1873. At his death he left behind voluminous writings and dictation (he was blind during the last years of his life) on almost every philosophical subject. Some of this material has since been published.

The most important of Brentano’s works published during his lifetime is *Psychologie vom empirischen Standpunkt* (Leipzig, 1874). The two-volume second edition (Leipzig, 1911) includes revisions and supplementary material; the third edition, edited by Oskar Kraus, was

published in Leipzig in 1925. The second edition includes *Von der Klassifikation der psychischen Phänomene*, which had also been published separately (Leipzig, 1911). The posthumously published *Vom sinnlichen und noetischen Bewusstsein*, also edited by Kraus (Leipzig, 1928), is referred to as Volume III of the *Psychologie*.

OBJECTS OF MENTAL PHENOMENA

Brentano took the mental to comprise such phenomena as hearing, seeing, sensing, thinking, judging, inferring, loving, and hating. He held that what is common to mental phenomena and what distinguishes them from the physical is “intentional inexistence,” which he also described as “reference to a content” and “direction upon an object.” Mental phenomena, he said, may be defined as phenomena that “include an object intentionally within themselves.” He did not mean to imply, however, that when, for example, a person thinks of a horse, there is a duplicate of the horse, a mental simulacrum, existing within the mind. The essential point, as he later emphasized, is that a person could think of a horse even if there were no horse. In the second edition of the *Psychologie*, he contrasted strict relations with mental relations. *A* and *B* cannot be related in the strict sense of the term *relation* unless *A* and *B* exist; if one tree is to the left of another, then both trees exist. “But in the case of psychical relations the situation is entirely different. If someone thinks of something, then, although there must be a thinker, the thing that he thinks about need not exist.”

Reference or “direction upon something” (*Gerichtesein*) thus is common and peculiar to what is mental, and Brentano classified mental phenomena in terms of the different ways in which they may refer to, or be directed upon, their objects. There are three ways in which one may be “intentionally” related to any object *A*. (1) One may think of *A*, or, as we sometimes say, have it “before the mind” or “present to consciousness.” (2) One may take an intellectual stand with respect to *A*; this stand will consist either of accepting *A* or of rejecting *A*. (3) One may take an emotional stand with respect to *A*: This is a matter of loving or hating *A*, in a very broad sense of these terms. It is a matter of pursuit or avoidance, or, as one might now say, a matter of having a “pro-emotion” or an “anti-emotion” with respect to *A*. Brentano identified these three types of phenomena with (1) *Vorstellungen* (ideas, thoughts, or presentations); (2) judgments; (3) “emotive phenomena,” or “phenomena of love and hate,” a category including both emotions and volitions.

Ideas, or thoughts, are basic in that the other two types of mental phenomena presuppose them. In judging

that there is food, or in wanting it, one has ipso facto the thought of food. Nevertheless, judging is not simply a matter of “combining ideas”; if we combine the idea of gold and the idea of a mountain, we obtain not a judgment but another idea—that of a golden mountain. The members of the third class of mental phenomena, the “phenomena of love and hate,” are like judging—and unlike the mere having of an idea—in that they involve an “opposition of intentional relation.” We adopt toward the object of our idea an attitude of liking or disliking, love or hate.

There is still another respect in which the third class of phenomena is like the second and unlike the first. This is stated in Brentano’s *Ursprung sittlicher Erkenntnis* (The origin of our knowledge of right and wrong; 1889).

Concerning acts of the first class, none can be called either correct [*richtig*] or incorrect. In the case of the second class, on the other hand, one of the two opposed modes of relation, affirmation and rejection, is correct and the other incorrect. The same naturally holds good of the third class. Of the two opposed modes of relation, love and hate, being pleased and being displeased, one of them in every case is correct and the other incorrect.

This significant thesis is basic to Brentano’s theory of knowledge and to his moral philosophy.

To judge, then, is to take an intellectual stand with respect to an object, and the object of the judgment is the same as the object of the idea that the judgment presupposes. If one judges that there are horses, the object of one’s judgment is simply the object *horse*, which one thereby accepts, affirms, or acknowledges (*erkennt*); if one denies that there are horses, the object of one’s judgment is again the object *horse*, which this time one denies or rejects (*leugnet*). In neither case does the judgment take as its object either a proposition or state of affairs or the type of entity that other philosophers have attempted to designate by such phrases as “the being of horses,” “the nonbeing of horses,” and “that there are horses.”

This nonpropositional theory of judgment, which is fundamental to Brentano’s theory of truth and his theory of categories, may be put schematically, in slightly oversimplified form, as follows. To judge that there are *A*’s is to accept (or affirm) *A*’s. To judge that there are no *A*’s is to reject (or deny) *A*’s. To judge that some *A*’s are *B*’s is to accept *AB*’s (*A*’s that are *B*’s), and to judge that no *A*’s are *B*’s is to reject *AB*’s. To judge that some *A*’s are not *B*’s, therefore, is to accept *A*’s that are non-*B*’s, and to judge

that all *A*'s are *B*'s is to reject them. (Brentano noted, however, that the sentence "All *A*'s are *B*'s" is normally used to express a twofold judgment: the acceptance of *A*'s that are *B*'s and the rejection of *A*'s that are non-*B*'s.)

Brentano attempted to extend his theory to apply to so-called compound judgments. "He judges that there are *A*'s and *B*'s" presents no difficulty, since, according to Brentano's theory of categories, if *A* is a concrete object and *B* is a concrete object, then the collective consisting of just *A* and *B* is also a concrete object. The object of this conjunctive judgment is simply *A*-and-*B*, which the judge is said to accept. Brentano suggests two interpretations of "He judges that if there are *A*'s, then there are *B*'s." According to the first interpretation, the judge is said simply to reject *A*'s-without-*B*'s. The second interpretation is more complex, making use of the terms *true* and *apodictic*. (The latter term designates a mode of judgment. To reject *A* "apodictically" is, in effect, to reject the possibility of *A*; but Brentano explicated "possibility" in terms of "apodictic rejection," and not conversely.) If by "a correct *A*-acceptor" we mean a man who accepts *A* truly, or correctly, then the hypothetical judgment becomes: "He apodictically rejects judges who are both correct *A*-acceptors and correct *B*-rejectors." The disjunctive judgment "He judges that either there are *A*'s or there are *B*'s" could then become "He apodictically rejects judges who are both correct *A*-rejectors and correct *B*-rejectors."

The philosophical consequences of this nonpropositional theory of judgment are far-reaching. One consequence is an interpretation of Immanuel Kant's dictum that "existence" is not a predicate. According to Brentano, when we say that *A* exists, "it is not the conjunction of an attribute of 'existence' with '*A*,' but '*A*' itself which we affirm." The word *exists* is a synsemantic term that is used to express the act of judgment.

All of the doctrines set forth above fall within the province of what Brentano called descriptive psychology. Unlike experimental psychology—including genetic and physiological psychology—descriptive psychology, according to Brentano, is an exact science, capable of arriving at laws that hold true universally and not merely "for the most part." It is the basis for all philosophy and is even capable of providing a *characteristica universalis* of the sort that Gottfried Wilhelm Leibniz had conceived. Descriptive psychology is closely related to what Husserl was to call phenomenology. Husserl had studied with Brentano in Vienna from 1884 to 1886, when Brentano used the expression *beschreibende Phänomenologie* (descriptive phenomenology) as an alternative name for

descriptive psychology. (Husserl later wrote that without Brentano's doctrine of intentionality, "phenomenology could not have come into being at all.") Brentano's conception of psychology has led some of his critics to accuse him of what Gottlob Frege and Husserl called psychologism. This accusation, however, does not take into account Brentano's theory of evidence and his moral philosophy, both of which he took to be branches of descriptive psychology.

MORAL PHILOSOPHY

Brentano's ethical views are set forth in *Ursprung sittlicher Erkenntnis* (Leipzig, 1889; 3rd ed., edited by Oskar Kraus, 1934), translated by Cecil Hague as *The Origin of Our Knowledge of Right and Wrong* (London, 1902), and in *Grundlegung und Aufbau der Ethik* (The basis and structure of ethics; edited by F. Mayer-Hillebrand, Bern, 1952). Brentano based his ethics upon the assumption that the members of the third class of mental phenomena, loving and hating, may be said to be correct or incorrect, just as judgments may be said to be correct or incorrect. To say that something, *A*, is good is to say that it is impossible to love *A* incorrectly; that is, it is apodictically to reject incorrect lovers of *A*. Analogously, to say that *A* is bad is apodictically to reject incorrect haters of *A*.

The only way to grasp the concept of correct emotion, according to Brentano, is to contrast actual cases of emotions that are "qualified as correct" with cases of emotions that are not. This is analogous to the way in which we understand, for example, what it is to be red and what it is to be colored. Thus we learn that knowledge is good, joy is good (unless it is joy in what is bad), every enrichment within the realm of ideas is good, love of the good is good, love of the bad is bad, and the right end in life is to choose the best among all attainable ends.

The correctness of loving and hating, like that of judging, is objective in that it is impossible for anyone to love correctly what anyone else hates correctly or to love incorrectly what anyone else hates incorrectly. Ethics must make use of the comparative concept *better than*, for which there is no analogue in the theory of knowledge. "*A* is better than *B*," according to Brentano, means that it is correct to prefer *A*, as an end, to *B*.

EVIDENCE AND TRUTH

Brentano's views on evidence and truth may be found in the posthumously published *Wahrheit und Evidenz* (edited by Oskar Kraus, Leipzig, 1930). The distinction between judging on the basis of evidence and judging "blindly" is not to be described in terms of instinct, feel-

ings, degree of conviction, or impulse to believe. We arrive at the general concept of being evident, according to Brentano, in the same way we arrive at the concept of a correct emotion: by contemplating actual instances of the concept, in this case actual instances of evident judgments and of blind judgments.

Every evident judgment is either directly or indirectly evident; if a judgment is indirectly evident, its evidence is conferred, ultimately, by judgments that are directly evident. Directly evident judgments are of two kinds. First, there are the judgments of “inner perception,” such as the judgments that I am now judging in a certain way, that I seem to see such-and-such, that I think I remember so-and-so. Second, there are judgments of reason or insights (*Einsichten*), such as the judgments that two things are more than one thing; that that which is red is, as such, other than that which is green; that there cannot be a triangle with four sides; or that a whole cannot exist if its parts do not exist.

Every judgment that is evident is true, but not every judgment that is true is evident. Most judgments of “outer perception” (of the external world), Brentano believed, are true, but all of them are “blind”; they are not evident. He argued, however, that the hypothesis of a three-dimensional external world, with its familiar details concerning physical bodies, has an “infinitely greater probability” than any of its alternatives. Judgments based on memory, too, are “blind”; but many of them confirm each other, and they are worthy of our confidence.

In *Wahrheit und Evidenz* Brentano characterized truth by reference to evidence: “Truth pertains to the judgment of the person who judges correctly ... hence it pertains to the judgment of one who asserts what the person who judges with evidence would assert” (p. 139). In addition, to say that *A* exists is to say that anyone who judged about *A* with evidence would accept *A*, and to say that *A* does not exist is to say that anyone who judged about *A* with evidence would reject *A*. The “measure of all things,” then, is the man who judges with evidence.

These statements, however, relating truth to evidence, do not give us the whole of Brentano’s theory of truth. “Evident” is said to be predicate in the strict sense of the term, but “true” and “exists” are not, being only synsemantic. This brings us to Brentano’s theory of categories.

THEORY OF CATEGORIES

The basic theses of Brentano’s theory of categories may be stated as (1) there is nothing other than concrete particular things, and (2) every judgment is either the acceptance

or the rejection of some concrete particular thing. “Concrete” must be taken as the opposite of “abstract” and not as a synonym for “physical.” Human souls and God, according to Brentano, are concrete things but not physical things.

Our language seems to make reference to a great variety of *irrealia*—entities that are not concrete things. In fact, however, “the objects of our thought are never anything other than concrete things,” and therefore for every sentence that is true and that seems to mention some nonconcrete thing, “one can form an equivalent in which the subject and predicate are replaced by something referring to a real thing” (*Psychologie*, Vol. II, p. 163). For example, “There is a lack of gold” becomes “There is no gold” (a rejection of gold); “He believes that there are horses” becomes “He accepts (affirms) horses”; and “Red is a color” becomes “A red thing is, as such, a colored thing.” This latter translation is more effective in German—*Das Rotes ist als solches ein Farbiges*—where adjectives are readily transformed into nouns.

Many philosophically troublesome words, such as “exists,” “good,” “impossible,” and “true,” are synsemantic; their linguistic function is not that of referring to concrete things. “Exists” in “God exists,” as we have noted, is used to express acceptance of God; “does not exist,” analogously, is used to express rejection. “*A* is good” expresses an apodictic rejection of incorrect lovers of *A*. “*A* is impossible” expresses an apodictic rejection of evident acceptors of *A*—of judges who accept *A* with evidence.

A true judgment, according to Brentano, is a judgment that cannot contradict an evident judgment. Thus “true,” in “It is true that God exists,” may be used to express apodictic rejection of evident rejectors of God. “It is not both true and false that God exists” may express apodictic rejection of collectives consisting of evident acceptors and evident rejectors of God. (He also noted that “true” may be used to express agreement and that, at times, it is simply redundant.) Brentano could thus be said to have an expressive theory of truth, but one that involves an objective—and not merely expressive—theory of evidence. His theories of existence and of the nature of goodness may be similarly described. Brentano’s theory of categories contains important material on substance and accident, wholes and parts, the theory of relations, causation, and time and space that cannot be summarized here.

LOGIC

Brentano proposed the following revision of the theory of the syllogism on the basis of his theory of judgment. He

wrote “All S are P” (A) as “There is no S which is a non-P”; “No S are P” (E) as “There is no S which is a P”; “Some S are P” (I) as “There is an S which is a P”; and “Some S are not P” (O) as “There is an S which is a non-P.” Since in this account both A and E are denials, and both I and O affirmations, Brentano was able to say that no affirmative judgment is universal and no negative judgment is particular. Barbara is written as “There is no M which is a non-P; there is no S which is a non-M; hence there is no S which is a non-P.” And Ferio is written as “There is no M which is a P; there is an S which is an M; hence there is an S which is a non-P.” Brentano was then able to formulate the doctrine of the syllogism in three rules, which may be confirmed by the two examples just cited.

- (1) Every categorical syllogism contains *four* terms, two of which are opposed to each other and the other two of which occur twice.
- (2) If the conclusion is negative, then each premise is negative and has a term in common with the conclusion.
- (3) If the conclusion is affirmative, then one premise will share its quality and contain one of its terms, and the other premise will have the opposite quality and contain the opposite of one of its terms. (*Psychologie*, Vol. II, p. 78)

The so-called weakened and strengthened moods, according to this account, are invalid. The subaltern inferences from A to I and from E to O fail, but all four propositions, if written in Brentano’s notation, may be simply converted.

OTHER WRITINGS

Vom Dasein Gottes (On the existence of God; edited by Alfred Kastil, Leipzig, 1929), is a systematic theodicy in which Brentano appealed to the fact of contingency and the principle of sufficient reason, a principle that he believed to be logically necessary, in order to prove that there is a Necessary Being. He appealed to the evidence of design in order to prove that this Being is intelligent and good. Here, and in *Religion und Philosophie* (edited by F. Mayer-Hillebrand, Bern, 1954), he attempted to show that the soul is both spiritual and immortal. The subject of consciousness is said to be a nonspatial substance, forming no part of the physical body but capable of acting upon and being affected by the brain; it is created ex nihilo at the time of the conception of the body. Brentano defended the concept of creation ex nihilo by noting that whenever one calls an image to mind, one creates ex nihilo.

In *Versuch über die Erkenntnis* (Inquiry into the nature of knowledge; edited by Alfred Kastil, Leipzig, 1925) and *Grundlegung und Aufbau der Ethik*, Brentano argued that the assumption that there can be absolute chance is self-contradictory and that the thesis of indeterminism is incompatible with the existence of human responsibility. But we have “freedom of the will” in that we are able to bring about some of the things we desire to bring about and are able to deliberate and then to decide accordingly. Moreover, we can “will to will” in that, at any given time, there are things we can do that will affect our volitions at some later time.

According to *Die vier Phasen der Philosophie* (edited by Oskar Kraus, Leipzig, 1926), those periods in which philosophy flourishes tend to be followed by three phases of decline: the first phase is characterized by a transfer of interest from the theoretical to the practical, the second by a tendency toward skepticism, and the third by a relapse into mysticism. This was the pattern of Greek philosophy; in modern philosophy the period of John Locke, René Descartes, and Leibniz was followed by the Enlightenment, then by the skepticism of David Hume, and finally, according to Brentano, by the obscurities of Kant and the idealists who followed him.

Bibliography

Brentano’s historical writings include the following works on Aristotle: *Von der mannigfachen Bedeutung des Seienden nach Aristoteles* (Freiburg, 1862; republished Darmstadt, 1960), an important work that is the source of much of Brentano’s later thought; *Die Psychologie des Aristoteles* (Mainz: Kirchheim, 1867); *Aristoteles Lehre vom Ursprung des menschlichen Geistes* (Leipzig: Veit, 1911); and *Aristoteles und seine Weltanschauung* (Leipzig: Quelle and Meyer, 1911). His *Geschichte der griechischen Philosophie*, edited by F. Mayer-Hillebrand (Bern: Francke, 1963), is compiled from the notes for his university lectures.

Brentano’s other writings include *Untersuchungen zur Sinnespsychologie* (Leipzig: Dunker and Humblot, 1907); *Die Lehre Jesu und ihre bleibende Bedeutung*, edited by Alfred Kastil (Leipzig, 1922); *Grundzüge der Ästhetik*, edited by F. Mayer-Hillebrand (Bern: Franck, 1959); and *Aenigmatias*, 5th ed. (Bern, 1962).

Certain portions of the *Psychologie* are translated in *Realism and the Background of Phenomenology*, edited by R. M.

- Chisholm (Glencoe, IL: Free Press, 1960); other translations are being prepared.
- The most informative works on Brentano are Alfred Kastil, *Die Philosophie Franz Brentanos: Eine Einführung in seine Lehre* (Bern: Francke, 1951) and Oskar Kraus, *Franz Brentano: Zur Kenntnis seines Lebens und seiner Lehre* (Munich: Beck, 1919). The latter contains "Erinnerungen an Franz Brentano," by Carl Stumpf and Edmund Husserl. See also G. E. Moore, "Review of Franz Brentano, *The Origin of the Knowledge of Right and Wrong*," in *International Journal of Ethics* 14 (1903): 115–123.

Bibliography updated by Michael J. Farmer (2005)

BRIDGMAN, PERCY WILLIAM (1882–1962)

An American physicist and professor of mathematics and natural philosophy at Harvard, Percy William Bridgman was awarded the Nobel Prize for physics in 1946 for his work on the properties of matter under extremely high pressures. He wrote at length on the philosophical implications of the discoveries of modern physics, particularly Albert Einstein's revolutionary special theory of relativity, and on the analysis of scientific concepts. To Bridgman it seemed that Einstein's theory arose chiefly from the application of sound conceptual analysis based on what Bridgman called the "operational point of view." In his

opinion, Einstein had not shown “something new about nature”—he was “merely bringing to light implications already contained in the physical operations used in measuring time.” Bridgman held that analysis shows that there exists no answer to the question of what we should do, what operations we could perform, in order to determine whether or not two distant events occurred simultaneously. Therefore, it is meaningless to speak of the two events as having or not having occurred simultaneously.

According to Bridgman, then, Einstein’s work dramatically highlighted an important feature of scientific methodology, the determination to link all scientific concepts to experimental procedures. From the operationalist views implicit in the practices of working scientists, we should learn to undertake a rigorous analysis of all scientific concepts, cleansing science of operationally undefinable elements.

Bridgman disclaimed all intention of founding a new philosophical school, yet his name has become linked inseparably with operationalism. Many scientists have hailed Bridgman’s ideas as indispensable to the correct understanding of modern science, and some, particularly psychologists, have urged the inauguration of an extensive program of analysis of scientific concepts along the lines laid down by Bridgman. Others have regarded Bridgman’s philosophy as not only wrong, but also harmful—if it were imposed on science, it could stifle creative inquiry. Bridgman later claimed that each concept need not be completely definable in terms of performable instrumental operations, but that it is sufficient that a concept should be one “indirectly making connection with instrumental operations.”

The controversy over operationalism diverted attention from Bridgman’s numerous other ideas, many of which are original and provocative. Perhaps the most interesting is his view that discoveries in physics may help us to deal with problems in quite different domains. In his opinion, the great achievements in physics are discoveries of new ways in which our minds can master problems, discoveries about our conceptual makeup.

Through relativity physics, we have learned how apparent contradictions may arise through inadvertently admitting into science meaningless propositions that cannot stand up to operational analysis. Similarly, in human affairs seemingly irreconcilable demands of different groups may be eliminated by showing that some of the basic tenets on which the demands rest are meaningless. The methodology of the social sciences no doubt can learn much from the methodology of physics, but Bridgman’s suggestion as to how human conflicts may be

resolved will strike many as overly optimistic and somewhat naive.

BRIGHTMAN, EDGAR SHEFFIELD (1884–1953)

Edgar Sheffield Brightman was the leading American advocate of personalism. At Boston University he studied under Borden Parker Bowne, the first philosopher in America to develop the personalistic position. Brightman taught at Nebraska Wesleyan University (1912–1915), Wesleyan University (1915–1919), and from 1919 at Boston University, occupying the chair of Borden Parker Bowne professor of philosophy from 1925 until his death. He was president of the Eastern Division of the American Philosophical Association in 1936.

Brightman conceived of personalism as a mediating position in philosophy. As such, it for him superseded William James’s pragmatism and Josiah Royce’s absolute idealism, to each of which, in turn, he had been attracted early in his career. Brightman also held that personalism could resolve the impasse between supernaturalism and naturalism. Furthermore, although he criticized positivism for being too restricted an empiricism and although he eschewed much in existentialism, Brightman’s personalism can be understood as an attempt to combine the surface experience (sense) of positivism and the depth dimension (value) of existentialism in a concept of the total person.

EPISTEMOLOGY

Brightman held firmly to an epistemic dualism of the “shining present” (immediate experience) and “the illuminating absent” (the referent). Constantly emphasizing that all primary data were present experiences, he advocated a radically empirical method; that is, a method that considers whatever is, at any time, present in consciousness. Since knowledge involves reference, it is always hypothetical and tentative. Brightman accepted this as a healthy probabilism (and not a destructive skepticism), because he found in the principle of coherence an adequate test of reference (or criterion of truth). Deeply influenced by Hegelian dialectic, he viewed coherence not as formal consistency but as a principle for interpreting experience: a statement or a set of statements is true to the extent that it organizes and orders experience.

ONTOLOGY

The metaphysical perspective that emerges is a pluralistic idealism. Reality is a society of persons: the ultimate (uncreated) Person and finite (created) persons. Reality is thus not nature but history. The natural order does not have ontological identity “outside” the ultimate Person; rather, this order is his “behavior.” The laws of logic do not have privileged priority; they are constitutive of the supreme mind. In philosophy of religion, this position is idealistic theism (not theological dualism). God is a conscious Person who creates finite persons and cooperates with them in the cosmic endeavor. A human person is a context of experience capable of self-consciousness, reason, and ideal values.

EVIL

Brightman is probably most widely known for his controversial treatment of the problem of evil. He argued that the power of God is limited by nonrational conditions (the Given) within the divine nature that God’s will neither created nor approves. God maintains constant and growing, though never complete, control of the Given.

Bibliography

Brightman’s chief works are *Introduction to Philosophy* (New York: Henry Holt, 1925; revised editions, 1951 and 1963, the latter edited by Robert N. Beck); *The Problem of God* (New York: Abingdon Press, 1930); *The Finding of God* (New York:

Abingdon Press, 1931); *Moral Laws* (New York: Abingdon Press, 1933); *A Philosophy of Religion* (New York: Prentice-Hall, 1940); *Nature and Values* (New York: Abingdon-Cokesbury Press, 1945); *Person and Reality* (edited by Peter A. Bertocci in collaboration with Jannette E. Newhall and Robert S. Brightman [New York: Ronald Press, 1958]). A selected bibliography of his philosophical writings, including some 200 monographs and articles in addition to books, may be found in *Person and Reality*, pp. 367–370, or in the Brightman Memorial issue of *Philosophical Forum* 12 (1954): 22–28.

For references to discussions of Brightman’s influence, see Peter A. Bertocci, “Edgar S. Brightman—Ten Years Later,” in *Philosophical Forum* 20 (1962/1963): 3–10.

John H. Lavelly (1967)

BROAD, CHARLIE DUNBAR

(1887–1971)

Charlie Dunbar Broad, the English epistemologist, historian of philosophy, moral philosopher, philosopher of science, and writer on the philosophical aspects of psychological research, was born at Harlesden, now a suburb of London. The only child of middle-class parents in comfortable circumstances, he received a good education at Dulwich College. With his special interest and ability in science and mathematics he won, in 1905, a science scholarship to Trinity College, Cambridge, with which Broad’s philosophical career was to be chiefly associated. Despite success in his work at Cambridge, he became convinced that he would never be outstanding as a scientist and turned to philosophy, in which he took first-class honors with special distinction in 1910. A year later he was elected to a fellowship at Trinity because of a dissertation that became his first book, *Perception, Physics, and Reality* (Cambridge, U.K., 1914).

From 1911 to 1920 Broad was at the University of St. Andrews, first as assistant to G. F. Stout, the professor of logic and metaphysics, then as a lecturer at Dundee. During World War I, he combined his lecturing duties with work for the Ministry of Munitions in a chemical laboratory. He followed C. Lloyd Morgan in the chair of philosophy at the University of Bristol in 1920, but after a few years he returned to Trinity College to succeed J. M. E. McTaggart as lecturer in moral science. In 1933 Broad somewhat reluctantly became Knightbridge professor of moral philosophy. Until his retirement in 1953, Broad had not traveled outside Great Britain except for periodic visits to Scandinavia, in particular to Sweden, a country whose people, life, and language had long attracted him. Broad’s encouragement of Swedish philosophers and phi-

losophy led to his being generously honored by the academicians of that country. In Britain his services to philosophy were recognized by bestowal of most of the honors available to a don so secluded from public activity.

At Cambridge, Broad was most influenced by his teachers, McTaggart and W. E. Johnson, and by Bertrand Russell and G. E. Moore. These four men, with the important additions of Stout and A. E. Taylor at St. Andrews, represent in the diversity of their thought something of the extraordinary range of Broad's own interests. Among British philosophers of this century, no one, including Russell, published so much on so many different philosophical topics. The largest part of Broad's writing falls within the theory of knowledge and the philosophy of science—provided that we assign some of the problems of traditional metaphysics to these two fields—although he also wrote extensively, if less systematically, on ethics and on the life and thought of such scattered figures as Francis Bacon, Isaac Newton, Butler, and Immanuel Kant.

The ample scope and scale of Broad's work were displayed early in his career. Within his first three years of serious publication, he had produced almost two dozen reviews of widely different books, essays on "The Doctrine of Consequences in Ethics" (*International Journal of Ethics* 24 [April 1914]: 293–320) and "Lord Hugh Cecil's 'Conservatism'" (*International Journal of Ethics*, 23 [July 1913]: 396–418), a critical notice of Meinong's *Über Annahmen* (*Mind*, n.s., 22 [January 1913]: 90–102), and his own first volume, which discussed the relation between causation and perception. This catholicity of interest remained apparent for the next fifty years, despite Broad's confession in the autobiographical chapter of *The Philosophy of C. D. Broad* that some time after his acceptance of the Knightbridge chair he gave up philosophy in all but title and routine: "I no longer believed in the importance of philosophy, I took little interest in its later developments, and I knew very well that I at least had shot my bolt and had nothing further of value to contribute."

The most curious feature of this confession is that it makes the development of ennui coincide with a period of considerable publication by Broad. The 800 pages of the second volume of his *Examination of McTaggart's Philosophy* (Cambridge, U.K., 1933–1938) were written at this time, as were his essays on John Locke (*Hibbert Journal* 31 [January 1933]: 249–267) and Henry Sidgwick (*ibid.*, 37 [October 1938]: 25–43), his inaugural lecture on determinism, a number of papers given to the Aristotelian Society, and a spate of notes on psychical phenomena. Broad's changed attitudes and feelings toward

his chosen field had little substantial effect on the work he contributed to it.

THEORY OF KNOWLEDGE

Broad's writings on perception and knowledge, like the rest of his work, form neither a system nor a set of unequivocal answers to a group of related questions. For every philosophical position there were always reasons pro and con; and on any given issue Broad often found it difficult to decide where the weightier reasons lay.

SENSE DATA. Thus, following Stout, and ultimately Locke, in distinguishing between the odors, noises, and colored patches that we sense and the physical objects like coins and books that we perceive, Broad gave rather cautious support to a version of the causal theory of perception. There are, he thought, two kinds of particulars involved in perception—persistent substances (bodies) with properties like shape, size, inertial mass, and spatial position; and the "sense-qualified occurrents" of which we are immediately aware in sensing, as when we see the upper surface of a dinner plate. Broad argued that visual sense data, or *sensa* as he called them, at least are never, in fact, identical with, or parts of, the surface of the physical object that is seen. If we recall that the sense data obtained by a given person in looking at the same surface from different positions and angles form a continuous series, and that the velocity of light is finite, it is reasonable to believe that at least some of the properties of sense data must be different from those of their correlated bodies, that a penny, for example, retains the same size and shape while our sense data of it change in these respects as we alter position. The greater the distance between our eyes and the body seen, the more obvious it is that the properties of the body and of our sense data must differ.

It is likewise reasonable that if this difference sometimes holds, it must always hold; for there is no gap in the continuity of conditions in which we obtain sense data of a particular surface that would allow us to identify only some of the sense data with that surface. As underpinning for this sharp distinction, Broad tried to establish that a sense datum must have all the properties that it is sensed as having, although it may also have unnoticed properties; that unsensed sense data can exist; and that the word *sensation* refers both to bodily feelings and to "genuine sensations," the former of which are not, although the latter are, analyzable into an act of sensing and its object, the sense datum.

In general, Broad treated these claims about the existence and properties of sense data as being empirical

ones, and so was led to a similar treatment of such questions as: Are *sensa* qualitatively mind-dependent? Can two people sense the same *sensum*? How long can a *sensum* last? Do we infer from the properties of our *sensa* to the properties of physical objects? How much resemblance is there between the properties of *sensa* and the properties of physical objects? In his “Reply to Critics,” written late in his career, Broad indicated that he did not feel the force of the view, made familiar by G. A. Paul and A. J. Ayer, that these questions can be answered only by decisions in particular cases or else are misconceived, since the sense-data theory is simply an elaborate terminological proposal for dealing with the argument from illusion. Nor did he recognize the radical criticism that this view offered of his own attempts to deal with sense data as private objects interposed between human observers and the unobservable physical world. The latter is the “remote causal ancestor” of our sensations, he thought, and the kind of isomorphism one must postulate between the properties of sense data and the properties of “the hypothetical system of physical things and events” he was “willing to leave to experts to decide.”

THE MIND-BODY PROBLEM. In his discussion of the mind-body problem, Broad set out to produce a theory that would account for the apparent fact that brain events are a necessary condition of mental events, and also leave open the possibility that some mental events occur after the death of their associated bodies. He suggested that minds are the result of two components—a nervous system, and a “psychogenic factor,” which is modified by experience and capable of persisting after bodily death. Since no other properties are assigned to the psychogenic factor, nor is its relation to the brain described, the factor remains unobservable, either directly or indirectly; and the parent theory is obviously *ad hoc*. Broad would have welcomed a theory that was more open to experimental testing; although he distinguished metaphysical from scientific theories by the latter’s susceptibility to such testing. He was thus in the position of answering the philosophical question, How are bodies related to minds? with what was, by his own criteria, an inadequate scientific theory. Just as he took sense data to be private objects whose properties could be investigated by introspection, so he took the mind-body relation as being similar to the relation between a visible body and an invisible one—a relation open in theory, if not in practice, to empirical investigation.

GENERAL EXPLANATORY PRINCIPLES. Closely related to this treatment of philosophical problems was Broad’s

attempt, throughout his writings, to isolate a set of very general principles that would be both necessarily true and genuinely explanatory of the most pervasive and important features of the world. Broad was not convinced either that every necessarily true statement is analytic or that every synthetic statement is testable by means of perceptual experience. He thought that there might well be propositions, such as “The cause of any change contains a change as an essential factor,” which are synthetic—informative about the world—but necessarily true. The denial of this proposition is not self-contradictory, so the proposition cannot be analytic; yet a counterexample is impossible to imagine, so the proposition, rather than being an ordinary empirical one, is self-evidently true. Propositions as general as this, Broad half suggested, are the appropriate axioms of metaphysical theories, theories whose results he compared unfavorably to the “beautiful and surprising consequences” deduced from the premises of geometry and such physical premises as the “entropy principle.” Broad’s pessimism about the utility of deductive metaphysics seems to have been the outcome of a desire to treat speculative philosophy as a *suprascience*, one that accounted for our most general concepts, such as cause, substance, potentiality, and actuality, in much the same way that physics accounted for such less general concepts as velocity, mass, simultaneity, and the atom.

A PRIORI CONCEPTS. This distinction between the concepts dealt with by the sciences and those more general ones dealt with by philosophy has its parallel, and perhaps its source, in the distinction drawn by Broad between empirical and *a priori* (nonempirical) concepts. He believed that the simplest empirical concepts, for example, the ideas of red or yellow, are formed by our contrasting and comparing many different red or yellow objects. Eventually, we abstract the required quality from all other qualities and from any particular substance in such a way that we are able to think of the quality in the absence of any instance or image of it. In thus accepting the traditional story of the genesis of empirical concepts, Broad hesitated between the two equally ancient views of how we form *a priori* concepts. The first view is that we have innate dispositions to form specific ideas like those of cause, substance, and rightness as the result of having certain kinds of experiences. The second is that we have “a general power of non-perceptual intuition,” distinct from our ability to have sense perceptions and to introspect, which allows us to intuit such relations as causation and rightness whenever we have the appropriate kinds of experiences to stimulate the power.

A standard criticism of these theories of concept formation is that the story about abstraction is logically circular; and that the accounts of a priori concepts apply equally well or little to empirical ones, so that Broad's distinction between the two cannot be drawn. The abstraction story is circular because in order to compare and contrast one color with another we must already have the ability to recognize and distinguish those colors. Yellow objects that are to be compared must be seen as yellow before the suggested procedure can begin. Hence, we can rightly claim that innate ideas or nonempirical intuitions are needed for the concept of yellow as they are for concepts like that of substance.

However, thinking of an absent quality yellow is not the intellectual analogue of sensing a yellow patch, for thinking of yellow is not a matter of "contemplating the characteristic" yellow, as Broad once assumed it was. Noting the logically necessary relations between concepts, for example, that all yellow things must be colored, is not like having a sense datum and noting that in it a red patch borders on a yellow patch. Granting these two points, as Broad did in his "Reply to Critics," would make it less plausible to hold that some synthetic propositions may be necessarily true. For once we abandon the sense-datum picture of logical necessity, there is little temptation to appeal to self-evidence (the intellectual sensing of universal connections) in support of metaphysical principles.

PSYCHICAL RESEARCH

Broad often urged philosophers to take something of his own keen interest in psychical research. He claimed that no one could answer the question as to whether any person actually has the power of paranormal precognition without having made a careful study of the available evidence; but most philosophers obviously considered this to be a scientific task for psychologists. In the absence of any encouragement from scientists, few philosophers would join Broad in discussing the further question, which chiefly interested him, How does the existence of supernormal precognition affect such philosophical topics as causation, the mind-body problem, immortality, and sense perception? Suppose we took seriously the suggestion that each person has an extended but intangible and invisible body as well as his ordinary body and that the invisible body puts forth pseudopods that touch and affect external objects. The existence of such a body would certainly alter a number of our views on topics like causation and the mind-body problem. But exactly how they were altered would depend on such factors as the degree of control we could exert over our invisible bodies,

whether they survived our corporeal bodies, and what sort of knowledge we could have of our intangible bodies.

Thus until there is scientific agreement on what has been established concerning paranormal cognition, it is difficult to say how its existence would affect philosophical discussion. What can undoubtedly be done is to consider whether the notion of supernormal precognition is logically coherent. Broad thought that it is and tried to rebut arguments that it is self-contradictory to speak of precognizing something that does not yet exist as well as arguments that paranormal precognition makes an effect precede its cause—correctly guessing a card symbol would be influenced by what is to be known later about the card. However, showing that paranormality is logically possible does nothing to advance its claims over alternative hypotheses in the explanation of unlikely experimental data, data that may be unlikely because of selective sampling alone.

PROBABILITY AND INDUCTION

Although Broad's two papers titled "Induction and Probability" gave what will probably be a definitive expression to their point of view, they were overshadowed by the simultaneous appearance of J. M. Keynes's *A Treatise on Probability*. In much the same way, Broad's *Scientific Thought* (London, 1923)—perhaps his best book—was neglected after the publication, a few years later, of Russell's *The Analysis of Matter*. Broad argued that the degree of belief we give to well-established inductions cannot be justified "by any known principle of probability unless some further premise about the physical world be assumed." Yet this premise is notoriously difficult to state. If induction is to be a rational procedure, nature must consist of a few kinds of substances that combine in various lawlike ways and thus produce variety in a finite world. In brief, we need Keynes's principle of limitation of independent variety. Without such a principle we cannot make use of inductive analogies, for they assume that future cases will resemble past cases, or in other words, that no one object has an infinite number of independent qualities or is producible by an infinite number of different causes. In "The Principles of Problematic Induction" (*PAS*, n.s., 28 [1927–1928]: 1–46), Broad went on to consider, and answer affirmatively, the question whether we can know that nature has this desirable structure.

Thus, Broad held that the problem of justifying inductive inferences is a genuine one. He thought that the two questions, What is meant by calling this inductive belief well-supported? and What makes induction a valid procedure? have similar answers. Each question requires

us to state the criteria by which we can distinguish sound from unsound inferences, and these criteria will enable us to provide the necessary and sufficient conditions for well-grounded inferences. Such conditions must in turn be based on fundamental principles that will serve as general premises in every sound inductive inference. This last step of Broad's claim has been much criticized as confusing two quite different issues. The first concerns the empirical statement, for which there is ample evidence, that nature is so organized that in the future at least some of our inductive beliefs will be correct. The second concerns the logically necessary truth that induction is a rational procedure; for we could not have an inductive policy that was both successful and irrational, that is, not supported by good evidence. What we mean by "rational inductive procedure" is one that is well supported by evidence. It is this support that "justifies" the policy in the only permissible sense of "justify." The structure of nature is known inductively and so cannot itself be referred to for support of the inductive procedure; nor is there any need to do so. The only justification we require is the success of the policy, and that we already have.

ETHICS

On the problems of ethics, Broad showed a cautious hesitancy to commit himself. Two of his late papers, "Some Reflections on Moral-Sense Theories in Ethics" (*PAS*, n.s., 45 [1944–1945]: 131–166) and "Some of the Main Problems of Ethics" (*Philosophy* 21 [July 1946]: 99–117), have been widely read; but they provide only hints as to Broad's own views. As in the early chapters of *Five Types of Ethical Theory* (London 1920), on such writers as Benedict de Spinoza and David Hume, Broad classified types of ethical theories, exposed their assumptions, and drew out their logical implications, without committing himself. For example, in his paper on moral-sense theories he distinguished three analyses of "That act is right": The sentence does not express the speaker's judgment, but his emotions or desires or commands; what is expressed is a judgment about "certain human experiences, certain sensations or emotions or desires," that is, a "moral feeling"; and a judgment is made that ascribes a property like "what it is fitting to approve" or "conducive to social stability," properties independent of the speaker's opinions, desires, or feelings.

In his "Reply to Critics" Broad said that theories of the second and third types must admit the existence both of nonempirical concepts of moral attributes and of synthetic a priori propositions like "any act of promise-breaking tends as such to be wrong." Since he was not

convinced that there were no such concepts and propositions, he was able to sympathize with theories of these types, as well as with theories of the first type. But to the question, does "That act is right" express a judgment, a feeling, or a command? Broad could only reply, "I have no definite opinion." He was similarly undecided on the question whether ethical terms such as *wrong* and *duty* stand for properties, and if so, exactly what sort of properties these might be. His attitude here, as to many other philosophical problems, resembled that of a prudent scientist awaiting further evidence before coming to a decision.

Broad had no "philosophy" in the sense of a deeply original way of interpreting and dealing with the issues of his field. He was a scientist manqué who took up philosophical problems much as he found them, leaving them classified and more manageable but not transformed. His impressive ability to understand and recast the most difficult arguments, the elegance of his writing, his unrivaled thoroughness and lucidity, were placed at the service of other people's questions rather than his own.

Bibliography

Broad's other books include *The Mind and Its Place in Nature* (London: Kegan Paul, 1925), his most characteristic work, and *Lectures on Psychological Research* (London: Routledge, 1963). Some of his essays have been collected in two volumes, *Ethics and the History of Philosophy* (London: Routledge, 1952) and *Religion, Philosophy, and Scientific Research* (London: Routledge, 1953). His two papers titled "Induction and Probability" appeared in *Mind* 27 (1918): 389–404 and 29 (1920): 11–45. There is a complete bibliography up to 1959 in *The Philosophy of C. D. Broad*, edited by P. A. Schilpp (New York: Tudor, 1959), which also contains 21 essays on his work by various philosophers, Broad's "Reply to Critics," and his "Autobiography." A critical examination of Broad's theory of perception is given in Martin Lean, *Sense Perception and Matter* (London: Routledge and Kegan Paul, 1953).

BROUWER, LUITZEN EGBERTUS JAN

(1881–1966)

Luitzen Egbertus Jan Brouwer, the founder of mathematical intuitionism, was born in 1881 in Overschie, near Rotterdam, the Netherlands. After attending schools in Medemblik, Hoorn, and Haarlem, he studied mathematics at the Municipal University of Amsterdam. He obtained his doctorate in 1907 for his thesis, *Over de Grondslagen der Wiskunde* (Amsterdam and Leipzig, 1907). He became *privaat-docent* at Amsterdam in 1909 and served as professor there from 1912 until his retirement in 1955. In the year that he became a professor he was elected to the Royal Dutch Academy of Sciences.

Besides contributions to the foundations of mathematics, Brouwer made major contributions to other areas of mathematics, in particular to topology, in which his most important publications date from the period 1909–1913. Combinatorial or algebraic topology came into being through discoveries of Henri Poincaré in the 1890s. A fundamental technique of Poincaré was to analyze figures into combinations of simple figures and to represent the topological structure of the figures by algebraic properties of the combination. Brouwer extended and deepened this technique, particularly in relation to questions of the existence of mappings and fixed points. He proved such classic results as the topological invariance of dimension, which implies that there is no bicontinuous one-to-one mapping of Euclidean m -dimensional space onto Euclidean n -dimensional space, for $m \neq n$.

Although he was primarily a mathematician, Brouwer was always preoccupied with general philosophy and had elaborated a highly individual philosophical vision. Indeed, the most remarkable feature of Brouwer's work in the foundations of mathematics was the boldness and consistency with which, starting from his own philosophical position, he questioned the principles on which

the mathematics he inherited was based, down to so elementary a principle as the law of excluded middle, and then proceeded to criticize these principles in detail and to begin to reconstruct mathematics on a basis he regarded as sound.

Although he later presented them more systematically, the essentials of Brouwer's philosophy were already present in his thesis of 1907 and, in certain respects, in *Leven, Kunst, en Mystiek* (Delft, 1905). These works antedate the decisive steps in the development of mathematical intuitionism. In effect, Brouwer argued in his thesis that logic is derivative from mathematics and dependent for its evidence on an essentially mathematical intuition that rests on a basis close to Immanuel Kant's notion of time as the "form of inner sense." Intellectual life begins with "temporal perception," in which the self separates experiences from each other and distinguishes itself from them. Brouwer describes this temporal perception as "the falling apart of a life moment into two qualitatively different things, of which the one withdraws before the other and nonetheless is held onto by memory" ("Weten, Willen, Spreken," 1933). This perception, however, belongs to an attitude (which Brouwer earlier termed "mathematical consideration") that the self adopts to preserve itself; the adoption of this attitude is an act of free will, in a broad sense that Brouwer probably derived from Arthur Schopenhauer. The fundamental intuition of mathematics is this structure of temporal perception "divested of all content"; in mathematics one sees that the process of division and synthesis can be iterated indefinitely, giving rise to the series of natural numbers. In the temporal order thus revealed, one can always imagine new elements inserted between the given ones, so that Brouwer could say that the theories of the natural numbers and of the continuum come from one intuition, an idea that, from his point of view, was made fuller and more precise by his theory of free choice sequences, although one might argue that it was made superfluous by that theory.

Brouwer's constructivism was developed in this context. His constructivism was probably motivated less by an insistence on absolute evidence and a rejection of hypotheses (which might have led to "finitism" in David Hilbert's sense of the term or even to a still narrower thesis) than by Brouwer's subjectivism and his insistence on the primacy of will over intellect. On these grounds, mathematics should consist in a constructive mental activity, and a mathematical statement should be an indication or report of such activity. Brouwer credited this

way of looking at mathematics to the inspiration of his teacher, Gerrit Mannoury.

In his thesis Brouwer limited himself to criticizing alternative theories of the foundations mathematics and to criticizing Cantorian set theory, but in “De Onbetrouwbaarheid der Logische Principes” (1908), perhaps urged on by Mannoury, Brouwer raised doubts about the validity of the law of excluded middle, although he still regarded the question as open. In *Intuitionisme en Formalisme* (1912) Brouwer did not say flatly that the law of excluded middle is false, but he gave an instance of his standard argument, an example like that presented in the section on intuitionism in the entry titled “Mathematics, Foundations of,” which also gives a fuller exposition of constructivism.

In a number of publications beginning in 1918 and extending through the 1920s, Brouwer developed intuitionist mathematics and worked out in detail his critique of classical mathematics, determining for different branches of mathematics which of their theorems are intuitionistically true. In “Begründung der Mengenlehre unabhängig vom logischen Satz vom ausgeschlossenen Dritten,” Brouwer undertook to develop an intuitionist set theory, on which a theory of the continuum could be based. In this work he introduced his concept of set (*Menge*; later, in “Points and Spaces,” 1954, he called it “spread”) and therefore the idea of an arbitrary infinite sequence as generated by successive free choices. He also introduced the notion of species, which led to his own version of a predicative hierarchy of classes. The principle that the value of a function everywhere defined on a spread must, for a given sequence as argument, be determined by a sufficiently large finite number of its terms is already present in “Begründung der Mengenlehre.” This “continuity axiom” is the first of the two distinctive principles of intuitionist analysis.

In “Beweis, dass jede volle Funktion gleichmässig stetig ist” (1924), Brouwer announced a proof that a function everywhere defined on the closed unit interval is uniformly continuous. In this proof Brouwer used two fundamental assertions about spreads, later called the bar and fan theorems. The bar theorem, or an equivalent assertion, constitutes the other distinctive principle of intuitionist analysis. Brouwer’s proof was presented in full in “Über Definitionsbereiche von Funktionen” (1927) and reworked, in a more general setting, in “Points and Spaces.”

After World War II Brouwer published a long series of short papers in which he developed a new type of

counterexample to classical theorems, based on another new principle.

Brouwer’s philosophy is not limited to what is relevant to the foundations of mathematics. Mathematical consideration has a second phase, which he called causal attention. In this phase “one identifies in imagination certain series of phenomena with one another,” an operation by which one can pick out objects and postulate causal rules. (The relation between temporal perception and causal attention is analogous to that between Kant’s mathematical and dynamical categories.) The whole point of mathematical consideration lies in the fact that it makes possible the use of means: One produces a phenomenon that will be followed in a certain repeatable series by a desired phenomenon that cannot be directly reproduced. This makes the pursuit of instinctual satisfaction more efficient.

Especially in *Leven, Kunst, en Mystiek* and in “Consciousness, Philosophy, and Mathematics” (1948), Brouwer regards this “mathematical action” as a kind of fall from grace, whose results are uncertain and ultimately disappointing. With this view he couples a pessimism about society. Society is based on communication, which is itself a form of mathematical action. What is ordinarily called communicating one’s thoughts actually amounts to influencing the actions of another, although sometimes a deeper communication of souls is approached. Brouwer, however, was not always aloof from all efforts at social reform, as is shown by his participation, immediately after World War I, with the poet Frederik van Eeden, Mannoury, and others, in the Signific Circle, whose original goal, inspired by the abuses of propaganda during the war, was a far-reaching reform of language.

BROUWER, LUITZEN EGBERTUS JAN [ADDENDUM]

Luitzen Egbertus Jan Brouwer was one of the first to clearly distinguish between language and metalanguage, as well as to distinguish between mathematics and metamathematics. Published in his dissertation from 1907—written in Dutch—these ideas did not disseminate quickly, although they soon found fertile ground when Brouwer explained them to David Hilbert on the beach of Scheveningen, Holland, in 1909.

Brouwer also had conversations with Ludwig Wittgenstein (Vienna, 1928), Edmund Husserl (Amsterdam, 1928), and Kurt Gödel (Princeton, New Jersey, 1953). These conversations may equally have been of philosophical interest, but little seems to be known about their actual contents.

Throughout his life, Brouwer explored a deep interest in the history and practice of mysticism, yet this had no effect on the content of intuitionistic mathematics. In fact, in Brouwer's view, not to engage in even the simplest mathematics is a necessary condition for obtaining mystical insight, and the other way around. He reasoned that, whereas mathematics comes into being with the perception of a move of time, abolishing that perception is a necessary condition for the return of consciousness to its "deepest home" (Brouwer 1975, p. 480).

A note by Brouwer in the margin of an offprint (kept in the Brouwer archive, Utrecht, Holland) of his 1928 lecture "The Structure of the Continuum" (Brouwer 1975, pp. 429–440) shows that he held that the introduction of choice sequences did not make the intuitive continuum dispensable: "the continuum is still the result of the Ur-intuition." One can make do with just the choice sequences as far as the mathematical modeling of the continuum is concerned, but from a philosophical point of view, its intuitive givenness remains: Continuity and discreteness are mutually dependent and irreducible polarizations of the fundamental intuition of mathematics.

While from the beginning of his career Brouwer had combined mathematical and philosophical work, it was upon the theft of his mathematical notebook from a tram

in Brussels, Belgium, in 1929, that he came to despair of the continuation of his mathematical research. Perhaps the difficulties he foresaw in reconstructing these notes made him want to concentrate on philosophy instead. However, there were two other setbacks around the time that, in the long run, proved so devastating to Brouwer as to thwart whatever career plans he may have had. One setback was his conflict with Hilbert over the German journal *Mathematische Annalen*, on the editorial board of which they both served. The direct outcome of this dispute was—as intended by Hilbert—Brouwer’s expulsion from the journal’s board. The other setback was Brouwer’s priority conflict with Karl Menger over the correct definition of *dimension*. Through the emotional and mental toll these fights took from someone of Brouwer’s constitution, his creative work was, for the most part, brought to a halt (he would resume his work after 1945).

BROWN, THOMAS

(1778–1820)

Thomas Brown, a philosopher on the periphery of the common sense school, was born at Kirkmabreck in Scotland. Radically opposed eighteenth-century traditions met in him. He shared with the common sense school, which derived from Thomas Reid, a number of its metaphysical doctrines and its appeal to intuitive truths; and he was also Reid’s tireless critic. Philosophy, for Brown, was very largely “analysis”: analysis of what he regarded as darkened notions, designed to exhibit their character free from spurious mystery and complication; analysis of the genuinely complex into its elementary constituents and of the deceptively simple into its real complexity. He saw Reid as a great resister of analysis. In the procedure of analysis Brown was influenced by French empiricism in the line of descent from Étienne Bonnot de Condillac.

During the course of his studies at the University of Edinburgh, Brown attended the lectures given by Dugald Stewart, Reid’s close adherent. He subsequently graduated in medicine. In 1798 he published a criticism of the *Zoonomia* of Erasmus Darwin and in 1804 a defense of David Hume’s account of causal relations (enlarged in 1806 and again in 1818, when it appeared under the title *Inquiry into the Relation of Cause and Effect*). Brown was

among the first of the contributors to the *Edinburgh Review* (he attacked Immanuel Kant in the second number of the *Review*). In 1810 he was appointed conjoint professor of moral philosophy with Stewart and took over the teaching duties of the chair. His lectures were a dazzling success; they were published after his death and went through many editions in a few years.

CAUSE AND EFFECT

Brown's views on causation typically combined an empiricist analysis with what he called a principle of intuitive belief. He defined a cause as "that which immediately precedes any change, and which, existing at any time in similar circumstances, has been always, and will be always, immediately followed by a similar change" (*Cause and Effect*, p. 13). Brown thought that if we reflect with sufficient patience and imagination, we can see that this definition exhausts the notion of a cause. To suppose that a cause is something more than the antecedent of an invariable consequent is to suppose that we might know all the unfailing regularities of nature and yet have no conception of a causal connection. Material and volitional agents, Brown argued in detail, do not differ in agency; all agency is the same. The omnipotence of God resides simply in the fact that whenever he wills anything, his will is "immediately and invariably followed by the existence of its object" (p. 103).

In tracing the sources of the complex illusion which, he thought, hangs over the relation of cause and effect, Brown emphasized the power of metaphor to mislead. Thus, things that are connected or bound together dependably go together; from this circumstance various figurative expressions enter the language and their figurative character is unnoticed. No bond or connection between causally connected events ever presents itself; yet unless we shift our attention from words to things, we shall easily suppose that it must be insensibly present. Experience (coupled with a kind of negative insight) enables us to see that the causal relation is merely one of sequence; but on what authority do we import the notion of invariableness into this sequence? Brown maintained that we are intuitively certain that the same antecedents will always be followed by the same consequents.

THE WILL

Under Brown's analysis, mystery vanished from the will: will is an amalgam of desire and the belief that one has it in one's power to realize the desire; there is no further, indefinable operator in our voluntary actions. Brown was not impressed by denials of the identity of will and desire

on the ground that there can be opposition between them—Reid had said, "We may desire what we do not will, and will what we do not desire." When the types of situation referred to are looked at more carefully, Brown said, the opposition is seen to lie between desire and desire, and to be terminated by the desire upon which action immediately depends.

CONSCIOUSNESS

The examination of consciousness that provides data for the philosophy of mind is not, in Brown's opinion, conducted by consciousness. Once again, he saw entities as having been multiplied beyond necessity and, in this case, beyond possibility. He maintained that consciousness is not, as some philosophers have supposed, a surveyor of the mind's various states as they occur; rather, it is constituted by them. To suppose that "the same indivisible mind" could exist at the same time in two different states, one of them an object to the other, is "a manifest absurdity" (*Philosophy of the Human Mind*, Lectures XI and XII). What is thought of as an introspective examination of mental phenomena is therefore, strictly speaking, retrospective.

Below the phenomena of the mind, analysis encounters metaphysical bedrock. Let us imagine, Brown said, a man born with fully matured powers and a completely blank mind. Let him now be allowed a single sensation. This will be his total consciousness. Let a second sensation be added and let him be made to recall the first. He will then come to a recognition of something different from either—of himself as their common subject. The conviction that we exist with an "absolute" identity through time is intuitive and irresistible; only the circumstances in which it arises afford matter for inquiry. This identity is the prerogative of our minds; "some sort of identity of the body" is associated with it in our ordinary ideas about "sameness of person" (Lecture XII).

PERCEPTION

Brown's most subtle analyses occur in his theory of perception. His general problems were to explain how we come to know of the existence of an external, physical world and to specify the precise content of this knowledge. He was very conscious of the danger of question-begging assumptions; he maintained that at every turn we take externality for granted, and that all our language implies it. ("There is no distinct vocabulary of scepticism." Lecture XXII). Brown considered that our original awareness of things in their externality—their independence of our perception—is brought about by means of

sensations commonly but inaccurately ascribed to touch. The sensations belonging to other senses acquire an external reference by association with these.

Brown proceeded first to reductive simplification: the various tangible qualities were maintained to be various modifications of either extension or resistance. He then went on to disclose and systematize the complexity of sensations involved in our tactual relations with things. He argued that sensations of mere touch do not primitively inform us of extension and externality. We derive the notion of spatial extension from our repeated experience of the temporal succession of muscular feelings in the movements of arms and fingers. When a familiar series of these feelings is interrupted by feelings of resistance to muscular effort—as, for example, our fingers closed around an object—we become aware for the first time of something separate from ourselves and learn something of its dimensions. Physical objects were, for Brown, essentially extended, resisting objects; but before his argument has ended, extension and resistance seem to have become merely phenomenal and, in their unperceived existence, to have disappeared into their unknown causes.

MORAL THEORY

Brown's zeal for simplification is nowhere more conspicuous than in his moral theory. The distinctions, for example, between the obligatoriness, rectitude, and merit of an action are simply a matter of tense: contemplated before performance, the action is "obligatory"; in performance, it is "right"; and it is "meritorious" afterward. And what makes it so is the "emotion" of approval it arouses in us when we are in a fit state of mind to form a moral judgment—an emotion in no way arbitrary, for as morally definitive it proceeds from constitution of human nature. The strength and elevation of Brown's moral sentiments assisted his great, brief reputation.

Bibliography

Principal works by Thomas Brown are *Inquiry into the Relation of Cause and Effect* (Edinburgh, 1818); and *Lectures on the Philosophy of the Human Mind* (Edinburgh, 1820).

Selections from Brown appear in Daniel Sommer Robinson, *The Story of Scottish Philosophy* (New York: Exposition Press, 1961).

For literature on Brown, see David Welsh, *Account of the Life and Writings of Thomas Brown* (Edinburgh: W. and C. Tait,

1825), and François Réthoré, *Critique de la philosophie de Thomas Brown* (Paris, 1863). Sir William Hamilton, *Discussions on Philosophy and Literature*, 2nd ed. (Edinburgh: Longman, Brown, Green and Longmans, 1853), pp. 39–99, attacks Brown in defense of Reid. Brown is defended against Hamilton by John Stuart Mill in *An Examination of Sir William Hamilton's Philosophy* (London: Longman, Green, Longman, Roberts and Green, 1865), Ch. 10.

There are chapters on Brown in James McCosh, *The Scottish Philosophy* (New York: R. Carter, 1875), and in Henry Laurie, *Scottish Philosophy in Its National Development* (Glasgow: J. Maclehose, 1902). An indication of Brown's influence in America can be found in Terence Martin, *The Instructed Vision* (Bloomington: Indiana University Press, 1961).

BROWNSON, ORESTES AUGUSTUS (1803–1876)

Orestes Augustus Brownson, a Transcendentalist philosopher and journalist, was born in Stockbridge, Vermont. He had little formal education. Until 1822 he belonged to the Congregationalist Church; he then joined the Presbyterians but was quickly repelled by their depreciation of human reason and by the Calvinist doctrine of predestination. In 1824 he became a Universalist, being ordained a minister in 1826. Three years later he abandoned Christianity and joined the socialist sect of Robert Dale Owen and Fanny Wright; at this time he wrote in behalf of the Workingmen's Party. He was reconverted to the Christian religion in 1832, when he joined the Unitarians.

Brownson was introduced to philosophy in 1833, through the works of Victor Cousin, whose disciple he remained for ten years. Cousin was warm in his praise of Brownson as a philosopher. Though Brownson later criticized Cousin's philosophy for its eclecticism and psychologism, he always remained under its influence. His reading of Immanuel Kant and the Italian idealist Vincenzo Gioberti were major factors in shaping his mature philosophy. For a while he was a member of the Transcendentalist group that met in Boston and at Brook Farm, but he considered their thinking poorly grounded and undisciplined.

In 1838 he founded the *Boston Quarterly Review*, which in 1842 was merged with the *U.S. Magazine and Democratic Review of New York*. In 1844, he was received into the Catholic Church. The same year he founded *Brownson's Quarterly Review*, which he published, except

for the years 1865–1872, until 1875. Most of Brownson's numerous articles and reviews appeared in this publication. His most important book was *The American Republic: Its Constitution, Tendencies, and Destiny*.

Although Brownson was a deeply religious thinker, he insisted that philosophy should begin not with authority or faith, but with data of reason. He criticized the notion of Christian philosophy proposed by the *Annales de philosophie chrétienne* for failing to do justice to the rational nature of philosophy.

Like Cousin, he made the starting point of philosophy the analysis of thought, stressing, in opposition to Cousin, its objective, rather than its subjective, side. All thought, he maintained, presupposes the presence of an object that can be analyzed into three elements: the ideal, the empirical, and the relationship between them. The ideal is the a priori element in all thought; it is that which makes any experience intelligible. The ideal is not a Kantian category, which Brownson interpreted to be a subjective form, but a necessary aspect of the object of knowledge. Since the object must be real in order to present itself to thought, its ideal, or content, must also be real. Further analysis revealed that this content includes both necessary and contingent "being," which Brownson identified respectively with God and creatures. God is a necessary and independent being; creatures are dependent existences, so called because they stand outside (*exstare*) their cause. Hence Brownson adopted the "ideal formula" of Gioberti: "Being creates existences" (*Ens creat existentias*). Accordingly, creative being is present to the mind in all its thinking; it alone makes thought possible.

Brownson defended himself against the charge of ontologism, which was condemned by Rome in 1861, on the ground that he did not teach that we have an immediate intuition of God, but only of being. Though being is God himself, we discover this only by rational analysis.

In his early days, Brownson believed in the divinity of humanity and the infallibility of the popular will. Political experience in later life convinced him of the absurdity of these notions. He rejected the idea that government and law have a purely human origin. Only in a qualified sense did he admit that governments derive their powers from the assent of the governed. All power ultimately comes from God; he alone has absolute sovereignty. Brownson thought the American constitution more nearly perfect than others because it recognizes the existence of the Creator and of God-given rights of individuals, which the government is bound to respect and protect.

BRUNNER, EMIL

(1899–1966)

Emil Brunner was a Swiss theologian. He was educated in Switzerland and served in the Swiss army in 1914. Later he became a pastor and then professor of theology at Zürich. He participated extensively in the work of the World Council of Churches and also for a time in the Moral Re-Armament movement. He lectured on theology in many countries, notably in the United States, Japan, and Scotland.

Brunner's earliest theological positions were typical of Swiss and German Protestantism before 1914. He accepted the liberal theological emphasis on the social and ethical aspects of the Gospel, as well as its stress upon the rational alliance between philosophy and theology. Even in his earliest theological writings he exhibited his personal interest in philosophy in a well-informed discussion of Edmund Husserl, *Das Symbolische in der*

religiösen Erkenntnis (Tübingen, 1914). But after World War I he embarked upon a critique of liberalism that at first seemed to make him the natural ally of Karl Barth. His *Die Mystik und das Wort* (Tübingen, 1924) is a hostile discussion of Friedrich Schleiermacher's attempt to find a basis for Christianity in the general form of religious experience. Against this, Brunner poses the distinctive claims of Christian revelation, a revelation that cannot be discovered or appropriated through the use of criteria derived from natural theology or private experience.

The adjective much used of Brunner's (and also Barth's) concept of revelation was "dialectical." Theology is dialectical in that its attempts to grasp revelation necessarily involve the use of concepts that in purely philosophical discourse would cancel each other out. So the contradictions that arise, for example, in combining belief in divine goodness and omnipotence with an acknowledgment of the occurrence of physical evil are taken by the dialectical theologian to be simply manifestations of the necessarily paradoxical character of theological concepts. Contradiction is not a sign of intellectual failure, but of the inadequacy of our intellects before the splendor of divine revelation. Thus, if we try to use our ordinary criteria of consistency, we shall fail to grasp revelation at all. The major reason for this is that we shall be at fault if we try to understand revelation as consisting in a set of propositions. When God reveals himself, he does so as a person. Revelation is the act of a person, not the setting out of a doctrine.

It is for this reason that philosophy must necessarily limit its aspirations. The god of whom philosophy speaks is not the God of Christian revelation for at least two reasons. First, he is an inferred entity; and second, he is an object. It is not always clear whether Brunner believes that what philosophy says about God is false or simply inadequate. At times it seems clear that it is the former, yet Brunner is unlike Barth in the stress he puts upon the positive contribution that philosophy can make to theological thinking. Philosophy's role is to be critical, in the Kantian sense. It is to exhibit the limitations of human reason, and so to prevent speculative reason from attempting to occupy territory that belongs by right to revelation.

In revelation, God encounters man as person to person; man cannot argue his way to God by philosophy or discover God apart from the biblical revelation, yet when God calls, man at least can answer. Even this minimal concession to human powers brought Brunner into conflict with Barth. Barth's position, which he outlined in the short, bitter pamphlet *Nein! Antwort an Emil Brunner*

(1934), is that man, totally corrupted by the Fall, cannot advance an inch toward God by means of his natural powers. Grace has to supply even the capacity of responding to God's initiative. Brunner, who always feared the depiction of men as mere puppets, laid great stress on the natural man's capacity for speech and for elementary rationality as a precondition of any response to God.

The contrast between Brunner's theology and both liberalism on the one hand and Barthianism on the other is most marked in Brunner's ethics and social philosophy. Unlike Barth, Brunner believes that the basis for a natural ethics, even if a very limited one, exists. He revives the idea, which is found in Luther, of orders of creation. An order of creation is a social institution or practice of ordinary human origin, not derived from revelation, but shown by biblical evidence to have divine authorization. So Christ blessed monogamy in his appearance at the wedding at Cana and in his utterances about marriage; so he expressed the divine source of the state's authority when he said, "Render unto Caesar ..." These orders supply human beings with norms to whose validity revelation itself testifies, but for knowledge of which revelation is not necessary. Such norms have the negative function of restraining sin, rather than any positive role. Brunner differs from liberal theology in his belief that no secular morality can hope to provide a satisfactory way of life, but is bound to founder on the sinfulness of human nature.

The key way in which sin manifests itself in human life is in the failure of men, both in theory and in practice, to understand themselves as persons. (It should be noted that it is not clear how far Brunner uses the word *person* in the same sense when he speaks of God as a person and men as persons. He speaks of God as the "original" person and of men as "derivative" persons, and says that before the Fall men were persons as God is a person. Some analogy is intended, but we are not told how strong the analogy is.) Brunner makes the position of philosophy in respect to human beings parallel to that which he gives it in respect to the knowledge of God. Philosophy as philosophy cannot grasp men as persons, but only as objects and inferred entities. The ghost of the view of both God and the self as Kantian noumena haunts his thought at this point. But it is not only in philosophy that the secular view of man is inadequate. In practice, too, men continually reject their status as persons.

They do this by seeking to be autonomous. The will, as the center of man's rebellion against God, seeks continually to be its own master. The ideal of the self-sufficient individual is one human ideal that must be rejected.

Its counterpart, the concept of man in the mass—collective man—is equally subhuman. But secular thought provides us with no adequate basis for rejecting these alternatives. Only revelation can do this, for it is only in revelation that we discover not only God as a person but also ourselves as persons. This is where Brunner's doctrine of atonement finds its place. What Jesus Christ showed us in his life, death, and resurrection was a love that alone can break our rebellious self-will and that alone can provide us with a model for goodness. Secular ethics can at best exhibit the kind of goodness that can defeat depersonalization as a hypothetical possibility. The revelation of Christ alone makes it actual. Revelation, however, does not provide us with a code that we can then detach from its origin and live by. We must return continually to revelation for renewal. This is in part because of the character of human sin, but it is also in part because we must reassert the personal character of social life in new contexts.

According to Brunner, the depersonalization that is a consequence of technology is distinctive of the contemporary context. Men are degraded to the status of tools and means. The social incarnation of this process is the totalitarian state. For Brunner, totalitarianism is the category ultimately opposed to that of true community, and both Nazism and communism are forms of it. This political judgment took Brunner into further public argument with Karl Barth, on the grounds that Barth's theological views obliterate the moral differences between rival political systems by insisting on the sinfulness of human nature as such.

BRUNO, GIORDANO

(1548–1600)

Giordano Bruno, the most famous of the Italian philosophers of the Renaissance, was born at Nola, near Naples. At an early age he entered the Dominican order and became an inmate of the Dominican convent in Naples. In 1576 he was accused of heresy and fled, abandoning the Dominican habit. Thereafter he wandered through Europe. After visiting Geneva, and lecturing on the *Tractatus de Sphaera Mundi* of Sacrobosco at Toulouse, Bruno reached Paris in 1581. Here he gave public lectures that attracted the attention of King Henri III, and published two books on the art of memory that reveal him as greatly influenced by that textbook of Renaissance magic, the *De Occulta Philosophia* of Henry Cornelius Agrippa, from which he quotes lists of magic images of the stars, incantations, and other occult procedures. Bruno as a Renaissance magus, in line of descent from the learned philosophical magic inaugurated by Marsilio Ficino, is already present in these books. The title of one of them, *De Umbris Idearum* (Shadows of Ideas), is taken from the necromantic commentary on the *Sphere* of Sacrobosco by Cecco d'Ascoli, whom Bruno mentions admiringly in other works. It may be inferred that the lectures at Toulouse were probably based on this commentary.

Early in 1583 Bruno went to England with letters of recommendation from Henri III to the French ambassador in London. He lived in the French embassy during the two years he spent in England, and the ambassador protected him from the tumults aroused by his writings, which were clandestinely printed in London. These included the *Triginta Sigilli* (Thirty seals), an extremely obscure work on his magic art of memory; those who manage to reach the end of it find an advocacy of a new religion based on love, art, magic, and mathesis. It is dedicated to the vice-chancellor and doctors of the University of Oxford in high-sounding terms in which Bruno announces himself as "the waker of sleeping souls, tamer of presumptuous and recalcitrant ignorance, proclaimer of a general philanthropy."

In June 1583 the Polish prince Albert Alasco (Laski) visited Oxford and was entertained with public disputations. Bruno was in his train, and, according to a recently

discovered account by George Abbot, afterward archbishop of Canterbury, Bruno returned to Oxford after the party had left and delivered, uninvited, lectures that were largely a repetition of Marsilio Ficino's work on astral magic, the *De Vita Coelitus Comparanda* (On drawing down the life of heaven), although he also maintained Nicolas Copernicus's opinion "that the earth did go round and the heavens did stand still." Abbot says that Bruno was induced to discontinue the lectures when the plagiarism from Ficino was pointed out to him.

While in England, Bruno published five dialogues in Italian. In *La cena de le ceneri* (The Ash Wednesday supper; 1584) he defends his version of the Copernican theory against Oxford "pedants," a reflection of his visit to Oxford. In *De la causa, principio e uno* (1584) he apologizes for the storms aroused by his attack on Oxford, but makes matters worse by defending the friars of pre-Reformation Oxford, whom he prefers to their Protestant successors. The *De l'infinito, universo e mondi* (1584) is an exposition of his vision of an infinite universe and innumerable worlds. The *Spaccio de la bestia trionfante* (The expulsion of the triumphant beast; 1584) envisages a universal moral and religious reform and is dedicated to Sir Philip Sidney. The *Cabala del cavallo pegaseo* (Cabala of the horse Pegasus; 1585) indicates Bruno's adaptation of the Jewish kabbalah. The *De gli eroici furori* (On heroic enthusiasms; 1585) also dedicated to Sidney, is in the form of a sonnet sequence with commentaries expounding the philosophical and mystical meanings of the poems. It is upon this series of most striking and brilliant works, in which Bruno appears as the propagator of a new philosophy and cosmology, a new ethic and religion, that his fame largely rests. They are all full of Hermetic influences and are bound up with a complex religious, or politico-religious, mission for which Bruno believed he had the support of Henri III, and which cannot have been uncongenial to the French ambassador, Michel de Castelnau de Mauvissière, to whom three of the books are dedicated. Sidney's reactions to Bruno are unknown.

Late in 1585 Bruno returned to Paris, where he delivered an address on his philosophy in the Collège de Cambrai, arousing strong opposition, and where he had a curious controversy with Fabrizio Mordente about the compass that Mordente had invented. Paris was in a disturbed state, on the eve of the wars of the League, and Bruno's activities added to the "tumults," from which he fled in 1586 and began his travels through Germany. He was favorably received at the University of Wittenberg, and during his stay there he wrote a number of works, particularly on the art of Ramón Lull, to which he

attached great importance and which he believed he understood better than Lull himself. From Wittenberg he went to Prague, where he tried to obtain the favor of Emperor Rudolph II with his *Articuli Adversus Mathematicos* (1588), in which he states that he is strongly against mathematics, which he regarded as a "pedantry" lacking in deep magical insight into nature. His objection to Copernicus as a "mere mathematician" had been on similar lines. The work is illustrated with magical diagrams, representing what he called his mathesis, and its preface outlines a movement of tolerance and general philanthropy that is to replace sectarian bitterness. He next spent some time at Helmstedt, where he enjoyed the favor of the reigning duke, Henry Julius of Brunswick-Wolfenbüttel, and made a speech in praise of the late duke in which he outlined his program of moral reform in language similar to that used in the *Spaccio de la bestia trionfante*. It was probably while at Helmstedt that Bruno wrote the *De Magia* and other works on magic unpublished in his lifetime.

With the money Henry Julius gave him for the oration, Bruno went to Frankfurt to have printed the Latin poems he had written during his wanderings. These were the *De Innumerabilibus, Immenso et Infigurabili*, the *De Triplici Minimo et Mensura*, and the *De Monade Numero et Figura*, all of which were printed by John Wechel in 1591. In these Latin poems, written in a style imitating Lucretius, Bruno expresses his philosophical and cosmological speculations in their final form. Like the Italian dialogues on these themes, the Latin poems are full of Hermetic influences, particularly of the mathesis, or magical numerology, which Bruno had been further developing during his travels. He also published the last of his books on his magical arts of memory at Frankfurt.

TRIAL AND DEATH

In August 1591, Bruno returned to Italy at the invitation of a Venetian nobleman who wished to learn the secrets of his art of memory. There can be little doubt that Bruno was encouraged to take this step by the hopes of greater religious toleration aroused by the conversion of Henri IV of France. Bruno had in his baggage the manuscript of a book he intended to dedicate to Pope Clement VIII. It is strange that one who had stated in his published works that Christ was a magus and that the magical religion of the Egyptians was better than Christianity should have felt that he could place himself with impunity within reach of the Inquisition. Bruno seems, however, always to have sincerely believed that his religious and moral reform could take place within a Catholic framework. He

was arrested in Venice and thrown into the prisons of the Inquisition. At the end of the Venetian trial he recanted his heresies, but was sent to Rome for another trial. Here he remained in prison for eight years, at the end of which he was sentenced as a heretic (having refused, this time, to recant) and was burned alive on the Campo de' Fiori.

Although the actual *processo* stating on what grounds he was condemned is not extant, it seems most probable that Bruno was burned as a magician, as an "Egyptian" who had been propagating throughout Europe some movement the nature of which remains mysterious, although it may well be connected with the origins of Rosicrucianism and of Freemasonry. His philosophical views in themselves can have had little to do with the condemnation, unless insofar as they, too, were associated with the movement.

LATER INTERPRETATION

In the seventeenth century there was a conspiracy of silence about Bruno and his reputation. Where the silence was broken, he usually appeared in the character of a diabolical magician. It was rumored that he had made a speech in praise of the devil at Wittenberg (Pierre Bayle and Gottfried Wilhelm Leibniz heard this story). In the eighteenth century he was interpreted by John Toland as a deist. The nineteenth century rediscovered Bruno and read its own beliefs and attitudes into his works. It was then that he appeared as the martyr for modern science and the Copernican theory, and statues were erected in his honor by anticlericals in Italy. The crudity of this approach was modified in later philosophical studies of Bruno, but the attempt to isolate a philosophy or a metaphysics from his works and to discuss his thought in a context of straight history of philosophy meant that large areas in his writings must be disregarded as unimportant or unintelligible. Moreover, no coherent philosophical system could be extracted in this way, as Leonardo Olschki saw when he criticized Bruno as a confused thinker. But when Bruno is placed in the context of the Renaissance Hermetic tradition, his philosophy, his magic, and his religion can all be seen as forming part of an outlook on nature and on man which, however strange, is nevertheless perfectly coherent within its own premises.

HERMETIC PHILOSOPHY

The extraordinary prestige of the Hermetica in the Renaissance was encouraged by the belief that they were the writings of Hermes Trismegistus, an Egyptian sage who foretold Christianity and whose wisdom had

inspired Plato and the Platonists. The Hermetic core in Renaissance Neoplatonism was an important factor in the revival of magic. Christian magi, like Ficino and Giovanni Pico della Mirandola, used some caution in their approach to the magical passages in the Hermetic *Asclepius*, which is the basis of the astral magic described by Ficino in his *De Vita Coelitus Comparanda*. These safeguards were largely abandoned by the magician Cornelius Agrippa and totally abandoned by Bruno, who adopted the position that the Hermetic magical religion was the true religion, the religion of nature in contact with its powers. The cure for the wars, persecutions, and miseries of contemporary Europe was a return to the magical religion of the Egyptians—hence the long quotations in the *Spaccio de la bestia trionfante* from the passages in the *Asclepius* describing the religious practices of the Hermetic pseudo Egyptians, ecstatically interpreted by Bruno as their worship of "God in things," and as a "profound magic" by which they were able to draw down cosmic powers into the statues of their gods. The lament for the Egyptian religion in the *Asclepius* was interpreted by Bruno as a lament for a better religion, destroyed by Christianity. Since Augustine had condemned these passages as referring to the wicked demon worship of the Egyptians, it is easy to see how Bruno's "demonic" reputation arose. Bruno's "Egyptian" religion included belief in metempsychosis, which he also derived from the Hermetic writings.

Bruno's views on religion are organically related to his philosophy, for the philosophy of the living Earth moving around the divine sun and of the innumerable worlds, moving like great animals with a life of their own in the infinite universe, is the animist philosophy of a magus who believes he can establish contact with the divine life of nature. The sun is frequently mentioned in the Hermetic writings as a god, and it is the chief of the astral gods worshiped in the religion described in the *Asclepius*. Ficino's use of the astral magic of the *Asclepius* was chiefly directed toward the sun, whose beneficent influences he sought to draw down through solar talismans and incantations.

BRUNO'S COPERNICANISM

That Bruno thought of the Copernican sun in the context of the magic of Ficino's *De Vita Coelitus Comparanda* is indicated in the report of his lectures at Oxford, in which he is said to have repeated the Ficinian text while also maintaining the opinion of Copernicus. This report fits in with passages in Bruno's works in which the sun appears in a magical context, and particularly with his

defense of the Copernican opinion against the Oxford doctors in *La cena de le ceneri*, where he describes Copernicus as “only a mathematician” who has not seen the true meaning of his discovery as he, Bruno, has seen it. When a speaker in these dialogues asks what is the cause of Earth’s movement around the sun, the reply is an almost verbatim quotation from *Corpus Hermeticum* XII, in which Hermes Trismegistus explains that the energy of life is movement and that therefore nothing in the living universe is immobile, not even Earth. Bruno applied these words as an explanation of the cause of Earth’s movement around the sun. The Copernican opinion had, for him, confirmed the “Egyptian” philosophy of universal animation. He also repeated from the same Hermetic treatise one of his most characteristic doctrines: that there is no death in nature, only change.

Thus Bruno’s acceptance of Copernican heliocentricity did not rest on Copernicus’s mathematical arguments. On the contrary, Copernicus as a mere mathematician was despised by him as a superficial person who had not understood the true meaning of his discovery. Bruno was always “against” mathematics. Although he had some acquaintance with the scientific basis of the Copernican theory, it was not on mathematical grounds that Bruno defended Copernicanism from reactionary Aristotelians, but on animist and magical grounds. In fact, when the passages on the sun in the different works are compared, it becomes apparent that Copernican heliocentricity was for Bruno a kind of celestial portent of the approaching return of “Egyptian” philosophy and religion. “Aristotelianism” was for Bruno a symbol of all that is dead and dry—or, as he would say, “pedantic”—in philosophy and religion (the two were for him inseparable), compared with his own philosophy and religion—in contact, so he believed, with living, divine nature.

NEW VISION OF THE UNIVERSE

The essence of the Hermetic writings is that they give a religious impulse toward the world. It is within the setting of the universe, not through any divine mediator, that the Hermetic gnostic achieves his religious experience. The closest parallel to Bruno’s imaginative leap upward through the spheres is the description in the Hermetic *Pimander* of how man “leant across the armature of the spheres, having broken through their envelopes.” So did Bruno break through the spheres in his ecstatic ascent to his new vision of the universe. The immediate source of his vision of infinite space and innumerable inhabited worlds was Lucretius’s poem *De Rerum Natura*, but Bruno transformed the Epicurean and Lucretian notions

by imparting animation to the innumerable worlds—a feature totally absent from Lucretius’s universe—and by imparting the function of being an image of the infinite divinity to the infinite. The godless universe of Lucretius turns in the Brunian vision into a vast extension of Hermetic gnosis; in order to receive this within himself, man, that “great miracle,” as he is defined in the *Asclepius*, must expand himself infinitely. The *magnum miraculum est homo* passage is quoted from Trismegistus near the beginning of the *De Immenso* as a preliminary to the new vision of the world to be revealed in the poem.

This infinitely extended All was nevertheless One. The unity of the All in the One is a basic theme of the Hermetic writings and also of Bruno’s. The unity of the All in the One is for Bruno “a most solid foundation for the truths and secrets of nature. For you must know that it is by one and the same ladder that nature descends to the production of things and the intellect ascends to the knowledge of them; and that the one and the other proceeds from unity and returns to unity” (*De la causa, principio e uno*, in *Dialoghi italiani*, edited by Giovanni Aquilecchia, p. 329).

This is the philosophy conducive to magic—that the magus can depend on the ladders of occult sympathies running through all nature. When this philosophy is not only a magic but also a religion, it becomes the religion of the Hermetic pseudo Egyptians who, as Bruno says in the *Spaccio de la bestia trionfante*, “with magic and divine rites ... ascended to the height of the divinity by that same scale of nature by which the divinity descends to the smallest things by the communication of itself” (*Dialoghi italiani*, p. 777). Bruno’s philosophy and religion are one and the same, and both are Hermetic. This accounts for the main aspects of his philosophy, his panpsychism and his monism, and also for the magic and the references to magical practices with which his books are filled.

Like all Renaissance magi, Bruno was a syncretist and drew from his vast reading many philosophies which had accreted to the Hermetic core. The pre-Socratics, Plato and the Platonists, the Scholastics (Bruno revered Thomas Aquinas as a great magus), Nicholas of Cusa—all were incorporated into the central theme. Bruno’s chief textbook of magic was Agrippa’s *De Occulta Philosophia*; he also used the conjuring books of Trithemius and admired, and perhaps practiced, the Paracelsian medicine.

ART OF MEMORY

The side of Bruno’s work that he regarded as the most important was the intensive training of the imagination

in his occult arts of memory. In this he was continuing a Renaissance tradition that also had its roots in the Hermetic revival, for the religious experience of the Hermetic gnostic consisted in reflecting the universe within his own mind or memory. The Hermeticist believed himself capable of this achievement because he believed that man's *mens* is in itself divine and therefore able to reflect the divine mind behind the universe. In Bruno, the cultivation of world-reflecting magic memory becomes the technique for achieving the personality of a magus, and of one who believes himself to be the leader of a religious movement. Strange though these beliefs and practices are, Bruno had some profound things to say in his books on memory concerning the imagination, which he made the sole cognitive power (sweeping away the divisions of the Aristotelian faculty psychology by a kind of inner anti-Aristotelianism), and on the mental image in relation to the psychology of the "inspired" personality. When the magical aspect (which includes such practices as the use of talismans or images of the stars as mental images) is discounted or allowed for, Bruno's bold explorations of the inner world may become important to the historian of psychology.

SIGNIFICANCE AND INFLUENCE

The emphasis on the Hermetic and magical side of Bruno's thinking does not discredit his significant contribution to the history of thought. He exemplifies the Hermetic religious impulse as a motive force behind the imaginative formulation of new cosmologies. From within his own frame of reference, this highly gifted man made guesses that may have given hints to seventeenth-century thinkers. A notable example is his transformation of the Democritean atoms, of which he read in Lucretius, into magically animated monads; this may well have been a stage leading to Leibniz's monadology, and there are other curious links between Bruno and Leibniz. Although Bruno was obviously not in the line leading to the mathematical advances, his extraordinary vision of an immensely expanded universe, ruled by the laws of magical animism, may be said to prefigure, on the Hermetic plane, the new cosmology of the seventeenth century. Drained of its animism, with the laws of inertia and gravity substituted for the psychic life of nature as the principle of movement, Bruno's universe would turn into something like the universe of Isaac Newton, moving under laws placed in it by a God who is not a magician but a mathematician and a mechanic. In the Hermetic phase of European thought, which was the immediate prelude to the seventeenth-century revolution, Bruno is

an outstanding figure. Regarding him in this light, the old legend of the martyrdom of the advanced thinker becomes almost true again, although not in the old sense.

BRUNSCHVICG, LÉON (1869–1944)

Léon Brunschvicg, the French idealist philosopher, was born in Paris and educated at the Lycée Condorcet, where he won awards in science as well as in classics and philosophy. He received both the *licence ès lettres* and the *licence*

ès sciences from l'École Normale Supérieure in 1891. During the following nine years he taught philosophy at lycées in Lorient, Tours, and Rouen. His doctoral thesis, *La modalité du jugement*, was presented to the Sorbonne in 1897, and published in Paris the same year. In 1900 he returned to Paris to teach at his old lycée, later moving to the Lycée Henri IV and l'École Normale de Sèvres. In 1909 he was named professor of general philosophy at the Sorbonne. Except for the period 1914–1918, when he served in the armed forces auxiliary and as adviser to the government on educational reform, Brunschvicg held various chairs at the Sorbonne until the German occupation of Paris in 1940. He then settled in Aix-en-Provence and finally in Aix-les-Bains until his death.

Brunschvicg was one of the founders of the *Revue de Métaphysique et de Morale* (1893) and of the Société française de Philosophie (1901). In 1919 he was elected to the Académie des Sciences morales et politiques, serving as president in 1932. A prolific writer, editor of Blaise Pascal, and well known for his studies of René Descartes and Benedict de Spinoza, Brunschvicg was a major figure in French intellectual life for nearly half a century.

The "critical idealism" of Brunschvicg primarily recalls Immanuel Kant's analysis of the conditions of knowledge, but Brunschvicg's method was historical rather than deductive: He wished to grasp the mind's activity as it has revealed itself in the history of mathematics, science, and philosophy. In general perspective, Brunschvicg may be seen as heir to two currents in nineteenth-century French philosophy: the tradition of epistemological idealism descending through Charles Renouvier from Kant and Antoine Cournot, and the metaphysical idealism of Maine de Biran, Félix Ravaisson, Jules Lachelier, and Jules Lagneau.

For Brunschvicg, the goal of philosophical reflection was to disclose intellectual activity tending toward self-consciousness as it progressively constitutes knowledge. He therefore frequently characterized history as "the progress of consciousness" (*le progrès de la conscience*). The double meaning of this expression—the progress of conscience as well as of consciousness—also suggests the moral dimension of Brunschvicg's monistic idealism. Viewed subjectively, the process is a conversion from naive acceptance of reality as external to an affirmation of the primacy of the mind as it provides intelligibility. Brunschvicg equated this with recognition of the supremacy of intelligence in a moral sense, which is to say that self-knowledge progresses toward refinement of conscience and moral autonomy. According to Brunschvicg, personal conversion reflects an absolute historical devel-

opment undetermined in form but immanently oriented toward spiritual values (of which Unity is highest) and self-knowledge on the part of humanity as a whole.

The critique of this process, Brunschvicg insisted, cannot depend on a priori assumptions, nor can it hope to specify categories or functions of thought; such analysis would only falsify the mind's essential freedom and inventiveness. The emphasis on creative spontaneity suggests a relationship with Henri Bergson that Brunschvicg was proud to acknowledge, but not to the extent that he wished to embrace Bergson's intuitionism. Although Brunschvicg preferred the general terms *mind* and *intelligence to thought* and *reason*, this does not imply a commitment to nonintellectual modes of understanding. At the heart of his work lay studies in the history of science and of mathematics. Brunschvicg regarded scientific progress not only as a triumph of intellect but also as an exemplification of humankind's growing self-understanding. In this way, he defended a moral or "spiritual" conception of science as opposed to positivistic and conventionalistic theories. In his view, the truth of a theory essentially depends on the creative vitality of the mind as it assimilates what is given as nonmental, and as it judges, in turn, the adequacy of this synthesis.

In *La modalité du jugement*, Brunschvicg attempted to delineate the mind's developing accord with being or the real in a theory that classifies judgments according to the forms of "internality" and "externality." Brunschvicg took judgment, rather than the concept or category, as fundamental because he saw it as a synthesizing or unifying act, combining form and content. The form of "externality" was interpreted (evidently following Johann Gottlieb Fichte) as a restraining activity that the mind imposes dialectically on its own creative freedom or "internality."

In *Les étapes de la philosophie mathématique* (Paris, 1912), Brunschvicg examined the highest expression of "internality," mathematical judgment, which he regarded as uniquely appropriate to science because it is at once a free creation—not to be justified through physical interpretation—yet inseparable from experience in its origin and in its "collaborative" task of assimilating being to the understanding. Brunschvicg substantiated this theme in *L'expérience humaine et la causalité physique* (Paris, 1922), which further revealed an implicit dualism and a reluctance to employ categories or principles of analysis, however provisional.

Brunschvicg's last decade was marked by works of a religious nature, following a comprehensive history of philosophy, *Le progrès de la conscience dans la philosophie*

occidentale (Paris, 1927), intended to bear witness to humanity's spiritual unification. "Our destiny is to tend toward unity." Religious value apparently attaches to a particular dimension of the "progress of consciousness": The assimilation of being to consciousness insofar as the process is regarded as immanently guided by the value of unity. In this assimilation, humankind moves toward self-identification through the communion of shared intelligence.

Although it appears likely that Brunschvicg felt a moral or spiritual ideal to be predominant in his career, he will perhaps be best remembered as an interpreter of the French philosophical tradition and as a leading spokesman for the life of reason and the value of science.

BUBER, MARTIN (1878–1965)

Martin Buber, the religious existentialist, was born in Vienna and spent his childhood in L'viv, Galicia, at the

home of his grandfather Solomon Buber, a businessman and well-known scholar of rabbinic literature. From 1896 to 1900 he studied philosophy and art history at the universities of Vienna, Leipzig, Berlin, and Zürich. He was early active in the Zionist movement, especially in its cultural and religious aspects, and in 1901 he was appointed editor of the Zionist journal *Die Welt*. Instrumental in the founding of the publishing house Jüdischer Verlag in 1902, in 1916 he founded the German Jewish monthly *Der Jude*, which, until it ceased publication in 1924, was the most respected and literate voice of German Jewry. From 1924 until 1933 Buber was professor of the philosophy of Jewish religion and ethics at Frankfurt-am-Main University, the only chair in Jewish religion at any German university. In 1920 he and Franz Rosenzweig founded the Freies Jüdisches Lehrhaus, an institute for adult Jewish education; and with Adolf Hitler's coming to power Buber devoted his energy to strengthening the religious and spiritual resources of German Jewry in the face of the unprecedented challenge posed to it. Buber continued in the institute until 1938, when he left for Palestine, where he was appointed professor of sociology of religion at the Hebrew University. With Y. L. Magnes he led the Yihud movement, devoted to Arab-Jewish understanding and to the creation of a binational state. In 1952 and 1957 he traveled widely in the United States, lecturing at many universities and to diverse student groups. While his acceptance of various German awards in the postwar period led to criticism from some Jewish quarters, Buber remained steadfast in his encouragement of those German circles that realize the magnitude of the Nazi crimes against the Jews and seem genuinely repentant. He died in Jerusalem.

Buber's basic insight, an insight that runs through all of his work and that determines his approach to everything he touches, is the realization that there is a basic difference between relating to a thing or to an object that I observe, and to a person or a "Thou" that addresses me and to whose address I respond. In its simplest form, this is the difference between the way people usually relate to inanimate things on the one hand and to living persons on the other. Inanimate objects are watched, while persons are spoken to. However, the distinction cannot be drawn simply on this basis. A person as well as an inanimate thing can be viewed as a thing, or, in Buber's terminology, an "It." Whenever we take an "objective" attitude toward a person, whenever we view him as part of the world and caught in its causal chain, we are in an "I-It" relationship, even though the object happens to be a person. The "I-It" relationship is characterized by the fact that it is not a genuine relationship because it does not

take place between the I and the It. When another person is an It to me, I am, first of all, perfectly alone. I gaze at him and view him from every possible direction, I observe his place in the scheme of things, and I find elements that he has in common with other persons and things and elements that distinguish him from them. All of this, however, takes place within me; I am judging and I am observing, and the external world is relevant only to the extent that it enters my being.

It is otherwise in the "I-Thou" relationship. Here the relationship is genuine because it is between me and the Thou that addresses me. This Thou is no longer one thing among other things of the universe; the whole universe is seen in the light of the Thou, and not the Thou in the light of the universe. In fact, it is not only the object in the "I-Thou" relationship that is different from that in the "I-It" situation; the very "I" is different in the two situations. There is no "I" that sometimes relates to a Thou and sometimes to an It. If that were the case, both the It and the Thou would be objects that float into the I's field of vision and then out of it, leaving the I essentially unaffected. Instead, Buber argues, the I of the I-It is a different I from that of the I-Thou because it is not the I as such that has preeminent reality, but the relations I-It and I-Thou. The I appears and is shaped only in the context of some relationship with either an It or a Thou and can never be viewed independently of such a relationship.

Buber further states that the I-It relationship is maintained with only part of ourselves in it. There is always a part of us that remains outside the relationship and views it from some vantage point. In the I-Thou relationship, on the other hand, our whole being must be involved. Should I attempt to hold back any part of myself, I will find myself in an I-It situation because there will be a part of me that is not participant but spectator, a sure sign of the I-It. This means that the I-Thou relationship carries with it much greater risk than the I-It, since there is no withholding of the self possible, as in the I-It. In the I-It situation the part of the self that remains outside the relationship cannot be injured by the other party because he cannot reach it. In the I-Thou relationship there is no such security because the Thou of the I is addressed with the whole of the I, and any response elicited necessarily pertains to this total I. In the I-Thou relationship, therefore, everything possible is risked without any defensive position being left to which the I can withdraw in case of need. However, this is not the only risk involved in the I-Thou situation. The Thou who is addressed cannot be viewed in the context of any causal, deterministic framework. He must be encountered in the

full freedom of his otherness, an otherness that is addressed and that responds in the total unpredictability of human freedom. The moment the responses of the Thou are calculated, the moment the I asks itself what impression its speech and being will make on the Thou, it is relating to an It instead of to a Thou.

Because of this, Buber tells us, there is never a present for the I–It relationship, only a past. This is so because all objective knowledge about a human being is knowledge about his past, of what he has been rather than of what he is. If the present moment is to have genuine novelty, if it is not perfectly determined by the events of the past, then it must be possible for the present to produce a break with the past in the form of a response that could not have been calculated from a knowledge of the past. In the I–Thou relationship we are therefore genuinely living in the present because we are prepared for any and every response to our address, the expected as well as the unexpected—and it is this that constitutes genuine listening. The difference between a pseudo listening and a genuine listening is that while in the pseudo listening situation the listener pretends to listen, what he hears is determined by his past knowledge of the person he is listening to or by his theories concerning the nature of man. Genuine listening does not know ahead of time what it will hear; in the full uniqueness of the present it listens to the speech of the other without filtering what it hears through the screen of its own prejudgments. The purpose of genuine listening is therefore really to hear what the other is saying, constantly being aware that he is saying something that is new and not just a revelation of his nature, which the hearer has already identified and which is fixed as the other’s “psychology.”

It is in the religious context that the significance of Buber’s distinctions emerges most clearly. In contrast to much of mysticism that aims at the obliteration of the abyss between the self and the Absolute in the ecstasy of mystical union, the essence of biblical religion, as conceived by Buber, is the dialogue between man and God in which each is the other’s Thou. “The extended lines of relations meet in the eternal Thou,” writes Buber in the opening sentence of the final portion of *I and Thou*. Life is an endless transition from the Thou to the It and back to the Thou. Sooner or later, the time comes when even the most cherished Thou recedes, when a spiritual tiredness overtakes the most authentic I–Thou relationship and turns it into the I–It. There is one Thou, argues Buber, who by his very nature cannot become an It. A man may hate God and curse him, he may turn away from him when the suffering of human destiny becomes

unbearable; but no man can reduce God to the status of a thing who no longer addresses him and who becomes one object among others in the world for him. Much of traditional theology, for Buber, errs in dealing with God as if he could be turned into an It. Time and again, however, man turns from thinking about God to addressing him, and it is then that he communicates with the living God, as distinct from merely giving intellectual assent to the God of the philosophers. This is true even when the Absolute Thou addressed is not called God. “But when he, too, who abhors the name, and believes himself to be godless, gives his whole being to addressing the Thou of his life as a Thou that cannot be limited by another, he addresses God.”

In the course of his long career Buber applied these basic ideas to a diversity of fields. In a number of works devoted to biblical interpretation, he developed in detail his view of the Bible as the record of Israel’s dialogue with God. He wrote a definitive work on the relation between Christian and Jewish faith. In this work he distinguishes between the Jewish *emunah* and the Greek *pistis*, the former of which, according to Buber, is faith in the sense of trust while the latter is faith in the sense of belief in the truth of propositions. Jewish faith, as found in the Hebrew Bible, is Israel’s trust in the faithfulness of God’s word as that word is spoken in dialogue. The faith of the New Testament, particularly in its Pauline version, is heavily influenced by Greek philosophical elements that are reflected in the emphasis on salvation as resulting from belief in the truth of propositions concerning the divinity and resurrection of Jesus. In Paul, Buber thus sees a profound departure from the Hebrew biblical spirit, a departure that is no more than partial and implicit in the Gospels.

In his later years Buber’s interest to some extent turned to psychotherapy, in which he emphasized the necessity for the therapist not to hide behind the teachings of his school and not to forget that psychotherapy is above all dialogue in which therapist and patient speak to each other. When seen in this light, the therapist encounters the patient for the individual he is and is ready for the unexpected that the theoretical categories of his discipline do not prepare him for. Similarly, in the field of social philosophy Buber contrasted Marxist socialism, with its centralized control and allegiance to impersonal and inevitable historical forces, with the socialism of the community in which the authenticity of the I–Thou relationship is the foundation on which the living community is built and to which it must return, again and again, for renewal. In the Israeli kibbutz Buber saw an exempli-

fictionation of the communal or “Utopian” socialism for which he stands.

Bibliography

Publication of the collected works of Buber in German, *Werke*, was begun in 1962 by Kösel Verlag in Munich. The first three volumes appeared by 1964.

Buber's most important work is *Ich und Du* (Berlin, 1922), translated by R. G. Smith as *I and Thou* (New York: Scribners, 1958). *Die Frage an den Einzelnen* (Berlin: Schocken, 1936), translated by R. G. Smith in *Between Man and Man* (Boston: Beacon, 1955), develops the basic themes in some detail. *Der Glaube der Propheten* (Zürich, 1950), translated from the Hebrew by C. Witton-Davies as *The Prophetic Faith* (New York: Macmillan, 1949), is one of Buber's best biblical studies. *Paths in Utopia*, translated by R. F. C. Hull (London: Routledge, 1949), is Buber's study of social philosophy; *Two Types of Faith*, translated by N. P. Goldhawk (London: Routledge and Paul, 1951) is his study of Judaism and Christianity.

Other writings that have been translated into English are *Eclipse of God; Studies in the Relation between Religion and Philosophy*, translated by Maurice Friedman et al. (New York: Harper, 1952) and *Bilder von Gut und Bose* (Cologne, 1952), translated by R. G. Smith and M. Bullock as *Good and Evil; Two Interpretations* (New York: Scribners, 1953); *Pointing the Way: Collected Essays*, translated and edited by Maurice Friedman (New York: Harper, 1957); and *Martin Buber, Writings*, a selection edited and introduced by Will Herberg (New York: Meridian, 1956).

Maurice Friedman's *Martin Buber: The Life of Dialogue* (Chicago: University of Chicago Press, 1955; New York: Harper, 1960) is a thorough secondary work with an extensive bibliography.

Bibliography updated by Christian B. Miller (2005)

BUCKLE, HENRY THOMAS (1821–1862)

Henry Thomas Buckle, the English historian, was the son of a prosperous businessman who left him sufficient money to devote his life to private study and writing. In common with a number of other dominant thinkers of the Victorian age—such as J. S. Mill, Herbert Spencer, and T. H. Huxley—he was largely self-educated. As he was a delicate child, it was thought unwise for him to undertake work involving much intellectual effort or strain, with the consequence that he was (as he put it) “never much tormented with what is called Education, but allowed to pursue my own way undisturbed ... whatever I may be supposed to know I taught myself.” Thus he was taken from school, at his own request, at the age of fourteen, never went to a university, and conducted his subsequent reading and research (which by any standards were vast) in the absence of all external supervision or direction. Buckle expressed no regret at not having gone to Oxford or Cambridge, considering both universities to be in a contemptible condition and believing himself in any case to be equipped with natural aptitudes and talents that more than compensated for the lack of a rigorous academic training. Certainly his gifts were far from negligible. He had an excellent memory, he could express himself both in writing and in conversation with great fluency and eloquence, and he was a first-class linguist (by the age of thirty he could read eighteen foreign languages and speak six); he possessed, moreover, an immense capacity for methodical work, together with an intense intellectual curiosity and a meticulous eye for detail.

Buckle led a comparatively uneventful life, his energies being to a large extent absorbed by the ambitious project of writing a history of civilization, to which, from his early twenties, he had decided to dedicate his career. But though the preparation of this enormous enterprise always remained his chief concern, he was not without other interests. He was, for example, a brilliant chess player, achieving an international reputation; he traveled widely, in Europe and beyond; and by the end of his life he had established a wide circle of acquaintances, including William Makepeace Thackeray, Charles Kingsley, Charles Darwin, and John Stuart Mill. For Mill in particular he had the highest admiration, and in 1859 he wrote a long review in *Fraser's Magazine* praising Mill's essay “On Liberty”—a review that created considerable stir at the time, since in it Buckle drew public attention to the fantastic sentence of twenty-one months' imprisonment recently passed upon a man for inscribing on a gate

words offensive to Christianity. Although Buckle never married, he liked feminine society and secretly kept a mistress; when, after his death, the truth ultimately leaked out, it caused consternation and dismay among some of his close friends and relatives.

SIGNIFICANCE OF THE HISTORY

Buckle died at the age of forty while touring the Middle East. Only two volumes of his *History of Civilisation in England* had appeared, and these represented no more than an introduction to the vast work he had envisaged writing. Yet they had been sufficient to achieve for their author sensational fame, not merely in his own country but also throughout Europe and in the United States; Darwin applauded the work's brilliance and originality; and an influential American writer, Theodore Parker, attributed to it an importance in the history of thought comparable to that of Francis Bacon's *Novum Organum*. Buckle's reputation has since suffered a heavy decline, and many of the claims made on behalf of his work at the time of its publication seem grotesquely exaggerated today. Even so, what he wrote represents (as Henry Sidgwick pointed out) the first major attempt on the part of a thinker versed in the tradition of British empiricism and inductivism to enter the treacherous field of historical speculation, and to offer a comprehensive and detailed theory of historical development of the type that previously only Continental philosophers had ventured to provide. For this reason alone it preserves a certain interest and is still worth studying.

BUCKLE'S INTENTIONS

Buckle was fully aware of what had been done by some of his predecessors in Germany and France; and references to their works, particularly to those of Johann Gottfried Herder and Auguste Comte, are to be found scattered among the footnotes that abound throughout his own volumes. Like Herder, he was eager to connect the facts of human history with the conditions imposed by different forms of natural and geographical environment; like Comte, he wished to present the course of history as exemplifying a fundamental pattern of progress and improvement. But he rejected the tendency to revere past ages, and to exalt imagination at the expense of rational and scientific modes of thinking, that often manifested itself in Herder's writings; and he equally distrusted the strain of aprioristic dogmatism and respect for authoritarian methods of social control that he detected in Comte's historical system, calling the latter's theory of government "monstrously and obviously impracticable."

Buckle's allegiance lay chiefly with the ideals set out by English radicals and Utilitarians early in the nineteenth century, and it was these that finally determined the valuations embodied in his conception of social and historical progress.

HUMAN ACTIONS SUBJECT TO LAWS

Early in his book Buckle raised the question, "Are the actions of men, and therefore of societies, governed by fixed laws, or are they the result either of chance or of supernatural interference?" He supposed these possibilities to represent exhaustive alternatives, and argued that either variety of the latter hypothesis was plainly unacceptable.

So far as the theory of supernatural interference was concerned, this, together with the associated theological doctrine of predestination, must remain a "barren hypothesis," since no conceivable experience could count for or against its truth. On the other hand, the view that what occurs in the realm of human affairs is the product of chance was demonstrably false; it had, however, been given an aura of spurious respectability by metaphysical philosophers who had carried the principle in question over into the sphere of individual human psychology. There it emerged as the famous doctrine of free will, according to which a mysterious, undetermined power of free choice is held to be directly vouched for by the evidence of the introspective consciousness. But in Buckle's opinion it is precisely such blind reliance upon the findings of individual introspection that has been the besetting sin of "metaphysicians," leading them to construct their impressive-looking, though nonetheless mutually incompatible, systems in accordance with a radically mistaken procedure.

By contrast, in order to achieve a realistic conception of the nature and workings of the human psyche it is necessary to adopt an external and general view of human behavior analogous to that taken by natural scientists in the investigation of nonhuman phenomena: From this altered standpoint it can indeed be seen that the actions of men are subject to regularities as strict and mathematically exact as those that operate in other spheres of scientific inquiry. As a conclusive demonstration of his thesis, Buckle cited the evidence afforded by large-scale statistical surveys concerning the numbers of marriages contracted, and of murders and suicides committed, in particular countries and towns during successive years; the relative uniformity of the results obtained would, he held, be unintelligible on any other assumption than that

there are certain social laws capable of keeping the level constant.

When discussing this topic, Buckle on occasions fell into confusions; he did not, for example, always distinguish between the necessary and the sufficient conditions of an occurrence, and was prone to disregard the difference between causal laws and statistical frequencies. In consequence he sometimes interpreted the statistical data in a misleading way, suggesting that the sole effective determinant of individual actions was what he called “the general condition of society.” He also spoke as if the mere existence of a proportional average, observed to hold over a period of time, necessitated, with a kind of irresistible momentum, the commission of a particular number of crimes in any given year. As a result, a picture is presented wherein human beings appear as the helpless victims of social forces over which they can exert no effective influence or control—a conclusion in no way entailed by the premises from which Buckle initially proceeded.

ORIGIN AND DEVELOPMENT OF CIVILIZATION

Be this as it may, it is noticeable that when Buckle approached his principal theme—the genesis and development of civilization—he made little further reference to precise numerical regularities or frequencies; although he still spoke of “laws,” it was the broad, indeterminate, and sometimes very doubtful generalizations concerning the factors influencing the evolution of human societies that he chiefly appealed to in providing his explanations. Thus, the fundamental agents of social growth were deemed to be material or, to use his term, “physical,” and were listed as being “Climate, Food, Soil, and the General Aspect of Nature.” These—and not, as some previous theorists had alleged, innate racial characteristics or mysterious “national spirits”—originally determine the divergent forms of organization and progress achieved by different historical cultures.

FOOD SUPPLY AND CIVILIZATION. Buckle believed that the degree of civilization attained by a society depended upon its wealth and upon the manner in which this wealth was distributed; such factors were in turn dependent upon the population of the country concerned, and the size of the population was determined by its food supply. In countries where cheap food was plentiful, the population increased in a fashion that led to the labor market’s becoming overstocked; as a consequence there was unemployment and also poverty, since there is an inevitable tendency in societies where there is a sur-

plus of labor for laborers to be underpaid and for immense economic inequalities to develop. He cited such examples as Egypt, Peru, Mexico, and India, where riches were concentrated in very few hands and where the vast majority of the inhabitants lived in a miserable and depressed condition: “Among nations subjected to these conditions, the people have counted for nothing, they have had no voice in the management of the state, no control over the wealth their own industry created.”

EUROPEAN CONDITIONS IDEAL. Buckle, in fact, considered that the ideal conditions for the development of civilization were to be found in Europe. Here the food supply was not so abundant as to lead to overpopulation, nor was it so scanty as to make the accumulation of wealth and the enjoyment of leisure (on which intellectual progress depends) impossible. Here, also, the temperate climate was favorable to enterprise and the energetic exploitation of natural resources; moreover, the aspect that nature presented to human beings was of a less extreme and unpredictable character than in other parts of the world. Thus, men did not regard it with superstitious awe as a terrifying and insuperable power, but saw it instead as something that obeys regular laws and is therefore capable of being tamed and utilized for their purposes. It followed (he thought) that Europe could be distinguished from all other centers of human society by the circumstance that it was human rather than natural or physical factors that had determined the course taken by its history and progress. Man was here the master of nature, and consequently the key to the development of European culture lay in the influence exercised by “the laws of the human mind.”

KNOWLEDGE DETERMINED DIRECTION OF CULTURE

It might be expected that Buckle would go on to state what these laws of the human mind were, using them to explain patterns of social change in European history in a fashion comparable to that suggested by Mill in Book VI of his *System of Logic* when he spoke of the possibility of deriving principles governing historical development from the “ultimate” laws of human psychology. Buckle can scarcely be said, however, to have adopted this procedure, perhaps because he believed that the psychological and historical data available at his time were insufficient to make it practicable. Instead, he contented himself mainly with trying to show that it was the advance and diffusion of knowledge, and particularly of scientific knowledge, that had in the last analysis given European

history its characteristic overall direction—"the progress Europe has made from barbarism to civilization is entirely due to its intellectual activity."

Other factors were considered, but only to be ruled out. Thus Buckle claimed—as if (rather surprisingly) it were a self-evident truth—that men's moral opinions had remained essentially unaltered for thousands of years: How then could these have been responsible for the far-reaching transformations that had overtaken European nations like England and France in the course of their historical evolution? Likewise, he rejected the claims of religion, literature, and government to be "prime movers of human affairs." Acceptance of a particular religious creed is a symptom rather than a cause of the condition in which a given society finds itself. The literature of a country merely reflects and serves to fix the degree of civilization already attained; it does not initiate further achievement. So far as the influence of government is concerned, Buckle maintained that the rulers of a nation were only "creatures of the age, never its creators." Enlightened legislation occurs only as a consequence of the pressure exerted by changes in the climate of opinion, these being due in the first instance to the efforts of "bold and able thinkers" who belong to the intellectual, and not the governing, classes; nor will such legislation be effective unless the ground has been prepared for it and "the age is ripe."

POLITICAL THOUGHT

Writing very much as an exponent of the principles of laissez-faire radicalism, Buckle displayed an intense distrust of governmental interference and "protectionism," which tended to be identified in his mind with the suppression of free opinion and free trade. Accordingly, he argued that most beneficial legislation is negative in character, taking the form of repealing the bad enactments passed by earlier generations; and, generally speaking, he restricted the legitimate functions of government to such things as the maintenance of order and the preservation of public health. The moral drawn is that the ineluctable laws of historical development should be permitted to take their course freely and without impediment; unlike many other philosophers of history, Buckle did not try to combine a doctrine of historical inevitability with a comprehensive positive program of political action and social reconstruction.

BUCKLE'S SIGNIFICANCE

There is much that is intellectually naive in Buckle's theory of history, and it is easy to find inconsistencies and

non sequiturs among his arguments; Leslie Stephen's gibe that Buckle's "mental fibre was always rather soft" is not wholly beside the mark. His uncritical use of vague abstractions like "intellectual progress" and the "spirit of a time" often led him into treating vacuous truisms as significant discoveries, and the collectivist conception of historical change that pervades much of his work contrasts oddly with the influence he ascribes to individual scientists and economists in promoting social advance. Nevertheless, the impact of his ideas upon his age was undeniably great, and his criticisms of previous and current historiography were not without important long-term effects. Like Karl Marx, though with far less insight and imagination, he helped to turn the eyes of historians away from the political surface of events, making them look more closely at the technological and economic realities of human life that lie beneath; at the same time, through his determinism, he provided a corrective to the tendency toward excessive moralizing that his contemporaries exhibited in their treatment of the past. And, by enlarging the perspective of historical study to include cultures and societies remote in time or space from his own, he made a definite, if limited, contribution to widening the horizons and counteracting the provincialism of future students of human affairs.

BUDDE, JOHANN FRANZ

(1667–1729)

The German philosopher, theologian, and historian Johann Franz Budde, or Buddeus, was born in Anklam, Pomerania. He entered the University of Wittenberg in 1685 and became an assistant there in 1689. Budde was appointed professor of moral philosophy at Halle in 1693, full professor of theology at Jena in 1705, and church councilor at Gotha in 1715. Although he insisted on his independence from all schools and considered himself an eclectic, he was close to Pietist thought and to the philosophy of Christian Thomasius, his colleague at Halle.

Budde's most significant work in theoretical philosophy was his *Institutiones Philosophiae Eclecticae* (2 Teile, Halle, 1703). In the first section, in which he expounded his logical doctrines and the intent was chiefly methodological, the influences of John Locke and Thomasius are apparent. Budde derived error from original sin and prescribed means for restoring the "good health" of the mind. He regarded ontology as a part of logic and as consisting in a simple explanation of basic metaphysical terms. According to Budde, these terms had a purely instrumental value because he refused to confer upon metaphysics the rank of independent and universal science. Rather, he interpreted it as the science of the most general nouns used in theology and philosophy.

In the second section of the *Institutiones*, Budde first discussed natural philosophy in a phenomenistic manner, holding that we cannot know the real nature of things, but only their appearances and effects. He attempted to reconcile the physical animism or spiritualism typical of Pietist natural philosophy with mechanism. He frequently appealed to the Bible and gave an important place to final causes. At the end of this section he discussed spirits and God, whose existence he demonstrated by rational proofs.

In practical philosophy (*Elementae Philosophiae Practicae*, Halle, 1697) Budde followed Hugo Grotius, Samuel von Pufendorf, and Thomasius. He completely denied human freedom, referring the possibility of good actions to God's grace and restricting accountability to a narrow and extrinsic sphere of material liberty. He devoted much space to discussions of practical psychology and prudence, for he believed that such practical psychology was a better means than abstract instruction of healing the human will from sin. However, revelation is essential to this healing process.

As with the Pietists, practical philosophy is central to Budde's thought. He also agreed with the Pietists in stressing the will's independence of the intellect, in his emphasis on psychology in practical philosophy and on spiritualism in cosmology, and in the importance he placed on revelation. However, Budde was much more systematic than Thomasius, who was likewise very much influenced by Pietism. Budde joined the Pietists in their fight against Christian Wolff, and in 1723 he wrote a pamphlet attacking Wolff.

Although in practical philosophy Budde agreed with the Pietists, in theology he tried to reconcile the views of orthodoxy and Pietism. Because he held that man has an original religious impulse, he gave an important position to natural religion. He presented cosmological, physicotheological, and historical proofs of God's existence, and tried to refute atheism by argument.

Budde was one of the most learned men of his time. His writings on the history of Jewish philosophy (*Introductio ad Philosophiam Ebraeorum*, Halle, 1707), on general history of philosophy, and on the history of theology (*Historia Theologiae Dogmaticae et Moralis*, Frankfurt, 1725) were excellent in their time and are still valuable for the information they contain.

BUDDHISM

Buddhism derives its name from the Sanskrit word *buddha* (awakened, wise, or learned), which was one of the many epithets given to Siddhārtha Gautama (c. 563–c.

483 BCE), the founder of the set of theories and practices that are now called Buddhism. Traditional accounts of Gautama's life are more inspirational and hagiographical than historical in nature, and any attempt to extract a historical record from them is likely to prove frustrating, although the attempts of such authors as Hans Wolfgang Schumann (1989) and Michael Carrithers (1983) to find a credible story of Gautama's life are well worth reading.

According to traditional accounts Gautama left his wife and newborn child to seek his liberation from suffering and followed various teachers who ultimately failed to satisfy his needs. He then set out on his own and found the liberation he sought through meditation and self-discipline. At first disinclined to teach, because he felt his teachings would appeal to few people, he finally decided to tell others what he had discovered. Soon after his death, his disciples met and repeated all they could remember being taught by him, and these recollections were committed to memory. All the rules he had set down for the community of his disciples were collectively known as the *vinaya*. The collections of his other teachings on good character, contemplative exercises, and the theory behind them were known collectively as *sutras*. The *vinaya* and *sutras* supposedly collected shortly after Gautama's death became a closed canon for some Buddhists; other Buddhists eventually accepted as canonical a large corpus of other literature. Although there is a great deal of agreement between what is found in both the closed and extended canon, there is also a good deal of difference. In what follows, an attempt will be made to make note of where there is agreement and where there is divergence of opinion among Buddhists.

The epithet Buddha emphasizes Gautama's claim to have awakened, as if from a slumber, to seeing things as they really are. Another epithet commonly given to Gautama is *jina* (conqueror), which emphasizes his having overcome his internal enemies, the passions. In much of the Buddhist canonical literature Gautama refers to himself as *Tathāgata*, an epithet that has been explained in various ways by later Buddhists; one possible interpretation is that the *Tathāgata* knew the truth or understood things as they really are. Traditionally being a follower of Buddhism consists in going for refuge to the Buddha, the *dharma* (the goal of Buddhist practice), and the *sangha* (the community of virtuous people). In what follows, each of these terms will be discussed with reference to how understanding of them has changed down through the centuries.

THE BUDDHA

During the time when the Buddha Gautama was alive, going for refuge to him meant becoming his disciple and agreeing to follow his teachings and the rules of his community. After his death, however, the meaning of going for refuge to the Buddha changed. The action came to mean making an effort to cultivate in oneself the virtues associated with buddhas in general, for the claim attributed to Gautama was that he was the most recent in a series of buddhas, all of whom had taught the same thing to the people of their generation and all of whom had had the same set of virtues. The set of virtues associated with buddhas are called the factors of awakening. Canonical texts always talk about thirty-seven mental factors that are required for awakening. These factors are the sum of seven different lists of wholesome mental qualities. When all redundant terms are eliminated from these lists, however, there are just ten different factors: wisdom, courage, concentration, mindfulness, inner joy, mental and emotional flexibility, equanimity, faith, right resolve, and good moral habit.

Wisdom is explained as understanding and discrimination, and it includes awareness of one's own body and mind, reflections on the inevitability of death, and recognition that all complex beings change and therefore are not worth striving for. Wisdom also entails realizing that no one is fully in control of one's own body, mind, or personality and that therefore these things are not really one's self, and none of them really belongs to anyone; rather, everything that comes into being is an essentially impersonal event. Because the factors conditioning any one event are beyond reckoning, no one can be in control of all of them; since it is possible to alter some of the conditions in one's life, however, discipline and practice are not in vain, however difficult they may be.

Courage consists in having the resolve and energy to do virtuous and wholesome actions that benefit oneself and others. Concentration is defined as having a healthy mentality focused on a single topic at a time. Mindfulness is defined as good memory, and especially recalling the importance of virtue in all situations and remembering to cultivate it. Inner joy is described as zest and enthusiasm for being virtuous and helping others do the same. Flexibility is defined as workability and pliability of one's thoughts and emotions, which are the opposite of intellectual and emotional rigidity, obsessiveness, and the tendency to pass judgment on others. Equanimity means indifference to pleasure and pain, and impartiality with respect to people. Faith is described as conviction and trust in the teachings of the Buddha as a result of experi-

encing the initial benefits of practicing what he taught. Right resolve consists in the resolve to cultivate wholesome and to eliminate unwholesome mental states. Good moral habit includes thinking, speaking, and acting in ways that conduce to the well-being of oneself and others, and it manifests in earning one's livelihood in ways that minimize damage done to other living beings and to their environment.

Even though it was considered possible for a person to cultivate all these virtues while living an ordinary family life, it was said to be much easier to succeed if one first renounced family life and lived alone or in a community of like-minded friends. For this reason, the ideal setting for Buddhist practice has nearly always been seen to be a monastery.

For the first several centuries in the history of Buddhism, the Buddha was venerated as a man who had been born an ordinary man and who had struggled to discover and eliminate the root causes of rebirth and its inevitable difficulties. After a long life of teaching others how to eliminate their own causes of rebirth, he died a serene death, knowing that he had helped many others to become awakened and liberated from their suffering. He likened himself to a physician who had studied the symptoms of a disease, made a diagnosis, and prescribed a course of treatment. Like a physician, he could only encourage his patients to take the necessary course of treatment; he could not do their work for them. After some five or six centuries, however, this description of the Buddha's career lost its appeal to many people, and new movements evolved within Buddhism that portrayed buddhas in importantly different ways.

One of the most influential of these new portrayals of what a buddha is appeared in a Mahayana Buddhist text, probably written in the second or third century CE, known as the Sutra of the White Lotus of the True Doctrine, commonly referred to simply as the Lotus Sutra. This complex and highly polemical text repudiates the earlier Buddhist doctrine that the Buddha was born, lived, and died, never again to be reborn in any form anywhere. The Lotus Sutra puts forth the view that all particular buddhas, including Gautama, are but manifestations of an eternal entity known as Shakyamuni Buddha, who is omniscient, omnipotent, and perfectly compassionate but otherwise beyond human comprehension. Shakyamuni Buddha, being transcendent, can be known to human beings only by taking human form. All the buddhas of the past, present, and future should be known to be manifestations of this cosmic buddha.

Moreover, the most important teaching of all these manifestations of Shakyamuni Buddha is that every sentient being in the universe is destined to become a fully enlightened buddha, for all beings, and not just those who are known now to be buddhas, are essentially one with the enlightened mind called Shakyamuni Buddha. Announcing this message in various ways, the Lotus Sutra pronounces harsh condemnation of those who teach that the goal of Buddhism is to attain nirvana, if that is understood as the end of the cycle of rebirths. Monks who teach that Buddha Gautama was an ordinary human being who achieved extraordinary things and that he eventually died never to be reborn, are denounced in the Lotus Sutra as charlatans and pseudo-Buddhists whose teachings could prevent others from attaining perfect enlightenment. The immediate destiny of such monks is a long and painful stay in hell, but even they, assures the Lotus Sutra, will eventually realize full and perfect enlightenment.

A second sort of new portrayal of a buddha figure is found in a genre of literature that has come to be known as Pure Land sutras. The term *pure land* is a translation of a Chinese expression that is in turn an interpretation of a Sanskrit expression that means "a happy land" or "a land of ease." The principal innovation in this genre of sutras is the notion that there are buddhas who attained buddhahood only after amassing an incalculable amount of merit through austerities and good works. After attaining buddhahood these buddhas used their merit to create realms in which all the distractions posed by hardships are unknown so that inhabitants of these realms could devote all their energy to cultivating virtue and striving for nirvana. People from our burdensome world are said to be able to gain entry in one of these realms of ease simply by calling on the name of the buddha who created it.

By far the most popular of these buddhas was Amitābha, whose name means "he whose light is unmeasured." The invocation of Amitābha's name became one of the most common practices among Buddhists in East Asia. In some places, and especially in Japan, some followers of the Lotus Sutra held Amitābha (Amida in Japanese) practitioners in contempt because of the latter's reluctance to regard Amitābha as a manifestation of Shakyamuni. The various views that Buddhists have held on what exactly the nature of a buddha is have been described in detail and with considerable philosophical refinement by Paul J. Griffiths in *On Being Buddha: The Classical Doctrine of Buddhahood* (1994).

THE DHARMA

Those who followed the closed canon of Buddhist texts teach that the dharma to which a Buddhist goes for refuge is nirvana, which is seen as the ultimate goal of all Buddhist practice and theory. Ultimately, nirvana is defined as the cessation of rebirth after one's present life comes to an end, but the term also refers to the cessation of psychological afflictions while one is still alive. The principal afflictions discussed in Buddhist teachings are greed, hatred, and delusion. Greed is understood broadly as all craving for material possessions, physical and psychological comforts, physical and psychological pleasures, celebrity, approval, and anything that one regards as desirable. Hatred includes irritation, resistance, anger, and any sort of aversion or wish for dissociation from something. Delusion includes any sort of misunderstanding or misjudgment that could result in unsuccessful action.

These three root afflictions are said to be the principal causes of all distress and discontent. Eliminating them results in being content with whatever situation that may present itself. In many Buddhist texts it is said that contentment arises not merely from the absence of afflictions but from the presence of their opposites. Thus, when greed is replaced by generosity, hatred by love, and delusion by wisdom, then one is truly contented, and when these replacements are permanent, then one has attained liberation from suffering in this life.

While the dharma to which a Buddhist goes for refuge is nirvana, the term *dharma* also refers to virtue in general and to anything, such as teachings and practices, that help one to cultivate virtue. The most important of the virtues is wisdom, since it plays a role in the cultivation of all other virtues. Wisdom is said to arise in three stages. The first stage consists in learning what wise people have said and how they have acted. The second consists in reflecting on what one has learned through study. And the third consists in realizing in one's own life what the wise people of the past have discussed. This third stage includes a variety of contemplative exercises that have been designed to improve a person's mentality. For each of the virtues discussed earlier as those associated with buddhas, specific meditative exercises have been designed.

In canonical Buddhism the attainment of nirvana is usually described as incremental. The analogy most frequently used is that one's mentality is like gold ore, which is a mixture of precious metal and various unwanted minerals. Refining ore to get pure gold requires a gradual elimination of the unwanted minerals through various

chemical and mechanical processes. Similarly, one's mentality is a mixture of wholesome and unwholesome habits that mute the effectiveness of the wholesome traits. Refining one's character requires the gradual elimination of bad habits through study, reflection, and cultivation, and the culmination of all this refinement is nirvana. In some forms of later Buddhism, however, a different conception of nirvana arose. In this new view nirvana, understood not as the mere absence of affliction but as the constant presence of tranquillity, lucidity, and bliss, is the fundamental nature of all things. Thus, all consciousness is fundamentally calm, lucid, and contented, and the so-called afflictions are temporary obscurations of that lucidity. The most common analogy for this view of nirvana is that of the sun, which shines all the time but is sometimes temporarily obscured by clouds. In this view of consciousness the condition of enlightenment is innate and permanent.

Nirvana, therefore, is not the cessation of existence but the realization that consciousness is beginningless and endless and constantly tranquil. In some forms of this doctrine it is said that ultimately there is only one mind, namely, the Buddha's; all apparently individual minds are but episodes of this one Buddha mind. Since the Buddha's mind can only be wholesome, it follows that all those who are apparently individuals are also wholesome, and all mental events, including those called unwholesome or vicious are in fact virtuous. Delusion, then consists in a failure to recognize the innate wholesomeness of all existence. In some formulations of this position delusion consists in thinking in terms of oppositions at all; thus, it is delusional to think in terms of the contrast between virtue and vice, wholesomeness and unwholesomeness, delusion and wisdom, liberation and bondage, buddha and ordinary person, and so forth.

THE SANGHA

The word *sangha* means "community." The community to which a Buddhist goes for refuge is the so-called noble (*ārya-sangha*) community, which comprises all those who have reached one of the four stages leading to and including nirvana. Since it is seen as nearly impossible for an individual to make the necessary refinements in character that lead to nirvana, it is considered almost essential for one to keep company with virtuous people who will understand and support one's resolve to cultivate virtue and attain nirvana. In the hopes of providing a community of people dedicated to virtue and thus providing a noble sangha, the Buddha Gautama founded a monastic community as well as a community of lay disciples. Ide-

ally, these formal communities should include enough members of the noble community to be of benefit to the world as a whole, and so to help these visible communities not only to be virtuous but also to be seen to be virtuous, Gautama set forth various sets of precepts. Lay disciples are expected to refrain from five harmful activities: killing, stealing, sexual transgressions, lying, and intoxication. Novitiates seeking ordination into the monastic community are expected to refrain from ten harmful actions and thoughts: the first four of the five expected of the laity plus refraining from harsh speech, gossip, frivolous speech, attachment, anger, and false views. Monastics are expected to observe more than two hundred vows, depending on which monastic order they belong to. Four of those vows are considered so important that any person who breaks them is dismissed from the monastic order for the rest of his or her life; these four vows are refraining from killing a human being, from the theft of anything that human beings regard as property, from any kind of sexual intercourse with any other being living or dead, and from making false claims about one's spiritual attainments.

The study of the monastic rules (*vinaya*) suggests that the principal purposes of the monastic community were twofold: to provide an ideal environment for individuals to cultivate virtue and to serve as a visible community that demonstrated to the society at large that a life of material simplicity dedicated to the cultivation of virtue and self-contentment is far more satisfactory than a life of material acquisitiveness dedicated to seeking possessions and the approval of others. Taking monastic vows is not seen as necessary for the attainment of nirvana, but is seen rather as the taking on of responsibilities to be of service to society at large. Some scholastics favor the view, based on passages in canonical texts, that, while it is not necessary to be a monastic to attain nirvana, it is impossible for anyone who has attained nirvana to remain a lay person for more than one day. Others, however, take the view that renunciation is itself a kind of attachment and that a liberated person would be able to live a normal lay life without becoming either attached to or afraid of its pleasures. This latter attitude can be found in many Buddhist movements within East Asia, and especially Japan, and in some movements in Tibetan Buddhism.

The Buddha Gautama made several observations about statecraft. He made these observations by telling stories, which often had a satirical edge. One attitude that emerges in these stories is that government came into human society at a time when morality was breaking

down, and, since government was devised by people living in morally broken down cultures, government is itself as likely to exacerbate the problem as alleviate it. That notwithstanding, those whose task is to provide governance can sometimes benefit by the counsel of wise people, although not all governments are equally willing to heed wise counsel.

In his own instructions to kings, Gautama urged them, above all else, to provide to all citizens the means to earn their own livelihoods. This could best be achieved by taxing the wealthy and distributing resources to the needy and by educating the unskilled. A king who fails to do these things, said Gautama, is most likely to bring about a society in which the poor have no means of living other than stealing from the wealthy, and the wealthy then hire guardians to protect their wealth. This situation in turn leads to both the thieves and the mercenary guardians arming themselves to protect themselves against one another, and it leads to the wealthy seeking ever stricter laws and more severe punishments, until nearly everyone is armed and afraid. As fear and suspicion grows, violence increases, and as violence increases, the life expectancy of people declines. Eventually, said Gautama, the decline will become so dramatic that most people will die only shortly after reaching the age of reproduction, and children will be left to raise themselves, and morality will become so rare that people will have forgotten even the word *virtue*, let alone know what it stands for. All this can be avoided by governments that are more interested in protecting the poor than in serving the wealthy, said Gautama, and such governments are more likely to occur if wise and learned men and women remain actively engaged in society. Even monks who have renounced the family life should take an interest in providing wise counsel to governments. The ideal of providing selfless service to one's society was particularly emphasized in some of the Mahayana sutras that came into prominence in the first several centuries CE.

The entire philosophy of Buddhism is traditionally summarized in a formula called the four noble truths: (1) all forms of existence involve some suffering, (2) suffering arises because of unrealistic expectations, (3) suffering can be eliminated by eliminating unrealistic expectations, and (4) there is a method to be followed to eliminate them. The method itself is summarized in the formula: "Do what is beneficial, avoid doing harm, and keep the mind pure."

MADHYMAKA
YOGĀCĀRA

CHAN AND ZEN

Zen is the latest Japanese development in a number of similar Buddhist traditions known as “Chan” in China, “Seon” in Korea, and “Thiền” in Vietnam, all supposedly having origins in India. It is an open question whether there is a sufficient degree of homogeneity to label this multifarious tradition “Chan” or “Zen.” A safe alternative would be to treat each of the regional variations as distinct traditions, or even to handle the numerous subcategories in each of the East Asian regions as not necessarily

connected with each other, at least not in the sense of a historical continuity.

One factor that makes these traditions especially complex is their emergence at various times and in various settings without being submitted to a central religious authority that would have defined their identity, their doctrine, and their structure as a religious unity. The multifarious nature of these traditions does not mean that Zen institutions did not participate in games of power; they certainly did. The vicissitudes of these lineages result from influences that cannot be reduced to institutional fates and orientations, or to their connections with political contingencies. This is because in most cases their self-proclaimed criterion for religious authority was spiritual realization.

ZEN AGENDAS

While there is no unified tradition, this presentation uses the word “Zen” to indicate the fuzzy field comprising all the traditions mentioned above. For the sake of simplicity it is convenient to adopt the widely used Japanese pronunciation, except when referring to a specific geographical area.

Since many Zen lineages and most Buddhist schools seek to disentangle the nexus of our projections even on sacred matters, awareness of our own hermeneutic circle is a necessary prerequisite for examining the possible confluence between traditional and philosophical approaches to Zen. One of the sources that have shaped the understanding of Zen is the agendas of those who first introduced it to Western audiences and readers. Fortunately, a growing array of sharp studies is now available to facilitate the deconstruction and subsequent understanding of how missionaries, apologists, and romantics contributed to fabricating a contemporary notion of Zen. These studies examine why, for instance, Daisetsu Suzuki (1870–1966) in his own time and context chose to present Zen as the finest product of “Japanese spirituality,” and even to claim, “As I conceive it, Zen is the ultimate fact of all philosophy and religion” (1961, p. 268). Works by Faure, McRae, and Wright provide an insightful analysis of this crucial dimension and some of the necessary antidotes. One of their achievements is to reveal contradictions inherent in the discourse of apologists who denied their own historicity.

THE CONCEPT OF MEDITATION

“Zen,” pronounced “Chan” in Chinese, has an interesting linguistic background. The Chinese compound “channa”

was used to phonetically transcribe the Pali terms “jhāna” or “jhān,” from which it derives. “Dhyāna” being the Sanskrit equivalent for the Pali “jhāna,” popularizers often simplify this etymology by explaining “chan” as if it derived from “dhyāna.” Eventually “chan,” the first half of the compound, became a word in itself, retaining some of its original implications.

Indian Buddhists chiefly used the word “jhāna” as a generic term for meditation (singular) and as a technical term for particular meditative states (plural). For example, in the *Sutta-nipāta*, “jhāna” is always singular, and appears in contexts such as “One who possesses the strength of wisdom, born of the moral precepts and restraints, who is tranquil in mind and delights in *meditation*, who is mindful, free from attachment, free from fallowness of mind and the Intoxicants, is called a sage by the wise” (I.12, verse 212; Saddhātissa 1985, p. 22; italics added). Here “meditation” is apt, as long as the English word is understood in its pseudo-etymological sense of (*re*)centering the mind, an approximation for one of the definitions of “jhāna,” the mind “focused on one point” (Skt., *ekagrātā*), and as long as the object of this concentration is understood as being nondiscursive.

The technical usage of “jhānas” in the plural refers to particular meditative states, often translated as “absorptions” or “enstasis.” In the Buddhist canon the *jhānas* gradually were systematized to include four stages. An even more elaborate description of these stages in the canon mentions how the practitioner moves through these four successive absorptions, then enters the four “attainments” (*samāpattis*), which culminate in the ninth stage with cessation of perception and feeling (Pali, *saññāvedayitanirodha*), better known as the attainment of cessation (Skt., *nirodha-samāpatti*).

Despite the importance of these nine meditative states, no Indian Buddhist school ever focused exclusively on the practice of absorptions or the practice of meditation. Such developments in the Chinese cultural sphere constitute a huge semantic leap and a complete reinterpretation of the tradition. (See Griffiths [1993] on *jhānas*.)

THE EMERGENCE OF CHAN AS A DISTINCT MOVEMENT

Details of how Buddhism entered East Asia around the first century CE and gradually spread within the Chinese cultural sphere remain surprisingly ill defined. At a certain point after the end of this transmission process, in some circles, meditation ceased to be considered as only

one of the three central methods of self-cultivation (morality, concentration, and insight), and groups of practitioners started identifying themselves as adepts of Chan, understood in the sense of “meditation.”

When did Chan Buddhism emerge as a distinct movement, historically and geographically? Here again caution is required, because those seeing themselves as spokespersons for Chan largely defined their identity in contrast with other Buddhist schools prevalent at that time. If we adopt the scheme proposed by John McRae (2003), this phase began with proto-Chan around 500–600 CE, which coincides with the growing success of the rival Tiantai lineage. In the following stage,

at the beginning of the eighth century the self-described successors to this community exploded on the national scene, and in the process they described themselves as an identifiable religious movement using the lineage model. No matter how diverse and multifaceted the Chan movement was at this point in time, no matter how fuzzy the boundaries were between it and other realms of Chinese religious life, from this point onward Chan had achieved a significant level of sectarian identity. (McRae, p. 121)

Yet in the Chinese context it would be inaccurate to speak of members of an organized “meditation school.” Even in the ninth century, Guifeng Zongmi (780–841) included in his *Chan yuan zhu quanji duxu* (Preface to the collected writings on the source of Chan) a list of Chan teachers that included the Tiantai patriarch Zhiyi (538–597) (Gregory 1991). Put differently, “Chan” in the sense of meditation never exclusively belonged to the Chan School. For one, it was part of the Buddhist legacy and played a central role in the practice of other lineages, such as the Tiantai School. For another, as John McRae convincingly argues, the organization of Chinese Buddhism never implied a sectarian-centered administrative system. Despite a heavy bureaucratic apparatus and the government-sponsored system that emerged in the Song dynasty (960–1279), monasteries were mostly administered in rotation by the different lineages, and in China sectarian borders never became as strictly delimited as in premodern and modern Japan.

Sectarian developments took a further turn in Japan during the Tokugawa period (1600–1867) and evolved into the present rigid structures at the beginning of the Meiji era (1868–1912). Yet even in Japan until at least the eighteenth century, the expression “Chanzong” (Jpn., *Zenshū*) meant the Chan lineage or the principle of Chan,

and by no means referred to the Zen School or any institutionalized sect. The latter connotation emerged in Japan after the Meiji Restoration, when in 1872 the new Ministry of Doctrine created a single school labeled “Zen sect” including the Rinzai, Sōtō, and Ōbaku denominations. However, this forceful attempt to centralize Buddhist institutions met such strong clerical opposition that the government quickly stepped back. It recognized the independence of the Rinzai and Sōtō schools in 1874, then the autonomy of the Ōbaku School in 1876.

Geographically, where did Chan emerge? Saying that it emerged in the Chinese cultural sphere, rather than in China, aims at avoiding the easy assumption that China (understood as the modern nation) was the one and only cradle in which the Chan tradition grew up. This point is still controversial. Thich Nhất Hanh, a leading representative of the Vietnamese Thiên tradition, claims that the area of Jiaozhou, a colony of southern China from 111 BCE until 939 CE corresponding to present Thuan Thanh in northern Vietnam, saw the emergence of such a tradition at a much earlier time. He argues, “Buddhism was first introduced to Vietnam from India via the sea trade routes, beginning around the first century CE. Many people think that Buddhism came to Vietnam through China, but in fact it arrived first in Vietnam from India and was subsequently introduced to southern China from Vietnam” (2001, p. 4). This idea is appealing, especially to demonstrate that the Vietnamese Buddhist tradition is older than that of its former Chinese oppressor, but the additional suggestion that Buddhism was introduced to southern Vietnam (Cham at the time) from Jiaozhou seems difficult to support. Further, Nhất Hanh’s presenting Kuong Tang Hôi (Chin., Kang Senghui; d. 280) as the first patriarch of Zen in Vietnam is questionable. Unfortunately, Nhất Hanh’s ambiguous use of the word “Zen” and his agenda to demonstrate the antiquity of the Vietnamese tradition with a candidate who predates proto-Chan by more than two centuries undermine the reliability of his perspective. (For a balanced evaluation of the construction of Vietnamese orthodoxy, see Nguyen’s [1997] study.)

THE PHILOSOPHICAL TURN

There are contemporary philosophers who seek inspiration in Zen or Buddhism, and there is a philosophical endeavor within the tradition itself. The former case stretches from intellectual curiosity to the commitment of Nishida Kitarō (1870–1945), whose Zen practice laid the basis for a major part of his philosophical work. Yet even Nishida claimed not to formulate a Zen philosophy,

but only to reflect about universal philosophical problems in the light of his personal understanding of Buddhism. In any case, Nishida and his philosophical project must be appreciated within the context of the Japanese industrial revolution. Japan was engaged in importing techniques and culture from the West at a high pitch. To compensate for the unbalance caused by this new situation, Japanese thinkers sought to highlight the unique aspects of Japanese culture. This desire found expression in efforts by Nishida and others to demonstrate the compatibility or superiority of the alleged intuitive thinking of the East with the newly imported Western rationality. (About Nishida, see Heisig 2001, Tremblay 2000, and Yusa 2002.)

The philosophical articulation of the tradition itself is a more difficult subject. The difficulty stems not from the alleged absence of rationality in the East Asian Buddhist tradition, a critique overcome by the dedicated work of a generation of scholars. Rather, it results from the absence of a clear demarcation between Zen philosophy and Buddhist philosophy. Kasulis observes that, despite a huge literary production, traditional Zen accounts fail to justify their distrust of verbal distinctions or dualistic formulations “simply because it has already been offered by traditions influential in the very emergence of Zen Buddhism” (1981, p. 15).

Here the term “Zen Buddhism” (an oddity coined by Daisetsu Suzuki that should be avoided in scholarly contexts) confirms the suspicion that philosophical questioning cannot be confined to Zen alone, insofar as it constitutes a subcategory of the Buddhist worldview. Past attempts to present Zen as special and unfathomable are now better understood for what they were: sectarian proselytism. This observation does not prevent one from asking whether, after all, the Zen traditions have a specific philosophical perspective to offer.

SPECIFIC FEATURES OF ZEN

The quest to discover the real self, with subtle nuances sometimes labeled as “awakening” or “seeing one’s true nature,” is not a uniquely Zen feature. No doubt it occupies a central place in the Zen traditions, but it equally belongs to all Buddhist schools, being precisely what makes them Buddhist. Yet each particular Buddhist approach definitely displays a different flavor. For instance, Pure Land practices favor more devotional attitudes, while the Tiantai or Huayan traditions tend to privilege a more intellectual apprehension of the Buddhist path. Specific features can be found in the style of teaching, in the emphasis on particular types of cultiva-

tion, in doctrinal formulations or textual records, in rituals, and in the interactions with distinctive sociohistorical contexts. The use of vernacular Chinese in the Chan literature to duplicate or imagine dialogical encounters also constitutes a new genre.

The special features of the various Zen lineages did not pop up from some transhistorical background. Scholars now unanimously agree that most of the above-mentioned features of Chan in the Chinese cultural sphere found some degree of standardization during the Song dynasty. This means that even philosophical investigations into the spiritual cultivation of past Zen practitioners must cope with a double-layered filter: the construction of various orthodoxies in the Song period and subsequent interpretations by proselytes, which often replicate or amplify the first filter. With this in mind, let us nevertheless examine an example of a Zen teaching device where the context appears sufficiently explicit.

CRITICAL VOICE OR RHETORICAL DEVICE

One of the literary monuments of the Song period is the *Blue Cliff Record* (*Biyān lu*), a Chan anthology with commentaries by Yuanwu Keqin (1063–1135). The following dialog is provided here as it stands as case 11 in the *Hundred Cases of Xuedou*, the older version containing only the cases selected by Xuedou Zhongxian (980–1052) without Yuanwu’s commentary:

Huangbo taught the Sangha saying: “All of you people are stuffing yourselves with wine lees! If you keep roaming this way, how could this [decisive] moment [ever] arrive? Are you aware of the *nonexistence* of Chan teachers in the whole Tang China?”

At this point, a monk emerged [from the crowd] saying: “What about all those [like you] who help students and lead the Sangha?”

Huangbo.—“I didn’t say Chan is nonexistent, only teachers are nonexistent.” (Taishō 48: 151b11–b16)

Previous translations used the expression “gobblers of dregs,” which sounds good in English and has the advantage of evoking lowlifes, but remains unsatisfactory. The provocation at the beginning of the passage refers to wine lees to make listeners aware that just as eating wine lees leads to intoxication, so depending on teachers and repeating teachings without personal insight is delusive.

Another overlooked dimension of this passage is the allusion of this metaphor to the Buddhist canon. The *Nir-*

vāna Sūtra tells an elaborate story about an ignorant king debating with a wise physician. The physician describes a marvelous medication that counteracts the effects of poison. This drug is actually a particular type of milk produced under strict conditions:

If the cows don’t eat *wine lees*, smooth grasses, or barley chaff, their calves will choose the good [path]. For grazing they will neither stay in the highlands nor come down to swamps. They will drink in limpid streams and won’t be forced to run. They will not gather in herd with the bulls. Their drinking and eating will be adjusted; they will fit walk or immobility and find their place. Milk [produced] this way perfectly eliminates all ailments. (Taishō 12: 378c04–07)

Should this metaphor remain obscure, several commentators offer keys to understanding it. Huiyuan (523–592) of Jingying Temple provides a straightforward explanation: “If the cows represent the bodhisattvas ... , *wine lees* represent ignorance, smooth grasses represent avidity, and barley chaff represents anger” (Taishō 37: 651a19–21).

In this light, the utterance attributed to Huangbo (d. c. 850) is far from simple rudeness to his audience or a dismissive critique of contemporary teachers. This teaching is a rhetorical device pointing at the auditors’ fundamental ignorance and need to rediscover true autonomy. Whether Huangbo really uttered these words is best answered by Wright’s careful statement: “The Huang Po texts available for our reading should be attributed not to any one creative individual or mind, but rather to the Zen tradition in China as it took shape over many centuries” (1998, p. 18).

The above excursion into the maze of intertextuality serves three purposes. First, it illustrates the immaturity of most Chan translations. Second, it shows the interdependence of Chan texts and Buddhist classics, and the need for further integration of the two fields. Third, it allows one to envision these dialogs in the context of monastic practice.

THE PRIORITY OF SOTERIOLOGICAL CONCERNS

If a common thread binds together the different Zen lineages, it may seem to be their uncompromising emphasis on awakening, based on the premise that the means and the end ultimately are not separate. In his characterization of Buddhism in general, Guy Bugault notes the priority of the soteriological dimension over theoretical

constructs, saying, “Accurately speaking, Buddhism at its original stage was neither a religion nor a philosophy, but a psychosomatic discipline including three elements: morality (*śīla*), concentration (*samādhi*), and intellectual discernment or *acies mentis* (*prajñā*). None of them can function without the other” (1994, p. 43, translated from the French).

As with the poisoned arrow representing existential dis-ease (Pali, *dukkha*), the most urgent task is to remove it, speculations about its nature or shape being no more than delusive thought. Acute intellectual discernment is required to remove the arrow. The subtle boundary separating concentration and intellectual discernment is itself a theme worthy of examination, from both the Zen and philosophical perspectives. If there is a philosophical aspect specific to the Zen traditions, it is not so much in their striving to remove the arrow than in their emphasis on going beyond it, aiming at removing all traces of the operation.

Michel Mohr (2005)

DGE-LUGS

The Dge-lugs (pronounced “geluk”) tradition of Tibetan Buddhism, the tradition followed by the Dalai Lamas, traces its origins to the towering Tibetan philosopher and monastic reformer Tsong kha pa (1357–1419) and his two closest disciples, Rgyal-tshab (pronounced “gyelt-sap”) (1364–1432) and Mkhas grub (pronounced “kay-drup”) (1358–1438), whose views have come to represent orthodoxy for the tradition. According to traditional hagiographies, Tsong kha pa studied with more than sixty of the greatest scholars in Tibet during his early life and went on to compose numerous treatises and commentaries on the entire spectrum of Buddhist thought and practice, leaving a set of collected works that numbers nineteen volumes. His philosophical works address virtually all the major topics in Buddhist philosophical discourse, including issues of ontology, metaphysics, epistemology, logic, soteriology, and hermeneutics, among others. Aided by historical and political conditions Tsong kha pa’s works, those of his disciples, and the monastic and educational systems he initiated made the Dge-lugs tradition the dominant philosophical tradition in Tibet. Indeed, Tsong kha pa was such a powerful intellectual force in Tibet that all subsequent philosophers, including those who disagreed with him, felt compelled to acknowledge and address Dge-lugs-type criticisms that they anticipated their views might incur.

While there is much in common among Dge-lugs philosophers in terms of their philosophical positions and methods, it would be misleading to suggest that the Dge-lugs tradition and its notable philosophers are univocal in their philosophical presentations. Many lively debates and polemic directed at fellow members of the Dge-lugs tradition can be found in the works of the great thinkers of the tradition, including Tsong kha pa’s direct disciples Rgyal-tshab and Mkhas grub, as well as later thinkers such as ’Jamdbyangs bzhad pa (1648–1721), Rje btsun Chos kyi ’gyal mtshan (1469–1544), and Lcang skya rol baī rdo rje (1717–1786), among others. Despite this marked diversity of opinion, there is nonetheless a relatively standard Dge-lugs philosophical presentation that those in the tradition generally agree on. The intra-tradition debates tend to focus on lofty and quite subtle points, while the mainstream Dge-lugs philosophical worldview accepted across the tradition remains as the foundation for debates about such subtle points of contention.

Many significant features of Dge-lugs philosophy stand in contrast with other Buddhist traditions. Among the most significant is the marked emphasis Dge-lugs

philosophers place on the study of the Indian Buddhist philosophical tradition they inherited and on what they understand to be the correct interpretation of that tradition. Thus any discussion of Dge-lugs philosophy must be approached through an examination of how the earliest Dge-lugs masters interpreted and represented Indian Buddhist philosophical history.

DGE-LUGS MADHYAMAKA

While the works of many Indian philosophers have impacted Dge-lugs philosophy, the Dge-lugs tradition traces its intellectual lineage most significantly through two important Indian philosophers: Nāgārjuna (c. first century C.E.) and Candrakīrti (c. 600–650). Nāgārjuna, author of the *The Fundamental Wisdom of the Middle Way (Mūlamadhyamakakārika)*, among other texts, is considered the founder and systematizer of the school of Mahayana philosophical thought known as Madhyamaka or the Middle-Way School. Virtually all Tibetan Buddhist schools consider themselves to be Mādhyamikas, followers of Nāgārjuna’s tradition in one form or another and the Dge-lugs are no exceptions in this regard. The central idea that guides the thought of Nāgārjuna and the Madhyamaka School is the notion of emptiness (*śūnyatā*). When Mādhyamikas such as Tsong kha pa use the term “emptiness,” they mean that an object lacks a fixed or unchanging nature. To say that a pot, for example, is empty (metaphysically empty) is to say that it lacks a permanent nature or essence, an independent, intrinsic identity.

The Dge-lugs presentation of the middle way owes much to their reading of the history of their Indian Madhyamaka predecessors. When Dge-lugs philosophers and scholars study the history of Indian Madhyamaka, they begin by recognizing that Nāgārjuna and his student Āryadeva are considered authoritative by all subsequent commentators and interpreters of Madhyamaka thought. According to Tsong kha pa’s assessment of the history of Indian Madhyamaka, an important philosophical split occurred in Madhyamaka discourse several centuries after Nāgārjuna when Buddhapālita (c. 470–540?) wrote a commentary on Nāgārjuna’s *Fundamental Wisdom of the Middle Way*. This was followed by a criticism of that treatise by Bhāvaviveka (c. 500–570?) and a subsequent defense by Candrakīrti of Buddhapālita’s position against those criticisms leveled by Bhāvaviveka. Much of this debate in the Indian tradition revolved around the appropriate form of reasoning to be utilized by Madhyamaka philosophers. With this point in mind, later Tibetans such as Tsong kha pa distinguished subschools of Indian Mad-

hyamaka philosophy, in part on the basis of the form of reasoning that their proponents utilize.

Buddhapālita's commentary, simply titled (in English) *Buddhapālita's Commentary on [Nāgārjuna's] "Fundamental Wisdom of the Middle Way"* is a lucid exposition of Nāgārjuna's text that utilizes a method known as consequentialist argument (*prasaṅga*). Much as in Nāgārjuna's text, Buddhapālita's form of argumentation examines the positions of philosophical rivals to reveal the absurd consequences of holding such positions. In other words, consequentialist arguments attempt to reduce the philosophical positions of opponents to absurdities. All philosophical opponents of Mādhyamikas maintain that some things are not empty, have a true nature or essence, and have independent, permanent existence. For all such contemporary opponents, Buddhapālita, like Nāgārjuna before him, attempted to reveal what he saw to be the absurd positions entailed by their various positions asserting true existence. Though the logical innovations of Dignāga (c. 480–540) were beginning to make headway into Mahayana discourse, Buddhapālita avoided these innovations in logic, such as the use of independent argument (*svatantrānumāna*), thus avoiding commitment to a counterposition when criticizing his opponents. Dge-lugspas have tended to presume that Buddhapālita was simply and faithfully following the method of Nāgārjuna.

Bhāvaviveka, in contrast, argued that Mādhyamikas must assert their own philosophical position. Simply to criticize others without establishing one's own position, the emptiness view, is inadequate. And to establish one's own position, Bhāvaviveka argued, one must use independent inferences. Thus, in *Prajñā-pradīpaḥ: A Commentary on the Madhyamaka Sūtra*, his commentary on Nāgārjuna's *Fundamental Wisdom of the Middle Way*, Bhāvaviveka offers a pointed criticism of Buddhapālita's failure to establish a Madhyamaka thesis, as well as an exposition of the need to use independent argument (*svatantrānumāna*) to fulfill that task. Accordingly, Dge-lugspas categorized Bhāvaviveka's particular brand of the middle way as Svātantrika-Madhyamaka. In contrast, Dge-lugs doxographers describe Buddhapālita and his defender Candrakīrti (described below) as Prāsaṅgika-Mādhyamikas, because they insist on primarily using consequentialist arguments (*prasaṅga*).

Candrakīrti (c. 600–650) is the third important figure in this Indian Madhyamaka debate, according to Dge-lugs authors. Candrakīrti composed several philosophical texts, two which are important to Dge-lugs philosophers on the central issue of the appropriate form of reasoning

for proponents of Madhyamaka views: his *Introduction to the Middle Way (Madhyamakāvatāra)* and *Lucid exposition of the middle way (Prasannapadā Madhyamakavṛtti)*. In these texts Candrakīrti philosophically defended Buddhapālita against the criticisms leveled by Bhāvaviveka. Candrakīrti argued not only that Buddhapālita was correct to use only consequentialist arguments, but also that using independent arguments are incompatible with Madhyamaka tenets.

In the Dge-lugs reading of this debate, there is a fundamental ontological problem with using independent arguments. Such usage implies acceptance of an inherent, absolute, or unchanging nature in phenomena, and this implication is utterly contrary to the most basic Madhyamaka tenet—that all phenomena are empty of just such a nature or essence. Dge-lugs philosophers such as Tsong kha pa argued that because one characteristic of an independent inference is a commonly appearing subject in the inference, the inference implies that the subject must have some sort of absolute existence. For example, in the independent inference “This book is impermanent because it is produced,” the subject, this book, must appear in precisely the same way, in a way which is common to both the proponent and opponent of the argument. If it does not, then the two debaters are just talking past each other. If it does have a precise and common mode of appearance to both the proponent and opponent, then it must have some absolute mode of existence, some intrinsic identity, some sort of inherent nature.

Thus, the mere use of independent arguments runs utterly contrary to the Madhyamaka view, according to Tsong kha pa and his Dge-lugs followers. Although Tsong kha pa considered Buddhapālita to be a Prāsaṅgika-Mādhyamika from his views and method, he considered Candrakīrti to be the “founder” of the Prāsaṅgika-Madhyamaka view, since he was the first clearly to articulate the importance of using consequentialist arguments and the contradictions involved when Mādhyamikas use independent arguments.

An interesting feature of Tsong kha pa's middle way is that though he recognized the limits of language, he still insisted on rationality and the laws of logic in his investigations and conclusions concerning the ultimate. In this sense, notes Georges Dreyfus in *The Sound of Two Hands Clapping*, Tsong kha pa ought to be considered a realist. Śāntarakṣita, an eighth-century scholar who was a key figure in the early dissemination of Buddhism in Tibet, was a late Indian Mādhyamika who incorporated the logico-epistemological (*pramāṇavāda*) innovations of Dignāga and, more prominently, Dharmakīrti (seventh

century) into his particular brand of the middle way. Though Śāntarakṣita was considered to be a Svātantrika-Mādhyamika with whom he took issue on several counts, Tsong kha pa nevertheless preserved, and even intensified, Śāntarakṣita's emphasis on the role of reason in his Madhyamaka method. The particularities of how Tsong kha pa integrated the logico-epistemological tradition into Madhyamaka analysis are central to the insights that made his thought unique.

To turn now to the Tibetan Madhyamaka tradition, for Dge-lugs philosophers, an issue central to all Madhyamaka philosophical analysis and inseparably tied to the issue of an appropriate logic is the issue of the two types of truth: ultimate truth (*don dam bden pa* [Tibetan], *paramārthasatya* [Sanskrit]) and conventional truth (*kun dzob bden pa, saṃvṛtisatya*). Truths in this context are objects of knowledge. Hence it makes sense to talk of truths existing. Since its earliest formulation in the works of Nāgārjuna, Madhyamaka thinkers have used a presentation of the two types of truths as a primary marker against which they have delineated their positions on central Buddhist topics in ontology and epistemology.

Dge-lugs philosophers illuminated the distinctions they drew between ultimate and conventional truths by contrasting their positions as Prāsaṅgika-Mādhyamikas with the position of their Madhyamaka rivals, the so-called Svātantrika-Mādhyamikas, such as Bhāvaviveka. This takes place in the treatises of Tsong kha pa and his direct disciples and also in a genre of philosophical literature prominent in monastic study and known as tenet-system texts or doxographies. In this literature, Dge-lugs authors present major systems of non-Buddhist and Buddhist philosophical thought in a hierarchically organized fashion. Each of the tenet systems (or at least the Buddhist systems) are presented in terms of a host of philosophical categories of analysis, such as the two truths, definitions of consciousness and objects of consciousness, delineation of the path, delineation of the fruits of the path, and so on. Consistency in analytic categories across the presentation of schools of thought facilitates easy comparisons between systems and usefully allows one easily to ascend a hierarchy of philosophical positions in a dialectical fashion by contrasting the present system with the less subtle and less accurate system just below it.

For example, one can easily compare all four Buddhist schools' definitions of ultimate truths, conventional truths, consciousness, and the like, by seeing that school *x* defines a conventional truth in one way, school *y* in another, and school *z* in yet another. Often the views presented in this literature do not precisely mirror those of

any single Indian author, but rather are amalgamations of the views of several presumably like-minded thinkers and of unstated positions considered to follow logically from other stated positions. As mentioned above, for Dge-lugs thinkers, the highest and most accurate Buddhist philosophical description of the nature of reality is the Prāsaṅgika-Mādhyamaka. Just below that position in the hierarchy is the Svātantrika-Mādhyamaka view. Thus, the Svātantrika view is most commonly contrasted with the Prāsaṅgika-Mādhyamaka position to help illuminate the Dge-lugs-Prāsaṅgika view.

When Dge-lugs authors discuss the issue of the two types of truths, they employ a number of key technical terms. Jeffrey Hopkins mentions sixteen terms in his book *Meditation on Emptiness*, of which the six most commonly used are the following:

- Ultimately established existence (*don dam par grub pa*)
- Truly established existence (*den par grub pa*)
- Existence established in reality (*yang dag par grub pa*)
- Existence established by way of the intrinsic identity/characteristics of an object (*rang gi mtshan nyid kyi grub pa*)
- Existence established by way of the inherent nature of an object (*rang bzhing gyis grub pa*)
- Existence established from its own side (*rang ngos nas grub pa*)

According to Dge-lugs philosophers such as Tsong kha pa, all Mādhyamikas, including the Prāsaṅgikas and the Svātantrikas, held that the first three terms on the list accurately describe ultimate truths, since such truths lack (are empty of) ultimately established existence, truly established existence, and existence established in reality. An example of an ultimate truth for either a Svātantrika-Mādhyamika or a Prāsaṅgika-Mādhyamika would be the lack of any ultimately established existence or truly established existence in this book, for example. The lack of ultimately or truly established existence refers to the absence of any objective existence, any independent absolute mode of being, any fixed independent essence, within this book. Thus far, according to Dge-lugs thinkers, both subschools of Madhyamaka thought are in agreement.

The disagreement between the two subschools concerns their positions on the ontological status of conventional truths. According to Dge-lugs thinkers, while all Mādhyamikas, when presenting ultimate truths, argue

that phenomena lack an ultimate nature, the Svātantrika-Mādhyamikas accept that conventional truths exist in the latter three ways listed above; that is, they exist by way of their own intrinsic identity, by way of inherent nature, and from their own side. This, according to Dge-lugspas, is how the Svātantrika-Mādhyamikas could view their position as maintaining a middle ground between absolute permanence and absolute nonexistence, or nihilism. They avoid the extreme of permanence by saying that phenomena ultimately lack true existence. They avoid the extreme of nihilism by claiming that phenomena conventionally exist by way of their own characteristics, by way of their intrinsic nature, or from their own side.

In relation to the logical issues discussed above, because phenomena conventionally exist from their own side or by way of their own intrinsic identity/characteristics, objects such as books and tables can serve as commonly appearing subjects in independent inferences. An inherent nature or intrinsic characteristics on the side of the book, for example, cause an ignorant, unenlightened consciousness to recognize that object and correctly impute the conventional designation “book” on the basis of a nondefective conventional cognition. Such an imputation has a referent as object, to which it correctly points with a conventional designation (“book”).

Dge-lugspas found this position, which they attributed to Svātantrika-Mādhyamikas, highly problematic. They argued that all six technical terms mentioned above to describe the ontological status of things are coextensive. If an object can be described in one of the six ways, it can be described in all six ways. Dge-lugspas thus argued that ultimate truths *and* conventional truths do not exist in any of the ways described above. They argued that if objects are established by way of their own intrinsic identity, by way of some sort of inherent nature of their own, or from their own sides, even conventionally, then objects must have some sort of ultimate nature. Dge-lugspas would criticize their Madhyamaka opponents by arguing that although they claim that some objects exist only conventionally, if they assert that the objects inherently possess some nature of their own in any way, even conventionally, this is really just a masked way of continuing to cling to some independent essence or nature in the objects ultimately. For an object to cause a conventional consciousness to correctly recognize and label it, there must be something true or absolute in the object. Thus in the Prāsaṅgika-Madhyamaka position held by Dge-lugspas, both ultimate and conventional

truths lack all six criteria (sixteen as listed by Hopkins) of ultimate and conventional truths.

While Svātantrikas accept that conventional truths exist inherently, by way of their own characteristics, and from their own sides, Dge-lugspas, such as the Prāsaṅgikas, reject the idea that even conventional truths are established in this way. Conventional truths are actually falsities. There is nothing true about how minds under the sway of ignorance conceptualize these falsities. This is not to say that the world does not exist out there. It is just to say that we are utterly deluded when we engage with the world because we impose fixed essences in things when no such essences exist. And this is what Svātantrikas are doing when they claim that even mere conventional truths inherently exist. For Dge-lugspas, such as the Prāsaṅgika-Mādhyamikas, conventional truths are true only for a consciousness for which the actual nature of reality is obscured. They do not exist as they appear to a conventional consciousness. Dge-lugspas such as Tsong kha pa held that they avoided the extreme of nihilism by accepting the functionality of conventional phenomena despite the falsity of their appearances.

It is important to keep in mind that this is a standard Dge-lugs presentation of this history and these ideas. While Dge-lugs authors associated specific Indian Madhyamaka thinkers with these subschools of Madhyamaka thought, there does not appear to be evidence in Indian sources before the twelfth century of any explicitly named subschools of Madhyamaka thought. Prior to this time, the thinkers discussed here and labeled “Prāsaṅgika-Madhyamaka” or “Svātantrika-Madhyamaka” in the Dge-lugs literature identified their own views as simply Madhyamaka.

THE DGE-LUGS CURRICULUM AND SCHOLASTIC METHODS

Any discussion of Dge-lugs philosophy must move beyond ideas and also discuss the curriculum and methods employed in Dge-lugs institutions, which direct a significant amount of their focus to philosophical study. Tsong kha pa initiated a scholastic approach to Buddhism that, although presented to lesser degrees before him in Tibet, marked a significant departure from the mystical gnosis of individuals as sources of authority for the tradition before him. Tsong kha pa emphasized reasoning, which could be learned, in time, only in monastic universities, thus advancing a shift in authority from individuals to institutions and a wholesale reform of monastic culture, which he saw as deteriorating in Tibet during his time. As time went on and the monastic colleges grew, the

degree of scholasticism grew with it. Key figures from the Dge-lugs monastic colleges began to compose textbooks (*yig cha*) as manuals for study in attempt to present coherent, consistent, totalizing systems of thought immune to critique, especially internal contradiction. This move toward scholasticism certainly reinforced institutional authority, but the importance of mystical gnosis of expert scholar-adepts was far from lost in the Dge-lugs tradition, though the reins on the careers of independent yogis were significantly tightened in this tradition.

The Dge-lugs tradition maintains a large monastic component that includes three major monastic seats—Sera, Drepung, and Ganden—and several colleges within those monastic seats. Traditionally, the monastic seats housed between 5,000 and 10,000 monks in each, with good portions of the monks engaged in the philosophical curriculum of one of the monastic colleges. Even in exile in south India, Sera and Drepung each had more than 5,000 monks in residence in 2005. The colleges of the three monastic seats all have a similar curriculum that culminates in a degree known as “geshe.” A geshe degree is somewhat akin to a doctorate in Buddhist philosophy. It generally takes somewhere between fifteen and twenty-five years to complete the curriculum, which includes study and memorization of all the major philosophical texts of the tradition, extensive periods of debate (usually four to six hours a day, six days per week), and study of the major commentaries and textbooks of the college, which serve as the interpretive frame through which to engage the major treatises of the Indian and Dge-lugs traditions. Though most monks at Sera, Drepung, and Ganden begin the geshe training, only a small percentage successfully complete the degree because of the difficulty of the subject matter and the rigors of the curriculum, again, much like a doctoral program in the West.

Each of the monastic colleges cover the same basic subjects, though they use different monastic textbooks (*yig cha*), commentaries that present the interpretive frameworks of their particular colleges. Here in the monastic textbooks one begins to find differences in interpretation on subtle philosophical points between authors within the Dge-lugs tradition. Often scholars from the different monastic colleges will take great pride in the monastic textbooks of their particular colleges and the interpretive framework they employ for understanding the philosophical views of Tsong kha pa, Candrakīrti, and other great philosophers. Within the curriculum there are preliminary subjects covering the basics of topics such as the forms of reasoning and debate, soteriolog-

ical grounds, and paths; types of minds/consciousnesses according to the Buddhist tradition; the philosophical tenet systems of the four Indian Buddhist schools; and so on. Once these preliminary subjects are successfully completed, the Dge-lugs scholar progresses on to the five subjects of the geshe curriculum, which include the perfection of wisdom, maplike descriptions of states of consciousness as the practitioner removes obstacles to enlightenment and progresses along the Buddhist path, logic and epistemology, Madhyamaka philosophy, cosmology, and monastic ethics. These five subjects include topics on ethics, metaphysics, ontology, hermeneutics, karma, and personal identity among others. For each of these subjects, years are dedicated to primary philosophical texts, which are memorized and then studied intensively with a teacher, who gives the students informed oral explanation on the texts. Students then debate the ideas and fine-tune their understanding in the debate courtyards. Progress exams are given regularly, and the final exam includes a multi-day public debate with top scholars in the tradition.

Many of those who complete this geshe curriculum successfully go on for a sort of postdoc for one to three years at one of the two major tantric colleges, Gyume or Gyuto. Here they study the theory and practice of the major tantric meditational cycles in the Dge-lugs tradition. Completing all these requirements usually qualifies the student as a teacher. Thus, authority is granted primarily through institutions, though this curriculum ideally cultivates—and indeed, was constructed to cultivate—experiential/gnostic authority as well.

The Dge-lugs tradition of Tibetan Buddhism is perhaps the most scholarly and philosophical of all the world’s Buddhist traditions. As a living Buddhist tradition, it makes for a fascinating area of investigation, not only for those interested in the history of Buddhist philosophy in general, but also and particularly for those interested in understanding the ideas and structure of a living Buddhist tradition, and understanding how philosophy and philosophical study are integrated with a larger human path.

HUA YAN

The Hua yan school of Buddhism developed in China between 600–1000 CE, flourishing at the end of the Tang dynasty. It relies for much of its doctrine on exegesis of

the Mahayana Buddhist scripture known as the *Hua yan Jing*. The name *Hua yan* (Japanese: *Kegon*) is intended to be the Chinese translation of the Sanskrit *Avataṃsaka*, which means "flower garland." The term is ostensibly the title of a Sanskrit sutra, the *Mahāvaiṣṭhavya Buddhāvataṃsaka Sūtra*. The Hua yan school developed a *panjiao* (system of classification of Buddhist doctrines), which takes the *Hua yan Jing* to be the most profound of all the Buddhist sutras. This is because it was, according to legend, spoken by the Buddha while in the throes of his awakening experience.

CENTRAL TEXTS

The term *vaiṣṭhavya* in the title indicates that the text is a composite one, cobbled together from several other texts of various lengths and origins. Some parts of the text, for example the *Daśabhūmika* and the *Gandavyūha*, do exist in a Sanskrit original. In addition, some parts of the text are laden with Chinese phoneticizations of Sanskrit terms, which also indicate a likely Indian origin. The rest is more or less likely to be of indigenously Chinese origin, passed off as or uncritically taken to be translations of Sanskrit originals. For this reason, the origins of the Hua yan tradition are linked to the evolution of a fully sinicized Buddhism.

This is complicated by the fact that many of the key, pivotal translators and advocates of these materials were not indigenously Chinese but in fact were from Central Asia. China and India were kept culturally autonomous for a long time because of the daunting obstacle presented by the Himalayas, so early contact actually was more likely to take place in areas of easy access to the Silk Road. This complicated matters because of the cultural homogenization that also followed along with such developments. Since the latter part of the twentieth century, there has been much study about the extent to which the flow of ideas from many cultures along the Silk Road influenced the development of the uniquely Chinese forms of Buddhism.

There are two arguably complete versions, or translations, of the text in Chinese. The earliest consists of sixty chapters, produced by Buddhahadra in about 420. Traditionally, this has been used by Hua yan writers as the standard text. In 699 a version in eighty chapters was produced by Śikṣānanda. The only complete English translation of the Hua yan sutra, in three volumes, was produced by Thomas Cleary in the late 1980s. For reasons he does not explain, Cleary translates Śikṣānanda's version, although it is not as historically important as Buddhahadra's text.

In addition, there do exist various Chinese versions of parts of the sutra, such as the *Gandavyūha*, for which is there is a Sanskrit original.

Another text of crucial importance to the development of the Hua yan tradition is the *Dasheng Qixin Lun* (Mahayana awakening of faith). This text is also arguably an apocryphal text, written in Chinese but taken as a translation of a nonexistent Sanskrit text ostensibly titled *Mahayānaśraddhotpāda*. This text is cited by all the prominent Hua yan writers and is thus granted a substantial authority. This text has been linked to the ontologization of Buddhism as it developed in the Chinese context, perhaps due to Central Asian and Silk Road influences. Ideas that take shape in this text include such metaphysical notions as buddha nature and *tathāgatagarbha* (womb of buddhahood), which some scholars take to be countertheoretical to basic Indian Buddhist premises of the pointlessness of metaphysical assertions and speculations. In fact, within modern Japanese Zen traditions, there are those who suggest that East Asian Buddhism in general is not Buddhism. These critical Buddhists point precisely to the type of foundational *tathāgatagarbha* thinking that can be directly linked to the *Awakening of Faith* and its influence as topical, non-Buddhist elements that encroach on the central insights.

PATRIARCHAL LINEAGE

According to the retrospective view of Zongmi (780–841), there are four patriarchs or lineage figures in the Hua yan tradition, and he styles himself as the fifth patriarch. This comes to be seen as the orthodox lineage by the subsequent tradition. This standard list of patriarchs includes Dushun, Zhiyan, Fazang, Chengguan, and Zongmi. This is a retrospective lineage, which means that it is not at all clear that Dushun and Zhiyan saw themselves as members of a Hua yan school. This attribution is applied after the fact, as the tradition comes to consider the sources of its own emphases.

Dushun is said to have lived from 558 to 640. Although apparently prominent as an adept and miracle worker in his time, he is most influential as the purported author of a text known as the *Hua yan Fajie Guanmen* (Meditative approaches to the Hua yan Dharmadhātu). This text introduces the Four *Dharmadhātu* model that will be discussed later on, and thus provides a solid basis for the later developments in Hua yan thought.

Zhiyan (602–668), the second patriarch, is not as well known. His most prominent contribution to the discourse is the so-called Ten Mysteries. These are basically a series of metaphors for interpenetration and mutual cau-

sation, and many of them are in fact redundant. Regardless, this language persists in the work of Fazang, perhaps the grand systematizer of Hua yan thought.

Although attributed as the third patriarch, Fazang (643–712) may have been the first to think of himself as founding or joining a specific school of thought. Fazang's family was of Central Asian origin, in Samarqand, a prominent center on the Silk Road. A prolific writer, he wrote somewhere between sixty and one hundred works on various topics, the most important being commentaries on the *Hua yan Jing* and the *Mahayana Awakening of Faith*. He rose to prominence at the court of the empress Wu, after a series of performances in which he used such examples as a room of mirrors to demonstrate Hua yan principles of interpenetration and nonobstruction. Fazang's school stood in contrast to the school of Xuanzang, who had gone to India to learn Sanskrit and translate scores of Buddhist texts into Chinese. This conflict can be seen as being between the Indic and the sinicized forms of Buddhism. Ultimately, Fazang's view prevails, for a variety of philosophical, cultural, and political reasons. This may be an early and important stage in the sinicization of Buddhism.

Chengguan, the fourth patriarch, lived from 738 to 840. The lineage is somewhat obscure here, as Fazang's actual disciple, Huiyan, was understood by the later tradition to have corrupted the teaching. Chengguan, who was born after Fazang died, was nevertheless seen as the fourth patriarch in the sense that he is believed to have restored the integrity of Fazang's teachings. He did seem to have led a renewed interest in the school on the part of the ruling class and the scholars.

The last of the orthodox patriarchs is Zongmi (780–841). Zongmi is best known for his syncretic concerns, including his interest in sorting out the various schools of Buddhism, especially Chan Buddhism. Because of his interest in *panjiao*, his works are a treasure house of historical information about the schools of Buddhism active at his time. What is perhaps most significant about Zongmi is his concern with reconciling and synthesizing Hua yan and Chan Buddhism. In fact, Zongmi is sometimes attributed with lineage roles in both the Chan and Hua yan traditions, though these claims cannot be accepted uncritically. This leads to an oversimplification expounded by the famous Japanese Zen scholar Daisetz Suzuki, who argues that Hua yan is theoretical and establishes the principle behind Zen that is practical. However, this is too polemic a description of the situation, since Chan and Zen have a long textual and theoretical history, while Hua yan does provide practices of its

own, for instance the meditation on the Four *Dharmadhātus* discussed later in this entry.

Besides the so-called orthodox lineage just discussed, there are also a number of figures who belong to what might be called heterodox lineages in the sense that they follow exegetical lines of reasoning not adopted by the later traditions. These include, as mentioned, Fazang's student, Huiyuan, and the iconoclastic Li Tongxuan.

THE FOUR DHARMADHĀTUS

Perhaps the most fundamental concept in all of Hua yan Buddhist thinking is the synonymy of emptiness and dependent arising. Emptiness (Sanskrit: *śūnyatā*; Chinese: *kong*) is a traditional Buddhist notion that refers to the absence of self-being in all things and events. It does not mean that things do not exist—it means that all things that exist do so in dependence on other things, which is the meaning of dependent arising (Sanskrit: *pratītyasamutpāda*; Chinese: *yinyuan*). Hua yan, consistent with characteristic Chinese attitudes, placed focus on the positive side of this formulation, that even though empty, things actually do exist.

This is perhaps most clearly expressed in the model of the Four *Dharmadhātus* as initially formulated in Dushun's seminal text, *Meditative Approaches to the Hua yan Dharmadhātu*, and subsequently developed further by Chengguan. The term *dharmadhātu* is a way of referring to the realm of all *dharma*s (events). In other words, the *dharmadhātu* is the world in the most comprehensive sense. This model of the world is represented sometimes, especially in the work of Fazang, in terms of the metaphor of Indra's jeweled net. This net consists of many-faceted gems, each of which reflects every other gem, and reflects itself reflected in every other gem.

The formula of the Four *Dharmadhātus* is proposed as a support for meditation practices. Although they are often rendered in such a way as to suggest that there are four separate realms, they more properly represent four types or orders of perspectives on experience. The first is the tacit, uncritical commonsense lower-order perspective, and the others are higher-order or meditative perspectives. The goal seems to be a type of perspectival flexibility, which corrects the obsessive-compulsive tendency to identify with a single perspective by acknowledging the multiplicity of perspectives available and by adopting higher-order perspectives that reconcile the inconsistencies present between lower-order perspectives. This is like standing in a hallway with two people on either end. I can see one or the other, because of my limited perspective, but I cannot see both simultaneously. If

I were to stand above the hallway somehow and look down on it, I might be able to see both at once. Higher-order perspectives similarly circumscribe and sustain perspectives that appear incompatible at the surface level.

The first of these types of perspectives is termed *shi*, often rendered as “phenomenon” or “event.” This is the tacit, ordinary, conventional perspective adopted and identified with by most people most of the time. It takes events at more or less face value—it does not raise questions about metaphysics or ontological or epistemological status. There is virtually an infinite set of possible perspectives at this level. Garma C. C. Chang, in *The Buddhist Teaching of Totality* (1971), offers the example of a glass of water. The water is seen by a chemist as H₂O, or a universal solvent. It is seen by a firefighter as something to extinguish flames. It is seen by a thirsty person as something to drink. It is in fact all these things, potentially, though at any given time it may function in one or another way. The problem with this perspective arises when it is universally applied, even in cases when other perspectives seem to conflict with it. Although admittedly a silly example, if a firefighter were dying of thirst but could only see the water as a means of extinguishing fires, then he might die of thirst before he would think to drink the water. An obstinate application of disjunctive perspectives is counterproductive and causes frustration or suffering, the elimination of which is the goal of Buddhism in general.

The second type of perspective is represented by the word *li*, which translates as “rule” or “underlying or abstract principle.” In that general sense, *li* is what all *shi* have in common. To shift perspective to the *li* is to resolve all distinctions into some commonality. For example, one can either see coffee and tea as separate things, which would be the level of *shi*, or one can see them as all being water, which is the level of *li*. However, in the case of Hua yan metaphysics, the *li* is *śūnyatā* (emptiness). What all things have in common is that they all lack self-causation or causal autonomy. Everything depends on everything else. The Buddhist texts warn, however, not to ontologize emptiness and make it into a thing. It is the nature of things, which is not a thing in itself. So whereas in the first *dharmadhātu* things are seen as distinct things, in the second they are all seen as empty of self-being.

The third *dharmadhātu* is called *lishi wuai* (nonobstruction of *li* and *shi*). From this perspective, the emptiness of things does not interfere with the thingness of things. This would be experience things as in some sense distinguishable while simultaneously experiencing them as indistinguishably empty.

This does not, however, yet constitute full accomplishment. The final *dharmadhātu* is *shishi wuai* (nonobstruction between phenomena and other phenomena). By realizing that the emptiness of things does not interfere with the thingness of things, one is then able to realize that the specific nature of any one thing does not interfere with the specific nature of any other one thing. As Zongmi says in his commentary to Dushun's text, "all distinct phenomenal dharmas interfuse and penetrate in all ways" (Fox 1988, p. 299). In terms of the example used earlier in the description of the first *dharmadhātu*, the potability of the water does not interfere with the fire extinguishing properties of the water, which does not interfere with the solvency of water. All these manifestations are all potential manifestations of the same phenomenon. This is how the Buddha sees the world according to the Hua yan tradition, as omnipotentially present in a world of infinitely fractal possibilities. This is a liberation from the fixation on a single, lower-order perspective.

To put this model using modern concepts, one might look at a baseball as a baseball, intended for a certain use in a certain game according to certain rules. One would not be wrong in doing so, but one can also see the baseball as more basically composed of atoms. One would also not be wrong, of course. When one sees the baseball as a baseball, one sees what makes it different from everything else. When one sees the baseball as atoms, one sees what the baseball has in common with everything else, that is, one overlooks the distinctions between things. At the level of the third *dharmadhātu*, one is able to see that the phenomenal and atomic natures of the object do not interfere with each other. It is both atoms and a baseball. Meanwhile, the fourth level encourages one to see the baseball in either its phenomenal or atomic sense as overlapping with every other ostensible object in the universe. This is not far fetched. Phenomenally, one might point out that a baseball would not exist if there was not a game and a population to play it, and so is not entirely separable from those other events. Atomically, one notes that objects share ions with their environments in such a way as to constitute overlapping. It would not even make sense to suggest that an atom could exist in complete isolation, since in fact the atom is made of parts as well, which are made of parts, possibly ad infinitum, as modern string theorists suggest.

Fazang is particularly famous for a couple of metaphors used to demonstrate this principle of nonobstruction and mutual penetration. He is said to have made a huge impression on the empress Wu with these

demonstrations, attracting much in the way of imperial support for his writing and translation projects. In one case he is said to have had constructed a room with mirrors on all four walls, as well as in the corners, floor, and ceiling. A torch and statue of the Buddha were placed in the center, and the result was reflections within reflections, each mirror reflecting the other mirrors reflecting itself. This suggested to Fazang a way of explaining how everything can simultaneously be the cause and the effect of everything else. As Chang notes in the *The Buddhist Teaching of Totality*, Fazang is said to have exclaimed that "[t]he principle of the simultaneous arising of different realms is so obvious here that no explanation is necessary" (1971, p. 24). Fazang is also known for using a golden statue of a lion to illustrate a similar principle. Although from one point of view the lion has distinguishable hairs and claws and limbs and teeth, from another point of view the lion is entirely and homogeneously gold.

It is worth pointing out that such an omnicausal model conflates the various types of causal relations that Aristotle, for example, distinguishes, such as efficient, material, final, contiguous, and other types of causal relations. By contrast, the purpose of the model is not to distinguish causal subtleties but to stimulate contextual and perspectival flexibility.

In general, the practice of Hua yan can be described as the attempt to deconstruct one's typically logocentric preoccupation with a fixed perspective, by engaging in a series of exercises that cultivate perspectival flexibility. This is seen to liberate one from the oppression of identifying with a single perspective, which leads to conflict and frustration.

There are many possible parallels between Hua yan thought and Western philosophers and philosophies. For instance, Alfred North Whitehead's process philosophy has been compared to Hua yan's emphasis on the actualization of events out of potentiality, an idea that is also present in modern quantum mechanics. Gestalt and other forms of cognitive psychologies share with Hua yan an emphasis on the importance of perspectival flexibility. In particular, contemporary phenomenological approaches have much in common with Hua yan's concern with the phenomenon qua phenomenon, and both share an emphasis on the importance of experience and perspective that renders metaphysical and absolute statements speculative and counterproductive.

MADHYAMAKA

Madhyamaka is one of the two major schools of Mahāyāna Buddhist philosophy (the other being Yogācāra. It traces its origins to the work of the South Indian philosopher Nāgārjuna (c. 150 CE), who first gave systematic philosophical expression to insights articulated in the earliest Mahāyāna sūtras, the *Prajñāpāramitā* literature. Central to those texts was the claim that all things thought to be ultimately real are in fact “empty” or devoid of intrinsic

nature. The Madhyamaka school arose out of efforts to defend this claim and explore its consequences. The Madhyamaka understanding of the concept of emptiness, and the dialectical strategies used to establish its validity, played central roles in the development of Mahāyāna thought in India and subsequently in Tibet and East Asia.

EMPTINESS AS LACK OF INTRINSIC NATURE

When the Mādhyamikas say that all things are empty (*śūnya*), what they mean is that nothing bears an intrinsic nature (*svabhāva*). To understand this claim, one must consider the concept of intrinsic nature as it was developed in the scholastic Abhidharma phase of Buddhist philosophy. It is a basic teaching of Buddhism that suffering is caused by one's ignorance of the truth of nonself: that one does not have a separately existing self and that what one thinks of as an enduring person just consists in a causal series of impermanent, impersonal physical and mental events. Philosophers of the Abhidharma schools sought to buttress this conclusion by arguing that all partite entities (wholes made up of parts) are conceptually constructed and thus not ultimately real. This would enable them to claim that the person is conceptually constructed out of the psychophysical elements making up a causal series and so is not itself objectively real.

The general argument is that a partite thing such as a chariot borrows all its properties from the properties of its parts: There is no fact about a chariot that cannot be explained strictly in terms of facts about its parts and their relations. This is taken to show that positing the chariot as an additional entity is superfluous, something one is inclined to do only because of facts about one's interests and cognitive limitations. Since this holds as well for the person, as a whole made up of the elements in a causal series, it follows that one's view of oneself as an enduring substance reflects a failure to distinguish between a mere useful fiction and what is ultimately or mind-independently real.

This reductionist line of thought in the Abhidharma rests on the assumption that there are entities that are ultimately real. To say that persons and other partite things are not ultimately real because they are conceptually constructed is to assume that there are those ultimately real things out of which partite things are constructed. Now conceptually constructed things were held to borrow their properties from the properties of their parts. So Abhidharma thinkers concluded that ultimately real things must have their natures intrinsically. Only that is ultimately real, they claimed, that “is found

under analysis,” that is conceptually irreducible. The Madhyamaka claim that all things are empty is meant to contest the Abhidharma view that there could be such things. Through a wide variety of arguments the Mādhyamikas seek to demonstrate the absurd consequences that would follow if it were held that there are entities with intrinsic nature.

THE ARGUMENT FROM CAUSATION

One such argument concerns the causal relation. It is a fact of one’s experience that existing things are impermanent, and this would seem to hold for whatever is ultimately real. But it is also a fact of one’s experience that things do not come into or go out of existence in an utterly random way. There seem instead to be patterns of regular succession. So an adequate account of the nature of reality seems to require that ultimately real things be said to arise and cease in accordance with causal laws. At this point the Mādhyamikas raise a simple question: Are cause and effect identical or distinct? Consider the first possibility. Certain Indian philosophers held that the effect is identical with the cause—that causation represents just the manifestation of what already exists in the cause in unmanifest form. But this view is readily dismissed. For it requires that there already exist something with the intrinsic nature of the effect before the effect is produced. And in that case one must wonder why one would set about trying to produce the effect. One might build a fire because one is cold and wants the heat of fire. But if the fire already existed in its cause, the fuel, then its heat should already be present there, so it would be pointless to build a fire.

If, on the contrary, cause and effect were distinct things, two difficulties would follow. First, if these are genuinely distinct things, some account must be given as to why things of the first sort regularly give rise to things of the second sort. Why should fuel give rise to fire and not, say, to cheese? The stock answer to this question is that fuel possesses the causal power to produce fire. But now it must be asked whether this causal power is a third thing that is distinct from both cause and effect or is rather identical with one or the other. If it is distinct from the cause, one may then ask why this sort of cause should be conjoined with just this sort of causal power. This quickly leads to an infinite regress: A second causal power will be required to account for the occurrence of the first, a third for that of the second, and so on. But if the causal power is identical with the cause, then no answer has been given to the original question, and likewise if the causal power is identical with the effect.

The second problem for the view that cause and effect are distinct things is that it is then unclear when the cause produces the effect. To call one thing the cause of another is to say that the first produces the second, so surely there must be some time when this productive activity takes place. There are three possibilities here: when the effect already exists, when the effect does not yet exist, and when the effect is coming into existence. The first is clearly ruled out, since production of something that already exists would be redundant. The second is likewise wrong, for something may be said to be productive only if there is some actually existing product. And with respect to things that are ultimately real, there could be no third time during which they are coming into existence. With respect to partite things like chariots it makes sense to speak of a process of assembly during which the entity is undergoing production. But this is possible only because the chariot is made of parts. Something impartite that bore its nature intrinsically could only be said to be either existent or nonexistent; a third intermediate time is ruled out for such a thing. The upshot of all this is that it appears impossible to account for the causal relations that should obtain among things with intrinsic natures.

THE ARGUMENT FROM THE PROPERTY-BEARER RELATION

A second Madhyamaka argument for emptiness involves examining the relation between an ultimately real thing and its intrinsic nature. Either these are distinct or they are identical. If they are distinct, a number of difficulties follow. First, there is the problem of saying what the entity itself is like apart from its intrinsic nature. Since the notion of a pure propertyless substrate seems incoherent, this problem is likely to prove intractable. But there is also the difficulty that then the entity’s acquiring its nature will depend on causes and conditions. Such dependence seems incompatible with calling its nature intrinsic; it then seems more appropriate to say that the entity borrows its nature from other things.

Suppose then that the entity and its intrinsic nature are identical—that one’s distinction between the thing and its nature merely reflects the concepts one uses. In that case an occurrence of what one calls fire is really just the occurrence of heat (the property of being hot). But then the question arises how fires are to be individuated. Suppose there are two distinct fires of equal intensity. Each fire is just its heat, and the two heats are identical in nature. Ordinarily, one would say that the two occurrences of heat are distinct because each occurs in a distinct particular (the fire whose heat it is). But on the

hypothesis under scrutiny there are no particulars over and above the property of heat; the occurrence of what one judges to be a particular fire just is the occurrence of heat. One might then suppose that each fire is individuated in terms of the discrete space that it occupies. But then the question arises what makes two spaces discrete? Suppose the intrinsic nature of a space is its nonresistance. Since one is now supposing that the existence of a space just is the occurrence of a certain nonresistance, it is not clear what will make two spaces distinct, unless it is their being occupied by distinct entities, such as two fires. But now one has come full circle. So it looks as if the hypothesis that entity and intrinsic nature are identical does not hold up to critical scrutiny either. It appears that no adequate account can be given of how something could have an intrinsic nature.

MADHYAMAKA AS NIHILISM

A host of similar arguments against things with intrinsic nature was developed by Mādhyamika philosophers such as Nāgārjuna, Āryadeva (170–270), Buddhapālita (c. 500), Bhāvaviveka (500–570), and Candrakīrti (c. 600–650). Nāgārjuna's targets were chiefly views held by Ābhīdharmikas, but Āryadeva extended the scope of Mādhyamika dialectics to include the views of non-Buddhist Indian philosophers, a practice that becomes systematic in Bhāvaviveka's *Tarkaḥvālā*. Suppose that these arguments succeed in showing that nothing could bear an intrinsic nature. Suppose also that the Ābhīdharmikas were correct in concluding that only something with an intrinsic nature could be ultimately real. What would then follow? What should one make of the Mādhyamika doctrine of emptiness? Modern scholars have put forward a wide variety of interpretations, but there is also some difference of opinion among classical Indian authors. One modern reading, that of Thomas E. Wood (1994) and David Burton (1999), that is also the common view of the Mādhyamikas' ancient Indian critics is that the doctrine of emptiness is tantamount to metaphysical nihilism, the thesis that reality is ultimately devoid of existing things. The stock characterization of the Mādhyamikas that one finds in the writings of their classical opponents is that the Mādhyamikas believe nothing whatever exists.

Of course, the thesis of metaphysical nihilism is virtually self-refuting: If nothing whatever existed, the thought could not occur that it might be true. Still, attributing this thesis to the Mādhyamikas might not seem unfair. If there is reason to believe that only things with intrinsic nature could be ultimately real, then

demonstrating the incoherence of the concept of a thing with intrinsic nature seems equivalent to showing that ultimately nothing whatever is real. One major difficulty with this interpretation, however, is that it is explicitly argued against by the Mādhyamikas. Thus, Nāgārjuna points out that to understand the thesis that no ultimately real things exist, one must first understand what it would mean for there to be ultimately real things. But an ultimately real thing would have to be something with intrinsic nature. Since the Mādhyamikas claim there can be no such things, they would say one cannot understand the thesis that ultimately nothing exists. So perhaps they should not be interpreted as seeking to establish metaphysical nihilism.

DO MĀDHYAMIKAS AFFIRM CONTRADICTIONS?

Of the remaining interpretations of emptiness found in the modern scholarship, only some find support in the original sources. (Of course, the lack of such support need not detract from the philosophical significance of an interpretation.) For instance, Graham Priest and Jay L. Garfield (2002) claim Nāgārjuna as perhaps the first exponent of dialetheism, the view that there are true contradictions that arise at the limits of thought. As evidence, they cite his assertion that it cannot be ultimately true that all things are empty (*Mādhyamakakārikā* chapter 22, verse 11). The notion of ultimate truth at work here derives from the Abhidharma distinction between two kinds of truth: conventional and ultimate. Only statements concerning ultimately real things can be said to be ultimately true; statements concerning such mere conceptual fictions as chariots and persons can only be conventionally true. For Abhidharma, then, the set of ultimately true statements would give the complete account of all those things with intrinsic natures; it would be a complete description of the ultimate nature of reality.

Now the Mādhyamikas claim to have shown that the only statement that can truly be made about those things that are thought to be ultimately real is that they are empty. But in the verse in question Nāgārjuna says that this cannot be ultimately true. Indeed, he says it is not ultimately true that all things are empty, or that they are nonempty, or both or neither. The reason for this is that emptiness is itself a mere conceptual fiction. So any statement about emptiness could at best be conventionally true. Priest and Garfield take Nāgārjuna to be thereby asserting both that the ultimate truth cannot be characterized and that it can be characterized (namely as being

uncharacterizable). But this is not how Mādhyamika commentators have understood the verse. Instead, they assimilate it to the Buddha's treatment of the so-called indeterminate questions (*avyākṛta*). When, for instance, the Buddha was asked whether the enlightened person survives death, does not survive death, both survives and does not survive, or neither survives nor does not survive death, the Buddha rejected all four possibilities. One can consistently do this, they explain, because all share an implicit presupposition—that there ultimately is such a thing as an enlightened person—and this presupposition should be rejected. By the same token, the commentators say, Nāgārjuna should be understood as rejecting the presupposition that there is such a thing as the ultimate truth. In that case he asserts neither that the ultimate truth is uncharacterizable nor that it can be characterized. He does not hold that a contradiction is true.

MADHYAMAKA AS SKEPTICISM

Other interpreters of the doctrine of emptiness, such as Thomas McEvilley (1982) and Bimal Krishna Matilal (1986), see it as a form of skepticism. This reading is suggested by the Mādhyamika response to objections coming from Indian epistemologists. The thrust of these objections is that since the Mādhyamikas hold all things to be empty, they must hold that all means of knowledge are empty. But in that case it cannot be known that all things are empty, so the Mādhyamika claim is a mere dogmatic assertion. Part of the Mādhyamika response involves calling into question the epistemologist's project of determining which are the means of knowledge. For instance, they argue that a given procedure can be known to be a means of knowledge—a reliable cause of veridical belief—only if one already possesses some means of knowing which beliefs are true. Thus, any attempt to determine which are the means of knowledge either is circular or else leads to an infinite regress.

An argument of this sort might be used to support the skeptic's claim that one can never know which, if any, of one's beliefs amount to knowledge. But this is not how the Mādhyamikas themselves see such arguments. For one thing, the skeptical conclusion requires the additional assumption that one can only know some statement *p* if one knows that one knows *p*—an assumption that neither the Mādhyamikas nor their opponents seem to have held. Second, nowhere do the Mādhyamikas appeal to the sorts of error possibilities that are the skeptic's stock in trade, such as perceptual illusions, hallucinations, dreams, and the like. Indeed, the Mādhyamikas do not deny that, conventionally, certain procedures can

count as means of knowledge. What they deny is just that anything could ultimately be a means of knowledge, that anything could have the intrinsic character of reliably causing veridical beliefs as part of its mind-independent essential nature. The Mādhyamika epistemological stance seems to be that something can be a means of knowledge only through its relations to other things that are themselves equally empty of intrinsic nature. The resulting view may have its affinities with some forms of skepticism (particularly Pyrrhonian skepticism). But its chief concern is not to call into question the possibility of knowledge, but to deflate the pretensions of a certain sort of epistemological realism.

THE MĀDHYAMIKAS AS MYSTICS OR AS QUIETISTS?

Two interpretations of emptiness seem more firmly grounded in the self-understanding of the Mādhyamika tradition. The first sees emptiness as leading to a kind of mystical silence. Mādhyamika arguments are said to demonstrate that no set of concepts can ever adequately represent the world. This realization is said to then usher in a nondiscursive grasping of the nature of reality (perhaps through a kind of intuition that is cultivated in meditation). On this interpretation, emptiness serves to point to an ultimate reality that lies beyond the reach of philosophical rationality. The second of the two, by contrast, sees emptiness not as pointing to an ineffable ultimate, but as indicating that the very idea of an ultimate nature of reality is incoherent. The exercise of philosophical rationality leads not to the silence of the beyond, but back to the conventional. For Mādhyamika dialectic reveals the error in the notion of an ultimate truth that represents how things are independently of all facts about the cognizer. This shows that truth can only be transactional, a matter of what facilitates interactions among creatures like us. The notion of a truth that potentially outstrips all our conceptual resources is revealed to be no more than a useful fiction.

The "mystical silence" reading of emptiness has been championed by T. R. V. Murti (1955) and David Seyfort Rugg (1977) among others. The second reading is commonly called a quietist interpretation, since it grows out of the attempt by Frederick J. Streng (1967) to read elements of the later Ludwig Josef Johann Wittgenstein into Nāgārjuna. But as developed by Tom J. F. Tillemans (2002), it has clear affinities with both antirealist and minimalist conceptions of truth. Both readings may be seen as seeking to explicate the claim that insight into emptiness results in a kind of nondual awareness.

Mahāyāna Buddhist texts commonly claim that final liberation from suffering requires a kind of seeing that transcends all problematic dualities. On the mystical silence interpretation it is the dualism fostered by conceptualization that is to be overcome, for without concepts one cannot make such invidious distinctions as that between cognizing subject and object. On the quietist reading it is the dualism of ultimate and conventional truth that is erased through knowledge of emptiness. Presumably, this duality is problematic because the notion of ultimate truth as correspondence to mind-independent reality fosters a subtle form of belief in a self, namely that expressed through attachment to metaphysical theories.

Each reading is not without its own difficulties. For the mystical silence view, the chief problem is to explain how Madhyamaka then differs from other views that posit an ineffable ultimate, such as the absolute monisms of Advaita Vedānta and Parmenides of Elea. For the quietist there is the difficulty of explaining how there can be truth without there being such a thing as how the world is anyway. This problem is sometimes addressed by claiming that what emptiness really shows is just that no entity has a nature that is independent of its relations to other things. But to the extent that this addresses the problem of grounding truth in mind-independent reality, it contravenes the quietist claim to be showing a way out of the trap of metaphysical theories.

THE SVĀTANTRIKA-PRĀSAṄGIKA DISTINCTION

Modern studies of the Mādhyamikas have profited enormously from contact with the Tibetan tradition, a tradition for which Mādhyamika thought continues to play a crucial role. But there are cases in which reliance on Tibetan doxographical categories has led to distortion of the Indian Mādhyamika sources. A case in point is the alleged distinction between two schools of Madhyamaka: Svātantrika and Prāsaṅgika. This distinction was invented by Tibetan doxographers, and it is a matter of some dispute to what extent it reflects substantive differences in the views of the Indian thinkers covered by the classification. It is in any event clear that Indian Mādhyamikas did not see themselves as falling into two camps to which these labels could be applied.

Those who accept the distinction identify a dispute between Bhāvaviveka and Candrakīrti as its point of origin. The dispute concerns the proper methodology for a Mādhyamika. The arguments of Bhāvaviveka's Mādhyamika predecessors were usually expressed in the *reductio ad absurdum* (*prasaṅga*) style: The hypothesis to

be refuted (e.g., that something with intrinsic nature could be an effect) is considered and then shown to lead to some absurd result (e.g., that its intrinsic nature is actually extrinsic). Employing the methods of the Buddhist logician Dinnāga, Bhāvaviveka sought to convert such *reductios* into independent arguments (*svatantra anumāna*). Thus, one would have:

It is not the case that ultimately an entity arises from distinct causes and conditions. Because of depending on them for its nature.

Whatever depends on other things for its nature is not ultimately real, like the chariot. Candrakīrti disagrees, claiming that the Mādhyamikas may only use *reductios*. But since the two types of argument turn out to be formally equivalent once the *reductio* has been fully spelled out, it may not be clear what the dispute is actually about.

The difference Candrakīrti sees between them is this: In giving a *reductio* one need not assert anything to be the case oneself; the proponent merely shows the opponent the inconsistency in his or her view, thereby impelling the opponent to withdraw assent from his or her thesis. In the case of an independent argument, on the contrary, both the proponent and opponent must agree about such things as the subject (in this case, an entity), the pervasion (that what is dependently originated is not ultimately real), and the example (the chariot). But the Mādhyamika proponent holds that entities can only exist conventionally, while the opponent thinks some entities are ultimately real, so the two sides do not agree about the subject. And likewise for the other elements of the argument that require consensus. From the perspective of the Mādhyamikas, the opponent is simply, hopelessly wrong about everything. So there can be no common framework for resolving their disagreement. Instead, the Mādhyamikas should just give their opponents the rope with which to hang themselves.

SYNCRETISM IN MADHYAMAKA

One may wonder if the opponent will be so obliging toward a proponent who seems to speak a different (and perhaps unintelligible) language. But there may be a deeper point here. Those Tibetan commentators such as Tsong-kha-pa (1357–1419) who align themselves with the Prāsaṅgika allege that Svātantrikas have not fully realized emptiness, since they continue to posit intrinsic natures, albeit at just the conventional level. And it is true that those Mādhyamikas who are identified as Svātantrikas exhibit a tendency toward syncretism, seeking to incorporate the views of overtly metaphysical Buddhist schools within an overall Mādhyamika framework.

This tendency is especially clear in Śāntarakṣita (eighth century), who embraces Dharmakīrti's formulation of the Yogācāra school's subjective idealist ontology and epistemology. But it can already be seen in Bhāvaviveka, who champions the Sautrāntika school's realism about physical objects and its associated representationalist theory of sense perception. In neither case is the other school's view identified as anything more than the best way of representing conventional truth. As Mādhyamikas, Śāntarakṣita and Bhāvaviveka remain committed to the position that the only ultimate truth is that there is no ultimate truth (i.e., that all things, including emptiness, are empty). Still, they do take a position on the question whether external objects exist conventionally.

Candrakīrti does as well. He sides with Bhāvaviveka in rejecting the idealist view. But his reasons are different. Where Bhāvaviveka tries to answer Yogācāra arguments against the existence of physical objects, Candrakīrti simply dismisses the arguments. For him such arguments can only show that physical objects are ultimately empty—something a Mādhyamika already knows. But by the same token mental states (which the idealist thinks are real) are equally empty. So the availability of philosophical arguments against the conventional belief in external objects cannot show that they are not conventionally real. While Bhāvaviveka thinks the use of philosophical rationality can lead to improvements in one's conventional account of the world, Candrakīrti thinks it can only lead to the ultimate truth of emptiness. Conventional truth neither needs nor can it sustain either refinement or defense at the hands of philosophers. It is just simply that which is given through the everyday practices of ordinary people.

Given this difference in attitude, one can see why Svātantrikas might be described by their critics as positing conventionally real intrinsic natures. It is, after all, philosophical analysis that gives rise to the demand for things with intrinsic nature. So if philosophical rationality is allowed to play a role in shaping one's conventional worldview, the resulting theory will be committed to there being such things, the things at which analysis stops. And to Candrakīrti, Bhāvaviveka's demand that the Mādhyamikas give independent arguments and not mere *reductios* looks like a requirement that the Mādhyamikas construct a philosophically defensible version of the conventional truth. This will inevitably lead in the direction of syncretism, and with it the danger that the Mādhyamikas will become ensnared in metaphysical theories. The Prāsaṅgika side in this dispute is not without its dangers as well though. For on its account, conventional

truth does not allow of progressive improvement, it can only be utterly overthrown. The result would seem to be a strong form of relativism about conventional truth. And an opponent could always use this to turn back the Prāsaṅgika's *reductio* arguments, in effect saying to the Mādhyamikas, "We simply disagree about whether there is an inconsistency in my position, and in such matters there is no right and wrong." What this dispute brings out, then, is a tension that seems inherent in the concept of truth, a tension that is also reflected in current debates between realists and antirealists.

Indian Madhyamaka came to an end in the late twelfth century, when all Buddhist philosophical activity ceased in India following the Turkish invasion. Madhyamaka has continued to play a prominent role in Tibetan Buddhism to this day. It also enjoyed some popularity among Chinese Buddhist philosophers, playing an important role in the development of the Huayan school. Perhaps a case might even be made for its having had a profound impact on Chan Buddhism. Chan formally eschews the study of precisely those sorts of doctrinal texts that form the core of Mādhyamika practice. But it does make extensive use of paradox in some of the methods it has devised for helping the adept attain enlightenment. Analysis of the structural features of those paradoxes and their uses might reveal more than merely superficial resemblances with the dialectical strategies of Madhyamaka.

YOGĀCĀRA

The origins of Yogācāra Buddhism—one of the two mainstream schools of Indian Mahāyāna Buddhism (the other being Madhyamaka)—are obscure, but tradition credits its founding to two half-brothers, Asaṅga and Vasubandhu (c. fourth century). Many of Yogācāra’s distinctive terms and models, such as eight consciousnesses, three self-natures, and *vijñapti-mātra* (explained later in this entry), had already appeared in certain Mahāyāna scriptures such as the *Saṅghinirmocana Sūtra* (Sūtra elucidating the hidden connections), but the expansion of those ideas in the prolific writings of Asaṅga and Vasubandhu gave the school its foundation. Yogācāra attempted to absorb the full range of teachings and practices that had arisen over the centuries since the time of the Buddha—from the elaborate scholastic schemas of the Abhidharma schools to the reformulation of Buddhist doctrine in terms of emptiness (*śūnyatā*) posed by early Mahāyāna literature—to fashion a detailed, systematic, coherent, step-by-step path to unsurpassable complete awakening (*anuttarā-samyak-saṃbodhi*) and nirvāṇa.

Since Buddhism identified the root problem as ignorance, Yogācāra devised methods for uncovering and correcting the cognitive errors inherent in the way the mind works. Yogācāra’s sustained attention to cognitive issues such as consciousness, perception, psycholinguistic conditioning, and epistemology, coupled with claims such as “external objects do not exist,” has led some to misinterpret Yogācāra as a form of metaphysical idealism. For Yogācāra, however, consciousness is not an eternal sub-

stance or immutable substrate. Rather, individual consciousnesses arise and cease each moment because of everchanging causes and conditions, these discrete moments of consciousness linked in sequential causal chains, giving the illusion of a continuous self-identity or selfhood. Overcoming ignorance meant first eliminating this false view of self and subsequently seeing things as they truly are. Yogācāra developed perhaps the most sophisticated examination and description in all of Buddhism of how the mind works—in psychological, epistemological, logical, emotional, cognitive, meditative, developmental, and soteric modes.

HISTORICAL OVERVIEW

Though the historical details of the lives of the early Yogācāras have been obscured by later legends—some so unreliable that a few scholars swayed by miscues theorized that tradition had conflated two different Vasubandhus who lived at different times, a theory no longer accepted—enough of their prolific writings has survived (though not always in the original Sanskrit) for us to appreciate the depth and complexity of their thinking. Legend holds that Asaṅga, after years of fruitless meditation, was about to give up when the future Buddha, Maitreya, appeared to him, instructing him in hitherto unknown scriptures. Some of his writings are ascribed to Maitreya, others to Asaṅga himself (the Chinese and Tibetan traditions differ on which texts to ascribe to which). Most important among his works are the encyclopedic *Yogācārabhūmi* (Stages of yoga practice), *Mahāyānasamgraha* (Compendium on Mahāyāna), *Abhidharmasamuccaya* (Abhidharma compilation), and *Madhyānta-vibhāga* (Differentiating the middle from the extremes). Vasubandhu at first studied Vaibhāṣika Buddhism at its headquarters in Kashmir, composing a detailed summary of its doctrines titled *Abhidharmakośa* (Treasury of Abhidharma). Under Asaṅga's influence, Vasubandhu became a Yogācāra, adding a commentary to his *Kośa* that critiqued the Vaibhāṣika positions, incorporating ideas and phraseology found in Asaṅga's works. Along with many commentaries on Mahāyāna scriptures (most no longer extant), his most important works are his commentary on *Madhyānta-vibhāga*, *Triṃśikā* (Thirty verses), *Viṃśatikā* (Twenty verses), and four of the earliest Buddhist treatises on logic.

Yogācāra subsequently split into two wings: (1) an Abhidharmic wing primarily engaged in commentary writing and doctrinal exposition, its main figures being Sthiramati (sixth century), Dharmapāla (sixth century), and Xuanzang (seventh century); and (2) an

epistemological-logic wing that for centuries became the vanguard of Indian epistemology and logic, its main figures including Dignāga (fifth century), Dharmakīrti (seventh century), and Ratnakīrti (c. eleventh century). By the seventh century Yogācāra dominated the leading Indian Buddhist centers at Nālandā and Vālabhi. Texts like the *Laṅkāvatāra Sūtra* blended Yogācāra with *tathāgatagarbha* (Buddhahood-potentiality) thought.

Translators introduced Yogācāra writings to China in the early fifth century, where it dominated for the following two centuries. It became influential in Korea and Japan in the seventh century, and though it eventually was overshadowed by other forms of East Asian Buddhism that themselves were offshoots of Yogācāra-*tathāgatagarbha* hybrids, periodically East Asians have renewed interest in Yogācāra. Yogācāra was also influential during the formative years of Tibetan Buddhism, and has remained part of the Tibetan Buddhist curriculum until the present.

VIJÑĀPTI-MĀTRA

The core of Yogācāra doctrine is expressed by the term *vijñapti-mātra*, usually translated “consciousness-only” or “representation-only.” Despite repeated strenuous denials in Yogācāra texts that *vijñapti-mātra* means that only consciousness exists or that consciousness alone is real, over the centuries many non-Yogācāras have interpreted it that way. Since consciousness (*vijñāna*) is the domain in which all contemplation, examination, theorization, and knowledge about reality occurs, its facticity is undeniable, though, for Yogācāra, consciousness is neither ultimate reality nor the solution to life's problems. Rather, consciousness itself is the problem. The grammatically causative term *vijñapti* means “what makes known,” signifying that consciousness actively constructs the appearances it apprehends and appropriates. Since to appear within a perception or cognition means to appear within an act of consciousness, we are usually not directly aware of anything outside of consciousness. Whatever one is aware of or thinks about necessarily occurs to one only within consciousness. *Vijñapti-mātra* means that we confuse our imaginary projections for the world itself. Since this confusion pervades ordinary mental operations, it ends only when those operations cease.

Yogācāra explains that each individual is a distinct consciousness stream or mental continuum (*citta-santāna*) that, like a river, changes moment by moment in accord with causes and conditions, giving the illusion of a continuity of identity despite the perpetual reconfiguring of the water. It has no fixed, invariant identity or self.

The stream flows from moment to moment and from life to life. These distinct consciousness streams can affect and communicate with other streams, learning from and teaching each other, and mutually influencing each other. Hence, Yogācāra rejects both solipsism and the idea of an overarching universal mind. If, as solipsists claim, each mind is closed off from others, how could Buddhas and others teach anyone anything? If we cannot learn from others, then Buddhism itself becomes superfluous and untenable. If everything shares a single mind, then that mind would have to be either deluded or enlightened. If deluded, then enlightenment for individuals would be impossible; if enlightened, then either unenlightened individuals should be impossible, or else they are already enlightened just as they are, which again would render individual practice and Buddhism meaningless.

Vijñapti-mātra is not the denial of anything real outside an individual mind. Even *rūpa* (sensorial materiality) is accepted, since physicality is known through the senses and cognition; sensations should not be confused, however, with abstract concepts or theories about materiality. Sensation is real (Asaṅga calls the five senses pure); conceptualization is not real in the same way, especially when it imports notions of selfhood or substantialism, or posits appropriational entities. That would be the sort of error the term *vijñapti-mātra* is designed to caution against.

Everything we know, conceive, imagine, or are aware of, we know through cognition, including the notion that entities might exist independent of our cognition. Cognitive objects appear within acts consciousness; Yogācāra never denies that. By definition, they cannot appear elsewhere. What Yogācāra denies in the term *external object* is the concept of externality, not the object itself. Although the mind does not create the physical world, it generates the interpretative categories through which we know, classify, and interact with the physical world, and it does this so seamlessly that we mistake our interpretations for the world itself. Those interpretations—conditioned conventionalisms expressed as desires, preferences, and anxieties—become obstructions (*āvaraṇa*) that prevent us from seeing what is actually the case. In simple terms, we are blinded by our own self-interests, our own prejudices, our desires. We think like others because we have undergone similar conditioning and reinforce that conditioning by congregating with those who are like-minded. Such consensus is bred from tautology, not universality.

Unenlightened cognition is an appropriative act. Yogācāra texts do not speak about subjects and objects; instead, perception is analyzed in terms of sentient beings and cognitive fields, or, more often, graspers (*grāhaka*)

and what is grasped (*grāhya*). The Buddhist notion of karma is intimately connected to the notion of appropriation (*upādāna*). As explained in the earliest Buddhist texts, suffering and ignorance are produced by karma. Karma is defined in Buddhism as any intentional activity of body, speech, or mind. Intention is the crucial factor, and, since intention is a cognitive condition, whatever is noncognitive must be also nonkarmic and nonintentional. Thus, by definition, whatever is noncognitive can have no karmic implications or consequences. Intention means to direct one's attention toward some thing or purpose, to desire something. Physically, linguistically, or mentally, we try to "get it."

Put another way, only cognitive acts can have karmic repercussions. Cognitive acts include meaningful bodily gestures that communicate intentions (such gestures are also called *vijñapti*). Thus, to overcome ignorance and suffering by eliminating karmic conditioning, Buddhists need only focus on what occurs within the domain of cognitive conditions (*citta-gocara*).

Categories such as external object and materiality (*rūpa*) are cognitive constructions. *Materiality* is a word for the colors, textures, sounds, and so on that we cognize in acts of perception, and it is only to the extent that they are perceptually apprehended and ideologically grasped, thereby becoming objects of attachment, that they have karmic significance. Materialism is not the problem. There is nothing intrinsically good or bad about gold, for example; rather, our ideas about gold's value and uses, which we project and then act upon, lead to good or bad consequences. The incessant propensity (*anuśaya*) to appropriate what consciousness projects is the problem. These projections are not just things, but moral qualities, status, ideals, religious and national doctrines and identities, the holding of opinions, whatever we can make our own, or make ourselves to be. For Buddhism, attachment to ideas and theories is much deeper and more problematic than attachment to physical things, since the latter is rooted in and merely an expression of the former.

A deceptive trick is built into the way consciousness operates at every moment. Consciousness constructs a cognitive object in such a way that it disowns its own creation, pretending the object is "out there," to render that object capable of being appropriated. Even while what we cognize is occurring within our act of cognition, we cognize it as if it were external to our consciousness. This is called *abhūta-parikalpa*, imagining something exists in a locus in which it is absent. Realizing *vijñapti-mātra* means exposing this trick at play in every act of consciousness, catching it in the act, as it were, and thereby

eliminating it. Consciousness engages in this deceptive game of projection, dissociation, and appropriation because there is no self. The most deep-seated erroneous view to which sentient beings cling, according to Buddhism, is *ātmadr̥ṣṭi*, the view that a permanent, eternal, immutable, independent self exists. No such self exists, and deep down we know that. This makes us anxious, since it entails that no self or identity endures forever. To alleviate that anxiety, we attempt to construct a self, to fill the anxious void, to do or acquire something enduring. Projecting objects and ideas that one can appropriate and cling to is the way consciousness contributes to this project. If I own things (e.g., ideas, theories, identities, and material objects), then “I am.” If there are eternal or universal objects that I can possess, then I, too, must be eternal or universal. To undermine this erroneous appropriative grasping, Yogācāra texts say: Negate the object, and the self is also negated (e.g., *Madhyānta-vibhāga*, 1:4, 8).

Intentional acts also have moral motives and consequences. Since effects are shaped by their causes, an act with a wholesome intent would tend to yield wholesome fruits, while unwholesome intentions produce unwholesome effects.

THREE NATURES

Yogācāra devised a model of three self-natures (*trīsvabhāva*) to explain *vijñapti-mātra* more concisely. The pervasive mental constructions that obstruct our view of what truly is the case are called *parikalpita* (imaginative construction). The actual webs of causes and conditions at play are called *paratantra* (dependent on other [causes]). Other-dependence is so-called to emphasize that no thing exists independently, self-caused, eternal, invariant; everything arises dependent on causes and conditions other than itself, in the absence of which it ceases to be. Ordinarily, *paratantra* is infested with *parikalpita*. *Pariniṣpanna* (consummation) is the removal of *parikalpita* from *paratantra*, leaving only purified *paratantra*.

Since the notion of self-nature is itself a *parikalpita* idea that presumes selfhood, it, too, must be eliminated. Thus, the three self-natures are actually three nonself-natures (*tri-niḥsvabhāva*). *Parikalpita* is devoid of self-nature since it is unreal by definition. *Paratantra* lacks self-nature, since other-dependence precludes self-nature. *Pariniṣpanna*—the Yogācāra counterpart to the Madhyamaka notion of *śūnyatā* (emptiness), which signifies the lack of self-nature in everything—is defined as the absence of self-nature. Thus, the three self-natures are ultimately understood as three nonself-natures.

EIGHT CONSCIOUSNESSES

According to Buddhism, consciousness arises as a by-product of the contact of a sense organ with its corresponding sphere of sense objects. The eye contacting visibles (e.g., colors and shapes) produces visual consciousness; likewise for the remaining four senses (hearing, smell, taste, and touch). The mental organ, *manas*, operates similarly. Coming into contact with the sphere of mental objects (*mano-dhātu*), mental consciousness (*mano-vijñāna*) arises. Hence, there are six sense organs and six corresponding sense realms, which, combined with the six types of resultant consciousnesses, makes eighteen factors altogether. Yogācāra accepted these eighteen factors but found them inadequate to explain several issues that had become important for Buddhists, including the sense of selfhood, appropriative propensities, continuity of experience, and how projection worked. To address these issues, Yogācāra expanded the mental level, resulting in eight rather than six types of consciousness. *Mano-vijñāna* became the sixth sense organ, a kind of empirical consciousness that discerns mental objects as well as the activities of the five senses; *manas* became the seventh consciousness, responsible for appropriating experience as “mine” and thus infesting experience with a sense of selfhood (thus also called *kliṣṭa-manas*, “defiled mind”). The eighth consciousness, *ālaya-vijñāna*, was a novel innovation.

Yogācāra used a seed metaphor to describe the process of karmic conditioning. Experience engenders a seed that is planted out of sight (unconsciously retained in the *ālaya-vijñāna*), where it remains latent until catalytic conditions bring it to fruition (karmic result, *vipāka*), engendering new seeds of the same type. This was a powerful metaphor in agrarian societies. As a warehouse (*ālaya*) to these seeds, the *ālaya-vijñāna* was called the all-seeds consciousness (*sarva-bījaka-vijñāna*). Since it was the conduit and repository of their fruitions, it was also called *vipāka-vijñāna* (karmic requital consciousness). Since the *ālaya-vijñāna* always operates, even when the other seven consciousnesses temporarily cease (e.g., in deep sleep), it was also called foundational consciousness (*mūla-vijñāna*). Although it stores karmic seeds and engenders their projection, the *ālaya-vijñāna* is a karmically neutral mechanical process (*anivṛta*, *avyākṛta*). *Manas* appropriates the activities of the other consciousnesses, thinking they are “my” experience, and appropriates the *ālaya-vijñāna* as a “self.”

Karmic continuity ceases by overturning the basis (*āśraya-parāvṛtti*), in which the *ālaya-vijñāna* and the other consciousnesses cease to function. The conscious-

nesses (*viñāna*) lose their discriminative (*vi-*, compare the English prefix *dis-*) projective propensities and become direct cognitions (*jñāna*). *Ālaya-viñāna* becomes the “great mirror cognition” (*mahādarśa-jñāna*), no longer appropriatively storing or engendering new seeds; instead, like a mirror, it reflects everything impartially without attachment. *Manas* loses its self-prejudicial nature and becomes the equalizing immediate cognition (*samatājñāna*), equalizing self and other. *Mano-viñāna*, which discriminates cognitive objects, becomes immediate cognitive mastery (*pratyavekṣamā-jñāna*), and properly discerns the particular and general characteristics of things. The five sense consciousnesses, now unhindered by the mental obstructions of the sixth and seventh consciousness, become immediate cognitions that accomplish what must be done (*kṛtyānuṣṭhāna-jñāna*), thereby engaging the world effectively. Yogācāra texts differ on which overturning occurs at which stage of practice, but they agree that full enlightenment entails accomplishing all of them.

ASAṄGA ON LANGUAGE AND NONLINGUISTIC THINGS

In his texts—notably the *Madhyānta-vibhāga* and the *tattvārtha* ([relation of] referents and real things) chapter of the *Yogācārabhūmi*—Asaṅga challenges the Madhyamaka claim that emptiness (*śūnyatā*) is the ultimate and final position, the true Middle Way, not by denying the importance and validity of emptiness, but by taking the analysis one extra step. For Asaṅga, emptiness is a tool for eliminating false views, especially the false view of selfhood attributed to beings or things. But once these views are emptied, something remains, namely reality understood as emptied of false conceptualizations.

A quick summary of the *tattvārtha* chapter of Asaṅga’s *Yogācārabhūmi* may illustrate how he refashioned rival teachings, in this case redefining emptiness (*śūnyatā*) and the Middle Way, while providing a useful summary of his philosophy. For Madhyamaka the Middle Way (*madhyamā-pratīpad*, from which Madhyamaka derives its name) entails that all things are empty (*śūnya*)—meaning they are devoid of self-essence or own-being (*svabhāva*)—because they are dependently arisen from causes and conditions that are themselves empty. Thus, existent things are conventionally real but ultimately empty.

Asaṅga responds by describing four types of people, each experiencing a different phenomenological sphere of reals (*tattva*) and conceptual-linguistic referents (*artha*): (1) ordinary people, (2) philosophers, (3)

Hīnayāna adepts, and (4) Mahāyāna adepts, the latter denoting accomplished Bodhisattvas and Buddhas. The first are naive realists, immersed in a cognitive field of compulsive presuppositions (*nīścītādhimukti-gocara*), who accept things as established by convention. What appears to be real to an ordinary person has been conceptually and linguistically constructed from one’s own discriminative imaginings (*vikalpa*) and remains unquestioned. Philosophers apply rational epistemological methods to logically investigate things and accept as real what has been logically proven by an articulate, discursive person. Hīnayāna adepts who have eliminated the affective obstructions (*kleśāvaraṇa*) realize there is no real referent corresponding to the notion self. They see a person as the five aggregates only (*skandha-mātra*; the five are form, hedonic tone, linguistic conceptualizing, embodied karmic conditioning, and consciousness), conditionally arisen, devoid of an imagined self.

By seeing that not only people, but all things lack selfhood, Mahāyāna adepts eliminate all obstructions to knowable realities (*jñeyāvaraṇa*). Asaṅga then enters a detailed discussion on the relation between the linguistic ideational sphere (nominal reality, *prajñapti*) and its cognitive basis (nonarticulable, nonconceptual things, *vastu*), providing numerous reasons for why they are not reducible to each other, nor entirely separable from each other. For Asaṅga emptiness signifies cleansing cognition of erroneous conditioning and views, so that reality is cognized nonerroneously. Emptiness is not a final state, but a purificatory, antidotal process that eliminates erroneous conceptualizations; once they are eliminated what remains is reality. Since this remainder is nonconceptual and therefore nonlinguistic, it cannot be adequately rendered in words without re-reducing it to the conceptual sphere.

Put simply, to perceive something blue is nonlinguistic (and hence indescribable to a blind person), though one can conceive of it as “something blue.” The concept *blue* is neither the same nor different from the perception. Without *vastus*, referential articulations (*abhilāpya*) would have no basis; without such articulations, the nature of *vastus* could not be defined or intellectually understood. To think that *vastus* are merely nominal realities is more pernicious than believing in self, Asaṅga argues, since believing in self is to be mistaken about only one type of knowable, whereas to reject all *vastus* is to be mistaken about everything. Not holding the extreme views that (1) nonexistent things (like self) exist or (2) that all cognizables are nonexistent is, for Asaṅga, the true

Middle Way. Neither *prajñapti* nor *vastu* is rejected completely or accepted naively.

In his *Madhyānta-vibhāga*, implicitly deploying the theory of three natures to explain Buddhist practice, Asaṅga illustrates how emptiness and cultivating positive insight (*pariṇiṣpanna*) act as an antidote (*pratipakṣa*) to the pervasive false mental constructions (*parikalpita*) one projects as lived experience, resulting in reality being experienced just as it is (purified *paratantra*). In the *Mahāyānasamgraha* Asaṅga asserts that bondage and liberation cannot be explained coherently without reference to the *ālaya-vijñāna*, since it conveys the seeds and habits (*vāsanā*) that make bondage and liberation possible. Even brief contact with true Buddhist teachings (*saddharma*) may instill a propensity (*śruta-vāsanā*), outside one's conscious awareness, toward enlightenment and Buddhahood. Asaṅga claims this propensity, called *mano-jalpa* (mental murmuring), is utterly different from and irreducible to the *ālaya-vijñāna*; it gradually destroys the *ālaya-vijñāna* from within, like a germ infecting a host. Eliminating the *ālaya-vijñāna* results in Buddhahood. To label Asaṅga an idealist would be a gross mischaracterization.

VASUBANDHU'S TWENTY VERSES

In the *Viṃśatikā* (Twenty verses) Vasubandhu, following Asaṅga's lead, refutes the realism of naive and philosophical realists. The realists assert that the objects we perceive exist outside of consciousness, which is the reason that these objects remain stable through (1) time and (2) space; (3) different people can have differing perceptions of a thing and yet reach a consensus about it; and (4) the objective world operates by determinate causal principles, rather than imaginary, ineffective fantasies.

Vasubandhu addresses each of these four claims with numerous counterarguments, including an analogy to dreams. In dreams seemingly external objects appear as if in time and space, even though no actual external object is present to cause them, thus proving that while consciousness is a necessary and sufficient condition for objects to appear in perception, the presence of actual external objects is neither necessary nor sufficient. For Vasubandhu, as for Asaṅga, the perceptions of ordinary people are like a dream, a mental projection based on conditioned predispositions. That different beings have differing perceptions of the purportedly same thing proves this. Updating Vasubandhu's example, that flies and humans perceive and react to excrement in radically different ways, demonstrates that what each perceives is a projection based on its own conditioning, or its own

mental seeds (*bījās*) acquired from past experiences (perhaps in past lives). Moreover, karma (action) is collective, in that we gravitate toward beings or types who perceive as we do, erroneously justifying the seeming universality of our group perspective.

Thus, the varying perception argument supports rather than undermines the Yogācāra position. Note that the dream example and the varying perception example not only neglect to disprove that something outside the activities of consciousness may play a role in its perceptions; on the contrary, both require that there be such a thing for the examples to make sense at all. The observation that dreams imitate waking perceptions minus the presence of actual objects requires that we appreciate the contrast; the object in contention between flies and humans is obviously not reducible to the perceptual projections of either.

Vasubandhu is not arguing for either a subjectivism or a metaphysical relativity, but he is pointing out that we mistake our imaginings for reality, obstructing our view of things as they are. Projective imaginings blocking our vision can have powerful karmic consequences, as Vasubandhu shows in his response to the realist's claim about causal efficacy. He uses the example of a wet dream. Though the erotic cognitive object is a mental construction, without an actual external or physical corresponding object present, the imaginative act causes actual seminal emission, a physical effect produced outside the dream and recognized as such on awakening. The monastic vow of celibacy treats wet dreams as an infraction of the monastic code. Even though dreams are only fantasies, they have real karmic consequences. The deluded mind produces real effects that can only be fully known after awakening, once delusion has ceased. Awakening means enlightenment—the term *bodhi* (awakening) can also mean “enlightenment”—the cessation of the deluded mind. Even though we act in a collective deluded world of our own construction, our actions have real causal consequences.

The realist objects that objects perceived while awake seem stable in time and space, whereas objects in dreams do not. Vasubandhu replies that objects and events seem less clear and consistent in dreams because one's mind is overcome by sleepiness so one is not “thinking clearly.” Furthermore, one does not know that the objects in a dream are only dream-objects until one awakens. Vasubandhu's reply to the question of whether we can know other minds extends the dream analogy: Even our own minds are opaque to us since our mental capacities are dim and sleepy. However, one who is awakened (the

literal meaning of *Buddha*) can know other minds more clearly than we know our own. Not only can we know other minds (if we awaken), but we constantly influence each other for better and for worse (though we may not notice that within our individual dreams). Thus, karma is intersubjective. Moreover, since the more awake one is the more causally effective one's mind becomes, sages and buddhas can exert powerful effects on the world, including devastating destruction, and even life and death.

THE FIVE STAGES

Precise details of the stages in which the mental stream is purified of pollutants (*āsrava*), filtering out karmically unwholesome seeds while nourishing and fortifying the wholesome ones, vary across different Yogācāra texts. A five-stage model is found in several foundational texts and has become the standard account:

(1) During the provisioning stage (*saṃbhārāvasthā*) one gathers and stocks up on “provisions” for the journey. The provisions consist of orienting oneself toward the pursuit of the path and developing the proper character, attitude, and resolve to accomplish it. This stage commences at the moment the aspiration for enlightenment (*bodhicitta*) arises.

(2) Next is the experimental stage (*prayogāvasthā*), in which one converts Buddhist theory into praxis. *Prayoga* also means “intensifying effort,” or applying oneself with increasing vigilance. While increasing meditative abilities, one begins to suppress the grasper-grasped relation and commences on a careful and detailed study of the relation between things, language, and cognition.

(3) The next stage is deepening understanding (*prativēdhāvasthā*), also called the Path of Corrective Vision (*darśana-mārga*). One works on realizing the emptiness of self and *dharmas* while reducing the obstructions (*kleśāvaraṇa* and *jñeyāvaraṇa*). This stage ends when one acquires some insight into non-conceptual cognition (*nirvikalpa-jñāna*), that is, cognition devoid of interpretive or imaginative overlay.

(4) In the Path of Cultivation (*bhāvanā-mārga*), non-conceptual cognition deepens. The grasper-grasped relation is utterly eliminated, as are all cognitive obstructions. This path culminates in the full Overturning of the Basis, or enlightenment.

(5) In the final stage (*niṣṭhāvasthā*) one abides in unsurpassable complete awakening and engages the world through the four immediate cognitions (mir-

ror cognition and so on). All of one's activities and cognitions are postenlightenment (*prṣṭhalabdha*), and one compassionately endeavors to alleviate the suffering and ignorance of others.

BUDDHIST EPISTEMOLOGY

For Buddhist thinkers philosophy should aid one in eliminating suffering and obtaining happiness. They maintain that to achieve those ends, one must eliminate ignorance (*avidyā*), a fundamental mental flaw that is suffering's basic cause. Although variously construed ignorance inevitably involves the mistaken belief that a fixed, unchanging personal essence, or *ātman*, lies at the core of each person's identity. Hence, to eliminate ignorance one must eradicate that belief, and to do so Buddhist philosophers stress the importance of seeing things as they are (*yathābhūta darśana*), a corrective cognitive state through which one knows that persons necessarily lack essence. The need to give an account of such a state leads to a concern with epistemology in Buddhist thought from its earliest period (500 BCE–100 CE) in South Asia.

Although early Buddhism evinces a nascent epistemology, precise and sophisticated accounts of knowledge do not begin until adequate tools are developed by South Asian philosophers, primarily non-Buddhists, starting no later than the first century CE. The Buddhist theorist Vasubandhu initially appropriates these tools, but Dignāga first employs them in a manner that reflects all the issues addressed by later Buddhist epistemologists. Finally, Dharmakīrti modifies and expands Dignāga's work in such a manner that all subsequent Buddhist epistemologists in India and Tibet cast their work as interpretations of Dharmakīrti's philosophy. Hence, for the purposes of this entry, *Buddhist epistemology* refers to the thought of Dharmakīrti and his subsequent interpreters in both India and Tibet, where epistemological works continue to be composed. In their voluminous writings Buddhist epistemologists express a variety of competing views developed in distinct historical contexts. Nevertheless, they largely agree on the following central theories and principles.

MODEL OF KNOWING

Buddhist epistemologists examine knowledge in terms of a knowledge-event or act of knowing (*pramiti*). Their account rests on the claim that the mind consists of a series of causally related, instantaneous mental moments, each of which is ontologically irreducible. Thus, as a mental event the act of knowing is ontologically identical to a mental moment. The act of knowing occurs when the mind comes into a direct or indirect causal relation with an object such that, with other conditions in place, the next mental moment contains an image (*ākāra*) of the object. Due to the ontological unity of a mental moment, the notion that the mental moment contains an image of the object is metaphorical; in fact, the image is ontologically identical to that mental moment itself. Nevertheless, from a phenomenal standpoint the act of knowing presents itself with two images, the aforementioned object-image (*grāhyākāra*) and a subject-image (*grāhakākāra*). The latter accounts for the sense of subjectivity in the act of knowing, whereas the former accounts for the content of the cognition.

On the Buddhist theory of mind all cognitions must have an object, which is to say that all cognitions have an object-image. Not every cognition, however, is an act of knowing. Instead, only two types of cognitions—perception (*pratyakṣa*) and inference (*anumāna*)—can be acts of knowing because only they can satisfy two criteria: they are reliable (*avisamvāda*) and they are motivators of action (*pravartaka*). Reliability concerns the justification of knowledge. The fact of being a motivator of action is a psychological feature that reflects teleological and ontological concerns.

RELIABILITY

For Buddhist epistemologists, an act of knowing—whether it be a perception or an inference—is reliable in that it directs one to an object with the desired telic efficacy (*arthakriyā*). On this criterion an act of knowledge is distinguished from an unreliable cognition in one of two ways: Either it directs one to an object that can fulfill a particular goal, or it presents itself as the fulfillment of that goal. Suppose, for example, that one is cold, and that one seeks to warm one's hands at a fire. Because the hearth contains a fire that is capable of fulfilling one's goal, the perception of a fire in the hearth is deemed reliable. When one reaches the hearth, the sensation of heat on one's hands is itself the fulfillment of one's goal. Thus, that cognition of heat is also reliable.

By grounding reliability in telic efficacy Buddhist thinkers seek to justify beliefs by interpreting them as

descriptions of their objects' causal characteristics. Hence, the ultimate arbiter of a cognition's reliability is the way in which it presents its objects in causal terms. If it presents the object's causal characteristics such that the object is capable of functioning in the expected fashion, then the cognition is reliable; otherwise, it is not. In some cases the evidence for the desired functionality is given with the cognition itself: for example, the sensation of warmth requires no other cognition to verify that one is feeling warm. Such cognitions are said to be intrinsically (*svataḥ*) reliable, and this applies to all inferences and some perceptions. In other instances of perception another cognition must verify the cognition's content. One may only glimpse the fire from a corner of the room, and one must appeal to inferential evidence (such as smoke) or a subsequent perception to verify that one was indeed seeing fire. A perception that requires such confirmation is said to be extrinsically (*parataḥ*) reliable.

PURPOSE AND MOTIVATION

Arguments for a cognition's reliability generally serve to justify a belief. Thus, one's belief that "there is a fire in the hearth" is true inasmuch as the cognition that includes that belief reliably represents the causal characteristics of the object in question. For that cognition to be an act of knowing, however, that cognition must include other dispositions. Of prime importance is the desire to know (*jijñāsa*) without which the cognition could not arise: it may be true that "there is a fire in the hearth," but without some purpose one will not have a cognitive event in which that belief occurs. Thus, for Buddhists the account of knowledge as justified true belief is inadequate if that account ignores the role played by cognitive dispositions, especially those related to purpose.

In appealing to dispositions related to purpose Buddhist epistemologists hold that the reliability of a belief shifts according to the purpose to which it is tied. One might believe, for example, that the object on one's table is an unbreakable vase, although it is in fact fragile. Relative to the purpose of containing a bouquet, the cognition in which that belief occurs is reliable, since the vase can function so as to hold flowers. But relative to the aim of cracking a walnut's shell, a cognition in which that belief occurs would not be reliable, since the vase lacks the causal capacity to crack open a nut. By thus evaluating complex beliefs within various teleological contexts, Buddhist thinkers can accept some philosophical claims in one context, while rejecting them in another—a strategy that is central to Buddhist soteriology.

In relating reliability to purpose Buddhist epistemologists argue that an act of knowing must not only be reliable but must also be a motivator of purposeful action. Frequently, this assertion is formulated as a requirement for novelty, whereby an act of knowing reveals a previously unknown object (*ajñātārthaprakāśa*). On either version—motivation or novelty—this requirement points not only to the role of purpose but also to the notion that an act of knowing reduces doubt. That is, the cognition must pass a threshold whereby the person, usually idealized as judicious (*prekṣāvanta*), is willing to act on a particular goal based on the content of that cognition. The early epistemologist Dignāga appears less concerned with the utter removal of doubt, but Dharmakīrti and most subsequent thinkers maintain that an act of knowing grants apodictic certainty, even if certainty must sometimes be supplied by a subsequent cognition.

Finally, the notion that an act of knowing must motivate action is also tied to ontological issues. The chief concern here is to eliminate the possibility that universals could be the objects of perception. As will be evident in the following text, the Buddhist strategy is to make perception the actual motivator of action, while relegating the determinate content of perception to a subsequent judgment, which is not strictly speaking the motivator.

PERCEPTION AND ILLUSION

As one of the two types of cognitions that are both reliable and motivate action, a perception is an act of knowledge. The Buddhist model of perception is causal and eidetic: an object interacts with a sense-organ such that, with other factors in place, the next moment of mind occurs with an image or simulacrum (*sādrśya* or *sārūpya*) of the object. Unlike inference, in perception the image is produced directly by the object, and the reliability of perception is based on this direct causal relation.

As a mental moment, a perception is causally conditioned by the previous mental moment, including all the dispositions and physiological conditions that contribute to its occurrence. In a perception, however, not only the previous mental moment but also the perceived object is contributing causally to the occurrence of the perception. Hence, the causal character of the mental moment that is a perception is restrained (*niyata*) by the causal characteristics of the object to which it is in relation through the sense organ. Thus, a perception is reliable—it accurately reflects the object's causal characteristics—because the causal constraints imposed by the object on the perception's contents are indicative of that object's causal characteristics. To put it another way, the perception of blue is

a reliable indicator of its object's causal characteristics because when that content—an image of blue—is the undistorted effect of an object, it can only be produced by an object with the causal capacity to produce a blue image.

This appeal to a causal relation between perceptual content and object compels Buddhist epistemologists to face the problem of illusion. A favorite Tibetan example is the “blue snow mountain”: When one looks at a snowy Himalayan peak on a clear day, the snowcap appears blue because it reflects the sky's color. Here, the cognition is a spurious perception (*pratyakṣābhāsa*) because it lacks reliability, in that snow is not blue. But since the perceptual content—the image—is distorted by causal factors not given with the object, the content itself does not provide any basis for recognizing that distortion. Instead, some other perception or inference would need to reveal that distortion. Still, as noted earlier, some perceptions are alleged to be intrinsically reliable, such that they do not require confirmation by a subsequent act of knowing. What then would distinguish those perceptions such that, unlike the sight of “blue snow,” they could never be spurious?

Buddhist epistemologists do not provide an easy answer to this question, but their theory of perceptual judgment provides a partial response. On their view perception itself is indeterminate in that it involves no conceptual or linguistic operation. A purely indeterminate cognitive event, however, cannot be either reliable or unreliable because it conveys no knowledge about the causal characteristics of its object in relation to one's goal. Hence, the reliability of a perception consists in that it leads to an immediately subsequent perceptual judgment (*tatprṣṭhalabdhanīścaya*) that does provide that knowledge. Strictly speaking, only the judgment is reliable or unreliable, in that it only describes the object in a determinate fashion. Nevertheless, since the form of that judgment is causally constrained by the image presented by indeterminate perception, the perception itself is considered reliable.

Returning, then, to the problem of illusion, the theory of perceptual judgment means that an uninterpreted perception could not itself be an act of knowing because, lacking any depiction of its object's causal characteristics, it could not be reliable. But when the subsequent judgment describes the object, it must do so in relation to a particular goal. One explicit outcome of this in theory is that a perception may only be partially reliable in that it can lead to correct judgments in regard to one goal, but not in regard to some other goal. For example, the per-

ceptual content interpreted as “blue snow” might be unreliable in regard to one's need to identify a blue object, and yet it may still be reliable in regard to the need to identify snow. Although the implications of this claim are left covert, it seems likely that for Buddhist epistemologists one factor in the intrinsic reliability of some perceptions is that the goals in question are such that the perceptual content could never be erroneously interpreted. In other words the teleological context constrains the perceptual judgment such that incorrect interpretations of the perceptual content cannot occur in those cases.

PERCEPTUAL JUDGMENT AND ONTOLOGY

Besides its role in intrinsic reliability, the theory of perceptual judgment is also closely allied to Buddhist ontological concerns. For Buddhist epistemologists to exist is to be knowable (*jñeya*), and since knowledge is a causal process, an existent entity must therefore be causally efficient; likewise, any causally efficient entity must exist. The paradigmatic case of an entity's causal efficiency is its capacity to produce an image of itself in a perceiver's mind, and it is for this reason that Dharmakīrti remarks, “To exist is to be perceived” (*sattvam upalabdhir eva*). Moreover, since any object of perception must exist, Buddhists are careful to exclude the possibility of perceiving any metaphysically objectionable entity, such as a fixed personal essence. Largely because a personal essence is considered a special case of a universal, Buddhists likewise reject the existence—and hence the perception—of universals. Instead, only particulars (*svalakṣaṇa*) truly exist, and particulars alone are the objects of perception because only particulars are causally efficient.

Perception cannot include universals, and linguistic or conceptual cognitions must include universals. Hence, perception must be a sheer apprehension of an object that is not linguistic or conceptual in character. But as noted earlier, the criterion of reliability requires a determinate cognition, which is necessarily conceptual or linguistic in form. Hence, on the one hand, perception must be the immediate apprehension of a particular through a nonconceptual image in the mind and, on the other hand, to be reliable and to motivate action, that nonconceptual content must be interpreted by a determinate cognition. The solution is to relegate the determinate aspect of a perception to an immediately subsequent judgment, and in doing so Buddhists avoid the notion that linguistic or conceptual entities—that is, universals—are the objects of perception.

INFERENCE AND THE PROBLEM OF REFERENCE

Besides perception, inference is considered an act of knowing. As with perception, inference is a cognitive event in which an image of the object appears. Unlike perception, however, the image in an inference is not directly produced by the object. Instead, it bears an indirect causal relation to the object in two ways, namely, by way of the relations on which an inference relies and by way of the process of constructing universals.

The Buddhist approach to universals is central to their theory of inference because inferences are conceptual or linguistic acts of knowing. Moreover, their theory arises in response to the way their non-Buddhist rivals address the problem of reference. In short, these rivals claim that, for words to successfully refer to their proper referents, they must always have a relation to those referents and only to those referents. The word *cow*, for example, should refer only to a cow, and not to something different, such as a horse. Each individual cow, however, is different from every other cow. Hence, if the word *cow* were to stand in a direct relation to one individual cow, it should always refer only to that individual. Such would be the case because the word *cow* should never refer to something that is different from its proper referent, and if the proper referent of the word *cow* were a particular cow, then by referring to some other cow, the word *cow* would be referring to something different from its proper referent. And if the word *cow* can refer both to its proper referent and something other than its proper referent, why should it not refer to a horse?

Most South Asian thinkers solve this familiar problem in the philosophy of language by positing the existence of real universals (technical terms for which include *sāmānya*, *jāti*, and *ākṛti*). On this model, the word *cow* does not have a direct relation to any particular cow. Instead, it is directly related to the universal “cowness.” Nevertheless, the word *cow* still refers successfully to each individual cow because the universal cowness is necessarily instantiated in each individual cow. A word such as *cow* thus refers to each particular cow by virtue of the universal cowness to which both the word and each particular are related. On this view one can thus say that all cows are the same not because each individual is identical, but because each individual instantiates that one universal cowness.

This model is problematic for Buddhists because it would justify the false belief in a personal essence. That is, just as cowness is present in each different cow in time and space, so, too, a personal essence would be present in

all the different spatiotemporal instances of what people consider to be one person. To avoid this outcome, Buddhist epistemologists therefore deny the ultimate reality of universals as things in the world. Thus, for them the universe is populated by spatiotemporally unique particulars, and nothing more. All cows are in fact unique; one only thinks that they are the same because one constructs a universal or sameness (*sāmānya*) for them. So too, each spatiotemporal instance of a person is actually unique. “John” at birth and “John” at forty-five are actually different. When one constructs a sameness that warrants one’s use of the label “John,” one falsely believes that the sameness is not constructed, but real.

THE EXCLUSION THEORY

Although Buddhist epistemologists deny the ultimate existence of universals, they nevertheless adopt their rivals’ approach to reference. They are therefore obliged to formulate a theory that, while denying the ultimate reality of universals, accounts for the way that universals may be contingently constructed so that words may refer to their referents. Buddhists develop a model known as the exclusion theory (*apohavāda*), and to do so they once again resort to causality. In brief, the sameness required to construct the universal cowness is formulated by appealing to the causal characteristics of the individuals in question. More specifically, even though all individual cows are in fact utterly unique and distinct, one may ignore the differences among them and focus instead on the way they are different or excluded from all other entities. That difference or exclusion from other entities is a matter of causality: All cows are the same in that they are all equally different from those entities that are not capable of the causal functionality that one expects when one uses the word *cow*.

Here as well, the paradigmatic case for causal functionality is a perceptual image. Thus, all cows are the same in that they produce the same effect, namely, the same perceptual image in the mind. The problem, however, is that just as each cow is a unique individual, so, too, each perceptual image should also be a unique mental particular. Hence, Buddhist epistemologists must argue that all those images are the same, and to do so they use the same reason: Those images are the same because they all have the same effect, which in this case is a second-order determination of sameness (*ekapratyavamarśajñāna*). The obvious question here is: What warrants the sameness of all those determinations? If one again asserts that they all have the same effect, then the argument ends in an infinite regress. Well aware of this

problem, Buddhist epistemologists follow Dharmakīrti's argument: The sameness of those second-order determinations is not constituted by the fact that they all produce the same effect; rather, they are counted as the same because they are phenomenally presented in that fashion. In short, each instance of the judgment, "That is a cow," just seems the same.

Dharmakīrti's answer to the problem of infinite regress may seem ad hoc, but it probably reflects a subtle approach to conventionality. In brief, Dharmakīrti apparently holds that some conventions—including causality—are so stable that they may be treated as invariable when they are used in nomological arguments about the interpretation of perceptual content. Most Buddhist epistemologists, however, do not pursue this controversial aspect of Dharmakīrti's thought and instead leave such concerns to philosophers of the *Madhyamika* or Middle Way school.

RELATIONS IN INFERENCE

The exclusion theory and the attendant problem of infinite regress may leave several questions unasked, but Buddhists seem satisfied with its use, perhaps because it so greatly simplifies the theory of inference. On their view, all inferences take this basic form: "S is P because S is E," where S is the subject of the proposition to be proven, P is the predicate, and E is the evidence. A common example would be: "The mountain is a locus of fire because it is a locus of smoke." The success of the inference depends on the pervasion (*vyāpti*), which by the time of Dharmakīrti is understood as a necessary relationship between evidence and predicate. Dharmakīrti formulates this relation as a necessary rule of unaccompanied nonarising (*avinābhāvaniyama*). In other words the evidence cannot occur if it is not accompanied by the proximate occurrence of the predicate, or to put it another way the predicate is necessarily predicable of any subject to which the evidence is correctly predicated.

Buddhist epistemologists describe this invariable relation between evidence and predicate as being of only two kinds: either the evidence is the effect of the predicate, or else the evidence stands in a relation of identity (*tādātmya*) to the predicate. The causal relation is operative in the inference of fire from smoke; the identity relation is operative in an inference such as, "This is a tree because it is an oak."

Both in the case of the causal relation and the identity relation the success of the Buddhist analysis of inference depends heavily on the exclusion theory of meaning and reference. For example, when one infers the presence

of fire from seeing smoke, the inference succeeds precisely because of the meaning of the concept smoke. That is, an instance of smoke is excluded from all those other entities that do not have the causal characteristics of smoke. One of those characteristics is central to the inference: namely, that any entity properly called smoke is necessarily caused by an entity that can be properly described as fire. Hence, if one's perceptual content has been correctly interpreted, the identification of the object as smoke already gives one the information needed to infer the presence of fire. The same type of account holds true in the identity relation: the concept or term *oak* can only be properly applied to an entity that also has all the causal characteristics that make it suitable to be called a tree. In this way the inferential process is a matter of recognizing the relation between concepts, sometimes through the help of empirical examples.

The exclusion theory thus provides a seemingly analytical relation between the concepts employed in an inference, and inferences are therefore treated as intrinsically reliable. This suggests that inference is largely a matter of understanding the conventions that govern the use of concepts. The problem, however, is determining whether those conventions accurately depict the causal characteristics of real things. How does one determine, for example, that smoke is necessarily produced by fire? Here, one encounters the general problems of induction, and while Buddhist epistemologists propose various empirical means of overcoming such problems, it would be difficult to argue that they have fully succeeded.

BUFFON, GEORGES-LOUIS LECLERC, COMTE DE (1707–1788)

The French naturalist and author Georges-Louis Leclerc, Comte de Buffon, enjoyed international acclaim for the artistic expression of his own grandiose, often brilliant theories and for presenting in similar fashion the discoveries of leading contemporaries, particularly in the field of natural science.

LIFE

Born at Montbard, son of an upper middle-class magistrate, Buffon was first educated by the Jesuits of Dijon. Details about his personal life are sparse and uncertain. It is generally believed that, after studying law and despite a marked proclivity for mathematics, he went to Angers at the age of twenty-two to study medicine while indulging in botany and horsemanship. His stay ended abruptly when, presumably having killed an opponent in a duel for no verifiable reason, he set out on travels through France and Italy with the irresponsible young duke of Kingston. His mother's death in 1731 recalled him to Montbard where, as heir to her wealth, he turned the family manor into a château. Assuming the name of de Buffon, he adroitly enlarged his estates, which, in due course, were raised to an earldom.

The rest of his long life was divided between Montbard and Paris; no evidence has yet appeared supporting the belief that he also spent a year in England. When only twenty-six, he was, through influence in high places, elected to the Academy of Science after having presented a paper on mathematical probability. He was soon engaged in silviculture and publishing experiments on the means of preserving and strengthening wood, and his

reputation as a scientist was further enhanced by a translation in 1735 of Stephen Hales's *Vegetable Staticks* and, five years later, of Isaac Newton's *Method of Fluxions*, for which he wrote a much admired preface on the history of calculus.

From 1739 until his death he was curator of the Jardin du Roi in Paris, which, under his direction, expanded greatly and became an important scientific center. By 1740 he had begun work on his monumental forty-four-volume *Histoire naturelle*, the most ambitious and comprehensive history of natural science until recent times. Buffon was aided in this enormous task by reports from correspondents scattered throughout the world and by a team of highly specialized collaborators at home.

The first three volumes of the *Natural History*, including *Theory of the Earth* and *History of Man*, appeared in 1749. Published by the royal press, they were exempt from censorship. Almost immediately, however, they incurred the wrath of the Sorbonne for the bold views that ran counter to the book of Genesis. Out of deference to religious authority, Buffon penned an act of submission, only to proceed serenely in the same audacious manner.

Along with the volumes on quadrupeds (1753–1767), birds (1770–1783), and minerals (1783–1788) were the so-called *Supplements* (1774–1779), which included his justly famous work on Earth's geological periods, *The Epochs of Nature* (1778). After Buffon's death the vast project was brought to a close by B. G. E. Lacépède, with eight volumes on oviparous quadrupeds, snakes, fish, and whales.

Buffon's *Discourse on Style*, delivered upon the occasion of his admission to the French Academy in 1753, remains the best known of his shorter pieces. It contains the celebrated dictum: "The style is the man himself," the meaning of which has often been simplified to the point of misinterpretation.

THOUGHT

Buffon's death in Paris shortly before the French Revolution was mourned by the leading journals of Europe as the passing of one of the great figures of the century. His place in the history of ideas has since been undergoing a gradual reassessment still far from settled; certain areas of agreement have, nevertheless, been established. It is generally accepted that while he often engaged in scientific investigation, either through personal observation or through wide reading, his true inclination was for generalization. Influenced especially by Bacon, Newton, Gott-

fried Wilhelm Leibniz, and John Locke, he held seminal views that frequently inspired others to push his inquiries to fruitful conclusions. He rejected the popular conception of God as the Great Clockmaker and, instead of final causes, he looked for natural causes to explain the world about him. He insisted, and the stand was unusual for the day, that religion and science should be strictly separated. Thus, he evolved the theory that our planetary system had resulted from the glancing blow of a comet against the sun's molten surface. Perhaps the most original contribution of Buffon's cosmogony to science was to have introduced a new concept of the vast expanses of geological time. His published calculation of Earth's age as some 80,000 years, rather than the traditional estimate of 6,000, was in itself a generous concession to the prevailing spirit of the day; in his unpublished manuscripts he deals with figures that run into the millions.

Not an evolutionist in the modern sense, he nevertheless persistently stressed change at least in varieties, if not in species, of animal life. This and similar propositions or speculations led Charles Darwin to acclaim Buffon as the first author in modern times to have treated transformism in a scientific spirit. Moreover, in biology he rightly opposed epigenesis to the more widely accepted preformation theory of generation, though his ideas on "inner molds," "organic molecules" and spontaneous generation have long since fallen into disrepute. "He may be said to have asked all the questions which were to be answered in the course of the succeeding century," the oft-quoted comment of Henry Fairchild Osborn, perhaps remains the best generalization to date on Buffon's contribution to posterity.

BULGAKOV, SERGEI NIKOLAEVICH

(1871–1944)

Sergei Nikolaevich Bulgakov, a Russian economist, philosopher, and theologian, was a leading twentieth-century religious philosopher in the tradition of Vladimir Solov'ev. Bulgakov was born in Livny, Russia, the son of a priest. He attended a church school in Livny and spent four years in a theological seminary before enrolling in the faculty of law at the University of Moscow in 1890. He was graduated in 1894 and began teaching political economy at the Moscow Technical School in 1895. From 1898 to 1900 he traveled in western Europe and Great Britain, gathering material for his master's dissertation, *Kapitalizm i zemledelie* (Capitalism and agriculture; 2 vols., St. Petersburg, 1900). Through this and other writings on economic and social questions he soon acquired a national reputation. After teaching in Kiev for five years, he returned to Moscow in 1906 to become professor of political economy at the Moscow Institute of Commerce; in the same year he was elected to the second state Duma as a Constitutional Democrat. In 1912 he received a doctorate from the University of Moscow, and in 1917 he was named professor of political economy at that institution.

Although Bulgakov was a leading "legal Marxist" in the 1890s, he even then acknowledged the philosophical supremacy of Immanuel Kant and soon began to depart from orthodox Marxism on socioeconomic issues as well. In his master's dissertation he argued that Karl Marx's the-

ory of the centralization of production is inapplicable to agriculture, where small-scale production is more stable and viable than large-scale. When, in the early years of the twentieth century, Bulgakov underwent a religious crisis, he abandoned Marxism completely, first for the idealistic position represented in his book of essays, *Ot Marksizma k idealizmu* (From Marxism to idealism; St. Petersburg, 1903), and subsequently for a mystical, “Sophiological” interpretation of the Russian Orthodox faith showing the direct and extensive influence of Solov’ev and Pavel Florenskii and the ultimate influence of Plato and Friedrich Wilhelm Joseph von Schelling. In 1909 Bulgakov contributed to the celebrated miscellany, *Vekhi* (Landmarks), in which ex-Marxist Russian intellectuals, including Nikolai Berdiaev and Petr Struve, criticized the radical intelligentsia. Bulgakov first outlined his positive religious philosophy in his doctoral dissertation, *Filosofia khoziaistva* (The philosophy of the economy; Moscow, 1912) and over the years 1911–1916 he composed the work in which this philosophy received its fullest expression, *Svet nevechernii* (The unfading light; Moscow, 1917).

During the same period Bulgakov studied for holy orders, and in 1918 he was ordained a priest in the Russian Orthodox Church. He moved to the Crimea, where he became professor of political economy and theology at the University of Simferopol’, but in 1921 he lost this position because he was a member of the clergy. At the end of 1922 he was expelled from Russia along with many other non-Marxist scholars and writers. He settled first in Prague and lived from 1925 in Paris, where he took part in founding the Orthodox Theological Institute, serving as its dean and professor of dogmatic theology until his death. During these years Bulgakov wrote extensively on theological subjects and took an active part in ecclesiastical conferences in many countries, becoming an internationally known church figure. Some of his later theological works, particularly *Agnets Bozhii* (The lamb of God; Paris, 1933) and *Nevesta Agntsa* (The bride of the lamb; Paris, 1945) also carried further the development of his distinctive philosophical outlook.

Basic to this outlook is a cosmology that, although marked in its expression by obscurities and progressive modifications, centered consistently on the following themes: (1) The world, or cosmos, is an organic whole animated by a “world soul” or entelechy that is revealed in the structure, function, and connection of its parts. (2) God, or the Absolute, in creating the cosmos “out of nothing,” created it not as something external or alien to him (for then it would limit the Absolute, which is impossible), but as an emanation of his own nature; the world is God as

becoming, the divine nature fused with nothingness. (3) Mediating between the Absolute and the cosmos, uniting them both within itself, is a “third being”—Sophia, the principle of divine wisdom. As the world of Platonic Ideas, Sophia is the ideal basis of the cosmos; as the object of divine love, purely receptive and conceiving everything within herself as the womb of being, Sophia is “eternal femininity”; as the principle of the Divine within the created, she is the “world soul,” or entelechy; as a participant with the Trinity in the generation of the cosmos, she is a kind of “fourth hypostasis” in God. In his later works Bulgakov distinguished between the “divine Sophia” in God and the “created Sophia” in the cosmos, but he still emphasized their ultimate metaphysical identity and thus the consubstantiality of God and the cosmos.

Bulgakov resisted the pantheistic implications of his position, preferring to call it a form of panentheism, and strove to provide solutions to the chief philosophical problems it raised, such as the problems of evil and human freedom. He attributed evil to the nothingness or nonbeing that is the substratum of the cosmos: Through the willfulness of created beings, nothingness is actualized as a chaotic force erupting into the created world, which in itself is not evil but simply incomplete. He provided for human freedom through a doctrine of self-creation: man is free even in the act by which he comes into existence, for God allows man to collaborate in his own creation; at the same time, however, Bulgakov also asserted that Sophia guides history by a kind of necessity.

Like Florenskii, Bulgakov laid great stress on the antinomic character of rationality and looked to divine revelation through religious experience for knowledge of the highest truths, but his epistemological views in general received no thorough, original development or synthesis; the same is true of his scattered treatments of ethical questions and of his aesthetic reflections—the latter appearing principally in *Tikhie dumy* (Quiet meditations; Moscow, 1918). The work Bulgakov himself regarded as his most strictly philosophical product—*Filosofia imeni* (Philosophy of the name)—was written in 1919 but first published posthumously in Paris in 1953. It is an exhaustive study of language, with particular application to theology, in which Bulgakov argued that words are not mere outward signs of meanings but are internally related to them as animate symbols.

Bulgakov’s later works abounded in imaginative theological conceptions, including a doctrine of universal salvation and original treatments of the Incarnation and of the theological differences between Roman Catholicism and Orthodoxy. Some of his theological views, par-

ticularly his Sophiology, were severely censured in the early 1930s by the Moscow patriarchate, which affirmed that the doctrine of Sophia is incompatible with the Trinitarian nature of God and that it falsely introduces a distinction between masculine and feminine principles into the divine essence.

BULLOUGH, EDWARD

(1880–1934)

Edward Bullough was a British aesthetician and literary scholar. He taught modern languages at Cambridge University, holding University lectureships in German and then Italia. He never held a philosophy fellowship or chair, but he gave the first lectures on aesthetics at Cambridge, beginning in 1907, and was widely read in aesthetics. He also conducted psychological research on

aesthetic responses in collaboration with Cambridge psychologists.

Bullough is known in aesthetics primarily on the basis of a single article, “‘Psychical Distance’ as a Factor in Art and an Aesthetic Principle,” originally published in *The British Journal of Psychology* in 1912, in which he maintains that aesthetic experience depends on a distancing from “our practical, actual self,” thereby “permitting only such reactions on our part as emphasise the ‘objective’ features of the experience.” By means of such distance, we can escape what is merely idiosyncratic but still experience a “*personal* relation, often highly emotionally coloured,” to the object, whether work of art or nature.

Bullough’s proposal stands in the long tradition of theories of disinterestedness dating back to Shaftesbury and Hutcheson and of the “aesthetic attitude” dating back to Schopenhauer. Bullough’s innovation in this tradition is to treat aesthetic distance as a factor in both the creation and reception of art (it is obviously not involved in the creation of nature), and as a variable in the sense that different degrees of distance are appropriate for different kinds of objects, artists, and audiences. The experience of a particular object could thus suffer from either underdistancing or overdistanting. Bullough’s emphasis on the variability of distance was suggested at least in part by his experiments on different aesthetic responses to colors, reported in a series of articles from 1907 to 1910, and led him to emphasize the variability rather than uniformity of individual tastes. In this regard he distanced himself from the traditional theory of disinterestedness.

The 1912 article does not, however, fully explain the value of distancing oneself from objects. For Bullough’s fuller account of the “aesthetic consciousness” that can be produced by the proper degree of distance from an object and its value to us, one must turn to his lectures on aesthetics, which were posthumously published in 1957. Here, after a thorough review of the problems of previous approaches to aesthetics, Bullough argues that “the aesthetic attitude is neither scientific nor ethical ... neither explanatory nor final, but *contemplative*,” giving “a plasticity and relief to objects and experiences which they inevitably lose” in ordinary scientific or practical contexts, an experience we obviously enjoy (Bullough 1957, p. 75). Here again Bullough stands in a long tradition, going back at least to Kant, but his view is distinguished by his emphasis on the availability of “aesthetic consciousness” in both quotidian and artistic contexts, and on its role in the creation and the reception of works of art. Bullough also stresses in a distinctive way in which “aesthetic consciousness” is a form of “objectivity,”

although it is distinct from both scientific objectivity and from the “egotistical *subjectivity* of practical consciousness.”

Bullough’s conceptions of aesthetic distance and aesthetic consciousness were harshly criticized by later analytical philosophers, such as George Dickie. But his use of these concepts to characterize a valued form of experience and to ground the possibility of a general “aesthetic culture” going beyond the specific realm of art save his reflections from the critique that these concepts cannot yield a satisfactory definition of art proper, which was not Bullough’s goal.

BULTMANN, RUDOLF (1884–1976)

Rudolf Bultmann, the biblical historian and theologian, was born in Wiefelsted, Oldenburg, Germany. He studied at Marburg, Tübingen, and Berlin and taught first at Marburg and then at Breslau and Giessen. In 1921 he became professor of New Testament studies at Marburg, where he remained until his retirement in 1951.

Bultmann’s work and the controversies it has generated are of undoubted importance for the philosophy of religion. His ventures in “demythologizing” the New Testament and in reinterpreting its content “existentially” have raised (and have tried to answer) crucial questions about the logical status of religious language and the nature of Christian belief.

CHRISTIAN FAITH

Bultmann’s thought was inspired by his keen sense of the remoteness and unacceptability of the thought forms of New Testament Christianity to most people of the twentieth and twenty-first centuries. We do not and cannot see our world as a theater of conflict between supernatural powers, the demonic seeking to possess and destroy us, and God intervening to secure our salvation. Moreover, miracle stories lie at the very heart of New Testament

belief: “If Christ be not raised, your faith is vain” (1 Corinthians 15:17). Thus, the critical question is: Must a man, in order to be a Christian, commit himself simultaneously to two mutually incompatible world pictures—that of twenty-first-century science and that of first-century prescientific speculation? According to Bultmann, to attempt this is to make Christian belief unnecessarily difficult. It is equally unrewarding to view Christianity as a strictly and objectively “historical” religion and anxiously to sift all the evidence for and against the recorded events of the life of Jesus. The evidence is substantial enough to show that Jesus indeed lived and that he made a quite extraordinary impact upon certain contemporaries. But if religious faith is to stand or fall with the historicity of, say, the birth stories or the Easter narratives, if its degree of assurance must rationally be tempered with the historical probabilities, the assurance will be pitifully uncertain, and faith will almost certainly fall.

To these perplexities Bultmann offers a bold remedy. The Christian may properly grant that a very large part of the New Testament message is couched in mythical language and does not record objective history. This mythical material is not, however, an embarrassment, and it need not be discarded. It can be interpreted as indirect description not of the cosmos but of the conditions and possibilities of human existence. Historical studies derive their real seriousness not from sheer factuality but from what they discover about viable ways of life and viable options for human decision. Among such options, the Christian gives preeminence to that displayed in the accounts of the cross and the resurrection. For it is through these that God makes available a distinctively “authentic” and free mode of existence to all humanity.

INFLUENCE OF HEIDEGGER

“Authentic” is Martin Heidegger’s term. It is only one of Bultmann’s many borrowings from *Sein und Zeit*. There is a prima-facie oddness here—a Christian theologian reinterpreting the New Testament teachings in terms of concepts drawn from atheist existentialism. Nevertheless, the concepts are undeniably relevant and, within limits, illuminating. There are clear and suggestive analogies between Heidegger’s general picture of inauthenticity and the New Testament’s accounts of life “in” and “after” the flesh, the life of the “natural man” who is alienated from God. In both views humans are uneasy, anxious, and guilty over their condition. If to Heidegger Angst reveals that man is “not at home” in the world, the New Testament affirms that here we have no continuing city

but seek one to come. To both we are strangers and pilgrims.

On the “authentic” type of existence, there are both marked similarities and differences in the views of Heidegger and Bultmann. Heidegger’s account centers upon a total acceptance of the fundamental conditions of our life. This involves, for any man, a realization of his own death, not as some vague, unpleasant, but indefinite future event, but as something whose constant presence, in possibility, should modify his sense of his own existence at every moment. Christianity, too, speaks of renouncing the world and a life entangled with the world, of “dying” to the life of self. It has, however—or ought to have—some very different things to say about life eternal.

Heidegger’s authentic man sees and accepts the limitations on his freedom imposed by the given circumstances of his life as so far lived (“facticity”); he sees the present moment as the locus of decision, and it is in the future that he will work out those authentic possibilities of existence for which he decides. The Judeo-Christian tradition also has a dualism of facticity and freedom: It claims both that man was created “out of the dust of the ground,” stressing the given factuality of human existence, and that God “breathed into his nostrils the breath of life,” endowing him with freedom to pursue his diverse possibilities.

How can we discover our authentic possibilities? In answering this question both Heidegger and Bultmann point to the thoroughly temporal, historical nature of human life. History discloses human possibility. For Bultmann the Christian is he who, in R. G. Collingwood’s term, “incorporates” the essentials of the New Testament story in his present thought and action.

Bultmann’s account of the human situation is, therefore, an “existential” analysis, and to call it that is to contrast it both with the findings of empirical psychology and with a philosophical analysis of nonpersonal structures. Far from being based on empirical investigations, existential analysis tries to uncover the concepts that are, and have to be, employed in any such researches—the fundamental concepts of personal existence.

But there are complexities to be noted here. Although to Bultmann the New Testament has much to say about the general human predicament, we must not analyze its discourse exhaustively as delineating permanent and universal human possibilities. The authentic life, crucially, is available to a man only by virtue of divine grace and through his appropriating the Word revealed in Christ.

DEMYTHOLOGIZING

There is, however, an uneasy duality in Bultmann’s thought. Almost everything in the New Testament is to be understood as describing modes of personal existence, but not so the central claim of the kerygma itself, the claim that God decisively acted in Christ. This contains a reference to God that cannot be eliminated. Yet it must be noted that although Bultmann refuses to “dekerigmatize,” others (Fritz Buri, for instance) have tried to do just that. They have been unable to stop at what looks to them like a halfway house and have taken the kerygma too as material for existential analysis.

Other theologians have offered various arguments to show that Bultmann’s position is too extreme. They claim that he has underestimated the importance of objective history, that he has made too many concessions to twentieth-century skepticism, that his existentialist concepts cannot express the full meaning, the nuances, the complex mesh of associations of the biblical writings, that the myth must be kept intact.

It is not surprising, therefore, that the controversy over demythologizing has been intense and involved. This entry shall single out for brief discussion only a few of the most crucial issues, beginning with the question of Bultmann’s existentialism.

CRUCIAL ISSUES. (1) Without doubt, Heidegger’s existential analysis has provided Bultmann with a valuable nonmythical vocabulary, able to express an important part of the New Testament message. However, there are certainly some points at which his analyses appear to clarify the Christian position but in fact tempt a theologian to distort it seriously. For example, if Christianity were no more than a philosophy of life, then matters of objective history would not be crucial to it. So long as we knew that someone had lived roughly the sort of life Jesus allegedly lived, we could at least take the “imitation of Christ” as an ideal for human living. “Possibility,” in this rather weak sense, would be enough. But if we want to go beyond that (as Bultmann certainly does) and claim that God was actually imparting himself in a quite distinctive and decisive way in the events of Jesus’ life, then it is a matter of immense seriousness to learn what these events were. We cannot have a historical religion, in that strong sense, without historical vulnerability. For all its subtlety (most likely because of its subtlety), the existential analysis of historicity deflects attention from this uncomfortable fact.

One should not conclude, however, that Bultmann has never stated a coherent and clear position on his

toricity and Christian belief. In *History and Eschatology* (1957) he expressed himself much more lucidly in alternative terms derived from Collingwood. But the link between his position in this book and traditional Christian theology has become very tenuous indeed. Whatever the impression we receive from other writings of Bultmann, in *History and Eschatology* the Gospel seems to be about human self-understanding from first to last; dependence on objective historicity has receded to the vanishing point.

(2) Several important and difficult New Testament concepts seem to yield very readily to existential analysis; yet these concepts remain philosophically problematic. The concept of “body” has clear existential meaning—related to Heidegger’s concept of what it is to “exist-in-a-world.” Likewise, “eternal life,” in the New Testament, characterizes a manner, or quality, of living. Yet even if much of the meaning of these expressions is translatable into existentialist language, there surely remains a vital part that is not. The existential analysis by itself cannot answer such a question as “Does our existence end with our bodily death?” Nor does it help solve the problems of meaning and logic (particularly problems of personal identity) that arise over concepts like life after death and the resurrection of the dead.

(3) Because the life and personality of Jesus play so muted a part in this theology, and because the summons to authentic existence tends to be rather individualistic in its emphasis, it is very difficult to build up an adequate account of Christian discipleship and Christian love on Bultmann’s foundations. The quality of the Christian ethical life has always been determined by the believer’s response not simply to the bare proclamation that a new life has been made available to him, but to the concrete particularities of the life and teaching of Jesus. One guesses that a theology like Bultmann’s can succeed in expressing this quality only through implicit dependence on a more conservative view of the New Testament that is still secretly operative in the religious imagination.

(4) From the philosopher’s point of view, perhaps the most urgent need is for Bultmannian theology to construct a much more precise logical map of its key concepts, myth, mythology, and analogy. “Mythology,” Bultmann wrote, “is the use of imagery to express the other worldly in terms of this world and the divine in terms of human life, the other side in terms of this side.” But Bultmann does not want to conclude that discourse about God is always, and necessarily, mythological. To speak mythologically is to represent God as a kind of superentity, observably acting upon and interacting with

natural entities. However, Bultmann has claimed (in *Kerygma and Myth*) that it is possible to speak of God’s “acts” analogically, and to do so with the help of concepts borrowed once again from the field of human personal existence.

Bultmann is here in pursuit of what may well be a valuable distinction, but it has not been at all clearly articulated. The different modes of discourse about God are not rigorously defined, and thus a good deal of uncertainty is left about appropriate tests for sense and nonsense, truth and falsity, in claims about God. It is by no means obvious, for instance, whether one can really think through those existential, “analogical” utterances about God without implicitly relying upon a mythological picture of God as a superperson and superentity. Further, since both mythological discourse and analogical discourse are indirect or oblique, we need to ask whether any direct, literal talk about God is possible, or whether it is necessarily all oblique. If it must all be oblique, the problem of how we can refer to God and relate the myths and analogies to him surely becomes unmanageable. If it is not all oblique, then we still need to discover what, and how much, can be affirmed directly and literally about God. The temptation is to resort to theological makeshifts—to analyze virtually all talk about God in terms of human self-understanding, but to rely, devotionally and pastorally, upon an unanalyzed transcendent remainder, of which, however, no clear account is given in a systematic theology.

All these puzzling instabilities in Bultmann’s thought are not careless or stupid blunders of reasoning. They are illuminating, disturbing indications of how immensely hard it is to steer between, on the one hand, a wholly secularized Christianity, a humanism, and, on the other, a religion of the supernatural and the miraculous.

BURCKHARDT, JAKOB

(1818–1897)

The Swiss cultural historian Jakob Burckhardt was born in Basel, the son of a Protestant minister. He began his university education as a theology student, but lost his faith in orthodox Christianity comparatively early and turned instead to history. He spent part of his formative years in liberal and freethinking circles in Germany; it was in Germany, too, that he discovered and worked under Leopold von Ranke, probably the most potent and lasting influence upon his future career as a historian. On his return to Switzerland in the 1840s, Burckhardt was at first attracted to the political and religious dissensions that he found there. The violence to which they subsequently led, however, was repulsive to his temperament; and he retired to Italy, having, in his own words, “given up political activity forever.” Some time later he finally settled in Basel, dedicating himself, as professor of history and history of art, to the routine of teaching and lecturing that was to occupy him continuously up to the last years of his life.

Burckhardt’s chief writings were all published before he was fifty: *The Age of Constantine the Great* (1852), *Cicerone* (1855), *The Renaissance in Italy* (1860), and *The History of the Renaissance* (1867). In addition to these major works, he also gave a number of lectures between 1868 and 1871 on the general study of history, the notes for which were preserved and eventually published posthumously under the title of *Weltgeschichtliche Betrachtungen* (Reflections on world history). These are remarkable, not only for the prophetic insight they display in their analysis of contemporary trends, but also for the many subtle and individual observations they contain concerning the purposes of historiography and the theoretical problems it poses. They were attended by Friedrich Nietzsche, who at the time was professor of classics at Basel and whose later essay, *The Use and Abuse of History*, bears the impress of some of Burckhardt’s ideas.

Burckhardt did not regard his lectures as representing a contribution to “philosophy of history” in the then current sense. Indeed, he made it clear at the outset that he was profoundly suspicious of fashionable schemes and systems that attempted to exhibit the course of historical development as conforming to a rationally ordered pattern, and referred with special scorn to the Hegelian conception of history as the “inevitable march of the world spirit.” For him such projects were the manifestation of a crude and vulgar “optimism”; they sprang from the arrogant and egotistical assumption that “our time is the con-

summation of all time” and tended to “justify” the crimes and disasters of previous ages as necessary to the promotion of what came afterward. Burckhardt thought that the role of moral judgment in history could not be spirited away in this complacent manner; but neither, on the other hand, should the historian allow his view of the past to be distorted by moral predilections peculiar to his own time and society. What was above all requisite for true historical understanding was a contemplative, disinterested sense of the abiding and tragic aspects of human existence. Only through such detachment from prevailing concerns and preoccupations could the historian transcend the barriers that separate the mental life of one age from that of another.

Burckhardt admired Arthur Schopenhauer, and he tended to extend to the historian a position in some ways similar to that which the German philosopher had reserved for the artist. It was not merely that works of art and culture provided the historian with his most fertile material for the interpretation of previous phases of human experience; history itself was (or should be) a form of art. The mechanical piling up of the results of specialized research, dear to so-called scientific historians, was not enough; there must also be “intuition,” an imaginative ability to re-create the vision of life underlying the relics left by former times. To see the past in these terms was to see it as the expression of the inexhaustible creative power of the human mind—great individuals, great artistic achievements, great moments of civilization, all exemplified in different ways its potentialities. Scholarship, painstaking investigation, were indeed essential, but they must be properly used and directed. Only thus could a particular source or authority throw light on the character of a person, the significance of a style, the pervasive atmosphere of a period.

Ultimately, Burckhardt claimed, the subject of historical study was man himself, not the hypostatized abstractions of the philosophers of history. These philosophers, by implying that the historical process followed a fixed and predetermined course, betrayed a fundamental blindness to its most striking feature, the revelation of individual originality and creativity. Likewise, their “astrological impatience” to set limits to its future by talk of world plans and metaphysical goals was not only unwarranted; it failed to respect the very conditions of uncertainty and suspense that make human achievement possible. From this point of view, and insofar as the development of humankind is concerned, “a future known in advance is an absurdity.”

Toward the close of the nineteenth century the tide of historical speculation began to recede. Philosophers, rather than continuing to offer sweeping interpretations of the human past, turned their attention toward examining the distinctive characteristics of historical thought and inquiry. In retrospect, Burckhardt can be seen to occupy an interesting position in this development. Though not a philosopher himself, he nonetheless anticipated in his own reflections on historical procedure some of the ideas that later found philosophical expression in the writings of Wilhelm Dilthey and Benedetto Croce.

Patrick Gardiner (1967)

BURIDAN, JOHN

(c. 1300–1361)

John Buridan, or Johannes Buridanus, was a philosopher and arts master at the University of Paris. Little is known

about his early life other than that he hailed from Picardy in the north of France, most likely from the town of Béthune. As a young man he studied at the Collège Lemoine in Paris, where he was awarded a benefice or stipend for needy students, and then at the University of Paris, where he earned the degree of master of arts and received his license to teach in the 1320s. He spent his entire academic career at the University of Paris, twice serving as its rector. He was a respected figure who was often asked to settle jurisdictional disputes and assist in other matters of academic governance.

Two features of Buridan's career are distinctive. The first is that he remained a teaching master in the faculty of arts without ever moving on to take a higher, doctoral degree in theology, which was the more typical career track for philosophers at the time. Why he decided not to join the more prestigious ranks of the theologians he does not say, but given his philosophical talent and stature at the University, it is safe to assume that he had his reasons for remaining where he was. One possibility, which is suggested by some of his remarks about the relation between philosophy and theology, is that he believed philosophy to be an essentially secular enterprise, which he would have to abandon if he became a theologian. Whether this represents an important first step in the direction of modernity awaits further investigation, but at the very least, Buridan was passionately committed to the autonomy of philosophy as a discipline proper to the faculty of arts, not theology.

The other distinctive feature of Buridan's academic career is that he remained a secular cleric rather than joining a religious order such as the Dominicans or Franciscans. The popularity of these orders in the thirteenth century had revitalized the study of theology, raising it to speculative heights it has not seen since. But as the larger orders began to institutionalize the training of their novices outside the university and develop their own intellectual traditions—with Thomas Aquinas being championed by the Dominicans and Bonaventure and John Duns Scotus by the Franciscans—serious disputes arose not only within religious orders but between them, a phenomenon that led to the development of different schools of philosophy: Thomistic, Scotistic, and so on (hence the term *Schoolmen*). As a secular cleric, Buridan could safely ride above these disputes, without being obliged to defend or explain the authorities of any particular tradition. This theoretical independence can be seen in the occasionally eclectic character of his remarks.

Most of Buridan's writings are in the form of commentaries on Aristotle, whose texts were the primary sub-

ject of study in the medieval arts curriculum. These commentaries survive in two forms: *expositiones* or literal commentaries and *quaestiones* or question commentaries, both of which have their origins in the way Buridan actually taught. He would begin by giving his students a line-by-line exposition of a portion of Aristotle's text and follow this up with a problem or question raised by the passage although not explicitly discussed in it, such as whether the intellect has the capacity to recall previous thoughts, analogous to the power of memory in the sensitive part of the soul (see Aristotle, *De Anima* III.5, 430a24). Arguments for and against would be inventoried, after which Buridan would give his own—sometimes lengthy—resolution of the question, with responses to arguments on the opposite side. A similar method was used by Thomas Aquinas in composing the *Summa Theologiae*.

Buridan wrote commentaries on all of the major works of Aristotle. But because he lectured more than once on a given text over the course of his long career, some commentaries exist in more than one version, and the evolution in his thinking about a particular issue can occasionally be seen in these different versions. In addition to the commentaries, he wrote a massive logic textbook, the *Summulae de Dialectica* (Compendia of dialectics), as well as a number of shorter, independent treatises on controversial topics such as the *Tractatus de relationibus* (Treatise on relations), *Tractatus de universalibus* (Treatise on universals), and *Tractatus de consequentiis* (Treatise on consequences). He was by any measure a prolific author.

Buridan's influence is immediately evident in the work of his younger contemporaries at Paris: Albert of Saxony, Marsilius of Inghen, and Nicole Oresme. But his commentaries and his *Summulae de Dialectica* continued to be read and commented on for several generations. Manuscripts and early printed editions of his writings were carried by his students and followers to the new universities in Heidelberg, Kraków, Prague, and Vienna, where they served as primary texts in courses on logic and Aristotelian philosophy. In this way, the *via Buridani* continued to influence European thought well into the early modern period.

LOGIC

Buridan's view of logic is best conveyed by the opening line of Peter of Spain's *Summulae Logicales* (Compendia of logics), the thirteenth-century textbook on the basis of which Buridan prepared his logical masterwork, the *Summulae de Dialectica*: "*Dialectica est ars artium, ad omnium*

methodorum principia viam habens (Dialectic is the art of arts, having access to the principles of all other inquiries).” More than just a method, logic is the grammar of philosophical discourse, the discipline whose procedures govern rational inquiry in virtually every field investigated by the arts master, from metaphysics and cosmology to natural philosophy and ethics. Buridan composed the nine treatises of his *Summulae* so that they exhibit an orderly progression of teachings based on the proposition, beginning with propositions themselves (I), moving down to the significance and referential function of their component terms (II–IV), then back up to propositions again, considered as parts of more complex patterns of reasoning: syllogisms (V), topics (VI), fallacies (VII), and demonstrations (VIII). The work closes with a series of logical exercises (IX). The order of the *Summulae* reflects Buridan’s assumptions about the semantic character of human understanding, which is in turn a reflection of the metaphysical structure of creation.

Buridan is usually classed as a terminist logician. The terminists (sometimes referred to as the *moderni* or *moderns*) were a diverse group of thirteenth- and fourteenth-century philosophers who regarded the semantic properties of terms (literally, the “ends [*termini*],” or subjects and predicates, of propositions) as the primary unit of logical analysis. His main contribution was to modernize and systematize the old logic of Aristotle and Boethius using the newer techniques of the terminists, though in the process he offered innovative solutions to traditional problems in the philosophy of logic. His solutions to logical paradoxes such as the liar are still being discussed today. Consider, for example, the sentence, “Every proposition is false,” assuming “that all true propositions are annihilated while the false ones remain, and then Socrates propounds only this: ‘Every proposition is false’ ” (*Summulae* 9.8, seventh sophism). Is Socrates’ proposition true or false? Buridan argues that it is false, and his reasoning shows his mastery of the semantic nuances of the question. “Every proposition,” he says, “virtually implies another proposition in which the predicate ‘true’ is affirmed of the subject that supposits for [the original proposition]” (*Summulae* 9.8, seventh sophism). Thus, for the truth of any proposition P, it is required not only (1) that the subject and predicate terms of P stand for the same thing or things, but also (2) that P imply another proposition, “P is true,” which must also be true—otherwise there would be a true antecedent and a false consequent. Accordingly, the constituent terms in the proposition uttered by Socrates—“Every proposition” and “false”—stand for the same things, since in the

posited case, “all true propositions are annihilated and the false ones remain, and then Socrates propounds only this: ‘Every proposition is false.’” So the first condition is satisfied. But the implied proposition, “P is true” (where P is the name of “Every proposition is false”), is false because its constituent terms, “Every proposition is false” and “true,” do not stand for the same thing, since *ex hypothesi*, P stands for the antecedent proposition “Every proposition is false,” not for things that are true. But this gives us a true antecedent and a false consequent, and so the consequence does not hold. Therefore, the sophism is false.

METAPHYSICS

Buridan viewed metaphysics as the highest form of philosophical inquiry, yet his *Questions on Aristotle’s Metaphysics* is among the shortest of his commentaries. There appear to be two reasons for this. First, he is not optimistic about the possibility of humans coming to know the ultimate nature of reality in this life because he doubts whether people are ever in a position to be acquainted with the natures or essences of things as such. Most of the time one must make do with inferences based on sense, memory, and experience, and the latter experience shows that even the firmest empirical conviction is subject to revision. Second, Buridan is adamant that metaphysics belongs to philosophy, not to theology, and hence that it cannot take its principles or starting points from Scripture or religious doctrine: “metaphysics differs from theology in the fact that although each considers God and things that pertain to divinity, metaphysics considers them only as regards what can be proved and implied, or inductively inferred, by demonstrative reason. But theology has for its principles articles [of faith], which are believed quite apart from their evidentness, and further, considers whatever can be deduced from articles of this kind” (*Questions on Aristotle’s Metaphysics*, I.2). This leads him to assert the autonomy of philosophers—and implicitly of the arts masters as well—in a rather striking way: metaphysics, or philosophical wisdom, cannot be ordained by theology because its methods, which are rooted in its principles, are different. Philosophy is accordingly not inferior to theology, just different. This was an important step toward the modern view of philosophy as a secular enterprise.

Buridan was also a nominalist, though it is better to think of late-medieval nominalism as a parsimonious way of doing philosophy than as a commitment to denying the existence of real or Platonic universals. The method in Buridan’s metaphysics is his logic. He tries

wherever possible to apply the *Summulae*'s analytical techniques to the interpretation of Aristotle, and his approach is critical in that it tends to view traditional questions in metaphysics as based on confusions of logic or language. Thus, when asked whether universals really exist outside the soul, he replies by clarifying the meaning of the common term *universal* with respect to its correlative terms, *individual*, *particular*, and *singular*. His rejection of realism is expressed in the same fashion: universal terms have no ultimate significate, nothing outside the soul they can make known as such. What such terms mean is other terms: the primary signification of *universal* is "predicable of many," which makes it a term of second intention, or a term of terms, since only terms are predicable. Likewise, when the term *universal* occurs in a proposition, it signifies not a *what* but a *how*, that is, how one conceives of something—in this case, that the term so designated is "indifferent to many suppositis," or individuals.

Clearly, Buridan thinks that the careful and systematic analysis of language is the best way of dealing with such metaphysical problems. The trouble usually begins with untutored persons who think that each and every substantive term must correspond to a thing, or that true predication must involve the real inherence of attributes in subjects rather than making the more modest assumption that the subject and predicate terms simply stand for the same thing(s).

NATURAL PHILOSOPHY AND ETHICS

Buridan's natural philosophy and ethics are also shaped by the methods of the *Summulae*. Thus, his treatment of infinite magnitudes in his *Questions on Aristotle's Physics* focuses on clarifying the different senses of the term *infinite*: nothing is infinite if by that one means an actually existing infinite magnitude, although one can always imagine a magnitude greater than the one being considered, and do so without limit. The concept of infinity is thereby redeemed for natural science as a mode, or way of thinking.

Buridan also played a key role in the demise of the Aristotelian picture of the cosmos in the later Middle Ages. His major contribution was to develop and popularize the theory of impetus, or impressed force, to explain projectile motion. Rejecting the Aristotelian idea of *antiperistasis*—according to which the tendency of a moving projectile to continue moving (think of a ball after it has left the hand of a thrower) is due to a proximate but external moving cause (the air surrounding it, in this case)—Buridan argued that only an internal

motive force, transmitted from the mover to the projectile, could explain its continued motion. The theory did not originate with Buridan, but he is perhaps the first to have seen that a force of this kind need not be self-dissipating: "[A]fter leaving the arm of the thrower, the projectile would be moved by an impetus given to it by the thrower," he says, "and would continue to be moved as long as the impetus remained stronger than the resistance, and would be of infinite duration were it not diminished and corrupted by a contrary force resisting it or by something inclining it to a contrary motion" (*Questions on Aristotle's Metaphysics*, XII.9). This is a long way from Aristotle, and not all that far from Galileo.

Despite its revolutionary implications, Buridan did not use impetus to transform the science of mechanics. He remained unapologetically Aristotelian in other respects, continuing to hold, for example, that motion and rest are contrary states of bodies. He should instead be thought of as someone who tried hard to reshape Aristotelian physics in the face of an increasingly mechanistic worldview.

Buridan's method in natural science is empirical in the sense that it emphasizes the evidentness of appearances, the reliability of a posteriori modes of reasoning, and the application of naturalistic models of explanation—such as the concept of impetus—to natural phenomena. Purely theological considerations are dismissed as irrelevant: "[O]ne might assume that there are many more separate substances than there are celestial spheres and celestial motions, viz., great legions of angels [*magnae legiones angelorum*], but this cannot be proved by demonstrative arguments originating from sense perception" (*Questions on Aristotle's Metaphysics*, II.9). Buridan concedes that an omnipotent God could deceive people in ways they could never detect, but this is tempered by his confidence, for which he cites empirical evidence, that people's ordinary powers of perception and inference are sufficiently reliable to make "the comprehension of truth with certitude possible for us" (*Questions on Aristotle's Metaphysics*, II.1). He had little patience for skeptical arguments (such as those he believed were advanced by his Parisian contemporary, Nicholas of Autrecourt), objecting that it is absurd to demand that all knowledge be demonstrable by reduction to the principle of non-contradiction. Natural philosophy is about what happens for the most part, assuming the common course of nature.

Despite Buridan's prolific output, stellar reputation, and profound influence on later thinkers, most philosophers know of him only in connection with Buridan's

Ass, the traditional example in which a donkey starves to death because it has no reason to choose between two equidistant and equally tempting piles of hay. This is doubly unfortunate because this example is nowhere to be found in Buridan's writings, though there are versions of it going back at least to Aristotle (see *De Caelo* 295b32). The best explanation of its association with Buridan is that it began as a parody of his account of free choice by later critics, who found absurd his idea that the will's freedom could consist in inaction, or more specifically, in its ability to defer or send back for further consideration any practical judgment that is not absolutely certain. But Buridan's Ass, which is apparently possessed of reason, would have surely seen the good in ceasing to deliberate once his hunger or thirst became too acute, and would have permitted his sensory appetite to lead him to whichever appeared first.

BURKE, EDMUND

(1729–1797)

Edmund Burke, the British statesman and political philosopher, was born in Ireland to a family of modest means. His mother's family was Catholic, his father's Protestant. He was raised a Protestant and educated at a Quaker school and at Trinity College, Dublin, where he took the equivalent of a first-class honors degree in classics. He went to London to read law but was never called to the bar. He devoted most of his time to authorship and literary journalism. Robert Dodsley, a leading London bookseller of the time, loyally backed him; by 1757, Dodsley had published two books by Burke, *A Vindication of Natural Society* (1756) and *Philosophical Inquiry into the Origin of Our Ideas on the Sublime and the Beautiful* (1756), had given him employment as editor of *The Annual Register*, and had contracted to pay him £300 for an *Abridgement of the History of England*.

A Vindication of Natural Society is a satire on the views of Henry St. John Bolingbroke. It claimed to be a recently discovered work by Bolingbroke and was designed to ridicule the idea that the rise of civilized society is attended by misery and suffering. The parody was written with such conviction, however, that many

assumed it was in fact the work of Bolingbroke, and even when it was known that Burke was the author, some critics still thought it was a sincere expression of his true opinion.

Burke's book *On the Sublime and the Beautiful* is more important; indeed, it might well be said to signalize the point at which aesthetic taste in England changed from the classical formalism of the earlier years of the eighteenth century to the romanticism of the later years. Burke attacked the rationalist, classicist notion that clarity is an essential quality in great art. He argued, on the contrary, that what is greatest and noblest is the infinite, and that the infinite, having no bounds, cannot be clear and distinct. He argued that the imagination, moreover, is most strongly affected by what is suggested or hinted at and not by what is plainly stated. Burke also maintained that fear plays a large part in our enjoyment of the sublime. Such fear is diminished by knowledge, but sharpened by veiled intimations. Obscurity, not clarity, is the property of the most powerfully moving art; and, Burke added, "It is our ignorance of things that causes all our admiration and chiefly excites our passions."

Both of Burke's first two works were well received, but neither set him on the road to any further achievement. The *Annual Register* was a success, although Burke regarded it as mere hackwork. He never finished the projected *History of England*. Burke's growing interest in questions of ethics and politics provided him, in time, with an escape from the frustrations of Grub Street. He entered the House of Commons at the age of thirty-seven, and this new life brought him satisfactions he had never known in his earlier career. He became an outstanding parliamentarian; what distinguished him and made him a philosopher among politicians, however, was his capacity to look beyond the matters of the day and to articulate general principles in terms of which he believed the problems of the day should be judged.

A diligent study of Burke's letters and manuscripts brings home the extent to which his approach to politics was a religious one. What is often spoken of as his "empiricism" appears in this light to be better described as Christian pessimism. As a Christian, Burke believed that the world is imperfect; he regarded his "enlightened" contemporaries' faith in the perfectibility of man as atheistical as well as erroneous. Thus, whereas the fashionable intellectuals of his time looked for the progressive betterment of the world through the beneficent influence of Reason and Nature, Burke maintained that the moral order of the universe is unchanging. The first duty of rulers and legislators, he argued, is to the present, not to

the future; their energies should be devoted to the correction of real ills, not to the promotion of an ideal order that exists only in the imagination.

Burke put great faith in the inherited wisdom of tradition. He held that the moral order of the temporal world must necessarily include some evil, by reason of original sin. Men ought not to reject what is good in tradition merely because there is some admixture of evil in it. In man's confused situation, advantages may often lie in balances and compromises between good and evil, even between one evil and another. It is an important part of wisdom to know how much evil should be tolerated. To search for too great a purity is only to produce fresh corruption. Burke was especially critical of revolutionary movements with noble humanitarian ends because he believed that people are simply not at liberty to destroy the state and its institutions in the hope of some contingent improvement. On the other hand, he insisted that people have a paramount duty to prevent the world from getting worse—a duty to guard and preserve their inherited liberties and privileges.

These considerations explain the so-called inconsistencies often attributed to Burke, who supported the movement for the independence of Ireland and the rebellion of the American colonists against the English government, but bitterly opposed the French Revolution. The reason for this seeming inconsistency was that Burke regarded the Irish movement and the American rebellion as actions on behalf of traditional rights and liberties that the English government had infringed on. The French Revolution was quite different, he argued, because it was designed to introduce a wholly new order based on a false rationalistic philosophy. Burke did not object to a resort to force as such; it was the aims of the French revolutionists to which he objected. Similarly, Burke approved of the English Revolution of 1688 because he saw it as designed to restore the rights of Englishmen and to secure the hereditary succession to the throne. The French Revolution, on the contrary, was intended to establish the so-called rights of man and the republican ideals of liberty, equality, and fraternity at the expense of personal property, religion, and the traditional class structure of a Christian kingdom.

In one of his most celebrated works, *Reflections on the Revolution in France* (1790), Burke attacked those of his contemporaries who made an abstraction of liberty, and who invited people to seek liberty without any real knowledge of what they meant by it. He claimed that he himself loved "a manly, moral, regulated liberty as well as any gentleman in France," but he would not "stand for-

ward and give praise” to an “object stripped of all concrete relations” and standing “in all the solitude of a metaphysical idea.” As for equality, Burke insisted that it was contrary to nature and therefore impossible to achieve; its advocates, moreover, did “great social harm,” for by pretending that real differences were unreal, they inspired “false hopes and vain expectations in those destined to travel in the obscure walk of laborious life.” Burke dismissed talk of fraternity as so much “cant and gibberish”; such splendid words were simply the pretexts of the French revolutionists; the causes of the French revolution, however, were “men’s vices—pride, ambition, avarice, lust, sedition.”

Burke’s view of the ancien régime in France was in many ways a romantic one; he was certainly no less a “man of feeling” than was Jean-Jacques Rousseau, whom he detested. But Burke was essentially a religious man living in a rationalistic age. Although he often spoke the language understood by that age—the language of calculation, expediency, utility, and political rights—he had a mind that his contemporaries, and many others, could not readily comprehend. Burke was conscious, above all things, of the reality and unavoidability of evil, and was thus led to claim that the only hope for humankind was to cling to safeguards that had stood the test of time. His hopes for bliss lay in heaven; on earth, his policy was to defend the tolerable, and sometimes the bad, against the immeasurably worse.

Until recently Burke was considered too unsystematic, too empirical, too “unphilosophical,” and too much of a theorist to deserve serious attention. His conservative views were uncongenial to left-wing historians, such as Harold J. Laski and Richard Wollheim, who found him inconsistent. In 1948, however, the Sheffield Public Library (Yorkshire, England) acquired the Wentworth Woodhouse manuscripts, and the largest known collection of Burke’s private papers became available to scholars for the first time since the writer’s death. The study of these papers did much to enhance Burke’s reputation as a political philosopher of signal importance and originality.

BURLEY, WALTER

(c. 1274–c. 1345)

Walter Burley, renowned logician, natural philosopher and theologian, was born in 1274 or 1275, perhaps at Burley-in-Wharfedale or Burley, near Leeds, in Yorkshire, England. He studied and taught both at Oxford (c. 1294–c.1309) and at the University of Paris (c.1309–1327). Based in England from 1327–1341, he perhaps spent his last years in retirement in southern France and Italy (1341–1344).

OXFORD

Burley was a master of arts by 1301 and is mentioned as a fellow of Merton College in 1305. He appears to have heard John Duns Scotus lecture on the *Sentences*, probably in the academic year 1298–1299, and adopts some Scotistic positions in later works: that being *qua* being is the primary and adequate object of the intellect, and that the intellect understands the singular as singular. If Bur-

ley began to study theology at Oxford, he and William of Ockham, whose studies began c.1307–1308, may have been fellow students. Burley's writings from this period, as Jan Pinborg (1937–1982) has rightly observed, "comprise an almost complete course of logic," including *Quaestiones in librum Perihermeneias* and *Quaestiones super librum Posterior Analytics*, as well as treatments of specific topics, *De suppositionibus* and *De consequentiis*. There are commentaries on Aristotle's natural philosophy as well, including *Questions on the De anima of Aristotle*, Book 3.

PARIS

Burley's career in Paris, assuming some prior study of theology, could be reconstructed as follows. Between 1309 and 1314 he was an *auditor* of lectures on the scriptures and the *Sentences* of Peter Lombard, from 1314 to 1317 a *biblicus* (lecturer) on the scriptures, and from 1317 to 1318 a *sententiarius* although his lectures on the *Sentences* are lost. The *Tractatus Primus*, however, recounts a controversy on accidental form with his master, Thomas Wilton, which arose out of his *principium* on Book IV. Its argumentation exhibits a layering of logic and physics in a way that makes Burley a precursor of the Oxford *calculators*, such as Richard Swineshead and John Dumbleton (fourteenth century). In support of his claim that contrary forms, such as hot and cold, belong to the same ultimate species, he argues first *from logic* that things equidistant from an extreme are of the same species. Then, *from Aristotle in natural philosophy*, he argues that if a cooled body is immediately reheated, at some instant, *B*, preceding the first instant the body is cold, *A*, it will have a degree of heat, and at some instant, *C*, succeeding *A*, it will have a degree of cold, both of which degrees will be formally equidistant from maximum heat and thus in the same species. This argument also reflects contemporary debates over first, the *latitude* of forms, the intensive range of possible degrees that an instance of a species of quality may possess; and second, the *first and last instants* of change, the subject also of his *disputatio* at Toulouse, *De primo et ultimo instanti* of the same period.

In 1321, now a priest, he received his last leave of absence for two years of study and had completed his studies by the end of 1323 at the latest. He is referred to as *doctor of sacred theology* in 1324. His teaching career was short since he had left Paris by the beginning of 1327.

BURLEY AND OCKHAM

Perhaps in the same year (1317–1318) that Burley was lecturing on the *Sentences* at Paris, William Ockham was

doing likewise at Oxford. It is clear that from his first exposure to Ockham's *Sentences* commentary, Burley found it necessary to oppose him on a number of important issues in logic and natural philosophy. It was not a one-sided engagement. Ockham borrows from Burley's *Tractatus primus* (before 1324) in his *Quaestiones* on the *Physics*, which Burley in turn uses and criticizes in his own final commentary on the *Physics*, the first six books of which were written after 1324–7. In the *Summa logicae* Ockham both uses and attacks Burley's *De suppositionibus*. Burley counterattacks in his second version (after 1323) of *De puritate artis logicae*. While Ockham's *Logic* is organized in the traditional way around terms, propositions, and arguments, Burley's is organized around the general rules of consequences, thus giving priority to propositional logic.

Burley's explanation of the supposition of terms differs from Ockham's, who holds that first, universals do not exist in re, and second, that they are not constitutive parts of the essence of individuals. On the contrary, Burley holds that universals do exist in re although not apart from singulars. Therefore, according to Burley, when the term *human* in a sentence has *simple supposition* or stands for what is common or universal, it stands for what it primarily signifies: the humanness in Socrates or Plato. For Ockham, however, when *human* has simple supposition, it stands for a common concept, humanness in the mind. The only thing a term can signify or refer to is the individual, for instance when *human* supposits *personally* for Socrates, Plato, and so on. Burley eventually ceded ground to Ockham on the issue of universals as constitutive parts, holding that the universal form merely discloses the individual's essence (for instance, human). Ockham's position that universals are only general concepts implies that science, which is of the universal, must be about spoken, written, and mental propositions while for Burley, science is founded on *real propositions*, that is, propositions whose subjects and predicates are real entities, either singular or universal, but whose copulas are purely mental.

As well as resisting Ockham's reduction of res to singular things, Burley objects to Ockham's reduction of Aristotle's categories to substance and quality. In his *De formis*, (c. 1324–1326), he holds that quantity is a form separate from the quantified body, and he also argues that motion is a form over and above the body in motion, increased and decreased by a succession of specifically distinct forms (*De intensione et remissione formarum*, written after 1323). This explanation, which can be called a *succession* theory, extends to all changes in the degree of a qual-

ity a thing may possess: how the just person comes to have more justice, or that something cold becomes somewhat hot. Every increase in justice or heat, every acceleration of motion, results from the acquisition of a new, more perfect form and the loss of the old, less perfect form.

ENGLAND

Burley's departure from Paris was coincident with the coronation of Edward III (1312–1377), who sent him with a deputation in February 1327 to the papal court in Avignon and again in 1330, now as one of the king's *beloved clerks*, men in the royal service, usually of humble beginnings, who were often the king's agents on diplomatic missions. Again, from September 1338 until Easter 1339, Burley went "beyond the seas on the king's service" (*Calendar of Patent Rolls*, 1338–1340, p. 123).

Burley's academic career ended when he left Paris, and it seems that he had no significant scholarly projects in hand during the next seven years. However, some time after Richard Bury was enthroned as bishop at Durham in 1334, Burley became a member of his household. Bury's patronage and the intellectual energy of the circle he gathered around him would fuel Burley's renewed career as a scholar.

Between 1334 and 1337 Burley completed a commentary on Books 1–6 of the *Ethics*, added Books 7 and 8 to his final commentary on the *Physics*, and revised his commentary on the *Ars vetus*. He began to revise the commentary on *Ethics* 1–6 and add a commentary on 7–10 in 1338–1339. In the commentaries on the *Physics* and *Ars vetus* are found Burley's references to the *moderni*, those thinkers encountered first during his Paris years, who threaten the purity of the font of all philosophy: Aristotle. The doctrines that Burley identifies as being those of the *moderni* are not confined to any single philosophical discipline, and appear, by Burley's account, to form a systemic threat to philosophy itself. His commentary on Aristotle's *Politics*, begun in 1338–1339, is, along with his *Ethics* commentary, heavily dependent on Thomas Aquinas's expositions of those works (written between 1269–1272). Nevertheless, they contain doctrines original with Burley, for example, in the *Politics*, that of the "co-rulership" of kings with those who are "their friends and the friends of the government" (fol. 186r) and doctrinal divergences from Aquinas, for example, in the *Ethics*, the role of the speculative intellect in understanding the precepts of natural law (1500, fol. 103r).

Upon completion of the four expositions of Aristotle (c.1340), Burley, who was now in his mid-sixties, appears

to have sought some disengagement from the rigors and antagonisms of scholarly life, which may have led to his journey to Italy, probably in 1341.

SOUTHERN FRANCE AND ITALY

In 1341 Burley engaged in a *disputatio de quolibet* in the arts faculty at Bologna, an event that has been connected with his supposed Averroism. Burley was not an Averroist, however, if this term implies someone who adopts positions contrary to the Christian faith on the authority of Averroes. This is clear from the beginning of his career in his questions on *De anima*, Book 3, where he concludes that "neither is the material intellect one in all, nor also the agent intellect" (3.44). Then in Paris, where his master was the Averroist Wilton, his short work *De potentiis animae* reiterates this position.

The *De vita et moribus philosophorum* was long thought to have been the fruit of Burley's retirement in southern Europe. However, large sections from it are found in a manuscript dated 1326, when Burley was in Paris, which, together with the claim that no attribution of the work to him is earlier than the fifteenth century, has led to a presumption against Burley's authorship of this immensely popular work. Nevertheless, this evidence is not conclusive, and given his habits of appropriating large amounts of text from other authors and frequently reworking his own texts, it is not impossible that the *De vita et moribus philosophorum* passed through Burley's hands at some point in its history.

On 23 November 1343, Burley was in Avignon to present a copy of his commentary on the *Politics* to his old Parisian acquaintance Pierre Roger, now Clement VI (1291–1352). This gift, complete with an elegant letter and a miniature showing the presentation, could have been both in appreciation and expectation of further patronage. Indeed, Burley obtained the rectory at Great Chart, Kent, on 19 June 1344, the last date he is known to have been alive.

Walter Burley exerted considerable influence both on his contemporaries and on philosophical thought into the sixteenth century, to which the number of early printed editions of his commentaries on Aristotle testify. This influence may be attributed, firstly, to the originality and the clarity of the positions he maintained in the controversies of his day, both in logic and natural philosophy. He contributed significantly to the debates concerning supposition theory, consequences, *obligationes*, and *sophismata*. In natural philosophy his theory of the *first and last instants* of change, which distinguishes between *permanent* and *successive* things or states, becomes a stan-

dard view, and the *succession* position, which he defends in his classic work, *On the Intension and Remission of Forms*, is frequently cited, being both opposed and defended, into the sixteenth century.

His skill at the traditional exercise of commentary on Aristotle was also acknowledged. In glossed Latin manuscripts of Aristotle and Averroes, he is one of the commentators most frequently cited, especially in connection with the *Ethics*, *Politics*, *Physics*, and logical works of Aristotle. In addition, manuscripts of Burley's commentaries on these works had a wide circulation. Early printed editions of an important collection of *auctoritates* of Aristotle and other philosophers carry his textual comments, along with those of Averroes, Robert Grosseteste, Albert the Great, and Thomas Aquinas. A revival of interest in Burley's thought, particularly his logic and natural philosophy, was underway by the 1960s, and earlier assessments of him as an unworthy opponent of Ockham have not survived a closer study of his work, which has revealed its originality and depth.

BURTHOGGE, RICHARD

(c. 1638–c. 1698)

Richard Burthogge, the English physician and idealist philosopher, was born in Plymouth. After taking an arts degree at Lincoln College, Oxford, he studied medicine at the University of Leiden and returned to his native country to practice near Totnes in Devonshire. Of pacific and conciliatory disposition, he seems to have wavered in the religious controversy between Catholicism and Puritanism, and in philosophy, between Lockean sensationalism and Cambridge Platonism. He distinguished between

heresy and error, maintaining that the former “must be eradicated,” but the latter tolerated for humanity’s sake. His life is obscure, and little is known of it beyond that information revealed in his writings, which have a certain importance as anticipations of Immanuel Kant.

We know the world, according to Burthogge, only through our own ideas, and these do not give us its real nature. On the contrary, our ideas transform the nature of things into qualities that are purely subjective. Similarly, our values are our own; and such relative judgments as those involving categories of cause and effect, or whole and part, are arrived at through the constitution of our minds, not discovered embedded *in rerum natura*. The things themselves, though remaining unknowable, nevertheless cause ideas to arise in our minds. Here Burthogge foreshadowed Kant’s paradox of the relation between *noumena* and *phenomena*. Burthogge’s view that the human mind projects relations into the external world exemplifies his Neoplatonic streak. However, this strain was accompanied by a Lockean one which led him to assert that no confidence could be placed in an idea contradicted by sensation. Burthogge thus seems to have accepted John Locke’s theory of two kinds of ideas, those of sensation and those of reflection.

For Burthogge, there were also two kinds of truth—metaphysical and logical. Metaphysical truth is found in the conformity between our ideas and those in the mind of God; logical truth, in the conformity between our ideas and the things of which they are ideas. We cannot apprehend the former kind of truth; but since the latter involves knowing the unknowable, logical truth is reduced to consistency. Burthogge would not accept the doctrine of innate ideas, because if we had such ideas, we would be able to discover truth through introspection alone. He asserted dogmatically that there is a coherent system of ideas, duplicating the system of things, even though no individual possesses it. This system, he maintained, exemplifies God’s ideas.

In his treatise on the soul of the world, Burthogge supported the Neoplatonic concept of a plastic nature permeating the universe and accounting for its “harmony.” This is breathed into things by God himself but is not to be identified with God. If nothing else, this treatise is valuable as an example of the philosophy of nature which was acceptable to learned men of the time.

Burthogge, in sum, is one of the anomalies of the history of philosophy. He advanced startlingly “modern” ideas, side by side with fantasies no longer taken seriously.

BUSINESS ETHICS

Discussions of ethics and business trace back to the writings of Plato and Aristotle and persist in the modern philosophical writings of Karl Marx, John Rawls, and others. Although business ethics as a specialized field of study did not emerge until the 1970s, it has grown sharply since. Philosophers, political scientists, business academics, and social psychologists have written systematically about a variety of issues such as the moral status of the corporation, the ethical foundations of the market, fairness in advertising, bribery, corporate governance, human rights and multinational corporations, and business obligations to the environment. During that time, rival theories for interpreting business ethics have emerged and been debated.

Traditional philosophers such as Plato, Aristotle, Aquinas, and Kant discuss issues of the right and wrong in economic activity. They sometimes examine specific business ethics puzzles, including the ethics of the profit motive, just price in trade, usury in lending, and ethics in negotiation. Thomas Aquinas writes at length about the

question raised first by Cicero of whether a grain merchant carrying grain to a community stricken by famine is obliged to reveal to the townspeople that other merchants behind him are bringing more grain. (Aquinas concludes that, contra Cicero, the merchant is not so obliged because no businessperson has an obligation to make a prediction which, if it turned out to be false, would rob him of a “just” price.) Moreover, questions about broad economic design are ubiquitous in the history of philosophy. For example, the issue of the communal ownership of property (in modern terms, communism and socialism) was first brought into sharp relief by Plato, was critiqued by Aristotle, and has been the subject of bitter controversy ever since.

For convenience, it is helpful to conceive business ethics as having three parts, where each part corresponds to the level of entity being analyzed: namely,

1. Individual businesspersons: including employees, entrepreneurs, investors, traders, and consumers
2. Business systems, including economic systems, cultural norms, and regulatory and judicial systems.
3. Business organizations, including corporations, trade associations, and international financial organizations such as the WTO, the World Bank, and the IMF.

Each of these three entities gives rise to both questions of right and wrong (normative issues) and to questions of fact (empirical issues). Because empirical issues are not, properly speaking, philosophical ones, and despite the fact that a large and important empirical literature now exists (authored by sociologists, economists, and business academics), this article will not attempt to analyze and explain that empirical literature.

INDIVIDUAL BUSINESSPERSONS

Philosophers have debated the issue of the individual’s pursuit of money and profit for centuries. Plato famously denied top-status positions of ruler or guardian in his ideal state, the Republic, to business people (indeed to all owners of property) out of fear that their pursuit of wealth would corrupt their political virtue. It remained for the eighteenth-century philosopher, Adam Smith, author of the *Wealth of Nations*, to make the pursuit of profit at least moderately respectable: “It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner, but from their regard of their own interest. We address ourselves not to their humanity, but

to their self-love and never talk to them of our own necessities, but of their advantage.” (p. 13.)

Smith meant to draw attention to the fact that efficient economic transactions frequently rely on self-interested or profit-oriented motives rather than more noble motives such as benevolence. In his view, then, our shared goal of achieving a healthy, efficient economy justifies a significant amount of profit-seeking and self-interested activity in business. His well known “invisible hand” provides a metaphor for explaining how free markets seem to direct the inevitable, if regrettable, self-interest of businesspersons toward the common good.

One’s ethical evaluation of profit-seeking by businesspersons may be influenced by one’s antecedent commitments to ethical theory. Smith’s invisible hand relies heavily on consequential considerations: Individual acts and motives are judged ethically through their consequences. For Adam Smith, then, we should sometimes tolerate darker, self-interested motives in business so long as the consequences produce social benefits. Yet a non-consequential approach to ethics—one placing more emphasis on the quality of the motive or the principle of the individual’s action—lacks appeal directly to such a practical justification. A nonconsequential approach must justify profit-seeking, if at all, by nesting the profit motive under other, less selfish motives, such as attempting to benefit one’s family, one’s community, or society by way of pursuing profit.

Critics have objected to a broad, self-centered view of business because it appears to presume selfishness or, at the very least, psychological egoism. The focus in much of modern economics is upon developing increasingly sophisticated conceptual mechanisms to maximize the achievement of economic goods such as money, market share, or profits, all of which seem to exclude the pursuit of “higher” interests such as benevolence, social welfare, and environmental integrity. Even well-known economists such as Amartya Sen have asserted that the rational economic man, *homo economicus*, is dangerously close to being a “rational fool.” Opposing economists respond, however, that the maximization of individual preferences can easily include the satisfaction of other-oriented preferences such as helping the poor or protecting the environment. A businessperson may simply prefer saving the environment to maximizing his income. Whether such other-oriented preferences can be subsumed comfortably within the mathematically inclined methods that dominate modern-day economics remains hotly debated.

BUSINESS SYSTEMS

Disputes are common about the extent to which self-interested motives are acceptable in economic behavior. These disputes overlap with others about the desirability of forms of business systems. Just as Adam Smith did, modern economists often stress the societal benefits of free, self-interested market activity. They note that markets free from government interference encourage free exchanges among individuals, and, in turn, business productivity. A realm of perfectly free exchanges, indeed, is often said to establish a condition called “Pareto Optimality”: a state in which no one can be made better off without someone being made worse off.

Not surprisingly, then, debates in business ethics have frequently centered on the assumptions of traditional economic theory. Microeconomic theory (which constitutes a part of what is sometimes called neoclassical economic theory) views market participants as rational agents seeking to maximize their own utility. In more recent economic writings “utility” is interpreted to mean the maximal satisfaction of one’s individual preferences.

Whether economic theory contains an embedded bias towards selfishness or not, most economists agree that market participants can encounter situations where a businessperson’s rational self-interest collides with the social welfare. One of the most notable of these situations is the “prisoner’s dilemma” discussed by game theorists, wherein rational self-interest leads each player to defect in certain contexts where cooperation is clearly the best long-term strategy for all. Because prisoner’s-dilemma situations are believed to arise frequently in business transactions, it follows that even fully self-interested businesspersons should have an interest in developing techniques of cooperation, both for themselves and others. Indeed, some philosophers have even argued that nearly all morality can be derived from such rational pursuit of self-interest through cooperation.

Others theorists argue that business ethics is simply impossible so long as market freedom is the dominant value. They assert that, in addition to problems such as the prisoner’s dilemma, persistent discrimination, sexual harassment, environmental pollution, false advertising, financial scandals, child labor, and bribery require a more of a “visible hand” (usually government’s) than an “invisible” one.

Nonetheless, even defenders of heavier regulation of business grant that often law is relatively impotent in ensuring business ethics. For example, law tends to lag behind the knowledge emerging in an industry, so that it

often comes too late to correct abuse. Scientists in the asbestos industry in the United States knew about the dangers of asbestos long before laws could be drafted to regulate asbestos harm. Moreover, laws tend to apply to the jurisdiction from which they emanate. Hence, U.S. or German law is nearly powerless to control multinational corporations operating in host countries. This point has special force in many developing host countries where laws are unsophisticated and poorly enforced.

Conflicting cultural values can frustrate ethical decisions. For example, in countries where “grease” payments are common, are businesspersons justified in paying customary bribes to government officials? Or consider issues of human rights. In countries where educational opportunities are inadequate, is it acceptable to hire a fourteen-year-old for full-time employment? Does it make a difference that, as sometimes happens, the majority opinion among adults in a given country holds that child labor is ethically acceptable? Business ethicists have proposed a variety of theories to help solve such dilemmas. Most deny that all employment conditions between the home and host countries of the corporations must be comparable; if that were true, it is argued, employees would, for example, receive exactly the same pay (or at least the same pay adjusted for cost-of-living differences) for the same work. But such wage parity would freeze out almost all foreign investment by multinational corporations in the developing world. Instead, the dominant approach has been to specify a floor of rights that apply to labor conditions and that all corporations must respect.

BUSINESS ORGANIZATIONS

Some disagree that a corporation can ever be “responsible” or “irresponsible.” They note that corporations have exceedingly narrow personalities; they are chartered for the purpose of making money for their investors. They have, in the words an English jurist, “no pants to kick or soul to damn.” Can such organizations be said to have a conscience or moral responsibility? A few theorists regard the corporation as analogous to a large bureaucratic machine and for this reason hold it to be misleading to speak of a corporate “conscience.” In turn, they reject the very idea of corporate ethical responsibility. Only individual businesspersons, not corporations, are the true bearers of ethical responsibility. They thus deny moral agency to the corporation, denying that a corporation attains the status of an actor for which such moral predicates as “is responsible” and “is blameworthy” are appropriate. In contrast, theorists who see the corporation as either a large, abstract “person” (the corporation in most

legal systems is regarded as a *persona ficta*, a fictional person) or an organization possessing a decision-making structure capable of rational deliberation are called moral-agency theorists. They believe that corporations are capable of behaving responsibly or irresponsibly.

Assuming, then, that the corporation is even the kind of thing that can behave responsibly or irresponsibly, the question next arises about what a corporation's "being responsible" means. Three major approaches to this question have been offered. These may be labeled: the Classical Framework, the Stakeholder Framework; and the Social Contract Framework.

THE CLASSICAL FRAMEWORK

The "classical" framework asserts that the moral responsibility of the corporation is nothing other than maximizing profits for its investors. This approach is associated with modern economic theory and writings of Frederick Hayek and Milton Friedman. The view holds that the sole moral responsibility of the corporation, and in turn of the managers who serve as agents for the shareholders, is to enhance the interests *only* of the owners of the corporation, the shareholders. The corporation is often seen by its classical defenders as a nexus of contracts among free-acting individuals whose peculiar advantage lies in its ability to reduce transaction costs among participants by, for example, offering organizational remedies in lieu of expensive, individual contracts among individuals.

Critics of this approach are quick to point out that corporate executives are not publicly elected officials and as such are poor choices for shouldering decision-making promoting the common good. Indeed, often corporate executives have been associated with bad choices, as when large U.S. companies in Chile decades ago helped unseat the country's democratically elected president. Do we really want, these critics ask, to entrust corporate officials with the common good?

THE STAKEHOLDER FRAMEWORK

On the stakeholder theory, managers have obligations primarily to shareowners but also have certain ethical obligations to other groups called "stakeholders"—those who have a stake in the corporation's activity, including customers, stockholders, employees, and people who live in areas affected by the corporation. Disagreements exist about precisely who should be included as stakeholders, but almost all theorists agree that three principal groups of stakeholders are customers, employees, and stockholders. Hence, the stakeholder framework agrees with the

classical framework in assigning special importance to the interests of stockholders. The difference between the stakeholder view and the classical view, however, is that stakeholder theorists do not limit the responsibilities of corporate managers entirely to satisfying stockholder interests. Managers, in turn, must make tradeoffs among the interests of the corporation's stakeholders if they are to manage well. Some stakeholder theorists argue that by working to enhance the interests of all stakeholders, the company will also maximize the long-run interests of the stockholders. But other theorists disagree, arguing that some stakeholders must inevitably receive less in order for the stockholder to achieve a maximum return on his investment.

THE SOCIAL CONTRACT/SOCIAL CONTRACTS FRAMEWORK

This view construes corporate and managerial obligations in terms of implicit "contracts" that exist in and among companies, industries, political units, and other relevant economic communities. For example, it has been argued that an implicit "social contract" exists between corporations and society requiring that corporations refrain from exploiting their workers or from destroying the environment; in return for the special favors it receives from society—unlimited longevity (because in most legal systems a corporation is a "persona ficta" or fictional person, it never dies) and limited liability (investors in corporations are responsible for the actions and debts of the corporation only up to the extent of their invested money). In a similar vein, it has been argued that an implicit social contract exists in most societies requiring that jobs and advancements allocated by a consideration of the qualifications of the applicant rather than his or her gender or race. Beginning in the 1990s, the idea of a social contract was extended by some to include the possibility of a multiplicity of social contracts, interpreted as the implicit set of agreements that exist within and among communities of economic actors, including corporations, trade associations, unions, industries, and professional associations.

Other business ethics issues arise for for-profit corporations. One of these is the factual question of whether a corporation that has better ethics will make more money in the long run than a corporation with worse ethics. Scores of empirical studies on this topic have been conducted, although the answer remains elusive. There is also the question of how a good corporation should be structured. What form of corporate governance should a corporation adopt? Should it include employees on its

board of directors? Should employees participate in the management of the corporation, and should they perhaps be given automatic status as shareholders?

Lurking in the backdrop of many discussions of corporate ethics is the issue of what power, if any, managers should have in making ethical decisions. Suppose, for example, that competitive market forces eclipse any moral "space" that managers might have. In such an instance, the entire notion of "business ethics" seems irrelevant. If "ought implies can" and if business managers are captive to the dictates of the market, then how can one say that they "ought" to behave well? On this view, the only way to reform business behavior is to change the surrounding market or regulatory environment—that is, to force business to recognize that its self-interest lies in ethical behavior. Most business ethicists, however, agree that corporations have at least some discretionary space. The empirical debate centers on how much.

BUTLER, JOSEPH

(1692–1752)

Though he has not left us a complete philosophical system, Joseph Butler produced a moral philosophy that is still held in the highest esteem, and a philosophical theology of considerable long-term value. Butler was the eighth child of a prosperous draper. His father enrolled him in a dissenting academy, but he decided to join the established church and entered Oriel College, Oxford, in 1714. While still at school he had engaged in a philosophical correspondence with Samuel Clarke and at Oxford was befriended by Edward Talbot, son of the Bishop of Salisbury. Clarke and Talbot's father were instrumental in Butler's being appointed, after graduation, as Preacher at the Chapel of the Rolls. A selection of his sermons there was published in 1726 under the title *Fifteen Sermons Preached at the Rolls Chapel*. In 1729 a second edition appeared, with an important new preface. Bishop Talbot's patronage continued with Butler's entering the living of Houghton, and later that of Stanhope, in Talbot's later diocese of Durham. While at Stanhope Butler wrote his other major work, of which the full title is *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*. This appeared in 1736, and appeared in a second edition in the same year. By then Butler had entered royal circles. His school friend Robert Secker had drawn him to the attention of Queen Caroline, who appointed him Clerk of the Closet in 1736, conversed with him frequently on theological and philosophical matters, and received the sacrament from him on her deathbed in 1737. The king promised her that he would advance Butler and made him Bishop of Bristol in 1738. There is an unsubstantiated story that he was offered the see of Canterbury in 1747 and declined it. In 1751 he

became Bishop of Durham but was not destined to preside there for long because his health rapidly declined. He died in 1752, and was buried in Bristol. He never married.

BUTLER'S AIMS AND METHODS

Butler's personal history shows that he was, in C. D. Broad's words, "a thoroughly unworldly man whom the world treated very well." His integrity and intellectual prowess were widely recognized, and the patronage he received merely ensured that he did not suffer for them. His writings are often hard reading (and the sermons must often have been hard listening), not because they are unclear but because Butler aims at clarity exclusively and often sacrifices elegance in pursuit of it.

Butler is a Christian priest who seeks his readers' spiritual welfare. So, although his theoretical skills are considerable, they are wholly subordinated to his practical concern for the exercise of virtue and the proper consideration of the claims of religion. In urging these, however, he does not appeal to revelation. Nor does he use the *a priori* arguments in ethics and theology employed by Clarke, although he says he agrees with these. Butler's own methods are empirical ones. His ethical arguments are designed to show that the exercise of virtue is the expression of our true human nature and that vice violates it. His religious apologetic is based on the same appeal to probability that he thinks necessary for prudent conduct in everyday life. His famous attacks on selfish and hedonistic theories of human nature are designed to remove what he sees as the morally dangerous influence of faulty philosophy and are not intellectual explorations undertaken for their own sake.

ETHICS

In the *Rolls Sermons*, Butler seeks to encourage his worldly-wise hearers to practice virtue by arguing that to do so is to live in accordance with our nature. Virtue is the natural form of life for us, and vice is unnatural. He assumes, as his hearers would also have done, at least nominally, that the motives and capacities in our nature are placed there by God for our good, and he maintains that a realistic attention to those motives and capacities will show that living virtuously represents their natural exercise.

His argument has two main stages. The first stage is an account of the components of human nature, and the second is a claim about its structure and about the implications of that structure for our conduct. He argues that our nature is misrepresented by those (particularly Hobbes) who think that we are always selfish and by those who hold

that we are always motivated by the desire for pleasure. If either of these theories were true, genuinely virtuous action would be impossible. Butler holds instead that our nature contains within it several distinct principles. There are, first, the "particular passions, appetites, and affections" such as the desires for food or possessions, or the emotions like joy or anger. There is, next, the "general affection of self-love," which is the desire for one's own long-term interest or happiness (which Butler interprets as the proper satisfaction or expression of one's own particular passions). It is self-love that causes us to restrain our present appetites in the interest of our long-term health, for example; and Butler clearly thinks of it as requiring rational calculation. Thirdly, there is the "natural principle" of benevolence. Butler uses this term as a general name to include all those desires we have for the good of others. (Scholars disagree over whether he also thinks of it as a rational principle in the same way that self-love is.) He identifies it with the love of one's neighbor.

Finally, and most important, our nature includes conscience. He describes this as "a principle of reflection in men, by which they distinguish between, approve and disapprove their own actions." Its judgments pronounce actions and motives to be "in themselves just, right, good" or "evil, wrong, unjust," and when it makes such judgments it "magisterially exerts itself." So conscience judges actions and motives in an intuitive manner and judges them as being of certain kinds, not as having good or bad consequences.

In defending his account of the components of our nature, Butler appeals primarily to our common experience. He also produces classic arguments against Hobbesian and other theories that say our motives are always selfish or are always directed toward pleasure. Experience seems to show us many examples of actions done from benevolence, and only *a priori* commitment to theory can incline us to doubt that our motives are often as they seem. Furthermore, self-love is only the motive for some actions and not for all. And although we do indeed gain pleasure from the successful pursuit of objects we desire, it is these objects themselves, and not the pleasure we derive from them, that we are pursuing.

But our nature is not merely one in which all these principles are to be found. It is one in which they form a system or constitution in which there is a built-in order of superiority and subordination. When we act in accordance with this order, we act naturally and so virtuously; when we violate it, we act unnaturally and so viciously. Butler introduces this claim with reference to the natural superiority of self-love to particular desires. If an animal

enters a baited trap in pursuit of food, it acts naturally because it follows the desire that is the strongest. But if a human knowingly satisfies a desire at the expense of his or her long-term good, then he or she acts unnaturally by ignoring the proper superiority of self-love to the ruinous desire. There is, therefore, a crucial distinction to be made in human nature between the strength of some motivating principle and its authority. In prudent behavior they coincide; in imprudent behaviour they clash.

Butler's key ethical doctrine is that of the natural supremacy not of self-love but of conscience. To live virtuously is to do what conscience approves and avoid what it disapproves. This does not mean that Butler identifies virtue with acting from duty (or conscientiousness); for conscience may well add its approval to actions that are already motivated by desire or by self-love. But when we are inclined to do something conscience rejects, or fail to desire what it enjoins, it may well have to supply its own motivating influence.

Butler thinks we usually have no difficulty in identifying right actions. He also thinks that these very largely coincide with the promptings of benevolence. But in the "Dissertation on Virtue" appended to the *Analogy*, he firmly rejects the utilitarian suggestion that virtue and benevolence can be identified. We lack the detailed knowledge of consequences for this to be true, so virtue consists rather in doing those acts that conscience approves—that is, acts of the right kind. That such acts will lead to the general good must be left to providence. He also thinks that providence must ensure that following conscience will not prove to be at odds with the demands of self-love and that benevolence (or love of neighbor) and self-love will also prove, in the end, to coincide.

Butler's case for the supremacy of conscience is therefore based on four related claims: that conscience has a natural authority, that is manifest in the way it makes its judgments; that to disregard it is to behave unnaturally; and that doing what conscience tells us is in the end for our good, even though we may not immediately discern this. These arguments are designed to persuade those who feel they know well enough what conscience tells them to do, but are still inclined to ask whether this is a compelling reason to do it. He tells them that if they recognized the place conscience has in their natures, they would see that it is.

The Rolls Sermons are notable for Butler's shrewdness, theoretical acumen, and wise moral psychology. They contain interesting and durable treatments of themes such as compassion, resentment, forgiveness, and self-deception.

PHILOSOPHICAL THEOLOGY

Butler's ethical sermons are still widely read, and their arguments have not dated. His religious apologetic has fared less well, even though it was better known in the century after his death. The reason for its present lack of influence is the fact that the debates to which it was intended to be a contribution have long since ceased. Butler's intent in the *Analogy of Religion* was to respond to the attacks on Christian orthodoxy made by the Deists. The Deists believed that the rational order of the cosmos revealed by science shows that our world had a creator, but they rejected Christian claims to revelation, maintaining that we only have need of "natural religion"—that is, the moral guidance of conscience and a vague general reverence for God. A deity who is rational in the way the design in nature shows God to be would have no need of special revelation, miracle, or priest craft to instruct us. Butler sees it as his task to restore the traditional connection between belief in God and openness to revelation in the face of this criticism.

Butler wants to encourage his readers, whom he assumes accept the reality of God, to pay close attention to the claims of Christianity and not dismiss them. He thinks that these claims have strong evidence in their favor; but his aim in the *Analogy* is less to show this than to persuade those who doubt it that they would still be prudent to examine them with care. He repeatedly stresses the importance of the claims that Christianity makes and the rashness of disregarding them. Probability, he tells us famously, is the guide of life. This assertion, though it is not accompanied by any philosophical analysis of the concept of probability, has two implications in Butler's thought. First, just as we have, in daily life, to base decisions on likelihoods rather than certainties, so in religious matters we must recognize our intellectual limitations and base our faith on what experience and reflection teach us is likely to be true rather than demand an unattainable certainty. Second, just as in life we often have to base decisions on the fact that there is a small chance of events that it would be foolish not to be prepared for, so in religious matters we should take the claims of revealed religion seriously as long as they have some degree of probability, even if it is a very modest one.

Butler opens the first part of the *Analogy*, on natural religion, with a case for a future life, a case that makes no appeal to providence. The key argument that he uses rests on a distinction between a person's possession of powers and the possession of means for their exercise. Although physical death clearly removes all sign of the capacity to exercise our powers, we cannot assume that it destroys

those powers themselves; just as there are many examples in nature of radical transformation in the history of living creatures, so we can reasonably expect the continuance of human powers hereafter. (In a well-known appendix to the *Analogy*, “Of Personal Identity,” he further argues that our consciousness reveals to us that we are identical beings in the “strict and philosophical” sense—that is, fundamentally unchanging spiritual substances.)

In the remainder of Part I, Butler draws an analogy between the early and mature stages of human life on the one hand and the present life and the future life taken together on the other. He argues that we can discern clear signs that God teaches us the value of prudent and moral behavior in the early years of life in order to equip us to make good choices in our adult years and that we can reasonably infer that the exercise of virtue in the present life should be viewed as a training that fits us to enter the next. We are, he says, in a state of moral probation—a concept that partially anticipates John Hick’s “soul-making” theodicy of the mid-twentieth century. God’s government of the world is a “scheme imperfectly comprehended”; our ignorance of it, which Butler repeatedly emphasizes, is nevertheless only partial.

Part II defends revealed religion against deist criticisms. There should be no general presumption against miracles, because occasional divine violations of natural law might still be manifestations of “general laws of wisdom” and thus teach us, even though we could not predict them; and even though biblical prophecies may not have involved foresight on the part of their writers, if one thinks of God as the ultimate author of the book in which they are recorded, they can still reveal a divine purpose. Butler’s basic defense, however, is that the recognition of our limitations should deter us from supposing that we know enough of God’s purposes to dismiss the claims of revelation without careful study and that the overwhelming importance of Christian claims, if they are true, makes it frivolous and imprudent not to consider them with care, even if their probability may not at first seem high. He insists that with our limitations we should not expect more certainty in religious matters than we do in comparable secular ones, where our knowledge is also often merely partial—a form of argument that anticipates later demands by Christian apologists for philosophers to accord intellectual parity to the claims of religion. He also tells us that the claims of Christianity should be considered as a whole rather than piecemeal and that the case for its acceptance must be a cumulative one.

Butler’s theology suffers in retrospect because Hume has made us question whether we can properly draw the

analogy between this life and another on which the arguments of Part I of the *Analogy* depend, because only one of the terms of this analogy has been an object of experience. It has also seemed dated because the assumption of divine government that Butler and the Deists shared are no longer current. But many features of his reasoning can be detached from these two handicaps. His emphasis on our intellectual limitations, his doctrine of probation, and his insistence that the case for Christianity is a cumulative and probable one, all have present-day counterparts, and his detailed defenses of revealed religion are easily detachable from their contexts.

Bibliography

There is no complete edition of Butler’s works in print at present. The best available is *The Works of Joseph Butler*, edited by J. H. Bernard, 2 vols. London: Macmillan, 1900. Next best is *The Works of Bishop Butler*, edited by W. E. Gladstone, 2 vols., Oxford, 1897. (Gladstone breaks up Butler’s paragraphs, which Bernard numbers but leaves intact; and Bernard’s notes are often helpful.) Butler, Joseph, *Fifteen Sermons and Dissertation upon the Nature of Virtue*, edited by T. A. Roberts, London: S.P.C.K., 1970, is a good recent edition of the Rolls Sermons. The most accessible reprint of the sermons it contains, and of the Dissertation, is *Five Sermons Preached at the Rolls Chapel and a Dissertation upon the Nature of Virtue*, edited by Stephen L. Darwall, Indianapolis: Hackett, 1983. There is no extant edition of the *Analogy of Religion*, although libraries and bookstores often have nineteenth-century reprints of it because it was required reading for Anglican ordinands for many years. As of this writing, a new edition of Butler’s sermons is expected from Oxford University Press (U.K.) in 2006, edited by David McNaughton.

There are two general books about Butler and his times that are valuable: W. A. Spooner, *Bishop Butler*, London: Methuen, 1901; and Ernest Campbell Mossner, *Bishop Butler and the Age of Reason*, New York: B. Blom, 1971. A recent collection that contains fine essays on all aspects of Butler’s life and work is Christopher Cunliffe, ed., *Joseph Butler’s Moral and Religious Thought: Tercentenary Essays*, Oxford: Clarendon Press, 1992. Terence Penelhum, *Butler*, London: Routledge, 1985, covers his ethical teachings and attempts to rescue his philosophical theology from undeserved neglect. Austin Duncan-Jones, *Butler’s Moral Philosophy*, Harmondsworth: Penguin, 1952, is a high-quality treatment of the ethics.

There are many good essays and chapters about Butler. On the ethics, the best beginning is Chapter 3 of C. D. Broad’s *Five Types of Ethical Theory*, London: Routledge, 1930. A severe critique of Butler that argues his doctrine of the naturalness of virtue leads to incoherence is Nicholas L. Sturgeon, “Nature and Conscience in Butler’s Ethics,” *Philosophical Review* 85 (1976), 316–356. On this and the issue of the

supremacy of conscience, see Stephen Darwall, "Conscience as Self-Authorizing in Butler's Ethics" in Cunliffe (1992), 209–242. The notion of the naturalness of virtue is explored with originality in Alan Millar, "Butler in God and Human Nature" in Cunliffe, 293–315. Another excellent essay is Jerome Schneewind, "The Divine Corporation and the History of Ethics," in *Philosophy in History*, edited by R. Rorty, J. B. Schneewind, and Q. Skinner, 173–192, Cambridge, U.K.: Cambridge University Press, 1984.

For a long time the only good treatment of Butler's theology was C. D. Broad, "Bishop Butler as Theologian," in C. D. Broad, *Religion, Philosophy, and Psychological Research*, London: Routledge, 1953, 202–219. The situation improved with Anders Jeffner's *Butler and Hume on Religion*, Stockholm: Diakonistyrelsens Bokforlag, 1966. Penelhum, *Butler* (above), carries the debate further. See also especially the essays by David Brown ("Butler and Deism," 7–28), Basil Mitchell ("Butler as a Christian Apologist," 977–1116), and T. A. Roberts ("Butler and Immortality," 169–188) in Cunliffe. The importance of Butler's thinking as a stimulus to Hume is explored in Paul Russell, "Butler's 'Future State' and Hume's 'Guide of Life,'" *Journal of the History of Philosophy* 42 (2004): 425–448. It is clear that Section 11 of Hume's *Enquiry concerning Human Understanding*, "Of a Particular Providence and Of a Future State," is for the most part an attempt to undercut the use of analogical reasoning found in Butler's *Analogy*. John Hick's "soul-making" theodicy is to be found in his *Evil and the God of Love*, London: Macmillan, 1966.

The best place to begin study of Butler's religious thought, however, is Sermon 15 of the *Rolls Sermons*, "Of the Ignorance of Man," which prefigures much of the prudential apologetic that the *Analogy* develops in detail.

Terence Penelhum (2005)

BUTLER, SAMUEL

(1835–1902)

The English writer and critic Samuel Butler was the author of the satirical novels *The Way of All Flesh*, *Erewhon*, and *Erewhon Revisited*, as well as several discussions of philosophical biology and the theory of evolution. He was the son of the Reverend Thomas Butler, whom he depicted as a domestic tyrant in *The Way of All Flesh*. Butler was sent to Cambridge by his father in the hope that he would become a clergyman, but after graduating he refused to take orders because of doubts about the Christian creed. In 1859 he emigrated to New Zealand, where he became a successful sheep farmer and for a time a convert to Darwinism. Returning to England in 1864 with enough money to live on, he began a career as an author, painter, and musician. The subject of evolution continued to occupy his mind for many years. It forms the substance of several essays and four books: *Life and Habit* (London, 1878), *Evolution, Old and New* (Lon-

don, 1879), *Unconscious Memory* (London, 1880), and *Luck or Cunning?* (London, 1887). These works reflect a mounting hostility to the ideas of Charles Darwin and a desire to champion those of Erasmus Darwin and the Chevalier de Lamarck. This hostility first made its appearance in *Erewhon* (London, 1872).

EVOLUTION

Butler was neither a scientist nor a philosopher. His discussions of evolution are the work of a literary man with strong intellectual interests but little capacity for exact thought. He was at his best when giving scientific and philosophical ideas an original twist that often put them in quite a new light. To many fellow Victorians he seemed an irreverent skeptic or even an atheist; but in fact, he wanted to retain religion while discarding the Christian creed and to discard Darwin while retaining evolution. This outlook pervades all his major writings.

The central weakness of Darwinism, according to Butler, was its failure to identify the cause of the variations on which selection was said to operate. They were described as random or accidental, which would mean that the course of evolution has been a matter of luck. The older evolutionists, such as Erasmus Darwin and Lamarck, were far sounder in their views, for they attributed the cause of variations to the activity of organisms and to the inherited effects of the use or disuse of their various functions. Not luck, they claimed, but cunning displayed by organisms in coping with their environment lies at the basis of evolution. Hence, the activity of organisms is profoundly purposive. The great mistake of Charles Darwin was to dismiss teleology from the domain of living things, for they then become indistinguishable from machines.

In an essay of 1865 Butler toyed with the idea that machines are adjuncts to organisms, like extra, though inferior, limbs, by means of which organisms have become more highly evolved. Hence, "a leg is only a much better wooden leg than anyone can manufacture." This led Butler to consider the problem of how living things have come to produce their natural organs and to equip themselves with adaptive habits. The answer, he asserted, is that the individual plant or animal must "know" at the start what to do. A fertilized ovum possesses the knowledge it needs to make itself into an embryo and subsequently into an adult organism. This knowledge is really a remembering of what its ancestors did in the past. Hence, we must postulate an "unconscious memory" at work in all living things, binding successive generations and providing the basis for the transmission of acquired characteristics.

Butler then leaped to two sweeping conclusions. First, consciousness and intelligence exist throughout the whole organic world. "For the embryo of the chicken, we claim exactly the same kind of reasoning power and contrivance which we claim for the amoeba, or for our own intelligent performances in later life." Second, since evolution involves a continuous process of derivation, there must be an "identity" between parents and offspring: the latter are not different individuals but *are* the parents at a later evolutionary stage. "Birth has been made too much of." A newborn infant is simply part of an unbroken biological process, not an utterly separate individual. Accordingly, there is a deep unity of all life, so that it constitutes "in reality, nothing but one single creature, of which the component members are but, as it were, blood corpuscles or individual cells."

With the aid of these conclusions, Butler sought to justify an idealistic and religious interpretation of evolution. In *Unconscious Memory* he contended that his earlier separation of the organic from the inorganic was unwarranted. "What we call the inorganic world must be regarded as up to a certain point living, and instinct with consciousness." Hence, "all space is at all times full of a stuff endowed with a mind," and "both stuff and mind are immaterial and imperceptible, so long as they are undisturbed, but the moment they are disturbed, the stuff becomes material and the mind perceptible." Evolution is therefore the life history of this primordial world stuff, "to which no name can be so fittingly applied as 'God.'"

Many of Butler's criticisms of Darwinism have been made irrelevant by the rise of the science of genetics. Yet he was justified in urging those criticisms at the time and in calling attention to vacillations in Darwin's thought on basic issues. If Butler had been more scrupulous in his own thinking and less facile with his pen, his works on philosophical biology might have had greater survival value.

THEOLOGY

Butler's rather unusual theology is set forth in three essays, posthumously published as *God the Known and God the Unknown* (London, 1909). He there contended that an adequate concept of God requires him to be a living person with a material body. To regard God as *merely* a spirit is tantamount to atheism. At first Butler held that the divine body is just the totality of life, the "one single creature" whose unconscious memory is part of the divine mind. When he rejected the distinction between the organic and the inorganic, his view shifted from a "panzoistic" conception of God to pantheism. He intended to rewrite his theology in the light of this shift,

but never managed to do so. One odd belief he expressed was that the grand design of the cosmos points to the existence of "some vaster Person who looms out behind our God, and who stands in the same relation to him as he to us. And behind this vaster and more unknown God there may be yet another, and another, and another." This pyramiding of deities was one of the many items with which Butler enlivened the Victorian scene.

SOCIAL THOUGHT

Despite the barbs he directed at the institutions of his day, Butler's social outlook was conservative. He took the position that those who are rich and successful are the highest types thus far produced in the evolutionary process. Poor men are biological misfits; hence, the sooner they disappear and leave room for those better able to take care of themselves, the better. In the imaginary society of Erewhon, "if a man has made a fortune of over £20,000, they exempt him from all taxation, considering him a work of art and too precious to be meddled with." Butler's account of this society is not so much a blueprint of utopia as a device for satirizing the beliefs and practices of middle-class Englishmen by inverting accepted values. Thus, in Erewhon bodily illness was considered a punishable crime, whereas moral failings deserved sympathy and were given therapeutic treatment. Instead of fostering machinery, the Erewhonians, after a long struggle, destroyed it when they realized that machines, like organisms, were evolving and would soon acquire a mastery over men. In *Erewhon Revisited* (London, 1901), Butler depicted a community showing signs of degeneration, as if to underline the conclusion that a social order is an impermanent evolutionary product and inevitably alters. Yet here again no consistent point of view was worked out.

BYZANTINE PHILOSOPHY

The age of the Byzantine Empire stretches from the end of late antiquity to the fall of Constantinople in 1453. During Byzantine times scholars who copied and studied or even lectured on the texts of ancient philosophers are known and praised chiefly for their efforts to transmit and to keep alive the philosophical traditions of antiquity. To take the obvious case of Plato's and Aristotle's works, there are more than 260 Byzantine manuscripts of dialogues by Plato and at least 1,000 Aristotelian texts. This does not mean, however, that all Byzantine scholars should be regarded as mere copyists. There were among them important figures who, being philosophers themselves, not only carefully studied and commented on ancient philosophical works but also wrote their own treatises on central philosophical problems.

How did the Byzantines conceive of philosophy and of themselves as philosophers? John of Damascus (*Dialectica* 1:56), for instance, gives six complementary definitions of philosophy:

- (1) the knowledge of beings as beings;
- (2) the knowledge of things divine and human;
- (3) a preparation for death;
- (4) the assimilation of man to God as far as humanly possible;
- (5) the art of arts and the science of sciences;
- (6) the love of wisdom.

These six definitions, which were often cited by other Byzantine philosophers too, can also be found in the works of the Neoplatonists of the Alexandrian school (for example, David, *Prolegomena* 20.27–31). They are clearly derived from Aristotelian (1, 5), Stoic (2), and Platonic (3, 4) conceptions of philosophy, attesting thus to the Byzantines' solid knowledge and eclectic use of the different traditions in ancient philosophy.

However, the Byzantines were by no means unanimous about the importance of ancient philosophy, or of "the wisdom from without," as they called pagan philosophy in contrast to Christian theology, which they called "the wisdom from within." Some, under the influence of St. Paul and authors like Tatian, considered ancient philosophy useless and dangerous because it corrupts the Christian view of things and leads to heresies. Others, under the influence of Basil the Great and Gregory of Nyssa, claimed that ancient philosophy, if used in a cautious way, could be a preparation for the true faith, help

in its elucidation, and serve as a dialectical weapon against heresies. Moreover, Byzantine philosophers like John Italos and Barlaam of Calabria undertook the task, in some cases at high personal risk, of defending ancient philosophy in its own right, but also as a means for a better understanding of Christian dogma.

The term *philosophy* could also be used in Byzantium in a much wider sense to include encyclopedic knowledge, including mathematical sciences such as astronomy. Sometimes, following some of the Church Fathers, the term could be used to refer to a life of contemplation as exemplified by Christian monasticism. But that philosophy was partly understood as the Christian way of contemplative life does not necessarily mean that philosophy collapsed into theology. On the contrary, the borders between philosophy and theology were reasonably clearly defined in Byzantium.

The view expressed by some Church Fathers, for instance by Clement and by Origen, that philosophy is the handmaiden of theology (*philosophia theologiae ancilla*), was not the dominant position in the Byzantine East. Byzantine philosophy seems to have managed to preserve its autonomy. Even though many of the problems with which Byzantine philosophers were concerned, like that of divine providence, did indeed arise in the context of a Christian theological tradition, these problems nonetheless constitute genuine philosophical issues that would be of interest to any philosopher, even one who did not believe in Christian dogma. For example, the following are some of the issues that profoundly and systematically occupied many Byzantine philosophers: the creation or origin of the world, the existence of God, the ontological status of universals, the character of the perceptible world, the problem of evil and human free will, the relation between soul and body, the necessary requirements for a good life, the possibility of a just state, the connection between faith and reason, the skeptical challenge to knowledge.

But did the Byzantine philosophers express original views in discussing these issues? There is no doubt, of course, that Byzantine philosophical writings are quarries of information about earlier philosophical doctrines, which would have been otherwise completely lost or only meagerly documented. Besides, whatever attitude the Byzantines took towards ancient philosophy, it was impossible for them to escape altogether from its influence. It was ancient philosophy that clearly provided them with a well-articulated theoretical framework and with the philosophical language that served as the basis for their own philosophical discourse. At the same time,

however, the Byzantine philosophers offered in their commentaries and treatises numerous clarifications, developments, criticisms, and modifications of ancient doctrines, some of which are philosophically interesting and remarkably subtle.

Even when they simply paraphrased or briefly commented on ancient philosophical texts, the Byzantines presented different degrees of independent thinking; sometimes they gave a slightly different argument to support an established position, sometimes they made a small but interesting addition to an ancient doctrine, and sometimes they considerably diverged from the view generally accepted in antiquity. But this should not be understood as suggesting that the Byzantine philosophers were interested in being original; like most of their late ancient predecessors they would have firmly rejected such a suggestion.

Nevertheless, Byzantine philosophy as a whole exhibits a distinctive character that differentiates it from the previous period in the history of philosophy. For it is clear that many of the views and doctrines presented by the Byzantines originated in their aim to reconcile their Christian tradition with ancient philosophy. For instance, they taught Aristotle's logic as generally useful, but mainly as a preparation for more theoretical studies; they disagreed, however, with his doctrine of the eternity of the world and his understanding of God as the first unmoved mover who moves the heavens but exerts no providence on the details of the sublunary world, including individual human beings. Instead, Byzantine philosophers considered Plato's metaphysics to be closer to the Christian worldview, especially on issues like the immortality of the soul and the creation of the world; still, for doctrinal reasons they could not accept the Platonic theory of metempsychosis and the separate existence of eternal ideas or forms.

Hence, Byzantine philosophers seem to have followed the eclectic tradition of late antiquity and combined aspects of Plato's and Aristotle's theories, although always strongly influenced by Neoplatonic philosophers like Proclus. The Byzantines also engaged in a limited dialogue with the other schools of ancient philosophy; for instance, they were interested in criticizing elements of Epicurean or Stoic doctrine, and they critically examined the implications of the Skeptics' views on the possibility of human knowledge. This is the picture at least up to the fifteenth century, when the leading intellectuals of the time, George Gemistos Pletho and George Scholarios Gennadios, started emphasizing the contrast between ancient philoso-

phers and believed that they should take sides, presenting themselves either as Platonists or as Aristotelians.

BYZANTINE PHILOSOPHERS

In Byzantium there were no institutions of higher education in which philosophers could be trained as philosophers. The main purpose of institutional higher studies was to train civil servants. The figure of the Byzantine philosopher, therefore, emerges as somewhat of a polymath and an erudite scholar, who, moreover, might make use of his knowledge and rhetorical skill to play an active role in the political life of his times. Philosophical instruction was mainly private, but it sometimes received support from the Emperor and the Church, as in the case of the so-called University of Constantinople, which was founded in 1045 by Constantine Monomachos. Such support, however, also meant occasional intervention by the secular or ecclesiastical authorities, as when John Italos was put on trial and condemned for advocating the systematic use of philosophical analysis in clarifying theological issues.

In general, the philosophical curriculum would start with Aristotle's logic, considered as the instrument of all sciences (Porphyry's *Isagoge*, Aristotle's *Categories*, *De interpretatione*, and *Prior Analytics* 1.1–7); then ethics, teaching a rationally ordered moral life of the soul as joined to the body; and finally, through physics and the *quadrivium* (arithmetic, geometry, astronomy, and harmonics), to Platonic or, more precisely, to Neoplatonic metaphysics, which is the highest philosophical science because it has to do with knowledge of first principles and brings the soul nearer to assimilation to the divine.

The genres of philosophical writing in Byzantium are quite diverse. For teaching purposes the Byzantine scholars produced marginal notes and explanatory paraphrases on ancient philosophical works, but also extended commentaries, sometimes in question-and-answer form, small handbooks, or large surveys of philosophy. They also wrote small treatises on specific topics or longer works, occasionally in dialogue form, with the aim of rebutting the views of their opponents and to explain and defend their own theories. To all these we should further add their letters and orations, which frequently made reference to philosophy.

The real starting point of Byzantine philosophy is usually placed in the ninth and tenth century, when the so-called Byzantine humanists, men like the Patriarch Photios, Arethas, or Leo the Mathematician, started again studiously to read, edit, and comment on the works of ancient philosophers. Having said that, however, the dis-

tinctive character of Byzantine philosophy undoubtedly owes a lot to the influence of the previous period, which was dominated by the thought of the Church Fathers such as Basil the Great, Gregory of Nyssa, Pseudo-Dionysius, Maximus the Confessor, and John of Damascus.

Photios (820–891), who is famous mainly for his *Bibliothēke*, a vast compilation of ancient Greek literature, also taught Aristotelian logic and wrote, for this purpose, comments on Aristotle's *Categories*. In addition, he composed a number of small treatises in which he criticized both Plato's and Aristotle's views, especially their theories on universals; he himself claimed that universals have no independent existence but are conceived by God and are instruments of God's will. Arethas (c. 850–944) also commented on Aristotle's *Categories* and Porphyry's *Isagoge*, but he is better known for having been instrumental in the transmission of ancient texts, in particular the Platonic corpus. He commissioned the transcription of a complete copy of Plato's works, to which he added marginal notes; the first part of his Plato text is extant as the famous Clarkianus 39 manuscript in the Bodleian Library of Oxford. Unfortunately, we know little about Leo the Mathematician (c.790–869), who seems to have taught philosophy at the so-called Magnaura School in Constantinople.

There is a significant development from the humanistic Photios and Arethas interests to the way the Byzantines in the eleventh and twelfth century, the period of the Comneni, viewed the philosopher as someone with a hard-earned and unsurpassed knowledge in all branches of learning, and especially as someone who formed his own views on the philosophical topics discussed by the ancients. Michael Psellos (1018–1078) was one of the most erudite and intriguing figures of the Byzantine Middle Ages. He was given the honorific title "first among the philosophers" and taught all branches of philosophy. He commented on Aristotle's logic (*Categories*, *De interpretatione*, *Prior Analytics*) and his physics, and he wrote a large number of short treatises discussing particular problems raised by his pupils; he also compiled a short encyclopaedia with the title *De omnifaria doctrina*. He was greatly influenced by Proclus, whom he considered as an authority among ancient authors. In his attempts to advance philosophical learning he was often attacked concerning his theological orthodoxy, so that he often had to be careful to distance himself from heretical doctrines, as in his writings on the *Chaldaean Oracles*.

John Italos (c.1025–1082), a pupil of Psellos, who was condemned by the Church of Constantinople for his extensive use of logical reasoning in theological matters,

wrote treatises discussing the Aristotelian categories and commented on Aristotle's logic (*De interpretatione*, *Topics*). Eustratios of Nicaea (c.1050–1120) and Michael of Ephesus (c.1050–1129) belonged to the intellectual circle around Anna Comnena and took part in her project to produce commentaries on Aristotle's works.

Eustratius wrote commentaries on Aristotle's *Posterior Analytics* and *Nicomachean Ethics*, whereas Michael of Ephesus commented on Aristotle's metaphysics, logic (*Sophistici elenchi*), ethics, and natural philosophy (*Parva naturalia*, *De partibus animalium*, *De generatione animalium*, *De motu animalium*, and *De incessu animalium*). Their work, in which they followed ancient commentaries (some of which are now lost) but also added their own insightful remarks, was instrumental in the transmission and revolutionary rediscovery of Aristotelian thought in the Latin West. Finally, Nicholas of Methone (d. 1165) wrote at the same time a detailed refutation of Proclus's *Elements of Theology*. During the short period after the Latin conquest of Constantinople in 1204, when the center of Byzantine intellectual life moved to Nicaea in Asia Minor, the main intellectual figure was Nikephoros Blemmydes (1197–1272), who wrote a much-used handbook of physics and logic that also was translated in Latin.

Lastly, the final centuries of the Byzantine empire, which are known as the Palaeologan period, saw a renewal of interest in the sciences, particularly in mathematics and astronomy. George Pachymeres (1242–1310) composed a summary of Aristotelian philosophy and wrote Neoplatonic commentaries, supplementing Proclus's commentary on Plato's *Parmenides*. Theodore Metochites (1270–1332) criticized Aristotelian physics and metaphysics in debate with Nikephoros Choumnos (c. 1250–1327), who in turn attacked the orthodoxy of Neoplatonic psychology. Sophonias and Leo Magentinos paraphrased works of Aristotle; Sophonias paraphrased Aristotle's *Categories*, *Sophistici elenchi*, and *De anima*, while Leo Magentinos paraphrased Aristotle's *De interpretatione*, *Prior Analytics*, and *Sophistici elenchi*.

Moreover, three important intellectuals of the fourteenth century, namely Nikephoros Gregoras (1290/3–1358/61), Barlaam of Calabria (c. 1290–1348), and Gregory Palamas (c.1296–1359), got involved in a fierce dispute over the use of logical reasoning in theology. Gregoras claimed that logical studies should be regarded as completely useless and should be therefore altogether dismissed, whereas Barlaam and Palamas adopted a more complex attitude toward logic. They both stressed that logic is indeed useful in defending Christian dogma

against pagans and heretics, but they disagreed about the limits of the use of logical reasoning in clarifying or establishing the truth of Christian belief; whereas Barlaam argued that logical methods can be used to prove the Christian beliefs, Palamas insisted that logical arguments are of no help in our attempt to acquire knowledge of God and of his attributes. The controversy between Gregoras, Barlaam, and Palamas extended to a second stage, known as the Hesychast debate, which centered on the method of prayer and contemplation of the Byzantine monks, who claimed to be able to achieve communion with God through inner quietude and silence.

In the fifteenth century, around the time of the fall of Constantinople, a main focus of Byzantine philosophers was, as mentioned above, stressing the differences between Plato and Aristotle and determining the superiority of the one over the other. George Gemistos Plethon (c. 1360–c. 1453) is famous for his renewal of Proclus's Neoplatonism as a theological and political alternative to Christianity. In his treatise *De Platonis et Aristotelis philosophiae differentia* he argued for the superiority of Plato over Aristotle; in his *Laws* he presented an utopia based primarily upon Plato and the Neoplatonists. George Scholarios Gennadios (c. 1400–1424) thought that Pletho's utopia was heretical and should be consigned to the flames. He defended Aristotle's works and was more favourable to Latin scholasticism. He commented on Aristotle's logic (*Categories*, *De interpretatione*), natural philosophy (*Physics* 1–3, *Parva naturalia*), and Aristotle's *De anima*. He also translated part of Petrus Hispanus's *Summulae logicales* and works by Thomas Aquinas, for instance the *De fallaciis* and his commentary on the *Posterior Analytics*. Bessarion (1403–1472), who had studied under Pletho, tried to mediate the dispute between Pletho and Scholarios, and gave a sympathetic summary of Plato's philosophy, which he thought reconcilable with Aristotelianism. He, like Pletho, greatly helped to bring works of Plato and Aristotle to the attention of Italian humanists.

From the second half of the thirteenth century onward, there were translations into Greek of Western Latin texts, especially logical texts: Manuel Holobolos (fl. 1267) translated Boethius's *De topicis differentiis* and *De hypotheticis syllogismis*; Maximos Planudes (c. 1255–c. 1305) translated Boethius's *De consolazione philosophiae* and Augustine's *De trinitate*; Demetrios Kydones (c. 1324–97/8) and his brother Prochoros Kydones (c. 1333–69/70) translated Augustine, Anselm, and Thomas Aquinas. But it was only in the fifteenth century that Byzantine and Western philosophers actually began to

talk to one another, to read one another's books, and to be influenced by others' traditions and views. Still, although the Byzantine scholars like John Argyropoulos—who went to Italy and worked there as teachers of Greek, editors of Greek texts and translators, and as teachers of philosophy—exerted a fertile influence on the West, Byzantium itself in general remained closed to Western scholasticism.

THE STUDY OF BYZANTINE PHILOSOPHY

Byzantine philosophy remains a little-explored field. Most of the writings of Byzantine philosophers are yet unpublished or are available only in old and often quite inadequate editions. The nineteenth-century Berlin series *Commentaria in Aristotelem Graeca*, which was supposed to include all commentaries on Aristotle's works, actually includes a very small selection of Byzantine commentaries. Translations of and commentaries on Byzantine philosophical works are hardly ever available. In addition, there are important unresolved issues about the authorship of many Byzantine philosophical texts, and we often have no reliable information concerning their sources. But even when we do have careful editions of the philosophical works of Byzantine thinkers, their philosophical contribution for the most part still needs to be critically assessed. Being regarded either as mere scholars or as religious thinkers, Byzantine philosophers have not been studied on their own merit, and their works have hardly been scrutinized as works of philosophy.

The interest of the scholars of the nineteenth and early twentieth century, who worked with great care on some Byzantine philosophical texts, was not primarily philosophical. Philosophers, on the other hand, understandably were discouraged both by the rhetorical style of the Byzantine writings and by the theological interests displayed in much of Byzantine philosophy. Therefore, although distinguished historians have in the past tried to reconstruct the intellectual life of the Byzantine period, we still lack even the beginnings of a systematic understanding of the philosophical works produced in Byzantium. It is particularly telling that there is no adequate recent monograph even on the most prominent Byzantine philosopher, Michael Psellos.

After World War II, however, we see significant changes in the study of Byzantine philosophy. These changes clearly are connected with the rediscovery and philosophical reappraisal of the Western medieval philosophical tradition and of certain areas in ancient philosophy, such as the works of the Neoplatonists and of the

ancient commentators. Critical editions of texts are appearing regularly, in particular in the series *Corpus Philosophorum Medii Aevi—Philosophi Byzantini* (The Academy of Athens) and in the Bibliotheca Teubneriana. Moreover, books and articles are now being published that investigate the teaching of philosophy in Byzantium and the original philosophical contributions of Byzantine philosophers in a philosophically more adequate and serious way. Nevertheless, much more work is required to achieve a reliable overview of Byzantine thought. Following the rising interest of the last decades of the twentieth century, it now seems important to encourage further the systematic study and critical assessment of the individual works of Byzantine thinkers. Most importantly, we need to take their works seriously as philosophical writings; putting aside our prejudices and misconceptions, we need to make a renewed effort to reconstruct and to do justice to Byzantine philosophy.
