preface to the second edition

Nearly four decades ago, in 1967, Macmillan published its eight-volume *Encyclopedia of Philosophy*. With Paul Edwards as its exceptionally able editor in chief, the *Encyclopedia* became a highly respected, premier reference work consulted by countless professors and students as they pursued the examined life. Indeed, it would be safe to say that most if not all of the scholars who have contributed to the new Second Edition of the *Encyclopedia* leaned on the First Edition for philosophical insight during their formative years as young academicians. For them to be able to participate in reshaping a reference resource that figured importantly in their intellectual development has been a unique opportunity and a privilege.

When Macmillan invited me to serve as editor in chief for the new ten-volume Second Edition, the task appeared daunting because of its magnitude. But it also seemed manageable because backing me up was a valuable learning experience I had as the editor in chief for Macmillan's single-volume *Supplement*, published in 1996, that updated the *Encyclopedia*. Among the insights I gained from that experience three were especially important.

First, it seemed that the *Encyclopedia* had gained the respect of academicians because its articles provided substantive discussions by exceptionally competent scholars and its coverage embraced a wide range of top-

ics in philosophy broadly construed. That was a winning formula: substantive articles by talented scholars exploring the full spectrum of philosophical topics. It would also guide the Second Edition.

Second, while that winning formula involved in-depth and broad coverage, nevertheless it did not and could not aspire to exhaustive coverage of all philosophical topics given the constraints imposed by the limited print space available. Whether the space available was the eight volumes of the First Edition or the one volume of the *Supplement* or the ten volumes of the Second Edition, a policy of selectivity had to be pursued with the unavoidable exclusion of some material that could have been, and perhaps should have been, included.

Third, to maintain the tradition of excellence established by the First Edition, an editor in chief needs to be surrounded by a group of distinguished philosophers who represent expertise in diverse subfields and who are willing to commit considerable time and effort to serve on an editorial board. I was fortunate indeed to have the support of an editorial team for the *Supplement* consisting of K. Danner Clouser, Paul Horwich, Jaegwon Kim, Joseph J. Kockelmans, Helen E. Longino, Vann McGee, Louis Pojman, Ernest Sosa, and Michael Tooley. Because of them, and the highly competent authors they helped to recruit, the *Supplement* continued Macmillan's tradition of publishing highly regarded reference works.

EDITORIAL BOARD FORMATION

Upon accepting the role of editor in chief for the Second Edition, I immediately turned to three of my former editorial colleagues—Jaegwon Kim, Michael Tooley, and Ernest Sosa—and invited them to become the core of a new Board of Associate Editors that would assist me in planning the new edition. The guidance provided by these three colleagues has been astute, seasoned, and truly indispensable from the early planning stages until the day of publication. With their assistance we were able to recruit Don Garrett, Barry Loewer, Doug MacLean, and Susan Wolf to join the Board of Associate Editors. Then we constituted a Board of Consulting Editors that would add expertise in specific subfields of philosophy not already covered by the specializations of the associate editors. The result was the impressive editorial team of distinguished philosophers listed below. Their areas of editorial oversight are noted after their names.

The Board of Associate Editors

Don Garrett—Modern Philosophy
Jaegwon Kim—Philosophy of Mind
Barry Loewer—Philosophy of Science
Doug MacLean—Ethics and Applied Ethics
Ernest Sosa—Epistemology
Michael Tooley—Metaphysics
Susan Wolf—Ethics and Applied Ethics

The Board of Consulting Editors

Louise Antony—Feminist Philosophy
John Burgess—Logic, Philosophy of Logic, Philosophy of Mathematics
Victor Caston—Ancient Philosophy, Medieval Philosophy
Richard P. Hayes—Buddhist Philosophy
Jeffrey King—Philosophy of Language
Oliver Leaman—Islamic Philosophy, Judaic Philosophy
Vladimir Marchenkov—Russian Philosophy
Thomas Nenon—Continental Philosophy
Karl H. Potter—Indian Philosophy
Philip Quinn—Philosophy of Religion
Jenefer Robinson—Aesthetics, Philosophy of Art
Kwong-loi Shun—Chinese Philosophy
James Sterba—Social and Political Philosophy
Charles Taliaferro—Philosophy of Religion

From the very beginning, our project's goal was not to replace the First Edition and the *Supplement* but to build the Second Edition on the foundation of their outstanding scholarly work. Accordingly, the task set before each editor was to analyze all the entries in the First Edition and the *Supplement* that were pertinent to his or her domain in order to determine which entries should be retained "as is" in the Second Edition with perhaps only a bibliographical update, which entries should be retained but needed an updating addendum, and which entries should be replaced by entirely new ones. In addition, all editors were given the opportunity to commission entirely new entries in their subfields. Each editor also had the responsibility to review and assess all new material appearing in his or her subfield. This generic description of the work of our subfield editors for the Second Edition masks all too easily the many hours of painstaking effort devoted to this project by these scholars.

In early autumn of 2004, regrettably, our editorial colleague Phil Quinn passed away after a brief struggle with esophageal cancer. Prior to his death, however, Phil had overseen his domain with an extraordinarily watchful and skilled eye. He had analyzed in detail every entry relating to the philosophy of religion in the First Edition and the *Supplement*, and sent me copious notes and recommendations for either improving, retaining, or replacing those entries. He also made specific recommendations for new entries to be commissioned and wrote detailed scope descriptions for those entries. When his illness forced him to withdraw from his teaching at the University of Notre Dame, he continued to work on the Second Edition, which provided concrete purpose for the day at hand. Phil worked carefully, deliberately, and had his eye on the prize of excellence. His fine work made it relatively easy for our colleague Charles Taliaferro to assume Phil's responsibilities on the editorial team.

If the Second Edition continues the tradition of excellence initiated by the First Edition, as I believe it will, that accomplishment will be due in no small measure to the exceptionally high quality work provided by our editors who, like Phil, have given of their time and talent to enhance the work of philosophy.

DEVELOPMENT OF THE SECOND EDITION'S CONTENT

Our strategy of building the Second Edition on the foundation of the First Edition and the *Supplement* requires a few additional comments.

Carefully and judiciously our editorial team selected those entries from the First Edition and the *Supplement*

that were so well done that they merited retention. To virtually all of these entries we added bibliographical updates and to many of them we added substantive addenda. We prized these entries because, appearing together with the new entries, they enabled the reader to view high quality philosophizing over the course of almost a half century thereby adding a measure of historical *gravitas* to our project.

Notwithstanding our respect for the First Edition and the *Supplement*, we added 450 entries on new topics, and nearly 300 completely fresh and newly authored treatments of important topics that were originally covered within the First Edition or Supplement. The presence of all of this new material is a clear indication of the vigorous and innovative philosophical activity that has occurred within the discipline since the *Encyclopedia* made its debut almost four decades ago. Entirely new subfields have appeared such as feminist philosophy, the philosophy of sex and love, and applied ethics. New important topics in virtually every subfield have been explored ranging from artificial intelligence to animal rights. New scholars, whose distinctive contributions to the discipline needed description in substantive personal entries, have appeared on the philosophical landscape. Among such individuals are Karl-Otto Apel, Mohammed Arkoun, Nancy Cartwright, Daniel Dennett, Fred Dretske, Ronald Dworkin, John Earman, Hassan Hanafi, Virginia Held, Julia Kristeva, Jacques Lacan, John McDowell, Ruth Millikan, Richard Montague, Thomas Nagel, Seyyed Hossein Nasr, Martha Nussbaum, Derek Parfit, Hilary Putnam, Peter Singer, Gregory Vlastos, Richard Wollheim, and many, many more.

We also added updates to 90 articles, with those updates provided by their original authors. Additionally, 150 scholarly updates to existing articles have been included by means of “addenda,” with each addendum compiled by an author other than the original writer, thus allowing for a fresh perspective that augments discussion of the topic at hand. Approximately 430 of the almost 1,200 classic First Edition or *Supplement* articles that appear in the Second Edition have been strengthened further by the inclusion of new bibliographic citations. Classic articles from the First Edition and *Supplement* are clearly identifiable via specific dates in the author bylines that follow each article. Author bylines followed by “(1967)” indicate that the article originally appeared in the First Edition, while bylines followed by “(1996)” indicate first publication within the *Supplement*. The designation “(2005)” denotes first publication within the Second Edition.

We have modified and expanded the philosophical inclusiveness of the First Edition in several ways. Both the analytic and continental philosophical traditions are well represented in the new topics and new personal entries, as well as in the style of presentation offered by our authors. In addition, enhanced cultural diversity is evident in the major space we have provided for topics relating to Buddhist philosophy, Chinese philosophy, Islamic philosophy, and Indian philosophy. Because of space limitations a number of First Edition entries devoted to national philosophies (such as American, British, and German) were not retained. The major figures from those countries and their contributions to philosophy have, however, been included in the Second Edition via personal and topical entries. Importantly, we have retained and expanded the entries on Japanese philosophy, Latin American philosophy, and Russian philosophy, and have added entries on African philosophy and Korean philosophy.

To preserve and enhance the detailed record of philosophical bibliographies, dictionaries, encyclopedias, and journals contained in the First Edition entries devoted exclusively to these topics, we moved these articles to the last volume of the Second Edition and increased substantially the space that had been allocated to them in the First Edition. The very large number of new philosophical bibliographies, dictionaries, encyclopedias, and journals that have been published in a multitude of languages during the last half century testifies not only to the vitality of philosophy but also to the increasing cultural diversity on its landscape.

A FEW FINAL POINTS

Several additional features of our editorial practices are important to note. In retaining entries from the First Edition, we have studiously avoided changing the text of those entries in the interest of preserving the philosophical and authorial integrity of those entries. Some of the authors, however, of those First Edition entries were available and wished to revise their entries. We, of course, welcomed their modifications. On some occasions, without compromising the integrity of an entry, we made some minor changes in the retained First Edition entries, such as inserting the year of death in the biographical part of a personal entry.

The entries in the Second Edition vary in readability level. Many entries will be readily accessible to the general public. Others will require some familiarity with the specialized vocabulary of philosophers. Still other entries will presuppose some acquaintance with logic. All the

entries, it would be safe to say, require the kind of careful reading that is customary in the humanities and that helps to fashion liberally educated persons.

A good number of entries—such as those dealing with ancient, Buddhist, Chinese, Islamic, Judaic, and Russian philosophies—use non-English language words that required transliteration and the use of diacritical marks. In our transliterations and use of diacritical marks we have tried to follow the standard practice adopted by the contemporary leading scholars and the leading journals in the particular subfield to which the entry belongs.

The bibliographies that accompany the entries are selective rather than exhaustive. They provide the references to the works of the scholars cited in the text of an entry. The bibliographical entries in the tenth volume, however, which provide a record of philosophical bibliographies, dictionaries, encyclopedias, and journals, are much more extensive but are not exhaustive.

Volume 10 fulfills at least three important purposes. First, it houses the Appendix, which enabled us to include in the *Encyclopedia* a number of entries that, for a number of reasons, did not move through the editorial process in time to be included in the main alphabetical arrangement of the entries. For example, a few of our contributors encountered unexpected delays in completing their entries because of illness, and a few needed extra time because of other demanding professional commitments. Second, it provided a discrete location where the three lengthy comprehensive bibliographical entries on philosophical dictionaries and encyclopedias, journals, and bibliographies could be bundled together so that they would not distract from the topical and personal entries listed alphabetically in the main body of the set. Third, it contains the Index, a critical access tool for the book's readers.

SPECIAL ACKNOWLEDGMENTS

As editor in chief of this large project I owe a debt of gratitude to many people. I begin with my colleagues at Ohio University. The members of the Philosophy Department were a reservoir of philosophical expertise, good will, and seasoned professional advice. The Philosophy Department's Administrative Assistant, Penny Schall, helped to lighten my tasks, especially with her computer skills. Michael Farmer, the Head of Monographic Cataloging at Ohio University's Alden Library, devoted many painstaking hours to updating the bibliographies of scores of First Edition entries being retained in the Second Edition. The College of Arts and Sciences provided me a professional leave at a crucial juncture in the project so that I could

work on the *Encyclopedia* without the standard professorial demands on my time.

Also, I wish to note with appreciation the role played by LinDa L. Grams, the Administrative Assistant in the Philosophy Department at the University of Notre Dame, who graciously served as a conduit of communication between Phil Quinn and me during his all too brief service as the editor overseeing the philosophy of religion.

In addition, there are four groups of people to whom all of us who use the Second Edition owe an expression of appreciation. The first group is the staff of Macmillan Reference and Thomson Gale. Frank Menchaca, Executive Vice President and Publisher, gave the support and encouragement of upper management to the Second Edition to ensure that it would go to press in 2005 and that it would continue the tradition of excellence that has been the hallmark of the reference works published by Macmillan through the years. Hélène Potter, Director of New Product Development, aided by her associates in the New York office, initiated the project and ever so adroitly assisted the editorial team to plan the structure and content of the new edition, and to operationalize those plans in each editor's domain of oversight. The five-person editorial team at Macmillan in Farmington Hills, Michigan, has exhibited seemingly untiring energy to bring the project to press at the targeted time. The core team consisted of Carol Schwartz, Senior Editor and Project Manager, who quarterbacked the team; Jane Malonis, Senior Editor and Project Manager; Brad Morgan, Senior Editor; Deirdre S. Blanchfield, Editor; and Lynn Koch, Associate Editor. This editorial team demonstrated the capacity to multi-task with incredible patience, resilience, diplomacy, and creativeness under many stressful conditions.

The second group to whom we owe words of gratitude consists of the hundreds of scholars who have contributed the multitude of articles that are the substance of the Second Edition. The extraordinarily fine entries that constitute the Second Edition were prepared by scholars with recognized expertise in the topics on which they have written. That fact should assure the reader that forays into the new edition of the *Encyclopedia* will prove to be always educationally valuable. We are deeply grateful for the intellectual heft that these distinguished authors have contributed to the Second Edition.

The third group that merits our appreciation is one that is almost invisible. I refer to the friends and families of our contributors who stood by patiently waiting for our contributors to complete their commitments to our project. Their patience is appreciated. The important contribution to learning that will be made by the new

Second Edition will ensure that the patience of these friends and family members will not have been in vain.

The fourth and final group that deserves appreciation is the team of associate and consulting editors who served on the *Encyclopedia's* board. They are all very busy, very talented, and very distinguished philosophers. I am amazed and delighted that they were able to find the time to do the tasks that Macmillan and I laid on them. I dare say, however, that they had a special reward accruing from the many hours they devoted to the project. Each of them was asked to assess the new entries in their subfields as those entries were submitted by the authors to Macmillan. The editors were asked to indicate on a review sheet

if, in their judgment, the entry at hand should be approved as is, if the entry needed revision, or if the entry should be rejected. As I reviewed the editors' assessments, I marveled at how often editors would characterize the entries as "superb" or "excellent" or "outstanding," and I could almost feel the editor's delight as those words were written on the review sheets. Occasionally, I even saw the words "the finest piece of this length on this topic that has yet been written." Those words exuded the joy and intellectual excitement which are truly the abiding rewards that the editors, and hopefully all readers, will receive from this project.

Donald M. Borchert, 2005

introduction to the first edition, 1967

The last and, in fact, the only previous major philosophical reference work in the English language, J. M. Baldwin's *Dictionary of Psychology and Philosophy*, appeared in 1901. While it was in many ways an admirable work (it numbered among its contributors men of such caliber as Charles Peirce and G. E. Moore), the scope of Baldwin's *Dictionary* was quite limited. The great majority of articles were exceedingly brief, providing concise definitions of technical terms sometimes accompanied by additional information of a historical nature. There were articles about individual philosophers, but these usually amounted to no more than a few lines. Baldwin himself insisted that his work was primarily a dictionary and not an encyclopedia, but he did feature several articles of "encyclopedic character" dealing with important movements in the history of philosophy and the general divisions of philosophy. Some of these "special" articles, as Baldwin called them, were of the highest quality and have become justly famous. Even they, however, were relatively brief—according to Baldwin's own estimate, they varied in length from 1,000 to 5,000 words—and many important questions were entirely neglected or treated in a very cursory fashion. In Baldwin's own day there was undoubtedly room for a philosophical reference work of more ambitious scope. Since then, especially in the light of the revolutionary developments in philosophy and related fields, the need for a truly encyclopedic presentation of philosophical theories and concepts has become increasingly acute.

The present encyclopedia is intended to fill this need. It has been our aim to cover the whole of philosophy as well as many of the points of contact between philosophy and other disciplines. The *Encyclopedia* treats Eastern and Western philosophy; it deals with ancient, medieval, and modern philosophy; and it discusses the theories of mathematicians, physicists, biologists, sociologists, psychologists, moral reformers, and religious thinkers where these have had an impact on philosophy. The *Encyclopedia* contains nearly 1,500 articles of ample length which can be of value to the specialist, while most of them are sufficiently explicit to be read with pleasure and profit by the intelligent nonspecialist. Some of the longer articles, such as those dealing with the history of the various fields of philosophical investigation or the work of the most influential philosophers, are in effect small books, and even the shorter articles are usually long enough to allow a reasonably comprehensive treatment of the subject under discussion. We believe that there is no philosophical concept or theory of any importance that is not identified and discussed in the *Encyclopedia*, although not every concept or theory has a separate article devoted to it. In apportioning the space at our disposal, we were guided by the thought that the majority of readers would derive more benefit from a smaller number of long and integrated articles than from a multitude of shorter entries.

Throughout we have aimed at presentations which are authoritative, clear, comprehensive, and interesting.

Reference works have a reputation, not altogether undeserved, for being deadly dull. There are notable exceptions to this rule, but by and large it is true that the articles in both general and specialized encyclopedias are written in the most colorless prose and shy away from controversial issues. The authors frequently adopt a pose of complete neutrality and Olympian superiority to the conflicts of warring schools of thought, but in practice this usually amounts to an endorsement of safe positions and to neglect or even misrepresentation of radical thinkers, especially if they are contemporaries. Whatever else may be said about it, we do not believe that the present work will be condemned as either dull or timid. Radical movements and thinkers are given their full due, and the most controversial contemporary issues are discussed at great length. Moreover, the authors of the relevant articles were free and welcome to express their own views and in some instances to propose new solutions. It should be added that our contributors were not required to be serious and solemn at all costs, and some of our articles are certain to offend those who believe that philosophy and laughter are incompatible. As a consequence of our approach, the present work may in some respects have a greater resemblance to Dr. Johnson's *Dictionary* and even to Diderot's *Encyclopedia* than to the uncontroversial reference works to which the public has become accustomed in more recent times.

I have no doubt that in years to come a number of the articles in the *Encyclopedia* will be regarded as original contributions to philosophy. This comment refers in particular to articles which deal with controversial philosophical issues, but many of our historical articles also embody original research and in some instances treat topics which have not previously been the subject of thorough scholarly investigations. We have also made it a special point to rescue from obscurity unjustly neglected figures, and in such cases, where the reader would find it almost impossible to obtain reliable information in standard histories or in general encyclopedias, we have been particularly generous in our space allotments. In addition, the reader will find a number of articles on unexpected subjects—such as “Greek Drama,” “If,” “Nothing,” and “Popular Arguments for the Existence of God”—that we considered sufficiently intriguing to be given individual attention.

In the attempt to make the articles interesting, we did not, however, lose sight of the basic goal of any reference work—to supply information in a clear and authoritative fashion. We have been fortunate in obtaining the collaboration of a large number of the foremost philosophers in

the world, representing all shades of opinion. It is notorious that philosophy differs from the natural sciences in having no body of generally accepted conclusions. There are, for example, no answers to the problem of causation or the mind-body problem which have the endorsement of all competent students of the subjects; and the same is true of all or nearly all other philosophical problems. However, it is possible to provide an authoritative account of the nature of philosophical problems and of the various attempts to answer them. As far as exposition is concerned, the articles in the *Encyclopedia* are meant to be authoritative: although our contributors were free to express their own opinions, this was never done at the expense of providing the necessary information. To the attentive reader it will always be clear where a writer's exposition ends and the statement of his personal position begins.

Something should perhaps be said at this stage about the question of editorial bias, a subject on which there exists a great deal of confusion. It is important to distinguish two very different varieties of bias. The first is what we may call “polemical” bias—the kind that is operative in political campaigns, in the lower forms of journalism, and wherever fanatics of any kind discuss the views of their opponents. The stock in trade of this kind of partisanship is familiar: where the writer does not resort to deliberate forgery, he nevertheless frequently distorts his opponent's position by quoting out of context and in general by making him look as foolish as possible. Regrettably, philosophers, including some very great ones, have not been above employing such weapons, but in this *Encyclopedia* the use of such techniques has not been allowed. There is, however, another kind of bias which cannot be totally eliminated. No matter how fair and equitable an editor may try to be, his personal views and commitments are bound to affect the organization of the work, the space allotted to different subjects, and the criteria employed in judging the quality of contributions. If this kind of bias cannot be eliminated, its influence can at least be restricted, and it also can and should be openly acknowledged. One method that was used to limit the influence of editorial opinions was to assign articles, wherever possible, to authors who were to some considerable extent sympathetic to the theory or the figure they were to discuss. This rule was adhered to in most, though not in all, cases. It was not applied when there was a serious conflict with other criteria which were also relevant to the selection of contributors. If, for example, an author was in our opinion far superior to all other available writers in such qualifications as intellectual incisiveness and capacity for clear statement, he was chosen even if his

sympathies for the subject of the article were limited. This happened in a few cases, but for the most part we succeeded in finding contributors who met all of our criteria.

It would, nevertheless, be idle to pretend that this *Encyclopedia* is free from bias and that my own ideological commitments have not significantly influenced its content. Like the majority of my closest advisers, I have been raised in the empirical and analytic tradition of Anglo-Saxon philosophy. There can be no doubt that if the *Encyclopedia* had been edited by a follower of Hegel or by a phenomenologist, assuming him to make every effort to be fair and equitable to other viewpoints, it would have looked very different. The topics chosen for separate articles would not have been the same, the space allotments would probably have been appreciably different, and there would undoubtedly have been a significantly different list of contributors. I doubt that an editor with such a background would have featured such articles as “Any and All,” “Paradigm-case Argument,” and “Proper Names and Descriptions,” to give just a few illustrations, or that he would have devoted the same space to logic or to the philosophy of language. I am not here concerned with arguing that what we have done is right and that what other editors, with different commitments, would have done is wrong. I merely wish to remind the reader that in producing an encyclopedia one has to make a vast number of decisions and that one is not in the fortunate position of copying a pre-existing heavenly original. The decisions may be more or less justifiable, but in the last resort they always reflect the beliefs and sympathies of the editors.

We are presenting more than 900 articles on individual thinkers, and any responsible editor, no matter what his viewpoint, would have decided to include articles on the great majority of these. On the other hand, some figures have been omitted who, in the opinion of competent judges, have as good a claim to a separate article as some of those now included. We may as well here and now offer our apologies to all whose lists would have been different and who find that their favorites do not receive adequate attention. Some of these omissions can fairly be blamed on editorial judgment, but others are the result of accidental circumstances. For a number of relatively minor figures even the most diligent search failed to locate a contributor who could write an authoritative and readable article. In such cases it was decided that the space could be put to better use. Fortunately, these omissions are very few, and the ideas of most of the philosophers about whom we should have had separate articles are

covered in various of our survey articles on the history of philosophy in different countries, in the articles on philosophical schools and movements, and sometimes also in those dealing with the history of the branches of philosophy. Nevertheless, there are some regrettable gaps, and we can only plead that if one works with over 500 contributors living in every corner of the globe, it is almost impossible that all one's plans should materialize.

One of the most difficult problems confronting the editor of any reference work is that of avoiding duplication without destroying the sense and continuity of individual articles. To be sure, not all duplication is undesirable, especially in a subject in which there is so much disagreement as in philosophy; and in the present work we have not tried to prevent discussions of the same topic in different contexts and from different viewpoints. To give one example, Zeno's paradoxes are discussed in the article bearing the philosopher's name and in the article “Infinity in Mathematics and Logic.” The former article critically analyzes the paradoxes considered in the wider context of Greek thought, while in the latter the paradoxes are examined in order to cast light on problems concerning mathematical infinity. We have done our best, however, to avoid all duplication that would not serve a useful purpose. To achieve this end, it was necessary to be extremely flexible in the relative space provisions for various articles. It seemed unwise, for example, to have a lengthy review of the theories of Husserl once in the article bearing his name and then again in the article on phenomenology. In this particular instance we decided to feature a short article under “Husserl” but a very long one under “Phenomenology.” This need for flexibility in order to use the available space to maximum advantage will account for many apparent disproportions in our space allotments. The articles on Marx and Engels, to give another illustration, are quite brief—much briefer than those on thinkers who have been far less influential; but this does not mean that Marxism has been neglected in the *Encyclopedia*. For, in addition to the biographical articles on Marx and Engels (and other Marxist thinkers), the *Encyclopedia* contains the very comprehensive articles “Dialectical Materialism,” “Historical Materialism,” and “Marxist Philosophy,” as well as several shorter pieces, in all of which the theories of Marx and Engels are discussed. Our very elaborate index, prepared by a staff of specialists, and our system of cross references have made it possible to avoid a good deal of duplication.

The *Encyclopedia* is primarily the creation of the contributors, and I wish here to record our gratitude to the many fine scholars who have given so much of their time

and energy to this enterprise. A certain type of reader drawn to philosophy is not happy unless he finds a plentiful supply of obscure and high-flown phraseology. Such readers will be disappointed by the present work. Those, on the other hand, who prefer simple and unpretentious language will (we hope) find our *Encyclopedia* to their liking. Nothing can make philosophy into an easy subject, but by taking very great pains it is possible to offer a lucid presentation even of extremely difficult and abstruse philosophical theories. If the majority of our articles are entirely intelligible to most educated readers, this is due to the special care taken by our contributors.

It should also be mentioned that although we were, unfortunately, compelled to reject a number of articles, this in no way reflects on their quality. Many of them were excellent studies and were excluded only for reasons pertaining to problems of space, duplication of material, or other technical considerations. The understanding and patience of all contributors as well as of all whose articles could not be used is greatly appreciated.

We are also very much indebted to the members of the editorial board, whose advice was constantly sought and always readily given. They aided us in a great many ways at all stages—they helped in mapping out the table of contents, in locating suitable contributors, and in evaluating manuscripts. When in the spring and summer of 1965 some absolutely indispensable articles had not arrived, it was chiefly through the intervention of members of the editorial board that outstanding scholars agreed to write the missing articles within the space of a few months. We would like to thank the following contributors for coming to our rescue at the last moment: William P. Alston, Stephen Barker, Thomas G. Bergin, George Boas, Vernon J. Bourke, Wing-tsit Chan, Arthur C. Danto, Phillip H. De Lacy, Ronald Grimsley, Philip P. Hallie, Peter L. Heath, John Hick, Paul O. Kristeller, Hugh R. MacCallum, James E. McClellan, Alasdair MacIntyre, John Macquarrie, F. S. Northedge, Robert G. Olson, John Passmore, Bede Rundle, Colin Smith, W. H. Walsh, and Edward Wasiolek. We are particularly grateful to Professor G. B. Kerferd for writing the article on Aristotle at incredibly short notice. That our extremely detailed and exhaustive article on the history of logic was completed in time is in large measure due to the tireless efforts of Professor A. N. Prior, who was wonderfully helpful in a great many other ways as well.

It would be impossible to praise too highly the performance of the members of the editorial staff. The best testimony to their skill and devotion is the fact that a work of this scope could be completed in a relatively

short time by such a small group of people. Ann Trabulsi had the very difficult task of coordinating the work of contributors, editors, copy editors, and the production staff. Her admirable calm and self-possession resolved many a potentially explosive situation, while her tact and firmness worked wonders with even the most reluctant contributors. Philip Cummings, Donald Levy, Sandra Litt, and Margaret Miner were the four full-time editors. Their high standards of scholarship and accuracy, their fine feeling for language, and their unfailing good sense again and again evoked admiring comments and expressions of gratitude from our contributors. Their enthusiasm and their delightful and contagious sense of humor made my own share of the work not only less burdensome but frequently a great deal of fun. Dr. Albert Blumberg joined the editorial staff on a part-time basis early in 1964. It is largely owing to his rich knowledge and painstaking labors that our articles on logic and foundations of mathematics are, as we believe, of an exceedingly high quality. Alix Shulman assisted us during the last year in dealing with various tricky editorial problems, and we are most grateful to her for the excellence of her work. Dr. Murray Greene and Sheila Meyer worked for extended periods in the very onerous position of managing editor, and to both of them I wish to express my appreciation of their valuable contributions. I should also like to thank Mr. Sidney Solomon, who designed the *Encyclopedia* and who was involved in the project from the beginning, for giving valuable advice and assistance on many occasions. Finally, we are all indebted to our editorial secretary, Eunice Dean, whose careful management of our vast and complicated records and correspondence has been an indispensable aid to the production of the *Encyclopedia*.

I have left to the last obligations of a more personal nature. Four of my own articles—"Atheism," "Life, Meaning and Value of," "My Death," and "Why" were written during the academic year 1964/1985 while I held a John Simon Guggenheim Foundation Research Fellowship. The award of this fellowship made it possible for me to take a leave of absence from my teaching duties, and I wish to thank the Guggenheim Memorial Foundation for its generous aid. I should also like to thank the following friends and colleagues for reading one or more of my own articles and for offering criticism and suggestions: Reuben Abel, F. M. Barnard, Sandra Bartky, Milič Čapek, Gertrude Ezorsky, Antony Flew, Peter Heath, Martin Lean, Ruth Barcan Marcus, C. Douglas McGee, Sidney Morgenbesser, Mary Mothersill, Ernest Nagel, Andrew Oldenquist, Robert Olson, Richard Popkin, Bertrand Russell, J. B. Schneewind, Elmer Sprague, and Carl Wellman. In connection with the difficult article about Wil-

helm Reich I am especially grateful for advice and comments to Mr. A. S. Neill, Drs. Allan Cott and Ola Raknes (all of whom knew Reich well), and to Sir Karl Popper, Alasdair MacIntyre, Sidney Hook, and Michael Scriven. Needless to say, none of those who kindly helped me with my articles is responsible for any of the views expressed in them. To my dear friend and teacher, Ernest Nagel, I am

deeply grateful for his unfailing encouragement and moral support ever since I began to edit the *Encyclopedia*. In spite of his many obligations he always found time to listen to our problems and to offer suggestions based on his immense erudition and his acquaintance with scholars in the most diverse fields.

Paul Edwards, Brooklyn College, March 1966

list of contributors

Contributors to the encyclopedia are listed below in alphabetic order followed by their academic affiliations and the article(s) they contributed. Articles reprinted from the first edition and supplement are indicated respectively by (1967) or (1996) following the article name. Affiliations provided for the authors of these articles were their 1967 or 1996 affiliations. New or updated articles are indicated by (2005) and include the current affiliation for the author.

ABBAGNANO, NICOLA (1901–1990)

Nicola Abbagnano, born in Salerno, was the chief exponent of Italian existentialism, which he defined as a militant and rational “philosophy of the possible.” Originally a pupil of Antonio Aliotta at the University of Naples, Abbagnano began teaching at the University of Turin in 1936, where he also for years had been coediting the influential *Rivista di filosofia*. Practically since his first book, *Le sorgenti irrazionali del pensiero* (Naples, 1923), Abbagnano had been advocating a change of philosophical horizon suitable to the problematic nature of human life. This advocacy is reflected in a notable series of historical studies, culminating in the monumental three-volume work *Storia della filosofia* (Turin, 1946–1950; 2nd ed., 1963).

Reacting against the prevailing neo-Hegelianism of Benedetto Croce and Giovanni Gentile in Italy, Abbagnano was influenced, in turn, by Edmund Husserl’s phenomenology and, later, by Søren Kierkegaard, Martin Heidegger, and Karl Jaspers; but he revealed in his first attempt at existentialism, *La struttura dell’esistenza* (Turin, 1939), that he was no mere expositor or disciple of German existentialism. In that work he took a stand

against Heidegger and Jaspers; and in subsequent writings his polemic was sharpened and extended to French existentialism, including Jean-Paul Sartre on the one hand and Gabriel Marcel, Louis Lavelle, René Le Senne on the other. He groups Sartre with Kierkegaard under German existentialism, and the others under “theological or ontological existentialism.”

According to Abbagnano, all forms of existentialism in vogue since Kierkegaard have been self-defeating, since they lead, on examination, to the negation of what is basic to their whole interpretation of human existence: “the primacy of possibility.” He discerns two principal directions within the contemporary existentialist movement. One (the left wing) is associated with the early Heidegger, Jaspers, and Sartre; the other (the right wing), with Marcel, Lavelle, and Le Senne. The first group of existentialists negates existence as possibility by reducing human possibilities to *impossibilities*, with everything projected by finite man inevitably foredoomed to fail; the second group negates existence by “surreptitiously” transforming human possibilities into *potentialities*, necessarily destined to succeed in the end.

Even though for Abbagnano the left and the right wings of the existentialist movement are founded, technically, on opposite principles—“the impossibility of the

possible” and “the necessity of the possible,” respectively—they at least share a common negative ground because each of them, in one way or another, ultimately makes possibility itself impossible. The only valid alternative to “negative existentialism,” which for polemical reasons Abbagnano calls “positive existentialism,” takes as its guiding principle “the possibility of the possible” or, in Kantian terminology, “transcendental possibility.” In this view, an authentic possibility in human life is one that, once it has been chosen or realized, remains open to further choice or realization; that is, continues to be possible. In short, Abbagnano’s alternative constitutes an *open possibilism*.

This alternative calls for a clarification and coherent use of the fundamental category of all existentialism: the modal category of possibility. It is perhaps here that Abbagnano made his greatest contribution to the entire existentialist movement, especially since in contemporary logic, as he himself observes, the concept of modality has not been given sufficient “analytic elaboration.”

Ever since Aristotle, Abbagnano maintains, there has been confusion concerning the modal categories, particularly with respect to the meaning of the term *possible*. The possible in the empirical sense of what may be has been distinguished from the possible in the purely logical sense of the noncontradictory. But, unfortunately, it has been confused with the “potential” in Aristotle’s sense and with the “contingent” in Avicenna’s. Since potentiality signifies “pre-determination” of the actual, the potential excludes the possible, *ex hypothesi*. Aristotle did concede that not all potentialities are actualized, but this concession on his part was only introduced “surreptitiously.” For, if the potential means what is destined to occur anyway, there is no room for possibility as such. As for Avicenna’s concept of the contingent, there is no doubt about its necessitarian character. For he makes the contingent into a species of the necessary—the contingent being, by his own definition, whatever is necessary through another. Hence, it follows that the modal status of the potential and the contingent is not that of possibility, of what may be; but that of necessity, of what must be. Abbagnano concludes that those who think in such terms, including existentialists, are necessitarians in disguise.

Historically, Abbagnano sees his own version of existentialism as an attempt to relate Immanuel Kant and Kierkegaard in a complementary way. In Kant’s Table of Categories three pairs of categories are listed under modality: possibility-impossibility, existence-nonexistence, and necessity-contingency. Abbagnano virtually

reduces Kant’s three pairs of modality categories to one primary pair: the necessary and the nonnecessary. The reason he gives for doing so is that necessity and contingency are not really opposites. Neither are possibility and impossibility. For impossibility is the negative of necessity, not the negative of possibility; what *can’t* be at all being the opposite of what *must* be of necessity.

As an existential possibilist, Abbagnano defines existence as possibility, and nonexistence as “non-possibility,” not as impossibility. While the nonnecessary excludes the necessary and the impossible, it includes the possible and the nonpossible. This means that man can neither be sure of realizing his conflicting possibilities, nor be sure of the impossibility of their realization. It also means that every concrete possibility open to man has two aspects, a promising (positive) prospect and an inauspicious (negative) aspect. To illustrate, the possibility of knowledge implies the possibility of error. Errors are not “impossible,” since we do in fact make them, but they are “non-possible” in the sense that they are unverifiable when put to test. Thus, a double-aspect theory of possibility lies at the heart of Abbagnano’s “positive existentialism.”

Another distinctive feature of Italian existentialism in general and of Abbagnano’s philosophy in particular is the deliberate focus on a problem that was originally foreign to German existentialism; to wit, the problem of value.

Starting with the assumption that the problem of value is the problem of what man *ought to be*, Abbagnano argues in effect that, since the *ought-to-be* is the possible in the normative sense, it is therefore the moral equivalent of the *may-be*, which is the possible in the empirical sense. As a consequence, the logic of possibility coincides with the ethics of possibility, and these two phases of the same problem come together in Abbagnano’s possibilistic interpretation of human conduct. This interpretation stresses the “normativity” of human existence, which involves the problem of freedom in all its dimensions. Thus, Abbagnano’s existentialism logically unites the complementary categories of possibility and freedom, as is clear from his important volume *Possibilità e libertà* (Turin, 1956).

In the mid-twentieth century, Abbagnano came to characterize the “New Enlightenment,” of contemporary philosophy and openly declared his affinities with the neopositivistic and neonaturalistic movements in the Anglo American world. As a result, he developed the empirical and naturalistic strains in his existentialism, emphasizing the methodological connections between possibility as a generic criterion of existence and verifia-

bility as a specific criterion in scientific inquiry. This “transfiguration” of existentialism into scientific methodology is clearly evident in the article on existentialism in *Dizionario di filosofia* (Turin, 1961). However, Abbagnano thought that the romantic “myth of security” in Auguste Comte’s positivism, typical of the nineteenth-century mentality, still survives in the scientific utopianism of the Vienna Circle; and although he sympathizes with the later Ludwig Wittgenstein’s thesis that the meaning of words depends on their use, he contends that the leader of the analytic movement failed to give a philosophical analysis of the notion of “use” itself. Abbagnano’s sympathies with North American naturalism are reflected in his writings on John Dewey and in his review of P. Romanell’s volume *Toward a Critical Naturalism* (*Rivista di filosofia* 50 [1959]: 108–109).

ABELARD, PETER

(1079–1142)

Peter Abelard has been famous since the fourteenth century for his exchange of love letters with Héloïse, his former wife, written when he was a monk and she a nun. Nineteenth-century historians saw him as a rationalist critic of traditional Christian doctrine and a forerunner of modernity. More recently, Abelard’s originality and power as a philosopher have come to be appreciated.

Abelard’s working life splits into two main, slightly overlapping periods. From about 1100 until about 1125, his activity as a thinker and teacher revolved around the ancient logical texts available in Latin at that time—the so-called *logica vetus* (“Old Logic”). But from about 1120, Abelard started to become strongly interested in questions about Christian doctrine, to which he gradually came to give an increasingly ethical emphasis. The important works of the first phase of his career were thus the *Dialectica* (c. 1113–1116), a logical textbook, and the *Logica Ingredientibus* (c. 1119), commentaries on ancient logical texts (along with a shorter logical commentary, the *Logica Nostrorum Petitioni Sociorum*, from the mid-1120s). To the second phase belong his *Theologia*, mainly a philosophical investigation of the Trinity, which exists in three different, much altered versions: *Theologia Summi Boni* (1121), *Theologia Christiana* (c. 1125), *Theologia Scholarium* (c. 1133–1134); biblical commentaries, and a set of *Sentences* (c. 1134), which record his lectures on a wide range of theological topics; the *Collationes* (Comparisons), an imaginary dialogue between a Philosopher, a Jew, and a Christian (probably c. 1130); and the *Scito teipsum* (Know yourself!) or, as it is sometimes called, Abelard’s *Ethics* (1138).

Although the division of his career into two phases was partly occasioned by his castration in 1117 (at the hands of ruffians hired by Héloïse's uncle, the canon of Notre-Dame), which put a violent end to his marriage, and his subsequent decision to become a monk of Saint-Denis, Abelard remained a teacher for most of his life. After studying with two of the most celebrated logicians of the time, Roscelin of Compiègne and William of Champeaux, both of whom later considered him an enemy, Abelard set up his own school and finally became the schoolmaster in Paris. He continued to teach as a monk of Saint-Denis and later, when he left that monastery to set up his own hermetic-monastic community. After a period as an unsuccessful reforming abbot of a remote Breton monastery, Abelard returned to the now numerous and flourishing Paris schools in the 1130s. He spent his final years at Cluny and its dependency, after his activity as a teacher was ended by his condemnation at the Council of Sens (1140).

LOGIC

The *logica vetus* included just two texts by Aristotle himself, the *Categories and On Interpretation*, along with the *Isagoge* (Introduction) to the *Categories* by Porphyry (c. 232–305 CE), and texts by Boethius (c. 475–c. 524 CE) on categorical and hypothetical syllogism, division, and topical inference. From this unpromising set of authorities, Abelard was able not merely to explore areas of formal logic untouched by Aristotle, but also to elaborate a whole metaphysics and semantics.

Ancient and medieval logicians worked in natural language, rather than devising a special logical symbolism. One of the hallmarks of Abelard's approach to logic was his awareness of the ambiguities in many ordinary sentences and the need to distinguish them carefully when constructing a logical argument. Abelard was not the first medieval logician to notice this point (Anselm of Canterbury, for instance, was an eleventh-century forerunner), but he placed an emphasis on it that would be taken up by many of his medieval successors. Consider, for instance, a sentence such as "Possibly the standing man sits." Abelard is quick to observe that it can be read in a composite sense (*This is possible: that the man is standing-and-sitting*) or in a divided sense (*The man is standing, and it is possible that he is sitting*). Although this distinction is made by Aristotle in his *Sophistical Refutations*, Abelard had already used it very widely in his *Dialectica* before he read it in the Aristotelian text.

Moreover, Abelard used this approach as the basis for devising—as Christopher Martin has shown—a gen-

uinely propositional logic, to complement the term logic of Aristotelian syllogistic. In antiquity, the Stoics developed a propositional logic, and traces of their theory are found in Boethius's writings on topical argument and hypothetical syllogisms. Boethius, however, clearly neither developed a propositional logic nor understood it. His hypothetical syllogisms (for instance, "If it is day, it is light. It is day. So it is light") look like arguments in propositional logic, but Boethius takes them as being based on the relation between the terms *day* and *light*; and he cannot grasp the negation of a conditional such as, "If it is day, it is light," except as the negation of one of the terms ("If it is day, it is not light"). By contrast, Abelard has a clear notion of propositional negation (It is not the case that: If it is day, it is light), and it governs his reconstruction of the theory of topical argument. For Boethius the theory of topics is a sort of logic for constructing real arguments on the basis of commonly accepted maxims, which range from basic logical principles to (fairly dubious) rules of thumb, such as "What the experts think about something is true." Abelard retains only those maxims which underwrite conditionals that are not just logically necessary, but where the sense of the consequent is contained in that of the antecedent (for example, Abelard accepts "Whatever is predicated of the species is predicated of the genus," on which is based, for instance, "If it is a man, it is an animal"). The resulting system of propositional logic turns out to be more like some modern connexive logics than classical modern propositional calculus.

METAPHYSICS AND SEMANTICS

Aristotle's *Categories* provided Abelard and his contemporaries with a basic metaphysics. It proposes that the items that make up the world are either substances, which exist independently, or non-substances, which exist only in dependence on substances; and that they are either particular or universal. For example, John Marenbon is a particular substance and man (in general) a universal one; the whiteness of John's skin and his rationality are individual non-substances, and whiteness and rationality (in general) are universal non-substances. Abelard, however, is a nominalist. Following, but exploring in more depth, a lead given by others, including Roscelin, he contended that everything which exists is a particular. There are no universal things, he argued, because to be universal a thing would have to be both one and shared between many in a way that is impossible. Abelard had, then, to show how the basic structure of the universe can be

explained solely in terms of particular substance and non-substances.

Unlike many more recent nominalists, Abelard accepted that the best scientific description (Aristotle's, he thought) cuts nature at the joints: It is a fundamental truth, he believed, that some things are human beings and others dogs, and that human beings are human because they are mortal, rational animals. To be a mortal, rational animal, indeed, is to have the "status" of man, Abelard said. But, he quickly added, a status is not a thing. Every human, then, is alike in having his or her own particular rationality, mortality, and animality. But what about these particular non-substance things? They are, in Abelard's view, real items on an ontological checklist because, he says, it might have been the case that the particularity rationality R^1 by which John is rational was the rationality by which William—who is in fact rational by rationality R^2 —is rational, and vice versa; and so R^1 cannot be explained away as just being John insofar as he is rational. The non-substance particulars are dependent, however, because they cannot exist except in some substance or other, and they cannot exist in one substance and then afterward in another. Just as Abelard has to explain what it is that makes John and William both human beings, he must explain too what it is that makes R^1 and R^2 both rationalities. But he does not, as might be expected, try to speak of a status of being rational—analyzing rationality into certain patterns of behavior, for instance. Rather, he seems to admit, in all but name, that there is a universal rationality.

Abelard's nominalism also poses a semantic problem with regard to universal words. It is important to grasp that this problem is *not* one about reference. Once a kind-word is first imposed, it automatically refers to every particular which is really of that kind, even if the impositor himself has merely a vague or inaccurate idea of the internal structure which characterizes the species in question. (This feature, as Peter King [1982] has pointed out, brings Abelard's semantics uncannily close to the thought of contemporary philosophers such as Kripke.) By contrast, a word's signification is, for medieval authors in general, a causal, psychological notion: a word w signifies x by causing a thought of x in the listener's mind. The signification of "human being" in "John is a human being" is clearly universal: the x of which it causes a thought is a universal human being, not a particular one. But how can there be such an x , if every thing is particular? Abelard's answer is to say that universal words cause a mental image, a confused conception of, for instance, what humans have in common, which is not the image of any

particular man. Such confused conceptions are not things, and it is these conceptions which universal words signify. The conceptions are not things, because they are not thoughts themselves (which Abelard would class as particular non-substance things), but the contents of thoughts—objects in the world envisaged, to use an anachronistic expression, under a certain mode of presentation.

Abelard also had a theory about the semantics of sentences. A sentence signifies neither the things to which its component words refer, nor the thought they produce, but rather its *dictum* (meaning "what it says"). At first sight, Abelard seems to mean by *dictum* what modern philosophers call a proposition, and he does indeed characterize those logical connections that he understands propositionally—as, for example, between the antecedent and consequent of a conditional—as holding between *dicta*. But it is not quite clear whether *dicta* are truth-bearers or rather, like facts, truth-makers. Moreover, Abelard insists that *dicta*—along with statuses and common conceptions—are not things. But whether he can coherently deny the reality of *dicta*, while at the same time using them to underpin his account of the workings of the universe, remains doubtful. Nonetheless, Abelard's metaphysics is bold and original, and it ranges into many areas other than those discussed here, such as parts and wholes, relations, the physical constitution of objects and their sensible properties, and the laws of nature.

ETHICS

Like any Christian thinker, Abelard held that every detail of world history is providentially ordained. Unlike the great theologians of the thirteenth century, such as Thomas Aquinas and John Duns Scotus, he did not accept that God has any freedom in choosing what the course of providence should be: God, he argues, must choose whatever is best to happen, and that, he believes, leaves no space for alternatives. Yet there is room, Abelard thought (contradicting the Platonizing tradition of Augustine and Anselm) for the existence of genuinely evil things, because—as he explains, citing the distinction between things and *dicta*—it is good that there is evil.

If God ordains the universe so that every human action, good or evil, contributes to the best providence, it is clear that ethical judgment cannot be based on consequences. Abelard is very often seen as a moral theorist who, rather, concentrates entirely on intentions, and subscribes to a subjective view of morality. Both aspects of this characterization need qualification. Following Augustine's lead, almost all medieval thinkers based

moral judgment on intentions. For instance, Abelard's immediate predecessors and contemporaries saw sinning as a stage-by-stage process of intending—a person begins to sin once he entertains a temptation to perform a forbidden act; as he thinks about it with pleasure and plans how to put it into effect, the sin becomes graver, and it is more serious still when he actually performs the act. By contrast, for Abelard someone is guilty of sinning when, and only when, he consents to the sin—when he is ready to perform it and will do so unless thwarted. Up until that moment, he is not guilty, and, once that moment is reached, his guilt is complete: performing the act will not increase it.

Abelard's account of what determines whether an action is sinful or not seems at first sight to be subjective. A person sins, he says, by showing contempt for God. It sounds, from this definition, as if it is the mere subjective state of someone's mind, and not what he does or plans to do, that makes him a sinner. But, for Abelard, one shows contempt for God precisely by consenting to an action one knows is divinely forbidden. Sinners do not usually want to perform a forbidden action because it is forbidden; rather, they perform it in spite of the fact that God forbids it, and very often with the fervent wish that it were licit. Moreover, he does not think that it is a matter of guesswork to decide which acts God forbids. Christians and Jews have scriptural revelation to guide them; but, in any case, Abelard believed, all people in all places and in all times, apart from children and the mentally incapable, are able to grasp natural law, which teaches them the fundamental rules for behavior ordained by God. Abelard would not hesitate, therefore, to say that, for example, it is and was always wrong for a mentally normal adult to commit adultery (unless, in some way, he is unaware that it is in this case adultery) because he could not fail to know that adultery is divinely forbidden and that, therefore, it shows contempt to God to perform it.

Abelard's account of acting well is less fully developed than his treatment of sinning. He takes over a list of four virtues (ultimately from Plato's *Republic*) from Cicero: prudence, justice, courage, and temperance. He does not, however, use these virtues to provide a view of the good life for human beings. Rather, he sees justice as the central virtue, by which a person acts in accord with God's commands as known through revelation or natural law. Prudence is a precondition for being just, but not a virtue itself. Courage and temperance are props of justice. A person may be deflected from just action by fear or by desire for pleasure; courage makes him stand firm,

despite what threatens him; temperance makes him resist the blandishments of pleasure.

As this description suggests, Abelard tends to think of morally good action as a hard-won victory over sinning, which is usually the easier or the more pleasant choice. Yet he also wants to insist that there is something deficient in goodness about actions which, although carried out from excellent motives, fail to achieve their intended good effect; as, for example, if a person works hard in order to provide for the poor or the sick, but his plans are never realized. Abelard's ethical theory is further complicated by a somewhat unexpected twist. He believes that judgments made by human judges should be based on a utilitarian evaluation of the punishments given. A woman who entirely unintentionally smothers her baby (whom she was trying to keep warm) should be punished severely, although she has committed no sin, so as to discourage others from making the same mistake.

PHILOSOPHY OF RELIGION

Modern interpreters of Abelard tend to play down any tension between his rationalism and Christian belief: He used the tools of his logic, they say, to analyse Christian doctrines and criticize heretical distortions of them, but he was fully willing to accept the ultimate mysteriousness of doctrines such as the Trinity. Yet there is good reason to see Abelard's main project in the works of his last decade as being the presentation of a rationalized Christianity, which in important ways did not accord with the accepted beliefs of his time.

Abelard's conception of a universal natural law was not merely a foundation for his ethical theory. People at all times and in all places, he believed, have been able to grasp the fact the God exists, and that God is triune. Supposedly pagan sources, such as Plato, the Sibylls, and the writings attributed to Hermes Trismegistus, provide better testimony, he believes, to the Trinity than anything in the Old or even the New Testament. Although Abelard—under pressure to conform to an orthodoxy which, as it turned out, he was in any case accused of infringing—might accept a certain element of inexplicable mystery in the doctrine of divine triunity, he elaborated in the different versions of his *Theologia* a complex theory of sameness and difference, which seems to have been designed to explain in terms of logic how something can be three and yet one. And he considered that God's triune nature emerged just from thinking about the attributes an omnipotent being must have: "For God to be three persons—Father, Son and Holy Spirit—is," he explains at the beginning of the *Theologia Summi Boni*, "as if we were

to say that the divine substance is powerful, wise and benign. ..." This attitude was part of Abelard's general, though nuanced, rejection of there being anything praiseworthy in the acceptance by faith of truths that are not understood, and of the limited function he gives to revelation. For most of his contemporaries, the Jews, to whom the Old Law had been revealed, were far closer to a grasp of the truth than the ancient pagans. For Abelard, the pagan philosophers, without revelation but using natural law, were able to live highly virtuous lives and to reach a better understanding of God than most of the Jews.

Abelard did not, however, think that every important theological truth could be grasped by reason, without revelation. In particular, only by revelation can people know of Christ's life and his death, and without this knowledge, he thought, no one can be saved. But Abelard went on to argue that God would reveal what was necessary for salvation to anyone who lived well, and also to give a rationalistic explanation of why it was necessary to know about Christ's crucifixion—because it set an example of love, indispensable for being able to overcome temptations. Similarly, while Abelard broadly accepted the biblical accounts of heaven and hell, he was one of the few medieval thinkers to insist that they should not be interpreted literally.

AFTER ABELARD

One of the schools of later twelfth-century philosophy, the *nominales*, probably consisted of Abelard's followers. But, apart from his letters to Héloïse, Abelard was not one of the authors who was much read after 1200. Elements of his approach to logic were absorbed into the developing medieval curriculum, although many of his subtlest ideas seem never to have been used. The type of doctrinal problems raised by him influenced the *Sentences*, written by Peter Lombard in the 1150s, and through this work, which became the standard textbook, the whole tradition of later medieval theology. Abelard's effect on the positions and arguments they developed was very limited, however, because the university theologians had their outlook formed by a reading of the whole range of Aristotle's philosophy and the Arabic commentary tradition. In many ways, however, Abelard's approach to metaphysics and the philosophy of religion, with its basis in logical and linguistic analysis, is closer to today's philosophical tastes than the grand systems of the thirteenth and early fourteenth-century philosophers.

ABORTION

The claims to which partisans on both sides of the “abortion” issue appeal seem, if one is not thinking of the abortion issue, close to self-evident, or they appear to be easily defensible. The case against abortion (Beckwith 1993) rests on the proposition that there is a very strong presumption that ending another human life is seriously wrong. Almost everyone who is not thinking about the abortion issue would agree. There are good arguments for the view that fetuses are both living and human. (“Fetus” is generally used in the philosophical literature on abortion to refer to a human organism from the time of conception to the time of birth.) Thus, it is easy for those opposed to abortion to think that only the morally depraved or the seriously confused could disagree with them.

Standard pro-choice views appeal either to the proposition that women have the right to make decisions concerning their own bodies or to the proposition that fetuses are not yet persons. Both of these propositions seem either to be platitudes or to be straightforwardly defensible. Thus, it is easy for pro-choicers to believe that only religious fanatics or dogmatic conservatives could disagree. This explains, at least in part, why the abortion issue has created so much controversy. The philosophical debate regarding abortion has been concerned largely with subjecting these apparently obvious claims to the analytical scrutiny philosophers ought to give to them.

Consider first the standard argument against abortion. One frequent objection to the claim that fetuses are both human and alive is that we do not know when life begins. The reply to this objection is that fetuses both grow and metabolize and whatever grows and metabolizes is alive. Some argue that the beginning of life should be defined in terms of the appearance of brain function, because death is now defined in terms of the absence of brain function (Brody 1975). This would permit abortion within at least eight weeks after conception. However, because death is, strictly speaking, defined in terms of the irreversible loss of brain function, the mere absence of brain function is not a sufficient condition for the absence of life. Accordingly, the claim that the presence of brain function is a necessary condition for the presence of life is left unsupported. Also, the standard antiabortion argument is criticized on the ground that we do not know when the soul enters the body. However, such a criticism is plainly irrelevant to the standard, apparently secular, antiabortion argument we are considering.

The Thomistic premise that it is always wrong intentionally to end an innocent human life is used by the Vatican to generate the prohibition of abortion. This premise is often attacked for presupposing “absolutism.” This Vatican principle seems to render immoral active euthanasia, even when a patient is in excruciating, unrelievable pain or in persistent coma; it even seems to render immoral ending the life of a human cancer-cell culture. In none of these cases is the individual whose life is ended victimized. Thus, the Vatican principle seems most implausible.

Opponents of abortion are better off appealing to the weaker proposition that there is a very strong presumption against ending a human life (Beckwith 1993). Because this presumption can be overridden when the victim has no interest in continued life, use of this premise provides a way of dealing with the above counterexamples. However, this tactic provides room for another objection to the antiabortion argument. Some pro-choicers have argued that insentient fetuses have no interest in continued life. Because what is insentient does not care about what is done to it and because what does not care about what is done to it cannot have interests, insentient fetuses cannot have an interest in living. Therefore, abortion of insentient fetuses is not wrong (Steinbock 1992, Sumner 1981, and Warren 1987).

If this argument were sound, then it would also show that patients who are in temporary coma, and therefore insentient, do not have an interest in living. M. A. Warren (1987) attempts to avoid this counterexample by making the neurological capacity for sentience a necessary condition for having any interests at all and, therefore, for having an interest in living. This move does not solve the problem, however. Because the argument in favor of permitting the abortion of insentient fetuses generated an untenable conclusion, that argument must be rejected. Because the argument rests on an equivocation between what one takes an interest in and what is in one’s interest, there are even better reasons for rejecting it. Accordingly, this objection to the standard antiabortion argument is unsupported.

The classic antiabortion argument is subject to a major theoretical difficulty. Antiabortionists have tried vigorously to avoid the charge that they are trying to force their religious views upon persons who do not share them. However, the moral rule to which the standard antiabortion argument appeals obtains its particular force in the abortion dispute because it singles out members of the species *Homo sapiens* (rather than persons or sentient beings or beings with a future like ours, for example). It is difficult to imagine how the *Homo sapiens*

rule could be defended against its competitors without relying upon the standard theological exegesis of the Sixth Commandment and upon the divine-command theory on which its moral standing rests. This leads to two problems. First, arguments against divine-command ethical theory seem compelling. Second, when arguments based on divine-command theory are transported into the Constitutional realm, First Amendment problems arise.

The philosophical literature contains two major kinds of pro-choice strategies. The personhood strategy appeals to the proposition that no fetuses are persons. If this is so, then, because a woman plainly has the right to control her own body if she does not directly harm another person, abortion is morally permissible. However, Judith Thomson (1971) has argued that a woman's right to control her own body can justify the right to an abortion in some situations even if fetuses are persons. This second strategy rests on the claim that no one's right to life entails the right to a life-support system provided by another's body even if use of that life-support system is the only way to save one's life. Thus, even if opponents of abortion are successful in establishing that fetuses have the right to life, they have not thereby established that any fetus has the right to anyone else's uterus.

It is widely believed that Thomson's strategy can justify abortion in cases of rape and in cases where the life of a pregnant woman is threatened by pregnancy (Warren 1973). There is much less unanimity concerning other cases, because it is generally believed that, if we create a predicament for others, we have special obligations to help them in their predicament. Furthermore, let us grant that A's right to life does not entail A's right to B's body even when A needs B's body to sustain life. Presumably, by parity of reasoning, B's right to B's body does not entail B's right to take A's life even if A's continuing to live severely restricts B's choices. Thus, we have a standoff, and the winner from the moral point of view will be that individual with the strongest right. Although Thomson's strategy has been widely discussed and raises interesting questions about the duty of beneficence, questions both about its philosophical underpinnings and about its scope suggest that philosophically inclined pro-choicers would be better off with a personhood strategy.

No doubt, this is why personhood strategies have dominated the pro-choice philosophical literature. Such strategies come in many varieties (Engelhardt 1986; Feinberg 1986; Tooley 1972, 1983, and 1994; and Warren 1973, 1987). Warren's 1973 version is most famous. She argued that reflection on our concept of person suggests

that in order to be a person one must possess at least more than one of the following five characteristics: consciousness, rationality, self-motivated activity, the capacity to communicate, and the presence of a concept of self. Since no fetus possesses any of these characteristics, no fetus is a person. If only persons have full moral rights, then fetuses lack the full right to life. Therefore, abortion may never be forbidden for the sake of a fetus.

One might object to such a strategy on the ground that, since fetuses are potential persons, the moral importance of personhood guarantees them a full place in the moral community. The best reply to such an objection is that the claim that *X*'s have a right to *Y* does not entail that potential *X*'s have a right to *Y* (think of potential voters and potential presidents; Feinberg 1986).

Although personhood theorists (like antiabortionists) tend to say little about the moral theories on which their views rest (Engelhardt 1986 is an interesting exception), presumably most personhood theorists will turn out to be, when driven to the wall, social-contract theorists. Such theories, according to which morality is a self-interested agreement concerning rules of conduct among rational agents, tend to have problems accounting for the moral standing of those who are not rational agents—beings such as animals, young children, the retarded, the psychotic, and the senile. Thus, the personhood defense of the pro-choice position tends to have problems that are the inverse of those of the classic antiabortion argument.

Both standard antiabortion and personhood accounts appeal, in the final analysis, to the characteristics fetuses manifest at the time they are fetuses as a basis for their arguments concerning the ethics of abortion. This appeal may be a mistake both defenses share. My premature death would be a great misfortune to me because it would deprive me of a future of value. This is both generalizable and arguably the basis for the presumptive wrongness of ending human life. Such a view seems to imply that abortion is seriously immoral, seems to have a defensible intuitive basis, and seems to avoid the counterexamples that threaten alternative views (Marquis 1989). However, this view is subject to two major objections. One could argue that the difference between the relation of fetuses to their futures and the relation of adults to their futures would explain why adults are wronged by losing their futures but fetuses are not (McInerney 1990). One might also argue that because human sperm and ova have valuable futures like ours, the valuable future criterion for the wrongness of killing is

too broad (Norcross 1990). Not everyone believes these objections are conclusive.

Bibliography updated by David Boonin (2005)

ABSOLUTE, THE

"The Absolute" is a term used by philosophers to signify the ultimate reality regarded as one and yet as the source of variety; as complete, or perfect, and yet as not divorced from the finite, imperfect world. The term was introduced into the philosophical vocabulary at the very end of the eighteenth century by Friedrich Wilhelm Joseph von Schelling and Georg Wilhelm Friedrich Hegel and was naturalized into English by Samuel Taylor Coleridge as early as 1809–1810 in *The Friend*. Later in the century it was an important term in the writings of such Idealist philosophers as James Frederick Ferrier, Francis Herbert Bradley, Bernard Bosanquet, and Josiah Royce.

INTRODUCTION OF THE TERM

One of the sources of the philosophy of the Absolute is the literature about Benedict (Baruch) de Spinoza commencing with Moses Mendelssohn's *Morgenstunden* (1785) and F. H. Jacobi's *Ueber die Lehre des Spinoza in Briefen an den Herrn Moses Mendelssohn* (1785). The expression "the Absolute" does not appear in these books, but there is a discussion of Spinoza's view that God does not transcend the world but is the sole infinite substance in which everything has its being. In the second edition of his book (1789), Jacobi printed as an appendix passages from Giordano Bruno's *De la causa, principio et uno* (1584) in order to call attention to a defense of pantheism that had, in Jacobi's view, influenced both Spinoza and Gottfried Wilhelm Leibniz.

Another source of the philosophy of the Absolute is Immanuel Kant's doctrine of the Reason as the faculty that aims at unified knowledge of the Unconditioned—"to find for the conditioned knowledge of the Understanding the Unconditioned that completes its unity" (*Critique of Pure Reason*, A307). In the Fourth Antinomy (A453) Kant writes of "an absolutely necessary being" (*ein Absolutnotwendiges*), and in the *Critique of Judgment*, in his account of the sublime, Kant distinguishes between what is great merely by comparison with something smaller (*comparative magnum*) and what is absolutely, not merely comparatively, great (*absolute magnum*). The former is a sensible concept, the latter is a concept of the Reason that "conducts the notion of nature to a supersensible substratum (underlying both nature and our faculty of thought) which is great beyond every standard of the senses" §26). Kant, of course, warned against supposing that these concepts of absolute unity and the absolutely unconditioned were more than Ideas that direct and regulate the search for empirical knowledge. But he himself, in the *Critique of Practical Reason* (1788), claimed to show that the reality of an unconditioned cause, and hence of freedom, could be *proved* "by means of an apodeictic law of the practical reason, and becomes the keystone of the whole edifice of a system of pure, even of speculative reason" (Preface). Thus Kant himself went some way toward repairing the destruction he had wrought upon "the edifice of speculative reason," and during his last years Johann Gottlieb Fichte and Schelling carried this work further in ways he by no means approved.

We have seen that Kant said that the Practical Reason provided proof of something Unconditioned, namely, of free, uncaused activity. Fichte, in his *Grundlage der gesammten Wissenschaftslehre* (1794), developed this

aspect of Kant's teaching, arguing that a nonempirical, free, and active self must be regarded not merely as a condition of human knowledge, but also as the source and essence of all that is. (It is "All my I," as Coleridge derisively parodies it in the *Biographia Literaria*.) Thus the Transcendental Ego, which in Kant's philosophy was a logical or epistemological conception, was transformed by Fichte into the "absolute ego," a being that he later described as "the creator of all phenomena, including phenomenal individuals." Schelling's earliest writings were reinforcements of Fichte's views and shared his philosophical vocabulary.

By 1800, however, Schelling was moving toward a position of his own, and in his *System des transzendentalen Idealismus* of that year he writes of "an Absolute," and even, once or twice, of "the Absolute." In his *Darstellung meines Systems der Philosophie* (1801) he writes that "there is no philosophy except from the standpoint of the Absolute," and "Reason is the Absolute." In Hegel's *Differenz des Fichtischen und Schellingschen Systems der Philosophie* (1801) the Absolute is constantly referred to. Hegel writes, for example: "Division and conflict [*Entzweiung*] is the source of the need for philosophy, and in the form of the culture of the age, is its unfree, merely given aspect. What is merely an appearance of the Absolute has isolated itself from the Absolute and set itself up as independent." It will be noticed that in this passage the Absolute is contrasted with appearances and with what is "unfree," and that there is a further contrast between appearances that are falsely regarded as independent and appearances viewed in relation to the Absolute.

In 1803, there appeared the second edition of the essay by Schelling titled *Ideen zu einer Philosophie der Natur*, which had first appeared in 1797. In an appendix written for this new edition, Schelling argues that philosophy, as concerned with first principles, must be "an absolute science," that it is therefore concerned with what is absolute, and that, since all things (*Dinge*) are conditioned (*bedingt*), philosophy must be concerned with the activity of knowing rather than with things or objects. "Philosophy," he writes, "is the science of the Absolute," and the Absolute is the identity of the act of knowledge and of what is known. Schelling gives the name "Absolute Idealism" to the philosophy in which this identity is recognized. The exponent of Absolute Idealism, he argues, seeks out the intelligence that is necessarily embodied in nature, and he achieves by means of "intellectual intuition" a grasp of the identity between knower and known.

“The Absolute” was now well established in the vocabulary of Idealist philosophy.

SOME VIEWS ABOUT THE NATURE OF THE ABSOLUTE

We have seen that Schelling regarded the Absolute as that which intellectual intuition revealed as the identity of the knower and the known. He argued, furthermore, that knowledge is inseparable from will, so that the ultimate whole is active and free. The Absolute is manifested not only in nature but also in human history, which is a progress toward self-consciousness. An important thesis of Schelling’s philosophy of the Absolute is that whereas in nature the Absolute is embodied in an unconscious way, in works of art it is consciously embodied, so that through his productions the artistic genius reveals the Absolute to humankind. In *Philosophie und Religion* (1804) Schelling tried to show how the finite, phenomenal world is related to the Absolute. He here had recourse to the notion of a fall that is a consequence of freedom and is yet, like the Absolute itself, outside time. He recognized that his view might be regarded as pantheistic (it was so regarded by Coleridge), and he attempted to show that human selves are, although finite, divine by nature. Thus the philosophy of the Absolute is developed as a sort of theology with some kinship to the speculations of Nicholas of Cusa.

It is well known that in his *Phenomenology of Mind* (1807) Hegel, by his characterization, “a night in which all cows are black,” insinuated that Schelling’s Absolute had no positive ascertainable features. Schelling, for his part, regarded Hegel’s Absolute as “panlogistical”; that is, as nothing but an array of abstract categories. In his *Encyclopedia* Hegel presents various “definitions” of the Absolute in ascending order of complexity and adequacy. It is Being, he says, as Parmenides had held, but this is the least that can be said about it. It is also the self-identical, and, at a higher level, it is inference (*Schluss*—Wallace translates it “syllogism”). These definitions, from the *Logic*, appear to confirm Schelling’s criticisms; but when Hegel comes to the *Philosophy of Mind*, the third part of the *Encyclopedia*, he writes that “the Absolute is mind: this is the highest definition of the Absolute.” In his account of mind, Hegel shows how it develops as society moves toward higher levels of freedom in the course of human history, and how it reaches its fullest expression in the self-consciousness of the philosopher. Hegel’s intention was to describe the Absolute in such a way that it would be seen to be infinite and yet comprise the finite within itself, and to be real and yet contain the apparent.

But this intention was so ambitious that the result is ambiguity, and the Hegelian Absolute has been regarded by some, including Andrew Seth (later Pringle-Pattison), as “a single self” in which finite selves are lost, and by others, such as J. McT. E. McTaggart, as a society of individual, nontemporal selves. The ambiguity is also reflected in divergent interpretations of the religious significance of Hegel’s Absolute, the majority of interpreters regarding it as equivalent to God, with others, for example, Bruno Bauer and Kojève, taking the view that “the Absolute” is Hegel’s designation for man as a progressing historical individual.

In the nineteenth century and the early twentieth century, Absolutism became an important influence in the philosophy of Great Britain and the United States. J. S. Ferrier, who had written a life of Schelling and who had studied Coleridge and was aware of Schelling’s influence on him, expounded, in his *Institutes of Metaphysics* (1854), a pluralistic Absolutism according to which there is a plurality of contingent “Absolute Existences” that are “minds-together-with-that-which-they-apprehend,” and one “Absolute Existence which is strictly *necessary* ... a supreme, infinite and everlasting Mind in synthesis with all things.” But the most influential version of Absolute Idealism to be published in English was Bradley’s *Appearance and Reality* (1893). In this book Bradley argued that mere appearances are conflicting and self-contradictory and that reality or the Absolute must therefore be harmonious and consistent. The self-contradictory character of appearances is due to their relatedness, and therefore the Absolute must not contain relations. Bradley maintained that the nature and possibility of a harmonious nonrelational whole is adumbrated in “immediate experience,” the prereflective experience from which the world of distinct and related things emerges as we learn to talk and to judge. In this prereflective experience, subject and object are not yet differentiated, and there is diversity without numerical plurality. “From such an experience of unity below relations,” Bradley writes, “we can rise to the idea of a superior unity above them.” In this view, the Absolute is a suprarrelational, differentiated harmony of experience. It is not a self, and it is not God, for “short of the Absolute, God cannot rest, and having reached that goal, he is lost and religion with him.” Some have thought that this view of the Absolute is less open to the charge of panlogism than is that of Hegel. Before the publication of *Appearance and Reality*, Andrew Seth had, from within the Idealist school, criticized the line of thought that submerged individual selves in an impersonal or suprapersonal Absolute. McTaggart, we have seen, did not interpret Hegel in this way, and endeavored on his own

account to show that the unreality of the phenomenal world is consistent with the absolute existence of individual selves. Josiah Royce's solidly and persuasively argued *The World and the Individual* (1904) is another attempt to rescue individual minds from absorption in the Absolute.

CRITICAL COMMENTS

It is remarkable that a line of philosophical argument that set out to defend the reality of mind and of freedom should end up with minds that are self-contradictory appearances and an Absolute that alone is free. The Absolute was to have been the seat of freedom, reality, truth, and harmony; yet if Bradley was right, harmony and reality shut out the possibility of truth and freedom. Like Spinoza he tried to meet the difficulty with a doctrine of degrees of truth and freedom; and the comparison is revealing, for Spinoza is often regarded as a determinist. What went wrong? Coleridge, although greatly impressed by Schelling, argued in *The Friend* that Schelling's view, like that of Spinoza, was pantheistic. We may agree that Schelling sought for truth and freedom in the universe at large instead of in the limited beings to which they really belong. Schelling continued Kant's error of locating freedom outside the only world in which it is of importance, the world in which individual men decide and act. The view of Absolute Idealists is, however, that this world is merely phenomenal and must be contrasted with an infinite reality that contains it. The critic will ask whether this infinite reality must exist or whether it is only a projection from the finite. In adopting the former view, Absolutists have used arguments analogous to the Ontological Argument and to the Argument from the Contingency of the World. It would be self-contradictory, that is, to suppose that the Perfect could fail to exist; and in any case contingent being could not *be* unless there were a Necessary Being. Pierre Gassendi, Kant, and others have brought forward arguments against these so-called proofs, but it will not do merely to move forward these "disproofs" in opposition to Absolute Idealism. For the defenders of the Absolute do not allow that the distinctions made in these objections, between thought and reality or between concepts and things, are tenable just as they stand. Absolute Idealists cannot be refuted by arguments in which commonsense distinctions or the terms of an opposed philosophical tradition are uncritically presupposed. It is true that the conceptual adventurousness of Absolute Idealism was the occasion for the extreme conceptual conservatism of G. E. Moore and of those philosophers who insist on the essential rightness of ordinary language. But in the course of philosophical

argument it has emerged that facts and concepts, the world and the ways in which it is thought about, cannot be isolated from one another as dogmatic common sense says they can be. On this matter the Absolutists' prejudice in favor of unity seems to have caused them to look in the right direction and to see how closely associated with one another are our conceptual framework and the world it is used to describe and classify.

Bibliography

Historians of philosophy do not seem to say much about the introduction of the term "the Absolute." Information can be obtained from Richard Kroner, *Von Kant bis Hegel*, 2nd ed. (Tübingen: Mohr, 1961) and from Frederick Copleston, S.J., *A History of Philosophy*, Vol. VII, *Fichte to Nietzsche* (London: Search Press, 1963).

On various views about the nature of the Absolute, see, in addition to the books mentioned in the text: Bruno Bauer, *Die Posaune des jüngsten Gerichts wider Hegel, den Atheisten und Antichristen* (Leipzig, 1841); Andrew Seth (later Pringle-Pattison), *Hegelianism and Personality* (London and Edinburgh: Blackwood, 1887); J. McT. E. McTaggart, *Studies in Hegelian Cosmology* (Cambridge: University Press, 1901); A. Kojève, *Introduction à la lecture de Hegel* (Paris: Editions Gallimard, 1947).

For criticisms of Absolutism, see: William James, *A Pluralistic Universe* (New York and London: Longmans, Green, 1909), Chs. II and III; G. E. Moore, *Some Main Problems of Philosophy* (London: Allen and Unwin, 1953), Chs. VIII–XII; A. C. Ewing, *Idealism, a Critical Survey* (London: Methuen, 1934). In Ewing, Ch. VIII, §3 is headed "The Absolute" and contains a brief discussion of the views of Bradley and Bosanquet.

ACTION

People speak not only of the actions of human beings and other intelligent animals but also of the actions of inanimate objects such as acids and waves. The philosophy of action, however, is not directly concerned with the actions of inanimate objects. Its primary subject matter is intentional action. Two questions are central in the philosophy of action: What are intentional actions? And how are intentional actions to be explained? An adequate answer to the first question would enable one to see how intentional actions differ from everything else—including the actions of acids and waves, nonactions, and unintentional actions. A successful answer to the second question would provide one with the theoretical machinery to use in explaining why you are reading this entry and why the author wrote it.

INTENTIONAL ACTION AND INDIVIDUATION

According to an attractive causal theory, intentional actions are, in one important respect, like money. The piece of paper with which Ann just purchased her drink is a genuine U.S. dollar bill partly in virtue of its having been produced (in the right way) by the U.S. Treasury Department. A duplicate bill produced with plates and paper stolen from the Treasury Department is a counterfeit bill, not a genuine one. Similarly, according to one kind of causal theory of intentional action, a certain event is Ann's buying a drink—an intentional action—partly in virtue of its having been produced in the right way by certain mental items. An event someone else covertly produces by remote control—one including visually indistinguishable bodily motions not appropriately produced by Ann's intentions or decisions (nor by physical states or events that realize the mental items)—is not Ann's intentional action, even if she feels as though she is in charge. (This view does not identify intentional actions with nonactional events—or nonintentional actions—caused in the right way. That would be analogous to identifying genuine U.S. dollar bills with pieces of printed

paper that are not genuine U.S. dollar bills and are produced in the right way by the U.S. Treasury Department, which is absurd.)

The question “What are intentional actions?” directly raises two other questions. “How do intentional actions differ from everything else?” and, “How do intentional actions differ from one another?” A crude sketch of one answer to the first question about differences has just been provided. Intentional actions differ from other events in their causal history. Events that are intentional actions are produced in a certain way by mental items (or physical states and events that realize these items); events that are not intentional actions lack such a causal history (a topic picked up again in section 2.) Alternative conceptions of intentional action include (1) an internalist view, according to which intentional actions differ experientially from other events in a way that is essentially independent of how, or whether, they are caused; (2) a conception of intentional actions as composites of nonactional mental events or states (e.g., intentions) and pertinent nonactional effects (e.g., an arm's rising); and (3) views identifying an intentional action with the causing of a suitable nonactional product by appropriate nonactional mental events or states—or, instead, by an agent.

A debate over the second question about differences—the question of action individuation—has produced a collection of relatively precise alternatives: a coarse-grained view, a fine-grained view, and componential views. Donald Davidson writes, “I flip the switch, turn on the light, and illuminate the room. Unbeknownst to me I also alert a prowler to the fact that I am home” (1980, p. 4). How many actions does the agent, Don, perform? Davidson's coarse-grained answer is one action “of which four descriptions have been given” (p. 4). The action is intentional under certain descriptions (e.g., “I flip the switch”), and unintentional under others (e.g., “I alert the prowler”). A fine-grained alternative view treats *A* and *B* as different actions if, in performing them, the agent exemplifies different action properties. In this view, Don has performed at least four actions (only some of which are intentional), because the action properties at issue are distinct. An agent may exemplify any of these action properties without exemplifying any of the others. One may even turn on a light in a room without illuminating the room (the light may be painted black). Componential views represent Don's illuminating the room as an intentional action having various components, including—but not necessarily limited to—his moving his arm, his flipping the switch, and the light's going on. Where proponents of the coarse-grained and fine-grained theo-

ries find, respectively, a single action under different descriptions and a collection of intimately related actions, advocates of the various componential views locate a larger action having smaller actions among its parts.

Davidson and Jennifer Hornsby hold that every action is intentional under some description. Proponents of alternative theories of action individuation may make an analogous claim: in every case of action something is done intentionally; when nothing is done intentionally, no action is performed. Where Davidson and Hornsby seek to distinguish descriptions under which an action is intentional from descriptions under which it is not, other philosophers may seek to distinguish intentional from unintentional actions in the same case of action. Either way, intentional actions are of primary importance.

This entry proceeds in a neutral way regarding the leading contending theories of individuation. Readers may treat the action variable *A* as a variable either for actions themselves (construed componentially or in a more fine-grained way) or for actions under *A*-descriptions, depending on their preferred mode of action individuation. The same goes for the term *action*.

CAUSALISM: BACKGROUND AND A CHALLENGE

One approach to understanding both the nature of intentional action and the explanation of intentional actions emphasizes causation. The conjunction of the following two theses may be termed *standard causalism*: (1) An event's being an intentional action depends on how it was caused; and (2) Proper explanations of intentional actions are causal explanations. Familiar causal theories feature as causes such psychological or mental items as beliefs, desires, intentions, and such related events as acquiring an intention to *A*.

Causalism typically is embraced as part of a naturalistic stand on agency, according to which mental items that play causal/explanatory roles in intentional action are in some way dependent on or realized in physical states and events. A range of options is open. Indeed, any viable solution to the mind-body problem that supports the idea that the mental has a significant causal/explanatory role in intentional action would, in principle, be welcomed by causalists.

Aristotle endorses the idea that intentional actions are to be explained, causally, in terms of mental states or events in his assertion that “the origin of action—its efficient, not its final cause—is choice, and that of choice is

desire and reasoning with a view to an end” (Aristotle 1984, 1139a31–32). Davidson, in an influential article, “Actions, Reasons, and Causes,” rebuts arguments against causalism, develops a positive causalist view, and presents noncausalists with what has proved to be a difficult challenge. Addressed to philosophers who hold that when people act intentionally they act for reasons, the challenge is to provide an account of the reasons for which people act that does not treat (people's having) those reasons as figuring in the causation of the relevant behavior (or, one might add, as realized in physical causes of the behavior). The challenge is acute when an agent has more than one reason for *A*-ing but *A*-s only for only one of them. Imagine that Al has a pair of reasons for mowing his lawn this morning. First, he wants to mow it this week and he believes that this morning is the most convenient time. Second, he has an urge to repay his neighbor for the rude awakening Al suffered recently when the neighbor turned on her mower at the crack of dawn; he believes that his mowing his lawn this morning would repay her. As it happens, Al mows his lawn this morning only for one of these reasons. In virtue of what is it true that he mowed his lawn for this reason, and not the other, if not that this reason—or his having this reason or what realizes either this reason or his having it—and not the other, played a suitable causal role in his mowing his lawn? Alfred Mele rebuts detailed noncausalist attempts to answer this challenge in chapter two of *Motivation and Agency*. Space constraints preclude pursuing the issue here.

TWO ALLEGED PROBLEMS FOR CAUSALISM

Two alleged problems for causalism that continue to be lively topics of debate are causal deviance and vanishing agents.

CAUSAL DEVIANCE. Deviant causal chains raise difficulties for causal analyses of action itself and of doing something intentionally. The alleged problem is that whatever psychological causes are claimed to be both necessary and sufficient for a resultant event's being an action, or for an action's being intentional, cases can be described in which, owing to a deviant causal connection between the favored psychological antecedents—for example, events of intention acquisition—and a resultant event, that event is not an action, or a pertinent resultant action is not done intentionally.

The most common examples of deviance divide into two types: (1) Examples of primary deviance, which raise a problem about a relatively direct connection between

mental antecedents and resultant bodily motion; and (2) examples of secondary deviance, which highlight behavioral consequences of intentional actions and the connection between these actions and their consequences. In Davidson's well-known example of primary deviance, "A climber ... want[s] to rid himself of the weight and danger of holding another man on a rope, and he ... know[s] that by loosening his hold on the rope he [can] rid himself of the weight and danger. This belief and want ... so unnerve him as to cause him to loosen his hold" unintentionally (1980, p. 79). In his equally well-known example of secondary deviance, "A man [tries] to kill someone by shooting at him. [He] misses his victim by a mile, but the shot stampedes a herd of wild pigs that trample the intended victim to death" (p. 78).

Instructive attempts to resolve the problems examples such as these pose highlight four points:

- ((1)) An event is an intentional action only if it is an action, and in many cases of deviance the pertinent event seems not to be an action. For example, the climber's "loosening his hold" is more aptly described as the rope's slipping from his trembling fingers.
- ((2)) An analysis of intentional action may preclude there being a gap between an action's psychological causal initiator and the beginning of the action. If, for example, every intentional action has the acquisition of a proximal intention—that is, an intention to *A* now or an intention to *A*, beginning now—as a proximate cause, there is no room between cause and the beginning of action for primary deviance. ("*Proximate* cause" may be defined as follows: *x* is a proximate cause of *y* if and only if *x* is a cause of *y* and there is nothing *z* such that *x* is a cause of *z* and *z* is a cause of *y*.)
- ((3)) Intention (or one's preferred psychological item) has a continuous guiding function in the development of intentional action.
- ((4)) An action's being intentional depends on its fitting the agent's conception or representation of the manner in which it will be performed—a condition violated in Davidson's shooting scenario.

George Wilson challenges point 2. Sometimes, Wilson observes, "intentions cause states of nervous agitation that positively *enable* the agent to perform the type of action intended" (1989, p. 252). He offers the example of a weightlifter whose "intention to lift the weight then caused a rush of nervous excitement that was, in fact, necessary for him to budge the great weight even slightly

from off the floor" (1989, p. 252). However, this observation and example arguably leave the requirement of proximate causation unscathed. What is required is not that intention-inspired nervousness, agitation, and the like, play no role in the production of intentional actions, but rather that they not fill a gap between the acquisition of a pertinent proximal intention and action in such a way that intention acquisition figures only indirectly in the production of the corresponding action. In Wilson's example, one may contend, there is no gap between intention acquisition and the beginning of the lifting that is filled by nervousness. Rather, one may argue that intention acquisition proximately initiates the lifting—which action, according to some causalists, begins with a relevant brain event prior to the weight's rising—while also producing nervousness that is required for the agent's even budging the weight.

Proximal intentions typically are not momentary states, and the intention to lift the weight in the present case is at work as long as the lifting continues. Even if nervousness were somehow required for the occurrence of the agent's muscular movements themselves, a nervousness producing proximal intention to lift the weight whose acquisition plays a causal role in the production of a corresponding intentional lift would, in conjunction with the resultant nervousness, figure in the proximate initiation of those movements. If, alternatively, the causal role of an intention to lift the weight were exhausted by the intention's issuing in nervousness, and the nervousness were somehow to result in the upward movement of limbs and weight independently of any pertinent intention present at the time, the weightlifting would not be intentional. The case—aside from its failure to provide an intuitively appealing mechanistic explanation of the focal occurrence—would then be on par with familiar examples of nonintentional occurrences caused by intention-inspired nervousness (e.g., the climber's case).

The point about the continued functioning of proximal intentions blunts an objection John Bishop (1989) raises to Myles Brand's position on primary deviance. Bishop observes that deviance can break in after intention acquisition has (properly) initiated a causal chain—but before bodily movement occurs—and strip agents of control over their motions. In such cases, although agents' motions may accord with their intentions, they do not act intentionally. On Brand's view, however, the proximal intentions that initiate intentional actions also sustain and guide them: "Given that intention is in part guidance ... of activity, the intention continues as long as

guidance ... continues" (1984, p. 175). In a case of the kind Bishop imagines, guidance is absent.

Some causal theorists who have assessed cases of primary deviance as attempted counterexamples to a causal account of what it is for an action to be intentional have dismissed them on the grounds that they are not cases of action at all. If this diagnosis is correct, primary deviance poses an apparent problem for the project of constructing a causal analysis of action. Can causalists identify something of a causal nature in virtue of which it is false that the climber performed the action of loosening his grip on the rope?

In a discussion of primary deviance, Alvin Goldman remarks: "A complete explanation of how wants and beliefs lead to intentional acts would require extensive neurophysiological information, and I do not think it is fair to demand of a philosophical analysis that it provide this information.... A detailed delineation of the causal process that is characteristic of intentional action is a problem mainly for the special sciences" (1970, p. 62). This remark may strike some readers as evasive, but Goldman has a point. A deviant causal connection between an *X* and a *Y* is deviant relative to normal causal connections between *X*-s and *Y*-s. Moreover, what counts as normal in this context is perspective-relative. From the point of view of physics, for example, there is nothing abnormal about Davidson's examples of deviance. And, for beings of a particular kind, the normal route from intention to action may be best articulated partly in neurophysiological terms.

One way around the problem posed by incomplete neuroscientific knowledge is to design (in imagination, of course) an agent's motor control system. Knowing the biological being's design in that sphere, there is then a partial basis for distinguishing causal chains associated with overt action—that is, action essentially involving peripheral bodily motion—from deviant motion-producing chains. If one can distinguish deviant from non-deviant causal chains in designed agents—that is, chains not appropriate to action from action-producing chains—then the same may also be done for normal human beings, if much more than is currently known about the human body is discovered. (This line of thought is pursued in Mele 2003, ch. 2).

VANISHING AGENTS. Some philosophers claim that causalism precludes there being any actions at all and therefore makes agents vanish. According to Thomas Nagel, "The essential source of the problem is a view of persons and their actions as part of the order of nature....

That conception, if pressed, leads to the feeling that we are not agents at all.... *My doing* of an act—or the doing of an act by someone else—seems to disappear when we think of the world objectively. There seems no room for agency in [such] a world.... There is only what happens" (1986, pp. 110–111).

Nagel's worry is not worrisome. Cats and dogs are part of the natural order. If radical skeptical hypotheses are set aside—for example, the hypotheses that everything is a dream and that all biological entities are brains in vats—it is plain that cats and dogs act. They fight, eat, and play. When they do these things they are acting. The same is true of humans, even if people are part of the natural order. Supernatural beings (e.g., gods and ghosts) are not part of the natural order. That a being needs to be supernatural in order to act is an interesting proposition, but it is difficult to take that proposition seriously in the absence of a powerful argument for it.

J. David Velleman voices a variant of Nagel's worry. He contends that standard causal accounts of intentional action do not capture what "distinguishes human action from other animal behavior" and do not accommodate "human action par excellence" (2000, p. 124). He also reports that his objection to what he calls "the standard story of human action" (p. 123), a causal story, "is not that it mentions mental occurrences in the agent instead of the agent himself [but] that the occurrences it mentions in the agent are no more than occurrences in him, because their involvement in an action does not add up to the agent's being involved" (p. 125). Velleman says that this problem would remain even if the mind-body problem were solved, and, like Nagel, he regards the problem as "distinct from the problem of free-will" (p. 127).

Here, Velleman runs together two separate issues. Human agents may be involved in some of their actions in ways that cats and dogs are involved in many of their actions. Human agents do not vanish in such actions. Scenarios in which human agents vanish are one thing; scenarios in which actions of human agents do not come up to the level of human action par excellence, whatever that may be, are another.

Causalists are entitled to complain that Velleman has been unfair to them. His description of the standard story of human action is apparently a description of the sort of thing found in the work of causalists looking for what is common to all (overt) intentional actions, or all (overt) actions done for reasons, and for what distinguishes actions of these broad kinds from everything else. If some nonhuman animals act intentionally and for reasons, a story with that topic definitely should apply to them.

Also, human action par excellence may be intentional action and action done for a reason in virtue of its having the properties identified in standard causal analyses of these things. That the analyses do not provide sufficient conditions for—or a story about—human action par excellence is not a flaw in the analyses, given their targets. If Velleman were to believe that causalism lacks the resources for accommodating human action par excellence, he may attack the standard story on that front, arguing that it cannot be extended to handle such action. But Velleman himself is a causalist. Moreover, causalists have offered accounts of kinds of action—for example, free or autonomous action and action exhibiting self-control (the contrary of weakness of will)—that exceed minimal requirements for intentional action or action done for a reason. Their story about minimally sufficient conditions for action of the latter kinds is not their entire story about human actions.

REASONS, DESIRES, AND INTENTIONS

Reasons, desires, and intentions are featured in many theories about how intentional actions are to be explained. According to Davidson's influential view, reasons for action are complexes of beliefs and desires. Some philosophers claim that Davidsonian reasons for action really are not reasons at all. T. M. Scanlon, for example, argues that "desires almost never provide reasons for action in the way described by the standard desire model" (1998, p. 43).

Philosophical work on reasons for action tends to be guided primarily either by a concern with the explanation of intentional actions or by a concern with the evaluation of intentional actions or their agents. In work dominated by the former concern, reasons for action tend to be understood as states of mind, along broadly Davidsonian lines. Philosophers with the latter concern may be sympathetic or unsympathetic to this construal, depending on their views about standards for evaluating actions or agents. For example, a theorist whose evaluative concern is with rational action and who holds that the pertinent notion of rationality is subjective—in the sense that a proper verdict about the rationality or irrationality of an agent's intentional action is to be made from the perspective of the agent's own desires, beliefs, principles, and the like, rather than from some external, or partly external, perspective—may be happy to understand reasons for action as states of mind. A theorist with a more objective conception of rational action or rational agency also is likely to have a more objective conception of reasons for action. Such a theorist may find it natural to insist that

many or all reasons for action are facts about the agent-external world. Consider Bob's starting a new diet after his doctor informs him that his cholesterol is dangerously high. Theorists with a subjective conception of rationality tend to regard Bob's reasons for starting the new diet as constituted by desires and beliefs (e.g., his desire to improve his health and his belief that the new diet will help him do that), whereas theorists with an objective conception of rationality tend to regard his reasons as objective facts (e.g., the diet will improve his health, or it is likely to do so). Alleged reasons of these two types may be termed, respectively, *agent-internal* and *agent-external* justificatory reasons.

COMBINING AGENT-INTERNAL AND AGENT-EXTERNAL REASONS. If there are agent-external justificatory reasons for action, it may be that intentional actions are to be relatively directly explained at least partially in terms of Davidsonian reasons, and that when agent-external justificatory reasons—for example, the new diet is likely to improve Bob's health—contribute to explanations of intentional actions, they do so less directly, by way of a causal contribution made by an agent's *apprehending* such a reason. For example, Bob's apprehension of the likelihood that the new diet will improve his health might, along with his desire for improved health, enter into a true causal explanation of Bob's starting the new diet. An exploration of the possibility of agent-external justificatory reasons and of their compatibility with the existence of Davidsonian reasons quickly takes one well beyond the philosophy of action into moral philosophy and value theory. Further discussion of this topic is beyond the scope of the present entry, but is discussed in chapters three through six of Mele's *Motivation and Agency* (2003).

DESIRES. There is a related controversy about the nature of desires. Scanlon's critique of what he calls "the standard desire model" (1998, p. 43) is framed partly in terms of his own account of "what is usually called desire" (p. 65). He contends that something's seeming to an agent to be a reason for *A*-ing is "the central element in what is usually called [a] desire" to *A* (p. 65). Seemings of this kind do important motivational work, according to Scanlon. He claims that in a thirsty man with a desire to drink, "the motivational work seems to be done by" the agent's taking "the pleasure to be obtained by drinking ... to count in favor of drinking" (p. 38).

Scanlon's account of what is usually called a desire is overly intellectualized. Toddlers and pretoddlers are commonly thought to desire to do things—for example, to

drink some juice or to hug a teddy bear. This common thought is not that although these little agents have desires to act, they lack what is usually called a desire. The thought is that they have desires in a usual sense of the term. But because it is unlikely that toddlers have the concept of a reason for action (or of something's counting in favor of a course of action), it is unlikely that things seem to them to be reasons for action (or to count in favor of actions). There is good evidence that younger three-year-olds tend not to have the concept—or a proper concept—of belief and that the concept of desire normally does not emerge until around the age of two. Presumably, even if the concept of a reason for action were to have no conceptual ties to the concepts of belief and desire, it would be sufficiently sophisticated to be out of reach of children too young to have proper concepts of belief and desire. Even so, it is commonly and plausibly thought that such children act intentionally and for reasons. (They also have desires and beliefs, on the assumption that having such attitudes does not require possessing proper concepts of these attitudes.) In thirsty toddlers or pretoddlers, desires to drink—rather than any taking of the pleasure to be obtained by drinking to be a reason for drinking—seem to do the work of motivating drinking.

Thirsty toddlers are attracted by cups of juice, and not in the way moths are attracted by light. Toddlers are flexible in their approach to getting drinks: they try alternative means. Moths behave tropistically. Even though it is unlikely that thirsty toddlers have the conceptual wherewithal to take features—including anticipated consequences—of drinking to be reasons for (or count in favor of) drinking, they are attracted by cups of juice in a way characteristic of desiring agents. Being attracted to cups of juice owing to a sensitivity to certain of their features is distinguishable from being attracted to cups of juice owing to the agent's taking those features to be reasons. An agent's behavior may be sensitive to attractive features of things without the agent's taking those features to be reasons. If this were not so, a radically new theory of animal behavior would be required, one entailing either that only members of the most conceptually sophisticated species ever act intentionally (perhaps just human beings) or that many nonhuman species are much more conceptually sophisticated than anyone has thought.

When ordinary thirsty adults drink (intentionally, and in ordinary scenarios), they presumably are motivated at least partly by a desire to drink. The strength of the desire may sometimes be explained partly by their believing that drinking would be pleasant, or, more fully,

by that belief together with a desire for pleasure. A toddler's desire to drink water and an adult's desire to drink water may admit of the same analysis. Just as something's seeming to be a reason for drinking is not a constituent of the toddler's desire, it may not be a constituent of the adult's desire either. If a seeming of this kind sometimes is at work in thirsty adults, it may function as a partial cause of the desire's strength or of the desire itself.

INTENTIONS. Next on the agenda are intentions, states of mind commonly regarded as being closely linked to desires and beliefs. Intention has a motivational dimension, and the word *desire* (like the word *want*) is often used in the literature as a generic term for motivation. Intention also is widely regarded as involving a belief condition of some sort. Few people are inclined to say that gamblers who believe that their chances of winning today's lottery are about one in a million intend to win the lottery. However, philosophers disagree about the tightness of the connection between intentions, on the one hand, and desires and beliefs, on the other. Some—drawn, perhaps, by the idea that desire and belief are the most fundamental representational states of mind—argue that intentions are reducible to combinations of desires and beliefs, whereas others argue that attempts at such reduction are doomed to failure.

The central issue is whether the settledness that intention encompasses can be articulated in terms of beliefs and desires. Ann wants to go to a 7:00 movie and she wants to attend a 7:00 lecture. She knows that she can do either but not both. Although Ann wants to see the movie more than she wants to attend the lecture and believes that, given what she usually does in such situations, she will probably go to the movie, she is unsettled about what to do. After further deliberation, Ann settles matters for herself by deciding to attend the lecture. In so deciding, she forms an intention to attend it. To intend to *A* is, at least in part, to be settled (but not necessarily irrevocably) on *A*-ing. Wanting or desiring to *A*—even when the desire is stronger than its competitors, and even when it is accompanied by a belief that one probably will *A*—is compatible with being unsettled about whether to *A*.

Functions plausibly attributed to intentions include initiating and sustaining intentional actions, guiding intentional actions, helping to coordinate agents' behavior over time and their interaction with others, and prompting and appropriately terminating practical reasoning. Some philosophers have advanced nonreductive accounts of intention designed to accommodate many or all of these functions. According to a representative

account of this kind, intentions are executive attitudes toward plans. Plans—which range from simple representations of simple actions to complex strategies for achieving remote goals—constitute the representational contents of intentions. What distinguishes intentions from other practical attitudes (e.g., desires to act), in this account, is their executive nature. The settledness on *A*-ing that is encompassed in an intention to *A* is a psychological commitment to executing the intention-embedded plan of action, a commitment of a kind arguably constituted exclusively by intentions.

ANALYZING INTENTIONAL ACTION: DIFFICULTIES

Attention to a trio of problems for the following pair of protoanalyses of intentional action sheds light on what the difficult project of analyzing intentional action encompasses:

- A1.* *S* intentionally *A*-ed if and only if *S* *A*-ed in the way that *S* intended to *A*.
- A2.* *S* intentionally *A*-ed if and only if *S* *A*-ed for a reason.

SIDE EFFECTS. Gilbert Harman discusses a scenario in which “In firing his gun,” a sniper who is trying to kill a soldier, “knowingly alerts the enemy to his presence” (1997, p. 151). Harman claims that although the sniper “does not intend to alert the enemy,” he intentionally alerts the enemy, “thinking that the gain is worth the possible cost.” If Harman is right, both *A1* and *A2* are false. The sniper does not intend to alert the enemy, and he does not alert them for a reason either (even if his alerting them is part of some larger action that he does for a reason).

Because Harman’s sniper does not unknowingly or accidentally alert the enemy, many people will deny that the sniper unintentionally alerted them. But the truth of that denial is consistent with the action’s not being intentional, if there is a middle ground between intentional and unintentional action. Arguably, actions that an agent in no way aims at performing but that are not performed unknowingly or accidentally are properly located on that middle ground. They may be nonintentional, as opposed to unintentional. Of course, it also is arguable that Harman correctly assesses the sniper’s case and that *A1* and *A2* are far too simple to be true.

BELIEF CONSTRAINTS. Some putative belief constraints on intentions or on rational intentions also pose problems for *A1*. Michael Bratman argues that intention has a

normative side that requires that an agent’s intentions be internally consistent (individually and collectively), consistent with the agent’s beliefs, and means-end coherent. Rational intentions, he maintains, satisfy those requirements, and he contends that agents rationally intend to *A* only if, “other things being equal,” they do “not have beliefs inconsistent with the belief that [they] will *A*” (1987, p. 116).

The normative demands figure prominently in an argument Bratman advances against what he calls “the Simple View”—the thesis that intentionally *A*-ing entails intending to *A*. The argument revolves around an example involving a pair of video games and an ambidextrous player who shall be called Vic. Vic’s task is to hit targets with missiles. In the main case, he simultaneously plays two games, each with its own target and firing mechanism, and he knows that the machines are “so linked that it is impossible to hit both targets” (Bratman 1987, p. 114). (He knows that hitting a target ends both games, and that “if both targets are about to be hit simultaneously,” both machines shut down before the targets can be hit.) Vic tries to hit the target on machine 1 while also trying to hit the target on machine 2. He succeeds in hitting the former—“in just the way that [he] was trying to hit it, and in a way which depends heavily on [his] considerable skill”—but, of course, he misses the latter.

If Vic hit target 1 intentionally, fans of the Simple View must say that he intended to hit it. Because Vic’s attitude toward hitting that target is not relevantly different from his attitude toward hitting target 2, Simple View fans apparently must also say that he intended to hit target 2. Bratman contends that having both intentions, given what Vic knows—namely, that he cannot hit both targets—would be irrational. Yet, it seems perfectly rational of Vic to have proceeded as he did. So given the point about the symmetry of Vic’s attitudes toward the targets, Bratman concludes that he did not have either intention. And if Vic hit target 1 intentionally in the absence of an intention to hit it, the Simple View and *A1* are false.

Some critics of the Simple View, including Bratman and Harman, also reject the idea that intentions are reducible to complexes of beliefs and desires; Hugh McCann argues that they are in danger of having to settle for an unwanted reductive analysis of intention (1998). Bratman, who suggests that a “guiding desire” (e.g., to hit target 1) can play the role of an intention (Bratman 1987, p. 137), is McCann’s main target. McCann notes that once it is conceded that desires can stand in for intentions, reductionists will justifiably ask what need there is for a

notion of intention that is irreducible to desire and belief. However, philosophers who reject the Simple View need not follow Bratman in appealing to guiding desires. For example, it may be argued that intentions to try to *A* can stand in for intentions to *A*, and, of course, intentions to try to *A* are intentions. Presumably, Vic intends to try to hit target 1 while also intending to try to hit target 2.

LUCK. Instances of lucky success pose problems for *A1* and *A2*. Beth, who has never fired a gun, mistakenly thinks that modern technology makes target shooting fool proof, and she intends to hit the bull's-eye on a distant target by aiming and firing at it. She luckily hits it in just the way she intended, but was her hitting it an intentional action? Suppose that Beth has no natural talent with firearms: she fires hundreds of additional rounds at the target and does not even come close. Here philosophers' intuitions differ. According to Christopher Peacocke (1985), an agent who makes a successful attempt "to hit a croquet ball through a distant hoop" intentionally hits the ball through the hoop (p. 69). But Brian O'Shaughnessy (1980) maintains that a novice who similarly succeeds in hitting the bull's-eye on a dart board does not intentionally hit the bull's-eye. Readers inclined to regard Beth's hitting the bull's-eye as an intentional action should consider her brother Bob. He wants to save his town by disarming a bomb, and he believes that his punching in any ten-digit sequence of numbers will disarm it. In fact, only one ten-digit code will work. Bob intends to disarm the bomb by entering ten digits. If he luckily punches in the right code, thereby disarming the bomb, is his disarming it an intentional action? Or was his chance of success too low for that action to count as intentional? If the correct answer to the latter question is yes, *A1* is false.

Protoanalysis *A2* also is threatened by stories such as these. Probably, many people would happily (but perhaps mistakenly) say that Bob's disarming the bomb—that action—was done for a reason. After all, he wanted to save the town and knew that he must disarm the bomb to do so, and this helps to explain why he entered ten digits. But, again, was Bob's chance of success too low for the disarming to count as an intentional action?

Recall the two central questions identified in the introduction to this entry: What are intentional actions? And how are intentional actions to be explained? Depending on how nuanced a satisfactory answer to the first question is, philosophers of action working on the second question may do well to focus their efforts on core instances of intentional action. If the sniper's alerting the

enemy is an intentional action, it is intentional in a different way than his firing his gun is. He fires his gun as a means to an end, but this is not true of his alerting the enemy. He also intends to fire his gun and fires it for a reason, but he does not intend to alert the enemy and does not alert them for a reason. One approach in looking for core instances of intentional action is to look for interesting properties that all cases of intentional action have in common, even if not all intentional actions have them. It may be discovered that there are no cases of intentional action in which the agent does not perform any intended intentional actions. (Even if Vic lacks an intention to hit target 1 in the video games example, he intends to fire at it and he intentionally fires at it.) If so, it may be fruitful for philosophers of action to focus primarily on intended intentional actions in developing their theories about how intentional actions are to be explained—theories in light of which it can be explained why the author wrote this entry and why you are reading it, and explain how those actions are produced. Possibly, theories of this kind can then be augmented to cover all intentional actions.

ADDISON, JOSEPH (1672–1719)

Joseph Addison—Oxford scholar, poet, playwright, essayist, and politician—figures in the history of philosophy chiefly on the strength of his *Essay on the Pleasures of the Imagination*, published in 1712 as numbers 411 through 421 of his and Richard Steele's journal *The Spectator*.

Addison defines "pleasures of the imagination" as "such [pleasures] as arise from visible objects" (no. 411). He calls "primary" those derived from things present to vision, "secondary" those derived from things merely called to mind. There are three qualities of objects from which the primary pleasures may arise: greatness, novelty, and beauty. Greatness is an extensiveness that throws the viewer into "a pleasing astonishment," as in, for example, the sight of a mountain range. Novelty includes what is new or unfamiliar to the viewer, as a fresh meadow in spring may be, as well as what continually changes its appearance, for example, a waterfall. Beauty includes, on the one hand, whatever appearances effect sexual attraction, and on the other, "the gaiety or variety of colors," "the symmetry and proportion of parts," and "the arrangement and disposition of bodies" (no. 412).

Addison's account of the secondary pleasures is more complex. Such pleasures may be produced by mere spontaneous imaginings, or by representational artifacts, such as sculptures, paintings, some pieces of music, and descriptions. In these cases, we derive pleasure not merely

from the object imagined, but also from the comparison of that object with that which represents it (no. 416). Addison also invokes comparison to explain the pleasure that we take in fictional descriptions of terrible things and events: our pleasure derives from our awareness that we ourselves are not actually threatened by the evils about which we read (no. 418).

Addison's *Essay* has been taken to mark the beginning of modern aesthetics. There are several grounds for such a claim. Addison, in contrast to previous writers on his various topics, investigates pleasures that can be derived from art and nature equally, treats the beautiful as merely one among several pleasing visual qualities, and centers his account on the mental activity of the onlooker rather than on the character of the object viewed. In all these respects, his *Essay* sets the direction for subsequent work in aesthetics.

At the same time, there are considerable differences of purview between Addison's investigation and later aesthetic thought. The sources of the pleasures of the imagination include works of art only so far as these either please the eye or awaken visual images; they do not include nonprogrammatic music, or even the nonimagistic aspects of literature. Further, for Addison, works of history, natural philosophy, travel narrative, and even criticism, morals, and speculative philosophy (so far as these use visual figures of speech) may be sources of the pleasures of the imagination just as much as works of fiction (nos. 420–421). Thus, for all the concerns and assumptions that Addison shares with subsequent writers on taste and the fine arts, the scope of his inquiry is distinctively his own.

ADLER, ALFRED

(1870–1937)

Alfred Adler, the medical psychologist and founder of Individual Psychology, was born in Vienna of Hungarian-Jewish parents. He received his MD from the University of Vienna in 1895 and practiced general medicine before turning to psychiatry. His soundest scientific works were written before World War I and largely prepared during his ambivalent association with the early Freudian group. After serving in the Austrian army he became concerned with child guidance as a method of preventive medical psychology, and gaining favor with the new Austrian government, opened child-guidance centers in Vienna, Berlin, and Munich schools. Family-guidance interviews in public, with general discussion periods, disseminated his methods and theories, particularly among educators. He became an international lecturer in Europe and the United States and was America's first professor of medical psychology, at Long Island Medical School. In the 1930s his efforts to spread his doctrine of "social interest" in the face of Europe's totalitarian nationalisms marked him as preacher rather than scientist, and his later published work served to promulgate a faith rather than to report scientific work. He died in Aberdeen, Scotland, during a lecture tour.

Adler's first psychologically important work, the *Study in Organ Inferiority and Its Psychical Compensation* (1907), was "a contribution to clinical medicine" in constitutional pathology. In it Adler explored constitutional defects of structure and function and their physiopathological compensation and also described "psychical" compensatory changes in disposition and way of life; overcompensation could produce not only "genius," like the deaf Ludwig van Beethoven, but also neurotic or psychotic responses, like hysteria or paranoia. Adler gave a causal-deterministic exposition of development as dependent upon constitutional endowments, innate biological drives, and environmental pressures. His papers of 1908 described as innate an "aggression drive" (to subdue the environment) and a "need for affection." Both concepts were then rejected by Sigmund Freud's group but reappeared in later psychoanalytic theories.

Adler himself modified both concepts and reformulated his whole psychology in *The Neurotic Constitution* (1912). He repudiated drive psychology and causal determinism. He viewed inferiority (*vis-à-vis* adults) and consequent "inferiority feeling" as experiences common to every child. The child responds as a whole individual with a "striving for superiority" (the former "aggression drive") directed toward a "fictive goal" of manly strength and dominance, which is pursued through a "guiding fiction," or life plan, modified by the "antifiction" of social demands. Goal and fiction are subjective creations of the individual's making, but unrealistic, rigid, neurotic patterns may be favored by organ inferiority, pampering, or neglect in childhood, or the child's age-ranking in the family. To Adler the Nietzschean "will to power" was this kind of neurotic pattern, not a universal human trait. He also described an opposite but equally effective response to increased insecurity:

It is one of the triumphs of human wit to put through the guiding fiction by adapting it to the anti-fiction, ... to conquer by humility and submissiveness ... to cause pain to others by one's own suffering, to strive to attain the goal of manly force by effeminate means, to make oneself small in order to appear great. Of such sort ... are often the expedients of neurotics.

In contrast to the neurotic, the psychotic character attempts to shape reality to the fiction, while the normal character adapts itself to the environment.

Adler's later works reiterated, renamed, elaborated, and finally, simplified and broadened the concepts on which he had founded Individual Psychology in 1912 after breaking with Freud. The basis of character was the response of the whole individual to a universal infantile inferiority feeling. Accentuated inferiority feeling became the celebrated "inferiority complex," and a pathological striving for superiority was a "superiority complex." The guiding fiction was renamed the "life style," usually unconscious or "not understood," which Adlerian analysis endeavored to illuminate with insight. The antifiction and the early "need for affection" fused in the important concept of social interest. Adler first diverged from psychoanalysis over Freud's emphasis on sexual instincts. Ultimately, where Freud saw animal instincts humanized through repression, Adler described inborn trends—social interest and striving for superiority—whose full development perfected the personality. In summary, "Heredity only endows [the individual] with certain abilities. Environment only gives him certain impressions ... it is his individual way of using these bricks, ... his atti-

tude toward life, which determines [his] relationship to the outside world.”

Despite their differences, Adler always acknowledged his debt to Freud’s psychogenetic theory of neurosis. He acknowledged Pierre Janet’s *sentiment d’incomplétude*, a predecessor of the inferiority feeling. Adler’s formulation of personality somewhat resembled the “psychic structure” and “attitudes” of Wilhelm Dilthey’s psychology, but direct influence is unlikely: Adler never mentioned Dilthey, although he did cite a work of Dilthey’s contemporary Hans Vaihinger, the *Philosophy of “As If”* (New York, 1924), for the theory of fictions. Individual psychology had a brushfire success in continental Europe and the United States, rather less in Britain; everywhere it found more acceptance among educators, psychologists, even writers than among physicians and psychiatrists.

Adler’s work has been largely absorbed into practice and thought without retaining a separate identity despite the familiar phrases—“overcompensation,” “inferiority complex,” “organ jargon”—which enrich a conversational rather than a psychological vocabulary. Individual Psychology still has its own centers, schools, and work groups, but Adler’s influence has permeated other psychologies. His “aggression drive” reappeared in the ego psychology of orthodox psychoanalysis; other Adlerian echoes are found in Karen Horney, Harry Stack Sullivan, and Franz Alexander, and in Ian Suttie’s mother-relationship theories, which surely influenced the contemporary mother-need ethological school. Child-guidance practice is non-Adlerian, and his name is not now invoked in progressive pedagogy, but those who try to see the backward child, the delinquent, the psychopath, or the psychiatric patient as a whole person are sharing Adler’s viewpoint.

Adler’s approach to psychology, normal and abnormal, was speculative rather than scientific. From 1912 on, he sought the elegantly economical theory rather than the proven fact. At first he recognized his theory as a fiction in Vaihinger’s nonpejorative sense; a person behaves “as if” compensating for inferiority feeling. Later this step was omitted—these things *were* so. Adler often illustrated his theory with case material, but this was invariably anecdotal and in excerpts, never statistically organized. He openly despised statistics. It is uncertain how many patients Adler treated in continuity, apart from single consultations to advise physicians or teachers. The same case histories appear as examples through many books over many years, with no systematic follow-up. He made no use of normal “controls,” an omission he justified by his insistence upon the uniqueness of the individual, but

this left unsolved the problem of why one creative self chose neurosis, another not. Adler never experimented, never firmly predicted, never attempted systematically to verify a hypothesis. He had great intuitive insight, the greater, perhaps, for having grown up as a second son and a sickly rachitic child of a Hungarian-Jewish family in the Austrian imperial capital. His intuitions and their formulations, if not so close to reality as he believed, remain as valuable guiding fictions.

Bibliography updated by Michael J. Farmer (2005)

ADORNO, THEODOR WIESENGRUND (1903–1969)

Theodor Wiesengrund Adorno, philosopher, composer, sociologist, and aesthetic theorist, was born September 11, 1903, in Frankfurt am Main and died August 6, 1969. His last days were beset by the "emergencies in democracy" prompted by the student movement of the 1960s; the students simultaneously treated him as friend and foe.

LIFE AND WORK

Studying in Frankfurt in the 1920s, but increasingly unable to secure employment in the first years of Nazi Germany, Adorno moved to England in 1934. Four years later, with his new wife, Margarethe ("Gretel") Karplus (1902–1993), he moved to the United States, first to New York and then to Los Angeles. In 1949 they returned to Frankfurt where Adorno worked both as professor at the university and as public intellectual, participating in radio and television programs on philosophy, society, education, and the arts.

Born into a comfortable bourgeois home, he was the only son of a Protestant wine merchant of Jewish descent, Oscar Wiesengrund, and of a Catholic singer, Maria Calvelli-Adorno. Before his move to the United States he was known by his father's name and after by his mother's. However, though "Wiesengrund" was abbreviated to a middle initial, the name was honored in Thomas Mann's *Doctor Faustus* (1947), the exemplary novel on the fate of musical modernism to which Adorno significantly contributed. The Beethovenian tones of the *Wiesengrund*—meadow-ground—expressed an early promise of happiness for the bourgeois age that would eventually be shattered, leaving the ill-fated dodecaphonic composer Adrian Leverkühn no choice but to complete his life with a melancholic requiem composed to the former greatness of German art.

Adorno wrote broadly on metaphysics, epistemology, political philosophy, ethics, the history of philosophy, and the philosophy of history. He is most widely known for his attempt to reveal the intricate historical and dialectical relationships between philosophy, society and the arts, or between philosophy, sociology, and aesthetic theory.

PHILOSOPHY AND MUSIC

In the 1920s, Adorno worked as a music critic reflecting upon contemporary developments in both the high and popular forms of the arts. Following his graduation in 1924 with a critical dissertation on Husserl's phenomenology he moved to Vienna to study composition with Alban Berg, a member alongside Arnold Schoenberg and Anton Webern of the Second Viennese School. Torn initially between philosophy and music he finally chose both, in this way furthering a tradition that had its beginnings with Plato. Following Schopenhauer, Kierkegaard, and Nietzsche (and knowledgeable of his contemporary Ernst Bloch), Adorno gave pride of place to music in his philosophical thinking and to philosophy in his musical thinking. However, he never aimed to reduce one to the other. He aimed neither to produce a philosophy of music nor, indeed, a philosophy of anything else, as if, by this use of "of," philosophy was assumed to be the master method to which all other disciplines were subject(ed). Philosophy, rather, was one of many nonreducible modes of thinking, and music was another, through which truth might be approached. Like music, philosophy was to be treated critically and self-reflectively; neither offered a guarantee regarding the good, the true, or the beautiful. Both were conditioned by what was going on in history and society. Yet both at best challenged the terms of that conditioning: philosophy by means of reason and music by means of expression.

Philosophy and music stood in an antagonistic but intimate relation. Because music was the exemplary language of pure expression but of no concept, and philosophy that of pure concept but no expression, each yearned, as if seeking a (Goethean) affinity, for what the other had—rational articulation for the one, and expression for the other. In their productive but troubled yearning they jointly tracked the historical course of modernity. Adorno focused predominantly on German philosophy and German music as both consummate and cautionary of enlightenment.

COLLABORATIVE PROJECTS

Temperamentally allied to the solitary thinkers and lonely composers of modernity, Adorno's thinking was shaped by notions of exile, otherness, and alienation. However, this did not render him merely an isolated or esoteric thinker; much of his work was produced collaboratively and often under the auspices of publicly sponsored research projects.

A leading member of the Frankfurt-based Institute of Social Research, he worked most closely with its founder Max Horkheimer, but so too with other members like Herbert Marcuse and Leo Löwenthal. In his early years he was in close contact with Walter Benjamin and Siegfried Kracauer. In New York he worked, albeit with difficulty, under the leadership of the Austrian exiled sociologist Paul Lazarsfeld on the Princeton Radio Project. He worked specifically on the empirical testing (a method of which he was highly critical) of listening habits, opinions, and tastes shaped by the then new means of technological production. A significant proportion of his writing on the arts was devoted to the mass media, to the radio, record player, television, and film, and particularly to the changes in modes of reception each instigated. Generally Adorno showed more interest in developing a critical, sociological aesthetic of the ear than of the eye. He did, however, think about the prohibition of the image and then about the adaptation of that prohibition to word and tone within an increasingly censorious society.

In Los Angeles he collaborated with Horkheimer in research on authoritarianism, fascism, anti-Semitism, and prejudice. To their results they linked descriptions of what came to be called the culture or mass entertainment industry, an industry of cultural production and propaganda devoted to "administering" public opinion and taste. In relation to philosophy, society, and the arts they traced the tendencies they took to be equally prevalent in Germany and America, although in different degrees and modes of advancement. They traced the tendencies toward mass consumerism and standardization, toward conformism and adaptation (as part of their critique of *identity thinking*), and toward domestication and normalization, as if, they argued, that which was being sold to the public as "the good, the true and the beautiful" was nothing but obviously "authentic," "natural," or "self-evident." They picked out these latter terms just because they were the ones most often used in public discourse, where the understanding was that to declare something self-evident, for example, rendered any further justification or reasoning unnecessary. In general, their work

aimed to disassemble the philosophical illusions and aesthetic appearances that sustained a modern society of self-evidence. The work culminated in their jointly authored *Dialectic of Enlightenment. Philosophical Fragments* (1944), Adorno's *Philosophy of New Music* (1948), and Horkheimer's *The Eclipse of Reason* (1947).

In tandem with the work he did with Horkheimer, Adorno argued against the false rationalizations offered on behalf of mainstream social and aesthetic forms: the *pseudo-individualization* associated with the mainstream production of jazz and popular music, the *pseudo-ritualization* of some of Igor Stravinsky's music, and the pseudo-naturalism of some of John Cage's. He objected to contemporary appeals made on behalf of particular arts to return to ritual, nature, or the individual, as if these things had not suffered what society in general had suffered. All had suffered the consequences of an ideology of progress or of enlightenment ideals gone wrong. Adorno wanted the contemporary forms of art to take account of what had historically occurred and not assume that good-sounding ideas and ideals remained guiltlessly in place.

While working with Horkheimer and Mann, Adorno also collaborated with the composer Hanns Eisler, a student of Schoenberg and collaborator also with Bertolt Brecht, all of whom were contemporaneously resident in Los Angeles. With Eisler, Adorno furthered his sociological aesthetic of listening. Together they wrote a primer (1947) for the composition of a progressive or new music for the film. They framed their recommendations by a sustained critique of the increasingly dominant Hollywood film industry.

CRITICAL THEORY

Adorno contributed significantly to the development of critical theory, a dialectical, historical approach to both thinking and writing that unrelentingly aimed to expose the errors of the dominant scientific, empiricist, and positivist methods of the day. In 1961, in Tübingen, he engaged in the so-called positivist dispute with, among others, Karl Popper and Jürgen Habermas. What he argued was just a continuation of his life-long double-pronged critique of a reductionist or eliminativist method, on the one hand, and an overly grounded or too securely founded totalizing metaphysics, on the other. (With the latter he usually associated the work of Heidegger and the postwar Heideggerians.) His work in aesthetic theory mirrored the same double-pronged critical aim.

Influenced by Goethe, Kant, Beethoven, and Hegel at the one end of modernity, and by the post-Marxists and Freudians, Lukacs, Kracauer, and Benjamin at the other, Adorno traced the convergences between philosophy, society, and the arts, or the dialectical movement of reason and irrationality that reached its inconceivable extreme in the Nazi concentration camps. Reversing Hegel's dictum that "the true is the whole"—where the whole is the positive and absolute completion of the dialectical movement of *Geist*—Adorno described the complex tendencies that had historically led toward untruth in its varying regressive and progressive concrete arrangements. He encapsulated his entire philosophical, sociological, and aesthetic reflections in the thought that there is no life—and thus no thought, no art, and no action—that is lived rightly when the whole is false.

Adorno focused on the major thinkers and artists of his times, for example: on Husserl and Heidegger in philosophy, on Schoenberg, Berg, Stravinsky, and Cage in music, and on Brecht, Kafka and Beckett in literature and drama. He did so partially to assess their historical relation to their great predecessors: Goethe, Schiller, Kant, Hegel, Beethoven, Kierkegaard, Wagner, Balzac, Valéry, George, and Proust, to name only a very few of the many writers who absorbed Adorno's indefatigable attention. He explored the tense relation between ideas of tradition, establishment, the accepted, and the expected, on the one hand, and ideas of the new, the unfamiliar, the unexpected, the explosive, and the shocking, on the other. (He particularly liked to work with an analogy between the artwork and the firework.) When he spoke of the old and the new, he most often thought, with Goethe, about how the new comes to suffer from its own aging. In other terms, his aesthetic reflections were also reflections constitutive of a *Geschichtsphilosophie*: a philosophy of history that would attempt to resist either falling into the safety of conservative, nostalgic, or utopian pastures, on the one hand, or reaching absolute or positive end points on a road that had no end, on the other. Most of his thinking aimed to invert the movement of Hegelian spirit in the light of the concrete social changes that had occurred between Hegel's time and his own.

TENDENCIES AND CATEGORIES

Adorno approached history by describing how the general social tendencies toward regression and progression were always mediated by concrete or particular instances. Though he had a rhetorical tendency to make it seem as if all the many thinkers, artists, and composers about whom he wrote would duly be lined up on the side of "the

good" or of "the bad," his more subtle aim was to show how particular thoughts, works, or genres were constellations of contradictory tendencies. Indeed, to show them as such was to counter the very tendency to which his rhetorical tendency pointed, namely, the extreme polarization into which modern, administered society had placed its products and its persons.

Adorno focused on categorization, on the social dynamics of organization that included the stereotyping and pigeonholing of persons, the social classification and marketing of the arts, as well as the construction and use of philosophical concepts. In his work on listening, he produced a taxonomy of listeners, to show less the type of which he approved (although his own tastes and preferences were always explicit in his critique), and more the types of listening that had developed in relation to the production of modern, "high" and "low" forms of music. Labels designating one sort of music as "serious," "elite," "esoteric," "difficult" or "incomprehensible" maintained a dialectical relation to those that designated another sort of music as "popular" and "authentic." On either side, the labels deflected the listener's attention from the music itself and refocused it in terms of what best suited the listener as consumer. Concepts of the high and low were not "givens" of aesthetic practice; they were sociological categories used to encourage musicians to produce music of perfect fit, equally "hit tunes" or "difficult works."

AESTHETIC THEORY AND NEGATIVE DIALECTICS

Adorno may be read through his many essays and books amounting to more than 20 volumes. Or he may be read through his two masterworks, his *Negative Dialectics* of 1966 and his unfinished and posthumously published *Aesthetic Theory* of 1970. More specifically, whether one reads his early *Kierkegaard: Construction of the Aesthetic* or his exemplary essay on the "Social Situation of Music," or one of his monographs on Richard Wagner, Gustav Mahler, or Alban Berg, or whether, rather, one reads only his last works, one sees immediately that his primary interest in music never confined him to this particular art. Music was the model through which to access the entire domain of the aesthetic if not also society. He pursued most of the traditional problems of classical, romantic and modernist aesthetic theory: judgment and experience; the sublime and the beautiful; form, content, and material; genre, movement, and style (naturalism, realism, expressionism, and surrealism); the fateful, tragic, and the comic; art's relation to nature, to time, temporality, history and movement, and to society, poli-

tics, and propaganda. He drew upon many concepts unfamiliar to us today as well as upon concepts that at the time had become overly standardized through long term (mis)use, notably: mimesis, autonomy, expression, remembrance, comportment, commitment, and convergence.

Central to his aesthetic theory were two dialectical relationships, first, between the concept of art and that of the work of art; second, between the articulated and the hidden, concealed, or unexpressed dimensions of meaning. To regard a work of art as a constellation of contradictory impulses was to regard it as suspended between historical, social, and aesthetic demands: for example, following Kant, between the demand that the work be a product of labor and construction and the demand that it be a product of genius and thus appear as if natural, spontaneous, and free; or, following Schiller, that the work embody the mutually antagonistic drives toward form and sensuousness; or, following Hegel, that a work tremble between freedom and necessity, or between form and content, or between the demands of the traditional and the new, or between the repetition of the same and the shock of the different, or, finally, between acceptance and exemplarity.

To the extent that a work maintained the tension between conflicting demands, the work, so Adorno argued, was truthful. To resolve the tension in any given direction tended to result in an ideologically, theory-laden, or aesthetically compromised product. Thus, the more autonomous, or the more philosophically and socially truthful a work, the more it failed to conceal its inherent tensions or contradictions behind the illusion of perfect order, the more it refused not to show the untruth of its times. The failure and refusal prompted Adorno to speak of a negative autonomy or of a negative dialectics. Following an old Platonic anxiety, art had the ability to expose the lie of appearance or the untruth of society at the same time that it was able to serve as the primary means (of appearance) by which to encourage and sustain the lie. Its double-sided character and dependence on appearance rendered it exemplary both as a means and as an object of critique.

For Adorno, artworks were social formations set at an aesthetic remove; as such they exhibited a drive toward order, harmony, and internal coherence. This drive was dominant in the very concept of a work, a concept coincident with the dialectical course of enlightenment. And precisely what this drive aimed to do was suppress its opposing drive, the drive that would itself attempt to flout the conditions or possibility of order in a work by

mimetically conveying as residue the non-expressed expression implicit to the concept of art. Just as the one drive toward order couldn't do without the drive toward free expression, so, under the condition of modernity, the concept of a work couldn't do without the concept of art, despite the antagonism they displayed toward one another. Yet in this antagonism resided all that was most productive and exemplary in the world of art. Hence, the more autonomous a work, the more the work exhibited the mimetic tension between silence and expression, between what it brought to expression under the concept of the work and what was concealed or excluded of the concept of art thereby. That Adorno often pursued an analogy between the artwork and the person was not without relevance for the truth art could indirectly reveal about society as a whole. The greater society's untruth, the more reified or fetishized the work's or the person's relation to society. The greater society's untruth the more the work was inclined to show the achievement of workhood as consumer product. The work, like a person, could show the achievement in two ways, either by adapting to or by resisting the social situation.

AFTER CATASTROPHE

When Adorno returned to Germany in 1949 he was confronted with the fact of having survived the catastrophe. He asked what it meant for (West) Germany to become a democracy given what he understood to be a continuation of social injustice and prejudice. He used his experiences in America partially as a model of both the promise and the curse of democracy. While convinced that neither the philosopher nor the artist could assume an ahistorical vantage point from which to view society, Adorno was nonetheless convinced that by describing the dominant tendencies toward philosophical, social, and aesthetic untruth, one would thereby show by dialectical negation what remained as the residue or remainder of truth. With Walter Benjamin, he did not think that truth could be found or established in a sustained method of philosophical argument; he rather looked in the cracks of such arguments, in what was not said, in what had historically come to be concealed by dominant patterns, be they philosophical theories, social formations, or artistic movements.

After the war, Adorno wrote that "to still write a poem after Auschwitz is barbaric," a claim he later somewhat modified (1992, vol. 2, p. 87). However, in the claim he asked a question of despair, whether and how continuation in art or thought was possible in a society that now lived "metaphysically"—as he used that term in conclud-

ing his *Negative Dialectic*,—under the condition of death. His *Aesthetic Theory* had, however, opened with the same claim, that it “is self-evident that nothing concerning art is self-evident any more, not its inner life, not its relation to the world, not even its right to exist” (1997, p. 1). Here, the point was to use the concept of self-evidence to begin a critique of its social, philosophical and aesthetic forms, where self-evidence found its subjective side in the formation of public opinion and its objective side in the production of ordered-appearances (say, in works of art). His preoccupation with how art and philosophy could continue in modern times had begun around 1930 when he asked after their “actuality.” Later, he posed the question again but now even more concretely against the background of the compromise the university and the concert hall had made under national socialism.

Adorno experimented with the essay form, as is shown in his exemplary essay in his *Notes to Literature* on the essay as form. He wrote his aesthetic theory conscious of aesthetic figuration, sometimes in aphorisms or fragments, sometimes in figures of montage, even if this text often reads as a single paragraph without end. He wrote in such a way as to show his interest both in the techniques of high modernism and in the use and mutilation of language (his own use included), be that language one of communication, speech, gesture, or expression. He often expressed his thoughts as catch-phrases articulated as statements of a negative dialectic: for example, only for the sake of happiness and beauty are happiness and beauty renounced; only in memory and longing is pleasure now possible in art; the old only has refuge in the new; dissonance is the truth about harmony. Adorno was an aesthetic thinker of exemplary modernist form; he mediated that thinking within a dialectical and materialist history of society.

AEGIDIUS COLONNA ROMANUS

See *Giles of Rome*

AENESIDEMUS (1st century BCE)

Very little is known about Aenesidemus's life. He was associated with the Athenian Academy around the time of its collapse in 87 BCE; and he was party to the dispute between Philo of Larissa, who advocated a mild form of skepticism in the form of an externalist, coherentist epistemology, and Antiochus of Ascalon, whose epistemology was basically that of Stoic foundationalism. The Academy had been for two centuries the home of epistemological skepticism, directed largely against the optimistic epistemology of the Stoics, who posited "apprehensive impres-

sions" (*phantasiai katalêptikai*), which carried their own guarantee of truth. Aenesidemus saw Philo and Antiochus as betraying that heritage, as "Stoics fighting with Stoics" (Photius, *Library Catalogue* 212), and resolved to "philosophize after the fashion of Pyrrho."

Aenesidemus wrote eight books of *Pyrrhonian Discourses*, which Photius summarized: "the whole aim of the book is to ground the view that there is no ground for apprehension, whether through perception or thought." The main burden of the *Discourses*, Photius says, is to establish that nobody really grasps anything. However, only Pyrrhonian skeptics are aware of this ignorance, while everyone else falsely considers themselves to be in possession of secure knowledge. This false conviction, and the inevitable disputes that follow from the evident fact that different people hold different and incompatible beliefs, leads the Dogmatists ("belief-holders," as skeptics styled their opponents) into "ceaseless torments." Skeptics, having no beliefs, avoid these torments; indeed they "are happy ... in the wisdom of knowing that they have firm apprehension of nothing." "Apprehension" (*katalêpsis*) is the Stoic technical term for sure and unshakable knowledge based on apprehensive impressions. When Aenesidemus claims that Pyrrhonists have no apprehension of anything, he is careful not to say that they have *apprehension* of that second-order fact. Yet they may still be aware of it, since it is evident to them introspectively that they are not certain of anything (thus skeptics seek to avoid the charge that their position is self-refuting).

Moreover, "even in regard to what he knows [this is Photius's language; and he may well be less careful than Aenesidemus in avoiding apparent self-refutation], he takes care to assent no more to its affirmation than to its denial." "Assent" (*sunkatathesis*) is another Stoic term, denoting unwavering commitment to the truth of some proposition (positive or negative); and no skeptic will claim that sort of cognitive security, even in regard to his own claims: a skeptic's "positions" (insofar as he really has any) are invariably provisional. In the same vein, "no more" (*ou mallon*) is a skeptical slogan: things may appear to be thus and so, but in themselves they are no more one way rather than the other. Diogenes Laertius (DL 9.106) reports Aenesidemus as saying that appearances are the criterion for action; thus he seeks to evade the common charge brought against skeptics (most famously by Hume) that their refusal to hold beliefs renders life impossible (it is a further, difficult question how far this notion of appearance can really be divorced from some concept of belief).

In the first *Pyrrhonian Discourse*, according to Photius, Aenesidemus distanced himself from the Academics, since they “posit some things with confidence and deny others unambiguously, while Pyrrhonists are aporetic and devoid of dogma; they say neither that all things are inapprehensible, nor that they are apprehensible, but that they are no more so than not so, or sometimes so and sometimes not so, or so for one person but not for another.” The Academics are negative dogmatists, positively affirming that nothing can be apprehended according to the Stoic criterion; Pyrrhonists, by contrast, will say that they do not seem to apprehend anything, but will not reject the possibility of there being apprehension. Crucially, “the Pyrrhonist determines absolutely nothing, not even this very proposition, that nothing is determined.” That this is the authentic skeptical attitude is confirmed by Sextus Empiricus, *Outlines of Pyrrhonism* (PH) 1.187–209; and Sextus probably relies heavily upon Aenesidemus in that work.

The second *Pyrrhonian Discourse* casts doubt upon “truth, causes, effects, motion, generation and destruction,” while the third “was also about motion and sense perception ... working carefully through a similar set of contradictions, he puts them too beyond our grasp.” These arguments about perception no doubt included the material of the so-called “Ten Modes of Aenesidemus,” arguments designed to undermine the Dogmatists’ truth-claims, and hence to induce *epochê*, or suspension of judgment, “which the skeptics say is the goal (*telos*), upon which tranquility follows like a shadow, according to Aenesidemus and Timon” (DL 9.107; cf. PH 1.25–30). Thus “Pyrrhonian discourse is a kind of recollection of appearances ... , on the basis of which they are all brought into confrontation with one another, and when compared are found to cause much disparity and confusion; so says Aenesidemus in the summary of his *Pyrrhonics*” (DL 9.78).

The Ten Modes are attributed to Aenesidemus by Sextus (*Against the Professors* [M] 7.345); Aristotle ascribes nine Modes to him, and we know the number of the Modes to have been fluid (our earliest source, Philo of Alexandria, records only eight). Neither Sextus in his extant treatment of the Modes (PH 1.31–163), nor Diogenes in his shorter summary (DL 9.79–88) father them on Aenesidemus; but it is still likely that he was responsible for this organization of earlier skeptical material. The Modes share a common form, involving conflicting appearances: x appears F in conditions C , or to observer O , not- F in conditions C^* , or to observer O^* ; there is no non-question-begging way of privileging either of C or

C^* , O or O^* ; so we should suspend judgment as to whether x is F . The Modes are differentiated by different fillers for C or O ; thus the first (in Sextus’s ordering) compares the different sensory representations of different animals, the second collects cases of dissonant judgment between different humans, the third conflicts in the deliverances of different sense-modalities, and the fourth includes discrepant reports from the same sense at different times. Other Modes collect cases of ethical or social discrepancy (the tenth), and point to the ways in which differing conditions of the perceiver may affect what they seem to perceive.

The upshot is that we cannot in any case say how things really are, but only how they seem in particular circumstances. Things are judged relatively to the perceiver and their circumstances. Sextus is careful not to draw relativistic conclusions (although the facts of relativity figure both as a particular Mode, the eighth, and in general in the articulation of all the Modes): He does not positively *assert* that things are for the observer as they appear. By contrast, Aenesidemus, judging from Photius’s summary, is quite happy to accept the relative judgments as such, since they do not (cannot) count as Dogmatic.

In the fourth *Discourse*, Aenesidemus discussed signs. Sign-theory and its associated epistemology was of overwhelming importance in post-Aristotelian philosophy. The Stoics (along with various Dogmatic medical schools) held that it was possible to infer directly from the phenomena to the underlying structural conditions responsible for them. Skeptics (and Empiricist doctors) denied the validity of such inferences, allowing only that memories of past conjunctions of phenomena might allow us to expect (although fallibly) similar conjunctions in the future. Aenesidemus advanced the following paradigmatically skeptical argument: If apparent things appear alike to all in a similar condition, then signs should appear alike to all in a similar condition; but they do not; hence signs are not apparent (M 8.215). That is, it is not unequivocal what they are signs of—different doctors, for example, draw radically different conclusions from the same symptoms (M 8.219–220).

In the fifth *Discourse* Aenesidemus turned to causes; again Sextus retails some of his arguments (M 8.218–226); crucial to them is the idea that a cause should operate from its own resources; but if it does, then, since it requires nothing else in order to exercise its causal power, it should do so invariably and continuously. More impressive are the Eight Modes against the Aetiologists, mentioned in Photius and ascribed to Aenesidemus by Sextus at PH 1.180–185. These are eight general argu-

ments against the possibility of inferring from evident phenomena to the hidden structures of things that are supposedly causally responsible for those phenomena, in the manner of Dogmatist philosophers and scientists (notably Epicureans, but also Peripatetics and Stoics). Aenesidemus's basic claim foreshadows the modern maxim that theories are invariably underdetermined by the available data. No amount of evidence can ever entail that any particular theory must be true: There are always many ways in principle of accounting for the same set of phenomena (1.181–182). Moreover (and here Aenesidemus turns from general methodological issues to castigating particular recurrent theoretical foibles), theorists sometimes offer piecemeal, unrelated explanations for what are evidently related sets of phenomena; and they tend to suppose, without justification, that the structure of the hidden, subperceptual realm will mirror in all important respects that of the phenomenal world (1.182; this point is particularly well-taken against Epicurean physics).

Furthermore, Aenesidemus notes (and this too is a staple of contemporary philosophy of science) that researchers are inclined to favor explanations that concur with their own prejudices (1.183), and indeed on occasion to prefer explanations that not only conflict with the facts, but also with their own theories (1.184). Finally, he notes that Dogmatists “frequently ... seek to explain doubtful things on the basis of things equally doubtful” (1.184). Taken together, the eight Modes are an impressive attack on the possibility of arriving at any soundly based understanding of the hidden natures of things. As such, they are obviously of a piece with, and complement, the rest of Aenesidemus's skeptical argumentation. The last three *Pyrrhonian Discourses* dealt with ethical issues, with Aenesidemus arguing that the lack of philosophical agreement regarding good and bad, choice and avoidance, virtues, and finally the end, preclude the possibility of arriving at any secure judgments about them.

All of the evidence so far reviewed makes Aenesidemus a consistent and powerful skeptic. However, a number of passages in Sextus portray him in a much more Dogmatic light, as holding various views about the intellect (M 7.350), and endorsing the view that there are two types of change (M 10.38). Elsewhere he is said to be in agreement with Heraclitus, whom Sextus explicitly describes as a Dogmatist. These discrepancies are too widespread simply to be brushed aside. But there is as yet no scholarly agreement as to what to do about them.

AESTHETIC EXPERIENCE

An aesthetic experience arises in response to works of art or other aesthetic objects. Although the term *aesthetic* itself was not introduced until the eighteenth century, it is clear that what are identified in contemporary discussions as “aesthetic experiences” were “felt” by individuals long before this: for example, when Plato worried about excessively emotional reactions to recitations of poetry or when Aristotle described the positive effects of attending the theater. Nevertheless, the exact nature of aesthetic experience—even the idea that there is such a unique form of experience—remains a matter of controversy.

WHAT AESTHETIC EXPERIENCES FEEL LIKE

One area of contention concerns what it feels like to have an aesthetic experience—that is, whether there is some special emotion or attitude or other internal sign that enables one to recognize that what one is having is an aesthetic experience and not some other kind. Immanuel Kant, one of the first philosophers to have addressed these kinds of questions, characterizes aesthetic experiences as those pleasures associated with occasions when one judges something to be beautiful. He asserts that one recognizes that this pleasure does not result from a realization that an object is useful or agreeable to one because of special things about oneself. Instead the pleasure arises simply because the form of the object is delightful and could and should be enjoyed by anyone. Kant makes a sharp distinction between responding positively in this manner and responding positively for moral or scientific reasons. Although several theorists have disagreed with Kant's argument, most theorists agree that aesthetic experiences are identified as such at least partly because of an emotional involvement of the experiencer. One feels good (or bad) when one responds aesthetically to a beautiful

sunset or elegant poem (or to a messy waste dump or plodding verse).

But it is more than just a feeling of pleasure (or pain) that characterizes aesthetic experiences, according to many theorists. John Dewey (1958), for example, argues that aesthetic experiences are the most complete, the richest, and the highest experiences possible. One is actively engaged and conscious of the world's effect on one but at the same time appreciative of one's possibilities for acting on the world. One senses an organization, coherence, and satisfaction as well as an integration of the past, present, and future that ordinary nonaesthetic experiences lack.

More recently, Nelson Goodman (1976) has warned that too much emphasis on the pleasurable aspects of aesthetic experiences deprives them of much of their importance. What he derisively calls "tingle-immersion" theories overlook the crucial role of intellect, he cautions. In aesthetic experiences, the emotions function cognitively, he says; one "feels" a heightened operation of both cognition and emotion operating together.

WHAT AESTHETIC EXPERIENCES FOCUS ON

Another area of debate is the object of aesthetic experience. Many philosophers have insisted that the pleasurable (or painful) responses associated with an aesthetic experience must be connected with something special about some objects and events—properties that nonaesthetic or nonartistic objects and events lack—for clearly we do not have aesthetic experiences with regard to just any old thing.

Aristotle believed that the pleasure unique to dramatic tragedies consisted in a catharsis of the painful emotions of pity and fear and that this could occur only if a play had certain properties—the right sort of plot and characters. Kant, we saw above, thought that aesthetic experiences were pleasant when objects were such that mere apprehension of their form alone evoked delight. In general, theorists and critics described as "formalists" insist that in an aesthetic experience attention is directed solely to immediately perceivable properties of objects and events—shape, colors, tones, sounds, and patterns. Monroe Beardsley (1958), for instance, characterizes the focus of aesthetic experiences as formal unity and the intensity of regional quality. Clive Bell (1914) claims that emotional responses to objects exhibiting "significant form" can be so intense that one does not care at all about the content of some artworks; what matters is always form and not content. Jerome Stolnitz (1960) argues that

one takes up a special attitude, distinterestedness, when one has an aesthetic experience. Ordinary everyday concerns or purposes are put aside, and one focuses on the form of an object for its sake alone, he believed.

An increasing number of theorists disagree with the formalist position that when one has an aesthetic experience one focuses solely on an object's formal properties and that one's scientific, moral, religious and other beliefs or concerns are put aside. For one thing, some insist, the expression of certain ideas plays a key role in some works of art, and surely thinking about these ideas (content) is an appropriate and important aspect of the aesthetic experiences of them. Even if focus on form is necessary to aesthetic experiences, it may be that content and context are also legitimate matters for aesthetic attention.

WHAT HAVING AN AESTHETIC EXPERIENCE REQUIRES

Even if one grants that aesthetic experiences arise only in the presence of objects that exhibit a form that pleases, many theorists have insisted that more than a formally pleasing object and passive viewer are required. Just as not every object gives rise to an aesthetic experience, so not all individuals have aesthetic experiences in reaction to the same objects. David Hume (1987) in the eighteenth century and, more recently, Frank Sibley (1959) in the twentieth, have insisted that only persons who have taste or special sensitivities are capable of responding aesthetically. Not all people are equally competent judges, Hume claims. Only people who are sensitive, attentive, open-minded, perceptive, clear-headed, trained, and experienced can tell a good poem from a bad poem. In the absence of sensitivity, one will be left completely cold by objects that enthrall a more acute and receptive observer.

Formalists, we saw above, insist that aesthetic experience requires an appropriate amount of distance—one must put aside beliefs or purposes and give oneself up entirely to the object. But others argue that precisely the opposite is the case. Contextualists insist that, before one can have an aesthetic response (or at least an appropriate or full one), one's intellect and moral beliefs must be engaged. Noel Carroll (2000), for example, argues that moral concerns may block or enhance aesthetic experiences. Kendall Walton (1970) asserts that one cannot interpret and otherwise respond to a work of art unless one is versed in the genre it represents. One cannot judge whether a sonnet is good or bad unless one knows that it is in fact a sonnet and not a haiku, for example. Allen Carlson (2000) points out that an aesthetic appreciation of nature requires an awareness that what one is appreci-

ating is nature (not a painted landscape, for instance). This in turn demands an understanding of how nature works. The person who brings a fair degree of scientific knowledge to a particular environmental system will have a much fuller, richer aesthetic experience of that environment. What is required by or, at the very least, relevant to aesthetic experience may be whatever directs one's attention as fully as possible to the potentially pleasurable formal properties of an object or event.

WHERE OR WHEN AESTHETIC EXPERIENCES OCCUR

The nature of aesthetic experience may not be fully accounted for even if one knows everything important about objects that occasion them—the context or circumstances attending an individual's response may prove critical. Some philosophers call attention to the viewing conditions: for example, whether a concert is live or recorded or whether a poem is read to oneself or recited aloud. Others focus on the political, economic, or social conditions of an experience. To what extent are aesthetic experiences socially constructed? Is responding pleasurably to the color of a flower, for instance, “natural” (in the way that hunger or sexual arousal is), is it taught (in the way that acquired tastes are), or is there some mix of innate and learned response? Herein lies another set of issues that philosophers and others (for example psychologists, sociologists, and economists) debate.

AESTHETIC VERSUS ARTISTIC EXPERIENCE

Art objects are examples of aesthetic objects. But not all aesthetic objects are artworks—for example, sunsets or mountain vistas. Whether there is a difference between aesthetic experience and artistic experience is still another question that theorists address. Kant notes that in appreciating art objects one is aware of the fact that a human created it (and, in the case of great Art, that someone of genius was responsible for it). Thus artistic experiences lack the “purity” associated with those disinterested pleasures that arise from form alone.

Arthur Danto (1986) has argued that developments in the history of Art (such as the appearance of rather odd artifacts in museums) mean that one cannot tell if something is a work of art or not in the absence of a theory of art. This is not the case for aesthetic objects, it would seem. One does not need a theory of the aesthetic in order to have an aesthetic response, for one can have such a response to anything at all. It may be that some experiences of art are not aesthetic at all. If one is prima-

rily concerned with the history of an object or its economic or religious value, then one may not care about or may even completely ignore the formal properties of that object.

THE NEED FOR THE CONCEPT OF AESTHETIC EXPERIENCE

Finally it must be pointed out that not everyone believes that it is possible or necessary to distinguish aesthetic from other kinds of experiences. The whole notion is too vague and abstract, some philosophers argue. Reporting that one has had an aesthetic experience is no more informative than claiming that one has had an “economic experience” or an “automotive experience,” according to some. One describes one's experience far better by saying things like “I bought some junk bonds yesterday” or “I had an exciting ride in a Porsche this morning” than by saying “I had an economic experience” or “I had an automotive experience.” Similarly, one might do away completely with talk about aesthetic experiences and rely instead on discussions of reading particular poems or listening to pieces of music or birdsongs or looking at specific paintings or landscapes or drinking particular wines.

Nevertheless, people do talk about aesthetic experiences, and there might be good reason to try to articulate what they involve. If one goal of education is to improve the quality of life through aesthetic experiences, then it will be important to determine what such experiences feel like, focus on, and require. Moreover, if one fears that significant properties of objects or events will be overlooked if one confuses moral or scientific perspectives with aesthetic ones, then it may be necessary to distinguish the last from the former two.

AESTHETIC JUDGMENT

In recent analytic aesthetics, there have been two prominent questions about aesthetic judgments. One is how to distinguish aesthetic judgments from other judgments. Answering this question seems particularly urgent when an aesthetic judgment and a nonaesthetic judgment about the same object are incongruent. In such a case it seems that an object might be judged to have aesthetic value but also to be negatively judged, say ethically or in terms of its practical use. A corollary question is whether the negative value of a nonaesthetic judgment should affect the allegedly purely aesthetic judgment.

The other prominent question, a question present at least since the eighteenth century, is actually two questions: first, whether aesthetic judgments are objective or subjective, and second, whether aesthetic judgments can be verified or otherwise substantiated. Somewhat curiously, perhaps, some philosophers have thought that even though such judgments are subjective, they are still capable of being supported. David Hume is an example. In contrast, other philosophers have thought that even though such judgments are genuinely objective, they are nonetheless incapable of being verified by customary procedures. Frank Sibley has been the leading exponent of this opinion. A more obvious thesis is Immanuel Kant's, namely that aesthetic judgments are both subjective and impossible to support by any interpersonal means.

Hume (1987) believed that it is possible to identify certain judges as having especially reliable taste and then to take their subjective responses to objects as a standard in evaluating the objects. When such judges deliver what Hume called "a joint verdict," meaning, presumably, that they concur in taking pleasure in an object, taking pleasure in the object is then established as correct, in a sense,

with at least customary probability, and any judge who fails to realize this pleasure is defective in his taste.

Kant, in contrast, thought that no corroboration of one's judgment is possible because a concurrence with or difference from the responses of other judges is logically irrelevant.

The idea of something explicitly called an aesthetic judgment seems first to have appeared in the eighteenth century and was formulated in detail by Kant (2000). By "aesthetic judgment" Kant meant a judgment based on a feeling. He was especially concerned to describe those feeling-based judgments in which an object is found beautiful, and then to show that we are entitled to make such judgments despite being unable to verify them. In his conviction that these judgments are essentially subjective (that is, derived from or based on the subject's feeling), Kant is in line with an earlier tradition. The most notable exponent of this tradition was Hume, though it remains unsettled just how much, if any, of Hume's writings on this topic were known to Kant. Yet Kant probably did know the earlier work of Francis Hutcheson, work in the spirit of Hume even if less compelling philosophically. In later developments of the idea of an aesthetic judgment, however, this feeling-based subjectivity has been less important than Kant's description of how an aesthetic judge attends to the object of his judgment.

The subjective character of judgments of beauty seemed obvious in the eighteenth century, especially to Hume and Kant, so obvious that neither of them argued for this notion but simply assumed it. Indeed, the etymology of the word "aesthetic" indicates that an aesthetic judgment must be essentially related to a feeling. The Greek term refers to sense perception, usually, but it has now come to refer to feelings in general, and in particular to feelings of pleasure. Hume does not use the term "aesthetic," and he speaks only of the exercise of taste in the discernment of beauty, but like Kant he takes it for granted that all judgments of beauty arise from feelings of pleasure experienced by the judge.

According to Hume, the term "beauty" does not correspond to any objective property of things, and so judgments of beauty cannot be correct or incorrect in any straightforward manner. Yet such judgments can be vindicated, he thought, by agreement with the judgments of especially well suited judges of the object. These exemplars of taste (whose responses, he said, constitute a "standard of taste") are identified by their stellar discernment, without prejudice, of all the properties of the objects being judged. There is no way to inspect an object for its beauty, Hume thought, because "beauty" does not

mark any property of an object, but it is possible, as a matter of empirical investigation, to determine whether any particular judge is an exemplary judge.

Kant, in describing what he calls “a pure judgment of taste,” had a different idea. He thought that the judge must pay no attention to any use to which the object might be put, to any concept that applies to the object, or to any interest that the judge might have in the object. The judgment must thus be entirely disinterested and free of any thought that relates the object to anything else. It is a judgment about the object purely and simply in itself.

Kant first described aesthetic judgments made about natural objects (his leading example being a beautiful rose), and then extended such judgments to works of art. He thus effectively regarded successful works of art (which for him meant artificial beautiful objects) as *loci* for such judgments.

The idea that aesthetic judgment requires a detached state of mind has sometimes been developed as the idea that aesthetic judgments require an aesthetic attitude, a distinct mode of addressing objects. An early exponent of this idea was Arthur Schopenhauer, although he does not use the term “aesthetic attitude.” Pursuing a line different from Kant’s, Schopenhauer thought that contemplation of works of art was an activity in which one could escape the usual constraints on one’s will.

In the early twentieth century, the idea of an aesthetic attitude was developed further, given this particular name, and given more detailed treatment, though it eventually became a problematic notion. An early formulation is Edward Bullough’s (1957), although his interests were somewhat more psychological than philosophical. A later, more sophisticated treatment is to be found in the works of Jerome Stolnitz (1978). A useful canvass of the idea is in George Dickie’s “The Myth of the Aesthetic Attitude” (1964), where Dickie seeks to do away with the idea.

Although continuing conceptions of aesthetic judgment in many respects derive from the early work of Hume and Kant, these conceptions have taken at least two noteworthy turns. In philosophy at the beginning of the twenty-first century, the term “aesthetics” has become a virtual synonym for “philosophy of art.” This assimilation sometimes draws attention to a question, but at other times tends to cover it up—the question of which is basic, the idea of art or the idea of the aesthetic. In Kant and many of his followers, the idea of the aesthetic is basic, and the idea of art is, so to speak, constructed out of the idea of the aesthetic. Kant thus first characterizes aesthetic judgments and then essentially describes works of

fine art as objects about which such judgments can be made. Richard Wollheim (1980), in contrast, reverses this dependence, declaring that to make an aesthetic judgment is to regard something as a work of art.

A radically different thesis is that of Frank Sibley (1959, 1965). Sibley takes aesthetic judgments to be judgments that apply aesthetic concepts to objects through the use of aesthetic terms. Rather than understand taste as Hume and Kant did, as the ability to take pleasure in the judgment of objects, Sibley takes taste to be the ability to use aesthetic terms and concepts. Furthermore, in view of his conviction that aesthetic judgments are objective, Sibley treats the term “beautiful” quite differently from his eighteenth-century predecessors. For Hume and Kant, the term “beauty” has very little semantic content, it indicating only that the object produces a particular feeling of pleasure in the judge. Sibley, in contrast, insists that the term refers to a property of the object being judged. Thus, for Sibley, “beautiful,” “elegant,” “graceful,” and other terms indicated mainly by example are all aesthetic terms, and as such they all refer to objective properties, although only judges exercising what Sibley calls “taste” can detect these properties and hence correctly apply the terms. Thus, quite apart from the tradition of Hume and Kant, Sibley’s thesis is that aesthetic judgments are perfectly objective, meaning that their terms refer to properties objectively present in the objects being judged. Yet Sibley’s thesis, at least in one respect, is more like Hume’s and Kant’s than it is like Wollheim’s. For Wollheim, to regard an object aesthetically is to regard it as a work of art. For Hume, Kant, and Sibley, aesthetic judgments are freely made of works of art but also of other objects, and in the latter case there is no need to treat these objects as works of art.

Even among those who regard the concept of art as more basic than the concept of the aesthetic, many such thinkers continue to insist, with Kant, that an aesthetic judgment must be disinterested and must not attend to anything besides the object itself. Those who believe aesthetic judgments to be a unique kind of judgment have been eager to distinguish aesthetic judgments from ethical judgments, in particular, and also from practical concerns. Others have wondered whether it is possible to make such a clear logical separation. When the question of design is raised, it becomes increasingly difficult to suppose that an aesthetic judgment about an object is entirely divorced from other considerations—an issue that is perhaps most acute in the case of architecture. If a building is beautiful to behold but ill suited to whatever activities it is meant to house, can one keep the building’s

evident disutility from contaminating one's sense of the aesthetic value of the building? The same question arises, obviously, in many other cases of artistic design, ranging from automobiles to writing instruments to time-keeping devices. It seems clear that a genuinely ugly object might be a perfectly serviceable automobile or watch. It is less clear that a poorly performing object can still be beautiful. On this matter, Kant's opinion is clear. He thought that it is one thing to judge a watch, say, to be a good watch because of its perspicuous time display and reliable time keeping, this being to judge the watch in terms relying on the concept of a watch; it is another thing to offer a pure judgment of taste. To other authors, this is not obvious, because for them, questions of utility are difficult to separate from questions of the aesthetic value of an object.

Recently much attention has been given to the separation of ethical concerns from aesthetic concerns (Levinson 2001), and in 2005 it is a much debated question whether the dubious moral character of an art work can be kept separate from its artistic or aesthetic value. There has thus been a renewal of interest in the question of the relations of ethics and aesthetics to one another.

AESTHETIC QUALITIES

It is generally, although not universally, agreed among philosophers that there is an important distinction to be drawn between the aesthetic qualities of objects, especially art objects, and their nonaesthetic qualities: between being serene, stunning, or grating, and being square, in the key of A-minor, or weighing seven pounds. The concept of an aesthetic quality is a philosophical one, not in general use, but aestheticians appeal to it in clarifying the practice of art criticism, justifying aesthetic judgments, and evaluating artworks.

HISTORICAL BACKGROUND

Both David Hume (1963) and Immanuel Kant (1966) set the stage for this modern distinction in their discussions of aesthetic judgments, judgments regarding the beauty of objects. Both argued that such judgments differ in kind from judgments regarding ordinary perceptual properties. Both held that aesthetic judgments depend on subjective feelings of pleasure and affective responses, but both also sought a universal ground for such judgments. Unlike Francis Hutcheson (1971) before them, they did not find this ground in an objective property (for Hutcheson, unity in variety) that always gives rise to this pleasurable response in qualified observers. Instead, recognizing the normative force of ascriptions of beauty, the demand for agreement in one's ascriptions of this property, they sought a standard in universal subjective grounds of the judgments of qualified critics.

Hume emphasized that only the judgments of fully competent or ideal critics indicate the presence of beauty or aesthetic merit. The property of beauty is similar in this respect to secondary qualities like colors, as analyzed by John Locke. For Locke, the color red is a power in objects, based on objective properties of their surfaces, to cause red sensations in normal observers in normal conditions. For Hume, beauty is similarly a relation between various objective properties and subjective responses, dif-

ferences being that, as noted, there is no single objective property to be found here, and that qualified observers are rarer and more difficult to define. Such observers must have developed tastes, be knowledgeable of the type of work they are judging and of the historical tradition with which to compare the work, and be sensitive to the sorts of subtle relations on which the beauty of the work might depend. In the end, even such qualified critics might disagree in their comparative aesthetic judgments, Hume recognized.

Kant was both more emphatic than Hume that there are no universal objective grounds for ascriptions of beauty, and was more confident that such judgments should nevertheless be universally shared. For him, there are no principles that connect objective properties with correct ascriptions of beauty. Nevertheless, the pleasure derived from the disinterested perception of form should be universally felt, since common human faculties are involved in such perception. The perception of formal properties elicits a value-laden (pleasurable) response that is common to all disinterested observers and expressed in ascriptions of beauty. Since there is no objective property common to all beautiful objects (no objective concept of beauty), one cannot tell from a description of an object whether it is beautiful. One must experience the pleasure from perception of the object. But in judging an object to be beautiful, one demands the agreement of other observers, unlike in judging mere agreeableness.

THE NATURE OF AESTHETIC QUALITIES: REALISM

The contemporary discussion of aesthetic qualities began with Frank Sibley (1959). He first expanded the list of aesthetic qualities from beauty and sublimity to include emotion qualities like being sad or serene, evocative qualities like being powerful or dull, behavioral qualities like being jaunty or sluggish, formal-evaluative qualities like being graceful or tightly knit, and second-order perceptual qualities like being vivid or steely. A major philosophical question resulted from this expansion. What do these qualities have in common that distinguishes them from nonaesthetic qualities? Other questions remain from the discussions of Hume and Kant. What is the nature of these qualities, and how are they related to the nonaesthetic qualities of their objects?

In regard to the first question, some of the properties listed may be ascribed to artworks only metaphorically, but others are ascribed literally. If “sad” here can mean expressive of sadness, and “powerful” can refer to the

power to evoke a strong response, then these two properties fall into the latter category.

According to Sibley, perceiving aesthetic properties requires taste. If taste is a special quasi-perceptual faculty different from the ordinary five senses, as his usage sometimes suggests, then its existence and operation becomes mysterious, as do the aesthetic qualities it alone can grasp. If taste refers simply to sensitivity to aesthetic properties, then there is a tight circularity in the definitions that needs to be removed. But appeal to taste here can have two other more plausible functions. First, it can indicate that the perception of all the relevant nonaesthetic properties of an object is not sufficient for the perception of its aesthetic properties. One must perceive nonaesthetic properties to perceive aesthetic qualities, but not vice versa.

Second, since “taste” in one of its senses refers to dispositions to evaluate in certain ways, appeal to taste here can indicate that ascribing aesthetic properties to artworks is always relevant to their evaluation. We justify aesthetic evaluations by pointing to the aesthetic properties of objects. Some of these properties, like being graceful or tightly knit, are typically value-laden in themselves. Others, like being sad, seem not to be. But if artworks not only have such properties, but, as Nelson Goodman (1969) claims, exemplify them, that is, refer to them and tell us something of their nature, then this is of some value. And experiencing such qualities can also be of value by being part of an overall response to an artwork that engages not only the emotions, but the perceptual, imaginative, and cognitive faculties as well.

Thus, we can define aesthetic qualities as those that contribute directly to an object’s aesthetic value, positive or negative. Again, there is a circularity here, but it can be removed by defining aesthetic value without appealing to aesthetic qualities, perhaps in terms of the overall engagement of our mental faculties just alluded to. What has aesthetic value, according to this concept, simultaneously challenges and exercises all our mental capacities—perceptual, imaginative, affective, and cognitive. If the concept of art itself is in turn evaluative, if having aesthetic value in the sense indicated is both necessary and sufficient for being a (fine) artwork, then aesthetic qualities are also definitive of (fine) artworks. Taken in this sense, however, the concept of aesthetic properties has not only been broadened from the initial reference to beauty; it has also been narrowed to the domain of artworks, at least in its primary use.

In regard to the second question on the nature of aesthetic qualities, it is clear that they are relational prop-

erties, as Hume and Kant held, involving appreciative responses to the objective or base qualities of objects. These base qualities include structural properties of tones, shapes, and colors; syntactic and semantic properties of literary texts; and relations between these and similar properties in other works. Appeal to these base properties justifies ascriptions of aesthetic qualities, and appeal to these aesthetic qualities in turn justifies overall aesthetic evaluations.

That aesthetic qualities involve subjective responses does not imply that these qualities are not real. Real properties are those that are instantiated independently of observers' beliefs about them and of how they appear to particular observers. Secondary qualities like colors are real in this sense because, even though particular observers can disagree and even though colors can appear other than they are, normal observers in normal conditions can achieve consensus on colors. Such consensus among qualified observers is essential to the reality of such relational properties. A crucial question is whether we would find agreement in the ascription of aesthetic qualities among fully qualified art critics.

THE RELATION TO BASE PROPERTIES: RELATIVISM

Kant held that there are no principles linking objective properties to beauty, and Sibley held that nonaesthetic properties are never sufficient conditions for aesthetic properties. The lack of such principles is due to the fact that aesthetic qualities are not only relational, but relative in several different senses. First, they are relative to the contexts of the particular objects that instantiate them. A graceful passage in a Mozart piece would not be graceful at all in a piece by Charles Ives. Second, they are relative to differing interpretations of the same work. Iago's "Credo" aria in Giuseppe Verdi's *Otello* can be interpreted as boisterous and defiant or as sinister and brooding. Third, they are relative to historical context and change with changing historical contexts. The works of Antonio Salieri were heard as graceful before Mozart but as somewhat stilted and awkward after Mozart. Finally, as Hume in the end affirmed but Kant denied, they are relative to differing tastes of different critics. What is poignant to one is maudlin to another; what is striking and powerful to one is garish and grating to another.

That the latter disagreements occur at all levels of actual competence and sophistication indicates that even ideal critics would fail to reach consensus in ascribing aesthetic properties. For every such property, there would be some disagreements among fully qualified critics as to

whether some objects had the property in question. And this would occur not only in borderline cases, indicating only vagueness in the concepts of such properties. A paradigm of poignancy for some critics, for example, a Tchaikovsky symphony or Puccini aria, is a paradigm of maudlin sentimentality for others.

It seems, therefore, that we must relativize ascriptions of aesthetic properties to both tastes and contexts (including work, historical, and interpretive contexts). The main problem with doing so is that it then becomes problematic to see opposed ascriptions as really in disagreement and difficult to explain why opposing critics argue for their interpretations and evaluations. Genuine disagreement and argument about the presence of an aesthetic property seem to assume a right answer to the question of whether or not the property is present. But if an artwork is powerful to one critic and not to another, then what are they disagreeing about? In short, the problem for the relativist is to account for the normative force of judgments regarding aesthetic qualities. Even if Kant was too strong in his claim that we demand universal agreement in our aesthetic judgments, surely the practice of critical argument reflects some demand for agreement.

To maintain a realist account of aesthetic qualities in the face of disagreement among fully qualified critics, one might say that an object really has an aesthetic quality only if the quality is experienced by all qualified critics, or, alternatively, that it really has the quality even if it is experienced only by some qualified critics. But the first response leaves artworks with too few aesthetic qualities and makes almost all aesthetic judgments false, while the second response ascribes too many aesthetic qualities, even incompatible ones, to the same objects. Another possibility for the realist is to hold that when critics disagree about the evaluative aesthetic properties they ascribe, there are nevertheless real nonevaluative aesthetic properties that they agree on in perceiving. When, for example, one critic sees a painting as elegant and another as insipid, they nevertheless see the same aesthetic quality underlying these opposed evaluative qualities. But the problem with this response is, first, that it splits the account of aesthetic qualities in two and, second, that it fails to specify what the underlying aesthetic quality might be. The critics seem to react to the base, nonaesthetic formal properties of the painting with different responses.

The relativist account therefore seems preferable. In addition, it explains why we cannot know from an objective description of an object whether it has a given aesthetic quality. We can infer that it does from testimony

only if we are certain that the testifier shares our taste. But the relativist must still account for the normativity of aesthetic judgments and how they are justified.

THE JUSTIFICATION OF ASCRIPTIONS OF AESTHETIC QUALITIES

Objective base properties justify ascriptions of aesthetic qualities, and these justify overall evaluations. But there are no principles at either level. On the second level, elegance, for example, usually contributes to a positive evaluation. But prose or painting styles can be too elegant for their subject matters, lessening the overall impact of their works. In view of the lack of principles and the relativity of aesthetic qualities to different tastes, how do these justifications work?

Ascriptions of aesthetic qualities are unjustified when based on inattention, bias, lack of knowledge of the formal properties of a work or its historical context, or an unacceptable interpretation. In asserting that an object has an aesthetic quality, one makes an implicit claim that one's judgment is not based on any of these disqualifying factors. This is equivalent to the claim that a fully competent or ideal critic who shares one's taste would respond to the object in the same way, would ascribe the same property to it. Thus, the relation between objective non-aesthetic properties and aesthetic qualities is simply that the former cause fully competent critics with certain tastes to respond in ways expressed by ascriptions of the aesthetic qualities.

Arguments over the presence of aesthetic qualities proceed until it is clear that both parties are fully competent in the circumstances to make the aesthetic judgments they make. Typically, critics proceed by pointing to the objective properties in the given historical context that elicit the responses expressed in their judgments, under the assumption that the other party has for one reason or another missed the relevance of the underlying base properties. But once the relevant base properties have been noted and interpretations agreed on, argument will cease, and the parties will have to accept ultimate differences in taste.

If aesthetic qualities are instantiated relative not only to contexts but, more significantly, to tastes of qualified critics, then two main questions remain. First, when do fully qualified critics share tastes? Can those who do share tastes nevertheless disagree about particular ascriptions of aesthetic qualities? Second, why should the judgments of such critics have normative force for others? If fully qualified or ideal critics who share tastes can disagree in their ascriptions of aesthetic qualities, and if objects have

the relational properties that these critics ascribe, then the same problem that relativizing was intended to solve, the ascription of incompatible qualities to the same objects, reappears. When such critics disagree, they therefore have slightly different tastes. But if an ordinary observer who shares tastes with an ideal critic in all other aesthetic judgments disagrees in a particular case, this is a strong (but not infallible) indication that the observer is not making a sound aesthetic judgment, that he is mistaken in ascribing the aesthetic quality to the object. Clarifying argument is then in order. Only when all relevant base properties have been noted and acceptable interpretations agreed on can disagreements be explained away as reflecting different tastes. The object will then be asserted to have the disputed aesthetic qualities only relative to these different tastes.

To turn to the second question, when an ordinary observer disagrees with a fully competent critic who shares his taste, why should he accept the judgment of the critic as correct or normative for him? The answer can only be that such critics experience works more deeply—on cognitive, emotional, imaginative, and perceptual levels simultaneously. The works and their aesthetic qualities, when so appreciated, offer lasting satisfaction.

AESTHETICS

The Encyclopedia features two very detailed survey entries, *Aesthetics, History of*, and *Aesthetics, Problems of*, as well as the following entries: *Beauty*; *Humor*; *Metaphor*; *Tragedy*; and *Ugliness*.

AESTHETICS, HISTORY OF

In the West, the history of systematic philosophizing about the arts begins with Plato. But his great achievement was preceded, and prepared for, by certain developments in the preceding two hundred years, of which we know or can guess only a little. Thus, the famous aesthetic judgment—if such it was—of the picture on Achilles' shield, "That was a marvellous piece of work" (*Iliad* XVIII 548), hints at the beginning of wonder about imitation, i.e., the relation between representation and object, or appearance and reality. Plato shows the aesthetic consequences of the thinking on this problem by Democritus and Parmenides. Further, the elevation of Homer and Hesiod to the status of wise men and seers, and moral and religious teachers, led to a dispute over the truthfulness of

poetry when they were attacked by Xenophanes and Heraclitus for their philosophical ignorance and misrepresentation of the gods. Homer and Hesiod themselves raised the question of the source of the artist's inspiration, which they attributed to divine power (*Odyssey* VIII; *Theogony* 22 ff.). Pindar traced this gift to the gods but allowed that the poet's skill can be developed by his own effort. Pythagoras and his Order discovered the dependence of musical intervals on the ratios of the lengths of stretched strings, generalized this discovery into a theory about the elements of the material world (that they either are, or depend upon, numbers), and developed an elaborate ethical and therapeutic theory of music, which, according to them, is capable of strengthening or restoring the harmony of the individual soul—*harmonia* being the term for the primary interval, the octave.

PLATO

Nearly all of the fundamental aesthetic problems were broached, and some were deeply considered, by Plato. The questions he raised and the arguments he framed are astonishingly varied and deep. They are scattered throughout his dialogues, but the principal discussions are in (a) the *Ion*, *Symposium*, and *Republic*, belonging to Plato's early, pre-Academy period (roughly 399–387 BCE); (b) the *Sophist* and *Laws*, written at the end of his life (roughly 367–348/347 BCE); and (c) the *Phaedrus*, which lies between these periods. Though perhaps not Plato's, the *Greater Hippias* is very Platonic and may be drawn upon. (In this entry, no distinction will be attempted between Plato's views and those of Socrates.)

ART AND CRAFT. When today we speak of Plato's aesthetics, we mean his philosophical views about those fine arts that he discusses: visual arts (painting, sculpture, architecture), literary arts (epic, lyric, and dramatic poetry), and mixed musical arts (dance and song). Plato does not himself assign them a special name; for him they belong in the more general class of "craft" (*technē*), which includes all skills in making or doing, from woodcraft to statecraft. In the *Sophist* (265–266), crafts are divided into "acquisitive" and "productive," the latter being subdivided into (1) production of actual objects, which may be either human or divine (plants and elements by god, houses and knives by men), and (2) production of "images" (*idola*), which may also be human or divine (reflections and dreams by god; pictures by men). Images, which imitate their originals but cannot fulfill their function, are further subdivided; the imitator may produce (1) a genuine likeness (*eikon*), with the same properties as his model, or (2) an apparent likeness, or semblance (*phantasma*),

which merely *looks* like the original (as when the architect makes his columns swell at the top so that they will not appear to diminish). There is thus false imitation, the making of deceptive semblances. Yet Plato finds this distinction troublesome to maintain, for it is essential to any imitation that in some way it falls short of its original; if it were perfect, it would not be an image (*eidolon*), but another example of the same thing, another bed or knife (*Cratylus* 432). So all imitation is in a sense both true and untrue, has both being and nonbeing (*Sophist* 240c).

IMITATION. The term “imitation” (*mimesis*) is one of the most troublesome in Plato’s aesthetics, for its denotation constantly expands and contracts with the movement of the dialectic, along with that of its substitutes and near synonyms, *methexis* (participation), *homoiosis* (likeness), and *paraplesia* (resemblance).

If, in one sense, all created things are imitations of their eternal archetypes, or “forms,” Plato seems also to regard paintings, dramatic poems, and songs as imitations in a narrower sense: They are images. It is this that places the arts at the second remove from the reality of the forms, on the lowest of the four levels of cognition, *eikasia* (imagining) (*Republic* 509–511). Some works of art, however—and Plato sometimes speaks as though he meant all of them—are imitative in the more pejorative sense, as deceptive semblances. In Book X of the *Republic*, the painter is said to represent the bed, not as it is but as it appears. It is this that puts him in the “tribe of imitators” (*Timaeus* 19d) and allies him with those pseudo craftsmen of the *Gorgias* (463–465) who do not possess a genuine craft, like medicine, but a pseudo craft, or knack (*tribē*), like cosmetics, which gives us the bloom of health rather than health itself.

BEAUTY. By this route, Plato approaches the question that is of great importance to him as a metaphysician: Do the arts contain, or convey, knowledge? Before coming to this question, there is another to be considered. If the architect, as a maker of semblances, changes reality to make it look better, why does he do this? He seeks those images that will appear beautiful (*Sophist* 236a). This is another basic fact about the arts, in Plato’s view; they can embody in various degrees the quality of beauty (*to kalon*—a term that can branch out into more general senses of appropriateness or fitness to function but that often appears in a more strictly aesthetic sense). The beauty of concrete things may change or disappear, may appear to some but not to others (*Republic* 479a); but behind these temporal embodiments there is an eternal and absolute form of beauty. Its existence can be demon-

strated dialectically, like that of the other forms; but direct acquaintance with it is to be sought, Plato says, via the partial and dimmer beauties open to the senses—and it is easier of access than the other forms (*Phaedrus* 249b–c).

The path to beauty is described most fully in the *Symposium*. A man possessed by love (*eros*) of beauty is to progress from bodily beauty to beauty of mind, to beauty of institutions and laws and the sciences themselves, and finally to beauty in itself. It is noteworthy that Diotima of Mantinea, who presents this picture, does not assign to the arts any role in assisting this progress; that step was taken by Plato’s successors.

It is also important to ask what beauty is, or, if that cannot be stated abstractly, what the conditions are under which beauty will be embodied in an object. The argument in the *Greater Hippias* takes up several possibilities, especially the possibility that the beautiful either is, or depends upon, what is beneficial or what pleases through the senses of hearing and sight. But in the *Philebus*, a careful discussion leads to the conclusion that beautiful things are made with care in the due proportion of part to part, by mathematical measurement (cf. *Timaeus* 87c–d; *Statesman* 284a). “The qualities of measure (*metron*) and proportion (*symmetron*) invariably ... constitute beauty and excellence” (*Philebus* 64e, Hackforth translation). And because it is, or depends upon, measure, beauty is assigned a high place in the final list of goods (*Philebus* 66a–b; cf. *Sophist* 228b).

ART AND KNOWLEDGE. Knowledge (*episteme*), as distinct from mere opinion (*doxa*), is a grasp of the eternal forms; and Plato clearly denies it to the arts, as imitations of imitations (*Republic* 598–601). So the poet is placed on the sixth level of knowledge in the *Phaedrus* (248d), and Ion is said to interpret Homer not by “art or knowledge” (532c) but in an irrational way (cf. *Apology* 22), for he does not know what he is saying or why he might be right or wrong. On the other hand, a work of art that embodies beauty has some direct relation to one form. And if the artist inspired by the Muses is like a diviner in not knowing what he is doing (*Meno* 99c; *Timaeus* 71e–72a), he may have a kind of insight that goes beyond ordinary knowledge (cf. *Laws* 682a). His madness (*mania*) may be possession by a divinity that inspires him to truth (*Phaedrus* 245a; *Ion* 533e, 536b). Moreover, since the arts can give us genuine likenesses, not only of appearances but of actualities, and even imitate the ethical character of the human soul (*Republic* 400–401b; cf. Xenophon, *Memorabilia* III viii), it is possible, and indeed obligatory, to judge

them by their truth, or their resemblance to actuality. The competent judge, especially of dance and song, must have “first, a knowledge of the nature of the original; next, a knowledge of the correctness of the copy; and thirdly, a knowledge of the excellence with which the copy is executed” (*Laws* 669A–B, Bury translation).

ART AND MORALITY. The supreme craft, for Plato, is the art of the legislator and educator, who must have the final say about the arts, for his task is to insure that they play their proper role in the life of the entire social order. The first problem is to discover what effects the arts have on people, and this problem has two aspects. First, there is the enjoyability of art. On the one hand, just insofar as it has beauty, the pleasures art gives are pure, unalloyed, and harmless (*Phaedrus* 51B–C), unlike the pleasure of scratching an itch, which is preceded and followed by discomfort. But, on the other hand, dramatic poetry involves the representation of unworthy characters behaving in undesirable ways (ranting and wailing) and tempts the audience into immoderate laughter or weeping. Therefore its pleasures are to be condemned for their unworthy effect on character. Second, when we consider this tendency of the arts to influence character and conduct, there are again two sides to the matter. In his *Republic* and *Laws*, Plato makes it quite clear that he thinks the literary imitation of evil conduct is an implicit invitation to imitate the conduct in one’s life (*Laws* 665B). Thus the stories of gods and heroes who behave immorally have to be excluded from the education of the young guardians in the *Republic*, and stories in which the gods and heroes behave as they should must either be found or written (*Republic* 376E–411; cf. *Laws* 800–802, 664A). Music composed in enervating modes must also be replaced by a suitable kind (*Republic* 398E, 411A).

But this does not mean that the arts have no role to play in the cultural life and education of the citizens. Indeed, the fear of their power that underlies Plato’s severe censorship and regulation is accompanied by an equally great respect. The measure that is so closely allied to beauty is, after all, closely allied to goodness and virtue too (*Laws* 655A; *Protagoras* 326A–B; *Republic* 432). Music and poetry and dancing are, at their best, indispensable means of character education, able to make men better and more virtuous (*Laws* 653–654, 664). The problem, as Plato in his role of legislator sees it, is to ensure the social responsibility of the creative artist by insisting that his own good, like that of every citizen, be subordinated and made conducive to the good of all.

ARISTOTLE

Our knowledge of Aristotle’s aesthetic theory comes chiefly from the little collection of lecture notes that has come down to us as the *Poetics*, composed probably about 347–342 BCE and later added to. The text is corrupt, the argument condensed and puzzling. No work in the history of aesthetics has given rise to such vexatious problems of interpretation; no work has had so great an influence on the theory and practice of literary criticism.

THE ART OF POETRY. Aristotle’s first task is to define the art of poetry (*poietike*), which is his subject. He assumes a distinction between three kinds of “thought,” knowing (*theoria*), doing (*praxis*), and making (*poiesis*) (see *Metaphysics* E 1; *Topics* VI 6); but in the *Poetics*, “poiesis” is taken in a narrower sense. One kind of making is imitation, which Aristotle seems to take fairly straightforwardly as representation of objects or events. The imitative art divides into (1) the art of imitating visual appearances by means of color and drawing and (2) the art of poetry, the imitation of a human action (*praxis*) through verse, song, and dance (*Poetics*, Ch. 1). Thus the art of poetry is distinguished from painting by its medium (words, melody, rhythm) and from versified history or philosophy (the poem of Empedocles) by virtue of the object it imitates. Two of the species of the poetic art are of primary concern to Aristotle: drama (either tragic or comic) and epic poetry, distinguished from comedy by the gravity of the actions imitated (Chs. 2, 6).

What is of the first importance in Aristotle’s treatise is his method of inquiry, for he aims to present a systematic theory of a particular literary genre. He asks: What is the nature of the tragic art? And this leads him to inquire not only into its material, formal, and efficient causes (many of his observations under these headings are of permanent value to literary theory) but also into its final cause or end (*telos*). What is a good tragedy, and what makes it good; what are “the causes of artistic excellence and the opposite” (Ch. 26, G. F. Else translation)? This function of tragedy, he thinks, must be to provide a certain kind of enjoyable experience—the “proper pleasure” (*oikeia he-done*) of tragedy (Chs. 14, 23, 26)—and if the nature of this pleasure can be determined it will then be possible to justify the criteria by means of which one can say that one tragedy is better than another.

THE PLEASURE OF IMITATION. Aristotle suggests briefly (Ch. 4) two motives that give rise to tragedy. The first is that imitation is natural; and the recognizing of imitation is naturally pleasurable to man because man

finds learning pleasant, and recognizing, say, a picture of a dog, is a form of learning (cf. *Rhetoric* I xi). Since tragedy is an imitation of a special sort of object, namely fearful and pitiable events, its proper pleasure “is the pleasure that comes from pity and fear by means of imitation” (Ch. 4, Else translation). The problem that evidently arises is how we can derive pleasure from feeling emotions that are painful (cf. the definitions of “fear” and “pity” in *Rhetoric* II v, viii). Aristotle’s nearest answer seems to be that though the object imitated may be in itself unpleasant to contemplate, the pleasure of seeing the imitation may overcome our distaste—as with skilled drawings of cadavers (see *De Partibus Animalium* I v; *Rhetoric* I xi). Here Aristotle is offering a partial answer to one of Plato’s grounds for skepticism about art; he takes the basic aesthetic pleasure as a cognitive one, of the same genus as the philosopher’s (though no doubt of a lower level).

THE PLEASURE OF BEAUTY. Tragedy also grows, Aristotle says (Ch. 4), out of our natural disposition to “melody and rhythm.” He does not develop this point and may be postulating a kind of decorative impulse. But if we may think here of Plato’s *Philebus*, our pleasure in melody and rhythm may be taken as pleasure in beauty in general. “A beautiful (*kalliste*) thing, either a living creature or any structure made of parts, must have not only an orderly arrangement of those parts, but a size which is not accidental” (Ch. 7). Thus a tragedy, or its plot, may be “beautiful,” i.e., artistically excellent (Chs. 1, 13). And the “proper pleasure” of the epic, for example, depends on its unity, on being “like a single whole creature” (*zoon*) with a beginning, middle, and end (Ch. 23). This analogy echoes Plato’s *Phaedrus* 264c. For the fineness of the object sensed or contemplated produces the highest degree of that pleasure that is proper to the organ sensing or mind contemplating (*Nicomachean Ethics* X iv).

THE UNIVERSAL. If the function of tragic poetry is to provide a certain species of enjoyment, we can then inquire into the features of a particular work that will promote or inhibit this enjoyment. Its concentration and coherence depend in large part upon the plot and the sense of inevitability in its development (Ch. 10). This is evidently achieved most fully when the characters act in accordance with their natures, when they do the “kinds of thing a certain kind of person will say or do in accordance with probability or necessity, which is what poetic composition aims at” (Ch. 9, Else translation). These sorts of behavior, i.e., behavior that is motivated in accordance with psychological laws, Aristotle calls “universal,” con-

trasting them with the events in a historical chronicle, which he thinks of as a causally unconnected string of particular incidents (“what Alcibiades did or had done to him”).

This famous passage has inspired many later theories about art imitating universals or essences, but the gist of it (for Aristotle) is that the poet must make his plot plausible by relying on general psychological truths. This important point adds another level to Aristotle’s defense (against Plato) of the cognitive status of poetry, for the poet must at least understand human nature or he cannot even produce a good plot.

THE CATHARSIS. In Aristotle’s definition of tragedy (Ch. 6) there is one phrase that has given rise to an enormous amount of interpretation: *di eleou kai phobou perainousa ten ton toiouton pathematon katharsin* (translated in the traditional way by Butcher: “through pity and fear effecting the proper purgation of these emotions”). Thus Aristotle is interpreted as having a further theory, not about the immediate pleasure of tragedy but about its deeper psychological effects. This phrase is the only basis for such an interpretation in the *Poetics*; but in the *Politics* (VIII 7), Aristotle clearly does propose a cathartic theory of music and even says he will explain catharsis further “when hereafter we speak of poetry”—a remark that possibly refers to the presumed lost parts of the *Poetics*. If tragedy produces a catharsis of the emotions, there are still other problems in deciding what Aristotle had in mind—whether, for example, he meant it in a medical sense (a purgation of the emotions, their elimination by mental physic) or in a religious and lustratory sense (a purification of emotions, their transformation into a less harmful form). Both senses had precedents. There is also the question whether Aristotle believed in a catharsis of pity and fear alone, or, through them, of all destructive emotions.

In any case, on this interpretation, Aristotle would be answering Plato’s second objection to poetry in Book X of the *Republic*, by saying that poetry helps men to be rational. The traditional interpretation has been interestingly challenged in recent years by Professor Gerald F. Else, who argues that the catharsis is not an effect on the audience or reader but something accomplished in the play itself, a purification of the hero, a release from the “blood pollution” of his crime, through his recognition of it, his horror at it, and the discovery that it was due to a “serious mistake” (*hamartia*) on his part. This reading does not seem to fit some of the tragedies. If it is correct, Aristotle has no therapeutic theory of tragedy at all, but

he may still be replying to Plato that the immoral effects of tragedy are not to be feared, since the finest ones, at least, will have to show a kind of moral progress if they are to be structurally capable of moving the spectator tragically.

THE LATER CLASSICAL PHILOSOPHERS

Aristotle's *Poetics* does not seem to have been available to his successors. His ideas had some influence via the works (now largely lost) of his favorite pupil, Theophrastus; and the *Tractatus Coislinianus* (Greek, probably first century BCE) shows an acquaintance with his work, for its definition of comedy parallels remarkably Aristotle's definition of tragedy. During the later classical period, Stoicism, Epicureanism, skepticism, and Neoplatonism flourished competitively, and each of these schools of thought had some contribution to make to the history of aesthetics.

STOICISM. The Stoics were much interested in poetry and in problems of semantics and logic. Zeno, Cleanthes, and Chrysippus wrote treatises on poetry, no longer extant. From Philodemus we know of a work on music by the Stoic Diogenes of Babylon, and from Cicero's *De Officiis* of a work on beauty by Panaetius. Both seem to have held that beauty depends on the arrangement of parts (*convenientia partium*, in Cicero's phrase). The delight in beauty was connected with the virtue that expresses itself in an ordered life, with decorum (*to prepon*). Thus not only irrational pleasure (*hedone*), but a rational elevation of the soul (*chara*), in keeping with the Stoic goal of tranquillity, was thought to be obtainable from poetry of the right sort. The Stoics emphasized the moral benefit of poetry as its chief justification and held that it might allegorize true philosophy (see Strabo, *Geography* I, i, 10; I, ii, 3).

EPICUREANISM. The Epicureans are said (by Sextus Empiricus, *Against the Professors* VI, 27) to have disapproved of music and its pleasure, but it appears that this is partly based on a misunderstanding of Epicurus's aversion to music criticism (see Plutarch, *That It Is Not Possible to Live Pleasurably According to the Doctrine of Epicurus* 13). Two important works by Philodemus of Gadara (first century BCE), parts of which have been unearthed at Herculaneum, give further evidence of Epicurean thinking about the arts. In his work *On Music* (*Peri Mousikes*), Philodemus strikes the earliest known blow for what later was called "formalism," by arguing (against the Pythagoreans, Plato, and Aristotle) that music by itself—apart from the words, whose effects are often confused with the music itself—is incapable either

of arousing emotions or of effecting ethical transformations of the soul. And in his work *On Poems* (*Peri Poematon*) he argued that specifically poetic goodness (*to poietikon agathon*) is not determined either by the moral-didactic aim (*didaskalia*), by the pleasure of technique and form (*psychagogia*), or by a mere addition of the two, but by a unity of form and content—his conception of which we do not now know.

The main lines of reflection about literature during the Roman period seem to have been practical and pedagogical. Two works were outstandingly influential (the second, however, not until its rediscovery in the modern period): the *Ars Poetica*, or *Epistle to the Pisos*, of Horace, which discusses many questions of style and form, and the work *On Elevation in Poetry* (*Peri Hypsous*, or *On the Sublime*), probably written during the first century CE, perhaps by a Greek named "Longinus." This lively and brilliant work defines the quality of great writing in affective terms, as that which transports the soul; and it investigates the stylistic and formal conditions of this effect.

PLOTINUS. The philosophical reflection that continued in the Platonic schools until the Academy at Athens was closed by Justinian I in CE, 529 culminated in the Neoplatonic system of Plotinus. Three of his fifty-four tracts, which make up the six *Enneads*, deal especially with aesthetic matters: "On Beauty" (I, vi); "On the Intellectual Beauty" (V, viii); and "How the Multiplicity of the Ideal-Forms Came into Being; and on the Good" (VI, vii).

Behind the visible world, in this view, stands "the one" (*to hen*), or "the first," which is ultimate reality in its first "hypostasis," or role, beyond all conception and knowledge. In its second hypostasis, reality is "intellect," or "mind" (*nous*), but also the Platonic forms that are known by mind. In its third hypostasis it is the "all-soul" (*psyche*), or principle of creativity and life. Within his scheme—infinite gradations of being "emanating" from the central "light"—Plotinus develops a theory of beauty that is highly original, though inspired by the *Symposium* and other Platonic dialogues. The tractate "On Beauty" (MacKenna and Page translation) begins by noting that Beauty lies in things seen and heard, and also in good character and conduct (I, vi, 1); and the question is, "What ... is it that gives comeliness to all these things?"

The first answer considered, and rejected, is that of the Stoics. Beauty is, or depends on, symmetry. Plotinus argues that simple sense qualities (colors and tones), and also moral qualities, can have beauty though they cannot be symmetrical; moreover, an object can lose some of its beauty (as when a person dies) without losing any sym-

metry (VI, vii, 22). Therefore, symmetry is neither a necessary nor sufficient condition of beauty. It is not beauty but participation in ideal-form, that is, embodiment of Platonic ideas, that marks the difference in a stone before and after the sculptor carves it; for he gives it form. Where ideal-form enters, he says, confusion has been “rallied ... into co-operation” (I, vi, 2): when an object becomes unified, “Beauty enthrones itself.” A homogeneous thing, like a patch of color, is already unified by similarity throughout; a heterogeneous thing, like a house or ship, is unified by the dominance of the form, which is a divine thought (I, vi, 2). In the experience of beauty, the soul finds joy in recognizing in the object an “affinity” to itself; for in this affinity it becomes aware of its own participation in ideal-form and its divinity. Here is the historical source of mysticism and romanticism in aesthetics.

Love, in Plotinus’s system, is always the love of beauty (III, v, 1) and of absolute and ultimate beauty through its lesser and dimmer manifestations in nature or in the work of the artist-craftsman (I, vi, 7; VI, ii, 18; V, viii, 8–10). Something of Plato’s ambivalence toward art reappears in Plotinus’s account at this point, though muted and closer to being overcome in the basic monism of the system. We ascend from the contemplation of sensuous beauty to delight in beautiful deeds, to moral beauty and the beauty of institutions, and thence to absolute beauty (I, vi, 8–9; II, ix, 16). Plotinus distinguishes three ways to truth, that of the musician, the lover, and the metaphysician (I, iii, 1–2); and he speaks of nature as offering a loveliness that cannot help but lead the admiring contemplator to thought of the higher beauties that are reflected there (II, ix, 7; V, viii, 2–3). Nor are the arts to be neglected, on the ground that they are mere imitations (here he comes closest to correcting the *Republic*, Book X), for both the painting and the object it copies are, after all, both imitations of the ideal-form; moreover, the painter may be able to imitate form all the more truly, to “add where nature is lacking” (V, viii, 1; cf. V, ix, 11). Yet, in his more religious mood, Plotinus reminds us that earthly and visible beauty may distract us from the infinite (V, v, 12), that “authentic beauty,” or “beyond-beauty,” is invisible (VI, vii, 33); and he who has become beautiful, and hence divine, no longer sees or needs it (V, vii, 11). The ladder, to use once more a too-familiar similitude, is kicked away by the philosophic mystic once he reaches home.

THE MIDDLE AGES

The early church Fathers were somewhat doubtful of beauty and the arts: They feared that a keen interest in

earthly things might endanger the soul, whose true vocation lies elsewhere—especially since the literature, drama, and visual art they were acquainted with was closely associated with the pagan cultures of Greece and Rome. But despite the danger of idolatry, sculpture and painting became accepted as legitimate aids to piety, and literature became accepted as part of education in the liberal arts. Concern with aesthetic problems was not a prominent part of medieval philosophy, but some important lines of thought can be observed in the works of the two greatest thinkers.

ST. AUGUSTINE. In his *Confessions* (IV, xiii), Augustine tells a little of his lost early work, *De Pulchro et Apto* (“On the Beautiful and Fitting”), in which he distinguished a beauty that belongs to things in virtue of their forming a whole and a beauty that belongs to things in virtue of their fitting in with something else or being part of a whole. It is not possible to be sure, from his brief description, of the exact nature of this distinction. His later thoughts on beauty are scattered throughout his works, and especially in *De Ordine* (“Concerning Order,” CE 386), *De Vera Religione* (“Concerning True Religion,” CE 390), and *De Musica* (CE 388–391), a treatise on meter.

The key concepts in Augustine’s theory are unity, number, equality, proportion, and order; and unity is the basic notion, not only in art (*De Ordine* II, xv, 42) but in reality. The existence of individual things as units, and the possibility of comparing them with respect to equality or likeness, gives rise to proportion, measure, and number (*De Musica* VI, xiv, 44; xvii, 56; *De Libero Arbitrio* II, viii, 22). Number, he emphasizes in various places, is fundamental both to being and to beauty—“Examine the beauty of bodily form, and you will find that everything is in its place by number” (*De Libero Arbitrio* II, xvi, 42, Burleigh translation). Number gives rise to order, the arrangement of equal and unequal parts into an integrated complex in accordance with an end. And from order comes a second-level kind of unity, the emergent unity of heterogeneous wholes, harmonized or made symmetrical through internal relations of likeness between the parts (*De Vera Religione* xxx, 55; xxxii, 59; *De Musica* VI, xvii, 58).

An important feature of Augustine’s theory is that the perception of beauty involves a normative judgment. We perceive the ordered object as being what it ought to be, the disordered object as falling short; hence the painter can correct as he goes along and the critic can judge (*De Vera Religione* xxxii, 60). But this rightness or wrongness cannot be merely sensed (*De Musica* VI, xii,

34); the spectator must bring with him a concept of ideal order, given to him by a “divine illumination.” It follows that judgment of beauty is objectively valid; there can be no relativity in it (*De Trinitate* IX, vi, 10; *De Libero Arbitrio* II, xvi, 41).

Augustine also wrestled with the problem of literary truth, and in his *Soliloquies* (CE 387) he proposed a rather sophisticated distinction between different sorts of lying or deception. In the perceptual illusion, the straight oar pretends to be bent, and could be bent, but the statue could not be a man and therefore is not “mendacious.” So, too, the fictional character could not be real and does not pretend to be real by his own will, but only follows the will of the poet (II, ix, 16; x, 18; cf. *Confessions* III, vi).

ST. THOMAS AQUINAS. Thomas’s account of beauty is given tersely, almost casually, in a few key passages that have become justly famous for their rich implications. Goodness is one of the “transcendentals” in his metaphysics, being predicable of every being and cutting across the Aristotelian categories; it is Being considered in relation to desire (*Summa Theologica* I, q. 5, art. 1). The pleasant, or delightful, is one of the divisions of goodness—“that which terminates the movement of appetite in the form of rest in the thing desired, is called the *pleasant*” (*S.T.* I, q. 5, art. 6, Dominican Fathers translation). And beauty is what pleases on being seen (*Pulchra enim dicuntur quae visa placent*, *S.T.* I, q. 5, art. 4).

Here, of course, “seeing” extends to all cognitive grasp; the perception of beauty is a kind of knowing (this explains why it does not occur in the lower senses of smell and taste, *S.T.* I–II, q. 27, art. 1). Since cognition consists in abstracting the form that makes an object what it is, beauty depends on the form. Thomas’s best-known statement about beauty occurs in the course of a discussion of Augustine’s attempt to identify the persons of the Trinity with some of his key concepts, the Father with unity, etc. Beauty, he says, “includes three conditions” (*S.T.* I, q. 39, art. 8). First, there is “integrity or perfection” (*integritas sive perfectio*)—broken or injured objects, incomplete objects, are ugly. Second, there is “due proportion or harmony” (*debita proportio sive consonantia*), which may refer partly to the relations between parts of the object itself but mainly refers to a relation between the object and the perceiver: that the eminently visible object, for example, is proportioned to the sight. Third, there is “brightness or clarity” (*claritas*), or brilliance (see also *S.T.* II–II, q. 145, art 2; q. 180, art. 2). The third condition has been variously explicated; it is connected with the medieval Neoplatonic tradition in which light is a symbol

of divine beauty and truth (see the pseudo-Dionysius on the *Divine Names*, Ch. 4; Robert Grosseteste, *De Luce*, and his commentary on the *Hexaëmeron*). Clarity is that “splendor of form [*resplendentia formae*] shining on the proportioned parts of matter” in the opusculum *De Pulchro et Bono* (I, vi, 2), written either by the young Thomas or his teacher Albertus Magnus. The conditions of beauty can be stated univocally, but beauty, being a part of goodness, is an analogical term (that is, has different senses when applied to different sorts of things). It signifies a whole family of qualities, for each thing is beautiful in its own way (Aquinas, *Commentary on the Psalms*, Psalm xlv, 2; cf. *Commentary on the Divine Names* iv, 5).

THE THEORY OF INTERPRETATION. The consuming tasks of the early Fathers, clarifying, reconciling, and systematizing Biblical texts in order to defend Christianity against external enemies and heretical deviations, required a method of exegetical interpretation. The Greek tradition of allegorizing Homer and Hesiod and the Rabbinical tradition of allegorical exposition of Jewish scriptures had been brought together and elaborately refined by Philo of Alexandria. His methods were adopted by Origen, who distinguished three levels of meaning in scripture: the literal, the moral, and the spiritual or mystical (see *De Principiis* IV, i, 16, 18, 20). This method was taken into the West by Hilary of Poitiers and Ambrose, bishop of Milan, and further developed by John Cassian, whose formulation and examples became standard throughout the medieval period up to the time of Dante (see Dante’s letter to Can Grande, 1319, the Preface to the *Paradiso*).

In Cassian’s example (*Collationes* xiv, 8), Jerusalem, in the Old Testament, is, “literally” or “historically,” the city of the Jews; on the “allegorical,” or what came to be called the “typical,” level, it refers prophetically to the later church of Christ; on the “tropological,” or moral, level, to the individual soul; on the “anagogical” level, to the heavenly City of God. The last three levels together are sometimes called the “allegorical,” or (as by St. Thomas) the “spiritual,” meaning. As Thomas also indicates (*Summa Theologica* I, q. 1, art 10), the “literal” meaning also includes metaphorical statements.

Origen insisted that all Biblical texts must have the highest level of meaning, the “spiritual,” though they may lack a moral sense and may even fail to make sense on the literal level, if too great an absurdity would be entailed by taking them that way. In this he was followed by St. Augustine (*De Doctrina Christiana* III, x, 14; xv, 23) but not by Hugh of St. Victor (*De Scripturis*, v; *Eruditiones*

Didascalicon VI, iv, viii–xi), who held that the second-level meanings are a function of the first level, and a first-level meaning can always be found if metaphor is included in it.

Because Christianity taught that the world was created *ex nihilo* by God, rather than generated or molded out of something else, Christian thinkers tended, in the Middle Ages, to hold that nature itself must carry the marks or signs of its origin and be a symbolic embodiment of the Word; in this respect, like Holy Scripture, God's other creation, it can be subjected to interpretation. Thus, nature becomes an allegory, and every natural object a symbol of something beyond. This view reaches its fullest development in John Scotus Erigena (*De Divisione Naturae* I, iii) and St. Bonaventure (*Collationes in Hexaëmeron* II, 27).

Though these reflections were primarily theological, rather than aesthetic, they were of great significance to the later history of aesthetics: They raised important questions about the nature of metaphor and symbol, in literature as well as in theology; they initiated reflection on the general problem of interpreting works of art; and they showed the possibility of a broad philosophy of symbolic forms, in which all art might be understood as a kind of symbolism.

THE RENAISSANCE

The most interesting philosophical development in the fifteenth and sixteenth centuries was the revival, by a number of thinkers, of Platonism and the creation of a vigorous Neoplatonism. Of these thinkers, Marsilio Ficino, translator of Plato and Plotinus and founder of the new Academy (1462), was the greatest. In *De Amore* (his commentary on the *Symposium*, written 1474–1475) and in his principal work, the *Theologia Platonica*, Ficino took over a number of the leading aesthetic notions of the Greeks and of St. Augustine, and to them he added one of his most original ideas, a theory of contemplation based on Plato's *Phaedo*. In contemplation, he held, the soul withdraws to some extent from the body into a purely rational consciousness of the Platonic forms. This inward concentration is required for artistic creation, which involves detachment from the real, to anticipate what does not yet exist, and also is required for the experience of beauty (this explains why beauty can be grasped only by the intellectual faculties—sight, hearing, and thinking—and not by the lower senses).

More significant for the future, however, were the changes taking place in basic assumptions about the arts and in attitudes toward them. The most significant works

on the fine arts were the three books on painting, sculpture, and architecture by Leon Battista Alberti, the large collection of notes toward a systematic treatise on painting by Leonardo da Vinci, and surviving memoranda and the two books, on geometry and perspective and on human proportions by Albrecht Dürer.

One of the most serious endeavors of these artists and others was to establish a status for painting within the liberal arts, separating it from the other manual crafts among which it had been classified throughout the medieval period. The painter, Alberti argued (in his *Della pittura*, 1436), requires a special talent and skill; he needs a liberal education and a knowledge of human affairs and human nature; he must be a scientist, in order to follow the laws of nature and produce accurate representations of natural events and human actions. His scientific knowledge, indeed, must be basically mathematical, for the theory of proportions and the theory of linear perspective (which preoccupied Renaissance theorists, and especially Dürer) are mathematical studies; and they provide the principles in terms of which paintings can be unified and made beautiful, but at the same time made to depict correctly. Leonardo's argument for the superiority of painting to poetry and music (and also, in some degree, to sculpture) followed similar lines (see the first part of the *Treatise on Painting*).

The concern for faithfulness of representation that is fundamental to Renaissance fine arts theory is also found in the developing theory of music. The music theorists, aiming to secure the place of music as a humanistic discipline, sought for a vocal music that would attain the powerful emotional and ethical effects attributed to Greek music. They stressed the importance of making the music follow the text, to intensify the meanings of the words. These ideas were defended, for example, by Gioseffe Zarlino, in his *Istitutioni Armoniche* (1558) and by Vincenzo Galilei, in his *Dialogo della musica antica e della moderna* (1581).

Renaissance poetics was dominated by Aristotle (especially the concept of poetry as imitation of human action) and Horace (the thesis that poetry aims to delight and instruct—though this dualism was rejected by one of the major theorists, Lodovico Castelvetro, in his commentary on Aristotle's *Poetics*, 1570). The concept of imitation was variously interpreted and criticized by the Italian theorists. Among the chief points of disagreement and contention was the question whether poetry must belong to fixed genres and obey rigid rules, such as the dramatic "unities" adopted so adamantly by Julius Caesar Scaliger in his *Poetics* (1561), and the question (as dis-

cussed, for example, in Sidney's *Defense of Poesie*, 1595) whether the poet is guilty of telling lies and of leading his readers into immorality. In these discussions, the Aristotelian *katharsis* and Plato's condemnation of the poets were central and recurrent topics.

THE ENLIGHTENMENT: CARTESIAN RATIONALISM

Though Descartes had no aesthetic theory, and indeed wrote nothing about the arts apart from his early *Compendium Musicae* (1618), his epistemological method and conclusions were decisive in the development of neoclassical aesthetics. As in other areas, the search for clarity of concept, rigor of deduction, and intuitive certainty of basic principles penetrated the realm of critical theory, and its effects can be traced in numerous works, for example, in Nicolas Boileau-Despréaux's *L'art poétique* (1674); in Alexander Pope's *Essay on Criticism* (1711); in Charles Du Fresnoy's *De Arte Graphica* (translated into French by Roger de Piles, 1668, into English by Dryden, 1695); and in Jean Philippe Rameau's *Traité de l'harmonie réduite à ses principes naturels* (1722). Cartesian and Aristotelian elements combined in the richly polysemous concepts of reason and nature, which became central to all theories of the arts. To follow nature and to follow rules of reason were identified in counsel to the creative artist as well as in critical judgment.

In the sixteenth century, the rules for making and for judging works of art were generally (but not always) supported by authority, either the supposed authority of Aristotle or the models provided by classical writers. The new rationalism in aesthetics was the hope that these rules could be given a more solid, a priori, foundation by deduction from a basic self-evident axiom, such as the principle that art is imitation of nature—where nature comprised the universal, the normal, the essential, the characteristic, the ideal. So, in Samuel Johnson (*Preface to Shakespeare*, 1765), “just representations of general Nature” become the end of art; the painter “is to examine, not the individual, but the species” (*Rasselas*, 1759, Ch. 10). And in the *Discourses* (1778) of Sir Joshua Reynolds, the painter is advised to “consider nature in the abstract, and represent in every one of his figures the character of its species” (III).

THE PROBLEM OF THE RULES. The controversy over the authority and infallibility of the rules reflected a conflict between reason and experience, between less and more empirical approaches to art. For example, Corneille, in his three *Discourses* (1660), admitted the

necessity of observing unity of space, time, and action in dramatic construction but confessed also that he was by no means their “slave” and sometimes had to break or modify them for the sake of dramatic effect or the audience's enjoyment. Molière, in his *Critique de l'école des femmes* (1663), was even more outspoken in making experiment the test. However, other theorists held the line in France, for example, George de Scudéry and Charles de Saint-Évremond. Dryden, in his *Defense of an Essay of Dramatic Poesy* (1668), suggested that if drama has a function or end, there must be rules, but the rules themselves are only probable and rest in part upon experience. In this spirit, Johnson criticized the pseudo-Aristotelian rules of time and place.

In music, the conflict between reason and experience appeared in controversies over harmony and consonance, as well as over the absoluteness of rules, such as the avoidance of parallel fifths. The followers of Zarlino insisted on a mathematical basis for acceptable chords; the followers of Vincenzo Galilei were more willing to let the ear be the judge. A kind of reconciliation of these views appears in Leibniz's theory (*Principles of Nature and of Grace*, 1714, § 17) that, like all sensations, musical tones are confused *mélanges* of infinite sets of *petites perceptions* that at every moment are in pre-established harmony with the perceptions of all other monads; in hearing a chord, the soul unconsciously counts the beats and compares the mathematical ratio which, when simple, produces concord.

TOWARD A UNIFIED AESTHETICS. The Cartesian theory of knowledge led to a more systematic attempt at a metaphysics of art in the *Meditationes Philosophicae de Nonnullis ad Poema Pertinentibus* (1735) of Alexander Gottlieb Baumgarten. Baumgarten, who coined the term “aesthetics,” aimed to provide an account of poetry (and indirectly of all art) as involving a particular form, or level, of cognition—“sensory cognition.” He began with Descartes's distinctions (*Principles of Philosophy* I, xlv–xlvi), elaborated by Leibniz (*Discourse on Metaphysics*, xxiv), between clear and obscure ideas, and between distinct and confused ideas. Sense data are clear but confused, and poetry is “sensate discourse,” that is, discourse in which such clear–confused ideas are linked together into a structure. The “extensive clarity” of a poem consists in the number of clear ideas combined in it, and the rules for making or judging poetry have to do with ways in which the extensive clarity of a poem may be increased or diminished.

Baumgarten's book is remarkably concise, and its formalized deductive manner, with definitions and deri-

vations, goes out of its way to declare the possibility of dealing in an acceptably rigorous Cartesian way with matters apparently so little suited for rigorous treatment. Though he did not finish his *Aesthetics*, which would have generalized his study of poetry, the makings of a general theory are present in the *Meditations*. Its basic principle is still the imitation of nature—the principle that is also fundamental to the influential work of the Abbé Charles Batteux, *Les beaux arts réduits à un même principe* (1746), and to the important classification of the fine arts in d’Alembert’s *Discours préliminaire* to the *Encyclopédie* (1751).

The importance of Lessing’s *Laokoon oder über die Grenzen der Malerei und Poesie* (1766) is that, though he did not reject the possibility of a system that will relate all the arts, he attacked superficial and deadening analogies (many of them based on the Horatian formula, *ut pictura poesis*, torn from its context). He looked for the specific individual potentialities and values of painting and poetry in their own distinctive mediums. The medium of an art is, he says, the “signs” (*Zeichen*) it uses for imitation; and painting and poetry, when carefully examined for their capacities to imitate, turn out to be radically different. Consisting of shapes and colors, side by side, painting is best at picturing objects and visible properties, and can only indirectly suggest actions; poetry is just the opposite. When a secondary power of an art is made primary, it cannot do its best work. By the clarity and vigor of his argument and his sharp criticism of prevailing assumptions, Lessing gave a new turn to aesthetics.

THE ENLIGHTENMENT: EMPIRICISM

Contemporaneous with the development of neoclassical critical theory was the divergent line of aesthetic inquiry pursued principally, though not exclusively, by British theorists in the Baconian tradition of empiricism. They were greatly interested in the psychology of art (though they were not merely psychologists), especially the creative process and the effects of art upon the beholder.

THE IMAGINATION. That the imagination (or “fancy”) plays a central, if mysterious, role in artistic creation had long been acknowledged. Its mode of operation—was the secret of inventiveness and originality—was not systematically investigated before the empiricists of the seventeenth century. Among the rationalists, the imagination, considered as an image-registering faculty or as an image-combining faculty, played little or no role in knowledge. (See Descartes’s Rule III of the *Regulae* [“the blundering constructions of imagination”]; *Principles* I, lxxi–lxxiii;

and *Meditation* VI.) But Bacon’s *Advancement of Learning* (1605) placed the imagination as a faculty alongside memory and reason and assigned poetry to it, as history and philosophy (including, of course, both moral and natural philosophy) were assigned to the other faculties.

Thomas Hobbes, in the first chapters of his *Leviathan* (1651), undertook to give the first analysis of imagination, which he defined as “decaying sense” (I, ii), the phantasms, or images, that remain when the physiological motions of sensation cease. But besides this “simple imagination,” which is passive, there is also “compound imagination,” which creates novel images by rearranging old ones. Hobbes stated that the mind’s “trains” of thought are guided by a general principle of association (I, iii), but he did not work it out very fully. Nor did Locke develop this idea very far in the famous chapter “Of the Association of Ideas” (II, xxxiii) that he added to the fourth edition (1700) of his *Essay concerning Human Understanding* (1690). The tendency of ideas that have accompanied each other to stick together and pull each other into the mind was noted by Locke as a pathological feature of the understanding: It explains various sorts of error and the difficulty of eradicating them (cf. *Conduct of the Understanding*, §41). The work of fancy is best seen, according to Locke, in the tendency of poetic language to become figurative. As long as we are interested in pleasure, we cannot be troubled by such ornaments of style; but metaphors and similes are “perfect cheats” when we are interested in truth (III, x, 34; cf. *Conduct of Understanding*, §§32–42). Locke here reflects a widespread distrust of imagination in the later seventeenth century. It is shown in a famous passage from Sprat’s *History of the Royal Society* (1702), in which Sprat describes the “close, naked, natural way of speaking,” in clearly defined words, required for scientific discourse, and contrasts it with the “specious tropes and figures” of poetry.

The theory of the association of ideas was developed into a systematic psychology by Hume, in his *Treatise of Human Nature* (1739–1740), and Hartley, in his *Observations on Man* (1749). In Hume, the tendency of ideas to consort with one another because of similarity, propinquity, or causal connection became a powerful principle for explaining many mental operations; and Hartley carried the method further. Despite attacks upon it, associationism played a crucial role in several eighteenth-century attempts to explain the pleasures of art.

THE PROBLEM OF TASTE. The investigation of the psychological effects of art and of the aesthetic experience

(in modern terms) developed along two distinct, but occasionally intersecting, paths: (1) the search for an adequate analysis and explanation of certain basic aesthetic qualities (the beautiful, the sublime) or (2) an inquiry into the nature and justification of critical judgment, the problem of “taste.” Without trying to keep these completely separate, let us first consider those philosophers in the early part of the eighteenth century in whose thinking the second problem was uppermost.

One phase of aesthetic thinking was launched by the very influential writings of the third earl of Shaftesbury (see especially his *Moralists*, 1709, III; *Inquiry concerning Virtue or Merit*, 1699, I; and *Characteristics*, 1711). Shaftesbury’s philosophy was basically Neoplatonic, but to emphasize the immediacy of our impression of beauty, and also to underline his view that the harmony perceived as beauty is also perceived as virtue, Shaftesbury gave the name “moral sense” to that “inward eye” that grasps harmony in both its aesthetic and ethical forms. The concept of a special faculty of aesthetic apprehension was one form of the theory of taste. Shaftesbury’s other contributions to the development of aesthetics are his description of disinterestedness as a characteristic of the aesthetic attitude (*Moralists* III) and his appreciation (along with his contemporaries John Dennis and Thomas Burnet) of wild, fearful, and irregular forms of nature—a taste that helped bring into prominence, in the eighteenth century, the concept of the sublime as an aesthetic quality distinct from beauty.

Joseph Addison’s *Spectator* papers on aesthetic enjoyment (1712, Nos. 409, 411–421) conceived taste as simply the capacity to discern those three qualities that give rise to “the pleasures of the imagination,” greatness (that is, sublimity), uncommonness (novelty), and beauty. Addison made some attempt to explain why it is that the perception of these qualities is attended by so much pleasure of so special a sort, but he did not go far; his service (earning the appreciation he received from succeeding thinkers) was the lively and provocative way in which he raised many of the basic questions.

The first real treatise on aesthetics in the modern world was Francis Hutcheson’s *Inquiry concerning Beauty, Order, Harmony, and Design*, the first part of *An Inquiry into the Original of our Ideas of Beauty and Virtue* (1725). From Shaftesbury, Hutcheson took the idea of an inner sense; the “sense of beauty” is the power to frame the idea of beauty when confronted with those qualities of objects suited to raise it. The sense of beauty does not depend on judgment or reflection; it does not respond to intellectual or utilitarian features of the world, nor does it depend on

association of ideas. His analysis showed that we sense beauty in an object when it presents “a compound ratio of uniformity and variety” (2d ed., p. 17), so that beauty varies with either of these, if the other is held constant. A basis is thus laid for a nonrelativistic standard of judgment, and variations in actual preference are explained away as due to different expectations with which the beautiful object, in art or nature, is approached.

The question of a standard of taste was the chief concern of David Hume’s thinking on aesthetic matters. In his *Treatise* (II, i, 8), he suggested that “beauty is such an order and construction of parts, as either by the *primary constitution* of our nature, by *custom*, or by *caprice*, is fitted to give a pleasure and satisfaction to the soul,” thus allowing, like Hutcheson, who influenced him considerably, an immediate delight in beauty, but allowing also for a transfer of this delight by association. For example, the appearance (not necessarily the actuality) of convenience or utility explains why many objects are esteemed beautiful (III, iii, 1). Some types of beauty, then, are simply seen or missed; judgments of them cannot be corrected. But in other cases, especially in art, argument and reflection can correct judgment (see *Enquiry concerning the Principles of Morals*, 1751, Sec. 1). This problem is discussed most carefully in the essay “Of the Standard of Taste” (in *Four Dissertations*, 1757). Hume argued that it is natural to seek for a standard of taste, by which aesthetic preferences can be called correct or incorrect, especially as there are clear cases of error (“Bunyan is a better writer than Addison”). The rules, or criteria, of judgment are to be established by inductive inquiry into those features of works of art that enable them to please most highly a qualified perceiver, that is, one who is experienced, calm, unprejudiced. But there will always be areas within which preference is due to temperament, age, culture, and similar factors unchangeable by argument; there is no objective standard by which such differences can be rationally resolved.

THE AESTHETIC QUALITIES. The search for necessary and sufficient conditions of beauty and other aesthetic qualities (the concept of the “picturesque” was added late in the century) was continued enthusiastically in the latter half of the eighteenth century. In this debate, an important part was played by Edmund Burke’s youthful work, *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757). Its argument develops on two levels, phenomenological and physiological. The first task is to explain by what qualities objects excite in us the feelings of beauty (“love” without desire) and sublimity (“astonishment” without actual danger). The

feeling of the sublime, to begin with, involves a degree of horror—controlled horror—the mind being held and filled by what it contemplates (II, 1). Thus, any object that can excite the ideas of pain and danger, or is associated with such objects, or has qualities that can operate in a similar way, can be sublime (I, 7).

Burke then goes on to argue that obscurity, power, privation and emptiness, vastness approaching infinity, etc. contribute to sublimity (II, 3–8). Beauty is analogously treated: The paradigm emotion is response to female beauty, minus lust; and objects that are small, smooth, gently varying, delicate, etc. can give the feeling of beauty (III, 1–16). The same scene can be both beautiful and sublime, but because of the opposition in several of their conditions it cannot be very intensely either if it is both.

Burke then moves to his second level of explanation (IV, 1, 5). He asks what enables the perceptual qualities to evoke the feelings of beauty and sublimity, and he answers that they do so by producing physiological effects like those of actual love and terror. “Beauty acts by relaxing the solids of the whole system” (IV, 19)—this is one of Burke’s celebrated hypotheses, a pioneering attempt at physiological aesthetics.

In this very fertile period of aesthetic investigation, many other writers, of various degrees of sophistication, contributed to the theory of beauty and sublimity and to the foundations of taste. Among the most important works, still worth reading for some of their suggestions, are Alexander Gerard’s *Essay on Taste* (written by 1756, published 1759; see also his *Essay on Genius*, 1774), which made much use of association in explaining our pleasure in beauty, novelty, sublimity, imitation, harmony, ridicule, and virtue; Henry Home’s (Lord Kames) *Elements of Criticism* (1762); Hugh Blair’s *Lectures on Rhetoric and Belles Lettres* (given from 1759 on, published 1783); Thomas Reid’s essay on Taste in his *Essays on the Intellectual Powers of Man* (1785). On the Continent, the question whether there is a special aesthetic sense was discussed, along with many other problems, by Jean-Pierre de Crousaz, *Traité du beau* (1714), and the Abbé Dubos, *Réflexions critiques sur la poésie et sur la peinture* (1719). Noteworthy also are Voltaire’s *Temple du goût* (1733), Yves-Marie André’s *Essai sur le beau* (1741), and especially the article on beauty that Diderot wrote for the *Encyclopédie* (1751), in which the experience of beauty is analyzed as the perception of “relationships” (*rappports*).

In general, the later development of empiricist aesthetics involved increasingly ambitious attempts to explain aesthetic phenomena by means of association; a

further broadening of the acknowledged aesthetic qualities, away from a limited concept of beauty; further reflection on the nature of “genius,” the capacity to “snatch a grace beyond the reach of art”; and a growing conviction that critical principles have to be justified, if they can be justified at all, in terms of empirical knowledge of the characteristic effects of art. The achievements and the high level of discussion reached by the empiricist movement can be seen very well in a later treatise by Archibald Alison, his *Essays on the Nature and Principles of Taste* (1790; rev. ed., which became highly influential, 1811). Alison abandoned the hope for simple formulas of beauty and resolved the pleasure of taste into the enjoyment of following a train of imaginations, in which some of the ideas produce emotions and in which the entire train is connected by a dominant emotion. No special sense is required; the principles of association explain everything. And the arguments by which Alison supported his main theses, the careful inductions at all points, are models of one kind of aesthetics. For example, he showed, by experimental comparisons, that particular qualities of objects, or of Hogarth’s “line of beauty” (II, iv, 1, Part II), do not produce aesthetic pleasure unless they become “expressive,” or take on the character of signs, by being able to initiate a train of associations; and it is the same, he said, with colors: “Purple, for instance, has acquired a character of Dignity, from its accidental connection with the Dress of Kings” (II, iii, 1).

GERMAN IDEALISM

By assigning to the problems of aesthetic judgment the major part of his third *Critique* (*The Critique of Judgment*, 1790), Kant became the first modern philosopher to make his aesthetic theory an integral part of a philosophical system. For in this volume he aimed to link the worlds of nature and freedom, which the first two *Critiques* had distinguished and separated.

KANT’S ANALYSIS OF JUDGMENTS OF TASTE. Kant recast the problems of eighteenth-century aesthetic thought, with which he was thoroughly familiar, in the characteristic form of the critical philosophy: How are judgments of the beautiful and the sublime possible? That is, in view of their evident subjectivity, how is their implicit claim to general validity to be vindicated? That such judgments claim general validity and yet are also subjective is argued by Kant, in careful detail, in the “Analytic of the Beautiful” and the “Analytic of the Sublime.”

Judgments of beauty (also called “judgments of taste”) are analyzed in terms of the four “moments” of the

table of categories: relation, quantity, quality, and modality. First, the judgment of taste does not (like ordinary judgments) subsume a representation under a concept, but states a relation between the representation and a special disinterested satisfaction, that is, a satisfaction independent of desire and interest (§5). Second, the judgment of taste, though singular in logical form (“This rose is beautiful”), lays title to universal acceptance, unlike a report of mere sensuous pleasure, which imposes no obligation to agree. Yet, paradoxically, it does not claim to be supportable by reasons, for no arguments can constrain anyone to agree with a judgment of taste (§9; cf. §33). Third, aesthetic satisfaction is evoked by an object that is purposive in its form, though in fact it has no purpose or function: because of a certain wholeness, it looks as though it were somehow made to be understood (§10; cf. §65 and Introduction): it has “purposiveness without purpose” (*Zweckmäßigkeit ohne Zweck*). Fourth, the beautiful is claimed by the judgment of taste to have a necessary reference to aesthetic satisfaction (§18): not that when we find ourselves moved in this way by an object we can guarantee that all others will be similarly moved, but that they *ought* to take the same satisfaction we do in it.

THE PROBLEM OF VALIDATION. It is the above four aspects of the judgment of beauty that give rise to the philosophical problem of validation, which Kant formulates as he had the parallel problems in the earlier *Critiques*: How can their claim to necessity (and subjective universality) be legitimized? This can only be done, he argues, if it can be shown that the conditions presupposed in such a judgment are not confined to the individual who makes it, but may reasonably be ascribed to all rational beings. A minor clue is offered by the disinterestedness of aesthetic satisfaction; for if our satisfaction is in no way dependent on individual interests, it takes on a kind of intersubjectivity (§6). But the validation of the synthetic a priori judgment of taste requires something more searching, namely, a transcendental deduction.

The gist of this argument is as follows: Empirical knowledge is possible because the faculty of judgment can bring together general concepts and particular sense-intuitions prepared for it in the imagination. These cases of *determinate* judgment presuppose, however, a general harmony between the imagination, in its freedom as synthesizer of representations, and the understanding, in its a priori lawfulness. The formal purposiveness of an object as experienced can induce what Kant calls “a free play of the imagination,” an intense disinterested pleasure

that depends not on any particular knowledge but just on consciousness of the harmony of the two cognitive powers, imagination and understanding (§9). This is the pleasure we affirm in the judgment of taste. Since the general possibility of sharing knowledge with each other, which may be taken for granted, presupposes that in each of us there *is* a cooperation of imagination and understanding, it follows that every rational being has the *capacity* to feel, under appropriate perceptual conditions, this harmony of the cognitive powers. Therefore a true judgment of taste can legitimately claim to be true for all (§9; cf. §§35–39).

Kant’s system requires that there be a dialectic of taste with an antinomy to be dissolved on the principles of critical philosophy. This is a paradox about the role of concepts in the judgment of taste: If the judgment involves concepts, it must be rationally disputable, and provable by reasons (which it is not); if it does not involve concepts, it cannot even be the subject of disagreement (which it is). The solution is that no determinate concept is involved in such judgments, but only the indeterminate concept of the supersensible, or thing-in-itself that underlies the object as well as the judging subject (§§56–57).

KANT ON THE SUBLIME. Kant’s analysis of the sublime proceeds on quite different grounds. Essentially, he explains this species of satisfaction as a feeling of the grandeur of reason itself and of humankind’s moral destiny, which arises in two ways: (1) When we are confronted in nature with the extremely vast (the mathematical sublime), our imagination falters in the task of comprehending it and we become aware of the supremacy of reason, whose ideas reach toward infinite totality. (2) When we are confronted with the overwhelmingly powerful (the dynamical sublime), the weakness of our empirical selves makes us aware (again by contrast) of our worth as moral beings (see the “Analytic of the Sublime”). In this analysis, and again in his final remarks on beauty in nature, Kant goes some way toward re-establishing on one level a connection between realms whose autonomy he has fought for on a different level. As he had done earlier with the a priori concepts of the understanding and the sphere of morality, he has here tried to show that the aesthetic stands on its own feet, independent of desire and interest, of knowledge or morality. Yet because the experience of beauty depends upon seeing natural objects as though they were somehow the artifacts of a cosmic reason bent on being intelligible to us, and because the experience of the sublime makes use of natural formlessness and fearfulness to cel-

eborate reason itself, these aesthetic values in the last analysis serve a moral purpose and a moral need, exalting and ennobling the human spirit.

SCHILLER. Kant's aesthetic theories were first made use of by the dramatic poet Friedrich Schiller, who found in them the key to a number of profound problems about culture and freedom that he had been meditating. In several essays and poems, and principally in the remarkable *Briefe über die ästhetische Erziehung des Menschen* ("Letters on the Aesthetic Education of Man," 1793–1795), he developed a neo-Kantian view of art and beauty as the medium through which humanity (and the human individual) advances from a sensuous to a rational, and therefore fully human, stage of existence. Schiller distinguishes (Letters 12–13) two basic drives in man, the sensuous impulse (*Stofftrieb*) and the formal impulse (*Formtrieb*), and argues that they are synthesized and lifted to a higher plane in what he calls the play impulse (*Spieltrieb*), which responds to the living shape (*Lebensform*) or beauty of the world (Letter 15). Play, in his sense, is a more concrete version of Kant's harmony of imagination and understanding; it involves that special combination of freedom and necessity that comes in voluntary submission to rules for the sake of the game. By appealing to the play impulse, and freeing man's higher self from dominance by his sensuous nature, art renders man human and gives him a social character (Letters 26–27); it is therefore the necessary condition of any social order that is based not upon totalitarian compulsion but upon rational freedom.

SHELLING. Friedrich Wilhelm von Schelling was the first philosopher to claim to have discovered an "absolute standpoint" from which the dualisms and dichotomies of Kant's epistemology could be overcome, or overridden; and he was the first since Plotinus to make art and beauty the capstone of a system. In his *System of Transcendental Idealism* (1800), he attempted a reconciliation of all oppositions between the self and nature through the idea of art. In the artistic intuition, he says, the self is both conscious and unconscious at once; there is both deliberation, *Kunst*, and inspiration, *Poesie*. This harmony of freedom and necessity crystallizes and makes manifest the underlying harmony that exists between the self and nature. There is at work an unseen creative drive that is, on the unconsciousness level, the same as conscious artistic activity. In Schelling's lectures on the *Philosophy of Art* (given 1802–1803, but not published until 1859), transcendental idealism becomes "absolute idealism" and art becomes the medium through which the infinite "ideas," which are the expressions of the various "potencies"

involved in the ultimate absolute self-identity, become embodied in finite form, and therefore the medium through which the absolute is most fully revealed. This same general position underlies the famous work *Über das Verhältniss der bildenden Künste zu der Natur* (*On the Relation Between the Plastic Arts and Nature*, 1807).

HEGEL. The most fully articulated idealistic system of aesthetics was that of George Friedrich Wilhelm Hegel, in his lectures between 1820 and 1829, the notes for which were published (1835) as his *Philosophy of Fine Art*. In art, he says, the "idea" (the notion at its highest stage of dialectical development) becomes embodied in sensuous form. This is beauty. Man thereby renders explicit to himself what he is and can be (see *Philosophy of Fine Art*, Osmaston translation, I, 41). When the sensuous is spiritualized in art (I, 53), there is both a cognitive revelation of truth, and also a reinvigoration of the beholder. Natural beauty is capable of embodying the idea to some degree, but in human art the highest embodiment takes place (see I, 39, 10–11, 208–214).

Hegel also worked out, in great detail, a theory of the dialectical development of art in the history of human culture, from Oriental "symbolic" art, in which the idea is overwhelmed by the medium; through its antithesis, classical art, in which the idea and the medium are in perfect equilibrium; to the synthesis, romantic art, in which the idea dominates the medium and spiritualization is complete (see Vols. III, IV). These categories were to prove very influential in nineteenth-century German aesthetic thought, in which the Hegelian tradition was dominant, despite attacks by the "formalists" (such as J. F. Herbart), who rejected the analysis of beauty in terms of ideas as an overintellectualization of the aesthetic and a slighting of the formal conditions of beauty.

ROMANTICISM

Without attempting to trace its roots and early stages, we may say that the romantic revolution in feeling and taste was fully under way in Schelling's philosophy of nature and in the new forms of literary creation explored by the German and English poets from about 1890 to 1910. From the start, these developments were accompanied by reflection on the nature of the arts themselves, and they led in time to fundamental changes in prevailing views about the arts.

EMOTIONAL EXPRESSION. The romantics generally conceived of art as essentially the expression of the artist's personal emotions. This view is central to such basic doc-

uments as Wordsworth's 1800 Preface to *Lyrical Ballads*, Shelley's *Defense of Poetry* (written 1819) Mill's "What is Poetry?" (1833), and the writings of the German and French romantics. The poet himself, his personality as seen through the "window" of the poem (Carlyle's term in "The Hero as Poet," 1841), becomes the center of interest, and sincerity (in Wordsworth, Carlyle, Arnold) becomes one of the leading criteria of criticism.

IMAGINATION. A new version of the cognitive view of art becomes dominant in the concept of the imagination as a faculty of immediate insight into truth, distinct from, and perhaps superior to, reason and understanding—the artist's special gift. The imagination is both creator and revealer of nature and what lies behind it—a romanticized version of Kant's transcendental idealism, ascribing the form of experience to the shaping power of the mind, and of Fichte's Ego "positing" the non-Ego. A. W. Schlegel, Blake, Shelley, Hazlitt, Baudelaire, and many others spoke of the imagination in these terms. Coleridge, with his famous distinction between imagination and fancy, provided one of the fullest formulations: The fancy is a "mode of memory," operating associatively to recombine the elementary data of sense; the imagination is the "coadunating faculty" that dissolves and transforms the data and creates novelty and emergent quality. The distinction (based on Schelling) between the "primary" and "secondary" imagination is between the unconscious creativity involved both in natural processes and in all perception and the conscious and deliberate expression of this in the artist's creating (see Chs. 13 and 14 of Coleridge's *Biographia Literaria*, 1817). Through most of Coleridge's work there runs his unfinished task of supplying a new theory of mind and of artistic creation that would replace the current associationism, which he had at first enthusiastically adopted and then, under the influence of Plotinus and the German idealists, came to reject.

ORGANISM. Another important, and related, aspect of Coleridge's critical theory was his distinction (derived essentially from A. W. Schlegel's *Vienna Lectures on Dramatic Art*, 1809–1811) between mechanical and organic form and his conception of a work of art as an organic whole, bound together by deeper and more subtle unity than that explicated in the neoclassic rules and having a vitality that grows from within (see his Shakespearean criticism for examples). The concept of nature as organic, and of art as growing out of nature like a living being, had already been developed by Johann Gottfried Herder (see, for example, his *Vom Erkennen und Empfinden der Menschlichen Seele*, 1778), and by Goethe, in some of his

essays (e.g., "Vom Deutscher Baukunst," 1772; "Über Wahrheit und Wahrscheinlichkeit der Kunstwerke," 1797).

SYMBOLISM. The idea of the work of art as being, in some sense (in some one of many possible senses), a symbol, a sensuous embodiment of a spiritual meaning, though old in essence, as we have seen, came into a new prominence in the romantic period. Goethe distinguished allegory, a mechanical combination of universal and particular, and symbol, as a concrete unity (see "Über die Gegenstände der bildenden Kunst," 1797); and Friedrich and August Wilhelm Schlegel followed with a new interest in myth and metaphor in poetry. The English Romantic poets (notably Wordsworth) evolved a new lyric poetry in which the visible landscape took on the attributes of human experience. And in France, later in the century, the symbolist movement, launched by Jean Moréas in 1885, and the practice of such poets as Baudelaire, Rimbaud, and Mallarmé emphasized concrete symbolic objects as the heart of poetry.

SCHOPENHAUER. Though first written in the climate of post-Kantian idealism, and, in that context, largely ignored, Arthur Schopenhauer's *Die Welt als Wille und Vorstellung* ("World as Will and Idea," 1819; 2d ed. enlarged, 1844) came into its deserved fame in the second half of the century. Its romantic pessimism and intuitionism and, more particularly, the central position it assigned to the arts (especially music) made it one of the most important aesthetic documents of the century. Schopenhauer's solution of the basic Kantian dualism was to interpret the thing in itself, or noumenal world, as the "Will to Live" and the phenomenal world as the objectification, or expression, of that primal will. The objects of the phenomenal world fall into a hierarchy of types, or grades, that embody, according to Schopenhauer, certain universals or Platonic ideas, and it is these ideas that are presented to us for contemplation by works of art. Since the idea is timeless, the contemplation of it (as, for example, some general character of human nature in a poem or painting) frees us from subjection to the "principle of sufficient reason," which dominates our ordinary practical and cognitive consciousness, and hence from the constant pressure of the will. In this "pure will-less state," we lose individuality and pain.

Schopenhauer has much to say about the various arts and the forms of ideas suited to them; the uniqueness of music in this scheme is that it embodies not ideas but the will itself in its striving and urging and enables us to contemplate its awfulness directly, without involvement.

Schopenhauer's theory of music was one of his most important contributions to aesthetic theory and influenced not only those theorists, such as Richard Wagner (see his essay on Beethoven, 1870), who emphasized the representative character of music, but also those critical of this view, such as Eduard Hanslick in *Vom Musikalisch-Schönen* ("The Beautiful in Music," 1854).

NIETZSCHE. Friedrich Nietzsche repudiated romantic art as escapist, but his own aesthetic views, briefly sketched in the notes published posthumously as *The Will to Power* (1901), are best understood in relation to those of Schopenhauer. Nietzsche's early work, *The Birth of Tragedy from the Spirit of Music* (1872), presented a theory of tragedy as arising from the conjunction of two fundamental impulses, which Nietzsche called the Dionysian and Apollonian spirits: the one a joyful acceptance of experience, the other a need for order and proportion. In Nietzsche's later thinking about art, it is the former that becomes dominant; he insists, for example, as opposed to Schopenhauer, that tragedy exists not to inculcate resignation and a Buddhist negation of life, by showing the inevitability of suffering, but to affirm life in all its pain, to express the artist's overabundance of will to power. Art, he says, is a "tonic," a great "yea-sayer" to life.

THE ARTIST AND SOCIETY

Political, economic, and social changes in the nineteenth century, in the wake of the French Revolution and the rise of modern industry, raised in a new form the Platonic problem of the artists' relation to their society, their possibly conflicting obligations to their craft and to their fellow human beings. In the nineteenth century, an important part of aesthetic thinking was concerned with this problem.

ART FOR ART'S SAKE. One solution to the problem was to think of the artist as a person with a calling of his own, whose whole, or at least primary, obligation is to perfect his work, especially its formal beauty, whatever society may expect. Perhaps the artist, because of his superiority, or higher sensitivity, or the demands of his art, must be alienated from society, and, though perhaps doomed to be destroyed by it, can carry his curse as a pride. This notion stems from the German romantics, from Wilhelm Wacken-Roder, Johann Ludwig Tieck, and others. From 1820–1830 it became the doctrine of "art for art's sake," the center of continuing controversy in France and, later, in England. In its extreme forms, as reflected, for example, in Oscar Wilde (*Intentions*, 1891) and J. A. M. Whistler ("Ten O'Clock" lecture, 1885), it was sometimes

a claim that art is more important than anything else and sometimes a flaunting of the artist's freedom from responsibility. More thoughtfully and fundamentally, as in Théophile Gautier (Preface to *Mademoiselle de Maupin*, 1835) and throughout Flaubert's correspondence with Louise Colet and others, *l'art pour l'art* was a declaration of artistic independence and a kind of professional code of dedication. In that respect, it owed much to the work of Kant in carving out an autonomous domain for art.

REALISM. The theory of realism (or, in Zola's sense, naturalism) arose as a broadened conviction of the cognitive duty of literature, a desire to give it an empirical, and even experimental status (in Zola's essay on "The Experimental Novel," 1880), as exhibitor of human nature and social conditions. In Flaubert and Zola, realism called for the cool, analytical eye of the novelist, treating virtue and vice, in Hippolyte Taine's words, as "products like vitriol and sugar"; see the Introduction to his *History of English Literature* (1863), in which Taine set forth his program for explaining art deterministically in terms of race, context, and epoch (*race, milieu, moment*). Among the Russian literary theorists, Vissarion G. Belinsky, Nikolai G. Chernyshevski ("The Aesthetic Relation of Art to Reality," 1855), and Dmitri I. Pisarev ("The Destruction of Aesthetics," 1865), all art was given a similar treatment—as a reproduction of factual reality (sometimes an aid in explaining it, which may have value as a substitute, like a photograph, says Chernyshevski) or as the bearer of social ideas (Pisarev).

SOCIAL RESPONSIBILITY. The theory that art is primarily a social force and that the artist has a social responsibility was first fully worked out by the French socialist sociologists. Claude Saint-Simon (*Du système industriel*, 1821), Auguste Comte (*Discours sur l'ensemble du positivisme*, 1848, Ch. 5), Charles Fourier (*Cités ouvrières*, 1849), and Pierre Joseph Proudhon (*Du principe de l'art et de sa destination sociale*, 1865) attacked the idea that art can be an end in itself and projected visions of future social orders free of violence and exploitation, in which beauty and use would be fruitfully combined and for which art will help prepare. In England, John Ruskin and William Morris were the great critics of Victorian society from an aesthetic point of view. They pointed to the degradation of the worker into a machine, unfree to express himself, the loss of good taste, the destruction of natural beauty, and the trivialization of art. Ruskin's essay on "The Nature of Gothic" (*Stones of Venice*, 1851) and many other lectures (for example those in *The Two Paths*,

1859; *Lectures on Art*, 1870) insisted on the social conditions and effects of art. Morris, in his lectures and pamphlets (see, for example, “Art under Plutocracy,” 1883; “The Aims of Art,” 1887; “Art and Socialism,” 1884), argued that radical changes were needed in the social and economic order to make art what it should be: “... the expression of man’s happiness in his labor ... made by the people, and for the people, as a happiness to the maker and the user” (“The Art of the People,” 1879).

The functionalist tendencies of Ruskin and Morris also turned up, even earlier, in the United States, in the trenchant views of Horatio Greenough (“American Architecture,” 1843) and in some essays of Ralph Waldo Emerson (“Thoughts on Art,” 1841; “Beauty,” *Conduct of Life*, 1860; “Art,” *Essays, First Series*, 1841).

TOLSTOY. It was, however, Leo Tolstoy who drove the social view of art to its farthest point in the nineteenth century and issued the most fundamental challenge to art’s right to exist. In *What Is Art?* (first uncensored edition, 1898, in English), he asked whether all the social costs of art could be rationally justified. If, as he argued, art is essentially a form of communication—the transmission of emotion—then certain consequences can be deduced. Unless the emotion is one that can actually be shared by men in general—is simple and human—there is either bad art or pseudo art: this criterion rules out most of the supposedly great works of music and literature, including Tolstoy’s own major novels. A work must be judged, in the end, by the highest religious criteria of the age; and in Tolstoy’s age that meant, he said, its contribution to the sense of human brotherhood. Great art is that which transmits either simple feelings, drawing men together, or the feeling of brotherhood itself (*Uncle Tom’s Cabin*). In no other way can it claim genuine social value (apart from the adventitious value of jewelry, etc.); and where it falls short of this high task (as it usually does), it can only be a social evil, dividing people into cliques by catering to sensuality, pride, and patriotism.

CONTEMPORARY DEVELOPMENTS

Aesthetics has never been so actively and diversely cultivated as in the twentieth century. Certain major figures and certain lines of work stand out.

METAPHYSICAL THEORIES. Though he later proposed two important changes in his central doctrine of intuition, the early aesthetic theory of Benedetto Croce has remained the most pervasively influential aesthetics of the twentieth century. The fullest exposition was given in

the *Estetica come scienza dell’espressione e linguistica generale* (“Aesthetic as Science of Expression and General Linguistic,” 1902), which is part of his *Filosofia dello spirito*. Aesthetics, in this context, is the “science” of images, or intuitive knowledge, as logic is knowledge of concepts—both being distinguished from “practical knowledge.” At the lower limit of consciousness, says Croce, are raw sense data, or “impressions,” which, when they clarify themselves, are intuitions, are also said to be “expressed.” To express, in this subjective sense, apart from any external physical activity, is to create art. Hence, his celebrated formula, “intuition = expression,” on which many principles of his aesthetics are based. For example, he argued that in artistic failure, or “unsuccessful expression,” the trouble is not that a fully formed intuition has not been fully expressed but that an impression has not been fully intuited. R. G. Collingwood, in his *Principles of Art* (1938), has extended and clarified Croce’s basic point of view.

The theory of intuition presented by Henri Bergson is quite different but has also been eagerly accepted by many aestheticians. In his view, it is intuition (or instinct become self-conscious) that enables us to penetrate to the *durée*, or *élan vital*—the ultimate reality which our “spatializing” intellects inevitably distort. The general view is explained in his “Introduction à la métaphysique” (1903) and in *L’évolution créatrice* (1907) and applied with great ingenuity and subtlety to the problem of the comic in *Le rire* (1900).

NATURALISM. Philosophers working within the tradition of American naturalism, or contextualism, have emphasized the continuity of the aesthetic with the rest of life and culture. George Santayana, for example, in his *Reason in Art* (1903; Vol. IV of *The Life of Reason*), argues against a sharp separation of “fine” from “useful” arts and gives a strong justification of fine art as both a model and an essential constituent of the life of reason. His earlier book, *The Sense of Beauty* (1896), was an essay in introspective psychology that did much to restimulate an empirical approach to art through its famous doctrine that beauty is “objectified pleasure.”

The fullest and most vigorous expression of naturalistic aesthetics is *Art as Experience* (1934), by John Dewey. In *Experience and Nature* (1925), Dewey had already begun to reflect upon the “consummatory” aspect of experience (as well as the instrumental aspects, which had previously occupied most of his attention) and had treated art as the “culmination of nature,” to which scientific discovery is a handmaiden (see Ch. 9). *Art as Experi-*

ence, a book that has had incalculable influence on contemporary aesthetic thinking, develops this basic point of view. When experience rounds itself off into more or less complete and coherent strands of doing and undergoing, we have, he says, “an experience”; and such an experience is aesthetic to the degree in which attention is fixed on pervasive quality. Art is expression, in the sense that in expressive objects there is a “fusion” of “meaning” in the present quality; ends and means, separated for practical purposes, are reunited, to produce not only experience enjoyable in itself but, at its best, a celebration and commemoration of qualities ideal to the culture or society in which the art plays its part.

A number of other writers have worked with valuable results along similar lines, for example, D. W. Prall, *Aesthetic Judgment* (1929) and *Aesthetic Analysis* (1936); C. I. Lewis, *An Analysis of Knowledge and Valuation* (1946, Chs. 14, 15); and Stephen C. Pepper, *Aesthetic Quality* (1937), *The Basis of Criticism in the Arts* (1945), *The Work of Art* (1955).

SEMIOTIC APPROACHES. Since semiotics in a broad sense has undoubtedly been one of the central preoccupations of contemporary philosophy, as well as many other fields of thought, it is to be expected that philosophers working along this line would consider applying their results to the problems of aesthetics. The pioneering work of C. K. Ogden and I. A. Richards, *The Meaning of Meaning* (1923), stressed the authors’ distinction between the “referential” and the “emotive” function of language. And they suggested two aesthetic implications that were widely followed: first, that the long-sought distinction between poetic and scientific discourse was to be found here, poetry being considered essentially emotive language; second, that judgments of beauty and other judgments of aesthetic value could be construed as purely emotive. This work, and later books of Richards, have been joined by a number of aesthetic studies in the general theory of (artistic) interpretation, for example, John Hospers, *Meaning and Truth in the Arts* (1946); Charles L. Stevenson, “Interpretation and Evaluation in Aesthetics” (1950); Morris Weitz, *Philosophy of the Arts* (1950); and Isabel C. Hungerland, *Poetic Discourse* (1958).

Meanwhile, anthropological interest in classical and primitive mythology, which became scientific in the nineteenth century, led to another semiotical way of looking at art, particularly literature. Under the influence of Sir James G. Frazer’s *The Golden Bough* (1890–1915), a group of British classical scholars developed new theories about the relations between Greek tragedy, Greek mythology,

and religious rite. Jane Ellen Harrison’s *Themis: A Study of the Social Origins of Greek Religion* (1912) argued that Greek myth and drama grew out of ritual. This field of inquiry was further opened up, or out, by C. G. Jung, in his paper “On the Relation of Analytical Psychology to Poetic Art” (1922; see *Contributions to Analytical Psychology*, 1928) and in other works. Jung suggested that the basic symbolic elements of all literature are “primordial images” or “archetypes” that emerge from the “collective unconscious” of man. In recent years the search for “archetypal patterns” in all literature, to help explain its power, has been carried on by many critics and has become an accepted part of literary criticism.

The most ambitious attempt to bring together these and other lines of inquiry to make a general theory of human culture (“philosophical anthropology”) is that of Ernst Cassirer. In his *Philosophie der Symbolischen Formen* (3 vols., 1923, 1925, 1929), the central doctrines of which are also explained in *Sprache und Mythos* (1925) and in *An Essay on Man* (1944), he put forward a neo-Kantian theory of the great “symbolic forms” of culture—language, myth, art, religion, and science. In this view, man’s world is determined, in fundamental ways, by the very symbolic forms in which he represents it to himself; so, for example, the primitive world of myth is necessarily different from that of science or art. Cassirer’s philosophy exerted a strong influence upon two American philosophers especially: Wilbur Marshall Urban (*Language and Reality*, 1939) argued that “aesthetic symbols” are “insight symbols” of a specially revelatory sort; and Susanne K. Langer has developed in detail a theory of art as a “presentational symbol,” or “semblance.” In *Philosophy in a New Key* (1942), she argued that music is not self-expression or evocation but symbolizes the morphology of human sentience and hence articulates the emotional life of man. In *Feeling and Form* (1953) and in various essays (*Problems of Art*, 1957), she applied the theory to various basic arts.

Charles W. Morris presented a closely parallel view in 1939, in two articles that (like Mrs. Langer’s books) have been much discussed: “Esthetics and the Theory of Signs” (*Journal of Unified Science [Erkenntnis]*, VIII, 1939–1940) and “Science, Art and Technology” (*Kenyon Review*, I, 1939; see also *Signs, Language and Behavior*, 1946). Taking a term from Charles Peirce, he treats works of art as “iconic signs” (i.e., signs that signify a property in virtue of exhibiting it) of “value properties” (e.g., regional properties like the menacing, the sublime, the gay).

MARXISM–LENINISM. The philosophy of dialectical materialism formulated by Karl Marx and Friedrich Engels contained, at the start, only the basic principle of an aesthetics, whose implications have been drawn out and developed by Marxist theoreticians over more than half a century. This principle is that art, like all higher activities, belongs to the cultural “superstructure” and is determined by sociohistorical conditions, especially economic conditions. From this it is argued that a connection can always be traced—and must be traced, for full understanding—between a work of art and its sociohistorical matrix. In some sense, art is a “reflection of social reality,” but the exact nature and limits of this sense has remained one of the fundamental and persistent problems of Marxist aesthetics. Marx himself, in his *Contribution to the Critique of Political Economy* (1859), pointed out that there is no simple one-to-one correspondence between the character of a society and its art.

In the period before the October Revolution of 1917, Georgi V. Plekhanov (*Art and Social Life*, 1912) developed dialectical materialist aesthetics through attacks on the doctrine of art for art and the separation of artist from society, either in theory or in practice. After the Revolution, there ensued a period of vigorous and free debate in Russia among various groups of Marxists and others (e.g., the formalists, see below). It was questioned whether art can be understood entirely in sociohistorical terms or has its own “peculiar laws” (as Trotsky remarked in *Literature and Revolution*, 1924) and whether art is primarily a weapon in the class struggle or a resultant whose reformation awaits the full realization of a socialist society. The debate was closed in Russia by official fiat, when the party established control over the arts at the First All-Union Congress of Soviet Writers (1934). Socialist realism, as a theory of what art ought to be and as a guide to practice, was given a stricter definition by Andrei Zhdanov, who along with Gorki became the official theoretician of art. But the central idea had already been stated by Engels (letter to Margaret Harkness, April 1888): the artist is to reveal the moving social forces and portray his characters as expressions of these forces (this is what the Marxist means by a “typical” character), and in so doing he is to forward the revolutionary developments themselves. (See also Ralph Fox, *The Novel and the People*, 1937; Christopher Caudwell, *Illusion and Reality*, 1937, and other works.)

Indications of recent growth in dialectical materialist aesthetics, and of a resumption of the dialogue with other systems, can be seen in the important work of the Hungarian Marxist Georg Lukács (see, for example, *The*

Meaning of Contemporary Realism, translated, 1962, from *Wider den missverstandenen Realismus*, 1958) and in the writings of the Polish Marxist, Stefan Morawski (see “Vicissitudes in the Theory of Socialist Realism,” *Dio- genes*, 1962).

PHENOMENOLOGY AND EXISTENTIALISM. Among many critics and critical theorists, there has been, in the twentieth century, a strong emphasis on the autonomy of the work of art, its objective qualities as an object in itself, independent of both its creator and its perceivers. This attitude was forcefully stated by Eduard Hanslick in *The Beautiful in Music* (1854); it was reflected in the work of Clive Bell (*Art*, 1914) and Roger Fry (*Vision and Design*, 1920); and it appeared especially in two literary movements. The first, Russian “formalism” (also present in Poland and Czechoslovakia), flourished from 1915 until suppressed about 1930. Its leaders were Roman Jakobson, Victor Shklovsky, Boris Eichenbaum, and Boris Tomashvsky (*Theory of Literature*, 1925). The second, American and British “New Criticism,” was inaugurated by I. A. Richards (*Practical Criticism*, 1929), William Empson (*Seven Types of Ambiguity*, 1930), and others (see René Wellek and Austin Warren, *Theory of Literature*, 1949).

This emphasis on the autonomy of the work of art has been supported by Gestalt psychology, with its emphasis on the phenomenal objectivity of Gestalt qualities, and also phenomenology, the philosophical movement first developed by Edmund Husserl. Two outstanding works in phenomenological aesthetics have appeared. Working on Husserl’s foundations, Roman Ingarden (*Das Literarische Kunstwerk*, 1930) has studied the mode of existence of the literary work as an intentional object and has distinguished four “strata” in literature: sound, meaning, the “world of the work,” and its “schematized aspects,” or implicit perspectives. Mikel Dufrenne (*Phénoménologie de l’expérience esthétique*, 2 vols., 1953), closer to the phenomenology of Maurice Merleau-Ponty and Jean-Paul Sartre, has analyzed the differences between aesthetic objects and other things in the world. He finds that the basic difference lies in the “expressed world” of each aesthetic object, its own personality, which combines the “being in itself” (*en-soi*) of a presentation with the “being for itself” (*pour-soi*) of consciousness and contains measureless depths that speak to the depths of ourselves as persons.

The “existential phenomenism” of Heidegger and Sartre suggests possibilities for an existentialist philosophy of art, in the central concept of “authentic existence,” which art might be said to further. These possibilities

have only begun to be worked out, for example, in Heidegger's paper "Der Ursprung des Kunstwerkes" (in *Holzwege*, 1950) and in a recent book by Arturo B. Fallico, *Art and Existentialism* (1962).

EMPIRICISM. The contemporary empiricist makes a cardinal point of attacking the traditional problems of philosophy by resolving them into two distinct types of questions: questions about matters of fact, to be answered by empirical science (and, in the case of aesthetics, psychology in particular), and questions about concepts and methods, to be answered by philosophical analysis.

Some empiricists emphasize the first type of question and have called for a "scientific aesthetics" to state aesthetic problems in such a way that the results of psychological inquiry can be brought to bear upon them. Max Dessoir, Charles Lalo, Étienne Souriau, and (in America) Thomas Munro have formulated this program (see, especially, Munro's *Scientific Method in Philosophy*, 1928, and later essays). The actual results of work in psychology, over the period since Fechner inaugurated experimental aesthetics (*Vorschule der Ästhetik*, 1876) to replace "aesthetics from above" by an "aesthetics from below," are too varied to summarize easily (see Bibliography). But two lines of inquiry have had an important effect on the way in which twentieth-century philosophers think about art. The first is Gestalt psychology, whose studies of perceptual phenomena and the laws of Gestalt perception have illuminated the nature and value of form in art (see, for example, Kurt Koffka's "Problems in the Psychology of Art," in *Art: A Bryn Mawr Symposium*, 1940; Rudolf Arnheim, *Art and Visual Perception*, 1954; Leonard Meyer, *Emotion and Meaning in Music*, 1956). The second is Freudian psychology, beginning with Freud's interpretation of Hamlet (*Interpretation of Dreams*, 1900) and his studies of Leonardo (1910) and Dostoyevsky (1928), which have illuminated the nature of art creation and appreciation. Description of aesthetic experience, in terms of concepts like "empathy" (Theodor Lipps), "psychical distance" (Edward Bullough), and "synaesthesia" (I. A. Richards), has also been investigated by introspective methods.

Analytical aesthetics, in both its "reconstructionist" and "ordinary language" forms, is more recent. This school considers the task of philosophical aesthetics to consist in the analysis of the language and reasoning of critics (including all talk about art), to clarify language, to resolve puzzles due to misapprehensions about language, and to understand its special functions, methods, and justifications (see M. C. Beardsley, *Aesthetics: Problems in the Philosophy of Criticism*, 1958; Jerome Stolnitz, *Aesthetics*

and Philosophy of Art Criticism, 1960; William Elton, ed., *Aesthetics and Language*, 1954; Joseph Margolis, ed., *Philosophy Looks at the Arts*, 1962).

Beardsley, *Aesthetics from Ancient Greece to the Present* (New York, 1965); Bernard Bosanquet, *A History of Aesthetic* (London, 1892; New York, 1957).

Monroe C. Beardsley (1967)

AESTHETICS, HISTORY OF [ADDENDUM]

TWENTIETH-CENTURY AESTHETICS

Aesthetics continued to be intensively cultivated in all the main schools of twentieth-century philosophy. The following survey emphasizes work that continues to be of interest at the beginning of the twenty-first century. It will focus first on the Anglo-American tradition, including continental work that has fed into it, and then will consider other work in the continental tradition.

ANGLO-AMERICAN AESTHETICS.

Naturalism, organicism, pragmatism. One main line of twentieth-century aesthetics begins with George Santayana's *The Sense of Beauty* of 1896. Santayana's book was a renewal of the empiricism and naturalism of the eighteenth century undertaken in opposition to the incorporation of aesthetics into speculative metaphysics by philosophers such as Schelling, Schopenhauer, and Hegel. Santayana held that beauty is "value positive, intrinsic, and objectified": a pleasurable emotion that is "pure gain" and that we regard as if it were a property of its object even though it depends upon our own response. The idea that beauty is objectified pleasure is found in writers from Hutcheson to Kant, but Santayana departed from the reductionism characteristic of many eighteenth-century authors by refusing to restrict the sources of such pleasure to a single category. He instead showed how such pleasure can arise from the materials of works of art, from their forms, and from their expression, which he defined broadly to include our emotional associations with objects. Santayana also rejected the attempt to justify the human interest in beauty, especially the often costly interest in artistic beauty, by claiming that it contributes to morality; for Santayana, morality is concerned with the removal of the evils of life, and thus exists only to facilitate the wider enjoyment of the positive pleasures of life, epitomized by beauty. In his second main work on aesthetics, *Reason in Art*, the fourth volume of his 1905–1906 *Life of Reason*, Santayana added that by the ability to adopt an aesthetic attitude and thus find beauty almost anywhere in nature, on the one hand, and by the ability to create art, on the other, we can augment our positive pleasure in life. In this work he also emphasized that the various arts have all arisen from the ordinary and natural activities of human beings, thus adding a pragmatist element to his naturalism and preparing the way for the later work of John Dewey.

Santayana's thesis that morality exists to remove the evils that stand in the way of the enjoyment of the positive pleasure of beauty anticipates the famous statement of G. E. Moore's *Principia Ethica* (1903) that "the most valuable things, which we can know or imagine, are ... the pleasures of human intercourse and the enjoyment of beautiful objects" (Moore 1903, p.237), which would become the creed of the Bloomsbury group of artists and intellectuals. Moore treated "aesthetic appreciation" as an "organic whole" consisting of consciousness of both the beautiful qualities of an object and the feeling of its beauty, an idea that is related to Santayana's notion of beauty as objectified pleasure; but Moore also held that

beautiful objects are themselves organic unities, in the sense that the contemplation of the individual parts may have no value, but the contemplation of the whole loses value without the contemplation of those parts. Moore thus adopted a more restrictive analysis of the objects of aesthetic pleasure than had Santayana.

Moore influenced the critic Clive Bell, who in his 1914 book *Art* postulated a special aesthetic emotion in response to “significant form” in works of art. Edward Bullough, a professor of literature who in 1907 gave the first course on aesthetics at Cambridge, has also been considered a follower of Moore, but his theory is different from Bell’s; according to Bullough’s famous 1912 paper “‘Psychical Distance’ as a Factor in Art and an Aesthetic Principle,” distancing oneself from the most obvious emotions that might be aroused by some object, such as the emotion of fear in response to a fog at sea, does not allow one to enjoy some special aesthetic emotion, but rather opens oneself up to a whole range of other feelings and emotions that can be aroused by the very same object, thereby increasing the richness and intensity of one’s emotional experience of life as a whole. Instead of being closely associated with Moore and Bell, Bullough might thus be better placed on a line of thought leading from Santayana to Dewey.

Dewey’s *Art as Experience* (1934) came late in his lengthy career, but remains his most widely read book as well as one of the still most widely read books of twentieth-century aesthetics. He anticipated its central idea of “consummatory experience” in his 1925 *Experience and Nature*. A consummatory experience is a moment felt as one of repose and equilibrium in the constant flow of energy, in stimulus and response, that constitutes human life, and it is paradigmatically produced by the experience of art. As Dewey put it in 1925, “art is the solvent union of the generic, recurrent, ordered, established phase of nature with its phase that is incomplete, going on, and hence still uncertain, contingent, novel, particular” (Dewey 1925, p.301), or as he said in 1934, “Art is the living and concrete proof that man is capable of restoring consciously, and thus on the plane of meaning, the union of sense, need, impulse and action characteristic of the live creature” (Dewey 1934, p. 25).

But in the later work Dewey also argued that art has a special role in the expression of emotion, not merely projecting our emotions onto objects but clarifying them by presenting the contexts in which they arise. Here Dewey’s thought comes into contact with the next stream of aesthetic thought to be considered here, which makes the expression of emotion the core of aesthetic experi-

ence. But Dewey’s pragmatism reveals itself in his insistence that the aesthetic “is the clarified and intensified development of traits that belong to every normally complete experience,” and even more so with his argument that while the term *aesthetic* connotes the “consumer’s rather than the producer’s standpoint” and the term *art* “denotes a process of doing and making,” there is a strong element of each in the other: The audience for art must take an active and imaginative role in appreciating it, while the artist must also adopt the standpoint of his audience to gauge the effect of his work—hence Dewey’s title *Art as Experience*, blurring the line between the production and the reception of art (Dewey 1934, p.47). This is a theme that would also be stressed by the British philosopher R.G. Collingwood a few years later, who though not considered a pragmatist came out of a Hegelian background with affinities to that of Dewey.

Before we turn to the tradition with which Collingwood is associated, we may note that Monroe C. Beardsley, the author of the first part of this article, was himself the most important heir to Dewey’s aesthetics in the period after World War II. Although there are certainly other influences at work, the central claim of Beardsley’s 1958 *Aesthetics* was clearly Deweyan. Beardsley wrote that an experience has a marked “aesthetic character” when it includes “attention firmly fixed on a perceptual or intentional object; a feeling of freedom from concerns about matters outside that object; notable affect that is detached from practical ends; the sense of exercising powers of discovery; and the integration of the self and of its experiences” (Beardsley 1981, p. lxii). The most recent heir to Dewey and Beardsley, Richard Shusterman, has particularly stressed the experience of one’s own body as part of the complete aesthetic experience (*Pragmatist Aesthetics*, 1992).

Expression. A second main line of twentieth-century aesthetics identifies the chief goal of art as the expression of emotion, a feature that was only one facet of Dewey’s notion of aesthetic experience. This theory is often thought of as an alternative to the idea that beauty is the essence of art, but at least in its early stages the successful expression of emotion in art was intended as an explanation of its beauty. This is evident in the 1892 *History of Aesthetic* by Bernard Bosanquet and in the 1902 work by Benedetto Croce, *Estetica come scienze dell’espressione e linguistica generale* (The aesthetic as the science of expression and of the linguistic in general). Bosanquet argued that art operates “through that expansion of self which comes in utterance,” that is, that content acquires beauty by passing through the crucible of an individual sensibil-

ity and style—even though this means that it may take others time to appreciate the beauty of a distinctive style of expression (Bosanquet 1904, p. 453). Croce wrote that the beautiful is “successful expression, or better, ... expression *simpliciter*, since expression, when it is not successful, is not expression (Croce 1992, p. 87). Ten years after Croce, the neo-Kantian Hermann Cohen based an elaborate *Ästhetik des reinen Gefühls* (Aesthetics of pure feeling) on the premise that human feelings have their own distinctive forms, which are most clearly revealed by art.

The fullest development of the expression theory, however, is found in the 1938 *Principles of Art* by the Oxford philosopher (and archaeologist) R. G. Collingwood. Collingwood is often thought of as a follower of Croce, but his theory is more fully developed than Croce’s, and it also overcomes the supposition that successful expression must be perceived as beautiful in some traditional sense. Collingwood begins by distinguishing art from craft, arguing that in the latter there is always a clear distinction between means and end, but that there is never such a distinction in the case of art proper. This leads to two important claims: that art is never intended merely to arouse emotions for the sake of magic or propaganda or to discharge them for the sake of amusement; and that the element of craft that is typically part of art, namely the production of a physical object, is not essential to the true work of art at all, which thus appears to exist complete in the mind of the artist without any physical expression.

The latter claim, however, is clearly modified over the rest of Collingwood’s book. The second part of the book argues that there is an affective or emotional aspect of all perception and thought, and that the special function of art is to clarify that dimension of our experience so that we can understand and gain control over it. In the third part of his work, Collingwood then argues that the clarification of emotion takes place through the artist’s interaction with a physical medium and an audience. So Collingwood’s initial claim that the work of art exists complete in the mind of the artist turns out to be an overstatement of the claim that the effort in art is aimed at the clarification of emotion rather than at the production of a physical object for its own sake. Writing at a tense moment in the 1930s, Collingwood concludes by stressing that art proper is necessary for the survival of civilization precisely because it allows us to gain control over our own emotions rather than having our emotions controlled by the propaganda of others.

Art and language. Expression theorists such as Croce and Collingwood suggested that all art, whether in verbal media or not, can be regarded as using or creating languages for the expression of emotion. Beginning in the 1930s, many other varieties of aesthetic theory focused on linguistic aspects of the arts and of critical discourse about art. One important movement was logical positivism, represented above all by A. J. Ayer’s 1936 *Language, Truth, and Logic*, which argued that aesthetic discourse does not consist of verifiable, descriptive propositions about its objects at all, but only expresses the response of the speaker to such objects, to which a prescriptive rather than descriptive recommendation of the object to others might also be added. This doctrine, which applied to ethical as well as aesthetic discourse, became known as “emotivism” and enjoyed considerable currency after its further development in C. L. Stevenson’s *Ethics and Language* (1944). It would become one of the sources for hostility to traditional aesthetic theory during the heyday of “analytical” philosophy in the 1950s and 1960s.

A different strand of thought can be traced back to Ernst Cassirer’s *Philosophie der symbolischen Formen*, published in German from 1923 to 1929 and translated into English (*Philosophy of Symbolic Forms*) only in 1953, but preceded by Cassirer’s English-language summary of his position, *An Essay on Man* of 1944. Cassirer, a student of Hermann Cohen, held that human beings represent and deal with their environment through a variety of symbolic systems, including natural language, mathematical and scientific language, mythology, and the arts, each of which has its distinctive uses and none of which can simply be subordinated to the others.

Cassirer was a major influence on the American philosopher Susanne K. Langer, who interpreted human thought as using a variety of symbol-systems in her 1942 *Philosophy in a New Key* and dedicated her major work in aesthetics, the 1953 *Feeling and Form*, to the memory of Cassirer. She held that the arts do not employ “discursive” symbol-systems to analyze experience but instead use non-discursive symbols to capture the felt quality of experience itself. Using music as an example, she argued that the symbol-systems of the arts do not use “syntactical terms with fixed connotations, and syntactical rules for deriving complex connections,” like ordinary and scientific language, but instead “present emotive experience through global forms that are as indivisible as the elements of chiaroscuro” (Langer 1942, p. 232). Her position thus looks back to Alexander Baumgarten’s original distinction between logic and aesthetics, but also looks for-

ward to the 1968 *Languages of Art* of Nelson Goodman, who acknowledged affinities between his own approach and that of Langer as well as of Cassirer, Charles Sanders Pierce, and the semiotician C. W. Morris.

Goodman abjured any interest in the traditional topics of beauty and pleasure in the arts, and instead offered analyses of fictional and metaphorical depiction and of expression within the framework of an austere nominalistic theory of language. But his affinity with Langer and indeed with Baumgarten became clear when he argued that symbols or uses of language are symptomatic of the aesthetic if they are syntactically and semantically dense rather than discrete, if they are replete, with many features of the symbol contributing to its meaning, and if they exemplify qualities metaphorically as well as literally. And while maintaining his emphasis on the cognitive rather than emotional or affective dimension of aesthetic experience, he also wrote about its dynamic rather than static character, its “restless, searching, testing” attitude, its creation and re-creation, in a way that ultimately makes clear the pleasurable character of the aesthetic form of cognition. At its deepest level, Goodman’s aesthetics thus falls within the Kantian tradition.

A third major influence on modern thought about aesthetics and language was of course the philosophy of Ludwig Wittgenstein. Through the influence of his 1921 *Tractatus Logico-Philosophicus* on the so-called Vienna Circle, he was in the background of Ayer’s *Language, Truth, and Logic*. In 1938 (thus the same year as the publication of Collingwood’s *Principles of Art* in Oxford), he lectured on aesthetics in Cambridge. One central theme of these lectures, presumably directed against such nineteenth-century German psychologists as Hermann von Helmholtz and Gustav Theodor Fechner, was that aesthetics cannot be made into a science causally connecting measurable responses to measurable qualities of objects. Here Wittgenstein was in fact only reminding his auditors of an argument made long before by Hume and Kant. More influential themes of his lectures were, first, that aesthetic discourse does not typically work by using a general predicate like “beautiful” but instead uses more particular words and gestures to focus attention on particular aspects of objects that in their particular context look right or satisfying, and, second, that aesthetic response often involves imaginatively seeing an aspect or interpretation in an object.

Although these lectures were not published until 1967, the first of these themes was influential before that date. Thus Frank Sibley (himself a student of Gilbert Ryle) argued in 1959 that aesthetic concepts are not “con-

dition-governed” but are instead highly context-sensitive; this theme was further developed in Peter Kivy’s 1973 *Speaking of Art*. The second theme, which Wittgenstein would develop further in the major work of his late philosophy, the *Philosophical Investigations*, posthumously translated and published in 1953, was carried on in Roger Scruton’s *Art and Imagination* (1974) and in Richard Wollheim’s theory of “seeing-in” in his A. W. Mellon Lectures on the Fine Arts, *Painting as an Art* (1987).

The greatest influence of the *Philosophical Investigations*, however, came from its view that many concepts, including the concept of language itself, are not defined by a determinate set of necessary and sufficient conditions, but by a looser network of “family resemblances.” Wittgenstein argued that a concept like that of games could only be understood in this way, and that the abstraction of “language” likewise consists of a loosely interconnected network of “language-games.” In a famous paper of 1956, Morris Weitz argued that this model applied to the arts as well, thus that the concept of art is an “open concept” for which there could be no determinate definition of art of the kind to which traditional aesthetics had aspired. In an equally important paper of 1965, Maurice Mandelbaum replied that a determinate definition of an abstract concept like art is compatible with diversity and constant change at the level of the particular objects of art. This interchange as well as the history of developments in twentieth-century art, from the “readymades” of Marcel Duchamp through Dada to the Pop Art of Andy Warhol and Robert Rauschenberg, launched a debate about the possibility of a definition of art that was a central topic of analytical aesthetics from the 1960s into the 1980s.

In a 1964 paper on “The Artworld,” Arthur C. Danto used the cases of artworks that are perceptually indiscernible either from other artworks or from ordinary objects that are not artworks at all to argue that an artwork is never identical to a physical object, but is rather a physical object embedded in a world of artistic theory. In his 1974 *Art and the Aesthetic*, George Dickie was inspired by Danto’s concept of the “artworld” to offer a definition of a work of art as an artifact offered as a candidate for appreciation by an agent of the artworld, where he understood the latter in sociological terms as the social system of artists, dealers, curators, critics, and so on.

Danto’s 1981 *Transfiguration of the Commonplace* made it clear that this was not what Danto had meant by an artworld, but that by this concept he instead meant the complex of meaning, metaphor, and style within which an artist intended his work to be received, a view that he

has refined in subsequent work, including his 2003 book *The Abuse of Beauty*, into the definition of art as “embodied meaning.” Dickie acknowledged this basic difference in the understanding of the concept of an artworld in his 1984 book *The Art Circle: A Theory of Art*, and redefined an artworld as a set of artistic conventions rather than a sociological formation.

Jerrold Levinson and Noël Carroll subsequently developed historicized versions of Dickie’s approach, arguing that a work of art is an object made within a historical tradition of art making. But from Danto’s point of view, all such appeals to artistic conventions, histories, or traditions are circular without some definition of what makes the latter conventions, histories, or traditions of art in the first place. However, in his 1997 *Philosophies of Arts*, Peter Kivy argued against the assumption that all art has semantic meaning, which underlies Danto’s definition of art, by appeal to “absolute” music and the decorative arts, which are not “about” anything.

The return of beauty. Danto’s earlier work was very much under the influence of Marcel Duchamp’s attack upon beauty as a mere “retinal flutter” inessential to the real character of art, and Goodman likewise dismissed beauty from the cognitive core of art. However, not all philosophers have been convinced of the inessentiality of beauty, and two important works of the 1980s offered detailed analyses of beauty while defending its centrality in the experience of art. In *The Test of Time* (1982), Anthony Savile argued that we find an object beautiful when we see it as a successful solution to its underlying problem or problems within its own style, that we are able to recognize a successful solution to a problem even when the problem is not our own, and that being beautiful in this sense, along with being deep—that is, revealing fundamental and general principles— and suggestive about the possibilities for successful forms of human life, is one of the things that enables a work of art to withstand the test of time.

Two years later, Mary Mothersill’s *Beauty Restored* reached back to Hume and Kant and beyond them to Thomas Aquinas to argue that beauty is a disposition actualized when a person is pleased by the apprehension of the aesthetic qualities of objects, where the latter are precisely what distinguish an object from all others, and that beauty so understood is central to the ambitions of art. More recently, Alexander Nehamas has interpreted the traditional conception of beauty as a “promise of happiness” (a phrase that comes from Baudelaire) to mean that we find an object beautiful when it draws us into an ongoing engagement with itself and an open-ended net-

work of related objects, and that this is essential to our experience of art, although he emphasizes that these networks are personal and that there is no reason to expect “universal validity” in responses to beauty. Art critics and literary theorists such as Dave Hickey, Elaine Scarry, and Wendy Steiner have also recently defended the importance of beauty in art.

Aesthetics and morality. One of the most significant developments in recent aesthetics is renewed interest in the relations between aesthetic experience and morality, one of the two issues initially raised by Plato’s attack upon popular arts in the education of his guardians but one that had been largely neglected during the heyday of “analytical” aesthetics, when indeed traditional modes of theorizing in both aesthetics and ethics were under attack. Both Plato’s original attack upon popular arts and contemporary versions thereof have themselves been subjects of recent investigations. Alexander Nehamas has examined parallels between the ancient and modern attacks in papers collected in his *Virtues of Authenticity* (1999), while in *A Philosophy of Mass Art* (1998), Noël Carroll has shown in detail how many forms of “mass” art engage their audiences in ways both cognitive and emotional that are no different from the ways in which “high” arts engage their audiences. This work may be considered as a rejoinder to the critique of the “culture industry” as necessarily a form of mass manipulation that was offered by Max Horkheimer and Theodor W. Adorno in their famous *Dialectic of Enlightenment*, first published in 1947 as *Dialektik der Aufklärung* (see below).

Most of the recent debates about aesthetics and morality, however, have focused on two distinguishable issues. The first concerns the value of the experience of art, especially literature, in moral education. One view here holds that the moral truths expressed in works of art are so obvious and general that there is no need to turn to art to learn them, thus that their role in moral education can hardly be central to the value we place on art. The opposing view concedes that it may be unnecessary to turn to art to learn general moral principles, but that we can learn a great deal from narrative art, particularly literature and cinema, about the emotions of both agents and patients in morally significant situations, and indeed that narrative art may well be the primary means by which we learn to be attentive to the details of the kinds of situations in which we will ultimately have to apply our general moral principles. This view has been defended in numerous works by Martha C. Nussbaum and Noël Carroll.

The current debate could be enriched by a return to its roots in the eighteenth century, where Kant recognized that the artistic presentation of examples of virtuous conduct are essential in teaching children not so much the content as the importance of aesthetic principles, while Schiller later argued that aesthetic experience sharpens our sensitivity to both general principles and particular situations in his letters *On the Aesthetic Education of Man* (1967). Another voice that needs to be incorporated into this debate is that of Stanley Cavell, who has argued in both his philosophical work such as *The Claim of Reason* (1979) and his critical work such as his 1969 essay “The Avoidance of Love” on Shakespeare’s *King Lear* that a central lesson we can learn from art concerns the epistemology of conduct itself, that is, our need to act upon trust in both ourselves and others in the face of our always imperfect knowledge of self and others rather than being destroyed by fantasies about the perfection of knowledge and love that are beyond human powers.

The other recent debate has been about what has come to be called “ethical criticism” of the arts. Here the issue is whether what may be perceived as ethical defects of works of art, that is, defects in the moral views that may be expressed by works of art, are necessarily also aesthetic defects in those works, or whether our appreciation of the aesthetic merits of a work can be independent of any such ethical defects. The latter position, called “autonomism,” has been defended by Daniel Jacobson and others; “moderate moralism,” the position that ethical defects are at least *pro tanto* aesthetic defects in a work of art, although they may be outweighed by other aesthetic merits of the work, has been defended by Noël Carroll and Berys Gaut. Carroll has argued that some moral defects may prevent imaginative “uptake” of a work while others may not, that is, that some ethical defects may be sufficient to prevent an audience from identifying with the characters and standpoints of a work in the way necessary for it to accomplish its aesthetic goals, while others may not. The conditions under which “uptake” of a work may be facilitated or blocked would seem to be a subject for psychological investigation, and thus one of the points at which aesthetics can intersect with contemporary cognitive science.

Fictionality. Another area of contemporary debate where aesthetic theory can intersect with cognitive science is the recent discussion of the emotional impact of fictions. This debate too has roots in antiquity, namely the paradox of tragedy. One side of this paradox is related to the issue just discussed, namely, how we can take pleasure in the depiction of events that, were they real, we

should surely abhor. But there is also an epistemological and psychological question here, namely, how we can have emotional responses to fictions that are anything like the emotional responses we would have to the depicted events if they were real, when we know that they are not?

In his 1990 book *Mimesis as Make-Believe*, Kendall Walton has argued that we use works of art as props in games of make-believe, that it is fictional rather than actual that we respond to the work with the emotions that the objects they depict would induce in ordinary life, for example, that we respond with fear to events depicted in a horror movie, and therefore that there is no paradox in either how we can like or how we can fear fictions, because we do not in fact have the same emotional responses to fictions that we do to reality. This leads to an interpretation of the experience of fiction as “simulation” that is also investigated in contemporary cognitive science. An alternative position holds that to experience a fiction is like entertaining but not asserting a thought, and that we can have the same emotional response to an unasserted as to an asserted thought. This position has been developed by Noël Carroll and Peter Lamarque, among others. It too seems suitable for investigation by cognitive scientists.

CONTINENTAL AESTHETICS. Just as the division between “analytical” and “continental” aesthetics is less than clear-cut, so any rigid division of the continental tradition into separate lines of development will also be misleading. Nevertheless, the present discussion will be organized around a division between Marxist, phenomenological, and post-structuralist aesthetics.

Marxist aesthetics. Both Marx and Engels included the arts among the cultural superstructure of societies, which is determined by their economic substructure, but neither provided an extended treatment of aesthetics. That awaited twentieth-century Marxism. In the early days of Bolshevism and Russian communism, both Lenin and Trotsky addressed the role of the arts at length. Lenin treated art as a category of “intellectual work” that, like any other form of labor, could be used for or against the revolution. He expected art to serve the political education of the proletariat and therefore to remain accessible through the use of conventional forms.

This line of thought led to the official adoption of the style of “Socialist realism,” defined by Andrei Zhdanov, at the First All-Union Congress of Soviet Writers in 1934. By that time, Leon Trotsky, a less conventional thinker, had already been exiled from the Soviet Union.

Trotsky, who had published *Literatura i revoliutsiia* (Literature and revolution) in 1924, also argued that art should serve as a “hammer” for building the new society, but recognized that art also needed to be a “mirror” of existing society in order to reveal what needed to be corrected or rejected in it. Trotsky also kept in mind that the ultimate point of the revolution was supposed to be the extension of the enjoyment of freedom from an elite to the masses, and therefore held that art was not merely instrumental in value, but should enjoy some freedom of its own. In this regard Trotsky actually remained closer to the mainstream of modern Western aesthetics.

Trotsky’s recognition that traditional forms of art could be used as a mirror for the flaws of existing society was developed by the Hungarian György Lukács. His first books, *Die Seele und die Formen* (The soul and the forms; 1910) and *The Theory of the Novel* (1916), (*Die Theorie des Romans* [1916]), were written in neo-Kantian and Hegelian veins respectively, but after World War I, Lukács became a major communist theorist with *Geschichte und Klassenbewusstsein* (History and class consciousness) in 1923. He then devoted the rest of his career to aesthetics, culminating in his massive and untranslated *Die Eigenart des Ästhetischen* (The uniqueness of the aesthetic) in 1963.

Lukács held that every society is a complex whole in which all aspects of life reflect its underlying economics and politics; that individual psychologies form types that reflect the roles that are possible within their society; and that art, especially the novel, should represent the types of psychologies possible within the society that it depicts. Lukács became hostile to modernists such as Joyce and Kafka, whom he saw as expressing their own, individual psychologies without regard for the larger society of which they were a part. He recognized that all art involves some abstraction, but rejected abstraction as an end in art. This led him into debates with Ernst Bloch and Bertolt Brecht, who held that abstract and unconventional means of presentation might work more effectively than traditional forms of mimesis to expose the contradictions within society and to agitate for change.

A figure who was much less influential when he was alive but who gained prominence in later decades is the literary critic Walter Benjamin. Benjamin failed to make an academic career in the 1920s with his work on the German baroque and romanticism, but had more of an impact with his work on modernist literature and life: He spent much of the last part of his life working on a Marxist-inspired study of modern sensibility through the lens of the twentieth-century shopping mall and its mass-

produced goods, his so-called “Arcades Project.” Among aestheticians, however, his most influential work was his 1936 essay on “The Work of Art in the Age of its Mechanical Reproducibility,” in which he argued that the “aura” of traditional art derived from its original cultic role and then from the restriction of its accessibility to elites, conditions that could not be maintained with contemporary mass arts such as cinema. But Benjamin’s essay left it open whether the mass rather than cultic accessibility of modern media makes them instruments for even greater domination, now by commercial rather than religious elites, or creates increased room for individual autonomy in the exercise of taste and choice of pursuits.

The most influential neo-Marxist aesthetician working after World War II was Theodor W. Adorno. Adorno was a student of composition under Alban Berg in Vienna as well as a student of philosophy in Frankfurt, where he became an associate of the “Frankfurt school” of critical theory before the war and eventually, after his return from his wartime exile in Oxford and Los Angeles, its postwar leader. Adorno wrote in many areas, from sociology (he coauthored *The Authoritarian Personality* in 1950), literary criticism (*Noten zur Literatur* [Notes to literature]; 1958–1965), and music theory (*Philosophie der neuen Musik* [Philosophy of modern music]; 1949). With Max Horkheimer, the original director of the Frankfurt school, he coauthored the *Dialektik der Aufklärung* (Dialectic of enlightenment; 1947), which argued that, contrary to its intention, the European Enlightenment was actually an extension of the traditional drive to dominate the individual by mythology, and then that the contemporary “culture industry” continues the mass manipulation of the individual. Horkheimer and Adorno thus disambiguated Benjamin’s ambivalent attitude toward modern media in favor of the more pessimistic interpretation.

Adorno’s largest works were his *Negativ Dialektik* (Negative dialectics) of 1966 and the posthumous *Ästhetische Theorie* (Aesthetic theory) of 1970. In the latter, a more optimistic work than the *Dialektik der Aufklärung*, Adorno emphasized that even though art is always located in a historical context and therefore “refuses definition,” it has always “turned against the status quo and what merely exists just as much as it has come to its aid by giving form to its elements” (Adorno 1997, p.2). On his account, art both reveals the contradictions of existing society and yet can make us aware of the possibility of something better. Art shows both the fissures in current society and the possibility of a non-coercive integration beyond those fissures. In spite of the length of the book,

much of Adorno's view remains programmatic. One distinctive feature often missing from other modern and especially Marxist aesthetics, however, is Adorno's reflection on the relation between artistic and natural beauty: He argues that natural beauty offers a model of integration or reconciliation that is often missing from the man-made, and thus that art often seeks to bring nature within its scope, but at the same time that we may easily be seduced by nature into thinking that reconciliation of social fissures will come automatically instead of by our own, intentional efforts.

The Frankfurt theorist who remained in America, Herbert Marcuse, drew on Freud to criticize orthodox Marxism in much of his late work, first in *Eros and Civilization* (1955), which as its title suggests argued for the necessity of Eros as well as social justice, and then in his last work, *The Aesthetic Dimension* (1978), which argued that art unequivocally reflects the human wish for life rather than death, that "Aesthetic form, autonomy, and truth... each *transcends* the socio-historical arena," and that art "challenges the monopoly of the established reality to determine what is 'real,' and it does so by creating a fictitious world which is nevertheless 'more real than reality itself'" (Marcuse 1978, p. 22). Marcuse's conviction that the resistance to the forces of Eros come primarily from politics rather than from the natural conditions of human life are regarded as naive by contemporary psychoanalysis.

The British literary theorist Terry Eagleton returned to more traditional Marxist-inspired critique of ideology in his 1990 *The Ideology of the Aesthetic*, arguing that the classical modern theory of the autonomy and universal validity of taste, which was developed simultaneously with the bourgeois domination of the economics and politics of European society beginning in the eighteenth century, was in fact a mask for that increasing domination.

The phenomenological tradition. The other main German-influenced line in twentieth-century aesthetics is the phenomenological tradition. This has its sources in both Wilhelm Dilthey and Edmund Husserl. Dilthey was a historian, biographer, and literary critic as well as a theorist of history, the arts, and the human sciences generally. He adopted the idea of hermeneutics from Friedrich Schleiermacher, the subject of one of his major studies, and introduced it into twentieth-century thought. He held that every society and period has a distinctive "worldview" (*Weltanschauung*), but that the modern worldview (since the Renaissance) has grown so complex that it can only be represented artistically, in virtue of

art's powers of isolation or abstraction, concentration, and integration. In his view, hermeneutics is the method for interpreting the larger worldview expressed by a work of art.

Husserl, by contrast, started off as a technical philosopher of logic and mathematics, and then argued for a distinctive power of apprehending the essential structures of logical, mathematical, and scientific concepts, of ordinary objects, and of the social world that is independent of ordinary empirical investigation—what he called *Wesensschau*, or the intuition of essence. From such a premise, it would be natural to see art as a form of *Wesensschau*, especially in the pioneering period of abstract art. Husserl himself did not apply his phenomenology to the case of art, but the Pole Roman Ingarden did in *Literarische Kunstwerk* (The literary work of art; 1931). Ingarden employed Husserl's approach in seeing a work of literature (and by extension other works of art) as containing complex layers of intentionality, including meaningful words, meaningful combinations of words and elements, represented objects, and "schematized aspects" or implicit perspectives that need to be developed in the thought of the reader rather than the writer. In this regard Ingarden's works can be seen as a forerunner of the "reception aesthetics" of Wolfgang Iser (*The Act of Reading*, 1978; originally published as *Der Act des Lesens*, 1976) and Hans Robert Jauss (*Aesthetic Experience and Literary Hermeneutics*, 1982; originally published as *Ästhetische Erfahrung und literarische Hermeneutik*, 1977).

Martin Heidegger, however, was influenced by Wilhelm Dilthey as well as by Husserl, and it could be argued that in his case the influence of the former gradually overtook that of the latter: for Heidegger, art reveals more *Weltanschauung* than *Wesensschau*. Heidegger's magnum opus, *Being and Time* (1927) (*Sein und Zeit*) argues for the priority of the human experience (*Dasein*) of the world as an arena for agency with tools and instruments over the objectivist standpoint of science and traditional philosophy, which treats humans as more passive knowers of independent realities. Heidegger did not discuss art in this work, but it has proven tremendously influential on writers from Jean-Paul Sartre and Maurice Merleau-Ponty to the present, all of whom treat art as the special vehicle for the expression of the point of view of *Dasein* rather than objectifying science.

During the 1930s, as the style of his philosophy became more mythic (some would argue that this was a reflection of his allegiance to National Socialism), Heidegger lectured explicitly on aesthetics, culminating in

the essay on *The Origin of the Work of Art* (Der Ursprung des Kunstwerks [1950]) that was written in 1935–1936 but not published until 1950. Here Heidegger describes art as revealing both “world” and “earth,” the former the complex of beliefs, practices, and feelings that characterizes a human way of life and the latter the chthonic domain and forces from which the human world emerges. One striking feature of this essay is that it begins by stressing that art is a form of work, thus a product of human activity, but ends with a theory of truth in which truth is *revealed* to the artist who knows chiefly how not to get in its way (an approach that goes back to Schopenhauer’s interpretation of genius). The essay thus ends up with a peculiarly passive view of artistic creation and, by implication, reception; it is thus very much opposed to the model of artistic creation and reception to be found in such writers as Collingwood, Dewey, Ingarden, and the “reception” theorists.

Heidegger’s most influential student in the arena of aesthetics was Hans-Georg Gadamer, whose major work was *Wahrheit und Methode* (Truth and method; 1960). Gadamer was also influenced directly by Dilthey, and was the major proponent of hermeneutics in the second half of the twentieth century. *Wahrheit und Methode* is a general theory of hermeneutics as the means, though not a formal method, for understanding oneself and others. But it begins with an attack upon traditional aesthetics, especially Kant’s, for “subjectivizing” aesthetic experience, or for seeing art as a means to producing an experience in the subject (the audience), which might be shared with other subjects because a *sensus communis* is presupposed, but not as a means for building a *sensus communis* or intersubjective understanding in the first place. Gadamer calls the first, narrowly subjective kind of experience *Erlebnis*, but the fuller experience that is essentially intersubjective *Erfahrung*. On his account, while we always already understand ourselves and others from within some conceptual framework, art is a fundamental means for us to revise and expand our understanding of self and others, and thus to make the transition from *Erlebnis* to *Erfahrung*.

Jean-Paul Sartre never wrote a treatise on aesthetics, although a large part of his enormous oeuvre consists of books and essays on particular artists such as Flaubert, Baudelaire, Jean Genet, and Mallarmé. His early work *Imaginaire; psychologie* (The psychology of imagination; 1940), under the influence of Husserl, stressed the role of forming images in imagining, although his own creative as well as critical output was in the field of literature rather than the visual arts. Like Adorno and Marcuse

later, he stressed the potential of art for non-alienating communication, in which the artist’s expression of freedom invites the audience to experience their own freedom of imagination as well. In this regard, his view falls into the Kantian rather than Heideggerian tradition. Merleau-Ponty’s emphasis on the primacy of perception over scientific understanding in his main work, *Phénoménologie de la perception* (The phenomenology of perception; 1945), is certainly influenced by the Heidegger of *Being and Time* as well as by Husserl’s late emphasis on the *Lebenswelt* (“lifeworld”), but his three seminal essays on aesthetics, especially “Cézanne’s Doubt,” also stress the freedom and individuality of artistic vision.

Post-structuralism. Main voices in the French “post-structuralist” or “post-modernist” movement, which has had its primary influence on literary theory rather than philosophical aesthetics, include among others Roland Barthes, Michel Foucault, Jacques Derrida, Paul de Man, Jean-François Lyotard, and the sociologist Pierre Bourdieu. (An independent form of “post-modernism,” and the term itself, originated within the precincts of architecture and architectural theory, beginning with the works of Robert Venturi and his widely read books *Complexity and Contradiction in Architecture* [1966] and *Learning from Las Vegas* [1972].)

With the exception of de Man, a literary critic who published only a few volumes of papers, all of these authors published a flood of works on a wide range of topics, and aesthetics in the traditional sense concerns only a small number of their works. Barthes’s works in aesthetics touch on topics including criticism, fashion, and photography (*Camera Lucida*, 1980). Foucault’s works, beginning with *Mots et les choses* (1966), translated as *The Order of Things* (1970), focused on the “archaeology of knowledge,” an historicist analysis of cognitive systems and of the power relations underlying such systems. But both Barthes and Foucault were known particularly for the thesis of the “death of the author,” which held that it is primarily the reader (or auditor or viewer) rather than the author who constitutes the meaning of a work of art, and thus of course that works of art do not have determinate meanings, since they may have many different audiences. This is an extreme version of what had been one aspect of aesthetic theory since Dewey and Collingwood, and a hyperbolic statement of the reception aesthetics developed in Germany by Iser and Jauss.

Derrida and de Man were the leaders of the movement called “deconstructionism,” which pervaded literary studies in the last decades of the twentieth century. The central idea of this approach is that a text never has a

“transcendental” meaning outside of itself, but only an endless deferral of meaning from one sign to another both within itself and intertextually, that is, in other texts but not in some reality beyond texts altogether, and further that texts, especially philosophical texts, are typically built upon unsustainable distinctions that inevitably collapse. A classic example of deconstructionist analysis is Derrida’s argument in *La vérité en peinture* (1978), translated as *The Truth in Painting* (1987), that Kant’s distinction between a painting and its frame (its *parerga*) collapses because sometimes one cannot tell the difference between the painting and the frame, and therefore the distinction between art and non-art collapses as well. This is a misreading of Kant, who introduced the concept of the *parerga* only to show that even in the frame or drapery around a work of art we respond primarily to formal properties, as with the work itself, and not to define the difference between art and non-art; and it ignores the fact that in the vast majority of cases we can perfectly well tell the difference between the painting and its frame, even if in a small number of cases we cannot. Most of our empirical concepts have a penumbra of borderline cases, and yet we successfully use them in all sorts of contexts.

Lytard extended Derrida’s attack on the determinacy of language by arguing that figural or visual imagery often brings us closer to our real desires (*Discours, figure* [Discourse, figure]; 1971), and among other works also published lectures on Kant’s concept of the sublime (1991) that manifest deconstructionism’s fascination with the sublime as purported evidence of the ultimate ineffability of meaning. Finally, in his widely influential *Distinction: Critique sociale du jugement* (*Distinction: A social critique of the judgment of taste*; 1979), Bourdieu argued against the existence of any universal validity in matters of taste, thereby rejecting the ambitions of traditional aesthetics.

As the creation and reception of art in many different forms remain fundamental features of human life in many different cultures throughout the world, it can be expected that aesthetics will remain a central branch of philosophy in the twenty-first century as in centuries past.

AESTHETICS, PROBLEMS OF

The philosophical discipline of aesthetics deals with conceptual problems arising out of the critical examination of art and the aesthetic. Monroe Beardsley subtitled his 1958 book on general aesthetics *Problems in the Philosophy of Criticism*, implying that aesthetics is about philo-

sophical concepts that are used—often unthinkingly—by critics of the arts, when they say that a work of art such as a painting is *beautiful* or has *aesthetic* value, that it *represents* some subject matter, has a well-composed *form*, is in a particular *style*, and *expresses* some emotion. But aesthetics also deals more broadly with the aesthetics of nature (Budd 1996, Carlson 2000) and gardens (Ross 1998), and with the aesthetic appreciation of objects and activities in everyday life (Dewey 1934). And even when focused on the arts, philosophical aesthetics is concerned with the philosophical problems that arise from the artist's point of view as well as the critic's. Thus creativity, expression, representation, form, and style are problems that can be addressed from the artist's point of view as well as the spectator's. Moreover, "the philosophy of criticism" does not do justice to the breadth of concerns addressed by philosophical aesthetics today. Some of the thorniest issues in aesthetics relate directly to problems in general philosophy: What is aesthetic value? Do the arts provide knowledge? Is there a special kind of aesthetic experience or aesthetic perception?

Most of the questions that come up in theorizing about particular art forms—the philosophy of literature, the theory of the visual arts, the philosophy of music, the philosophy of film, environmental arts and so on—are general questions having implications for other art forms. Some theorists, however, think that the individual arts come with their own unique sets of philosophical problems (Kivy 1997). The problem of the experience and value of absolute music, for example, does not have a clear parallel in any of the other arts, including the other abstract arts (Kivy 1990). Authenticity is a particular problem in the performing arts such as dance and music. But for the most part, questions in the philosophy of art have general application across the arts. Thus the problem of the nature of fictional characters has usually been taken to be a problem about literature, but representational works of visual art also contain fictional people, objects and events (Walton 1990). Similarly, the question as to why people get emotionally involved with fictional characters may seem to be unique to films and novels (Carroll 1990, Currie 1990, Feagin 1996, Lamarque 1996), but it applies equally to fictions in works of visual art. Again, the question why people enjoy tragedies is not peculiar to tragedies: It is the same kind of question as the question why do people listen to sad music if it makes them feel sad (Davies 1994, Levinson 1990)?

This brief overview first discusses the aesthetic in general and then turns to problems peculiar to the arts. It ends with some general remarks about how aesthetics

connects to more general questions about knowledge, emotion, and value. Some effort has been made to point out how the most important concepts of aesthetics came to be considered important. The tendency of late-twentieth-century philosophy—especially analytic philosophy—has been to treat the problems of aesthetics as timeless problems having correct answers that will be true of all art works and aesthetic experiences no matter where or when they occur. But if one approaches aesthetics with an eye to the historical background from which its characteristic problems emerged, one will have a better sense not only of what those problems are but also of the different ways they have been conceptualized and why.

THE AESTHETIC

What is the realm of the aesthetic? Should it be thought of as a special kind of pleasure, or, more broadly, as a special kind of experience, as a special type of judgment, as a special type of attitude toward the world, or as a special type of quality? All these options have been pursued. The term "aesthetics" derives from the Greek word *aesthesis*, meaning "perception." The German rationalist philosopher Alexander Baumgarten coined the term in 1735 to mean the science of "sensory perception," which was designed to contrast with logic, the science of "intellect" (Baumgarten 1954), and ever since, the term "aesthetic" has kept its connotation as having an essential connection to the perceptually discriminable.

Although German rationalism gave the field of aesthetics its name and a rationale, it was the British empiricists who established aesthetics as a philosophical discipline and who set the agenda for its subsequent development. The problem that chiefly exercised the eighteenth century thinkers in aesthetics was the nature of aesthetic pleasure and of aesthetic judgment, the judgment of "taste." If aesthetics were to be a serious philosophical discipline, then presumably there must be principles that would justify aesthetic judgments, and distinguish them from mere assertions of liking or disliking. At the same time it was taken for granted by the empiricists that aesthetic judgments depend on subjective feelings of pleasure. For Hutcheson (1973), Hume, and their successors, the aesthetic judgment was primarily a judgment that something is beautiful. So the challenge was to figure out if there was a special kind of pleasure that was the proper response to beauty or a special kind of judgment that was being made when one judged an object beautiful.

BEAUTY

The concept of beauty was an heirloom of ancient and Medieval philosophy. For Plato (1953), only the Idea of Beauty is really beautiful, since everything else is only beautiful in one respect or at one time rather than another or by comparison with one thing and not another. Beautiful people and things can only approach the Form of Beauty. The Medievals, under the influence of the Neoplatonist Plotinus, thought of beauty, the good, and other perfections, as true in the strictest sense only of the highest level of reality. Christianity echoed this idea in the doctrine that beauty is one of God's perfections. In this framework the beauty of the world is derivative from "an image and reflection of Ideal Beauty" (Eco 1986, p. 17). Augustine, for example, believed that a person possesses beauty of body or soul only to the degree that he or she approximates God's perfect beauty. Such a conception of beauty is a far cry from the way it has come to be thought about in modern aesthetics.

Since the Enlightenment, beauty has by and large no longer been regarded as having or being an ethical or religious value. Instead, the eighteenth-century empiricists thought of it simply as the capacity of an object to produce a particular kind of pleasurable experience. The judgment that something is beautiful was the paradigm of what they called the aesthetic judgment or judgment of taste. If, however, the judgment that something is beautiful is not to be a mere statement of liking or preference, then there must be a standard of taste, a principle of justification for claims that something is beautiful which nevertheless preserves the insight that judgments of the beautiful are based on subjective feelings of pleasure. It is this formulation of the problem of beauty and the aesthetic that has come down to us and which continues to exercise theorists.

THE AESTHETIC JUDGMENT

The empiricists rejected the idea that there are universal standards of beauty: The great variety of beautiful things suggests that there are no general canons or rules of beauty as assumed by some classical writers in the Renaissance. Hutcheson thought that the classical idea of "unity in variety" is the one property that reliably evokes aesthetic pleasure (Hutcheson 1973), but whether something has the right degree of unity or variety is itself problematic. Hume famously solved the dilemma by arguing that we are all so constituted as to be pleased by the same sorts of objects in nature and works of art but that we do not all have the same background of experience, delicacy of taste, good sense, ability to make comparisons and lack of

prejudice that we ideally could and should have (Hume 1985). Those who have these abilities in the highest degree are the "ideal critics" to whom the rest of us should defer about what is beautiful, and in theory these ideal critics will all agree with one another. Even Hume himself, however, suspected that this would not do entirely, pointing out that younger people have different tastes from older, and that people from one culture might take no pleasure in the art of another if the values it assumes and promotes are sufficiently alien. Today, Marxist critics, reader-response theorists and feminist critics have all emphasized the difficulty of generalizing about the responses of perceptive critics with different background assumptions and points of view.

KANT AND FORMALISM

After Hume, Kant (2000) gave an equally famous *a priori* argument that judgments of taste, though based on subjective feelings of pleasure, lay claim to universality because the pleasure in question is neither pleasure in the sensuously pleasing nor pleasure in the useful, but a disinterested pleasure that arises from the harmonious free play of imagination and understanding, which are cognitive faculties common to all rational human beings. Since it derives from these shared abilities, this pleasure is itself shareable and communicable. Kant thought that an aesthetic judgment is disinterested because it is not addressed to anything in which we have an interest or personal stake but instead is a judgment about the form of an object. The object of aesthetic judgment is "purposiveness without purpose," the appearance something has of having being harmoniously put together for some end even though it lacks any specific end. Kant's examples of aesthetic judgment are drawn primarily from the beauties of nature such as the shape and sweetness of the rose, but his ideas were influential in fixing attention on the formal aspects of art works as well. Kant himself emphasized the role of art works in producing "aesthetic ideas," but critics who focus exclusively on the early part of the *Critique of Judgment* have found there a justification for the view that with respect to both nature and art, the aesthetic judgment or judgment of taste is directed exclusively to formal qualities. This idea no doubt ultimately derives from the classical notion that measure and symmetry are important or even definitive of beauty.

At any rate, Kant has, perhaps unjustly, been seen as the main source of formalism, the idea that the most or only important features of a work of art are its formal qualities. To twentieth-century critics of painting such as Clive Bell and Clement Greenberg, this means that only

color, line, and shape, and their inter-relations are of aesthetic importance and that content is aesthetically irrelevant. In music it is the doctrine that only structure is important. In literature, formalists have emphasized the structures of plots in narratives and the use of imagery and other rhetorical devices in poetry. There is something to be said for formalism—it draws people’s attention to what is truly artistic in a work of art, the “art” with which it is put together—but it assumes a distinction between form and content that is very difficult—perhaps impossible—to make out.

Bell (1914) thought art could be defined as “significant form,” suggesting that two paintings can imitate or represent the very same thing—the Virgin, say, or a field full of cows—yet one can be art and the other not, because of the way the artist has rendered the form of the work. Bell was part of the Art for Art’s Sake movement that swept England in the late nineteenth and early twentieth century. The emphasis on form is congenial to critics of the abstract arts such as architecture and instrumental music, but it is far less plausible for such arts as literature and photography. Moreover, as has often been pointed out, Bell seems to be defining good art rather than art *simpliciter*, and in defining good art, he is attributing to it his own favored criterion of value.

AESTHETIC QUALITIES, AESTHETIC EXPERIENCE, AESTHETIC ATTITUDE

In the early eighteenth century the paradigm of an aesthetic judgment was taken to be the judgment that something is beautiful; and the beautiful was explained in terms of pleasure. In the later part of the century, however, the notion of aesthetic judgment was expanded to include judgments of the picturesque and the sublime, but the judgment of the sublime is no longer wholly pleasurable. Burke described the source of the feeling of the sublime as “whatever is fitted in any sort to excite the ideas of pain and danger” such as vastness, power and obscurity (Burke 1909, p. 36).

Once aesthetic judgments were no longer directed solely at the beautiful, the way was clear for thinking of the aesthetic not as one particular kind of pleasure or as one particular kind of judgment, but rather as a certain kind of quality of an object. Beauty and sublimity might then be merely two among a much broader class of aesthetic qualities, such as “dainty,” “garish,” “delicate,” “insipid,” and so on. One question raised by expanding the range of aesthetic qualities is whether all aesthetic qualities are correctly describable as formal qualities. Frank Sibley, who initiated the modern discussion of aes-

thetic qualities, includes on his list of examples not only clear-cut examples of formal qualities, such as “graceful” and “garish,” but also qualities such as “melancholy,” which are usually thought of as *expressive* properties, a special subset of aesthetic qualities (Sibley 1959).

Interestingly, very similar questions arise in connection with aesthetic qualities as formerly arose about beauty: Are they intrinsic or mind-dependent qualities? And if they are mind-dependent, do they behave like colors which are perceived similarly by everybody with properly functioning eyes, or are they more like the taste of curry or cilantro, which is perceived as delicious and piquant by some and disgusting by others? Is there a set of ideal critics, as Hume proposed, whose faculties are keener than those of the rest of us and who should be the true judges of aesthetic qualities? These are questions that are still being hotly debated.

The notion of a special aesthetic pleasure or aesthetic perception has also broadened since the eighteenth century into the more general concept of *aesthetic experience*. John Dewey is partly responsible for this change in emphasis. He wanted to stress the importance of having “experiences” in daily life that have the same wholeness, richness, and sense of integration that are characteristic of our encounters with works of art. Other theorists (for example, Schopenhauer [1958] and Stolnitz [1960]) have insisted that what marks out the aesthetic is a special kind of attitude, that should be taken to works of art but that can in theory be taken to anything whatsoever. It turns out that the aesthetic attitude has many of the features of an aesthetic judgment: It is a special kind of disinterested contemplation, often taking the form of an object or art work as the focus of attention.

THE THEORY OF THE ARTS: IMITATION AND REPRESENTATION

The idea that poetry and painting are arts of imitation derives from Plato, who likened imitations to shadows and reflections, and as such, he thought, led away from rather than toward the truth. Aristotle, too, thought that the arts of poetry and painting were imitations of reality, but, unlike Plato, he thought that we learn from imitations and that we take pleasure in doing so. Plato and Aristotle were the first in the western tradition to theorize about poetry and painting as arts of imitation, but they did not think of them as a special category of “fine arts” or Art with a capital “A.” The Ancient Greeks had no concept of “the aesthetic” (Sparshott 1982). The arts of painting and sculpture were varieties of *technē* or craft. The word “art” derives from the Latinized form of the Greek

technē, meaning a “corpus of knowledge and skills organized for the production of changes of a specific kind in matter of a specific kind,” like the arts of cobbling or leatherwork (Sparshott 1982, p. 26). The art of poetry had a more important educational role as a source of moral education but it too is an art of imitation. In the Renaissance and the Enlightenment under the influence of Aristotle and his descendants in the classical period, it became a commonplace that poems and paintings imitated or represented the world.

The first attempt to systematize the fine arts came in 1746 when the abbé Batteux grouped together poetry, painting, sculpture, dance and music under the rubric of the imitation of beautiful nature. This was a revolutionary idea in that it categorized together craftsmen such as sculptors and painters with the more highly educated poets, and implied that all the practitioners of the fine arts provided representations of the world that were potential sources of knowledge (Kristeller 1951–1952). Once the idea of the fine arts was established, it was possible to search for traits that they all have in common, and the search for a definition of the fine arts and eventually of “Art” was born.

From the beginning, the search for a definition has been challenged by the multiplicity of the arts. Thus the idea that the arts imitate or represent beautiful nature may have seemed plausible in the age of Pheidias and Praxiteles who made realistic but highly idealized sculptures of the human body, and similarly in the High Renaissance when the beautiful paintings of Raphael and Leonardo imitated the beautiful female form in their paintings of the Virgin, but the arts of “pure” music and dance are not obviously imitating anything. Architecture, too, is only exceptionally an art of imitation. In the eighteenth-century synthesis of the fine arts as arts of the imitation of beautiful nature, we see an attempt to fit together two different conceptual traditions, on the one hand the new empiricist concern with aesthetic judgment, the judgment of beauty, and on the other hand the classical idea—derived from Plato and Aristotle—that the fine arts are arts of imitation. Although buildings, dances and music do not fit very well under the description of arts of imitation, they can certainly be beautiful by satisfying the formal demand for “unity within variety.” We see here the beginnings of a clash which lasts to our own day, roughly speaking, the clash between thinking of the arts as aspiring to beauty of form or as seeking to show us the way things are in the world.

The idea that the arts are all arts of imitation has seemed more and more far-fetched in the contemporary

world, where a tendency toward abstraction is the rule in the visual arts, and even literature has drawn attention to its formal aspects rather than the story it tells. Perhaps in some very broad sense the arts are “about” the world, but even this has been denied by some defenders of “absolute music” who see it rather as a means of escape from the world (Kivy 1990).

At the same time the notion of “imitation” has come under attack as an account of representation. Many works of art, such as representational paintings, photographs, films, and sculptures represent the world, but it does not seem right to say that they *imitate* it. The role of convention and style is too important in all these genres to make a comparison with a mirror image plausible. Widely discussed theories of pictorial representation include Ernst Gombrich’s view that the history of realistic painting is a history of “making and matching” (Gombrich 1960), and Richard Wollheim’s theory that pictorial representation rests upon a prior capacity people have for “seeing in” (Wollheim 1987). In literature, a distinction has been made between literary narratives that talk about the world in some sense but arguably do not *represent* it and literary dramas that do represent the world, but perhaps not in quite the same sense that pictures do. Kendall Walton thinks that representations in general should be analyzed in terms of the concept of what a work prescribes us to imagine (Walton 1990). When, for example, we encounter a pictorial representation of a water mill, we imagine of our act of seeing that it is a seeing of a water-mill. His controversial theory of photography holds that, in contrast to paintings, we do not merely imagine but *really see* the object photographed that appears in the picture (Walton 1984).

EXPRESSION

In the Romantic period, artists and writers began to describe themselves not as merely imitating an inert reality but as expressing their own emotional perspectives on the world. Poetry, wrote Wordsworth in a famous phrase, is the “spontaneous overflow of powerful feelings” that are “recollected in tranquility” (Wordsworth 1963, p. 260). After the imitation theory, the next great attempt to define Art was the theory of art as expression. Kant had stressed the role of imagination in art, and the role of the genius that “gives the rule to art” (Kant 2000, p. 187), i.e. who makes up his own rules rather than obeys conventional canons. The Platonic notion of the craftsman who knew how to craft sculptures or poems and who was creative only insofar as he was inspired by the gods, gave way to the idea of the artist who used his creative imagination

to come up with novel expressions of novel ideas and emotions.

Kant's notion that the mark of genius is to come up with "aesthetic ideas" was taken up by Hegel, who argued that art is one of the modes of consciousness whereby man reaches knowledge of Absolute Spirit; specifically it is that mode of consciousness whereby ideas are embodied in some sensuous form. For Hegel, then, art was an important means to knowledge, but it was a special kind of knowledge that could not be detached from the medium in which it is conveyed. The theorists of expression, including the idealist R. G. Collingwood and the pragmatist John Dewey, echoed some of these ideas, insisting that artistic expression is a *cognitive* activity, a matter of elucidating and articulating emotions (Collingwood 1938, Dewey 1934). Like Hegel, they seemed to think that the emotional attitude embodied in a poem or painting was unique to that poem or painting: Any change in color or line in a painting, any change in imagery or rhythm in a poem would change the emotion expressed. Some theorists stressed not so much personal expression as the communication of emotion from one person to another (Tolstoy 1960).

Just as the definition of art as the imitation of reality fits well with eighteenth-century poems and paintings, so the theory of art as expression fits best with Romantic and Expressionist poetry, music, sculpture and painting. Once again architecture is a problem: Most buildings do not seem to express the personal emotions and attitudes of their makers.

The concept of expression has proved malleable, however. More recent theories include Goodman's view that expression is metaphorical exemplification (Goodman 1976). In this sense a work of architecture can express some of its aesthetic properties, its gracefulness, its minatory look, its wit, and it can literally exemplify its mass, its solidity, and perhaps its style. Likewise, a piece of music can metaphorically exemplify its melancholy or jovial character. Other theorists have argued that expression is nothing but the *possession* of a certain sort of aesthetic property (Hospers 1954–1955), namely expressive properties such as "melancholy," "jovial," "witty," and "lively," and have disputed about whether these properties are possessed metaphorically or literally (Davies 1994). In this discussion, too, we see a clash of different conceptual traditions. The idea that art is expression is far removed from the notion that art has a special set of aesthetic properties called "expressive" properties.

The idea that art has expressive properties is not a very surprising revelation, but it does have the advantage

of being true across a wide range of art works. By contrast the Romantic, idealist theory of art as expression fits poorly with most of the works made before the end of the eighteenth century. And although twentieth century modernist artists thought of themselves as "embodying" ideas and emotions in a medium just as Collingwood recommended, in the postmodern world artists seem to want to convey their ideas by any means possible rather than "embodying" them in a carefully constructed work of Collingwoodian expression. At the same time, however, many artists continue to talk about *expressing* themselves in their work.

THE INSTITUTIONAL THEORY OF ART

The imitation theory, the theory of art as form, and the expression theory all seem incapable of providing a definition of art that covers all those things that people in Western societies generally want to count as art. Consequently, some have despaired of the possibility of defining art at all, and have retreated to the position that "art" is a "family resemblance" concept in Wittgenstein's sense (Weitz 1956). The more popular move, however, has been to look for a definition which does not appeal to "exhibited" properties such as the form of a work, its representational content or its expressive qualities, but rather to historical or contextual features of the work. Arthur Danto has proposed that we count something as art if there is an artistic theory behind it that links it to the history of art (Danto 1964, 1981). Just as the theory of art as imitation had its origins in the classical world and the theory of art as expression in the Romantic period, so Danto's theory is a response to the conceptual art of the late twentieth century, art that does not necessarily *embody* or exemplify its meaning but which needs to be decoded by those who have an understanding of "the art-world"—an "atmosphere of artistic theory, a knowledge of the history of art"—in virtue of which the work counts as art (Danto 1964, p. 580). Again, the theory is most appropriate to works of "high" art that are made within and in recognition of the contemporary institutions of art. Work of folk art—such as the tattoos and walrus tusk carvings of the ancient Inuit—do not fit very easily into this definition, because folk cultures often do not have a concept of "Art" as was developed in the West in the eighteenth century.

George Dickie has taken the concept of the artworld to refer not to a body of theory but to a particular group of people—artists, curators, art critics, museum-goers—and has argued that, roughly speaking, something is art if it is the sort of thing that is designed to be presented to

members of the artworld (Dickie 1984). But if we understand the artworld is this way, then once again the theory will not happily apply in cultures where there are no curators, critics or museums, and nothing approaching an “artworld.” Modern attempts to surmount this problem (Levinson 1990, 1996; Carroll 2001) have emphasized the historical dimension of art and art appreciation: Perhaps we can define art in terms of the kinds of intention with which art works have traditionally been made or by the kinds of responses they have traditionally invited.

MEANING AND INTERPRETATION

In insisting that art works require an artistic theory to justify them, Danto is emphasizing that all art works have artistic meaning and require *interpretation*: One cannot just contemplate the beauty of an artwork; one needs to grasp the ideas that lie behind it, ideas that may not even be manifest in the aesthetic surface, at least until the artist or her surrogate has pointed them out. In Goodman’s *Languages of Art*, art works are conceived of, by analogy with language, as symbols in different kinds of symbol system. As in Danto’s theory, art is meant to be interpreted and understood, rather than merely contemplated and appreciated. The idea that works require interpretation fits well with the ethos of modernism. Modernist works are often difficult—one thinks of *The Wasteland* or the works of Schoenberg—and they *need* to be interpreted. Postmodern works may sometimes be more playful but often they too are mystifying unless you know the theory behind them, for example the stories of Italo Calvino or the late works of architecture by Peter Eisenman.

But what is it to interpret a work of art? In the late twentieth century there developed a sharp divide between the approach taken by analytic philosophers of literature who tend to stress the importance of understanding the author’s probable intentions in constructing a work (Levinson 1996, Stecker 2003) and the various approaches taken by continental thinkers. German reception theory saw interpretation as primarily determined by readers’ responses rather than the artist’s intentions (Iser 1978). Thinkers in the structuralist and poststructuralist tradition emphasize the importance of how readers or viewers decode or deconstruct art works, thereby uncovering an abundance of possible meanings permitted by the interweaving structures of a text as well as by their interactions with further texts (Barthes 1974, Derrida 1974). Marxist, Freudian, and feminist theorists have reinterpreted works from the past from the perspective of

the contemporary reader’s assumptions, that might well not have been shared by the author of the work. In both analytic and continental traditions, however, the importance of taking account of the cultural context of artist and reader has been stressed.

The rage for interpretation has even reached the aesthetics of nature. Instead of just contemplating the beauties of a waterfall, a flower or a mountain, it has been argued that we should base our appreciation on scientific knowledge about what we are looking at (Carlson 2000) and that the more we know about it the more aesthetically pleased we will become. To others this seems doubtful about much of our experience of nature (Budd 1996). They could argue that the Romantics who first fostered interest in the wilder aspects of nature were no experts in the sciences of botany or geology, but were deeply moved by nature all the same.

ONTOLOGY

The question of interpretation is closely bound up with the ontological status of art works. What is it that we are interpreting when we interpret a work of art? On the face of it, paintings and sculptures and works of architecture are individual physical objects, whereas novels, symphonies, etchings and digital art works are types or abstract objects of some kind (Wollheim 1980). In addition, some arts are performing arts, requiring a performance in order to be experienced (Davies 2001). Performance arts such as dance and music raise additional questions about the authenticity of modern performances of older works. If performance practice has changed radically from when a piece was composed, are we really experiencing the work itself, a modified version of the work, or a wholly new work bearing some resemblance to the old?

Goodman distinguished allographic from autographic art forms, the former being identifiable as a structure or sequence of symbols, such as a novel, and the latter being identifiable only by means of the history of production of the artwork (Goodman 1976). One problem with this distinction is that even allographic art works may need to be distinguished by their history of production (Levinson 1990): if Smith in 2005 composes what we identify as Beethoven’s Fifth in total ignorance of the “original” Beethoven’s Fifth, he would on Goodman’s view have composed the very same symphony. But if we take seriously the idea that a work of art is partly identified by when, where, and by whom it was made, then it would seem that Smith’s “Fifth” is a different work. Confirming this conclusion is the fact that Smith’s Fifth has

different artistic and aesthetic qualities from Beethoven's, being conventional and derivative, predictable and old-fashioned.

Works of art are cultural objects, objects with cultural significance, so they cannot be treated simply as individuals like tables and chairs on the one hand or like abstract types such as the standard meter on the other. Whether a work of art is an individual or a type, it has to be identified partly by means of the cultural context that spawned it, hence the importance of the artist's intentions and the historical, geographical, and intellectual context in which the artist operated (Margolis 1999). From this point of view, interpretation is necessarily bound up with ontology. Not everyone agrees, of course. But those who think that ontological questions should be kept separate from questions about interpretation have some difficulty in explaining how this is to be accomplished.

ART AND KNOWLEDGE

If art works are symbols that need to be pored over in order to release their meanings, then it is reasonable to expect them to advance our cognitive skills and to reveal truths about the world. This claim, however, has been controversial ever since Plato, who famously rejected the claims of poetry to knowledge, arguing that shadows and reflections lead away from rather than toward the truth. Aristotle, on the other hand, argued that poetry is more philosophical than history, because it is about universals rather than particulars, the probable rather than the actual (Janko 1987).

In the classical period, when the arts were thought of as arts of imitation, art works could be a means to knowledge in a very straightforward way: If a painting of Napoleon's Coronation is an imitation or representation of the coronation, then it can inform the world at large that Napoleon has been crowned emperor, what the event looked like, and how important it was. The absolute Idealists, however, made far weightier claims for art: For them it was a mode of knowledge of absolute Spirit. Shorn of its idealist underpinnings this idea can be seen to be a variety of a very old idea: that the artist is a special person with special insight into reality. In the Romantic period, when the arts were thought of as expressions of the artist's attitudes and emotions, the knowledge art works could be expected to provide was knowledge of the emotions, both the artist's and our own. The artist worked out his emotions for us in such a way that we can recreate them in imagination and thereby arrive at self-knowledge.

Current theories about the cognitive value of art are less ambitious. The tendency is to emphasize that works of art are not the best conduits for propositional scientific knowledge, but that they can teach us in other ways. Goodman stressed how paintings, sculptures, films and the other visual arts can teach us to become more adept at making perceptual discriminations of various kinds (Goodman 1976). Literary works in particular have often been thought to provide us with moral knowledge, knowledge of moral truths that can be expressed in propositional terms, as well as knowledge of how to live, how to balance different goods, how to treat one's friends and how to make moral decisions. Novels, films, plays and short stories are thought to be tailor-made to educate our emotions and teach us moral values (Nussbaum 1990, Robinson 2005). On the other hand, if we try to abstract what moral truths are taught by a great work of literature, the best we can often come up with is some banality that may not even be true: *King Lear* teaches us that love is exhibited in deeds, not words, *Anna Karenina* that misery ensues if you abandon your husband and children.

ART AND EMOTION

Goodman has suggested that in our appreciation of art works, the emotions function cognitively. This is an idea first found in Aristotle, who argues that the goal of tragedy is to evoke a catharsis of pity and fear. Although the meaning of "catharsis" has been much debated, nowadays it is usually thought to imply that the evocation of pity and fear is an aid to understanding, not just a fortuitous accompaniment of the tragedy. Aristotle is replying to Plato's denunciation of the art of tragedy as evoking emotions that weaken the moral fiber.

Goodman's idea is more general than Aristotle's. It suggests that understanding any kind of art work may be accomplished in part by having our emotions aroused. For example, feeling surprised, bewildered, and finally relieved by the way the themes and harmonies behave in a piece of music may alert us to the form or structure of the piece (Meyer 1956). Having our emotions aroused by the gradual unfolding of the plot of a novel may draw our attention to important structural high points. But in the literary case our emotions may also help us to understand not just the works of art themselves but also something of life itself. In responding sympathetically to how the characters are feeling and responding and what the significance of their various situations is, we learn what it is like to be in various unfamiliar situations. Responding sympathetically to characters in a novel can give us practice in

understanding other people in real life (Feagin 1996, Carroll 2001). More generally, imaginative engagement with works of literature, film, painting and so on can broaden our imaginative horizons.

The Expression Theory insists that art works do not merely arouse emotions in audiences but also express emotions themselves. This means that an art work can contain a point of view or attitude that gets articulated in the work (Robinson 2005), as, for example, Wordsworth's famous poem articulates the emotions of a stranger, a wanderer, who feels "lonely as a cloud," but becomes happy when he comes across a joyous crowd of daffodils. Paintings too can contain such emotional points of view, for example Monet's *The Seine in Thaw*, painted after the death of his wife Camille, which Wollheim sees as an expression of mourning (Wollheim 1987).

ART AND VALUE

Views about the value of art vary depending on what the essential features of art are taken to be (Budd 1995). For formalists, the value of art is likely to be purely aesthetic, the provision of aesthetic pleasure or aesthetic emotion (Bell 1914). Expression theorists value the arts for their ability to articulate the artist's emotions (Collingwood 1938, Dewey 1934) or to communicate emotions from one person to another (Tolstoy 1960). Cognitive theories of art stressing the meaning and interpretation of art works stress the cognitive values of art, its ability to improve our perceptual and emotional awareness of the world (Goodman 1976, Langer 1953). Of these kinds of value, aesthetic value seems to be a genuinely intrinsic value and a value intrinsic to art. Increased understanding and improved communication among people are no doubt intrinsic goods also, but they are not unique to the arts. By contrast, theories of art that define art in terms of its cultural context or the institutions that surround it do not seem to explain why art has value.

One problem that has been much discussed returns us to the origins of aesthetic theory in the eighteenth century. The question is whether the aesthetic value of the arts includes other sorts of value. Most thinkers on the subject have rejected the idea that monetary value has any bearing on aesthetic value, and most have also distinguished between the aesthetic value of an artwork and its value as a historical or archeological document. But there is no clear consensus on whether the value of art includes moral value, or whether we should keep a sharp divide between the realms of the moral and the aesthetic (Lamarque and Olsen 1994, Gaut 1998). Those who think that art works are primarily designed to provide aesthetic

experiences (Beardsley 1958, Iseminger 2004), are more likely to think that moral value is irrelevant to aesthetic value. But to those who think that the arts are rich repositories of values of all sorts, including cognitive and emotional values (Goldman 1995), moral value will be just one more source of artistic value in a work.

Jenefer Robinson (2005)

AFFIRMATIVE ACTION

Affirmative action is a policy applied in the United States and other countries that aims to enhance educational and career opportunities for minorities and women by granting them preferences in college and graduate school admissions, promotions, and contract awards. Its detractors argue that a policy of favoring some races and ethnic groups over others not only fosters resentments and unrest but also compromises educational and professional standards by considering race or ethnicity ahead of objective criteria of achievement and qualifications. But supporters of affirmative action maintain that it necessary to redress past injustices—in their view created in part by traditional forms of de facto affirmative action (such as university “legacy” admissions) that have benefited only privileged elites.

In the United States, the term “affirmative action” originally referred to a court order requiring companies that had engaged in illegal racial or sexual discrimination to compensate those they had wronged and to show that they planned to avoid future illegal discrimination. Although this ruling suggested that affirmative action was compensation for unjust discrimination, it could not explain why the main beneficiaries of affirmative action were young women and young African Americans who had not been discriminated against by the companies required to hire and promote them. Some defenders of affirmative action responded that women and African Americans were the victims of a generalized prejudice compounded by a legacy of slavery. But critics pointed out that it hardly followed that companies that had refrained from participating in the pervasive discrimination and prejudice were required to compensate its victims; these critics contended that although the slaves deserved compensation from their masters, it did not follow that the descendants of the slaves deserved compensation from the descendants of the masters.

The debate on these issues was lively, but it was never completely settled because affirmative action began to refer to policies that took race and sex into account in order to increase the number of women and racial minorities in universities and businesses, with no implication that the policies were justified because the universities and businesses had practiced illegal discrimination. The defense of affirmative action therefore came to emphasize future results as much as past injustices. One early argument was that affirmative action would reduce inequality; critics countered that although it might increase the number of blacks in the middle and upper classes, it might do little to reduce overall inequality.

The most popular current defense of affirmative action in higher education centers on the educational and cultural advantages of a racially and ethnically diverse student body; this rationale was introduced by Justice Lewis Powell in the 1978 *Regents of the University of California v. Bakke* decision. Writing for the majority, Justice Sandra Day O'Connor appealed to this argument in the *Grutter v. Bollinger* decision of 2003, but critics objected that the principle of strict scrutiny forbids the state from giving racial preference unless it demonstrates that they serve a compelling state interest, which, in their view, had not been demonstrated in these cases. Defenders of these decisions countered that states do indeed have an obvious and compelling interest in eliminating the racial subordination that would likely persist without some form of affirmative action. If these observers are right, the diver-

sity argument for affirmative action may require supplementation with evidence that affirmative action is necessary to reduce racial subordination.

Bernard R. Boxill (2005)

AFRICAN PHILOSOPHY

Many of the greatest thinkers of the modern era, including David Hume, Immanuel Kant, and Thomas Jefferson,

considered Africans and their descendants to be so intellectually handicapped as to make them philosophical invalids, incapable of moral and scientific reasoning. Thus, prior to the twentieth century, the idea of African Philosophy was, for most educated Europeans and Americans, an oxymoron (Eze 1997, pp. 4–5).

Moreover, the notion of African philosophy was provocative (in a way that the notion of British or French or German or Chinese philosophy was not) because the cultures of sub-Saharan Africa had no indigenous written languages in which issues were traditionally discussed and examined. Other than the Egyptians and Ethiopians, most African cultures developed a written script only in response to Islamic and European influences. Following the model of European and North American philosophy, one group of contemporary African philosophers has contended that philosophy requires a tradition of written communication, and that African cultures must evolve beyond traditional conceptions expressed in oral forms if they are to develop the levels of critical exchange required for sophisticated scientific and philosophical activities (Wiredu in Mosley 1995, pp. 160–169; Hountondji 1983, p. 106). But others have argued that African philosophy should be sought in the values, categories, and assumptions that are implicit in the language, rituals, and beliefs of traditional African cultures. In this view, African philosophy is a form of ethnophilosophy—such as ethnobiology and ethnopharmacology—one of the many subject areas of ethnology.

AFRICAN PHILOSOPHY AS ETHNOPHILOSOPHY

One of the principal sources of African ethnophilosophy was the French philosopher Lucien Levy-Bruhl (1857–1939). Levy-Bruhl taught at the Sorbonne from 1896 to 1927 and was one of the leading ethnologists of his era. He argued that the primary concepts, causal relationships, and modes of reasoning used by non-European people were not the result of scripts developed through academic exercises to conform to the laws of Aristotelian logic. Rather, they were “collective representations” inculcated during rites and rituals as a result of intense affective and psychomotor experiences. The concepts of non-European people were felt rather than understood, mystical rather intellectual, and mediated relationships between both physical and nonphysical modes of being. Every event had not only a physical but a “mystical” significance, and the connections between physical and mystical realities were governed by “laws of participation” that transcended the laws of logic that structured thought

in European cultures. In contrast to the law of the excluded middle and the law of noncontradiction, these “laws of participation” allowed things to be both themselves and something else, to be “here” and not here, and to exist both in the present and in the future. Medicine, magic, witchcraft, divination, and communication with the dead were made possible through mystical forces apprehended through “laws of participation” that could not be reduced to “rational explanations” structured by the laws of logic.

In *Bantu Philosophy* (1945), Father Placide Tempels proposed to articulate the structure of reality implicit in traditional African culture. For Tempels, the basic difference between European and African views of reality was ontological. Whereas the basic constituents of reality in European civilization tended to be things with fixed natures (atoms, minds, bodies), the basic constituents of reality in traditional African cultures were dynamic forces. These forces were organized hierarchically into divine, celestial, terrestrial, animal, plant, mineral (including fire, water, and air), and human forces. Good and evil were made manifest in the use of these forces to amplify or diminish the vitality of human beings. Through medicine, witchcraft, sorcery, and divination, certain individuals were able to manipulate these forces to the benefit or detriment of their communities.

Tempel’s analysis reflected in many respects the Sapir-Whorf thesis that the structure of a culture’s language shapes the way that culture structures reality. In his book *Whorf* argued that the structure of Native-American languages such as Hopi gave rise to an ontology of fields and forces, whereas the structure of Indo-European languages gave rise to an ontology of discrete things. From this point of view, philosophical principles were implicit in the structure of the language, beliefs, and practices of a culture, whether or not they were stated explicitly by any member of that culture. Tempel’s analysis was extended and refined by Father Alexis Kagame of Rwanda and by the Belgian ethnographer Jahnhein Janz.

In his influential book, *African Religions and Philosophy* (1969), Professor John Mbiti elaborated the view that implicit in African cultures were different concepts of causality, time, and personhood. Every event had both a physical and a spiritual cause, traceable to the influence of a continuum of spiritual beings (consisting of the living, the ancestral dead, deities, and God). Key to understanding this African metaphysic was a concept of time that consisted of an endless past (the *Zamani*), a living present (the *Sasa*), and a truncated future that returned to the past. Those who had recently died continue to interact

with the living for as long as they were remembered, and then they too returned to the *Zamani*.

One of the major expressions of philosophy as ethnology was *negritude*, a principal exponent of which was Leopold Senghor. Senghor argued that Africans have a distinctive approach to reality in which knowledge is based on emotion rather than logic, where the arts are privileged over the sciences, and where sensual participation is encouraged over cerebral analysis. For Senghor, the European analyzes reality from an objective distance whereas the African embraces reality by participating in it aesthetically and spiritually. This difference between African and European cultures was, for Senghor, physiologically based and inherited (Senghor 1962). However, for Aime Cesaire, the other principal exponent of *negritude*, though the differences between African and European cultures were real, they resulted primarily from historical circumstances rather than biological differences (Arnold 1981, p. 37).

Whether biologically, culturally, or historically determined, many have claimed that the African contribution to civilization was invaluable because it was unique and peculiar to Africans. Nationalists in Africa and in the diaspora—Edward Blyden, Martin Delany, Alexander Crummell, Ndabaningi Sithole, Kwame Nkrumah, Alex Quaison-Sackey, and Leopold Senghor—denied that the African was a degenerate form of the European, and instead held that Africans as a race embodied capacities and potentialities that were different from but equal to those of Europeans. Pan-African nationalists typically held that abolition of the slave trade, slavery, colonialism, and the return of Africans in the diaspora to Africa would reverse the paralyzing effect of European imperialism and make it possible for Africans to develop their peculiar contributions to the evolution of civilization. Africans who chose to remain in the diaspora nonetheless had an obligation to focus inward to develop their peculiar talents so as to address their peculiar problems, rather than looking to Europe for ideas and solutions. From a nationalist perspective, African philosophy should be concerned with articulating those factors that distinguish the African worldview. This orientation rejects the European Enlightenment focus on universal standards of reason, religion, and political development, relative to which every other culture was to be measured. Among European philosophers, it drew its support from Johann Herder, who championed a kind of cultural pluralism that encouraged each race or ethnic group to develop a national character that reflected its peculiar linguistic, historical, and cultural heritage.

CRITICISMS OF AFRICAN ETHNOPHILOSOPHY

Many critics of ethnophilosophy deny that the basis of African philosophy should be sought in the structure of traditional African culture, and tend to favor the more universalist outlook of the European Enlightenment. For Kwasi Wiredu, the development of philosophy in Africa should parallel the development of philosophy in Europe, and traditional African thought should not be considered the principal source of contemporary African philosophy any more than traditional European thought (of the Celtic and Nordic variety) is considered the primary source of contemporary European philosophy. Wiredu is critical of the tendency to preserve traditional beliefs and practices even when they have little rational justification or practical utility. He stresses the need to develop written modes of communication, arguing that literacy is a necessary condition of the transition from a prescientific to a scientific world view. In his view, it is likely that literacy will have as great an impact on the oral cultures of Africa as it had on the oral cultures of premodern Europe.

The fight against colonialism in Africa gave rise to many activists—such as Julius Nyerere, Kenneth Kaunda, Sekou Toure, and Leopold Senghor—who used philosophy for political purposes. But for the critics of ethnophilosophy, postcolonial philosophy in Africa is the era of the professional philosopher, whose interests have been formatively shaped by training in the European philosophical tradition. For the professional philosopher, just because something may have developed by Europeans is no argument against its proving useful for Africans. African philosophers have a pivotal responsibility to domesticate the products of European thought into materials usable by Africans both on the continent and in the diaspora.

But defenders of the professionalization of contemporary African philosophy are also critical of the tendency to automatically reject traditional African institutions and beliefs in favor of modern European ones. A central function of postcolonial African philosophy should be “conceptual decolonization,” which means avoiding or reversing the unexamined assimilation of European ideas by African people. The necessity of a decolonization of the African mind derives from the imposition on Africa of foreign conceptual schemes through the mediums of language, religion, and politics. Wiredu, along with Kwame Gyekye (1995, 1997), Marcien Towa, and others, stress that the professional African philosopher must be prepared to utilize indigenous

sources of wisdom when they offer viable insights and options. Only by the critical assessment of both modern and traditional sources will Africa develop cultural variants that are not the result of the indiscriminate acceptance of either.

Thus, Wiredu defends professional African philosophers from the charge of inauthenticity, and challenges them with two important responsibilities: domesticating European ideas and adapting them to African needs; and reconstructing traditional African ideas so they are relevant to contemporary problems. With his colleague, Kwame Gyekye, the procedure he suggests for domesticating European ideas is that of translating European ideas into an indigenous African language. If an issue addressed in European languages (e.g., the mind-body problem) makes no sense when translated into one's indigenous African language, then it is likely to be an issue that is peculiar to its European origins, and may produce more problems than it solves when applied within the African context. But one must recognize that this test of relevancy is problematic. For given the multiplicity of languages in Africa, even within a single modern nation state, it is questionable whether what does not make sense in one African language (e.g., Akan, Ga) will also not make sense in other African languages (e.g., Xhosa, Zulu). And what of Africans in the diaspora, whose indigenous language is English or French or Portuguese?

UNAMISM

One of the chief criticisms of the ethnophilosophical approach to African Philosophy is its tendency to treat African cultures as if they all must have some essential feature in common. Paulin Hountondji (1983, 2002) rejects the contention that there is some unarticulated collective philosophy imbedded within folk beliefs that all Africans adhere to, a view he calls "unamism." Too often, he argues, ethnophilosophers intentionally or unintentionally reconstruct traditional beliefs according to categories provided by Europeans to advance European interests. Thus, Hountondji claims, Tempels' analysis was made in order to help European colonialists devise better ways to rule the Bantu people. The intent was to benefit not Africans, but Europeans. Likewise, it was European racists who characterized Africans as being ruled by their emotions, incapable of logical thought or the ability to effectively plan for the future. Valorizing these traits as definitive of traditional African cultures simply plays into the hands of the racists. In contrast, Hountondji argues that African philosophy must be a

critical literature produced by Africans for Africans. And philosophy, like science, must be a process of continual self-examination and critical reflection that requires a tradition of literacy. Only if ideas are recorded can energy be focused on assessing them rather than merely recalling them (Hountondji 1983).

APPROACHES TO AFRICAN PHILOSOPHY

Whereas Wiredu and Hountondji construe literacy as essential to the practice of African philosophy, others such as Odera Oruka (1990), Kwame Gyekye, and J. O. Sodipo insist that active engagement in critical reflection on the beliefs and practices of one's culture is a requirement sufficient for that culture to have a tradition of philosophy. From their perspective, African sages that critically reflect on the assumptions of their culture are just as much philosophers as was Socrates. Thus, one may legitimately consider proverbs to be the result of critical reflection in traditional African thought, their purpose being to provide, not a scripted system of abstract rules, but a situational model to guide concrete action. If one follows the orientation of traditional thought, Godwin Sogolo argues, the point of African philosophy would be more to guide people in how they should interact with the world rather than to provide them with a true understanding of it. Odera Oruka's conversations with Luo sages, Hallen and Sodipo's (1986) conversations with Yoruba Babalawo, and Marcel Griaule's conversations with Ogotemmelé show them to be individuals with levels of critical wisdom comparable to that of Socrates.

THE NATIONALIST-IDEOLOGICAL APPROACH.

Another approach to African philosophy may be characterized as nationalist-ideological, hermeneutical, or liberationist. Its exponents would include Tsenay Serequeberhan, Franz Fanon, Kwame Nkrumah, Julius Nyerere, Amical Cabral, W. E. B. Dubois, Chubba Okadigbo, and Wamba Dia Wamba. In this approach, philosophy takes the lived experience of African people as its starting point, and the lived experience of most Africans revolves around a struggle to cope with the omnipresent effects of European colonialism and neo-colonialism. As such, the principle objective of African philosophy must be how to achieve liberation from the injuries imposed by European imperialism. Traditional beliefs are not valuable in themselves, but have merit in modern Africa only to the extent that they contribute to this end. A focus on the past as the source of authenticity diverts attention from the regressive nature of many

beliefs and practices, and detracts from a critical posture that evaluates all practices, both traditional and modern, of both African and European origin, relative to their contribution to the liberation of Africa. African philosophy must address the fact that many traditional leaders were installed by European imperialists as mere mouthpieces of colonial rule, and many contemporary African leaders have remained neocolonial puppets, even as they have appropriated the symbols of traditional Africa with the power of the modern state.

In addressing the question of liberation, a central question for many African philosophers is the relative importance of race versus class. Many see race to be as or more important than class in the struggle for African liberation, and they doubt whether the white proletariat will abandon the privileges of white supremacy in order to form a united front with people of color. A case in point is the apartheid regime of South Africans, where poor whites who considered themselves Africans nonetheless insisted on privileges over black Africans. Even when race is secondary, the effects of colonial rule continue to divide Africans along tribal lines. Thus where Africans have replaced Europeans in neocolonial states, it is often tribal differences among Africans that is a source of current problems. As Kwame Gyekye (1997) points out, loyalty to family and tribal affiliations tends to breed nepotism, graft, and corruption when fostered by neocolonial ties. For Franz Fanon, racism was simply a way of justifying oppression by insisting on the inferiority of the oppressed. Africans would gain a sense of agency, he argued, only when, through struggle, they overcame the false separations of race and tribe introduced by colonialism. Africans must devise, through their own initiative, the means to liberate themselves (Fanon 1963). Cabral argued that this would require urban intellectuals to “return to the source” and form alliances with the agricultural peasantry in the fight for freedom from colonialism and neocolonialism. (Cabral 1979)

AFROCENTRISM. Afrocentricism is built around the claim that Black Africa’s contributions to world culture have been denied in order to further a racist agenda. Afrocentrists take as their patron Cheik Anta Diop, who argued that Egypt was an African culture, and its achievements in science, mathematics, architecture, and philosophy were the basis for the flowering of classical Greek civilization. That the ancient Egyptians were black Africans was freely acknowledged in the ancient world but was denied and misrepresented by modern Europeans in order to justify racism, slavery, and colonialism. Diop uses language, rituals, and practices to trace the ori-

gins of the major sub-Saharan African cultures to ancient Egyptian civilization. As such, he denies that Africans are “naturally” more oriented towards the arts than to science and technology. Rather, he claims that European imperialism in the modern era impoverished Africa’s resources and stifled its scientific, technological, and political development. The imposition by Europe of a patriarchal ethical and social structure on an African orientation that was traditionally matriarchal further distorted Africa’s social and political development.

THE PROBLEM WITH RACE. Kwame Appiah has mounted a sustained attack on the view that African philosophy should express the peculiar orientation of the African race. He argues in *In My Father’s House* (1992) that, before their contact with Europeans beginning in the fifteenth century, people on the African continent did not view themselves as members of the same race. The notion of the African race was invented by Europeans to justify a generic form of continental oppression. Moreover, Appiah has argued that people should reject the notion of race because there is no biological or cultural basis for dividing humankind into races: there is more variation, he claims, both biologically and culturally, among those characterized as Africans than there is between the average African and European. Thus, the Pan-African ideal of uniting all members of the African race, both on the continent and in the diaspora, is flawed and is itself a form of “intrinsic racism.” (Appiah 1992, p. 17) Attempts to identify some set of traits as the essence of the African race are misguided, whether the intent is to denigrate or valorize.

Appiah’s views reflect a trend, since the end of WWII, of rejecting racism by rejecting the existence of races. However, within biology and anthropology this orientation is highly contentious. Many, including Diop, reject racial essentialism and racism but insist nonetheless that there are legitimate grounds for recognizing the existence of races. That Africa is the source of all humankind is one explanation for the huge range of variation among its people, who are moreover united by a history of super exploitation and denigration.

THE FEMINIST PERSPECTIVE European philosophy has typically assumed that the interest of males represents the interest of the species, just as it has assumed that European philosophy is the standard for judging all other attempts to do philosophy. Thus, given similar histories of struggling against domination, many feminist philosophers have shared with Africans and African Americans an interest in deconstructing traditional philosophical

methods and assumptions so as to expose implicit agendas of domination. Ifa Amadiume (1997) has elaborated Diop's contention that precolonial Africa was primarily matriarchal, but moves beyond Diop to stress the advantages of small political units such as the family and village over large political units such as nations and empires. Other African feminists not only deny that traditional African societies followed the European paradigm of privileging men over women but also consider patriarchy and matriarchy to be European categories imposed to configure Africa on a European standard.

Africa has had its biggest cultural impact on the direction of contemporary European culture, not in the sciences, but in the arts. African sculpture, painting, music, and dance have radically influenced the development of modern European art forms and aesthetic values. But traditional African art forms have differed from modern European art forms in several important respects. Modern art is often displayed in museums as objects to be viewed, not touched. But traditional African art played functional roles in addressing practical realities, and Beauty resided as much in what something did as in how it looked. Music and dance were activities to be participated in, not simply perceived from a distance, and they provided individuals with a model of how to situate themselves in a world in which they played an active role in creating.

The American feminist Sandra Harding has stressed the similarity between the struggle of Africans and the struggle of women against European male hegemony. Other American feminists have argued that values implicit in Africa's practice of the arts may help to develop a better appreciation of the ingredients of the ethical life and reinforce orientations that enhance people's ability to live together. In much of the European philosophical tradition, ethics involves the attempt to articulate principles that should guide and justify the choices one makes. But Cynthia Willett (1995) and Kathleen Higgins (1991) have attempted to ground ethical relationships in the music and dance traditions of the African aesthetic rather than in principles deriving from rational choice or compassionate care. In a similar vein stressing the importance of the aesthetic orientation in African philosophy, Richard Bell (2002) proposes that African philosophy should be conceived as embodied in narrative icons rather than verbal texts. These developments show how African philosophy should not be considered the exclusive domain of men, that it need not take science as its principal exemplar, and that one need not be

African in order to address issues of central importance in African philosophy.

The domination of African states by repressive regimes of colonial and neocolonial tyrants has institutionalized violence throughout Africa and its diaspora. The Truth and Reconciliation tribunals of South Africa have provided a novel process for achieving justice. This approach recognizes that the purpose of seeking the truth concerning violence against the people is to seek atonement and reconciliation; and that this is something that is as much needed in dealing with crimes of Africans against Africans as in crimes of Europeans against Africans.

AGENT CAUSATION

The concept of an agent's causing some event seems distinct from that of an event's causing another event, and this apparent distinctness has been exploited by some philosophers of action—agent causationists—to defend an incompatibilist and libertarian account of free will. Agent causationism is associated historically with, among others, the philosophers Francisco Suárez and Thomas

Reid, and in more recent times has been defended by Richard Taylor and Roderick Chisholm.

AGENT CAUSATION AND EVENT CAUSATION

What is indisputable is that causal statements come in at least two forms, one in which a term denoting a person or persisting object is the subject of the verb *cause* and one in which a term denoting a particular event occupies this role. Compare, for example, "The bomb caused the collapse of the bridge" and "The explosion of the bomb caused the collapse of the bridge." Here it seems plausible to contend that the first of these statements is elliptical, meaning something such as "Some event involving the bomb caused the collapse of the bridge," and more generally that the causation of events by inanimate objects is always reducible to the causation of those events by other events involving those objects. However, it is less evident that this sort of analysis applies in cases in which a person or other intelligent agent is said to cause some event. Sentences containing transitive verbs of action generate many such cases, because an action sentence such as "John raised his arm" clearly entails a corresponding agent-causal sentence, "John caused a rising of his arm." What seems less clear is that the latter sentence entails an event-causal sentence, "Some event involving John caused a rising of his arm," at least on the assumption that John raised his arm as a so-called basic action.

A basic action is standardly taken to be one that is not done by doing anything else. An action such as closing a door is nonbasic, because one can only close a door by doing something to it, such as pushing it. It is possible to raise one's arm as a nonbasic action—for example, by pulling on a rope attached to the arm, using one's other arm. But, it seems, there is nothing one needs to do in order to raise one's arm when one raises it in the normal way. This appears to generate a difference between the case of the bomb's causing the collapse of the bridge and that of John's causing the rising of his arm: the bomb caused the collapse by exploding, but John, it seems, did not cause the rising by doing anything else. Consequently, it is not evident that there was any event involving John that could be said to have caused the rising in the way that the explosion of the bomb can be said to have caused the collapse of the bridge. In this case it appears that a statement of agent causation is not reducible to one of event causation.

Philosophers who favor a volitionist theory of action may dispute this suggestion. They may urge that there is in fact something that John did, and by doing this he

raised his arm—on the assumption, at least, that he did so voluntarily. Namely, John willed to raise his arm. It was by willing to raise his arm that he did raise it, and so it might be said that the agent-causal statement, “John caused the rising of his arm,” is true only in virtue of the truth of the event-causal statement, “John’s willing to raise his arm caused the rising of his arm.” However, volitionism is now a minority position in the philosophy of action—in contrast with its heyday in the seventeenth and eighteenth centuries—because many philosophers are skeptical about the existence of volitions as a supposedly distinctive class of mental events. Proponents of the irreducibility of agent causation to event causation may take comfort in this fact, although they still have to face another and more prevalent kind of critic: the proponents of mainstream causal theories of action. These critics contend that intentional actions have mental causes of another sort—the onsets of states of belief and desire. While these philosophers may concede that there is no action by doing which John caused his arm to rise, they still contend that there was an event involving John that caused the rising of his arm—to wit, the onset of his desire to raise it and, perhaps, his belief that by raising it he could achieve some further desired end. This event was not an action of John’s, to be sure, but it was nonetheless an event involving him that, like the exploding of the bomb, seems to explain how the effect he caused was brought about.

AGENT CAUSATIONISM AND FREE WILL

Agent causationists—that is, philosophers who maintain the irreducibility of agent causation to event causation—are opposed to mainstream causal theories of action, not least because the latter seem inhospitable to libertarianism (the doctrine that free actions lack determining causes in the form of antecedent events which causally necessitate their occurrence). Proponents of such mainstream theories are typically compatibilists concerning the relationship between free will and determinism. Agent causationists, in contrast, standardly hold that certain events caused by agents are not caused by any antecedent events, or at least that these certain events lack sufficient causes in the form of antecedent events. Some agent causationists maintain that the events in question are bodily movements—such as the rising of an arm—when these are the products of basic actions. Others maintain, perhaps more plausibly, that the events in question are certain neural events that are the causal precursors of bodily movements. Yet others seek to combine

agent causationism with a form of volitionism by contending that what agents cause directly are their own volitions, choices, or endeavors. Thus, agent causationism is not necessarily opposed to volitionism, only to certain versions of it.

Common to all standard forms of agent causationism, however, is the doctrine that at least some cases of an agent *A*’s causing an event *e* do not consist in *e*’s being caused by any antecedent event involving *A*. This doctrine seems to help the case for libertarianism in the following way. The libertarian wants to say that in a case of free action, an event *e* occurs that lacks a sufficient cause in the form of antecedent events. But this prompts the objection that *e* would then be a mere chance event—such as the spontaneous decay of a radium atom—and as such would not exhibit the kind of freedom associated with an action for which an agent may be held morally responsible. The agent causationist may respond by urging that there is a significant difference between the decay of a radium atom and a case of free action because in the latter an event *e* occurs that, while lacking a sufficient cause in the form of antecedent events, still has a cause in the form of the agent whose action it is. A radium atom does not cause itself to decay, but a free human agent may cause him or herself to act in a certain way, according to agent causationism. Free agents, according to this conception, are unmoved movers or ultimate initiators of certain trains of events. And it is in having this capacity for initiation that their freedom allegedly lies, for it supposedly enables free agents to intervene in and affect the ongoing stream of events in which natural physical processes consist. Free agents’ capacity for initiation is conceived to be a “two-way power”—a power either to cause or to refrain from causing an initial event of an appropriate kind.

OBJECTIONS TO AGENT CAUSATIONISM

Not surprisingly, agent causationism is subject to many criticisms—in particular from philosophers who advertise their own position as being “naturalistic”—and is charged with being mysterious and incompatible with the modern scientific worldview as revealed by physics and biology. More specifically, one popular objection is that agent causationism is committed to some form of substance dualism in the philosophy of mind, which in the eyes of most naturalistic philosophers would be enough to condemn it. However, whereas many agent causationists may in fact be substance dualists, it is not clear that their agent causationism requires them to be.

A more cogent objection to agent causationism, forcibly expressed by C. D. Broad, is that the agent causationist cannot explain why an event supposedly caused irreducibly by an agent should occur when it does (since agent-causes, unlike event-causes, are not datable items). The collapse of the bridge occurred when it did because the explosion, which was its cause, occurred when it did. But why should the many different events supposedly caused by a single agent during his or her lifetime have occurred when they did? One possible answer is that these events also have contributory causes in the form of antecedent events occurring at different times, even though each of them additionally requires causation by the agent for its occurrence. Another possible response, consistent with the first, is to appeal to temporal factors included in the agent's reasons for causing the various different events in question. (Agent causationists typically repudiate the doctrine that reasons are causes, and distinguish between reasons-explanations and causal explanations—or at least they deny that an agent's reasons, in the form of certain beliefs and desires of the agent, are part of a sufficient event-cause of the agent's action.)

Others may object that agent causationism does not really assist the case for libertarianism in the way it is alleged to for the following reason. Suppose, for the sake of argument, that instances of irreducible agent causation really do occur, and that sometimes it is the case that an agent *A* causes an event *e* in this irreducible fashion, while *e* lacks a sufficient cause in the form of antecedent events. It was suggested earlier that this still allows us to say that *e* was not just a chance event, because it was caused by *A*. However, what about the event of *A*'s causing *e*? It would seem that this event must either possess or lack a sufficient cause in the form of antecedent events. If the former, then it is hard to see how libertarianism is saved. If the latter, then it would seem that *A*'s causing *e* is itself just a chance event and so once again provides the wrong sort of freedom for moral responsibility.

Once more, various replies are available. One is simply to deny that *A*'s causing *e* qualifies as an event and as such is something eligible to possess a cause. After all, it seems odd to think of one event's causing another as itself being an event, just as it may be deemed equally odd to think of an agent's causing an event as itself being an event. Another possible reply is that when there is an instance of agent causation—*A*'s causing *e*—the agent *A* is not only the agent-cause of *e* but is also, by virtue of that fact, the agent-cause of this instance of agent causation. If this is the case, then the instance of agent causa-

tion is excluded from being a mere chance event for the same reason that the event *e* is thus excluded.

It does not appear, on close inspection, that there is anything incoherent in the notion of irreducible agent causation, but whether it really helps to solve the problem of free will and whether it is consistent with current scientific theories in physics and biology are questions that still remain open to further debate.

E. J. Lowe

AGENT INTELLECT, THE

In his *On the Soul*, iii 4–5, Aristotle wrote that there is one intellect that becomes all things and another that makes all things, just as light makes colors visible. It is separate, impassible, unmixed, and in essence activity; it alone is

immortal and eternal. Those few statements are the basis of the theory of the agent intellect.

Aristotle was studied with intense and sometimes imaginative care by ancient and medieval scholars, and his ideas were developed to the extent of dominating thought about human thinking. Our concept arose in Greek but was developed in Arabic and flowered in medieval Latin; “agent intellect” is the English rendering of the Latin *intellectus agens*, but behind that lie a number of other terms. Furthermore, English writers have sometimes used active instead of agent.

The field falls into three parts: the Greek commentators on Aristotle, the Arabic philosophers who developed his views, and the medieval Europeans who built on the rest. Aristotle himself was sparing with technical terms, and the text of *On the Soul*, iii 4 and 5, is in a poor state that raises several questions. Later thinkers brought in material from earlier parts of *On the Soul* (i 4, ii 2); part of *On the Generation of Animals* (ii 3) in which Aristotle says that in humans the intellect (unqualified) comes into the fetus from outside (*thurathen*); passages from his ethics and his metaphysics, in which the intellect is regarded as in some sense divine; and the end of his *Posterior Analytics* (ii 19). The result is far from anything Aristotle can have held.

Aristotle’s student Theophrastus raised pertinent questions about the agent intellect, reported, perhaps unreliably, by Themistius (c. 317–88), who himself studied Aristotle with care and ingenuity. He reports one early view—that the agent intellect was the body of premises and deductions that form knowledge—but dismisses it, as he does the view of Alexander of Aphrodisias (c. 200 CE), who held that the productive or active or agent *nous* (now identified with the *nous thurathen* that for Aristotle was a biological concept) was identical with the First God or the unmoved mover of *Metaphysics* XII 8. It is clear that there had been much discussion about this already, and already we see a tendency to the hypostatization of various intellects.

Themistius and Alexander together influenced Arabic thinkers. Most important are Avicenna (980–1047) and Averroes (1126–98). Avicenna had a theory of celestial intellects, derived from Neoplatonist views as well as Aristotle’s metaphysics and psychology; for him the agent intellect was the tenth and lowest of a chain descending from the First Intellect, far removed from the human soul. More accessible was Averroes’s view, which started from Aristotle’s distinction between intellect as potential and as active or agent but went on to argue that the agent intellect was one and the same in all men, leading on to

the question whether the potential intellect was also one and the same in all men. The Arabic philosophers were also interested in this intellect as the source of prophecy, and in the possible conjunction with it of the human reason.

Arabic works were translated into Latin by Western medieval scholars, so that Europe became aware of much of Aristotle and of his Arabic interpreters at almost the same time; in the thirteenth century it was taken for granted that the words *intellectus agens* stood for something definite, but there remained many questions about it. Albert the Great (c.1200–1280) introduced the Latin expression *intellectus agens*. He got to know the Arabic evidence and dealt with the fourfold distinction of agent, possible, acquired, and speculative intellects, which became the basis for later discussion.

In his time there was an Averroist school of thought, particularly in Padua, which troubled more orthodox thinkers; even Thomas Aquinas (1225–1274) wrote against them. In his extensive writings he worked out a theory aimed at satisfying both Aristotelians and Christian theologians. He quoted Aristotle to disprove his opponents’ views, using the *Physics*, *On the Soul*, and Themistius, Avicenna, and others. He was primarily concerned with whether there was but a single intellect for all men and the subsidiary question about the agent and the receptive intellects. In his *Summa* he concentrates on the internal features of the intellect, and the agent is that which by its light abstracts species from images.

A single agent intellect would not secure individual immortality as required by Christianity, and when many Averroist doctrines were condemned by the Church in 1277, a number were about the Agent Intellect. An anonymous work from the early fourteenth century covers sixteen supposed views about the agent intellect from Plato (who is said to have denied its existence) through the Arabs to a number of others; the writer favors Thomas Aquinas. An array of arguments, partly from Aristotle but partly independent, is deployed. There are questions about the existence of the agent intellect, and again about whether there is one in each person or only one for all, as there is one light source illuminating all illuminated objects.

Even in the Renaissance the concept is found in the Averroism of Pomponazzi (1462–1525): in his *On the Immortality of the Soul* he doubted immortality, but, opposed by the Church, argued that philosophy could not prove anything in this area. Zabarella (1533–1589), a logician, also still spoke of the agent intellect as playing a part in induction. Finally, Aristotle’s dominance came to an

end, and his account of the intellect has been described recently as a museum piece. Instead of his metaphysical approach, a scientific psychology slowly developed, which was not interested in analyzing his actual words.

AGNOSTICISM

In the most general use of the term, "agnosticism" is the view that we do not know whether there is a God or not. Although the history of agnosticism, in this general sense, is continuous with that of skepticism (thus reaching back to the ancients), the term itself was coined by T. H. Huxley and its distinctive philosophical bearings emerged in the course of the nineteenth-century debate on religious belief. Participants in that debate often used the word in a strong and specific sense: To be an agnostic was to hold that knowledge of God is impossible because of the inherent, insuperable limitations of the human mind. To assert confidently either the existence or the nonexistence of a deity with definite and intelligible attributes was to transgress these limits.

This consciousness of limitation is classically expressed in the "Transcendental Dialectic" of Immanuel Kant's *Critique of Pure Reason* (1781). There is a continual temptation, Kant stated, to raise questions about the totality of things; but these questions, he argued, are demonstrably unanswerable. Contradictions are encountered, for instance, whether it is assumed that the world is finite in space and time or infinite in space and time. Or, in another instance, one event may properly be called the cause of another event, but such a concept cannot be used to assert that something (a First Cause) is the cause of the

universe as a whole. Of this "whole" one has, and can have, no experience. The main line of agnostic argument in the nineteenth century followed Kant closely in his criticism of cosmological reasoning, although many agnostic writers were not thoroughgoing Kantians. Nor did they have to be Humeans to have their metaphysical assurance called in question by David Hume's famous (or notorious) criticism of speculation in *An Enquiry concerning Human Understanding* (1748): "If we take in our hand any volume; of divinity or school metaphysics, for instance; let us ask, *Does it contain any abstract reasoning concerning quantity or number?* No. *Does it contain any experimental reasoning concerning matter of fact and existence?* No. Commit it then to the flames: for it can contain nothing but sophistry and illusion."

A person who calls himself agnostic commonly judges that he cannot have both agnosticism and, say, Christian belief. Yet the main positions of nineteenth-century agnosticism were in fact worked out and held by "religious agnostics," writers who argued that a very high degree of ignorance concerning the deity was nonetheless compatible with a religious commitment of some kind. In fact, if not in name, this view was also found in the twentieth century; it is essentially the view of those who disclaim metaphysical knowledge of God, but yet stake all upon "faith," "authority," or Christianity as a practical way of life. Kant may again provide the archetypal model: Having denied that theoretical reasoning could furnish arguments for the existence of God, he nevertheless claimed that God had to be "postulated" in order to make sense of moral experience.

In his most influential article, "Philosophy of the Unconditioned" (*Edinburgh Review*, 1829), Sir William Hamilton tersely introduced themes that were to be developed, refined, and repudiated by writer after writer to the end of the century and well beyond. "The mind," he wrote, "can ... know only the *limited, and the conditionally limited*." To attempt to think the unconditioned or absolute is to think away "those very conditions under which thought itself is realized." "Loath to admit that our science is at best the reflection of a reality we cannot know, we strive to penetrate to existence in itself; ... But, like Ixion, we embrace a cloud for a divinity."

H. L. Mansel, in his Bampton Lectures, *The Limits of Religious Thought* (1858), tried to show in detail that alleged knowledge of the Absolute is self-contradictory at many points. One attributes personal qualities to God, for instance, and yet one cannot think through the notion of personality without the idea of limitation; thought must be distinguished from thinker, and so on. But limitation

is incompatible with infinite and absolute deity. The conclusion, however, is not a total religious skepticism. For although speculation about the divine nature is a vain attempt to escape the inescapable conditions of human thought, yet through the “feeling of dependence” and in moral conviction faith may still operate where speculative reason cannot.

Herbert Spencer in his *First Principles* (1862) accepted this picture of a limited human reason, aware of its limits and yet (in his view) aware also that those limits are decidedly not the limits of the real. Science and religion could, in fact, be reconciled by realizing that each of them testifies to a mystery, to an inscrutable Absolute, quite beyond the frontiers of knowledge or conception but yet not mere negation or nothingness.

The sources of nineteenth-century agnosticism—particularly the agnosticism of those who abandoned organized religion—were, however, more numerous and complex than has been indicated so far. It is rare indeed that a single line of philosophical argument produces by itself either religious conviction or disillusionment. At least three additional sources should be mentioned.

First, a growing mass of data and theory supplied by the physical sciences was *prima facie* at variance with biblical history and cosmology. There was the new time scale of geology, the impersonal and amoral Darwinian evolutionary theory, and the radical textual, historical criticism of the Bible itself.

Second, once the strong initial resistance to systematic and searching criticism of Christian teaching had been overcome, it was possible to express openly a good many moral misgivings about the Christian conception of God and his governance of the world. J. S. Mill declared it was impossible for a thoughtful person to ascribe “absolute perfection to the author and ruler of so clumsily made and capriciously governed a creation as this planet” (*Three Essays on Religion*, 1874). He found “moral difficulties” also in “the recognition ... of the object of highest worship, in a being who could make a Hell” and create creatures whom he foreknew to be destined to suffer in it eternally. No less morally repugnant to many writers was the insistence of the orthodox that their dogmas required sheer unswerving acceptance, and that breakdowns in argument or intelligibility were simply occasions for the exercise of an intensified faith. T. H. Huxley was forthright. In “Agnosticism and Christianity” (1889) he wrote, “I, and many other Agnostics, believe that faith, in this sense, is an abomination.” In “Agnosticism” (1889) he said, “I verily believe that the great good which has been effected ... by Christianity has been

largely counteracted by the pestilent doctrine ... that honest disbelief in their more or less astonishing creeds is a moral offence, indeed a sin of the deepest dye.”

Third, the same authors were vehemently critical of the standards of evidence and reasoning normal in theology, and contrasted them with the severe, rigorous, and dispassionate criteria of the sciences. To Mill, “The whole of the prevalent metaphysics of the present century is one tissue of suborned evidence in favour of religion.” If one considers the nature of the world as one actually observes it, the very most one could dare to hazard is the existence of a good but finite deity; and Mill put forward even this possibility with a characteristically agnostic tentativeness. For Huxley agnosticism was “not a creed but a method, the essence of which lies in the rigorous application of a single principle”: Reason should be followed “as far as it can take you,” but undemonstrable conclusions should not be treated as if they were certain. “One may suspect,” he said, “that a little more critical discrimination would have enlarged the Apocrypha not inconsiderably.” In a similar vein, Leslie Stephen protested against theologians who ventured to define “the nature of God Almighty with an accuracy from which modest naturalists would shrink in describing the genesis of a black beetle” (*An Agnostic’s Apology*, 1893).

It is not the purpose here to estimate how far theologians remedied, or could ever remedy, the deficiencies in their arguments that offended their agnostic critics. Some permanently valuable lessons can be learned, however, from the course of the controversies. An obvious one is the odd instability or ambiguity of certain agnostic positions. Let us suppose—as did many of the writers just quoted—that one ceases to find convincing the arguments for the existence of a deity. Experience, one now judges, is limited to the observable world; and reason, although it may lay bare the conditions and presuppositions of that experience, cannot extend our experience of what is. A religiously minded person, in this situation, is tempted to divide reality into the knowable and the unknowable and to attribute to the latter many of the lineaments of deity. Thus, “negative theology” and a religiously toned agnosticism can be the closest of relatives. No sweeping philosophical criticism can demonstrate that all such positions are untenable or involve a cryptotheism; each case must be scrutinized individually. Certain religious attitudes toward the unknown or unknowable—attitudes, for example, of wonderment and awe—can be perfectly appropriate and invulnerable to criticism, whereas others—such as the expectation of personal encounter with the unknown—are obviously

most vulnerable. One can turn to history for some examples.

In 1896 James Ward delivered his Gifford Lectures, *Naturalism and Agnosticism* (published in 1899), at Aberdeen University. These contained a vigorous attack on the basic presuppositions of the Hamilton-Mansel-Spencer approach. The sciences, Ward said, do not form a whole that floats in a surrounding “nescience.” The world we know does not consist of “appearance” concealing an “ultimate reality” that lies behind or beyond it. In any case, nescience is nescience. “Where nescience is absolute, nothing can be said; neither that there is more to know nor that there is not.” Spencer and like-minded writers had, however, said a good many mysterious things about their Absolute, things that, by their own account, were strictly unsayable.

R. Flint (*Agnosticism*, Croall lectures, 1887–1888, published in 1903) also denounced the equivocations (as he saw them) of a religious agnosticism. “All that the mind can do on the side of the Unknowable is to play at make-believe, to feign faith, to worship nothingness.” “Call your doubts mysteries,” said Stephen, satirizing the complacent, “and they won’t disturb you any longer.”

Is it possible for a reflective person to be an agnostic in the present time? Logical positivists have answered “No.” In *Language, Truth and Logic* (1936), A. J. Ayer claimed that since “all utterances about the nature of God are nonsensical,” the agnostic’s statements about God are no less nonsensical than the theist’s. Both assume, wrongly, that “the question whether a transcendent God exists is a genuine question.” According to positivism and postpositivist logical analysis, the theological problem is not a problem of evidence and argument, but a problem of meaningfulness. If “God” is a meaningless word, the sentence “Perhaps God does not exist” is also meaningless.

In stating the situation thus, positivism was dramatically drawing attention to what it believed to be distinctive in its approach, but it simultaneously obscured some important lines of continuity with the earlier debate on agnosticism. Before the nineteenth century had ended, Flint had written, in criticism of Hamilton, “*Credo quia absurdum* can be the only appropriate motto of a philosopher who holds that we may believe in a God the very idea of whom we can perceive to be self-contradictory.” The possibility of internal illogicality in the very notion of deity, the risk of the absurd and nonsensical, were well enough recognized. Spencer, wrestling with the problems of the world’s origin and beginning, said that the questions here are not questions of credibility but of *conceiv-*

ability. Notions such as self-existence and creation by an external agency “involve symbolic conceptions of the illegitimate and illusive kind.” The logical positivist tethered his theory of meaning to the demands for observational verification and falsification of our claims about existents. Compare Spencer once more, writing in 1899: “Intellect being framed simply by and for converse with phenomena, involves us in nonsense when we try to use it for anything beyond phenomena.” It must, of course, be added that the positivists and later analysts carried out their austere program with far greater thoroughness and consistency than did their predecessors. But the lines of continuity are there; and they are—once more—those same lines that reach back to Kant’s “Transcendental Dialectic” and to David Hume. They justify the use of “atheist” to describe one who rejects the performances and attitudes of religion on the grounds that talk about God is unverifiable talk, or that the concept *God* contains inner illogicalities.

But is there still room for agnosticism as undogmatic dubiety or ignorance about the existence of God? A case for saying that there is still room can be made on the following lines. Where one gives an account of an expression in our language, and where that expression is one that refers to an existent of some kind, one needs to provide not only a set of rules for the use of the expression, but also an indication of how the referring is to be done—through direct pointing, perhaps, or through giving instructions for an indirect method of identifying the entity. Can this be done in the case of God? Pointing, clearly, is inappropriate, God being no finite object in the world. The theologian may suggest a number of options at this point. He may say: God can be identified as that being upon whom the world can be felt as utterly dependent, who is the completion of its incompletenesses, whose presence is faintly adumbrated in experience of the awesome and the numinous. Clear direction-giving has here broken down; the theologian may well admit that his language is less descriptive or argumentative than obliquely evocative. Does this language succeed in establishing that statements about God have a reference? To persons susceptible to religious experience but at the same time logically and critically alert, it may seem just barely to succeed, or it may seem just barely to fail. Some may even oscillate uneasily between these alternatives without finding a definite procedure of decision to help them discriminate once for all. A person in this last category is surely an agnostic. His agnosticism takes full account of current linguistic criticisms of religion; it is in the course of his reflections upon meaning that he sees the necessity of relating the linguistic to the

extralinguistic, and his answers to this problem, the problem of reference, plunge him into the deepest uncertainty.

The temper of mind just outlined, with all its inner turbulence and anxiety, is probably the most creatively fruitful of the many varieties of agnosticism. Where there is no temptation to believe, there can be little philosophical interest in not believing. Where there has been little or no religious experience, no sense of the haunting strangeness that makes the believer wittingly violate language and logic to express it, there can be little incentive to explore minutely the possible interpretations—theistic, pantheistic, naturalistic—of that experience. As a matter of history, agnostics of this temper are to be found far more rarely today than at the height of the agnosticism controversy a century ago. For the great writers of that controversy were in most cases brought up within the Christian faith, had identified themselves with it, and subsequently suffered a bewildering disorientation. Yet, if one is to take seriously today the problems of philosophical theology, there must be some suspension of disbelief, at least an imaginative venture, in order to see why the believer feels compelled to use the extraordinary language he does use. He knows well enough that it is extraordinary; but he deems that it is ordinary language that is found wanting, and not his experiences and the interpretations he puts upon them. The agnostic knows that sometimes ordinary language needs to be violated, as a poet often violates it. He knows also that to disturb our linguistic apparatus in so radical a way can obscure some movements of thought of a very questionable (or downright invalid) logic. Has this happened in the particular case of theism? Searching in this obscurity, the agnostic reports that he cannot tell. For the health of philosophy and theology, it is well that he should continue to search.

AGRIPPA

(c. 50 BCE–c. 150 CE)

Agrippa is known by way of one citation in Diogenes Laertius's *Lives of the Philosophers* (DL 9.88). Nothing is known of his life, and little of his dates (he lived between the mid-first century BCE and the second century CE). Yet Agrippa is indisputably a figure of the highest importance in the history of skepticism, indeed of epistemology in general. The citation attributes to him the invention (or at least the codification) of five "Modes," or argument patterns, which represent a new methodological rigor and self-consciousness in the development of Pyrrhonian skepticism. Earlier skeptics such as Aenesidemus had presented certain aspects of skeptical procedure in a more or less organized fashion; but the Ten Modes attributed to him are arranged according to the subject matter of the considerations appealed to. By contrast, the Modes of Agrippa seek to categorize skeptical practice according to the type and function of the argument patterns involved.

The Five Modes are summarized in two sources; in addition to Diogenes's brief notice (DL 9.88–89), a somewhat longer treatment survives (although without mentioning Agrippa by name) in Sextus Empiricus's *Outlines of Pyrrhonism* (PH 1.164–177). Taken together, they offer a general strategy for inducing doubt (and suspension of judgment, *epochē*) on every contentious issue. Two of the Modes, the First and the Third, may be described as material. The First Mode notes, in standard Pyrrhonian fashion, that most important issues are matters of dispute (*diaphōnia*) and if they are not, the skeptic will make them so. Sextus Empiricus describes skepticism as "a capacity for opposing appearances to appearances and judgments to judgments in whatever manner, so that we are brought ... first to *epochē* and then to tranquility" (PH 1.8). Thus "we find an irresolvable conflict both among lay people and philosophers," which leads to these conditions "since we are unable either to assent or deny" (PH 1.165, cf. DL 9.88). The disputes are said to be "irresolvable" (PH 1.98, 212), because (skeptics allege) no independent criterion of judgment is available for them. Unpacking this claim involves invoking the other three, formal, Modes. This is because, as the Third Mode from Relativity holds, things are never apprehended in themselves and unalloyed, but only "along with something else" (DL 9.89): "the underlying object appears thus and so in relation to the one judging and concomitant circumstances, so we suspend judgment as to its real nature" (PH 1.167). Such considerations form the material for the Ten Modes of Aenesidemus, and via René Descartes and others came to dominate the landscape of epistemologi-

cal scepticism (e.g., lights seem bright in the dark but dim in sunlight; oars seem straight in air, but bent in water: PH 1.119). Thus people can say how things appear to them but they have no grounds for any pronouncements as to how things really are.

But it is in the exposition and deployment of the three formal Modes that the power and originality of Agrippan skepticism becomes manifest. The Second is that from Regress: "what is adduced as confirmation for what is posited itself requires further confirmation, and that another, and so on *ad infinitum*" (PH 1.166). The Fourth is the Mode of Hypothesis, which the *Dogmatists* (Sextus's generic term for his nonskeptical opponents) resort to "when being forced to regress *ad infinitum*, take as an axiom something which they have not established, but see fit to assume as agreed without demonstration" (PH 1.168). This is hopeless, as Diogenes points out, because there is as a matter of fact no such agreement (DL 9.89). Finally the Fifth Mode, of Circularity, claims that "what ought to support the matter under investigation itself requires confirmation from that very matter" (PH 1.169). Diogenes adds an example: "as for instance someone seeking to confirm the existence of pores [in the skin] on the grounds of the emanations should establish the latter on the basis of the former" (DL 9.89).

The Modes lend themselves to use in combination. Take any dogmatic proposition *p*: one may ask what it is supposed to rest on. If the answer is "nothing," then it is a mere hypothesis, unworthy of credence by the Fourth Mode. If it is alleged to rest on *q*, one may ask the same question of *q*. If one gets the same answer, the same response applies. If *q* is said to rest on *p*, then the Mode of Circularity comes in; or else the process goes on, potentially *ad infinitum* in line with the Second Mode (PH 169–174). Credit for seeing the force of such objections is not due to Agrippa. Aristotle was aware of them (*Posterior Analytics* 1.3 [Barnes, ed. 1984]), and realized that any foundationalist epistemology requires its basic propositions to be more than mere assumptions. But how that is to be done—if it is to be done at all—is still a matter of dispute, apparently undecidable. Agrippa fashioned a powerful and elegant arsenal of skepticism, and all modern nonskeptical epistemologies sooner or later must confront them, and the challenge they pose, in one form or another.

AGRIPPA VON NETTESHEIM, HENRICUS CORNELIUS (1486–1535)

Henricus Cornelius Agrippa von Nettesheim, a colorful Renaissance figure—a diplomat, a military adventurer, a kabbalist, an expert on occult science, a medical doctor, a lawyer, a theologian, an early Reformer, as well as a troublesome and troubled intellectual—was born of minor nobility in or near Cologne. His first official position was that of a court secretary of the Holy Roman emperor. He was sent to Paris in 1506 and there joined a secret group of theosophists. He next became involved in a revolutionary plot in Catalonia. In 1509 he gave lectures at the University of Dôle, on Johannes Reuchlin's kabbalistic *De Verbo Mirifico*. He learned Hebrew and immersed himself in kabbalistic, Gnostic, and hermeneutic writings. This research culminated in three volumes on occult science, *De Occulta Philosophia*, written in 1509–1510 but not published until 1531–1533 in Cologne (trans. by J. E., London, 1651). At Dôle he also wrote on the superiority and nobility of women and entered into his first marriage. These early unpublished writings touched off a fight between Agrippa and certain conservative monks, who accused him, along with Reuchlin, Desiderius Erasmus, and the French humanist–Reformer Jacques Lefèvre d'Étaples, of being Judaizers and heretics.

In 1510 Agrippa was sent to London, where he lived with Erasmus's friend John Colet, who interested Agrippa in St. Paul's epistles. Next, Agrippa lectured on theology in Cologne. From 1511 to 1513 he fought in various Italian campaigns and engaged in theological battles, even with the pope. In 1515 he taught occult science at the University of Pavia. Three years later Agrippa became public advocate and orator of Metz and was soon

embroiled again in theological battles and in defending a peasant woman accused of sorcery. The opposition of the inquisitor of Metz forced him to leave. Agrippa's wife died soon after, and he retired to Geneva. In 1522 he remarried and became a medical practitioner. He was appointed physician to the queen mother of France and became involved in a demoralizing struggle to collect his salary and to fulfill his duties. At the queen mother's orders he was stranded in Lyons from 1524 to 1526 without funds and without permission to leave. Agrippa wrote many bellicose letters to the court, antagonizing numerous people but settling nothing. His only official duty was the drawing up of horoscopes (which he knew were useless and fraudulent). In this period Agrippa wrote his major work, *De Incertitudine et Vanitate de Scientiarum et Artium* (Antwerp, 1530; trans. by James Sandford as *Of the Vanitie and uncertaintie of artes and sciences*, London, 1569), attacking every type of intellectual endeavor and art, as well as courtiers, princes, and monks. Even kabbalistic and occult researches were disowned as superstitious rhapsodies. Only pious Bible study remained worthwhile.

Agrippa abandoned hope of regaining court favor or receiving his salary and in 1528 went to Antwerp, where he had a brief flurry of success. He was appointed historiographer to Charles V, achieved success as a medical doctor, and finally published his works. This happy phase was soon followed by catastrophes. His second wife died of the plague. The publication of his *Vanity of the Sciences* outraged Charles V. Agrippa was jailed and branded a heretic. A disastrous marriage left him financially ruined and miserable. He returned to Germany, battled with the inquisitor of Cologne, and was banished in 1535. Having fled to France, he was arrested for having criticized the queen mother, was released, and died in Grenoble.

Agrippa was notorious as a magician and as a stormy opponent of the monks and the “establishment.” He made his main intellectual contributions as an expositor of kabbalism and occult science, as a critic of all intellectual activities, and as a Reformer within Catholicism. His *De Occulta Philosophia* tried to explain the universe in terms of kabbalistic analyses of Hebrew letters and their relations to natural phenomena and divine understanding; in terms of the Pythagorean numerological symbols; and of the Christian interpretation of kabbalism and Pythagoreanism. *De Occulta Philosophia* played a major role in Renaissance magical and kabbalistic studies.

Agrippa's *Vanity of the Sciences* was one of the first contributions to the Renaissance revival of skepticism, but its weapons were denunciation and ridicule, not philosophical analysis. It is more a bitter version of Eras-

mus's *In Praise of Folly* than a serious epistemological examination of whether knowledge can be gained by human means. Its final appeal is to a type of fundamentalistic anti-intellectualism. The work represents a stage in Agrippa's journey from occult studies to a simple biblical faith opposed to late medieval Scholasticism. Agrippa, although he did not revolt against Catholicism, lacked Erasmus's patience and calm and became almost a Catholic Martin Luther, violently denouncing monks, Scholastic theologians, and others. In the end he rejected occult studies—and all others—as a way of penetrating the divine mysteries, and he proclaimed: "It is better therefore and more profitable to be idiots and know nothing, to believe by Faith and Charity, and to become next unto God, than being lofty and proud through the subtillies of sciences to fall into the possession of the Serpent."

AILLY, PIERRE D'

(1350–1421)

Pierre d'Ailly, the Ockhamist philosopher, was born at Compiègne in France. He studied at the Navarre College in Paris in 1372, receiving his doctoral degree in 1380 and becoming chancellor of the university in 1389. He was made bishop of Puy in 1395 and bishop of Cambrai in 1396 and cardinal in 1411. He took a leading part in the Council of Constance (1414–1418), where he asserted the superiority of a general council of the church over the pope. He died as papal legate at Avignon.

D'Ailly's literary output was vast and wide-ranging. It comprehended philosophy, theology, scientific theory, political theory, canon law, and ecclesiastical politics and touched on mysticism. Among his more important writings were the treatise *De Anima*, commentaries on Boethius's *Consolation of Philosophy* and the four books of the *Sentences*, two studies of mysticism and asceticism, three works on different aspects of church government, and a series of works on logic, astronomy, and geography.

In his philosophical outlook d'Ailly seems to have been sympathetic to Ockhamism. Like so many fourteenth-century thinkers he postulated different degrees of certainty. The main distinction d'Ailly made was between what he called "natural light" and reason. Natural light corresponded to knowledge that was indubitable—namely, that which could be reduced to the principle of contradiction or immediate intuition of the existence of the self, in the manner of John of Mirecourt. Reason, on the other hand, was only relative in its certainty and was confined to the natural order. Included within it were the traditional arguments for God's existence, which d'Ailly treated as merely probable. The influence of William of Ockham is also apparent in d'Ailly's

treatment of God's omnipotence; since it was independent of the natural order, God was in no way bound to follow nature's laws. Accordingly, God could create the illusion that something existed when in fact it did not; this was one of the most insistent Ockhamist arguments against the infallibility of experiential knowledge. At the same time d'Ailly was careful to distinguish the realm of God's absolute power (*potentia absoluta*) from the realm subject to his ordained power (*potentia ordinata*). Whereas the first realm referred to God's omnipotence as such, the latter constituted the specific application of his omnipotence to this world; it provided the laws by which creation was regulated, and among them d'Ailly included the laws of physics. They therefore operated constantly and with certainty.

D'Ailly's debt to Ockham and John of Mirecourt is also to be seen in his views on essences. There was no inherent reason why hot was hot or cold cold other than God's willing it. The same applied to the moral order, where good and bad were such because of God's voluntary decree: "Nothing is good or bad of itself such that God must love or hate it." Similarly, a man was just not from possessing the intrinsic property of justice but because God accepted him as just. Here was the same absence of a constant scale of values that had proved so destructive of the traditional teachings in the time of Ockham and the first generation of his followers, who included Robert Holkot, Adam of Woodham, and John of Mirecourt. D'Ailly further emphasized the uncertain nature of natural experience by his acceptance of the so-called *complexe significabile*, by which an expression such as "sin" did not denote a specific object but was a description or statement that referred to an action. As employed by Nicolas of Autrecourt, it had denied the reality of a wide range of expressions. Thus the word *God* stood not for a specific being but for a verbal expression: supreme or highest being. As such it lacked correspondence to anything but a grouping of words. At the same time, in keeping at the natural level, d'Ailly granted a correspondingly wider area of jurisdiction to faith. Thus evidence for God's existence could be held only as a matter of belief.

AITIA

The Greek word *aitia* (or *aition*) derives from the adjective *aitios*, meaning "responsible," and functions as such as early as the Homeric poems. It was originally applied to agents, and only later does it come to qualify nonsentient items—although owing to the fragmentary nature of earlier sources, it is by no means clear when this transition takes place. But certainly by the latter part of the fifth century BCE, Hippocratic doctors were using the term, as were the historians Herodotus and Thucydides. It is in the latter, as well as in some of the Hippocratic texts, that the beginnings of the distinction of causal terminology can be found. Similar fine distinctions are also beginning to appear in the forensic and rhetorical traditions. In his discussion of the plague at Athens (*Peloponnesian War* 2.47–54), Thucydides disavows any knowledge of its origins or "what causes (*aitiai*) may be adduced adequate to explain its powerful natural effects" (2.48), and notes that "in some cases there seemed to be no *prophasis*" (2.49). A *prophasis* is an external cause, or occasion, or antecedent event correlated with an outcome. This word, as well, has Homeric roots, but it also has a legal (and more general) sense of pretext. Hippocratic texts also contrast *prophaseis* with *aitiai*, and in the same general way: *Prophaseis* are the observable antecedent signs, *aitiai* the inferred inner, structural facts causally responsible for the outcome. *Aitiai* are now closely linked with the notion of *phusis* or nature, the primary matter of pre-Socratic inquiry. If things have natures—internal structures—then those natures will explain how and why things behave the way they do.

Plato was the first philosopher to subject the concept of an *aitia* to detailed examination. Whereas generally an *aition* is "that because of which something comes to be"

(*Cratylus* 413a), and “the cause and the productive may rightly be said to be identical” (*Philebus* 26e), Plato treats these characterizations generally—they do not restrict causation to efficient causation. Indeed, at *Phaedo* 95e–103b, he takes the pre-Socratics to task for concentrating on mechanical causation at the expense of teleology: It is only if you know why things are for the best that you understand them. Moreover, Plato elaborates a thesis of necessity and sufficiency with regard to cause and effect (or *explanans* and *explanandum*): If *F*'s cause *G*'s, then there is no *F* without a *G*, and vice versa.

Aristotle followed Plato in espousing teleological explanations, and referring to them in the language of *aitiai*. Final causes are one of his four causal (or explanatory) types, along with material, efficient, and formal (*Physics* 2.3). But unlike Plato, Aristotle's final causes in nature presuppose no agency. Where Plato spoke of the Craftsman who designed everything for the best (*Timaeus*), Aristotle makes finality an irreducible component of nature itself. Nature is goal-directed, and no adequate account of natural processes can ignore that fact (as those of the atomists and other mechanists do). As Plato had before him, Aristotle thinks explanatory resources available to pure mechanism are inadequate to give a satisfying explanation of the order and regularity of the cosmos. The four causes are designed primarily to account for substances, and only derivatively for events and processes. Thus one might ask what makes an oak tree what it is. Firstly, its efficient cause—namely its parent tree, which supplies the formal model from which it derives. Secondly, its material cause: There could be no oak tree without a suitable supply of matter for the form to mold. Thirdly, there is the form itself, deriving from the efficient cause—yet from the moment the seed is created (or at least begins to germinate) it is an independent structural principle. And finally there is the end—or completely expressed form—toward which the process of maturation is directed and in which it will culminate if all other (material) factors equal.

Aristotle seeks to apply this model, with varying success, to all cases of coming to be (although he allows that coincidences lack final causes: *Physics* 2.4–6); and that all of the factors involved may equally be called *aitiai*. Moreover, he believes that even abstract objects have formal causes (the formal cause of the octave is the ratio 2:1). Plato's Stoic successors, however, reserved the term *aition* for a physical productive cause—a body that brought about in another body an incorporeal effect, a predicate's coming to be true of it. They allowed matter a role in overall explanation, yet being passive by definition it

could not be a cause; neither could it be disembodied goals or ends. These Stoic successors, or their contemporaries in the medical schools, turned to making further fine distinctions within the notion even more restricted, distinguishing between “perfect” or “sustaining” causes on the one hand and “antecedent” causes on the other. “Perfect” or “sustaining” causes were sufficient, necessary, and coterminous with their effects—and functionally correlated with them—in that any increase or decrease in intensity in the one is matched by a similar change in the other, “antecedent” causes answered roughly to the earlier *prophaseis*: prior events that set a causal process in train but are not sufficient for it (since they require suitably constituted bodies upon which to act).

Skeptics were to argue that causes could not both precede and be coterminous with their effects; and that because cause and effect are relative terms, they cannot be conceived independently, as they must be if one is to explain the other. This and other such attacks in turn prompted doctors and philosophers such as Galen to even further conceptual refinements that continued at least until the third century CE, whereas Neoplatonists like Proclus would later insist that, properly speaking, all causes were immaterial (being the action of soul).

ALBERT OF SAXONY

(c. 1316–1390)

Sometimes nicknamed Albertucius to distinguish him from Albert the Great, Albert of Saxony was born in Rickensdorf in the region of Helmstedt (Lower Saxony), in present-day Germany. He did his early studies in his native region, then most likely took a trip to Elfurt. He later went to Prague and Paris, where he earned his master of arts degree in 1351. He was rector of the university in 1353. He taught the arts there for a decade, while studying theology at the Sorbonne, apparently without

earning a degree. After a few years as a diplomat mediating between Pope Urban VI and the Duke of Austria, he was called on to found the University of Vienna, becoming its first rector in 1365. He was appointed canon of Hildesheim in 1366 and became bishop of Halberstadt the same year. He served in that capacity until his death on July 8, 1390.

Albert of Saxony left behind no theological writings and is known primarily for his works in logic and natural philosophy. He also composed commentaries on Aristotle's *Nicomachean Ethics* and *Economics*, as well as a short mathematical treatise on the squaring of the circle.

In logic, his masterwork is a summa titled *Perutilis logica* (Very useful logic). He also composed a voluminous collection, the *Sophismata* (Sophisms), in which he examined many statements that raise difficulties of interpretation because they contain syncategoremes. In addition, he wrote *Commentarius in Posteriora Aristotelis* (Commentary on Aristotle's *Posterior Analytics*) and a collection of twenty-five questions (*Quaestiones circa logicam*) relating to semantic problems or the status of logic. He also commented on Aristotle's writings in logic. During Albert of Saxony's career, Jean Buridan enjoyed great renown at the faculty of arts in Paris. Albert's writings, however, attest to the influence exerted in Paris by English ideas. His *Very Useful Logic*, while developing treatises on obligations, insolubles, and consequences—topics that were becoming increasingly important during the period—was modeled after William of Ockham's *Summa logicae* (Summa of logic). Albert of Saxony adopted the Ockhamist conception of the sign and based signification on a referential relationship to a unique thing. He also subordinated the oral sign to the conceptual sign. He was an Ockhamist in his conception of the universal and, for the most part, in his theory of the supposition. In particular, he retained the notion of the simple supposition—that is, the reference of a term to a concept to which it is subordinated, even though it signifies an extra-mental thing. Finally, he was Ockhamist in his theory of categories. Unlike Jean Buridan, he refused to consider quantity an absolute reality and relegated it to a disposition of the substance and the quality.

On a few points, however, Albert departed from William of Ockham. Hence he rejected the idea that an ambiguous proposition ought to be assigned multiple meanings. Such a proposition can only be conceded, rejected, or called into doubt. In the *Sophisms*, William Heytesbury often served as his guide (for example, in the analysis of epistemic verbs and the study of the infinite). He grants the proposition a literal meaning, which is not

that of its terms. Like the syncategoreme, the proposition signifies a “mode of being.” Nevertheless, Albert of Saxony avoided accounting for these “modes of being” and, in the last analysis, transferred them to relationships between the things to which the terms referred. But he used the idea of a proposition's meaning to define truth and to deal with “insolubles,” that is, semantic paradoxes. By virtue of its form, every proposition signifies that it is true; for that reason, the insoluble is false, since it signifies both that it is true and that it is false.

This analysis of language was combined with a gnoseological realism that stemmed in part from an analysis of the void. It is possible to imagine that the void exists by divine omnipotence, but no science of nature can integrate the existence of the void as a hypothesis. Albert refused to extend the referent of physics terms to supernatural possibilities. For him, physics cannot develop into a study of imaginary cases, despite what was being done at Oxford at the time. It must account for the natural course of things.

In addition to commentaries on Aristotle's *Physica* (Physics), Albert composed a commentary on Johannes de Sacrobosco's *De sphaera* (On the sphere) and a treatise on relationships inspired by Thomas Bradwardine. In pursuing the work of the Oxford Calculators and of Nicole d'Oresme in Paris, he created a compendium setting out the elements of the theory of relationships and their application to different motions, adopting the rule elaborated by Bradwardine on the relationship between powers of propulsion and resistance. In his physics texts, he also displayed a curiosity for many natural phenomena, taking an interest in motions of the earth, tides, and geology.

It was undoubtedly in the field of dynamics, however, that Albert's role was most important. To account for the motion of projectiles and the acceleration of falling objects, he adopted the Buridianian theory of impetus, a quality acquired by the body. He drew clearly the consequences of extending that notion to celestial movements, rejected the notion of a propulsive intelligence, and followed the same principles in studying celestial bodies and earthly bodies. His commentary on Aristotle's *De caelo* (On the sky) exerted a great influence in northern Italy. Albert of Saxony thus played a role in developing a vision of the cosmos that departed from conceptions inherited from Greco-Arab Peripateticism.

ALBO, JOSEPH

(c. 1380–c. 1444)

The Spanish-Jewish preacher and philosopher Joseph Albo was the last major figure of the philosophical surge in medieval Jewry. Little is known about his early life; he was probably born at Monreal, in the kingdom of Aragon, and he asserted that Hasdai Crescas was his teacher. Albo was one of the principal apologists for the Jews at the Colloquium of Tortosa (February 7, 1413–November 3, 1414); his activities as apologist and preacher are reflected in the style of his philosophic classic, *Sefer ha-Ikkarim* (*The Book of Roots*).

Albo’s acknowledged and unacknowledged borrowings from other writers are so extensive that he was accused of plagiarism in his own age, as well as in more recent and more sensitive times. We must recognize, however, that Albo’s purpose was to systematize and thus to defend the dogmas of Judaism rather than to produce an original philosophic work. Clarity and lucidity, systematic and easily remembered organization of materials, and simple and uninvolved style of presentation have made Albo’s *The Book of Roots* one of the most popular works of medieval Hebrew literature. Indeed, it was one of the earliest printed Hebrew books, the first edition having been issued at Soncino, Italy, in 1485. Albo’s occasional use of medical materials to illustrate his thought has suggested to critics that he may have been trained as a physician. He was well trained in Jewish philosophy, and in addition he knew, probably at second hand, the works of the Arabic Aristotelians.

Albo asserted that there are three essential dogmas (“roots”) of Judaism: the existence of God, revelation, and reward and punishment. Seven secondary principles were derived from these three. The existence of God yields four: his unity, his incorporeality, his timelessness, and his perfection. From the dogma of revelation Albo derived two secondary principles: the prophets were the medium of revelation, and the Mosaic law will have binding force until another law is proclaimed with equal publicity; that is, before 600,000 men. God’s providential knowledge in the matter of retribution was, for Albo, the sole secondary derivative from the doctrine of reward and punishment. Beyond these primary and secondary roots are other logically derived “branches” that every professing Jew must believe or be guilty of heresy, among them the doctrine of the Messiah.

It may be presumed that Albo removed the doctrine of the Messiah from the center of the Jewish faith as an important part of his polemic against Christianity, a

recurrent feature of *The Book of Roots*. As an aspect of this polemic, Book III, Chapter 25 contains an actual summary of a disputation between a Jew and a non-Jew (omitted in some editions).

ALBO, JOSEPH [ADDENDUM]

Albo remains one of the lesser-studied philosophers of the medieval period, in part because his main work more apologetic than philosophical in nature. No full-length monograph has been written on him; rather, he is the subject of scattered articles on diverse topics. Not surprisingly, the most systematic work has been done on his dogmatics, with the place of dogma in Judaism generally arousing a measure of philosophical interest in the late twentieth and early twenty-first centuries. Albo follows Simeon ben Tzemach Duran (1361–1444) in reducing Maimonides's thirteen principles of faith to three—with eight, not seven, derivative principles: revelation yielding (1) God's knowledge; (2) prophecy; and (3) the authenticity of the divine messenger. Menachem M. Kellner, however, has argued that in his portrayal of Torah as having the axiomatic structure of a deductive science, Albo is the first to present the commandments rather than metaphysics as embodying this scientific structure. Support for this view may be found in Albo's account of the six nonessential beliefs, or branches, particular to Jewish dogmatics, which are not strictly entailed by the earlier fundamental or derivative principles, even though their denial constitutes heresy.

A further significant strand in Albo's thought in which this emphasis on practice can also be found is the shift from the intellectualism of the Aristotelians—for whom intellectual apprehension was the path to perfection—to an act-based theology in which acts are even at one point referred to as knowledge.

The particular scientific topic of time has been subject to detailed analysis by Warren Zev Harvey. Whereas Albo follows his teacher Crescas in asserting that time is independent of motion and therefore of the physical world, Harvey argues that Albo is the first to state that time is an imagined duration rather than one that is intellectually cognized. This is significant for Albo as a foundation for one of his derivative principles—that God is independent of time—though Harvey argues that the links here are not demonstrated. As with all of the above, Albo's remarks here are suggestive, but left underdeveloped.

ALCINOUS

(fl. c. 150 CE)

Alcinous is the name that has come down to us in the manuscript tradition as the author of a handbook of Platonic doctrine, *Didaskalikos tôn Platonos dogmatôn*, probably from the second century CE. Following an 1879 suggestion by the German scholar Jacob Freudenthal, this figure was identified for more than a hundred years with the Middle Platonist philosopher known as Albinus, but this is now recognized to have been based on unsound

assumptions, and the work has been returned to its shadowy author. The *Didaskalikos* has much in common with another second-century handbook of Platonism, the *De Platone et eius dogmate* of Apuleius, but the similarities are not close enough to indicate that they emanate from the same school.

The *Didaskalikos* is an introduction to Platonism as it was understood in the first and second centuries CE, which means that it exhibits an amalgam of Platonic, Aristotelian, and Stoic formulations and doctrines, presented as clarifications and amplifications of Plato's views. Aristotelian influence is particularly to be seen in the sphere of logic, where the whole system of syllogistic is claimed for Plato; Stoic influence may be seen chiefly in ethics, in relation to the doctrine that virtue is sufficient for happiness. In either case the assumption is that Aristotle and the Stoics are only expounding Platonic doctrine.

The work is divided as follows. After three introductory chapters, concerned with the definition of philosophy and the distinction of its "parts"—physics, ethics, and logic—Alcinoos proceeds to take these three topics in order, beginning with logic (chaps. 4–6), then turning to "physics" (chaps. 7–26), comprising both an account of first principles, Matter, Form, and God (chaps. 7–11), and then of the physical world, largely based on Plato's *Timaeus*, but also including discussions of the immortality of the soul, and of fate and free will (chaps. 12–26); and finally ethics, covering such topics as the virtues, happiness, the purpose of life (*telos*)—which he characterizes as "likeness to God"—the emotions, and political theory (chaps. 27–34). The work ends with a disquisition on the difference between the philosopher and the Sophist (chap. 35), and a brief conclusion (chap. 36).

While the *Didaskalikos* is not securely datable, there is nothing in it that cannot be seen as "Middle Platonist" in doctrine. Even the discussion of God in chapter 10, which has many intriguing aspects, including a distinction between a supreme God, a cosmic Intellect and a World Soul, can be accommodated within Middle Platonist parameters.

ALCMAEON OF CROTON

(c. 540–500 BCE)

Alcmaeon of Croton (a Greek city-state in southern Italy) was a pioneer in the study of human psychology and physiology. He published one book in the late sixth or first half of the fifth century BCE. Only two or three fragments of the book survive, but substantial reports of his views are preserved in authors such as Theophrastus. It is controversial whether Alcmaeon was primarily a physician and medical writer or whether he dealt with physiological issues as part of a typical pre-Socratic account of the cosmos. Beginning in the second century CE, some authors call him a Pythagorean, but the earliest sources do not. Aristotle appears to distinguish him from the Pythagoreans (*Metaph.* 986a22).

Alcmaeon is the earliest author to state the common ancient view that health depends on a balance of opposed powers in the body. Just as Anaximander used a political analogy to explain the workings of the cosmos, Alcmaeon said that "equality (*isonomia*) of powers (wet, dry, cold, hot, bitter, sweet, etc.) maintains health, but monarchy among them produces disease" (Fr. 4 Diels-Kranz). Alcmaeon may have excised an eyeball and observed passages (*poroi*—i.e., the optic nerve) leading from the eye toward the brain. Perhaps as a result of this observation, he was the first person in the Greek tradition to argue that the brain was the seat of thought. There is no evidence, however, that he used dissection to any further extent or that he practiced it systematically. He was the first to address a series of issues that would become standard in later writings on physiology, such as the causes of sleep, waking, and death. He argued that human seed came from the brain, that the brain was the first part of the embryo to develop and that both parents contributed seed in the production of children.

In contrast to the wealth of evidence for Alcmaeon's views on human physiology, the evidence for his cosmological views is sketchy. He may have believed that the cosmos, like the human body, arose from a balance of opposing powers. He also maintained that the sun was flat.

Alcmaeon argued that there was no human knowledge of what is not perceptible and that judgments about what is not perceptible can only be made on the basis of what is perceived. He was the first to make a clear distinction between animals, which only have sense perception, and human beings, who also have understanding. Alcmaeon may have originated the three-step empiricist epistemology found in both Plato (*Phaedo* 96a–b) and Aristotle (*Posterior Analytics* 100a3) that begins with sensations, which when collected become memories and opinions, which in turn become knowledge when they gain fixity. Finally, Alcmaeon gave the first argument for the immortality of the soul. The exact nature of Alcmaeon's argument is hard to reconstruct, because it was later developed by Plato in the *Phaedrus* (245c), but he appears to have argued that the soul was immortal because it was in constant motion.

ALEMBERT, JEAN LE ROND D' (1717–1783)

The French mathematician and encyclopedist Jean Le Rond d'Alembert was the illegitimate son of Madame de Tencin and the artillery general Destouches-Canon. He was abandoned by his mother on the steps of the baptistry of Saint-Jean-Le-Rond in Paris, from which he received his name. Shortly afterward his father returned

from the provinces, claimed the child, and placed him with Madame Rousseau, a glazier's wife, with whom d'Alembert remained until a severe illness in 1765 forced him to seek new quarters. Through the Destouches family, Jean Le Rond was placed in the exclusive Jansenist Collège de Mazarin and given the name of d'Aremberg, which he later changed to d'Alembert, no doubt for phonetic reasons. At the college an effort was made to win him over to the Jansenist cause, and he went so far as to write a commentary on St. Paul. The intense Jesuit-Jansenist controversy served only to disgust him with both sides, however, and he left the college with the degree of bachelor of arts and a profound distrust of, and aversion to, metaphysical disputes.

After attending law school for two years he changed to the study of medicine, which he soon abandoned for mathematics. His talent and fascination for mathematics were such that at an early age he had independently discovered many mathematical principles, only to find later that they were already known. In 1739 he submitted a *mémoire* on integral calculus to the Académie des Sciences, but it was his *Traité de dynamique* in 1743 that won him acclaim and paved the way for his entry into the academy that same year. The introduction to his treatise is significant as the first enunciation of d'Alembert's philosophy of science. He accepted the reality of truths rationally deduced from instinctive principles insofar as they are verifiable experimentally and therefore are not simply aprioristic deductions. Although admitting unproved axioms at the base of his principles of mechanics, thus revealing his debt to René Descartes, d'Alembert rejected metaphysical affirmations and the search for universals and expressed admiration for Bacon's experimental and inductive method.

The decade of the 1740s may be considered d'Alembert's mathematical period during which he made his most outstanding and fruitful contributions to that discipline. In addition to the *Traité de dynamique* he wrote *Mémoire sur la réfraction des corps solides* (1741); *Théorie de l'équilibre du mouvement des fluides* (1744 and 1751); *Réflexions sur la cause générale des vents*, which won him the prize of the Berlin Academy in 1746 as well as membership in that body; a *mémoire* on vibrating strings (*Recherches sur les cordes vibrantes*), written in 1747 for the Berlin Academy; *Recherches sur la précession des équinoxes et sur la nutation* (1749); *Réflexions sur la théorie de la résistance des fluides* (1752); *Recherches sur différents points importants du système du monde* (1754–1756), plus eight volumes of *Opuscules mathématiques* (1761–1780).

D'Alembert's first philosophical work, the *Discours préliminaire* to the *Encyclopédie*, appeared in 1751. As early as 1746 he, with Denis Diderot, had been on the publisher's payroll as translator, in connection with the projected French version of Chambers's *Cyclopaedia*. We may suppose that, like Diderot, he had already worked for the publishers as a translator of English works for French consumption, thus exposing himself to the writings of the English empiricists and supplementing the meager pension left him by his father. In any event, d'Alembert had read Bacon as early as 1741; and his *Discours préliminaire* revealed not only his debt to the Descartes of the *Regulae*, shorn of metaphysics, but his admiration for, and indebtedness to, Bacon for his experimental method; Isaac Newton, whom he admired for proving gravitational force without trying to explain its first cause; and John Locke, whose metaphysical method he adopted. While paying lip service to the traditional religious concepts of his time, d'Alembert used Lockian sensationalist theory to arrive at a naturalistic interpretation of nature. It is not through vague and arbitrary hypotheses that nature can be known, he asserted, but through a careful study of physical phenomena. He discounted metaphysical truths as inaccessible through reason. In the *Discours*, d'Alembert began by affirming his faith in the reliability of the evidence for an external world derived from the senses and dismissed the Berkeleian objections as metaphysical subtleties that are contrary to good sense. Asserting that all knowledge is derived from the senses, he traced the development of knowledge from the sense impressions of primitive man to their elaboration into more complex forms of expression. Language, music, and the arts communicate emotions and concepts derived from the senses and, as such, are imitations of nature. For example, d'Alembert believed that music that is not descriptive is simply noise. Since all knowledge can be reduced to its origin in sensations, and since these are approximately the same in all men, it follows that even the most limited mind can be taught any art or science. This was the basis for d'Alembert's great faith in the power of education to spread the principles of the Enlightenment.

In his desire to examine all domains of the human intellect, d'Alembert was representative of the encyclopedic eighteenth-century mind. He believed not only that humanity's physical needs are the basis of scientific and aesthetic pursuits, but also that morality too is pragmatically evolved from social necessity. This would seem to anticipate the thought of Auguste Comte, who also placed morality on a sociological basis, but it would be a mistake to regard d'Alembert as a Positivist in the manner of

Comte. If d'Alembert was a Positivist, he was so through temporary necessity, based on his conviction that since ultimate principles cannot be readily attained, one must reluctantly be limited to fragmentary truths attained through observation and experimentation. He was a rationalist, however, in that he did not doubt that these ultimate principles exist. In the *Discours préliminaire* he expressed the belief that everything could be reduced to one first principle, the universe being "one great truth" if we could only see it in a broader perspective. Similarly, in the realm of morality and aesthetics, he sought to reduce moral and aesthetic norms to dogmatic absolutes, and this would seem to be in conflict with the pragmatic approach of pure sensationalist theories. He was forced, in such cases, to appeal to a sort of intuition or good sense that was more Cartesian than Lockian, but he did not attempt to reconcile his inconsistencies and rather sought to remain within the basic premises of sensationalism. D'Alembert's tendency to go beyond the tenets of his own theories, as he did, for example, in admitting that mathematical realities are a creation of the human intellect and do not correspond to physical reality, has led Ernst Cassirer to conclude that d'Alembert, despite his commitment to sensationalist theory, had an insight into its limitations.

During the early 1750s d'Alembert engaged actively in the polemics of the time, particularly in the defense of the *Encyclopédie* and the party it represented. Many of the articles he wrote for that publication, as well as his preface to Volume III (1753), were aimed at the enemies of the *Encyclopédie*, notably the Jesuits, who were among the first to attack it for its antireligious and republican orientation. In addition, he took part in the controversy over French versus Italian music, which was inflamed by Jean-Jacques Rousseau's attack on French music in "Lettre sur la musique française" (1753). D'Alembert had already published his *Éléments de musique* (1752), based on Jean-Philippe Rameau's theories on harmonics, and in 1754 he published anonymously his *Réflexions sur la musique en général et la musique française en particulier*.

D'Alembert's chief preoccupation at this period, however, was with philosophy and literature. His *Mélanges de littérature et de philosophie* appeared in 1753 in two volumes (expanded to four volumes in 1759, with a fifth volume added in 1767), and it is here that his skepticism concerning metaphysical problems is delineated. Proceeding on the premise that certainty in this field cannot be reached through reason alone, he considered the arguments for and against the existence of God and cautiously concluded in the affirmative, on the grounds that

intelligence cannot be the product of brute matter. Like Newton, d'Alembert viewed the universe as a clock, which necessarily implies a clockmaker, but his final attitude is that expressed by Montaigne's "Que sais-je?" Humankind's uncertainty before this enigmatic universe is the basis of d'Alembert's plea for religious tolerance. He maintained his skeptical deism as an official, public position throughout his life, but there is evidence for believing that in the late 1760s, under the influence of Diderot (whose *Rêve de d'Alembert* appeared in 1769), d'Alembert was converted to Diderot's materialism. In private correspondence with intimate friends, d'Alembert revealed his commitment to an atheistic interpretation of the universe. He accepted intelligence as simply the result of a complex development of matter and not as evidence for a divine intelligence.

Aside from the publication of a polemical brochure, *Histoire de la destruction des Jésuites*, in 1765 (with two additional *Lettres* on the subject in 1767), d'Alembert spent the last two decades of his life in furthering the cause of the *philosophes* in the Académie Française—by writing his *Éloges*, which were read in the Académie (and published in 1779), and by fostering the election of candidates of his own choice. Mademoiselle de Lespinasse's salon, where d'Alembert presided, became, in the words of Frédéric Masson, the "obligatory antechamber of the Académie." In this period he became influential with young aspiring men of letters, whom he recruited for his party and whose careers he fostered. The most notable of his disciples was the Marquis de Condorcet. After years of ill health, d'Alembert died of a bladder ailment and was buried as an unbeliever in a common, unmarked grave.

ALEXANDER, SAMUEL

(1859–1938)

The British realist metaphysician Samuel Alexander was born in Sydney, New South Wales, and was educated at Wesley College, Melbourne. He came to England in 1877 on a scholarship to Balliol College, Oxford, where he read mathematics, classics, and philosophy (*literae humaniores*). In 1882 he was elected to a fellowship at Lincoln College, Oxford, becoming the first Jew to be a fellow of an Oxford or Cambridge college. His earliest work, the Green Prize essay in moral philosophy, subsequently published as *Moral Order and Progress* (1889), shows the influence of the idealist ethics dominant in Oxford at the time. But he soon began moving toward an approach to philosophy that could be more closely related to the development of the empirical sciences, particularly biology and psychology. He gave up his fellowship and spent a year in Hugo Münsterberg's psychological laboratory at Freiburg, Germany, continuing in private study until his election to the chair of philosophy at Owens College (later the Victoria University of Manchester) in 1893. He held the chair until his retirement in 1924 and lived in Manchester until his death in 1938, a beloved, influential, and, indeed, legendary figure in both city and university.

EMPIRICAL METAPHYSICS

Alexander wrote occasional papers and a small book on John Locke, but it was not until 1920 that he published his major work, *Space, Time and Deity* (delivered as the Gifford Lectures in Glasgow in 1915). This was a comprehensive and constructive system, which he claimed was metaphysics following an “empirical method.” By this he meant that he understood metaphysics to be a very inclusive kind of science, differing from the special sciences “not in its spirit, but only in its boundaries, dealing with certain comprehensive features of experience which lie outside the purview of the special sciences.” Alexander called these features “categorical” and “a priori” but said that this must not be taken to mean that they are imposed or constructed by thought; they are discerned by reflective inspection as pervasive features of the world. As such he called them “nonempirical,” reserving the term *empirical* for the variable features of the world. But the *study* of both, as a study of what is found in experience, he called “empirical.” This could be considered an empirical way of thinking only in a much broader and more speculative sense than subsequent forms of empiricism, with their stricter notions of what constitutes tests in observation and experiment. Nevertheless, Alexander insisted that his system not only was a speculative world view but also took account of certain ways of thinking he believed were suggested by work in contemporary experimental science. Here his starting point was probably his interest in physiological psychology (he had introduced this study into the University of Manchester at a time when British universities were still slow to recognize it).

MIND. In contrast to idealistic or dualistic views, Alexander regarded mind as, in one sense, identical with an organized structure of physiological and neural processes, there being no animistic or purely “mental” factor over and above these. But in another sense, mind could be looked on as a new “emergent”—when neural processes are organized in a certain way, they manifest a new quality, consciousness, or awareness.

EMERGENTS. By *emergents* (a term generally ascribed to C. Lloyd Morgan, though its first use can be found in G. H. Lewes) Alexander designated certain organized patterns which, he held, produce new qualitative syntheses that could not have been predicted from knowledge of the constituent elements of the pattern before they were so organized. Emergents are thus what others have called gestalt properties of organized systems; Alexander thought of them particularly as characteristics of those syntheses where some strikingly new quality can be dis-

cerned. He generalized the idea that new qualities emerge from patterns of subvening elements of certain degrees of complexity, so as to look on the world as a hierarchy of qualities, a hierarchy in which those higher in the scale depend on the lower but manifest something genuinely new.

SPACE-TIME. At the basis of nature Alexander set *space-time* as a continuum of interrelated complexes of motion. These can be analyzed into relations between “point-instants,” a point-instant being the limiting case of a motion. Sometimes he spoke of point-instants as if they were real elements, the smallest instances of spatiotemporal motions, sometimes as if they were ideal concepts, the bare notion of time at a point or space at an instant, while any actual motion has a spatiotemporal spread.

Space-time was also distinguished into “perspectives.” A perspective defines how space-time can be ordered with reference to particular point-instants. It is a line of advance, or phase of a spatiotemporal process, seen in relation to some point-instant as its center of reference. Alexander used the illustration of a tree sawn across. For the carpenter the concentric rings are simultaneous, but this is to look on it as an artificial section. For the botanist they are of different dates, carrying with them the history of the tree. Thus, a perspective is a historical phase of the process of nature, ordered with reference to some event, *e*, as center and integrating other events related to the event from which the perspective is developed. These may be integrated as observably contemporaneous or as earlier and later stages in motions of which *e* is a stage.

The definition of a perspective thus depends on the notion of motions and their interrelation, and even on their causal relations. It is difficult to see how these notions can be derived purely from that of structures within space-time. Indeed, the notion of space-time itself as the fundamental stuff or matrix out of which things arise is certainly not one that it is natural to see as an “empirical” description of the most general features of the world as it discloses itself to an observing mind.

CATEGORIES. It might be more plausible if Alexander could be taken to have meant that the basic universal feature of all experience is its spatiotemporal character. He did indeed claim to follow Kant in holding that the world is apprehended first and foremost as a spatiotemporal manifold, under categories. Apart from the union of space and time in a four-dimensional continuum, his categories follow closely the Kantian ones of substance,

cause, number, and relation. But Alexander insisted that these categories are discovered or discerned in the world and are not a conceptual framework imposed by the mind. Indeed, according to his realist theory of knowledge, thought does not construct or impose conceptual schemes. Knowledge is “contemplation” of an object where there is a relation of “compresence” between a mind and an object (except in the special case of a mind’s knowledge of itself, for a mind cannot be compresent as an object to itself but is aware of itself as knowing and perceiving; Alexander calls this kind of knowing “enjoyment”). But it is surely difficult to understand why any mind compresent with the world of nature would see in it just these particular all-pervasive categorial features.

EMPIRICAL FEATURES OF REGIONS OF SPACE-TIME. Beside the categorial features, which Alexander called “nonempirical,” meaning by this that they are invariable and all-pervasive, we discover “empirical” features, defined as variable qualities characterizing particular regions of space-time. “Universals” are discerned *in rebus*, as plans of configurations of motions in space-time showing persistent identities; Alexander called them “habits” of space-time. Within space-time arises the hierarchy of emergent qualities. The patterns of motions that differentiate it are in the first place bearers of the properties of extension and inertia that characterize “matter.” These organized patterns of matter are bearers of the qualities found in physical structures and chemical syntheses. Some of these syntheses, in turn, are bearers of the quality of “life,” and some living structures are bearers of mind or consciousness, which is the highest empirical quality known to us. There is no reason, however, to assume that this is the highest possible emergent quality. Alexander held that the structures that are bearers of “mind” may in their turn become productive of a new emergent quality, which he called “deity.”

DEITY. The term *deity* does not here stand for a God who precedes the universe as its cause or creator. Alexander did not try to find in such terms an “explanation” of why the universe should exist. Existence, he held, should be accepted with “natural piety” (borrowing a phrase of William Wordsworth’s), and its general character should then be described. This general character is first and foremost spatiotemporal. In addition, Alexander held that it exhibits a *nisus*, or creative tendency, toward the production of new qualitative syntheses. So in one sense God can be thought of as *Deus sive Natura*, the universe of space-time “pregnant” with emergent qualities. In another sense deity is “the next highest emergent quality which the uni-

verse is engaged in bringing to birth.” This quality, Alexander suggested, may emerge in beings—we do not yet know what they would be like—who would be bearers of deity as we are of mind, and these in their turn might prepare the basis for a yet further emergent quality. Alexander held that the existence of religious sentiments and aspirations witnesses to an experience of the *nisus* toward the higher quality of deity in some of those who are already bearers of mind. Such religious feelings, he thought, are incipient aspirations toward a new level of development. It is toward this further stage of development, not toward an already existent object, that the religious sentiment is directed. Alexander claimed that he started from the empirical fact of this sentiment, rather than from a theory of its object, and asked what it suggests; the religious sentiment can be interpreted as the feelings of beings caught up in the *nisus* of a universe “pregnant” with the quality of deity.

TIME AS MIND. Is there any reason in the nature of space-time itself why there should be this *nisus*? Alexander sometimes spoke as though the mere fact of conjoining time with space in itself produces the possibility not only of a dynamic but even of a creative process. He summed this up in the saying “Time is the Mind of Space”—surely one of the most astonishing remarks ever made by a metaphysician. But it was not intended merely to shock. It should be read in connection with Alexander’s interest in physiological psychology and the view of the body-mind relation that he derived from this and that he here extended in a daring analogy. Alexander reported that he reached his notion of perspectives in space-time by considering the unity of the self. There is no such thing as awareness of the self at an instant. The least moment of conscious experience is a “specious present” with a durational aspect and, as embodied, a spatialized aspect. Our consciousness of what we are thinking at any moment is linked with the memory of what we were thinking, for example, a fraction of a second ago, and it is directed in anticipation toward what we are going to think a fraction of a second from now. What we are, at any given stage, is partly constituted by memories of the past and anticipation of the future.

Hence, the unity of the self depends on events of different dates being brought into a perspective with reference to the self of “present” experience. Similarly, a physical perspective consists of all events that can be shown to be earlier or later stages in lines of development in which a given event, taken as center of reference, is a phase. A perspective thus describes a historical line of advance. The temporal aspect of this is said to be the ana-

logue of its “mind” and the spatial aspect the analogue of its “body.” This is because mental experience is partly constituted by memory of the past and anticipation of the future and, more specifically, because the “mind” aspect of anything is looked on as the *new* quality it may exhibit at its latest point of development, whereas the organized structure that is the bearer of this property and could be described beforehand as accomplished fact is looked on as its body. Time is not mind in the sense of consciousness or thought, which is the distinctive quality characteristic of the level we call mind proper. It is “mind” in an analogical sense, as whatever is the new property characteristic of a new qualitative synthesis. Thus, for example, to Alexander the defining qualities of matter are the primary qualities, such as extension and inertia. Secondary qualities, such as color, are emergents from organized complexes of matter and may, as such, be called their “mind.” This is not to give them some rudimentary degree of consciousness; it is to say that on each level there is an element that can be called the analogue of mind, as introducing something new. But what is new appears sometimes to be not describable as an *element*, but rather as a new way of *functioning* released in some particular kind of ordered structure. When this happens, the new way of functioning dominates the lower levels that support it but does not transform them into something different. Physicochemical processes continue to be physicochemical processes, and neural processes to be a form of physicochemical processes. But where there is conscious thinking, although no separate animistic or mental factor may be present, the whole ordered structure becomes a vehicle for this new activity, and we say we are confronted by an “embodied mind.”

TIME AS AN ATTRIBUTE OF REALITY. Alexander’s view of a hierarchy of syntheses with new emergent qualities may be significant, but can time, as the pure notion of irreversible succession, be sufficient to account for their possibility? To say that there is a general tendency for complexes of one order to combine and form complexes of what will become a new order must surely presuppose some fundamental property or properties in the world besides those of space and time; Alexander, in fact, admits this when he speaks of a *nisus*, or creative tendency, in space-time. But is this a necessary property of an infinite four-dimensional continuum, unless one can assume that the mere fact of succession entails creative advance? Alexander may have been near enough to nineteenth-century ideas of inevitable evolutionary progress to be able implicitly to assume this. In agreement with these ideas, he insisted that philosophers must “take Time seri-

ously”; that is to say, they must incorporate a conception of time as an essential attribute of reality and not only as describing a way of experiencing or measuring a reality that is ultimately nontemporal. Alexander said that if Benedict (Baruch) de Spinoza could be rewritten with time as well as extension as an attribute of substance, this would represent the type of past philosophy most congenial to him; indeed, if someone were to write on his funerary urn “*Erravit cum Spinoza*,” he would be content.

REALITY AS PROCESS. Alexander’s view of space-time as the final reality seems, however, open to two interpretations. On the one (perhaps the more Spinozistic) interpretation, space and time are the two necessary attributes of an infinite substance, distinguishable, it is true, into perspectives defined by reference to point-instants, but where “motions” (analogous to Spinoza’s “modes”) are simply the redistribution of spatiotemporal coefficients within the whole already existent space-time. In this view space-time is looked on as that out of which things come, and we can ask whether, as with the materialist’s conception of matter, this is not to treat an abstraction as though it were a reality. In another sense Alexander was giving a view of reality as essentially a process, and as historical. There is an irreversible direction in it, defined by “time’s arrow” (to use Arthur Stanley Eddington’s expression). In this, nature is focused in lines of development whose “history” describes the successive levels of ordered structures they exhibit. At each stage in time, where there is a new emergent quality, this quality is the spearhead of a genuine creative advance. Yet if this new emergent quality at each stage is said to be analogous to mind, is it satisfactory to equate this with saying that it is analogous to time? It might be more plausible to say that it was Alexander’s notion of the *nisus* in space-time that corresponds to the “mind” factor in those complexes whose extended patterns can be regarded as the analogue of the body. Or one might say that the “body” of anything is the external view of nature as unified in that particular perspective, while its “mind” is the “idea” of the distinctive internal quality of that particular perspective; this indeed suggests comparison with Spinoza’s view of the body-mind relation.

VALUES

Alexander wrote no large work besides *Space, Time and Deity*. The volume *Beauty and the Other Forms of Value* (1933) is a collection of occasional papers and lectures on themes relating to aesthetics and ethics. The general notion underlying these is that of values as related to the satisfaction of impulses. Values are “tertiary qualities”

(supervening on the primary and secondary qualities), characterizing complexes where one component is a mind capable of interest or appreciation. The higher values—beauty, truth, and goodness—are qualities that arise in the satisfaction of certain impulses where these have become contemplative and disengaged from their immediate practical ends. Thus aesthetic creation and enjoyment grow out of the impulse to construct things, which Alexander traced down to the animals (“impulse,” he thought, was a less question-begging term than “instinct”). The impulse to construct something out of physical materials, including sounds, becomes a contemplative delight in the form so imposed on the material. Truth is a value analogous to beauty, as that which satisfies the impulse of curiosity when this too becomes contemplative rather than practical. Moral value is a quality created out of natural impulses by the introduction of another natural impulse that can bring form and harmony into the impulses that are its materials. This impulse Alexander called “gregariousness.” His interpretation of this was close to Adam Smith’s view of “sympathy” as fellow feeling with the feelings of others. Gregariousness, like Smith’s sympathy, becomes disinterested and so is able to act as a harmonizing agent both among a person’s other impulses and in producing “sociality.” The impulse of “sociality” was also invoked in support of Alexander’s view that we are directly aware of other minds in such experiences as friendly conversation or quarrels, which are completed as experiences through reciprocated responses. These are not, in Alexander’s view, adequately described as merely responses to behavior; they are responses to behavior as expressing the mind of the other person.

A collection of occasional papers and addresses, *Philosophical and Literary Pieces* (1939), was published posthumously by John Laird, prefaced by a memoir that gives a sympathetic account of Alexander the man, including a number of the stories, true or apocryphal, that were told about him. Some of the pieces on nontechnical themes—on Dr. Johnson, for instance, or Jane Austen, or Blaise Pascal—show Alexander in his happiest vein.

Alexander was awarded the Order of Merit in 1930. His appearance was impressive; a bust by Jacob Epstein in the entrance hall of the Arts Building of the University of Manchester gives a good impression of his massive head and beard but misses his kindliness. The library of the University of Manchester contains a large collection of letters written to him by his contemporaries, including the philosophers F. H. Bradley, G. F. Stout, and T. Percy

Nunn, the physiologists C. Lloyd Morgan and Sir Charles Scott Sherrington, and the Jewish leaders Chaim Weizmann and Claude Montefiore.

Bibliography

WORKS BY ALEXANDER

Books

Moral Order and Progress. London: Trübner, 1889.

Locke. London: Constable, 1908.

Space, Time and Deity. 2 vols. London: Macmillan, 1920.

Beauty and Other Forms of Value. London: Macmillan, 1933.

Philosophical and Literary Pieces. Edited by J. Laird. London: Macmillan, 1939.

The papers of particular philosophical interest appearing in this volume are “Art and Instinct,” Herbert Spencer Lecture (1927); “Artistic Creation and Cosmic Creation,” Annual Philosophical Lecture of the British Academy (1927); and “Spinoza and Time,” Arthur Davis Memorial Lecture (1921). The book also contains a list of Alexander’s published works, including reviews and contributions to journals.

Periodicals

“The Method of Metaphysics; and the Categories.” *Mind*, n.s., 21 (1912): 1–20.

“On Relations” and, in particular, “The Cognitive Relation.” *Mind*, n.s., 21 (1912): 305–328.

“Collective Willing and Truth.” *Mind*, n.s., 22 (1913): 14–47 and 161–189.

“The Basis of Realism.” In *Proceedings of the British Academy*, 1914. Republished in *Realism and the Background of Phenomenology*, edited by Roderick M. Chisholm. Glencoe, IL: Free Press, 1960. This lecture relates Alexander’s views on the theory of knowledge to those of other philosophers of the time and presents his theory that mind and object are both empirically within nature, their relation being a particular form of a more general relation of “compreence.”

“Sense-Perception: A Reply to Mr. Stout.” *Mind*, n.s., 32 (1923): 1–11. Written in answer to criticisms by G. F. Stout, in *Mind*, n.s., 31 (1922): 385–412.

ALEXANDER OF APHRODISIAS

Alexander of Aphrodisias, who was teaching at Athens in 200 CE, was recognized for centuries as the most authoritative exponent of Aristotle. His influence has probably been most far-reaching in the development of the theory of universals because he emphasized certain elements in Aristotle's not always unambiguous account. These were the unqualified priority of the particular substance and the existence of universals only as concepts, or "acts of intellect." The form was what made "this" matter (that is, an identifiable piece) what it was, but it was contingent whether the form was universal in the sense of generic. (Alexander does not notice that a class with only one member, like his case of the sun, is still a class.) What the form is as a subject remains unclear.

More famous is his doctrine about soul and intellect. A human being's intellectual faculty can exist in three conditions, described as three intellects: (1) the "material" intellect (*intellectus possibilis*), which is nothing actual but the bare potentiality (so Aristotelian matter) of the body to develop reason—the condition of babies; (2) the intellect (*intellectus in habitu*) that is the possession of, in fact, is identical with, concepts, or universals gained from sense experience—the condition of adults; (3) the "active" intellect (*intellectus agens*), which is exercising the thoughts that form the *intellectus in habitu* and is thus equivalent to the intellect as aware of itself.

What is distinctively Alexandrist is the identification he made, or seemingly made, of the "active" intellect both with the intellect that Aristotle said entered the body "from outside" and with the intellect eternally thinking of itself that Aristotle said was God. Intellect was, of course, the highest part or function of the soul, but since only the "active" intellect, as a "separate form," could exist without matter, it followed that there was no individual immortality for human beings. The exact relation of the "active" intellect to the individual soul or intellect is obscure in Alexander. He does not describe an active intellect acting directly like an efficient or even formal cause on a passive intellect but suggests rather the quasi-logical relationship which was fundamental to Neoplatonism and which made the less perfect instance of a kind entail the existence of the perfect. Thus, it is not at all certain that he meant thinking itself to go the way of immortality. In the fifteenth century Italian philosophers known as Alexandristi defended this interpretation of Aristotle's psychology against both Averroes's version and the theologically orthodox version of Themistius and Thomas Aquinas.

In other subjects we see Alexander less original but often attacking Stoic doctrine, notably in his tracts *On Fate* and *On Mixture*. But the exact understanding of him is colored always by the difficulty of knowing how far we can trust the writings attributed to him. The commentary on Books E (VI) to N (XIV) of Aristotle's *Metaphysics* and parts of Book II of his own *De Anima* are probably not his. The latter includes the section *On Intellect* which greatly influenced later Greek, Arab, and medieval philosophers. But both may well depend on and be closer to his thought than is allowed by a modern tradition that underestimates Neoplatonizing features of Aristotle as well as of Alexander.

See also Aristotle; Averroes; Neoplatonism; Themistius; Thomas Aquinas, St.; Universals, A Historical Survey.

Bibliography

Alexander's works, including dubious ones, are in *Commentaria in Aristotelem Graeca*, Vols. I–III, and *Supplementum Aristotelicum*, Vol. II (Berlin, 1883–1901). P. Moraux, *Alexandre a'Aphrodise, exégète de la noétique d'Aristote* (Paris, 1942), includes a French translation of *On Intellect*. See also F. E. Cranz, in *Catalogus Translationum et Commentariorum: Mediaeval and Renaissance Latin Translations and Commentaries*, Vol. I (Washington, DC: Catholic University of America Press, 1960), pp. 77–135; Ernst Cassirer, *Das Erkenntnisproblem*, 3rd ed., Part I, "Die Reform der aristotelischen Psychologie" (Berlin: Cassirer, 1922); and J. ALEXANDER OF APHRODISIAS [ADDENDUM]

Alexander of Aphrodisias's influence on Islamic philosophy was far reaching. In fact, it could appear to be somewhat out of proportion with his real importance as a thinker. The reason for this is partly fortuitous in that a large number of his works were preserved long enough for them to reach Baghdad in the ninth century CE and be translated into Arabic. Among the most significant of these are the following:

- (1) The fragments of the Commentary on Aristotle's *Metaphysics*, book lambda (*lam* in Arabic) preserved by Ibn Rushd in his own Great Commentary on the same work. The original text is lost in Greek.

- (2) The short treatise *On the Principles of the Universe* describing the mechanics of the heavenly motions and the mode of their influence on the sublunary world. It could be defined as a free synthesis of the main themes of Aristotle's *Physics* and *Metaphysics*, with some borrowings from the *De Anima* and the *Nicomachean Ethics*.
- (3) A treatise, *On Providence*, preserved in two fairly different translations. This last work was of particular importance to the Muslims in that it provides an Aristotelian answer to a question that is crucial in the context of a monotheistic religion, but was never treated as such by Aristotle himself.

The main features of the philosophical system set forth in these works can be summarized as follows. The heavenly motions are caused by the souls of the spheres (which carry the stars) in their desire to imitate the First Mover of the universe. The counterpart of this upward motion is the influence that the contrasting motions of the stars exert on the world of nature. This influence is as a matter of fact identified by Alexander with nature and providence. But this providence, although emanating from the heavens, is not willed by them, because Alexander postulates that the superior cannot care for the inferior without debasing itself.

Another Alexandrian tenet that exerted a profound influence on the Arab philosophers is his identification of the Active Intellect of Aristotle's *De Anima* with the Unmoved Mover of the *Metaphysics*. The intellectual processes of the human mind were thus directly connected with the divine.

ALEXANDER OF HALES

(c. 1185–1245)

Alexander of Hales, “Doctor Irrefragabilis,” friar minor, was an English Scholastic at the University of Paris. He was born in Hales Owen, Shropshire, and died in Paris.

Alexander was a student at Paris about 1200 and received his M.A. before 1210. He joined the faculty of theology, becoming a master regent about 1220. After

1222 Alexander made an innovation in the university by using the *Book of Sentences* of Peter Lombard as the basic text for theological courses. His newly published *Glossa* (identified only in 1945) was the result of this work. At the height of his career, about 1236, he became a Franciscan, “edifying the world and giving new status to the Order” (in the words of Roger Bacon). After he was put in charge of the school at the Paris friary, he continued his teaching, especially through his *Disputed Questions*, and had some part to play in the “great Summa weighing more than a horse, which the friars out of reverence ascribed to him and called ‘the Summa of Friar Alexander’” (R. Bacon). At the same time, he participated in the affairs of the order, attending the chapter that deposed Brother Elias in 1239, and was a coauthor of an *Exposition of the Rule of St. Francis*; he was also active in the affairs of the church, both in the university and in the First Council of Lyon (1244–1245). His sudden death after his return from Lyon apparently resulted from an epidemic current in Paris. An epitaph in the convent church saluted him as *Gloria doctorum, decus et flos philosophorum* (Glory of learned men, the honor and pride of philosophers).

TEACHINGS

Alexander's own doctrines are found in his *Glossa* and *Disputed Questions* (which are divided in the British Museum manuscript *Royal 9. E. 14.* into two series: those written before and those written after he became a friar); the *Summa* ascribed to him does not necessarily represent his opinions. Both the *Glossa* and the *Questions* labor under the disadvantage of being students' reportations (although some copies seem to have had a kind of official approval); both, however, justify the encomium of Bernard of Bessa: *maximus in theologia et philosophia magister* (greatest master in theology and philosophy). Alexander is both theologian and philosopher, masterfully handling a wide range of questions. Undoubtedly a traditionalist whose prime sources are Augustine, John of Damascus, and Pseudo-Dionysius, and whose thought is close to the scholastic traditions of his predecessors, Alexander nonetheless surpasses his contemporaries in the breadth and profundity of his questions and in the new problems and tracts he introduced into theology. To this extent he was an innovator who helped open the way for the scholastic renaissance of the mid-thirteenth century. In particular, as head of the friars' studium at Paris, he initiated a certain approach that came to characterize such representatives of the Franciscan school as Odo Rigaldus, Bonaventure, and Matthew of Aquasparta.

The problems of the distinction between philosophy and theology, and the nature of theology as a science, much discussed after 1240, are not treated explicitly (though it is possible that Alexander wrote a question on the subject; see below). These problems are implicitly considered in scattered remarks on the kinds of human knowledge and the validity of arguments, in the general organization of material into specific questions and problems, and in the principles used in the solution of the problems. For example, our knowledge of God arises both from authority and from reason; that is, either from faith, which “depends on hearing” (Romans 10.17), or from knowledge drawn from the things God has made. Proofs of God’s existence are suggested rather than developed at length: one is derived from the transcendental attributes of truth, goodness, and unity found in things; others are argued from the changing to the Unchanged, from dependent being to the Highest Being, from participated and partial good to the *summum bonum* (*Glossa* I, pp. 39–41). In the tradition of Augustine, Alexander finds analogies of the triune God in all creatures, thus setting the pattern for the Franciscan school, which, with St. Francis, delights to make of creation a “ladder” to the Creator. At the same time, Alexander shows the simplicity of the divine being to be in marked contrast to the composite character of all created being (*Glossa* I, p. 254; *Quaestiones*, pp. 14, 19). The doctrine here, that of *quo est* (the substance) and *quo est* (essence), is derived ultimately from Boethius, not from Avicenna, who seems to have been unknown to Alexander. In contrast to the *Summa Fratris Alexandri* and to Bonaventure, Alexander vehemently rejects any composition of matter and form either in angels or in the human soul (*Glossa* II, p. 28; other texts are in V. Doucet, *Prolegomena*, pp. 237, 268, n. 2). Apart from a lengthy question on immortality (*Quaestiones*, pp. 556–565), only passing remarks embody his notion of the soul. His attention is drawn more to the problem of free will (*Ibid.*, pp. 566–608, plus an unedited question). Here, Alexander teaches that man by his nature is free and that freedom of choice resides both in the intellect and in the will. The primary purpose for which man has been given this freedom is to choose that which is morally good. Alexander considers the moral life of man in such *Disputed Questions* as “On Ignorance,” “On Scandal,” “Love of Neighbor,” “Fraternal Correction,” “On Impediments to Reason,” “On Lying,” and “Conscience” (the last two as yet unpublished). To the last question must be joined his study of *synderesis* (*Glossa* II, pp. 380–385), which seems to make Alexander, not Philip the Chancellor, the creator of such a tract in Scholasticism.

LITERARY PROBLEMS OF THE “SUMMA FRATRIS ALEXANDRI”

Since the *Summa* attributed to Alexander was unfinished at his death, William of Militona, who became master regent in 1248, seems to have undertaken its completion, for in 1255 Pope Alexander IV charged the provincial of Paris to supply Militona with capable assistants who without delay would bring the work to a finish. The text as it now stands consists of four parts. Book I deals with the nature of theology, the existence and nature of God, the divine names, and the Trinity. Book II is divided into two sections: II–1, creation in general, the angels, the six days of creation, the soul, the body, and the human composite, and II–2, a lengthy study of moral theology—the nature of evil, definition and classification of sins, and original and actual sins. Book III considers the Incarnation and mysteries of Christ’s life, law (eternal, natural, positive, the commandments), grace, and faith (tome IV). Book IV treats of man’s reparation through the sacraments, the mass, prayer, fasting, and almsgiving; quite evidently a section on “Last Things” was to be included as the climax of the work.

Except in a few manuscripts and in the protest of Roger Bacon, however, the compilatory nature of the *Summa* was forgotten. All four books came to be attributed to Alexander, despite the manifest contradictions and conflicting opinions in the various parts. Only since the end of the nineteenth century, with the renewal of interest in medieval Scholasticism, has the question of authorship attracted attention. A few writers, it is true, have gone to an extreme in claiming that the whole *Summa* was a compilation of the last half of the thirteenth century, in basic dependence on Thomas Aquinas, Albert the Great, and Bonaventure. But more mature and solid scholarship has established that, if by and large the *Summa* is a compilation, it existed as a whole by 1257. The first three books were in existence before the death of Alexander, with three notable exceptions: The last tract of Book I was added between 1250 and 1253, while in Book II–1 the two sections “On the Human Body” and “The Human Composite” were composed after Bonaventure, almost certainly in 1255–1257, as was the last book. On the other hand, modern research is forced to agree with Roger Bacon that Alexander was not the author, in the strict sense, of the pre-1245 *Summa*. At most, it appears that he planned and organized the work, while the details were left to others. Internal criticism of style, language, and doctrine would show essentially two authors at work, neither of whom, by reason of doctrinal positions, can be Alexander. Books I and III were almost certainly the work

of John of La Rochelle, although the presence of other collaborators may be detected. Both parts of Book II, on the other hand, were written or compiled by some unknown friar who possessed a keen philosophical mind and a greater spirit of independence.

DOCTRINES OF THE PRE-1245 "SUMMA." The work of the "Summists" was largely one of compilation, yet not without a certain new and fresh viewpoint. If they drew on earlier material, they did not hesitate to insert their own views or add fresh tracts written specifically for the *Summa*. Relatively new was the opening inquisition on the nature of theology, based on the tract in manuscript *Vatican Latin 782*, folio 184d–186d (which may be by Alexander himself); it bears witness to the growing influence of Aristotle's ideal of a science. This inquisition is followed by an original tract on natural theology, remarkable for its metaphysical doctrine of God and creatures. This doctrine holds that the very conditions of finite being demand the existence of a First Being, even as the positive perfections of finite things reflect and lead to the infinite. The unknown author of Book II does not hesitate to repeat some of this material in an interesting and well-balanced dissertation on Creator and creature; he examines in detail the meaning of the act of creation, the properties of created being that reflect the divine cause, and those properties peculiar to creatures: composition, changeableness, time and space, and the beauty and order of the universe. Several questions seem to have bearing on problems that arose in the early thirteenth century under the influence of the newly known Arabian philosophers.

The importance of the *Summa* lies chiefly, perhaps, in its presentation and defense of the so-called Augustinian traditions in theology and philosophy without neglecting whatever was solid in the new philosophical literature. It may rightly be called the *Summa Minorum*, embodying the fundamental doctrines of the Franciscan school of the early thirteenth century.

Bibliography

For texts of Alexander, see *Glossa in Quattuor Libros Sententiarum Petri*, 4 vols. (Quaracchi, 1951–1957); *Quaestiones Disputatae "Antequam Esset Frater,"* 3 vols. (Quaracchi, 1960)—the series "after he became a friar" awaits publication at Quaracchi; *Expositio Quattuor Magistrorum Super Regulam Fratrum Minorum*, L. Oligier, ed. (Rome, 1950). The text of the *Summa* is *Doctoris*

Irrefragabilis Alexandri de Hales Summa Theologica, 4 vols. (Quaracchi, 1924–1948), books I–III; Book IV is found in several early editions, such as Nuremberg, 1482, and Cologne, 1622.

With regard to studies of Alexander's works, writings previous to 1948 that are concerned with doctrinal problems rather than literary ones must be interpreted in the light of new discoveries. For literary and historical aspects, see V. Doucet, *Expositio Quattuor Magistrorum III Necnon in Libros I et II Summa Fratris Alexandri* (Quaracchi, 1948), partially translated in *Franciscan Studies*, Vol. 7 (1947): 26–41, 274–312; *Ibid.*, Vol. 6 (1946): 403–417; and Doucet's introductions to the authentic *Glossa* and *Quaestiones*.

Doctrinal studies on the authentic Alexander are just beginning to appear: A. Fuerst, *A Historical Study of the Doctrine of the Omnipresence of God* (Washington, DC: Catholic University of America Press, 1951); E. Lio, *Determinatio "Superflui" in Doctrina Alexandri Halensis* (Rome: Apud Pontificium Athenaeum Antonianum, 1953); A. Hufnagel, "Die Wesensbestimmung der Person bei Alexander von Hales," in *Freiburger ZPT*, Vol. 4 (1957): 148–174; Bettoni, *Il problema della cognoscibilità di Dio nella scuola francescana* (Padua, 1950); see also *Franciscan Studies*, Vol. 10 (1950): 164–185, 286–312; Vol. 19 (1959): 334–383; Vol. 20 (1960): 96–148; Vol. 22 (1962): 32–149.

For earlier and somewhat outdated studies on Alexander as author of the *Summa*, see I. Herscher, "A Bibliography of Alexander of Hales," in *Franciscan Studies*, Vol. 5 (1945), 434–454; and P. Boehner, "The System of Metaphysics of Alexander of Hales," in *Ibid.*, 366–414.

Ignatius Brady, O.F.M. (1967)

AL-FĀRĀBĪ

(c. 873–950)

Al-Fārābī, more fully Abū-Nasr Muhammad al-Fārābī, known in Latin as Alfarabius or Avennasar, was one of the greatest Muslim philosophers. He was widely known as "the second master," Aristotle being the first, and Ab-Ar-Rahman ibn-Khaldūn rates him above Avicenna and Averroes. He was of Turkish origin, and his name indicates that he came from the district of Fārāb, on the middle Jaxartes River (now Syr Darya).

One of al-Fārābī's teachers was the Nestorian Christian Yuhannā ibn-Haylān, who was noted as a logician; it is uncertain whether al-Fārābī studied with him in Merv (Persia) or Harran (Syria) or Baghdad. His principal teacher was Abū-Bishr Mattā ibn-Yūnus, the most prominent member of the school of Christian Aristotelians in Baghdad. Here al-Fārābī studied not merely the various branches of philosophy, but also physics, mathematics, astronomy, and music, even becoming a skilled musical performer. He spent the last few years of his life at the court of the ruler Sayf-ad-Dawla at Aleppo. He did not

seem to have had any regular occupation by which to earn a livelihood and lived frugally, even ascetically, often in solitude.

Al-Fārābī's philosophy is based on the teachings of Plato and Aristotle as they were interpreted in the school of Baghdad in the tenth century. Like all writers in Arabic he assumed there were no essential differences between the two, but he preferred the metaphysics of Aristotle, as interpreted by Neoplatonists. Plato, however, he regarded as superior in practical matters, and he wrote commentaries on the *Republic* and the *Laws*. What is often regarded as his major work is reminiscent of these books; it has the clumsy title "On the Principles of the Views of the Inhabitants of the Excellent State," often shortened in practice to "Der Musterstaat," or "The Ideal City" (*al-madīna al-fadila*). The first third of this work sets out al-Fārābī's metaphysical system, the second third his psychology (largely Aristotelian), and the concluding third his views on the ideal state and various imperfect states.

To those familiar with the intellectual environment in which al-Fārābī lived, it is immediately apparent that he wrote in such a way as to commend his views to as many different groups of people as possible. It has been alleged that he supported the Shi'ite sect of Islam, and certainly his last patron Sayf-ad-Dawla was a Shi'ite; features of his "ideal city," such as the dependence of all on the head, resemble Shi'ite conceptions. Yet it is also clear that he wrote in such a way as not to offend the Sunnite majority; for example, by avoiding such a technical Shi'ite term as *imam*. Indeed, his view of the relation of philosophy and religion led him to attach positive value to the religions, although he regarded them as inferior to philosophy. Philosophy was the supreme exercise of human reason and therefore the primary requirement of an ideal city. By it, humanity came to know the one ultimate truth about the universe. To this ultimate philosophical truth the symbolic representations of it found in the several religions stand in varying degrees of proximity and remoteness. Al-Fārābī paid particular attention, of course, to the forms of the main Islamic states of his time and developed his conception of the ideal city in such a way that the actual states he knew were within measurable distance of the ideal.

His metaphysics, similarly, resembles that implicit in the Qur'an (Koran) and Islamic theology. God is the One or the First from whom all existence proceeds; and in this sense he accepts the Islamic doctrine that God is the creator of the world, although he also holds the heretical view that the world is eternal. In the relation of existent

things to God there is a hierarchical order. Similarly in the ideal city there is a head (*ra'īs*) who is the source of all authority and who assigns men to their appropriate grades. This head is also described as commanding but not obeying; all the intermediate grades obey those above and command those below, and the lowest grade only obeys.

Interest has been shown, especially in recent times, in al-Fārābī's theory of prophecy; that is, in particular, how it was possible for Muhammad to receive the Qur'an from God. Philosophic knowledge, the highest of all, he regarded as coming to the passive intellect of the philosopher from the Active Intellect, an existent below God in rank. Prophetic revelations also come from the Active Intellect but are received by the imagination of the prophet. In this al-Fārābī was able to accept the Qur'an as coming from God and yet to place philosophy above it.

See also Aristotle; Averroes; Avicenna; Islamic Philosophy; Kant, Immanuel; Plato.

Bibliography

WORKS BY AL-FĀRĀBĪ

The "Ideal City" has been translated as *Der Musterstaat von al-Fārābī* by Friedrich Dieterici (Leiden: Brill, 1900) and as *Idées des habitants de la cité vertueuse* by R. P. Jaussen, Youssef Karam, and J. Chlala (Cairo, 1949). A critical edition of the Arabic text and an English translation by Richard Walzer is in preparation.

AL-FĀRĀBĪ [ADDENDUM]

Al-Fārābī was a key figure in establishing much of the problematic of Islamic philosophy in the peripatetic tradition. He built on the earlier attempt by Abū-Yūsuf Ya'qūb ibn Ishāq al-Kindī to establish a technical language of philosophy in Arabic and presented a vocabulary and a curriculum that came to dominate for many centuries after his death. Al-Fārābī's epistemology and political philosophy were particularly influential. Firmly neoplatonic in tone, he differentiated between diverse kinds of intellect to describe human thought and gave an interesting and influential account of how knowledge can be analyzed in terms of a range of degrees of abstraction. The active intellect became a controversial topic in Islamic philosophy; it represented the highest one could go in one's thoughts and was responsible for emanating form to the world in which one lived. The nature of this concept came to dominate much of Islamic philosophy for a long time after al-Fārābī's death. There was a great deal of debate on the precise role and nature of the active intellect and whether the hidden agenda of its use by the philosophers was to limit human knowledge to a relatively low level of impersonal thought.

Similarly, the distinctions he made in his political thought won attention as a result of their conceptual clarity. Following Plato he distinguished between different kinds of state, and he used the concept of happiness as the ultimate aim of government. Different kinds of government can be distinguished from each other by their varying links with happiness, with corrupt states being very poor at reaching happiness while the virtuous states achieve that end to a high degree. Not surprisingly, the idea that philosophers make the best rulers was rather attractive to philosophers, and in al-Fārābī's case the skills of the philosopher need to be blended with those of a religious leader if the state is to be well organized and led. As with his work on epistemology and metaphysics, his writings on political philosophy produced a lively debate in Islamic philosophy on the role of philosophy and philosophers in the state and on the nature of the state itself.

AL-GHAZĀLĪ, AḤMAD

(c. 1062–1126)

Aḥmad al-Ghazālī's reputation as an Islamic thinker has unfortunately been overshadowed by that of his more celebrated elder brother, Muḥammad al-Ghazālī, author of the famous *Revivification of the Sciences of Religion*. The former was in fact the foremost metaphysician of love in the Sufi tradition and the chief founder of the philosophy of love in mystical Islam, and his impact on the later Persian Sufi tradition was more profound than his brother the theologian.

He spent most of his life in his *khānaqāh* (Sufi cloister) in Qazvīn, where he was famed for his eloquence as a preacher, and died there in 1126. Al-Ghazālī was the teacher of Abū' l-Najīb al-Suhrawardī, who was in turn the master of his nephew Shihāb al-Dīn Yaḥyā Suhrawardī, founder of the Suhrawardī order, famed as the "mother of Sufi orders." He was also the master of the enigmatic mystical theologian 'Ayn al-Quḍāt al-Hamad-hānī, who was executed in 1132 by fanatical Muslim clerics for his uncompromising Sufi beliefs. He features as a central figure in the initiatic chains of most of the great Islamic Sufi orders.

His fame derives mainly from his authorship of the first treatise on mystical love in Persian, the *Sawāniḥ al-'ushshāq* (The lovers' experiences), a short work on the spiritual psychology of divine love couched in the terminology of human erotic relationships. The main subject of his philosophy is passionate love ('*ishq*), which is not formally speaking "philosophy"—*Falsafa*—but rather comprises a sort of erotic theosophy apprehended by intuitional means (*dhawq*), based on contemplative experience rather than on rational meditations and deliberations. Expressing little of the same animosity to peripatetic philosophy manifested by his famous brother,

almost all his teachings are set in the context of commentary on Qur'ānic verses and prophetic traditions. Al-Ghazālī deliberately abstained from using any overt philosophical vocabulary in the text, employing instead terminology from a number of other fields, ethics, erotic poetry, and psychology, and so on. He follows Maṣū' al-Ḥallāj in identifying love with the divine essence as well as with the divine spirit. He maintained that knowledge ('ilm) alone is unable to grasp love ('ishq), comparing knowledge to the shore of the sea and love to a pearl in an oyster buried in its lowest depths. Forever shore-bound in immanence, neither dry reason ('aql) nor barren knowledge ('ilm) can ever access or apprehend the transcendent truths of love's apophatic teachings. The summit of knowledge lies in a kind of drunken inapprehension that is nonetheless a kind of apprehension without any of the limitations of subjective consciousness. Al-Ghazālī paradoxically describes this understanding of love that is "beyond knowledge" as being a kind of surmise or conjecture. This conjectural wisdom is higher than certainty for it is only that surmise or conjecture that can swim love's ocean to dive under in pursuit of its pearl. Due to *Sawānīh* and the many works of imitations it spawned, al-Ghazālī has come to be generally regarded as the foremost metaphysician of love in the Sufi tradition and the founder of the literary topos and mystical persuasion known as the "religion of love" (*madhhab-i 'ishq*) in Islam.

AL-GHAZĀLĪ, MUḤAMMAD

(450 or 451 AH [1058 or 1059 CE]–
505 AH [1111 CE])

Muḥammad al-Ghazālī (in Persian, "Ghazālī"), the Islamic theologian known to medieval Scholastics as Algazel, was born in Ghazāleh, a village on the outskirts of Tūs, in Khorāsān, northeastern Iran. His name is the same as that of his birthplace, which should be transcribed as Ghazālī, not as Ghazzālī. He died at Tūs. He was undoubtedly one of the strongest spiritual personal-

ities of Islam, one of those who strove most effectively for the establishment of an "orthodox" Sufism that would transcend the legalistic and superficial religion of the doctors of the Law. Al-Ghazālī was well known to the medieval Scholastics through a Latin translation of an unfortunately truncated work, *Maqasīd al-Falāsifa* ("The Intentions of Philosophers"). As a result the true meaning of his work was completely misunderstood, and he was thought to be a philosopher, whereas in fact he was the most ardent critic of philosophy.

At the age of thirty-six, al-Ghazālī experienced a profound crisis, provoked by the problem of intellectual certitude. He abandoned his professorship and his position as rector of Niẓāmīya University of Baghdad. During a period of ten years, clothed in the characteristic wool garment of the Sufis and completely absorbed in spiritual practices, he made solitary pilgrimages throughout the Muslim world, to Syria, Egypt, Mecca, and Medina. What he conveyed in his doctrines cannot be separated from this pathetic experience. He solved the problem of knowledge and certitude by affirming a degree of comprehension that left the heart no room for doubt, a comprehension that is the essential apprehension of things. The thinking soul becomes the focus of the universal Soul's irradiations, the mirror of intelligible forms received from the universal Soul. This theme dominates certain characteristic short treatises (the *Monqīdh*, or "Preservative from Error," and the *Risālat al-Ladonīya*) as well as the great synthesis titled *Ihyā' 'Ulūm ad-Dīn* ("Revival of the Religious Sciences"). But this theme had already been treated, undoubtedly without his knowledge, by the Imāms of Shi'ism, and it does not differ essentially from the *Ishrāq* of Sohrawardī. This very theme led Sohrawardī to advance philosophy on a new basis rather than destroy the efforts of philosophers as such.

It is principally this aspect of al-Ghazālī's work, developed in his *Tahāfut al-Falāsifa* ("Autodestruction of the Philosophers") that Westerners have been inclined to emphasize. An attempt has even been made to read into it a more incisive and decisive critique or metaphysics than that of Immanuel Kant. In fact, al-Ghazālī strove vehemently to destroy the demonstrative range that philosophers, Avicennians as well as others, accorded to their arguments regarding the eternity of the world, the procession of the Intelligences, the existence of purely spiritual substances, and the idea of spiritual resurrection. In general al-Ghazālī strove to refute the idea of any causality, of any necessary connection. According to him all that can be experimentally affirmed is, for example, that combustion of cotton occurs *at the moment of* contact with

fire; it cannot be shown that combustion takes place *because of* the contact between cotton and fire. Nor can it be shown that there is any cause whatsoever. From this bursts forth the paradox of a thinker who professes the inability of reason to attain certitude while maintaining the certitude of destroying, with massive doses of rational dialectic, the certitudes of the philosophers. Averroes clearly discerned this self-contradiction and replied to it with his celebrated *Tahāfut al-Tahāfut* (“Autodestruction of the Autodestruction”).

The same paradox is apparent in al-Ghazālī’s other polemical works; in the “Courteous Refutation of the Divinity of Jesus Christ according to the Gospel”; in his treatise in Persian against all sorts of “freethinkers,” or heretical thinkers (*Ibāhīya*); and, finally, in the treatise against the Ismā‘īlites (the Bātinītes, or “esoterics”). The last treatise was overly influenced by the fact that it had been commissioned for political reasons by the ‘Abbāsīd caliph al-Mostāẓhir, and the savage *dialectic*, deployed against an essentially *hermeneutic* Shi‘ite thought, rings false. The Ismā‘īlites met this attack in the twelfth century with a monumental response (a work of the fifth Yemenite Dā‘ī, in 1,500 pages), which unfortunately, is still unedited.

In any case, these polemical works had but a limited echo; al-Ghazālī’s influence made itself felt principally through the *Ihya*. Without doubt this influence was, and remains, considerable in Sunnite Islam. In Shi‘ite Islam, notably in Iran, it was another matter. First of all, his effort did not respond to the same necessity, since the teaching of the Imāms of Shi‘ism had already opened the way to spiritual Islam. But his effort was not ignored in Shi‘ism, especially in the Ispahan School. Moḥsen Fayẓ (d. 1091 AH/1680 CE), one of the most celebrated pupils of Mullā Ṣadrā Shīrāzi (d. 1050 AH/1640 CE), even went so far as to rewrite the whole *Ihya* with a Shi‘ite interpretation. (Certain authors believe with him, assuming the authenticity of the book titled *Sirr al-‘Ālamayn*, “Secret of the Two Universes,” that al-Ghazālī would finally have rallied to Shi‘ism.) In any case, in Iran no one ever thought or heard it said, as in the West, that the Ghazalian critique might have rendered impossible the continuation of philosophy in Islam and that Islamic philosophy was perhaps obliged to transport itself to Andalusia, where its last flames glowed with Ibn Bājja, Ibn Ṭufayl, and Averroes. Avicennianism, for example, enriched and modified by diverse contributions, continued to develop in Shi‘ite Iran, not only during the Safavid epoch but also afterward, even to this day.

AL-GHAZĀLĪ, MUHAMMAD [ADDENDUM]

For comparisons with the western Christian tradition, Augustine comes more readily to mind than Aquinas, yet al-Ghazālī fulfills something of the role of each. He realized that understanding can be perfected in a faithful response to divine revelation, and that human reason can elucidate that response by showing the way through many pitfalls. Al-Ghazālī is aware of the deleterious effect of a simple reading of the scriptures, and so helps his readers to a sophisticated yet respectful grasp of the Word of God in the Qur’an, all the while insisting that variant readings need to be discerned by careful intellectual examination. He is acutely aware of the way in which ordinary philosophical categories need to be stretched to accommodate the “creator of heaven and earth,” and so of the necessary negative moments in using the names which the Qur’an itself gives to God. Al-Ghazālī’s recommended way to engage in that negative moment is via Sufi meditation, which can alert both mind and heart to their

inadequacy as well as bolster both to continue the journey toward proximity with the divine. In this respect he can also be favorably compared with Moses Maimonides, who was probably cognizant of at least some of al-Ghazālī's writings.

ALIENATION

The term *alienation* (estrangement) has many different meanings in everyday life, in science, and in philosophy; most of them can be regarded as modifications of one broad meaning which is suggested by the etymology and the morphology of the word—the meaning in which alienation (or estrangement) is the act, or result of the act, through which something, or somebody, becomes (or

has become) alien (or strange) to something, or somebody, else.

In everyday usage alienation often means turning away or keeping away from former friends or associates. In law it usually refers to the transfer of property from one person to another, either by sale or as a gift. In psychiatry alienation usually means deviation from normality; that is, insanity. In contemporary psychology and sociology it is often used to name an individual's feeling of alienness toward society, nature, other people, or himself. For many sociologists and philosophers, alienation is the same as reification: the act (or result of the act) of transforming human properties, relations, and actions into properties and actions of things that are independent of man and that govern his life. For other philosophers, "alienation" means "self-alienation" (self-estrangement): the process, or result of the process, by which a "self" (God or man) through itself (through its own action) becomes alien (strange) to itself (to its own nature).

HISTORY OF THE CONCEPT

The concept of alienation was first philosophically elaborated by Georg Wilhelm Friedrich Hegel. Some writers have maintained that the Christian doctrine of original sin and redemption can be regarded as a first version of Hegel's doctrine of alienation and dealienation. According to others, the concept of alienation found its first expression in Western thought in the Old Testament concept of idolatry. Still others have maintained that the source for Hegel's view of nature as a self-alienated form of Absolute Mind can be found in Plato's view of the natural world as an imperfect picture of the sublime world of Ideas. As investigation continues, probably more forerunners of Hegel will be discovered. But it seems established that Hegel, Ludwig Feuerbach, and Karl Marx were the three thinkers who first gave an explicit elaboration of alienation and whose interpretation is the starting point for all discussions of alienation in present-day philosophy, sociology, and psychology.

HEGEL. It is a basic idea of Hegel's philosophy that whatever is, is, in the last analysis, Absolute Idea (Absolute Mind, Absolute Spirit, or, in popular language, God) and that Absolute Idea is neither a set of fixed things nor a sum of static properties but a dynamic Self, engaged in a circular process of alienation and dealienation. Nature is only a self-alienated (self-estranged) form of Absolute Mind, and man is the Absolute in the process of dealienation. The whole of human history is the constant growth of man's knowledge of the Absolute and, at the same

time, the development of self-knowledge of the Absolute, who through finite mind becomes self-aware and “returns” to himself from his self-alienation in nature. Finite mind, however, also becomes alienated. It is an essential characteristic of finite mind (man) to produce things, to express itself in objects, to objectify itself in physical things, social institutions, and cultural products; and every objectification is, of necessity, an instance of alienation: the produced objects become alien to the producer. Alienation in this sense can be overcome only in the sense of being adequately known. Again, it is the vocation of man as man to serve as the organon of the self-knowledge of the Absolute. To the extent that he does not perform this function, he does not fulfill his human essence and is merely a self-alienated man.

FEUERBACH. Feuerbach accepted Hegel’s view that man can be alienated from himself, but he rejected both the view that nature is a self-alienated form of Absolute Mind and the view that man is Absolute Mind in the process of dealienation. Man is not self-alienated God. On the contrary, God is self-alienated man; he is man’s essence absolutized and estranged from man. And man is not alienated from himself when he refuses to recognize nature as a self-alienated form of God; man is alienated from himself when he creates and puts above himself an imagined alien higher being and bows before that being as a slave. The dealienation of man consists in the abolition of that estranged picture of man which is God.

MARX. Marx praised Hegel for having grasped that the self-creation of man is a process of alienation and dealienation. But he criticized Hegel for, among other things, having identified objectification with alienation and the suppression of alienation with the abolition of objectivity, for having regarded man as self-consciousness and the alienation of man as the alienation of his self-consciousness, and for having assumed that the suppression of objectification and alienation is possible only and merely in the medium of pure thought. Marx agreed with Feuerbach’s criticism of religious alienation, but he stressed that the religious alienation of man is only one among many forms of man’s self-alienation. Man not only alienates a part of himself in the form of God; he also alienates other products of his spiritual activity in the form of philosophy, common sense, art, morals, and so on. He alienates products of his economic activity in the form of commodities, money, capital, etc.; he alienates products of his social activity in the form of the state, law, and social institutions. Thus, there are many forms in which man alienates from himself the products of his

own activity and makes of them a separate, independent, and powerful world of objects toward which he is related as a slave, powerless and dependent.

Nevertheless, man not only alienates his own products from himself; he also alienates himself from the very activity through which these products are produced, from the natural world in which he lives, and from other men. All these kinds of alienation are, in the last analysis, one; they are only different aspects of man’s self-alienation, different forms of the alienation of man from his human “essence” or “nature,” from his humanity. The self-alienated man is a man who is really not a man, a man who does not realize his historically created human possibilities. A nonalienated man would be a man who really is a man, a man who fulfills himself as a free, creative being of praxis.

The concepts of alienation and dealienation were elaborated by Marx in his early writings, especially in his *Economic and Philosophical Manuscripts*, written in 1844 and first published in 1932. In his later works the two concepts were basic, but they were used implicitly rather than explicitly. Their importance was therefore overlooked. In no exposition or interpretation of Marx’s views written in the nineteenth century or in the first three decades of the twentieth did the concepts of alienation and dealienation play any important role. But since the publication of the *Manuscripts* and especially since World War II, they have become the object of passionate discussions, not only among Marxists but also among non-Marxists (especially existentialists and personalists), and not only among philosophers but also among psychologists (especially psychoanalysts), sociologists, literary critics, and writers.

CONTEMPORARY INTERPRETATIONS AND DEFINITIONS

Present-day writers who use the term *alienation* differ very much in the ways in which they understand and define it. Some authors think that the concept can be applied both to man and to nonhuman entities (to God, world, and nature, for instance); but most writers insist that it is applicable only to humans. Some of those who apply it only to humans insist that it can refer only to individuals and not to society as a whole. According to a number of such authors, the nonadjustment of the individual to the society in which he lives is a sign of his alienation. Others maintain that a society also can be alienated, or “sick,” so that an individual who cannot adapt to the existing society is not, of necessity, alienated.

Many of those who regard alienation as applicable merely to individuals conceive it as a purely psychological concept referring to a feeling, or a state of mind. Others insist that alienation is not only a feeling but that it is also an objective fact, a way of being. Some of the writers who characterize alienation as a state of mind regard it as a fact or concept of psychopathology; others insist that although alienation is not good or desirable, it is not strictly pathological. They often add that one should distinguish alienation (a psychological state of the individual characterized by feelings of estrangement) both from anomie (relative normlessness in a social system) and from personal disorganization (disordered behavior arising from conflict within the individual).

Those who oppose characterizing alienation as a psychological concept usually say that it is also (or primarily) an economic, or political, or sociological, or ethical concept. Some insist that it is basically a concept of general philosophy, or a concept of ontology and philosophical anthropology.

According to Gwynn Nettler, alienation is a certain psychological state of a normal person, and an alienated person is "one who has been estranged from, made unfriendly toward, his society and the culture it carries" ("A Measure of Alienation," p. 672). For Murray Levin, "the essential characteristic of the alienated man is his belief that he is not able to fulfill what he believes is his rightful role in society" (*Man Alone*, p. 227). According to Eric and Mary Josephson, alienation is "an individual feeling or state of dissociation from self, from others, and from the world at large" (Introduction to *Man Alone*, p. 13). For Stanley Moore, the terms *alienation* and *estrangement* "refer to the characteristics of individual consciousness and social structure typical in societies whose members are controlled by, instead of controlling, the consequences of their collective activity" (*The Critique of Capitalist Democracy*, p. 125). According to Jean-Yves Calvez, alienation is "a general type of the situations of the absolutized subject who has given a world to himself, a formal world, refusing in this way the true concrete and its requirements" (*La pensée de Karl Marx*, p. 51); and according to Erich Fromm, "Alienation (or 'estrangement') means, for Marx, that man does *not* experience himself as the acting agent in his grasp of the world, but that the world (nature, others and he himself) remain alien to him. They stand above and against him as objects, even though they may be objects of his own creation. Alienation is essentially experiencing the world and oneself passively, receptively, as the subject separated from the object" (*Marx's Concept of Man*, p. 44).

With such a variety of definitions, it is difficult to say which is the best one. One may reserve the term for a specific phenomenon in which one is interested and, consequently, define it in such a narrow way as to make the majority of existing uses of "alienation" entirely inadmissible; or one may define it so broadly as to make as many as possible of the existing uses at least partly admissible and then distinguish between different forms of alienation in order to account for the variety of phenomena and to prevent possible confusions. The latter course seems more promising.

FORMS OF ALIENATION

All authors who have used the concept of alienation have distinguished between different forms of alienation; but not all of them have done so explicitly. Hegel attempted no explicit classification of the forms of alienation; but since, for him, the essence of all development was a process of alienation and dealienation, different stages in the development of the Absolute could be regarded as so many forms of alienation. It would be much more difficult to develop a similar classification for Feuerbach's works because the essence of his philosophy was negation of systematic philosophy. "Alienated Labor," a well-known fragment in Marx's *Economic and Philosophic Manuscripts*, seems to suggest that we should distinguish between four forms of man's alienation: the alienation of man from the products of his own activity, the alienation of man from his productive activity itself, the alienation of man from his human essence, and the alienation of man from other men. But in other places Marx talked about other forms and subforms of alienation not mentioned in this fragment. The enumeration seems to be defective also in that it puts on the same level forms of alienation that should not be at the same level.

Twentieth-century writers differed greatly in their enumeration of the basic forms of alienation. Frederick A. Weiss distinguished three basic forms (self-anesthesia, self-elimination, and self-idealization); Ernest Schachtel distinguished four (the alienation of men from nature, from their fellow men, from the work of their hands and minds, and from themselves); Melvin Seeman, five (powerlessness, meaninglessness, social isolation, normlessness, and self-estrangement); and Lewis Feuer, six (the alienation of class society, of competitive society, of industrial society, of mass society, of race, and of generations).

In listing five different forms of alienation, Seeman tried to define them strictly. According to him, powerlessness is "the expectancy or probability held by the individ-

ual that his own behavior cannot determine the occurrence of the outcomes, or reinforcements, he seeks”; meaninglessness results “when the individual is unclear as to what he ought to believe—when the individual’s minimal standards for clarity in decision-making are not met”; normlessness is the characteristic of a situation “in which there is a high expectancy that socially unapproved behaviors are required to achieve given goals”; isolation is characteristic of those who “assign low reward value to goals or beliefs that are typically highly valued in the given society”; and self-estrangement is “the degree of dependence of the given behavior upon anticipated future rewards, that is upon rewards that lie outside the activity itself” (“On the Meaning of Alienation,” pp. 786, 788, 789, 790).

Instead of trying to enumerate all classifications of the forms of alienation that have been made so far, we shall only mention a few of the basic criteria according to which such classifications could be made and actually have been made.

(1) According to the nature of that which is alienated, we may distinguish between alienation of things and alienation of selves. And if we distinguish different types of things or selves, we may add further subdivisions. To those for whom the only self is man, alienation of self is only another name for the alienation of man. But they may distinguish between individual alienation and social alienation. We may classify as types of social alienation the alienation of societies as a whole (such as feudal societies and capitalist societies), the alienation of social groups (capitalists, workers, intellectuals, bureaucrats, producers, consumers, etc.), and the alienation of social institutions (such as the state, the church, and cultural institutions).

(2) According to the question, we can distinguish between alienation from something else or somebody else and alienation from oneself. The distinction is applicable only to alienation of selves; a thing cannot be alienated from itself. A self can be alienated either from something or somebody or from itself. According to the different kinds of “others” and according to the different aspects or sides of the self, further subdivisions can be added (for example, alienation from nature, alienation from fellow men, or alienation of the self from its body, its feelings, its needs, or its creative possibilities).

(3) According to whether that which is alienated is alienated through its own activity or through the activity of another, we could distinguish between alienation through others and alienation through oneself. Alienation of a thing can obviously be only an alienation

through others. There can be different kinds of alienation of things (stealing, giving, and buying and selling). Alienation of self can be either alienation through others or an alienation through oneself.

SELF-ALIENATION

The concept of self-alienation, found in Hegel and Marx and of the greatest interest for philosophy, is a result of applying a combination of the above three basic criteria. What Hegel and Marx called self-alienation is alienation of a self *from* itself *through* itself. They differ in that Marx recognized only one self-alienated self (man), while Hegel recognized two (man and God, or Absolute). Some writers hold that one could also speak about self-alienation of nature or of the world. In religious myths we find self-alienated angels (for example, Lucifer), and in children’s stories and fables we find self-alienated animals (the cowardly lion, the naive fox) and even plants (a humpy fir tree, a stinking rose). But the concept of a self-alienated man is basic.

In what sense is it possible for a self (either an individual man or a society) to be alienated from itself? It seems plausible to say that to be self-alienated means to be internally divided, split into at least two parts that have become alien to each other. But in that case, why talk of self-alienation; why not, instead, simply refer to an internal division or split? The term *self-alienation* seems to suggest some or all of the following points. (1) The division of the self into two conflicting parts was not carried out from the outside but is the result of an action of the self. (2) The division into conflicting parts does not annihilate the unity of the self; despite the split, the self-alienated self is nevertheless a self. (3) Self-alienation is not simply a split into two parts that are equally related to the self as a whole; the implication is that one part of the self has more right to represent the self as a whole, so that by becoming alien to it, the other part becomes alien to the self as a whole.

One way to specify and clarify the inequality of the two parts into which a self-alienated self is split is to describe the self-alienation as a split between man’s real “nature,” or “essence,” and his factual “properties,” or “existence.” The self-alienated man in such a case is a man who is not in fact what he is in essence: a man whose actual existence does not correspond to his human essence. Similarly a self-alienated society would be a society whose factual existence does not correspond to the real essence of human society.

How can the actual existence of man deviate from his real essence or nature? If one were to conceive man’s

essence as something shared by all men, then somebody alienated from man's essence could not be a man in fact. Accordingly, if alienation of man from his essence is possible, his essence must not be conceived as something that all men have in common.

One possible interpretation would be the conception of man's essence as an eternal or nontemporal idea of man toward which the real man ought to strive. This interpretation is full of difficulties and leads to unanswerable questions, such as Where and in what way does such an idea of man exist? What is the way or method to achieve an adequate knowledge of it? Why should a real man strive toward it?

Another interpretation would consist in conceiving man's essence as something actually belonging to men—not to all, but only to some men; for example, to the majority of all so-far-existing men or to the majority of future men. Whichever interpretation one chooses, new difficulties arise. Why should a majority be more representative of the nature of man than a minority? If we already allow the split into essence and existence, why should we not also allow the possibility of the split being present in the majority? And why should a future actuality have any advantage over the past and the present one?

The third, and perhaps the most promising, interpretation consists in saying that man's essence is neither an eternal idea nor a part of actuality, but the sum of historically created human possibilities. To say that a man alienates himself from his human essence would then mean that a man alienates himself from the realization of his historically created human possibilities. To say that a man is not alienated from himself would mean that a man stands on the level of his possibilities and that in realizing his possibilities he permanently creates new and higher ones. The third interpretation seems more plausible than the first two, but it too leads to difficulties. In what way do the possibilities exist, and how do we discover them? On what basis do we divide man's real possibilities into human and inhuman possibilities?

SELF-ALIENATION AND HISTORY

Another much-discussed question asks whether self-alienation is an essential, imperishable property of man as man or whether it is characteristic only of one historical stage in man's development. Some philosophers, especially existentialists, have maintained that alienation is a permanent structural moment of man's existence. Man as man is necessarily self-alienated; in addition to his authentic existence he leads a nonauthentic one, and it is

an error to expect that he will one day live only authentically.

Opposed to this view is the view that the originally nonself-alienated man, in the course of development, alienated himself from himself, but that he will return to himself in the future. This view was held by Friedrich Engels and is accepted by many contemporary Marxists; Marx himself seems to have been inclined to think that man had always been self-alienated, but that in spite of this, he can and ought to overcome his self-alienation in the future. In this sense, Marx, in *Economic and Philosophical Manuscripts*, wrote about communism as the positive supersession of all alienation and the return of man from religion, family, state, etc., to his human (that is, social) existence. Such a conception of communism as a dealienation of human community formed the basis of all of Marx's other works.

ALIENATION IN PAST AND PRESENT. If we assume that the whole of history up to now has been a history of humanity's self-alienation, then it may be asked whether history has been characterized by the gradual elimination of alienation or by its permanent deepening. Those who believe in constant progress have maintained that alienation has always been diminishing. But many contemporary philosophers and sociologists have found that alienation has constantly increased, so that it is much deeper and more pervasive than ever before in contemporary capitalism and bureaucratic socialism. A third group of authors have maintained that alienation has diminished in some respects and increased in others. Some have insisted that the question cannot be answered simply in terms of more or less, that we should investigate different types of self-alienated individuals typical of different periods in human history. An interesting attempt in this direction was made by Erich Fromm, who distinguished four basic types of "nonproductive" (self-alienated) character orientations (the receptive, hoarding, exploitative, and marketing orientations), each typical of a successive stage of historical development. According to Fromm, all four are found in contemporary self-alienated society, but whereas the first three were inherited from earlier periods, the marketing orientation is "definitely a modern product," typical of twentieth-century capitalism (*Man for Himself*, pp. 62–81).

ALIENATION IN THE FUTURE. For those who regard alienation as a historical phenomenon, the question about a possible end of alienation (dealienation or disalienation) naturally arises. Two main answers have been given.

According to one group of thinkers, absolute dealienation is possible; all alienation, both social and individual, can be once and for all abolished. The most radical among this group have even maintained that all alienation has already in principle been eliminated in socialist countries, that it exists there only as a case of individual insanity or as an insignificant remnant of capitalism. More realistic representatives of this view have not denied facts showing that in countries considering themselves socialist, many old forms and even some new forms of alienation exist. But they have insisted that in more mature stages of socialism all these forms of alienation are destined to disappear.

According to a second group, only a relative dealienation is possible. It is impossible to eliminate alienation completely and finally because human nature is not something given and unchangeable that can be fulfilled once and for all. It is possible, however, to create a basically nonalienated society that would stimulate the development of nonalienated, really human individuals.

OVERCOMING ALIENATION. The means recommended for overcoming self-alienation differ according to one's view of the essence of self-alienation.

Those who regard self-alienation as a psychological fact, as a fact of the life of the individual human self, dispute the importance or even the relevance of any external changes in circumstances and suggest the individual's own moral effort, a revolution within the self, as the only cure. Those who regard self-alienation as a result of the neurotic process are quite consistent in offering a psychoanalytical medical treatment; they regard the new creative experience of acceptance and meeting in a warm, truly mutual and trusting doctor–patient relationship as the main therapeutic factor.

Diametrically opposed to this view are those philosophers and sociologists who, basing their ideas on a degenerate variant of Marxism called economic determinism, hold that individuals are the passive products of the social organization, that the whole of social organization is determined by the organization of economic life, and that all economic life is dependent on the question of whether the means of production are or are not private property. For economic determinists, the problem of dealienation is reduced to the problem of social transformation, and the problem of social transformation is reduced to the abolition of private property.

In criticizing “the materialist doctrine that men are products of circumstances and upbringing,” Marx stressed that “it is men that change circumstances,” so that

“the coincidence of the changing of circumstances and of human activity can be conceived and rationally understood only as *revolutionizing practice* (Praxis)” (*Basic Writings on Politics and Philosophy*, with Engels, New York, 1959, p. 244).

Those who have tried to elaborate such a conception have insisted that dealienation of the society and dealienation of individuals are closely connected: One cannot be carried out without the other or reduced to the other. It is possible to create a social system that would enable and even stimulate the development of dealienated individuals, but it is impossible to organize a society that would automatically produce such individuals. A nonalienated individual is an individual who fulfills himself as a free and creative being of praxis, and free creativity is not something that can be given as a gift or forced upon anyone from outside. An individual can become free only through his own activity.

It is not simply that dealienation of individuals cannot be reduced to dealienation of society; the dealienation of society, in turn, cannot be conceived as a change in economic organization that will automatically be followed by change in all other fields and aspects of social life. Far from being an eternal fact of social life, the split of society into mutually independent and conflicting spheres and the predominance of the economic sphere is, according to Marx, a characteristic of a self-alienated society. Therefore, the dealienation of society is impossible without abolishing the alienation of the different human activities from each other.

Finally, the problem of dealienation of economic life cannot be solved by the abolition of private property. The transformation of private property into state property does not introduce an essential change in the situation of the working man, the producer. The dealienation of economic life also requires the abolition of state property, that is, its transformation into real social property; and this can be achieved only by organizing the whole of social life on the basis of the self-management of immediate producers.

ALIOTTA, ANTONIO

(1881–1964)

Antonio Aliotta, the Italian philosopher, was born in Palermo and taught at the universities of Padua and Naples. Moving from studies in experimental psychology, *La misura in psicologia sperimentale* (1905), Aliotta published in 1912 a vast critical analysis of contemporary philosophy titled *La reazione idealistica contro la scienza* (English translation, London, 1914) in which he defended a monadological spiritualism with a theistic tendency. When the shadow of the neo-Hegelianism of Benedetto Croce and Giovanni Gentile began to loom over Italy, Aliotta took sides with the opponents of this idealism and in his teaching and writings spread the news of other philosophical movements going on outside Italy, especially the philosophy of science, realism, and pragmatism.

From 1917 to 1936, in the mature phase of his thought, Aliotta's sympathies were above all with pragmatism, and his experimentalism suggests many points of similarity with the philosophies of William James and George Herbert Mead. Experimentation is the only means of establishing the truth of any knowledge whatever, even metaphysical and religious. By "experimentation," Aliotta does not mean simply the techniques of the laboratory but any kind of trial-and-error procedure in any field of human activity. History is a kind of grand laboratory in which people seek, through conflict, to attain more harmonious forms of life.

The success of the experiment, according to Aliotta, consists in the elimination of conflict and in the realization of a certain degree of harmony. "The quest for truth," he says in *Relativismo e idealismo*, "is the quest for a superior harmony of active human and non-human forces, operating in the universe of our experience." Obviously, the presupposition is that experience is not a single and continuous process, but is composed of a plurality of individual centers that meet and limit each other by stages and, through conflicts, try to realize a growing coordination. Common sense, science, and philosophy

are the steps, or phases, of this coordination. The "thing" of common sense makes possible a certain degree of coordination between individual intuitions. The syntheses of science represent a superior degree of coordination, since they eliminate the disparity between the perspectives of common sense; and philosophical inquiry seeks to collect the remaining dissident elements, to correct the restricted vision of the particular sciences, and to achieve a more comprehensive view. The concept limit toward which this process tends is the coordination of all activities and their convergence to a single end, which is, in other terms, the Leibnizian monad of monads, or God.

Aliotta insists, however, on the social character, in Mead's sense, of all degrees of knowledge. He denies the absoluteness of truth and defends philosophical relativism, of which he sees implicit proof in the physics of Albert Einstein; and he holds that the measure of truth is in every case determined by the degree of coordination that is experimentally realized between the intuitions, the perspectives, and the individual points of view that constitute the rough fabric of experience.

In later writings, for example, *Il sacrificio come significato del mondo* (1943), Aliotta sought to extend this point of view to ethics with an inquiry into what he calls "the fundamental postulates of action." The indeterminacy of the world and its relative uniformity, the value of the human person and the transcendence of reality, and the plurality of persons and their tendency toward unity are among these postulates, but *the* fundamental postulate is that of the "perennial character of human-values" and of the existence of God, which guarantees this character. The spiritualistic and fideistic aspect prevails over the pragmatic and methodological aspect in this final phase of Aliotta's thought.

ALISON, ARCHIBALD

(1757–1839)

Archibald Alison was born in Edinburgh, Scotland, and educated at Glasgow and Balliol College, Oxford. He was ordained in the Church of England and held positions in both England and Scotland. He married a daughter of John Gregory (1724–1773), who was a professor of philosophy and medicine at Aberdeen and an associate of Thomas Reid in the Aberdeen Philosophical Society. Alison preached at the Cowgate Chapel in Edinburgh from 1800 until his death. He published a volume of sermons, but is known primarily for his “Essays on the Nature and Principles of Taste,” published in 1790 and reissued in 1810.

Alison's theory of taste breaks with earlier eighteenth-century theories in several respects while retaining other characteristic features. Like his predecessors, Alison regards beauty and sublimity as essentially emotional, hedonic experiences. Beauty is a form of pleasure, and as such it is found not in objects but in the mind. He accepts a faculty psychology that is essentially associative, and he regards what he is doing as a scientific investigation of the principles of human nature. In addition, Alison is the first theorist to clearly separate what he calls the emotions of taste—beauty, sublimity, and so on—from other kinds of pleasure. Although earlier theories speak of the pleasures of the imagination as special pleasures and sometimes suggest distinctions from other pleasures, it is Alison who first clearly appeals to a separate aesthetic pleasure that in his words is distinct from “every other emotion of pleasure” (1790/1999, p. 407).

Alison also argues that the ideas required to produce the emotions of taste must be complex. A simple idea,

such as that of a color, which may be pleasant in itself, is only felt as beautiful when it enters into an associative complex. Thus, he rejects both the view that taste is an effect of an internal sense and the view that some single principle, such as relation, utility, or order and design, produces the emotions of taste. Alison believes that the emotion he seeks to describe is very much a product of an active mind. So he distinguishes two elements in complex emotions such as beauty. One is a simple idea and its accompanying emotion. Almost any simple emotion will do, including painful as well as pleasurable emotions. But the complex emotion of taste only appears when the simple emotion is acted on by the faculty of the imagination to produce “a consequent excitement. ... The peculiar pleasure of the beautiful or the sublime is only felt when these two effects are conjoined, and the complex emotion produced” (1790/1999, p. 408).

Alison's theory of the imagination moves away from the earlier eighteenth-century theories of imagination according to which imagination is essentially a faculty that recombines preexisting ideas into new, artificial images—for example, a centaur is a combination of the ideas of horse and man. Alison still thinks of imagination as producing new ideas, but his emphasis is on its ability to detect resemblances, “trains of imagery” (1790/1999, p. 412), and expressive signs. So the faculty of imagination is essentially an active, associative faculty and the peculiar pleasure that it produces arises from the activity of the mind itself.

Alison draws a conclusion, which parallels Immanuel Kant's theories in many respects, that for the imagination to do its work it must be “free and unembarrassed” (1790/1999, p. 412)—that is, disinterested—“so little occupied by any private or particular object of thought, as to leave us open to all the impressions which the objects that are before us can produce” (p. 412). Whereas the earlier theories that suggest the need for disinterestedness understand it as a negative condition—a condition of good taste (Third Earl of Shaftesbury [Anthony Ashley Cooper]) or an avoidance of prejudice (David Hume) and thus a part of a theory of criticism, Alison treats it as a condition of experience. It is what allows the imagination to form the associations that are a necessary condition for the production of the complex emotion of beauty or sublimity. Alison goes so far as to describe a kind of free play of the imagination, which is opposed to attention. For Alison, however, these are competing mental habits and not Kantian epistemological principles.

Alison does draw the conclusion, common to some twentieth-century aesthetic attitude theories, that criti-

cism is incompatible with the emotion of taste. Thus, taste ceases to be a form of critical judgment. He acknowledges that an active imagination does not necessarily produce good taste—the young are indiscriminating, for example—but he does not seem to recognize that on his theory taste has ceased to be what it had been since the Renaissance formation of the idea—a form of judgment with social implications.

Instead, Alison develops two essentially romantic theses: “matter is not beautiful in itself, but derives its beauty from the expression of mind” (1790/1999, p. 417) and the qualities of matter that are productive of beauty or sublimity are either themselves immediately expressive of mental qualities or powers—for example, the activity of creation in the arts or of the divine creator in nature; or they are signs of mental qualities—for example, the tone of voice. So Alison’s theory combines three elements: imagination, association, and expression. He concludes, “[T]he beauty and sublimity which is felt in the various appearances of matter, are finally to be ascribed to their expression of mind; or to their being, either directly or indirectly, the signs of those qualities of mind which are fitted, by the constitution of our nature, to affect us with pleasing or interesting emotion” (p. 419).

Alison anticipates Kant and many of the features of romantic and twentieth-century aesthetics, therefore, without completely abandoning the tradition of theories of taste with which he is most closely associated—particularly those of Alexander Gerard and Reid. Although there are extensive references to the fine arts, Alison’s theory of the arts remains a theory of imitation, not a theory of artistic creation or genius. Natural beauty provides the paradigm for beauty in the arts. The only creative mind is the divine mind; artists can only discover beauty, not create it. At the same time, however, imagination and expression are given a new scope. They are the necessary faculties for an artist. Artistic imitation is an active, not a passive mental operation.

Alison does not go far in formulating the epistemological requirements of his theory. He is not prepared to go as far as Samuel Taylor Coleridge and declare that the artist is a second creator. He takes for granted a theory of natural signs, found also in Reid and drawn from earlier theories, and he depends on a theory of association that is rapidly losing its grounding in the theory of ideas developed by John Locke and Hume. This produces some obscurity about what aesthetic qualities in objects are, a good deal of rhetorical excess, and an avoidance of the problems that exist for a theory of taste in which taste is no longer a form of judgment. But the new scope given to

the imagination makes Alison one of the first to formulate a full theory of aesthetics as expression.

AL-JABIRI, ‘ABD

(1935–)

Muḥammad ‘Abd al-Jabiri studied philosophy at Muḥammad V University in Rabat, Morocco, where he got his PhD in 1970. He had been a school teacher since 1957 and after successive promotions he became professor of philosophy at that university in 1971. Al-Jabiri has been involved in politics and journalism, and he is the main editor of the journal *Fikr wa-Naqd* (Thought and criticism) published in Rabat. His philosophy has to be understood in the context of the effort to modernize his country while at the same time preserving its cultural identity.

Al-Jabiri is a prolific writer; his large project, *The Critique of the Arab Mind*, is in three volumes: *Formation of the Arab Mind* (1984), *Structure of the Arab Mind* (1986), and *The Arab Political Mind* (1990). Al-Jabiri emphasizes the concept of cultural legacy (*turāth*) and analyses different readings of it. The fundamentalists (*al-salafīya*) search for the pristine Islam and they commit a

grave mistake because they ignore the historical factor. The original “authentic” form of Islam was valid in its time, but the fundamentalists do not see it as subject to the course of history, they consider its initial form perpetually valid. The liberals and the Orientalists read cultural legacy from the Western standpoint. Arab liberals suffer under such cultural alienation that they cannot perceive their own identity. As for the Marxists they expect tradition to develop into revolution and the revolution to develop into tradition, and they cannot escape this vicious circle.

Al-Jabiri’s reading is based on his criticism of Arab rationality, or mind (*‘aql*). To this purpose he follows a methodology to liberate the reader-subject from being a hostage as the read-object, that is, Arabic language and Arabic tradition. After gaining objectivity, the reader rejoins the object, apprehends it by means of intuition (*h?ads*), and recognizes the historicity of reason. According to him Arab reason started as a political instrument. Two trends existed within the Umayyad regime: the one rationalist and reformist—Mu‘tazilite—and the other traditional and conservative—Sunnite; the Sunnites were in power, and the Mu‘tazilites in opposition. When the Abbasids overthrew the Umayyads, the Mu‘tazilites moved to the governing side, and the Sunnites to the opposition. Nevertheless, since the Mu‘tazilites were not strong enough to face the challenge of esoteric movements, the caliph [Abū] al-Ma‘mūn (786–833) turned to the philosophy of Aristotle for help.

For al-Jabiri philosophy in the Islamic East is radically different from that in the West. Avicenna in the East wanted to create the “Oriental” philosophy by combining Platonic philosophy with the Aristotelian and integrating esoteric Gnostic doctrines and Mu‘tazilite theology; it survived only in Iranian Gnosticism. By contrast, Averroes in the West succeeded in standing by Aristotle and abandoning the other doctrines and solved the long-lasting issue of the relationship between revealed religion and philosophy by proving their coherence and continuity. Thus, al-Jabiri asserts that the future of Arab philosophy lies in Averroes’s philosophical method and his rationalism (*‘aqlānīya*).

AL-KINDĪ, ABŪ-YŪSUF YA‘QŪB IBN ISHĀQ (ninth century)

Abū-Yūsuf Ya‘qūb ibn Ishāq al-Kindī was the first outstanding Arabic-writing philosopher. He was born in the Mesopotamian city of Basra and later held a distinguished position at the caliph’s court in Baghdad, where he died shortly after 870. For about a century he enjoyed a reputation as a great philosopher in the Aristotelian-Neoplatonic tradition. He appears to have been the first to introduce the late Greek syllabus of philosophical learning into the Muslim world. It was mainly, though not exclusively, based on the *Corpus Aristotelicum* and its Peripatetic and Neoplatonic commentators. Numerous competent Arabic versions of Greek philosophical texts were available then, and al-Kindī himself commissioned translations of Aristotle’s *Metaphysics* and of the so-called *Theology of Aristotle* (in fact a paraphrase of Plotinus) which are extant and available in print.

Al-Kindī’s fame, however, was eclipsed by such later philosophers as al-Fārābī and Ibn-Sīnā (Avicenna). Only a few of his numerous treatises reached the Latin Schoolmen, but one recently discovered Arabic manuscript contains twenty-four of his otherwise unknown philosophical writings.

Two basic tenets of al-Kindī’s, concerning prophecy and the creation of the world, were not accepted by his more famous Muslim successors. First, knowledge acquired through revelation in the Scriptures and from divinely inspired prophets is unambiguously superior to any knowledge acquired through philosophical training. In many cases, religious tradition and speculative, dialectical theology (repudiated emphatically by al-Fārābī) lead one to the same conclusions as philosophy and natural theology, which al-Kindī very consciously and proudly

introduced for the first time into the Muslim discussion. He maintained, however, that there are certain fundamental tenets of faith that are guaranteed by revelation alone and cannot be demonstrated by human reason.

Second, unlike the later Muslim philosophers, al-Kindī did not proclaim the eternity of the world and an eternal, emanating creation. Rather, he attempted to prove in philosophical terms that the world had been created from nothing, in time, through a divine creator, and that at some future date, according to divine dispensation, it would dissolve again into nothing. In doing this, he appears to use essentially the same arguments that were developed with more sophistication and subtlety by John Philoponus, the Christian Neoplatonic-Aristotelian philosopher, in sixth-century Alexandria. Al-Kindī also disagreed with the leading later thinkers by considering astrology to be a genuine branch of rational and methodical knowledge.

AL-KINDĪ, ABŪ-YŪSUF YA'QŪB IBN ISHĀQ [ADDENDUM]

Al-Kindī is important as the individual who established the earliest vocabulary for philosophy in the Islamic world. He was unusual in tending to avoid religious issues. In particular, in his ethics he tended to steer clear of specifically religious issues altogether. In this respect he followed a broadly Stoic line by advocating the life of the mind and the futility of relying on physical things to bring happiness. Virtue is attained by adhering to the middle ground and avoiding extremes. Toward the end of his life al-Kindī came under sustained attack by the local ruler. All in all, he did place philosophy in the Islamic world on a firm footing, and his influential disciples continued to debate and write along the lines their teacher had demonstrated.

ALSTON, WILLIAM P.

(1921–)

William P. Alston, an American philosopher, was born in Shreveport, Louisiana. He earned his Ph.D. from the University of Chicago (1951), and has taught at the University of Michigan (1949–1971), Rutgers University (1971–1976), the University of Illinois (1976–1980), and Syracuse University (1980–2000). Alston is a past president of the Central Division of the American Philosophical Association, the Society for Philosophy and Psychology, and the Society of Christian Philosophers as well as the founding editor of both *The Journal of Philosophical Research* and *Faith and Philosophy*. He is best known for his work in epistemology, the philosophy of religion, metaphysics, and the philosophy of language.

Alston made his early reputation in *Philosophy of Language* (1964), where he rejects the verifiability criterion of meaning and referential theories, and argues that the meaning of a sentence consists in its illocutionary act potential. He defends this view in his recent *Illocutionary Acts and Sentence Meaning* (2000), emphasizing the normative character of illocutionary acts. To illustrate, in uttering “Eat all of your vegetables,” Trudy performs the illocutionary act of ordering the hearer to eat all of his vegetables only if she *takes responsibility* for the satisfaction of certain conditions, including: the hearer has some vegetables, it is possible for him to eat them, and Trudy has authority over him. So, Trudy performs the aforementioned illocutionary act only if she renders herself liable to censure in case these conditions are not satisfied—only if, Alston argues, she subjects her utterance to an illocutionary rule. Alston endorses a “Use Theory of Meaning,” according to which a sentence’s having a particular meaning consists in its being usable to play a particular role in communication. Because it is a sentence’s illocutionary act potential that enables it to play this role, the meaning of a sentence consists in its usability to perform illocutionary acts of a particular type (in its being subject to a particular illocutionary rule).

Alston is also one of the leading proponents of realism about truth. In *A Realist Conception of Truth* (1996), he argues for alethic realism, the view that (1) truth is important and (2) a proposition is true if and only if what it claims to be the case *is* the case. Accordingly, the proposition that snow is white is true if and only if snow is white. Nothing else is necessary for the truth of that proposition. In opposition to epistemic conceptions of truth, a person need not be justified (rational, warranted) in believing that snow is white, nor must it be the case

that she or he would be justified in believing it in ideal epistemic circumstances. Snow must simply be white. This is a minimalist—but not a deflationist—account of the *concept* of truth because the *property* of truth may have features that go beyond this concept. Consequently, Alston’s realist conception of truth is consistent with the correspondence theory, but does not entail it. His conception of truth is also consistent with different types of metaphysical antirealism, including idealism and Hilary Putnam’s conceptual relativism. In *A Sensible Metaphysical Realism* (2001), Alston defends his own version of *metaphysical* realism, according to which large and important stretches of reality do not depend on conceptual schemes for their existence.

Alston’s early work in the philosophy of religion, much of which is collected in *Divine Nature and Human Language* (1989), focuses on the nature and properties of God, the literal application of predicates (e.g. “knowing”) to God, and divine action. While Alston’s views on philosophical theology are crucial contributions to the field, his most pioneering work is thought to be *Perceiving God* (1991), in which he develops a “doxastic practice” approach to the epistemology of religious experience. He argues that putative experiences of God can provide *prima facie* justification for beliefs about God. This is because mystical perception (MP), in which beliefs about a religiously construed ultimate reality are based directly on putative experiences of it, is a basic doxastic practice—a family of socially established belief-forming dispositions or mechanisms. MP (which includes Christian mystical perception [CMP], Hindu mystical perception, etc.) is analogous to sense perception—the basic practice of forming perceptual beliefs about the physical environment on the basis of sensory experience. Alston argues here, and in *The Reliability of Sense Perception* (1993), that any attempt to *show* that basic doxastic practices are reliable will be infected with epistemic circularity. Still, it is practically rational to suppose that CMP is reliable, and hence that the beliefs it generates are *prima facie* justified. It is also rational for practitioners of CMP, and practitioners of other forms of MP, to continue to engage in their respective practices.

Alston has had a striking impact on epistemology. His early work is devoted to defending fallibilist foundationalism, delineating and evaluating different concepts of epistemic justification, and advocating an account of justification that combines a core externalism with minimal accessibility to grounds. Rejecting perspectival internalism and higher-level requirements, Alston distinguishes between the activity of showing that a belief

is justified and a belief's being justified. In *Epistemic Justification* (1989), he argues that a belief's being prima facie justified consists in its being based on an adequate ground that is fairly readily accessible. The ground must be adequate—it must actually be sufficiently indicative of the truth of the belief. Because the subject need not have access to, or beliefs about, its adequacy, this is primarily an externalist, reliable-indicator account of justification. It anticipates the externalism of Alston's doxastic practice approach, according to which, for example, the socially established practice of sense perception must simply be reliable in order for a person's perceptual beliefs to be prima facie justified. In his recent work, he defends the Theory of Appearing as a superior alternative to sense-data and adverbial theories of the nature of perception. And, radically, in *Beyond "Justification": Dimensions of Epistemic Evaluation* (2005), he argues that there is no objective, epistemically crucial property of beliefs picked out by "justified." Consequently, epistemologists should dispense with the debate over justification, and instead investigate a plurality of epistemic desiderata, some of which are salvageable from it.

ALTERITY

The term *alterity* derives from the Latin word *alter*, which means "other." In contemporary philosophy the question of the other is primarily that of the other human being, the Other (*Autrui*, in French), although some thinkers have raised the question of whether the human other should be privileged in this way. However, the central question governing philosophical discussions of alterity is not that of who the other is, but that of our access to alterity. So-called continental philosophy highlights the ontological dimension of this question rather than its epistemological dimension, which was the focus in English-speaking philosophy of what, since the nineteenth century, has been called the problem of other minds.

In his *Cartesian Meditations* (1960 [1931]) Edmund Husserl offers an account of how, by an analogy with my own body, I recognize another body as organic and, by a kind of alienation in which I make myself other than we call empathy, constitute an other as an alter ego. Martin Heidegger in *Being and Time* (1966 [1927]) dismisses this approach as based on René Descartes's inadequate understanding of the human being as an isolated subject. Heidegger displaces the epistemological problem of alterity by issuing the ontological claim that the other possesses the kind of being that he calls *Mitsein* (literally "with-being"). Nevertheless, the problem of the other reappears in Jean-Paul Sartre's *Being and Nothingness* (1956 [1943]), where, in part under the impact of Georg Wilhelm Friedrich Hegel's account of the master-slave dialectic, the relation with the Other is presented as conflictual.

LEVINAS, DERRIDA, AND THE ABSOLUTE OTHER

In *Totality and Infinity* (1969 [1961]) Emmanuel Levinas radicalizes the problem of alterity by thinking of the other not as another subject like me, but as radically Other, the one who puts me in question and calls me to my responsibility. This ethical relation is asymmetrical in the sense the Other is accessible only starting from an I. However, the Other is no longer defined by his or her differences from me, but by the way he or she exceeds this relation in absolute separation from me. Thus, Levinas's conception of the absolute Other self-consciously breaks with the way that the other has been thought in the West since Plato's *Sophist*. According to Plato the other is always relative to some other (*Sophist* 255d), a formulation usually understood to mean that the other is "other than the same."

When Jacques Derrida challenges Levinas's account of the absolute Other in "Violence and Metaphysics" (1978 [1964]), he explicitly evokes Plato's critique that renders such a conception unthinkable, impossible, and unsayable (*Sophist* 238e). Without underwriting the legitimacy of Husserl's account of intersubjectivity Derrida asks whether Husserl's notion of an alter ego does not better secure the ethical character of the radical alterity of the other than does Levinas's notion of the absolutely other. Derrida's point is that the Other cannot be the Other of the Same except by being itself the same, that is, an ego, but he himself subsequently embraces Levinas's language of alterity with the phrase *tout autre est tout autre* (every other is wholly other) (1995 [1990]), p. 82).

Meanwhile, and in part in response to Derrida's essay, Levinas developed the fundamental idea of his later thought: the substitution of the one for the other. To the question of how it is possible for the Other to call me into question, Levinas, in *Otherwise Than Being* (1981 [1974]), gives the answer that it is possible because I am already for-the-other, that is to say, because the other is in me in the midst of my self-identification. A parallel gesture by which alterity is relocated within the same can be found in psychoanalytic literature, for example, in Julia Kristeva's *Strangers to Ourselves* (1991 [1988]). However, it can be argued that the new kind of cosmopolitanism she promotes retains the division between "them" and "us" and that it seeks to overcome, insofar as the world is now divided between those who recognize that there are no foreigners and those who do not.

To address the difficulty of thinking substitution, Levinas has recourse to Arthur Rimbaud's impossible phrase *je est un autre* (I is an other). Levinas uses the very

difficulty of thinking and saying alterity not only to challenge the priority of ontology and proclaim the primacy of ethics but also to mark an exit from Western philosophy as he inherits it. This shows how far the question of alterity has departed from the Husserlian problem of intersubjectivity, as a regional problem, to become the philosophical site for explorations of the limits of thought and language.

Robert Bernasconi (2005)

ALTHUSIUS, JOHANNES (1557–1638)

Johannes Althusius, the German legal and political philosopher, was born at Diedenshausen, a village of the county of Wittgenstein-Berleburg in the Westphalian Circle. He is thought to have been the son of a farmer, although all data of his early youth are quite unknown. By 1581 he was studying Aristotle in Cologne, and he later studied Roman law at Basel. His experience of the Swiss way of life gave him a predilection for municipal freedom and self-government and for republican constitutionalism. Although deeply influenced by Calvinist piety, he

was eager to become a learned classical scholar. The forces of Christian faith, humanistic learning, and democratic feeling formed his character. He was both a man of strong will with a tendency to stubbornness and an austere moralist. It is, therefore, not surprising that he was a rigorous logical thinker and a systematic teacher as well as a realistic positivist with a desire to describe the empirical realities of social life.

Althusius passed his examination for the doctorate of civil and ecclesiastical law at Basel in 1586 with theses on the right of succession. In the same year he published a booklet, *Iurisprudentia Romana, vel Potius Iuris Romani Ars, 2 Libri, Comprehensa, et ad Leges Methodi Rameae Conformata* (Basel, 1586), that discussed fundamental questions of Roman law and that is also of philosophical interest. Through this work Althusius introduced into political science the systematic method of the French philosopher Petrus Ramus that contrasted with the prevailing humanistic method based on philological concerns. But although Ramus opposed the traditional Scholastic method of instruction, he had nevertheless retained the formalism of his predecessors insofar as he used the “method of dichotomy.” This specific “ramistic” method divided every logical concept into two others, and each of them into two new concepts. This method of an endless, progressing, systematic presentation was applied by Althusius to all his later writings.

Soon after receiving his doctorate, Althusius became a lecturer in Roman law and in philosophy at Herborn, a newly established Calvinist college attended by students from many countries. In 1594 he became professor of law, and he was appointed rector of the college in 1597 and again in 1602. He also served as an advocate in the chancellery at Dillenburg. In this capacity he defended the rights of the college against the ambitions of the noblemen of the county. He was also involved in controversies with his colleague, the law professor Anton Matthäus (1564–1637), and with some of the Herborn theologians. In spite of these activities, he found time to write his most famous work, *Politica Methodice Digesta et Exemplis Sacris et Profanis Illustrata* (Politics methodically arranged and illustrated by holy and profane examples [Herborn, 1603; 2nd enlarged ed., Groningen, 1610; 3rd enlarged ed., Herborn, 1614]). This work was, as C. J. Friedrich wrote, “the culminating point of his life.” The book clearly showed Althusius’s systematic strength. He undertook to coordinate the diverse views of the Bible, Roman law, and the advocacy of the right to resist an unjust monarch of George Buchanan and the monarchomachs,

and, on this basis, to write a compendium of political science.

The book was a natural and rational system of sociology, involving all the contemporary discussions of the problematical questions of theology, ethics, and jurisprudence. Althusius’s fundamental view was that “politics is the science of linking human beings to each other for a social life.” The whole of humankind, living in natural cooperative groups, builds up a universal community of civil and private corporations. The members join each corporation by the force of their sympathetic emotions. In this respect Althusius resembled both Hugo Grotius and Jean-Jacques Rousseau. However, he was a strong opponent of Jean Bodin’s doctrine of royal absolutism, believing that the constituent power belongs to the community and that sovereignty is an attribute of the organized people, not of the king. The people decide all fundamental political questions through the representative assembly, and the chief of state is only a commissioner of the people and may be deposed if he acts contrary to the contract between him and the community. The representative assembly must obey the commandments of God and observe the natural laws. The necessities of human nature are as much a source of social order as is God’s will.

Thus, Althusius held a threefold conception of social order: as a biopsychological social phenomenon, as a historically conditioned reality, and as a divinely limited work of man.

The principal sources of Althusius’s thought were faith, reason, and experience. A major work composed somewhat later, *Dicaiologicae Libri Tres Totum et Universum Ius, Quo Utimur, Methodice Complectentes* (Digest of jurisprudence [Herborn, 1617]), is based on these three elements. In this work Althusius discussed the fundamental principles, institutions, and concepts of public and private law as they were found in the Roman jurisprudence of his day. By presenting the law as the realization of the concept of law and of its component legal categories, Althusius became one of the most important forerunners of modern Continental “legal conceptualism.”

Meanwhile, in 1604 Althusius had been called as a syndic to Emden, a Calvinist city in eastern Frisia. He was soon appointed to the council, and he played an important part in the struggles of the city with the count of Frisia. He also became a dominant figure in the consistory of the Reformed Church in Emden.

ALTRUISM

While benevolence, compassion, and humanity were not major virtues for the ancient philosophers, modern moral philosophers generally agree that altruism is important to morality, although they disagree about what it is, how to explain it, and what its scope should be. The nineteenth-century French theorist Auguste Comte, who first coined the term *altruism*, claimed that the way to end social conflict is by training people to "live for others," rather than themselves. In a popular sense, altruism means something like noble self-sacrifice. A more minimal understanding, one that many philosophers favor, is an acknowledgment that the interests of others make claims on us and limit what we may do.

Altruism made its way into moral theory when Christian philosophers added the theological virtues of faith, hope, and charity to the cardinal virtues of the Greeks. Charity, the greatest of the theological virtues, was thought to be an inner spiritual orientation toward others. Charity is characterized as disinterested, universal, and unconditional. It should be directed to everyone, saint and sinner alike, regardless of merit.

The eighteenth-century Scottish philosopher Francis Hutcheson followed the Christian philosophers, claiming that everyone is capable of Christian love—calm universal benevolence—that aims at the good of all sentient creatures. He also distinguished two other types of benevolence: love directed toward smaller groups or particular persons, such as parental affection and friendship, and particular feelings of pity, sympathy, and gratitude. Christian love is the best form of benevolence; the other two are good so long as they do not counteract it.

Hutcheson's view about how altruistic we should be is even more radical than the Christian view. Reducing virtue to benevolence, he argues that none of the four cardinal virtues of the Greeks—temperance, courage, prudence, justice—are virtues unless their practice is motivated by love. Temperance is not a virtue, unless motivated by a concern to make ourselves fit to serve others. Courage is mere craziness, unless we face dangers in order to defend the innocent or to right wrongs. Prudence is not a virtue if it aims only at promoting our own interests. Justice is not a virtue unless it has a regard for the good of humankind. Hutcheson derives the utility principle—maximizing happiness for the greatest number—from the idea that the morally best motive is calm, universal benevolence.

Later utilitarians made the utility principle central to their account of moral rightness, but detached it from Hutcheson's basis in Christian love. Many utilitarians have argued that our duties of benevolence are extreme, so their view about the scope of benevolence is radical in another way. As long as I have the power to benefit others without hurting myself so much that total utility is reduced, I am obligated to help them. On this view, giving aid to famine relief, for example, is not a matter of charity but a duty.

There are two other ways of understanding altruism. One way, adopted by David Hume in the eighteenth century and by Bernard Williams as well as some feminist thinkers in the twentieth, characterizes altruism in terms of particular benevolent dispositions, desires, or affections. According to this view, you help others because you love them. Hume denied that we have the universal love of humankind to which Hutcheson and the Christian philosophers appealed, but thought that such benevolent dispositions as parental love and friendship were morally important character traits essential for virtue. Hume also thought that we possess the capacity to act from sympathy. When you see someone in distress, sympathy leads you to feel distress, which in turn motivates you to alleviate your distress by alleviating theirs. Sympathy enables

us to extend our love for particular individuals and smaller groups to larger groups of people.

Williams's view is similar to Hume's. Some of our particular benevolent desires are directed toward people we care about, for example, a daughter or friend, and are motivated by thoughts like "Mary needs help." Other benevolent desires are more general and impersonal concerns, motivated by thoughts like "someone needs help." Williams claims that the structure of the motivating thought in both cases is the same. Although altruism is not a rational requirement on action, Williams thinks that sympathetic reflection may move us from benevolent desires motivated by our love of particular individuals to more general altruistic dispositions.

Some feminist philosophers have argued that altruistic dispositions such as caring, compassion, and maternal love should be made the focus of morality. These philosophers claim that relationships should be at the heart of morality and that most of our relationships are not only intimate, but also involuntary. They argue that an ethics of care rather than an ethics of justice is appropriate for these types of relationships.

By contrast, philosophers in the Kantian tradition conceive of altruism as a rational requirement on action. They claim there is no need to postulate a benevolent desire to explain altruism. Kant's initial argument appeals to his requirement that we may only act on principles that we can will as universal laws. Willing a world in which everyone has a policy of not helping others, while knowing that you will need help, would be inconsistent, so we must will to help those who are in need. Kant also argues for a duty of beneficence on the basis of the requirement of treating humanity as an end in itself. He argues that you must treat the ends of others as you treat your own ends. You take your own ends to be good and worth pursuing, so consistency requires that you treat the ends of others as good and worth pursuing. This suggests that we have reason to help not only those in need, but anyone we are in a position to help.

Thomas Nagel follows Kant in thinking that the reasons of others directly provide us with reasons. Suppose someone wants you to stop tormenting him. How does that person's desire not to be treated that way give you a reason to stop? At an intuitive level, Nagel's argument appeals to the question: How would you like it if someone did that to you? You realize that if someone were tormenting you, you would not merely dislike what he was doing, you would resent it. Resentment is a response to the idea that someone has ignored a reason he has to not treat you badly. The reason in this case is your own desire

not to be tormented. You think your desire not to be tormented is a reason for your tormentor to stop. Since you think that your reasons provide direct reasons for others, you must also think that the reasons of others provide you with reasons. The argument turns on the idea that your reasons and the reasons of your victim are the same: they are the reasons of a person. According to Nagel, the argument works only because you have the capacity to view yourself as just one person among others. Although Humeans and Kantians disagree about whether to explain altruism in terms of particular desires or to view it as a rational requirement on action, they agree that the force of altruism springs from our common humanity.

AMPÈRE, ANDRÉ MARIE

(1775–1836)

André Marie Ampère was a French physicist and philosopher; his main achievement in physics was the foundation of electrodynamics. He correctly recognized that Hans Christian Ørsted's discovery, in 1819, of the effect of electric current on a magnetic needle was merely a special case of the general correlation of electricity in motion with the rise of a magnetic field. His explanation of magnetism in terms of molecular electric currents was a bold anticipation of one feature of the later electron theory.

Shortly after Ampère's death his *Essai sur la philosophie des sciences* appeared with a biographical note by Charles-Augustin Sainte-Beuve and a warm appraisal by Émile Littré. Its subtitle, *Exposition analytique de toutes les connaissances humaines*, indicated that the main topic was the classification of sciences, in which Ampère was as much interested as his contemporary Auguste Comte. Ampère's main division of sciences into "cosmological" and "noological" was inspired by Cartesian dualism. The details of the classification, which also included "applied sciences"—medicine, agriculture, etc.—are now of only historical interest.

Far more interesting is *La philosophie des deux Ampères*, edited by J. Barthélémy Saint-Hilaire. The title is misleading because the only contribution of Ampère's son Jean Jacques is an introduction to the philosophy of his father. Besides this, the book contains some unfinished philosophical manuscripts as well as Ampère's letters to Maine de Biran, with whom he remained in personal contact and in correspondence until Maine de Biran's death in 1824. Ampère accepted the central idea of Maine de Biran's voluntaristic idealism that the true nature of the self is revealed in the introspective experience of effort. But unlike Maine de Biran, Ampère more cautiously differentiated what he called *emesthèse* (that is, consciousness of personal activity) from the sensation of muscular effort that can be induced by some external agency.

This was not the only instance of Ampère's remarkable gift for introspective analysis. In dealing with the association of ideas he distinguished two cases. The first is *commémoration*, or ordinary recall, when two associated ideas remain unaffected by their contiguity. The second is *concrétion*, when two ideas merge, for example, when the present perception of an object seen before blends with the recollection of its previous perception. But the main difference between Ampère and Maine de Biran concerned the problem of knowledge of the external world. Maine de Biran, under the influence of Immanuel Kant, denied any possibility of knowing things-in-themselves; Ampère, under the influence of Isaac Newton, John Locke, and his own scientific interests, believed in the possibility of knowing inferentially the relations between things-in-themselves. These "noumenal relations" are similar to Locke's primary qualities; they can be known when the general spatial, temporal, and numerical relations are divorced from the qualitative content (Locke's secondary qualities) of sensory experience. But unlike Locke, Ampère interpreted the impenetrability of matter dynamically, as being a

result of inextensive resistances (*résistances inétendues*) of which there is an indefinite number in each body. This view of matter as being a product of inextensive dynamic centers is thus closer to the dynamism of Gottfried Wilhelm Leibniz, Roger Joseph Boscovich, and Michael Faraday than to the traditional atomism of Newton. On the other hand, Ampère remained a Newtonian in his insistence on the reality of absolute space and time, which he interpreted theologically, again like Newton, as attributes of God. Equally Newtonian was his rejection of the Cartesian plenum.

ANALOGY IN THEOLOGY

Religious discourse has been under scrutiny since ancient Greece when Anaxagoras said if oxen and dogs could paint, they would depict the gods in their own likenesses. The Jewish, Christian, and Muslim scriptures depict the divine being in vivid humanlike traits while conveying the divine otherness, mystery, immateriality, and eternity. Thus there are religious currents of anthropomorphism, of transcendentalism, of metaphor and symbolism, and of literalism about the being and nature of God. The Greek philosophical ancestry of Western culture presents the divine as immaterial, immutable, everlasting, perfect, and incomprehensible. Both the Platonic and Aristotelian

metaphysicians developed theories of analogical predication that were later extended to theology, the study of the revealed divinity.

Theologians used a theory of analogy that had three parts: analogy of *being* (of reality between God and world, and among created realities, too); analogy of *meaning* (of words and concepts); and analogical thinking (of conception by proportionalities). The aim was to explain how words that apply to sensible things also adapt in meaning to apply literally, not only metaphysically, to the transcendent deity known only by inference, revelation, or mystical experience. Words applied to God—“wise” and “good,” for example—are neither entirely equivocal (such as *bank/savings*; *bank/river*), nor merely metaphorical (*drop/an argument*), but rather, they are analogous; that is, they adjust in ways explained below to the context, just as words generally adjust to contrasting contexts, say, as “knows”/the way differs from “knows”/arithmetic, and as “exist” does in “*there exist/trees/species/numbers/shapes*.” Metaphysics articulates *theoretical* truth-conditions for such statements and for ordinary religious beliefs—conditions not accessible without such metaphysics—the way science states the molecular structure for water.

1. SECULAR ORIGIN IN PLATO AND ARISTOTLE

The thesis that words fit in literal meaning to diverse verbal contexts that reflect differences of reality—the analogy theory—has its origin in secular philosophy. For Plato, things that share in the Forms are not said to exist in the same sense as the Forms (compare *Sophist*; *Parmenides*), and the Form “Human” is *what-it-is-to-be-human*, and thus is human, but not in the sense in which Calicles is human by participating in the Form. Further, Plato used the same names, such as the *courageous* man and the *courageous* act, *just/state*; *just/man*, for things related as cause to effect and sign to signified.

Aristotle used those distinctions, added more, and regarded *real*, entitative analogy, reflected in word-meaning, as central to his explanatory principles. (*Metaphysics* 1070a.31). Such predication is *literal*, as opposed to metaphorical (*Poet* 1457b)—for example, “the fields *smile* with the sunlight” (Aquinas called that *improper* proportionality [*Summa Theologiae* 1.13.3.ad 3]). Aristotle acknowledged analogy by *attribution* (relational naming: *healthy/animal*; *healthy/diet*), and by *proper proportionality* (e.g., genus is to species as body is to soul, namely, as *potency* is to *act*). The explanatory terms—for example, “act/potency”—apply to diverse things analogically (*Met*

1048b, 5–8). Aristotle further reasoned that qualities, such as color and shape, and other accidentals, are said *to be* derivatively (*pros hen*) to substances; and “analogically the same things are principles, i.e. actuality and potentiality; but they are not only different for different things, but also apply in different ways to them” (*Met* 1071a.5). Aristotle says the causes and principles of different things are analogous and are spoken of analogously (*Met* 1070a.31). Moreover, the contrast-dependent notions, “act/potency,” “matter/form,” “substance/accident,” “cause/effect,” are all *analogical* in meaning because the phenomena to which they apply are really, *de re*, analogous; for instance, body is matter for soul, and clay is matter for a statue.

2. TRANSITION TO THEOLOGY

The Arabic philosophers adopted Aristotle’s views on analogy in their metaphysics and physics and in their discussion of the simplicity of God in the Qur’an. That made the first connections of Aristotelian analogy-theory to scriptural theology. Islamic religious believers differed on how to interpret the physical descriptions of God’s face, eyes, hands, speaking, sitting, and so on, in the Qur’an, as well as the description of God’s feelings—for example, wrath, satisfaction, and God’s traits, such as cunning and patience—whether anthropomorphically, metaphorically, symbolically, and so on (compare Van Ess 1954). Al-Kindī (c. 850) thought a literal reading of the Qur’an on creation is coherent with Aristotelian concepts. In his treatise “On the One True Agent” he holds God is literally the only agent bringing being from (absolute) nonbeing, whereas humans are only metaphorically (analogically?) agents, bringing being from potentiality. Al-Fārābī (c. 900) in chapter 1 of “On the Perfect State” says “existing,” “having intellect,” “knowing,” “being wise,” “real,” “true,” “living,” and the like, are said of God in senses different from what we say of creatures because the divine being is simple, without composition or distinct traits. And Avicenna (980–1037) used Aristotle’s views about analogy of meaning and of reality directly in his metaphysics and in his physics, where “motion,” for instance, is said (as Aristotle also said) to apply analogously, to augmentation, alteration, and locomotion, and the analogy of “being” within the ten categories is acknowledged.

Avicenna reasoned that being and essence are really the same in God, and indicated that a creature’s being is not explained by “*what-it-is*” as is the divine; Aquinas would adopt this. Avicenna also formulated the principle that God’s knowledge is the cause of things (later used by

Aquinas as *cognito dei causa rerum*, *ST* 1.14.8), whereas our knowledge is posterior to things known. The Arabic writers, including the Jewish Moses Maimonides, all hold that God is simple; he is not a body, without any plurality of attributes except by attribution from the divine effects, infinite and incomprehensible. It is from those Arabic, chiefly Islamic, sources, along with the corpus of Aristotle, that the analogy theory came into Latin theology, Avicenna being the most influential in metaphysics.

Maimonides (1135–1204) argued that the eternity of the world is not demonstrated, and that it is both created and has a temporal beginning. Like Avicenna, he affirmed the divine simplicity in a strong sense, so that: “either every attribute we predicate of Him is an attribute of action [and so named from the received effect], or, if the attribute is intended for the apprehension of His essence and not of his action, it signifies the negation of the privation of the attribute in question” (*Guide for the Perplexed*, 1, p. 58). Thus, saying, “God is all knowing” means “God is not unknowing of anything,” and saying “God is simple” means “God is not composite,” and saying “God is eternal” means “God is without beginning or end.” That came to be known as “negative theology,” with no positive ascriptions to God, except existence and creation and the metaphors provided by scripture.

Christians, from the earliest fathers of the church, developed explanatory analogies—that is, proportional comparisons, say, of the Trinity to the unity amidst distinction of the essence, power, and operation of the human soul, and an analogy of the relation of the Father to the Son as “light from light” (in *Nicene Creed*, and Augustine’s *De Trinitate*). Such explanatory analogies, not part of the theory described here, were devised throughout the predominantly neoplatonic first millennium of Christian thinking, for instance in Augustine’s *De Trinitate* (c. 410) and Boethius’s *De Trinitate* (c. 510), the School of Chartres (twelfth century), and the School of St. Victor (twelfth century), and continued throughout the later history of theology (compare Chollet 1923–1967).

A neoplatonic writer historians call Pseudo-Dionysius (c. 500) was widely believed, but not by Aquinas, to have authority as a disciple of St. Paul. He proposed, in his *Divine Names*, that one first knows God by negation (*via negationis*), “not a body,” “not with parts,” and so on, then by inadequate affirmation as “wise,” “good,” “loving,” qualified by “but not in the way of creatures,” and then in a third stage by superlatives, such as “infinitely knowing” and “good beyond excellence” (*via eminentiae*). But in his *Mystical Theology* Pseudo-Diony-

sus is more restrictive, saying one starts *via remotionis* by denying of God the things most remote from him, such as “drunkenness and fury,” then progressing by denial even through all the higher attributes of creatures until one reaches “the super-essential darkness,” entering “the cloud of unknowing,” mystically united to what is “wholly unknowable” (because of the limitations of the human mind). This work had a profound influence on the development of transcendentalism in medieval theology and even into the twenty-first century.

3. AQUINAS (1225–1274)

Aquinas combined the influences of Avicenna, Maimonides, and Pseudo-Dionysius, along with mastery of Aristotle and Plato. He held that God infinitely transcends every true description achieved by human philosophical efforts, but that, nevertheless, a great deal can be known and positively established about God; in fact, Aquinas believed, there can be both a philosophical science of God from unaided reason, and a *divine science* whose first principles are given by revelation (*ST*, 1.q.1.a.2). Furthermore, he absorbed Aristotle’s notion of analogy of “being” (*pros hen*) for the ten Categories into his own wider theory of analogy between creatures and God by participation. Aquinas said “being can be essentially predicated of God alone, because to be divine is to be subsistent and absolute, whereas being is predicated of any creature by participation; for no creature *is* its own being, but is something having being,” as the actuality (*esse*) of its potentiality (its essence), because creatures do not exist on account of *what* they are, but on account of God (*Quod*.2, q.2, 1.1). Further, *what* God is, essentially, is not naturally knowable to humans, though it is disclosed to the blessed by divine gift (*ST* 1.12.1).

Thus, Aquinas reasoned that our knowledge is not limited to what we can attribute negatively or only by metaphor, or merely by the *extrinsic* attribution that would make “God is good” mean merely “God is the *cause* of creaturely goodness” (*ST* 13. a.6) in the way that a person is called “captain” because of what he does. Many writers, influenced by Philo Judaeus (c. 20 BCE–40 CE) whose work came to the West through Clement of Alexandria and Origen, held that God is named only with names of his effects. Aquinas, however, says we can know that pure perfections (unmixed with limits, such as “educated”) apply intrinsically to God by *explanatory priority* because the divine perfections are the cause and exemplar of all perfections in creatures, such as being, life, knowledge, freedom, and love. This position is variously developed in *Summa Theologiae* (q.13, a.4–5), and *Summa*

Contra Gentiles (1, chap. 34), and *Q. D. De Veritate* (q 2.a.1). Nevertheless, the names and concepts of pure perfections are acquired only through our perceptual experience with creatures (*ST* 1.q.13, a.6), even though their primary reality is in God. Thus the words “loves,” “knows,” “chooses,” and so forth, used of God and of humans, have similar definitions but differing presuppositions that reflect the diverse manner of being of God and creatures, the perfections being prior and all the same as God’s being, and finite, received, and really separable from one another in creatures.

So whatever is predicated positively of God is either by *attribution*, as God is called “creator” on account of what is made and “happy” because of his perfect enjoyment, or predicated by *proportionality* and priority, as God is said to be “knowing, loving, wise, excellent and beautiful,” and so on, but in a manner explanatorily prior to the creature’s imperfect and derived being and knowledge. Aquinas also acknowledged metaphorical predicates of God, too (*ST* 1.19.11), many sanctioned by scripture (“angry,” “Prince of Peace”), and many useful negative ones (“not a body,” “not in space,” “not with parts or complexity,” “not with a beginning or end”).

The religiously and philosophically central attributes are predicated literally and intrinsically, with their presuppositions adjusted to religious discourse (e.g., “God chooses” but does not deliberate), and elaborated theoretically (e.g., God’s attributes are all “really the same as the divine being, *esse*, differing from one another only in concepts”). They include “knowing,” “loving,” “good,” “righteous,” “just,” “omnipotent,” “omniscient,” “immutable,” and “present everywhere”—and every other unmixed perfection, too. They apply to God but are adjusted to the priority and perfection of divine being. Thus, God knows but does not find out; God loves but does not need. All creation participates in God’s being, not as being divine in any way, but as being continuously *from and on account of* God, and thus, being said “to be” analogously. Created being is God’s proper and continuous effect; the way setting-alight—igniting—is the *proper* effect of fire; and the illumination of the air is the *continuous* effect of the sun (*ST* 1, 8.1).

Aquinas thought the real analogy between divine subsistent being (*ipsum esse subsistens*) and creaturely, participated being is an adequate basis for demonstrative knowledge of the existence and of the many attributes of God by reasoning that he displayed in *Summa Contra Gentiles*.

Nevertheless, Aquinas emphasizes that because what is received is received in the manner of the recipient

(*quidquid recipitur recipitur modo recipientis*, *ST* 1.75.5), God is disclosed through nature only as far as nature is capable, with all creatures falling infinitely short of the divine reality. And he holds that the divine biblical revelation, though vastly exceeding anything humans could discover or even conceive on their own, is proportioned to what is fitting for humankind, thus leaving the infinite divine mystery “wrapped in a mist” (*caligine abvoluta*, *Const. Dei Filius* ch. 4, Vat. 1), with the essence of God beyond all natural understanding.

By the Reformation in the sixteenth century, a religious role for scholastic philosophy was largely rejected, and the reformers held the faith to be in no need of fragile and contested support from philosophy. Biblical authority was said to stand on its own, to be understood by the “analogy of Faith” (*analogia fidei*, based in Rom. 12.6, according to both Luther and Calvin). Thus the analogy discussions dried up, except among Catholic philosophers such as Cardinal Cajetan (1458–1564), Sylvester of Ferrara (1474–1528), and Francisco Suárez (1548–1617), and mostly stayed that way, apart from the historical scholarship that continues to the present.

David Hume (1711–1776) inaugurated modern noncognitivism, consigning metaphysics to the flames (*Enquiry*, 1748), asserting that all truths are grounded in sense impressions or relations of ideas, thus setting the framework for twentieth-century verificationism and the attack on the cognitive content of religious discourse.

4. CONTEMPORARY CONTEXT

In the twentieth century, positivist philosophers, seeking to be like scientists, questioned whether talk about God had any cognitive content at all. Alfred Jules Ayer argued that talk about God is without content because it is unverifiable. Some believers, such as Richard Bevan Braithwaite and Frank Plumpton, proposed empirical understandings of its content; others, such as John Hick, even propose eschatological verifiability. Philosophers such as D. Z. Phillips argued that religious discourse belongs to its own “language game”—a notion adopted from Ludwig Wittgenstein—with its own conditions for meaningfulness, and its own conditions of rational belief, analogous to mathematics and aesthetics. Mostly, however, the discussion of meaningfulness was unconnected to the historical positions on analogy in metaphysics and theology.

One twentieth-century adaptation of the classical accounts (Ross 1981) reasoned that analogy, as “fit of word-meaning to contrasting contexts,” is a universal feature of natural languages within which the Aristotelian

cases of relational and presuppositional adaptation are particular species, and that the cognitive content of utterances is a function of the family of statements and practices in which they are employed (and often craft-bound to specialized skills and tasks, such as medicine or sailing). Thus, analogy of meaning in religious contexts is a special case of the analogy phenomena found in all the neighborhoods of discourse, whether specialized or not. And Aquinas's metaphysical theory, say of participation and *esse subsistens*, was interpreted, on that account, as his articulating *theoretical* truth-conditions for the ordinary and analogous talk of divine existence, perfection, and action, the way a chemist might explain the atomic constitution of a commonly known metal such as lead.

Thus there are at least two additions to Aristotle's and Aquinas's work on analogy: first, that the linguistic phenomena involve differences of *discourse* commitment (e.g., "God decides," but does not deliberate), as well as the differing *theoretical* presuppositions articulated by metaphysicians, such as "all divine perfections are really *de re* the same"; and second, that analogous fit of meanings to diverse context is lawlike, universal, and dynamic in natural languages. But *lexical* meanings of words are not to be regarded as direct pairings of words to concepts (considered to be their meanings), but are relations of contrast-dependence within the language itself (compare Saussure 1915)—that is, relations of contrastive expressive *capacity*, so that *meanings* and the world are correlated in clouds or clusters of discourse, not simply item by item.

As Wittgenstein, Wilfrid Sellars, and others observed, the cognitive content of verbalized beliefs is a function of the community of social behavior in which they have a place in the giving of explanations, reasons, motivations for actions, and interpretations. Thus, although a lot of nonsense is easily formulated in religious talk—as in any other talk—expressed convictions that modify action and attitudes either reflect reality or fail to, and either do so poorly or well. They are thus suitable for epistemic attitudes such as belief and denial. Nevertheless, the truth or falsity of what is said by the religious may not be accessible from outside the practicing community, just as the truth of medical, musical, manufacturing, or scientific expert discourse is largely inaccessible from outside the community of expertise.

The late twentieth- and early twenty-first-century cognitivism issue for religion involved three challenges: (i) whether characteristic expressions (say "Jesus is my personal savior"; "There is one God in three Persons") have stable conditions of appropriate utterance, qualification,

reasons, rejoinder, and so on, within a practicing (relatively narrow) religious community; (ii) whether the community practice is one of coherent stable conditions, positive or negative, for acceptable use and endorsement and reason-giving for such assertions; and, (iii) whether basic claims, say, about the existence and nature of God, or some of them (*praeambula fidei*), can be rationally accepted or rejected, as well, from outside the confessing community. The common core of Judeo-Christian-Islamic monotheism meets the challenges affirmatively, and many find it externally well supported, even demonstrated in part, though other competent assessors disagree.

Some participants, such as the Reformers, thought external assessment carries no weight or utility for religious faith, though it may have some value in defense of the faith (apologetics). Note also that, in general, the false may sometimes be rationally accepted and the true rationally rejected, as the history of medicine and physics illustrates. Nothing requires a body of convictions to be decidable entirely, or even at its heart, from outside the practice in which conviction is arrived at and sustained. Otherwise the fabric of science would be subject to non-scientific rejection, rather than just parts of it. The same holds for religion. Still, Augustine and Aquinas held that the scripture cannot mean literally what science has demonstrated to be false (*ST* 1.68.1).

Some recent writers talk as if words, including temporal ones, apply to God not only literally but univocally; for instance, Richard Swinburne, in *The Coherence of Theism* (1977) said he applies "good" to God in the "perfectly ordinary" sense in which he would say his grandmother was good, though the conditions differ (p. 71). That contrasts with those philosophers such as D. Cupitt or Bishop Robinson who regard talk about God as merely metaphorical. Perhaps, like Duns Scotus, Swinburne and others consider the meaning of the words to be unaffected by differences in the mode of a thing's being. Charles Hartshorne, a Whiteheadian "process metaphysician," came closer to anthropomorphic literalism when he said that God, in process of self-surpassing, can suffer, change, and have other temporal predicates. Analogy theory is often mistaken for a theory of *nonliteral* predication, when it is just the opposite: an account of the literal but not anthropomorphic.

Some theologians such as Karl Barth say the meanings of "God loves," "forgives," "redeems," and "commands" are determined by the *scriptural* context as understood by the church (the community of believers): "Language about God has the proper content, when it

conforms to the essence of the Church, i.e., to Jesus Christ.... according to the analogy of faith, (Rom 12.6)” (*Church Dogmatics*). In accord with Luther and Calvin, he probably meant that nothing *more* than the *analogia fidei*, as understood by the Church, determines what a faithful Christian is to believe and mean. But to say there can be *no further* truth-conditions at all, say, for “Jesus is the Son of God,” would conflict with simple logic. So, sciences might investigate such conditions. And whether extrascriptural theoretical content is sometimes required for faithful belief (say, Eucharistic consubstantiation vs. transubstantiation, vs. mystical presence) is a matter not settled by *sola scriptura* and *analogia fidei*, unless theological inquiry is included.

Thus the analogy theorists, historically and in the twenty-first century—like the Reformers—and Barth, the Evangelicals, and philosophers such as Swinburne and Alvin Plantinga, hold that talk about God is neither empty of intelligible content (nonscintivism), nor only metaphorical, poetic, or symbolic (Paul Tillich); nor only negative, except for God’s existence (Maimonides); nor positive only in superlatives (Pseudo-Denis—*via eminentiae*). And they reject the principle that what is not observationally verifiable or falsifiable is meaningless. They agree that the scripture is the norm for what is to be said about God as Revealed. But analogy theorists additionally maintain (i) that analogous predication is literal and perfectly common in discourse generally, and characteristic of discourse about God, and (ii) that the metaphysical exploration of the divine, even of what is revealed, discloses theoretical truth-conditions, not otherwise accessible, for claims that God exists and has the divine perfections, just as science discloses microconditions for water that are not contained on the surface of the ordinary vocabulary.

So it seems that analogy theory both as linguistic theory and as metaphysical account of being has more innings to play in the history of theology.

ANALYSIS, PHILOSOPHICAL

Philosophical analysis is a term of art. At different times in the twentieth century, different authors have used it to mean different things. What is to be analyzed (e.g., words and sentences versus concepts and propositions), what counts as a successful analysis, and what philosophical fruits come from analysis are questions that have been vigorously debated since the dawn of analysis as a self-conscious philosophical approach. Often, different views of analysis have been linked to different views of the nature of philosophy, the sources of philosophical knowledge, the role of language in thought, the relationship between language and the world, and the nature of meaning—as well as to more focused questions about necessary and apriori truth. Indeed the variety of positions is so great as to make any attempt to extract a common denominator from the multiplicity of views sterile and not illuminating.

Nevertheless analytic philosophy—with its emphasis on what is called “philosophical analysis”—is a clear and recognizable tradition. Although the common core of doctrine uniting its practitioners scarcely exceeds the platitudinous, a pattern of historical influence is not hard to discern. The tradition begins with G. E. Moore, Bertrand Russell, and Ludwig Wittgenstein (as well as Gottlob Frege, whose initial influence was largely filtered through Russell and Wittgenstein). These philosophers set the agenda, first, for logical positivists such as Rudolf Carnap, Carl Hempel, and A. J. Ayer and then later for Wittgenstein, who in turn ushered in the ordinary language school led by Gilbert Ryle and J. L. Austin. More recently the second half of the twentieth century has seen a revival of Russellian and Carnapian themes in the work of W. V. Quine, Donald Davidson, and Saul Kripke. Analytic philosophy, with its changing views of philosophical analysis, is a trail of influence, the broad outlines of which we will trace here.

G. E. MOORE

We begin with George Edward Moore, whose influence, along with that of his Cambridge classmate Bertrand Russell, was felt from their student days in the last decade

of the nineteenth century throughout the whole of the twentieth. As a student Moore, who was to become the great defender of the Common Sense view of the world, was fascinated and perplexed by what he took to be the dismissive attitude toward common sense adopted by some of his philosophical mentors. He was particularly puzzled about the doctrines of absolute idealism that time is unreal (and so our ordinary belief that some things happen before other things must, in some way, be mistaken), that only the absolute truly exists (and so our ordinary conception of a variety of independently existing objects is incorrect), and that the essence of all existence is spiritual (and so our ordinary, non-mentalistic view of material objects is erroneous). Moore was curious how proponents of such doctrines could think themselves capable of so thoroughly overturning our ordinary ways of looking at things. How could anyone by mere reflection arrive at doctrines the certainty of which was sufficient to refute our most fundamental pre-philosophical convictions?

Before long he came to believe one couldn't. On the contrary, one's justification for a general principle of philosophy could never outweigh one's justification for the most basic tenets of the Common Sense view of the world. In essence he held that philosophers have no special knowledge that is prior to, and more secure than, the best examples of what we all pre-theoretically take ourselves to know. The effect of this position was to turn the kind of philosophy done by some of his teachers on its head. According to Moore the job of philosophy is not to prove or refute the most basic propositions, those we have no choice but to accept. It is however a central task of philosophy to explain *how* we know them. The key to doing so, he thought, was to analyze precisely what these propositions state, and hence what we know, when we know them.

Moore turned his method of analysis on two major subjects—perceptual knowledge and ethics. Although he achieved important results in both, they didn't fulfill his hopes for analysis. For example despite making a persuasive case in “A Defense of Common Sense” (1925) and “Proof of an External World” (1939) that we do know such elementary truths as *I am perceiving this and this is a human hand*, he never succeeded in explaining how, precisely, perception guarantees their truth. Moreover his speculative explorations of different analyses of their contents—briefly canvassed in “A Defense of Common Sense”—didn't advance the case very far. The paucity of these results—in which analysis aims at theoretical reconstructions of the contents of ordinary propositions—

contrasts with the modest but much more successful conception of analysis that emerges from his painstaking philosophical practice in papers such as “The Refutation of Idealism” (1903). The burden of that piece is to show that idealists who hold that all of reality is spiritual have no good reason for their view. A crucial step is the isolation and analysis of a premise—roughly *For anything to exist, or be real, is for it to be experienced*—that Moore takes to be crucial to their argument. His point is that in order to play the role required by the argument, it must be a necessary truth. But, he thinks, the only plausible ground for believing it to be necessary lies in wrongly taking the concept of being experienced to be (analytically) included in the concept of an object existing, or being real—a mistake, he thinks, that is akin to wrongly identifying the sensation of yellow with that of which it is a sensation. Putting aside the accuracy of Moore’s depiction of his opponents, or of his contentious views of the distinction between analytic and synthetic propositions, the paper is a beautiful example of the theoretically modest but philosophically illuminating practice of analysis at which Moore excelled—conceptual clarification, the drawing of clear distinctions, avoidance of equivocation, logical rigor, and attention to detail.

Much the same can be said about his use of philosophical analysis in ethics. On the one hand his enormously influential view that *good* is unanalyzable may be criticized for falling prey to a crippling dilemma. On any understanding of analyzability on which the unanalyzability of good would justify Moore’s claim that conclusions about what is good are not derivable from, or supported by, premises that don’t contain it, his “open question” argument does not show that good is unanalyzable; whereas on any understanding of analyzability on which his argument does establish that good is unanalyzable, this result does not justify the claim that conclusions about what is good can’t be derived from or supported by premises that don’t talk about goodness. In this sense his most famous ethical analysis was unsuccessful. Moreover this failure was connected to his official view of analysis, which conferred a privileged status on those necessary, apriori truths that reflect part-whole relations between concepts—roughly those propositions expressed by sentences that can be reduced to logical truths by putting synonyms for synonyms (where pairs of synonyms are thought to be easily recognizable by anyone who understands them)—as opposed to those necessary, apriori truths that do not fall into this category. Far from a source of strength, this theoretically-loaded conception of analysis was, arguably, Moore’s Achilles heel.

On the other hand the decidedly more modest, theoretically uncontentious, conception of analysis that emerged from his exemplary analytic practice of unrelenting, conceptual clarification undeniably advanced the subject and served as a model for generations of analytic philosophers to come. It also produced, in the first paragraph of *Principia Ethica* (1903), what may be the best expression of the guiding spirit of analytic philosophy, and philosophical analysis, ever written.

It appears to me that in Ethics, as in all other philosophical studies, the difficulties and disagreements, of which its history is full, are mainly due to a very simple cause: namely to the attempt to answer questions, without first discovering precisely *what* question it is which you desire to answer. I do not know how far this source of error would be done away, if philosophers would *try* to discover what question they were asking, before they set about to answer it; for the work of analysis and distinction is often very difficult: we may often fail to make the necessary discovery, even though we make a definite attempt to do so. But I am inclined to think that in many cases a resolute attempt would be sufficient to ensure success; so that, if only this attempt were made, many of the most glaring difficulties and disagreements in philosophy would disappear. At all events, philosophers seem, in general, not to make the attempt, and, whether in consequence of this omission or not, they are constantly endeavoring to prove that that ‘Yes’ or ‘No’ will answer questions, to which *neither* answer is correct, owing to the fact that what they have before their minds is not one question, but several, to some of which the true answer is ‘No’, to others ‘Yes.’ (p. vii)

BERTRAND RUSSELL

Bertrand Russell’s views on philosophical analysis are unique in two respects. They are more explicit, highly articulated, and theoretically fruitful than those of other leading figures; and their historical influence remains unsurpassed. The most well-known of his doctrines about philosophical analysis is his theory of descriptions presented in “On Denoting” (1905). The initial problem to be solved was an ontological one, posed by negative existentials—sentences of the form ‘ α doesn’t exist’ in which α is a name or description. The puzzle posed by such a sentence is that if it is true then there would seem to be nothing named or described; but if α doesn’t stand

for anything then it is hard to see how the sentence can be meaningful at all, let alone true. According to Russell the problem arises from false ideas about meaning—(i) the idea that the meaning of α is the entity it names or describes, and (ii) the idea that the meaning of ‘ α doesn’t exist’ is a proposition that predicates non-existence of that entity. At first blush these ideas seem doubly problematic since, on the one hand, if α doesn’t stand for anything then there is nothing for non-existence to be predicated of, and on the other if there is an object with the property of non-existence, it would seem that there must exist an object that doesn’t exist, which is a contradiction. Since Russell thought that (i) and (ii) led to these paradoxical results, he rejected both. His theory of descriptions is a proposal for replacing them with a conception of meaning that avoids such paradox.

Russell begins by distinguishing grammatically proper names (like the ordinary names of people and places) from logically proper names (*this* and *that*). Whereas the meaning of a logically proper name is its referent, the meaning of a grammatically proper name n for a speaker s is given by some singular definite description, ‘the F ’, that s associates with n . When it comes to singular definite descriptions, Russell’s view is that they are incomplete symbols, which have no meaning in isolation. By this he means three things: (i) that the objects (if any) they denote are not their meanings, (ii) that the propositions expressed by sentences containing them do not contain constituents corresponding to them, and (iii) that their meanings can be given by rules that explain the systematic contributions they make to the meanings of sentences containing them.

Consider, for example, the negative existential ‘The F doesn’t exist’. To understand this sentence is to grasp the proposition it expresses. However since for Russell its grammatical form is not the same as the logical form of the proposition p it expresses, he found it useful to translate it into a formula of his logical system the syntactic structure of which did match the logical structure of p . (Russell later came to think that he could dispense with propositions themselves as real entities, and get by with his logico-linguistic structures alone, but that may be regarded as a never-fully-worked-out afterthought.) The logical form of ‘The F doesn’t exist’ was identified with that of ‘ $\sim\exists x \forall y (Fy \leftrightarrow y = x)$ ’—where the proposition expressed by this formula was seen as having three constituents: negation, the property expressed by ‘ $\exists x$ ’, of being “sometimes true,” and the propositional function f expressed by the sub formula ‘ $\forall y (Fy \leftrightarrow y = x)$ ’. This function assigns to any object o the proposition that says

of o that it is identical with any object y if and only if y has the property expressed by F . Since o is identical with itself and nothing else, this means that the proposition f assigns to o is one that is true if and only if o , and only o , has the property expressed by F . Finally to say of a propositional function that it “is sometimes true” is to say that in at least one case it assigns a true proposition to an object. Putting all this together we get the result that the negative existential ‘The F doesn’t exist’ expresses a proposition which is true if and only if there is no object which is such that it, and only it, has the property expressed by F . Since this proposition simply denies that a certain propositional function has a certain property, neither the truth nor the meaningfulness of the negative existential that expresses it requires there to be any object with the property of non-existence.

Negative existentials were, in Russell’s view, special in that they contain the grammatical predicate *exist*, which, on his analysis, does not function logically as a predicate of individuals. However his theory was intended to cover all sentences containing descriptions. Whenever ‘is G ’ does function as a predicate, the analysis of ‘The F is G ’ is ‘ $\exists x \forall y (Fy \leftrightarrow y = x) \& Gx$ ’, which may be paraphrased *there is something such that it, and only it, is F , and it is also G* . In “On Denoting,” Russell showed how this analysis could be used to solve several logico-linguistic puzzles, and many other applications have been found since then. With the exception of Gottlob Frege’s invention of the logical quantifiers in his *Begriffsschrift* (1879), one would be hard pressed to identify any comparably fruitful idea in the history of philosophical analysis.

Russell’s revival of Frege’s logicist program of reducing arithmetic to logic—in *Principia Mathematica* with Whitehead (1910, 1912) and *Introduction to Mathematical Philosophy* (1919)—represented a different, more philosophically ambitious kind of analysis. The task of deriving the axioms of Peano arithmetic from what Russell took to be axioms of pure logic required defining the arithmetical primitives *zero*, *successor*, and *natural number* in purely logical terms. Russell’s approach (which he shared with Frege) was both elegant and natural. Let zero be the set whose only member is the empty set; let the successor of a set x (of sets) be a set y (of sets) with the following property: For each member of y the result of removing a member leaves one with a member of x . It follows that the successor of zero (i.e., the number one) is the set of all single-membered sets, the successor of one (i.e. the number two) is the set of all pairs, and so on. Note how natural this is. What is the number two? It is

that which all pairs have in common; more precisely, it is the set of which they, and only they, are members. Finally the set of natural numbers is defined as the smallest set containing zero and closed under the operation of successor.

With these definitions, together with Russell's proposed logical axioms (formulated within his theory of logical types, so as to avoid paradox), the axioms of Peano arithmetic can be derived as theorems. As a result, arithmetical sentences can be viewed as convenient abbreviations of the complex formulas associated with them by the Russellian definitions. Since the sentences of higher mathematics can themselves be viewed as abbreviations of complex arithmetical sentences, it seemed to many that Russell's reduction had succeeded in showing that all of mathematics can be regarded as an elaboration of pure logic and that all problems in the philosophy of mathematics could, in principle, be solved by a correct philosophical account of logic. Thus the reduction, in addition to being recognized as a substantial technical achievement, was viewed by many as a stunning demonstration of the extraordinary philosophical power of Russell's version of logico-linguistic analysis. No matter that his system of logic and theory of types was, in point of fact, epistemologically less secure than arithmetic itself; the program of attacking philosophical problems by associating the sentences that express them with hidden logical forms was considered to have taken a huge step forward.

Russell pushed the program further in *Our Knowledge of the External World* (1914), in which he applied his method of analysis to Moore's problem of the external world. The problem that perplexed Moore was that, although we know that there are material objects and although our evidence is perceptual, there seems to be a gap between this evidence and that which we know on the basis of it. Whereas material objects are public and independent of us, Moore had come to think of the data provided to us by our sensory impressions as logically private and dependent for their existence on the perceiver.

Russell set out to bridge this gap. His solution was to analyze material-object talk as talk about a system of interrelated private perspectives—a forerunner of the idea that material objects are logical constructions out of sense data. According to this view sentences that appear to be about material objects are really about the sense data of perceivers, and each material-object sentence is analyzable into a conjunction of categorical and hypothetical sentences about sense data. Apart from the obvious, Berkeleyan problems inherent in this view, its portents of the future of philosophical analysis were omi-

nous. Prior to this Russell's main examples of analysis—his theory of descriptions and logicist reduction—were precisely formulated and well worked out. By contrast the supposed analysis of material object statements was highly programmatic—neither Russell nor anyone else ever attempted to provide a fully explicit and complete analysis of any material-object statement. It was supposed to be enough to sketch the outlines that presumed analyses were supposed to take.

This programmatic approach also characterized Russell's position in his 1918 lectures "The Philosophy of Logical Atomism," in which he sketched the outlines of an ambitious philosophical system that posited a thoroughgoing parallelism between language and the world. The idea was to use the techniques of logical and linguistic analysis to reveal the ultimate structure of reality. Before, Russell had offered analyses piecemeal—to provide solutions to different philosophical problems as they came up. Now he sought to develop a systematic framework in which philosophy would, for all intents and purposes, be identified with logico-linguistic analysis. However it was his former student, Ludwig Wittgenstein, who pushed this idea the furthest.

EARLY WITTGENSTEIN

The *Tractatus* (1922) is an intricate, ingenious, and highly idiosyncratic philosophical system of the general sort Russell had imagined. In it Wittgenstein presents his conception of a logically perfect language, which, he believes, underlies all language and, presumably, all thought. Crucial to the construction of a theory of meaning for this language is the account of its relation to the world, which we are told in the opening two sentences is the totality of facts rather than things. The simplest—atomic—sentences of language correspond (when true) to simple—atomic—facts. The constituents of these facts are metaphysically simple objects and universals named by linguistically simple expressions—logically proper names and predicates. All meaningful sentences are said to be truth functions of atomic sentences, each of which is logically independent of all other atomic sentences. Since atomic facts are similarly independent, all and only the possible assignments of truth values to atomic sentences determine possible worlds, which are possible constellations of atomic facts. The actual world is the combination all existing atomic facts.

For Wittgenstein what a sentence says is identified with the information it provides about the location of the actual world within the logical space of possible worlds. If *S* is atomic then *S* represents the actual world as being

one that contains the possible atomic fact the existence of which would make *S* true. If *S* is both meaningful and logically complex, then *S* is a truth function of a certain set A_s of atomic sentences, and *S* represents the actual world as containing a constellation of facts that corresponds to an assignment of truth values to A_s that would make *S* true. However, in the system of the *Tractatus*, *P* is a member of A_s only if there are situations in which the truth value of *S* is affected by which truth value is assigned to *P*—only if there are complete assignments of truth values to A_s which differ solely in what they assign to *P* that determine different truth values for *S*. Since, when *S* is a tautology, its truth does not depend on the truth values of any atomic sentence in this way, it follows that *S* isn't a truth function of any non-empty set of such sentences.

For Wittgenstein this means that tautologies don't provide any information about the world, and so, strictly speaking, don't say anything. In this sense tautologies are not fully meaningful, though we may regard them as meaningful in the degenerate sense of arising from meaningful atomic sentences by permitted applications of truth-functional operators. Thinking of them in this way we may take tautologies to be true, so long as we understand that they don't state or correspond to any facts. For Wittgenstein there are no necessary facts for necessary truths to correspond to. Rather their truth is an artifact of our linguistic system of representation. Because of this, he thought, they should be knowable apriori, simply by understanding them and recognizing their form.

Many philosophers found the strikingly simple Tractarian conception of necessity, apriority, and logical truth to be compelling. According to the *Tractatus* (i) all necessity is linguistic necessity, in the sense of being the result of our system of representing the world, rather than the world itself; (ii) all linguistic necessity is logical necessity, in that all necessary truths are tautologies; (iii) all tautologies are knowable apriori; and (iv) only necessary truths are apriori. In short the necessary, the apriori, and the logically true are one and the same. These truths make no claims about the world but instead constitute the domain of logic, broadly construed. All other truths are contingent and knowable only by empirical investigation. These truths do make claims about the world and constitute the domain of science.

There are no other meaningful sentences, save for the logically or contingently false. According to the *Tractatus*, all meaningful sentences are either tautologies, contradictions, or contingent, aposteriori statements which are truth functions of atomic sentences that describe possible

combinations of the basic metaphysical simples that make up the world. Since virtually all of the traditional statements of ethics, philosophy, and religion seem to fall outside these categories, Wittgenstein concluded that these statements are nonsense. No aspect of his system was more fascinating to readers of the *Tractatus* than this consequence of his global criterion of intelligibility. Moreover his conclusion was not limited to language. If one assumes, as Wittgenstein clearly did, that all genuine thoughts are in principle expressible by meaningful sentences then his criterion not only fixes the limits of meaning but it also fixes the limits of thought. Since ethical, philosophical, and religious sentences are meaningless, they don't express propositions; since there are no such propositions for us to believe, we have no ethical, philosophical, or religious beliefs.

Where does this leave philosophy and philosophical analysis? The lesson of the *Tractatus* is that here are no meaningful philosophical claims and hence no genuine philosophical questions for philosophers to answer. What then is responsible for the persistence of the discipline and for the illusion that it is concerned with real problems for which solutions might be found? Linguistic confusion. As Wittgenstein saw it all the endless disputes in philosophy are due to this one source. If we could ever fully reveal the workings of language, our philosophical perplexities would vanish, and we would see the world correctly. Fortunately, philosophy can help. Although there are no new true propositions for philosophers to discover, they can clarify the propositions we already have. Like Russell, Wittgenstein believed that everyday language disguises thought by concealing true logical form. The proper aim of philosophy is to strip away the disguise and illuminate the form. In short, philosophy is a kind of linguistic analysis that doesn't solve problems but dissolves them. As he put it in his first post-*Tractatus* paper, "Some Remarks on Logical Form" (1929),

The idea is to express in an appropriate symbolism what in ordinary language leads to endless misunderstandings. That is to say, where ordinary language disguises logical structure, where it allows the formation of pseudo-propositions, where it uses one term in an infinity of different meanings, we must replace it by a symbolism which gives a clear picture of the logical structure, excludes pseudo-propositions, and uses its terms unambiguously.

(p. 163)

Though the Wittgenstein of the *Tractatus* did not himself practice this form of analysis, the vision of analysis he

articulated was one that later philosophers found attractive in its own right, quite apart from the doctrines that led him to it.

LOGICAL POSITIVISM

We now turn to something new—a self-conscious school of philosophy that arose through the collaborative efforts of several like-minded thinkers, including, most prominently, Rudolf Carnap, Moritz Schlick, Hans Reichenbach, A. J. Ayer, and Carl Hempel. The evolving creation of many minds, logical positivism was not monolithic; there was always plenty of disagreement on matters of detail, and even its central doctrines were never formulated in a way that commanded universal assent. The positivists did, however, share a common commitment to the development of certain themes inherited largely from Russell and Wittgenstein. From Russell they took the theory of descriptions as the paradigm of philosophical analysis (so characterized by F. P. Ramsey), the reduction of arithmetic to logic as the key to the nature of all mathematical truth (set out in Hempel's "On the Nature of Mathematical Truth," 1945), and the systematic, empiricist reconstruction of our knowledge of the external world—undertaken in Carnap's *The Logical Structure of the World* (1928). From Wittgenstein they took the idea of a test of intelligibility, the identification of necessary, a priori, and analytic truth, the bifurcation of all meaningful statements into the analytic versus empirical, the dismissal of whole domains of traditional philosophy as meaningless nonsense, and the goal of philosophy as the elimination of linguistic confusion by philosophical analysis.

The centerpiece of logical positivism was, of course, the empiricist criterion of meaning, which stated roughly that a non-analytic, non-contradictory sentence *S* is meaningful if and only if *S* is in principle verifiable or falsifiable—where verifiability and falsifiability are thought of as logical relations R_V and R_F between observation statements and *S*. Although the idea initially seemed simple, the devil proved to be in the details. One source of contention was the nature of observation statements. Initially Carnap, Schlick, and others construed them as reports of private sense data of observers. However the dangers of solipsism and phenomenalism soon forced a retreat to reports of (unaided) observation of everyday physical objects. Even then the theoretical / observational distinction proved elusive, with obvious strain on the clarity and plausibility of the criterion of meaning.

Defining the relations R_V and R_F that were to hold between meaningful (empirical) sentences and observa-

tion statements proved even more problematic. Initially it was hoped that the needed relations could be something quite strong—like the notion of being either conclusively verifiable (i.e., logically entailed by some finite, consistent set of observation statements) or conclusively falsifiable (i.e., something the negation of which is conclusively verifiable). However it soon became clear that when R_V and R_F are defined in this way, many obviously meaningful statements of science and everyday life are wrongly characterized as meaningless. This led to the attempt, illustrated by Ayer's proposal in the Introduction to the second edition of *Language, Truth and Logic* (1946), to define empirical meaningfulness in terms of a weak notion of verifiability—roughly that of being a statement which, when combined with an independently meaningful theory *T*, logically entailed one or more observation statements not entailed by *T* alone. However, as Alonzo Church demonstrated in his 1949 review of Ayer, this criterion was far too promiscuous, classifying no end of nonsense as meaningful.

There were of course other attempts to secure a workable empiricist theory of meaning, such as Carnap's criterion of translatability into an empiricist language, sketched in his 1936 essay "Testability and Meaning." But as Hempel showed in "Problems and Changes in the Empiricist Criterion of Meaning" (1950) this formulation runs into serious problems over theoretical terms in science. In Hempel's view the source of these problems is that sentences about theoretical entities are meaningful by virtue of being embedded in a network of hypotheses and observational statements, which as a whole makes testable predictions. As W. V. Quine emphasized even more forcefully in "Two Dogmas of Empiricism" (1951) these predictions are the product of all the different aspects of the system working together—in the sense that, given a set of observational predictions made by a theoretical system, one cannot in general match each prediction with a single discreet hypothesis, or small set of hypotheses.

Quine suggests that this is the crucial fact that makes it impossible to devise an adequate criterion of empirical meaningfulness for individual sentences. If for each sentence *S* we could isolate a set *P* of predictions made by *S* alone, and if *P* exhausted the contribution made by *S* to the predictions made by the theory as a whole then one could define *S* in terms of *P*. However the interdependence of *S* with other sentences in the system makes this impossible. Thus, Quine maintained, what we have to look for is not the empirical content of each statement taken in isolation, but rather its role in an articulated sys-

tem that, as a whole, has empirical content. This point effectively marked the end of the positivists' version of verificationism.

QUINE

From the *Tractatus* through logical positivism and beyond, many analytic philosophers identified the apriori with the necessary and attempted to explain both by appealing to the analytic. As they saw it there simply is no explaining what necessity is, how we can know any truth to be necessary, or how we can know anything apriori, without appealing to statements that are, and are known to be, true by virtue of meaning. From this point of view necessary and apriori truths had better be analytic, since if they aren't one can give no intelligible account of them at all. Ironically this theoretical weight placed on analyticity left the doctrines about necessity, apriority, and analyticity advocated by positivists and others vulnerable to a potentially devastating criticism. If it could be shown that analyticity cannot play the explanatory role assigned to it, then their commitment to necessity, apriority, and perhaps even analyticity itself might be threatened. This was precisely Quine's strategy.

He launched his attack in "Truth by Convention" (1936), the target of which is the linguistic conception of the apriori. According to this view all apriori knowledge is knowledge of analytic truths, which in turn is explained as arising from knowledge of the linguistic conventions governing our words. This view was attractive because it provided a seemingly innocuous answer to the question of how any statement could be known without empirical confirmation: A statement can be known in this way only if it is devoid of factual content—that is, only if its truth is entirely due to its meaning. Surely, it was thought, there is no mystery in our knowing what we have decided our words are to mean. But then, it was concluded, there must be no mystery in the idea that the truth of a sentence may follow, and be known to follow, entirely from such decisions. Putting these two ideas together, proponents of the linguistic conception of the apriori thought that they had found a philosophical explanation of something that otherwise would have been problematic.

Quine argued that this is not so. As noted, the proposed explanation rests on two bits of knowledge taken to be unproblematic—(i) knowledge of what our words mean, and (ii) knowledge that the truth of certain sentences follows from our decisions about meaning. However there is a problem here, located in the words *follows from*. Clearly we don't stipulate the meanings of all the necessary / apriori / analytic truths individually. Rather, it

must be thought, we make some relatively small number of meaning stipulations and then draw out the consequences of these stipulations for the truth of an indefinitely large class of sentences. What is meant here by *consequences*? Not wild guesses or arbitrary inferences with no necessary connection to their premises. No, by *consequences* proponents of the linguistic apriori meant something like *logical consequences, knowable apriori to be true if their premises are true*. But now we have gone in a circle. According to these philosophers, all apriori knowledge of necessary truths—including apriori knowledge of logical truths—arises from our knowledge of the linguistic conventions we have adopted to give meanings to our words. However, in order to derive this apriori knowledge from our linguistic knowledge, one has to appeal to antecedent knowledge of logic itself. Either this logical knowledge is apriori or it isn't. If it is then some apriori knowledge is not explained linguistically; if it isn't then it is hard to see how any knowledge could qualify as apriori. Since neither alternative was acceptable to proponents of the linguistic apriori, Quine's attack was a telling one.

Fifteen years later, in "Two Dogmas of Empiricism" (1951), he renewed it. He agreed with the positivists' premise that there is no explaining necessity and apriority without appealing to analyticity. However he challenged the idea that any genuine distinction can be drawn between the analytic and the synthetic without presupposing the very notions they are supposed to explain—a point he sought to drive home by demonstrating the circularity of the most obvious attempts to define analyticity. Hence, he concluded, there is no way of explaining and legitimating necessity and apriority—or analyticity either. For him this meant that there is no genuine distinction to be drawn between the analytic and the synthetic, the necessary and the contingent, or the apriori and the aposteriori. The idea that any such distinctions exist was one of the two dogmas targeted in his article.

In assessing this argument it is important to remember that it was directed at a specific conception of analyticity, which was taken to be the source of necessity and apriority. Although this conception was widely held at the time Quine wrote, it is radically at variance with the post-Kripkean perspective according to which necessity and apriority are, respectively, metaphysical and epistemological notions that are non-coextensive and capable of standing on their own. From this perspective the attempt to explain necessity and apriority in terms of analyticity appears to be badly mistaken. Since Quine's circularity argument shares the problematic presupposition that all these notions are acceptable only if such an explanation

can be given, it doesn't come off much better. For this reason Quine should not be seen as giving a general argument against analyticity. At most his argument succeeds in undermining one particular conception that enjoyed a long run among analytic philosophers in the middle fifty years of the twentieth century.

The second dogma attacked by Quine is *radical reductionism*, the view that every meaningful sentence is translatable into sentences about sense experience. Quine points out that the two dogmas—(i) that there is a genuine analytic / synthetic distinction, and (ii) radical reductionism—are linked in empiricist thinking by verificationism. Roughly speaking, verificationism holds that two sentences have the same meaning if and only if they would be confirmed or disconfirmed by the same experiences. Given this notion of synonymy, one could define analyticity as synonymy with a logical truth. Thus if verificationism were correct then the analytic / synthetic distinction would be safe. Similarly if verificationism, or at any rate a particularly simple version of verificationism, were correct then any empirical sentence would be translatable into the set of observation sentences that would confirm it, and radical reductionism would be saved. For these reasons, Quine concludes, if simple verificationism were correct then the two dogmas of empiricism would be corollaries of it.

By the time Quine wrote “Two Dogmas,” verificationism, as a theory of meaning for individual sentences, was already dead, as was radical reductionism. Nevertheless he noted that some philosophers still maintained a modified version of the latter according to which each (synthetic) statement is, by virtue of its meaning, associated with a unique set of possible observations that would confirm it and another that would disconfirm it. Against this Quine argued that verification is holistic, by which he meant that most sentences don't have predictive content in isolation but are empirically significant only insofar as they contribute to the predictive power of larger empirical theories. Since he continued to assume, with the positivists, that meaning is verification, his position was one of holistic verificationism. According to this view the meaning of a theory is, roughly, the class of possible observations that would support it, and two theories have the same meaning if and only if they would be supported by the same possible observations. Since individual sentences don't have meanings on their own, any sentence can be held true in the face of any experience (by making necessary adjustments elsewhere in one's overall theory), and no sentence is immune from revision—since given a theory T incorporating S, Quine thought that one

could construct a different, but predictively equivalent, and hence synonymous, theory T incorporating the negation of S.

The resulting picture of philosophy and philosophical analysis that emerges from Quine's work is radically at variance with any we have seen. He rejects the doctrine that philosophical problems arise from confusion about the meanings of words or sentences, and with it the conception of philosophy as providing analyses of their meaning. He rejects these views because he rejects their presuppositions—that words and sentences have meanings in isolation and that we can separate out facts about meanings or linguistic conventions from the totality of all empirical facts. For Quine philosophy is continuous with science. It has no special subject matter of its own, and it is not concerned with the meanings of words in any special sense. Philosophical problems are simply problems of a more abstract and foundational sort than the ordinary problems of everyday science.

In later years Quine put less emphasis on holistic verificationism (which is itself beset with problems akin to earlier versions of verificationism), but he did not back away from his skepticism about our ordinary, pre-theoretic conception of meaning. Instead he deepened and extended his attack with his doctrine of the indeterminacy of translation in *Word and Object* (1960) and its corollary, the inscrutability of reference, in “Ontological Relativity” (1969). Since Quine, the naturalist, could find no place in nature for meaning and reference as ordinarily conceived, he repudiated both in favor of radically deflated, behaviorist substitutes. Thus it should not be surprising that there is no place in his brave new world for philosophical analysis as a distinctive intellectual activity. Nevertheless his actual philosophical practice is hard to discern from that of his analytic predecessors. Like them he does little, when arguing for his central doctrines, to delineate their alleged contributions to the observational predictions made by our overall theory of the world.

LATER WITTGENSTEIN

In *The Philosophical Investigations* (1953) Wittgenstein outlines a new, essentially social conception of meaning that contrasts sharply with the one presented in the *Tractatus*. In the earlier work language was viewed on the model of a logical calculus in which conceptual structure is identical with logical structure, and all meaningful sentences are truth-functions of atomic sentences that represent metaphysically simple objects standing in relations isomorphic to those in which logically proper names stand

in the sentences themselves. In the *Investigations* the picture is quite different. Language is no longer seen as a calculus, derivability by formal logical techniques is accorded no special role in explaining conceptual connections among sentences, and naming is not taken to be the basis of meaning. Instead, meaning arises from socially conditioned agreement about the use of expressions to coordinate the activities and further the purposes of their users. For the later Wittgenstein, to know the meaning of an expression is not to know what it names or how to define it but to know how to use it in interacting with others.

According to this conception of meaning, understanding a word is not a psychological state but rather a disposition to apply it in the correct way over a wide range of cases; where by *the correct way* we do not mean the way determined by a rule the speaker has internalized. The problem, as Wittgenstein sees it, with appealing to such rules to explain our understanding of words is that rules are themselves made up of symbols that must be understood if they are to be of any use. Obviously this sort of explanation can't go on forever. In the end we are left with a large class of words or symbols that we understand and are able to apply correctly, despite the fact that what guides us and makes our applications correct are not further rules of any sort. When we reach rock bottom we are not guided by rules at all; we simply apply expressions unthinkingly to new cases.

What determines whether these new applications are correct? The mere fact that I am inclined to call something F can't guarantee that I am right. If my use of F is to be meaningful, there must be some independent standard that my application is required to live up to in order to be correct. Wittgenstein thinks this standard can't come from me alone. The reason it can't is that the same argument that shows that the standard of correctness cannot be determined by an internalized rule can be repeated to establish that it can't be determined by any belief, intention, or other contended mental state of mine. The problem, Wittgenstein thinks, is that in order to perform such a role, any such mental state must itself have gotten its content from somewhere. A regress argument can then be used to conclude that the contents of all my words and all my mental states must, in the end, rest on something other than my mental states. Thus, he suggests, the standard of correctness governing my use of F cannot rest on anything internal to me, but must somehow come from the outside. What more natural place to look for this than in the linguistic community of which I am a part? Hence, he suggests, for me to use F correctly is for me to apply it

in conformity with the way it is applied by others. For Wittgenstein this, in turn, implies that F must be associated with public criteria by which someone else can, in principle, judge whether my use of it is correct. Language is essentially public; there can be no logically private language.

This conception of language leads Wittgenstein to a new conception of philosophy and philosophical analysis. He continues to believe that philosophical problems are linguistic, and that philosophical analysis is the analysis of language—but this analysis is no longer seen as a species of logical analysis. According to the new conception there is no such thing as the logical form of a sentence, and one should not imagine that sentences have unique analyses. According to Wittgenstein we do not give an analysis of a sentence because there is anything wrong with it that demands clarification. We give an analysis when something about it leads us into philosophical confusion. The same sentence might even receive different analyses, if people become confused about it in different ways. In such a case each analysis may clear up a particular confusion, even if no analysis clears them all up.

Accompanying this deflationary view of analysis is a highly deflationary conception of philosophy. According to the *Investigations* the philosophical analysis of language does not aim at, and cannot issue in, theories of any kind. Philosophy, as Wittgenstein says in section 109, “is a battle against the bewitchment of our intelligence by means of language.” According to this view the task of philosophy is essentially therapeutic. It is the untangling of linguistic confusions, achieved by examining our words as they are ordinarily used, and contrasting that use with how they are misused in philosophical theories and explanations.

This deflationary conception arises naturally from Wittgenstein's new ideas about meaning, plus certain unquestioned philosophical presuppositions that he brings to the enterprise. These include his long-held convictions (i) that philosophical theses are not empirical, and hence must be necessary and apriori, and (ii) that the necessary, the apriori, and the analytic are one and the same. Because he takes (i) and (ii) for granted, he takes it for granted that if there are any philosophical truths, they must be analytic. To this he adds his new conception of meaning—with its rejection of abstract logical forms, its deflationary view of rule-following and algorithmic calculation, and its emphasis on social conditioning as generating agreement in our instinctive applications of words. Having jettisoned his old conception of meaning as something hidden and replaced it with a conception of

meaning that sees it as arising from an unquestioning, socially-conditioned agreement, he has little room in his conceptual universe for surprising philosophical truths. Genuinely philosophical truths, if there are any, can only be necessary and a priori, which in turn are taken to be true in virtue of meaning.

But how are the analytic truths of interest to a philosopher to be established if they are not to be translated into the formulas of a logical calculus and demonstrated by being given rigorous but sometimes also innovative and insightful logical proofs? For the Wittgenstein of the *Investigations*, the answer is that they don't need to be established, since they are already implicitly recognized by competent language users. To be sure they may sometimes need to be brought into focus by assembling examples of ordinary use that illustrate the constitutive role they play in our language; but there is little room here for surprising philosophical discoveries. Such is the official view of the *Investigations*.

As with the *Tractatus*, there is an evident problem here. Wittgenstein's official view of philosophy is at variance with his own philosophical practice. His general theses about language and philosophy (to say nothing of his surprising and, arguably, revisionist views about sensation and other psychological language arising from the private language argument) are by no means obvious or already agreed upon; nor are they the sorts of things that one can just see to be true, once they are pointed out. On the contrary they require substantial explanation and argument, if they are to be accepted at all. As was so often the case throughout the twentieth century, the practice of philosophical analysis—understood as whatever it is that analytic philosophers do—eluded the official doctrines about analysis propounded by its leading practitioners.

THE ORDINARY LANGUAGE SCHOOL

This school, which received great impetus from the *Investigations*, was shaped by two leading ideas. The first was that since philosophical problems are due solely to the misuse of language, the job of the philosopher is not to construct elaborate theories to solve philosophical problems but to expose linguistic confusions that fooled us into thinking there were genuine problems to be solved in the first place. The second idea was that meaning itself—the key to progress in philosophy—is not to be studied from an abstract scientific or theoretical perspective. Rather philosophers were supposed to assemble observations about the ordinary use of words, and to show how misuse of certain words leads to philosophical perplexity. In retrospect this combination of views seems quite

remarkable: All of philosophy depends on a proper understanding of something that there is no systematic way of studying. Fortunately this anti-theoretical approach changed over time with much of the progress in the period being marked by significant retreats from it—including Austin's theory of performatives in *How to Do Things with Words* and Paul Grice's theory of conversational implicature in "Logic and Conversation" (both originally delivered as the William James Lectures at Harvard, in 1955 and 1967, respectively).

A good example of the standard, anti-theoretical approach is Ryle's *Dilemmas* (1953), in which he identifies the main aim of philosophy as that of resolving dilemmas. For Ryle a dilemma arises when obvious theories or platitudes appear to conflict with one another. In such cases a view that is unobjectionable in its own domain comes to seem incompatible with another view that is correct when confined to a different domain. When this happens we find ourselves in the uncomfortable position of seeming to be unable jointly to maintain a pair of views, each of which appears correct on its own. Ryle believes that in most cases the apparent conflict is an illusion to be dispelled by philosophical analysis. However, the needed analysis is not a matter of defining key concepts or uncovering hidden logical forms. Although analysis is conceptual what is wanted is never a sequence of definitions that could in principle be presented one by one. Instead Ryle compares the required analysis to the description of the position of wicket keeper in cricket. Just as one can't describe that position without describing how it fits in with all the other positions in cricket, so, Ryle thinks, one cannot usefully analyze a concept without tracing its intricate connections with all the members of the family of concepts of which it is a part.

His most important application of this method is to psychological language, in *The Concept of Mind* (1949). There he rejects what he calls the myth of "the Ghost in the Machine," according to which belief and desire are causally efficacious, mental states of which agents are non-inferentially aware. Ryle takes this view to be "entirely false" and to be the result of what he calls "a category-mistake," by which he means that it represents mental facts as belonging to one conceptual type, when they really belong to another. He illustrates this with the analogy of someone who visits different buildings and departments of a university and then asks "But where is the university?" Here the category mistake is that of taking the university to be a separate building or department alongside the others the visitor has seen, rather than

being the way in which all the different buildings and departments are coordinated.

Similarly, Ryle maintains, someone who believes that the mind is something over and above the body fails to realize that the mind is not a separate thing, and that talk of the mental is really just talk about how an agent's actions are coordinated. According to this view, to attribute beliefs and desires to an agent is not to describe the internal causes of the agent's action but simply to describe the agent as one who would act in certain ways if certain conditions were fulfilled. This is rather surprising. According to Ryle's ordinary-language ideology, philosophy is not supposed to give us new theories but to untangle linguistic confusions—leaving us, presumably, with a less muddled version of what we pretheoretically thought. Here, however, his aim was to undermine a certain widely-held view of the mind and to provide what, arguably, amounts to a sweeping revision of our ordinary conception of the mental.

J. L. Austin was similarly ambitious. In his elegant classic *Sense and Sensibilia*, published in 1962 but delivered as lectures several times between 1947 and 1959, he attempted to dissolve, as linguistically confused, phenomenalism, skepticism about knowledge of the external world and the traditional sense-data analysis of perception. His goal was to show these positions to be incoherent by undermining the presupposition that our knowledge of the world always rests on conceptually prior evidence of how things perceptually appear. For this he employed two main strategies. One was to try to show that certain statements—such as, “there is a pig in front of me” in normal circumstances, with the animal in plain sight—are statements about which the claim that knowledge of them requires evidence of how things appear cannot be true. Austin drew this conclusion from the observation that it would be an abuse of language for the speaker in such a situation to say, “It appears that there is a pig in front of me,” or “I have evidence that there is a pig in front of me.” His other strategy was to argue that appearance statements themselves are parasitic on ordinary non-appearance statements and so cannot be regarded as conceptually prior to the latter.

Neither strategy was successful. The first was rebutted by Ayer in “Has Austin Refuted the Sense Datum Theory” (1967), in which he pointed out that the abuse that Austin spotted was, in effect, a matter of Gricean conversational implicature (*Don't make your conversational contribution too weak!*) from which no conclusion about the possibility of knowledge without evidence can be drawn. The general lesson here is that not all matters

of language use (or misuse) are matters of meaning (or truth). Austin's second strategy, though not similarly rebutted, was not developed in enough detail to be compelling. In addition it faced the general difficulty (common to many ordinary-language attempts to undermine skepticism) of appealing to non-skeptical claims about meaning to refute the skeptic. Even if the view of meaning is correct, it may have little argumentative force against a determined skeptic.

By contrast the theory of performative utterances given in *How to Do Things with Words* (1962) has become an enduring fixture of the study of language. The idea, in its simplest form, is that utterances of sentences like “I promise to come” or “I name this ship *The Ferdinand*” are, in proper circumstances, not reports of actions but performances of them. Although there have been many disputes about how to develop this idea, there is no question that there is something to it. Austin himself was inclined to think that performative utterances of this sort were attempts, not to state facts, but to perform certain conventionally recognized speech acts.

For a time this idea generated considerable optimism about performative analyses of important philosophical concepts of the sort illustrated by Peter Strawson's 1949 paper, “Truth”—according to which “It is true that S” is analyzed as “I concede / confirm / endorse that S”—and R. M. Hare's *The Language of Morals* (1952)—according to which “That is a good N” is assimilated to “I commend that as an N”. However, these views, along with other ambitious attempts to use performative analyses to sweep away age-old philosophical problems, ran into serious difficulties. Chief among them was the point—made by Peter Geach in “Ascriptivism” (1960) and John Searle in “Meaning and Speech Acts” (1962)—that any analysis of the meaning of S must explain the contribution S makes to complex sentences of which it is a constituent. Since analyses that focus exclusively on the speech acts performed by utterances of S on its own don't—and often can't—do this, they cannot be taken to be correct accounts of meaning. This reinforced a message noted earlier; not all aspects of language use are aspects of meaning. As this point sunk in, the need for systematic theories to sort things out became clear, and the ordinary language era drew to a close.

LATER DEVELOPMENTS

Many philosophers found what they were looking for in Donald Davidson's attempt to construct, in the 1960s and 1970s, a theory of meaning for natural language modeled on Alfred Tarski's formal definition of truth for logic and

mathematics. According to Davidson it is possible to construct finitely axiomatizable theories of truth for natural languages *L* that allow one to derive—from axioms specifying the referential properties of its words and phrases—a T-sentence, ‘‘*S* is a true sentence of *L* if and only if *p*’’, for each sentence *S* of *L*, which gives its truth conditions. Since such a theory gives the truth conditions of every sentence on the basis of its semantically significant structure, it is taken to count as a theory of meaning for *L*. The theory is empirically tested by comparing the situations in which speakers hold particular sentences to be true with the truth conditions it assigns to those sentences. According to Davidson’s view the correct theory of meaning is, roughly, the theory T_M according to which the conditions in which speakers actually hold sentences to be true most closely matches the conditions in which T_M , plus our theory of the world, predicts the sentences to be true. Roughly put Davidson takes the correct theory to be the one according to which speakers of *L* turn out to be truth tellers more frequently than on any other interpretation of *L*.

This bold idea generated a large volume of critical comment, both pro and con, over the next two decades. One important cluster of problems centers around the fact that the T-sentences generated by Davidsonian theories are material biconditionals and so provide truth conditions of object-language sentences only in the very weak sense of pairing each such sentence with some metalanguage sentence or other that has the same truth value.

One popular way of countering this difficulty is to strengthen the theory of meaning by putting it in the form of a theory of truth relative to a context of utterance and a possible world-state. This approach, widely known as *possible worlds semantics*, was pioneered from the 1940s through the 1970s by Carnap, Saul Kripke, Richard Montague, David Lewis, and David Kaplan, among others. As commonly pursued it involves enriching the formal languages amenable to Tarski’s techniques, so that they incorporate more and more of the concepts found in natural language—including modal concepts expressed by words like *actual*, *necessary*, *possible*, *could*, and *would*, temporal concepts expressed by natural-language tenses, and indexical expressions like *I*, *we*, *you*, *he*, *now*, and *today*. By the end of the century it had become possible to imagine the day in which natural languages would be treatable in something close to their entirety by the descendants of the logical techniques initiated by Tarski. Analyses of central philosophical concepts, formulated in terms of possible world-states, had also become com-

monplace, as illustrated by the highly influential treatment of counterfactual conditionals given by Robert Stalnaker and David Lewis as well as Lewis’s related analysis of causation.

However the most important philosophical development in the last half of the century occurred in Princeton in January of 1970 when Saul Kripke, then twenty-nine years old, delivered the three lectures that became *Naming and Necessity*. Their impact was profound, immediate, and lasting. In the philosophy of language Kripke’s work ranks with that of Frege in the late nineteenth century, and of Russell and Tarski in the first half of the twentieth. Beyond the philosophy of language, it fundamentally changed the way in which much philosophy is done. The most important aspects of the work are (i) a set of theses about the meaning and reference of proper names according to which neither their meanings nor reference-determining conditions are determined by descriptions associated with them by speakers; (ii) a corresponding set of theses about the meaning and reference of natural kind terms such as *heat*, *light*, *water*, and *tiger*; (iii) a compelling defense of the metaphysical concepts of necessity and possibility; (iv) a sharp distinction between necessity and apriority; (v) forceful arguments that some necessary truths are knowable only aposteriori and some apriori truths are contingent; and (vi) a persuasive defense of the view that objects have some of their properties essentially and others accidentally. In addition to these explicit aspects of the work, Kripke’s discussion had far-reaching implications for what has come to be known as externalism about meaning and belief—roughly the view that the meanings of one’s words, as well as the contents of one’s beliefs, are partly constituted by facts outside oneself. Finally *Naming and Necessity* played a large role in the implicit but widespread rejection of the view—so popular among earlier analytic philosophers—that philosophy is nothing more than the analysis of language.

ANALYTIC FEMINISM

Analytic feminism applies analytic concepts and methods to feminist issues and applies feminist concepts and insights to issues that traditionally have been of interest to analytic philosophers. Analytic feminists, like analytic philosophers more generally, value clarity and precision in argument and use logical and linguistic analysis to help them achieve that clarity and precision. Unlike nonfeminists, they write against a background of recognition of sexism (practices that take women and feminine things to be inferior to men and masculine things) and androcentrism (practices that take males or men or men's life experiences to be the norm or the ideal for human life), and work with the aim of contesting both.

Analytic feminism holds that the best way for scholars to counter sexism and androcentrism in their work is through forming a clear conception of and pursuing truth, logical consistency, objectivity, rationality, justice, and the good, while recognizing that these notions have often been perverted by androcentrism throughout the history of philosophy. Analytic feminists engage the literature traditionally thought of as analytic philosophy, but also draw on other traditions in philosophy, as well as work by feminists working in other disciplines, especially the social and biological sciences.

Analytic feminists assert the sex/gender distinction, a distinction between the biological concept of sex and the socially constructed concept of gender (non-isomorphic to sex), though they may disagree widely on how this distinction is to be drawn and what moral or political implications it has. Although they share the conviction that the social constructions of gender create a fundamentally unjust imbalance in contemporary social and political arrangements, there is no other political thesis generally held by them. Analytic feminists who are political philosophers defend political views that reflect progressive positions found in contemporary nonfeminist political philosophy, from liberalism (Okin 1989, Nussbaum 1999) to republicanism (Phillips 2000) to socialism (MacKinnon 1989, Ferguson 1991). They also draw on views of previous generations of feminist political philosophers from John Stuart Mill and Mary Wollstonecraft to Friederich Engels, Emma Goldman, Charlotte Perkins Gilman, and Simone de Beauvoir. Analytic feminists, like nonanalytic feminists, have written much about social and political issues like abortion, pornography, prostitution, rape, sexual harassment, surrogacy, and violence against women. What characterizes analytic feminism here is the use of logical and conceptual analysis and, sometimes, decision theoretic analysis (see article by Cudd in Antony and Witt 2001).

Analytic feminists often defend traditional analytic methods and concepts against criticism from nonanalytic feminists. Many nonanalytic feminists charge (in various ways) that the notions of reason, truth, objectivity, or the methods of logical and linguistic analysis are hopelessly masculinist, and cannot be reclaimed for feminist purposes. They criticize canonical male philosophers, including Aristotle, Descartes, Kant, Rousseau, Frege, Quine, and Rawls, as sexist or at least androcentric, and at times suggest that these philosophers have nothing useful to say to women. These charges challenge feminist philosophers who have been trained in the analytic tradition and who find that tradition valuable. To reject philosophers on those grounds, they argue, would indict similarly almost the entire history of philosophy. The question analytic feminists ask is whether those androcentric or sexist writings can be corrected and rescued by an enlightened critical reader. Annette Baier's work on Hume in "Hume, the Women's Moral Theorist?" and "Hume, the Reflective Women's Epistemologist?" (Baier 1994), Marcia Homiak's work on Aristotle in "Feminism and Aristotle's Rational Ideal" (Antony and Witt 2001), Barbara Herman's work on Kant in "Could It Be Worth Thinking about Kant on Sex and Marriage?" (Antony and Witt 2001), and Peg O'Connor's work on Wittgenstein in *Oppression and*

Responsibility: A Wittgensteinian Approach to Social Practices and Moral Theory (2002) exemplify such attempts.

An important insight of feminism has been to expose the androcentric bias toward seeing human individuals as essentially isolated, epistemically, socially, and morally, from others. One early result of this insight was the ethics of care (Held 1995), which challenges the dominant tradition of ethical theory with the idea that caring for others is a central ethical activity. Eva Kittay developed the “dependency critique” (Kittay 1999) of Rawls’s theory of justice, arguing that the capacity for caring for dependent others is one of the central moral powers, just as basic as the capacities to form a sense of the good and a sense of justice. Analytic feminists have joined other feminist theorists in focusing much of their recent attentions to questions of the self. In the anthology *Relational Autonomy: Feminist Perspectives on Autonomy, Agency, and the Social Self* (2000), several articles examine the notion of relational autonomy, which takes seriously the idea that humans must define their identities in relation to others in ways which challenge their ability to be completely autonomous in the traditional sense. These articles attempt to define a new notion of autonomy that incorporates that insight. Another important book on the self (Brison 2002) connects traditional theories of personal identity with recent research on trauma, arguing that the trauma arising from sexual violence, for example, challenges those theories.

Analytic feminism holds that many traditional philosophical notions are not only normatively compelling, but also in some ways empowering and liberating for women. While postmodern feminism rejects the universality of truth, justice, and objectivity and the univocality of “women,” analytic feminism defends these notions. They recognize that to reject a view because it is false or oppressive to women, one needs some rational, objective ground from which we can argue that it is in fact false or oppressive. An important task for analytic feminism involves investigating the objectivity of science. Helen Longino’s *Science as Social Knowledge* (1990) was the first such analytic feminist work. Elizabeth Anderson’s “Feminist Epistemology: An Interpretation and a Defense” (Anderson 1995) shows how a carefully aimed feminist critique can improve the objectivity of science by distinguishing and illustrating four ways that feminist critiques have corrected the distorted lenses of masculinist science: through the critique of gendered structures in the social organization of science, through the analysis of gendered symbols in scientific models, through exposing sexism in

scientific practices and focuses, and through revealing androcentrism in its concepts and theories.

Louise Antony, in “Quine as Feminist: The Radical Import of Naturalized Epistemology” (Antony and Witt 2001) presented what she called the *bias paradox*: Feminists (and others) want to criticize certain claims as false because they are biased, and yet feminism is also clearly a bias; in effect, a particular slant on the world. She locates a solution in naturalized epistemology. First we must see that what we can know necessarily comes through our particular human cognitive apparatus, which *biases* the content of our claims. Thus, bias *per se* is not the problem, but some biases lead us away from the truth. Her more recent work has emphasized the importance of embodiment generally in epistemology (Antony 2002), and she credits feminism in large part for this insight. Other analytic feminists (Grasswick and Webb 2002) have extended the naturalized epistemology analysis to argue for a social feminist epistemology, which asserts that socially induced sexist and androcentric biases can affect the content and justification of knowledge. In its analysis of traditional philosophical topics like objectivity and personal identity and new topics such as sexism in language (Vetterling-Braggin 1981), analytic feminism reveals the blurriness of the distinction between metaphysics, epistemology, and social/political philosophy.

Ann E. Cudd (1996, 2005)

ANALYTIC AND SYNTHETIC STATEMENTS

The distinction between analytic and synthetic judgments was first made by Immanuel Kant in the introduction to his *Critique of Pure Reason*. According to him, all judgments could be exhaustively divided into these two kinds. The subject of both kinds of judgment was taken to be some thing or things, not concepts. Synthetic judgments are informative; they tell something about the subject by connecting or synthesizing two different concepts under which the subject is subsumed. Analytic judgments are uninformative; they serve merely to elucidate or analyze the concept under which the subject falls. There is a *prima facie* difficulty as to how a judgment can be simultaneously about an object, uninformative in relation to it, and explicative of the concepts involved, but this question will be examined later.

Kant associated this distinction with the distinction between a priori and a posteriori judgments. The one distinction was taken to cut across the other, except that there are no analytic a posteriori judgments. The remaining three classifications were, in Kant's opinion, filled;

there are analytic a priori judgments, synthetic a posteriori judgments, and synthetic a priori judgments. Since Kant there has been little argument concerning the first two of these, but considerable argument and opposition, chiefly from empiricists, about the last. Analytic a priori and synthetic a posteriori judgments correspond roughly to logically and empirically true or false judgments. In distinguishing them, Kant was following in the steps of Gottfried Wilhelm Leibniz and David Hume, both of whom had made a similar distinction, although in different terms. Leibniz had distinguished between truths of fact, guaranteed by the principle of sufficient reason, and truths of reason, guaranteed by the principle of contradiction. The latter were such that their denial involved a contradiction; they could indeed be reduced to identical propositions via chains of definitions of their terms. Hume had likewise distinguished between matters of fact and relations of ideas. The former were merely contingent, while the latter were necessary and such that their denial involved a contradiction. Kant's innovation was to connect this distinction with the two further distinctions between the analytic and the synthetic and the a priori and the a posteriori.

It should be noted that Kant's distinction between the analytic and the synthetic was made in terms of judgments and concepts. This gave it a psychological flavor for which it has been criticized by many modern philosophers. The notion of judgment is ambiguous between the act of judging and what is judged. One problem is how to extend what Kant said so that it applies only to what is judged or to propositions. Furthermore, an implication of Kant's formal account of the distinction was that it is limited in its application to subject-predicate judgments (although it was also one of Kant's doctrines that existential judgments are always synthetic).

KANT'S CRITERIA AND USE OF THE ANALYTIC/SYNTHETIC DISTINCTION

CRITERIA. Apart from the general distinction, Kant offered two criteria for it. According to the first criterion, an analytic judgment is one in which the concept of the predicate is contained (although covertly) in the concept of the subject, while in a synthetic judgment the concept of the predicate stands outside the concept of the subject. According to the second criterion, analytic judgments are such that their denial involves a contradiction, while this is not true of synthetic judgments of any kind. Kant was here following his predecessors, although, with Leibniz, he did not suggest that analytic truths can be reduced to simple identities. This criterion can scarcely be said to

suffice as a definition of an analytic statement, although it may provide grounds for saying whether a judgment is analytic or not. It will do the latter if it can be assumed that all analytic judgments are logically necessary, since reference to the principle of contradiction may provide the basis of logical necessity.

The first criterion seems on firmer ground in this respect, since it offers what seems to be a formal characteristic of all analytic judgments. It specifies what we must be doing in making an analytic judgment, in terms of the relations between the concepts involved. It has been objected that the idea of one concept being contained in another is also a psychological one, but this was certainly not Kant's intention. The point may perhaps be expressed in terms of meaning. When we make an analytic judgment, what we mean when we invoke the predicate concept is already included in what we mean by the subject concept. Just as the notion of a judgment is ambiguous, so a concept can mean either the act of conceiving or what is conceived, and it is the latter which is relevant here. By this criterion, therefore, a judgment is analytic when, in judging about something, what we judge about it is already included in what is meant by the term under which we subsume the subject. Kant assumed that all judgments of this kind are a priori, presumably on the grounds that their truth can be ascertained merely by considering the concepts involved, without further reference to the facts of experience.

CHARACTERISTICS OF ANALYTIC STATEMENTS. Kant's criterion could be applied only to statements of subject-predicate form, and could not, therefore, be used to make an exhaustive distinction between all statements. If Kant's distinction is to be of use, however, it must be extended to cover propositions or statements and, moreover, statements of any form, not just those of subject-predicate form. If an analytic judgment is of an object, an analytic statement must similarly be about the object or objects referred to by the subject expression. Analytic statements cannot, therefore, be equated with definitions, for the latter are surely about words, not things. It has sometimes been said (for instance, by A. J. Ayer in his *Language, Truth and Logic*) that analytic statements make clear our determination to use words in a certain way. Apart from the fact that the use of words cannot be a simple matter of choice, what Ayer says cannot be the main function of analytic statements, since this would be to identify them with (possibly prescriptive) definitions. If we learn something about the use of words from analytic statements, this must at most be indirect.

Analyticity, a property of statements. We have seen that Kant's point of view might be represented as saying that only the meaning of the terms involved, the nature of the corresponding concepts, makes the judgment true. It might, therefore, seem feasible that an analytic statement could be characterized as a statement about something which says nothing about the thing but is such that the meanings of the words involved make it true. To be more exact, it would be the meanings of the words involved in a sentence—*any* sentence that expresses the statement—that make that statement true. It is important to stress the words "any sentence," for analytic truth can be a feature only of *statements*. It cannot be a feature of sentences per se, nor can it be limited to sentences in a given language (as Rudolf Carnap in effect supposes). Truth is a property of statements, not sentences, and the same must be the case with analytic truth. No account of analyticity which explains it in terms of what is the case with regard to sentences in any one language will do. If someone who says "All bodies are extended" makes an analytic statement, so will anyone who says the same thing in any other language.

Analyticity as a function of the meanings of words. What is meant by saying that the meanings of the terms involved *make a statement true*? Are analytic truths those which follow from the meanings of the words involved; that is, from their definitions? This cannot be so, since all that can follow from a definition is another definition, and how, in any case, can a statement about things follow directly from one about words? If analyticity is connected with meaning, it must be more indirectly. Friedrich Waismann has suggested that an analytic truth is one which is so *in virtue of* the meanings of the words involved. But the words "in virtue of" are themselves vague. It has been held by certain empiricists that "All bodies are extended" is analytic if and only if we use "body" in exactly the same way we use "extended thing"; that is, if we attach the same meaning to each expression. Nevertheless, the truth of "All bodies are extended" does not follow simply from the fact that the expressions "body" and "extended thing" have the same meaning, for the substitution of expressions equivalent in meaning leaves one with a statement corresponding in form to the law of identity. Hence, the original statement will be true only if the law of identity holds. In other words, an analytic statement will be one whose truth depends not only on the meanings of the words involved but also on the laws of logic. This raises the question of the status of these laws themselves. It is sometimes claimed that they, too, are analytic; but this cannot be so if a definition of analyticity involves reference to the laws of logic.

Analyticity as a function of the laws of logic. The necessity of referring to the laws of logic in any account of analyticity has been noted in modern times by many philosophers. Waismann, for example, eventually defines an analytic statement as one which reduces to a logical truism when substitution of definitional equivalents is carried out. Gottlob Frege had much earlier defined an analytic truth as one in whose *proof* one finds only “general logical laws and definitions,” and he had sought to show that arithmetical propositions are analytic in this sense. Both of these accounts make reference to logical truisms or logical laws. Whatever the status of these, it certainly seems that analytic statements must depend for their validity not only on the meanings of the terms involved but also on the validity of the laws of logic; and these laws cannot themselves be analytic.

OBJECTIONS TO THE DISTINCTION

THE PROBLEM OF SYNONYMY. Nevertheless, objections to the notion of analyticity have been made, particularly by Willard Quine, on the basis of supposed difficulties about meaning itself, and not merely on those about the status of the truths of logic—although here, too, Quine has found difficulties. He distinguishes between two classes of analytic statements. There are, first, those which are logically true, such as “No unmarried man is married”; these are statements which are true and which remain true under all reinterpretations of their components other than the logical particles. Second, there are those, such as “No bachelor is married,” which can be turned into logical truths by substituting synonyms for synonyms. It is the second kind of analytic statement that raises problems here, and these problems arise from the notion of synonymy or, to be precise, cognitive synonymy; that is, synonymy that depends on words having the same meaning for thought, as opposed to merely applying to the same things. The notion of definition which other philosophers have invoked in this connection rests, Quine maintains, on that of synonymy. How is this to be explained?

Quine’s difficulties here are associated with general difficulties about synonymy raised by himself and Nelson Goodman in the effort to embrace a nominalism that does not involve the postulation of so-called meanings, and to push as far as possible the thesis that language is extensional; that is, such that it can be built up from variables and an indefinite set of one and many-place predicates, so that complex sentences are related to atomic sentences by truth-functional relationships and by quantification. In such a language, sameness of meaning might

be equivalent to extensional equivalence, such that any two extensionally equivalent expressions are interchangeable *salva veritate*; that is, leaving unchanged the truth value of the statements in which they occur, wherever the expressions occur. The outcome of Goodman’s argument in this connection is that since there may always be some occurrence in which the two expressions are not interchangeable *salva veritate*, no two expressions are identical in meaning. Quine himself recognizes something of this and has explored the restrictions which must be put upon the general thesis.

In the present connection, Quine explores the possibility that synonymy might be explained by interchangeability *salva veritate* except within words. But the interchangeability of, say, “bachelor” and “unmarried man” in this way may be due to accidental factors, as is the case with “creature with a heart” and “creature with kidneys.” If it is the case that all—and only—creatures with a heart are creatures with kidneys, this is due simply to the fact that, as it happens, the two expressions always apply to the same things and not to any sameness of meaning. How do we know that the situation is not the same with “bachelor” and “unmarried man”? It is impossible to reply that it is because of the truth of “Necessarily, all—and only—bachelors are unmarried men,” for the use of “necessarily” presupposes a nonextensional language. Furthermore, a sense has already been given to the kind of necessity involved here: analyticity. Hence, while cognitive synonymy might be explained in terms of analyticity, to try to explain analyticity in terms of cognitive synonymy would involve something like circularity.

Quine argues that similar considerations apply to attempts, such as Carnap’s, to deal with the matter in terms of a semantic rule. Quine then considers the further possibility that, given that the truth of statements in general rests upon a linguistic component and a factual component, an analytic statement might be one in which the factual component is null. This, while apparently reasonable, has not, he objects, been explained; and the attempt by positivists to do so by reference to the verification theory of meaning (with its assumption that there are basic propositions in which the factual component is all that matters and, on the other hand, that there are analytic propositions in which the linguistic component is all that matters) involves reductionism, an unjustified dogma.

Synonymy and meaning. A possible objection to Quine—one in effect made by H. P. Grice and P. F. Strawson—is that his difficulty over synonymy involves a refusal to understand. There is a family of terms that

includes analyticity, necessity, and cognitive synonymy, and Quine will not accept, as explanations of any one of them, accounts that involve reference to other members of the family. On the other hand, to go outside the family in one's explanations, as is involved in having recourse to extensional equivalence, is necessarily an inadequate explanation. This is a situation that frequently occurs in philosophy, wherever one is confronted with families of terms between which and any other family there is a radical or categorical distinction. This is perhaps an oversimplification of the situation, true though it is. It must be remembered that Quine's basic urge is to do without meanings, so as not to introduce unnecessary entities into our ontology. The failure of this particular enterprise of defining synonymy is, however, in fact, a demonstration of its futility. Meaning is a notion which must be presupposed rather than explained away in this connection.

THE BOUNDARY BETWEEN ANALYTIC AND SYNTHETIC STATEMENTS. Quine also has a second thesis in connection with analyticity, a thesis that has been echoed in different forms by other philosophers. It is a quite general thesis, in the sense that it does not depend on considerations about synonymy and is not, therefore, restricted to statements whose truth turns on synonymy. This thesis states that even if a distinction could be drawn between analytic and synthetic statements or between logical and factual truth, it is impossible to draw a sharp boundary between them. The contrary supposal rests on the dogma of reductionism already referred to. On that thesis, there is clearly an absolute distinction to be made. The denial of the dogma entails that there can be, at the most, a relative distinction. Within any particular system it is possible to distinguish those statements, those of logic and mathematics, which we should be extremely reluctant to give up and those, on the other hand, which we should be ready to give up if required to do so. The former are entrenched because of their close connections with other elements of the system. It has often been pointed out that the giving up of some high-grade scientific statements would involve the giving up with them of whole scientific systems. On Quine's view, the situation is worse, but not intrinsically different, with logical statements. There are no statements that depend for their truth on a direct confrontation with experience. The best that can be produced in the way of a distinction between different kinds of statements is a relative distinction between those which are more or less entrenched. No absolute and sharp distinction between analytic and synthetic statements can be drawn. Quine's conventionalism here reflects pragmatist tendencies.

One possible reply to this thesis is that the rejection of the dogma of reductionism does not by itself dispose of an absolute distinction of this kind. Even if it is accepted that there are no statements in which the factual component is everything, it does not follow that there are no statements in which the linguistic component is everything. Despite what Quine says, the thesis that there is a distinction between analytic and synthetic statements is independent of that of reductionism. Grice and Strawson have also attempted to deal with the issue by making a distinction in terms of the responses to attempts to falsify a statement. Analytic statements are those that, in a falsifying situation, demand a revision in our concepts; synthetic statements are those that demand a revision in our view of the facts. It has frequently been pointed out that it is possible to preserve a scientific statement against falsifying circumstances by making it logically true and thus immune to falsification. In doing this, we revise our concepts but not our view of the facts. It is clear that Quine could not accept this suggestion as such, since it presupposes that an answer has been given to the first of his problems—the definition of analyticity—in terms of notions like those of a concept or meaning. But, given that Quine's thesis is untenable in this first respect, there is no reason for denying its untenability in the second.

STATEMENTS THAT ARE NEITHER ANALYTIC NOR SYNTHETIC. Other reasons for dissatisfaction with a sharp distinction between analytic and synthetic statements have been offered by other philosophers. Waismann, for example, has maintained that there are some statements which do not admit of a clear classification; for instance, "I see with my eyes." In this case there are reasons for saying that it is analytic, since whatever I see with might be called "eyes"; on the other hand, it might be said that it is a matter of fact that it is with my eyes that I see. Hence, Waismann maintains, such statements are neither analytic nor synthetic, properly speaking. The objection to this, as has been pointed out by W. H. Walsh, is that Waismann has failed to consider the contexts in which such statements are made. The sentence "I see with my eyes" may be used in one context to express an analytic statement and in another to express a synthetic one. The fact that the same sentence may have different uses and that the analyticity or syntheticity of a statement is a function of those uses (a statement is just the use of a sentence) shows nothing about the necessity of abandoning the analytic-synthetic distinction.

ARE THERE ANY ANALYTIC STATEMENTS? Emphasis of the point that analyticity is a function of use prompts the question of whether sentences which purport to express analytic statements have a use at all and whether, in consequence, there *are* any analytic statements. It has been emphasized from Kant onward that analytic statements are trivial, and similar things were said even before Kant—by John Locke, for instance. The truth of an analytic statement makes no difference to the world. It is, therefore, difficult to see why anyone should ever make an analytic statement. A possible reply is that such a statement might be made in order to clarify something about the concepts involved. If the statements in question are about concepts, however, rather than about the thing or things referred to by the subject expression, why are they not simply definitions? Definitions are not in themselves analytic statements, whatever their exact status. It could thus be argued that any statement which has a use either provides information about things or about the meanings of words, and in either case the statement would be synthetic, or at least not analytic. The only viable function remaining for the term *analytic* would be as a term of logical appraisal, not as a classificatory expression. That is to say, the use of the words “That is analytic” would not be to classify the statement in question, but to say, in effect, “You have not said anything.”

Whether or not this is plausible in itself, the crucial question remains: How is it possible for a statement both to be about something and to elucidate the concepts involved? (The question is probably more crucial for judgments than for statements, since it might seem obvious what a judgment must be about, while the criteria of “aboutness” are less obvious in the case of statements.) The issues are simple. A statement is one use of a sentence, and an analytic statement is such a use that conforms to certain conditions—two of which are that it says nothing about its subject and that its truth depends at least in part on the meanings of the words involved. If this is so, it cannot be used to make clear those meanings. If an analytic statement does serve to make clear those meanings to someone, this must be an incidental and unintended consequence of its use, not an essential part of that use. On the other hand, if the triviality of analytic statements is accepted, there can be no argument to show that their use is impossible, for there is no reason why a statement, if it is to be about something, should also *say* something about that thing. The use of such statements would simply lack point.

A POSSIBLE WAY OF MAKING THE DISTINCTION

Ludwig Josef Johann Wittgenstein pointed out in the *Tractatus Logico-Philosophicus* (4.4611) that tautologies are senseless but not nonsense. By “senseless” he meant that they do not pick out any determinate state of affairs that makes a difference to our view of the world. They are, in effect, trivial. They are not nonsense, however, because they are part of our symbolism, just as “0” is part of the symbolism of arithmetic, although it is useless for counting. Given a system of symbolism, or a language, it must always be possible to construct sentences that could be used to assert analytic truths or falsehoods (contradictions), whether or not there would be any point in doing so. This possibility is a necessary consequence of the nature of language. A language, however, is not just a system of symbols; it is something whose function is, among other things, to state and communicate facts. Hence, it is possible to say that, given that these sentences have a use, the truth of their uses (or, in the case of contradictions, their falsity)—that is, the truth of the relevant statements—is a necessary condition of the employment of the language from which the corresponding sentences are drawn, or of any language in which there are sentences with the same meaning. More briefly, analytic statements will be those whose truth is necessary to the employment, as expressed in language, of the system of concepts on which they depend. Any statement of which this is not true will be synthetic. Of these other statements, many will be such that their truth is not necessary in any way, but there may be others whose truth is necessary in some way other than that of analytic statements—as Kant maintained about the synthetic a priori.

ANALYTIC AND SYNTHETIC STATEMENTS [ADDENDUM]

There are several major philosophical projects that having a viable analytic/synthetic distinction would advance. For example: Analytic (true) sentences are supposed to have their truth values solely in virtue of the meanings (together with the syntactic arrangement) of their constituents; in effect, their truth values are supposed to supervene on their linguistic properties alone (Quine 1953). So they are true in every possible world where they mean what they mean here. So they are necessarily true. So if there were a viable analytic/synthetic distinction, we would understand the necessity of at least some necessary truths. If, in particular, it were to turn out that the logical and/or the mathematical truths are analytic, we would understand why *they* are necessary (Gibson 1988, Quine 1998).

An account of necessity according to which necessary truths are analytic has special virtues. Necessity is not, of course, an epistemic notion. Still, suppose that the necessity of a sentence arises from the meanings of its parts. It is natural to assume that one of the things one

knows in virtue of knowing one's language is what the expressions of the language mean (Boghossian 1994). A treatment of modality in terms of analyticity therefore connects the concept of necessity with the concept of knowledge; and knowledge *is*, of course, an epistemic property. So if there is a viable analytic/synthetic distinction, we could explain why the necessary truths, or at least some of the necessary truths, are knowable a priori by anybody who knows a language that can express them (Quine 1991). It bears emphasis that not every theory of necessity yields a corresponding treatment of apriority; doing so is a special virtue of connecting modality with meaning.

Many philosophers interested in the metaphysics of semantical properties find attractive the idea that the meaning of an expression supervenes on its conceptual/inferential role (Sellars 1954, Harman 1987, Block 1994 and references therein). It is, however, a plausible objection to conceptual role semantics that it courts a ruinous holism unless there is some way to distinguish meaning-constitutive inferences from the rest (Fodor and Lepore 1991, 1992). A tenable analytic/synthetic distinction might resolve this tension; the meaning constitutive-inferences could be identified with the analytic ones. In practice, it is pretty widely agreed that saving the analytic/synthetic distinction is a condition for saving conceptual role semantics (Block 1994, Peacocke 1992).

For many linguists, it is a main goal of "lexical semantics" to predict which sentences express them; typically, by "decomposing" the meanings of some words into their definitions. On this sort of view, intuitions of analyticity play much the role vis-à-vis theories of meaning that intuitions of grammaticality do vis-à-vis theories of syntax (Katz 1972).

For all of the aforementioned points, many philosophers have been persuaded (largely by considerations Quine raised) that there is no unquestion-begging way to formulate a serious analytic/synthetic distinction (Gibson 1988, Harman 1999, Lepore 1995). The moral might be that philosophy will have to do without it, even if, in consequence, notions like necessity, apriority and definition seem deeply mysterious.

Harman (following Quine) has famously offered an across-the-board argument that the notion of analyticity is untenable; namely, that the truth of analytic sentences is supposed somehow to be independent of "how the world is," but it is puzzling how the truth of anything could be independent of how the world is. How, for example, could a stipulation, or a linguistic convention (implicit or otherwise) make a proposition *true*? How

could our undertaking to respect the inference from “bachelor” to “unmarried” make it true that bachelors are unmarried?

There is an obvious problem in understanding how the truth of a statement can be independent of the way the world is and depend entirely on the meaning of the statement. Why is it not a fact about the world that copper is a metal such that, if this were not a fact, the statement “copper is a metal” would not express a truth? And why doesn’t the truth expressed by “copper is copper” depend in part on the general fact that everything is self-identical (Harman 1999)?

Boghossian (1996) holds that a sentence can be made true by stipulation; and that that stipulation determines which proposition the sentence expresses. Call the sentence *S* and the proposition *P*. Surely, if *S* is true, *P* is true, since it is a truism (assuming sentences have truth values at all) that each sentence has the same truth-value as the proposition it expresses. It is thus unclear why making a sentence true by stipulation is not *thereby* making the corresponding proposition true by stipulation.

Still, whatever the truth maker for a proposition is, the proposition is true just in case its truth maker is “in place.” Now consider the proposition expressed by a sentence that is true by stipulation. Presumably, the truth maker for that proposition *must be* in place since the sentence that expresses it is true. If so, then, Harman can object as follows: “It’s not obvious how a stipulation could make the world such that a certain sentence is true of it. But it’s also, and equally, not obvious how a stipulation could guarantee that the truth maker of the proposition that a sentence expresses is ‘in place.’” In fact, the second question is plausibly just the first one all over again.

Ernest Lepore (2005)

ANALYTICITY

The idea of “analyticity”—or truth by virtue of meaning—can be understood in two different ways. On the one hand, it might stand for an epistemic notion, for the idea that mere grasp of the meaning of a sentence suffices for knowledge that it is true. On the other hand, it might stand for a metaphysical notion, for the idea that a statement owes its truth value completely to its meaning, and not at all to “the facts.” We may call the first notion “epistemic analyticity” and the second “metaphysical analyticity.” On the face of it, these are distinct notions that subserve distinct philosophical programs. Willard Van Orman Quine, whose writings are largely responsible for the contemporary rejection of analyticity, failed to distinguish between them; as a result, many philosophers came to assume that the two notions stand or fall together. However, it is the moral of recent work in this area that this assumption is mistaken: epistemic analyticity can be defended even while its metaphysical cousin is rejected.

The metaphysical concept of analyticity is presupposed by the logical positivist program of reducing all necessity to linguistic necessity. Guided by both the fear

that objective, language-independent necessary connections would be metaphysically odd, and that no empiricist epistemology could explain our knowledge of them, philosophers like Rudolf Carnap (1947) and A. J. Ayer (1946) attempted to show that all necessary truths are simply disguised decisions concerning the meanings of words. According to this view, there is no more to the truth of, say, “Either snow is white or it is not” than a decision concerning the meaning of the word “or.” On this view, linguistic meaning by itself is supposed to generate necessary truth; a fortiori, linguistic meaning by itself is supposed to generate truth. Hence the play with the metaphysical notion of analyticity.

However, it is doubtful that this makes a lot of sense. What could it possibly mean to say that the truth of a statement is fixed exclusively by its meaning and not by the facts? Is it not in general true that for any statement *S*,

S is true if and only if (iff) for some *p*, *S* means that *p*
and *p*?

How could the mere fact that *S* means that *p* make it the case that *S* is true? Doesn't it also have to be the case that *p* (see Harman, 1960)?

The proponent of the metaphysical notion does have a comeback, one that has perhaps not been sufficiently addressed. What he will say instead is that, in some appropriate sense, our meaning *p* by *S* makes it the case that *p*.

But this line is itself fraught with difficulty. For how are we to understand how our meaning something by a sentence can make something or other the case? It is easy to understand how the fact that we mean what we do by a sentence determines whether that sentence expresses something true or false. But as Quine (1951) points out, that is just the normal dependence of truth on meaning. What is not clear is how the truth of what the sentence expresses could depend on the fact that it is expressed by that sentence, so that we would be entitled to say that what is expressed would not have been true at all had it not been for the fact that it is expressed by that sentence. But are we really to suppose that, prior to our stipulating a meaning for the sentence

“Either snow is white or it is not”

it was not the case that either snow was white or it was not? Is it not overwhelmingly obvious that this claim was true *before* such an act of meaning, and that it would have been true even if no one had thought about it, or chosen it to be expressed by one of our sentences?

There is, then, very little to recommend the linguistic theory of necessity and, with it, the metaphysical notion of analyticity that is supposed to subserve it. Epistemic analyticity, by contrast, is not involved in that futile reductive enterprise. Its role, rather, is to provide a theory of a priori knowledge.

Intuitively speaking, it does seem that we can know certain statements—the truths of logic, mathematics, and conceptual analysis, most centrally—without recourse to empirical experience. The problem has always been to explain how.

The history of philosophy has known a number of answers to this question, among which the following has been very influential: We are equipped with a special evidence-gathering faculty of intuition, distinct from the standard five senses, that allows us to arrive at justified beliefs about the necessary properties of the world. By exercising this faculty, we are able to know a priori such truths as those of mathematics and logic.

The central impetus behind the analytic explanation of the a priori is to explain the possibility of a priori knowledge without having to postulate any such special faculty of “intuition,” an idea that has never been adequately elaborated.

This is where the concept of epistemic analyticity comes in. If mere grasp of *S*'s meaning by *O* were to suffice for *O*'s being justified (with a strength sufficient for knowledge—henceforth, we will take this qualification to be understood) in holding *S* true, then *S*'s apriority would be explainable without appeal to a special faculty of intuition: the very fact that it means what it does for *O* would by itself explain why *O* is justified in holding it to be true.

How could mere grasp of a sentence's meaning justify someone in holding it true? Clearly, the answer to this question has to be semantical: something about the sentence's meaning, or about the way that meaning is fixed, must explain how its truth is knowable in this special way. What could this explanation be?

In the history of the subject, two different sorts of explanation have been especially important. Although these, too, have often been conflated, it is crucial to distinguish between them.

One idea was first formulated in full generality by Gottlob Frege (1884). According to this view, a statement's epistemic analyticity is to be explained by the fact that it is transformable into a logical truth by the substitution of synonyms for synonyms. We may call

statements that satisfy this semantical condition “Frege-analytic.”

Quine’s enormously influential “Two Dogmas of Empiricism,” (1951) complained that there could not be any Frege-analytic statements because there could not be any synonymies. But, as Herbert P. Grice and Peter F. Strawson showed (1956), the arguments for this claim are highly disputable. And Paul Boghossian (1995) has added to this by arguing that Quine’s negative arguments cannot plausibly stop short of his radical thesis of the indeterminacy of meaning, a thesis that most philosophers continue to reject.

The real problem with Frege-analyticity is not that there are not any instances of it, but that it is limited in its ability to explain the full range of a priori statements. Two classes remain problematic: a priori statements that are not transformable into logical truths by the substitution of synonyms for synonyms, and a priori statements that are trivially so transformable.

An example of the first class is the sentence “Whatever is red all over is not blue.” Because the ingredient descriptive terms do not decompose in the appropriate way, this sentence is not transformable into a logical truth by substitution of synonyms.

The second class of recalcitrant statements consists precisely of the truths of logic. These truths satisfy, of course, the conditions on Frege-analyticity. But they satisfy them trivially. And it seems obvious that we cannot hope to explain our entitlement to belief in the truths of logic by appealing to their analyticity in this sense: Knowledge of Frege-analyticity presupposes knowledge of logical truth and so cannot explain it.

How, then, is the epistemic analyticity of these recalcitrant truths to be explained? The solution proposed by Carnap (1947) and the middle Ludwig Wittgenstein (1974) turned on the suggestion that such statements are to be thought of as “implicit definitions” of their ingredient terms. Applied to the case of logic (a similar treatment is possible in the case of the other class of recalcitrant truths), this suggestion generates the semantical thesis we may call:

Implicit definition: It is by arbitrarily stipulating that certain sentences of logic are to be true, or that certain inferences are to be valid, that we attach a meaning to the logical constants. A particular constant means that logical object, if any, which makes valid a specified set of sentences and/or inferences involving it.

The transition from this sort of implicit definition account of grasp to an account of the apriority of logic can then seem immediate, and the following sort of argument would appear to be in place:

1. If logical constant **C** is to mean what it does, then argument-form **A** has to be valid, for **C** means whatever logical object in fact makes **A** valid.
2. **C** means what it does.

Therefore,

3. **A** is valid.

Quine’s “Truth by Convention” (1936) and “Carnap and Logical Truth” (1976) raised several important objections against the thesis of implicit definition: first, that it leads to an implausible conventionalism about logical truth; second, that it results in a vicious regress; and third, that it is committed to a notion—that of a meaning-constituting sentence or inference—that cannot be made out.

Even the proponents of implicit definition seem to have agreed that some sort of conventionalism about logical truth follows from implicit definition. However, Nathan Salmon (1994) and Boghossian (1997) have argued that this is a mistake: No version of conventionalism follows from the semantical thesis of implicit definition, provided that a distinction is observed between a sentence and the claim that it expresses.

Quine’s second objection is also problematic in relying on a defective conception of what it is for a person to adopt a certain rule with respect to an expression, according to which the adoption of a rule always involves explicitly stating in linguistic terms the rule that is being adopted. On the contrary, it seems far more plausible to construe **x**’s following rule **R** with respect to **e** as consisting in some sort of fact about **x**’s behavior with **e**.

In what would such a fact consist? Here there are at least two options of which the most influential is this: **O**’s following rule **R** with respect to **e** consists in **O**’s being disposed, under appropriate circumstances, to conform to rule **R** in his employment of **e**.

According to this view, then, the logical constants mean what they do by virtue of figuring in certain inferences and/or sentences involving them and not in others. If some expressions mean what they do by virtue of figuring in certain inferences and sentences, then some inferences and sentences are constitutive of an expression’s meaning what it does, and others are not.

Quine’s final objection to implicit definition is that there will be no way to specify systematically the meaning-constituting inferences, because there will be no

way to distinguish systematically between a meaning constituting inference and one that is not meaning-constituting but simply obvious. However, although this is a serious challenge, and although it remains unmet, there is every reason for optimism (see, for example, Peacocke 1994 and Boghossian 1995).

Quine helped us see the vacuity of the metaphysical concept of analyticity and, with it, the futility of the project it was supposed to underwrite—the linguistic theory of necessity. But those arguments do not affect the epistemic notion of analyticity, the notion that is needed for the purposes of the theory of a priori knowledge. Indeed, the analytic theory of apriority seems to be a promising research program, given reasonable optimism about the prospects both for a conceptual role semantics and for the idea of Frege-analyticity.

ANALYTIC JURISPRUDENCE

Analytic jurisprudence divides into two related areas: substantive and methodological. Until the late 1980s most analytic jurisprudence had been substantive. It focused on producing theories of the nature of law, the relationship between laws (particular legal standards) and law (a system of governance by laws), and the relationship of law to morality and other institutions for regulating human affairs and actions.

Whereas these debates in substantive jurisprudence remain as lively and urgent as ever, analytic jurisprudence has taken a decidedly methodological turn. Jurisprudence is a philosophical theory of the nature of law, not a historical, economic, or sociological one. But how can philosophy shed light on law? The conventional answer is that philosophy aims to uncover the nature of law.

But how can philosophy help uncover the nature of law? Since H. L. A. Hart, at least, the most prominent answer has been that philosophical theories of law are theories of the concept of law, of concepts related to it (such as obligation and authority), and of the relationships among these concepts. The philosophical method of jurisprudence is conceptual analysis. Thus, analytic jurisprudence is on the same footing as analytic epistemology, metaphysics, and metaethics. Analytic jurisprudence is conceptual analysis of the concept of law, just as epistemology is conceptual analysis of the concepts of epistemic warrant and knowledge.

The standard view is that competent speakers share the concept of law, though each has an incomplete grasp of it. While we take ourselves to be employing the same concept—a concept that regulates our usage and enables us to communicate meaningfully—in fact few competent speakers have theories of the concept in all its particulars. Constructing such a theory is the task of the jurist. Such a theory refines and regulates our use and aims to

deepen our understanding. Constructing such a theory begins with ordinary use, which reflects a partial understanding, but does not end there. Nor is jurisprudence merely a descriptive activity reporting on common or shared understandings.

Since Hart, at least, this has been the dominant method for approaching the study of the nature of law. Of contemporary legal philosophers, Joseph Raz is perhaps the preeminent proponent of this way of understanding conceptual analysis as a distinctive philosophical approach to law.

The place of conceptual analysis within jurisprudence has recently come under sustained attack from several quarters. These attacks have been responsible for much of the current interest in the methods of analytic jurisprudence. The first line of attack raises doubts about conceptual analysis, not just in jurisprudence, but in philosophy more generally. This is the naturalist challenge. In its stronger forms, naturalized jurisprudence argues that conceptual analysis is a form of inquiry that proceeds by culling usage and then testing various refinements and revisions against intuitions about proper use, and that it turns philosophical inquiry into an irreducible battle among competing intuitions and is ultimately hopeless.

Naturalists invite us to understand law by taking our cues from the social-scientific theories that explore the role of law in our social lives. We revise or amend those accounts only insofar as the theories fail to deliver the requisite goods: to enable us to make our way through the social world.

Within law, naturalists, Brian Leiter in particular, have focused more narrowly on the theory of adjudication. If we take authoritative legal texts as inputs and judicial decisions as outputs, then a theory of adjudication is a set of norms that takes the set of relevant authoritative texts, together with pertinent factual premises, and generates correct judicial opinions from them. A theory of adjudication is an account of warranted or justified legal inferences or decisions. The naturalist rejects the view that the norms governing proper legal reasoning can be determined by a priori reflection on our practice. Instead of trying to determine the norms by which judges ought to decide cases, they urge that we study how judges in fact decide cases. In this way, the legal naturalist echoes the claim, often attributed to W. V. O. Quine, that properly understood, epistemology would be no more than a chapter in a psychology text book.

The second kind of objection does not reject the idea that jurisprudence aims to provide a theory of the con-

cept of law. Rather, it focuses on the form of conceptual analysis that Hart and others have been committed to, according to which the goal of jurisprudence is to identify the rule or criteria for the proper use of the concept of law. There are several objections to this project. One worry is that the concept of law may not be governed by a rule for its proper use, at least not one that is fixed by the shared understandings and behavior of competent speakers. As some have put it, the concept of law may be an essentially contested concept, the criteria of its proper application being fundamentally and inevitably in dispute.

Ronald Dworkin, for one, views the concept of law as essentially contested. Because the criteria for its application are necessarily in dispute, the proper application of the concept cannot be determined by a rule, and certainly not one whose content is shared by competent speakers. The essentially contestable nature of the concept of law implies that a theory of it cannot be constructed from reports of common use and understandings, even suitably revised and refined. Instead, the method of conceptual analysis appropriate to law is “constructive interpretation.” Such an interpretation requires first attributing a value or purpose to law. The purpose of law is introduced to explain why it would be rational for agents to participate in it, or in some other sense to legitimate the practice. The theory of the concept is constructed by imposing this value on the practice of law as a way of organizing it and determining which features of it are most important to explain. Most important, a constructive interpretation of the concept of law is a normative theory of law. The interpretation begins with a contestable claim about the value of law that can only be defended by appealing to substantive moral principles.

Interestingly, Dworkin shares more with the natural jurist than one might think. Both feel that a descriptive account of our legal practice is best left to social scientists, not philosophers. The naturalist takes this to be reason enough to deny that philosophical jurisprudence is a distinctive endeavor. For Dworkin, it is reason to think that philosophical jurisprudence must be normative.

Interpretivism is one form of normative jurisprudence. Like the so-called descriptivists and Dworkin, and unlike the naturalists, Stephen Perry accepts that the project of jurisprudence is to analyze the concept of law. Like Dworkin, he thinks the descriptivists have gone awry by thinking that an analysis of the concept of law can be achieved by reflecting on ordinary use, that is, by culling data about use, then revising and refining accordingly.

Perry's argument for normative jurisprudence is very different than Dworkin's, however. His point of departure is the claim that every theory of law has embedded within it a range of normative premises—about the nature of human agency, the value of governance by law, and most important, the proper function of law. According to Perry, the best way to interpret Hart is as claiming that the function of law is to guide conduct by reasons. By the same token, the best way to understand Dworkin is as claiming that the function of law is to justify the application of coercive force in terms of the past political decisions of legal actors. For Perry, defending a theory of the concept of law requires defending one or another view about the proper function of law. Any such defense calls for arguments of political morality, not for reports of common use or understanding.

Finally, other philosophers of law, notably Jules Coleman and Ori Simchen, take issue with conceptual analysis as the method of jurisprudence in somewhat different terms. As they see it, there are at least two problems with conceptual analysis. The first is that it relies on an unsustainable formulation of the analytic/synthetic distinction, according to which theorizing about a subject has distinct conceptual and empirical dimensions. The role of philosophy is identified with the former; the rest is a matter of empirical science. This division of labor, they claim, relies on a way of distinguishing the analytic from the synthetic that is untenable. Those who identify philosophical inquiry with conceptual analysis believe that the role of philosophy is to explore the fundamental concepts of an area of study. Philosophy uncovers the nature of the things studied by uncovering the conditions for the proper application of the relevant concepts. But this again artificially constrains the role of philosophy. It may well be that we cannot study a subject without having a concept of it, but that does not mean that philosophical inquiry must be identified with determining the conditions for the proper application of the concept. There is no reason why philosophical inquiry into law cannot be a direct account of the significant features of legal practice itself, and not merely of the concepts used to refer to the practice of law.

To sum up, the methods of analytic jurisprudence are hotly contested. The partisans fall into two camps: those who identify the distinctive role of philosophical inquiry with traditional conceptual analysis and those who, in one way or another, reject this approach. Arguably, Raz falls into the first category, whereas Leiter, Dworkin, Perry, Coleman, and Simchen, among others, fall into the second. Those who reject traditional con-

ceptual analysis do so for a variety of reasons. Some naturalists, such as Leiter, take the rejection of the analytic/synthetic distinction to mean in effect that there is no distinctive role for philosophy in jurisprudence. That is, they implicitly accept the view that what is distinctive of philosophy is conceptual analysis, but since conceptual analysis requires the analytic/synthetic distinction, rejecting the distinction implies abandoning a distinctive role for philosophy.

Defenders of normative jurisprudence, especially Dworkin, believe that if there is a role for philosophy in the wake of the rejection of the analytic/synthetic distinction, it must take the form of a normative theory of law. After all, if jurisprudence cannot be conceptual, and empirical inquiries are best left to the social scientists, all that remains for philosophy is to advance a speculative normative philosophy of law. Still others who reject the analytic/synthetic distinction, like Coleman and Simchen, are inclined to the view that abandoning the distinction means that philosophical inquiry into law can be an amalgam of the empirical and the conceptual.

ANAPHORA

The study of *anaphora* (from Greek, "carry back") is the study of the ways in which occurrences of certain expressions, particularly pronouns, depend for their interpretations upon the interpretations of occurrences of other expressions. Problems of anaphora are of interest to philosophy and logic because of their intersection with problems of ontology, quantification, and logical form.

REFERENTIAL ANAPHORA

Pronouns understood as anaphoric on referential noun phrases are plausibly viewed as referring to the same things as their antecedents. Sentences (1)–(3) permit such readings (coindexing will be used to indicate an intentional anaphoric connection):

- (1) Jim₁ respects students who argue with him₁.
- (2) Jim₁ loves his₁ mother.
- (3) Jim₁ is here. He₁ arrived yesterday. I think he₁'s asleep right now.

We might call these pronouns "referential anaphors."

It is sometimes suggested (see, e.g., Soames 1994) that anaphoric pronouns in such constructions can be understood in a second way. For example, although (2) might be understood as equivalent to "Jim loves Jim's mother," it might seem to admit of another interpretation that makes it equivalent to "Jim is a self's-mother-lover," the logical form of which is given by (2'):

- (2') $\lambda x(x \text{ loves } x\text{'s mother})\text{Jim}$.

The contrast between the two readings emerges when (2) is embedded, as in

- (4) Mary believes that Jim₁ loves his₁ mother.

Certainly, many of the traditional problems involved in interpreting proper names recur for pronouns anaphoric on names.

BOUND-VARIABLE ANAPHORA

Pronouns anaphoric on quantified noun phrases cannot be treated as straightforwardly referential. Consider the following:

- (5) Every man₁ thinks he would be a good president₁.
- (6) No man₁ respects his₁ brothers' friends.

There is no point inquiring into the referents of the pronouns in examples like these. Following W. V. Quine (1960) and P. Geach (1962), philosophers have tended to treat such pronouns as the natural-language analogs of the variables of quantification theory. Certainly, the logical forms of quantified sentences of the form "every F is G" and "some Fs and Gs" can be captured using the standard first-order quantifiers " \forall " and " \exists ." But a comprehensive semantic theory must treat sentences containing noun phrases formed using "no," "the," "exactly one," "most," "few," and so on. This fact highlights two problems. Using the identity sign "=" and the negation sign " \neg ," it is possible to use " \forall " and " \exists " to represent sentences containing "no," "the," "exactly one," "exactly two,"

and so forth, but the resulting formulae obscure the relationship between the surface syntax of a sentence and its logical form. For example, if Bertrand Russell is right that “the F is G” is true if and only if every F is G and there is exactly one F, then the logical form of this sentence is as follows:

$$(7) (\exists x)((\forall y)(Fy \equiv y = x) \& Gx).$$

A more serious problem is that there are sentences that cannot be dealt with in first-order logic—for instance, sentences of the form “most Fs are Gs.”

Both of these problems are solved if quantification in natural language is viewed as *restricted*. The basic idea here is that determiners combine with their complements (noun complexes) to form restricted quantifiers. So, for example, “every,” “some,” “most,” “the,” and so on combine with simple nouns such as “pig” (or “pigs”), “man” (or “men”), and so forth (or complex nouns such as “man who owns a pig,” etc.) to form restricted quantifiers such as “some man,” “most men,” “every man who owns a pig,” and so forth. We can represent a restricted quantifier “every man” as “[every x: man x].” This quantifier may combine with a predicate phrase such as “is mortal” (which we can represent as “x is mortal”) to form the sentence “every man is mortal,” which we can represent as

$$(8) [\text{every } x: \text{man } x]x \text{ is mortal.}$$

Now consider sentences (5) and (6) again. If we treat the anaphoric pronouns in these examples as bound variables, their logical forms will be (abstracting somewhat):

$$(5') [\text{every } x: \text{man } x](x \text{ thinks } x \text{ would be a good president}).$$

$$(6') [\text{no } x: \text{man } x](x \text{ respects } x\text{'s brothers' friends}).$$

VARIABLE BINDING AND SCOPE

G. Evans (1977) has argued that not all pronouns anaphoric on quantified noun phrases are bound variables. Consider the following examples.

(9) Jim bought some pigs and Harry vaccinated them.

(10) Just one man ate haggis and he was ill afterward.

A bound-variable treatment of the occurrence of “them” in (9) yields the wrong result. On such an account, the logical form of the sentence will be

$$(9') [\text{some } x: \text{pigs } x](\text{Jim bought } x \& \text{Harry vaccinated } x).$$

But (9') can be true even if Harry did not vaccinate *all* of the pigs Jim bought, whereas (9) cannot. (If Jim bought

ten pigs and Harry vaccinated only two of them, (9') would be true whereas (9) would not.) And if the pronoun “he” in (10) is treated as a bound variable, the logical form of the sentence will be

$$(10') [\text{just one } x: \text{man } x](x \text{ ate haggis and } x \text{ was ill afterward}).$$

This is also incorrect; if two men ate haggis and only one was ill afterward, (10') will be true whereas (10) will be false.

There is a plausible syntactic explanation of these facts. In both (9) and (10), the pronoun is located outside the smallest sentence containing the quantifier upon which it is anaphoric and hence lies outside its scope, according to the most promising syntactic characterization of this notion. The scope of an expression α in a sentence of a natural language appears to correspond to the first branching node dominating α at the syntactic level relevant to semantic interpretation. If this is correct, and contemporary syntactic theory suggests it is, then syntactic theory explains why the pronouns in (9) and (10) are not understood as bound variables. There seem to be, therefore, anaphoric pronouns that are neither bound nor straightforwardly referential.

UNBOUND ANAPHORA

A plausible paraphrase of (9) is (9''):

(9'') Jim bought some pigs and Harry vaccinated the pigs Jim bought.

In view of this, Evans (1977) suggests that the pronoun “them” in (9) is understood in terms of the plural description “the pigs Jim bought,” as what he calls an “E-type” pronoun. An E-type pronoun has its reference fixed by description (in Saul Kripke’s sense) and is therefore a rigid designator. On this account, in (9) the pronoun “them” is taken to refer to those objects satisfying “pigs Jim bought.”

Similarly where the antecedent is singular. A plausible paraphrase of (11) is (11'):

(11) Jim bought a pig and Harry vaccinated it.

(11') Jim bought a pig and Harry vaccinated the pig Jim bought.

According to Evans, the pronoun “it” in (11) refers to the unique object satisfying “pig Jim bought.”

This idea forms the basis of Evans’s general account of the semantic content of unbound anaphors. The pronoun “he” in (10) has its reference fixed by “the man who

ate haggis”; and in (12) “they” has its reference fixed by “the philosophers who came”:

- (12) A few philosophers came. They drank far too much.

Evans’s proposal can be summarized thus: if P is an unbound pronoun anaphoric on a quantified noun phrase “[DET x : ϕ]” occurring in a sentence “[DET x : ϕ] ψ ,” then the referent of P is fixed by the description “[the x : ϕ & ψ].”

Examination of more complex cases reveals weaknesses in Evans’s theory (see below). The problems uncovered have tended to steer semanticists in one of two directions. First, there have been attempts to modify or refine Evans’s framework (Davies 1981, Neale 1990). Second, there have been attempts to replace the entire framework with a uniform, discourse-based approach (Kamp 1981, Heim 1982). Both approaches will now be examined.

DESCRIPTIVE ANAPHORA

Evans rejected the view that unbound anaphors go proxy for descriptions (in favor of the view that they have their referents fixed by description) on the grounds that such pronouns, unlike overt descriptions, do not give rise to ambiguities of scope. But consider the following:

- (14) A man murdered Smith, but Jim doesn’t think he did it.
 (15) A man murdered Smith. The police have reason to think he injured himself in the process.

If “he” goes proxy for “the man who murdered Smith,” there will be two readings for each of the anaphor clauses in these examples—the so-called *de re* and *de dicto* readings—according as the description for which the pronoun goes proxy is given large or small scope:

- (14a) [the x : man x & x murdered Smith] (Jim doesn’t believe that x murdered Smith)
 (14b) Jim doesn’t believe that [the x : man x & x murdered Smith](x murdered Smith)

It is natural to interpret (14) as attributing to Jim a non-contradictory belief concerning the murderer to the effect that he is not the murderer. On the proxy view this is captured by the *de re* reading of the second conjunct. The *de dicto* reading is technically available to the proxy theorist but is obviously not the preferred interpretation. But with (15) the *de dicto* reading of the second sentence is actually the more natural; yet Evans’s theory explicitly precludes its existence.

Further support for the proxy rather than reference-fixing approach comes from examples containing modal expressions:

- (16) Mary wants to marry a rich man. He must be a banker.

The first sentence in (16) may be read either *de re* or *de dicto*. Moreover, the pronoun “he” can be anaphoric on “a rich man” on either reading. But as L. Karttunen (1976) points out, the modal expression has to be there for the anaphora to work if the antecedent sentence is to be interpreted *de dicto*. That is, in

- (17) Mary wants to marry a rich man. He is a banker.

it is not possible to get the *de dicto* reading for the antecedent clause if “he” is anaphoric on “a rich man.” This contrast between (16) and (17) is explicable on the assumption that the anaphoric pronoun in (16) goes proxy for the description “the man Mary marries” and may therefore take large or small scope with respect to the modal expression. On the *de dicto* reading of the antecedent clause, the *de re* reading of the anaphor clause is infelicitous because an implication of existence results from giving the description large scope. But the *de dicto* reading of the anaphor clause is fine because on such a reading the description is within the scope of the modal expression. In (17), on the other hand, since there is no modal operator with respect to which the pronoun can be understood with small scope, the sentence has no felicitous reading when the antecedent clause is read *de dicto*.

DONKEY ANAPHORA

H. Kamp (1981) and I. Heim (1982) have explored alternative approaches that aim to treat all anaphoric pronouns in a unitary fashion. One motivation is the problem of so called donkey anaphora, typified by sentences such as (18) and (19), originally discussed by Geach (1962):

- (18) If a man buys a donkey he vaccinates it.
 (19) Every man who buys a donkey vaccinates it.

Both Evans’s theory and the simple proxy theory seem to fail here. For example, if the pronoun “it” in (19) is analyzed in terms of the singular description “the donkey he buys” (with “he” bound by “every man who buys a donkey”) the sentence will be true just in case every man who buys a donkey vaccinates the unique donkey he buys. Consequently, it will be false if any man buys more than one donkey. But this is incorrect; the truth of (19) is quite compatible with some men owning more than one donkey, as long as every man who buys a donkey vaccinates

every donkey he buys. It would appear, then, that the indefinite description “a donkey”—which can normally be treated as an existentially quantified phrase—has the force of a *universally* quantified phrase in (19). And in (18) both “man” and “a donkey” appear to have universal force.

A common explanation of the “universalization” of the indefinite descriptions in such examples has been proposed by Kamp. The idea (roughly) is that noun phrases introduce variables to which common nouns and predicates supply “conditions” within a “discourse representation” (DR). Typically, the variable is bound by an existential quantifier taking scope over the entire discourse. On this account, an indefinite description is not inherently quantificational; rather, it introduces a variable with conditions on it imposed by, among other things, the predicative material it contains. The DR for (18) might be represented as:

(18') [man(x) & donkey(y) & buys(x,y)] IFTHEN [vaccinates(x,y)].

Kamp proposes that (18') is true if and only if every assignment of values to x and y that makes the antecedent true also makes the consequent true. The apparent universalization of the indefinite descriptions “a man” and “a donkey” is thus explained as a consequence of a general analysis of conditionals.

In the light of the equivalence of (18) and (19), Kamp suggests that, although (18) is not actually a conditional, because the subject quantifier is universal we get a DR in which the indefinite “a donkey” has universal force. That is, the DR for (19) is given by

(19') [man(x) & donkey(y) & buys(x,y)] EVERY [vaccinates(x,y)].

Like (18'), (19') is true if and only if every assignment of values to x and y that makes “[man(x) & donkey(y) & buys(x,y)]” true, also makes “[vaccinates(x,y)]” true.

One problem with this proposal is that it does not predict that indefinite descriptions “universalize” when they are embedded in *other* quantifiers and thus leads to the so-called proportion problem. Consider

(20) Most men who buy a donkey vaccinate it.

By analogy with (18') and (19'), the DR for (20) will be

(20') [man(x) & donkey(y) & buys(x,y)] MOST [vaccinates(x,y)]

which is true just in case *most* assignments of values to x and y that make “[man(x) & donkey(y) & buys(x,y)]” true also make “[vaccinates(x,y)]” true. But on its most

natural reading, the truth of (20) requires that most men who buy a donkey vaccinate *every* donkey they buy, whereas (20') can be true as long as most of the donkeys that are bought by men are vaccinated by their respective buyers. Suppose Alan buys five donkeys, Bill buys one donkey, Clive buys one donkey, and no other man buys any donkeys. Sentence (20') will come out true if Alan vaccinates at least four of his donkeys, even if Bill and Clive do not vaccinate their respective donkeys; but in such a situation (20) would be false. (It has been suggested that there is another reading of (20), which requires that most men who buy at least one donkey vaccinate most of the donkeys they buy; but (20') does not capture this reading either.)

From this brief overview it should be clear that both the simple descriptive theory and the simple DR theory need to be refined if they are to do justice to the full range of antecedent/anaphor relations in natural language. For example, the descriptive approach needs to be modified if it is to handle donkey anaphora, perhaps allowing for the possibility of interpreting some donkey pronouns in terms of “all of the” rather than “the” (Davies 1981, Neale 1990). And the DR approach needs to be modified to avoid the proportion problem and also permit pronouns to be understood with various scopes. At the time of writing, more sophisticated versions of these theories are being developed, as are alternatives to both.

Stephen Neale (1996)

ANAPHORA [ADDENDUM]

Most recent work on anaphora has tended to focus on cases in which a pronoun is anaphoric on what appears to be a quantifier phrase, where it cannot be understood as a variable bound by that quantifier phrase (as it is in 5 and 6 above). Two central cases of this sort, to which attention will be confined here, are as follows. First, there is *discourse anaphora* in which the anaphoric expression is in a different sentence from its antecedent (see also 12, and 15–17 above):

- (21) Few cars are gasoline and electric hybrids. They are expensive;
- (22) A woman is at the door. She is from Santa Monica.

There are at least two reasons for thinking that the pronouns in 21 and 22 are not variables bound by its quantifier antecedents. Garreth Evans (1977) appears to be the first to discuss both reasons. Focusing on 21, the first reason is that such a treatment gets the wrong truth conditions for an example like 21. If *they* is a bound variable in 21, the two sentences of 21 together should be equivalent to: 21a) Few cars: x (x is a gasoline and electric hybrid and x is expensive). But this is obviously incorrect because 21 entails that few cars are hybrids, whereas 21a does not.

Second, it is generally thought that the scope of a quantifier cannot extend beyond the sentence in which it occurs. If that is correct, then the pronoun in 21 falls outside the scope of its quantifier antecedent and so cannot be bound by it. So, though the pronoun in 21 has a quantified antecedent, it cannot be understood as a variable bound by it.

Another sort of case in which this occurs is that of *donkey anaphora*, which comes in two varieties as illustrated above by 18 and 19. Let us call the former *conditional donkey anaphora* and the latter *relative clause donkey anaphora*. In the case of 18, all independent evidence suggests that (what appears to be) the quantifier “a donkey” cannot take wide scope over the conditional and bind the pronoun in the consequent. When one attempts

to do this with other quantifiers, one cannot bind the pronoun, as is the case here:

- (23) If John buys every donkey₁, he beats it₁.

And even if “a donkey” could somehow scope over the conditional and bind the pronoun in the consequent, assuming it is as usual an existential quantifier, we still wouldn’t get the right truth conditions for 18, which intuitively require donkey-owning men to vaccinate every donkey they own. In the case of 19, again the independent evidence suggests that a quantifier occurring in a relative clause cannot bind a pronoun outside the relative clause:

- (24) Every teacher who flunks every male student₁ hates him₁.

So both donkey anaphora and discourse anaphora require treating the anaphoric pronoun as something other than a bound variable. Thus both of these phenomena shall be grouped under the heading *unbound anaphora*. In addition to the descriptive and discourse representation approaches discussed above, there are at least two other attempts to treat unbound anaphora.

First, there are Dynamic Logic Accounts (DL), originally formulated by Jeroen Groenendijk and Martin Stokhof (1991). Other DL accounts have been suggested by Gennaro Chierchia (1995) and Makoto Kanazawa (1994a and 1994b). DL accounts, which are descended from DR accounts, characteristically claim that quantifiers can semantically bind pronouns even if those pronouns do not occur in their syntactic scopes. The pronouns in 18, 19, 21, and 22, then, are semantically (though not syntactically) bound by their quantifier antecedents even though they are beyond the syntactic scope of their antecedents. DL also provides new accounts of the semantics of conditionals and universal quantification in assigning to 18 and 19 the intuitively correct truth conditions.

The second other sort of approach to unbound anaphora (in addition to descriptive and DR approaches) is the Context Dependent Quantifier Approach (CDQ), which was first suggested by George Wilson (1984) and further articulated and defended by Jeffrey King (1987, 1991, 1994, 2005). The CDQ approach holds that in cases of unbound anaphora, the pronouns in question are quantifiers. The forces (universal or existential), restrictions (what the quantifiers range over—e.g., “every student” ranges over students), and relative scopes of these pronouns and quantifiers are determined by features of their linguistic contexts. Thus, according to CDQ, the

anaphoric pronouns in cases of unbound anaphora are contextually sensitive devices of quantification.

The precise natures of the quantifications they express, the forces, restrictions, and relative scope of the quantifications, are determined by features of their linguistic contexts. In 22, CDQ holds that the pronoun expresses the existential quantifier normally expressed outside any context by the indefinite “a woman who is at the door.” Similar remarks apply to 18 and 19, except that the semantics of the conditional interacts with the pronoun qua quantifier to get the proper reading of 18 (King 2005); and in 19 the pronoun qua quantifier takes narrow scope with respect to the universal quantifier “every man” (because its antecedent does as well).

ANARCHISM

“Anarchism” is a social philosophy that rejects authoritarian government and maintains that voluntary institutions are best suited to express man’s natural social tendencies. Historically the word *anarchist*, which derives from the Greek *an archos*, meaning “no government,” appears first

to have been used pejoratively to indicate one who denies all law and wishes to promote chaos. It was used in this sense against the Levelers during the English Civil War and during the French Revolution by most parties in criticizing those who stood to the left of them along the political spectrum. The first use of the word as an approbatory description of a positive philosophy appears to have been by Pierre-Joseph Proudhon when, in his *Qu’est-ce que la propriété?* (*What is property?*, Paris, 1840), he described himself as an anarchist because he believed that political organization based on authority should be replaced by social and economic organization based on voluntary contractual agreement.

Nevertheless, the two uses of the word have survived together and have caused confusion in discussing anarchism, which to some has appeared a doctrine of destruction and to others a benevolent doctrine based on a faith in the innate goodness of man. There has been further confusion through the association of anarchism with nihilism and terrorism. In fact, anarchism, which is based on faith in natural law and justice, stands at the opposite pole to nihilism, which denies all moral laws. Similarly, there is no necessary connection between anarchism, which is a social philosophy, and terrorism, which is a political means occasionally used by individual anarchists but also by actionists belonging to a wide variety of movements that have nothing in common with anarchism.

Anarchism aims at the utmost possible freedom compatible with social life, in the belief that voluntary cooperation by responsible individuals is not merely more just and equitable but is also, in the long run, more harmonious and ordered in its effects than authoritarian government. Anarchist philosophy has taken many forms, none of which can be defined as an orthodoxy, and its exponents have deliberately cultivated the idea that it is an open and mutable doctrine. However, all its variants combine a criticism of existing governmental societies, a vision of a future libertarian society that might replace them, and a projected way of attaining this society by means outside normal political practice. Anarchism in general rejects the state. It denies the value of democratic procedures because they are based on majority rule and on the delegation of the responsibility that the individual should retain. It criticizes utopian philosophies because they aim at a static “ideal” society. It inclines toward internationalism and federalism, and, while the views of anarchists on questions of economic organization vary greatly, it may be said that all of them reject what William Godwin called accumulated property.

Attempts have been made by anarchist apologists to trace the origins of their point of view in primitive non-governmental societies. There has also been a tendency to detect anarchist pioneers among a wide variety of teachers and writers who, for various religious or philosophical reasons, have criticized the institution of government, have rejected political activity, or have placed a great value on individual freedom. In this way such varied ancestors have been found as Laozi, Zeno, Spartacus, Étienne de La Boétie, Thomas Münzer, François Rabelais, François Fénelon, Denis Diderot, and Jonathan Swift; anarchist trends have also been detected in many religious groups aiming at a communalistic order, such as the Essenes, the early Christian apostles, the Anabaptists, and the Doukhobors. However, while it is true that some of the central libertarian ideas are to be found in varying degrees among these men and movements, the first forms of anarchism as a developed social philosophy appeared at the beginning of the modern era, when the medieval order had disintegrated, the Reformation had reached its radical, sectarian phase, and the rudimentary forms of modern political and economic organization had begun to appear. In other words, the emergence of the modern state and of capitalism is paralleled by the emergence of the philosophy that, in various forms, has opposed them most fundamentally.

WINSTANLEY

Although Proudhon was the first writer to call himself an anarchist, at least two predecessors outlined systems that contain all the basic elements of anarchism. The first was Gerrard Winstanley (1609–c. 1660), a linen draper who led the small movement of the Diggers during the Commonwealth. Winstanley and his followers protested in the name of a radical Christianity against the economic distress that followed the Civil War and against the inequality that the grandees of the New Model Army seemed intent on preserving. In 1649–1650 the Diggers squatted on stretches of common land in southern England and attempted to set up communities based on work on the land and the sharing of goods. The communities failed, but a series of pamphlets by Winstanley survived, of which *The New Law of Righteousness* (1649) was the most important. Advocating a rational Christianity, Winstanley equated Christ with “the universal liberty” and declared the universally corrupting nature of authority. He saw “an equal privilege to share in the blessing of liberty” and detected an intimate link between the institution of property and the lack of freedom. In the society he sketched, work would be done in common and the products shared

equally through a system of open storehouses, without commerce.

Like later libertarian philosophers, Winstanley saw crime as a product of economic inequality and maintained that the people should not put trust in rulers. Rather, they should act for themselves in order to end social injustice, so that the land should become a “common treasury” where free men could live in plenty. Winstanley died in obscurity and, outside the small and ephemeral group of Diggers, he appears to have wielded no influence, except possibly over the early Quakers.

GODWIN

A more elaborate sketch of anarchism, although still without the name, was provided by William Godwin in his *Enquiry concerning Political Justice* (1793). Godwin differed from most later anarchists in preferring to revolutionary action the gradual and, as it seemed to him, more natural process of discussion among men of good will, by which he hoped truth would eventually triumph through its own power. Godwin, who was influenced by the English tradition of Dissent and the French philosophy of the Enlightenment, put forward in a developed form the basic anarchist criticisms of the state, of accumulated property, and of the delegation of authority through democratic procedure. He believed in a “fixed and immutable morality,” manifesting itself through “universal benevolence”; man, he thought, had no right “to act anything but virtue and to utter anything but truth,” and his duty, therefore, was to act toward his fellow men in accordance with natural justice. Justice itself was based on immutable truths; human laws were fallible, and men should use their understandings to determine what is just and should act according to their own reasons rather than in obedience to the authority of “positive institutions,” which always form barriers to enlightened progress. Godwin rejected all established institutions and all social relations that suggested inequality or the power of one man over another, including marriage and even the role of an orchestra conductor. For the present he put his faith in small groups of men seeking truth and justice; for the future, in a society of free individuals organized locally in parishes and linked loosely in a society without frontiers and with the minimum of organization. Every man should take part in the production of necessities and should share his produce with all in need, on the basis of free distribution. Godwin distrusted an excess of political or economic cooperation; on the other hand, he looked forward to a freer intercourse of individuals through the progressive breaking down of social and economic barriers.

ers. Here, conceived in the primitive form of a society of free landworkers and artisans, was the first sketch of an anarchist world. The logical completeness of *Political Justice*, and its astonishing anticipation of later libertarian arguments, make it, as Sir Alexander Gray said, “the sum and substance of anarchism.”

NINETEENTH-CENTURY EUROPEAN ANARCHISM

Despite their similarities to later libertarian philosophies, however, the systems of Winstanley and Godwin had no perceptible influence on nineteenth-century European anarchism, which was an independent development and which derived mainly from the peculiar fusion of early French socialist thought and German neo-Hegelianism in the mind of Proudhon, the Besancon printer who has been called the father of anarchism. This tradition centered largely on a developing social revolutionary movement that attained mass dimensions in France, Italy, and Spain (where anarchism remained strong until the triumph of Franco in 1939), and to a lesser extent in French-speaking Switzerland, the Ukraine and Latin America. Apart from Proudhon, its main advocates were Michael Bakunin, Prince Peter Kropotkin, Errico Malatesta, Sebastien Faure, Gustav Landauer, Elisée Reclus, and Rudolf Rocker, with Max Stirner and Lev Tolstoy on the individualist and pacifist fringes, respectively. Also, there arose among nineteenth-century anarchists a mystique that action and even theory should emerge from the people. Libertarian attitudes, particularly in connection with the anarchosyndicalism of France and Spain, were influenced by the rationalization and even romanticization of the experience of social struggle; the writings of Fernand Pelloutier and Georges Sorel in particular emanate from this aspect of the anarchist movement. Nineteenth-century anarchism assumed a number of forms, and the points of variation between them lie in three main areas: the use of violence, the degree of cooperation compatible with individual liberty, and the form of economic organization appropriate to a libertarian society.

INDIVIDUALIST ANARCHISM. Individualist anarchism lies on the extreme and sometimes dubious fringe of the libertarian philosophies since, in seeking to assure the absolute independence of the person, it often seems to negate the social basis of true anarchism. This is particularly the case with Max Stirner, who specifically rejected society as well as the state and reduced organization to a union of egoists based on the mutual respect of “unique” individuals, each standing upon his “might.” French anar-

chism during the 1890s was particularly inclined toward individualism, which expressed itself partly in a distrust of organization and partly in the actions of terrorists like “Ravachol” and Émile Henry, who alone or in tiny groups carried out assassinations of people over whom they had appointed themselves both judges and executioners. A milder form of individualist anarchism was that advocated by the American libertarian writer Benjamin Tucker (1854–1939), who rejected violence in favor of refusal to obey and who, like all individualists, opposed any form of economic communism. What he asked was that property should be distributed and equalized so that every man should have control over the product of his labor.

MUTUALISM. Mutualism, developed by Proudhon, differed from individualist anarchism in its stress on the social element in human behavior. It rejected both political action and revolutionary violence—some of Proudhon’s disciples even objected to strikes as a form of coercion—in favor of the reform of society by the peaceful spread of workers’ associations, devoted particularly to mutual credit between producers. A recurrent mutualist plan, never fulfilled, was that of the people’s bank, which would arrange the exchange of goods on the basis of labor notes. The mutualists recognized that workers’ syndicates might be necessary for the functioning of industry and public utilities, but they rejected large-scale collectivization as a danger to liberty and based their economic approach as far as possible on individual possession of the means of production by peasants and small craftsmen united in a framework of exchange and credit arrangements. The mutualists laid great stress on federalist organization from the local commune upward as a substitute for the national state. Mutualism had a wide following among French artisans during the 1860s. Its exponents were fervently internationalist and played a great part in the formation of the International Workingmen’s Association in 1864; their influence diminished, however, with the rise of collectivism as an alternative libertarian philosophy.

COLLECTIVISM. Collectivism is the form of anarchism associated with Michael Bakunin. The collectivist philosophy was developed by Bakunin from 1864 onward, when he was forming the first international organizations of anarchists, the International Brotherhood and the International Alliance of Social Democracy. It was collectivist anarchism that formed the principal opposition to Marxism in the International Workingmen’s Association and thus began the historic rivalry between libertarian and

authoritarian views of socialism. Bakunin and the other collectivists agreed with the mutualists in their rejection of the state and of political methods, in their stress on federalism, and in their view that the worker should be rewarded according to his labor. On the other hand, they differed in stressing the need for revolutionary means to bring about the downfall of the state and the establishment of a libertarian society. Most important, they advocated the public ownership and the exploitation through workers' associations of the land and all services and means of production. While in mutualism the individual worker had been the basic unit, in collectivism it was the group of workers; Bakunin specifically rejected individualism of any kind and maintained that anarchism was a social doctrine and must be based on the acceptance of collective responsibilities.

ANARCHIST COMMUNISM. Collectivism survived as the dominant anarchist philosophy in Spain until the 1930s; elsewhere it was replaced during the 1870s by the anarchist communism that was associated particularly with Kropotkin, although it seems likely that Kropotkin was merely the most articulate exponent of a trend that grew out of discussions among anarchist intellectuals in Geneva during the years immediately after the Paris Commune of 1871. Through Kropotkin's literary efforts anarchist communism was much more elaborately worked out than either mutualism or collectivism; in such books as *La conquête du pain* (*The conquest of bread*, 1892) and *Fields, Factories and Workshops* (1899) Kropotkin elaborated the scheme of a semiutopian decentralized society based on an integration of agriculture and industry, of town life and country life, of education and apprenticeship. Kropotkin also linked his theories closely with current evolutionary theories in the fields of anthropology and biology; anarchism, he suggested in *Mutual Aid* (1902), was the final stage in the development of cooperation as a factor in evolution.

Anarchist communism differed from collectivism on only one fundamental point—the way in which the product of labor should be shared. In place of the collectivist and mutualist idea of remuneration according to hours of labor, the anarchist communists proclaimed the slogan “From each according to his means, to each according to his needs” and envisaged open warehouses from which any man could have what he wanted. They reasoned, first, that work was a natural need that men could be expected to fulfill without the threat of want and, second, that where no restriction was placed on available goods, there would be no temptation for any man to take more than he could use. The anarchist communists laid great stress

on local communal organization and even on local economic self-sufficiency as a guarantee of independence.

ANARCHOSYNDICALISM. Anarchosyndicalism began to develop in the late 1880s, when many anarchists entered the French trade unions, or syndicates, which were just beginning to reemerge after the period of suppression that followed the Paris Commune. Later, anarchist militants moved into key positions in the *Confédération Générale du Travail*, founded in 1895, and worked out the theories of anarchosyndicalism. They shifted the basis of anarchism to the syndicates, which they saw as organizations that united the producers in common struggle as well as in common work. The common struggle should take the form of “direct action,” primarily in industry, since there the workers could strike most sharply at their closest enemies, the capitalists; the highest form of direct action, the general strike, could end by paralyzing not merely capitalism but also the state.

When the state was paralyzed, the syndicates, which had been the organs of revolt, could be transformed into the basic units of the free society; the workers would take over the factories where they had been employees and would federate by industries. Anarchosyndicalism created a mystique of the working masses that ran counter to individualist trends; and the stress on the producers, as distinct from the consumers, disturbed the anarchist communists, who were haunted by the vision of massive trade unions ossifying into monolithic institutions. In France, Italy, and Spain, however, it was the syndicalist variant that brought anarchism its first and only mass following. The men who elaborated the philosophy of anarchosyndicalism included militants, such as Fernand Pelloutier, Georges Yvetot, and Émile Pouget, who among them created the vision of a movement arising from the genius of the working people. There were also intellectuals outside the movement who drew theoretical conclusions from anarchosyndicalist practice; the most important was Sorel, the author of *Réflexions sur la violence* (*Reflections on violence*, 1908), who saw the general strike as a saving “social myth” that would maintain society in a state of struggle and, therefore, of health.

PACIFIST ANARCHISM. Pacifist anarchism has taken two forms. That of Tolstoy attempted to give rational and concrete form to Christian ethics. Tolstoy rejected all violence; he advocated a moral revolution, its great tactic the refusal to obey. There was much, however, in Tolstoy's criticisms of contemporary society and his suggestions for the future that paralleled other forms of anarchism. He denounced the state, law, and property; he foresaw

cooperative production and distribution according to need.

Later a pacifist trend appeared in the anarchist movement in western Europe; its chief exponent was the Dutch ex-socialist, Domela Nieuwenhuis. It differed from strict Tolstoyism by accepting syndicalist forms of struggle that stopped short of violence, particularly the millenarian general strike for the abolition of war.

Despite their differences, all these forms of anarchism were united not merely in their rejection of the state, of politics, and of accumulated property, but also in certain more elusive attitudes. In its avoidance of partisan organization and political practices, anarchism retained more of the moral element than did other movements of protest. This aspect was shown with particular sharpness in the desire of its exponents for the simplification of life, not merely in the sense of removing the complications of authority, but also in eschewing the perils of wealth and establishing a frugal sufficiency as the basis for life. Progress, in the sense of bringing to all men a steadily rising supply of material goods, has never appealed to the anarchists; indeed, it is doubtful if their philosophy is at all progressive in the ordinary sense. They reject the present, but they reject it in the name of a future of austere liberty that will resurrect the lost virtues of a more natural past, a future in which struggle will not be ended, but merely transformed within the dynamic equilibrium of a society that rejects utopia and knows neither absolutes nor perfections.

The main difference between the anarchists and the socialists, including the Marxists, lies in the fact that while the socialists maintain that the state must be taken over as the first step toward its dissolution, the anarchists argue that, since power corrupts, any seizure of the existing structure of authority can only lead to its perpetuation. Anarchosyndicalists, however, regard their unions as the skeleton of a new society growing up within the old.

The problem of reconciling social harmony with complete individual freedom is a recurrent one in anarchist thought. It has been argued that an authoritarian society produces antisocial reactions, which would vanish in freedom. It has also been suggested, by Godwin and Kropotkin particularly, that public opinion will suffice to deter those who abuse their liberty. George Orwell, however, has pointed out that the reliance on public opinion as a force replacing overt coercion might lead to a moral tyranny which, having no codified bounds, could in the end prove more oppressive than any system of laws.

ANAXAGORAS OF CLAZOMENAE

(c. 500–428 BCE)

One of the leading philosophers of the fifth century BCE, Anaxagoras continued the cosmological style of philosophy begun in Miletus in the preceding century. Born in Clazomenae in Asia Minor around 500, he came to Athens and spent thirty years there, enjoying access to intellectual circles through his friendship with Pericles. Two alternate accounts of his dates in Athens are available: either he came around 480 and stayed until 450, or he came around 460 and stayed until 430. Because his name is associated with a meteor that fell near Aegospotami around 467, and his theory of the Nile floods was known to Aeschylus (d. 456), it appears that his work was well known already in the 460s, supporting an early date at least for his philosophical activity. Anaxagoras is said to have fled Athens to avoid prosecution on a charge of impiety, and he finished his days in Lampsacus in northern Greece, where he died in 428. He wrote a book that was well-known in Athens in the late fifth century BCE and was available until the sixth century CE. About twenty fragments of the book survive, describing some key points of his theory. Although Anaxagoras wrote in simple Ionic prose, many details of his theory remain obscure and controversial.

Like most natural philosophers of his time, Anaxagoras tells how the world arose from a primeval chaos. Initially, all things (kinds of matter, presumably) were mixed together to such an extent that nothing was differentiated. But Mind (*Nous*) caused a whirling motion to start, which caused different materials to separate out, as in a centrifuge, leading to the articulation of the cosmos. At the center of the cosmos is a flat earth, surrounded by stony bodies in the heavens carried around by the cosmic vortex motion. The sun is a hot stone and the moon an earthy body. This cosmogony broadly follows the pattern set by Anaximander, and it shows the influence of Anaximenes in some details. In making the heavenly bodies spherical bodies, Anaxagoras may be following the pattern of Parmenides's cosmology.

ANAXAGORAS'S PRINCIPLES

What is innovative about Anaxagoras's theory is not the sequence of his cosmogony, but the principles on which he bases it. In the first place, he adheres to a principle of No Becoming—previously articulated by Parmenides—according to which nothing can come to be out of what is not. But whereas Parmenides seems to have meant this

principle as a grounds for ruling out cosmological theories, Anaxagoras uses it as a restriction on what kind of explanation is allowed. Second, Anaxagoras follows a principle of Universal Mixture, which he states repeatedly, to the effect that everything is mixed with everything. There has been much controversy among interpreters about what the domain of “everything,” in its two occurrences, is. Whatever the precise interpretation, the principle clearly applies to the primeval chaos insofar as all stuffs seem to be thoroughly mixed; but Anaxagoras maintains that even when the separation process takes over, some quantity of every stuff remains mixed with any given stuff. Third, Anaxagoras holds to a principle of Infinite Divisibility, according to which there are no minimal particles of matter—no atoms. Finally, Anaxagoras accepts a principle of Predominance, such that any stretch of matter manifests the properties of whatever stuff it has the largest quantity. Thus, if there is more water than salt in a mixture, people perceive it to be water; if more salt than water, they then perceive it to be salt.

It is generally agreed that the point of Anaxagoras's principles is to account for change with the least allowance for novelty: When one thing seems to change into another thing, the second does not arise out of nothing, but was already present (if in a lower concentration). Thus there is change, but no radical coming to be out of what is not—a possibility forbidden by Parmenides. What is less clear is whether Anaxagoras succeeds in formulating a coherent account of change. Whether he succeeds depends in large measure on how one interprets the details of his theories of matter and change, which will be discussed briefly below.

CONTROVERSIES

A fifth principle that is often attributed to Anaxagoras is Homoiomereity, using a Greek term of Aristotle's that designates a stuff in which the parts are like the whole. Thus if one divides a quantity of water in half, one gets two (smaller) quantities of water; but if one divides a chair in half one does not get two chairs. The former sort of being is called *homoioimerous*. Aristotle calls Anaxagoras's basic stuffs homoiomeries, but it is not clear whether he intends to say of them that they have the property of homoiomereity; or whether he simply wishes to denote things that in Aristotle's own system are homoiomeries (e.g., flesh and bone), whatever their properties for Anaxagoras. In any case, neither the term nor the property is found in the fragments of Anaxagoras—except as

the property is applied to Mind, which does not behave like a physical element.

Another controversy concerns the relationship between stuffs and contraries, or qualities in general. Anaxagoras mentions qualities such as hot and cold alongside stuffs such as earth (fr. 4) and maintains that contrary qualities cannot be cut off from each other (fr. 8). Does Anaxagoras recognize a strong categorial difference between stuffs and qualities, and if so, what is their relationship? According to one interpretation, the stuffs are composed of qualities, such that different amounts of hot, cold, wet, dry, and so on, combine to constitute different stuffs. Thus Universal Mixture signifies that every stuff is potentially in every stuff because by changing the ratios of qualities one can produce other results. On this view Anaxagoras is a reductionist who reduces stuffs to qualities. Defenders of this view have sometimes claimed that only on this interpretation can Anaxagoras's principles be rendered consistent. Yet, other interpreters have shown that his principles can be made consistent without reducing stuffs to qualities. Critics of the reductionist view see Anaxagoras's stuffs as elemental bodies. Qualities could be either stuffs in their own right, or simply properties that happen to describe certain stuffs.

Another controversial question is the meaning of the seeds Anaxagoras refers to in fr. 4 as being part of the original mixture. Are these biological seeds, as some interpreters hold, from which the first plants and animals grew? Or are they structural principles generally, to account for the presence of shapes and structures which emerge from the formless mixture (perhaps including, but not confined to, shapes of plants and animals)? Or are they small particles of a given stuff that are present as starting points for the growth of that given stuff? (A number of other hypotheses have also been advanced.) On many of these hypotheses, at least, no stretch of matter could be homoiomerous, for it would contain seeds having a different composition from the whole. Anaxagoras does not say enough about seeds to allow scholars to make a clear determination in favor of one of these hypotheses.

In another difficult saying in fr. 4, Anaxagoras talks about an alternative to "our" world. But is his statement merely counterfactual, or does he hold that there are other worlds, like the atomists; or worlds within worlds, as among Leibniz's monads; or repeating worlds, as does Empedocles? There is no more consensus on this question than on the other controversies mentioned.

MIND AND KNOWLEDGE

One of Anaxagoras's most interesting and innovative theories is his philosophy of mind. As has been shown, Anaxagoras makes mind responsible for the beginning of the cosmic vortex. He says that mind is "boundless, autonomous, and mixed with no object" (fr. 12). If it were not "by itself" it would be mixed with everything, by Universal Mixture, which would hinder it from ruling things. As it is, mind is "the finest of all objects and the purest, and it exercises complete oversight over everything and prevails above all" (fr. 12). Mind is present in some things, namely those things that have soul, but it does not mix with them. Thus mind is not immaterial, but it is not material in the same way as the stuffs are. It exercises control over the stuffs of the world and comprehends all things. Anaxagoras's theory suggests a dualism of mind and matter, though it is not nearly as radical as Descartes's dualism. In any case, Anaxagoras is the first philosopher to recognize mind as a distinct reality alongside physical entities. In cosmology, Anaxagoras is the first philosopher to support creationism—involving not a creation *ex nihilo*, to be sure, but an organization of pre-existing elements by an intelligent agency distinct from those elements.

Anaxagoras accounts for sense perception as the effect of opposite qualities on opposites; thus one perceives hot by cold and wet by dry. He observes that because of the weakness of the senses people are not able to perceive the truth (fr. 21). But, on the positive side, "Appearances are a vision of the invisible" (fr. 21a). A serious philosophical problem for Anaxagoras is how humans can have knowledge at all. Because everything is mixed in everything, if I perceive something as water, I may infer that it is composed of water, and salt, and every other kind of stuff. But how can I say that I know the body before me as water if I have to analyze it as, among other things, water, and the water that I analyze it into is a theoretical entity I do not perceive? I seem to be involved in a regress that keeps me from knowing anything, except in a purely hypothetical way, in which everything has exactly the same components (all the stuffs there are), all of which are perceptually inaccessible to me.

Here, fr. 21a (just cited) provides a possible way out of the problem. People know by an inference to the best (or only possible) explanation that there are countless basic stuffs in the world. Further, they are acquainted with those stuffs by their manifestations to sense experience. Because when some stuff predominates, it gives its character to the whole body it predominates in, they can infer the character of, for instance, elemental water from

the character of phenomenal water in bodies of water they encounter. Similarly, people can infer the character of all other basic stuffs from their appearances, because, by hypothesis, the basic stuffs are like their phenomenal counterparts. People cannot give an adequate verbal definition of water, but they can give an ostensive definition of it. Thus they know the structure of reality by theory, but the content of reality by experience. This same sort of strategy appears to have appealed to Democritus, who approved of Anaxagoras's statement in B21a and applied it to his atoms (for a limited range of properties).

PHYSICAL THEORY

Though in some ways conventional, Anaxagoras's physical theories made some important advances. Like most of his predecessors, Anaxagoras envisioned a flat earth at the center of the circling heavens; the earth is held in place by air pressure, and the solstices of the sun are caused by winds in the heavens. He explained the annual floods of the Nile as the result of melting snows in southern Africa (the Nile is in fact fed by melting snows, but the floods are caused by monsoon rains), a view cited by Aeschylus, Sophocles, and Euripides, and criticized by Herodotus. He gave an essentially correct explanation of hail. His view that the heavenly bodies are earthy or stony was probably novel, and he believed that invisible stones were also carried aloft with the vortex—in effect, he posited asteroids. When a large meteor fell at Aegospotami, Anaxagoras was given credit for predicting it, and henceforth meteors were included among data to be explained by cosmological theories. He gave the first correct explanation of solar and lunar eclipses (perhaps inspired by Parmenides's recognition that the moon gets its light from the sun), a feat that Aristotle regarded as a paradigm of scientific discovery. He also correctly hypothesized that the moon had mountains and valleys on its surface. In his physical theory he was followed by Archelaus of Athens, and in his teleological tendencies by Diogenes of Apollonia.

After Anaxagoras, natural philosophers mostly accepted his theory of eclipses and his view of heavenly bodies as spherical solid bodies. Though his astronomy was influential among intellectuals, it clashed with popular religious views according to which the sun and moon were gods, and led to an indictment of impiety in Athens. It was the sort of theory that Plato criticized in the *Laws* as leading to atheism. Anaxagoras presumably would reply that his views offered grounds for a more enlightened religion than those based on worshipping forces of nature.

Plato saw one of Anaxagoras's views as offering a new approach to cosmology. If Mind ordered everything with a view to the best, then philosophers should be able to explain the structure of the cosmos on the basis not of how it arose from a primeval chaos, but how it manifests order and value. Plato reports that Anaxagoras's book was disappointing because it failed to exploit this insight, and Aristotle agrees. In fact, Anaxagoras used the same style of explanation as other pre-Socratics stressing the natural capacities of different kinds of matter. But Plato later used Anaxagoras's insight to construct the cosmos on teleological principles in his *Timaeus*. In a sense, then, Anaxagoras provided the impulse for the rational cosmologies of Plato and Aristotle that dominated ancient and medieval thought. He was the first philosopher to make his home in Athens, and also the first to offend the Athenian people. Through the Athenian philosophical tradition he had a lasting influence.

Daniel W. Graham (2005)

ANAXIMANDER

(c. 610 BCE–after 546 BCE)

Anaximander is the first Greek scientist and philosopher whose thought is known to us in any detail. He was born in Miletus c. 610 BCE and died shortly after 546 BCE. He was thus in his twenties in 585 BCE, the year of the famous solar eclipse that Thales is said to have predicted. According to the ancient tradition, Anaximander was the “pupil and successor of Thales”; but in view of our ignorance of Thales’ real achievements, it is perhaps Anaximander who should be considered the founder of Greek astronomy and natural philosophy. Nothing is known of his life except an unverifiable report that he led a Milesian colony to Apollonia, on the Black Sea. His lifetime corresponds with the great age of Miletus, when it was the richest and most powerful Greek city in Asia Minor.

His scientific achievements are said to include the first Greek world map, the first Greek star map or celestial globe, and the invention, or rather adaptation, of the gnomon (the vertical pointer of a sundial) for use in measuring the hours of the day and annual variations in the course of the sun. According to Pliny, he also traced the sun’s annual path in the ecliptic and noted its inclination with regard to the celestial axis. This last discovery may really belong to a later age, but there is no doubt that Anaximander conceived (and almost certainly constructed) a spherical model for the heavens, in the center of which was placed Earth, as a disk or cylinder whose height was one-third its diameter. The ratio 1:3 seems also to have been used in the spacing of the celestial circles or rings assigned to stars, moon, and sun: The conjectural sizes for these rings are 9, 18, and 27 Earth diameters, respectively. (His strange error in assigning the lowest circle to the stars is unexplained. There is, unfortunately, no evidence to support J. Burnet’s attractive suggestion that this circle corresponds not to the fixed stars but to bright planets such as Venus. If we could accept this, the fixed stars might then be assigned to their natural place at the periphery of the celestial sphere.)

Anaximander is thus the author of the first geometrical model of the universe, a model characterized not by vagueness and mystery but by visual clarity and rational proportion, and hence radically different in kind from all known “cosmologies” of earlier literature and myth. The highly rational character of the scheme (despite its factual errors) is best indicated by Anaximander’s explanation of Earth’s stable position in the center: It remains at rest because of its equal distance from all points of the celestial circumference, having no reason to move in one

direction rather than in another. This argument from symmetry contrasts not only with all mythic views but also with the doctrine ascribed to Thales: that Earth floats on water. Here Anaximander is clearly the precursor of the mathematical approach to astronomy developed later by the Pythagoreans, Eudoxus, and Aristarchus.

The book of Anaximander, quoted later under the standard title *On the Nature of Things* (*peri physeôs*), seems to have contained a description of his map and celestial model, as well as an account of how the natural world functions and how it reached its present form. Beginning from a first principle called the Boundless or Infinite (*to apeiron*: see below), he describes how “something capable of generating Hot and Cold was separated off ... and a sphere of fire from this source grew around the air in the region of earth like bark around a tree. When this sphere was torn off and enclosed in certain rings, the sun and moon and stars came into existence” (Diels-Kranz, 12 A 10). These heavenly bodies are “wheel-like, compressed masses of air filled with fire, which exhale flames from an orifice at one point” (Diels-Kranz, 12 A 17a).

Eclipses and lunar phases are explained by obstruction of the orifices. The sea is what remains of the primeval moisture, the rest having been evaporated as air or dried up by the celestial fire to form Earth. Land, sea, air, and heavens are thus all explained by a continual process of separating off from the primeval pair of Hot (dry) and Cold (wet). Wind, rain, lightning, thunder, and related phenomena are explained by the interaction of these elemental principles (water, air, fire) and opposite powers (hot, cold; dry, moist; thick, thin; light, dark). The origin of living things is explained as part of the same process: They arose as aquatic beings in moisture and later transferred to dry land. The first examples of each species developed to maturity within a protective membrane. In an interesting anticipation of modern ideas, Anaximander remarked that the first human beings could never have survived as helpless infants, but must have been born “from living things of another kind, since the other animals are quickly able to look for their own food, while only man requires prolonged nursing” (Diels-Kranz, 12 A 10).

The one quotation from Anaximander’s book that seems to have been preserved in very nearly the original wording is his famous statement on cosmic justice: “Out of those things whence is the generation of existing things, into them also does their destruction take place, as is right and due; for they make retribution and pay the penalty to one another for their offense [or “injustice,”

adikia], according to the ordering of time.” The interpretation of this oldest surviving philosophic text has been a subject of much controversy. The earlier commentators (including Friedrich Nietzsche) interpreted the “injustice” as the separation of individual things from their infinite source and saw the eventual reabsorption of all things back into the *apeiron* as their only fitting atonement. This fails to explain how the things that perish can pay the penalty *to one another*, or why the source of generation is referred to in the plural. It is now generally agreed that offense and compensation must both refer to the strife of opposing principles (such as the hot and cold), and that the “ordering of time” stands primarily for periodic regularity in the daily and seasonal variation of heat, moisture, daylight, and the like. Whether there is also a reference here to a larger cycle in which the cosmos itself would perish into its source is more doubtful.

Anaximander’s fame rests chiefly on his doctrine of the Boundless as the *arche*, the starting point and origin of the cosmic process. For him, the term *apeiron* meant “untraversable” or “limitless” rather than “infinite” in any precise mathematical sense. He described this principle with the Homeric epithets for divinity, calling it “ageless and immortal,” and probably even “the divine” (*to theion*). This *apeiron* surrounds and embraces all things and apparently “steers” or governs them as well. It seems to have been conceived as ungenerated as well as imperishable, and thus contrasts in every respect with the limited, perishable world it engenders. Our sources refer to “worlds” (*kosmoi*) in the plural; a succession rather than a simultaneous plurality of worlds seems to be meant. The Boundless transcends this process of world creation, circumscribing each individual world in space, outlasting all of them in time, and providing the inexhaustible material source, the eternal motive power, the vital energy, and (presumably) the geometrical form and cyclical regularity for the cosmic process as a whole. In its archaic complexity, the *apeiron* is thus both a physical and a metaphysical or theological concept, and points the way not only to the infinite void of the atomists but also to the cosmic deity of Xenophanes, Aristotle, and the Stoics.

ANAXIMENES

(6th century BCE)

Anaximenes was the third and last member (the others were Thales and Anaximander) of what is traditionally called the Milesian school of natural philosophers (*physiologoi*). The date of his death is estimated 528/526 BCE; it is probable that he “flourished” about 545 BCE. Although little is known about his life and work, fragments of ancient testimony credit him with studies under his older contemporary, Anaximander; with the writing

of a book in “simple Ionic”; and with the doctrine that air is the underlying principle of the universe, changes in physical state being the result of its condensation and rarefaction. It is likely that Aristotle read Anaximenes’ book and that Theophrastus had access to it. Several of the doxographers (Aëtius, Hippolytus, Diogenes Laertius) may have read later Hellenistic versions of the work.

On the strength of ancient testimony, historians of philosophy after Aristotle regarded Anaximenes’ doctrine as a contribution to the Milesian debates on Nature. They assumed that from Thales to Anaximenes there was a continuous development in physical thought, and they insisted that this development was intelligible only in terms of the supposedly unique problem of the period: the birth and structure of the physical world. On this interpretation, Anaximenes’ air was taken to be an *arche*, and his condensation-rarefaction doctrine was construed as a theory about physical transformations. The physical system reconstructed along these lines was then usually shown to be, in comparison with that of Anaximander, not as cogent; and whatever could not be accommodated within such a reconstruction was relegated to Anaximenes’ “retrogressive astronomy.”

Recent studies in mythical and early cosmogonic discourse (Hesiod) perhaps call for some revision of the traditional estimate. At a time when mechanical change and biological growth had not yet been distinguished from each other, when physical permanence was regarded as incomprehensible apart from “justice” between the warring Opposites, when inanimate continuity was mistaken for animal kinship, when experience was permitted only to illustrate but never to refute supposed insight, when meteorology served as the foundation for astrophysics—several of Anaximenes’ ideas were pioneering. A schematic reconstruction of some of these ideas follows.

The fundamental and most pervasive thing in the world is air (*aer*), according to Anaximenes. Air is infinitely vast in extent but perfectly determinate in character: It is ordinary atmospheric air, invisible where most even in consistency, visible through the Hot and Cold and Damp and motion. It is from air that all the things that exist, have existed, or will exist come into being. This applies to gods and divine things and also to the rest of the world, inasmuch as the world is compounded out of the offspring of air. On this account, Anaximenes suggests, the primordial air is continually in motion, and this motion is the cause of alternating physical states. Condensation and rarefaction are the key manifestations of changing air: rarefied air generates fire; condensed air creates winds; condensed winds, clouds; condensed

clouds, water; condensed water, earth; earth, stones and the rest of the world.

Throughout the process of cosmic change, the Hot and the Cold are dominant states of physical activity, but in no way are they forces distinct from air. They never come out of air by “separating off” (*ekkrisis*); rather, they are “attributes” of air when it condenses through “felting” or is rarefied through “loosening up.”

From the genesis of the universe at large, Anaximenes moves to the description of the shape of Earth and of the visible sky. Earth, according to him, is broad, flat, and shallow—tablelike. All the heavenly bodies are fires in the sky, caused by the moist exhalations of Earth. The heavenly bodies are nailed on a hemispherical diaphanous membrane and move around Earth like a cap that can be turned around one’s head, and not under Earth. The stars do not produce any sensible heat because of their distance. When the sun, moon, and stars disappear, they are hidden by the distant elevations of Earth. The stars may also be likened to fiery leaves floating on the air.

Clouds, rain, hail, and snow—all these phenomena, too, are caused by condensed air. And the same is true of the violent breaks of the clouds that produce lightning and thunder.

With the elements of his cosmology worked out, Anaximenes seems to need a general natural law guaranteeing the regularity of the world. He observes that as our souls, being air (according to an ancient tradition), hold us together, so does the cosmic Air hold the world together by enclosing it. Presumably what Anaximenes meant by this was that the regularity of an animated world is reliable and intelligible, as is the regularity of an animated body, a body that is organically self-regulative and autonomous—a microcosm. For Anaximenes, law-like regularities were inconceivable without access to the idea of cause. The notion of physical constraint was accordingly effected through containment. The divine Air, by encasing the world, successfully regulates it.

ANCIENT AESTHETICS

In antiquity, aesthetics did not form a distinct branch of philosophy. Ancient philosophers discussed literature, music, and the visual arts and reflected on the nature of beauty in a variety of contexts. Since the Greek word for “beautiful” or “fine,” *kalos*, is a very general value term that can also be used to describe what is morally admirable, ancient discussion of beauty is often embedded in wider-ranging discussion of values. Literature, music, and the visual arts are frequently considered in an educational and political context; at the same time, most ancient philosophers’ views about the arts are strongly influenced by other aspects of their philosophy, in particular their metaphysics.

The earliest Greek philosophy does include some suggestive remarks on aesthetic topics, notably some comments by Gorgias in his *Encomium of Helen*, written in the fifth century BCE, about the power of speech. However, in aesthetics as elsewhere, it was Plato and Aristotle who set the philosophical agenda for all subsequent discussion. We shall therefore begin with Plato and Aristotle and shall trace the development of what we now call aesthetics through the Hellenistic and Roman periods into late antiquity.

PLATO

Plato raises questions about the arts, and about beauty, in a number of different dialogues. Poetry is the art to which he devotes the most discussion, but this entry will also discuss his attitude to rhetoric, his use of the visual arts to illustrate his arguments about both poetry and rhetoric, his comments on music, and finally his view of beauty.

Plato alludes to “an old quarrel” between philosophy and poetry (*Republic* 10.607B). He saw dangers in the widespread use of Homer in classical Greek education and in the role played by tragic drama in classical Athens, a role comparable to that of the mass media in modern society. He therefore argues in the *Ion* and in *Republic* 10 that poets, unlike philosophers, do not have knowledge, and in *Republic* 2 and 3 he places strict limits on the amount of Homer that the future guardians of his ideal state may read and on the type of dramatic performance in which they may take part. In *Republic* 3 he describes drama as imitation (*mimesis* in Greek) and regards both acting and viewing drama as dangerous, both because playing a variety of different roles can destabilize the personality and because imitation of evil characters may likewise make us evil. Since poets lack knowledge, their poetry, according to Plato, appeals not to reason but to the emotions. This point recurs in the *Ion*, in *Republic* 2 and 3, and in *Republic* 10, where it is made using the theory of three parts of the soul first set out in *Republic* 4.

Traditionally Greek poets claimed to be inspired by the Muses. Plato too regards poets as inspired, in the *Ion* and elsewhere, but since such inspiration is contrasted with knowledge, it may not be worth much. However, he does suggest at *Phaedrus* 245A that inspired poetry is more valuable than poetry produced by technical skill alone.

In *Republic* 10, Plato puts forward perhaps his most famous and influential argument to distinguish poetry from philosophy, using the metaphysics developed in the central books of the *Republic*. According to that metaphysics, the physical world is only an imitation (*mimesis*, again) of a world of transcendent Forms. In *Republic* 10, Plato suggests that painters simply copy objects in the physical world and are thus at two removes from the true reality of the world of Forms. The point is then immediately applied to poets, who are regarded as low-grade copyists of the same kind. The scope of *mimesis* is now much wider than in *Republic* 3, where it applied only to drama; here Plato treats virtually all poetry as mimetic and so banishes it from his ideal state.

Plato is as harshly critical of rhetoric as he is of poetry, and for similar reasons. In classical Athens, teachers of rhetoric were popular and rhetorical skill was widely seen as the passport to a successful political career. Many of the Sophists, such as Gorgias and Thrasy-machus, taught rhetoric. Plato regularly sets up an opposition between the Sophists, as false teachers, and his own mentor, Socrates; in dialogues such as the *Gorgias*, he contrasts the persuasive power of rhetoric, aimed only at

pleasing the audience, with philosophy, which aims for knowledge of the truth. Similarly, in the *Sophist*, at 235Bff., Plato defines the Sophist as a maker of images, comparing his techniques to those used by sculptors and painters. In the *Phaedrus*, however, although Socrates criticizes severely a speech said to be by the orator Lysias, he also raises the possibility that there could be an ideal kind of rhetoric, based on knowledge.

Plato makes occasional remarks about music and in *Republic* 3.398Cff. proposes to regulate the music to which the future guardians of the ideal state may listen, just as he regulates the poetry that they may study. He assumes that music, like poetry, affects the emotions, and he distinguishes between musical modes such as the Dorian and the Lydian on ethical grounds: the future guardians should listen to music that will make them brave and warlike, not to music that will encourage excessive indulgence in unmanly emotions such as grief.

When Plato discusses poetry, rhetoric, and music, sometimes using the visual arts to illustrate and support his argument, he says little or nothing about beauty. He considers beauty in a quite different context in *Symposium* 210ff. where Socrates, speaking in praise of Love (*Erōs* in Greek), reports what he says he was told by a wise woman, Diotima. This passage describes, in lyrical, poetic language, a progression from the love of physical beauty to the love of moral and intellectual beauty and finally to the Form of Beauty itself. Plato here makes no direct reference to the arts, but it is worth noting that in the *Phaedrus* too he recognizes love as a powerful but nonrational motive force in the human soul. The *Phaedrus* also contains a mythical account of how the human soul, before it entered the body, was able to see the Forms, including the Form of Beauty. As we have seen, the *Phaedrus* includes some favorable comments on inspired poetry and the suggestion that an ideal rhetoric, based on knowledge, could be devised. It is therefore tempting to suggest that the right kind of poetry and rhetoric could find a place among the moral and intellectual beauties mentioned in the *Symposium*. Yet we should note that even if this is correct, such beauties will still be left behind by the soul that ascends to the Forms, the ultimate object of philosophical inquiry.

ARISTOTLE

Whereas Plato always discusses poetry and the other arts within a broader context, Aristotle devotes the *Poetics* solely to an examination of poetry. In fact the scope of the *Poetics* as we have it is narrower still: after some introductory remarks about the nature of poetry in general, Aris-

totle concentrates on tragedy and epic; a lost second book was devoted to comedy. Although the *Poetics* is the main source for Aristotle's aesthetic thought, there is a brief but important discussion of music in the *Politics* that supplements the single allusion in the *Poetics* to *katharsis*, and his views on rhetoric, expounded in the *Rhetoric*, are also of interest.

Like Plato, Aristotle regards poetry as a form of *mimesis*, or "imitation," but since Aristotle's metaphysics differs radically from Plato's, his understanding of *mimesis* is also radically different. For Aristotle forms are immanent in matter, not transcendent. Poetry imitates the world around us, and Aristotle is happy to accept both that we enjoy recognizing such imitation and that we can learn from it. Tragedy, for Aristotle, is an imitation of an action, and Aristotle focuses not on the characters represented but on the plot. Although he does discuss what kind of tragic hero is best, for example, his concern is primarily with what makes a good play. For that reason he has often, with some justice, been regarded as the first formalist in literary theory. He stresses the importance of a unified plot, arguing, for instance, in 1459a that Homer's *Iliad* and *Odyssey* are superior to other epics such as the *Cypria* or the *Little Iliad* in being less episodic. He illustrates his argument with many examples from classical Greek plays, particularly Sophocles' *Oedipus Tyrannus*, which he admires as a supreme example of a well-constructed tragedy.

Yet Aristotle's approach to poetry is not purely formal. He regards the action and the characters of a tragedy as morally significant and believes that poetry can convey universal truths, claiming, at 1451b, that it is closer to philosophy than to history in that respect. Like Plato he recognizes that poetry has a powerful effect on the emotions and like Plato he holds that tragedy arouses both pity and fear. However, whereas Plato, in *Republic* 10 and elsewhere, argues that tragedy and other forms of poetry overstimulate these emotions, Aristotle has a more complex view. When he gives a definition of tragedy in *Poetics* 1449b, he describes it as bringing about a *katharsis* of pity and fear and in *Politics* 8. 1341bff., in a discussion of music, he mentions a similar *katharsis* effected by the healing use of music in certain religious rites. There has been much scholarly discussion of just what Aristotle means by *katharsis*. Arguably it is best understood in the light of Aristotle's ethics: Aristotle holds that in order to act virtuously we need to feel the right emotions at the right time, in the right way and toward the right objects; in some way that is not fully explained, our feeling pity and fear as we watch a good tragedy brings about the

result that, when we leave the theater, we feel not too much pity and fear, as Plato supposed, but just the right amount that we need for ethical action.

The rest of Aristotle's discussion of music in *Politics* 8 assumes, as Plato did in the *Republic*, that music has a powerful effect on the emotions. He criticizes some details of Plato's argument in *Republic* 3.398Cff., and by introducing the notion of *katharsis*, Aristotle opens up the possibility that music can be used for therapeutic purposes.

A similar interest in the effect of art on the emotions can be seen in Aristotle's *Rhetoric*. Aristotle devotes much of *Rhetoric* 2 to a discussion of the emotions because the orator will need to understand his audience's emotional responses in order to persuade them effectively. The *Rhetoric* also contains important discussions of rhetorical reasoning and of prose style. Just as the *Poetics* is not a handbook for poets but a philosophical treatise on poetry based on close study of tragedy and epic, so the *Rhetoric* is not a handbook for orators but a philosophical treatise based on close study of rhetorical practice.

THE HELLENISTIC AND ROMAN PERIODS

After the death of Aristotle, Greek philosophy became increasingly diverse. While the Platonist and Aristotelian schools continued, the Epicureans and the Stoics developed new approaches to many issues. Aristotle's pupil, Theophrastus, was interested in the therapeutic powers of music and claimed that music could even cure bodily afflictions such as sciatica. Another pupil of Aristotle, Aristoxenus, studied music from an empirical point of view, opposing the mathematical approach that had been taken by the Pythagoreans.

The Stoics regarded both the order of the universe and moral virtue as beautiful, and their interest in the philosophy of language led them to discuss poetry and rhetoric. They thought poetry could express truth, as we can see from Cleanthes' choice of verse to convey his philosophy in the *Hymn to Zeus* and from the way in which critics such as Heraclitus and Cornutus used allegorical interpretation of poetry and mythology. By contrast, Epicurus appears to have rejected the idea that poetry could have any value as a means of instruction, although he was prepared to accept that it could be a source of pleasure.

In the first century BCE, Philodemus, an Epicurean, wrote his important works *On Poems* and *On Music*, which survive only in fragmentary form in papyrus scrolls found at Herculaneum. Much of Philodemus's

work took the form of attacks on other critics and theorists. His own view was that poetry, and music, do not give pleasure by their sound alone. Music at this time was normally an accompaniment to poetry, and Philodemus holds that the value of music comes from the poetry that is performed with it, and the value of that poetry comes from the thought that it expresses; he also holds that form and content go closely together and that a poem cannot be good in thought but bad in composition.

Although Philodemus influenced the Roman poets Virgil and Horace, Epicurean views remained outside the mainstream of thinking about the arts in the first century BCE and the first century CE. Many educated writers of this period combine together ideas from more than one philosophical school. In both Cicero (*Orator* 8) and Seneca (*Letters* 58 and 65) we find an important new idea about the metaphysical status of works of art. Both these writers suggest that rather than merely imitating objects in the physical world, which are themselves copies of transcendent Forms, the artist looks to ideas in his own mind, which are themselves reflections of the Platonic Forms, understood by the Platonists of this period as the thoughts of God. The Greek sculptor Phidias, famous for his statue of the supreme god, Zeus, is used as an example of an artist who worked in this way.

Throughout the Hellenistic and Roman periods there continued to be great interest in the moral effect of the arts and the role of the arts in education. Plutarch (c. 45–c. 120 CE) discusses poetry from a moral point of view in his *De audiendis poetis*, in a way that reflects the continuing influence of Plato's views. He is familiar with the idea that music can be used as psychological therapy and associates this with Pythagoreanism in *De Iside* 384A.

The Pythagoreans, as we saw earlier, were also credited with a mathematical approach to music. Ptolemy's *Harmonics*, written in the second century CE, contrasts Pythagorean and Aristoxenian views of music. Ptolemy agrees with the Pythagoreans that musical structures must be analyzed in mathematical terms but criticizes them for neglecting empirical, perceptual evidence.

Literary criticism in the Hellenistic and Roman periods was closely intertwined with the theory and practice of rhetoric. Writers such as Cicero and Quintilian discuss literary and aesthetic matters in the context of rhetorical education. The work *On the Sublime* attributed to Longinus, which probably dates from the first century CE, blends ideas drawn from the rhetorical tradition of literary criticism with ideas drawn from philosophy, particularly from Platonism. The work is unusual among surviving ancient works of literary criticism both because

the author develops the view that the best works of literature have an essential quality of sublimity that explains their enduring appeal and because he illustrates his view with detailed discussion of examples in a way that combines technical analysis with judgment of literary value.

LATE ANTIQUITY

Plotinus, writing in the third century CE, regarded himself as a Platonist but is now labeled rather a “Neoplatonist” because he elaborated a more complex metaphysics than previous Platonists, postulating a transcendent One beyond the realm of the Platonic Forms. In aesthetics, Plotinus combined the suggestion that the artist uses ideas in his own mind that directly reflect the Forms, already found in Cicero and Seneca, with the account of the ascent to the Form of Beauty offered in Plato’s *Symposium*. *Ennead* 1.6 begins by rejecting a Stoic account of beauty as symmetry of parts, arguing that incomposite things can also be beautiful and that they derive their beauty from a higher source. Plotinus then draws on Plato’s *Symposium* and *Phaedrus* to describe an ascent from physical beauty through moral and intellectual beauty to the Form itself, and ultimately to the One beyond the Form of Beauty. *Ennead* 1.6 has often been regarded as presenting an aesthetic theory, but we must recognize, first, that Plotinus is not talking just about “beauty” in the modern sense and, second, that his theory implies that beauty in the physical world is to be valued only insofar as it leads us to a higher realm. As noted at the beginning of this entry, the Greek word *kalos*, standardly translated as “beautiful,” is a very general value term. It would be a mistake to say that Plotinus is aestheticizing morality when, like the Stoics and Plato before him, he describes moral virtue as *kalos*; it would be more correct to say that, like most ancient thinkers, he makes no distinction between aesthetic and moral value. It is also important to recognize that for Plotinus our ultimate goal is union with the One; intellectual contemplation is the next best thing, and appreciation of beauty is only a means to achieving these goals, not something valued for its own sake.

Plotinus says little or nothing about art in *Ennead* 1.6, but in *Ennead* 5.8.1 he combines the view of beauty found in 1.6 with the suggestion that the artist can imitate the Forms directly, using principles in his own mind that derive from the Forms. He uses the standard example of Phidias’s statue of Zeus and suggests, very politely, that Plato’s argument in *Republic* 10 is mistaken in representing works of art as imitating only objects in nature. According to Plotinus’s argument, art itself is superior to

its products, and he moves on in the rest of 5.8 to discuss the intellectual beauty of the world of Forms.

Although Plotinus himself shows only limited interest in the arts, his view of beauty led to important developments in poetic and musical theory. His views were applied to poetry by the later Neoplatonist Proclus, in the fifth century CE. In his *Commentary on the Republic*, Proclus argues that much of Homer’s poetry is not after all vulnerable to Plato’s criticisms, since it is not mimetic but inspired. Just as Phidias’s Zeus, for both Plotinus and Proclus, portrays the god, capturing something of divine beauty in the statue we see, so Homeric poetry conveys truths about the divine world of Neoplatonic metaphysics. In order to maintain this view of Homer, Proclus resorts to allegorical interpretation of episodes criticized by Plato, drawing on a long tradition of such interpretation by Stoics and others.

Proclus and other later Neoplatonists also devoted attention to music. On the one hand, they integrated traditional views about the effect of music on the emotions into their philosophical system. On the other, they regarded music as one of the mathematical sciences, following a Pythagorean rather than an Aristoxenian approach. They perceived the same mathematical patterns in music as in the physical universe, believing that the beauty of such perceptible order derived from the ordered structure of the intelligible world. The *Institutio musica* of Boethius (c. 480–c. 524 CE), written in Latin, draws heavily on these ideas.

ANCIENT SKEPTICISM

Tradition recognizes two schools of ancient skepticism: the Academics and the Pyrrhonists. The ancient Greek term “skeptik” was used by the Pyrrhonists to describe themselves. They denied that it described the Academics, but this point could be and was disputed, and later in antiquity the word may have been used as a common designation for both schools. Our use of the term in this way goes back to the seventeenth century.

The term itself is derived from a verb in common use meaning “to inquire” or “to investigate”—hence the skeptic as inquirer. This is a surprise. We take skepticism, roughly speaking, to imply a denial of the possibility of knowledge. Yet Sextus Empiricus, the second-century CE Pyrrhonist—and the only member of the school whose works have survived intact and in bulk—is quite firm on this point. In the opening chapter of his *Outlines of Pyrrhonism*, he distinguishes three types of philosophers: those who take themselves to have discovered the truth, those who hold that it cannot be apprehended, and those who persist in inquiring. Philosophers of the first type he calls “dogmatists,” members of the last group “skeptics,” and those of the middle tendency “Academics.”

This is unfair. Even Academics like Philo of Larissa, who did hold that nothing can be apprehended, did not conclude from this that inquiry was pointless. Though they held that certain knowledge was unobtainable, they believed that it was possible to identify views that enjoyed a high degree of probability or verisimilitude—among them, the view that nothing can be known for certain—and they regarded inquiry for the sake of such discoveries as eminently worthwhile. What is more, Academics like Carneades and Clitomachus were no more convinced that nothing can be known than the Pyrrhonists, and they and deserved to be described as inquirers at least as much.

These facts only add to the puzzle, however. If not only the Pyrrhonists but also many Academics were skeptics in Sextus’s sense, why the persistent tendency, beginning with the ancient skeptics’ own contemporaries, to equate skepticism with one of the positions that Sextus expressly opposes to it? And why should a dedication to inquiry set the skeptics apart from members of other schools? Philo of Alexandria, who was active in the first century CE, was able to use the term “skeptikos” (in the sense of “inquirer”) of philosophers quite generally.

Sextus’s idea seems to be this: Inquiry into a particular question comes to a natural end either when the question that set the inquiry in train is resolved or when it becomes plain that it cannot be resolved. Absent either outcome, further inquiry is indicated. Dogmatists take themselves to have brought many inquiries to a successful conclusion in the first way. Negative dogmatists, or dogmatic skeptics as we may also call them, have satisfied themselves that the questions are beyond resolution. By contrast, skeptics, properly so called, find that question after question remains open and hence calls for further inquiry. On their view, dogmatists of both the positive and negative variety were guilty of calling off their inquiries prematurely. And the fault about which ancient

skeptics complain most frequently is rashness or precipitate judgment.

The condition in which skeptics find themselves regarding the questions they investigate resembles that of negative dogmatists or dogmatic skeptics in being one of not knowing. But those who saw Academics and Pyrrhonists as skeptics in the modern sense were not simply confusing the condition of the inquirer with the dogmatic rejection of the possibility of knowledge. They were reacting to the fact that skeptics of both schools devoted far more time and energy to the case that nothing can be known than to arguments bearing on any other question.

The reason for this seems to be the following: It is possible to pursue unresolved inquiries into all sorts of questions without ever doubting that knowledge is, at least sometimes, achievable. But it is also possible to make the nature and possibility of knowledge an object of inquiry. If questions about knowledge remain stubbornly open, one of the things that one will not know, and that will require further study, is whether one can know at all; and from this central epistemological question the skeptical condition will spread to other inquiries, which can be brought to a conclusion only by justified claims to knowledge that the skeptic cannot make with confidence about anything. The inquiry into the possibility of knowledge remains open because of the persistent lack of satisfactory answers to the powerful arguments that knowledge is impossible. And ancient skeptics pursued the inquiry into the nature and possibility of knowledge chiefly by confronting the best theories of knowledge with these arguments.

Because the ancient skeptics consistently declined to make knowledge claims and constantly argued that nothing can be known, it is hardly surprising that outsiders took them to hold the position that nothing can be known and to hold it because they were convinced by the arguments they advanced in support of it. But if, in deference to tradition, we call this position the skeptical position and arguments supporting it skeptical arguments, for most ancient skeptics, being a skeptic was not a matter of holding the skeptical position in this traditional sense, and their reason for arguing skeptically was not to establish or defend the skeptical position. Rather, their skepticism was a matter of being unable to terminate the inquiries in which they were engaged—chiefly about the possibility of knowledge, but about the other matters as well.

PRECURSORS

The history of ancient Greek philosophy before the emergence of the main skeptical schools contains many figures who expressed doubts about the possibility of knowledge. Some of these were collected by skeptical Academics in order to provide themselves with a distinguished lineage.

Already in the sixth century BCE, the pre-Socratic philosopher Xenophanes composed some verses about the impossibility of human beings ever knowing for sure whether they had hit upon the truth or not. Perhaps the most important pre-Socratic precursor of skepticism was Democritus, who observed that his theory of atomism, which he took to be based ultimately on the evidence of the senses, had the consequence that the senses were unreliable, since the colors and flavors with which they appear to put us in contact would have no real existence if he were correct. It was characteristic of Academic argument especially, but also of many Pyrrhonian arguments, to proceed in the same way by deducing consequences imperiling the possibility of knowledge from dogmatic theories about knowledge. Though we are not well informed about the details, it is clear that a tradition calling the possibility of knowledge into question arose among philosophers influenced by Democritus. They include Metrodorus of Chios (fourth century BCE), whose work on nature begins, “None of us knows anything, not even this, whether we know or do not know,” and Pyrrho of Elis (circa 365–275 BCE), who is traditionally, though probably wrongly, viewed as the founder of the school which bears his name.

Unsurprisingly, skeptical Academics in search of illustrious antecedents appealed to the example of Socrates, who was the teacher of the Academy’s founder, Plato, and well known for claiming that he knew nothing except perhaps that he knew nothing. This was Socrates’ explanation for the pronouncement of the oracle in Delphi that he was the wisest man in Greece. The wisdom that set him apart from others, he conjectured, could only be his recognition that he lacked knowledge, whereas others, who were no more knowledgeable, deluded themselves and others into believing that they had knowledge.

Academic skeptics were inspired by at least two other characteristics of Socrates. First, though he set the highest possible value on knowledge and devoted his life to the pursuit of wisdom, Socrates lived an exemplary life without having attained it, thus providing the Academic skeptics with a model of the life they took themselves to be leading. Second, Socrates was a master of dialectic. A dialectical argument involves two parties: a questioner and an answerer. The answerer commits himself to a the-

sis, which it is his task to defend. The questioner aims to construct an argument to the contradictory of the answerer's thesis from grounds acceptable to the answerer, and he poses his questions with this end in view. When the questioner succeeds, it is through an argument all of whose premises have been conceded by the answerer. The answerer is thereby shown to lack the kind of understanding of the subject under discussion that Socrates' interlocutors typically claimed. The dialectical inquiry thus exposes problems inherent in the answerer's position or his defense of it or both. Since this kind of refutation can be accomplished by a questioner with no independent knowledge of the matters in contention, dialectical argument recommended itself to committed inquirers like Socrates, and it became the principal method of the Academic skeptics, who drew their inspiration from him.

Attempts were also made in the Academy to interpret Plato as a skeptic. The argument is based on his many expressions of caution and his manifest willingness in the dialogues to raise difficulties without resolving them. Whatever the merits of this claim, questions about the possibility of knowledge were not as prominent among Socrates' and Plato's concerns as they were among those of the Academics and Pyrrhonians.

Although book 9 of Diogenes Laertius's *Lives and Opinions of Eminent Philosophers* (the fullest treatment of Pyrrhonism apart from Sextus Empiricus) includes a list of Pyrrhonists extending from Pyrrho to Sextus and beyond, the first part of it is almost certainly a construction. Pyrrho should probably not be viewed as the founder of a skeptical school. The modern scholarly consensus is that the Pyrrhonian school was founded in the first century BCE by Aenesidemus, who appears to have been an Academic dissatisfied with what he saw as the drift to dogmatism in the Academy of his time. He and his followers seem to have turned to Pyrrho in an effort to create an alternative history of skepticism that would make his school the legitimate heir of an older skeptical tradition.

Pyrrho wrote nothing but made a strong impression on his contemporaries, at least as much through his character as through his teachings. Figures with no sympathy for the positions he is thought to have held praised his imperturbability, lack of conceit, and tranquility. His views are elusive, however. Cicero seems to have known of him only as a moralist. He grouped Pyrrho together with figures like the heterodox Stoic Aristo of Chios (third century BCE). Such thinkers, he maintains, by making virtue the sole human good, fail to supply it with an

object outside itself and so produce ethical theories incapable of furnishing practical guidance. The poet Timon of Phlius (c. 325–c. 238 BCE) became a follower of Pyrrho, whom he celebrated in a number of works that were probably the later Pyrrhonists' principal source of information about Pyrrho.

There was enough of an affinity between Pyrrho and Arcesilaus, the school leader of the Academy responsible for its skeptical turn, for their relationship to be the subject of a satirical verse by Aristo. Later on the characteristics of the Pyrrhonian school were imputed to Pyrrho. But whether and in what way Pyrrho was himself a skeptic remains subject to controversy. The most complete surviving account of his views is a late antique quotation of a first century CE citation of Timon. According to it, Pyrrho maintained that "things are equally indifferent, unmeasurable, and undecidable," and he went on to say that "neither our perceptions nor our opinions are true or false." According to one school of interpretation, the first claim is best viewed as an epistemological thesis that Pyrrho deduced from the second, which, on this view, is an assertion about the apparent impossibility of distinguishing true from false beliefs. This interpretation would make him a skeptic, albeit probably a dogmatic one. But others have argued that the claim that "things are equally indifferent, unmeasurable, and undecidable" is a metaphysical thesis about the nature of reality from which Pyrrho inferred that perceptions and opinions cannot be true or false. In any case, he maintained that the proper response was to be without opinion, and he claimed that the result for those who attain this condition is tranquility.

ACADEMIC SKEPTICISM

Arcesilaus (316/15–241/40 BCE) became the fifth head of the Academy after Plato and was responsible for the school's turn to skepticism. To mark this change in outlook, later ancient writers speak of Arcesilaus as the founder of the New Academy as opposed to the Old Academy of Plato and his earliest successors; sometimes the Academy of Arcesilaus and his successors is called the Middle or Second Academy to distinguish it from the New or Third Academy of Carneades and his followers. (None of these distinctions corresponds to changes in the Academy as an institution.)

Like Socrates, Arcesilaus wrote nothing but was distinguished by his mastery of dialectic in face-to-face conversation. Rather than expound or defend views of his own, he would let his interlocutors put forward a view that he would then subject to dialectical examination. His decision to make Stoic epistemology the principal object

of his inquiries exerted a decisive influence on the subsequent history of ancient skepticism.

The Stoics took wisdom to mean a firm grasp of the truth, entirely free from error. They maintained that, though exceedingly rare and difficult of attainment, wisdom was nevertheless within the power of human beings. The key concept in the Stoics' account of wisdom, what they called cognitive impressions—their criterion of truth—which they define as impressions “from what is, stamped and impressed in exact accordance with what is, and such as could not be from what is not.” In the paradigm case of perceptual impressions, this means that cognitive impressions arise in a way that ensures that they capture their objects with perfect accuracy, thus guaranteeing their truth, and at the same time impart to them a character that human beings can discern.

Assent to a cognitive impression is a cognition or apprehension, and, if further conditions are satisfied, it will qualify as knowledge. Assent to anything but a cognitive impression is opinion, and, according to the Stoics, the wise avoid error by remaining entirely free of opinion. Arcesilaus began the long Academic tradition of arguing that there are no cognitive impressions, which in the context of Stoic epistemology amounts to arguing that knowledge is impossible. He did this by arguing for indiscernibility—that is, he held that the character purportedly peculiar to cognitive impressions could also belong to impressions that did not arise in the required truth-guaranteeing way and were in fact false. His arguments were based as much as possible on considerations that the Stoics would have to acknowledge, either because they were drawn from Stoic theory or could be rejected only at a high cost in plausibility.

The idea that there are no cognitive impressions (“inapprehensibility” for short) was the first skeptical proposition with which the Academy came to be associated. The second, that it is incumbent on the wise to suspend judgment on all matters, Arcesilaus deduced from the first, along with the Stoic doctrine that wisdom is incompatible with opinion. Together they make up what we might call a skeptical position.

On a strictly dialectical interpretation of Arcesilaus's arguments, the conclusions he drew need tell us nothing about what views, if any, he held. The propositions that make up the skeptical position follow in the context of arguments dominated by Stoic assumptions about what is to count as knowledge and about the incompatibility of wisdom with opinion; these issues raise problems for the Stoics to solve. To be sure, Arcesilaus responded to Stoic arguments that action was impossible without assent, and

assent senseless in the absence of cognitive impressions, by defending the possibility of a life in which all judgment is suspended. But this argument may only have shown that the Stoics were not in a position to easily escape the difficulties raised by his first set of arguments. And the fact that his response to the Stoics was based so closely on their theory of action as to have no force outside this debate lends support to this suggestion.

It is clear, however, that Academics after Arcesilaus interpreted him as endorsing the skeptical propositions in a certain way. This was their own view, and they may have been right about Arcesilaus. Thus a skeptical stance or outlook arose in the Academy as a result of a dialectical dispute with the Stoa that was expressed by means of the skeptical propositions. But the Academic followers of Arcesilaus seem not to have subscribed to the skeptical propositions in the ordinary way. Instead, their situation is akin to that of the skeptics described by Sextus: They were not in a position to conclude the inquiry into the nature and possibility of knowledge or other inquiries dependent on its resolution. And it is this condition that they described in terms borrowed from their debate with the Stoa—inapprehensibility and suspension of judgment—not the condition of being convinced by the arguments on their side of the debate.

We know little about Arcesilaus's successors before Carneades. Carneades was another exceptionally gifted dialectician and nonwriter. It is likely that he supplemented and refined the arguments against cognitive impressions that he inherited from his predecessors, but his most distinctive contribution was his response to the Stoics' argument that without cognitive impressions and assent, action and life are impossible. Whereas Arcesilaus's response stayed very close to Stoic theory, Carneades's did not. Instead he seems to have worked out a full-blown theory of so-called probable impressions (*probabilis* was Cicero's Latin translation of the Greek *pithanos*, meaning *persuasive*). And he appealed to them to explain how life, even a life of wisdom, was possible without the perfectly secure foundation provided by cognitive impressions.

As Arcesilaus had done before him, Carneades defended the possibility of acting without assent. There is, he argued, a way of using or following probable impressions that does not amount to assent but is adequate for action and inquiry. But he also sometimes conceded that assent was essential in order to argue that even this concession did not vindicate Stoic claims about the cognitive impression. For, he suggested, it was permissible for the wise to form opinions by assenting to noncogni-

tive impressions, opinions held in the full consciousness that they were only opinions and might be wrong.

This line of argument is behind the view that Carneades relaxed or weakened the more militantly skeptical stance of Arcesilaus. But perhaps the new features of Carneades's arguments are part of a broadly dialectical form of argument. The Stoics believe their views should win acceptance not because they are theirs but because they do justice to common assumptions about human nature—its needs and the resources available to it—as no others can. The challenge that Carneades accepted, then, was to show that the ready availability of equally sound or even better alternatives ought to discourage a premature embrace of the Stoic position.

This posture makes it hard to know whether Carneades actually subscribed to any of the views he defended. And his students and successors interpreted him in different ways. Clitomachus, his student and eventual successor, held that one should suspend judgment and that this had been Carneades's view. Philo of Larissa, who succeeded Clitomachus, contended that Carneades believed that the wise were permitted to form opinions in the absence of cognitive impressions and that one of the probable views deserving assent was inapprehensibility. Philo was, then, a dogmatic skeptic, who championed one of the skeptical propositions simply because he was convinced by the arguments for it. There is an air of paradox about this position, but it must be remembered that he did not claim to know for certain that nothing can be known for certain, but rather that it was highly probable, which, if nothing can be known for certain, is the most that can be said for it.

PYRRHONISM

It seems to have been Philo of Larissa's dogmatic skepticism that moved Aenesidemus to found or revive a competing school of Pyrrhonian skepticism in the first century BCE. The Pyrrhonian school he founded existed past the time of Sextus Empiricus, who is usually thought to have been active in the latter part of the second century CE. Although none of Aenesidemus's works have survived, a summary of eight books of his Pyrrhonian Arguments by Photius (ninth century CE) has. From it we learn that Aenesidemus, who had been an Academic himself, charged the Academics of his time with being little more than Stoics fighting Stoics, disagreeing only about cognitive impressions while agreeing about many other issues. Though the decision by Aenesidemus and his followers to call themselves "Pyrrhonists" does not imply a direct line of descent from Pyrrho, it is probable

that they were influenced by traditions about Pyrrho. Another important influence came from the Empirical school of medicine, with which Pyrrhonism maintained close ties and shared many members including Sextus Empiricus (whose name means "the Empiricist").

In view of the school's origins, it is not surprising to find many points of contact between it and Academic skepticism. The Pyrrhonists describe the skeptical condition with the aid of terms like "inapprehensibility" and "suspension of judgment," which have their origins in the epistemological debate between the Academy and the Stoa. They view this condition as the result of a standoff or impasse between their arguments and those of their dogmatic opponents, not as the result of being convinced by their own skeptical arguments. And they explain that they are able to act and to live despite suspending judgment on all questions. This argument hinges on a distinction between two senses of "belief" (Greek: *dogma*) that is indebted to Carneades's and Clitomachus's contrast between assenting to an impression and using or following it. In the former sense, the Pyrrhonists had no beliefs, but in the latter sense they did have beliefs, which were able to serve as a basis for action. The two works of Sextus that have come down to us, the *Outlines of Pyrrhonism* in three books and *Against the Mathematicians* in nine, are packed with arguments against dogmatic positions, many of which are of Academic origin.

There are, however, equally notable differences between the two schools, some of which may reflect other influences on Aenesidemus and his followers. The most striking and important of these is the positive value the Pyrrhonists seem to attach to the skeptical suspension of judgment about all matters. According to Sextus, Pyrrhonism has a *telos*, a supreme aim or goal in life: tranquility (and, where that is unattainable, moderation in one's emotions). Suspension of judgment is recommended because it gives rise to tranquility. This recommendation is not based on a theory of human nature that would explain why it finds fulfillment in tranquility. Rather the argument seems to presupposed that tranquility is humans' goal. This assumption commands greater credibility if viewed not as a claim about the essential nature of the best life for human beings, which would elicit vehement disagreement from some ancient philosophical schools, but as a weaker claim that such a life will somehow involve tranquility. And the Pyrrhonists do not pretend to be able to explain why suspension of judgment should give rise to tranquility; they claim to have made this discovery only by accident. Tranquility is supposed to arise in a manner exemplified by the famous story of

Apelles the painter, who, despairing of being able paint the foam on the neck of a racing horse, gave up and threw his sponge at the painting, thereby producing by chance what he had been unable to achieve deliberately.

The idea of a correlation between freedom from opinion and tranquility may have been the Pyrrhonian school's truest debt to Pyrrho. This idea sets it clearly apart from the Academy. The Academy attached the highest value to knowledge and regarded the skeptical condition as a stop-gap, albeit a surprisingly congenial one. As we have seen, the Pyrrhonists were officially committed to the quest for knowledge. But the accounts of Pyrrhonism in Sextus and Diogenes Laertius give evidence of a positive attachment to suspending judgment as a means to tranquility. Arguments and argumentative strategies are recommended for their efficacy in bringing about equipollence, the condition in which arguments on either side of a question are of apparently equal force; and equipollence is cultivated not as a means to cognitive certainty but to the suspension of judgment that leads to tranquility. Thus there is a sense in which Academics like Arcesilaus and Carneades exemplified true "skepticism," in the sense of open-minded inquiry, more than the Pyrrhonists did.

There is also a difference in the kinds of arguments the two schools used. Sextus and our other sources give pride of place to the so-called modes or tropes of argument that bring about suspension of judgment. There is a set of ten such tropes, which seem to go back to Aenesidemus, and a later set of five ascribed to Agrippa, who may, however, be a fictional character in a Pyrrhonian work. (There is also a set of two tropes, and a further set of eight tropes concerning causal explanation, which is likewise credited to Aenesidemus). The ten tropes appear to be the oldest, and they draw on arguments and examples with a long history. Book Gamma of Aristotle's *Metaphysics* is already familiar, with arguments resembling those in the ten tropes. Most of the ten aim to demonstrate that there are undecidable conflicts between the appearances perceived by different species or different human beings or the different senses or by the same human being in different conditions or between the appearances presented by objects in different circumstances. The existence of such conflicts is illustrated by a wealth of examples, some of them fanciful. Left unclear are the exact arguments envisaged and how they relate to the official program, which calls for the production of equipollence by the balancing of arguments. The tropes seemingly aim to elicit from these conflicting appearances a thesis of undecidability that requires suspension

of judgment. That is, it appears as though undecidability arises from an argument whose premises would command the assent of the skeptic. But perhaps the arguments for the undecidability of conflicts are meant to oppose arguments that they are decidable, and it is the equipollence between these arguments that is supposed to lead to suspension of judgment.

Even so, by comparison with Academic arguments, and with the arguments found elsewhere in Sextus, the trope-based arguments appear somewhat naive. Substantial assumptions about species, perceptual faculties, and the requisite conditions for the acceptance of an impression as true enter the argument without being marked as dialectical concessions or without comment of any kind about their status. Perhaps the material collected in the ten tropes arose from traditions of dogmatic skeptical thinking outside the Academy and maybe even from Pyrrho himself. There is a problem with the trope of relativity, which may suggest a similar conclusion about origins. According to this trope, since all things are relative, we must suspend judgment about their real natures. Though Sextus makes an attempt to correct for this, the conclusion of this argument is not, properly speaking, skeptical.

The five Agrippan modes are (i) disagreement, (ii) regress to infinity, (iii) relativity, (iv) hypothesis, and (v) circularity. Except for relativity, they form a system by means of which dogmatic attempts to justify a disputed claim can be counteracted. Any claim put forward invites disagreement. Further claims enlisted in support of it will lead to an infinite regress, by requiring justification themselves, unless the process is brought to an arbitrary halt with a hypothesis or the justification depends on the originally disputed claim. To judge from the enormous mass of arguments preserved by Sextus, neither set of tropes consistently guided the Pyrrhonists as they collected and composed arguments to further their skeptical purposes.

James Allen (2005)

ANDERSON, JOHN (1893–1962)

John Anderson, the Scottish-born Australian philosopher, was the son of a politically radical headmaster. Born at Stonehouse, Lanarkshire, and educated at Hamilton Academy and at the University of Glasgow, which he entered in 1911, he was at first principally interested in mathematics and physics; he turned to philosophy partly under the influence of his brother William, then a lecturer at Glasgow and later professor of philosophy at Auckland University College, New Zealand. Anderson graduated with an M.A. in 1917, with first-class honors both in the school of philosophy and in the school of mathematics and natural philosophy (physics). He lectured at Cardiff (1918–1919), Glasgow (1919–1920), and Edinburgh (1920–1927) before accepting an appointment in 1927 as professor of philosophy at the University of Sydney, Australia. He remained there, except for a visit to Scotland and the United States in 1938, until his retirement in 1958. He had almost no personal contact with philosophers in England, a country he regarded with the suspicion characteristic of a Scottish radical.

Anderson's career as a professor was an unusually stormy one. He attacked whatever he took to encourage an attitude of servility—and this included such diversified enemies as Christianity, social welfare work, professional patriotism, censorship, educational reform of a utilitarian sort, and communism. For a time he was closely associated with the Communist Party, seeing in it the party of independence and enterprise, but he broke with it in the early 1930s. His passionate concern for independence and his rejection of any theory of "natural subordination" were characteristic of his whole outlook—political, logical, metaphysical, ethical, and scientific. Attempts were made to silence him and even to remove him from his professorship; he was subjected to legislative censure and clerical condemnation. In the debates that these attacks provoked, he spoke out forcibly and fearlessly in defense of free speech and university autonomy.

METAPHYSICS AND EPISTEMOLOGY

Anderson was trained at Glasgow as an Absolute Idealist. However, he soon abandoned Idealism, influenced by William James, whom he studied very closely, G. E. Moore, Bertrand Russell, the American "new realists," and, most significantly, Samuel Alexander, whose Gifford Lectures on *Space, Time and Deity* he attended in Glasgow in 1916–1918. James and Alexander taught him that

it was possible to reject absolute idealism without, like Russell, reverting to a modified version of traditional British empiricism. Anderson set out to show that continuity, stressed by absolute idealists, and distinction, stressed by empiricists, are equally real and equally involved in every experience. In experience, he argued, we encounter neither an undifferentiated continuum nor isolated sense data; our experience is of complex states of affairs, or “propositions,” understood not as sentences, but as what true utterances assert to be the case. These propositions do not mediate between ourselves and reality; to take that view, Anderson argued, is to leave us in a state of invincible ignorance about this supposed “reality.” To be real simply is to be “propositional,” that is, to be a thing of a certain description, or, in Anderson’s view, a complex of activities in a spatiotemporal region.

Unlike many of his British contemporaries, Anderson was by no means opposed to the use of philosophical labels; he was prepared to describe himself as an empiricist, a realist, a pluralist, a determinist, a materialist, or a positivist—but always in a somewhat individual sense. For example, although he insisted that he was an empiricist, he rejected what is usually taken to be the most characteristic doctrine of empiricism—that our experience is of “impressions” or “sense data.” For Anderson, empiricism consisted in the rejection of the view that there is anything “higher” or “lower” than complex states of affairs as we encounter them in everyday experience; he rejected ultimates of every sort, whether in the form of ultimate wholes, like Francis Herbert Bradley’s Absolute, or ultimate units, such as “sense data” or “atomic propositions.”

Similarly, although he agreed with positivists in their opposition to metaphysics, when it is understood as the revelation of realities “beyond facts,” he shared neither the positivist hostility to traditional philosophy as such, nor its conception of experience as consisting in “having sensations,” nor its interpretation of logic and mathematics as calculi. He was a realist, insofar as he argued that what we perceive exists independently of our perceiving it; but he forcibly criticized the phenomenalism characteristic of so many twentieth-century realists. He described himself as a pluralist, but whereas classical pluralism had defended the thesis that there is a plurality of ultimate simples, everything, for Anderson, is complex. No state of affairs is analyzable into just so many ingredients—whether in the form of sense data or of abstract qualities. Pluralities, in his view, consist of pluralities, not of simples. For the same reason he was not a determinist in the classical sense, because for him no description of a

situation was ever complete; his determinism consisted only in his holding that there are sufficient and necessary conditions for the occurrence of any state of affairs. Finally, his materialism did not incorporate the classical conception of matter; what is essential to his view is the idea that every state of affairs is describable in terms of physical laws—which does not exclude its also being describable in terms of biological, psychological, or sociological laws.

The arguments by which Anderson attempted to establish his philosophical conclusions were manifold and diverse. What was perhaps his fundamental argument can be put thus: As soon as we try to describe “ultimate” entities or offer any account of their relation to those “contingent” entities whose existence and behavior they are supposed to explain, we find ourselves obliged, by the very nature of the case, to treat the alleged “ultimates” as possessing such-and-such properties as a “mere matter-of-fact.” The metaphysician either sees his ultimate entities vanish into emptiness—like John Locke’s “substance”—or else he is forced to admit that they exhibit precisely the logical characteristics which were supposed to indicate that a thing is not ultimate.

The emptiness of ultimates, Anderson thought, is often disguised by the fact that they are defined in wholly relational terms—as when, for example, substance is defined as “that which underlies qualities,” or a sense datum as “that which is an object of immediate perception.” Anderson attacked this procedure as “relativism,” that is, as the attempt to think of an entity or a quality as being wholly constituted by its relation to something else. To be related, Anderson argued, an entity must be qualitatively describable; relational definitions, it follows, cannot be used to avoid the conclusion that the “ultimate,” if it exists at all, must itself be a thing of a certain description. According to Anderson, every state of affairs is “ultimate,” in the sense that it is something we have to take account of; but it is contingent, too, in the sense that there are circumstances in which it might not have come about. There is nothing whose nature is such that it must exist, but there is nothing, either, whose nature is exhausted by its relation to other states of affairs.

Particularly in Anderson’s lectures, through which his influence has been mainly exerted, such general considerations were supported by detailed analyses of specific philosophical theories. Although he was not, in a professional sense, a scholar, it was his habit both to develop his own views by way of a criticism of his predecessors and also to ascribe to those predecessors—espe-

cially perhaps to Heraclitus and to the Plato of the later dialogues—the views that he took to be correct.

LOGIC AND MATHEMATICS

Anderson's approach to philosophy was in some respects formal. He agreed with the Russell of *Our Knowledge of the External World* that logic is the essence of philosophy—if by this is meant that philosophical problems are to be settled by an analysis of propositions. But despite strong mathematical interests, he was only to a very limited degree influenced by Russell's mathematical logic. He worked out, and defended against Russell's criticisms, a reformulated version of the traditional formal logic, which he tried to show had a much greater range and power than its critics would allow to it. He related logic very closely to discussion: the conception of an "issue," of what is before a group for consideration, bulks very large in his logic. The issue, he thought, is always whether some kind of thing is of a certain description, and discussion consists in drawing attention to connections between such descriptions. Unless these connections actually hold, discussion falsifies unless it is actually the case, for example, that what one person brings forward as an objection is logically inconsistent with what another person has said. To point to logical relations, Anderson concluded, is to assert that something is the case, just as much as to draw attention to any other sort of relation.

He took a similar stand concerning mathematics, which, he argued, can be applied to the world only in virtue of the fact that it describes that world. "Application," in Anderson's view, consists in drawing conclusions from what is being applied. If mathematics offered no description of the world, no application of it could describe the world.

He did not, however, agree with John Stuart Mill that mathematical propositions are "inductions from experience." He was a vigorous critic of induction. If, as traditional empiricists had assumed, all our experience is of "pure particulars," then, according to Anderson we would not have the slightest ground for believing in—we could not even conceive the possibility of—general connections. But, in fact, the least we can be acquainted with is not a bare particular but a particular state of affairs; from the very beginning, generality is an ingredient of our experience. We can recognize directly that, say, fire burns, although we can be mistaken in this as in any other of our beliefs; for to "recognize" is nothing more or less than to hold a belief.

AESTHETICS, ETHICS, AND POLITICAL PHILOSOPHY

Although even in his aesthetic, ethical, and political writings, Anderson was constantly concerned to make formal points—as, for example, that the definition of good as "that whose nature it is to be an end" exhibits the vice of "relativism"—yet he was also a good deal influenced by, and deeply concerned with, the issues raised by economists like Alfred Marshall, social theorists like Karl Marx and Georges Sorel, critics like Matthew Arnold, psychologists like Sigmund Freud, and novelists like James Joyce and Fëdor Mikhailovich Dostoevsky. His aesthetic, ethical, and political writings conjoin the logical and the concrete; in virtue of this fact he has influenced many Australian intellectuals who would not accept his formal analyses.

In his aesthetics, Anderson argued that the beauty of works of art is independent of the observer; and similarly in ethics, that acts are good or bad in themselves. He was influenced by Moore's *Principia Ethica* but critical of Moore's attempt to treat "good" as being a simple and indefinable quality and at the same time to define it as "that which ought to be," and thus a quality. Anderson took "good" to be a predicate of certain forms of mental activity—the spirit of inquiry, love, courage, artistic creation, and appreciation—and tried to work out a theory of the connection and distinction between these different forms of activity.

In his political theory, Anderson attacked, on the one hand, the view that human society has a single "good" to which all activity ought to be subordinated, and, on the other hand, the doctrine that it is a set of contractual relations between individuals. Society, as he saw it, is a complex of complex institutions, of which the state is only one. A community flourishes when this fact is fully realized, when no attempt is made to enforce uniformity upon these diverse competing and cooperating types of institutions. The attempt to achieve absolute security by social planning, Anderson held, is doomed to failure and is stultifying in its effects in society.

INFLUENCE. Anderson's ideas were presented in a series of articles, mainly in the *Australasian Journal of Philosophy*, and in his influential lectures at the University of Sydney, where he founded what has been described as "the only indigenous school of philosophy in Australia." Among those philosophers who have, in varying degrees, felt his influence, the best known are D. M. Armstrong, A. J. Baker, Eugene Kamenka, J. L. Mackie, P. H. Partridge, and J. A. Passmore.

Bibliography

Anderson's principal contributions to periodicals, together with two previously unpublished papers, have been brought together as *Studies in Empirical Philosophy* (Sydney: Angus and Robertson, 1962), with an introduction by J. A. Passmore, which contains a full bibliography. For further information, see Gilbert Ryle, "Logic and Professor Anderson," in *Australian Journal of Philosophy* 28 (3) (1950): 137–153; J. L. Mackie, "The Philosophy of John Anderson," in *Australian Journal of Philosophy* 40 (3) (1962): 264–281; J. A. Passmore, "Philosophy in Australia," in *Australian Culture* (Ithaca, NY: Cornell University Press, 1963).

John Passmore (1967)

ANDŌ SHŌEKI

Andō Shōeki was a critical thinker in the Tokugawa period of Japan. All that is known of his life is that he was born in Akita toward the end of the seventeenth century and died in the second half of the eighteenth century, that his profession was medicine, and that he went to Nagasaki, the first Japanese port to receive Western trade, where he learned about conditions in foreign countries. He is described as a man of stern character who in his teaching never quoted, except to criticize, the Chinese classical books, meaning that he followed only his own ideas, a very unorthodox way of teaching for Tokugawa Confucianists. Very fond of the peasant class, he insisted that his pupils, and he had very few, should do manual work to be in contact with nature, the greatest master of all. Until recently he was virtually unknown, because of his nonconformist ideas, although nowadays he is overpraised. His manuscripts were found only in 1889, and only in part. They were published with difficulty. The better-known are *Shizen shin-eidō* (The way and activity of nature, written in 1755) and *Tōdō shinden* (A true account of the ruling of the way). They are the most devastating critique ever made of Tokugawa society and of every kind of Japanese ideology.

Andō's iconoclasm was directed first of all against Shintoism and Buddhism. He sharply attacked Shinto mythology and Prince Shōtoku (574–622) for his role in

spreading Buddhism. Other rulers, too, and priests of all sects came under his critical scrutiny, which is too negative. Nor had he a better appreciation of the different schools of Confucianism, for he accused them of perverting the teaching of the old sages in their interpretation of nature.

Nature for Andō is an eternal *ki*, or material energy, in perpetual motion. Nature is not to be conquered but to be known; and in following nature man attains the ideal. More positive were his ideas about society; he was the only genuine equalitarian of Tokugawa Japan, arguing against the evils of a system which oppressed the peasant. He cannot be considered completely iconoclastic, since he was not against authority as such, nor was he an atheist, and even his alleged materialism has to be qualified.

ANIMAL MIND

Mind is considered in terms of contents or processes or both. The term usually includes both conscious and unconscious events. In the case of the term *animal mind*, there is intense scientific and philosophical disagreement as to whether animal minds are unconscious or can include conscious events as well. In particular, even among scientists who may accede to the possibility of animal consciousness, there is great reluctance to consider the issue as amenable to scientific study. Donald R. Griffin is a particularly notable exception, who has made the issue a focus of his scientific attention.

OVERVIEW OF PHILOSOPHICAL AND SCIENTIFIC HISTORY

Concerns that still strongly engage philosophers and psychologists to this day were raised by the opposing ideas of John Locke (1632–1704) and Rene Descartes (1596–1650). In Locke's accounting, the elements of mind are ideas. Ideas are written by experience onto the blank slate

of the mind, the *tabula rasa* first proposed by Aristotle. Descartes claimed that ideas are innate.

Locke considered that human's ideas are created through sensations; furthermore human minds can reflect upon their ideas. According to Locke, an automatic process of association is an essential mechanism in the linkage between ideas. Descartes, too, proposed automatic, mechanistic connections to explain the mind and behavior of animals and much of humans'. Descartes emphasized automatic reflexes, which are connections between stimulating sensations of the external world and the organism's response to those sensations. For humans, Descartes proposed a mediating influence that could be exerted on reflexes by the soul operating through the brain. These views of Locke and Descartes strongly determined the field of experimental psychology; the reflex and the process of association formed the basis of the phenomenon of classical conditioning.

Both Locke's and Descartes's ideas impacted directly on the study of animal mind. Descartes had claimed that man has a soul, while animals do not; they are mere automata. Humans too have automatic processes, but humans are conscious, feel pain, and experience pleasure, while animals do not. Locke considered animals to have memory and to be capable of simple cognitive processes, including simple reasoning. They lack, however, the capacity to manipulate their ideas, to reflect upon them, as humans can. Essentially, "Brutes abstract not" (Locke 1690, website, p. 31).

With the advent of Charles Darwin's theory of evolution, the proposed continuity between humans and animals promoted a search for animal abilities that were precursors of human abilities. Darwin's *The Expression of Emotions in Man and Animals* (1872) not only proposed that animals experience emotions, but that, indeed, the expression of human emotion is in many ways similar to and derivative from that of certain other species, particularly nonhuman primates. At about that time, George Romanes (1882) compiled numerous examples of animal intelligence; the range of presumed capacities startled the public and scientists were criticized. The criticism, especially in later decades, decried the anecdotal nature of many observations and stressed the need for experimental verification. These issues continue to trouble the adequate documentation of observed instances of intelligent behavior, which would most plausibly be revealed in single, unique instances as an organism attempts to deal with a novel situation.

In the 1920s, Ivan Pavlov's study of digestion in dogs led him to discover that the dogs learned to anticipate the

arrival of food via signals in the environment, such as his entry into the room. Evidence was the dogs salivating well before food was in their mouths. Pavlov's many subsequent detailed studies revealed underlying laws of classical conditioning.

The behavioristic approach was further espoused by James Watson and then by B. F. Skinner. They argued that private mental states cannot be the subject matter of science, only public events can be. Concentration was on learned behavior, reducible to stimulus-response units, which were subject to psychological laws. The laws of behavior were derivative of Locke's postulated process of association and, with the Pavlovian laws of classical conditioning, dominate experimental psychology even into the twenty-first century.

In a more cognitive approach, Edward Tolman's studies (1948) of rats learning their way through complicated mazes led him to propose that rats create a tentative, cognitive map indicating routes and environmental relationships, which determine the rats' responses. He struggled with the issue of behavioral indices of mental states. Of particular interest to him was specifying descriptive properties of a behavior to indicate that it is purposive. Tolman's views met with skepticism and interest in them faded until the concept of animals' cognitive maps was revived in an important book by John O'Keefe and Lynn Nadel (1978).

Griffin's influential book, *The Question of Animal Awareness* (1976), and his several subsequent books, reawakened both interest and controversy about animal awareness and thinking. His emphasis that animal awareness is an issue amenable to scientific study spurred investigations into animal cognitive capacities, both in the lab and the field.

Yet just what cognitive processes animal minds possess is controversial. Most contemporary experimental psychologists prefer to examine such processes without relevance to issues of consciousness. In an effort to create highly replicable experimental paradigms in controlled laboratory settings, the scientists can justifiably be strongly criticized for setting for their subjects very simplistic tasks, many of little or no relevance to the organism in its natural life, situating them in impoverished environments for rearing and testing (e.g. T- mazes or Skinner boxes/operant chambers) and for ignoring the contextual effects that are always part of the experimental conditions (e.g., as Pavlov had noted, the dogs in his study began salivating before his original digestion experiment had officially begun). Furthermore the subject of choice is most often the white rat, a genetically inbred

docile animal, which may well have lost some of the cognitive and other traits essential to survival in the complex, treacherous world of the wild rat.

In addition to psychologists, ethologists, in particular cognitive ethologists, also study animal minds. Cognitive ethology is a field established by Griffin, being the study of animals' mental experiences, particularly in the course of their daily lives in their natural environment. Data are gathered either from observations or experiments in the field, initial observations often forming the basis for creating the experimental investigations. Likewise some laboratory work has become more naturalistic, employing larger spaces and other means to simulate the organism's niche. Philosophers of science and of mind have shown interest in the field of cognitive ethology, and some, such as Daniel Dennett and Colin Allen, have collaborated in varying degrees with ethologists. Other very relevant contributions have been made, such as Ruth Millikan's (1984, 1995) analysis of natural functions and both Jonathan Bennett's (1989) and John Searle's (2000) considerations of intentionality, belief-desire systems, and consciousness.

CAPACITIES OF ANIMAL MIND

The aspects of animal mind include cognitive, emotional, moral, and communicative capacities and consciousness.

COGNITIVE CAPACITIES. By defining cognition very broadly, one can include the simplest processes, for example, habituation, found in fairly simple creatures such as the sea slug, *Aplysia*, to processes of abstraction, inference, and deception, credited to some primates and selected other species. (Habituation is a process whereby an organism decreases responding to a repeated stimulus.) In most psychological analyses, investigators assume that processes found at the lowest evolutionary levels are similarly to be found in any and all higher organisms (insofar as a hierarchical notion of evolution is appropriate). This is the model of experimental psychologists who conduct laboratory studies of white rats and pigeons.

However neurophysiological studies of simple organisms such as *Aplysia* and the mollusk *Hermissenda* do note different biochemical and neural mechanisms that may underlie similar psychological processes (e.g., classical conditioning at the cellular level). Ethologists, too, are quick to note species specific and niche specific behavioral traits, which often depend upon specialized sensory receptors. Without the capacity to detect certain information, there is no opportunity to develop advanced cognitive capacities dependent upon such information.

Thus bats can echo-locate and, thereby, in the dark navigate through obstacles and catch minute insects; dogs can follow faint odor trails of individuals; humans can do neither.

Psychologists would argue that the same basic psychological laws can be applied to different sensory systems, but there is mounting evidence against this interpretation. Rather than the laws of classical conditioning applying equally to all stimuli, evidence shows, for example, a bias for associating stimuli that are involved with ingestive systems. Thus, in laboratory experiments, rats tend to associate taste with apparent nausea (induced by X-rays) while visual and auditory stimuli are readily associated with painful exteroceptive stimuli. The latter biases are usually interpreted as associations most relevant in predatory-prey interactions and in other dangerous environmental events, as seen in work by John Garcia and R. A. Koelling (1966). Pigeons are biased to associate visual cues with X-ray induced illness; for the pigeon, vision is most essential in detecting their appropriate foods, such as grains. Simply put, organisms have evolved to readily learn which food associated stimuli make them ill, and thus are better able to avoid such. And further they can associate the stimuli with an illness occurring several hours later, contrary to assumed need for temporal contiguity.

In brief, all animal species, including some insects that have been studied, and probably even some single-celled animals, have been shown to be capable of at least the following: habituation, classical conditioning, and operant conditioning. But since the 1960s, important constraints on those basic processes have been recognized. Classical conditioning most simply refers to the learning process whereby a previously neutral stimulus (the conditioned stimulus or CS), when paired with a noxious or positive stimulus (the unconditioned stimulus or US), comes to elicit a response preparatory for or similar to that elicited by the US.

Since the 1960s important constraints on the basic learning processes have been recognized. Lab experiments showed that necessary conditions for classical conditioning were not merely those of temporal association as indicated by Locke and Pavlov. In addition, the CS had to have predictive value; thus if the US occurred too frequently not preceded by the CS, the CS was no longer predictive and much reduced conditioning occurred, if any (Rescorla 1966, 1988). These matters become of special significance when interpreting the overall cognitive abilities of animals: Are many processes most properly interpreted as simple, automatic, stamping in of associa-

tions, or should they be considered as expectancies and predictions that organisms hold about their world?

The same issues arise in considering operant conditioning, the strengthening of responses which are followed by reinforcement, or colloquially, rewards. This is basically the question: How do organisms learn how to behave in the world? Are the laws governing response learning automatic, generally applicable processes? Can animals learn behaviors without responding at all? An example might be the ability to form a cognitive map simply from observation. An early experiment had cats towed about in carts through a maze, so they never made responses to be reinforced; nevertheless the cats later could walk correctly through the maze. This may not seem surprising to many readers, but to psychologists intent on establishing simple, noncognitive, stimulus-response laws; this was anathema.

Animals are capable of many advanced abilities; certainly Locke was wrong in proclaiming, “Brutes abstract not.” Even lab pigeons can learn natural, humanmade or even arbitrary categories. Pigeons were trained to peck for food reward at various slides including: tree/non-trees, water/non-water, people/non-people, scenes with a particular person/scenes with other people or no people, the letter *A* in various fonts/other letters, fish/non-fish (a natural category but not one within a pigeon’s usual experience) and a random selection of fish versus non-fish versus another random collection of the same types. The pigeons succeeded at all these discriminations as indicated by differential pecking rates and were able to generalize appropriately to novel instances. Interestingly the birds took far longer to learn the arbitrary sets. And they were capable of correctly categorizing together such examples of water as a droplet or a pond.

Precisely what the pigeons were learning is open to question and beyond the scope of this limited survey. It has not been definitively demonstrated that the birds had formed concepts of tree and non-tree; they could have pecked upon detecting leafiness or trunkness; they could have refrained from pecking at various sub-groupings rather than non-tree. Numerous other studies do not resolve the issue to the satisfaction of all, though at least some species, particularly ravens, parrots, and great apes, can form concepts to criteria acceptable by very many researchers.

COGNITIVE MAPS. The study of cognitive maps in animals has produced evidence of impressive abilities. After training, pigeons shown a photograph with objects and food in it can go correctly to that location in a lab room.

Pigeons that have flown around a campus can, from an aerial photograph, learn to go to designated locations, including untrained sites (Honig 1991). In bird species that cache food for the winter, numerous experiments indicate that birds not only recall the placement of hidden seeds, but they recall better those seeds which they have hidden themselves. Experiments involving displaced landmarks indicate that rats and avian species studied use geometric information from their stored representations. Chimpanzees hide stones for later use as tools, and retrieve them using near optimal paths to do so. Succinctly put, pigeons, rats, and other species have been shown, with experimental evidence, to form concepts and cognitive maps, though the precise definitions of those terms is debated.

Animal knowledge of time presents a challenge to investigating scientists. There are many reports of animals returning at appropriate times to access regularly occurring food arrivals; the most notable may be the return of bees just before tea time each afternoon to the garden tea table of the famous bee scientist Karl von Frisch. Laboratory studies indicate that rats and pigeons can learn complicated schedules of responding for food, and can estimate time durations on the order of seconds very accurately.

But there are other aspects to the knowledge of time. As the philosopher Ludwig Wittgenstein noted when discussing Locke’s ideas, “We say a dog is afraid his master will beat him, but not, he is afraid his master will beat him tomorrow.” (Wittgenstein 1963, vol.1, p. 650). Relevant to this concern is research with scrub jays, a species that caches food for use at a later time; the work indicates use of elapsed time information in a fairly subtle way. According to the work of Nicola Clayton and colleagues (2003), these birds can discriminate and preferentially retrieve, depending on time elapsed since storage, either a preferred food (larvae) with a shorter time until decay or a less preferred food (peanuts), which lasts longer. Some of the ape cognition and language studies do include reports by apes of past occurrences, but those data do not appropriately tackle the issue of animal knowledge of time past, present, and future. In summary, by the current two-system hypothesis, both simple, automatic learning processes and more sophisticated cognitive skills are characteristic of both animals and humans.

MOTIVATIONAL, EMOTIONAL, AND MORAL CAPACITIES OF ANIMALS. These capacities have received far less investigation than have the cognitive. Motives and emotions have been studied in the laboratory and occa-

sionally in the field (Robert Sapolsky), particularly in reference to possible practical applications to humans. Thus theoretical and neurophysiological/hormonal models have been proposed with regard to stress, addiction, learned helplessness, and depression. Experimental psychologists are in a dubious position, whereby some deny the possibility of animal consciousness or its scientific study, while others use animals as models for human emotions and motivations.

A possible evolutionary basis for morality reawakened research interest, beginning in the 1990s with neuroanatomical investigations and field studies. Apparent animal altruism has long intrigued scientists, resulting in theoretical models drawn, for example, from economic theorizing. Some suggest that the basis for human morality can be found in human's capacity for empathy, for understanding another's thoughts and feelings. Neurological studies confirm that merely viewing pictures of people injuring themselves, even stubbing their toes, activates some of the same brain regions that are engaged when people stub their own toes. Relevant animal research could be undertaken with potentially important results.

COMMUNICATION. Griffin suggests that animal communication may well serve as a window on animal minds, and thus provide evidence relevant to animal consciousness. Comparisons are frequently made to human linguistic communication, provoking agreement and controversy. To be discussed here are both natural and artificial communication systems.

Natural animal communication systems. Late-twentieth-century research has developed beyond the rigid stimulus-response model of classical ethology and the notion that at least some animal communication is merely a by-product of an internal state, what Griffin (1992) has termed the Groan of Pain (GOP) interpretation. Central issues now concern *what* is being communicated.

An important approach to communication by W. John Smith (1977) stresses an interactional, informational framework, which, however, has not received adequate attention. He notes that animals' signals by themselves do not provide sufficient information to enable recipients to choose appropriate responses. The context of the signal, including the roles of the specific interactants, their past history, and the environmental characteristics, all help determine meaning. This evaluation of information implies complex cognitive processes. In Smith's view, communication importantly allows

interactants to predict the other's behavior; he avoids use of intentional terms, but his analyses are indeed amenable to such.

Beginning with mere insects, one finds surprising complexity and versatility in the genetically based dance communication system of honeybees. It has been known since the time of von Frisch, from studies begun in the 1920s, that the figure eight shaped waggle dances that honeybees perform inside their darkened hive convey information about the distance, direction, and desirability of a food source, though many academic battles were fought until that information was accepted. Later research indicated the dances could convey the same information about a potential new hive location, even including site height. The dance itself seems able to persuade other dancers to change their steps, and sometimes a recipient will begin to dance about a new location, sight unseen.

Of particular interest in the continuing controversy about the distinctions between human and animal communication, is the fact that several investigations indicate that some species' signals appear to be referential, that is, the calls specify the type of predator that has been detected. The species include vervet monkeys that appear able to indicate their three major predator types: the martial eagle, the leopard or other large carnivore, and the python. Diana and Campbells monkeys likewise have two different alarm calls, one for each of their major aerial and ground predators. Even some lemurs, primitive primate-like creatures, have calls specific to raptors, as does a mongoose species.

Sometimes level of arousal is included in the information of these various species' calls. Prairie dog calls reputedly identify predator types, even conveying information about the intruder's color and size, but the research needs further verification. Note, however, that the term *alarm call* is controversial, for some scientists, such as Smith, emphasize the broader use of some such calls. Peter Marler and his colleagues (1986) have also investigated reference in alarm and other calls, emphasizing the role of the audience, both that present and that to which a call is directed, in determining if a signal is given and which signal is made. It is also the case that many scientists are very reluctant to accept referential use of a signal by a nonhuman animal.

Artificial communication systems. Scientists have also undertaken studies of communication in apes and other species using modified forms of human sign language, plastic chips, computerized geometric figures (lexigrams), and spoken words. It is beyond the scope of this

entry to discuss these investigations fully, but it should be noted that some of the chimpanzees can respond to and produce strings of words similarly to the behaviors of a two-and-one-half-year-old human. That is not to say that the understandings of the humans and other species are the same. Whether the units should properly be termed words and whether the behavior should be termed language use is hotly debated (Terrace 1979); linguists are the strongest dissenters.

However both apes and African Grey parrots can use the communication units to indicate the color, number, and shape of items, and can accomplish cognitive tasks such as indicating same-different. Some of the apes understand and use artificial units, while also appropriately responding to some spoken English words. Apes have been reported to use the lexigrams to express simple thoughts and emotional feelings (Ristau and Robbins 1982, Ristau 1991, Savage-Rumbaugh 1998, and others).

ANIMAL CONSCIOUSNESS. To study consciousness, it is first necessary to delineate possible levels or kinds of consciousness, a task for both psychologists and philosophers. Since the topic is beyond the scope of this entry, note at least that consciousness can refer most simply to perceptual consciousness or awareness of sensations and pain and in more complex states to consciousness of self through past, present and anticipated future and to metacognition, or thoughts about one's thoughts and knowing *that* one knows. Yet even at a primitive level, it is difficult to imagine that a sensing creature, infant or animal, does not in some way distinguish between an external world and that which belongs to itself—such as its own paw.

Griffin has suggested the following as kinds of evidence for consciousness:

- (1) An argument from evolution: Given that many other aspects of human structure and function are derived from those of other animal species, why should not consciousness likewise be part of the continuum?
- (2) An argument from neurology: No Consciousness producing neurological structure or process can be found in humans, but absent from nonhuman animals. On the contrary, similar electrical brain waves are correlated to apparently similarly psychological functions in both humans and animals.
- (3) As Griffin notes, "Appropriate responses to novel challenges for which the animal has not been prepared by genetic programming or previous experi-

ence provide suggestive evidence of animal consciousness because such versatility is most effectively organized by conscious thinking" (Griffin and Speck 2003, p. 5).

(4) Animal communication may well serve as a window to the minds of animals, revealing their subjective experiences, including intentions.

In his books and papers, Griffin (1976, 2001, 2003) reviews many experiments that provide evidence for consciousness. A few examples are noted. Beginning in the late 1970s, experiments examined the ability of chimpanzees to recognize themselves in a mirror (Gallup 1970). Children can do this after about eighteen months of age, but up to that time, they react socially to the mirror, interacting with their reflection as though it were another child. Chimpanzees also react socially, unless they have had extensive experience with mirrors. Results are mixed for other great apes, with controversial evidence from monkey species and no positive results from chickens and a myriad of other animals. Yet some monkey species, unable to recognize themselves by the mirror test, can nevertheless use a mirror to help them in a task with their otherwise unseen hand. Whatever the final evidence and interpretations, the mirror test can imply only some sense of the self as a body and not necessarily of the self as a mind, or as a self persisting from the past into the future.

A more limited claim, that rats can discriminate their own behaviors, derives from a task in which rats learned to push one of four different levers when a buzzer sounded, depending upon their own activity at the moment, for example, face washing, rearing, walking, or immobility (Beninger et al. 1974). Again interpretations of the results vary; for example, whether a rat is associating a particular lever with kinesthetic feedback from its behavior or whether a rat is indicating, "Now I am walking."

There is evidence that monkeys sometimes know what they know. As Griffin notes, "Consciously considering the contents of memory, in contrast to automatically using stored information, is a kind of metacognition, which many are still hesitant to infer in animals" (Griffin and Speck 2003, p. 13). Yet the ability to consciously consider uncertainties faced in nature is indeed an asset for an animal in a critical situation. In experiments investigating metacognition, monkeys had a choice of pressing one lever, thereby producing a less preferred food, or another lever requiring correct stimulus selection in order to receive a more preferred reward. Correct selection was difficult if monkeys had to delay their respond-

ing after seeing the stimulus they were to match. On such trials, the monkeys most often chose the less desirable reward, rather than take the test and quite likely get no reward. The author concludes that the monkeys can report the presence or absence of memory (Hampton 2001).

Creative tool making by crows, and indeed by other species, is another ability that strongly suggests conscious deliberation. There has long been considerable evidence of tool making by chimpanzees and orangutans, but less so for other species. New Caledonian crows studied in lab aviaries spontaneously used sticks to reach food in a clear cylinder, most often selecting sticks of the proper length. In other experiments, the crows selected a hooked wire, rather than a straight one to reach food most readily gained with a hook. When only a straight wire was available, the female crow, never having seen the process of wire bending, bent the wire herself to make a hook and thereby obtain the food.

Experiments have also been conducted in the field, suggesting purposeful, strategic behavior by the organisms involved. For example, Carolyn Ristau (1991) conducted experiments with piping plovers, birds that perform broken-wing or distraction displays at an intruder's approach to their nest/young. She suggested criteria for purposive behavior and found that the birds met such criteria. The plovers used the display correctly, so as to draw a human intruder away from the nest/young, positioning themselves in the intruder's front visual field. When plovers flew to reposition themselves before displaying, they went nearer the intruder and the center of the intruder's visual field. Plovers, even mid-display, monitored the intruders. Should the intruder not follow the birds' displays, the plovers modified their behaviors, re-approaching the intruder or increasing display intensity. Other experiments indicated the plovers' awareness of the direction of an intruder's attention, by becoming more aroused when a passing intruder looked toward their nest area in the dunes in contrast to looking towards the sea. Alexandra Horowitz (2002) has further developed Ristau's criteria for intentional behavior and has applied the ideas to dogs' interactive behavior.

In research by David Premack (1978, 1992), Daniel Povinelli (2000), Michael Tomasello (1997), and Frans de Waal (2003) and their colleagues, chimpanzees have been shown to be capable of complex problem solving and social understanding, sometimes interpreted as the ability to attribute and to understand other minds. Such abilities include determining the intentions of others, detecting, understanding and engaging in deception, and distin-

guishing between knowledge held by another in contrast to another's visual perception. Many aspects of these capacities seem reasonable evidence for consciousness.

In summary, though unresolved in the view of some, many behavioral scientists appear to be coming to agree that animals are conscious. The matter of proof of the content of mental states of any creature, human or otherwise, remains a philosophical problem. There simply are no incontrovertible means by which external behaviors, linguistic or otherwise, provide absolute proof of specific mental states. One can be certain only of one's own consciousness; this is the extreme version of the solipsistic position.

PHILOSOPHICAL IMPLICATIONS

The essential problem confronting the study of animal minds as conscious entities is that of solipsism. However, in order to survive in daily life, one cannot accept the solipsistic position. In science, one can at least recognize that to declare that animals are not conscious is not a neutral stance, but one that demands proof. As Griffin notes, the probability of awareness (pA) must be assumed to be 0.5, not 0.0. So the scientific task becomes one of accumulating evidence that shifts pA in either direction, noting that level of awareness for a particular task does not necessarily imply the organism's consciousness during another task.

PHILOSOPHICAL PROBLEMS. Several traditional philosophical lines of inquiry are to be considered in the study of animal mind, certainly the philosophy of science and of mind including the nature of scientific evidence, solipsism, nature of experience (e.g., *qualia*), intentionality and gradations of belief-desire systems, linguistic concerns, nature of a referent and of representation, nature of specific cognitive capacities, and defining levels of awareness/consciousness and at least suggestive evidence for each.

POTENTIAL ROLES FOR PHILOSOPHERS

In the past, philosophers were usually dismissive of the need for scientific data in pursuing philosophical problems. Fortunately, that attitude has changed. Philosophers cognizant of the data in their area of interest can play much needed roles in elucidating unidentified assumptions in scientists' work. They can suggest the kinds of data and experimental designs required to provide insight into mental states. Philosophical examinations of Kantian

and other concepts of space and time as relevant to animal minds would likewise be helpful.

But philosophers also need to accept real-world constraints on their thinking, prime among them being temporal: Organisms act in a time-limited world and often the most dangerous situations they face require making very rapid decisions. Thus organisms often operate using default mechanisms as well as more time-consuming, deliberative, or trial-and-error methods. Organisms, both animal and human, are often overloaded with information; thus simple heuristics must often suffice. Aware of constraints such as these, as well as the need to communicate effectively to those in other fields, philosophers' contributions to the understanding of animal mind can be outstanding.

Carolyn A. Ristau (2005)

ANIMAL RIGHTS AND WELFARE

Although all the major moral philosophers in the Western tradition have had something to say about the moral status of animals, they have commented infrequently and for the most part only in brief. This tradition of neglect changed dramatically during the last quarter of the twentieth century, when dozens of works in ethical theory, hundreds of professional essays, and more than a score of academic conferences were devoted to the moral foundations of human treatment of nonhuman animals.

Two main alternatives—animal welfare and animal rights—have come to be recognized. Animal welfarists accept the permissibility of human use of nonhuman animals as a food source and in biomedical research, for example, provided such use is carried out humanely. Animal rightists, by contrast, deny the permissibility of such use, however humanely it is done.

Differ though they do, both positions have much in common. For example, both reject Descartes's view that nonhuman animals are *automata*. Those animals raised for food and hunted in the wild have a subjective presence in the world; in addition to sharing sensory capacities with human beings, they experience pleasure and pain, satisfaction and frustration, and a variety of other mental states. There is a growing consensus that many nonhuman animals have a mind that, in Charles Darwin's words, differs from the human "in degree and not in kind."

Proponents of animal welfare and animal rights have different views about the moral significance of human psychological kinship with other animals. Animal welfarists have two options. First, they can argue that we ought to treat animals humanely because this will lead us to treat one another with greater kindness and less cru-

elty. On this view we have no duties to animals, only duties involving them; and all those duties involving them turn out to be, as Kant wrote, "indirect duties to Mankind" (Immanuel Kant, "Duties to Animals," in Regan and Singer, 1991, p. 23). Theorists as diverse as Kant, St. Thomas Aquinas, and John Rawls favor an indirect-duty account of the moral status of nonhuman animals.

Second, animal welfarists can maintain that some of our duties are owed directly to animals. This is the alternative favored by utilitarians, beginning with Jeremy Bentham and John Stuart Mill and culminating in the work of Peter Singer (1990). Animal pain and pleasure count morally in their own right, not only indirectly through the filter of the human interest in having humans treated better. The duty not to cause animals to suffer unnecessarily is a duty owed directly to animals.

Of the two options the latter seems the more reasonable. It is difficult to understand why the suffering of animals should count morally only if it leads to human suffering in the future. Imagine that a man sadistically tortures a dog and dies of a heart attack as a result of his physical exertion; what he does seems clearly wrong even though he does not live long enough to mistreat a human being. If this is true, then we have at least some direct duties to animals.

Animal welfarists who are utilitarians (Singer is the most notable example) use utilitarian theory to criticize how animals are treated in contemporary industries (animal agriculture and biomedical research, for example). For in these industries animals are made to suffer and, Singer alleges, to suffer unnecessarily.

Other animal welfarists who are utilitarians disagree. Government and industry leaders agree that some animals sometimes suffer in the course of being raised for food or used in biomedical research; but they deny that they are made to suffer unnecessarily.

Consider organ transplant research. Research on animals in this quarter involves transplanting some internal organ from one healthy animal to another; the "donor" animal, who is under anesthetic, is killed, but the "receiver" animal is permitted to recover and doubtless experiences no small amount of postoperative pain before being humanely killed.

Is the pain unnecessary? In one sense it clearly is. For since the organ was not transplanted for the good of the recipient animal, all the pain that animal experienced was unnecessary. However, this is not the real question, given the utilitarian perspective. The pain caused to this partic-

ular animal is only one part of the overall calculation that needs to be carried out. One also needs to ask about the possible benefits for humans who are in need of organ transplants, the value of the skills surgeons acquire carrying out animal organ transplants, the value of knowledge for its own sake, and so on. After these questions have been answered and the overall benefits impartially calculated, then an informed judgment can be made about whether organ transplant research involving nonhuman animals does or does not cause unnecessary suffering.

As this example illustrates, animal welfarists who are utilitarians can disagree about when animals suffer unnecessarily. As such, these animal welfarists can differ in judging whether animals are being treated humanely and, if not, how much reform is called for.

Advocates of animal rights advance a position that avoids the always daunting, frequently divisive challenge of carrying out uncertain utilitarian calculations. Central to their view is the Kantian idea that animals are never to be treated merely as a means to human ends, however good these ends might be. The acquisition of knowledge, including biological knowledge, is surely a good end, as is the promotion of human health. But the goodness of these ends does not justify the utilization of nonhuman animals as means. Thus, even if animal-model organ transplant research can be justified on utilitarian grounds, animal rights advocates would judge it immoral.

Of the two main options—animal welfare and animal rights—it is the latter that attempts to offer a basis for a radical reassessment of how animals are treated. Animal welfare, provided the calculations work out a certain way, enables one to call for reforms in human institutions that routinely utilize nonhuman animals. But animal rights, independent of such calculations, enables one to call for the abolition of all forms of institutional exploitation.

However these matters are resolved, one should note the major contribution philosophers have made in placing the “animal question” before a wider audience. Despite their philosophical differences, none of the philosophers participating in the debate is satisfied with how animals are treated by the major animal user industries. This consensus has meant that those who manage these industries have had to respond to new forms of moral criticism. Collectively, these philosophers have been and will continue to be a powerful voice calling for better treatment of animals.

In addition, the interest philosophers have shown in the “animal question” has spilled over into other disci-

plines, including sociology, history, anthropology, and law. The latter is of particular interest. Whereas thirty years ago not a single law school in America offered courses on animals and the law, upwards of thirty do so today. The evidence suggests that a new field of inquiry, Human and Animal Studies, is in the offing.

ANNET, PETER

(1693–1769)

Peter Annet, an English freethinker and deist, was by profession a schoolmaster. He lost his employment in 1744 because of his outspoken attacks on certain Christian apologists. A debater at the Robin Hood Society (named after a public house where the meetings were held), he soon became a popular lecturer. The first published result was a pamphlet of 1739, titled *Judging for Ourselves: Or Free-Thinking, the Great Duty of Religion. Display'd in Two Lectures, deliver'd at Plaisterers-Hall*, "By P. A. Minister of the Gospel. With A Serious Poem address'd to the Reverend Mr. Whitefield." The tone of the work is indicated by the statement: "If the Scriptures are Truth, they will bear Examination; if they are not, let 'em go." This was followed by several tracts directly attacking Thomas Sherlock, bishop of London: *The Resurrection of Jesus Considered: In Answer To the Tryal of the Witnesses* "By a Moral Philosopher," which ran through three editions in 1744; *The Resurrection Reconsidered* (1744); *The Sequel of the Resurrection of Jesus Considered* (1745); and *The Resurrection Defenders stript of all Defence* (1745).

In *Social Bliss Considered* (1749) Annet, like John Milton before him, advocated the liberty of divorce. He answered Gilbert West's *Observations on the Resurrection of Jesus Christ* (1747) in *Supernaturals Examined* (1747) and George Lyttleton's *Observations on the Conversion and Apostleship of St. Paul in a Letter to Gilbert West* (1747) in *The History and Character of St. Paul Examined* (1748). Arguing that all miracles are incredible, Annet proceeded to attack Old Testament history in his journal, *The Free Enquirer* (9 numbers, October 17, 1761–December 12, 1761). For this work he was accused of blasphemous libel before Lord Mansfield in the Court of King's Bench in the Michaelmas term of 1762. There is some evidence that Lord Mansfield, urged on by Bishop Warburton and others, used Annet as a scapegoat after a fruitless attempt had been made to suppress the publication of David Hume's *Four Dissertations* of 1757.

Annet pleaded guilty to the charge. "In consideration of which, and of his poverty, of his having confessed his errors in an affidavit, and of his being seventy years old, and some symptoms of wildness that appeared on his inspection in Court; the Court declared they had mitigated their intended sentence to the following, viz., to be imprisoned in Newgate for a month; to stand twice in the pillory [Charing Cross and the Royal Exchange] with a paper on his forehead, inscribed Blasphemy; to be sent to the house of correction [Bridewell] to hard labour for a year; to pay a fine of 6s.8d.; and to find security, himself to 100 £ and two sureties in 50 £. each, for his good behaviour during life." Having survived this "mitigated," charitable, and humane punishment based on the iniquitous Blasphemy Act of 1698, Annet returned to schoolmastering. Archbishop Secker is said to have so far relented as to afford aid to the culprit until his death in 1769. In 1766 Annet issued *A Collection of Tracts of a Certain Free Enquirer noted by his sufferings for his opinions*, a work containing all of the tracts mentioned above.

Annet was long thought to have been the author of *The History of the Man after God's Own Heart* (1761), in which the writer took exception to a parallel drawn by a divine between George II and King David. The anonymous writer argued that such a comparison was an insult to the late king. Recent scholarship has proved that the real author was John Noorthouck, a respected member of the Stationers' Company.

Among his accomplishments, Annet was the inventor of a system of shorthand. Unlike most of the leading English deists, Annet had relatively little formal education and spoke and wrote plainly and forcefully directly to the masses. He was the last to suffer physical punishment for his heterodox religious opinions.

Ernest Campbell Mossner (1967)

ANOMALOUS MONISM

Originated by Donald Davidson, "anomalous monism" is a nonreductive, token physicalist position on the relation between the mental and the physical. According to it, each mental event is a physical event, although mental descriptions are neither reducible to nor nomologically correlated with physical ones. In terms that are ontologically more robust than those used by Davidson, the position asserts identities between individual mental and physical events while denying that mental types or properties are either identical with, or nomologically connected with, physical ones. The position specifically concerns intentional mental phenomena such as beliefs and desires, although it is arguable that it can be extended to cover other mental phenomena such as sensations.

Davidson's argument for this position results from an attempt to reconcile three apparently inconsistent principles, two of which he finds independently plausible and the third of which he defends at length. The first is the principle of causal interaction (PCI), which states that mental events cause physical events and vice versa, causality being understood as relating events in extension. The second is the principle of the nomological character of causality (PNCC), which states that events that are causally related have descriptions under which they instantiate strict causal laws. The third is the principle of the anomalism of the mental (PAM), which states that there are no strict laws in which mental terms figure. The principles appear to conflict in that the first two imply what the third seems to deny—namely that there are strict laws governing causal interactions between mental and physical events.

Davidson argues that the principles can be reconciled by adopting the thesis that each mental event has a physical description and so is a physical event. He further suggests that a sound argument can be constructed from these principles to this thesis. Suppose a mental event, *m*, causes a physical event, *p*. Then, by the PNCC, *m* and *p* have descriptions under which they instantiate a strict causal law. By PAM this cannot be mental in that it cannot contain mental terminology. Therefore *m* must have a physical description under which it instantiates a strict

causal law, which is to say that it is a physical event. Although the argument is formulated in terms of events and their descriptions, it can be formulated equally effectively in the terminology of events and their properties.

Davidson does not take PAM to be obvious. His defense of it involves the idea that laws bring together terms from the same or similar conceptual domains. Using this idea he argues that the constraints that govern the application of mental terms and their associated concepts to things are normative in nature, involving "constitutive" principles of rational coherence, deductive and inductive consistency, and the like. These principles constitute the distinctive rationalistic normativity that is the earmark of the intentional domain; and Davidson argues that they have no place in physical theory.

The argument for anomalous monism appears to work because of the extensionality of the causal relation and the intensionality of nomologicality. Events are causally related no matter how described; but they are governed by laws only as they are described one way rather than another. This opens up a conceptual space between causality and nomologicality that makes it possible to hold both that mental events that interact causally with physical ones are governed by laws and that there are no strict psychological or psychophysical laws.

Davidson's argument has had a profound effect on discussions of mental causation and token physicalism. Many have found either the PNCC or the PAM questionable and have taken issue with it. However, the main objection to the argument is that, on a certain conception of the relation between causality and laws, it leads either to inconsistency or to epiphenomenalism. According to this conception, laws link events causally by linking certain, but not all, of their descriptions or properties, the causally relevant ones. The question now arises, In virtue of which of their properties do mental events interact causally with physical ones? If the answer is the mental ones, then anomalous monism is threatened with inconsistency since this implies that there are laws in which mental descriptions/properties figure. If the answer is the physical ones, then anomalous monism is threatened with epiphenomenalism since it is in virtue of their physical properties that mental events are causally efficacious. Since PAM is a crucial premise in the argument for anomalous monism, it is the epiphenomenalism charge that poses the real threat to the position.

There is a general question of whether nonreductive token physicalist theories count as proper forms of physicalism since they recognize the existence of irreducibly mental properties. Davidson himself favors supplement-

ing his position with some sort of supervenience thesis, according to which, necessarily, if things (events) are the same with regard to their physical descriptions/properties, then they are the same with regard to their mental descriptions/properties. The principal difficulty in formulating such a thesis is in specifying a dependency relation strong enough to ensure that physical properties determine mental ones without leading to reducibility and hence to type physicalism.

ANSCOMBE, GERTRUDE ELIZABETH MARGARET (1919–2001)

G. E. M. Anscombe, English philosopher, was educated at Sydenham High School and St. Hugh's College, Oxford, where she read *Literae Humaniores* (Greats). She went as a research student to the University of Cambridge, where she became a pupil of Ludwig Wittgenstein (1889–1951). He and Aristotle were the most important influences on her philosophical thought. Anscombe became a Roman Catholic while in her teens, and her Catholicism was also a shaping influence. She was a Fellow for many years of Somerville College, Oxford, and held the Chair of Philosophy at the University of Cambridge from 1970 until 1986. A philosopher of great range, she made important contributions to ethics, philosophy of mind and action, metaphysics, epistemology, philosophical logic, and philosophy of language. Much of her most interesting work was in the history of philosophy; her discussions of ancient, medieval, and modern philosophers combine illuminating accounts of challenging texts with penetrating treatment of the philosophical problems themselves. As one of Wittgenstein's literary executors, as an editor and translator of his writings, and as a writer and lecturer about Wittgenstein, she has done more than anyone else to make his work accessible. Her *Introduction to Wittgenstein's "Tractatus"* (1959) is a superb introduction to the central themes of that work, making clear the character of the problems (like that of negation) treated in it.

Long before it became fashionable in the 1970s for moral philosophers to concern themselves with practical problems, Anscombe was writing about them. Her first published essay, in 1939, shortly after the beginning of World War II, concerned the justice of that war. She discussed closely related topics in her protest against the honorary degree that Oxford University awarded Harry Truman in 1957 and in connection with the policy of nuclear deterrence. She wrote also on contraception, murder, and euthanasia. All her writings on such questions reflect her belief that the concepts of action and intention are important for ethics, especially in connection with questions about our responsibility for the con-

sequences of our actions. She explained and defended the doctrine of double effect (it is sometimes permissible to cause, as a side effect, a merely foreseen harm that is forbidden if sought intentionally). She argued that denial of this doctrine “has been the corruption of non-Catholic thought and its abuse the corruption of Catholic thought” (1981, 3:54).

Anscombe’s interest in war and in the concept of murder led her also to more general philosophical questions about political authority. “Modern Moral Philosophy” (1981, 2005) has been the most influential of her papers on ethics and was an important impetus for the development of virtue ethics (which emphasizes the character traits a human being needs in order to flourish). She defended three theses in the paper: that moral philosophy cannot be done until we have an adequate philosophical psychology; that the concepts of moral obligation, moral duty, and moral “ought” are survivals from a now largely abandoned conception of ethics, are incoherent outside that framework, and should therefore be abandoned if possible; and that English moral philosophers from Henry Sidgwick (1838–1900) on differ only in superficial ways. In explaining the third thesis, Anscombe introduced the term “consequentialism” for the common view that right and wrong are determined by consequences (including among consequences the promotion of intrinsic values), and she argued that consequentialism is a corrupt and shallow philosophy.

In her ground-breaking monograph *Intention* (1957), Anscombe raised and discussed questions about intention, action, and practical thought (practical reasoning and practical knowledge). Widely prevalent philosophical ideas about intention had treated it as some special kind of mental state or event. Departing radically from that tradition, Anscombe gave an account of intentional action in terms of the applicability to it of a kind of question asking for the agent’s reason. This account enabled her to show how conceptions of good are important for practical thought. The questions with which Anscombe was concerned frequently straddled metaphysics, philosophy of logic, and philosophy of mind. For example, in “The First Person” (1981), she explained how we are led into confusion by misunderstandings of “I” on the model of a proper name. In “The Intentionality of Sensation: A Grammatical Feature” (1981) she drew on philosophy of language in explaining grammatical analogies between intention and sensation, and was able to give a very interesting and original account of what is right in sense-impression philosophy and of what is misleading in it.

Anscombe explored the topic of causation in several papers, questioning in them widely held assumptions. “Causality and Determination” (1981) begins by formulating two such assumptions: that causality is a necessary connection of some kind, and that it involves a universal generalization connecting events of two kinds. One or the other or both of the assumptions are accepted by virtually all writers on causation, but Anscombe questioned both, together with the related idea that if two courses of events appear similar but have different outcomes, there must be some further relevant difference. She argued that the root idea in all our causal notions is that of one thing deriving from another, and that this need not involve necessitation. In “Times, Beginnings, and Causes” (1981) she challenged two widely accepted views of Hume’s: that causal relations are never logically necessary, and that logically something can begin to exist without being caused to do so. Questions about time figure centrally in other papers as well. For example, in “The Reality of the Past” (1981) she treats a problem raised by Parmenides (b. c. 515 BCE) and shows how attempts to explain the concept of the past by reference to memory must fail. This paper also contains one of the best short discussions of Wittgenstein’s later approach to philosophy.

While Anscombe worked within the tradition of twentieth-century analytic philosophy, she challenged many of the assumptions of her contemporaries. Although her work, especially on intention and action, has exercised wide influence, much of her thought has not yet been assimilated, owing partly to the fact that she maintained a critical distance from the ideas of her contemporaries and partly to the fact that many of her later papers are not readily accessible.

ANSELM, ST. (1033–1109)

The greatest philosopher of the eleventh century, Anselm of Canterbury was the author of some dozen works whose originality and subtlety earned him the title of "Father of Scholasticism." Best known in the modern era for his "Ontological Argument," designed to prove God's existence, Anselm made significant contributions to metaphysics, ethics, and philosophy of language.

Anselm was born in Aosta, in the Piedmont region of the kingdom of Burgundy, near the border with Lombardy. His family was noble but of declining fortunes. Anselm remained at home until he was twenty-three; after the death of his mother he quarreled irrevocably with his father and left home, wandering for some years before arriving at the Benedictine Abbey at Bec in Normandy. Impressed by the abbey's prior Lanfranc, who had a reputation as a scholar and teacher of dialectic, Anselm joined the monastery as a novice in 1060. Such was his ability that in 1063 he was elected prior and in 1078 abbot, a position he held until his elevation as archbishop of Canterbury in 1093. While at Bec, Anselm wrote his *Monologion*, *Proslogion*, and the four dialogues *De grammatico*, *De veritate*, *De libertate arbitrii*, and *De casu Diaboli*. While archbishop, Anselm wrote his *De incarnatione Verbi*, *Cur Deus homo*, *De conceptu virginali*, *De processione Spiritus Sancti*, and *De concordia*. Perhaps from this time also date his fragmentary notes on power, ability,

and possibility. Anselm's archbishopate was marked by controversy with the English kings William Rufus and Henry I over royal privileges and jurisdiction; Anselm spent the years from 1097 to 1100 and from 1103 to 1107 in exile. After a brief illness, Anselm died on April 21, 1109, in Canterbury, where he is interred in the Cathedral.

METHOD

Most of Anselm's work systematically reflects on the content of Christian doctrine: Trinity, Incarnation, the procession of the Holy Spirit, original sin, the fall of Lucifer, redemption and atonement, virgin conception, grace and foreknowledge, the divine attributes, and the nature of sin. He called this reflective activity "meditation" and also, in a famous phrase, "faith in search of understanding" (*fides quaerens intellectum*). His search for understanding is of interest to philosophers for three reasons. First, he often addresses arguments to those who do not share his dogmatic commitments—that is, he offers proofs based only on natural reason. He begins the *Monologion*, for example, with the claim that a person who does not (initially) believe that there is a God with the traditional divine attributes "can at least persuade himself of most of these things by reason alone if he has even moderate ability." Likewise, the "Ontological Argument" of the *Proslogion*, and indeed the treatise as a whole, is addressed to the Biblical Fool, who denies the existence of God. This approach, later known as "natural theology," may be given in support of but does not depend upon particular points of doctrine.

Second, even when Anselm assumes certain dogmatic theses, his analysis is often directed to specifically philosophical issues in the case at hand, and thereby has broader implications. While discussing Lucifer's sin and subsequent fall in his *De casu Diaboli*, for instance, Anselm formulates a series of general theses about responsibility and motivation that hold not only of Lucifer's primal sin (or Adam's original sin), but which apply to ordinary cases of choice. Elsewhere he offers a defense of metaphysical realism (*De incarnatione Verbi*), a reconciliation of foreknowledge with the freedom of the will (*De concordia*), an account of sentential truth-conditions (*De veritate*), and so on.

Third, even when pursuing his doctrinal agenda, Anselm is always a philosopher's philosopher: Distinctions are drawn and defended, theories proposed, examples given to support theses, and tightly constructed arguments are the means by which he meditates on Christian themes. He uses the selfsame method when no

doctrinal commitment is at stake, as in the semantic analysis of the *De grammatico*, the account of power and ability in his fragmentary notes, or the analysis of freedom of choice in *De libertate arbitrii*. For Anselm, understanding—the very understanding for which faith is searching—is a philosophical enterprise, and his treatment of even the knottiest doctrinal difficulties is clearly philosophical in character. Intellectual integrity, he held, demands it. (He further held that although a philosophical approach to matters of faith is necessary, it is not sufficient; hence, in addition to systematic treatises, Anselm also composed prayers and devotional works.)

METAPHYSICS

Following Augustine, Anselm is, broadly speaking, a platonist in metaphysics. A thing has a feature in virtue of its relation to something paradigmatically exhibiting that feature. Anselm begins the *Monologion*, for example, by noting the diversity of good things in the world, and argues that we should hold that “there is some one thing through which all goods whatsoever are good” and that that one thing “is itself a great good ... and indeed supremely good” (chap. 1). He reasons that we can judge that some things are better or worse than others only if there is something, namely goodness, which is the same in each, though in different degrees—a claim sometimes dubbed “the Platonic Principle” for Plato’s use of it in the case of equal sticks and stones in his *Phaedo*. To establish the uniqueness of this one thing, Anselm applies the Platonic Principle again and rules out an infinite regress. Furthermore, since the goodness of good things is derivative, and things might be good in any degree imaginable, it follows that the one thing through which all good things are good must be supremely good; it can be neither equaled nor excelled by the goodness of any good thing that is good through it. Note that the Supreme Good does not strictly speaking “have” goodness but rather *is* goodness itself, a quasi-substantial entity whose nature is goodness.

Much of Anselm’s metaphysics is a sustained study of such relations of dependence and independence: things may be the way they are “through themselves” (*per se*) or “through another” (*per aliud*), Anselm holds, and roughly the same reasoning can be applied to features other than goodness. The later medieval tradition called such features “pure perfections,” and their defining characteristic is that it is unqualifiedly better to have them than not. Just as the presence of goodness in things leads to the conclusion that there is some one thing that is paradigmatically good, through which all good things have their

goodness, Anselm argues that so too the bare fact of their existence leads to the conclusion that there is some one thing through which everything else exists. Moreover, this one thing “paradigmatically” exists, namely, it exists through itself and of necessity: it is existence itself, something whose nature is existence (chaps. 3–4).

Anselm drops from the Platonic Principle the requirement that things having a certain feature exhibit it in varying degrees; rather, the possession of the same feature by itself licenses the inference that there is something each thing has, something exemplifying the feature itself. Likewise, the key move in his argument that there is only one such thing that exists through itself, rather than a plurality of independent things each equally existing through itself, is to apply the Platonic Principle to the feature of *self-existence* itself; this entails that there is a unique self-existent nature. Furthermore, since it is better to exist through oneself than through another (independence is better than dependence), the Supreme Good must exist through itself, and hence is identical with the self-existent nature, the source of the existence and goodness of all else there is. Anselm concludes that “there is accordingly a certain nature (or substance or essence) that through itself is good and great, and through itself is what it is, and through which anything that exists is genuinely either good or great or anything at all” (chap. 4). In short order Anselm shows that this being is appropriately called “God,” and the remainder of the *Monologion* is devoted to establishing that God has the full range of divine attributes: simplicity, unchangeableness, eternity, triune nature of persons, and the like.

The existence of God is therefore the most fundamental metaphysical truth. Anselm tells us that he sought to replace the chain of arguments outlined above with “a single argument that needed nothing but itself alone to prove its conclusion, and would be strong enough to establish that God truly exists and is the Supreme Good, depending on nothing else, but on whom all other things depend for their existence and well-being.” In doing so, he devised one of the most-discussed arguments in the history of philosophy, presented in *Proslogion 2* as follows:

Therefore, Lord, You Who give understanding to faith, give me understanding to the extent You know to be appropriate: that You are as we believe, and You are that which we believe. And, indeed, we believe You to be something than which nothing greater can be thought. Or is there is not some such nature, then, since “The Fool hath said in his heart: There is no God” [Psalms 13:1]? But certainly that same Fool,

when he hears this very thing I say, ‘something than which nothing greater can be thought’, understands what he hears; and what he understands is in his understanding, even if he were not to understand that to be. It is one matter that a thing is in the understanding, another to understand a thing to be. For when the painter thinks beforehand what is going to be done, he has it in the understanding but does not yet understand to be what he does not yet make. Yet once he has painted, he both has it in the understanding and also understands to be what he now makes. Therefore, even the Fool is convinced that there is in the understanding even something than which nothing greater can be thought, since when he hears this he understands, and whatever is understood is in the understanding. And certainly that than which a greater cannot be thought cannot be in the understanding alone. If indeed it is even in the understanding only, it can be thought to be in reality, which is greater. Thus if that than which a greater cannot be thought is in the understanding alone, the very thing than which a greater cannot be thought is that than which a greater can be thought. But certainly this cannot be. Therefore, without a doubt something than which a greater is not able to be thought exists (*exsistit*), both in the understanding and in reality.

The logical analysis, validity, and soundness of this argument have been a matter of debate since Anselm came up with it. Yet its general drift is clear. God, Anselm tells us, is something than which nothing greater can be thought. (Note that he does not present this formula as a definition or part of the meaning of “God” but rather only as a claim that is true of God; the indirect negative formulation is important since we cannot adequately think of or conceive God as such.) So understood, the denial of God’s existence leads to a contradiction, as follows. That than which a greater cannot be thought cannot itself be thought not to exist, since if it were, we could think of something greater than it, namely that than which nothing greater can be thought existing in reality. But it is logically impossible to think of something greater than that than which nothing greater can be thought. Thus the denial of God’s existence must be rejected, and so God’s existence affirmed. Hence Anselm’s argument as a whole is *ad hominem*, directed against someone who accepts the claim that God is something than which nothing greater

can be thought; once accepted, Anselm offers a *reductio ad absurdum* of the denial of God’s existence.

Anselm’s argument (as it was known in the Middle Ages) attracted attention from the very first. When the *Proslogion* was initially circulated, Gaunilon, a monk of Marmoutiers, wrote a brief in defense of the Fool; Anselm wrote a gracious reply and directed that thereafter the treatise should be copied with their exchange.

In the *Monologion* and *Proslogion*, Anselm says that he is trying to establish the existence of a “nature” (or equally an essence or a substance). The divine nature is identical with the very qualities of which it is the paradigm, and furthermore is also a concrete particular: God is an individual, albeit a three-in-one individual. In addition to such an extraordinary nature, there are also common natures, such as human nature, which is present in each human being as his or her individual nature. Anselm holds that such common natures “become singular” when combined with a collection of distinctive properties (*proprietas*) that distinguish an individual from all others (*De incarnatione Verbi* 11). In the same work he inveighs against the extreme nominalism of Roscelin of Compiègne that anyone taking universals to be no more than vocal utterances deserves no hearing on theological matters; Roscelin cannot understand how a plurality of humans are one human in species, and cannot understand how anything is a human being if not an individual (chap. 1).

While the extent of Anselm’s metaphysical realism is a matter of debate, remarks such as these make it clear that he countenanced some form of realism about universals. Whereas some form of platonic exemplarism works for features that are identical with the divine essence, a more traditional realism applies to nondivine natures in the mundane world of creatures. From Boethius, Anselm adopts the standard metaphysical framework of substances and accidents, sorted into the ten Aristotelian categories. In the case of substances, Anselm holds that common names designate common natures, while proper names designate individuals metaphysically composed of a nature combined with distinctive properties with further accidental qualities. In addition, there are nonsubstantial qualities such as whiteness, instances of which may be found in individuals. Anselm speaks occasionally of form and of matter, but does not have a developed hylomorphic theory.

ETHICS

Anselm’s positive ethical theory is grounded on his theory of the will and free choice, one of his most striking and

original contributions. The traditional account of free will holds that an agent is free when there are genuine alternatives open to her, so that she can do one or another of them as she pleases. This traditional account is sometimes called “bilateral” since the agent must have at least two possible courses of action in order to act freely. In his *De libertate arbitrii*, by contrast, Anselm defends a unilateral normative conception of freedom, according to which an agent is free when two conditions are jointly satisfied: (a) she has the ability to perform a given action; and (b) that action is the one she ought to perform, that is, it is objectively the right action and hence the one she ought to want to perform—roughly, that an agent is free when she can act as she ought, regardless of alternatives. (Anselm, like all medieval philosophers, holds that what an agent ought to do is an objective matter.)

Note that Anselm is careful to say that an agent is free when she *can* act as she ought, not that she *does* so act; we commit wrongdoing freely when the right course of action is open to us but we fail to pursue it. The crucial issue, of course, is when an agent has the ability to perform a given action. Anselm devotes most of his fragmentary notes on ability and power to investigating this issue. His analysis tracks connections among ascriptions of ability, responsibility, and the cause of an action, much in the spirit of contemporary philosophical reflections on tort law. Very roughly, Anselm thinks there are a variety of freedom-canceling conditions; some of these, such as compulsion, are extremely sensitive to the kind of ability at stake.

One case in particular attracts Anselm’s attention in his *De libertate arbitrii*. Some abilities can be exercised by an agent more or less at will: lifting a book, thinking about Rome, deciding not to eat pork, playing the piano. Other abilities depend on external factors, which may include the actions and abilities of other agents. It takes two to tango, a multitude of musicians to play a symphony, other runners to have a race. These are all necessarily dependent abilities: They require other agents acting appropriately for their exercise. But consider a case in which an ability that could be exercised at will can no longer be so exercised, though the agent retains the ability. A ballerina tied to a chair cannot dance but still has the ability to do so. More exactly, Anselm holds, she does not have the opportunity to exercise the ability, though she retains the ability; were the constraint removed, she could exercise her ability at will. Anselm argues that the ballerina’s ability to dance is what matters to her free choice, according to (a), not whether she currently has the opportunity to exercise her ability.

Now suppose that the ballerina, no longer tied to a chair, has through excessive dancing injured her legs so badly that she can dance only if a doctor operates on her legs. Here too, Anselm maintains, she has not lost the ability to dance but only the opportunity to exercise her ability, and can regain the opportunity only if a doctor helps her to do so. This is the situation in which Anselm finds the human race. Through the (wrongful) exercise of our free choice in original sin, we have lost the opportunity to freely do what is right, and can only recover it through the actions of another (namely through God’s grace). We can legitimately be faulted for not doing what is right even now, despite the fact that we cannot do what is right at will, by our unaided efforts; we have the ability, and we lost the opportunity to exercise it through its improper use, but these facts do not stand in the way of our being free to act rightly; hence our culpability for failing to do so. Whether we agree with Anselm or not, his analysis is subtle and provocative, and represents a new level of sophistication in the analysis of free choice.

Following Augustine, Anselm argues that we abandon rectitude of will only by our own choice. Many things can happen against one’s will, but it is impossible to will against one’s will, since that would require both willing something and willing not to will it—but that can be done by simply not willing it in the first place. Not even God can take away our rectitude of will, Anselm maintains, since rectitude of will is doing what God wants; if God wanted to deprive our wills of rectitude, He would want us to not do what he wants, and whether we try to obey or to disobey, we wind up doing as He wants. Thus abandoning rectitude must be through our own choice, since it cannot happen against our will or by external (even divine) compulsion. The responsibility for wrongdoing rests squarely on our shoulders.

Anselm returns to these topics in his *De casu Diaboli*, perhaps returning to the traditional bilateral conception of freedom in the process. In Chapter 12 he puts forward a famous thought-experiment in which God creates an angel with free will, but without any motive for action whatsoever—a free being with no ends at all. Anselm argues that such a being would never act, since any action is motivated by pursuit of an end, and by hypothesis the angel has no ends. (Nor is an angel ever prompted by biological needs, and this is the point of using an angel rather than a human being in the example.) From this case Anselm and later philosophers drew the moral that at least some ultimate end has to be given to agents in order for there to be action at all, and hence the possibility of

moral action. An agent must therefore have at least one ultimate end, an end she does not choose.

Yet one end is not enough for moral agency. Anselm argues that there must be two ultimate and incommensurable ends to make sense of moral choices, and specifically of moral dilemmas. He reasons as follows. If an agent had only a single end, she would always act in pursuit of that end, unless deceived or misled through ignorance. There would be no moral conflict; her motives and reasons for action would be transparently in the service of her single ultimate end. This is quite similar to the life of nonrational animals. A dog pursues only its apparent good, as defined by its nature (which establishes its ultimate end). Dogs naturally aim at their own “perfection,” as Anselm puts it. But human beings are more complicated. We face choices in which each alternative serves a distinct end, the ends being ultimate and incommensurable. Anselm holds that this fact explains moral agency and the possibility of moral wrongdoing, for rational agents have two distinct ultimate ends: they seek their own happiness (through advantage or benefit) on the one hand, and they seek justice (rectitude of will) on the other hand.

This is the core of Anselm’s so-called “two-will theory” of motivation. Moral conflicts and dilemmas arise when we are faced with the choice between happiness and justice, between individual self-interest and impersonal fairness. Each end is a genuine good to the individual agent, and the conflict between them is real. Morality demands that we favor justice over happiness in such conflicts; wrongdoing is explained as the choice of happiness over justice. A thief prefers his own advantage to following the laws. While we might not side with the thief, his choice is not inexplicable; indeed, we may even sympathize with him while deploring his actions. The possibility of an irreducible clash between ultimate ends that we cannot forgo gives us the ability to explain moral agency. To say that justice and happiness can conflict is of course not to say that they do; if we are lucky, we might avoid moral dilemmas. Nevertheless, our actions are free because of the pull between these ends, even if we consistently take one side or the other.

Human fulfillment for Anselm thus turns out to be surprisingly paradoxical. We do not deserve to be happy unless we are prepared on principle to forgo happiness for justice. Indeed, only by pursuing justice for its own sake can we attain the self-interested happiness we have scorned. The price of moral agency is that happiness is the reward for those who do not pursue it.

PHILOSOPHY OF LANGUAGE

Anselm adopts Augustine’s view of language as a system of signs. This general category covers linguistic items, such as utterances, inscriptions, gestures, and at least some acts of thought; it also covers nonlinguistic items, such as icons, statues, smoke (a sign of fire), and even human actions, which Anselm says are signs that the agent thinks the action should be done. Roughly, a sign signifies something by bringing it to mind; this single semantic relation, founded on psychology, is the foundation of Anselm’s semantics.

As noted above, common names—at least natural-kind terms—signify common natures, and proper names signify the common nature in combination with distinctive properties. Nondenoting terms are problematic; “nothing” seems to be significant only by signifying nothing, a paradox that perplexes Anselm in several treatises. Troublesome as they are, Anselm directs his most sustained inquiry into semantics not at empty names but at “denominative” terms, roughly what we call adjectives.

The difficulty he addresses in his *De grammatico* can be stated simply: “white” cannot signify whiteness (“whiteness” does that); nor can it signify what is white (“snow” does that); what then does it signify? Anselm’s answer depends on several distinctions, the most important of which is between direct and indirect signification (*per se* and *per aliud* signification). A term signifies directly if it brings the proper and customary signification to mind; it signifies other things indirectly, perhaps things linked somehow to what the term directly signifies. As a first approximation, then, Anselm holds that ‘whiteness’ directly signifies whiteness, whereas ‘white’ directly signifies whiteness and indirectly signifies things that have whiteness (and is used to pick out the latter).

Verbs, for Anselm, signify actions or “doings” of some sort, broadly speaking, including even passive processes; that is their distinguishing feature. Names and subjects, respectively, signify subjects and their doings; when combined in a sentence, the truth of the sentence reflects the underlying metaphysical dependence of doings on doers, of actions on subjects. Now just as Anselm’s theory of meaning applies to more than words, so too his theory of truth applies to more than statements. In the *De veritate*, Anselm puts forward an account that recognizes a wide variety of things to be capable of truth—statements, thoughts, volitions, actions, the senses, even the very being of things. Truth, for Anselm, is a normative notion: Something is true when it is as it ought to be. Thus truth is in the end a matter of correctness (*rectitudo*), the correctness appropriate

in each instance (*De veritate* 11). For statements there are actually two forms of correctness: A given statement ought to signify what it was designed to express, and, if assertoric, it ought to signify the world the way it is. The first is a matter of the propositional content of an utterance, the second whether that propositional content is asserted (or denied). The statement “snow is white” does what it should do when it succeeds in signifying that snow is white; it also does what it should do when it succeeds in signifying that snow is white in the circumstances that snow really is white. The latter is the closest to our contemporary notion of truth for statements, but Anselm insists that the former is a kind of truth too (he calls it the “truth of signification”), and indeed can hold even if the world changes such that snow is no longer white.

Henry, *The Logic of Saint Anselm* (Oxford: Clarendon Press, 1967); and Marilyn Adams, “Saint Anselm's Theory of Truth” in *Documenti e studi sulla tradizione filosofica medievale* 1 (1990): 353–372.

Peter King (2005)

ANTHROPIC PRINCIPLE, THE

The term *Anthropic Principle* (AP) was introduced by the physicist Brandon Carter, who stated that “what we can expect to observe must be restricted by the conditions necessary for our presence as observers” (Carter 1974, p. 292). The central idea of AP could be put as follows: We can observe only those states of affairs that are compatible with the existence of observers.

The term has subsequently been applied to all manner of claims, variously obscure and bizarre. This entry restricts its attention to the central and philosophically interesting idea. Carter distinguished what he called the weak version of the principle, according to which “our location in the universe is necessarily privileged to the extent of being compatible with our existence as observers” (Carter 1974, p. 293), and the strong version, which states that “the universe (and hence the fundamental parameters on which it depends) must be such as to admit the creation of observers within it at some stage” (p. 295). The distinction was meant merely to apply the simple insight of AP on the one hand to local conditions at places and times within the universe, and on the other to features of the universe as a whole. The unfortunate wording of Carter's strong principle has led many to misunderstand it as attributing necessity to the universe's fundamental parameters. Whatever appeal this idea has seems to derive from a simple scope confusion. AP tells that necessarily, if humans observe a universe, then it has the parameters that allow for the development of observers. It does not follow that if humans observe a universe then the conditions required for observers take hold necessarily.

APPLICATIONS WITHIN THE UNIVERSE

AP is obviously true, and may appear too obvious to be of any interest. It is said to play a crucial role in explanation and theorizing about the universe. But how could a seemingly trivial, necessary truth enter into scientific explanations and inferences at all?

One can begin to answer this question by recalling that failure to consider the limits on what can be observed often leads to errors in scientific reasoning. This is well illustrated by one of John Leslie's cases of selection bias in *Universes* (1989). If a person finds all of the fish he or she has caught to be more than five inches long, this person may be tempted to inductively infer that all fish in the lake are longer than five inches. But the strength of this inference is undermined by noting that the net used cannot hold smaller fish. One can understand this epistemic situation in terms of competing explanations. The hypothesis that all fish in the lake are more than five inches long may, in principle, explain the failure to observe any shorter fish: One has not seen short fish because there are none around to see (perhaps chemical waste has rendered the adult fish population infertile). But such an explanation becomes redundant when it is noted that the method of observation prevents one from seeing smaller fish, whether there are any in the lake or not. If this person had been fishing with a regular reel and bait, it would be remarkable that he or she would have failed to catch small fish, and the hypothesis that all the fish in the lake are longer should be taken more seriously. The inference to all fish being more than five inches long is undermined by eliminating its use as an explanatory hypothesis.

It pays to be clear on what is explained here and what is not. The observational limitation—using a net with large holes—does nothing to explain, for any particular fish, why that fish is longer than five inches. What is explained is the failure to observe anything but long fish.

In a similar way, AP can serve as a check on overly zealous use of what is known as the Copernican Principle in cosmology. Copernicus famously taught that the Earth is not central to the solar system, let alone the universe. Taking this lesson to heart, cosmologists have been wary of theories that attribute special characteristics to the Earth's spatio-temporal position. The Copernican Principle instructs, roughly, to proceed on the assumption that the conditions that take hold within one's observable neighborhood are more or less the same throughout space-time. As a guard against gratuitous biases about the human place in the universe, the Copernican Principle is

appropriate. But it would be equally arbitrary to rule out the possibility that in the vastness of space-time, there are isolated pockets with strikingly unique features. And it is not out of the question that humans may happen to occupy one of these special regions. Indeed, if these rare conditions are necessary for the development of intelligent life, this is just where humans should expect to find themselves. It would be a mistake akin to that in the fishing story to extrapolate too eagerly from observations of local conditions to the wider universe if these locally observed features are a necessary condition of one's being here to observe anything. For in this case one can adequately explain the failure to observe any other features, even if most of the universe is different. (One of the earliest influential appeals to AP by the physicist R. H. Dicke, in "Dirac's Cosmology and Mach's Principle" [1961], uses this kind of strategy.)

One must be careful to distinguish this lesson from some more grandiose claims made on behalf of AP. Some incautious statements by physicists have been taken to suggest that human's existence and ability to observe the universe helps to explain why those observed features took hold. Clearly this explanation goes in the wrong direction. From human existence together with certain laws of nature, it may be possible to deduce that certain conditions took hold; this is not, however, sufficient for explanation. It is the required conditions that (partly) explain why humans are here, and not the other way round. Human observational limits no more explain why any observed conditions took hold than the use of a fishing net with large holes explains the length of any fish. In each case it is only one's failure to make contrary observations that is explained.

APPLICATIONS TO THE UNIVERSE'S FUNDAMENTAL PARAMETERS

According to contemporary cosmology, if the values of various fundamental parameters of the universe—such as force strengths and particle masses—differed ever so slightly from their actual values, life could not possibly have developed anywhere in the universe. And it appears that these parameters could easily have been different. It is as if the universe were the product of a machine with dozens of dials that determined its features. The vast majority of dial combinations result in a universe that collapses within seconds, or that contains nothing but hydrogen, or nothing but black holes. Only the most delicate adjustment of the dials will produce a stable universe, capable of supporting life at some time and place. Without the aid of deliberate adjustment, the odds of the

big bang producing a life-permitting universe appear extremely low.

In the light of these data, that the universe meets the conditions for life has struck many scientists and philosophers as a striking fact that requires explanation (whether or not this attitude is appropriate may be questioned, but it is only on this initial assumption that uses of AP arise). Some have taken these facts as the basis of a new version of the argument from design. The remarkable coincidence of physical parameters required for life may be explained by the actions of a rational agent. Others have suggested that the solution may lie in a more fundamental theory, with laws constraining the range of values that crucial parameters can take. The application of AP is supposed to undermine the need for such hypotheses. The simplest anthropic-style response takes the form of a popular glib reply: "If the physical parameters hadn't been just so, then we wouldn't be here puzzling about the matter!" The inadequacy of this response is well illustrated by the following analogy from Leslie (1989). Standing before a firing squad, a dozen guns are fired your way, but not a single bullet hits you. Clearly you have grounds to be astonished and wonder why you have been so lucky. Did they all deliberately miss? Did they fill their guns with blanks? It is possible that their missing you is just a fluke, but this seems incredible. It becomes no more credible when one considers that if the gunmen had not all missed, you would not be here to puzzle about it. Given that people do observe a universe, it is no surprise that they see one that meets the conditions for observers to exist. But they may well still wonder how they, or anyone, are here to see anything at all.

MULTIPLE UNIVERSES

More serious uses of AP couple it with the suggestion that this universe is just one of an enormous variety of actually existing universes. (Here "universe" does not refer to the totality of what there is, but rather to a large, more or less isolated aggregate of matter in space-time.) Of course this strategy is viable only to the extent that reason exists to suppose that there are a great number of universes. This is highly controversial. One of the proposed universe-generating models is the inflationary theory in cosmology. The multiple-universe hypothesis is distinct from the many-worlds interpretation of quantum mechanics, but some have appealed to the latter as a way in which the required variety of universes might be generated (see Leslie 1989).

How could the existence of other universes help solve a puzzle about this universe? For any improbable out-

come of an event, if you repeat the type of event enough times you can expect to get an outcome of that type eventually. To take the popular example, if a monkey types for long enough, or a large enough army of monkeys is put to work, it is all but certain that somewhere, at some time, a monkey will type a sonnet. Similarly, whereas it may be extremely unlikely that any particular universe meets the conditions for life, if there are a large enough number of them, it is to be expected that at least one of them will by chance be life-permitting. The vast majority of universes will be rather bland, containing no stars or planets, let alone life. There should be no room to wonder why humans have been lucky enough to see only one of the nice universes. They may note by AP that they could not possibly have found themselves in any other kind of universe, as those universes fail to meet the conditions for human existence.

The same explanatory strategy has been employed in areas of science as diverse as statistical mechanics and evolutionary biology. Ludwig Boltzman (1895) suggested a similar idea to account for the extremely low level of entropy (i.e., roughly, the high degree of order) in the observable neighborhood. Boltzman's speculation was that the universe is extremely large in space and time, with disorder on the large scale, but large, finite regions of order within. One can picture this view as like an infinite number of coins tossed on an infinite expanse. The big picture will almost certainly be a random, disordered mess. But with maximum probability there will also be enormous finite stretches of nothing but heads, and vast regions of beautiful and orderly patterns. Boltzman noted that it is only in regions of low entropy that living organisms such as humans can be found. So on this hypothesis, people should not be surprised to find that theirs is a low-entropy environment. Similar principles are applied in Darwinian explanations of the evolution of organisms. The tree of life consists of an enormous variety of branches produced by random mutations. Most of these are hidden from human view. It is only those that have the remarkable ability to sustain themselves and reproduce that people are able to observe.

As before, care needs to be taken in stating what has been explained and what has not. The plenitude of universes does not explain why this particular universe humans inhabit is life-permitting. The answer to the question "Why is this universe suitable for life?" is not "Because there are many other universes." The existence of many universes does not raise the probability that any particular one such as this can support living creatures. At most, what is to be expected is some universe will do this.

What the hypothesis of many universes may do, however, is remove the urgency of explanation regarding the particular universe in which humans find themselves. That this universe is life-permitting seems remarkable only insofar as it seemed remarkable that there was life at all. But if there are many universes, then it is not surprising that somewhere in some universe life can develop. The more specific question of why it is this universe and not another one appears less urgent, such as the question of why Jones won the lottery, or why the golf ball landed on this blade of grass. An adequate answer may be along the lines of “That’s just how it turned out.”

ANTIOCHUS OF ASCALON

(130/120?–68/7 BCE)

Antiochus joined the Academy, the school founded by Plato, late in the second century BCE, when Philo of Larissa was its head. Philo was (at this time) a moderate Academic skeptic who had been convinced by the Acad-

emy’s anti-Stoic arguments that nothing can be known for certain, but he did not embrace the other doctrine for which Academic skeptics argued—suspension of judgment. According to Philo, although certain knowledge is unobtainable, it is possible to identify highly probable impressions, and there is no reason not to accept them, provided that one realizes that one might be wrong. Prominent among them is the impression that nothing can be known.

After defending this view for many years, Antiochus became a dogmatist by accepting that knowledge is possible. His epistemological position was now essentially that of the Stoa. He responded to accusations that he had left the Academy for the Stoa by claiming that Zeno of Citium (335–263 BCE), the founder of Stoicism, had introduced a new vocabulary but was otherwise in essential agreement with the schools of Plato and Aristotle. Far from abandoning the Academy, Antiochus maintained, he had returned it to its true self. For this reason, he and his followers styled themselves the Old Academy. It is unclear what institutional status this group enjoyed or whether Antiochus ever officially succeeded Philo.

Antiochus regarded the criterion of truth and the goal of life as the most important concerns of philosophy, and his ethical theory is the other area about which we are well informed. In opposition to the Stoics, who maintained that virtue is the sole good and therefore sufficient for happiness, Antiochus held that there were also bodily and external goods. He rightly took this to be the view of Aristotle and the Old Academy, but the form in which he presented his theory owes a good deal to the Hellenistic schools. Thus Antiochus relied heavily on the so-called cradle argument, which takes the uncorrupted behavior of infants as its starting point. Antiochus combined evidence from this source about the objects of our first natural concern with the general principle that what accords with a creature’s natural impulses is its good, to derive his account of the goal.

He was in broad agreement with the Stoics that our constitution and things that preserve and develop it are the first objects of our natural concern, and not pleasure as Epicurus supposed. But the Stoics take it that this natural concern is replaced by a unique attachment to virtue. Antiochus held that, as the perfection of reason, which is the most important part of our constitution, virtue is the chief good. But he also regarded the other objects of natural concern as goods, albeit lesser goods, and therefore a part of the goal.

Antiochus wanted to claim that, even so, virtue is sufficient for happiness. To this end, he distinguished

between the happy life (*vita beata*), for which virtue was enough, and the entirely happy life (*vita beatissima*), which requires other goods as well.

None of Antiochus's books have survived, but he is known to have written a work about epistemology, the *Canonica*, and another epistemological work, the *Sosus* against Philo of Larissa's late views. A book in which he stressed the close relation between the Peripatos, Aristotle's school, and the Stoa is attested, and Cicero tells us that he wrote in many places about his views concerning happiness and virtue.

ANTIPHON

(c. 480–411 BCE)

Antiphon was an Athenian sophist, author of *Truth*, *Concord*, and—if identical with the same person as Antiphon of Rhamnus—three *Tetralogies* and many court speeches. The identity of the sophist and the speechwriter remains uncertain but is increasingly accepted (see Gagarin 2002; for contra, Pendrick 2002). If the two are the same, Antiphon was an aristocratic Athenian, admired by Thucydides (*History of the Peloponnesian War* 8.68), who wrote sophistic works, taught, gave legal and political advice, and wrote speeches for litigants in court. He was a leader of an oligarchic coup in 411 BCE and was tried and executed after the coup quickly failed.

Antiphon's *Tetralogies*, probably his earliest works (450–430 BCE), were intended for intellectual stimulation and pleasure and perhaps for public performance. Each group of four speeches (two on each side) treats a hypothetical case of homicide. In the *First Tetralogy*, the identity of the killer is uncertain, and arguments are based on the likelihood (*eikos*) that the defendant is the

killer. The *Second* disputes whether a young man who threw a javelin that killed a boy is responsible for the death. The *Third* questions who is responsible for a man's death during a drunken fight. None of the *Tetralogies* has a conclusion or verdict. Their aim is to explore issues and forms of argument (likelihood vs. truth, fault and responsibility, cause and effect) with subtlety and cleverness. They also raise questions about the relationship of *logos* (speech, argument) to reality, and the relationship between opposed arguments when each claims, with some justification, to speak the truth.

Perhaps in the 420s BCE, Antiphon composed the sophistic works *Truth* and *Concord*—only fragments of which now remain—and the even more fragmentary *Politicus* and *Dream-Interpretations*. *Truth* explored a wide range of issues, including mathematics (squaring the circle), meteorology, and natural philosophy. The largest surviving fragments show Antiphon exploring the relationship between *nomos* (law, convention) and *physis* (nature), particularly with respect to law and justice. He may be saying that law is purely a matter of convention, and that a person may violate the law as long as no one else will know of it.

ANTIREALISM

See *Realism*

ANTISTHENES

(ante 443 BCE–post 366 BCE)

Antisthenes, son of an Athenian father and Thracian mother, was a pupil of the rhetorician Gorgias and an intimate and admirer of Socrates. He taught professionally at Athens, maintaining his own interpretation of Socrates against other Socratics such as Plato and Aristippus. There is, however, only one reference in classical literature to Antisthenes (Aristotle, *Metaphysics* 1043b24); later antiquity saw him as a founder of Cynicism, a view that may have gained support through later historical systematization or from Stoics attempting to trace their philosophical pedigree to Socrates. Nevertheless, while the historical relationship between Antisthenes and Diogenes remains obscure, there were elements in Antisthenes' thought that heralded and may have given some impulse to Diogenes. His numerous works have not survived (a list of titles is found in Diogenes Laertius's *Lives*, 6.15–18); but he is characterized in Xenophon, and Diogenes preserves a doxographical and anecdotal account. Antisthenes had rhetorical and sophistic interests and was famed for his style and his myths as well as for his Socratic dialogues.

The influence of Socrates shaped Antisthenes' overriding interest in practical ethics. He held happiness to be dependent solely on moral virtue, which involved practical intelligence and so could be taught, partly from a study of the names of things and definitions. But the good man also required strength of mind and character; for by contrasting external goods with the inviolability of the "wealth of the soul," Antisthenes came to stress the importance of self-control by a hostility to luxury and sensual pleasure that went some way toward Cynic asceticism. Thus, the achievement of virtue necessitated a mental and physical effort to toil through opposing difficulties, suffering, and pain. Antisthenes glorified this struggle in the myths of Heracles; and for Cynics "toil" (*ponos*) became a technical good and Heracles a saint.

Antisthenes combined a moral interest in politics with a wariness of the dangers of participation, and attacked the rules of convention when they were in opposition to the laws of virtue. He denounced famous statesmen of previous generations and outlined his own ideal king, whose preeminence was due to his own moral self-mastery.

Most tantalizing is the brief glimpse Aristotle affords of Antisthenes' interest in the logic of predication and definition. He denied the possibility of contradiction (*Topics* 104b21), apparently because he believed (*Meta-*

physics 1024b27 ff.) that each object could be spoken of only by its own peculiar verbal designation that said what it was; that is, words corresponded directly with reality, and since predication was confined to assigning names to things, or limited to formulas determining their real structure, any other predicative account must then refer to something different or to nothing at all, and contradiction did not arise. There was a similar difficulty with falsity. Elsewhere (*Metaphysics* 1043b23ff.) the Antisthenes are said to have denied the possibility of defining what a thing (like silver) was; one could only explain what sort of thing it was (for instance, "like tin"). Aristotle's context referred to simple substances that could not be analyzed but only named or described. Similar problems to these occur in Plato (as in *Sophist* 251A f.; *Theaetetus* 201C ff.; *Euthydemus* 283E ff.; *Cratylus* 429B ff.). It has been argued that in one or more of these passages Plato had Antisthenes in mind, but this is not at all certain. The problems were common to the period. Interesting similarities have been pointed out between Antisthenes' logic and the nominalism of Thomas Hobbes.

APEIRON/PERAS

The Greek term *Apeiron*, meaning originally “boundless” rather than “infinite,” was used by Anaximander for the ultimate source of his universe. He probably meant by it something spatially unbounded, but since out of it arose the primary opposite substances (such as the hot and the cold, the dry and the wet) it may have been regarded also as qualitatively indeterminate. Aristotle, summarizing the views of certain early Pythagoreans (*Metaphysics* A, 5), puts the pair *Peras* (“Limit”) and *Apeiron* (“Unlimited”) at the head of a list of ten opposites. *Peras* is equated with (numerical) oddness, unity, rest, goodness, and so on; *Apeiron* is equated with evenness, plurality, motion, badness. The two principles *Peras* and *Apeiron* constituted an ultimate dualism, being not merely attributes but also themselves the substance of the things of which they are predicated. From the Pythagoreans on, the opposition of *Peras* and *Apeiron* was a standard theme in Greek philosophy.

Parmenides (fr. 8, 42ff.) seems to have accepted Limit and rejected the Unlimited for his One Being. The later Pythagoreans removed unity from the list of identities with *Peras* and argued that unity was the product of the imposition of the *Peras* upon the *Apeiron*, or else it was the source of both of them. Plato in the *Philebus* regards *Peras* and *Apeiron* as contained in all things, and supposes that it is through limit that intelligibility and beauty are manifested in the realm of Becoming. Exactly how the Ideas fit into this scheme is controversial, but in the doctrine of ideal numbers which Aristotle attributes to him Plato seems finally to have identified a material principle with the *Apeiron* and a formal principle with the *Peras*. Both principles apply to the ideal as well as to the sensible world. This leads in due course to the doctrine in Proclus (*Elementa* 89–90) that true being is composed of *Peras* and *Apeiron*, and beyond being there is a first *Peras* and a first *Apeiron*. The Christian writer known as Dionysius the Areopagite identified this doubled First Principle with God.

INFINITY

The concept of infinity, for long wrongly regarded as contrary to the whole tenor of Greek classicism, was in fact a Greek discovery, and by the fifth century BCE the normal meaning of *Apeiron* was “infinite.” Infinite spatial extension was implied in the doctrines of Anaximander, Anaximenes, and Xenophanes and was made explicit by the Pythagoreans (see Aristotle, *Physics* IV, 6). Denied by Parmenides, it was reasserted for the Eleatics by Melissus

(frs. 3–4) and adopted by the Atomists. Plato, however (in the *Timaeus*), and Aristotle (*Physics* III) insisted upon a finite universe, and in this they were followed by the Stoics and most subsequent thinkers until the Renaissance. Aristotle had, however, admitted that infinity could occur in counting and he stated the concept clearly for the first time. He also accepted infinite divisibility (*Physics* VI), which had been “discovered” by Zeno and adopted wholeheartedly by Anaxagoras. It was rejected by the Atomists. Plato rejected it in the *Timaeus*, although he seems to have admitted it at the precosmic stage in *Parmenides* 158B–D, 164C–165C. Aristotle accepted infinite divisibility for movements, for magnitudes in space, and for time. The concept of a continuum so reached has been a basic concept in physical theory ever since. The mathematical concept of infinitesimal numbers associated with infinite divisibility and also with the doctrine of incommensurables remained important until the development of calculus in modern times.

APEL, KARL-OTTO

(1922–)

Karl-Otto Apel (born in Düsseldorf) is an influential post-World War II German philosopher responsible for creatively introducing analytic linguistic philosophy to the German philosophical tradition. He fought in the German army on the eastern front and, in fact, began his university studies while a prisoner-of-war in France. He completed his doctoral dissertation on Martin Heidegger in Bonn in 1950, wrote his *Habilitation* (“The Idea of Language in the Tradition from Dante to Vico”) in Mainz in 1960, and, after several years teaching at the Universities of Kiel and Saarbrücken, spent the rest of his academic career at the Goethe University in Frankfurt am Main (where Jürgen Habermas, whom he had known since his student years in Bonn, was his colleague). He is best known for his development of transcendental semiotics that, as a first philosophy distinct from both tradi-

tional metaphysics and a modern (e.g., Cartesian, Kantian, or Husserlian) philosophy of the subject, provides an ultimate foundation (*Letzbegründung*) for knowledge (1998, chapter 2).

His so-called transformation of philosophy represents an ambitious attempt to bring together in a systematic form analytic philosophy of language, American pragmatism (especially Charles Sanders Peirce), and philosophical hermeneutics (Heidegger and Hans-Georg Gadamer). According to Apel, in light of these innovative traditions, the transcendental philosophy of Immanuel Kant must be fundamentally reconceived. In particular, the conditions for intersubjectively valid knowledge cannot be explicated in terms of the structure of consciousness or the cognitive capacities of the individual knowing subject but only through a systematic investigation of language as the medium of symbolically mediated knowledge. The pragmatic turn, initiated by Peirce and Charles W. Morris (1901–1979) and continued in the early twenty-first century in speech act theory, further implies that an adequate explanation of how meaningful communication is possible cannot be achieved by a semantic theory alone. Rather, it must be supplemented by a pragmatic study of the relation between linguistic signs and the conditions of their use by speakers. Apel's strong thesis is that his transcendental semiotics yields a set of normative conditions and validity claims presupposed in any critical discussion or rational argumentation. Central among these is the presupposition that a participant in a genuine argument is at the same time a member of a counterfactual, ideal communication community that is in principle equally open to all speakers and that excludes all force except the force of the better argument. Any claim to intersubjectively valid knowledge (scientific or moral-practical) implicitly acknowledges this ideal communication community as a metainstitution of rational argumentation, to be its ultimate source of justification (1980).

Drawing on the Continental tradition, Apel argues that the most important contribution of philosophical hermeneutics, Gadamer's in particular, has been to show that interpretation is not another method of investigation in addition to the methods used within the hard sciences, but an unavoidable dimension of all understanding. Every empirical investigation of a domain of objects implies at the same time a relation to other subjects, to a community of interpreters. Thus, the attempt to study language from an exclusively objectivistic or naturalistic perspective involves an abstraction from the inquirer's own membership in a linguistic community. The

inquirer's verbal behavior must also be interpreted by the community of investigators and this interpretive moment can never itself be displaced by objectivistic investigation. In fact, such investigation itself presupposes a communication community. But Apel's transcendental hermeneutics departs from Gadamer's historicism in that successive interpretations not only purport to understand differently but also raise an implicit claim to truth or correctness that can be clarified, once again, with reference to the ideal communication community. Furthermore, like Habermas, Apel does not exclude the possibility of introducing causal or functional explanations to clarify systematic distortions to communication, so long as they are "considered to be capable of conversion into a reflexively heightened self-understanding of the communicating parties" (1980, p. 125). In a response to externalist approaches (such as the strong program in the sociology of knowledge) Apel proposes a principle of self-appropriation that further develops this internalist (or rationalist) theme (see Kettner 1996).

In an important critique of the critical rationalism of Karl Raimund Popper and his followers, Apel further clarifies the status of transcendental pragmatics. He suggests that their skepticism with regard to the possibility of ultimate philosophical grounding is based on an abstractive fallacy in which sentences are viewed in isolation from the pragmatic contexts of argumentation. The so-called Münchhausen trilemma—that is, that all attempts to discover ultimate foundations result in either logical circularity, infinite regress, or an arbitrary end to the process of justification—can be overcome by moving from the level of semantic analysis to the level of pragmatics and recognizing that some presuppositions are necessary for the very possibility of intersubjectively valid criticism and argumentation. Similarly, he argues, even the "principle of fallibilism" (which holds that any claim can, in principle, be doubted) is only meaningful within an "institution of argumentation," where some pragmatic rules and norms are not open to question. Thus, contrary to the claim of critical rationalism, the principle of fallibilism does not exclude the notion of philosophical foundations and, Apel argues, certainly could not replace it as the basic principle of rational discourse (1998, chapter 4).

In a series of essays and in *Diskurs und Verantwortung* (1988) Apel argues that transcendental pragmatics can be used to develop an ethics of communication or *Diskursethik* that closely parallels the moral theory of Habermas. Like other cognitivist approaches, this ethics rejects the claim that moral judgments are ultimately the expressions of subjective preferences or an arbitrary will

and hence beyond the reach of rational justification. By elucidating its basic principle in relation to the pragmatic presuppositions of argumentation in general, Apel seeks a more secure foundation than Kant's appeal to a fact of reason or John Rawls's reflective equilibrium. According to the basic principle of his ethics of communication, only those norms are justified that could meet with the agreement of all concerned as participants in a practical discourse. However, in contrast to Habermas, to avoid an abstract utopianism, Apel (1988) maintains that this basic principle must be supplemented by a further principle of responsibility. Taken together, however, these two basic principles offer a secular foundation for a new global ethics.

APOLOGISTS

"Apologists" is the term used historically in reference to Christian teachers from the second century to the fourth who wrote treatises defending their religion against charges of godlessness and immorality and usually ascribing these traits to their opponents. The way had been prepared for such writings in Hellenistic Judaism when Philo of Alexandria wrote an apologetic *Hypothetica* (now lost). All his extant writings can be regarded as attempts to set forth the nature of Judaism in a way comprehensible to a Greek audience. Josephus had explained away the revolt against Rome (*History of the Jewish War*), had rewritten the history of Israel (*Antiquities of the Jews*), and had provided an explicitly apologetic defense

of Judaism (*Against Apion*). In addition, fragments of apologetic sermons are preserved in the New Testament book of Acts (14.15–17; 17.22–31), and perhaps may be reflected in I Thessalonians 1.9, I Corinthians 12.2, and Romans 1.18–32. The earliest known Christian apologists, however, wrote early in the second century.

Quadratus apparently wrote at Athens in the reign of Hadrian (117–138), and the one extant fragment of his work contrasts "our Savior" with some other savior. He argues that Jesus' healings and revivifications were authentic because some of the beneficiaries survived until Quadratus' own time. The *Apology* of Aristides (second century) begins with a semi-Stoic definition of God and goes on to show that all the gods of popular cult and legend cannot be gods because their deeds or sufferings are not in harmony with the definition. Finally, Aristides provides rather faint praise of Jews and high commendation for Christians. These writings cannot have won much, if any, favor with the pagans who read them.

The principal Christian apologist of the second century was Justin (c. 100–c. 165), born in Samaria of Greek parents and converted to Christianity (c. 130) after a fruitless quest for truth that had led him to religious-minded Middle Platonism. His education, he says, had not included many of the liberal arts; and from his account of his conversion, it is evident that he knew little about philosophy. A Christian whom he met by chance used Peripatetic arguments to indicate inconsistencies in Platonism. Justin, seeking new authority, was given the Old Testament prophecies. He had already admired the constancy of Christian martyrs; he soon became a Christian himself and instructed others, first in Asia Minor, later at Rome. He was martyred there between 163 and 167. Three of his works have survived: his *Apology*, written about 150 to show that Christians are not immoral and that Christ's life was foretold in the Old Testament; the *Dialogue with Trypho*, written about 160, developing this argument from the Old Testament; and an appendix to the *Apology*, also written about 160. His writings reflect a combination of Middle Platonism with Stoic terminology; he speaks of the divine Logos ("Word" for earlier Christians, "Reason" for Philo and the apologists), which was seminally present in some Greek philosophers but was incarnate in Christ. By working out some of the implications of this identification, Justin produced the first semiphilosophical Christian theology. It is possible that he knew something about Philo, but he cannot have understood his writings.

Justin's disciple Tatian (born c. 120), who later left the church, knew little about philosophy except for odd

details from philosophers' biographies, although like Justin he discussed the Logos as God's agent in creation and criticized the Stoic doctrine of fate. From Alexandria, perhaps, came the *Plea for the Christians* by Athenagoras (second century). He is the first Christian writer to reflect knowledge of the compendium of philosophical opinions apparently used in school teaching, especially by Skeptics. On the basis of earlier arguments in the schools, Athenagoras constructed a defense of the unity of God; and his later work *On Resurrection* contains a similar rearrangement of arguments from the schools to prove that God is able and willing to raise corpses, and will do so because man is a unity of soul and body. The last Greek apologist of the second century was Theophilus, bishop of Antioch, whose work in three books, *To Antolycus*, is concerned with the works of the invisible God (Philonic-Platonic arguments), God's revelation to the prophets and his six-day work of creation, and Christian ethics and the antiquity of the Jewish-Christian revelation. Theophilus used handbooks for much of his information about philosophy, but he may have read some works by Plato.

Generally speaking, the second-century apologists knew something about Platonism (that is, Middle Platonism) and Stoicism (largely the older Stoics) and made use of philosophy at points where it supported—or could be made to support—their own ideas of revelation, creation, providence, free will, divine punishment, and resurrection. They reinterpreted the Johannine “Word” as the divine Reason, instrumental in creation and revelation alike; Justin, unlike the others, used this Reason to explain how it was that some Greeks possessed inklings of the truth. The apologists also stressed the disputes among various schools in order to show how wrong the Greek philosophers usually were and how subjective their knowledge was.

At the very end of the second century an ex-lawyer named Tertullian produced two apologies in Latin. The first, *Ad Nationes*, is not very original, since much of it is derived from Varro's critique of Roman religion; the second, the *Apologeticum*, is a completely rewritten, and much more brilliant, revision of the first. Either before or after these works were published, another Latin apology, the *Octavius* of Minucius Felix, appropriated much of Cicero's treatise *De Natura Deorum* to Christian use. Both Tertullian and Minucius also made use of their Greek predecessors' writings.

Greek apologetic continued to be produced in the third century; examples include the anonymous booklet *To Diognetus*, the *Protrepticus* by Clement of Alexandria,

and the highly important work *Against Celsus* by Origen, in which the author often makes use of philosophical topoi (commonplaces) in his argument (for instance, Platonic discussions of the divine nature; Stoic arguments in favor of providence) and reveals that he shares many presuppositions with Celsus himself. Apparently some of the writings later ascribed to Justin, such as the *Cohortatio* and the *Oration*, also come from the third century. In them we find extensive use of handbooks and a little first-hand knowledge of philosophical writings.

Stimulus for the production of further apologies was provided about 260, when the Neoplatonist Porphyry produced a work in fifteen books, *Against the Christians*. Now lost because it was later proscribed, this work criticized the Old and New Testament, the apostles, and the life and thought of the church. The *Praeparatio Evangelica* of Eusebius is primarily a reply to it and to the similar work by Hierocles. In the fourth century the emperor Julian composed a work in three books, *Against the Galileans*; this was answered by Theodoret and Cyril of Alexandria, among others. Among the later Latin apologists we should mention Arnobius (d. c. 330, vaguely acquainted with Neoplatonism), Lactantius (c. 240–c. 320, who relied extensively on Cicero), and—above all—Augustine, whose *City of God* contains much from Varro and sets forth a Christian philosophy of history in response to Porphyry and other critics.

The significance of the apologists lies not so much in what they actually wrote (their works seem to have been read chiefly within the church) but in the influence their effort had on one another's thought and on the thought of later theologians. Their criticisms of Greco-Roman philosophy compelled them not only to learn something about it but also to employ its modes of discourse and some of its axioms in expounding the nature of Christianity. It was through the apologists that philosophical theology entered, and to some measure shaped, Christian thought. To be sure, later theologians could not accept the apologists' rather naive theologies (Irenaeus, for example, learned from the apologists but also corrected some of their statements); but impetus for philosophical study was given in the apologists' works and by the school of Alexandria, whose members were more at home in philosophy, especially Platonism.

All the early apologists, and most of the later ones, admired Plato and were influenced by Middle Platonism; the work they valued most highly was the *Timaeus*, in which they found intimations of Christianity (sometimes explained as derived from the Old Testament). They usually employed traditional Stoic arguments in defense of

providence and anti-Stoic arguments in opposition to fate. When they dealt with pagan mythology, they often employed the arguments of Skeptics. Their approach, then, was eclectic; and the famous statement of Justin, “Whatever has been well spoken by anyone belongs to us,” had been made by eclectic philosophers. At the same time, the apologists were aware of the difference between all philosophies and their own cardinal doctrines of God (*Creator ex ouk ontōn*, “wrathful against sin”), the Incarnation, and the future corporeal resurrection. Even those apologists who were most eager to express their doctrines in philosophical modes of discourse were usually aware that the basic beliefs could not be so expressed. Theophilus, for example, defines *pistis* (faith) in a manner strongly reminiscent of the probabilism of Carneades and then provides analogies to the resurrection of the body that are based on Stoic arguments for the cosmic cycle. He admits, however, that only faith is ultimately convincing.

Robert M. Grant (1967)

APPEARANCE AND REALITY

In *The Problems of Philosophy* Bertrand Russell referred to the distinction between appearance and reality as “one of the distinctions that cause most trouble in philosophy.” Why it should cause trouble in philosophy, however, when it causes little or no trouble outside of philosophy, Russell did not say. The distinction has played an important part in the thinking of many philosophers, and some of them, including Russell, have employed it in curious

ways to support odd and seemingly paradoxical claims. It may be this last fact that Russell had in mind when he spoke of trouble.

Before turning to some of its troublesome uses in philosophy, let us consider some of its relatively untroublesome uses in everyday discourse.

LOOKS AND APPEARANCES

There is a potentially troublemaking ambiguity in the term *to appear* and its cognates. (This ambiguity is not peculiar to English but is also to be found, for example, in the Greek verb *phainesthai* and its cognates.) Contrary to Russell's suggestion, the distinction between appearance and reality is not simply the distinction “between what things seem to be and what they are,” more precisely, the distinction between what things seem to be and what they are is not a simple distinction. There are at least two groups of appearance idioms—what might be called “seeming idioms” and “looking idioms.” The first group typically includes such expressions as “appears to be,” “seems to be,” “gives the appearance of being”; the second, such expressions as “appears,” “looks,” “feels,” “tastes,” “sounds.”

The two groups are not always as obviously distinct as these examples make them appear to be. The same expression, particularly one from the second group (notoriously, “appears,” but also such expressions as “looks as if”), may be used either as a seeming expression or as a looking expression. For example, “The oar appears bent” may mean either “The oar looks bent” or “The oar appears to be bent.” These are by no means the same. I may say that the oar appears to be bent *because* it looks bent, and this is not to say that the oar appears to be bent because it appears to be bent or that it looks bent because it looks bent. Nor is there any necessary connection between the two statements—or, generally, between statements employing seeming idioms and those employing looking idioms. “The oar looks bent” does not imply or entail “The oar appears to be bent”; for the oar may look bent—immersed in water, it naturally does—without appearing to be bent. As St. Augustine put it in a striking passage in *Contra Academicos* (III, xi, 26): “Is that true, then, which the eyes see in the case of the oar in water? ‘Quite true. For since there is a special reason for the oar’s looking (*videretur*) that way, I should rather accuse my eyes of playing me false if the oar looked straight (*rectus appareret*) when dipped in water; for in that case my eyes would not be seeing what, under the circumstances, ought to be seen.’” (Compare J. L. Austin, *Sense and Sensibilia*, p. 26.) The oar’s looking bent in water is not an

illusion, something that appears to be the case but is not; but this does not mean that the oar does not look bent. Conversely, “The oar appears to be bent” does not imply “The oar looks bent”; for the oar may appear to be bent without its looking bent; there may be reasons for saying that it appears to be bent (evidence that suggests that it is bent) other than its looking bent. (On this distinction, compare C. D. Broad, *Scientific Thought*, pp. 236–237.)

An example of the troublemaking neglect—or at least apparent neglect—of this distinction is to be found in Russell (op. cit.): “Although I believe that the table is ‘really’ of the same colour all over, the parts that reflect the light look much brighter than the other parts, and some parts look white because of reflected light. I know that, if I move, the parts that reflect the light will be different, so that the apparent distribution of colours on the table will change.” But further on he wrote: “To return to the table. It is evident from what we have found, that there is no colour which pre-eminently appears to be *the* colour of the table, or even of any one particular part of the table—it appears to be of different colours from different points of view, and there is no reason for regarding some of these as more really its colour than others.” But if all we have found is that the parts of the table that reflect the light *look* brighter than the others, it is by no means “evident” that there is no color which *appears to be* the color of the table.

SEEMING IDIOMS. Seeming idioms have nothing strictly to do with the senses; looking idioms characteristically do. From the evidence at hand, it may *appear*, or *look as if*, there will be an economic recession within the year. The characteristic uses of seeming idioms are to express what one believes is probably the case, to refrain from committing oneself, or to express hesitancy about what *is* the case. (Compare G. J. Warnock, *Berkeley*, p. 186: “The essential function of the language of ‘seeming’ is that it is noncommittal as to the actual facts.”) Hence, “I know that *X* is *Y*, but it appears (to me) that it is not *Y*” is odd or paradoxical in much the same way as is “I know that *X* is *Y*, but it may not be the case that it is.” From “*X* appears to be *Y*” (though *not* “merely appears to be *Y*”), I cannot validly infer either “*X* is *Y*” or “*X* is not *Y*.” But “*X* appears to be *Y*” entails that it is possible that *X* is *Y* and possible that *X* is not *Y*.

The same is not true of looking idioms, except in so far as they double as seeming idioms. No oddity or paradox is involved in saying such things as “I know that the two lines in Müller-Lyer’s drawing *are* the same length, but one of them still *looks* longer than the other.”

LOOKING IDIOMS. Looking idioms have a number of uses or senses that must be kept distinct.

Noticing resemblances. To notice that an inkblot has the appearance of (looks like) a face or that Alfredo’s voice sounds like Caruso’s is to note a visible resemblance between the inkblot and a face or an audible resemblance between Alfredo’s voice and Caruso’s. Here appearance does not normally contrast with what is possibly reality; rather it is a reality. “Alfredo’s voice sounds like Caruso’s” does not mean either “Alfredo’s voice appears to be Caruso’s” or “Alfredo’s voice (merely) sounds like Caruso’s, but it isn’t Caruso’s voice.” To be sure, in certain circumstances one might be misled by appearances. For instance, by the audible resemblance between Alfredo’s voice and Caruso’s one might suppose that he was hearing Caruso’s voice. Compare, however, “At a distance (in this light, at a quick glance) that looks like blood (a dollar bill), but it’s really just red paint (a soap coupon).”

Describing. To describe something’s appearance may merely be to describe its perceptible (visible, audible, tactile) features, and as such it is to describe how something *is*, not how it looks or appears as possibly *opposed* to how it is. Here the *apparent* qualities of something are the *real* perceptible qualities of it. To describe a man’s appearance, as opposed, say, to his character, is to describe those features of him (his “looks”) that he can be seen to possess. Appearances in this sense are what are most often referred to as phenomena in the nonphilosophical use of the latter term, in such phrases as “biological phenomena.”

“Looks” and “merely looks.” The phrase “mere appearance” (“merely looks, sounds”) shows that there is a sense of “appears” as a looking idiom which is neutral with respect to how things are. “*X* merely looks red (to me, or under such-and-such conditions)” implies that *X* is not (really) red. But simply from “*X* looks red (to me, or under such-and-such conditions)” I cannot validly infer either that *X* (really) is red or that *X* (really) is not red. If it is possible, however, for *X* to look (sound, feel, taste) *Y*, it must at least be possible for *X* (really) to be *Y*. This logical feature of looking idioms, which—in this sense—they share with seeming idioms, may be the source of some confusion between them.

PROTAGOREAN RELATIVISM

According to Plato (*Theaetetus*, 152; Cornford trans.), Protagoras held that “man is the measure of all things—alike of the being of things that are and of the non-being of things that are not.” And by this he meant that “any given thing is to me such as it appears to me, and is to you

such as it appears to you.” This statement can be read in two different ways, depending on whether “appears” is construed as a seeming idiom or a looking idiom. In either interpretation, however, it is a paradox or else a tautology.

Expressions such as “is for me” and “is for you” are distinctly odd, and one is puzzled to know what to make of them. If they are construed to mean the same as “is,” Protagoras’ statement then becomes manifestly paradoxical. For if “*X* appears to me to be *Y* (or looks *Y* to me)” and “*X* appears to you to be *Z* (or looks *Z* to you)” are equivalent respectively to “*X* is *Y*” and “*X* is *Z*,” where *Y* and *Z* represent logically incompatible predicates, then the joint affirmation of two (possibly) true propositions, “*X* looks *Y* to me” and “*X* looks *Z* to you,” would be equivalent to the necessarily false proposition that *X* is both *Y* and *Z*.

On the other hand, if we interpret “is for me” to mean the same as “appears to me” and “is for you” as “appears to you,” Protagoras’ dictum reduces to a tautology. For if “*X* appears to me to be *Y*” and “*X* appears to you to be *Z*” are equivalent respectively to “*X* is *Y* for me” and “*X* is *Z* for you,” then, even if *Y* and *Z* represent logically incompatible predicates, the equivalent statements can be substituted for one another. In that case, Protagoras’ dictum, generalized, reduces to either “Everything is for any given person such as it is for that person” or “Everything appears to any given person such as it appears to that person.” But since the two statements are themselves equivalent, the effect of Protagoras’ dictum is to obliterate any possible distinction between appearance and reality, or to claim what is clearly false, that there is no such distinction.

Protagoras’ statement can be read in yet another way, but read in that way it is also a truism. The Greek verb *phainesthai*, especially with the participle, was used to state, not that something (merely) appears to be so, but that something manifestly is so. Read in this way, Protagoras’ claim that appearance is reality is simply the claim that what is manifestly the case is the case. This innocent truism may have been intended to remind those of Protagoras’ contemporaries who contemned the common run of men for living by appearances, which they equated with error, that what is reliably observed to be the case is justifiably said to be the case.

THE ARGUMENT FROM ILLUSION

What has been called the “argument from illusion” has been used by many philosophers (for example, George Berkeley in *Three Dialogues*, I, and A. J. Ayer in *Founda-*

tions of Empirical Knowledge, pp. 3–5) to justify some form of phenomenalism or subjective idealism. The argument rests on the fact that things sometimes appear (for example, look) different to different observers or to the same observer in different circumstances. This fact is supposed to show that sensible qualities, such as colors or odors, are not really “in” things. For if things can, say, look one color when they are (supposedly) really another, then we can never say what color they really are, what color really “inheres” in them. For all sensible qualities, as Berkeley put it, “are equally apparent”; he seems to have meant that for every putatively veridical perception there is a possible corresponding illusory one (or wherever it is possible that “*X* is *Y*” is true, it is equally possible that “*X* merely looks *Y*” is true). Hence, given any perception, *P*, it is possible that *P* is veridical and possible that *P* is illusory. But since there is no apparent or observable difference between a veridical *P* and an illusory *P*, we cannot in principle tell which it is. We cannot, for example, say what colors things *are*; we can only say what colors they *look*.

The consequence of this argument is the same as that of Protagoras’ dictum, namely, to obliterate in principle any distinction between “is” and “(merely) looks or sounds.” But this is a distinction on which the argument itself rests: if the distinction cannot, in principle, be made, then the argument cannot get off the ground; but if the distinction can, in principle, be made, the conclusion of the argument cannot be true.

“IS *Y*” AS A FUNCTION OF “APPEARS *Y*.” Many philosophers who have used the argument from illusion have attempted to resist the consequence that there is then no distinction between “is” and “(merely) looks.” Berkeley, for example, protested that “the distinction between realities and chimeras retains its full force” (*Principles of Human Knowledge*, §34). He was able to suppose that it does because he supposed that “*X* is *Y*” is a logical function of “*X* appears (appears to be *or*, for example, looks) *Y*”: when the appearances of *X* are not only “lively” but “steady,” “orderly,” and “coherent,” we say that *X* is (really) *Y* and not that it merely *appears* *Y*. Being is orderly and coherent appearing (*Principles*, §29).

But if this is so, the distinction between realities and chimeras does not retain its full force. “*X* appears *Y* consistently (steadily, in an orderly and coherent way)” neither is equivalent to, nor does it entail, “*X* is *Y*”; for it is possible that the former is true while the latter is false. The truth of the former may be *evidence* for the truth of the latter, but the latter is not a logical function of the former. (Compare Warnock, *op. cit.*, pp. 180–182.) The same

holds for such claims as that of G. E. Moore (*Commonplace Book*, p. 145) that “‘This book is blue’ = This book looks (or *would* look) blue to normal people ... who look at it by *good* daylight at *normal distances*, i.e. not too far off or too near.”

PHENOMENA AND THINGS-IN-THEMSELVES

One of the foundation stones of Immanuel Kant’s philosophy is the claim that “we can know objects only as they *appear* to us (to our senses), not as they may be in themselves” (*Prolegomena*, §10.) Read in one way, Kant’s claim is tautologous. If by “an appearance” we mean a possible object of knowledge and by “a thing-in-itself” something that can be “thought” but cannot be known, the claim reduces to “What we can know, we can know; and what we cannot know, we cannot know.” As such, this tells us nothing about the limits of knowledge, about what we can know, any more than “God can do everything that it is possible for God to do” tells us anything about the extent of God’s powers.

Kant may, however, have meant the following: I can know that *X* is *Y* only if *X* can appear (to be) *Y*; if, in principle, *X* cannot appear (to be) *Y*, then I cannot know that *X* is *Y*. This, too, is a truism. But it does not follow from this that “the things we intuit are not in themselves what we intuit them as being. ... As appearances, they cannot exist in themselves, but only in us” (*Critique of Pure Reason*, A42; Kemp Smith trans.). That is, it does not follow that *X* as it appears is not what it is apart from how it appears; nor does it follow that what *X* is apart from how it appears is different from how it appears. To allow Kant’s inference is implicitly to endorse a paradox or to adopt a new use of “appears” to which no sense has been given. For if something appears (to be) so, it must be *possible* for it to *be* so “in itself”; and this is precisely the possibility which Kant does not allow.

APPEARANCES OF THE IMPOSSIBLE. Closely related to Kant’s distinction between appearances and things-in-themselves is the notion of appearances of the impossible. According to Parmenides and Zeno, multiplicity and motion, empty space and time, are impossible; yet things appear to be many, some of them appear to move, and so on. Similarly, for Gottfried Wilhelm Leibniz bodies with their qualities, such as colors, are well-founded appearances (*phaenomena bene fundata*), mere appearances “grounded” in monads and their perceptions; in reality there can be no such things as colored bodies. And according to F. H. Bradley in *Appearance and Reality*,

space, time, motion and change, causation, things, and the self are “unreal as such” because they “contradict themselves”; hence, they are “mere appearances” or “contradictory appearances.”

Taken at face value, this view is blatantly paradoxical: If for something to appear (to be) the case it must be *possible* for it “really” to be the case, then if it is *impossible* for it to be the case, it is impossible for it to appear (to be) the case. (Compare Morris Lazerowitz, *The Structure of Metaphysics*, pp. 208–209.) The metaphysician of “contradictory appearances,” however, may mean that for certain kinds of things, *t*, it is *never* permissible to say “There are *t*’s,” but only “There appear to be *t*’s.” But this, as Lazerowitz has pointed out (op. cit., esp. p. 225), has the consequence of obliterating the distinction between “is” and “appears” and hence of depriving “appears” of its meaning. For if “There are *t*’s” is in principle disallowed, “There appear to be *t*’s” loses its sense.

W. E. Kennick (1967)

APPERCEPTION

Apperception is usually defined as the mental process that raises subconscious or indistinct impressions to the level of attention and at the same time arranges them into a coherent intellectual order. The term *apperception*, however, has been used ambiguously, sometimes to mean merely consciousness or awareness, at other times to mean the acts of concentration and assimilation. Inevitably, a process of such significance has implicitly and explicitly been dealt with by philosophers ever since they first concerned themselves with the cognitive process. Aristotle, the Church Fathers, and the Scholastics all distinguished between vague notions and feelings on the one hand, and conceptions brought about by an act of intellectual willing on the other.

DESCARTES

The concept of apperception (in the form of the verb *apercevoir*) appears in René Descartes's *Traité des passions*.

Later writers generally use the term *perception* for denoting a state of dim awareness. So John Locke believes that perception is "the first step and degree towards

knowledge, and the inlet of all materials of it." It "is in some degree in all sorts of animals" (*Essay concerning Human Understanding*, Book II, Ch. 9). On the other hand, apperception denotes a state of conscious or reflecting awareness.

In contrast, Descartes makes no distinction between the two. But he stresses the volitional element (which he calls passion) in the cognitive process: "For it is certain that we would not even know how to will something, unless we had apperceived it by the same medium by which we will. And just as one can say with regard to our soul that willing is a form of action, so one can also say that there is in the soul an element ["passion"] by which it apperceives that which it wills" (*Traité des passions*).

LEIBNIZ

It was Gottfried Wilhelm Leibniz who introduced the concept of apperception into the more technical philosophical tradition. In his *Principes de la nature fondés en raison et de la grâce* he says: "One should distinguish between *perception*, which is an inner state of the monad reflecting the outer world, and *apperception*, which is our conscious reflection of the inner state of the monad."

For the understanding of Leibniz's ideas about perception and apperception, one should also refer to his *Nouveaux essais sur l'entendement humain*, which contain a discussion of Locke's *Essay concerning Human Understanding*. There Leibniz objects to Locke's *tabula rasa* theory, according to which "there are no innate principles in the mind" (Book I, Ch. 2). Leibniz's insistence on innate mental powers had a decisive influence on the idealism of Immanuel Kant and Johann Friedrich Herbart.

KANT

The concept of apperception was taken up by Kant in his *Critique of Pure Reason*. There he distinguished between empirical apperception, the person's awareness of himself which depends on the changing conditions of his consciousness, and transcendental apperception, or "pure reason," the inner, unchangeable fundamental, and therefore "transcendental" unity of consciousness. This transcendental unity of consciousness precedes all data of perception and makes possible their inner order and meaning ("Transcendental Logic," Para. 12). It consists of the ideas of space and time, which are not objects of perception but modes of perceiving, and a number of categories which Kant orders under the headings of quantity, quality, relation, and modality. Kant's attempt to organize these categories and their subcategories according to a symmetrical scheme has been generally rejected as artifi-

cial. Kant's rejection of the opinion, however, that our conscious reasoning about the world reflects the world as it really is remains as one of the great epistemological problems in his concept of apperception.

IDEALISTS

The self-critical quality in Kant's philosophy was not heeded by romantic idealists impatient to achieve a complete insight into the essence of all existence. Thus Johann Gottlieb Fichte turned Kant's self-critical concept of apperception into the absolute self; Hegel developed logical idealism; and Friedrich Wilhelm Joseph von Schelling maintained in his philosophy of identity that the evolution of mind or consciousness is nothing but the evolution of ultimate reality from its prerational and groping state of willing toward self-consciousness and self-direction, toward the discovery of its inherent and universal laws. Whatever we think about Schelling's lofty speculation, it led its author to the understanding of myth. For in myth, so Schelling concluded, the human mind in its prerational state creates its first perceptions of reality in the form of artistic intuition and imagery. Myth, so we could say with Schelling, is not untruth but pretruth. About half a century later, following Schelling's lead, Wilhelm Wundt became one of the foremost interpreters of prerational or mythical thinking.

HERBART

In contrast with the romanticists, Kant's successor, Johann Friedrich Herbart, insisted on a less romantic and more empirical interpretation of the transcendentalist position. In the second part of his *Psychologie als Wissenschaft*, however, Herbart characterizes the gift of apperception as one—though not the only one—of the qualities that distinguish man from animal because it gives him the power of reflection. In the human soul, so Herbart says, there are operating series of presentations, combinations, and whole masses of perceptions that are sometimes completely and sometimes incompletely interwoven, in part conforming and in part opposed to each other. It is the function of apperception to assimilate the various and often divergent ideas. In this process the older apperceptive mass, consisting of concepts, judgments, and maxims, will tend to assimilate more recent and less settled impressions. No one, however, can measure how strong the older apperceptive mass must be in order to fulfill effectively the function of assimilation.

Obviously, the power of apperception as conceived by Herbart is closely related to a person's inner stability, self-consciousness, and self-identity. Apperception

requires will and attention in order to function adequately. A mentally sick person will be unable to perform it.

Inevitably, the concept of apperception plays a decisive role in Herbart's pedagogical theory. In his *Allgemeine Pädagogik aus dem Zweck der Erziehung Abgeleitet*, Herbart emphasizes the obligation of the teacher to arrange the course of instruction in such a way that the new material can be properly integrated with the already available store of knowledge. If the two fall apart, the learner cannot assimilate the new experience and will feel frustrated.

WUNDT

The qualities of will and attention, which from Descartes to Herbart were emphasized as inherent in the apperceptive process, are still more accentuated by Wilhelm Wundt. In his *Grundriss der Psychologie*, Wundt distinguishes between passive apperception, in which the consciousness simply accepts impressions, and active apperception, in which the new impression is met by an emotional state of tension followed by a sense of satisfaction. Furthermore, in all apperception a personifying element is at work in that the apperceived objects are colored by the mode of the apperceiving subject. This is the reason why we tend to identify apperceived objects with our own form of existence. The most obvious historical example of this tendency is myth, in which, for example, animals, the forces of nature, and the gods appear in anthropomorphic transfiguration.

Entirely in the spirit of Wundt is the following (freely translated) passage from the well-known *Grundriss der Geschichte der Philosophie seit Beginn des neunzehnten Jahrhunderts*:

There is nothing inside and outside of man which he could call totally his own but his will. ... Hence, looking for the terminus of individual psychological regression, we discover the *inner will* or the *pure apperception*, which is not in a state of quiet, but in a state of never resting activity. The apperceptive will is not an a-posteriori conception, but an a-priori, postulated by reason, a transcendental quality of the soul, postulated by empirical psychology as the ultimate source of all mental processes, yet at the same time beyond the competence of the empirical psychologist.

THE DEEPER UNITY

In quoting the foregoing passage (omitted in later editions of Ueberweg-Heinze) we have already indicated the deeper unity that in spite of all differences underlies the apperception theories of Leibniz, Kant, Herbart, and Wundt. They predicate a transcendental element, or an inherent logos, in the human process of cognition because they are convinced that there is no other explanation for its uniting and ordering capacity. They belong, in the wide sense of the term, to the “idealistic” tradition of the *philosophia perennis*, although they are in no way opposed to painstaking empirical and statistical inquiry, as the examples of Herbart and Wundt prove.

In postulating a transempirical factor as the condition of experience, however, they expose themselves to the reproach of mysticism by the empiricist. And there can be no doubt that the modern experimental, associationist, and behaviorist schools have made us more critical of psychological concept. Nevertheless, it still seems to many contemporary philosophers and psychologists that a purely empirical account of knowledge is inadequate and that in order to achieve a defensible position it is necessary to have recourse to nonempirical factors such as apperception.

APPLIED ETHICS

Moral philosophers have traditionally aspired to normative theories of what is right or wrong that are set out in the most general terms. But a practical price is paid for generality in ethical theory: It is often unclear whether and, if so, how theory is to be applied in specific cases and contexts. The terms applied ethics and practical ethics came in vogue in the 1970s, when philosophical ethics began to address issues in professional ethics as well as social problems such as capital punishment, abortion, environmental responsibility, and affirmative action. Philosophers interested in applying their training to such problems share with persons from numerous other fields the conviction that decision making in these areas is fundamentally moral and of the highest social importance.

Philosophers working in applied ethics sometimes do more than teach and publish articles about applications of ethical theory. Their work involves actual applications. They serve as consultants to government agencies, hospitals, law firms, physician groups, business corporations, and engineering firms. Branching out further, they serve as advisers on ethics to radio and educational television, serve on national and state commissions on ethics and policy, and give testimony to legislative bodies. Occasionally, they draft public policy documents, some with the force of law.

Controversies have arisen about whether philosophers have an ethical expertise suited to such work and also about whether the work is philosophical in any interesting sense. Enthusiasm about applied ethics is mixed in academic philosophy. It has been criticized as lacking in serious scholarship, and many philosophers regard it as reducing ethics to engineering—a mere device of problem solving. Some philosophers are not convinced that philosophical theories have a significant role to play in

the analysis of cases or in policy and professional contexts, and others are skeptical that philosophical theories have direct practical implications.

DEFINITIONAL PROBLEMS

“Applied ethics” has proved difficult to define, but the following is a widely accepted account: Applied ethics is the application of general ethical theories to moral problems with the objective of solving the problems. However, this definition is so narrow that many will not recognize it as reflecting their understanding of either the appropriate method or content. “Applied ethics” is also used more broadly to refer to any use of philosophical methods critically to examine practical moral decisions and to treat moral problems, practices, and policies in the professions, technology, government, and the like. This broader usage permits a range of philosophical methods (including conceptual analysis, reflective equilibrium, phenomenology, etc.) and does not insist on problem solving as the objective.

Biomedical ethics, political ethics, journalistic ethics, legal ethics, environmental ethics, and business ethics are fertile areas for such philosophical investigation. However, “applied ethics” is not synonymous with “professional ethics” (a category from which business ethics is often excluded). Problems such as the allocation of scarce social resources, just wars, abortion, conflicts of interest in surrogate decision making, whistleblowing, the entrapment of public officials, research on animals, and the confidentiality of tax information extend beyond professional conduct, but all are in the domain of applied ethics. Likewise, professional ethics should not be viewed as a part of the wider domain of applied ethics. The latter is usually understood as the province of philosophy, the former as reaching well beyond philosophy and into the professions themselves.

HISTORY

Philosophers from Socrates to the present have been attracted to topics in applied ethics such as civil disobedience, suicide, and free speech; and philosophers have written in detail about practical reasoning. Nonetheless, it is arguably the case that there never has been a genuine practical program of applied philosophy in the history of philosophy (the casuists possibly qualifying as an exception). Philosophers have traditionally tried to account for and justify morality, to clarify concepts, to examine how moral judgments and arguments are made, and to array basic principles—not to use either morality or theories to solve practical problems.

This traditional set of commitments began to undergo modification about the time the *Encyclopedia of Philosophy* was first published in 1967. Many hypotheses can be invoked to explain why. The most plausible explanation is that law, ethics, and many of the professions—including medicine, business, engineering, and scientific research—were profoundly affected by issues and concerns in the wider society regarding individual liberties, social equality, and various forms of abuse and injustice. The issues raised by civil rights, women’s rights, the consumer movement, the environmental movement, and the rights of prisoners and the mentally ill often included ethical issues that stimulated the imagination of philosophers and came to be regarded by many as essentially philosophical problems. Teaching in the philosophy classroom was influenced by these and other social concerns, most noticeably about unjust wars, dramatic ethical lapses in institutions, domestic violence, and international terrorism. Increases in the number of working women, affirmative action programs, escalation in international business competition, and a host of other factors heightened awareness. Classroom successes propelled the new applied ethics in philosophy throughout the 1970s, when few philosophers were working in the area but public interest was increasing.

It is difficult to identify landmark events that stimulated philosophers prior to *Roe v. Wade* (the U.S. Supreme Court decision on abortion in 1973), which deeply affected applied philosophical thinking. But at least one other landmark deserves mention. Research ethics had been poorly developed and almost universally ignored in all disciplines prior to the Nuremberg Trials. This apathy was shaken when the Nuremberg Military Tribunals unambiguously condemned the sinister political motivation and moral failures of Nazi physicians. The ten principles constituting the “Nuremberg Code” served as a model for many professional and governmental codes formulated in the 1950s and 1960s and eventually influenced philosophers as well.

In the late 1960s and early 1970s there emerged a rich and complex interplay of scholarly publications, journalism, public outrage, legislation, and case law. The 1970s and 1980s saw the publication of several books devoted to philosophical treatments of various subjects in applied ethics, concentrating first on biomedical ethics and second on business ethics. Virtually every book published in these applied fields prior to 1979 was organized topically; none was developed explicitly in terms of moral principles or ethical theory. Philosophers had by this time been working in areas of applied ethics for several years with

an interest in the connection between theory, principles, practical decision making, and policy. However, in retrospect, it appears that these connections and their problems were not well understood prior to the mid-1980s.

MODELS OF APPLICATION, REASONING, AND JUSTIFICATION

When applied ethics began to receive acceptance in philosophy, it was widely presumed that the “applied” part involves the application of basic moral principles or theories to particular moral problems or cases. This vision suggests that ethical theory develops general principles, rules, and the like, whereas applied ethics treats particular contexts through less general, derived principles, rules, judgments, and the like. From this perspective applied ethics is old morality or old ethical theory applied to new areas. New, derived precepts emerge, but they receive their moral content from the old precepts. Applied work need not, then, generate novel ethical content. Applied ethics requires only a detailed knowledge of the areas to which the ethical theory is being applied (medicine, engineering, journalism, business, public policy, court cases, etc.).

Many philosophers reject this account because it reduces applied ethics to a form of deductivism in which justified moral judgments must be deduced from a pre-existing theoretical structure of normative precepts that cover the judgment. This model is inspired by justification in disciplines such as mathematics, in which a claim is shown to follow logically (deductively) from credible premises. In ethics the parallel idea is that justification occurs if and only if general principles or rules, together with the relevant facts of a situation (in the fields to which the theory is being applied) support an inference to the correct or justified judgment(s). In short, the method of reasoning at work is the application of a norm to a clear case falling under the norm.

This deductive model is sometimes said to be a top-down “application” of precepts. The deductive form in the application of a rule is the following:

1. Every act of description A is obligatory. (rule)
2. Act b is of description A. (fact)

Therefore,

3. Act b is obligatory. (applied moral conclusion)

This structure directs attention from particular judgments to a covering level of generality (rules and principles that cover and justify particular judgments) and then

to the level of ethical theory (which covers and warrants rules and principles).

This model functions smoothly whenever a fact circumstance can be subsumed directly under a general precept, but it does not adequately capture how moral reasoning and justification proceed in complicated cases. The failure to explain complex moral decision making and innovative moral judgment has led to a widespread rejection of deductivism as an appropriate model for applied ethics. Among the replacements for deductivism as a model of application, two have been widely discussed in the literature: case-based reasoning and reflective equilibrium.

CASE-BASED REASONING (A FORM OF CASUISTRY).

This approach focuses on practical decision making about particular cases, where judgments cannot simply be brought under general norms. Proponents are skeptical of principles, rules, rights, and theory divorced from history, circumstances, and experience: One can make successful moral judgments of agents and actions, they say, only when one has an intimate understanding of particular situations and an appreciation of the record of similar situations. They cite the use of narratives, paradigm cases, analogies, models, classification schemes, and even immediate intuition and discerning insight.

An analogy to the authority operative in case law is sometimes noted: When the decision of a majority of judges becomes authoritative in a case, their judgments are positioned to become authoritative for other courts hearing cases with similar facts. This is the doctrine of precedent. Defenders of case-based reasoning see moral authority similarly: Social ethics develops from a social consensus formed around cases, which can then be extended to new cases without loss of the accumulated moral wisdom. As a history of similar cases and similar judgments mounts, a society becomes more confident in its moral judgments, and the stable elements crystallize in the form of tentative principles; but these principles are derivative, not foundational.

In addition to having a history dating from medieval casuistry, the case method, as it is often called, has long been used in law schools and business schools. Training in the case method is widely believed to sharpen skills of legal and business reasoning as well as moral reasoning. One can tear a case apart and then construct a better way of treating similar situations. In the thrust-and-parry classroom setting, teacher and student alike reach conclusions about rights, wrongs, and best outcomes in cases. The objective is to develop a capacity to grasp problems

and to find novel solutions that work in the context: Knowing how to reason and act is more prized than knowing that something is the case on the basis of a foundational rule.

The case method in law has come to be understood as a way of learning to assemble facts and judge the weight of evidence—enabling the transfer of that weight to new cases. This task is accomplished by generalizing and mastering the principles that control the transfer, usually principles at work in the reasoning of judges. Use of the case method in business schools springs from an ideal of education that puts the student in the decision-making role after an initial immersion in the facts of a complex situation. Here the essence of the case method is to present a situation replete with the facts, opinions, and prejudices that one might encounter and to find a way of making appropriate decisions in such an environment.

REFLECTIVE EQUILIBRIUM (A FORM OF COHERENCE THEORY). Many now insist that the relationship between general norms and the particulars of experience is bilateral (not unilateral). Moral beliefs arise both by generalization from the particulars of experience (cases) and by making judgments in particular circumstances by appeal to general precepts. John Rawls's celebrated account of "reflective equilibrium" has been the most influential model of this sort. In developing and maintaining a system of ethics, he argues, it is appropriate to start with the broadest possible set of considered judgments about a subject and to erect a provisional set of principles that reflects them. Reflective equilibrium views investigation in ethics (and theory construction) as a reflective testing of moral principles, theoretical postulates, and other relevant moral beliefs to make them as coherent as possible. Starting with paradigms of what is morally proper or morally improper, one then searches for principles that are consistent with these paradigms as well as one another. Widely accepted principles of right action and considered judgments are taken, as Rawls puts it, "provisionally as fixed points" but also as "liable to revision."

"Considered judgments" is a technical term referring to judgments in which moral beliefs and capacities are most likely to be presented without a distorting bias. Examples are judgments about the wrongness of racial discrimination, religious intolerance, and political conflict of interest. By contrast, judgments in which one's confidence level is low or in which one is influenced by the possibility of personal gain are excluded from consideration. The goal is to match, prune, and adjust consid-

ered judgments so that they coincide and are rendered coherent with the premises of theory. That is, one starts with paradigm judgments of moral rightness and wrongness and then constructs a more general theory that is consistent with these paradigm judgments (rendering them as coherent as possible); any loopholes are closed, as are all forms of incoherence that are detected. The resultant action guides are tested to see if they too yield incoherent results. If so, they are readjusted or given up, and the process is renewed, because one can never assume a completely stable equilibrium. The pruning and adjusting occur by reflection and dialectical adjustment, in view of the perpetual goal of achieving reflective equilibrium.

This model demands the best approximation to full coherence under the assumption of a never-ending search for defects of coherence, for counterexamples to beliefs, and for unanticipated situations. From this perspective moral thinking is analogous to hypotheses in science that are tested, modified, or rejected through experience and experimental thinking. Justification is neither purely deductivist (giving general action guides preeminent status), nor purely inductivist (giving experience and analogy preeminent status). Many different considerations provide reciprocal support in the attempt to fit moral beliefs into a coherent unit. This is how we test, revise, and further specify moral beliefs. This outlook is very different from deductivism, because it holds that ethical theories are never complete, always stand to be informed by practical contexts, and must be tested for adequacy by their practical implications.

METHOD AND CONTENT: DEPARTURES FROM TRADITIONAL ETHICAL THEORY

In light of the differences in the models just explored and the enormously diverse literature in applied philosophy it is questionable whether applied ethics has a special philosophical method. Applied philosophers appear to do what philosophers have always done: They analyze concepts, examine the hidden presuppositions of moral opinions and theories, offer criticism and constructive accounts of the moral phenomena in question, and criticize strategies that are used to justify beliefs, policies, and actions. They seek a reasoned defense of a moral viewpoint, and they use proposed moral frameworks to distinguish justified moral claims from unjustified ones. They try to stimulate the moral imagination, promote analytical skills, and weed out prejudice, emotion, misappropriated data, false authority, and the like.

Differences between ethical theory and applied ethics are as apparent over content as over method. Instead of analyzing general terms such as “good”, “rationality”, “ideals”, and “virtues”, philosophers interested in applied ethics attend to the analysis of concepts such as confidentiality, trade secrets, environmental responsibility, euthanasia, authority, undue influence, free press, privacy, and entrapment. If normative guidelines are proposed, they are usually specific and directive. Principles in ethical theory are typically general guides that leave considerable room for judgment in specific cases, but in applied ethics proponents tend either to reject principles and rules altogether or to advance precise action guides that instruct persons how to act in ways that allow for less interpretation and discretion. Examples are found in literature that proposes rules of informed consent, confidentiality, conflict of interest, access to information, and employee drug testing.

However, in philosophy journals that publish both applied and theoretical work no sharp line of demarcation is apparent between the concepts and norms of ethical theory and applied ethics. There is not even a discernible continuum from theoretical to applied concepts or principles. The applied/theoretical distinction therefore needs to be used with great caution.

COMPETING THEORIES AND PROBLEMS OF SPECIFICITY

One reason theory and application are merged in the literature is that several different types of ethical theories have been employed in attempts to address practical problems. At least the following types of theories have been explicitly invoked: (1) utilitarianism, (2) Kantianism, (3) rights theory, (4) contract theory, (5) virtue theory, (6) communitarianism, (7) casuistry, and (8) pragmatism. Many proponents of these theories would agree that specific policy and practical guidelines cannot be squeezed from appeals to these philosophical ethical theories and that some additional content is always necessary.

Ethical theories have rarely been able to raise or answer the social and policy questions commonplace in applied ethics. General theories are ill suited for this work, because they address philosophical problems and are not by their nature practical or policy oriented. The content of a philosophical theory, as traditionally understood, is not of the right sort. Philosophical theories are about morality, but they are primarily attempts to explain, unify, or justify morality, not attempts to specify the practical commitments of moral principles in public

policy or in particular cases. In applied ethics, ethical theory is often far less important than moral insight and the defense and development of appropriate guidelines suited to a complex circumstance.

Every general ethical norm contains an indeterminacy requiring further development and enrichment to make it applicable in a complex circumstance. To have sufficient content, general theories and principles must be made specific for contexts; otherwise, they will be empty and ineffectual. Factors such as efficiency, institutional rules, law, and clientele acceptance must be taken into account to make them more specific. An ethics useful for public and institutional policies needs to prove a practical strategy that incorporates political procedures, legal constraints, uncertainty about risk, and the like. Progressive specification of norms will be required to handle the variety of problems that arise, gradually reducing dilemmas, policy options, and contingent conflicts that abstract theory and principle are unable to handle.

Some philosophers view this strategy of specification as heavily dependent upon preexistent practices. They maintain that major contributions in philosophical ethics have run from “applied” contexts to “general” theory rather than the reverse. In examining case law and institutional practices, they say, philosophers have learned about morality in ways that require rethinking and modifying general norms of truth telling, consenting, confidentiality, justice, and so forth. To the extent that sophisticated philosophical treatments of such notions are now emerging, they move, not from theory application (including specification), but from practice to theory. Traditional ethical theory, from this perspective, has no privileged position and has more to learn from “applied contexts” than the other way around.

Nonetheless, there are problems with attempts to base applied ethics entirely in practice standards. A practice standard often does not exist within the relevant field, group, or profession. If current standards are low, they could not legitimately determine what the appropriate standards should be. Most moral problems present issues that have to be thought through, not issues to which good answers have already been provided, which explains why many in the professions have turned to philosophers for help in developing professional ethics. Applied philosophers are often most useful to those with whom they collaborate in other fields when practice standards are defective or deficient and a vacuum needs filling by reflection on, criticism of, and reformulation of moral viewpoints or standards.

A PRIORI AND A POSTERIORI

The distinction between the a priori and the a posteriori has always been an epistemological one; that is to say, it has always had something to do with knowledge. The terms *a priori* and *a posteriori* are Scholastic terms that have their origin in certain ideas of Aristotle; but their use has been considerably extended in the course of history, and their present use stems from the meaning given to them by Immanuel Kant. The terms literally mean "from what is prior" and "from what is posterior." According to Aristotle, *A* is prior to *B* in nature if and only if *B* could not exist without *A*; *A* is prior to *B* in knowledge if and only if we cannot know *B* without knowing *A*. It is possible for these two senses of "prior" to have an application in common; substance, for example, is prior to other things in both of these senses and in others. It follows that to know something from what is prior is to know what is, in some sense, its cause. Aristotle believed that it is possible to demonstrate a causal relationship by means of a syllogism in which the term for the cause is the middle term. Hence, to know something in terms of what is prior is to know it in terms of a demonstrable causal relationship. To know something from what is posterior, on the other hand, can involve no such demonstration, since the knowledge will be inductive in form.

The transition to Kant's conception of the matter is evident in Gottfried Wilhelm Leibniz. According to the latter, to know reality a posteriori is to know it from what is actually found in the world, that is, by the senses, by the effects of reality in experience; to know reality a priori is to know it "by exposing the cause or the possible generation of the definite thing" (*Nouveaux Essais*, Bk. III, Ch. 3). It is also possible to speak of a priori proofs. As a general consequence of this, Leibniz could distinguish between "truths a posteriori, or of fact," and "truths a priori, or of reason" (*ibid.*, Bk. IV, Ch. 9); for a priori truths can be demonstrated in terms of their being based on identical propositions, while a posteriori truths can be seen to be true only from experience. Thus the distinction between the a posteriori and the a priori comes to be a distinction between what is derived from experience and what is not, whether or not the notion of the a priori also has the notion of demonstration in terms of cause or reason associated with it. Such is the distinction in Kant, and it has remained roughly the same ever since. Since in Kant there is no simple opposition between sense experience and reason (there being also the understanding), it is not possible to express the distinction he laid down as one

between what is derived from experience and what is derived from reason.

The distinction, then, is roughly equivalent to that between the empirical and the nonempirical. Kant also connected it with the distinction between the necessary and the contingent, a priori truths being necessary and a posteriori truths contingent. But to assume without further argument that the two distinctions coincide in their application is to assume too much. The same is true of the distinction between the analytic and the synthetic; this too cannot be assimilated without argument to that between the a priori and a posteriori. Whether or not these distinctions coincide in their applications, they certainly cannot have the same meaning. The distinction between the a priori and a posteriori is an epistemological one; it is certainly not evident that the others are.

THE DISTINCTION APPLIED TO CONCEPTS

The distinction between the a priori and the a posteriori has been drawn not only in connection with truths or propositions but also in connection with concepts. Indeed, some truths are doubly a priori; not only is their truth knowable independently of experience but the concepts that they involve are similarly independent of experience. The distinction between a posteriori and a priori concepts may seem a perspicuous one, for it may be thought to be a distinction between concepts that we derive from experience by building them up therefrom and concepts that we have independently of experience. It has sometimes been said also that the latter concepts are innate ideas, with which we are born, so that we have no need to acquire them. But the question whether ideas are innate or acquired seems to be one of psychology, as is the question how we acquire ideas if we do. The distinction under consideration, being an epistemological one, has no direct connection with psychology. A concept that is independent of experience may or may not be innate; and although it cannot be acquired directly from experience, it may still be that experience is in some way a necessary condition of our having the concept. What then does it mean to say that a concept is independent of experience? The answer must be in terms of the validation of the concept.

It may be assumed for present purposes that a concept is what is meant by the corresponding term (although this may not be a fully adequate view and bypasses the question whether concepts are independent of words). To have a concept will thus at least be to understand the corresponding term. Perhaps, then, an a poste-

riori concept is one expressed by a term understandable purely in terms of experience, and an a priori concept one that does not satisfy this condition. The point has sometimes been made by saying that an a posteriori, or empirical, concept or term is one that is cashable in terms of sense experience. This is of course a metaphor, and what it means is that the meaning of empirical terms can be given by definitions that must ultimately depend on ostensive definitions only. Ostensive definitions are those which provide the definition of a term by a direct confrontation with experience. To define a term ostensively it is necessary only to repeat the expression together with some form of pointing to the object or phenomenon in question. It is highly questionable, however, whether any performance of this kind could ever constitute definition as such. For the meaning of a word to be taught in this way there would have to be (as Ludwig Wittgenstein in effect pointed out at the beginning of his *Philosophical Investigations*) a previous understanding that the noise made was a word in a language and in a language of a definite sort. Furthermore, it would have to be understood what sort of term was being defined—whether it was descriptive and, if so, what range of phenomena it was being used to describe. If all this must be understood, it can scarcely be said that the term in question is defined purely by reference to sense experience.

Nevertheless, there is some distinction to be made here. Even if such terms as “red” cannot be defined purely by reference to experience, they could not be understood fully without experience, for example, by someone who does not possess and never has possessed sight. There is a sense in which the blind *can*, up to a point, understand terms such as “red,” in that they can know that red is a color and even a color of a certain sort related to other colors in certain ways. But since they cannot know when to apply the term in fact, there is an obvious sense in which they do not have a full understanding of it—and the same applies to the notion of color itself. A posteriori terms and concepts may thus be defined as those that directly require our having experience in order for us to apply them or those that can only be fully understood by reference to terms that directly require our having experience to apply them. Whether or not a creature without experience could ever come to have a concept such as, for example, validity, it is clear that being able to apply the concept does not directly require experience. This may afford the basis of a distinction between a posteriori and a priori concepts. There may be various views about a priori concepts, concerning, for example, whether they are to be restricted to concepts of, or concepts involved in, mental operations on a posteriori concepts. Empiricists

have in general held that the only a priori concepts are those that express relations of ideas. The field is thus restricted to the concepts of logic and mathematics.

THE DISTINCTION APPLIED TO PROPOSITIONS

In a sense, the distinction between concepts presupposes the distinction between propositions, since concepts can be applied only in propositions. According to the rough criteria already mentioned, an a priori proposition will be one whose truth is knowable independently of experience. It may be questioned, however, whether there are any truths that can be known if the subject has no experiences whatever. Hence, the matter is better put in terms of the validation of the proposition in question, in terms of its verification or falsification. It has sometimes been suggested that a proposition is a priori if its truth is ascertainable by examination of it alone or if it is deducible from such propositions. An a priori proposition would thus be one that provides its own verification; it is true in itself. This account is too restrictive, since there may be propositions whose truth is ascertainable by argument that makes no reference to empirical matters of fact, but that may not be deducible from any propositions of the kind previously mentioned. That is to say, there may be circumstances in which it is possible to validate propositions by argument that makes no reference to matters of fact discoverable by experience. Empiricists have generally denied this, but the possibility of what Kant called “transcendental arguments” cannot be so lightly dismissed. Aristotle’s argument for the truth of the principle of contradiction would be a case in point, namely, that a denial of it already presupposes it.

On the other hand, to say simply that a priori propositions are those whose truth can be discovered without reference to experience is too wide a definition. For it may be argued that the terms in which many such propositions are expressed could only be fully understood by reference to experience. A proposition may be a priori without its involving terms that are without exception a priori. It was for this reason that Kant distinguished between a priori and *pure* a priori judgments; only in the latter are all the terms a priori. In view of this, an a priori proposition may be defined as one whose truth, given an understanding of the terms involved, is ascertainable by a procedure that makes no reference to experience. The validation of a posteriori truths, on the other hand, necessitates a procedure that does make reference to experience.

CAN ANALYTIC PROPOSITIONS BE A POSTERIORI? It has already been mentioned that Kant superimposed upon the a priori–a posteriori distinction the distinction between the analytic and the synthetic. There are difficulties involved in defining this latter distinction, but for present purposes it is necessary to note that Kant assumed it impossible for analytic judgments to be a posteriori. He does this presumably on the grounds that the truth of an analytic judgment depends upon the relations between the concepts involved and is ascertainable by determining whether the denial of the judgment gives rise to a contradiction. This latter procedure is surely one that makes no reference to experience. Kant is clearly right in this. As already seen, it is not relevant to object that since analytic judgments, propositions, or statements need not involve purely a priori terms, evaluation of the truth of some analytic propositions will involve reference to experience; for in determining whether a proposition is a priori, it is necessary to take as already determined the status of the terms involved. It is similarly irrelevant to maintain that it is sometimes possible to come to see the truth of an analytic proposition through empirical means. It may be possible, for example, for a man to realize the truth of “All bachelors are unmarried men” as an analytic proposition as a consequence of direct experience with bachelors. But this consequence will be an extrinsic one. That is to say that while the man may attain this insight in this way, it will be quite accidental; the validity of the insight does not depend upon the method by which it is acquired. That is why the definition of an a priori proposition or statement involves the idea that its truth must be ascertainable without reference to experience. As long as a nonempirical procedure of validation exists, the proposition in question will be a priori, whether or not its truth is always ascertained by this procedure. It is quite impossible, on the other hand, for an a posteriori proposition to be validated by pure argument alone.

MUST A POSTERIORI PROPOSITIONS BE CONTINGENT? Given that all analytic propositions are a priori, it is a further question whether all synthetic propositions must be a posteriori. This is a hotly debated question, with empiricists maintaining that they must be. But first it is necessary to consider the relation between the a priori–a posteriori dichotomy and the necessary–contingent one.

Kant certainly associated the a priori with the necessary, and there is a *prima facie* case for the view that if a proposition is known a posteriori, its truth must be contingent. For how can experience alone tell us that some-

thing must be so? On the other hand, it might be maintained that we can learn inductively that a connection between characteristics of things holds as a matter of necessity. Some philosophers maintain that natural laws represent necessary truths, and they do not all think this incompatible with the view that natural laws can be arrived at through experience. What is sometimes called intuitive induction—a notion originating in Aristotle—is also something of this kind; we see by experience that something is essentially so and so. An even greater number of philosophers would be willing to assert that, in *some* sense of the word “must,” experience can show us that something must be the case. Certainly the “must” in question is not a logical “must,” and empiricists have tended to maintain that all necessity is logical necessity. This, however, is just a dogma. It seems plausible to assert that an unsupported body must in normal circumstances fall to the ground.

Yet it must be admitted that the normal philosophical conception of necessity is more refined than this, and to say that an unsupported body must in normal circumstances fall to the ground need not be taken as incompatible with saying that this is a contingent matter. Similarly, there is an important sense in which natural laws are contingent; they are about matters of fact. If we also think of them as necessary, the necessity in question stems from the conceptual framework into which we fit them. It is possible to conceive of empirical connections in such a way that, within the framework of concepts in which we place them, they are treated as holding necessarily. It is still a contingent matter whether the whole conceptual framework has an application. If propositions expressing such connections are a priori, it is only in a relative sense.

MUST A PRIORI PROPOSITIONS BE NECESSARY? It seems at first sight that there is no necessity for nonempirical propositions to be necessary, or rather that it is possible to construct propositions which, if true, must be true a priori, while they apparently remain contingent. These are propositions that are doubly general. They may be formalized in such a way as to contain both a universal and an existential quantifier, for example, $(x) \cdot \exists y \cdot \phi xy$. Such propositions have been called by J. W. N. Watkins (following Karl Popper) “all and some propositions.” Because they have this kind of double generality, they are both unverifiable and unfalsifiable. The element corresponding to the universal quantifier makes them unverifiable; that corresponding to the existential quantifier makes them unfalsifiable. Under the circumstances they can hardly be said to be empirical. An example of this kind of proposition is the principle of universal causality,

“Every event has a cause,” which is equivalent to “For every event there is some other event with which it is causally connected.” It has been claimed by some philosophers, for instance, G. J. Warnock, that this proposition is vacuous, since no state of affairs will falsify it. But the most that can be claimed in this respect is that no *particular* state of affairs *which can be observed* will falsify it. It is clearly not compatible with any state of affairs whatever, since it is incompatible with the state of affairs in which there is an event with no cause. It remains true that it is impossible to verify that an event has no cause.

Watkins does not claim that the proposition is necessary, although the principle of causality has been held by many, for instance, Kant, to be an example of a necessary truth, and it could no doubt be viewed as such. But it is also possible to treat it as a contingent truth, one that holds only in the contingency of every event being causally determined. How we could know that such a contingency held is a further question. It is clear that nothing that we could observe would provide such knowledge. Such propositions certainly could not be *known* a posteriori; if true, they must be known a priori if they are to be known at all. The difficulty is just this—how *are* they to be known at all? Thus, it may be better to distinguish between a priori propositions and nonempirical propositions of this kind. A priori propositions are those which can be known to be true and whose truth is ascertainable by a procedure that makes no reference to experience; nonempirical propositions of the kind in question are not like this, for their truth is, strictly speaking, not ascertainable at all. If we accept them, it must be as mere postulates or as principles whose force is regulative in some sense.

This does not exclude the possibility that there are other propositions whose truth can be ascertained by a nonempirical procedure but that are less than necessary. It has been argued by J. N. Findlay that there are certain propositions asserting connections between concepts that are only probable, as opposed to the commonly held view that all connections existing among concepts are necessary. He maintains that our conceptual systems may be such that there are connections between their members that are by no means analytic; the connections do not amount to entailments. Perhaps something like the Hegelian dialectic is the prototype of this. Findlay argues, for example, that if one has likings, there is the presumption that one will like likings of this sort; on this sort of basis one could move toward the notion of a community of ends. It is difficult to speak more than tentatively here. Given, however, that the propositions stating these con-

ceptual connections are, if true, then true a priori (as they surely must be), it is not clear that it is necessary to claim only that what one knows in relation to them is probable. Certainly the connections do not constitute entailments; but this of itself does not mean that what one knows is only probable. The fact that the argument for a certain position is not a strictly deductive one does not mean that the position cannot be expressed by truths that are necessary and can be known to be so. For the argument may justify the claim to such knowledge in spite of the fact that the argument is not deductively valid in the strict sense. If such a necessary proposition does not seem to have universal application, this may be due to the fact that it holds under certain conditions and that its necessity is relative to these conditions. This was Kant's position over the principle of universal causality. He held that the principle that every event has a cause is necessary only in relation to experience. If propositions of this sort lack absolute necessity, they need not lack necessity altogether. The tentative conclusion of this section is that while some propositions may in a certain sense be both nonempirical and contingent, it nevertheless remains true that if a proposition is known a priori, it must be necessarily true in some sense or other.

MUST A PRIORI PROPOSITIONS BE ANALYTIC? It has been suggested in the previous section that there may be a priori propositions that are not analytic. They depend for their validation on a priori argument but cannot be given a deductive proof from logical truths. The question of the synthetic a priori is one of the most hotly debated topics in philosophy and has, indeed, been so ever since Kant first stated the issues explicitly. Empiricists have always vehemently denied the possibility of such truths and have even tried to show that a proposition that is a priori must be analytic by definition. Most attempts of this sort rest on misconceptions of what is meant by these terms.

Kant's synthetic a priori. Kant claimed that synthetic a priori truths were to be found in two fields—mathematics and the presuppositions of experience or science—although he denied that there was a place for them in dogmatic metaphysics. He maintained that although mathematics did contain some analytic truths (since there were propositions which summed up purely deductive steps), the main bulk of mathematical truths were synthetic a priori; they were informative, nonempirical, and necessary, but not such that their denial gave rise to a contradiction. These characteristics were in large part due to the fact that mathematical knowledge involved intuitions of time (in the case of arithmetic) and space (in the

case of geometry). Kant's conception of arithmetic has not found much support, and his view of geometry has often been considered to have been undermined by the discovery of non-Euclidean geometries. It is doubtful, however, whether the situation is quite so simple as this, for what Kant maintained was that an intuition of space corresponding to Euclidean geometry was necessary at any rate *for creatures with sensibility like ours*. That is to say, what we perceive of the world must conform to Euclidean geometry, whether or not it can be conceived differently in abstraction from the conditions of perception. Whether or not this is true, it is not obviously false.

The main attack on the Kantian view of arithmetic, and thereafter on that view of other branches of mathematics, came from Gottlob Frege and from Bertrand Russell and Alfred North Whitehead. Frege defined an analytic proposition as one in the proof of which one comes to general logical laws and definitions only; and he attempted to show that arithmetical propositions are analytic in this sense. The crucial step in this program is Frege's definition of "number" roughly in terms of what Russell called one-to-one relations. (Russell himself gave a parallel definition in terms of similarity of classes.) Given Frege's definition of number, arithmetical operations had to be expressed in terms of the original definition. It is at least an open question whether this attempt was successful. The definition has been accused of being circular and/or insufficient. This being so, the most that can be claimed is that arithmetic, while not reducible to logic, has a similar structure. Nevertheless, Gödel's proof that it is impossible to produce a system of the whole of formal arithmetic that is both consistent and complete may be taken to cast doubt even on this claim. At all events, the exact status of arithmetical truths remains arguable.

Other synthetic a priori truths claimed by Kant were the presuppositions of objective experience. He tried to demonstrate that the truth of such propositions as "Every event has a cause" is necessary to objective experience. These propositions indeed express the necessary conditions of possible experience and of empirical science. As such, their validity is limited to experience, and they can have no application to anything outside experience, to what Kant called "things-in-themselves." According to Kant, these principles—which are of two kinds, constitutive or regulative in relation to experience—are ultimately derived from a list of a priori concepts or categories, which he claims to derive in turn from the traditional logical classification of judgments. These principles, in a form directly applicable to empirical

phenomena, are also established by transcendental arguments. In the “Second Analogy” of the *Critique of Pure Reason*, for example, Kant sought to show that unless objective phenomena were irreversible in time, and therefore subject to rule, and therefore due to causes, it would be impossible to distinguish them from merely subjective phenomena. Causality is therefore a condition of distinguishing phenomena as objective at all. The cogency of this position depends upon the acceptability of the arguments, and it is impossible to examine them here. It is to be noted, however, that what the arguments seek to show is that certain necessary connections between concepts must be accepted if we are to give those concepts any application. The connection between the concepts of “objective event” and “cause” is not an analytic one, but it is a connection that must be taken as obtaining if the concepts are to have any application to empirical phenomena.

Another instance of this kind of situation, perhaps more trivial, can be seen in such a proposition as “Nothing can be red and green all over at the same time in the same respect.” This proposition has sometimes been classified as empirical, sometimes as analytic; but it has been thought by empiricists a more plausible candidate for synthetic a priori truth than any of Kant’s examples. There is clearly some kind of necessity about this proposition. It may be possible for something to *appear* red and green all over, but to suggest that something might *be* red and green all over or that one might produce examples of such a thing has little plausibility; for in some sense red excludes green. The question is, In what sense? Since “red” does not mean “not-green” and cannot be reduced to this (for terms such as “red” and “green” do not seem capable of analysis), the proposition under consideration cannot, strictly speaking, be analytic. How can red and green exclude each other without this being a logical or analytic exclusion? It is not merely a contingent exclusion, since it is clearly impossible to produce something that is red and green all over (shot silk, for example, although it appears so, does not conform to the conditions of being two-colored all over), and we cannot imagine what such a thing would be like.

It may be suggested that red and green are different determinates of the same determinable—color. We distinguish colors and use different terms in order to do so. To allow, then, that something might be described by two such terms at the same time would be to frustrate the purposes for which our system of color classification was devised. However, this may sound too arbitrary. After all, given two colors that do in fact shade into each other, we

might be less reluctant to allow that something might be both of them at once. It is no accident that we distinguish colors as we do. For creatures of our kind of sensibility, as Kant would put it, colors have a definite structure; it is natural to see them in certain ways and to conceive of them accordingly. We then fit them to a conceptual scheme that reflects those distinctions. If we will not allow that something may be red and green all over, it is because the mutual exclusion of red and green is a necessary feature of our scheme of color concepts. Yet the whole scheme has application to the world only because we see colors as we do.

THE RELATIVE AND ABSOLUTE A PRIORI. Because of the empirical preconditions for our scheme of color concepts, if we maintain that we can know a priori that something cannot be red and green all over, it cannot be absolutely a priori. For the truth that something that is red cannot also be green at the same time and in the same respect can scarcely be said to be ascertainable without any reference whatever to experience. The same is true of the principle of universal causality discussed earlier. It might be maintained that the truth that every event has a cause is necessary because “cause” and “event” are so definable that there is an analytic connection between them (implausible as this may be in fact). In that case the proposition in question would be true in all possible worlds (to use a Leibnizian phrase), since its truth would not depend on what is. In a world in which no events occurred, it would be true, in this view, that every event (if there were any) would have a cause. We can know the truth of this proposition absolutely a priori. However, if the principle is not analytic (and it is clearly not, in its ordinary interpretation) but is still thought to be necessary, this can be so only because the connection between cause and event is necessary to our conception of the world as we see it. Similarly, the mutual exclusion of red and green is necessary to our conception of colors as we see them. These propositions are not true in all possible worlds, and while their truth can be known a priori, it is not known absolutely a priori.

On the other hand, the so-called laws of thought, such as the principle of contradiction, while not analytic, must again be known absolutely a priori, whatever the kind of necessity they possess. The truth of the principle of contradiction is necessary to the possibility of thought in general, including the thought of the principle itself. It is not possible even to deny the principle without presupposing it. It cannot be maintained that its truth is in any way ascertainable by a procedure that makes reference to experience. Its truth is a necessity of thought, not of experience.

rience, and is not relative to experience. Hence it may be said to be known absolutely a priori.

Of those propositions that are absolutely a priori there are two kinds—analytic truths and the principles of logic themselves. (It is perhaps not surprising that these have sometimes been classified together, even if wrongly so.) On the other hand, there are some truths that are necessary but known only relatively a priori—truths such as the principle of causality and the principle of the incompatibility of colors. Finally, of course, there is that large class of truths which can only be known a posteriori. But for philosophers these are naturally much less interesting than truths of the first two kinds—those which are a priori in some sense or other. And over these there is still much argument.

ARCESILAUS

(316/315–241/240 BCE)

Arcesilaus was born in Pitane, a Greek city on the coast of Asia Minor. In Athens, after a period of study with Theophrastus—Aristotle’s successor as head of the Peripatos—he joined the Academy, Plato’s school, which was then dominated by Crantor, Polemon, and Crates. Arcesilaus succeeded Crates, Polemon’s successor, as head of the Academy and was responsible for the school’s turn to skepticism. From this point, the skeptical examination of other schools’ theories replaced the elaboration of its own positive doctrines as the Academy’s principal occupation. This change in the Academy’s direction is recognized in the ancient tradition that credits Arcesilaus with founding the second or Middle Academy, which replaced the first or Old Academy and gave way in turn to the third or New Academy of Carneades.

Like Socrates before him and Carneades after him, Arcesilaus wrote nothing, but made his mark in face to face philosophical argument. His practice was not to present views of his own, but instead to invite his interlocutors to put forward their views, which he then subjected to rigorous scrutiny. His method was dialectical: He put questions to his interlocutors from the answers to which he aimed to deduce conclusions at odds with their positions. The effect was to uncover difficulties internal to the interlocutors’ positions without committing him to a position of his own. These arguments were conceived by Arcesilaus and his Academic followers as their contribution to argument on both sides of the question, which they regarded as the best way to discover the truth—their ultimate aim. The resemblance to Socrates is unmistakable and was much emphasized by the Academics.

Their principal target was Stoic epistemology. According to Zeno of Citium, the founder of Stoicism and an older contemporary of Arcesilaus’s, it is possible for human beings to free themselves entirely from opinion—that is, false or insecure belief—and to attain the kind of knowledge that qualifies as wisdom. In the Socratic tradition, Zeno held that wisdom was identical with virtue and as such the one necessary and sufficient condition for happiness. A necessary condition for knowledge on the Stoic view was the existence of cognitive impressions (*kataleptikai phantasiai*). Each of these is a perceptual impression that arises in conditions which both ensure that, by capturing its objects with perfect accuracy, it is true while at the same time imparting to it a character that belongs only to impressions that arise in this way and which human beings can discriminate. According to Stoic epistemology, all knowledge depends in one way or another on cognitive impressions, which is why the cognitive impression is the school’s criterion of truth. By restricting one’s assent (in the sphere of perception) to impressions with this character, one can avoid ever assenting to a false perceptual impression. If further conditions are satisfied, one can avoid error altogether.

Arcesilaus and the Academics argued that, on any plausible account of it, the character allegedly proper to cognitive impressions was not in fact confined to impressions produced in the specified truth-guaranteeing way, but also belonged to false impressions. As a result, the former, though true, are indistinguishable from the latter and therefore unable to serve as a criterion. It follows on Stoic assumptions about knowledge that nothing can be known. This is the first of the two propositions most closely associated with ancient skepticism. The second—that one ought to suspend judgment—Arcesilaus deduced from the first, together with the Stoic insistence that wisdom is incompatible with mere opinion. Assent to a noncognitive impression (or an impression that does not stand in the proper relation to cognitive impressions), automatically results in opinion, so that, in the absence of cognitive impressions, a wise person can avoid opinion only by suspending judgment entirely.

On a strictly dialectical interpretation of his arguments, Arcesilaus did nothing more than present his Stoic opponents with a set of difficulties. On this view, it was their task either to resolve the difficulties or to abandon or modify the position that had given rise to them. Some ancient authorities held that Arcesilaus’s arguments against the possibility of knowledge and in favor of suspension of judgment had implications only for the Stoa and did not prevent him from espousing a form of dog-

matic Platonism within the Academy. But according to another, better-founded tradition in the Academy itself, Arcesilaus agreed with Zeno that opinion is utterly alien to wisdom and that it is a grave failing—indeed a sin—to allow assent to run ahead of knowledge. But, according to this tradition, the lesson he drew from the difficulties that he had uncovered in the Stoic position among others, was that he and his opponents were not, or not yet, in a position to assent, secure in the conviction that they were in possession of the truth. In these conditions, suspension of judgment and continued open-minded inquiry were indicated. The skepticism characterized by this attitude was a matter of intellectual honesty and prudence, rather than convinced adherence to the skeptical proposition that nothing can be known. And Arcesilaus, it is told, was careful to maintain that one could not even know that one could not know anything.

The Stoics responded to Arcesilaus by arguing that, if nothing can be known and people are therefore obliged to withhold assent, life becomes impossible, as there can no basis for judgment without a criterion nor any possibility of action without assent. Arcesilaus's answer appears to have been an extension of his first dialectical arguments, for it aimed to show that Stoic epistemology and moral psychology had the resources to explain how a human being may proceed in the absence of cognitive impressions and act without assent. In these conditions, one will be guided by what is reasonable, the notion that the Stoics had used to explain how the wise will act when certainty is not available. It will, for instance, be reasonable to expect a successful voyage if the weather is fair, the crew skilled and so on. Action, on the other hand, requires only that an impression elicit an impulse, which the Stoics used to explain the behavior of nonrational animals and human children, who lack the power of assent.

Arcesilaus's explanation of how action is possible without assent, at least in the form in which it has survived, is sketchy, and it is not clear that it can do justice to the concerns that moved the Stoics and other philosophers to develop their theories in the first place. It plainly does not have the independent appeal of Carneades's theory of probability or his suggestion that assent, as the Stoics conceived it, could be replaced either by qualified assent or a way of following or using impressions that did not entail assent. Nonetheless Arcesilaus's proposals marked the beginning of a long tradition of defending the skepticism as a way of life, of which Carneades's probabilism and Pyrrhonism were later examples.

The example of Arcesilaus continued to inspire members of the Academy until the end of the school's history and thereafter Pyrrhonists, who regarded New Academics such as Carneades as apostates from the true skeptical way but acknowledged a kinship with Arcesilaus.

ARCHĒ

The Greek term *archē* refers to the original stuff from which the world came to be, according to pre-Socratic philosophers. In his *Metaphysics* Aristotle explains:

Of the first philosophers, the majority thought the sources [*archai*, plural] of all things were found only in the class of matter. For that of which all existing things consist, and that from which they come to be first and into which they perish last—the substance continuing but changing in its attributes—*this*, they say, is the element and this the source [*archē*] of existing

things. Accordingly they do not think anything either comes to be or perishes, inasmuch as that nature is always preserved. ... For a certain nature always exists, either one or more than one, from which everything else comes to be while this is preserved. All, however, do not agree on the number and character of this source, but Thales, the originator of this kind of theory, says it is water....

(*METAPHYSICS* 983B 6–21)

Aristotle seems to use the term *archē* to refer to several different notions that he holds are all part of the pre-Socratics' conception: (1) a primeval chaos in which only one element (or one set of elements) exists; (2) the primeval element that constituted the primitive state, from which all the bodies of the present world were formed; (3) that same fundamental element insofar as it even now constitutes the world; (4) the principle of explanation, or explanatory source (identified with the primeval element), that logically and causally accounts for the phenomena of the world.

According to Aristotle, the pre-Socratic philosophers with cosmological theories agreed in explaining all phenomena as deriving from a single stuff or set of stuffs (sense 4). They disagreed about whether there was only one stuff or several. Those who held that there was only one stuff (monists) disagreed as to what it was: Thales said water; Anaximander said the Boundless; Anaximenes said air; and Heraclitus said fire. Those who held there were several stuffs or elements (pluralists) disagreed among themselves as to what those were: Empedocles said earth, water, air, and fire; Anaxagoras said an unlimited number of homogeneous stuffs including flesh, gold, wood; the atomists said an infinite number of atomic particles of differing shapes.

Aristotle's account, partly through the writings of his colleague Theophrastus on the history of philosophical opinions, dominated ancient and then modern interpretations. Unfortunately, there are a number of problems with his account. First, it seems to conflate two different types of theory, that of the alleged monists, and that of the pluralists, which may operate on different principles. Second, it ignores theories that posit a stable cosmology (in which the world does not arise out of a primeval chaos), such as those of Xenophanes and Heraclitus. Third, it seems to project back onto cosmologists of the sixth century BCE the theory of changeless being that Parmenides invented in the early fifth century BCE.

Fourth, it assumes a sophisticated theory of matter in which a subject is distinguished from attributes or properties, which seems to arise only in the fourth century BCE. Fifth, it embodies a tendentious interpretation of how the pre-Socratics understood causal explanation.

The term *archē* itself in the sense of "beginning, starting point" might have been used by early pre-Socratics such as Anaximander, but there are no extant quotations to verify this. In the late fifth century Diogenes of Apollonia used the term to mean something like "starting point," with a possible implication of being an explanatory principle. (fr. 1). But the term only seems to become a philosophically important one when one considers that Plato described an *archē* as a principle to which nothing is prior (Republic 511b, Phaedrus 245c-d), in effect as supplying a metaphysical ground and a logical axiom. Aristotle himself distinguished six senses of the term, only the last of which is a technical philosophical one, reflecting Plato's use (*Metaphysics* V.1). Aristotle's account of the *archē* as a principle of explanation among the pre-Socratics is highly suggestive but should not be accepted uncritically.

Most of the pre-Socratics were interested in explaining how the present world arose out of a primeval chaos, and also in identifying the basic realities from which the world arose. In those two senses, they sought through their studies and writings to elucidate the sources, the *archai*, of the world. Whether, or in what sense, their basic realities were material, and whether they were changeless, are controversial questions scholars still wrestle with.

ARCHYTAS OF TARENTUM

(c. 425 BCE—c. 350 BCE)

Archytas of Tarentum was active in the first half of the fourth century BCE as a mathematician and a philosopher in the Pythagorean tradition. He is famous for having sent a ship in 361 BCE to rescue Plato from Dionysius II, tyrant of Syracuse. Archytas is unique among ancient philosophers for his success in the political sphere—he was elected general seven consecutive times in a democratically governed Tarentum (at the time one of the most important Greek city-states in southern Italy).

More texts have been preserved in Archytas's name than in that of any other Pythagorean, but the majority of these texts are spurious. The pseudo-Pythagorean treatises of the first century BCE and later were often written in his name, considering him the latest of the three great early Pythagoreans (following Pythagoras himself and Philolaus). The spurious works on categories in Archytas's name were regarded as genuine by the commentators on Aristotle's *Categories* and were frequently cited. Four fragments survive from Archytas's genuine works, of which *Harmonics* was the most important, and there is a relatively rich set of testimonia.

Archytas provided the first solution to one of the most celebrated problems in ancient mathematics, the duplication of the cube. One romantic version of the problem reports that the inhabitants of the island of Delos were commanded by the god to build an altar double the size of the current altar, which had the shape of a cube. The problem was thus to determine the length of the side on which to build a cube of double the volume. Archytas's solution is a masterpiece of mathematical imagination, requiring one to envision the intersection of two lines drawn on the surface of a semicylinder—one by a rotating semicircle and one by a rotating triangle. In later antiquity, a story arose that Plato was critical of Archytas for using mechanical instruments to find the solution and thus perverting the true function of mathematics—that is, to direct the soul to the intelligible realm. This story was probably invented to explain the separation of the science of mechanics from philosophy. No physical instruments are employed in Archytas's solution, and it was criticized by some ancient authors as too abstract and of little practical application. Although Plato's complaints about the state of solid geometry in his day (*Rep.* 528b–d) may be directed at Archytas, they focus not on the use of instruments but rather on the failure of its practitioners to develop a coherent science of solid geometry.

Fr. 1, the beginning of Archytas's *Harmonics*, is the earliest text to identify a quadrivium of four sciences (the science of number, geometry, astronomy, and music). Archytas praises the sciences for beginning by distinguishing the universal concepts relevant to the specific science, but he regards their ultimate goal as an account of individual things in the world in terms of number, thus building on Philolaus's insight that all things are known through number. Archytas's own *Harmonics* begins by distinguishing important general conceptions in acoustics. His mistaken view that pitch depends on the speed with which a sound travels—it depends, in fact, on the frequency of impacts in a given period—was adopted with modifications by both Plato and Aristotle and was the most common view in antiquity. Archytas provided an important proof that the basic musical intervals such as the octave, which correspond to ratios of the form $(n+1)/1$, cannot be divided in half.

The goal of Archytas's harmonics, however, was the description of a particular set of phenomena—in this case the musical scales in use in his day—in terms of specific numerical ratios. Plato complained that such a science of harmonics sought numbers in the sensible world rather than ascending to more abstract problems, which were independent of the phenomena (*Rep.* 531c). For Archytas, however, there was no split between the intelligible and sensible world. Logistic, the science of number and proportion, was the master science for Archytas, because all other sciences ultimately rely on number to provide knowledge of individual things (Fr. 4). Just as his science aimed at mathematical description of concrete phenomena, so Archytas also developed a theory of definition that earned Aristotle's praise (*Metaph.* 1043a14–26) for taking into account not just the limiting (formal) aspect of the definiendum but also the unlimited (material) aspect.

Archytas argued that number was crucial in the political and ethical sphere as well. The stability of the state is based on the widely held human ability to calculate, which convinces the rich and the poor that they have their fair share (Fr. 3). Archytas regarded bodily pleasure as inimical to the rational calculation that should guide one's life, because, he believed, someone in the throes of the most intense pleasure (e.g. sexual orgasm) is manifestly unable to calculate.

There is little evidence for Archytas's cosmology, but he developed the most powerful ancient argument for the infinity of the universe. Archytas assumes that, if the universe is limited, it has an edge (modern science would question this assumption) and asks whether or not some-

one standing at the edge would be able to extend his or her hand beyond the edge. Normal assumptions about space suggest that it would be paradoxical if the person could not extend a hand beyond the edge. Archytas can ask the same question about any supposed limit, and hence the universe will not have a limit and will extend indefinitely. Versions of this argument were adopted by the Epicureans, Stoics, Locke, and Newton—although both Plato and Aristotle rejected it. Aristotle wrote three books—now lost—on Archytas and presents him favorably. Plato was impressed with Archytas's work in mathematics, but the two philosophers disagreed sharply on important philosophical issues.

ARDIGÒ, ROBERTO

(1828–1920)

Roberto Ardigò, the principal figure in Italian positivism, was born in Casteldidone in Cremona. He became a Catholic priest, but left the priesthood when, at the age of forty-three, he found it no longer compatible with his beliefs, particularly his conviction that human knowledge originates in sensation—a conviction that came to him suddenly, as he recounted it, while staring at the red color of a rose (*Opere*, Vol. III, p. 368). From 1881 to 1909 he taught history of philosophy at the University of Padua. He spent the last years of his life defending and illustrating his fundamental ideas and debating with the prevail-

ing idealism, which had supplanted positivism as the dominant viewpoint within and without the Italian universities during the last three decades of the nineteenth century. He died in Padua after two attempts at suicide.

The basic interests of Ardigò's positivism were not historical and social, as were Auguste Comte's, but scientific and naturalistic, like Herbert Spencer's. From Comte, Ardigò accepted the principle that facts are the only reality and that the only knowledge possible is the knowledge of facts, which consists in placing one fact in relation to others either immediately or by means of those mental formations that constitute ideas, categories, and principles. When these relations are established, the fact is "explained." Science, therefore, is the only kind of knowledge possible; and philosophy itself is a science that, like all other sciences, uses induction and does not have at its disposal privileged principles or procedures. Metaphysics, which claims to start from principles independent of facts and to use deduction, is a fictitious science. Yet philosophy is not just a "synthetic" discipline in Spencer's sense of the unifier of the general results of the individual sciences. On the one hand, it is a complex of special disciplines that is left after the natural sciences have gone their way. As such, it encompasses the disciplines that are concerned with the "phenomena of thought" and finds articulation in two spheres: psychology, which includes logic, "gnosis" (epistemology), and aesthetics; and sociology, which includes ethics, *dikeika* (doctrine of justice or of law), and economics. On the other hand, to philosophy belongs the field of the *indistinct*, which lies outside the realm of the distinct, which constitutes the object of the individual sciences (matter, for physics; life, for biology; society, for sociology; mind, for psychology, etc.). This realm of the indistinct constitutes the unique and common origin of all the realms of the distinct, and it is the object of philosophy as *peratology* (*Opere*, Vol. X, p. 10).

The indistinct in the philosophy of Ardigò had the same function as the unknowable in Spencer. Ardigò distinguished it from the unknowable in that the indistinct is not that which is not known but that which is not yet known distinctly. It is a relative concept, because the distinct that emerges from some knowledge is in its turn indistinct with respect to further knowledge insofar as it is that which produces, solicits, and explains that knowledge (*Opere*, Vol. II, p. 350). The indistinct-distinct relationship was, moreover, used by Ardigò—in a manner analogous to the way Spencer used the homogeneous-heterogeneous relation—to explain "the natural formation" of every known reality. Every natural formation, in the solar system as well as in the human spirit, is a passage

from the indistinct to the distinct. This passage occurs necessarily and incessantly, regulated by a constant rhythm, that is, by an immutable order. But the distinct never exhausts the indistinct, which both underlies and transcends it; and since the distinct is the finite, then we must admit that, beyond the finite, lies the infinite as indistinct. Ardigò conceived the infinite as a progressive development without beginning or end (the analogue to Spencer's evolution), denying that such a development leads to a transcendent cause or principle (*Opere*, Vol. II, p. 129; Vol. III, p. 293; Vol. X, p. 519). All natural formations, including thought, which is a kind of "meteor" in the life of the universe, emerge from and return to this infinite (*Opere*, Vol. II, p. 189).

In the domain of psychology, Ardigò held that the I (self) and natural things are constituted by neutral elements, that is, sensations. The self and things differ, therefore, only by the nature of the synthesis, that is, by the connections that are established among the sensations. Those sensations that refer to an internal organ and have the character of continuity are associated in the "autosynthesis," or the self. Those sensations that refer to an external organ and are discontinuous are associated in the "heterosynthesis" that gives rise to things (*Opere*, Vol. IV, p. 529 ff.). This doctrine, propounded by Ardigò in his very first work, *La psicologia come scienza positiva* (Mantua, 1870), is similar to that later propounded by Ernst Mach in *Die Analyse der Empfindungen* (Jena, 1886).

In the moral domain Ardigò carried on a polemic against every kind of religious and rationalistic ethic. It is a fact, according to Ardigò, that humans are capable of disinterested or altruistic actions, but such actions can be explained by recourse to natural and social factors. The ideals and the prescriptive maxims that determine them derive from the reactions of society to acts that either preserve or damage it—reactions that impress the individual and become fixed in his conscience as norms or moral imperatives. That which is called "conscience," therefore, is the progressive interiorization accomplished by the repeated and constant experience of the external sanctions that the antisocial act encounters in society (*Opere*, Vol. III, p. 425; Vol. X, p. 279).

Finally, Ardigò tried to mitigate the rigorous determinism found in all forms of positivism by giving some emphasis to the notion of chance. Chance consists in the intersecting of various causal series that, taken together, constitute the order of the universe. These intersections are unpredictable, though the events that constitute every individual series are not unpredictable. So-called human "freedom" is an effect of the plurality of the psychical

series, that is, of the multiplicity of the possible combinations of various causal orderings that constitute man's psychical life (*Opere*, Vol. III, p. 122).

ARENDT, HANNAH

(1906–1975)

Hannah Arendt, American philosopher and political scientist, was born in Hanover, Germany. In 1928 she completed her PhD under Karl Jaspers at the University of Heidelberg, having previously studied with Martin Heidegger at the University of Marburg. Upon immigrating to the United States in 1941, she became director of several Jewish organizations and served as chief editor of Schocken Books before being appointed to the Committee on Social Thought at the University of Chicago in 1963. She taught at the New School for Social Research in New York from 1967 until her death.

THE INFLUENCE OF HEIDEGGER AND PHENOMENOLOGY

Despite sharing Jaspers's views about the existential importance of communication, Arendt's philosophy mainly bears the imprint of Heidegger's phenomenology. Following Edmund Husserl, Heidegger argued that the scientific worldview conceals the genuine appearances of things as they are directly presented within lived experi-

ence. By abstracting from, and thereby concealing, the primal experience of meaning and value, this worldview provokes a crisis of nihilism, the practical upshot of which—foreshadowed in Friedrich Nietzsche’s thought—is a technological “will to power” that reduces all of being to the status of a predictable and useful object. Because modern science is but the culmination of a metaphysical tradition dating back to Plato, Heidegger turned to the pre-Socratics and the archaic language and life of the ancient Greek *polis* for disclosing a more original experience of things. Arendt followed him in this respect, but with different results. Heidegger’s supreme estimation of the revelatory power of the lone thinker/poet/artist to open up a new experience of community and world—coupled with his contempt for the indecisiveness of public opinion and democratic political debate—led him to embrace the resolve of a Nazi *fürher* who embodied the will of the German people. In Arendt’s judgment, Heidegger’s politics betrayed his own critique of European metaphysics as an elitist form of idealism that conceals the common roots of meaning and value in democratic action.

FREEDOM AND POLITICAL ACTION

Action is part of a triad of compartments that together make up the active life definitive of the human condition. As the quintessential appearance of human freedom, political action, Arendt argued, must be distinguished from both work and cultural fabrication. Laboring to procure life’s necessities is unfree; and the freedom of artistic creation is at best hidden and derivative. As distinct from the solitary application of means in pursuit of ends, true freedom must be communicated publicly, in political deeds and words. For this there must be a public space—exemplified by the Greek *polis* and such modern-day equivalents as the worker council and town hall meeting—wherein equals representing diverse opinions meet and deliberate together.

Arendt often invoked Augustine’s comment on the miracle of birth, or what she called *natality*, in capturing the distinctive capacity of political action to initiate new beginnings. The concept owes much to Arendt’s lifelong obsession with modernity and political revolutions, although she traces it back to ancient Greek and early Christian notions of freedom. In discussing the archaic Greek notion of freedom (*archein* = to begin or initiate), Arendt stresses the utter unpredictability of actions that draw their meaning and identity from the distinctiveness of the individual actors whose personality they express. Early Christian thinkers such as Paul and Augustine

develop this idea further in discussing religious conversion as spiritual rebirth. The existential pathos of continually breaking with the past and remaking oneself also informs modern revolutionary thought, which appeals to free consent rather than traditional authority as the principal underlying political life.

THE TENSION BETWEEN FREEDOM AND SOCIAL EQUALITY

Although modern revolutions exemplify political freedom, Arendt thought that their failure to distinguish this end from the social struggle for equality conflated the imperatives of political action with those of economic production and consumption. The subsequent substitution of efficient administration for political action is especially apparent in the revolutionary movement inaugurated by the French Revolution and brought to completion in twentieth-century communist and fascist revolutions. Here, freedom is reduced to the sovereign legislation of a unified will that seeks to administer the general welfare of all citizens with the ultimate aim of remaking them into a single, harmonious body. In Arendt’s opinion, the American Revolution evolved differently, partly because it was not faced with the same social problems, and partly because it was nourished on Protestant individualism rather than Catholic paternalism. It was not driven by economic need and class struggle, and the remnants of feudalism—mainly concentrated in the slave economy of the South—had already been eclipsed by the modern commercial economies of the North. Yet according to Arendt, the individualistic spirit of commercial life that compelled the Founding Fathers to adopt limited and divided forms of governance would also prove to be the undoing of their revolution. As Americans became more preoccupied with their private economic pursuits and problems of class developed within industrial capitalism, political life receded in importance and a paternalistic welfare state eventually emerged.

POWER, VIOLENCE, AND LEGITIMACY

Arendt’s distinction between political power and political violence builds upon her critique of the welfare state. Contrary to the dominant view held by the Weberian school, political power is not equivalent to wielding a monopoly of instruments that can be brought to bear in top-down fashion by governmental elites in coercively defending and administering a state. On the contrary, political power consists in popular consent and public opinion nourished in open discussion. As such, its vital-

ity depends on multiplying resistances rather than by concentrating forces, a condition that is best promoted by encouraging the flourishing of open debate. Following Baron de Montesquieu, Arendt held that policies that preserve this discursive plurality by separating or dividing governmental powers and instituting a system of checks and balances are more powerful and enduring than ones that do not. Totalitarian regimes that dispense with the rule of law and concentrate all power in the hands of a single leader are notoriously unstable and weak because they deprive their own citizens of the public space necessary for taking independent initiative and uniting politically.

According to Arendt, the violence exercised by totalitarian regimes against their own citizens is but the reverse side of their impotence. Arendt equates violence with any coercive, instrumental action that lacks prior popular consent. Although it can never be legitimate, or politically justified, violence may sometimes be morally justified as a necessary means for avoiding great evil. Emergencies of state sometimes call for violent measures, but as Arendt notes, liberal democracies often use this pretext to suppress political action unjustly, and indeed any unilateral governmental intervention, however bureaucratically routine, bears traces of violence.

THE DECLINE OF AUTHORITY AND THE CRISIS IN CULTURE

Many of Arendt's studies—on totalitarianism, evil, revolution, and the Jewish question—document the political impact wrought by the decline of traditional authority and the crisis of culture. Although she did not blame secular Enlightenment and its revolutionary offspring for this decline, she nonetheless believed that the destruction of the old Roman trinity of religion, tradition, and authority contributed to a crisis of culture that undermined essential differences—between public and private, political and economic, action and work—on which the survival of a public political space depended. Transcendent authority anchored the autonomy of the public realm as a space for manifesting immortal deeds in beautiful words; the waning of authority diminishes that autonomy, thereby enabling the assimilation of both culture and politics to economic life.

Arendt's diagnosis of the crisis in culture bears directly on her political concerns. She appealed to the Greek ideal of culture as a religious memorialization of political community. In the absence of traditional religious authority, culture can provide those standards of judgment so essential for maintaining a common space

for action. Political life is thus jeopardized whenever culture loses its normative authority—that is to say, whenever it is monopolized by elites, manipulated by government for purposes of propaganda, or is degraded to the mundane level of mass consumption and entertainment.

TOTALITARIANISM AND RADICAL EVIL

According to Arendt, the crisis of culture is symptomatic of all mass societies, or societies wherein individuals—isolated from one another in the lonely pursuit of familial and vocational aims—cease to engage in political action; and it is therefore one of the main conditions paving the way for modern totalitarianism. Under these conditions, it is the state, not politically engaged individuals, that assumes responsibility for integrating the masses, even when doing so renders individuality and life itself superfluous.

By engendering a system in which life is made superfluous, totalitarianism represents the epitome of evil. Contrary to popular opinion, such evil is seldom if ever motivated by diabolical intentions. Adolph Eichmann's evil, Arendt observed, simply consisted in his banal "thoughtlessness." Like most persons living in mass society, he confused moral duty with the duty to obey authority. However, Arendt also believed that the "absolute goodness" and violence born of idealism (as personified in Melville's *Billy Budd*) are as pernicious as the radical evil and destructiveness born of any workmanlike devotion to order. In both instances, the critical check provided by consulting the opinion of others who comprise an enlarged public sphere is totally absent.

JUDGMENT AND POLITICAL ACTION

Arendt's appeal to an enlarged public sphere touches upon the importance of judgment in sustaining political action. In the classical tradition of Aristotle and Aquinas, the judgment that guides action is intimately connected to a practical wisdom (*phronesis*), or prudential art, cultivated by experience and habituation in customary modes of behavior. In modern times, beginning with Immanuel Kant, judgment acquires an altogether different sense, one based on an impartial consideration of possible points of view. These two senses of judgment—the former typically associated with the standpoint of the political or moral actor faced with practical decision, the latter with the historical or aesthetic spectator who understands, interprets, and narrates action retrospectively and disinterestedly—intersect in Arendt's thought.

Prior to *The Life of the Mind* (1978), Arendt still affirmed the intimate connection between “a judgment of the intellect” and knowledge of the rightness and wrongness of practical aims (1968, p. 152). Indeed, she insisted that moral and political agents living in modern conditions are especially obligated to judge the laws, opinions, and actions of their society from the common—if not universal—standpoint of “all those who happen to be present” (p. 221).

Arendt’s late lectures on Kant’s political philosophy revise this connection between action and judgment. With the deterioration of public spaces requisite for exercising practical judgment, judgment ceases to be linked with the two faculties of practical reasoning—knowing and willing—and instead takes on the function of retrospective interpretation. As a vicarious form of action, historical spectatorship preserves the memory of those all-too-rare and tragically ill-fated moments of political action—such as the Paris Commune of 1871, the resistance of the Warsaw Ghetto, and the Hungarian revolt of 1956—by judging their universal, exemplary validity. Rescuing these unprecedented displays of spontaneous self-determination from the oblivion of history, judgment dignifies what otherwise appears to be an unbearable, arbitrary, compulsive—in short, utterly contingent and irresponsible—act of freedom.

Jürgen Habermas and others have rightly criticized Arendt for dissociating the common sense guiding judgment from any relationship to truth or justice. Her earlier work, for example, links the cultivation of common sense to the agonial exchange of opinions. Because this communication is constrained by the real effects of social domination, it remains prejudiced by ideological distortions. By contrast, her later work (following Kant) links historical judgment to an ideal *sensus communis*, or hypothetical community of taste (feeling). Here judgment achieves impartiality by imaginatively representing the standpoints of other persons as they may have been communicated had these persons been free from domination and constraint. No doubt, an accurate account of responsible judging lies somewhere between these extremes of realism and idealism, as even Arendt herself suggests; for judging, it seems, bears witness to rationality only when tempered by the real—mutual and impartial—criticism that obtains between actors who aspire to ideal freedom and equality.

ARETĒ/AGATHON/KAKON

Aretē, meaning “excellence” or “virtue,” is central to ancient Greek ethics, from the early poets through Plato and Aristotle to the Stoics. It is a quality necessary for success, and the *aretai* for moral success are moral virtues. *Agathon*, meaning “good,” implies virtue when used to describe human beings, as does *kalon* (meaning “noble” or “beautiful”), the adjective most closely associated with *aretē* and nearly synonymous with *agathon*. *Kakon* implies the lack of virtue. In Hesiod and Solon the moral use of these terms is well established, and it is clearly pre-figured in Homer. Virtue, to such poets, no less than to Plato, is long lasting and independent of wealth and power. The principal virtues under discussion before Socrates were shame (*aidos*), reverence (*hosion*), and justice (*dike*). Protagoras evidently considered shame and justice to be essential to a stable society.

Socrates and Plato taught that virtue is to the soul as health is to the body. In addition to reverence and justice, they treated wisdom, courage, and sound-mindedness (or temperance; in Greek, *sôphrosunê*) as virtues. Plato represents Socrates in the early dialogues as unsuccessfully seeking definitions for the virtues, while hypothesizing that they are in some way identical with each other. Socrates is often thought to have held an intellectualist account of *arête*.

In the *Republic* Plato works out a theory of virtue from his account of health in the soul: Justice is the quality that allows the parts of the soul to work together in harmony, and the other virtues depend on that harmony.

In a related context Plato somewhat mysteriously compares the form of the good to the sun; what the sun does to illuminate and nourish the world humans can merely see with their senses, and what the good does for the world humans can investigate with their intellect.

Aristotle's ethics begins from the hypothesis that all things aim at the good (*agathon*). The good for human beings, he says, is flourishing or happiness (*eudaimonia*), and the qualities that enable people to reach these goals he calls virtues (*aretai*). His account of virtues has been fundamental to all subsequent discussion of the subject in the European tradition. Moral and intellectual virtues are both necessary for human flourishing, and for each other. Moral virtues temper the soul to enjoy what is good, rather than what is bad, and consist in a disposition to experience emotions that lie on a mean between excess and defect. Courage, for example, belongs to a soul that is neither too rash nor too timid. In Stoic theory, nothing is entirely good but virtue, and this consists mainly in the ability to resist powerful emotion.

Some early Greek authors distinguish aristocrats as *agathoi* from common people as *kakoi*. The scholar A. W. H. Adkins identified the virtues that marked this class difference as competitive (as opposed to moral) virtues; he argued that in the time of Socrates and Plato, Greek thought about virtue underwent a major shift, and the philosophers brought the first usage of these terms that is moral in human sense. Hugh Lloyd-Jones and Bernard Williams contested Adkins's arguments, and the emerging consensus among scholars favors a more unified account of these terms.

ARISTIPPUS OF CYRENE

(c. 435–c. 356 BCE)

Aristippus of Cyrene, founder of the Cyrenaic school of philosophy, was born in the Greek North African port city of Cyrene (now Shahhat, Libya). Attracted to Athens by the fame of Socrates, he became a member of the Socratic circle and probably associated with Protagoras and Gorgias as well.

Like Socrates, Aristippus concentrated on ethics, conceived as endeavoring to determine the good life for the individual, and rejected the study of nature as both uncertain and useless for furthering the good. He gave a simple answer to the question of the goal of life: It is pleasure and nothing else. The wise man will arrange his life so that, as far as possible, one pleasure follows another and pains are kept to a minimum. He will not forgo a present pleasure for the sake of one to come, for the future is uncertain. But he will be master of his pleasures, as Socrates was, unperturbed when they must be done without.

Pleasures are individual episodes of internal feeling, not mere absence of pain but positive bodily sensations as experienced in eating, drinking, and sex. All pleasures, considered as pleasures, are equal, he declared, though they may differ in intensity, which is why those of the body take precedence over those of the mind. They are still pleasures even if produced by activities conventionally regarded as shameful. Virtues and friendships are goods only insofar as they are productive of pleasures. He found proof that pleasure is the goal of life in the (alleged) fact that all animals, as well as uninstructed human beings, pursue it by nature.

Aristippus taught his philosophy in the marketplace (unlike Plato, who taught in his gated Academy) and charged substantial fees. Like a modern psychiatrist, he regarded his services as therapy: liberation from superstitions and irrational conventions; and the fees, illustrating (so he claimed) the proper use of money, were part of the treatment. He also showed his pupils how to get along with anybody in any situation.

Many stories illustrate how Aristippus lived by his own principles, such as they were. Notorious for his involvement with the famous and expensive prostitute Lais, he insisted, “I have her, she doesn’t have me.” (As Cicero remarked, this sounds better in Greek.) And, he averred, having sex with one who has sex with many is no different from voyaging on a ship that carries other passengers. He perfumed himself. Sojourning in Syracuse at the court of Dionysius, he dressed in women’s clothing

for a party at the tyrant’s behest. (Plato, there at the same time, refused.) When a client protested the high price he asked for educating his son, saying that for the same amount of money he could buy a slave, Aristippus told him to go ahead and buy the slave: Then he would have two slaves, the one he bought and his own son.

Traveling widely, Aristippus was pleased to be “everywhere a stranger,” freeloading the advantages of city life without incurring the burdens of citizenship. Freedom, he held, consists not only in not being ruled but also in not ruling, for the ruler is the slave of those he rules.

ARISTO OF CHIOS

(third century BCE)

Aristo of Chios was a disciple of Zeno of Citium, the founder of Stoicism. The scant biographical information that exists, from Diogenes Laertius (VII 160–64), describes him as an unorthodox Stoic, who later abandoned the school to found one of his own. There is some question in Diogenes’ sources as to whether works ascribed to him are genuine or belong to the peripatetic Aristo of Ceos. But there are difficulties about his views as well. Like Zeno, he accepted the Socratic and cynic principle that virtue was sufficient for happiness. But whereas Zeno identified this with “living consistently,” Aristo understood it as an internal consistency, where one behaved indifferently toward anything that was not virtue or vice (*adiaphoria*). At the core of his philosophy is the view that moral values are absolute: Only virtue is good and only vice bad; everything else intermediate between these is absolutely indifferent and equal. The third head of the school, Chrysippus, who polemicized against Aristo, was successful in establishing his own interpretation of Zeno’s thought as the orthodox Stoic position, thus leading to Aristo’s marginalization. But Aristo was held in high esteem by his contemporaries: Eratosthenes of Cyrene (c. 276–c. 194 BCE) maintained that Aristo’s

philosophy, along with that of the skeptic Arcesilaus, was the most important of his time.

The confusion with Aristo of Ceos makes it difficult to attribute fragments that do not specify the author's origin. The most important is the summary given by Philodemus (*PHerc.* 1008, columns 10–23 Jensen), which has been attributed by Wehrli (1952), to the peripatetic Aristo of Ceos, but a study of the language and philosophical terminology reveals similarities with the surviving fragments of the Stoic Aristo. (Although this is included by Wehrli in the fragments of the peripatetic Aristo, a study of the language and philosophical terminology reveals similarities with the surviving fragments of the Stoic Aristo.)

ARISTOTELIANISM

The question of what it means to be an Aristotelian—whether this requires adherence to a specific set of doctrines, a certain methodological approach, or the fulfilment of some other set of conditions—is a vexed one and has exercised the minds of self-professed Aristotelians and anti-Aristotelians alike over the course of twenty centuries. Like many problems of definition, it is best approached indirectly (as indeed Aristotle would likely have approached it). This historical overview starts from the broad assumption that one may consider Aristotelian all those thinkers who have either (a) considered Aristotle's texts a suitable point of departure for an enquiry into a given subject, or (b) thought themselves to

be extending a peripatetic approach to a subject not covered by Aristotle himself. This assumption will have the consequence of making Aristotelians out of many whom modern reckoning would not readily count as philosophers. The result is not untoward because Aristotle's own enterprise extended far beyond philosophy thus narrowly defined.

THE FIRST PERIPATOS

Upon returning to Athens in 335 BCE, Aristotle founded a school in a grove consecrated to Apollo Lyceus. Hence the school was termed the Lyceum, yet it became forever known as the Peripatos for its covered colonnade. Indeed, in the annals references to "Peripatetics" greatly outnumber those made to "Aristotelians."

Aristotle's school was both a teaching and a research institution, with scholars pursuing interests ranging from musicology and the cataloguing of Greek forms of government to public lectures on popular subjects. The school survived Aristotle's departure from Athens and subsequent death in 322 BCE: Indeed, it flourished under Aristotle's successor and close collaborator, Theophrastus (372–287 BCE), who is reported to have presided over some 2,000 students.

Theophrastus expanded upon Aristotle's philosophical and scientific program. Theophrastus's botanical studies are pioneering works; the ancients especially valued his contributions to the categorical and hypothetical syllogistic. Theophrastus adheres to an aporetic methodology in the philosophical treatises while amassing observations in the scientific; this commitment to a peripatetic approach even leads Theophrastus to criticize Aristotle's *Metaphysics* Lambda in his own work on first philosophy. Theophrastus questions the extent to which teleological language, central to Aristotle's explanation of living nature, is applicable in a cosmic context: In effect, Theophrastus questions whether Aristotle is Aristotelian enough.

The Lyceum's independent spirit is further manifested in how its third head, Strato of Lampsacus (d. 269), departed from Aristotle on several important points, notably in natural philosophy. The diffuse activities and conflicting viewpoints countenanced within the Peripatos may have worked to its detriment in an age of intensifying competition between the philosophical schools. Strato's stewardship coincided with a decline in the school's fortunes, and within two generations it had all but disappeared from view.

THE IMPERIAL AGE

The nascent Hellenistic schools found elements to their liking in Aristotle's now-lost dialogues, praised for their style by Cicero and plundered for their edifying materials. Through criticism and creative appropriation, the Stoa in particular remained indebted to the peripatetics, who in the second century enjoyed a measure of resurgence under Critolaus. Still, self-professed peripatetics are hard to come by before Andronicus of Rhodes presented the ancient world with his authoritative collection of Aristotle's school works c. 50 BCE. Thereafter appear figures such as the Augustan intellectual Nicholas of Damascus, whose self-portrait is a model of Aristotelian virtue and who is credited with writing a compendium of Aristotelian philosophy, and Alexander of Aigai, teacher to Nero.

Andronicus's epoch-making edition is as important for the organization of its materials as for its contents, which quickly became canon. Immediately the impression is one of a full-fledged curriculum: The acquisition of methodological tools—the *Organon* of reasoned argument—is followed by an account of natural principles and natural bodies. After this comes living nature, then first philosophy (now dubbed “metaphysics”), and then the practical and productive sciences. Aristotle's widely varied investigations take on the appearance of a system here and retained it thereafter.

In Andronicus's wake there are two signal developments. First, propounding Aristotelian doctrine comes to be viewed as involving the writing of commentaries, starting with the *Categories* and *On Interpretation*. Second, in the first century BCE the Academician Antiochus thinks to present Aristotle as belonging essentially to the Platonic tradition. This classification set the tone for much of the imperial period. The fundamental continuity of Plato's and Aristotle's projects was correctly ascertained by late ancient thinkers and seized upon with momentous consequences.

The most important late ancient philosopher of purely peripatetic persuasion was Alexander of Aphrodisias. Around 200 CE Alexander was appointed to Athens's imperial chair in Aristotelian philosophy: He expounded his master's teaching in a series of magisterial commentaries *ad litteram*. Alexander's commentaries remain unsurpassed for erudition and insight, taking on all comers in a spirited defence of the Aristotelian worldview. Alexander's sharp, down-to-earth observations—for instance his unflinching admission that Aristotelian psychology makes no provisions for an immortal soul—provided a sobering reminder to later commentators who

approached Aristotle's texts with loftier aspirations and syncretistic leanings. Though Alexander's Aristotle is undeniably a system-builder—it is with Alexander that the Aristotelian program of “saving the appearances” becomes a desire to explain each Aristotelian sentence by reference to another—he occasionally advances different interpretations without feeling the need to come down on one side. Alexander also wrote new treatises where he felt a lacuna existed in the extant corpus; and from his circle derives the peripatetic genre of disputed questions.

A different approach to Aristotle's texts is offered by Themistius, a late-fourth-century senator and proconsul of Constantinople. Themistius wrote paraphrases rather than commentaries; aporias and scholarly disputes take a back seat to a clear exposition of the main points. Yet Themistius positions himself as a peripatetic: his works and Alexander's provided a touchstone for later scholars who sought a genuine understanding of Aristotle's meaning.^H

THE LATE ANCIENT SYNTHESIS

Plotinus (d. 270) is credited with an impressive dismantling of Aristotle's criticisms of Plato, and with the subsequent triumph of (neo-)Platonism in antiquity. But in the process, Plotinus also consolidated the assimilation of central Aristotelian concepts into a Platonic framework: for example, the potentiality-actuality distinction and the notion of pure contemplation as self-reflective. Plotinus's pupil Porphyry (d. 309) went further, attempting to show how nothing in Aristotle's virulently anti-Platonic categorical scheme in fact speaks against the primacy of separate Forms. The *Categories*, in its own words, purports to detail how things are spoken of: its universals are those abstracted from sense-particulars. The suggestion, embedded in Porphyry's enormously influential introduction (*Eisagôgê*) to Aristotle's *Organon*, is that Aristotelian science deals with substances prior to us, not with those prior by nature. This move made Aristotelian logic, and by extension natural philosophy, innocuous to ancient Platonists. It also set up the protracted Latin debate concerning the universals.

The Platonist appropriation of Aristotle was made complete in the fifth-century revival of the Athenian and Alexandrian schools. Aristotle was considered a largely reliable guide to the workings of the sensible cosmos: His works became positioned between those Platonic dialogues that were considered propaedeutic in character and those that disclosed the higher realities that Aristotle either failed to mention or knew nothing about. Though committed to the supremacy of the “divine” Plato over

the “daemonic” Aristotle, late ancient Platonists were thus Aristotelians, too, in their fashion. The voluminous commentaries on Aristotle’s logic and natural philosophy testify to the care and attention devoted to subtle points of argument and doctrine. In negotiating tensions between Aristotle’s treatises and Plato’s dialogues, notably the *Timaeus* (a prime target of Aristotle’s but a treatise that the Platonists ranked high), both reconciliation and taking Plato’s side could produce philosophically interesting work, as the examples of Simplicius (*fl.* in the 530s) and Proclus (d. 485) show. So could an unorthodox mindset coupled with a healthy self-image and a nascent Christian agenda, as witnessed by the groundbreaking work of John Philoponus (d. 574).

Opinion varied about how far harmony extended in the direction of Plato’s supernal principles. Iamblichus (d. 325) came under fire for suggesting that Aristotle would have subscribed to Plato’s Forms, while Ammonius’s (d. 517/526) equally hyperbolic claim that Aristotle’s Prime Mover was intended as a divine creative force was broadly accepted. Ammonius’s project of harmonizing Aristotle with Plato thus made Aristotle more acceptable to monotheists both in the Arabic-speaking East and, eventually, the Latin Christian West.

As for the Eastern Roman Empire, after the decline of Alexandria, the next high point for Aristotelian studies came with the Aristotelian circle assembled by Princess Anna Comnena in early-twelfth-century Constantinople. This activity resulted in commentaries by Eustratius and Michael of Ephesus and helped secure the transmission of Aristotelian materials to the Latin world.

ARISTOTELES ARABUS

Legend depicts Greek wisdom as passing from Alexandria to Baghdad: Although the chain of transmission is not as ironclad as Arabic-speaking Hellenophiles liked to pretend, the story contains a kernel of truth. The philosophy the Islamic world inherited, in particular, was Alexandrian and hence broadly Aristotelian. Aristotle’s works were translated mostly through Syriac, by Christians. Many went through several recensions because the audience’s growing scholarly acuity demanded progressively more exacting translations. By 950, all of Aristotle except for the *Politics* was available in Arabic (Plato’s *Republic* replacing the latter), along with a host of commentaries. Creative reflection was underway among Muslims, Christians, and Jews alike, all of who wrote in Arabic.

A reliance on Alexandrian learning, which for the most part accepted the “lower” calling of explaining Aristotle, had the effect of making of Aristotle the preeminent

sage of old. In the Arabic understanding, Aristotle had perfected, but also corrected, the views of other ancient thinkers, including his teacher Plato: The well-known adage of Aristotle considering “truth a truer friend” is traceable to al-Ghazālī (1058–1111), who can thus mockingly position himself as a peripatetic in spirit even when questioning the cogency of the Muslim *falāsifah*. But the Arabic Aristotle also manifested Platonic traits. This was due partly to the pseudonymous *Theology of Aristotle* and *Epistle concerning the Pure Good* (really Plotinus and Proclus in disguise), and mostly to a comfortable familiarity with the synthesis effected in late antiquity. The Peripateticism taught in the wake of al-Kindī (d. ca. 873) and al-Fārābī (d. 950) was both theist and emanationist.

The most powerful synthetic mind in Arabic philosophy, and the man responsible for tying the disparate threads of Aristotelianisms past into the service of a singular vision, was also the philosopher who eclipsed Aristotle in the East. Ibn Sīnā (the Latin Avicenna, 980–1037) progressed from traditional commentary to comprehensive philosophical encyclopaedias “presented in the manner of the peripatetics” to free-form expositions of his own views. Too Platonizing to be considered purely peripatetic, altogether too Aristotelian to be mistaken for a Platonist, lifting materials from the Muslim dialectical theologians as needed, Ibn Sīnā’s philosophy constitutes an original achievement, one whose success is measured by the fact that in the East his works supplanted Aristotle’s as the basis for study and philosophical reflection. It is thanks to Ibn Sīnā that mainstream Islamic philosophy to this day retains a broadly peripatetic vocabulary and orientation. Yet his substantial revisions to Aristotelian metaphysics, psychology, and logic, among other areas, were presented in such an attractive package that later philosophers rarely paused to consider whether Ibn Sīnā’s philosophy faithfully reflected that of Aristotle. More important was that it conveyed truth. The subsequent period is consequently more rightfully called Avicennian than Aristotelian.

From this perspective, Ibn Rushd (Averroes, 1126–1198) appears a man out of place. Following upon al-Ghazālī’s criticisms of Ibn Sīnā, Ibn Rushd advocated a return to an undiluted Aristotle, undertaking a massive commentary project worthy of Alexander or Themistius, both of whom he used extensively. This Cordovan commentator regarded Aristotle as a model of human perfection (*In De anima* III, comm. 14). For him, this faith in Aristotle’s exemplary rationality and consistency held the key to settling any outstanding scholarly dispute. Sidelined in Islamic philosophy, Ibn Rushd became fabulously

influential among Jews and Christians, who viewed him as *the* Commentator (in antiquity, Alexander was similarly honoured).

ARISTOTELES LATINUS

The story of the Latin Aristotle begins with Boethius's (d. 525) stated intention of translating all of Aristotle's works. The project only got so far as the logical treatises; until the mid-twelfth century, of these only the *Categories* and *On Interpretation* circulated, making of Aristotle primarily a logician, and a curious one at that. A slow dissemination of the "new logic" (the full *Organon*) occurred in the twelfth century: acquaintance with Arabic philosophy—above all, Avicenna's *De anima* and *Metaphysics*—helped raise interest in Aristotle's natural philosophy and metaphysics, which were then translated in short order, often concurrently from the Greek and the Arabic in a race to get to the heart of the matter.

The theologically suspect aspects of Aristotelian teaching, which the Arabic tradition helpfully pointed out, promptly resulted in the 1210 and 1215 bans in Paris, then the most prestigious of the rising universities. This did little to stem the tide. By mid-century, studying the entire range of Aristotle's works—often coupled with Averroes's commentaries—was commonplace in the arts faculties. Aristotle himself was so ubiquitous that writers could refer to him simply as "the Philosopher."

Thereafter, Aristotle dominated philosophical teaching in the Christian West for three centuries. Hundreds upon hundreds of commentaries were produced at the height of scholasticism; the list of the major commentators was a roll call of the best and brightest of the schoolmen: Albertus Magnus, Thomas Aquinas, John Duns Scotus, William Ockham, Jean Buridan, and so on—for every major figure, there was a score more. As in ancient scholasticism, considerable philosophical ingenuity and innovation went on under a nominal exposition of the text (the *quaestiones* providing an even more congenial setting).

Especially going into the nominalist phase, the question arises: To what extent are some of these thinkers to be considered Aristotelian at all? Clearly, greater liberties were being taken; but this freedom would be expected following a period of assimilation. Moreover, adherence to a tradition need not stifle creative thought. The fallout from the famous condemnations of 1270–1277 spotlights the complex dynamic. For the most part, the condemnations were directed against the allegedly heterodox teachings of the so-called "Latin Averroists." But just because their radicalism was so resolutely Aristotelian—uphold-

ing the world's eternity and the unity of the intellect, and so on—the condemnations could be interpreted as an invitation to read Aristotle more creatively. And could the resultant bold conceptual and scientific inquiry not be considered more authentically Aristotelian than a single-minded adherence to the master's letter? "Radical" Aristotelians and radical "Aristotelians" were similarly drawn to the spirit of Aristotle's texts, in equal parts confident and intellectually curious. They merely took their admiration of the master in different directions.

THE MODERN AGE

The Renaissance humanists' newfound appreciation for the breadth of ancient culture put an end to Aristotle's supremacy. With the intellectual scene splintering into multiple incommensurable paradigms, Aristotle was effectively demoted to the headmastership of one school once more after long representing Greek wisdom in its entirety. As the quality of texts and translations came under scrutiny, the very state of Aristotle's preserved writings was found wanting. What to make of this was less evident. The Ciceronian Mario Nizilio could claim that wrinkles in expression signaled confusion in thought, whereas others blamed Andronicus's editorializing. Yet others took refuge in the ancient tradition, so that by the sixteenth century any configuration of Alexandrine, Themistian, Averroist, and even neo-Platonist tenets could be combined in an attempted rehabilitation of Aristotle, as exemplified by the works of philosophers such as Nicoletto Vernia (1442–1499) Agostino Nifo (d. 1538), and Pietro Pomponazzi (1462–1525). The textual drive had other unforeseen consequences. Elegant new translations of works such as the zoological and elemental treatises excited new scholarship, and Aristotle's *Poetics* at last found an appreciative audience among the literati.

With the Reformation, new complications emerged. Martin Luther's attitude towards Aristotle was ambivalent, but Melancthon enthusiastically endorsed the teaching of solid scholarly materials (excepting the *Metaphysics*). The Counter-Reformation likewise gravitated towards neoscholasticism. The late sixteenth and early seventeenth centuries thus saw a resurgence in the fortunes of Aristotle's works, which for a time were studied with equal intensity in the Protestant north and the Catholic south. Of particular note are the efforts of Francisco Suarez (1548–1617) and the Coimbra commentators.

By comparison, the seventeenth to nineteenth centuries represent a true dry spell for Aristotelian philoso-

phy. One may ask why; a tentative answer, if necessarily incomplete and hesitant, may yet tell us something about Aristotelianism as a historical force. Part of Aristotle's attraction had been the promise of a comprehensive, largely unified worldview, with pressure points doubling as the main locus for scientific advancement (discrepancies calling for new solutions). With the new sciences wresting fields of inquiry from the philosophers' hands, discipline by discipline, what appeared to be left of Aristotle was the barest husk of a system—in effect its extremities, logic and moral education. And of these, the nineteenth century threatened to supplant Aristotle's logic, long regarded as his lasting achievement. Antiquarian interest, it seems, could not of itself make Aristotelianism thrive. It could, however, help keep it alive, at least for a time.

THE NEW ARISTOTLE

The post-Enlightenment rise in Classical scholarship eventually brought about a renewed interest in ancient philosophy. But the philological and historical orientation of the new generation meant that Aristotle (along with Plato) returned with a difference. Instead of unity, the new scholarship sought signs of discrepancy, editorial interference, and intellectual development. Werner Jaeger's (1888–1961) studies mark a watershed, representing the culmination of a century's worth of textual work but also providing the launching point for countless philosophical studies sharing the same problem-oriented, if not aporetic, approach to Aristotle's works. An alternative to the genetic method would be to treat individual treatises as essentially closed units, examined closely but in splendid isolation. Twentieth-century analytic philosophy produced many such Aristotelian essays, while thinkers such as Brentano, Husserl, and Heidegger took more general inspiration from the Stagirite's writings.

Within the Catholic Church's sphere of influence, the nineteenth century witnessed the ascendancy of neoscholasticism, culminating in Leo XIII's 1879 encyclical officially endorsing Aquinas. Pius X further singled out twenty-four Thomist tenets to be taught in all Catholic institutions. This development injected a more systematic impulse into Aristotelian studies because Aquinas's Aristotle was the undisputed “master of those who know.” Still, questions about Aristotle's perennial wisdom—as opposed to his historically conditioned contributions—persisted. The Thomist revival undoubtedly perpetuated a medieval understanding of Aristotle. But it also represented an important moment in the recovery of the medieval Aristotelian tradition as a whole.

Late-twentieth-century philosophers discovered in Aristotle new things again. As virtue ethics flourished, some proponents declared themselves neo-Aristotelians (Alasdair MacIntyre, Martha Nussbaum), while others were so labeled. Philosophers of mind and biology found intriguing formulations in Aristotle's studies on living nature; even Aristotle's notoriously problematic modal syllogistic has garnered newfound respect as a philosophically sophisticated formalization of an essentialist metaphysics. In each case many have determined that Aristotle is best approached through an analytic engagement with his commentators—itsself an ancient strategy.

This interplay of historical and systematic concerns prompts one final observation. Aristotle's works have been said to present a system *in potentia*. One possible history of Aristotelianism would accordingly unfold as a series of attempts by different thinkers in different ages to map out and explore the conceptual possibilities and limitations embedded in the texts received as Aristotle's. Such a story would span the history of Western thought, because no other philosopher has enjoyed such sustained attention (admittedly, Plato comes close). A welcome corollary is that the contemporary student has at her disposal a kaleidoscope of “Aristotelianisms” to aid in further understanding and exploration.

Taneli Kukkonen (2005)

ARISTOTLE

(384 BCE–322 BCE)

Aristotle was born in Stagira, a Greek colony in Macedonia. His father was physician to the Macedonian king, and the family had both a tradition of learning and connections to the Macedonian elite. At the age of seventeen Aristotle came to Athens to study in Plato’s Academy (he may also have briefly studied rhetoric under Isocrates). The community of the Academy included some people who would stay for a few years to learn some philosophy before pursuing political careers in their native cities, and others for whom philosophy was an end in itself, and who might spend their entire lives in the Academy. Aristotle

was one of the latter, and stayed in the Academy for twenty years, until Plato’s death in 348, when Plato’s nephew Speusippus succeeded him as head of the Academy, while the other most prominent Academics, Aristotle and Xenocrates, went to Assos in Asia Minor. There they seem to have formed a kind of local branch of the Academic community under the patronage of the tyrant Hermias of Atarneus, whose niece (and adopted daughter) Aristotle married.

Aristotle spent thirteen years around the north and east Aegean: in Assos; on Lesbos, where he did biological research; in Macedonia, as tutor to the future Alexander the Great; and in Stagira, where he is said to have given laws when it was rebuilt after the Macedonians burned it. He returned to Athens only in 335 (after the Macedonians had attained supremacy over Greece in 338, and after Alexander had succeeded his father in 336), not to the Academy, where Xenocrates had succeeded Speusippus, but to found his own school in the Lyceum, later called the Peripatetic school. He taught there until, after Alexander’s death in 323, the Athenians revolted against Macedonia, and Aristotle was charged with impiety for a poem he had written that was held to have given divine honors to Hermias. He left Athens for family property in Stagira’s mother-city, Chalcis on Euboia, where he died the following year.

With Aristotle, much more than with Plato, most of the preserved writings are closely connected with his teaching activity. Many of Aristotle’s writings bear titles which remain the names of disciplines today (*Physics*, *Politics*, etc.), and much of Aristotle’s work was either to introduce these disciplines into the Academy and its daughter communities, or to turn them from less systematic practices into systematically teachable disciplines. “Philosophy” in fifth–fourth century Athens meant simply “higher education,” that is, whatever disciplines, beyond elementary education in gymnastics and “grammar” and “music” (including poetry), might be needed for someone who wishes to live well and to rule his city (or even his own household) well. For different teachers, this would cover different disciplines. For Isocrates, “philosophy” meant rhetoric. For Plato, to judge from the ideal curriculum of *Republic VII*, it meant mathematics (arithmetic, plane and solid geometry, astronomy, and “harmonics” or music theory) and dialectic (an art of regimented discussion, in which a respondent defends some thesis, typically a definition, and a questioner tries to refute it by yes-no questions leading to a contradiction); these are the means that will lead to knowledge of

what really and eternally *is*, and ultimately of divine things (the Forms and the Good).

Plato conspicuously leaves out rhetoric, which deals with mere opinions rather than with how things really are. He also leaves out pre-Socratic-style “physics” or “natural history,” which he thinks is approximate and probable rather than precise and certain, and which explains things by placing them in a grand cosmogonic narrative of how things come to be, rather than (like mathematics and dialectic) by defining and demonstrating what things eternally are. Aristotle teaches all of these disciplines, without claiming that they are all equally scientific; he introduces a hierarchy of disciplines, from those accessible even to an aspiring politician with no great patience for philosophy, up through more strictly scientific disciplines, to the most demanding but most intrinsically rewarding philosophical wisdom.

Aristotle’s introduction of rhetoric (probably already in the Academy) should be seen in the context of the conflict between the Academy and the school of Isocrates. Plato draws a sharp contrast between dialectic and rhetoric: that is, between using question and answer to refute a single respondent on a universal question and using long speeches to persuade a group about such particular questions as are discussed in meetings of a citizen assembly (deliberative rhetoric) or a jury (forensic rhetoric). Plato thinks that only dialectic is worthy of the philosopher. But rhetoric is the path to political success, and so students flock to Isocrates instead. Aristotle thinks that, however narrowly practical many students are, “we Academics,” with our philosophical knowledge, ought to be able to educate them better than Isocrates can. (Aristotle is said to have justified his teaching of rhetoric by saying “it were shameful to keep silence and let Isocrates speak,” varying a line of tragedy, “it were shameful to keep silence and let barbarians speak.”)

This might be merely a practical compromise. More shocking to a Platonist is Aristotle’s claim that “rhetoric is the counterpart of dialectic”—they are both, not sciences of any one subject matter, but sub-scientific abilities to discover and arrange and express arguments, applicable equally to any subject. Rhetoric also requires rudimentary knowledge of ethics and politics, because these are the subjects about which we must persuade, and because we must know how to project a given character or emotional state, and how an audience of given character and political background will react; the focus remains on argument.

Plato thinks that dialectic, by allowing us to arrive at definitions, gives us a scientific knowledge of eternal

Forms existing apart from the sensible world. Aristotle, who has participated in the same dialectical practice as Plato, thinks this claim about its status is spurious. Dialectic is not scientific knowledge of eternal separate Forms, since there are no such Forms. Aristotle is willing to speak of forms present within sensible things (a form is whatever is the object of scientific definition), but dialectic is not scientific knowledge of these forms either, since scientific definition of (say) lunar eclipse depends on specific knowledge of the cause of lunar eclipse, which the dialectician, as a generalist, does not have; it is not the dialectician but the physicist who grasps forms of physical things. Dialectic remains a valuable preliminary training because, by showing what can be refuted, it rules out wrong definitions and helps us find the right ones, and because, by allowing us to find arguments on both sides, it sets out puzzles that science must solve, but it is not itself science or philosophy. And while Plato speaks not of *teaching* in dialectic, but only of a communal *practice* of questioning and answering, Aristotle demystifies the practice, and claims in his *Topics* to teach rules for discovering dialectical arguments, just as his *Rhetoric* teaches rules for discovering rhetorical arguments.

The average practically minded student will probably study only rhetoric and not dialectic, but Aristotle hopes to lure the better students on further to more scientific disciplines. In the first place, this means ethics and politics, which are philosophical, that is, scientific or causal discussions of what is good for individuals and cities, based on an understanding of what human beings and cities are. But Aristotle distinguishes these “practical sciences” from the “theoretical sciences,” that is, kinds of knowledge valued purely for the sake of knowing them, which are capable of greater precision and are more intrinsically worth knowing, though less useful. Against Plato, physics or natural science (in the broadest sense, including biology and psychology) is a theoretical science: when done correctly, it grasps forms of natural things, and proceeds by definition and demonstration, but the forms it grasps are inseparable from matter and motion, and many of its results hold only “for the most part,” or *ceteris paribus*, rather than universally.

Aristotle agrees with Plato that the highest wisdom, the knowledge most intrinsically worth knowing, must be a science of things existing eternally apart from matter, and ultimately of the Good. But neither dialectic nor physics is such a wisdom (nor is mathematics, which is not about separately existing objects, but about ordinary objects hypothetically idealized), and so Aristotle announces, beyond dialectic and physics, a new discipline

of “first philosophy” (what commentators of Aristotle since antiquity have called “metaphysics”), which will provide the theoretical wisdom that he thinks both Plato and the pre-Socratics have failed to deliver.

WRITINGS

We can broadly divide Aristotle’s writings into three classes:

“Exoteric,” or “published” writings, were intended for circulation outside the circle of philosophers, elegantly written and sometimes in dialogue form (also the poem for Hermias and a similar poem for Plato). All such writings are lost, but there are substantial fragments; we have perhaps as much as half of Aristotle’s *Protrepticus*, or *Exhortation to Philosophy*, addressed to a royal patron, which remains an excellent introduction to Aristotelian philosophy. (Aristotle’s will is also preserved, in Diogenes Laertius.)

Collections of data, classified but not written up with any literary pretensions, were intended as raw material to be further used in philosophical research and writing and teaching. These texts may have been “loose-leaf,” with new material constantly added, some of it perhaps by members of the school other than Aristotle. Extant writings of this type are the *History of Animals*, the *Constitution of Athens* (discovered in a papyrus in 1890 and not quite complete, a fragment of a vast series of 158 *Constitutions* of different cities), and the *Physical Problems*.

“Acroamatic” writings, that is, writings related to Aristotle’s lectures, form the bulk of the surviving corpus. This does not mean that the texts are verbatim identical with the lectures; while Aristotle sometimes speaks as if addressing a live audience, that is compatible with the texts being notes written beforehand as a basis for lectures, or a later revision retaining the lecture style (as in published Gifford or Sather lectures), and the treatises contain many passages which no student then or now could endure if read verbatim as a lecture. The problem is not special to Aristotle; most Greek literature was intended for oral performance, and in every case it is difficult to determine how close the transmitted text is to any given performance. Performances would vary, and the written text is not a transcript of any one occasion but a model for varying expanded or abridged oral performances. In Aristotle’s case, while usually only one written version survives for each lecture

series, occasionally (as in the *Ethics*) we can compare two and gain a sense of the range of variation.

The transmitted texts of the acroamatic writings vary greatly in style. Some passages are highly literary (often marked by avoidance of “hiatus”—the juxtaposition of a vowel at the end of a word with a vowel at the beginning of the next—as in Isocrates and in Plato’s late dialogues), whether because they have been more thoroughly revised toward eventual publication, or because Aristotle delivered some pieces (especially the beginnings of works) in more elaborate form, or because they are excerpted from Aristotle’s exoteric works. Other passages are long strings of brutally truncated arguments for the same conclusion, connected merely by “also”; in performance Aristotle would have selected only some arguments, and filled them out and connected them better.

The transmitted texts contain many references to “what we have said previously/elsewhere” or “what we will say,” sometimes with a title “in the [writings or lectures] on x.” (It is possible, but should not be the default assumption, that some of these cross-references were added by later editors.) While we can often supply a plausible page reference, we should beware of assuming that Aristotle’s references are to texts now extant, or else to lost parallel texts: They are not necessarily to fixed texts at all, but to earlier and later parts of an idealized curriculum, each part of which would be repeatedly given (with variations) as a lecture, and also written down and occasionally updated, even if no actual student ever heard the whole series in order. “We have said” and “we will say” refer not to order of composition but to order in the curriculum; however, while Aristotle is *mostly* consistent about the ideal order, there are contradictions that may indicate that he changed his mind on the appropriate sequence of the psychological-zoological writings. There is no real contradiction in the fact that Aristotle (and his followers) cite the same work under different titles; the curriculum may be subdivided more or less finely, and the same title may be used generically for a large section or specifically for a smaller subsection: “physics” or “on nature” may refer to the entire physical-biological corpus or to something as narrow as *Physics* I–IV (with *Physics* V–VIII cited contrastively as “on motion”).

Some ancient catalogs list Aristotle’s works by shorter units and some by longer units (the catalogs may also contain duplications, and some catalogs refer to works not available to other catalogs, or to us). Andronicus of Rhodes in the first century BCE attempted to introduce order by determining the correct titles and sequence, generally opting for longer “works,” and it is

probably roughly his decisions that won out. (But the story that Andronicus, drawing on a rediscovery of Aristotle's library, made the acroamatic works available for the first time and so touched off a renaissance of Aristotelianism, is mostly or wholly fiction.) Following a Stoic division of philosophy, Andronicus organized the corpus into first "logical" writings, then "physical" (or more broadly "theoretical" writings, to include the *Metaphysics*, concerned with nonphysical things), then "ethical" writings (or more broadly "practical," to include the *Politics*).

Many of the texts are now lost. As with the rest of Greek literature, what survived was generally only what was used and copied for educational purposes, which explains why the "exoteric" works are lost and why usually only one version of each "acroamatic" text survives. The surviving texts have been edited many times since the invention of printing, often in complete editions that generally try to follow Aristotle's and other ancient indications of the correct sequence of the corpus (although these are not fully consistent and, for example, give no hint how to order the three surviving ethical works, which all fill the same place in the curriculum).

Immanuel Bekker's nineteenth-century edition has become standard. Modern editions and translations give "Bekker pages" in the margins (e.g., "1042b5," where "a" or "b" is a column of a double-columned page), and Aristotle is always cited in this form where possible; editions that aspire to completeness print the texts in Bekker's sequence. The editions divide Aristotle's treatises into books and chapters; the book divisions have (not always undisputed) ancient authority and may in some cases go back to Aristotle himself, but the chapter divisions are modern artifacts and deserve no deference (medieval authors use a different division into "lectiones"). Ancient writers cite the books of multibook treatises by Greek letter-names; modern writers generally use numbers, but prefer letters in the *Metaphysics*, where the presence of two books alpha (conventionally designated A and α) disrupts the usual letter-number conversion.

The following list presents the texts in Bekker's sequence, leaving out texts currently agreed to be spurious, and marking with an asterisk texts whose authenticity is currently controversial. The traditional Latin titles are added where these sound significantly different from the English.

Logical writings (*Organon*): *Categories* (the title is controversial), *On Interpretation*, *Prior Analytics*, *Posterior Analytics*, *Topics*, *On Sophistical Refutations* (*De sophisticis elenchis*).

Theoretical writings: *Physics*, *On the Heaven* (*De caelo*), *On Generation and Corruption*, *Meteorology*, *On the Soul* (*De anima*), *Parva naturalia* (including *On Sense and Sensibilia*, *On Memory*, *On Sleep* [*De somno*], *On Dreams* [*De insomniis*], *On Divination in Sleep*, *On Length and Shortness of Life*, and *On Youth, Old Age, Life, Death and Respiration* [*De juventute* for short]), *History of Animals*, *Parts of Animals*, *Movement of Animals*, *Progression of Animals* (*De incessu animalium*), *Generation of Animals*, **Physical Problems*, *Metaphysics*.

Practical writings: *Nicomachean Ethics* (abbreviated "NE" or "EN"), **Magna Moralia*, *Eudemian Ethics* ("EE"), *Politics*. (In a peculiar situation, three central books are identical: NE V–VII = EE IV–VI. These books are usually printed with the NE, but most modern scholars agree that they were originally written with the EE instead.)

Bekker puts at the end the *Rhetoric* and *Poetics*, under the head of "productive philosophy" (i.e., philosophy to guide production, in this case of speeches or poems); their place is controversial, and they had sometimes been put at the end of the *Organon*. The **Constitution of Athens* and other texts not printed by Bekker (fragments discovered on papyrus or in later ancient citations or translations) are often placed at the end.

With Aristotle, as with Plato, there have been attempts to determine the order of composition of the works, distinguishing "early," "middle," and "late." Sometimes stylometric tests are applied. Some scholars, like Jaeger, assume that Aristotle moved from an early Platonism, to a critical revision of Platonism, to an independent mature philosophy. Such "developmental" studies have had the merit of bringing out tensions in Aristotle's work, and calling attention to works (often fragmentary, like the *Protrepticus*) that had been ignored or deemed spurious because they seemed embarrassingly close to Plato. Some chronological results have won widespread assent, notably that the *Protrepticus* is early, and the EE earlier than the NE. But dating has not generally been successful, and for a good reason, namely that Aristotle regularly revised his work, so that a single text may show both "early" and "late" features and thus resist easy classification. Aristotle was trying to present his treatises as parts of a synchronic system, ordered by pedagogical role; tensions remain, and while sometimes these tensions are best explained diachronically, this is not always the case. In what follows, the most important texts will be discussed, not in Bekker's order or in a presumed chronological order, but in roughly the order of increasing difficulty:

probably many of Aristotle's students dropped out early in this sequence, and only a few remained until the end.

ETHICS AND POLITICS

Aristotle conceives ethics as a part of political philosophy: We cannot understand and evaluate different political structures unless we understand individual character, and conversely, we cannot fully describe the best life for an individual without reference to the city in which he lives and is educated. Many comments in the ethical works assume that the reader or hearer is (or wants to be) a *politikos*, or statesman, and Aristotle assumes that the best life for an individual and the best *politeia* or constitution for a city, whatever they turn out to be, will be analogous. The ethical works, then, emerge from popular lectures to aspiring *politikoi*, who have come to hear lectures by a philosopher in the hope that it will make them happier and more successful *politikoi*, but who do not intend to spend their lives on philosophy.

Aristotle can be seen as trying to repair the damage that Plato did in his lecture on the Good, where an audience who had come expecting to hear about "health or wealth or some marvelous happiness" were surprised to find that the lecture was about numbers and that its conclusion was that the Good was the One, with the result that some of the audience gave up on philosophy altogether, while others presumably turned to the more practical philosophy of teachers like Isocrates (see Aristoxenus, *Elements of Harmonics* II,1, and cf. EE I,8). Aristotle is in part rejecting Plato's conclusions (he thinks mathematics has nothing to do with goodness), in part simply rejecting his method of presentation: we must start with what the audience antecedently believes and values, get them to see the difficulties, and so introduce philosophical doctrines (including any doctrine of a higher good) as solutions to those difficulties. But in ethics, as in rhetoric, he thinks that the Academics should be able to educate them better than Isocrates can.

Anyone who can choose how to live, and who wants to approach the question rationally, must first clarify what he is aiming at—what is the chief good of human life. Everyone agrees that the aim is *eudaimonia*—usually translated as "happiness," but perhaps best neutrally as "success"; it need not be introspectible, must be evaluated over a lifetime rather than at one moment, and can be said of cities as well as of individuals—but they disagree about what *eudaimonia* consists in. The three plausible contenders for the best way of life—the pleasure-seeking life, the active or political life, and the contemplative or philosophical life (Aristotle thinks the money-making life

is chosen only from necessity)—go with different contenders for the human good. The pleasure seekers think it is pleasure; the *politikoi* may think it is fame or honor or, more appropriately, that it is *aretè*, virtue, or excellence (what *deserves* honor).

Among the philosophers, Socrates thinks that virtue (consisting in some kind of knowledge) is necessary and sufficient for happiness, and Plato talks about the Form of the Good or about the One. Aristotle creates an *aporia* by using these views against each other and raising objections against each, in order to motivate his own account of happiness, and the conceptual distinction on which it is based, as a solution to the *aporia*. Happiness or success in life is not virtue, which is a stable *hexis* ("habit" or acquired state) persisting even when it is not exercised, but rather the *energeia* (exercise or activity) of virtue throughout a complete lifespan. We can thus avoid the paradox of saying that the good person is happy even when poor, sick, and unjustly despised by his fellow citizens; in such a condition he remains virtuous but cannot exercise his virtue, or is greatly hampered in exercising it. The happy life will *involve* virtue, and it will also involve wealth if the virtues (say, generosity) need wealth to be exercised, and these facts explain the temptation to identify happiness with virtue or even wealth. Likewise, the happy life is pleasant, since Aristotle analyzes pleasure as being (or following upon) the exercise of a natural state, but its pleasantness is not what *makes* it happy or worthy of choice. (This is against the view of some Academics that pleasure is always a process, the *restoration* of a natural state, and that the happiest life is a steady natural state without deficiency or restoration. Aristotle avoids the paradox that the happiest life is without activity or pleasure by arguing that there are *energeiai* that are not processes.)

Aristotle applies the same method of setting out competing beliefs and arguments, resolving the *aporia* through a distinction, and showing how justice can be done to all sides, to resolve Socrates' paradoxical argument that incontinence is impossible: I can do something wrong if I have *hexis*-knowledge that this type of action is wrong, but not if I am applying the *hexis* and have *energeia*-knowledge that this particular action is wrong. It must be stressed that this is a *teaching* method, designed to motivate Aristotle's doctrines and conceptual distinctions for his audience and to make softened versions of Socratic or Platonic paradoxes more palatable. We do not know that this is how Aristotle himself arrived at his conclusions.

Aristotle also tries to show what is right in the Socratic and Platonic conclusions that virtue and happiness consist in knowledge, perhaps knowledge of a transcendent Good. The work or task or function (*ergon*) of a human being is rational activity, and a virtue is a condition that disposes to such activity. But there are two kinds of virtues: “intellectual virtues,” or virtues of the rational soul, and “moral virtues,” conditions of an irrational part of the soul, according to which it is disposed to act as reason would require.

Genuine moral virtue is not simply habituation to desire the right amount, but involves choice, which involves deliberation or means-end reasoning; so moral virtue is not possible without the intellectual virtue of *phronêsis* (“prudence,” “practical wisdom”) or deliberative ability. (Nor, conversely, is *phronêsis* possible without moral virtue, since uncontrolled passions will warp our deliberations.) But *phronêsis* is not identical with the highest intellectual virtue, *sophia* (“wisdom”), knowledge of the divine things that are intrinsically most worth knowing. *Sophia* is exercised only in contemplation (*theôria*) and not in action: we cannot deduce, from these necessary eternal things, knowledge of the contingent temporal objects of practical choice. But *sophia* gives a starting point for deliberative reasoning in another way, because contemplation is itself the exercise of the highest virtue, and is therefore the highest happiness we can try to achieve. (It is the only exercise of virtue we can attribute to the gods, who can hardly be courageous or temperate.) So while happiness is possible with only moral virtue and practical intelligence, the highest happiness needs theoretical intelligence as well.

When Aristotle says that maximizing contemplation is the highest goal of human planning, he means not only planning an individual life, but also a statesman’s planning for the city. (The statesman may have only *phronêsis*, but needs proper respect for *sophia*.) Happiness, for cities as for individuals, is an exercise of virtue, and while this may require material conditions (prosperity and external peace), the statesman’s main concern should be making the city virtuous. And, for cities as for individuals, some virtues are more worth exercising than others: courage and military solidarity are virtues we would rather not have occasion to exercise. While a city must be able to defend itself, its highest goal is the exercise of the virtues of peaceful leisure. This is *theôria*, not only in its metaphorical sense (the philosopher’s contemplation of nature or of incorporeal divine things), but also in its ordinary sense: attendance at civic religious festivals, including the musical-poetic contests (of tragedies,

comedies, etc.), which may be occasions for private or communal moral and political reflection. (The *Poetics* defends the value of such musical-poetic performances, and inquires how it comes about; it thus elaborates an important point too briefly treated in the *Politics*.)

Aristotle’s main goal in the *Politics* is the construction of an ideal *politeia* (constitution or collective mode of life and governance), a critical revision of Plato’s *Republic* and *Laws*. But he also discusses less ideal *politeiai*, how they are preserved by proper legislation, and how they are corrupted, leading to revolution; the trained *politikos* will be useful even to a non-ideal *politeia*, helping to preserve it by moderating and improving it. (And Aristotle’s 158 collected *Politeiai* will help give an empirical base.) The central thesis of the *Politics* is the distinction between genuinely political rule (rule over free fellow citizens, in the interest of the ruled) and despotic rule (rule as of a master over slaves, in the interest of the ruler). While *Politics* I is notorious for defending slavery, Aristotle’s main interest is to make clear the differences between despotic rule (legitimate only within the household) and political rule. (He thus also defuses the Socratic paradox that there is only one art of ruling, depending on philosophical knowledge of the good: to the Athenian bourgeois, this suggests that the Academics are claiming the right to rule over their fellow citizens, while not allowing ordinary citizens even to give orders to their servants.)

Within the city, not only tyranny but also oligarchy and democracy are despotic: even when they are ruled by law, their laws express the economic and political interests of a ruling individual or group (the rich few in an oligarchy, the poor majority in a democracy). But rather than conclude, with Thrasymachus, that all rule is despotic, Aristotle argues, with Plato, that genuinely political rule is possible. Officially (like Plato’s *Statesman*) Aristotle has a two-by-three grid of constitutions: corresponding to tyranny, oligarchy, and democracy are three good constitutions, kingship, aristocracy, and (what Aristotle calls in a narrower sense) *politeia*, which are the rule of the one, the few, or the many in the interest of the whole city. But actually Aristotle treats kingship and aristocracy as an ideal constitution run by morally and practically virtuous people and aiming at the development and exercise of virtue; *politeia* is a more attainable ideal, a “mixed constitution” between democracy and oligarchy, as the moral virtues lie between vices of excess and deficiency. *Politeia*, though a “virtuous” constitution, does not aim at virtue in the citizens and does not choose officials for their virtue, but at least its laws, balancing the

interests of different groups and designed to preserve peace between them, do not impose a partisan “justice” that would conflict with genuine moral virtue in the individual.

DIALECTIC AND ANALYTICS

Aristotle’s logical treatises are usually grouped as the *Organon*, or “instrument”; against the Stoics, who make logic a part of philosophy alongside physics and ethics, the Peripatetics say that logic is a mere instrument of philosophy, valuable neither intrinsically nor as guiding action, but only as guiding reasoning in other fields. Also ancient is the arrangement of the *Organon*: first the *Categories*, dealing with single terms and the simple objects (substances, quantities, qualities, relations, actions, passions, “where,” “when,” positions [e.g., standing], states [e.g., armed]) that they signify; then the *De interpretatione*, dealing with propositions composed of two terms linked by a copula (affirmative or negative, universal or particular, assertoric or modal); then the *Prior Analytics*, dealing with syllogisms, valid arguments composed of three propositions sharing three terms (e.g., “A belongs to no B, C belongs to all B, therefore A does not belong to all C,” valid since Aristotle rejects empty terms).

Then come treatises dealing with different types of syllogism: the *Posterior Analytics*, with scientific or demonstrative syllogism, where the premises must be true and causally explanatory of the conclusion; the *Topics*, with dialectical syllogism, where the premises need only be plausible; the *Sophistical Refutations*, with sophistical or pseudo-dialectical syllogisms, which are only apparently valid or have only apparently plausible premises; some ancient writers add “rhetorical” and even “poetic” syllogisms. At the end of the *Sophistical Refutations*, Aristotle says that while he has perfected earlier teaching of rhetoric, in the case of the syllogism there had been no such teaching before him; Aristotle has been taken as here summing up the *Organon* and reflecting on his crucial discovery, the syllogism.

However, Aristotle has no conception of “logic,” but of two different disciplines, analytics (*Prior* and *Posterior*), and dialectic (the *Topics*, taken as including the *Sophistical Refutations*); the *Categories* and *De Interpretatione* seem designed to support the *Topics* rather than the *Analytics*. We have spoken above of dialectic, the practice of regimented discussion in which a questioner seeks to refute a respondent’s thesis by a series of yes-no questions. The end of the *Sophistical Refutations* is summing up not the entire *Organon* but only the *Topics*, which has for the first time made dialectic a teachable art and has

shown how to discover syllogisms to deduce the contradictory of the respondent’s thesis.

These arguments, unlike rhetorical arguments, can proceed only from premises the respondent will grant, and by steps he must accept as valid. Dialectic must proceed from plausible (*endoxa*) premises, since these are just those premises that a respondent will concede (if he does not see that they favor or hurt his thesis). It is a mistake to turn dialectic into “argument from prereflective intuitions,” detached from the context of refutation, and to give it a foundational role in philosophy. Aristotle does say that dialectic gives a path to the principles of the sciences, but these principles are, especially, definitions, and, as in Socratic dialogue, dialectic is chiefly devoted to testing and refuting proposed definitions. The structure of the *Topics* brings this out: successive books give rules for testing claims that *P* belongs to *S*, that *P* is or contains the genus of *S*, and that *P* is proper (*idion*) to *S* (i.e., belongs to every *S* and no non-*S*), which are necessary but insufficient conditions for *P* to be the definition of *S*, and then give special rules for testing claims of definition. Aristotle also gives advice on how to order your questions, how to proceed as respondent, and background knowledge the dialectician should have.

The *Categories* and *De interpretatione*, as well as *Topics* I, seem to give such background knowledge; the most recent edition of the *Categories* prefers the alternative ancient title *The Before the Topics*, in part because the text is not just about categories. First, Aristotle distinguishes simple from complex expressions; then, what is signified by a simple expression is signified either synonymously (univocally) or homonymously (equivocally) or paronymously (denominatively). Two things are synonymous if they are signified by the same name and according to the same definition; homonymous if signified by the same name according to two different definitions (bank and bank, but also *mousikê*, the art of music, and *mousikê*, a female musician); paronymous if one name is derived from the other (“just” is paronymous or derived from “justice,” not because the word “justice” is older, but because something is called “just” because there is justice in it).

Only synonymous things, not homonymous or paronymous, can be given genus-differentia definitions (“just” is neither a species of animal nor a species of virtue). Synonymous things that are in a subject (like justice) fall under one of the nine categories of accidents; synonymous things that are not in a subject are substances. (Substances can be “said of” something, but cannot be “in” something; horse is said of Bucephalus, since

Bucephalus is said to be a horse, but there is not a horse *in* Bucephalus. “Primary substances,” like Bucephalus, are neither in anything nor said of anything.) Aristotle gives tests for when a thing falls under each category, which are needed to apply the rules of the *Topics* (thus if *P* is the genus of *S*, *S* and *P* must belong to the same category, but we need tests to determine to which category they belong). Likewise, after the categories proper, Aristotle gives accounts of the different kinds of opposition, priority and simultaneity, motion and having, which serve similar functions in dialectic.

Sometimes a dialectical questioner poses a series of questions that appear to necessitate the contradictory of the respondent’s thesis, but which contain some hidden fallacy; the respondent must avoid assenting to what does not follow, and must be able to explain *why* it does not follow, in order to avoid appearing, to the spectators and perhaps even to himself, to have been refuted. The *Sophistical Refutations*, which may be considered as a final book of the *Topics*, is devoted to classifying such “sophisms,” or “sophistical refutations,” explaining how each type arises, and advising the respondent on how to recognize and to “solve” or “resolve” each such sophism as it comes at him in questioning.

Sophisms are not intrinsically dishonest: They are puzzles demanding solution. We should imagine, not an arms race between sophists devising offensive weapons and philosophers improving defenses, but a single intellectual community exploring sophisms and discussing the merits of different possible solutions. Often the most philosophically interesting sophisms are “sophisms of figure of speech,” arising when the grammatical form of a term misrepresents its logical form: these include the family of sophisms concluding that “there is a third man” beyond mortal individuals and the Platonic Form, which turn on treating “man” as “signifying some this.” Aristotle himself, in the fragmentary *On Ideas*, constructs a series of such philosophically serious sophisms, giving for each Platonic argument for the Forms a parallel argument to an unacceptable conclusion, such as the third man. Each sophism challenges the Platonists: “dismantle my sophistical argument without at the same time dismantling your own allegedly probative arguments for the Forms.” The *Categories* helps solve sophisms of figure of speech by testing what category each term signifies, and its distinction between primary and secondary substances can solve many third man sophisms; but if Platonists accept these solutions, they risk undermining their own favorite arguments and conclusions.

A syllogism or deduction is “a discourse in which, some things being supposed, something different results of necessity through their being so.” Syllogisms are as old as thought and language, and Aristotle does not claim to have invented them. What the *Analytics* invents is a method for *analyzing* them: that is, for classifying them and then, by giving a few primitive argument forms and derivation rules for generating more complicated forms, explaining why syllogism comes about. In every case, syllogism depends on two premises sharing a common term (the syllogism will be in different “figures,” depending on whether the shared term is subject of one premise and predicate of the other, predicate of both, or subject of both; some “moods” will be valid and others not, depending on whether the premises are affirmative or negative, particular or universal, assertoric or modal). Aristotle’s analysis depends on the realization that the necessity or validity of an argument, once all premises are made explicit, depends only on its form, so that the same analysis applies whether the premises are true or false; this realization presumably arose from the deliberate exploration, in dialectic, of the consequences of false hypotheses.

But Aristotle sharply distinguishes dialectical from scientific or causal reasoning, and he devotes the *Posterior Analytics* to analyzing “demonstrations” or *scientific* syllogisms, arguments that give their possessors knowledge or science (*epistêmê*) of some object; here *epistêmê* is a cognitive state that not only grasps an object as it is, without the possibility of falsehood, but also understands *why* the object is as it is. It seems surprising that mere arguments, without direct contact with the object, can give such knowledge, and Aristotle tries to analyze the conditions under which this can happen. The premises must be true, necessary, and better known than the conclusion; they must also express the causes that explain why the conclusion is true. We can of course come to know an object by reasoning from effects to causes, but properly scientific and explanatory knowledge must reason from causes to effects; the logical structure of the argument will mirror the causal structure of the world.

On pain of circularity or regress, the first principles of demonstrations must be known by some means other than demonstration (Aristotle calls the non-demonstrative grasp of first principles *nous* rather than *epistêmê*). Apart from some topic-neutral principles of reasoning (“axioms”), these will be either “hypotheses” that the objects of each science exist, or “definitions” of those objects; we accept without demonstration both the existence and definitions of the simple objects of the science (e.g., for geometry, point and straight line) and pre-

liminary definitions of the complex objects (e.g., regular pentagon), but we demonstrate the existence of complex objects satisfying those definitions. Dialectic can reach these preliminary definitions, but we can give properly scientific definitions of complex objects only once we demonstrate their existence from simple causes (thus not “thunder is noise in the clouds” but “thunder is noise of extinction of fire in the clouds”). We cannot give justificatory explanations of how we know the first principles of the sciences, but only causal explanations of how the human mind, primed by experience, comes to grasp them by *nous*; Aristotle’s account is compressed enough that it has been read both as an empiricist account of induction and as a friendly revision of Plato’s theory of recollection.

Aristotle’s account of science is clearly modeled on geometry. But he tries to show that physics too can be a science, beginning from a grasp of the forms of natural things.

PHYSICS AND COSMOLOGY

Aristotle’s project in physics is a response to Platonic challenges both to the narrative method and to the content of pre-Socratic physics. Anaxagoras’s physics—to take a typical pre-Socratic example—narrates the origin of everything from a cosmogonic vortex, whose rotation and centrifugal force explain the separation of heaven from earth, the rotation of the heavens, the motion of heavy bodies down and light bodies up and the sorting of like bodies to like, and then the formation of the first plants and animals and humans out of seeds present in the precosmic mixture. Plato thinks such narrative can never be scientific; science must be concerned not with how things come to be but with what they are, beginning from their forms as grasped by definitions, and proceeding to demonstration.

Plato also complains that pre-Socratics explain the emergence of the cosmos by reference not to a rational plan or to some good to be accomplished, but through violence; if things are where they are because of a vortex (i.e., through being shoved by other bodies that are shoved into them) rather than because it is best for them to be there, then there will be no explanation of the goodness and orderliness of the universe, as manifested in the mathematically precise motions of the planets. In the *Timaeus*, Plato addresses the second objection by sketching an alternative teleological physics; but this too follows a narrative method, and even a reformed physics cannot be science but only a likely story.

Aristotle tries to address both objections and to produce a genuinely scientific physics, explaining the physi-

cists’ traditional explananda (rotating heavens, fall of heavy bodies, lightning, earthquakes, animals . . .) not in a narrative sequence but in a causal or explanatory sequence, beginning from the form or nature of each body, which is the object of a properly physical definition. Aristotle broadly accepts the *Timaeus*’s picture of the cosmos: a spherical earth is at rest at the center of a single spherical cosmos. The cosmos is made of earth, water, air, and fire intertransformed and combined, teleologically organized to support living things, and surrounded by heavenly bodies that are themselves living and divine; these move in several uniform circular motions, which combine to produce complex astronomical phenomena, and they are ultimately governed by an incorporeal god or gods. But Aristotle’s method contrasts with the *Timaeus*, and leads him to challenge particular claims of the *Timaeus* as well as of the pre-Socratics.

Aristotle’s particular physical treatises—the *De caelo*, *On Generation and Corruption*, *Meteorology*, and psychological-zoological writings—follow roughly what had been the traditional narrative sequence of the explananda. Thus the *De caelo* treats the rotation of the heavens and the motions of heavy and light bodies, traditionally explained through a cosmogonic vortex. But Aristotle rejects explanations through vortices or any other violent cause. What happens to a thing violently, contrary to its own nature, cannot happen always or for the most part, but only as a temporary interruption of a thing’s natural behavior (e.g., a stone being thrown upward). Physics, as a science, seeks to explain what happens always or for the most part, and must therefore start by grasping the nature of each thing, where “nature” means “principle of natural motion”; so the nature of heavy bodies is to move toward the center of the cosmos, and thus teleology is built into each nature. (Thus physical definitions necessarily involve motion, and the forms they describe cannot exist separately from matter, as the Form described by a Platonic dialectical definition is supposed to. And fire and so on must be defined physically by their motions, rather than mathematically by their shapes as in Democritus and the *Timaeus*.)

Aristotle draws the conclusion that the heavens cannot be made of the four standard elements; since these naturally move in straight lines toward or away from the center, the heavens would have to be constrained to circular motion by violence (whether by a vortex or by a providential soul as in the *Timaeus*), and such motion could not be regular or permanent. Consequently, the heavens are made out of a fifth element (sometimes called “aether”) whose natural motion is around the cen-

ter. The aether is free of the accidents that obstruct natural motion in the sublunar world, so it rotates eternally without interruption or irregularity. Because this motion arises eternally from the nature of the thing, Aristotle rejects the claim of the pre-Socratics and the *Timaeus* that the rotation of the heavens and the separation of the elements into an ordered cosmos arose (by what could only be a violent process) from a precosmic chaos; the ordered world and its more-or-less regular phenomena have always existed, and a narrative explanation is excluded, since there is no precosmic situation from which a narrative could begin. Rather, the phenomena must be explained by the influence of the naturally rotating heavens on naturally moving sublunar elements.

The *On Generation and Corruption* and *Meteorology* continue this program. If it were not for the rotation of the heavens, the four sublunar elements would separate out into concentric spheres of heavier and lighter elements, with no intertransformation or combination, and therefore no living things. But the regular daily rotation of the heavens, combined with the regular rotation of the sun through the inclined circle of the ecliptic, bring it about that the sun is above the horizon more of the time in the summer than in the winter, causing regular cycles of heating and cooling, and thus of evaporation and condensation.

Aristotle sees evaporation as a genuine transformation of water into air, and likewise of earth into fire; when a heavy element is transformed into a light element, it begins to rise (and when a light element is condensed, it falls), and this cycle keeps the elements from separating and gives rise to combinations. But properly the light elements are not “air” and “fire” but “moist exhalation” and “dry exhalation”; air is a mixture of both, and the portion of the dry exhalation that gathers above the air and beneath the sphere of the moon is not actually fire, but is a fuel that easily becomes inflamed, as it does in comets and shooting stars.

Since Tycho Brahe proved that comets and novae are supralunar, Aristotle’s account has been regarded as a desperate attempt to save his theory of immutable heavens by moving all changes in the heavens to a fictional sublunar fire-sphere governed by a fantastic exhalation process. Historically this is the wrong attitude. Aristotle’s explanation of comets is among the most traditional parts of his physics: Heraclitus explains even the sun through a continuous process of exhalations rising from the sea and becoming inflamed. Aristotle’s innovation is to separate out from meteorological phenomena genuinely astronomical things like the sun, which are not

dependent on the sublunar world but are governed only by themselves and by unchangeable incorporeal things, and therefore have eternally constant motions and can be objects of precise mathematical science; it is only because these things are perfectly regular that they can impose even an approximate regularity on the sublunar world.

The *Physics* in the narrower sense is a deliberately non-cosmological prolegomenon to the physical works, describing the principles from which all natural things arise and the necessary conditions (above all, motion) for anything to arise from these principles, and using a definition of “nature” to delimit the physicist’s domain and methods and the causes or explanations that he must invoke in tracing natural things back to their principles. Aristotle begins, traditionally enough, with the *archai*, the principles or starting points of natural things—whatever must exist before each natural thing comes to be, and can be used in explaining it. (For narrative physics these would be whatever existed before the cosmos, e.g., for Empedocles the four elements and love and strife, for the *Timaeus* the Forms and receptacle and demiurge; but Aristotle’s *archai* do not exist before the cosmos, since his cosmos never came to be.) We will infer to the *archai* by analyzing the characteristic effect that arises from them, which is, most generally, motion or change—not only change of place (locomotion) but also change of quality (alteration), change of quantity (growth and diminution), and the coming to be and passing away of substances (generation and corruption).

Aristotle argues that whenever some new *F* comes to be, in any category, there must be some persisting substratum that was not *F* and comes to be *F*; this analysis shifts *F* to predicate position. The subject that persists through even substantial change is one *archê*, the matter. This echoes the *Timaeus*’s argument that the apparent substantial change of (say) water into air shows that the real *archê* is not water or air, but the receptacle, the persisting substratum that appears now watery, now airy. But the *Timaeus* seems to infer that the change is not really substantial, that all sensible things are just accidental modifications of this single persisting substance. Aristotle argues that there is real substantial change, that the substance of a natural thing is not the matter that persists through the thing’s generation and corruption, but the form that comes to be in the matter. Both form and matter are *archai* of natural things, and while the matter is *potentially* this or that substance, the form, as what makes each substance *actually* that substance, is substance in a stronger sense. (Plato would reply that while form as well as matter is an *archê* and a substance, the real Form is

eternal and separate, and what comes to be in the matter is a nonsubstantial image of the Form.)

How do we tell when a form acquired through change is a new substance, and when it is merely a new accident of a persisting substance? The shape of an artifact is merely an accident, but the *nature* of a natural thing, that is, the distinctive “principle of motion and rest” within it that is responsible for its carrying out its characteristic activities, is a substance. *Physics* II argues that the nature of a natural thing is more properly its form than its matter, and therefore that the physicist must study form as well as matter; thus, as we have seen, physics must define and not merely narrate, giving definitions that, unlike Platonic dialectical definitions, are inseparable from motion and thus from matter—natures are like “snubness,” which is neither the matter “nose” nor the form “concave,” but a form that cannot be defined without reference to its appropriate matter, the nose. A natural thing acts *for the sake of* actualizing the characteristic potentialities of its nature, and so the physicist will give explanations not only through the material and formal causes and through the mover or efficient cause, but also through the final cause. Aristotle thus, like Plato in *Laws* X, argues against many pre-Socratic physicists that purposive activity is prior to chance and violence, but he does this while preserving what is specific to nature, and without reducing natural things to artifacts of a designing soul.

Nothing will arise from matter and form without motion; motion depends on time and place and (some people think) on void; also a motion, to be a single motion, must be continuous, and continuity implies infinite divisibility. All these concepts are problematic, and Aristotle tries to define, and to resolve *aporiai* about, motion, place, and time, and to show that the infinite and the void do not exist (except in specially qualified senses). He then turns to the “*On Motion*,” *Physics* V–VIII (*Physics* VII seems to interrupt the argument, and may be a survivor of an earlier stage of Aristotle’s work). *Physics* V–VI give non-causal considerations that would apply equally to natural and violent motion, notably about when a motion is a single motion, about when two motions or a motion and a rest are contrary, and about the continuity of motion, place, and time; they seem to be there chiefly to supply premises for the causal argument of *Physics* VIII. *Physics* VIII, relying only on the abstract concepts of the *Physics* and not on empirical cosmology, gives an elaborate argument from the natural motions of corruptible things, first to the eternity of motion as such, then to self-moved movers (empirically, animals) and unmoved

movers (their souls), then to an eternally continuous motion (the motion of the heavens), and finally to an eternally unmoved cause outside the cosmos. This bravura display reaches beyond physics to metaphysics or theology, and Aristotle relies crucially on it in *Metaphysics* Λ, discussed below.

PSYCHOLOGY AND ZOOLOGY

Narrative physics typically ends with the production of plants and of animals, including humans, before turning to human societies and conventions, which Aristotle treats under practical philosophy. Aristotle devotes a large part of his writing to animals, complemented by Theophrastus’s studies of plants. But his program of denarrativizing physics, and of physical teleology and physical definition, entail major differences from earlier accounts of animals; Aristotle also integrates an account of soul into his study of animals, though not as fully as we might expect. The crucial methodological texts are *Parts of Animals* Book I, which serves as an introduction to the zoological works generally, and *De anima* I,1.

A narrative physicist believes he has accounted for the elephant once he has taken the cosmogonic narrative far enough to generate the first elephant. This means that he puts his “Generation of Animals” before his “Parts of Animals.” (The parts of an elephant are simply whatever results from the prior generative process: Thus the Hippocratic *On Fleashes* gives a cosmogonic account of the generation of each tissue, with no regard to how the tissues are arranged in the animal, what animal they are parts of, or what functions they have.) Such a physicist will also be more concerned with the hard problem of the “spontaneous” (nonsexual) generation of the first elephant than with the easier problem of how to get more elephants out of the elephants there already are.

For Aristotle, however, the whole cosmos with all its species has existed from eternity, so there is no reason to believe elephants were ever generated spontaneously. We never see elephants generated spontaneously anymore, and while nature might have had greater generative force at some past time when it was undergoing more violent motions (see *Physical Problems* X,13), when we understand the extremely complex arrangement of parts required for a functioning, self-sustaining elephant, it becomes incredible that the crude natural powers of the pre-elephantine era could have combined to produce it. (Plato might say that God intervened to produce the first elephant, but Aristotle thinks that God acted no more or less than now, and that his activity simply sustains the regular activities of natures. While Aristotle is now

notorious for defending spontaneous generation, he actually allows less scope to spontaneous generation than any other Greek philosopher, restricting it to lower life-forms.)

Thus when Aristotle studies the generation of living things, he is chiefly studying their generation out of already existing members of the same species. And we can understand this process not in narrative sequence but only backward, starting from the arrangement of parts that the generative process is for the sake of producing; so methodologically the *Parts of Animals* must precede the *Generation of Animals*. And the parts themselves must be explained teleologically, not through the generative process but through their function in the animal. Different species of animals will have different strategies for survival and reproduction, thus different characteristic activities, requiring different characteristic parts; the scientist will define each animal species by describing its characteristic parts, defining each part as an “organ” or instrument of some activity and deducing its shape and matter from its function.

Aristotle describes the parts, and the whole animal, as organs of the *soul*, that is, instruments through which the soul’s powers are exercised. Because they cannot be defined without reference to the soul, it belongs to the natural scientist to study soul, or at least those powers of soul that are exercised through bodily instruments—all powers except, possibly, intellect (*nous*). Aristotle is trying here both to reform physics by making it include the soul, and also to make the study of soul scientific by bringing it under physics. However, he also makes the study of soul *further* from physics as usually conceived, by denying that the soul is moved, either in moving the body or in sensing and thinking. In *De anima* I he says that earlier philosophers have approached the soul either from its capacity to originate motion in the body, concluding that it is a self-moving source of motion; or from its ability to represent all things, concluding that it is composed of the elementary constituents of all knowable objects; or from its “bodilessness,” identifying it either with fire or air or with something entirely incorporeal.

The *Timaeus* combines all of these approaches but, Aristotle thinks, in a mistaken way, representing the soul as a magical quasi-body interwoven with visible bodies, moved in the same way that bodies are, and moving bodies and being moved by them in the same way that bodies move each other. In *De anima* II, Aristotle instead defines the soul by its relation to its *energeiai*, the activities it carries out through the body. Soul is the *dunamis* (power, potentiality, capacity) for these *energeiai*, or it is that

which, added to a potentially living thing (a seed or embryo), makes it an actually living thing, where to be an actually living thing is to have the potentiality to carry out an appropriate range of the vital activities (nourishment, growth, reproduction, sensation, memory, imagination, desire, locomotion, intellection). In Aristotle’s formula, soul is “the first actuality [*entelecheia*] of a potentially living body,” the second actuality being the vital activities; soul stands to these activities as a *hexis* of science stands to the exercise of that science in contemplation, or as a productive art stands to its exercise in production.

Aristotle spells out his definition by saying that soul is “the first actuality of a natural organic body.” Modern connotations of “organic” are misleading here: an organic body is an *instrumental* body, as is, for example, a hammer; the living body is the instrument of the soul as the hammer is an instrument of the art of carpentry. But the hammer is an *artificial* organic body, while the living body is a *natural* one, meaning (by the definition of the *Physics*) that it has an internal principle of motion and rest. So while the art of carpentry moves the hammer from outside (by inhabiting the body of the carpenter), the soul is a *nature* moving the body in a quasi-artistic way from inside, in producing and maintaining its natural instrument (nutrition, growth, reproduction) and in further using that instrument (sensation and the higher activities). The arts give us a model for how the soul can move its body without itself being moved (unlike a body pushing or pulling another body): though the carpenter’s hand is moved when he moves the hammer, his art of carpentry is not. The arts also give a model for the cognitive powers, since an art contains the “formula,” the definition or perhaps recipe, of its objects, without containing their matter; and arts can recognize individual objects through cognitive instruments (the art of measuring might use scales), as well as moving them through instruments of action.

The vegetative powers (powers shared even by plants) and the sensitive powers (powers shared by irrational animals) are “not without” their appropriate bodily instruments, as snubness is “not without” nose. So souls of plants and irrational animals cannot exist when separated from their bodies. The question whether any soul can so exist, and thus whether any soul is immortal (besides the souls of the heavens, which have immortal bodies), depends on whether all psychic powers are similarly dependent on bodily instruments. Sensation is not without its instruments, and imagination is not without sensation, so these are inseparable.

Some passages in *De anima* III suggest that intellection is not without imagination, so that it too is inseparable; other passages suggest that a special kind of intellection, of special matterless objects, is separable. (Fragments of Aristotle's "exoteric" works also argue that soul is immortal; perhaps Aristotle changed his mind from these early texts to the *De anima*, perhaps the texts can be reconciled, or perhaps the "exoteric" texts should be regarded as a popular approximation to a more precise truth.) *De anima* III,5 says that "the passive *nous* is corruptible," and that only the active or productive *nous* is immortal. But what is this productive *nous* and what does it do? Since it is eternally and essentially intellectually cognizing, it seems that it must not be a part of the human soul, but rather a separate immaterial divine thing that acts on the "passive *nous*" in the soul. This recalls Platonic texts on *nous* (here best translated as "reason" or "rationality") as a separately existing virtue in which souls participate, the *nous* apparently personified as the divine craftsman of the *Timaeus*. Aristotle rejects all other separately existing virtues, because they are "not without" the irrational soul and the conditions of the body, but he has no reason to reject this one; and he too in *Metaphysics* Λ will identify such a *nous* with a world-governing divine *archê*.

For Aristotle, we can fully understand soul only by understanding its specific powers, their activities, and the objects and instruments of those activities; the *De anima* gives a general abstract account, which is filled in by the *Parva naturalia*, which treats of the actions and passions "common to soul and body"—and almost all the soul's actions and passions are in common with the body—and by the accounts of the instruments and activities of different animal species in the zoological works. But the neat sequence of "psychological works" (*De anima* and *Parva naturalia*) followed by "zoological" or "biological" works (the *History*, *Parts*, *Movement*, *Progression*, and *Generation of Animals*), as presented in Bekker and other modern editions, is probably an illusion. The texts themselves frequently refer to what has preceded or what will follow, but they seem to indicate two different sequences. Some texts, especially the *Parts* and *Generation of Animals*, imply a sequence in which the *Parts* would lead immediately into the *Generation* (both presupposing the *History*, as giving the facts for which they will supply the causes); the *De anima* and *Parva naturalia* would be a separate sequence, if anything more likely to come after than before (Aristotle refers to a lost part of the *Parva naturalia*, on the principles of health and disease, as the end point of natural philosophy).

But other texts imply a different order. Call "*Parva naturalia* Group I" the treatises connected with sensation, the *On Sensation*, *On Memory*, *On Sleep*, *On Dreams*, and *On Divination in Sleep*; "*Parva naturalia* Group II" would be the *On Length and Shortness of Life*, *On Youth, Old Age, Life, Death and Respiration*, and the lost treatise on health. There are many indications for a sequence *Parts of Animals*, *Progression of Animals*, *De anima*, *Parva naturalia* Group I, *Motion of Animals*, *Generation of Animals*, *Parva naturalia* Group II, and perhaps a treatise on plants. It seems most likely that Aristotle began with the *Parts-Generation* sequence, and later inserted the other texts between the *Parts* and *Generation*, treating reproduction, like sensation and breathing, as an activity involving soul as well as body. No evidence supports putting the *De anima* before the *Parts of Animals*; one option is to regard biology as beginning with the body, turning to the soul, and then exploring how they act together.

METAPHYSICS

Sophia as an intellectual virtue—"epistêmê and *nous* of what is most noble by nature"—had been discussed in the *Ethics*. In the *Metaphysics*, Aristotle tries to provide a new discipline to bring us to this virtue, because he thinks that the existing disciplines with a claim to yield theoretical wisdom—physics, mathematics, and dialectic—are insufficient. The awkward title, literally "The [books or things] after the physical [books or things]," first attested in Nicolaus of Damascus (1st century CE), reflects the difficulty of fitting the treatise into the standard scheme of disciplines: it belongs to theoretical philosophy, and draws on physics, but does not belong to physics, because the divine things it considers (unlike the heavens, also divine) exist separately from matter and motion.

The unity of the treatise is problematic. It is clear that Aristotle intended to write a long treatise on *sophia*, and that most of the books of the *Metaphysics* were intended as materials for such a treatise. But it is also clear (from almost verbatim duplication between A9 and M4–5, verbatim duplication between the latter part of K and parts of the *Physics*, looser duplication between the former part of K and BΓE, and the coexistence of two books called alpha [now distinguished as A and α]) that Aristotle never finished the treatise to his satisfaction. Perhaps he would have discarded some parts of the *Metaphysics*, and perhaps some were never intended for the treatise; and there are grounds for suspecting that K is a student's reworking of Aristotle's lectures. In what follows, it will be assumed that all the books except α and K were intended to belong to the treatise, but many scholars

have doubted this for Δ and (less plausibly) Λ . (There is nothing to support the view, popular among nonspecialists, that the *Metaphysics* consists of fourteen independent books assembled by later Peripatetic editors; there are many forward and backward references between the books, including Δ and Λ .)

Aristotle says different things in different parts of the *Metaphysics* about the object of wisdom (or “first philosophy,” as he says when distinguishing it from physics; once he calls it “theology”). Jaeger took these as evidence of different chronological strata: Aristotle would first have conceived the project of wisdom as searching for divine substances to replace the Platonic Forms, then reconceived it as a general study of being. But usually, and rightly, Aristotle’s descriptions of wisdom are thought to be compatible. They are best taken as part of a developing strategy in the *Metaphysics* to narrow down and finally to acquire *sophia*.

It is perhaps most often thought that Aristotle aims at a universal science; that this project faces a difficulty, because “being” is said in different ways of things in different categories; that Aristotle proposes to solve this by discovering things that *are* in the primary way (these things, whatever they are, will be called substances, and once we understand their mode of being, we can understand the derivative modes of being of other things); that there are different and sometimes conflicting criteria for something to *be* in the primary way; that forms meet these different criteria better than matter or matter-form composites, but that the forms of corruptible things do so only imperfectly (because they are not separable except by reason); and that Aristotle therefore turns to divine forms (forms existing separately from matter), which will allow us to understand the derivative modes of being of other forms, other substances, and non-substances. This would explain why Aristotle can say that wisdom is about being, that it is about substance, and that it is about divine things.

However, the *Metaphysics* does not actually follow this program, and Aristotle nowhere calls divine things “forms,” and nowhere says that they are beings or substances in any stronger sense than ordinary form-matter composites are (still less does he use them to understand the inferior modes of being of other things). Instead, Aristotle begins with an ethical characterization of wisdom, infers that wisdom will be a science of the *archai* (the “principles,” or first of all things) and of first causes, then specifies these as causes of *being*, then reaches an account of divine things as *archai* and first causes of being, not as instances of a special sense of being. Theol-

ogy is not a means to ontology; rather, ontology is a means to theology, or more precisely to “archeology” (knowledge of the *archai* might still count as wisdom even if there were nothing divine to know).

Metaphysics A begins by characterizing wisdom as the kind of knowledge intrinsically most worth having, setting aside practical consequences; Aristotle then argues that this is knowledge of the *archai*, and that these *archai* will be first causes of all things. Indeed, all philosophers who believe in theoretical wisdom claim knowledge of some *archai*; for pre-Socratic physicists, these are whatever existed from eternity before the ordered world arose out of them; for Platonic dialecticians, the Forms, especially maximally universal forms like being and unity; for Pythagorizing mathematicians, the one and the two or the infinite. We cannot directly observe any of these claimed *archai*, but must infer them as causes of more manifest things. Aristotle asks how each philosopher uses his *archai* as causes—that is, how the things he posits at the beginning of his account function in explaining the things he describes as arising later.

The best earlier philosophers, Anaxagoras and Empedocles and Plato, agree that among the *archai* is a Good and cause of goodness to the world. But, Aristotle claims, Anaxagoras and Empedocles cite only material and efficient causes (using *nous* or Love, their good *archai*, as efficient causes), and Plato cites only material and formal causes (using the one, his good *archê*, as a formal cause). Aristotle’s main point is not that earlier philosophers have been discovering the four causes of his *Physics*, but that no one has yet used the Good as a *final* cause, thus no one has made it a cause whose *goodness* is explanatory. Aristotle thus motivates a new search for *archai* which will lead, in Λ , to a good *archê* as a final cause. He thus hopes to vindicate a key aspiration of Platonism, which Plato had undermined in his lecture on the Good by reinterpreting the Good as mathematical unity. Aristotle’s rival Speusippus had concluded that the *archê* is One but not good; Aristotle makes the opposite decision, to discard the mathematics and save goodness. (Aristotle gives detailed objections against Academic accounts of Forms and numbers and their *archai* in *Metaphysics* MN.)

Metaphysics B raises a series of *aporiai*, some about how the science of *archai* should proceed, some about the *archai* themselves, some about what things exist “by themselves” or as substances. If some *X* (a genus or a number, or being or unity) is not a substance, but is merely an attribute of some other underlying nature, then *X* is posterior to that nature and cannot be among

the *archai* that wisdom seeks. Now while we know that the *archai* will be first causes, this does not tell us how to find them, since there are different kinds of causes, and different effects we might seek to explain.

Metaphysics Γ proposes to find the highest causes as causes of the most universal effects: “there is a science of being, inasmuch as it is being, and its *per se* attributes”—a science that knows the causes to all things of the facts that they *are*, that they are each *one*, are severally *many*, and so on. It is sufficient to study the causes of being to *substances*, since the being of accidents is dependent on that of substances. (Γ argues that this science will also give explanatory understanding of the principles of noncontradiction and excluded middle.)

Metaphysics Δ distinguishes different senses of “*arché*,” “cause,” “one,” “being,” and other terms necessary for the investigation. Δ7 argues that “being” is said in several ways: being in different senses will have different kinds of cause, and confusion will result if we look for causes of being without drawing the necessary distinctions.

Metaphysics EZHΘ investigate causes of being in these different senses. E1 sets out the program of looking for the *archai* as causes of being, and specifically for *archai* which will be eternally unmoved and exist separately (not as attributes of something else); physics fails to reach unmoved *archai*, and mathematics fails to reach separately existing *archai*, and a new discipline of first philosophy or “theology” is needed. This might be dialectic, if Plato were right that the formal causes of things were eternal and separate, but he is not; E1 argues that physics, not first philosophy, understands the formal causes of natural things. E2–3 investigate the causes of “being *per accidens*,” and E4 the causes of “being as truth,” both concluding that no science (and certainly not wisdom) deals with these causes; the serious possibilities are “being as said of the categories,” primarily of substance and derivatively of accidents, treated in ZH, and “being as actuality and potentiality,” treated in Θ. *Metaphysics* I (“Iota”) deals with causes of *per se* attributes of being such as unity, difference, and contrariety, arguing that these do not lead to a separately existing one-itself or first pair of contraries, but only to a unit or a contrariety within each genus.

Metaphysics Z examines the causes of being as said of substances and accidents, but quickly restricts itself to the primary case, causes of substance. Aristotle speaks interchangeably of “the cause of substance to *X*” and “the substance of *X*.” The conventional translation “substance” for *ousia* (the nominalization of the verb “to be”) obscures

the point that the *ousia* of *X* is whatever answers the question “what is *X*?”

There are several ways we might answer this question, notably by giving the *subject* of *X* (i.e., a *Y* such that *Y* is *X*: “what is Socrates?” “this flesh and these bones”), or by giving the *essence* of *X* (i.e., a *Y* such that *X* is *Y*, or such that for *X* to be is for it to be *Y*: “what is man?” “wingless biped animal”), or by giving some part of the essence of *X*, such as a universal or genus under which *X* falls. The *ousia* of *X* taken the first way is its material cause; the *ousia* of *X* taken the second way is its formal cause. A philosopher might hope to reach *archai*, eternal and prior to sensible things, by starting with some sensible substance and asking “what is it?” repeatedly, in one of these ways, until some ultimate answer is reached: this might be, as a material cause, atoms and the void, or earth, water, air, and fire, or the “receptacle” of the *Timaeus*; or, as a formal cause, Platonic Forms, especially the genera and being and unity.

Z devotes much ingenuity to showing that these projects do not succeed; what a sensible substance *is* is most properly its form, not a separate eternal form but one that does not exist prior to the form-matter composite. Plato might argue that, if the composite *X* came to be, there must already have been a form or essence of *X* for the process of coming-to-be to aim at; Aristotle agrees, but argues that this is not a separate eternal form, but a form existing in a generator of the same species (e.g., for an animal, the father) or in the soul of the artisan who produced *X*. Aristotle also argues that if the parts of the essence mentioned in the definition of *X* (like three lines in the definition of triangle, or like the four elements in Empedocles’ definition of blood as “earth, water, air, and fire in equal proportions,” or like animal and biped in the definition of man) were *archai* existing in actuality prior to *X*, *X* would not be one thing but many things (thus, as a *reductio ad absurdum* of Plato, there would not be one Form, Man, but two Forms, Animal and Biped). This argument might seem to make definition impossible, since the *definiencia* are supposed to be prior to the *definiendum*; but Aristotle argues that they can be definitionally prior without being capable of separate existence. There is no Animal that is just animal, prior to the differentiae of animals: an actual animal is always a biped animal or a quadruped animal or the like, and the genus “animal” is merely a potentiality for these differentiae. Likewise, actual matter is always hot or cold, wet or dry, and the common matter that underlies all sensible changes is only a potentiality, not something actually existing prior to all sensible things. *Metaphysics* ZH thus

give rules for definition, with implications for understanding the relations between genus and differentia, universal and particular, form and matter; but the *archai* of these definitions are not the eternal, separately existing first things sought by wisdom (whether pre-Socratic physics or Platonic dialectic or Aristotelian first philosophy); prior in definition but not in separate existence, they are objects of Aristotelian physics.

Metaphysics Θ examines causes of being as actuality and as potentiality. A power or potentiality (*dunamis*), whether an active power to produce *X* or a passive power to undergo or become *X*, is a cause of *X*'s existing potentially (*dunamei*). Most of the *archai* of the physicists would be potentialities or potential causes. Thus the "seeds" in Anaxagoras's precosmic mixture *can become* plants and animals and their functional parts; Anaxagoras's *nous*, or the demiurge of the *Timaeus*, prior to the cosmos, *can act* to produce order, but are not yet doing so. But such causes explain only the potential existence of the cosmos, and give no sufficient reason why the active *archê* should begin to act on the passive *archê*. That the effect exists *actually* (*energeiâ[i]*) requires an *activity* (*energeia*) or an actual cause ("housebuilder" is a potential efficient cause, "housebuilder housebuilding" an actual efficient cause). Aristotle tries, both to extract general concepts of *dunamis* and *energeia*, and to argue that *energeia* is prior to *dunamis*: seeds are not prior to mature living things (since a seed exists dependently on a previous mature member of the species), and the *archai* in the strict sense, the first of all things, are not *dunameis* or potential causes, but *energeiai* or actual causes. Thus against (say) Anaxagoras's conception of the *archai* as temporally and narratively prior to the cosmos, the *archai* must from all eternity have been acting to produce the cosmos, so the cosmos too must have existed from eternity.

Metaphysics Λ pulls together the threads of ΖΗΘ and draws conclusions for what causal chains lead up from changing sensible things to separate eternal *archai*. There is no single separately existing matter of all changeable things, nor a single form even for all things in the same species. While the form of a natural composite substance does not exist before the composite, its generator, a previous mature member of the same species, does exist before; but this chain of efficient causes goes back *ad infinitum*, without leading to a separate eternal *archê*. But Aristotle argues (drawing on *Physics* VIII) that the eternal continuance and approximate periodicity of sublunar generation require a further cause: not simply the sublunar generators, but something eternal and perfectly regular—namely, the rotations of the heavens—that sets the

precise time lengths that sublunar cycles aim to approximate. Especially the daily and yearly motions of the sun, yielding the cycle of the seasons, serve to regulate cycles of generation.

Furthermore, these eternally unchanging motions require eternally unchanging substances as their efficient causes. Aristotle accepts Anaxagoras's and Plato's description of the mover of at least the first motion, the daily rotation of the whole heaven, as *nous*. But, using the premise that the *archê* must be pure *energeia*, he critically examines earlier philosophers' descriptions of *nous*'s causality, rejecting anything that would imply *dunamis* or changeability. Notably, *nous* must always move the heavens in the same way, and it must not move them in such a way as to be reciprocally affected by them. "Purifying" the Anaxagorean and Platonic accounts in this way, Aristotle concludes that *nous* moves the heaven only by causing the heaven to know and desire it: *Nous* is an efficient cause only by being a final cause. (When the heaven desires its mover, what does it desire to do, and how does this explain its motion? It should, like humans, order its actions toward contemplating God; and presumably its eternally unchanging motion is the best available imitation of God's eternally unchanging *energeia*.)

The premise that this *nous* is pure *energeia* also allows Aristotle (drawing on *De anima* III on "active *nous*") to "purify" earlier accounts of how it thinks and what it thinks. It is not a cognitive ability that could be applied to many objects, but a single eternal act of cognition of a single eternal object—the best object, or "good-itself." If this object were outside *nous*, *nous* would depend on something external to complete its act of cognition, and would of its own essence be merely potential *nous*; Aristotle concludes that *nous* is identical with the good-itself that it contemplates. This result allows Aristotle to fulfill various promises about wisdom from *Metaphysics* Α, showing how the good is a cause, *qua* good (as a final cause), and not just as an efficient or formal cause. He vindicates Plato's promise of a single first good *archê* against Speusippus's criticism, but only by giving up on talk of the One, and finding a causal route up to the *archê* from physics rather than from mathematics.

INFLUENCE

Aristotle's immediate influence came through the Peripatetic school, led after Aristotle's death by his student Theophrastus; other important students were Eudemus, Aristoxenus, and Dicaearchus. The Peripatetic Demetrius of Phalerum governed Athens, backed by Macedonian power, from 317 to 307 BCE. But the Peripatetic school

declined after this (perhaps in part because of the reaction against Demetrius at Athens); for most of the Hellenistic period (323–30 BCE), the dominant schools were the Academics, Stoics, and Epicureans. Peripatetics turn up more at Alexandria than at Athens, and more in biography and literary scholarship than in scientific philosophy.

However, there was a revival of Aristotle, as well as of Plato, in the first centuries BCE–CE, and attention turned from the “exoteric” texts to the “acroamatic” texts as offering a systematic teaching in all philosophical disciplines. Teaching would take place, by oral exposition of the texts of Aristotle, in whatever was thought to be the correct sequence, accompanied by refutations of more recent schools and solutions to new *aporiai*. This oral teaching is reflected in written commentaries, of which the most important are those of Alexander of Aphrodisias (c. 200 CE); we also have paraphrases of several Aristotelian treatises by Themistius (fourth century CE).

Besides the Peripatetics, late ancient Platonists make use of Aristotelian concepts in trying to extract a systematically teachable technical philosophy out of Plato’s dialogues, and often wind up incorporating Aristotelian doctrines. In particular, they share Aristotle’s concern to avoid inappropriately assimilating soul or *nous* or other divine realities to lower things, notably by attributing to them extension or change or *dunamis*. (Aristotle is here seen as an ally especially against Stoic corporealism.) Where Plato describes intelligible forms as conspecific with sensible things, the demiurge as acting after a period of inactivity, or thinking as a circular motion of soul, the Platonists use Aristotle’s arguments, together with a principle of charity, to argue that Plato must have intended these comparisons to sensible things to be understood allegorically; they say either that Aristotle’s criticisms of Plato are misunderstandings, or that Aristotle intended to criticize not Plato, but only disciples who took Plato’s metaphors literally. At the same time, they reinterpret Platonic forms as a plurality of sciences in God, weakening Aristotle’s insistence on the singleness of God’s knowledge. Thus fifth- and sixth-century commentaries both on Plato and on Aristotle harmonize the two authors to some extent. This is taken furthest by Simplicius; by contrast, John Philoponus, for Christian reasons, defends some specifically Platonic doctrines, including creation in time, against Aristotle.

After the mid-sixth century, the teaching of philosophy collapses, beyond introductions to philosophy and lectures on Porphyry’s *Introduction (Isagoge)* to the *Organon* and Aristotle’s *Categories*, *De interpretatione*,

and the elementary part of the *Prior Analytics*. The recovery of the rest of Aristotle’s work as a basis for systematic philosophical instruction occurred first in the Islamic world; key figures are al-Fārābī and Avicenna (Ibn Sīnā). These thinkers accept the guidance of late ancient commentators, and thus share to some extent in the harmonizing of Aristotle and Plato; by contrast, Averroes (Ibn Rushd) champions Alexander of Aphrodisias against harmonistic commentators, and tries to defend “scientific” Aristotelian philosophy against what he sees as unscientific Platonist contamination. Versions of Avicennian philosophy are taught in Iran to the present day.

In Greece, Michael Psellus revived late ancient Platonic-Aristotelian philosophy, which remained vital until the fall of the Byzantine Empire. In the Latin West, knowledge of Aristotelian philosophy survived in the translations and commentaries on the *Organon* by Boethius; Abelard and his twelfth century contemporaries began a renaissance of Aristotelian philosophy based almost wholly on the logic. Around 1200, translations of the whole Aristotelian corpus became available (first from Arabic, along with Arabic commentaries and treatises, then directly from Greek), and a systematic teaching of Aristotelian philosophy (“scholasticism”) became the basis for university instruction, and a prerequisite for the study of Christian theology; different solutions were proposed to the conflicts between Aristotle and biblical revelation (key figures are Thomas Aquinas, John Duns Scotus, and William of Ockham).

While scholastic Aristotelianism flourished in the Renaissance (key figures are Pietro Pomponazzi in Italy, Francisco Suárez in Spain and Portugal), there is also much Renaissance polemic against Aristotle. The charge may be that he is irreligious (he makes the causal connection of God with the world too thin, and seems to deny providence over the sublunar world and the immortality of human souls; he certainly denies miracles such as creation in time or resurrection); that his claims of scientific knowledge cannot overcome skeptical challenges; or that his explanations are tautologous, multiplying words without practical consequences either technical or moral. These criticisms are taken up by the mechanical philosophers of the seventeenth century (notably Descartes, Gassendi, Hobbes), who aim to give a systematic replacement for Aristotelian physics, doing without forms or qualities superadded to matter (except possibly the human rational soul), abolishing the distinction between heavenly and earthly matter, and deriving phenomena from a natural tendency of bodies to persist in rectilinear motion, and from the results of collisions between bod-

ies. Since the successes of this new physics (culminating in Newton), no systematic revival of Aristotelian philosophy has been possible; likewise, modern mathematical logic has permanently eclipsed Aristotelian syllogistic. Kantians often accuse Aristotle of uncritical realism in epistemology.

But Aristotle continues to be central in philosophical education, and to be a source of inspiration, chiefly in practical philosophy, metaphysics, and the philosophy of mind. Often philosophers have turned back to Aristotle for a description of phenomena of ordinary experience and language, careful attention to which (it is claimed) would undermine the appeal of oversimple modern reductionist theories (utilitarianism, associationism, materialism), without positing anything radically beyond ordinary experience (categorical imperatives of pure reason, intellectual intuitions, incorporeal substances). Neo-Aristotelians prefer intensional to extensional distinctions: a soul is not a substance other than the living body, but is the body itself *qua* living and not merely *qua* body. And these intensional differences are discerned, not by intellectual intuition, or by Kantian *a priori* synthesis, but by ordinary perception disciplined to recognize things *as* what they are. (Thus the practical rationality required for virtue is neither means-end reasoning nor a Kantian faculty of rules, but a sensitivity to morally salient features of situations.) Aristotle is seen as seeking a “middle way,” for example, between pre-Socratic materialism and Platonic metaphysics, that could be a model for modern philosophers. Such interpretations tend to understate the commitments that Aristotle shares with Plato, and his internal criticisms and refinements of the Platonic philosophical (and theological) project; the use of Aristotle for inspiration in contemporary philosophy should be balanced by an awareness of the risks of removing Aristotle from his context and reducing him to what seems usable for current philosophical problems.

Bibliography

There is an excellent annotated bibliography in Jonathan Barnes, ed., *The Cambridge Companion to Aristotle* (Cambridge, U.K.: Cambridge University Press, 1995); there are also comprehensive bibliographies in Hellmut Flashar, ed., *Grundriss der Geschichte der Philosophie* (“Ueberweg”), *Die Philosophie der Antike*, Vol. 3, pp. 407–492 (Basel: Schwabe, 2004), and, for the *Metaphysics*, in Robero Radice and Richard Davies, *Aristotle’s Metaphysics: Annotated*

Bibliography of the Twentieth-Century Literature (Leiden: Brill, 1997). Only primary sources, indispensable scholarly tools, and starting points for entering into scholarly discussions, including some particularly important publications that have appeared since Barnes, will be listed here. All the transmitted works and many fragments are translated in Jonathan Barnes, ed., *The Complete Works of Aristotle*, 2 vols. (Princeton, NJ: Princeton University Press, 1984); the translations are not uniform, and some are better than others. Many works have been well translated, with useful notes, in the Clarendon Aristotle series from Oxford University Press (thus far: *Categories and De interpretatione*, translated by J. L. Ackrill, 1962; *Posterior Analytics*, translated by Jonathan Barnes, 2nd ed., 1994; *Topics I and VIII*, translated by Robin Smith, 1994; *Physics I–II*, translated by William Charlton, 1980; *Physics III–IV*, translated by Edward Hussey, 1983; *Physics VIII*, translated by Daniel Graham, 1999; *De generatione et corruptione*, translated by C. J. F. Williams, 1982; *De anima II–III*, translated by D. W. Hamlyn, 2nd ed., 1993; *De partibus animalium I and De generatione animalium I*, translated by David Balme, 2nd ed., 1993; *De partibus animalium*, translated by James Lennox, 2001; *Metaphysics B*, translated by Arthur Madigan, 1999; *Metaphysics ΓΔΕ*, translated by Christopher Kirwan, 2nd ed., 1993; *Metaphysics ΖΗ*, translated by David Bostock, 1994; *Metaphysics ΜΝ*, translated by Julia Annas, 1977; *Eudemian Ethics I, II, and VIII*, translated by Michael Woods, 2nd ed., 1992; *Nicomachean Ethics VIII–IX*, translated by Michael Pakaluk, 1998; *Politics I–II*, translated by Trevor Saunders, 1996; *Politics III–IV*, translated by Richard Robinson, 1962; *Politics V–VI*, translated by David Keyt, 1999; *Politics VII–VIII*, translated by Richard Kraut, 1997). The editions and translations in the Loeb Classical Library are usually less good. Hackett has published good annotated translations of the *Prior Analytics* (translated by Robin Smith, 1989), *Nicomachean Ethics* (translated by Terence Irwin, 1985), *Politics* (translated by C. D. C. Reeve, 1998), and *Poetics* (translated by Richard Janko, 1987), all Indianapolis, IN: Hackett. Also useful is George Kennedy’s annotated translation of the *Rhetoric*, *On Rhetoric: A Theory of Civic Discourse*, New York: Oxford University Press, 1991. Many works are also available in the Budé series, from Editions Les Belles Lettres, Paris: Presses Universitaires de France, Greek text with facing French translation, and in the Oxford Classical Texts (Greek only, many of them edited by W. D. Ross) and the Teubner series (Greek text only; previously Leipzig: Teubner or Stuttgart: Teubner, now Munich: Saur). W. D. Ross’s *editiones maiores* (Greek text with English introduction and commentary) of the *Metaphysics* (2 vols., 1924), *Physics* (1946), *Analytics* (1955), *De anima* (1961) and *Parva naturalia* (1955), and Harold Joachim’s *editio maior* of the *On Generation and Corruption* (1922), all Oxford: Oxford University Press, are extremely useful. However, on the *Metaphysics* and *De anima*, it is advisable to compare Werner Jaeger’s Oxford Classical Text (1957) and Antonio Jannone and Edmond Barbotin’s Budé (1966), respectively; with Joachim compare Marwan Rashed’s Budé (2005). The Budé texts are generally more prudent and reliable than Ross’s; some have very useful introduction and notes, others are only sparsely annotated. For the *Categories*, compare the Oxford Classical Text of Lorenzo Minio-Paluello (also including the *De*

- interpretatione*, 1949) with Richard Bodéüs' Budé (2001), which puts "[*Catégories*]" in brackets on the title page and then switches to *Les Avant les Lieux* ("The Before the Topics"). Jacques Brunschwig's Budé *Topiques* (Vol. 1, 1967; Vol. 2, forthcoming) particularly stands out. For the *Rhetoric*, the standard text is Rudolfus Kassel, *Aristotelis Ars rhetorica*, Berlin: De Gruyter, 1976. For the *De motu animalium*, see Martha Nussbaum, *Aristotle's De motu animalium*, Princeton, NJ: Princeton University Press, 1978; for the *Historia animalium*, see David Balme, *Aristotle: Historia animalium*, Cambridge, U.K.: Cambridge University Press (Vol. 1, 2002; Vol. 2, forthcoming). For the fragmentary *Protrepticus*, compare Ingemar Düring, *Aristotle's Protrepticus: An Attempt at Reconstruction*, Göteborg: Acta Universitatis Gothoburgensis, 1961 (including an edition of the fragments with English translation) with the forthcoming translation by Douglas Hutchinson and Monte Johnson (expected Indianapolis: Hackett). For the fragmentary *On Ideas*, see Gail Fine, *On Ideas*, Oxford: Oxford University Press, 1993, and Walter Leszl, *Il "De ideis" di Aristotele e la teoria platonica delle idee*, Florence: Olschki, 1975 (including a critical edition by Dieter Harlfinger). An extremely useful tool for studying concepts across the Aristotelian corpus (unfortunately presupposing Latin as well as Greek, and using a reference system that takes some getting used to) is Hermann Bonitz, *Index Aristotelicus*, Berlin: Reimer, 1870.
- The most important secondary literature on Aristotle remains the late ancient commentaries collected in *Commentaria in Aristotelem Graeca*, 23 vols., Berlin: Reimer, 1882–1909, especially those of Alexander of Aphrodisias and Simplicius. Many of these volumes have been translated into English in the series *Ancient Commentators on Aristotle*, edited by Richard Sorabji, London: Duckworth, and Ithaca, NY: Cornell University Press. On the Greek commentators see Richard Sorabji, ed., *Aristotle Transformed*, London: Duckworth, 1990, and Richard Sorabji, ed., *Philoponus and the Rejection of Aristotelian Science*, London: Duckworth, 1987. For the earlier Greek reception of Aristotle, see Paul Moraux, *Der Aristotelismus bei den Griechen*, 2 vols., Berlin: De Gruyter, 1973–1984. For the availability of medieval Arabic and Latin commentaries on Aristotle, see the articles on, especially, al-Fārābī, Averroes (Ibn Rushd), and Thomas Aquinas.
- Articles on Aristotle*, edited by Jonathan Barnes, Malcolm Schofield, and Richard Sorabji, 4 vols., London: Duckworth, 1975–1979, is a good cross section of modern scholarship up to its time, with non-English articles translated. There are also excellent collections of articles, usually on a particular work of Aristotle, often arranged so as to form a collective commentary, in the proceedings of the triennial Symposia Aristotelica, including thus far: Ingemar Düring and G. E. L. Owen, eds., *Aristotle and Plato in Mid-Fourth Century*, Göteborg: Acta Universitatis Gothoburgensis, 1960; Suzanne Mansion, ed., *Aristote et les problèmes de méthode*, Louvain: Publications universitaires, 1961; G. E. L. Owen, ed., *Aristotle on Dialectic: The Topics*, Oxford: Oxford University Press, 1968; Ingemar Düring, ed., *Naturphilosophie bei Aristoteles und Theophrast*, Heidelberg: Stiehm, 1969; Paul Moraux, ed., *Untersuchungen zur Eudemischen Ethik*, Berlin: De Gruyter, 1971; Pierre Aubenque, ed., *Etudes sur la Métaphysique d'Aristote*, Paris: Vrin, 1979; G. E. R. Lloyd and G. E. L. Owen, eds., *Aristotle on Mind and the Senses*, Cambridge, U.K.: Cambridge University Press, 1978; Enrico Berti, ed., *Aristotle on Science: the Posterior Analytics*, Padova: Editrice Antenore, 1981; Paul Moraux and Jürgen Wiesner, eds., *Zweifelhaftes im Corpus Aristotelicum*, Berlin: De Gruyter, 1983; Andreas Graeser, ed., *Mathematics and Metaphysics in Aristotle (= Metaphysics MN)*, Bern: Haupt, 1987; Günther Patzig, ed., *Aristoteles' Politik*, Göttingen, 1990; David Furley and Alexander Nehamas, eds., *Philosophical Aspects of Aristotle's Rhetoric*, Princeton, NJ: Princeton University Press, 1994; Michael Frede and David Charles, eds., *Aristotle's Metaphysics Lambda*, Oxford: Oxford University Press, 2000; and Frans de Haas and Jaap Mansfeld, eds., *Aristotle's On Generation and Corruption I*, Oxford: Oxford University Press, 2004.
- The classic attempt to write Aristotle's intellectual biography is Werner Jaeger, *Aristotle: Fundamentals of the History of his Development*, translated by Richard Robinson, Oxford: Oxford University Press, second edition, 1948. For a survey of the *status quaestionis* on Aristotle's development, see William Wians, ed., *Aristotle's Philosophical Development*, Lanham, MD: Rowman and Littlefield, 1996. The ancient sources on Aristotle's life are collected by Ingemar Düring, *Aristotle in the Ancient Biographical Tradition*, Göteborg: Acta Universitatis Gothoburgensis, 1957. On the titles and histories of Aristotle's writings, see Paul Moraux, *Les listes anciennes des ouvrages d'Aristote*, Louvain: Editions universitaires de Louvain, 1951; on stories about the rediscovery of the texts and on the possible role of Andronicus of Rhodes in editing and ordering Aristotle's texts, compare the treatment of Paul Moraux, *Der Aristotelismus bei den Griechen* (cited above) with that of Jonathan Barnes, "Roman Aristotle," in *Philosophia Togata II*, edited by Jonathan Barnes and Miriam Griffin, pp. 1–69, Oxford: Oxford University Press, 1997; and see Stephen Menn, "The Editors of the *Metaphysics*," in *Phronesis* 40, no. 2 (July 1995): 202–208. On Aristotle's treatment of his predecessors, the classic (but highly controversial) works are Harold Cherniss, *Aristotle's Criticism of Presocratic Philosophy*, Baltimore, MD: Johns Hopkins Press, 1935, and *Aristotle's Criticism of Plato and the Academy*, Vol. 1 (Vol. 2 was never published), Baltimore, MD: Johns Hopkins Press, 1944.
- On the *Nicomachean Ethics*, starting points are R. A. Gauthier and J. Y. Jolif, *L'Ethique à Nicomaque*, introduction, traduction et commentaire, 2 vols. in 3, Louvain: Publications universitaires de Louvain, 1958–1959; W. F. R. Hardie, *Aristotle's Ethical Theory*, 2nd ed., Oxford: Oxford University Press, 1980; Sarah Broadie, *Ethics with Aristotle*, Oxford: Oxford University Press, 1991; and Amélie Rorty, ed., *Essays on Aristotle's Ethics*, Berkeley: University of California Press, 1980. On the relation between the different ethical works, starting points are (besides Michael Woods's Clarendon *Eudemian Ethics* I, II, and VIII) Anthony Kenny, *The Aristotelian Ethics*, Oxford: Oxford University Press, 1978 (although Kenny's claim that the *Nicomachean Ethics* is earlier than the *Eudemian* is idiosyncratic); and John Cooper, "The *Magna Moralia* and Aristotle's Moral Philosophy," in his *Reason and Emotion*, pp. 195–211, Princeton, NJ: Princeton University Press, 1999. On the *Politics*, besides the introductory volume and the essays and notes of the classic W. L. Newman, *The Politics of Aristotle*, 4

vols., Oxford: Oxford University Press, 1887–1902, see now Richard Kraut, *Aristotle: Political Philosophy*, Oxford: Oxford University Press, 2002; and, for the context of political debate, Josiah Ober, *Political Dissent in Democratic Athens*, Princeton, NJ: Princeton University Press, 1998. On the *Constitution of the Athenians*, see P. J. Rhodes, *A Commentary on Aristotle's Athēnaiōn Politeia*, Oxford: Oxford University Press, 1981; and John Keaney, *The Composition of Aristotle's Athēnaiōn Politeia*, New York: Oxford University Press, 1992.

On dialectic, besides Robin Smith's Clarendon *Topics I and VIII*, the introduction to Jacques Brunschwig's Budé *Topiques*, and G. E. L. Owen's Symposium Aristotelicum volume, all cited above, see the introduction to Eleonore Stump, *Boethius De differentiis topicis*, Ithaca, NY: Cornell University Press, 1978; and Robin Smith, "Aristotle on the Uses of Dialectic," in *Synthese* 96 (1993): 335–358. The majority of English-language literature on dialectic is really about the use of pre-reflective intuitions or ordinary language in argument, and has little to do with what Aristotle calls dialectic. On the *Categories*, see Michael Frede, "Title, Unity and Authenticity of the Aristotelian *Categories*," in his *Essays on Ancient Philosophy*, pp. 11–28, Oxford: Oxford University Press, 1987; and Stephen Menn, "Metaphysics, Dialectic, and the Categories," in *Revue de Métaphysique et de Morale* 100, no. 3 (July–September 1995): 311–337; on the *On Interpretation*, see C. W. A. Whittaker, *Aristotle's De interpretatione: Contradiction and Dialectic*, Oxford: Oxford University Press, 1996; on the *Sophistical Refutations*, see Louis-André Dorion, *Aristote, Les réfutations sophistiques, introduction, traduction et commentaire*, Paris: Vrin, 1995. On Aristotle's syllogistic, besides Robin Smith's introduction to his Hackett *Prior Analytics*, see Jan Łukasiewicz, *Aristotle's Syllogistic*, 2nd ed., Oxford: Oxford University Press, 1957; Günther Patzig, *Aristotle's Theory of the Syllogism*, Dordrecht: Reidel, 1968; and Paul Thom, *The Syllogism*, Munich: Philosophia, 1981; on demonstration, see Enrico Berti's Symposium Aristotelicum volume (*Aristotle on Science*) and Jonathan Barnes' Clarendon *Posterior Analytics*. On the *Rhetoric*, the Symposium Aristotelicum volume (D. Furley and A. Nehamas, *Aristotle's Rhetoric*) gives one approach, and George Kennedy's translation (mentioned above), and his *The Art of Persuasion in Greece*, Princeton, NJ: Princeton University Press, 1963, give another. On the *Poetics*, good starting points are Richard Janko's Hackett and Amélie Rorty, ed., *Essays on Aristotle's Poetics*, Princeton, NJ: Princeton University Press, 1982.

On physics and cosmology, there is unfortunately not much to recommend, beyond the *editiones maiores* and Symposium Aristotelicum volumes noted above; still useful is Friedrich Solmsen, *Aristotle's System of the Physical World*, Ithaca, NY: Cornell University Press, 1960; on Aristotle on causality see Richard Sorabji, *Necessity, Cause and Blame*, London: Duckworth, 1980; and for the issues of Greek cosmology, see David Furley, *The Greek Cosmologists*, Vol. 1, Cambridge, U.K.: Cambridge University Press, 1987 (the promised Vol. 2 has not yet appeared), and his collection of articles *Cosmic Problems*, Cambridge, U.K.: Cambridge University Press, 1989. By contrast, there is a large literature on Aristotle's psychology and zoology. For orientation to the literature on the psychology, see Martha Nussbaum and Amélie Rorty, eds., *Essays on Aristotle's De anima*, 2nd ed., Oxford: Oxford

University Press, 1995; and see Stephen Menn, "Aristotle's Definition of Soul and the Programme of the *De anima*," in *Oxford Studies in Ancient Philosophy*, 22 (Summer 2002): 83–139. On Aristotle's ordering and reordering of the psychological-physiological-zoological corpus, see Marwan Rashed, "Agrégat de parties ou *vinculum substantiale*? Sur une hésitation conceptuelle et textuelle du corpus aristotélicien," in André Laks and Marwan Rashed, eds., *Aristote et le mouvement des animaux: dix études sur le De motu animalium*, pp. 185–202, Lille: Presses universitaires du Septentrion, 2004. On zoology, besides the translations and commentaries of Lennox, Balme, and Nussbaum, cited above, the best starting point is Alan Gotthelf and James Lennox, eds., *Philosophical Perspectives on Aristotle's Biology*, Cambridge, U.K.: Cambridge University Press, 1985.

For the *Metaphysics*, it is always helpful to compare Theophrastus's *Metaphysics*, for which see the Budé by André Laks and Glenn Most, 1993; for an English translation, see W. D. Ross and F. H. Fobes, eds., Theophrastus, *Metaphysics*, Oxford: Oxford University Press, 1929. Modern landmark studies on the *Metaphysics* are Werner Jaeger, *Studien zur Entstehungsgeschichte der aristotelischen Metaphysik*, Berlin: Weidmann, 1912; Pierre Aubenque, *Le problème de l'être chez Aristote*, Paris: Presses universitaires de France, 1966; Joseph Owens, *The Doctrine of Being in the Aristotelian Metaphysics*, Toronto: Pontifical Institute of Medieval Studies, 3rd ed., 1978; Günther Patzig, "Theology and Ontology in Aristotle's *Metaphysics*" in *Articles on Aristotle* (cited above), Vol. 3, pp. 33–49; Vianney Décarie, *L'objet de la métaphysique selon Aristote*, Paris: Vrin, 1961; Giovanni Reale, *The Concept of First Philosophy and the Unity of the Metaphysics of Aristotle*, translated by John Catan, Albany: SUNY Press, 1980; Michael Frede, "The Unity of General and Special Metaphysics: Aristotle's Conception of Metaphysics," in his *Essays on Ancient Philosophy* (cited above), pp. 81–95; Michael Frede and Günther Patzig, *Aristoteles: Metaphysik Z: Text, Übersetzung, Kommentar*, Munich: Beck, 1988; and Myles Burnyeat, *A Map of Metaphysics Zeta*, Pittsburgh: Mathesis Publications, 2001.

ARIUS AND ARIANISM

Arius was a controversial fourth-century Christian thinker in Alexandria, Egypt, who was condemned by the first ecumenical council at Nicaea in 325. Because most of his writings were destroyed as heretical and "Arianism" as a movement developed only after his death, historians continue to debate both the content and the purpose of his teaching. Theological debate continued for a century

within Christianity, prompting a number of councils and creeds as well as a voluminous literature exploring the definition of God as Trinity, the origin of the divine Son, and the nature of salvation. From these events “Arianism” has been traditionally defined in theological polemic as a denial of the essential divinity of the Son and therefore of both the orthodox doctrines of Incarnation and Trinity.

ARIUS AND THE COUNCIL OF NICAEEA

As a Christian presbyter in Alexandria, Arius claimed a connection to a famous martyr and theologian, Lucian of Antioch. Philosophically educated as well as an exegete of scripture, he criticized Bishop Alexander of Alexandria for using language of eternity and nature with regard to the generation of the Son from the Father; this defended a common shared divinity, but muddled their separate personal identities. Arius argued that the Father, defined as the creator of all existence, could not share his uncaused nature or being with the Son. To speak of a shared divine nature would compromise biblical monotheism as well as contradict the definition of the creator as unbegun by nature, therefore opposing the first principle of all existence. The Son had to be of a separate nature because he was created or generated at some point as the offspring of the Father.

Contrary to earlier theologians, Arius argued that the Son could not be eternally begotten or he would be a coexistent principle. Instead, the Son possessed divinity from his direct creation by the Father and preexistence before all creation, but this was a separate and secondary divinity. Early authors had also interpreted the title of Word from the Gospel of John or Wisdom from Proverbs to show the Son’s eternal presence with the Father as a mental attribute. By contrast, Arius accepted the traditional titles, but denied the eternal presence; he also denied that the Son knew the Father apart from what knowledge the Father had bestowed upon him. The secondarily divine Son remained the revealer of the Father, the agent of creation, and the mediator of the divine will and salvation through Incarnation.

The origins and motivations of Arius’s views remain controversial, and no single interpretation has yet to persuade all scholars. Only three of his documents remain, and his opponent, Athanasius, preserved fragments of his theological poem, *Thalia*. All historians emphasize his indebtedness to earlier theologians, such as Origen, who described the Son as Word, and ascribed a lesser and derivative nature to the Son. This hierarchical model echoed both the philosophy of Numenius and Philo, in which the Logos was the mediator between transcendent

reality and the material world, as well as biblical accounts of the Son’s obedience to the Father. However, by contrast, Arius denied any communication or participation of essence between the Father and the Son; apophatic theology became central to his thought. This highly significant shift may well reflect changes in contemporary Platonism, such as the increased transcendence of Plotinus’s thought, but the parallels are not entirely conclusive.

Arius may also be defending the theology of Lucian of Antioch, which emphasized the will of God and the agency of the Son. The emphasis on the distinct nature of the Son may have been to portray him as a moral exemplar and mediator, in line with the New Testament model of the obedient Christ in Luke; the evidence for this interpretation, however, remains contested. Finally, Arius’s rejection of coexistent principles could also be linked to the growing presence of Manichees in Egypt, who taught two eternal principles of good and evil. Clearly, Arius was a creative and powerful thinker who was revising traditional categories to clarify the singularity of the Father and the mediation of the Son.

After local councils did not succeed in reconciling or suppressing the controversy, Emperor Constantine convened a council of bishops from the East and West at Nicaea in 325. The accounts of the council show the difficulty of using scriptural language that, insofar as it was metaphorical, did not solve analytical difficulties concerning causality or nature. *Homoiousios*, or “of the same nature,” was adopted as a definition of the relation of the Father and Son, less as a positive definition than as a term rejected by Arius and others. However, the creed was not readily adopted by the larger church, and other councils were held over the next five decades to find more acceptable language. Constantine accepted a later statement by Arius that avoided discussing the nature of the Father and Son, if affirming the priority of the Father. Arius died in 336 before being accepted back into communion with the church, perhaps by poisoning.

“ARIANISM” AFTER ARIUS

The issues of divine causality and saving knowledge raised by the Arian controversy and the Nicene definition were strenuously debated for several decades. We may best speak of these shifting alliances as “non-Nicenes” rather than use the older categories of “Arians” or “Semi-Arians” to describe all those who for various reasons rejected the authority of the creed of Nicaea. Many were content to avoid substance language or affirm a “like substance” (*homoiousios*) between the Father and the Son,

maintaining a traditional hierarchy of being and action. Aetius and Eunomius, often called “Neo-Arians,” were the most strenuous opponents of Nicene theology; they argued that the Father and Son must be dissimilar in nature since the divine essence was “unbegun,” and insisted this description was fully revelatory of God. These varied opponents of Nicaea thinkers did not describe themselves as followers of Arius; rather, they were tagged with his condemnation by opponents, such as Athanasius and Marcellus of Ancyra, in order to discredit their theological positions.

The separation of divine nature between the Father and the Son also had implications for salvation and incarnation. The author of the Latin *Opus imperfectum* insisted that the created Son was able to suffer authentically on the cross; he criticized the Christology of the orthodox of Docetism, since they claimed only the body suffered and not the eternal Word. A series of legislative acts curtailed the activities of the non-Nicenes after the council of Constantinople in 381.

LATER ARIANISM

The Christianization of the Goths occurred during this theological turmoil, and they were baptized as “Arians.” The destruction of the Visigothic library in medieval Spain erased documents that might have provided significant clues to Gothic theology. In the seventeenth century “Arianism” was embraced by a number of English theologians, including Isaac Newton and William Whiston, who questioned the logic of the Trinity and the biblical authority of creeds.

See also Christianity; Newton, Isaac; Platonism and the Platonic Tradition; Plotinus.

J. Rebecca Lyman (2005)

ARKOUN, MOHAMMED

(1928–)

Mohammed Arkoun was born in Kabylia, Algeria, and spent much of his career at the Sorbonne in Paris. His early work in philosophy was in the history of Islamic philosophy, and in particular the thought of the Persian philosopher Miskawayh. Like so many modern Arab philosophers, Arkoun is part both of the Islamic world and of the secular European world, and how to reconcile those two worlds has been a continuing issue for those philosophers. It has been a continuing issue of interest to them how to reconcile these two worlds. Arkoun, on the one hand, has in general been supportive of *laïcité*, the determined secularism of France that he argues preserves the freedom of all to follow their religions. On the other hand, he has roundly criticized the ways in which the Islamic and the non-Islamic worlds have cast each other in the role of the Other. He outlines in his work how a tradition creates a world of discourse, but at the same time also cuts people off from other forms of discourse. Thus traditions, and in particular religious traditions, can be seen to have both positive and negative features. Arkoun suggests that it is not acceptable for a tradition to rule out some ways of thinking, because in order to understand the whole range of alternatives that are available, people first need to contemplate a wide range of options.

But does this not contravene the idea that a tradition establishes rules about what can and cannot be thought? Here Arkoun broadens his analysis to suggest that traditions are not pure, and so do not have fixed boundaries. Traditions need to be applied to the world of experience; in turn, experiences will affect traditions on a piecemeal basis, and followers of a tradition will have to inevitably consider their responses to those experiences and the affect they had on the tradition. This brings out the problem with traditions that see the different approaches as representing the Other, because the distinctions between the tradition and the Other are often slight and difficult to determine. It follows that a program of secularism is not in opposition to religion, but should be seen as providing space for religions, and their opposites, to flourish

and think through their foundations. He also argues that Islam's renaissance in the nineteenth century is incomplete, that Muslims should radically examine the roots of their faith and establish it in line with contemporary forms of reality. If there is a theme in Arkoun's work it is the significance of history. History shows that doctrines such as Islam are never finished and complete, but continue to develop. History also shows that the antagonisms and conflicts between different ways of looking at the world are variable. An investigation of history allows people to ground their understanding of significant ideas within a particular context and thus acquire a critical understanding of them. There is a tension in this thesis—which owes much to the thought of Foucault—and the transcendent role that any religion seeks to establish for itself. Much of Arkoun's work tries to reconcile the clash between these two intellectual positions.

ARMINIUS AND ARMINIANISM

Jacobus Arminius (Jacob Harmanszoon, 1560–1609), who gave his name to a variant of Reformed belief, was born in Oudewater, Holland. After his father's early death, the boy was protected in turn by a minister, who converted him to Protestantism; by Rudolphus Snel van Rooijen the mathematician; and by Pieter Bertius of Rotterdam. With Pieter Bertius Jr., later important in the great Arminian disputes, Arminius studied at Leiden under the French Protestant Lambertus Danaeus. Later Arminius studied under Theodorus Beza in Geneva, where he met Johannes Uytenbogaert (Wtenbogaert), the chief proponent of Arminian doctrines after the death of Arminius.

Soon after his ordination (1588), Arminius was called upon by the ecclesiastical court of Amsterdam to refute the arguments of the Dutch "libertine" theologian Dirck Volckertszoon Coornhert, an exercise that undermined Arminius' orthodox Calvinism. He came to doubt

the deterministic doctrine of damnation, and believed that election, dependent in part on man's free will, was not arbitrary but arose from God's pity for fallen men. Arminius was consistently attacked by orthodox clergymen (notably Petrus Plancius and Franciscus Gomarus) for his alleged Pelagianism; in spite of all opposition, however, he was made professor of theology at Leiden in 1603 and thereafter exercised great influence upon the next generation of divines. He died just prior to the national schism brought about by his beliefs.

ARMINIANISM

In 1610 the Arminian clergy published their Great Remonstrance, a codification of Arminius' creed. This work dealt with five doctrinal points: It rejected the doctrine of election and predestination, both supralapsarian and sublapsarian. It rejected the idea that Christ died for the elect alone and belief in irresistible grace. It asserted belief in the sufficient power of saints, rejecting the idea that saints could fall from grace.

To the orthodox, these were Romish heresies; for eight years the battle of the pulpits raged, with Uytenbogaert, Bertius, and Hugo Grotius the great defenders of the Remonstrance. A theological question of this magnitude necessarily involved political theory and practice: the Remonstrants developed several versions of a theory by which, to protect consciences, the magistrate, rather than the Dutch Reformed Church, was given final say in matters of religion. Naturally, since such a theory favored republican administration, Arminianism gained support in the town governments and in the States-General, particularly in the figure of the pensionary of Holland, Jan van Olden Barneveldt.

In 1618 a synod was called to rule on Remonstrant doctrine, with the open support of the *stadholder*, Prince Maurice of Orange, who realized that the theological controversy might be used to curb the power of the States-General. For the hearing at Dordrecht (Dort), Arminian tenets were slightly modified by Uytenbogaert. Election was interpreted as God's grace to true believers; but this grace was not irresistible, and salvation still depended on the cooperation of the human will, which was sufficiently strong to overcome the temptations of evil. By the time the sessions began, the leading Arminian laymen had been arrested for treason: Olden Barneveldt was sentenced to be beheaded in The Hague; Grotius and Rombout Hogerbeets were imprisoned in Loevestein Castle.

The Synod was international: Representatives from Germany, Geneva, and England took part in the hearings, but the Remonstrants were barely allowed to be heard.

Their five tenets were declared inadmissible, or heretical, and orthodox Calvinism was upheld. Remonstrants were given the choice of recantation or exile.

Most chose exile—in France, Geneva, or England. Until the death of Prince Maurice in 1625, Arminianism was persecuted in Holland; but with the accession to the *stadholderate* of the tolerant Frederick Henry, Arminians began to return, particularly to the great cities of Amsterdam and Rotterdam. In 1630 a church was organized in Amsterdam, to which in 1632 an academy was attached, to train Remonstrant clergymen and the sons of Remonstrants barred from studying at the universities.

Dutch Arminianism was closely allied with advanced secular learning, both philosophical and scientific. The Remonstrant “*Illustre School*” (later the nucleus of the University of Amsterdam) was distinguished for its mathematical and medical, as well as its theological and philosophical, faculties. Whatever the philosophical implications of Arminius’ humanistic doctrine, in the seventeenth century it was coupled with broad learning: An Arminian professor translated René Descartes’s *Discourse upon Method* into Latin for the general use of the learned world; Arminian professors contributed to the periodicals of the republic of letters; and John Locke found a home among the Arminians during his exile from England.

ARMSTRONG, DAVID M.

(1926–)

David Malet Armstrong was born in Melbourne, Australia. He received his first degree at the University of Sydney where John Anderson held the Challis chair of philosophy. He then completed the bachelor of philosophy at Oxford (in 1954), being one of the first of the many Australian philosophers in the 1950s and 1960s to take that degree. After a short spell at Birkbeck College, London, he accepted a position at the University of Melbourne. In 1964 he took up the Challis chair in Sydney where he stayed until his retirement in 1991.

Armstrong has made influential contributions to a remarkable range of major topics in epistemology and metaphysics, including perception, materialism, bodily sensations, belief and knowledge, laws, universals, and the metaphysics of possibility. Recurrent themes have been the need to reconcile what the philosopher says with the teachings of science, a preference for realist over instrumentalist theories, and an interest in the fundamental elements of being. A feature of his work is his ability to write about difficult issues with directness and clarity without sacrificing rigor.

Armstrong’s *A Materialist Theory of the Mind* (1968) is a seminal and comprehensive presentation of the mind-brain identity theory, the view that mental states are states of the brain. Armstrong argues that for each mental state, there is a distinctive functional role. For each mental state, we can specify what it does by way of mediating between inputs, outputs, and other mental states. For example, pain is typically caused by bodily injury and typically causes behavior that tends to alleviate it; thirst is typically caused by lack of water and typi-

cally gives rise to behavior that leads to drinking water, provided there is water knowingly available to the subject. This means, Armstrong argues, that the question of the identity of a given mental state is nothing more than the question of the identity of that which plays the functional role distinctive of that state: Thirst is that which plays the role just described. It is then a question for science what state in fact plays that role, and that it will in fact be some state of the brain. Thus, Armstrong derives the mind-brain identity theory from a view about the distinctive roles played by mental states, combined with a view about what kinds of states—namely brain states—play those roles.

In the philosophy of perception he was one of the first to argue that we must move away from the tradition that thinks of perception as acquaintance with a special, mental item sometimes called a “sense datum.” Instead, we should adopt an account that analyses perception as the acquisition of putative belief about our world—an account that has the signal advantage of making sense of the role of perception in our traffic with the world. Armstrong saw bodily sensations as being a special kind of perception—in the case of pain, a perception of putative damage in a part of one’s body, accompanied by a desire that it cease. His work on sensations and perception may be seen as a precursor to currently much discussed representationalist accounts that analyze an experience in terms of how the experience represents things as being.

Armstrong revived interest in F. P. Ramsey’s view that belief is like a map by which we steer, in opposition to approaches that think of belief as a kind of “saying to oneself.” His account of knowledge is a version of reliabilism: S’s true belief that P is knowledge if it is an empirically reliable sign that P.

Armstrong is a realist about universals: they exist, they are not reducible to sets of particulars (squareness is not the set of square things), and although they serve as the truth makers for predication, there is no simple one-to-one correspondence between predicates and universals. But there are no uninstantiated universals, so Armstrong is not a realist in Plato’s sense. Armstrong deploys his realism about universals to deliver an account of laws of nature and of possibility. Laws are to be understood in terms of relations of nomic necessitation between universals: Roughly “Every F is G” is a fundamental law if being F necessitates being G. Armstrong’s account of possibility is a combinatorial one. The various possibilities are the various combinations and recombinations of particulars (individuals) and universals that obey the right combinatorial rules (for example, combin-

ing being square with not being square does *not* deliver a possibility).

Armstrong’s overall position in analytic ontology—that part of metaphysics that seeks to inventory at the most fundamental level what there is—is given in *A World of States of Affairs* (1997), where states of affairs are the basis on which accounts of properties, relations, numbers, necessity, dispositions, classes, causes, and laws are constructed.

Frank Jackson (1996, 2005)

ARNAULD, ANTOINE

(1612–1694)

Antoine Arnauld, a Jansenist theologian and Cartesian philosopher, was one of the most skilled philosophical and theological controversialists of the seventeenth century. His reputation was such that he was known in the early modern period as *le grand Arnauld*. Arnauld was born in Paris on February 8, 1612, the last of twenty children of Catherine Marion de Druy and the elder Antoine Arnauld. Arnauld’s father served as an attorney for Queen

Catherine de Médicis, and at the beginning of the seventeenth century he successfully argued the case in the Parlement de Paris for the expulsion of the Jesuits from France. Arnauld's sister, Mère Angélique Arnauld, was installed as abbess of Port-Royal des Champs at the age of thirteen and became a prominent member of the convent. Though Arnauld initially intended to follow in his father's footsteps by becoming a lawyer, he later changed his mind and began to study theology in 1633. He received his baccalaureate in theology in 1635, and soon thereafter came under the influence of Jean Duvergier de Hauranne, the abbé de Saint-Cyran, who was then closely linked to Port-Royal. Because Saint-Cyran was also a political opponent of Cardinal Richelieu, Arnauld was prevented from receiving a doctorate from the Sorbonne during Richelieu's life. Soon after Richelieu's death, however, Arnauld received his doctorate in 1641 and became a member of the Sorbonne.

In 1641 Arnauld also wrote a critically sharp yet sympathetic set of objections to René Descartes's *Meditations*, an event that marks the start of his lifelong association with Cartesianism. In 1643 he published *De la fréquente communion*, an attack on the penitential theology of the Jesuits that earned him the enmity of members of that order. At the urging of Saint-Cyran, Arnauld also responded that same year to the criticisms of the theological account of grace and sin in the *Augustinus* (1640) by Cornelius Jansen, the bishop of Ypres, against the criticisms of Isaac Habert, a Paris theologian. In particular Arnauld insisted that Jansenius's views were in line with the criticisms in St. Augustine of the heretical Pelagian view that salvation depends on one's free will rather than on the workings of grace.

After 1648 Arnauld lived near Port-Royal as one of the solitaires associated with the convent. He was forced to go into hiding during this time because his opposition to the campaign against the *Augustinus* brought him into conflict with Cardinal Mazarin, the French first minister. This opposition also set Arnauld against the decision in Rome to condemn five propositions purportedly drawn from the *Augustinus* in 1653 and to attribute those propositions to Jansenius's text in 1656. Arnauld criticized those who refused absolution to the Duc de Liancourt because of his failure to assert that Jansenius affirmed these propositions. For his efforts, Arnauld was excluded from the Sorbonne in 1656, after a celebrated trial. In defense of Arnauld, the Port-Royal solitaire Blaise Pascal wrote a series of *Lettres provinciales* (1656–1657) attacking the moral theology of the Jesuits. In further response to the 1656 papal bull attributing the condemned propo-

sitions to the *Augustinus*, Arnauld argued that, though the pope's word is definitive with respect to the *question de droit* regarding the unacceptability of the propositions, it is not authoritative with respect to the *question de fait* concerning the presence of the propositions in Jansenius. He advocated a "respectful silence" in response to the pope's opinion on the latter question.

LATER CAREER. After 1661, when Louis XIV took sole control of the government following the death of Mazarin, considerable pressure was placed on those associated with Port-Royal to bring them into conformity with the official church rejection of Jansenism. This pressure involved the closing of the *petite écoles* at Port-Royal, but the instruction there informed two books that Arnauld coauthored with fellow Port-Royalists, the *Grammaire generale et raisonnée*, which he authored with Claude Lancelot in 1660, and the *Logique ou l'art de penser*, which he authored with Pierre Nicole in 1662. Noam Chomsky (1966) emphasizes the importance of the view in the former work that there is an innate "universal grammar" responsible for language (compare Arnauld and Lancelot 1975). The latter work served as a popular Cartesian alternative to scholastic texts on logic, and indeed the University of Paris formally adopted it in 1720 for use with Descartes's *Meditations*.

In 1669 the campaign against Jansenism was brought to a temporary end by the Peace of the Church that Pope Clement IX established in concert with Louis XIV. During this temporary truce, which allowed for the respectful silence concerning the heretical nature of the *Augustinus*, Arnauld turned his attention to his work with Nicole on the three-volume *Perpétuité de la foi* (1669–1674), which attacked the Eucharistic theology of the Calvinists. In 1672 Arnauld met the German intellectual Gottfried Wilhelm Leibniz during the latter's visit to Paris, and in 1679 he met his fellow Cartesian, Nicolas Malebranche. Both of these meetings set the stage for important later exchanges on philosophical and theological matters.

In 1679 Louis XIV forced Arnauld to leave France, bringing to an end the Clementine Peace. Arnauld took up residence in the Spanish Netherlands, where he lived the rest of his life. In 1683 he composed a critique of Malebranche's *Recherche de la vérité*, which triggered a long and increasingly bitter dispute with Malebranche over issues concerning the nature of ideas and of grace and divine providence. In 1686 Arnauld began a brief but important correspondence with Leibniz on a summary of Leibniz's *Discourse on the Metaphysics and the Monadology*. This correspondence addressed issues concerning the

nature of divine freedom and creation as well as the tenability of a Cartesian conception of the material world.

In 1690 Arnauld succeeded in his campaign to have certain works of Malebranche placed on the Roman *Index of Prohibited Books*. During this same time he engaged in disputes with Nicole over general grace and one's knowledge of moral truth. Arnauld was also involved in several disputes with the Jesuits in the Spanish Netherlands. He died in Brussels on August 8, 1694, and was buried in the Church of St. Catherine in that city. His heart was buried in Port-Royal, and after the destruction of the latter in 1710 it was moved to the Church de Palaiseau.

FAITH AND FREEDOM

Arnauld was fond of the Augustinian slogan that "what we know, we owe to reason; what we believe, to authority" (1964–1967, p. 38:94). This slogan reflects Arnauld's own view that philosophy and theology are distinct disciplines with their own standards. Philosophical questions are to be resolved through the use of reason, and he took issue with scholastics who attempted to settle such questions by means of an appeal to the authority of Aristotle. In contrast, Arnauld insisted that questions pertaining to religious belief, and in particular to the content of the Catholic faith, are to be decided by an appeal to the authority of Scripture, interpreted in light of the church tradition. Here, he took issue with Jesuit critics who attempted to use their Aristotelian philosophy to explicate the mysteries of the faith.

Arnauld did recognize a distinction between "sacred theology" concerning Catholic doctrine and "natural theology" concerning theological truths accessible to reason. Indeed, one of the reasons he defended Cartesian philosophy so vigorously, even in the face of opposition from his fellow Port-Royalists, was that he took it to provide compelling arguments for the existence of a transcendent God and for the real distinction of the human soul from body. For Arnauld, Descartes's theistic and dualistic system complemented perfectly a theology based on the authority of Augustine.

Arnauld began by defending the particular version of Augustinian theology in Jansen's work. In particular, he was concerned to argue with Jansenius for the view that meritorious action is the result of grace that is "efficacious in itself," that is, that brings about the relevant action. This position conflicted with the Jesuit insistence on one's ability to freely reject the divine grace that is offered. In the last decade of his life, however, Arnauld rejected Jansen's account of grace in terms of a prevenient state of delight that causes the meritorious action. He

claimed to find in St. Thomas Aquinas the alternative view that efficacious grace is simply the meritorious act of will that God produces in each person. His final position did not bring him closer to the Jesuits, however, and is in fact similar to the view of the Dominican Domingo Bañez, which the Jesuits had opposed, that God causally determines free human action.

EUCCHARISTIC THEOLOGY

The other theological issue of most importance to Arnauld concerned the Catholic doctrine of the Eucharist. According to the Council of Trent there is in this sacrament a "marvelous and unique change of the whole substance of the bread into the body [of Christ], and of the whole substance of the wine into the blood, while only the appearances [*species*] of bread and wine remain." Arnauld and Nicole composed *Perpétuité de la foi*, in which they defended the Tridentine doctrine against the Calvinist position that Christ has a merely "spiritual presence" in this sacrament. In 1680 Arnauld wrote in defense of the compatibility of Descartes's view with Catholic teachings on the Eucharist to silence critics, including some Port-Royalists, who charged that Cartesianism has heretical implications. His "Examen" considers a text in which it is argued that since Christ's body must be present in the sacrament without its extension, it cannot be the case, as the Cartesian doctrine, that extension constitutes the essence of body. Arnauld countered that Catholic teaching requires only that Christ's body is present without the impenetrability by means of which it is enclosed in a place.

Though Arnauld thought of himself primarily as a theologian, his writings on both human freedom and the Eucharist reflect his ability to grapple with the subtle philosophical issues pertaining to theological topics. This facility with philosophical discourse is revealed as well in his interaction with three of his great philosophical contemporaries: Descartes, Malebranche, and Leibniz.

ARNAULD AND RENÉ DESCARTES

MEDITATIONS AND CORRESPONDENCE. Arnauld's set of objections to the *Meditations* prompted Descartes to comment that he could not have asked for a more perceptive critic. Arnauld was particularly sympathetic to those aspects of the *Meditations* that he took to be in line with Augustinian views of the soul and God. The first two sections of Arnauld's Fourth Objections are in fact devoted to these two topics. He offered penetrating objections in these sections to Descartes's arguments for mind-body distinctness and for the existence of God, as well as

mentioning difficulties concerning Descartes's denial of the souls of nonhuman animals, his discussion of the "material falsity" of sensations, and the circularity of his defense of the truth of clear and distinct perceptions. Still, Arnauld also emphasized the Augustinian nature of Descartes's insistence that the intellect is distinct from and epistemically superior to the senses, and he showed himself to be sympathetic throughout to the central conclusions of the *Meditations*.

In a final section, "Points Which May Cause Difficulty to Theologians," Arnauld insisted that Descartes's principle that proper assent is governed by clear and distinct perception be restricted to intellectual matters to allow for the Augustinian conclusion that one's religious beliefs are grounded in one's acceptance of religious authority. He further noted that what is "likely to give the greatest offense to theologians" is the appearance that Descartes's view that bodily modes are inseparable from the substance they modify conflicts with the Catholic doctrine that in the Eucharist the sensible species of the bread and wine remain without inhering in any substance.

In 1648 Arnauld renewed contact with Descartes while in hiding because of the political controversies in France involving Jansenism. Arnauld asked for clarification on several issues pertaining to the nature of memory, the relation of particular thoughts to the attribute of thought, the duration of mind as a thinking thing, and Descartes's argument for the impossibility of a vacuum. In responding to questions concerning this argument, Descartes cited his view that all truths depend on God's omnipotence in warning against the claim that God cannot create a vacuum. Neither in this correspondence nor in his later exchanges with Malebranche and Leibniz, where this view was broached, did Arnauld take a firm position on Descartes's doctrine that all truths depend on God's will. However, Arnauld did profess himself satisfied with Descartes's responses to his questions concerning the nature of mind and its relation to body, concluding that "what you wrote concerning the distinction between the mind and the body seems to me very clear, evident, and divinely inspired" (1964–1967, vol. 5, p. 186).

QUALIFICATIONS OF CARTESIANISM. In his correspondence with Descartes Arnauld professed satisfaction with Descartes's solution to the problem concerning the Eucharist raised in the Fourth Objections. However, he mentioned as a further difficulty that Descartes's identification of the extension of a body with its quantity seems to conflict with the Catholic teaching that Christ's body is

present in this sacrament without local extension. Descartes did not respond to this difficulty, even though in earlier correspondence with the Jesuit Denis Mesland he had proposed that the physical presence of Christ in the Eucharist is explained by the union of His soul with the matter of the elements. This proposal provided the basis for a Cartesian account of the Eucharist in the *Considérations sur l'état présent* (1671) by the French Benedictine Robert Desgabets. Louis XIV's confessor declared the *Considérations* to be heretical, and Louis had his archbishop of Paris condemn it. When called before the archbishop, Arnauld and Nicole denounced the work, in part to disassociate it from their own account of the Eucharist in their writings against the Calvinists. In his later 1680 "Examen" Arnauld did offer his own version of a Cartesian account of the Eucharist. However, his version deviates from Descartes's own views insofar as it requires the possibility of the existence of the extension of Christ's body apart from the quantity by means of which it occupies a place.

Arnauld also departed from Descartes's views on human freedom. Although he approved of the account that Descartes provided in the Fourth Meditation, he was less happy with later correspondence in which Descartes attempted to accommodate the Jesuit position that free action involves an indifference that explains the power of the agent to act otherwise. Indeed, in response to Desgabets's claim that Descartes is "exceedingly enlightened in matters of religion," Arnauld responded that Descartes's "letters are full of Pelagianism and, outside of the points which he was convinced by his philosophy—like the existence of God and the immortality of the soul—all that can be said of him to his greatest advantage is that he always seemed to submit himself to the Church" (1964–1967, vol. 1, p. 671). Therefore, Arnauld's theological commitments placed clear constraints on what he could accept from Descartes's own writings.

ARNAULD AND NICOLAS MALEBRANCHE

THE SEARCH AND IDEAS. During the early 1670s Arnauld was on friendly terms with his younger Cartesian colleague, Malebranche. He also had an initially positive view of Malebranche's masterwork, the *Search after Truth* (first published 1674–1675). After seeing an initial draft of Malebranche's *Treatise on Nature and Grace* (1680), however, Arnauld had a more negative view. In a meeting with Malebranche in 1679, just before he left France for good, Arnauld took exception to the claim in that work that though God wills that all be saved, his wis-

dom requires that he distribute grace by means of a “general will” that allows for the salvation of only a few. Arnauld objected that this emphasis on the role of the general will is a novelty that is out of line with the view, deriving from the work of the church fathers, that God exhibits a “particular providence” in distributing grace to those whom he has predestined for salvation.

After Malebranche decided to publish his *Treatise* in 1680, Arnauld decided to go public with his criticisms of Malebranche. The public debate began with the publication in 1683 of Arnauld’s *On True and False Ideas*, and it lasted until Arnauld’s death in 1694. During his lifetime Arnauld published eight critiques of Malebranche and Malebranche published seven responses. A further text from Arnauld was published after his death, and Malebranche published three further responses to Arnauld, with the last appearing in 1709. The debate ranged over several topics, the most well known being the nature of ideas, but included as well the relation of “intelligible extension” to God, the relation of pleasure to happiness, the nature of causation, miracles, the efficacy of grace, divine providence, and divine freedom.

The issue of ideas is prominent at the start of the debate, for Arnauld’s *On True and False Ideas* focuses on the doctrine in the *Search after Truth* that “we see all things in God,” and more specifically, that one perceives bodies by means of ideas that exist in the divine intellect. For Arnauld, such a doctrine has the “bizarre” consequence that “we see God when we see bodies, the sun, a horse, or a tree” (1964–1967, p. 38:236). Still, Arnauld objected not only to the placement of ideas of material objects in God but also, and more basically, to the reification of the ideas. As an alternative to Malebranche’s claim that the ideas one perceives are “representative beings” distinct from one’s perceptions, he offered the position, which he claimed to find in Descartes’s Third Meditation, that such ideas are merely the “objective reality” of perceptions, that internal feature of the perceptions in virtue of which they represent particular objects. Malebranche sometimes offered a different reading of this text, on which the objective reality of an idea is something distinct from the perception as a modification of mind. However, he typically appealed not to Descartes but to the view, which he claimed to find in Augustine, that “archetypes” in the divine intellect serve as the principle of one’s knowledge of objects. In response, Arnauld insisted that it was never Augustine’s intention to hold that one apprehends features of God’s essence in perceiving objects.

GOD AND GENERAL WILL. The debate over the nature of ideas held the attention of the early modern intellectual community, with philosophers as diverse as John Locke, Leibniz, Pierre Bayle, and Pierre-Sylvain Regis offering commentaries on it. Indeed, Arnauld’s friend, Nicole, claimed that the preoccupation with the topic of ideas served to divert attention from more important theological issues. Even so, most of the exchanges between Arnauld and Malebranche concerned just such issues. As discussed earlier, Arnauld’s initial concerns with Malebranche’s system derived from the claim in Malebranche that God distributes grace by means of His “general will.” But Arnauld also objected that the stress on the generality of God’s action undermined the belief in miraculous exceptions to the natural order. Most fundamentally, Arnauld was worried that the introduction of Malebranche’s impersonal “God of the philosophers” would displace the “God of Abraham, Isaac, and Jacob,” a God who takes a personal interest in the welfare of His creatures. Arnauld held that the latter sort of God governs by means of particular volitions, even in the case where He acts in accord with general laws.

Arnauld further protested against the suggestion in Malebranche that God cannot act to correct certain deficiencies in creation since He is constrained to act by means of His general will. For Arnauld, such a suggestion involves an unacceptable limitation of God’s freedom. On this point Arnauld showed some sympathy for considerations that led Descartes to affirm that God is not constrained by the eternal truths since they derive from his free will. Even so, he never did explicitly affirm this doctrine in his exchange with Malebranche. One can speculate that Arnauld was reluctant to endorse this philosophical position due to his uncertainty about its implications for theology. This would at least be in keeping with his concern, evident in his long debate with Malebranche, to purify theology of various novelties deriving from philosophy.

FREEDOM AND CAUSATION. Arnauld’s lifelong preoccupation with theological issues involving Jansenism is reflected in his objections to the view in Malebranche that meritorious action involves one’s free and undetermined “consent” to the promptings of divine grace. Arnauld commented that he did not think that “Pelagius ever said anything more pelagian” (1964–1967, p. 37:648f). Though Arnauld later retracted his original endorsement of the view in Jansenius that this consent is determined by a psychological state of delight deriving from grace, he consistently held that such consent must be determined by God’s action. It is interesting, however, that Arnauld at

the same time took exception to the occasionalist position in Malebranche that God is the only real cause and that creatures serve merely as inefficacious “occasional causes” for the exercise of divine power. Since Arnauld held that mind is “more noble than” body, and since he accepted the Augustinian dictum that the less noble cannot act on the more noble, he allowed that bodily events can be only occasional causes of changes in mental states. He apparently saw no difficulty in allowing for the action of bodies on each other or the action of mind on body.

ARNAULD AND GOTTFRIED WILHELM LEIBNIZ

FATALISM AND ACTUALISM. On February 11, 1686, in the midst of Arnauld’s polemical exchanges with Malebranche, Leibniz sent a request to the Landgrave Ernst von Hessen-Rheinfels to pass along to Arnauld “a short discourse” on “questions of grace, the concurrence of God and creatures, the nature of miracles, the cause of sin, the origin of evil, the immortality of the soul, ideas, etc.” (Mason 1967, p. 3). This discourse was simply a list of the titles of the thirty-seven articles of what became Leibniz’s *Discourse on Metaphysics*. Arnauld engaged somewhat reluctantly with Leibniz on the content of some of these articles. In the end the two exchanged through Hessen-Rheinfels some dozen letters before Arnauld, preoccupied with other matters, failed to respond to Leibniz’s letter to him of October 9, 1687. Leibniz attempted to reengage the correspondence in 1688 and 1690 letters to Arnauld, but without success.

In his initial response to Leibniz, Arnauld took exception to the claim in the title to article thirteen of Leibniz’s discourse that “since the individual concept of each person contains once for all everything that will ever happen to him, one sees in it the a priori proofs or reasons for the truth of each event, or why the event has occurred rather than another,” even though such truths “are nevertheless contingent, being based on the freewill of God and creatures” (Mason 1967, p. 5). He held that this claim is “shocking” since it seems to imply that everything that happens is obliged to do so “through a more than fatal necessity” (p. 9). In particular, God would have no choice, having decided to create Adam, to create all the features of the world that Adam actually inhabits.

After Leibniz bitterly rejected the charge of fatalism and some further letters were exchanged, Arnauld withdrew his charge in a letter of September 28, 1686. His willingness to do so was prompted by Leibniz’s insistence that certain truths that are present in the individual concept of a person are present there only contingently. Even

so, Arnauld mentioned in this letter that he still had qualms about Leibniz’s conception of God as “having chosen the universe amongst an infinite number of other possible universes which he saw but did not wish to create.” A hint concerning the source of these qualms is provided by Arnauld’s insistence in an earlier letter that God’s omnipotence, being a “pure act,” does “not permit the existence in it of any possibility” (Mason 1967, p. 31f). On Arnauld’s view here, possibilities pertain only to the substances that God has freely created. On the basis of such a view, one commentator claims to find in Arnauld an “actualism” that contrasts with a “possibilism” in Leibniz that allows for possibilities founded in nothing external to the divine intellect (Nelson 1993). A further development of this sort of actualism may have led Arnauld to endorse some version of Descartes’s doctrine of the creation of the eternal truths. As in the case of his debate with Malebranche, however, Arnauld failed in his correspondence with Leibniz to take any explicit stand on this doctrine.

CONCOMITANCE AND CARTESIANISM. In contrast to his treatment of Leibniz’s critique of the eternal truths doctrine, Arnauld did engage both Leibniz’s “hypothesis of concomitance or agreement between substances” and his claim that the reality of material objects depends on their possession of a “substantial form.” Arnauld urged that the hypothesis of concomitance is not distinct in the end from the occasionalist position that God brings about the harmony among various substances by means of an eternal act of will. Moreover, he objected to Leibniz’s claim that the soul expresses everything in its body on the Cartesian grounds that the soul must have some thought or knowledge to express anything. Since the soul has no more thought or knowledge “of the movements of lymph in the lymphatic vessels than of the movements of Saturn’s satellites” (Mason 1967, p. 132), it cannot intelligibly be said to express this aspect of its body. Arnauld’s Cartesianism is also evident in his response to Leibniz’s position that to be substantial, material objects must have a unity conferred on them by an immaterial and indivisible substantial form. Assuming the Cartesian identification of matter with extension, Arnauld held that all material objects are mere composites and that their unity derives not from Leibniz’s substantial form but from the functional interrelation of their parts.

In the note to Hessen-Rheinfels accompanying his final letter to Leibniz, Arnauld expressed the opinion that it would be “preferable” if Leibniz, a lifelong Protestant, “gave up, at least for a time, this sort of speculation, and applied himself to the greatest business he can have, the

choice of the true religion" (Mason 1967, p. 138). This opinion indicates Arnauld's own preference for theology over philosophical speculation. Even so, his philosophically rich exchanges with Descartes, Malebranche, and Leibniz provide reason for philosophers to be grateful that he did not give up philosophical speculation entirely in the interests of furthering acceptance of the Catholic faith.

ARNOLD, MATTHEW

(1822–1888)

Matthew Arnold, the English poet and social and literary critic, was the son of Dr. Thomas Arnold, headmaster of Rugby. Matthew Arnold was educated at Winchester and Rugby and entered Balliol College, Oxford, in 1841. In 1847 he became private secretary to Lord Lansdowne, who in 1851 appointed Arnold inspector of schools, a position he held until 1886. In 1857 he was elected professor of poetry at Oxford.

As a critic, Arnold ranged over a broad spectrum from literary criticism through educational theory to politics, social thought, and religion.

Arnold's most important contribution to nineteenth-century thought was his discussion of the significance of culture as a social ideal. His related discussion of the function of criticism has been widely influential. He also contributed to the dispute over the relation between the Christian Scriptures and belief.

In *Culture and Anarchy* (London, 1869), Arnold defined "culture" as "a pursuit of our total perfection by means of getting to know, on all the matters which most concern us, the best which has been thought and said in the world; and, through this knowledge, turning a stream of fresh and free thought upon our stock notions and habits." Culture is thus a process of learning, which can refine individuals and reform societies. Arnold often attacked the kind of reforming or progressive spirit that is not governed by this humane reference. At the same time, he made it clear that the object of the learning and refining process was indeed reform. He laid great stress on the development of the individual through the right use of literature and knowledge, but the pursuit of total perfection was still the ultimate objective. He argued that culture taught men "to conceive of true human perfection as a *harmonious* process, developing all sides of our humanity; and as a *general* perfection, developing all parts of our

society.” Perfection, although an “*internal* condition,” is nevertheless “not possible while the individual remains isolated. The individual is required, under pain of being stunted and enfeebled in his own development if he disobeys, to carry others along with him in his march towards perfection, to be continually doing all he can to enlarge and increase the volume of the human stream sweeping thitherwards.”

This position illuminates some of the apparent paradoxes of Arnold’s thinking. In one sense, he was clearly a liberal thinker, stressing the criticism of institutions and beliefs by thought and knowledge and placing central emphasis on the development of the individual toward a possible perfection. In other respects Arnold was a notable critic of much of the liberal thought of his time. He criticized the “stock notions” of nineteenth-century liberalism and was a particularly firm advocate of increased social intervention by the state. He criticized the common liberal conception that progress is merely mechanical and the liberals’ preoccupation with material and external improvement, which not only ignored the human results of its materialist emphasis, but also failed to advance any conception of humanity toward the realization of which material progress might be a means. His criticism of the “stock notions” of industry and production as major social ends is of this character. He similarly criticized the standard conception of freedom—“a very good horse to ride, but to ride somewhere.” It is the way men use freedom, not merely their abstract possession of it, that for Arnold is really important.

Most liberal thought in his time opposed the state in the name of just this kind of abstract freedom. Arnold argued that the state was simply “the representative acting-power of the nation.” To deny its right to act was to deny the possibility of any general action on behalf of the nation as a whole and to reserve the power of action to particular interests and classes. In the England of his time, he distinguished three classes—the aristocracy (“Barbarians”), the middle classes (“Philistines”), and the working class (the “Populace”). Social action by any one of these interests alone merely led to the clash of men’s “worst selves.” This disorder, or the resultant breakdown of effective government, would be “anarchy.” But there existed, within each of these classes, “persons who are mainly led, not by their class spirit, but by a general *humane* spirit, by the love of human perfection.” Each member of this human “remnant,” maintaining his own “best self” by the process of culture and seeking to awake in others the “best self” now obscured by the “stock notions” and habits of the group, represented the “best

self” of society as a whole. It was this “best self” that the state must represent and express.

Arnold never translated these ideas into a coherent political philosophy, but his liberal critique of liberalism was of considerable historical importance. The state, he felt, had to become a “centre of authority and light”; yet it must do this through the existing struggle, or deadlock, between limited interests and classes. Arnold’s arguments, at this point, were sometimes vague. In line with his definition of culture as a learning process and with his career as inspector of schools, he stressed not politics, but education. It was in education that the state most needed to intervene, and Arnold acted as a tireless propagandist for a new system of humane state education.

Arnold saw the study of literature as a principal agency of the learning process, that is, of culture. At times, his definitions of criticism and of culture were virtually identical. Criticism was the central way of learning “the *best* that is known and thought in the world.” Poetry in particular offered standards for the development of the best life of man.

In the same vein, in *Literature and Dogma* (London, 1873) Arnold offered to “reassure those who feel attachment to Christianity, to the Bible, but who recognise the growing discredit befalling miracles and the supernatural.” For any adequate reading of the Bible, after the effects of the Higher Criticism and the scientific controversies, the spirit of culture was indispensable. Only by this approach could the Christian ethic, and its intense expression in the Scriptures as read undogmatically, be preserved in a time of inevitable change. In particular, it was necessary to understand that “the language of the Bible is fluid, passing and literary, not rigid, fixed, and scientific”; its truth had to be verified through reading, rather than merely assumed. The Christian ethic so verified would be stronger than the dogmatic theology that had made the Bible into what it evidently was not.

ART, AUTHENTICITY IN

In the main sense of the term an artwork is "authentic" if it is the artwork it is thought to be—if it has the history of production it is represented as having or gives the impression of having, if it was created where, when, how, and by whom it is supposed or appears to have been created. Thus, a work may be inauthentic in virtue of being a forgery, or a misattribution, or a replica not identified as such. A reproduction (e.g., in an art book) is inauthentic only in a weaker sense: Though not the artwork it reproduces, it does not purport to be and runs no danger of being confused with it.

The chief issue concerning the authenticity of artworks has been the extent to which a work's aesthetic properties, artistic value, and proper appreciation legitimately depend on questions of authenticity in the above sense. The issue is often framed in terms of a challenge: What is wrong with a forgery? or What privileges an original artistically?

Broadly speaking, there are two opposed views on this issue. On one view an artwork is merely a perceivable structure—for example, a constellation of colors and shapes, a set of notes, a string of words, or the like. Furthermore, this structure is the entire source of its aesthetic and artistic properties and is the only thing relevant to its appreciation and evaluation as art. Thus, anything preserving the artwork's perceivable structure, so as to be perceptually indiscernible from it, is equivalent to it artistically and even ontologically. Such a view underlies the formalism of Clive Bell and Roger Fry, the literary stance of the New Critics, and to some extent the aesthetics of Monroe Beardsley. By these lights there is nothing much wrong with a forgery—provided, of

course, that it is a perfect one, not detectably different from the original.

On the other view perceivable structure is not the sole determinant of a work's aesthetic complexion or its artistic character. Rather, a work's context of origination, including the problematic from which it issues, partly determines how the work is rightly apprehended and experienced and thus its aesthetic and artistic properties. Aspects of the context or manner of creation arguably enter even into the identity of the work of art, as essential to its being the particular work it is. By these lights there is quite a lot wrong with a forgery. It differs from the original in numerous respects, both aesthetic and artistic, and as a human product—a making, an achievement, an utterance—it is of an entirely different order, however similar it appears on superficial examination.

If the second view sketched above is sound, then any artwork, *pace* Nelson Goodman, can be forged—that is, represented as having a provenance and history other than its own, though how this will be effected differs from art form to art form, especially when one crosses from particular arts (such as painting) to type arts in which structure may be notationally determined (such as music). And this is because, in all art forms, the identity of a work is partly a matter of the historical circumstances of its emergence.

Goodman famously argued, against the aesthetic equivalence of an original painting and an ostensibly perfect forgery, that the possibility of discovering a perceptual difference between the former and the latter constitutes an aesthetic difference between them. Unfortunately, this argument seems to trade on conflating an aesthetic difference and an aesthetically relevant difference between two objects. As suggested above, however, the aesthetic and artistic differences between originals and forgeries, which are ample, rest securely on quite other grounds.

AUTHENTICITY OF ARTWORK INSTANCE

In cases of multiple or type arts an instance of a work—a copy, impression, casting, performance, staging, screening, and so forth—may be denominated authentic or inauthentic insofar as it is or is not a correct or faithful instance of the work. And this, according to different accounts, is a matter of its adequately instantiating and representing the structure thought definitive of the work in question, a matter of its having the right sort of causal or intentional relations to the work in question or of being produced in a certain manner, a matter of its con-

veying the aesthetic or artistic properties believed crucial to the work—or some combination of these.

AUTHENTICITY OF ARTIST

Finally, authenticity is sometimes considered a predicate of the artist, describing laudatorily the artist's characteristic mode of creating or the relation between the artist and the content of the works the artist creates. An authentic artist is one thought, variously, to be sincere in expression, pure in motivation, true to self, honest about medium, rooted in a tradition, resistant to ideology yet reflective of society—or all of these. There seems to be only a passing relation between authenticity in this sense and the authenticity of work or instance canvassed above.

ART, DEFINITIONS OF

A range of related topics are gathered together under the title "The Definition of Art." These include: (1) meta-physical questions, such as "Is there a set of necessary properties whose possession is conjointly sufficient for a candidate to qualify as an artwork?" and, if so, "What are they?"; and (2) the epistemological issue of how we go about establishing that a candidate is an artwork. Traditionally the default assumption among many philosophers has been that there are necessary and sufficient conditions for classifying things as artworks; that these conditions can be assembled into a real or essential definition of art; and that the application of the aforesaid definition provides us with the means to establish that this or that candidate is an artwork. The trick with this approach is to specify, successfully, the pertinent necessary and sufficient conditions.

Needless to say, this enterprise has turned out to be more challenging than one might have anticipated. And the difficulties encountered in successive attempts to carry off this endeavor have left some philosophers either skeptical or agnostic regarding the prospects of the meta-physical project of defining art. Instead, they have tried more modestly merely to identify the epistemological grounds for classifying candidates as artworks without resorting to real definitions.

The search for a definition of art was not something that taxed ancient philosophers like Plato and Aristotle. For Aristotle, art was skill with respect to any practice or craft. There was an art of poetry and an art of painting, but also the art of medicine, navigation, warfare, and so on. Though Plato, Aristotle, and Horace compared poetry and painting, they did not presume an overarching framework that groups certain arts (in their sense) together in the category that we now call the fine arts or beaux arts, or maybe more simply just Art with a capital A—roughly, poetry (literature), painting, sculpture, music, theater, dance, architecture, and, nowadays, photography, film, and video.

The system of the arts was not stably consolidated until the eighteenth century (Kristeller 1992). Thus, it comes as no surprise that Aristotle felt no inclination

toward defining the conditions for membership in the category, though he did analyze the nature of some of the things—like tragedy—that would later be subsumed under the concept of (fine) art. For the ancients, there were arts that were tied to certain functions—quite often religious, political, or otherwise social ones—and these art forms were defined and evaluated in light of that function. For example, Aristotle maintained that the function of tragedy was to educate the emotions by eliciting the catharsis or clarification of pity and fear.

When Aristotle and Plato single out mimesis or imitation as a necessary feature of drama—both tragedy and comedy—and painting respectively, it is immensely unlikely that they were attempting to isolate the essence of art in our sense of fine art. It is more plausible to suppose that they were merely singling out a necessary condition of the relevant art forms that is particularly revelatory of the point and purpose of these practices. If one wants to understand what poetry and painting are about, or wants to know what is appropriate to expect from them, the concept of imitation is central. However, when Plato speaks of mimesis in poetry and painting, he is not offering an analysis or definition of what we mean by (fine) art or even a real or essential definition of poetry or painting. Rather, he is merely pointing to a general feature of these art forms that is especially useful to have in mind, if one hopes to comprehend them and gauge their value.

The pressure to define Art (with a capital A) does not arrive on the scene, until the subset of arts mentioned above are separated from the rest and treated as an exclusive confraternity. Perhaps the reason for the emergence of this grouping has to do with the rise of the bourgeoisie who, with leisure time on their hands, turned to these particular arts to fill their hours and days. But, of course, once this grouping took hold, a question arises concerning what property or properties a prospective member needs in order to join the category.

At least initially, it seems that the first gambit for answering this question was that a candidate for membership in the fine arts had, harkening back to Plato and Aristotle, to be an imitation, but, more specifically, an imitation of the beautiful in nature. This view is explicitly advanced in Abbé Charles Batteux's 1746 treatise *The Fine Arts Reduced to the Same Principle* in which the eponymous principle is none other than the imitation of beautiful nature (Beardsley 1966). For something to count as art, then, in the relevant sense of that which the eighteenth century called the fine arts or the beaux arts (and what we now simply call Art with a capital A), something

had to be the imitation of the beautiful, though it seems that sometimes this requirement was slackened to no more than that the art form in question had to be representational. If the art form in question was representational, then a work made in accordance with this propensity of the pertinent art form was an artwork. That is, a painting that is a picture is, all things being equal, a work of art.

This definition of art—often called the representational theory of art (Carroll 1999, Chap. 1)—was certainly ill-suited for the developments in the arts to come, for example: An abstract expressionist painting is not a representation of anything and especially not an imitation of something beautiful in nature (Carroll 1999). So the definition was fated to be incessantly accosted by counterexamples in the future. But, perhaps more to the point, the representational theory of art was not even viable in its own day.

Dance, for instance, belonged to the system of the fine arts; it had its own muse, Terpsichore. However, not all dance, even in the eighteenth century, was representational. Much dance involved no more than cadenced steps, gracefully executed. In fact, in order to legitimize a place for dance in the newly anointed system of the arts, choreographers, like Georges Noverre, had to invent the *ballet d'action*—the ballet that told a story. But in cases like this, the definition of art as a matter of representation, in fact, functioned prescriptively rather than descriptively.

But an even greater embarrassment for the representational theory of art than dance was the emergence of absolute music—that is to say, pure orchestral music. When opera and song were the dominant forms of music, music could be counted as implicated in representation because the words that accompanied the notes referred. But once absolute music took pride of place in the order of Calliope, it became very strained to think of the imitation of nature as the essence of art status. Indeed, as absolute music came in the nineteenth century to be praised for its possession of a condition to which all the other arts aspired, it became less and less credible that imitation was a necessary condition for entry into the citadel of art. Though some swatches of Beethoven's *Pastorale* symphony are imitative, most of the rest of his purely musical oeuvre is not. If for no other reason than the ascendancy of absolute music, the representational theory or definition of art was clearly inadequate. Another approach was needed.

Consonant with the reigning artistic movement of the day, Romanticism, one alternative approach to the

representational theory of art was the expression theory—the view that something is an artwork only if it is the expression of an emotion or a feeling (Carroll 1999). Variations of this view have been defended by figures such as Leo Tolstoy (Tolstoy 1996), and R. G. Collingwood (Collingwood 1938).

If the representational theory of art emphasized the representation of the outer world, the expression theory of art stressed art as the presentation of the inner world of the affective life. William Wordsworth asserted that poetry is “the spontaneous overflow of powerful feelings,” and this was also thought to be applicable to the other arts. It certainly appeared to fit the absolute music that is now called Romantic. Is that not why it is called Romantic? Moreover, the expression theory seemed to resist counterexamples insofar as it might be supposed that any human artifact would unavoidably carry an expressive trace of the affects of its maker.

Nevertheless, counterexamples appeared in droves starting in the early twentieth century. One source of these counterexamples were various sorts of aleatoric art; the Dadaist Tristan Tzara composed poems by cutting out words from a newspaper, placing them in a hat, and drawing them out randomly—thus thwarting the possibility of any causal connection with what he was feeling. Related chance techniques were mobilized by the surrealists and artists like John Cage and Merce Cunningham. Another kind of counterexample to the expression theory derived from found artworks an ordinary comb presented as an artwork by the likes of Marcel Duchamp, which projects no expressive properties, let alone the trace of anything felt by Duchamp.

Nor could these counterexamples be blocked by appealing to the idea that every human product bears an emotive residue from its maker, for the preceding strategies incontrovertibly sever the emotional link between the artist and the art object. Moreover, the expression theory of art would not only be challenged by the artists of the twentieth century. The theory was undermined by certain forms of art already in existence in the heyday of Romanticism, including art that aspired simply to beauty, as in the case of decorative art, perhaps some absolute music, and art that aimed only to represent the look of the world objectively.

Defenders of the expression theory might attempt to fend off these examples by invoking the claim that there is an inevitable and manifest emotive tie between any artifact and its creator. However, not only does this appear controversial, but if it were so, then the theory would be far too broad to be a satisfactory definition of

art because it would fail to differentiate an artwork from any other artifact.

Around the same time that expression theories begin to make their appearance, so, too, do two alternative accounts of art derived from Immanuel Kant’s *Critique of Judgment*. These theories can respectively be called the formalist theory of art and the aesthetic theory of art (Carroll 1999). Formalism, as presented by someone such as Clive Bell (1914), maintains that something is an artwork if and only if it is designed primarily to possess a formal design (called significant form) that is worthy of contemplation for its own sake. That is, the form of the work is intended, first and foremost, to afford an aesthetic experience, (which is sometimes called an experience of disinterested pleasure pursuant to contemplating the work’s design).

The aesthetic theory of art (Beardsley 1983) is like formalism except that it leaves the object of experience unspecified by making no reference to the form of the work. On this view, something is an artwork if, and only if, it is made primarily with the intention to support an appreciable amount of aesthetic experience (in other words, experience valued for its own sake). Both the formalist theory of art and the aesthetic theory of art make essential reference to intentions in order to differentiate artworks from natural scenes that might give rise to aesthetic experience. With their emphasis on experiences valued for their own sake, both these views may actually articulate the motive behind the modern category of art as a grouping of the things suitable for leisured contemplation and/or diversion.

Neither formalism nor the aesthetic theory of art provides necessary conditions for classifying candidates as artworks. For it is implausible to suppose that most religious artworks were created with the primary intention of abetting experiences valuable for their own sake. Rather, like so many other premodern artworks, they were produced to perform a function. They were created with the primary intention of advancing religious purposes. Paintings of Christ’s crucifixion were intended to instill reverence; they were not meant to be occasions for intrinsically valuable experiences of painterly form. And the designs on the shields of the Sepik warriors of New Guinea were not drawn in order to engender experiences valued for their own sake, but with the instrumental aim of frightening the enemy. Nor is experience valued for its own sake a sufficient condition for art status. Games of chess may be said to promote experiences valued for their own sake, but games of chess are not artworks, not even performance artworks.

The successive failures of attempts to define art disposed many philosophers to skepticism about the very venture itself. By the mid-twentieth century, the suspicion, generally encouraged by the writings of Ludwig Wittgenstein, that art could not be defined became popular. Philosophers like Morris Weitz (1956) argued that because art making is an arena in which experimentation, innovation, and novelty are prized, the notion of defining art is incompatible with the practice of art making. For to define art in terms of necessary and sufficient conditions would putatively somehow shackle the essential openness of art to invention and creativity. Philosophers of this ilk, often called neo-Wittgensteinians, maintained that to define art was to contradict the concept of art as that which contained the permanent possibility of art to expand its horizons in new directions. Consequently, neo-Wittgensteinians rejected the metaphysical project of identifying for artworks a set of necessary conditions that were conjointly sufficient. Moreover, with respect to the epistemological question of how it is established that something is an artwork, they suggested that it was a matter of family resemblance; something A is an artwork when it resembles artwork B in some respects, artwork C in other respects, and so on for further paradigmatic artworks.

Though initially quite influential, the spell of the neo-Wittgensteinian brief began to wane by the 1970s. On the one hand, the argument that specifying the conditions according to which a candidate counted as an artwork is inconsistent with the innovative nature of art could be seen to rest on an equivocation. For even if the practice of art is always, in principle, open to innovation and, therefore, supposedly inhospitable to definition, it is not clear why this would stand in the way of defining the concept of an artwork because individual artworks are not typically open to the permanent possibility of change. It just does not follow that if art (in the sense of the practice of art) is an open concept, then art (in the sense of an individual artwork) is an open concept. Moreover, this open concept argument, as it was called, was also challenged by the appearance of definitions of art by people like Arthur Danto (1981) and especially George Dickie (1974), which, though stated in terms of necessary conditions, provided more than ample room for artistic invention, accommodating the entire gallery of works of Dada and its legacy.

Finally, the epistemological wing of neo-Wittgensteinianism also came under fire. Because it relied upon similarity to establish art status and because everything is like everything else in some respect, by means of the fam-

ily resemblance method one could in fairly short order establish that any candidate is an artwork. For example, Auguste Rodin's *Gate of Hell* and an I-beam about to be shipped from a steel mill are both physical objects, metallic, shaped by human designs, weigh more than 100 pounds, over two feet long, and so on. But all these similarities and more are not enough to warrant calling the I-beam an artwork. Though it may be that in the wake of the found artwork anything can be art, it is not the case that everything *is* art. Nevertheless, the family resemblance method for classifying artworks would appear to force us to conclude that everything is art now.

A common failing of the theories of art as representation, as expression, as form, as well as the family resemblance model for identifying art is that, in each case, art status rests upon some discernible or manifest feature of the object—such as the possession of anthropomorphic or expressive properties, significant form, or similarities with antecedently acknowledged artworks. Perhaps, it was suggested, by Danto and others, that art status rested in some property of art that the eye could not descry. Duchamp's *In Advance of a Broken Arm* and an ordinary snow shovel are putatively indiscernible. Thus, a theory of art that relies on discernible features of artworks cannot hope to cut the difference between them. Rather, the property (or properties) that are constitutive of art status is something perceptually indiscernible.

For Danto (2000), like G. W. F. Hegel, the relevant feature here is *aboutness* in a double sense. Something will be an artwork, on this account, only if: (1) It is about something; and (2) its mode of presentation says something about, makes some comment upon, or advances a point of view concerning whatever it is about. However, this formula is, on the one hand, too exclusive—there are artworks that may be about nothing, but which are simply beautiful or delightful to the senses. On the other hand, Danto's theory may be too inclusive. Though Danto means it to tell us the difference between Andy Warhol's artwork *Brillo Box* and an allegedly indiscernible, though inartistic, one from Proctor and Gamble, surely the ordinary soap pad container in the grocery store meets both of the conditions of Danto's theory of art.

Like Danto, George Dickie is impressed by the thought that the defining features of art might be perceptually indiscernible. This has disposed him to look toward the context that surrounds and frames the work for clues about its status as a work of art. That is, the work does not wear its artistic status on its face; rather, its position in a social framework or institution is the source of its pedi-

gree. This insight has motivated Dickie (1984) to develop a series of what have been referred to as institutional theories of art, the latest version of which he has christened *The Art Circle*. According to Dickie, our concept of art can be captured by five interlocking definitions:

- 1) An artist is a person who participates with understanding in the making of a work of art.
- 2) A work of art is of a kind created to be presented to an art world public.
- 3) An art world public is a set of persons the members of which are prepared in some degree to understand an object which is presented to them.
- 4) The art world is the totality of all art world systems.
- 5) An art world system is a framework for the presentation of a work of art by an artist to an art world public.

Even a cursory examination of the preceding set of definitions reveals that it is circular. One needs the concept of an art world to define what counts as a work of art but the concept of a work of art figures in the definition of an art world system, which, in turn, is an element in the definition of an art world. Dickie is aware of this circularity but claims that it is not problematic. Yet it appears to leave the crucial notion of art undefined, though a definition of art was that at which Dickie was aiming.

Dickie's framework does articulate the structure of any communicative practice with its emphasis on mutual understanding. However, what makes art the very communicative practice it is rather than some other, such as philosophy, has not been clarified by Dickie's analysis. Moreover, some, such as Jerrold Levinson, suspect that the model does not even offer a set of necessary conditions for art status because it does not allow for art made by a solitary artist for himself—for example, some Neolithic wanderer who arranges a pile of colored stones in front of his fire because they are delightful to look at as the flames illuminate them variously (Levinson 1979).

Instead of social context, Levinson locates the defining feature of art in the intention of the artist. On Levinson's view, a candidate is an artwork if, and only if, it is created by a person: (1) who has a proprietary right over the work in question; and (2) who nonpassingly intends the work for regard as a work of art (i.e., in one or more of the ways that artworks have been correctly regarded historically [Levinson 1979]). Like Danto and Dickie, Levinson deploys a non-manifest property of the work—a certain kind of intention—as the crux of his definition.

Because this intention must be linked to the history of art, Levinson titles his approach *defining art historically*.

It is not clear why Levinson feels compelled to require that artists must have a proprietary right over the work in dispute. Surely if Brancusi constructed a sculpture out of stolen materials, there would be no question that he had created a work of art, even if the ownership of the object was in question. Moreover, the second condition of Levinson's definition is also fraught with difficulties. Though it is called a historical definition, it is historically insensitive. It overlooks the possibility that some historical art regards may become obsolete. For example, appreciating the verisimilitude of a picture was an art regard for centuries, but it is arguably no longer decisive, lest many ordinary family snapshots made with the intention to be appreciated integrally and nonpassingly for their accuracy would, counterintuitively, count as artworks. Unfortunately, Levinson makes no provision for anachronistic art regards.

Like Levinson, Robert Stecker (1997) appeals to history in order to define art. He labels his view *historical functionalism*. It is a disjunctive definition of art. Stecker claims that something is an artwork if, and only if, it is in a central art form at time t and it is made with the intention of fulfilling functions standardly or correctly recognized for that form, or it is an artifact that achieves excellence in fulfilling one of the functions of the central art forms at t .

This definition seems far too inclusive. According to Pierre Bourdieu, one of the functions of our art form is to produce social capital, or status, or identity. Thus, a Cadillac convertible would be a work of art in virtue of the second disjunct in Stecker's formula. The problem here is that Stecker has not limited the functions he countenances to exclusively artistic functions, but, of course, it is not evident that he can do that readily without inviting circularity.

Historical functionalism is also too exclusive. It cannot assimilate as artworks the initial avant-garde entries of radical art movements, for these works may not belong to a central form of art and they may be designed expressly to repudiate the recognized functions of art at time t . Consider the cases of found objects (Duchamp), found music (Cage), and found movement (Yvonne Rainer and Steve Paxton) when they first emerged. They were not obvious examples of a central form and, in any event, they repudiated the functions correctly associated with the forms to which they were related adversarially. Yet certainly any definition of art at this late date must accommodate works such as these.

Perhaps the historical functionalist will attempt to negotiate this shortfall in the theory by saying that once art movements like Postmodern Dance are successful they become—say at time $t+1$ —central forms of art with correctly recognized functions; thus, in virtue of the second disjunct of the theory, the originating works of the movement from time t can be reclaimed as art. Yet this gambit comes with costs because it has the avant-garde works in question only becoming artworks due to our appreciation of them long after their creators produced them. But surely a dance such as *Satisfyin' Lover* or a composition such as 4'33" were artworks from the very moment of their inception. And it is their actual creators who imbued them with art status and not some other folks at time $t+1$.

Due to the recurring difficulty with constructing an adequate conceptual analysis of art, some contemporary philosophers are agnostic about the metaphysical prospects of discovering a set of necessary properties that are conjointly sufficient for identifying artworks. Instead they focus their energies upon articulating epistemically satisfactory methods for identifying candidates as artworks which methods are not real definitions. Berys Gaut (2000), mining Wittgenstein again for inspiration, resurrects the notion of a cluster concept, arguing that it is sufficient for classifying a candidate as an artwork that the candidate scores well against the following ten criteria:

- 1) It possesses positive aesthetic properties.
- 2) It expresses emotion.
- 3) It is intellectually challenging.
- 4) It is complex and coherent.
- 5) It has the capacity to express complex meanings.
- 6) It exhibits an individual point of view.
- 7) It is an original exercise of the imagination.
- 8) It is the product of skill.
- 9) It belongs to an established form of art.
- 10) It is made with the intention to be a work of art.

This is not a real or essential definition of art because none of these properties are necessary conditions for art status. Anything that is a work of art will have at least one of these features; a work that has more and more of these features provides us with more and more reasons to categorize it as an artwork. On this view, a cluster account of a concept is true of that concept just in case it isolates properties whose possession by the work in question necessarily counts toward its belonging to that category.

However, though Gaut provides this list of the components of the cluster concept, he does not believe that the cluster concept approach to identifying art stands or falls with his particular sketch of it. He asserts that even if problematic cases for his formulation exist, that should not lead us to distrust in general the cluster concept approach to identifying artworks.

But is Gaut's assertion here convincing? Clearly, there are problem cases with respect to his dissection of the putative cluster concept. I see no reason why a delicious meal made by a master chef to express his devotion to his beloved and to recall their life together by means of culinary references could not instantiate every component of Gaut's list save obviously (9). Indeed, since the preparation of food occasionally figures in certain theatrical works, and especially in examples of performance art, maybe a case could even be made that it satisfies (9), generously construed. It should, therefore, count as a work of art, though this is certainly at least a very controversial case and, for many, a decisive counterexample to Gaut's proposal. But if Gaut's proposal is defeated, why believe that there is some other model of the cluster concept of art that will do the job? If it is inadmissible to maintain that the definitional approach to the concept of art will succeed despite the lack of evidence so far, why should one have faith in the cluster concept approach, when the best version of it so far misses the mark?

Another non-definitional approach to answering the epistemic question of how we might establish that a candidate is an artwork is that we do so by employing historical narratives (Carroll 1993 and 2001). According to what we may call narrativism, establishing that a candidate is an artwork involves telling a certain kind of story about the work in question, namely an accurate historical narrative about the way in which the candidate came to be produced as an intelligible response to an antecedently acknowledged art-historical situation. That is, in order to corroborate the claim that something is an artwork, one standardly mobilizes a narrative explanation of how the work emerged coherently from recognized artistic modes of thinking, acting, composing, decision-making, and so forth already familiar to the practice.

Usually the pressure to establish that something is an artwork arises when there is some dispute over its art status, as frequently occurs with works of the avant-garde. The narrativist observes that these imbroglios are typically managed by recounting art historical narratives that demonstrate the connection between the disputed work and some earlier artworks whose membership in the order of art is uncontested.

If, for example, the distorted figuration of German Expressionist painting is rejected as art properly so-called on the grounds that it departs from the canons of accurate pictorial representation, the narrativist traces its lineal descent from styles of art, such as that of the medieval artist Matthias Grunewald, where distortion was a strategy for signaling the sentiment of the artist toward his subject. Even if German Expressionist art repudiated prevailing styles of realism, the narrativist argues that there is still reason to count the works in question as art because they harken back to earlier forms of art making, discharging functions, such as the expression of feelings, that are abroad, alive, and acknowledged in their contemporary art world.

One objection to narrativism is that it is circular. However, though circularity is a defect in definitions, it is not clear that it raises any problems for narratives. It is also charged that narrativism confronts the same problem that perplexed the family resemblance approach to identifying art. But this is not the case because narrativists do not merely cite similarities between earlier and later works, but also seek to establish a network of causal relations between them. It is not merely that German Expressionist paintings resemble some medieval art that supports their art status; it is also the case that German Expressionist painting was influenced and inspired by the antecedently recognized medieval art.

Insofar as the narrative approach relies upon tracing lines of descent within historically situated artistic practices, the question arises as to how the narrativist intends to identify artworks in alien traditions. A first response is: by tracing the emergence of later works in that tradition from earlier works. But how can the narrativist identify the first works in alien traditions of art—something he needs to do in order to establish the bona fide origin of subsequent artworks from genuine precedents? Here, the narrativist needs to concede that narrativism is not the only way in which artworks may be identified.

With works in alternative traditions of art making, we frequently need to fix the earliest instances of art in those practices by isolating the works that in that culture are meant to perform the same functions—such as representation, expression, symbolization, decoration, signification, and so forth—that the earliest, already recognized artworks execute in our own culture. This, of course, admits that narration is not the only means of identifying candidates as artworks; sometimes we must depend on functional considerations. Moreover, though historical narration may be sufficient for establishing that a candidate is an artwork, it is not a necessary condition for art

status, if only because with certain cases of art, notably from ancient and remote civilizations, it may not be possible to retrieve a narrative account of their provenance.

Noël Carroll (2005)

ART, EXPRESSION IN

Art is an expressive business, few would deny, but this assertion has meant quite different things to the large number of thinkers who have contemplated the concept of aesthetic expression over the centuries. Certainly, the fact that art has the power to evoke potent emotions has

been noticed since ancient times. Thus Plato, although perhaps more centrally concerned with the imitative or mimetic dimensions of art, worried famously about the power of poetry and tragedy to subvert the control of reason by the arousal of intense emotions (*Republic* 10.605c, *Ion* 535, *Philebus* 47e–50b). Rather more positively, Aristotle argued that one of the beneficial functions of tragic drama is to provide a catharsis of pity and fear in an audience that is emotionally engaged with tragic personae (*Poetics*, Book VIII).

THE AROUSAL THEORY

The power of art to evoke emotional responses is the basis of the “arousal” theory of expression. The core idea is that an artwork expresses x if it has the capacity to arouse a feeling or sensation of x in the viewer or listener. Sad music, for example, is music that stirs sadness in the listener. The arousal theory has had many proponents, from Francis Hutcheson (1725) to Colin Radford (1989). The British associationist Archibald Alison, as early as 1790, characterized aesthetic experience in general as the employment of the imagination in the creation of a train of ideas that must be “productive of emotions.”

Problems arise immediately for this thesis, however. Some writers with “formalist” inclinations flatly reject it. Eduard Hanslick, for example, in his 1891 work, *On the Musically Beautiful*, denied both that the purpose of music is to arouse emotions and that feelings are in any sense the “content” of music. Moreover, it has often been observed that the reactive emotions of the audience are not always those it is most appropriate to say the work expresses. A tragedy expressive of love, jealousy, and hatred may, as Aristotle said, cause feelings of pity and fear in its viewers. Furthermore, it seems possible to recognize the expressive content of a work without undergoing that very emotion or feeling. A sad or elegant artwork need not make the perceiver sad or elegant.

By contrast, Jerrold Levinson (1990) and Aaron Ridley (1995) have argued that music can arouse a truncated version of the emotions it expresses; the emotions or feelings aroused by music lack their usual contexts and intentional objects. Jenefer Robinson (1994) has pointed out that, although the emotions expressed by music are not always identical with what is aroused in the listener, certain “primitive” emotions can be directly aroused by music expressing those same emotions; music that disturbs us, makes us tense, or calms us down *is* disturbing, tense, or calm. However, music, as an extended composition, also expresses more complex emotions, for example, unrequited passion, which are not aroused in us, but

which we attribute as true of the piece partly on the basis of the clues given by the more basic emotions aroused in us.

EXPRESSION AND NINETEENTH-CENTURY IDEALISM

Much grander claims for the expressive power of art were made during the period of German idealism, when art was seen as a manifestation of Spirit. Schelling held that art can show what philosophical concepts cannot: the Absolute, the organic unity of the knower and the known. Schopenhauer called music a copy of the will itself—a direct presentation of the will, expressing the essential nature of emotion types. For Hegel, art provides an irreducible form of self-reflection, conveying knowledge of Spirit through a natural sensuous medium. Along with religion and philosophy, art expresses “the Divine, the deepest interests of mankind, the most all-embracing truths of Spirit” (Hegel 1835–1838, vol. I, p. 21).

In his earlier writings, especially *Die Geburt der Tragödie* (1872, later translated as *The Birth of Tragedy*), Friedrich Nietzsche saw art, especially tragedy and music, as expressing the conjunction or synthesis of two strong human impulses, the “Apollonian,” a love of order, measure, and formal beauty, and the “Dionysian,” the spirit that glories in a state of elation and joyful acceptance of the excitements and pains of life. Later, Nietzsche allied art more closely with the Dionysian solution to the problem of living, presenting the Dionysian in art as an expression of the basic human drive called the “will to power.”

THE EXPRESSION THEORY

Romanticism, with its general emphasis on the emotions and its shift away from classicism, embraced and fostered the view that art is a form of expression in the sense of self-reflection or self-discovery. This theory, labeled by Alan Tormey (1971) the “expression theory of art,” is a rival to both high-flown idealism and the arousal theory. According to the expression theory, artworks are expressions of the emotional states experienced by the artist during the creative process. In one variation or another, this view has been endorsed in the nineteenth and twentieth centuries by thinkers such as Eugène Véron, Benedetto Croce, R. G. Collingwood, John Dewey, L. A. Reid, and C. J. Ducasse.

Expression theorists see expressive art as a means of articulating the artist’s inner life. In fact, the view can perhaps be thought of as romanticism’s alternative to the

arousal theory. Very early in the period, Samuel Coleridge observed that “in *Paradise Lost*—indeed in every one of his poems—it is Milton himself whom you see” (1833, p. 250). A systematic development of expression theory can be found in Véron’s influential *L’Esthétique* of 1879, but the view reached its zenith in the early twentieth century in the writings of Italian philosopher Benedetto Croce.

Strongly influenced by Hegelian thought as well as by romanticism, Croce proposed that intuition is a kind of nonconceptual awareness of a mental image, and expression is the forming of “artistic intuitions,” which are always infused with intense feeling. Artists express these initially inchoate feelings in the process of forming artistic, or “lyrical,” intuitions. Indeed, famously and problematically, Croce identified intuition and expression, and defined art in terms of this mental process. “Intuition is truly such because it expresses intense feeling. ... Not idea but intense feeling is what confers upon art the ethereal lightness of the symbol” (1965 [1913], p. 25).

Clearly indebted to Croce, R. G. Collingwood took all art to be an expression of individual and unique emotions, but the process is not the mere exhibiting of the symptoms of the emotion. (“The artist never rants”; 1938, p. 22). Rather, expression is the lucid transformation of sensuous-emotional experience by the artist’s imagination into an image or idea. True art, unlike the physical crafts accompanying the various arts, is made in the imagination of the artist.

The idealist tendencies seen in Croce and Collingwood are not shared by all expression theorists, perhaps for good reason. If expression is a purely mental or imaginative process, the artist’s manipulation of the medium of his or her art appears to be wrongly undervalued. Although agreeing with Croce and Collingwood that expression always involves the artist’s “inner” emotions in need of clarification and transformation, American pragmatist John Dewey emphasized that expression is an “outgoing activity” of interaction with the environment, involving the controlled working of a medium (1934, p. 62). In aesthetic expressiveness we find “meanings and values extracted from prior experiences and funded in such a way that they fuse with the qualities directly presented in a work of art” (p. 98).

Perhaps, then, expression theory can be rescued from the common objection that it makes art and the expressive process overly mentalistic, but it is unclear that it can be saved from another, which charges it with committing the “genetic fallacy” of mistaking judgments about the artist, the source of the art, for judgments about the art itself. The presence of expressive properties in an artwork

does not entail the occurrence of prior acts of expression, any more than a cruel expression on a face entails that the owner of the face has acted cruelly.

The expression theory is correctly characterized as a theory of expression emphasizing the emotive processes undergone by the artist, but it would be misleading to think that the arousal of emotions in the viewer or audience is not at least acknowledged by most expression theorists. Dewey remarked, “Because the objects of art are expressive, they communicate. I do not say that communication to others is the intent of an artist. But it is the consequence of his work ...” (1934, p. 104). He and Collingwood claim that the emotional reaction of the viewer should mirror or reconstruct the artist’s expressive process. When elements of the expression and arousal views are conjoined, the result is a kind of “communication” theory of the sort offered by Leo Tolstoy. In *What Is Art?* (*Chto takoe iskusstvo?*) Tolstoy wrote, “To evoke in oneself a feeling one has experienced, and having evoked it in oneself by means of movements, lines, colors, sounds or forms expressed in works, so to transmit that feeling that others experience the same feeling—this is the activity of art” (1960 [1898], p. 55). For Tolstoy, it is essential to the “sincerity” of the art that the artist feel the emotion communicated, and a condition of “success” of the art that the audience is “infected” with the same feeling.

Of course, a theory conjoining the arousal and expression theses inherits the problems of both views. And it does seem quite possible both that an artist can create a passionate artwork without himself being in a passionate state, and that the audience can recognize that the work is passionate without being made to feel passionate themselves. Composer Richard Strauss said, “I work very coldly, without agitation, without emotion, even” (Osborne 1955, p. 162).

Guy Sircello (1972) champions the romantic view that the mind does not merely mirror or represent non-mental reality but is an original source of some of the features of art, and that it thereby infuses art with intentional or anthropomorphic properties. Although Sircello admits a variety of sources for art’s expressive properties, he emphasizes that many of the expressive features that we attribute to artworks are true of them because of the “artistic acts” in which the artist is engaged as he or she creates a work. Pieter Brueghel the Elder’s painting *Peasant Wedding Dance* (1566) is ironic, Sircello says, because Brueghel views a happy scene ironically. Nicolas Poussin’s *Rape of the Sabine Women* (c. 1635–1637) is aloof and detached, even though the scene

is one of violence, because Poussin observes calmly and paints in a detached fashion.

THE EMBODIMENT THEORY

The “embodiment” theory of expression is a reaction to both the expression and arousal theories, and asserts that expressive properties are rightly said to be possessed by, or true of, the artwork itself either in virtue of its form or composition, or as properties that “emerge” in the work due to broader contextual considerations of a cultural, artistic, interpretational, or psychological sort. Whereas the arousal theory focuses on the effects of expressive art, and whereas the expression theory is a theory of the source of art’s expressiveness, the embodiment theory is a cognitivist view of our awareness of the expressive properties that are in, or are possessed by, an artwork. A work can be expressive of x even if the artist was not experiencing x in creating the work, and the audience does not necessarily feel x when they appreciate it.

It is worthy of note that American pragmatist George Santayana, although fitting no category very exactly, is closer to the embodiment theory than to the expression theory with which he is sometimes associated. Santayana wrote quite generally about a sense of expressive beauty and did not focus on the artistic process, nor exclusively on art *per se*. His position may be closer to the earlier British “taste” and associationist theories such as those of Archibald Alison and Joseph Addison: A thought or mental image becomes expressive, according to Santayana, when feelings, meanings, or emotive “tones,” proper to some past experience, color and reverberate in our present consciousness, indeed become “incorporated” into it (1988 [1896], pp. 121–124).

Although embodiment theories of various sorts gained currency in the second half of the twentieth century, its most common variant, the “resemblance” thesis, has precursors in the eighteenth century. Johann Mattheson (1739), for example, asserted that by resembling the motion and structure of our vital spirits, music, in its structure, comes to bear a resemblance to the “emotive life,” and the primary response of the listener is not to feel emotion but to perceive or recognize the emotive content present in the music. A contemporary version of this position can be found in Peter Kivy’s theory of musical expressiveness. In most cases, we perceptually recognize music’s expressive properties “in virtue of some perceived analogy” (Kivy 1989, p. 167) to the sound of a person’s voice or the movements and gestures made by a person who is literally expressing some emotion. But the reason we animate our musical perceptions, so that we cannot

but hear the music as expressive, is, Kivy says, “a divine mystery” (p. 258). Stephen Davies (1994) has a similar view. Like Kivy, he says that music’s expressive properties or “emotion characteristics in its appearance” depend mainly on a resemblance that we perceive between the dynamic character of the music and human movement, gait, bearing, or carriage. Both Kivy and Davies also allow that some cases of expression are to be explained by the fact that the musical work engages some wider social conventions surrounding the expression of emotions.

Some resemblance views conclude, on the basis of the resemblance, that an expressive artwork is a symbol of, or signifies, what it expresses. Semiotic theory is then seen as a tool for understanding the nature of expression in art. The best-known signification view based on resemblance is that of Susanne Langer. Art, especially music, is, for Langer, a “presentational symbol” of human feeling. Although feelings are not denoted by such symbols (because such symbols are non-discursive and in this respect unlike language), their form is presented to us in the artwork because there is a logical “isomorphism” between the structure of the work and the “morphology” of the feeling state. Artistic form is congruent with the dynamic forms of our direct sensuous, mental, and emotional life. According to Langer, “music is not the cause or the cure of feelings, but their logical expression.” (1942, p. 218).

Other theories have also emphasized the semiotic functions of art in their treatment of expression, but have downplayed the resemblance theme. In his extremely influential book, *Languages of Art* (1968), Nelson Goodman, like Langer, treated artworks as symbols but, unlike Langer, defined expression in terms of the semantic relations of reference and denotation. A work expresses ϕ if and only if the predicate “ ϕ ” metaphorically denotes the work, and the artwork, in turn, “refers back” to that predicate. Less nominalistically stated, expression is a form of property exemplification for Goodman. A work exemplifies a property if it not only possesses but “highlights” that property, much as a tailor’s swatch highlights the texture and design of the material because of the conventions surrounding its use. Expression, in this view, is the exemplification of properties that an artwork actually, though metaphorically, possesses. Artworks can express more than human emotions, for example, poised power or flashing action.

Although it is unclear whether Alan Tormey’s embodiment theory is committed to the resemblance thesis, he does suggest that the relation between an artwork’s nonexpressive and expressive properties is analo-

gous to the relation between human behavior and the intentional states of which the behavior is partially constitutive. Tormey (1971) says that expressive properties are those properties of artworks whose names also designate the intentional states of persons. But, since artworks have no mental states, a work's set of nonexpressive properties is wholly constitutive of its expressive properties. In an interesting though puzzling turn, Tormey claims that expressive ambiguity is ineliminable in art, and therefore expressive properties, though wholly constituted by non-expressive features, are ambiguously so constituted. Within a certain range of compatibility, there is no objective fact whether an artwork has one or another expressive property; only critical choice leads to a unique judgment as to whether Ravel's *Pavane*, for example, is tender, yearning, or nostalgic. The important question of how one comes to perceive the expressive features of art is left largely unanswered by this view.

OTHER VIEWS

Like all philosophical classifications, those of the arousal, expression, and embodiment theories need to be employed with an awareness of the shortcomings of pigeonholing. A case in point is the work of Richard Wollheim. Influenced by Ludwig Wittgenstein, psychoanalytic theory, and the celebrated work of psychologist E. H. Gombrich concerning the cognitive nature of our perception of art, Wollheim proposes that artistic expression involves "expressive perception," a kind of "seeing or hearing as," by which an artwork, because of how it looks or sounds, causes us to project an emotion or feeling onto that which we see or hear (1987, p. 138). Although the artwork does not simply arouse in us an emotion that we associate with its other features, it does arouse in us the process of projection. And, as in the embodiment theory, the expressive property is ascribed to the work, literally projected onto it, and the work is perceived as possessing it. Lastly, like the expression and communicative views, Wollheim's position suggests that correct expressive perception mirrors or recaptures the emotions that, either through direct experience or through contemplation of them, caused the artist to paint, write, or compose as he or she did.

Finally, a number of writers have introduced an imaginary or fictive element into the discussion of expression, especially regarding music. These theories suggest that artistic expression is often best described in terms of the imaginary occurrence of emotion in oneself or in a fictional persona. Bruce Vermazen (1986) thinks of the expressiveness of a musical passage in terms of an

inferred ascription of a state of mind to an imagined utterer of the passage that would best explain the passage's features. Kendall Walton (1990) thinks that expressive music can induce listeners to imagine particular instances of properties expressed, such as instances of someone (perhaps oneself) or something's being exuberant, aggressive, uncertain, or resolved. Walton also claims that sometimes one is induced to imagine of one's own auditory experience that it is an expression of, say, anguish or exuberance (1994).

For Jerrold Levinson, the expressiveness of music derives from its "hearability" as a "sui generis" expression, by an imagined persona, of inner states through outer signs (Levinson 1990, 1996). What a passage of music expresses is what it can most readily and spontaneously be imagined to express by "suitably backgrounded" listeners. That is, music invites listeners to hear it, immediately and directly, as an alternate audible mode of behaviorally manifesting emotions by an imagined persona. Levinson argues against resemblance-based accounts, claiming that recognition of a similarity between music and some emotional behavior is not sufficient for hearing the music as expressive. Similarly, Gregory Karl and Jenefer Robinson (1995) claim that what a musical passage expresses can be the mental state ascribed to the imaginary protagonist of the passage that figures in the best overall interpretation of the work. Whether these "fiction-based" views are types of embodiment theory is somewhat difficult to say with confidence since, rather like expression theories, they emphasize the processes underlying expression in the arts rather than the logic and semantics involved in ascribing expressive properties to works of art.

John Bender (1996, 2005)

ART, FORMALISM IN

The term *formalism* refers to a number of theses and programs in the philosophy of art and art criticism, all of which assign a priority to the formal elements of works of art.

The doctrine of formalism exists in a number of versions, not all of them compatible with one another, but in general it is a thesis that insists on the importance—either preeminent or exclusive—of the formal features of works of art in determining the value of those works. As such, it is both a topic for philosophical debate and a prescription for critical practice. This brief essay gives a description of the philosophical background of formal-

ism, an indication of formalist commitments in criticism, and a statement of some logical problems besetting formalism.

PHILOSOPHICAL BACKGROUND

The philosophical basis of formalism is often, and typically, traced to Kant, and indeed Kant is a kind of formalist; but a much earlier formalist doctrine is to be found in Aristotle. A central thesis of Aristotle's *Poetics* is that plot is the most important part of tragedy. Aristotle says a tragedy customarily has six parts (plot, character, thought, diction, spectacle, and melody), and, in declaring plot the most important, he seems to be asserting that excellence of its plot contributes more to the overall excellence of a tragedy than does the excellence of any of its other parts.

Aristotle offers a number of arguments in support of his claim of the preeminent importance of plot. Two are of special interest here. One is the assertion that of all the parts, only plot is necessary to something's being a tragedy. The other is the claim that plot has more of a bearing than the other parts of a tragedy on the work's special and proper effect, namely the production of *catharsis*. Thus, although Aristotle himself does not speak in these terms, his arguments are close to a claim that plot is both a necessary and a sufficient condition of tragedy, and his thesis is a kind of essentialism. What makes this essentialism a formalism is Aristotle's conception of plot: a plot, he says, is the "arrangement of incidents." Although Aristotle sometimes uses the term *plot* in something like the modern sense, meaning roughly the "story," the more abstract conception (arrangement of incidents) suggests a structure—a formal entity. And indeed Aristotle identifies plot as the "formal cause" of a tragedy.

There have been attempts to generalize Aristotle's theory. The theory is offered by Aristotle specifically with reference to tragedy, and the obvious question is how to apply it to any other artistic form. Some interpreters have thought that Aristotle would regard the plot as the most important part of any artwork that has a plot, including, for example, an opera or ballet. But it might be a mistake to regard the plot as the most important element of, say, an opera. What an Aristotelian should be looking for is the necessary and sufficient condition of something's being an opera—opera's formal cause—and this may well be its music, as Joseph Kerman has argued in *Opera As Drama*. The incidents whose arrangement is vital will be musical incidents.

Whereas for Aristotle the centrality of form is a metaphysical or ontological matter, having to do with the

nature of the objects themselves, for Kant the importance of form is grounded in a quasi-epistemological conviction. A Kantian judgment of taste requires exclusive attention to form because nothing else can underwrite such a judgment's claim to universality. Kant's reasons for thinking this are relatively clear, even if his argument is difficult to formulate.

According to Kant, a judgment of something's beauty is based on the judge's feeling of pleasure in the thing. It is distinguished from other so-called "aesthetic" judgments by its implicit claim to an intersubjective validity. The judgment is thus not parochial because it is in part to some extent a rational judgment, requiring the use of the faculty of concepts. In the exercise of such judgment, according to Kant, attention is restricted to the form of the object. The judge is entitled to suppose that any other judge would also experience pleasure in the object if he judged in the same way—taking pleasure in his contemplation of the mere form of the object. Why does Kant think that everyone judging in this way will experience pleasure? In answering this question, Kant seems to rely on what he claims to have proved in the *Critique of Pure Reason*—namely that states of mind are communicable because unless they were, objective knowledge of the world would not be possible, and he thinks that he demonstrated that such knowledge is possible.

The definition of form is much less clear in Kant than in Aristotle. Kant seems to be thinking of what we might roughly think of as shape, and that seems a reasonable way to understand one of Kant's leading examples, namely the judgment of the beauty of a rose. But it leaves it utterly unclear why Kant has such a low opinion of music, given the entirely plausible conviction that music may well display abstract form more conspicuously and typically than does any other art.

FORMALISM IN THE VARIOUS ARTS

In any art, formalism concentrates on the formal elements in the works it deals with. It is not always clear just which elements are formal, in these theories, and it is not uncommonly clearer which elements do not count as formal than it is how the formal elements are defined.

VISUAL ARTS. In the visual arts, formalism has insisted on a concentration on line and shape. Its early proponents were Clive Bell and Roger Fry, and perhaps its most conspicuous twentieth-century advocate was Clement Greenberg. In its more extreme formulations, formalism in the visual arts has insisted that the value in, say, a painting, is unrelated to its representational features and

is due entirely to the its form, where that form is understood entirely as a generally abstract structure constituted by the lines, shape, and, perhaps, color of the painting.

MUSIC. Formalist theory and criticism of music almost always explicitly refuses to give attention to any “program” associated with the music or even to the sung text in vocal music. Formalism does not always refuse attention to the emotions that may be evoked by music, but it insists that these feelings arise from “music alone” and not from any representational or narrative features, no matter how closely these may be associated with the music. An early statement of this view is given by Eduard Hanslick, and recently one of its most sophisticated exponents has been Peter Kivy.

LITERATURE. Formalist literary theory is somewhat harder to describe than is formalism in the other arts. If formalism, in general, is thought to be a doctrine in which principal or exclusive attention is to be paid to the perceptual elements of a work and to the relations between these elements, then it would seem to require that literary formalists attend only to the shapes and sounds of words, and this requirement is surely incredible. Thus formalism in literature has to be understood more subtly. It is commonly taken to require attention exclusively to “the work itself,” where this seems to mean eschewing references to considerations coming from “outside” the work. In particular, formalists have wished to deflect historical, biographical, and psychoanalytical interests, although, of course, even the most severe formalism may have to countenance some historical interests in so far as these are necessary to establish certain features of the work—for instance, the meanings of various words or the references of proper nouns. Furthermore, there have been different species of formalism because of different opinions about which formal features are most important.

PROBLEMS FOR FORMALISM

With its professed interest in works of art themselves, and not to any ancillary features, it is fair to say, with some qualification, that formalism does *not* want attention to representational or narrative features, or to any emotional evocations that result from those things. There are two main problems facing any advocate of formalism. One is to supply some argument in favor of the claim that a work’s formal properties are either the only or the most important of its elements; but before that, there is a need to offer some criterion that distinguishes formal from nonformal elements. The latter problem may be more

bothersome than it first appears, especially when one asks what formalists mean by *formal*. A useful way of doing this is to ask, “Formal as opposed to what?” When that question is raised, quite different answers are given for various arts. Thus, some procedure or routine must be given that will answer, for any true statement about a work of art *A*, with the form *A* is *F*, whether the property *F* ascribed to *A* is a formal property. This is very difficult to do, and that difficulty often leads to something of a reduced insistence—namely that it be determined, given that *F* is a property of *A*, whether *F* is an *essential* property of *A*. This formulation tends to be more or less agreeable depending upon how favorably one looks at philosophical essentialism.

Supposing it is settled how to tell whether a property is a formal property; the formalist now needs an argument for dealing with this issue: Given that *A* has the property *F*, and also the property *N*, and that *F* is a formal property, whereas *N* is not a formal property, why is *F* a more important property of *A* than *N*, more critical to assessing *A*’s value or importance? Even if it were true that *F* is an essential property, how does it follow that *N* is less important?

Whatever its defensibility as a philosophical thesis, and however vaguely it has to be stated, formalism retains one merit: it has recommended and insisted upon attention to those features of an art work that incontestably are features of the work itself—features often scanted in the assessments of antiformalists.

Ted Cohen (2005)

ART, INTERPRETATION OF

The concept of interpretation is key to our commerce with artworks. For if something is an artwork, then it falls into the category of things that are at least eligible for an interpretation. For example, all things being equal, an ordinary snow shovel is not a candidate for interpretation, but Marcel Duchamp's *In Advance of a Broken Arm* is, despite the fact that it is indiscernible from the other snow shovels produced at the same time, in the same factory.

However, not all the elements or combinations of elements in an artwork merit interpretation. Only those elements or combinations thereof are worthy of interpretation, which somehow mystify, perplex, or elude. The appropriate object of interpretation is that which goes beyond what is given or foregrounded (Barnes 1988).

An interpretation is a hypothesis that accounts for the presence of an element or combination of elements in an artwork where the presence of the relevant elements is not immediately obvious to the interpreter and/or to some target audience. The item may not be obvious in the sense of being unintelligible or enigmatic, or because it is symbolic or allegorical, or because it is understated, barely hinted at, only suggested, or it is in some other way recessive.

The purpose of an interpretation is to enhance our understanding of an artwork. There is something about the artwork that is obscure, ambiguous, apparently incoherent, anomalous, unexpected, inaccessible, perplexing, or latent that invites illumination. The aim of an interpretation is to elucidate the presence of the pertinent ele-

ments in the artwork by explaining the contribution they make to the unity, meaning, design, intended effect, and/or structure of the work. Consequently, the work of interpretation presupposes some target audience—to which the interpreter may or may not belong—for whom the significance of some part of the work, or even the artwork as a whole, is elusive, puzzling, obscure, nonmanifest, unfocused, symbolic, or otherwise not immediately apprehensible. The interpretation, then, ideally alleviates that perplexity or gap in the audience's understanding.

Not every element in an artwork calls for an interpretation. Where with respect to a painting such as El Greco's *The Adoration of the Shepherds*, everyone recognizes the subject to be a woman, a child, and two men, then the observation that "this painting represents a woman, a child and two men" is not an interpretation, but a description. Descriptions are nevertheless relevant to interpretations, since sound interpretations must rest upon accurate descriptions.

The literal meaning of many of the words and sentences in literary works are grasped by means of subpersonal routines of processing by literate readers in the language in which the work has been composed (Currie 2004). The literal meaning of the opening line of Kafka's *The Castle*—"It was late in the evening when K. arrived"—does not require an interpretation, insofar as it is obvious to the prepared reader. What might require an interpretation, on the other hand, is its place in the broader design of the novel. Interpretation only pertains to that which is not apparent to some audience. Thus, what is suggested, entailed, or implicated is grist for the interpreter's mill, though not what is spoken outright (although why an author chooses to speak directly rather than obliquely, in certain circumstances, may be a legitimate interpretive question).

That, in a movie, shots of waves pounding on the beach often symbolize intercourse when juxtaposed to shots of lovers may be obvious to the jaded film critic; however, making note of this cinematic figure counts as an interpretation, since there is a target audience for whom it is news. Likewise, a reading of the symbolism of the death's head in a *vanitas* painting is an interpretation, since most people, untutored in art history, are unaware of the association between it and the concept of mortality.

Interpretation is, in general, a holistic enterprise. It strives to isolate the point(s) or purpose(s) of an artwork in order to explain the ways in which the parts cohere or segue with the aims of the whole as contributions to the function and/or meaning of the artwork. The predomi-

nant tendency of interpretation is to show a work to be more and more unified in intent. Of course, in order to build up a conception of the whole, the interpreter must begin with the parts, conjecturing and then adjusting his hypotheses regarding their significance as they arrive before him. The interpreter moves from hypotheses about the part to hypotheses about the whole and then back to the part again. This is sometimes referred to as the *hermeneutic circle* (Gadamer 1975); it underscores the fact that interpretation is a continuous process of reflective equilibrium involving an iterative feedback loop from part to whole and then from whole to part.

The overall direction of interpretation is toward establishing the unity of intent, thought, or design in the artwork. Even an avant-garde work, like Luis Buñuel's *L'age d'or*, which is predicated upon insistently subverting our expectations by a series of what appear to be narrative *non sequiturs*, can be shown by an interpretation to exhibit a sort of second-order unity in virtue of its consistent choice for surrealist purposes of incoherent sequences of events. On the other hand, interpretation can also have a role to play in revealing the disunity in a work. After identifying the intended effect of a novel to provoke a sense of mystery in the audience, the interpreter may then go on to point out that that purpose was ill served by the ineptly transparent way in which the murderer was crudely marked as guilty from his first appearance onwards. Because of its overriding concern with the unity of the artwork, interpretation is intimately related to evaluation, often supplying premises for our judgments of the quality of artworks.

Since interpretation is so involved with exhibiting the unity of artworks, it is often connected to the discovery of meaning, especially in works of narrative, dramatic, and symbolic import. For meaning—in the sense of a theme, a thesis, or an overriding concept—is one of the most frequent ways in which such works may be unified. The theme of the inhumanity of war, for instance, governs *All Quiet on the Western Front*. The interpreter, contemplating the parts of the work, for example its various episodes, hypothesizes this theme and then goes on to show how this concept colligates or unifies Remarque's choice of the incidents he presents to the reader. That is, an interpretation like this isolates the principle of selection—in this case, a concept—that makes a coherent package of the collection of details assembled in the novel.

ANTI-INTENTIONALISM

Meaning of various sorts is so frequently associated with interpretation that many philosophers identify the excavation of meaning as the sole object of interpretation and, for that reason, propose linguistic meaning as the model for understanding interpretation. Linguistic meaning, of course, is highly structured in terms of conventions of semantics and syntax. So on this view, interpreting a work is a matter of discovering its meaning through the rules of the relevant art form. With respect to a poem, for example, it is said, one need only appeal to the public meanings of the words and the traditional practices of figuration; no recourse, for example, to authorial intention is necessary. Because of its reliance upon the conventional meanings of words to the exclusion of authorial intention, this view, which was ably defended by the late Monroe Beardsley, can be called anti-intentionalism.

To the extent that anti-intentionalism depends upon our understanding of linguistic meaning in terms of conventions as a model for the interpretation of works, it cannot, at the very least, be generalized across the arts. For most of the arts do not possess the highly structured meaning conventions that language does. The fact that a stage director chooses to incorporate a swimming pool into the set of her theatrical production of *A Midsummer Night's Dream* is certainly a decision worth pondering in an interpretation of the performance (“What might the director be symbolizing by this?”); but there is no fixed, public meaning attached to the appearance of swimming pools onstage.

And yet even with respect to the literary arts, many of the traditional objects of interpretation are inhospitable to the linguistic model. For example, interpreters often focus upon the significance of plot ellipses or they question why a character possesses a certain set of apparently conflicting attributes. But neither of these recurring objects of interpretation can be referred to pre-existing codes or conventions of decipherment.

Furthermore, literary works often mobilize irony and allusion. The conventions of language will be of no avail with radical cases of irony, since in these instances the author means to say exactly the opposite of what the rules of language entail, while there are no conventions to tell the difference between allusions, properly so called, and coincidental similarities of phrasing. Indeed, even in the case of metaphor, we have no laws to tell us how to proceed in unraveling them interpretively. So it is even controversial whether the anti-intentionalist or conventionalist stance can serve as a comprehensive account of

the arts of language which, on the face of it, would appear to be its most welcoming field of application.

Perhaps an even deeper problem with the linguistic-model version of the conventionalist or anti-intentionalist stance is that it presumes that the object of interpretation is always something construable as a meaning—that is, either as a proposition, an utterance, or a concept. But often the object of interpretation is what the artist has done rather than what he has “said.” For example, the art historian may explain to her class that the artist has placed the crucified Christ at the vanishing point of his painting in order to emphasize that it is Christ’s death that is the subject of the painting and not, for instance, the Roman soldiers playing dice at the side of the cross. This is a rhetorical or dramaturgical effect that, inasmuch as it may not be apparent to many viewers until it is pointed out, is worthy of interpretive attention. However, it does not involve meaning, linguistically construed. It does not say, “look here”; rather it has the effect of tending to draw the eye of the normal viewer in that direction. Yet, explaining the function of this device in the design of the work as a whole is interpretative because it contributes to disclosing the unity of intent of the work—in effect, to explaining the way in which this strategy reinforces the plan, point, or purpose of the painting.

The limitations of the conventionalist model may encourage us to look elsewhere for a way of understanding interpretation. Moreover, we need not search far afield. For interpretation is not some strange phenomenon that we engage only with respect to rarefied objects like art objects; ordinary human life is shot through with interpretation.

INTENTIONALISM

Barely an hour goes by when most of us are not involved in interpreting the words and deeds, the sayings and doings of our conspecifics. The ability to read the minds of others is an indispensable part of social existence, and those who are extremely deficient at it, such as persons stricken by autism, are typically thought to be disabled. The interpretation of artworks appears simply to be a specialized extension of this natural capacity of the human frame, no different in kind than our interpretation of the behavior, verbal and otherwise, of the family, friends, strangers, and enemies who surround us daily.

Thus, our ordinary practices of interpretation may be expected to shed some light on the interpretation of artworks. In everyday life, interpretation is typically aimed at understanding the intentions of others. We scrutinize the speech and the behavior, often nonverbal, of

conspecifics in order to make sense of it by inferring the intentions that gave rise to it. If the behavior takes place against the background of conventions, as speech does, we factor those conventions into our deliberations. However, arriving at our interpretation of an action, including a speech act, rarely involves applying conventional rules to behavior mechanically. We appeal to what we know about the agent, about her beliefs and her desires, about the context of her activity as well as what we know about pertinent conventions to arrive at our interpretations. Why not approach the interpretation of artworks in the same way that we interpret our conspecifics every day? Isn’t it very likely that the interpretation of artworks is on a continuum with the interpretative propensities that appear to have been endowed innately by natural selection as a beneficial adaptation for social beings like ourselves?

If it is plausible to answer these questions affirmatively, then the narrow compass of linguistic meaning emphasized by the anti-intentionally disposed conventionalist may be exchanged for the broader notion of sense that is invoked when we speak of making sense of an action—where what makes sense or what renders an action comprehensible is the identification of the coherent intention that lies behind it. Why not suppose that making sense of an artwork is of a piece with making sense of an action? One advantage of this view, in contradistinction to the previous version of anti-intentionalism, is that art forms that are not governed by rules as strict as those of semantics and syntax are still readily interpretable under an intentionalist understanding of interpretation such as this one.

Artworks have a communicative dimension. Consequently, all things being equal, we should try engage them as we do the other communicative behaviors of our fellow humans—as sources of information regarding their intentions. Where interpretation comes into play, its point is arguably to discern the communicative intentions of the creator of the work. An interpretation is successful to the degree that it tracks the intentions of artists. This view, for obvious reasons, we may call intentionalism.

Intentionalism is often rejected because it is thought to force its proponents to the nonsensical position that the preferred interpretation of an artwork is that it has whatever meaning or function its creator says it does. So if a poet says the word “blue” in his poem means “red,” then “blue” means “red.” But this is absurd. Of course, in a case like this, we may suspect the poet is dissembling about what he truly intends. In the ordinary course of

affairs, we do not allow our interlocutors the last word on their intentions. So it needs to be emphasized that intentionalism is not committed to the view that an artwork means whatever an author merely says it does. Rather, intentionalism is after the actual intention of the artist.

But let us imagine that in this case, we somehow are able to ascertain that the poet really does intend “blue” to mean “red.” Surely, we will not accept that this is what the word means, and, moreover, the anti-intentionalist can say why—because it violates the rules of language.

This objection is fatal to the most radical variety of actual intentionalism (Knapp and Michaels 1982). However, there may be more modest forms of actual intentionalism that are capable of dodging this objection. One strategy in this respect is to regard the intentions of the creators of artworks as pertinent to the interpretation of artworks just in case the work itself—including, in this instance, the words and their conventional meanings—can support the putative intention of the artist (Hirsch 1967, Iseminger 1996, Carroll 1999). Where they cannot, isolating the artist’s intention will not, the intentionalist concedes, promise a successful interpretation of the work. In this way, the modest actual intentionalist acknowledges the role of both conventional meaning as well as intention in interpretations (Stecker 2003).

Nevertheless, the modest actual intentionalist must surmount further challenges. One charge is that this approach misdirects the interpreter. Instead of focusing on the work, the interpreter is focused on something outside the work, in effect the artist’s intention. However, the modest intentionalist notes that since the artwork is the primary source for our evidence about the artist’s intention, intentionalism does not beckon us to turn away from the artwork, but to inspect it more closely. Furthermore, the intentionalist contends that it is not quite right to maintain that our interest is in the artwork as if it were an object in nature. Surely, since so many of the critical remarks we lavish on artworks presuppose the notion of *achievement*, our interest in the artwork is in the way intentions are realized in the work. But to appreciate that requires a grasp of the intentions that gave rise to the work.

The intentionalist argues that the interpretation of artworks is on a continuum with our everyday interpretation of our conspecifics. However, critics of intentionalism maintain that once we enter the realm of art, things change. Even if standardly we interpret in order to identify the intentions behind the words and deeds of others, art is not like that. It has purposes above and beyond the practical concern with gathering information from our

conspecifics. An essential function of art is to afford aesthetic experience—experience valued for its own sake—by encouraging the imagination of the reader, listener, or viewer of the artwork in lively interpretive play. The claim that the proper aim of interpretation is to attempt to identify the intention of the artist may conflict with this putatively central function of art. Thus, in order to engage artworks appropriately, our normal inclination towards interpreting for intention should be suspended.

On the one hand, the view that a central function of art, one that trumps all the others, is to engender aesthetic experience by abetting the imaginative play of interpretation is, to say the least, controversial. Nor can it be bolstered, without begging the question, by suggesting that the authority of this viewpoint is manifest in the behavior of informed participants in the art world, since one finds that informed participants in the art world indulge in intentionalist interpretations with remarkable frequency.

On the other hand, it is difficult to gainsay that an artwork has at least a communicative dimension—that it is meant as the expression of a thought or a feeling or as a projection of a design for contemplation, or is meant to have some other intersubjectively detectable effect. Moreover, it may be argued, that once we enter a communicative relationship with another, including the creator of an artwork, then it would appear that we are bound by certain moral responsibilities.

That is, we must treat the communiqué of the other fairly, with charity, and with accuracy; we must engage our interlocutor justly and attempt to get at what she intends to communicate. Perhaps the best evidence for this moral commitment is the injustice we ourselves feel when we believe that others are “putting words in our mouths.”

But if such moral considerations are germane to interpretation, then it does not seem that the supposed pursuit of aesthetic experience through the free, or, at least intentionally independent, play of interpretations trumps all of our other legitimate interests in artworks. Rather the range of acceptable interpretations will be morally constrained by our best hypotheses about what the creator of the artwork intended (Carroll 1991).

HYPOTHETICAL INTENTIONALISTS

Nevertheless, even if it is conceded that the work of interpretation aims at hypothesizing the intention of the creator of the artwork, there is a dispute among intentionalists over what should count as its preferred

interpretation. One side—call them hypothetical intentionalists—claims that the preferred interpretation of the artwork is the one that would be conjectured by an idealized, fully informed audience member, availing herself of all the publicly accessible information surrounding the artwork (including knowledge about the rest of the creator's oeuvre, about the history and practice of the pertinent genre and style of the artwork, about the social context of the work, and even concerning whatever is in the public record of the author's life) (Levinson 1996). The other half of this debate—call them modest actual intentionalists—maintains that the preferred interpretation of the work is whatever the actual intention of the creator was so long as that is supported by the work itself.

Since both hypothetical and actual intentionalists will usually rely upon the same kinds of considerations to arrive at their interpretations—historical context, art history, the rest of the creator's oeuvre, and so forth—in practice the two positions are apt to converge generally on the same interpretations of the work. There is a point at which they clash, however. Since the goal of the modest actual intentionalist is the retrieval of the actual intention of the creator, she is willing to help herself to information—wheresoever it comes from—about what the author really intended, so long as what the creator is thought to intend is consistent with his creation. This includes being prepared to use clues from the private diaries, letters and notes of the creator as well as the reliable testimony of friends of the creator. In contrast, the hypothetical intentionalist believes that the interpreter must be limited in her hypotheses to just what can be found in the public record.

The hypothetical intentionalist defends his viewpoint, in part, by asserting that the aforesaid limitations on the kinds of evidence to which an interpreter has a genuine right are part and parcel of the principles underwriting art world practice. It is a violation of the rules of the game, in other words, to use the private papers of an artist to formulate the preferred interpretation. However, it is not clear where the hypothetical intentionalist locates the basis of this alleged rule. It cannot be observed in the actual practice of interpretation, since many critics appear quite happy to use unpublished biographical confidences in their work. Perhaps they are in some violation of some rule, but, since the eclipse of the New Criticism, no one appears to call them on it anymore. Moreover, the notion that such a rule could govern the art world seems unlikely. For when we become interested in an artist and his artworks, we are happy to learn everything we can

about him and to incorporate it into our understanding, irrespective of from whence that information originates.

READER-RESPONSE THEORY

Because interpretation is so often involved with the identification of meaning, it is quite natural to suppose that it is connected to intentions. For, the meaning of an utterance—such as “The door is closed”—depends upon whether the speaker intends to be reporting a fact or asking a question (signaled, perhaps, by changing one's intonation at the end of the sentence). However, while agreeing that the meaning of an utterance requires an intention, some may question whether the pertinent intention needs to be that of the author or creator of the artwork. Might not the intention be supplied by the consumers of the work—the readers of the poem, for example?

On this view, which is a variant of reception theory or reader-response aesthetics (Tompkins 1980), the author of the poem supplies his readership with a text—a mere sequence of words whose meanings are to be imputed by the audience, albeit usually within the constraints of the possible dictionary senses of the relevant words and the rules of grammar. In this way, each reader may be thought to construct her own artwork, much as the interpretation of a score by a musician counts as a work of performing art in its own right. That is, in the inevitable process of filling-in the indeterminacies of the text (a sheer sequence of symbols sans fully determinate meaning), the reader putatively creates her own artwork.

Even if this view of interpretation suits some art forms, like literature, it is difficult to generalize across the arts. How exactly would it apply to architecture? It strains language violently to say that each spectator *constructs* his own building, and where, in any event, would those buildings be situated exactly? There would appear to be room for only one Notre Dame cathedral on its present site in Paris; or, Are all those imputed cathedrals immaterial? Surely, such thinking leads to a strange form of architecture.

Another problem with this way of talking is that it would seem to evaporate the relevant category of interpretation entirely. In ordinary language, we countenance at least two notions of interpretation—the notion of a critical interpretation (which has been the topic of this entry) and what might be called a performative interpretation—the sort of interpretation that a musician gives to a piece of music or that an actor gives to a role. These two kinds of interpretations may be related—the actor may produce or consult a critical interpretation of a play

before creating his role through an interpretation/performance. But the two sorts of interpretation are usually thought to be distinct.

However, on the variation of reception aesthetics under discussion, the difference disappears. There is no artwork to be interpreted critically because the interpretation—the performative interpretation—by the reader just is the artwork. There is no conceptual space left over for the critical interpretation to inhabit. Or, in other words, the distinction between the artwork and its (critical) interpretation has disappeared.

Furthermore, if each interpretation, in the sense germane to the reception theorist, amounts to a different artwork, then it is not clear how we will go about comparing different interpretations. What will be the reference point in such comparisons? But we do compare interpretations. Consequently, a theory that makes this impossible is suspicious.

And finally, if audiences create artworks, what is it precisely that artists do? Is it that short-story writers produce texts—strings of symbols without intended meanings? This surely is not what writers think they do, nor does it seem humanly feasible for an author to produce a document on such a scale with no definite utterance meanings in mind. And how would we go about evaluating works constructed on this construal? Would the “text” that generated the most (or the least) reader-response artworks be the best and why? Or, would there be some other criteria.

At the very least, the reception-theory version of interpretation canvassed so far would call for a dramatic overhaul in the way in which we talk and think about art. Before embracing such a view of interpretation, we should require a fuller account of that alternative conceptual framework than any developed so far. On the other hand, it may be an added virtue of modest actual intentionalism that it fits our current interpretive practices as neatly as it does.

ART, ONTOLOGY OF

Ontology is concerned with what exists. So one may think the ontology of art is concerned with whether artworks exist. However, most people take the existence of artworks for granted. (See Dilworth 2004 for someone who does not.) The main issue for the ontology of art is what kind or kinds of objects artworks are. A second important issue is about the identity and individuation of works. Concerning both of these issues there is wide disagreement along a variety of parameters.

OBJECTS THAT ARE ARTWORKS

ONE KIND OR MANY. One parameter along which there is disagreement is whether all artworks belong to a single kind or whether they belong to irreducibly different kinds. The second view seems more plausible, at least initially. A painting, such as one made with oils or watercolors, is an entity that has physical properties, such as spatial dimensions, that exists in a single place at a single time, and, for these reasons, may be plausibly taken for a physical object. A novel could be said to exist in many places—wherever there is a copy—or in no place, because no copy or even the original manuscript is the novel. For this reason, novels could not be physical objects. One of a kind sculptures are more like paintings in the respects mentioned above, whereas many musical works are more like novels.

Nevertheless, there are a variety of attempts to argue that artworks belong to a single kind. One strategy for doing this is to argue that all works are types or kinds of some sort, thereby assimilating those, such as paintings, that appear to be physical objects to the category to which novels and musical works more obviously belong. One proposal is that all artworks are structural types. Musical works are sound-structures and literary works are linguistic structures (or possibly, in some instances, plot structures). Paintings also have a structure that could be defined in terms of patterns of colors and shapes, or defined in some other way. This structure is duplicated in a copy of the painting, perfectly duplicated in a perfect copy. Prints and sculpture produced from a model seem to fit this proposal better than paintings, because people currently recognize that prints and sculpture that share a common structure belong to a single work. Current practice does not do this for paintings, no matter how perfect the copy. One can imagine a future time when painters produce a work in two stages. First they paint something. Second, they authorize a certain number of mechanically produced copies to be housed in several different museums or galleries as instances of the work, just as there are now several authorized instances of Henry Moore's sculpture *King and Queen* on different sites in different parts of the world. However, the possibility of imagining this new practice does not show that paintings are really abstract structures. If anything it shows the opposite, because the imaginary practice stands in stark contrast with the actual one. This actual practice does not recognize copies as instances of the work, asserts that the work is deteriorating when the paint applied by artist to canvas deteriorates despite the existence of good copies, and so on. Because painting and some sculptures are not structural types, there are other works that also do not fit the proposal, even though they are not physical objects. Improvisations and happenings are nonrepeatable events. So the strategy of arguing that all artworks are abstract structural types fails.

These considerations also speak against a second proposal: that artworks are action-types (Currie 1988). The type is the discovering of an abstract structure in a specific way (a "heuristic path"). The proposal recognizes a consideration that is discussed at length below: a work's pattern or structure and the context of its making are distinct sources of important artistic properties. However, if the reasoning of the last paragraph is correct, the present proposal has a defect similar to the first proposal in misidentifying the sort of objects that paintings and uncast sculptures are. These are not types of achievement; rather, they are specific concrete objects that are appreci-

ated only in part for what they achieve. Even genuinely abstract works seem to be objects brought about by a type of activity rather than that action-type itself.

A different strategy for arguing that all artworks belong to a single ontological category is to argue that they are all concrete objects of some sort rather than abstract objects. One proposal on the table that fits this approach claims that all artworks are action *tokens*, in particular, the creative activity of artists that bring into existence those objects normally thought of as works of art (D. Davies 2003). On this proposal, the actual work is uniformly the creative activity, the product of that activity being dubbed the work-vehicle and distinguished from the work itself. One may wonder what this accomplishes other than a renaming. Both the creative act and the object are recognized by everyone, and as such, no novel entity is involved in the act-token conception of artworks. So why depart from normal practice and assert that the artwork is not the object produced by the artist's activity, but is the activity itself? Simplifying a complicated argument, the main reason is the importance for art appreciation of reconstructing the artist's creative activity. The claim is that the only way to acknowledge this importance fully is to identify the work with the activity. This claim is unjustified. An object has many relational properties in virtue of its origin and recognizing these properties may be crucial to fully appreciating the object as an artwork. People can accord recognition to the artist's creative activity by understanding that it is in virtue of the creative act, and of the project that gives rise to it—that the work (object) has the relational properties crucial to appreciating it. There is no need to identify the work with the creative activity itself. Hence the renaming that the act-token view proposes is neither necessary nor desirable.

One may conclude that the heterodox view that artworks belong to irreducibly different kinds is not only more plausible initially, but more plausible after reflection as well. Taking this for granted, the next question is how to more sharply define these kinds.

THE ROLE OF INTENTIONS AND CONTEXT. According to the heterodox view, some artworks are abstract types or kinds, others are concrete objects with physical properties, and there are still others that are particular events or processes. One individuating feature of abstract artworks, such as novels, plays, and pieces of music, is that instances of each work share a common structure. Is this sharing of a structure sufficient to individuate a single work? It is clear that this is not always so. Consider the

case of a sculpture that has multiple instances. The structural element here consists of a material such as bronze being shaped in a certain way. Wherever there is a piece of bronze so shaped there is an object that has a structure in common with the sculpture. But this is clearly not sufficient for the object to be an instance of the sculpture. Someone who produced pieces of bronze with shapes identical to those belonging to *King and Queen* would not thereby produce an instance of that sculpture. For the pieces to be such instances, they would have to be produced from the cast Moore supplied to a certain foundry chosen by the artist and be one of a specific number of instances as indicated by Moore. This much is obvious. Controversy arises when one asks why this is so and whether a common structure is equally insufficient to individuate musical and literary works.

One explanation of the insufficiency of structure to individuate works such as cast sculptures and prints appeals to a purported distinction between autographic and allographic works (Goodman 1968). The latter are those that, because they are made in a notational symbol system, are in fact individuated by a shared sequence or structure of symbols. A thought experiment suggesting that musical and literary works are allographic relies on the impossibility of forging a musical or literary work by copying the score of one or the sequence of words of the other. This simply would produce the score of the musical work or a copy of the novel rather than something to be passed off for one of these. If, however, someone copied a cast sculpture by creating a new cast that produced a piece of bronze identical in shape to the sculpture, that would be a forgery. To be the sculpture, even one that has multiple instances, each instance must derive in the right way from the hand of the artist. This is what makes sculpture an autographic art form.

One can accept a version of the autographic/allographic distinction that simply says that some works are made in notational symbol systems and others are not. What this version of the distinction does not imply is that if a work is made in a notational system, it is individuated entirely by notational structure. A different thought experiment suggests that even for works in notational systems, instances sharing a common structure are not necessarily the same work. The experiment revolves around structurally identical items from different periods or cultures. Because of the different historical contexts, the items will have different artistic properties despite sharing, say, the same sequence of words. A well-known version of this thought experiment is the often-cited story by Jorge Luis Borges, “Pierre Menard, Author of the

Quixote” (1970). In this story, Borges imagines a late-nineteenth-century writer, Menard, who produces a manuscript word-for-word identical to some chapters of Cervantes’ great novel. Borges plausibly proceeds to note the huge differences in style and meaning between the two works. Cervantes’ style is colloquial, whereas Menard’s is self-consciously archaic. The latter contains allusions to contemporary philosophic thought that the former could not possibly have. Hence even ignoring that Menard’s text is identical to only a small part of Cervantes’, the two are different works in virtue of different authorial intentions and contexts of creation.

Once one recognizes that intentions and context play roles in individuating works that have the ontological status of types or kinds—whether or not they are also “allographic” in the weak sense noted in the preceding paragraph—one can also recognize that intention and context play similar roles in the case of concrete works such as paintings and uncast sculptures. To recall another famous example from Arthur Danto’s *The Transfiguration of the Commonplace* (1981) consider three pieces of canvas covered with red paint by the hand of three different, independent artists. Three “structurally identical” red canvases could form parts of a single work of art, a triptych, if produced with that intention by a single artist or a group working together. That three distinct physical objects are produced in isolation from each other, the product of three different “hands,” implies that, if each red canvas is or constitutes a work of art, there are three distinct works. However, when does a red-paint-covered canvas constitute a work of art, and what sort of entity is the art object so constituted? The answer to the first question once again appeals to intentions and context. For a canvas uniformly covered with red paint to be a work of art—a painting—an art-historical context must be in place that permits certain intentions to count as art-making ones. In eighteenth-century France such institutions were not present, whereas in twentieth-century America (or France) they were. Second, the art-making intentions must actually exist. If one canvas became red because the artist needed an empty spray paint can and got it by discharging the paint onto this canvas, there is no art-making intention and no artwork. If the canvas became red as the result of an intention to produce a work in the color-field genre, then there is an art-making intention, and thus an artwork.

The second, strictly ontological, question asked above is: What sort of entity is the art object? Is it the painting that results from covering the canvas with red paint? Is it identical to the paint-covered canvas or not?

To grasp the ontological puzzle here, it is easier to turn to a different example: a piece of clay shaped into a human figure. Is the sculpture identical to the lump of clay? Obviously not, because the lump existed before it was shaped to create the sculpture, but the sculpture itself did not exist. An alternative answer to this question is that the sculpture is the human-shaped lump. This entity came into existence when the sculpture did and could be regarded as a phase of the existence of the lump itself. However, even such a “phase” or “time-slice” could be understood as having its shape contingently. That is, if it is possible for it to continue existing as one and the same phase of the lump while radically changing in shape, the phase is not identical to the sculpture because the sculpture would not survive such a radical change in shape. Also, if it is possible for this entity to come into existence independently of any human intention, it could not be identical to the sculpture. A sculpture cannot come into existence exclusively through natural processes. These considerations imply that the entity identical to the sculpture is not simply a lump of material structured in a certain way but such a lump structured to fulfill an artistic function or intention typically made possible by certain institutions or practices. Exactly the same is true of the red painting. It is a canvas covered by red paint in order to fulfill an artistic function or intention made possible by certain institutions or practices (Levinson 1996).

ARE ALL ARTWORKS CREATED? Concrete artworks such as the red paintings and the clay sculpture just discussed are obviously created. Are the abstract works—the novels, musical pieces, and so on—also created? Some scholars, such as Jerrold Levinson (1980), have argued that it is a condition on a satisfactory ontology of art that the ontology accounts for the createdness of abstract artworks. Others, such as Peter Kivy (1993) and Julian Dodd (2000, 2002), have disputed this. Underlying these conflicting views are conflicting intuitions. One intuition is that novels, plays, and musical works are just as much the products of creative activity as are paintings. The other intuition is that abstract objects cannot be created because of the sort of objects that they are.

It may seem that the argument of the preceding section supports the claim that abstract artworks are created. It was argued that these works are not identical to abstract structures *per se*, but to structures tied to certain intentions and contexts. What could “tied to” mean but created with certain intentions in a certain context? But this raises an important question: What are these entities that are purportedly created? They are not pure abstract structures, because these are really uncreated and eternal,

and it has already been denied that they are the artworks. The best known proposal on this score is Levinson’s. He claims that they are indicated structures “a structure-as-indicated-by-P-at-T-in-[art]-historical-context-C” (1996, p. 146). The dashes are intended to indicate that this is not a set-like ordered quadruple but something more “unified,” a type that comes into existence with the act of musical or literary composition.

There are a variety of objections to Levinson’s view. Stefano Predelli asserts that indicating does not in general create new entities (1980). If I point out my favorite house in the neighborhood, I haven’t created a new entity: the-house-as-indicated-by-me. So it is implausible that indicating creates one when authors or composers indicate abstract structures. There are two ways of replying to this objection. One reply would be to claim that new entities are always created by indicatings, but people pay no attention to most of them because the indicatings are of no interest to them. The house-as-indicated-by-me is an entity that has about as much interest as a scattered object such as a nose-tie consisting of Bill Clinton’s nose and a tie he left in a hotel during a visit to Australia. Both nose-ties and indicated-buildings nevertheless exist. The other reply claims that some indicatings are special because they occur within institutions or practices that endow them with special properties and give them special recognition. Sentences can be regarded as abstract syntactic structures, which, when used (when *indicated* by a speaker or hearer) creates a new entity, which has semantic or pragmatic properties not possessed by the abstract sentence type. The ability to convey something distinct from the semantic meaning of the sentence type results from linguistic conventions combined with the intentions of language users and the context of use. Writers are just special cases of people who use (indicate) strings of sentence types to convey something through the creation of a complex literary object. Composers do something similar with abstract sound structures. The two replies are consistent with each other, though the second is available to those who would resist the first.

A second objection is that abstract entities, such as structural types, cannot be created because they cannot enter into causal relations. Being created means being caused to exist and, if an entity cannot enter into a causal relation, it cannot be caused to exist. This claim is said to apply to any abstract type whether it be of the pure unindicated variety or an indicated structural type. A related third objection should also be mentioned at this point. It could be said that even if there are indicated types, they are just as eternal and uncreated as any other

abstract thing. Such types exist just in case a property corresponding to the type does, and all properties exist eternally. Hence the property of being a structure indicated by P at T in C exists eternally. Therefore the indicated structural type does too. Hence it is not created (Dodd 2000, 2002).

Both of these objections are too tendentious to be decisive. The issue of whether types can be caused to exist is not settled by their being abstract; they are abstract because they have instances or tokens. Someone could claim that a type does not exist until at least one token of it does, or instructions for creating a token are present. In either case causing the token (or the instructions for making tokens) to exist in effect causes the type to as well. There are many types that it is plausible to conceive in these terms. Consider artifact types, one example of which is an automobile model. It is plausible that automobile designers bring this type into existence when they create the design for a car model. This plausible claim is deniable. It could be consistently maintained that the type Volkswagen Beetle would exist even if intelligent life had never evolved anywhere in the universe. Though consistently maintainable, the claim is implausible. Saying it is tendentious is perhaps an understatement. If this is true for car models, it would be equally true for literary and musical works. So one may perhaps set aside the second and third objections to the idea that indicated structural types are a kind of entity that can be brought into existence.

INDIVIDUATING ARTWORKS

What has been demonstrated thus far is that indicated structures are distinguishable from unindicated ones, and that the idea that they come into existence—indeed, are brought into existence—is, at least, plausible. However, there is a final set of objections to them that question whether they individuate musical and literary works correctly. Are such works always essentially tied to the precise times they are created, to their creators, and to their context of creation? This is what is denied by the final set of objections.

Look first at authorship. It may be true that Cervantes and Menard (had there been such a person) could not possibly create the same work. But imagine two contemporary writers, composers, or even painters who belong to the same school working at the same time. There are two different scenarios to consider. One occurs when both produce identical works. Suppose Mozart and Haydn had produced, independently of each other, identical scores for a string quartet in the year 1787. Would

they both have independently composed the same work? An alternative scenario can be created by supposing a possible world in which Haydn instead of Mozart composed a score identical to the score for Mozart's G major quartet K.387 and in which Mozart produced no such score. Would Haydn have composed in this possible world the same quartet that Mozart composed in actuality? Some people would answer yes to both of these questions; but, if that answer is right for either one, the identity of the artist *may not* be essential to the identity of the work. The first scenario does not raise a problem when it comes to painting because two numerically distinct painted canvases from the hand of different artists are different paintings even if they are indistinguishable. The second scenario, however, raises the same question for painting as it does for music or literature. In a possible world in which Braque rather than Picasso had painted a portrait of Gertrude Stein exactly similar to Picasso's actual painting, would Braque be the artist responsible for the work Picasso actually made (Currie 1988, S. Davies 2001)?

Something similar can be said about the time at which the work is indicated or brought into existence. Is this always an essential property of artworks? Some works seem to be tightly tied to their time of production. Hemingway's fiction is closely tied to the World War I generation. Picasso's *Les demoiselles d'Avignon* seems even more tightly tied to its moment of production. But consider traditional African sculpture from a particular region, some forms of traditional Chinese painting, or the naive work of an amateur artist, all of which may remain unchanged in style over many years. In these cases, it may seem plausible that the same work could be produced many years apart in different possible worlds. However, it seems possible that even those works that seem most closely tied to a moment in time might have been produced at slightly different times or, in special circumstances, very different times. Consider a possible world that duplicates the history of European art, but in which that whole history begins two hundred years earlier than it in fact did. In that world, Picasso paints *Les demoiselles* in the early eighteenth century (D. Davies 2003).

The contextual variable is perhaps immune to considerations such as those just raised about artist and time of production. Works from different eras, traditions, styles, or works made with different intentions will not be the same no matter how superficially similar they appear. This is an important point of the Menard example. Nevertheless, a case may be made for the possibility of the same work in different contexts by appealing to the idea

that slight differences in context in different possible worlds may still result in the same work. This is especially plausible if the specific difference in context would not make a difference to the creator of the work in question (D. Davies 2003).

This set of objections raises two broad concerns for the idea that musical and literary works are indicated structural types and that paintings are contextually identified physical objects. It raises objections to Levinson's specific proposal regarding the individuation of indicated structures, but it also questions whether any general formula appealing to any of the variables under discussion can individuate artworks correctly.

Before concluding that these concerns are correct, one needs to evaluate the objections on which they are based. Do the objections show what they set out to show? One problem with them is that they rely on uncertainties in human modal intuitions about artworks, which point more directly to epistemic rather than metaphysical possibilities. That is, in the face of the sorts of examples considered thus far, many individuals will be uncertain what to think, and so it will be epistemically possible, relative to their beliefs, that a certain principle of individuation is wrong. That, however, falls short of showing it is wrong.

Is there a way of sharpening intuitions to arrive at principles of individuation? Perhaps this can be done by getting clearer about what the Menard example and other similar examples reveal about structurally identical works. Cervantes and Menard had different artistic projects and, in pursuing these, each achieved (did) different things in their respective works. This pair of differences, concerning artistic project and artistic achievement, is crucial in individuating works and in identifying important artistic properties of them. In highlighting these differences, the analogy mentioned earlier between abstract sentence types and utterances—or, more broadly, sentences-in-use—is a helpful one to remember. The language user in question, along with the user's intentions, the time of utterance, and the context of use, all commonly contribute to fixing what the utterance conveys beyond or in distinction from the semantic content of the sentence. However, the precise role each of these items plays may vary in different uses of language. Further, it is possible for different utterances to convey precisely the same thing. Regarding artworks, something similar is true (Stecker 2003): They are individuated by being a specific abstract or concrete structure used by an artist in pursuing such and such a project and achieving so and so. Usually the three variables—identity of artist, time of creation, and artistic context—are crucial in constituting

projects and what they achieve, yet their exact role can vary in different art forms and different traditions, as well as for many other reasons. The emphasis on the artistic project and the artist's achievement recalls the idea that artworks are action types or tokens. However, those views identified the work with the wrong entity. As the indicated-structure view emphasizes, the artwork is the product that results from the project and embodies the achievement.

Robert Stecker (2005)

ART, PERFORMANCE IN

Some philosophers hold that the creation of art always involves performance, and that artworks are more accurately defined as processes or actions than as objects or events. This entry will consider the more traditional view that only some art forms—drama, music, dance, opera or musical theater, and “performance art”—involve performance.

Performances can be freely improvised. In addition to being judged for their general interest and skill of execution, such performances are rated as well for elements of spontaneity and risk. The performers make and coordinate their activities in real time, without knowing how their performance will continue or end. Though drama can be extemporized, jazz takes improvisation to its highest level. In the paradigm case, however, performance involves the live presentation and interpretation of a previously specified work.

THE LIVE PRESENTATION OF WORKS

Works for performance are often specified through a form of notation, such as a musical score or a script. The notation is addressed to the performer and prescribes what must be done or achieved if the work is to be faithfully performed. It may also contain recommendations that are not work-determinative, and that need not be followed. Features crucial to the work’s identity are not always mentioned in the notation, for instance, where they are dictated by practices and conventions that are taken for granted. The performer’s first act of interpretation occurs in following and understanding what is instructed in the work’s notation, if it has one, along with appreciating the background of performance practices and conventions that it assumes.

In oral traditions, works are transmitted verbally, not by notations. One or more suitably authorized performances are given the status of a model for further instances of the work. Just what in the model is work-specifying and what is merely optional is settled by reference to the work-and-performance traditions and genres within which the relevant piece is located. For example, although the melody in the exemplary performance is elaborately decorated, it might be understood that the manner of decoration is left to the performers’ discretion, as long as they respect limits set by the appropriate style. Or it might be understood that the choreography of a sword fight need not be aped in subsequent performance, though appropriate fighting actions will be required.

The actor’s, singer’s, or dancer’s medium is her body, along with costumes, props, and sets. For other musicians, their instruments are their media. When a work is designed for performance, its medium is usually crucial to its identity, since the medium affects and constrains what can be done by the performer. The artist’s instructions usually indicate both what is to be achieved and the medium or manner in which this is to be done. To perform a violin concerto, one should play the violin. Merely generating the appropriate sounds on a synthesizer (or a record player) does not qualify as performing the work.

Some works call for media that are not standard. Electronic compositions for live performance involve the use of microphones, sound generators, and the like. One of John Cage’s pieces was issued as a vinyl disk with instructions about how the settings of the hi-fi amplifier are to be modified as the disk plays. Hip-hop artists and sound appropriators take the recordings of others as source materials for their own works and, like Cage, turn the record player into an instrument of musical performance.

INTERPRETATION

Works that are for live performance are always ontologically thinner and more abstract than the concrete performances that instance them. If all the artist’s work-determinative prescriptions are faithfully followed, many aspects of the performance’s detail are not determined. The performer (or conductor/producer) resolves these uncertainties. The playwright might indicate that the actor is to say “Curse the gods,” but the choice of facial expressions, gestures, and bodily attitude, along with the tone, inflection, pitch, and volume of the voice, are usually left to the actor. Whether through deliberation or not, the delivery of the line in an actual performance inevitably will display a particular version of all these features.

In adding flesh to the skeleton that is the work, and thereby creating a living performance, the performer interprets the work. It would be misleading, though, to say that interpretation is something added by the performer after he or she has satisfied the work-determinative prescriptions of the artist, or to suggest that interpretation fills the gap between the work’s abstractness and its performance’s concreteness. The delivery of the work is not prior to or apart from the interpretative contribution, which is crucial at every point or moment. The presentation of the words of a play or the notes of a symphony is not separable from the manner and inflection with which they are presented.

Some works for live performance can be very spare, ontologically speaking. Songs are so, when specified only as a melody, sequence of chords, and verse and chorus. Very different interpretations can be consistent with the faithful presentation of such works. The thinner the work, the more the performer becomes the focus of attention and the more the evaluation of the performance concerns the performer's creativity and vitality, rather than the faithful delivery of the work. But even where works are very detailed, as are Mahler's symphonies or Shaw's plays, the importance of the performer's interpretative contribution cannot be overlooked. Indeed, complex works offer the performer wonderful opportunities for displaying her talents, because their realization is unmistakably demanding and they allow for interpretations that are subtle, rich, and multilayered. Some works, such as instrumental concertos, are intended to draw attention to the virtuosic performances they require.

If all live performances embody interpretations of their works, so do thoughtless, unplanned performances and mechanical ones learned by rote. In the normal case, however, the interpretation is planned by the performer who delivers it and reveals a considered vision of the work. Some performers concentrate on the work's progression from moment to moment, leaving the artist's design to ensure that the whole is satisfying. Other performers structure their efforts in terms of a conception of the work's overall structure. Some performers can describe the ideas that inform their interpretations, while others have a more applied, unarticulated knowledge of what they do.

An interpretation, once mastered, can be repeated. Different performances of a production of a play usually present the same interpretation. Yet a given performer can have more than one way of interpreting a given work. A performer with a long career often adopts a fresh approach when she returns to works she performed previously.

AUTHENTICITY AND INTEGRITY CONDITIONS

The purpose of a performance of a work is to present the work along with an interpretation of it. Such performances therefore presuppose a commitment of faithfulness to the work, or authenticity. Deliberate departures from the work undermine the claims of a performance to be of that work. Accidental errors and slips in performances need not prove fatal to the attempt at performance, however. A performance can instance a work because of its intent, and the work can be recognized in what is pro-

duced, despite the imperfection of its representation of that work.

There is disagreement about what faithfulness requires when questions such as the following are debated: Is it necessary to use boys rather than women when performing Shakespeare? Should Scarlatti be performed on the harpsichord only, and can its jacks be made of plastic instead of quills? If an eighteenth-century playwright specifies that his work is set in the present, should we use period costume or the clothes and milieu of the twenty-first century?

Such disagreements can reflect deeper differences of opinion about the ontological character of the works in question. Someone who thinks a musical work is merely a pattern of notes will regard any presentation that reproduces that pattern as faithful, no matter what means are used to produce it. But another who believes the work's instrumentation is also central to its identity will conclude that authentic performances must use instruments of the kind known to and specified by its composer. Differences between their ontological theories lead philosophers to draw the line between performers' legitimate liberty and illegitimate license in contrasting places.

There is another reason for conflict, though. Some people think that authenticity can be traded for interpretative interest. In other words, they do not regard the pursuit of faithfulness to the work as a paramount virtue in performances. As supporting evidence, they may cite the free approach sometimes taken to the interpretation of Shakespeare and of the most famous musical works and operas. It might not be coincidental, however, that works approached in this manner are very familiar to the established audience and that there is a concern to maintain their relevance for future audiences. In other words, the free approach to interpretation in these cases is not necessarily indicative of indifference to or disrespect of the work as such. Provided that audiences are interested in the works being performed, authenticity in performance cannot be reduced merely to another interpretive option.

Stan Godlovitch (1998) specifies the following conditions for the integrity of performances: only one work is performed at a time; its proper sequence is respected, as is the indicated rate of delivery; the performance is continuous, without unjustified breaks; performers comply with the appropriate roles (and do not, for example, swap parts midway through). Also, the audience is in a position to receive the entire performance in its detail. Not all of these conditions are satisfied in all performances. Nevertheless, these conditions are normative in that they indicate what is expected from a performance.

Activities not directed to an audience—practicing, rehearsing, learning, doodling—do not result in performances, according to these conditions. (In many cases, such activities have the goal of preparing performers for performances, however.) Other performance-like activities violate other of the specified conditions and are not exemplary for that reason. Music-minus-one disks and karaoke (as well as new technology, allowing a person to speak one of the roles in a movie) are examples.

STUDIO PERFORMANCES

Not all performances are given live. Some take place in studios and result in recordings or films. Studio performances have their own integrity conditions. The work's segments can be recorded piecemeal and out of order. A single performer can take many different roles in the finished product, as a consequence of multitracking or filming. The performer's inputs can be electronically modified. The projected audience is not present to witness the studio performance.

We accept studio performances of pieces created originally for live performances, such as recordings of classical symphonies or movies of Elizabethan plays. They may use some of the studio's resources, such as the possibility in film of moving seamlessly between different indoor and outdoor locations. But in general, they simulate live performances, and the artists involved are capable of giving live performances.

Some works are designed for studio performances. Rock recordings that sculpt sounds electronically in a fashion that could not be achieved in real time are examples. These are works for performance, but not for live performance. The same song can be recorded by another group, and the result is a new (studio) performance of it, not a different but a derivative work.

Yet other works are not *for* performance of any kind, though they involve studio performances in their creation. Most films rely on the resources of the studios (slow motion, flashbacks, stunts, digital editing, and special effects) and result in works that are for screening, not performance. Similarly, purely electronic musical works are for playback, not for performance, though performers might supply material that is integrated into the work. "Directors' cuts" result in new versions of movies, not in new performances, while remakes result in new but derivative works.

PERFORMANCE ART

During the mid-twentieth century, artists began to challenge traditional conceptions of artworks and the separa-

tion of art from life by using their own bodies as the medium for their works. They posed in public or structured some aspect of their lives in terms of an aesthetic goal; they lived in cages or staged happenings. Different strands of the movement featured bodily mutilation, sexual orgies, and primitive rituals, often intended to deliver a political or socio-sexual message. Some feminist artists embraced performance art for its liberating energy, but were sensitive also to the need to subvert the objectifying equation of women with their bodies. Performance artists have often integrated video into their artworks. The works of the French feminist Orlan display many of these features; they are films of the surgical alteration of her face to give it the features of famous art-historical beauties.

ART, REPRESENTATION IN

Pictures form a subset of the artifacts that serve to represent particular things or kinds of thing, real or imagined, in a broad inclusive sense of the term *represent*. Like some of their fellow representations, but unlike others, pictures go on to attribute properties to the things or kinds they represent—properties that thereby constitute their pictorial content. How does this work? What distinguishes the representing done by pictures—*depiction*—from the representing done by various other familiar kinds of representation?

PLATO AND PICTORIAL MIMESIS

Near the start of his case for banishing the poets from his ideally just city (Plato 1992, *Republic* X, 595a–598b), Plato urges that poetry and painting are analogous mimetic activities, structured so as to be able to imitate—approximately replicate—only a superficial and trivial part of the deep and serious things they profess to take as models. The argument employs a three-story metaphysics with Plato's Forms at the top, ordinary three-dimensional worldly particulars in the middle, and appearances (*eidola*, *phainomena*, *phantasmata*) at the bottom. Paradigm cases of appearances are shadows and reflections. Shifty, shimmery, and insubstantial, they owe such limited stability and stable apprehensibility as they to their owners, the three-dimensional worldly particulars from which they derive and to which they bear a real if limited resemblance. They therefore bear to worldly particulars many of the relations that worldly particulars are said to bear to the Forms.

The phrase “what S sees of X here and now” may be taken to refer to another appearance, another insubstantial something owing such limited stability and stable apprehensibility as it possesses to its three-dimensional owner X, the entity it manifests and imperfectly resembles. Such an appearance differs from a reflection or cast shadow in that it is attached to or embedded in its owner. In fact, it may be regarded as literally a part—albeit a

dependent and ontologically inferior part—of that owner.

Now painters and poets are mimetic artists, renderers. Painters undertake to render three-dimensional arrangements of physical objects and to do so on a two-dimensional surface, using as their medium line and color. Tragic poets undertake to render human agents engaged in spontaneous morally significant action and to do so on a stage before an audience, using as their medium the rehearsed movements and speeches of actors. One may take these renderers at their word when they say that they are out to replicate important worldly originals to the full extent it is in their power to do so. Still, what extent is that? Given the materials he must work in and the way he must manipulate these materials to count as a painter or poet at all, the most such an imitator can ever accomplish by way of replicating his original is to produce a second worldly particular almost entirely unlike the first except for possessing an exactly similar appearance. His would-be traffic in second-rate entities (worldly particulars) comes to no more than a traffic in third-rate entities (appearances). “Imitation is far removed from the truth, for it touches only a small part of a thing and a part that is itself only an image” (598b).

Add that what meets the eye (or ear) about an important or valuable object seldom if ever includes what makes it behave as it does or what makes it a good or bad thing of its kind, and one will have powerful reason for suspecting that the theoretically and practically decisive aspects of worldly particulars lie beyond the reach of the senses, hence beyond the reach of the particular media that make painters painters and poets poets. Echoes of Plato's reasoning abound in texts as recent as Susan Sontag's *On Photography* (1977).

Thinkers who reject Plato's metaphysics and his deprecatory attitude toward painting nevertheless often agree that depiction consists in the partial replication in a new and alien medium of a certain superficial aspect of the depicted thing's nature, something inherently capable of meeting the eye, call it the depicted thing's outward appearance. Such thinkers have various ways of embracing Plato's account of depiction's workings while avoiding his negative conclusions about painting's value. Sometimes they insist that depictive success is one thing and artistic success is something different and deeper. Sometimes they insist with Oscar Wilde that there is nothing superficial about surfaces.

There have always been dissenters, of course. One is René Descartes, who insists that engravings successfully

portray the things they depict as having lots of properties they could not possibly share with those things. Indeed, when it comes to objects standing at a great distance or whose accurate depiction requires foreshortening, “the perfection of an image often depends on its not resembling its object as much as it might” (Descartes 1985, *Optics*, Discourse IV, AT 113). Descartes thereby prepares his reader for the alarming thought that our most useful and reliable sense-based ideas resemble their originals as little as engravings do theirs.

GOMBRICH AND THE PURSUIT OF ILLUSION

A vast renewal of philosophical interest in depiction begins in the 1950s with the work of the art historian E. H. Gombrich. Like Hermann von Helmholtz, Karl R. Popper, R. L. Gregory, and others, Gombrich holds that the content of visual experience is produced in a kind of unconscious inference by the human visual system to the best available explanation of the available retinal stimuli. (The stimuli on which visual system inferences are ultimately based remain permanently out of introspective reach.) The conceptual resources a visual system may draw on in framing these hypotheses include any and all concepts available to its owner and the standards by means of which it assesses them are sensitive to the full range of beliefs, expectations, and practical priorities its owner brings to the task of seeing what is before his eyes. The beholder’s share in determining the content of his own visual experience is therefore substantial indeed; there is no such thing as *the* appearance a thing can possess when accurately seen from a particular physical viewpoint.

Only one particular kind of image, the *naturalistic* kind, is out to replicate an appearance taken on by a particular object in a particular context for a particular sort of appropriately prepared spectator. Naturalistic image making catches on only in particular cultural traditions at particular times. Images more generally are best conceived as substitutes for the things they depict, standing in for them in various forms of ritual and imaginative activity and sharing with them only the handful of specific properties, visible and otherwise, required for this special purpose. (Think of how a hobby horse stands in for a real horse.) In this sense, *making* (the production of substitutes) comes before and is more generally prevalent than *matching* (the production of objects designed to visually match the things they depict under appropriate objective and subjective conditions).

Consider a naturalistic image maker, out to capture some particular appearance of the particular object she is about to depict. Just as there is no way for her to set aside the effects of past encounters with other objects when it comes to trying to see this one accurately, there is no way for her to set aside the effects of past efforts to depict other objects when it comes to trying to render her depiction of this one appropriately responsive to how she now sees it. Instead she must rely on habits, routines, and formulas inherited from past image-making practice to give her a skeletal generic image of an object of the right general kind, which she then works over in a trial-and-error manner until she finally achieves a convincing likeness of this particular object. Naturalistic image making is a process of *schema and correction*.

Such small-scale explorations contribute to the larger-scale explorations conducted in image-making communities as they invent, refine, and promulgate redeployable techniques for appearance-capturing techniques based on hard-won empirical insights into how the human visual system works. Foreshortening, tonal modeling, and the various perspective systems are major inventions of this sort, but there are countless smaller ones: Think of Rembrandt’s readily imitated trick of suggesting the glint of gold braid with a few loose, broad dots and dashes of yellow paint. When and where the naturalistic project catches on in the first place, the history of art largely consists in the history of such progressive innovation. When and where it does not catch on, art may change over time, but not in ways that possess the large-scale narrative coherence historians demand.

The history of art ... may be described as the forging of master keys for opening the mysterious locks of our senses to which only nature herself originally held the key. ... Like the burglar who tries to break a safe, the artist has no direct access to the inner mechanism. He can only feel his way with sensitive fingers, probing and adjusting his hook or wire when something gives way. Of course, once the door springs open, once the key is shaped, it is easy to repeat the performance. The next person needs no special insight—no more, that is, than is needed to copy his predecessor’s master key (Gombrich 1961, pp. 359–360).

Gombrich’s relation to Plato is complex. When properly experienced, a successful naturalistic image partially replicates an appearance the depicted object is capable of taking on. But this appearance is not a superficial part of the object; it is an effect of the object on a particular spec-

tator made possible by the particular concepts and concerns he brings to the act of seeing. The artist devises her own means of achieving *some* of the effects the depicted object would have on a spectator's visual system if it were standing before him. But limitations inherent in her media—the restricted range of lights and darks available from her paints and inks, the manifest flatness of the surface on which she deposits these substances—ensure in advance that her replication of the object's appearance is partial at best. A depiction takes on the appearance the artist intends it to take on only if the spectator actively brings to his inspection of it the highly particular mental set the artist intends for him.

Still, and here Gombrich again sides with Plato, the experience the naturalistic image maker means to induce in the spectator is one in which it is for him as if he were seeing the depicted object face to face. This means he manages to neglect the lack of appropriate color (in drawings), the lack of appropriate binocular disparity (in full-color paintings of nearby objects), and so on. It also means that as the picture takes on its intended appearance for him, the content of his visual experience of the picture has less and less to do with the picture, and more and more to do with the thing depicted. He loses sight of the depiction in favor of the thing depicted, with the result that the specific devices by means of which the image maker induces the intended experience drop from visual awareness at the very moment they achieve their intended effect. Gombrich concludes that naturalistic image makers are inducers of illusion and that illusion obliterates its own conditions.

This illusion will be available to a given spectator only if he can approach the painting with its called-for mental set, hence only if he can readily identify this set and readily assume it without detailed instructions. Pictorial intelligibility is a special case of communicative intelligibility, depending on a rich, historically variable, culturally conditioned stock of expectations, assumptions, and conventions. In order to generate and disappear into an appropriate illusion, a set of marks must first be correctly interpreted as a communicative gesture on the part of the artist. Like Ferdinand de Saussure and Roman Jakobson before him, Gombrich holds that to understand any communicative gesture, one must view it as a choice from among a fixed range of available alternatives, owing its significance in part to the natural significance of certain dimensions of difference (darker tones are naturally taken to signal darker objects, more vigorous gestures to signal greater urgency), in part to the conventional fact that one is tacitly but publicly committed

to working within such and such a restricted set of choices (only these tones, only these gestures). To this extent, at any rate, art is a language, a system of signals resting on contingent and mutable conventions that must be internalized and respected by artists and audiences alike. All three main approaches to understanding depiction draw heavily on Gombrich's work, accepting some strands of it while rejecting others.

INTELLIGIBILITY ACCOUNTS

According to the intelligibility approach, pictures are distinctive in virtue of how one's ability as an audience member to make appropriate interpretive sense of them builds on and derives from one's ability as a perceiver to make appropriate visual sense of one's immediate physical surroundings.

J. J. Gibson (1971) holds that perceivers extract certain crucial elements of a picture's content (e.g., depicted recessions in depth) from features of the marked surface (e.g., texture gradients across that surface), using precisely the same methods they use to extract corresponding features of their real visual environment (e.g., actual recessions) from locally available features of the visual stimulus (e.g., texture gradients across one's visual field). Pictorial understanding is just routine environmental feature extraction applied to a special artificially contrived stimulus: a picture's marked surface. The proposal is closely bound up with Gibson's idiosyncratic account of ordinary visual perception, his environmental optics.

Flint Schier (1986) proposes that pictures exhibit a distinctive division of cognitive labor between the mastery of particular pictorial idioms and the ability to visually recognize a particular thing or kind when presented with it face to face. On the one hand, pictorial idioms possess *natural generativity*: every pictorial idiom is such as to make possible a picture so representative of the idiom as a whole that understanding this particular picture would suffice to confer a general competence with the entire idiom. On the other hand, the interpretation of any given picture P redeploys ordinary capacities for face-to-face visual recognition in such a manner that:

- (1) a general competence with the idiom employed by P, and
- (2) a capacity to recognize each of the particular things or kinds that P depicts (and each of the particular visually detectable properties and relations that figure in P's pictorial content)

are individually necessary and jointly sufficient for a given spectator to be able to understand P. As it stands,

Schier's proposal makes no allowance for the depiction of particular people that nobody could recognize on sight—Christ, for instance—nor does it allow for the large role collateral information plays in the correct interpretation of many pictures. Still, it feels like a first approximation to an important insight.

SEMIOTIC ACCOUNTS

According to the semiotic approach, pictures are conventional symbols in a richer sense than Gombrich allows. A *symbol system* involves syntactic rules that classify items as tokens of various permanently available symbol types, together with semantic rules determining what an object must be like if it is to *comply with*—be such that it could be accurately symbolized by—tokens of a given type. What differentiates pictures from other conventional symbols are distinctive structural features of the systems to which they belong and from which they derive their pictorial content—*pictorial symbol systems*.

Nelson Goodman (1976) never offers sufficient conditions for a system's being pictorial, but he declares that a system cannot be pictorial unless it is syntactically dense, semantically dense, and relatively replete. The effect of the first condition is to insist that there is no limit to how similar two pictorial symbol tokens can be while remaining tokens of distinct symbol types. The effect of the second is to insist that there is no limit to how similar two objects can be while remaining such that the accurate depiction of one and the accurate depiction of the other would require the deployment of two distinct symbol types, one for each. The effect of the third is to insist that a relatively large range of perceivable features of a given pictorial symbol token are relevant to determining its type. Yet depictions formed in the array of lights on a baseball scoreboard fail to exhibit any of Goodman's three features.

Commonly the most salient parts of a picture are depictions in their own right, depicting parts of the larger whole depicted by the bigger picture and arranged in a manner reflective of the arrangement in this larger whole of those depicted parts. This constitutes an interesting affinity between pictures and such manifestly conventional representations as maps and diagrams. Andrew Harrison (1991) infers from it that maps, diagrams, and pictures are conventional symbols, belonging to systems whose (compositional) syntax and semantics relate the part-whole structure of complex symbols to the part-whole structure of compliant objects in an especially simple and uniform manner. Yet while maps and diagrams often come equipped with keys explaining their simplest

individual significant components, full-fledged pictures do not and apparently cannot come with anything comparable.

EXPERIENTIAL ACCOUNTS

According to the experiential approach, Gombrich is correct in thinking that pictures operate by inducing a distinctive kind of experience, with the thing depicted figuring in the content of that experience. But he is wrong to attribute an illusionist phenomenology to the experience. Instead we should conceive it as a unitary experience, visual at least in part, whose content involves both the depicted thing and various visible features of the depiction itself. There are three main stories about how this goes.

Experienced resemblance theorists (Peacocke 1987, Budd 1993, Hopkins 1998) hold that when one experiences a picture appropriately, one visually experiences it as resembling the thing or kind of thing it depicts with respect to certain of the visually detectable properties possessed by each. Hopkins's version of the theory centers on a highly relational property known as outline shape. Begin with the cone of rays connecting visible points on the object's facing surface to a given perceiver's point of view. Take the intersection of that cone with a plane perpendicular to the perceiver's line of sight. The shape of this intersection is the object's outline shape for the particular perceiver in question. Hopkins is at pains to argue that despite the arcane way outline shape is defined, people are ordinarily implicitly visually aware of the outline shapes of things around them. He contends that whenever one experiences portion D of marked surface P as depicting object O, one visually experiences the outline shape of P (as seen from where one actually stands) as resembling that of object O (as seen from an appropriate hypothetical place).

The most basic kind of pictorial content accruing to pictures in any given idiom consists of resemblances to parts of the picture surface itself with respect to some fixed list of visually detectable determinable properties renderable in that idiom. The list always includes outline shape; it sometimes includes such further properties as local color and texture. One can call the properties on such lists *visual field properties*. Hopkins maintains that portion D of picture P depicts object O if and only if we are meant to experience D (as seen from here) and O (as seen from some appropriate hypothetical place) as resembling one another with respect to the visual field properties renderable in P's idiom.

Hopkins's indebtedness to the optical approach to picturing running from figures like Euclid in the ancient world to figures like Leon Battista Alberti in the Renaissance is obvious enough. Yet when I inspect the portion of Pablo Picasso's *Guernica* depicting a lantern carrier, I am acutely aware that its outline shape resembles that of a teardrop. (It is by making me aware of this shape and this fact about it that Picasso suggests the haste and strain with which the lantern carrier peers into a scene of carnage from a position outside and behind it.) Still, I do not see the relevant portion of *Guernica* as depicting a teardrop, aware as I am and am meant to be of the just-mentioned resemblance in outline shape. Moreover, I do not experience the lantern carrier's neck and head as having an outline shape resembling that of the portion of *Guernica* by means of which they are depicted—to wit, one very much like that of a teardrop. To do so, I would need to experience the lantern carrier himself as having a flat face and a neck tapering off to nothing—and I do not.

Richard Wollheim (1987) begins by noticing cases in which one's experience of a differentiated flat surface (a muddy wall or a frosty windowpane) involves two distinct aspects:

- (1) a *configurational* aspect, thanks to which one is visually aware (in a manner that is mostly veridical as far as it goes) of the surface itself and its variations in local color; and
- (2) a *recognitional* aspect, thanks to which one is visually aware of various robustly three-dimensional things, things that are not and are not believed to be before one's eyes at the time of the experience (battling horsemen, dancers in gauzy dresses).

These two awarenesses are distinguishable but inseparable aspects of a single experience, an experience of *seeing-in*: seeing the relevant three-dimensional things *in* the relevant surface. The configurational aspect can be described on analogy with a veridical simple seeing of a differentiated surface, which it resembles both intrinsically and in its characteristic causal-psychological role. The recognitional aspect can be described on analogy with a face-to-face seeing *of* the things one in fact merely sees *in* the surface. However, one can be aware of a differentiated surface in the particular manner exhibited here only by using the surface to discern absent three-dimensional things, and one can be aware of discerned absent things in the particular manner exhibited here only by being aware of a differentiated surface whose features enable one to discern them in it. In at least this

respect, (1) and (2) are inseparable aspects of a single experience. And although they can be described on analogy with the simpler experiences just mentioned, there is a sense in which a detailed point-for-point comparison between them and such simpler experiences is out of the question: seeing-in and the simpler experiences to which it is in various ways analogous are "phenomenologically incommensurate" (1987) Such, Wollheim thinks, is the *twofoldness* involved in seeing-in. A painting depicts a given subject matter when one is inferably meant to see that subject matter in its surface and can indeed do so.

Michael Podro (1998) takes over from Wollheim's early *Art and Its Objects* (1980) the suggestion that a pictorial representation proposes a kind of simile or figurative comparison whose terms are the marked surface D and the subject O. And he adopts from I. A. Richards an interactionist view of figuration, on which any really deep comparison restructures one's thinking about both terms, reshaping one's thoughts about each on the model of one's thoughts about the other.

On the recognitional side of things, Podro insists that for depiction to occur, it is not enough that one's inspection of D activates one's capacity to recognize O in O's acknowledged absence; one must exploit one's recognition of X in a sustained, successful effort to visualize O. On the configurational side, he insists that one's awareness of D is never simply an awareness of how D is differentiated (lighter here, darker there; redder here, greener there); instead, it is framed in terms of how one takes the artist to have made her marks and handled her medium. There are at least two departures from Wollheim here. There is now a difference in kind between the configurational aspect of seeing a subject in a picture and the configurational aspect of seeing a dancer in a frosty windowpane. And configurational awareness is no longer largely veridical; the impressions a painter's marks generate about the manner of their making may be as designedly fanciful as the impressions a dancer's movements generate about the manner of their making. Configurational and recognitional awareness restructure each other repeatedly as one searches O (the represented subject) for real or merely fancied counterparts of what one has already discerned in D (the way the surface has been worked) and vice versa.

If Wollheim views depiction as one of several modes of pictorial meaning, Kendall Walton (1990) views it as lying at the heart of one of several related forms of make-believe pervading the cultural lives of children and adults alike. A *game of make-believe* is a form of individual or collective imaginative activity in which what players are

to imagine comes under the sway of rules or norms of a certain special kind: given the rules of the game in question, what they are to imagine about themselves, the things around them, and reality at large (what is *fictional*) becomes a fixed function of what is actually and discernibly the case about them, the things around them, and reality at large (what is discernibly true). The rules of such games may be maddeningly difficult to state, yet people seem awfully good at playing them and awfully invested in doing so.

Walton proposes in effect that a depiction D of an object O is a prop in a game of make-believe whose role in the game to which it belongs has the following features:

- (1) The player is to look at and thereby come to see the object D
- (2) He is to imagine about his act of looking at D that it is instead an act of looking at O, and about his resulting experience of seeing D that it is instead an experience of seeing O
- (3) He is to manage the foregoing lookings, seeings, and imaginings in such a manner that he imagines *looking at and thereby coming to see* O—and imagines it both (a) vividly and (b) from the inside
- (4) The game leaves him free to look at D in any of a wide range of ways, tending to result in a correspondingly wide range of experiences of seeing D
- (5) How he is to imagine himself looking at O depends in a richly detailed manner on how he actually ends up looking at D, and the nature and content of the experience of seeing O he is to imagine having as a result depends in a richly detailed manner on the nature and content of the experience of seeing D he actually ends up having

Even the most naturalistic images continue to function as Gombrichian substitutes. When such a game is played, the called-for imaginings are such that they could not take place in the absence of the called-for perceivings, since they are about those perceivings, take those perceivings as their objects. It is equally true that the called-for perceivings could not take place in the absence of the called-for imaginings, since the perceivings involved in the execution of any demanding exploratory project are colored by it, owe their phenomenal character to it, and contain thoughts specifying its goals. This suffices to account for our sense that a spectator's visual experience of a picture is a unitary experience with two different kinds of subject matter: the depicted thing on the one hand, the depiction itself on the other.

THE FUTURE OF DEPICTION THEORY

In the last years of the twentieth century, the perceptual hypothesis account of vision favored by Gombrich lost ground to the modular computational account advocated by David Marr (1982). Many now regard vision as the computation of an accurate spatial model of one's immediate physical surroundings, from raw data about intensity distributions across the visual field, via a fixed set of speedy unconscious algorithms that provably deliver the goods in all but a special and statistically rare set of working conditions—algorithms having no access to the higher recognitional capacities of the person who steers through the world with their help. The various mathematical representations computationalists must appeal to in dividing the task of vision into manageable subtasks turn out to bear striking structural affinities to various familiar kinds of picture. The work of Michael Baxandall (1995), John Willats (1997), and Patrick Maynard (2005) constitute the beginnings of an effort to make principled sense of the whole range of psychologically natural pictorial idioms (and the uses and limitations of each) in a manner informed by emerging computational accounts of vision. What impact these emerging accounts of how pictures differ will eventually have on the best philosophical accounts of how pictures are alike it is too soon to tell.

ART, STYLE AND GENRE IN

Style and genre are two distinct but related ways in which artworks can be grouped together in the interests of understanding and appreciation. Neither mode of classification is easy to characterize, and much of the philosophical discussion of both genre—predominantly by literary theorists—and style—predominantly by historians and philosophers of the visual arts—has been clarificatory in aim. In the case of genre, there is a tension between structural (e.g., ode, epic, and collage) and functional (e.g., tragedy, romance, and altarpiece) ways of cat-

egorizing artworks. But many genres seem to have more to do with subject matter (e.g., bildungsroman and still life)—at least in those art forms that are broadly representational. The diverse bases for generic classification of artworks are reflected in René Wellek and Austin Warren's proposed definition of a literary genre as "a grouping of literary works based, theoretically, upon both outer form (specific metre or structure) and also upon inner form (attitude, tone, purpose—more crudely, subject and audience)" (1949, p. 231).

A much discussed theme in contemporary discussions of literary genre is whether the latter is merely a taxonomic convenience, reflecting the classificatory interests of literary critics and historians, or whether it reflects real differences between works. Certainly, the ascription of a work to a genre sometimes plays a part in explaining puzzling features of that work. For example, the art historian Michael Baxandall (1985) accounts for puzzling features of a Renaissance painting in terms of its belonging to the genre altarpiece. This seems to require an objective basis for genre classification. One can explain features of a work by appeal to genre only if one takes the genre to which the work is ascribed to be causally implicated in its generation—presumably in virtue of the artist's creative activity being guided by a conception of relevant generic constraints.

While genre is predominantly a critic's term for which art historians sometimes have a use, style is traditionally a historian's categorization whose critical and appreciative relevance has been increasingly remarked. Originating etymologically in the Latin term for a writing instrument (*stilus*), and thus applying to styles of writing, the term came to prominence in the writings of eighteenth- and nineteenth-century German art historians such as Johann Joachim Winckelmann. Art historians seek to historically situate individual works in groupings that are open to analogous kinds of explanation and to explain how such works so grouped stand in historical relations to one another. Style serves the first purpose inasmuch as an artistic style is taken to be a manifest feature of works that provides evidence as to their provenance, and the second if one posits an internal or external dynamics to the development of style.

Perhaps the most enduring testament to this tradition in art history is Heinrich Wölfflin's (1950) account of how painting in the High Renaissance differs from Baroque art in its style of pictorial representation. He introduces certain binary distinctions that provide a framework within which one can define different ways in which one might articulate pictorial space. The most

influential of these distinctions is between linear and painterly modes of representation and is defined in terms of a number of interrelated factors such as the way in which form is articulated (through outlines of masses or interplay between masses), the qualities of things through which they are represented (shape or texture), the manner in which relationships between objects are conveyed (atomistically or holistically), and the faculties through which pictorial articulation is primarily grasped (understanding and sensation).

Once one thinks of artworks as being groupable in terms of their styles, it is natural to ask why this is so and why such styles change over time—why, for example, late Renaissance and Baroque paintings differ in the cited ways. Wölfflin (1950) himself posits an internal logic underlying the historical development of artistic styles. His distinctions are taken to capture the various representational possibilities permitted by the artistic medium, and communities of artists are seen as pursuing their artistic goals within this framework of possibilities, which has within it its own dynamic. Wölfflin's account is interestingly but controversially extended to nonrepresentational painting by Clement Greenberg (1962), who sees an oscillation between linearity and painterliness in the postimpressionist tradition. A related idea is found in Arthur Danto's (1964) conception of the "style matrix." Alois Riegl's notion of *Kunstwollen* also manifests a commitment to an internal dynamic in the development of artistic style. On the contrary, James S. Ackerman (1962), reacting against the whiff of stylistic determinism in such accounts, offers an individualistic model where artistic styles change as a result of the attempts of artists to overcome problems arising in the activity of painting. Ernst Gombrich (1968) offers a more materialistic but still broadly individualistic model in which stylistic change is fueled by technological innovation and guided by the social structure of the art world.

As in the case of genre, some question whether the stylistic classifications employed by art historians reflect independent realities of the sort that both call for and furnish explanations, or whether they are taxonomic devices that reflect the culturally inflected interests and purposes of historians. A related concern is that, to the extent that style categories are viewed taxonomically, they are of questionable relevance for one's critical and appreciative engagement with particular artworks. In an influential paper, Richard Wollheim (1979) argues that the concept of style plays two importantly different roles in discussion about visual art. Wollheim distinguishes between general and individual style. The former, which

he subdivides into universal style, historical or period style, and school style, is indeed taxonomic in the manner just described. Individual style, however, is what is at issue when one talks of "the style of A" in reference to the work of a given painter A. Those painters whose works are objects of aesthetic interest have "a style of their own," which allows their works to be understood as expressive.

Furthermore, and crucially, individual style is to be understood in generative rather than taxonomical terms: a style description for a painter A picks out elements in A's work that depend on those "processes or operations characteristic of his acting as a painter" that Wollheim terms *style processes* (1979, p. 135). A style process is analyzable in terms of some subset of the pictorial resources available to a painter on which the painter is disposed to act in a rule-like manner. Individual style, so construed, has "psychological reality" in these dispositions of the artist and can be seen as causally operative in the production of the artist's works. Wollheim argues for this generative conception of individual style on the grounds that it is required to make sense of the role played by style descriptions in the explanation of the details of pictures and of the susceptibility of the works of a given artist to grouping in terms of a common style. While Wollheim explicitly restricts his account of individual style to painting, the notion has been extended to literary artworks and, by implication, to artworks in general in two articles by Jenefer Robinson (1984, 1985).

In extending Wollheim's analysis Robinson also insists, in line with an early paper by Kendall Walton (1979), that an artist's individual style is properly identified not with some set of manifest features of the products of the artist's "artistic acts" (Sircello 1975), but with features of those acts themselves, "[Pictorial] style ultimately cannot be defined as a list of pictorial elements but rather as a way of doing certain things, or manipulating pictorial elements" (Robinson 1981, p. 10). In the case of literary works, for example, the relevant artistic acts are "*describing* people, *portraying* landscape, *characterising* personal relationships, *manipulating* rhythms, *organising* patterns of imagery, and so forth" (Robinson 1984, p. 138). Furthermore, these ways of doing things, insofar as they constitute an artist's style, are taken to be characteristic expressions of the mind and personality that the artist appears to have. This agential conception of individual style accords with talk of style in nonartistic contexts and explains both the restriction of style predicates to human actions and their products and the explicitly expressive nature of many style predicates (e.g., a sentimental or witty style). As for those sets of elements

proper to a given art form that are cited as constitutive of style by those who take the latter to reside in the products of artistic activity, Robinson maintains that they are grouped together as stylistic elements only in virtue of being the elements that the artist characteristically uses in performing the relevant artistic acts in a distinctive way.
