The interest in culture and solidarity or social reproduction aligns Gramsci's thinking with Émile Durkheim. Hegemony might be viewed as a parallel for *conscience collectif,* and like Durkheim, Gramsci views socialism as a better way to organize modernity, with the difference that Gramsci insists on viewing the new order as a proletarian order. The image of the subaltern classes becomes increasingly significant in the *Prison Notebooks,* 15 years after his conciliar period after World War I. The subaltern classes indicate to Gramsci the ongoing pertinence of the peasants, or of precapitalist modes of production in modernity. Gramsci rejects the Eurocentrism of other period socialists, for whom the peasants were part of the problem, and only the revolutionary proletariat could be its solution. In *The Southern Question* ([1926]1995), Gramsci makes clear his insistence that the world-system plays itself out locally in the exploitation of Southern Italy by the North. Underdevelopment is built into capitalism, or modernity; Marxists henceforth must frontally address this problem, rather than seeing the future of a modernizing proletariat as an alternative bourgeoisie, or even as joining in a new historic bloc with the bourgeoisie and against the peasants. Yet Gramsci remains a modernizer, as well as a populist. Though Lenin and Trotsky enthused for Taylorism, Gramsci is the first Marxist to develop a stronger argument for Fordism as a social model, an image of new society, a new culture as well as a new political economy. Italy had its

own avant-garde, and its own futurism, its own automotive and industrial revolution with Fiat rather than Ford at the forefront. Gramsci wanted more of this, not less. He was a modernizing Marxist, but one who retained a sense that the modernity of the cities needed to take the peasants with it. Like the contradiction between democracy and bolshevism in his political thought, these contradictions in his sociology were never resolved.

GRAPH THEORETIC MEASURES OF POWER

Power is a topic of long-standing interest in sociology, and its nature, causes, and consequences are approached through a variety of theoretical perspectives. A particularly fruitful definition, attributable to Max Weber, treats power as the ability of individuals or collectivities to exercise their will over another, even against the will of the other.

Graph theoretic approaches to explaining and measuring power have attracted significant interest due to their conceptual precision and predictive accuracy in experimental tests. Graph theory is a branch of mathematics that focuses on properties of graphs, which it defines in terms of sets of points and lines, or *vertices* and *edges,* respectively. This makes it very useful for the description and analysis of social networks that typically represent social actors (individual or collective) as points or *nodes,* and their relationships (directed or nondirected) as lines or *ties.*

In general, graph theoretic measures of power determine the relative levels of power for each position in a network. They do so by taking into account certain attributes of the network structure and aspects of a position's location in that structure. This is in contrast to more individualistic approaches to power that focus on attributes of actors such as personal charisma or negotiation skills.

Graph theory provides methods for describing and deriving a wide array of network structural properties. Some of these properties are quite simple and intuitive. For example, the *geodesic* between two points is simply the minimum number of ties that separates them; the *indegree* of a network node is the number of its ties from other nodes; and the *density* of a network is the ratio of the number of existing ties to the number of possible ties. At the other extreme, some graph properties are much more complicated and esoteric. However, theories of power in social networks usually employ relatively simple graph theoretic measures.

There are two important precursors to graph theoretic approaches to power: measures of *prestige* and measures of *centrality.* Prestige measures usually entail directed ties, for example A → B. Prestige may be assumed to accrue to one who is chosen by many others, such as to a person who is a key source of information. More sophisticated measures account for an actor's prestige in terms of the level of prestige of the actors who select him or her.

In contrast to prestige measures, centrality measures are designed to capture the degree to which a given actor is well connected to the rest of the network. These measures typically employ nondirected or mutual ties. Similar to the case for prestige, more sophisticated measures may be designed to take into account the centrality of not only the focal actor, but also the centrality of actors with whom the focal actor has ties.

Because power is not identical to centrality or prestige, it stands to reason that it is not measured the same way. Even if we suspect that centrality is essential for power, it would not make sense always to equate them. For example, while being tied to others with high centrality may raise one's own centrality, being tied to others with high power may diminish one's own power.

Graph theory does not specify which network properties and measures may be useful for detecting power. Such directives must come from substantive theories of power. Moreover, any theory of power in networks must have certain elements in addition to graph theoretic measures (or measures based in any other logical or mathematical system) in order to generate hypotheses that are testable in social settings.

The relationship between network exchange theory (NET) and its graph-theoretic power index (GPI) illustrates the foregoing point. Although several theories employ graph theoretic methods to explain power phenomena in exchange networks, NET is among the most explicit and thoroughly tested. First, NET includes definitions for its key terms, imbuing with sociological relevance the abstract concepts it borrows from graph theory. For instance, the notion of a *graph* containing *vertices* connected by *edges* is implemented as a *network* containing *positions* (occupied by *actors*) that are in *exchange relations* with one another.

Second, NET includes provisional *scope conditions* that describe and delimit properties of the actors and social

exchange settings to which the theory's authors are willing to commit the theory at a given stage of its development. In this case, the scope conditions specify the kinds of shared norms or rules that govern negotiations between actors in positions linked by network ties. For instance, the theory may be applied to "resource pool" networks wherein a certain number of resource units are associated with each potential exchange relation, and the two relevant actors may negotiate the allocation of resource units within a specified period of time. The pool is replenished at the start of each new exchange period, permitting the analysis of sequences of exchanges having long-term consequences.

Third, the first of several axioms in NET specifies the procedure used to calculate GPI for each position in the network. The procedure is an algorithm for tallying each position's direct and indirect ties. Each position's advantageous paths to other positions, both direct and indirect, add to its GPI; disadvantageous paths subtract from its GPI. Once these values are calculated, additional axioms determine whether the network will remain intact and, if not, what the new GPI values will be for positions in the smaller networks that emerge.

Finally, the last of NET's axioms asserts that relative GPI values will translate into relative accumulations of resources obtained through negotiation and exchange. This completes the bridge from the abstract realm of graph theory to the concrete realm of observable phenomena and testable hypotheses—a bridge that any graph-theoretic measure of power must build in order to make a contribution to sociological theory.

GREEN MOVEMENTS

GREEN MOVEMENTS DEFINED?

The diversity of stances on green movements makes a unitary definition problematic. For present purposes, however, green movements are collective actors engaged simultaneously in conflictual contestation and cooperative capacity building informed by ecological and environmental paradigms. The conflictual spheres engaged with are diverse, including economics, formal politics, social relations, culture, gender, science, and technology in relation to the organic realm most frequently referred to as nature. The primary issue focus of a movement combined with its prioritised mode of engagement result in a highly differentiated green movement milieu. This has been theorised as a number of discrete single issue movements engaged in specific conflicts and as a network of networks (Melucci 1996). The notion of a network of networks provides a means of articulating the diversity of movements engaged within a domain where cooperative capacity-building activities take place. Capacity building here is understood as the cumulative potential of green movements to define, formalise, and mobilise social force around ecologically and environmentally defined stakes within specific spheres of engagement. This is a historically constituted process incorporating sources of green critique formalised and engaged with since the nineteenth century and earlier (Wall 1994).

AN ANATOMY OF GREEN MOVEMENTS

Green movements became theoretically important as one of the "new" collective actors to emerge from the constellation of protest movements of the 1960s with theoretical implications for approaches towards transformative social actors. Throughout the 1970s, green movements assumed a variety of forms, including formal political parties seeking electoral recognition such as the U.K. Green Party and Germany's Die Grunnen; mass membership campaigning organisations such as Greenpeace and Friends of the Earth usually known as social movement organisations (SMOs); and more loosely organised movements lacking formal membership structures like the 1970s antinuclear movements. In advanced industrial societies, these movements coexisted with long established organisations focussed on "conservation" of the "natural environment" by intervening through formal channels such as planning inquiries and political lobbying (McNaghten and Urry 1998). Green movements marked a shift to a wider range of interventions, including the pursuit of media coverage, often utilising direct action to heighten the profile of "green" concerns within the public sphere. Significant cleavages shaping the green movement milieu included debates between those advocating alternative trajectories, for example, alternative technology and those emphasising the need for more fundamental changes in consciousness, values, and the economic order. Gender represented a further significant divide, with the eco-feminist movement emphasising the centrality of patriarchal political, economic, scientific, and military institutions in subordinating and exploiting both the "natural" and social order.

Throughout the 1980s, the consolidation of neoliberalism in the United Kingdom and United States coincided with the inclusion of prominent environmental issues, particularly climate change, within the global political arena. Following the demise of Soviet communism, green movements were identified as the most significant ideological challenge to the resultant neoliberal orthodoxy. The UN-sponsored Rio Earth Summit of 1992, which endorsed sustainable development, biodiversity, and rain forest protocols, has been theorised by Maarten Hajer in terms of the ascendancy of the green agenda, marking a transition to ecological modernisation and as the global capture of the green movement and the influential "think global, act local" philosophy by Klaus Eder. The subordination of the measures adopted at Rio to economic global regulatory regimes pursued through the General Agreement on Trade and Tariffs (GATT) and consolidated through the successor organisation, the World Trade Organization (WTO), became prominent within a more globally engaged green movement increasingly aware of connections between environmental and social justice (Harvey 1996) through increasing links with indigenous peoples' movements in the developing world and the engagement of people of colour with environmental issues, particularly toxic waste disposal in the United States.

The increasing engagement of 1970s movement actors within formal political and regulatory initiatives at both national and global levels during the 1980s coincided with the emergence of a second wave of modern green movements lacking formal membership structures. Earth First!, an American movement emphasising direct action, was the most prominent example, quickly spreading to other industrialised nations (Wall 1994) and hybridising to create a diverse direct action milieu widely theorised in terms of identity, neotribalism, culture, and reflexive subjects. This marked a major shift in the tactics and level of engagement of green movements. Tactically and strategically, the adoption of direct action repertoires represented alienation from and skepticism about formal political initiatives in the environmental arena. Whilst green movements had hitherto engaged with relatively macro level issues such as global warming, and high prestige modernist technologies such as nuclear power, mundane features of modernity such as road building, shopping malls, and airport locations became increasingly contested. Activist engagement in these areas increased contacts with sections of local communities opposed to contested developments reemphasising work on community activism and cross class alliances.

GREEN MOVEMENTS AND DEVELOPMENT

The 1980s diversification of green movements within the developed world coincided with the rise of environmentally engaged indigenous peoples and workers' movements responding to modernisation agendas pursued under the auspices of the International Monetary Fund (IMF) and World Bank (WB). Here, rain forest clearance, high-impact infrastructure developments, genetically modified seed programmes, the assertion of trade related intellectual property rights (TRIPs), and the consolidation of free trade zones, notably the North American Free Trade Agreement (NAFTA), were prominent. In the developing world, these movements represented the simultaneous development of class relations and environmental engagement as wage relations and forms of substantive rationality displaced tradition. According to the late Chico Mendes, a Brazilian rubber tapper simultaneously pursuing trade union recognition and rain forest protection, support from Northern green movements played a crucial role, signifying the emergence of a global civil society. Feminist and eco-feminist analyses have focussed on the linkages between the developed and developing countries in terms of gender issues (Mies & Shiva 1993). In Mexico, the Zapatistas' resistance to the impact of NAFTA, in conjunction with a range of movement actors from around the world, was influential in consolidating what became known as the Anti-Globalisation Movement. By 1996, the initial conflictual agenda of this movement, the contestation and disruption of global economic and political fora, had been formalised and the 1999 Seattle meeting of the WTO targeted as the first such engagement. Theoretically, the increasingly networked nature of green movements elevated debates on the importance of civil society and particularly the emergence of a global civil society to a position of prominence with Castells (1997) arguing that neoliberal ascendancy unifies the movement milieu around a common opponent.

THEORETICAL STAKES AND ISSUES

The significance of green movements within social theory is a contested area structured around a number of key questions, which are addressed from a range of perspectives. Key here are the following: Is there a unified green movement or a number of green movements constitutive of a wider movement milieu? If there is a single unified green movement, how is it constituted as a coherent collective actor? What is the relationship between green concerns over the "organic" and social realms? Do green movements represent reformist agents of modernisation or a systemic source of critique and transformation incompatible with capitalism?

In terms of social theory, these and other issues have been engaged with across the sociological canon, invoking a wide range of philosophical traditions and debates. Given the engagement of green movements with environmental concerns, the dominance of the natural sciences in this area and the historic tendency for the social sciences to metaphorically appropriate key concepts and methodological

means of engagement from the natural sciences (Urry 2003), tensions between modernist and postmodernist approaches have become increasingly prominent. Here postmodernist critique and rejection of all foundationalist knowledge claims are particularly significant as green agendas were initially defined by Western technocratic expert-driven discourses operationalised through the global regimes mentioned. From the 1990s, the question of whether existing theoretical concepts and methods were adequate to address the global arena within which green movements situate themselves assumed increasing importance. The new divides introduced resulted in a range of competing stances with little prospect of any unifying theory to date.

THE VARIETY OF GREEN MOVEMENTS

Environmental and ecological paradigms exert a major influence on green movements. Environmental paradigms prioritise technological solutions to environmental problems identified and defined through substantive scientific rationality granting primacy to human interests and needs. An early formulation of this position can be found in the American human exceptionalist paradigm (HEP). Ecological paradigms, by comparison, include the impact of human societies upon the organic realm, questioning wider society/"nature" relations, arguing that human activities should be constrained to secure the integrity of the biosphere. The new environmental paradigm (NEP) formalised this position within American sociology. European approaches toward these paradigms emphasise the ontological status of individuals focussing particularly upon issues of consciousness founded in ego-based and transcendent forms of self with implications for the kinds of material, social, and cultural issues formalised and the resultant axes of social and movement solidarity (see Fox 1990).

THE SOCIAL ORIGINS OF GREEN MOVEMENTS

Two major theories accounting for the origins of green movements in advanced industrial societies were advanced during the 1970s. The notion of a counterculture was introduced by Theodore Rosak. The emphasis on culture and a shift in consciousness were developed in a variety of ways, with Ronald Inglehart's notion of a transition to postmaterial values being particularly influential. Whilst countercultural stances emphasised the role of youth in movements at a time when generational differences were considerable, work on value shifts associated with environmentalism extended beyond a particular generation revealing marked gender, age, and occupational class profiles. The transition to postmaterial values was, however, conditional upon an affluent life style associated with the middle classes.

Following World War II, the increasing prominence of the middle classes arising from significant changes in occupational structure and educational provision within advanced industrial societies resulted in Marxist-based analyses identifying a New Left. The American civil rights movement, the anti-Vietnam War movement, and events in Paris in 1968 directed theoretical attention towards the emergence of new collective actors constituted around race, gender, student, peace, and environmental movements. Members of the Frankfurt School (notably Marcuse and Habermas) were central in arguing that marginal groups in society now had transformatory potential irrespective of capitalist society's ability to absorb protest through repressive-desublimation. Claus Offe provided a coherent account of the relationship between class structure and the emergent green movement in Germany, identifying a coalition of decaying classes—the peasantry, propertied land holders, and sections of the urban middle classes, particularly those employed in service sector locations distant from the point of direct production. Offe's schema applied particularly well to Germany and France but less directly to countries where a residual peasantry no longer existed, underlining the importance of specific national characteristics in the expressive form taken by green movements.

In Germany and France, urban middle classes identified a range of quality of life issues organised at a community level, becoming particularly influential in Germany at the federal level of the state. The centralised nature of the French state confined the impact of the French green movement on the formal political system to the local level. In all industrial societies, environmental issues assumed prominence through developments in knowledge production as new technologies and techniques contributed to a rapid growth in environmental science. The rise of green movements occurred during a set of intense expert-led debates on environmental issues and their relation to human activity, with nuclear energy being prominent (Welsh 2000).

This period coincided with consolidation of the main environmental SMOs and Green Parties mentioned earlier. Friends of the Earth and Greenpeace both formed in 1969 in the United States and Canada respectively. The British Green Party formed in 1973 whilst the German Die Grunnen emerged following fragmentary electoral successes between 1977–1980. The institutional consolidation of elements of the green movements can be seen as a test of classical pluralist models of interest representation, though there is no consensus on the success or otherwise of established social and political systems to accommodate these interests. Membership and electoral support for green parties has fluctuated widely, and political representation is largely dependent upon the presence of proportional representation. The European Union thus has a small caucus of green MEPs, and Die Grunnen were influential in the German coalition government, which formally announced the end of nuclear power. Whilst green movements are widely regarded as socially and politically progressive, it is

important to recognise the existence of extreme right-wing green movements and parties within advanced industrial economies. The end of Soviet communism witnessed the rise of eco-nationalist movements in countries previously, with the CCCP adding a further dimension to such expressions (Tickle and Welsh 1998).

MODERNITY, POSTMODERNITY, AND GREEN MOVEMENTS

Postmodernism's rejection of metanarrative and foundational knowledge claims fundamentally challenges the modernist environmental paradigm. In particular, the idea of science as a prioritised form of green knowledge, notions of a single unified green movement, linear modernist progress, and arguments about the social importance of "simulacra" and "hyper-real" phenomena generated through increasingly sophisticated electronic media challenged ideas of an organic domain existing as an unmediated reality. Niklas Luhmann's work, with its emphasis on self-regulating or autopoietic systems, was particularly influential in theorising green movements and postmodern politics. The postmodern emphasis on consumption and social identities based on life style were influential in at least two ways. First, notions of identity and life style politics were applied to the increasingly hybrid green movements merging environmental, cultural, and social protests that emerged from the 1980s onwards. Second, notions of ethical and green consumption gained prominence as consumer demand and life style choice were presented as adjuncts to the green business movement. The postmodernist arguments about self-regulating hybrid social forms whilst sharing many points of contact with the ecological paradigm, particularly an emphasis on the local and difference, rejected the prioritisation of ecological systems, with Bludhorn postulating the emergence of a postecological politics.

Ulrich Beck and Anthony Giddens' reflexive modernisation theories—the critical realignment of modernity—were a response to postmodernist positions emphasising the importance of risk and trust relations. Here, green movements are central to the realignment of the otherwise runaway juggernaut of modernity as knowledge becomes a key resource and means of mediating the relationship between the present and future with unavoidable moral and ethical dimensions. Green movements combined with a more critical approach to knowledge, particularly scientific knowledge, in conjunction with increased public awareness of risk through media intervention, are thus regarded as key agents of social change. In terms of the anatomy of green movements sketched here, the key issues are shaped by the publics and movements that gain expression through the process of reflexive modernisation. In particular, these issues are shaped by problems such as what kind of gendered,

ethnic, and North/South balance is achieved, and questions such as whether a reflexive capitalist modernity is compatible with sustainable futures (see McKechnie and Welsh in Dunlap et al. 2002).

Whilst the place of green movements within postmodern and modernist theorisations is widely regarded as incompatible, it has been argued (Lash and Urry 1994; Urry 2003) that the issues posed by postmodernist accounts constitute global material forces, characterised as flows in a set of exchange relations increasingly organised around symbolic or "sign" values. Here, green movements represent both a material and symbolic challenge to established social and political systems as the bearers of a cultural politics with sufficient liminality to exercise a critical reflexive project. The consolidation of the alternative globalisation movement (AGM) through proactive networks such as Peoples Global Action (PGA) and World Social Forum (WSF) from the mid-1990s onwards serves as an exemplar of these processes indicating the increasing engagement of green movements at the global level. From this perspective, green movements are an example of a Meluccian "antagonistic movement," challenging what is socially produced as well as the goals and direction of development at both a high level of abstraction and via concrete contestation around specific sites. As a "planetary action system," the conflictual and capacity-building activities of the AGM thus renders visible the functional and dysfunctional implications of global neoliberalism as an economic, political, and social system articulating environmental, ecological, and social justice movements as a network of networks.

Ultimately, green movements engaged from both environmental and ecological paradigms raise issues of interest representations that established theories of social and political systems are ill equipped to address. The primary sociological focus upon the interests of extant individuals coordinated as collectivities within discrete societies and nations is ill equipped to address intergenerational issues and transboundary flows, with consequences for individuals not yet born. Here, Barbara Adam's (1998) work on the importance of the temporal dimensions of environmental change provide one means of engagement. The recent move to global contestation by green movements, the use of computer-mediated communications, enhanced spatial mobility, and the adoption of network forms resonates strongly with analytical themes central to complexity theory which seems set to become a key theoretical resource for twenty-first-century social science and the study of green movements (Urry 2003).

H

HABERMAS, JÜRGEN

Today, Jürgen Habermas (b. 1929) is the best known representative of critical theory or the Frankfurt School. At the center of his theory of modernity is the explication of a twofold concept of society combining action and system theory. Two forms of integration correspond to these paradigms in social theory: social and system integration (Habermas 1981:223ff.). Mechanisms of social integration refer to orientations of actors constituting the societal order of values, norms, and communicative process. In contrast, market exchange and power as mechanisms of system integration transcend the orientations of actors and integrate nonintended contexts of action through functional networks. Whereas socially integrated interaction remains at least intuitively understandable for actors and can therefore be captured meaningfully, system integrated contexts lie beyond the self-explication of actors and can only be explained from the point of view of the observer.

Hence, two concepts of society can be assigned to these mechanisms of integration: The central idea of social integration points in conjunction with communicative action to the concept of the *lifeworld.* In contrast, system integration refers to the concept of a boundary-maintaining system that connects consequences of social action functionally. However, it is always the same one and only society that is described by these diverging categories. From the internal point of view of actors, society is seen as a sociocultural lifeworld, while from the observer's point of view, it is regarded as a social system. By means of this conceptual duplex, Habermas describes all kinds of societies as systemically stabilized contexts of socially integrated groups.

For Habermas, a differentiation of lifeworld and system has developed in the process of social evolution. In primitive societies, social and system integration are closely related, while in the course of societal development, the mechanisms of system integration become disconnected from social integration. With the transition to modernity, these two principles have become largely separated. In contemporary societies, lifeworld and system exist in opposition to each other.

Private sphere and political-cultural public represent the institutional orders of the lifeworld. In these primarily socially integrated areas, the symbolic reproduction of society takes place (i.e., the tradition and innovation of cultural knowledge, social integration, and socialization). Therefore, symbolic reproduction not only represents just one but several functions which modern lifeworlds serve (Habermas 1992:77). The lifeworld consists of *culture, society* and *personality* (Habermas 1988:99). With these three elements, modern lifeworlds develop the educational system, the law, and the family as institutions highly specialized to fulfil these functional specifications. According to Habermas, these lifeworld components remain connected to each other through the medium of language. Colloquial language imposes strict limits on the functional differentiation of the lifeworld so that its totality is not endangered.

With regard to the reciprocal interpenetration of lifeworld discourses, Habermas (1985:418) speaks of the ability of intersubjective self-understanding of modern societies. Thus, the borders between the socially integrated areas remain open. All parts of the lifeworld refer to one comprehensive public, in which society develops reflexive knowledge of itself. Although the lifeworld is structured by communicative action, it does not, however, constitute the center of modern societies. Habermas sees the potential of rationality as highly endangered because the communicative infrastructure of lifeworlds is threatened by both colonialization and fragmentation.

Outside of the lifeworld, the capitalist economy and public administration are situated. These two functional subsystems of society use money and organizational power as their media of exchange. They specialize in the material reproduction of the lifeworld. Between economy and

private households, on the one hand, and public administration and political-cultural public, on the other hand, exchange relations exist. Habermas conceptualizes economy and politics as open systems that maintain an intersystemic exchange with their social environments. From the point of view of the economy and the political system, the lifeworld is just a societal subsystem. From the vantage of the lifeworld, the economic and administrative complex appear as rationalized contexts of action which transcend the intuitive understanding of actors.

As the media-based exchange relations between the lifeworld and system illustrate, the separation of system and social integration is, even in contemporary societies, far from complete. The economic and administrative complex remain connected to the lifeworld as the systemic media money and organizational power are in need of an institutional anchorage in the lifeworld. Although communicative action, on the one hand, and capitalist economy and political administration, on the other, are asymmetrically related, the lifeworld remains, in contrast to the functional subsystems, the more comprehensive concept of social order. Only by anchoring legal institutions in the lifeworld, markets and the authority of the state can persist (Habermas 1992:59). This is why the areas of system integration are constituted legally.

In his study *Between Facts and Norms: Contributions to a Discourse Theory of Law and Democracy* (1992), Habermas points to the importance that the theory of communicative action attributes to the category of law. Modern law is connected with both the lifeworld and the functional subsystems, hence serving intermediary functions between social and system integration. Lifeworld messages must be translated into the language of law before they can be understood in economy and politics. Modern law works like a transformer that guarantees that normative messages circulate throughout society.

Habermas's theory of modernity has been criticized in many ways. One important line of criticism refers to the normative texture of the theory of communicative action. Rational potential of reflexivity is only imputed to the socially integrated lifeworld even though lifeworlds constitute only a part of modern societies. Also, the categorical distinction between functionally specialized subsystems (economy, administration, politics) and the specific parts of the lifeworld (education, law, family) is not as clear as it may seem at first glance. According to McCarthy (1986:209ff.), only a gradual distinction can be observed between these areas. Education, law, and family also suffer from unintended consequences of social action. At the same time, economy and public administration remain, just as the communicative structure of the lifeworld, dependent on the use of ordinary language.

HABITUS

The concept of habitus is characterised by a useful degree of imprecision that has allowed it to be taken up by a range of very different social theorists, in very different contexts. It addresses the need to think about humans without resorting to the gnomic mysteries of psychoanalysis, on the one hand, or the implausible clarity of rational actor theories, on the other. The closest one might be able to come to a generally acceptable definition of habitus would focus on those aspects of human behaviour and cognition that are inexplicit, less than fully conscious, ungoverned by deliberate decision making, and bound up with and in the embodied encounter with others and the environment. Any lack of conceptual clarity thus arguably has its origins in the indeterminacy of what the notion is attempting to grasp.

Deriving from philosophy—being used by, among others, Hegel and Husserl—habitus, in its original Latin meaning, refers to the habitual or typical state or condition of the body. The notion came to prominence and found its widest currency, however, within twentieth-century social theory. Following occasional mentions by Weber, Durkheim, and Mauss, the first extensive sociological use of the concept can be found in Norbert Elias's work on "the civilising process" during the 1930s. Acknowledging habitus as a concept capable of individual and collective application, Elias talks about our "second nature," "an automatically-functioning self-restraint, a habit that, within certain limits, also functions when a person is alone" (Elias 2000:117). Rooted in early socialisation, according to Elias, the embodied disciplines of thoughtless habit create the everyday possibility of ordered, complex, and intense social life. This was also later emphasised by Berger and Luckmann in *The Social Construction of Reality* (1966:70–85). It is, arguably, a key theme that lurks, semiacknowledged at best,

below the surface of most interactionist sociology, not least the work of Erving Goffman.

An increasingly common item in the modern social theory vocabulary, habitus owes its popularisation to the late Pierre Bourdieu (so much so that he is often taken to be the concept's originator). A key component in his project of developing a sociological understanding of human practice that transcends the "ruinous opposition" between individualistic voluntarism and structuralist determinism, the notion of habitus is threaded in and out of his extensive and broad-ranging legacy of empirical studies. The concept's outlines and ramifications were developed most thoroughly in his foundational theoretical statements, *Outline of a Theory of Practice* (1977), and *The Logic of Practice* (1990).

What Bourdieu encapsulates in habitus are those aspects of human beings that are neither fully conscious nor unconscious, neither collective nor individual (or, perhaps, both simultaneously). Definitively located in embodied individuals, these are inculcated during primary and secondary socialisation, although Bourdieu goes out of his way to avoid the word. In early childhood, the foundations of sociality, from language to morality, are learned, only to be forgotten as the condition of their durability and power. Unreflexively, they are constituted in and through habituation and habit formation.

Habitus is defined by Bourdieu as "an acquired system of generative schemes objectively adjusted to the particular conditions in which it is constituted" (1977:95). This is central to his vision of human beings as internally in tune, albeit perhaps nonreflexively, with the external material conditions of their existence. Habitus comprises both classificatory schema and practical dispositions, both generative of action and each inextricably implicated in the other. They are subject to a continuous, if less than conscious, process of adjustment to the objective realities of the world to which each individual belongs. These schema and dispositions—notably in the case of the fundamental taxonomies that combine classification and disposition most completely—are transposable, applicable across a widely range of social fields. It is partly in these all-purpose bodies of knowing and doing that the collective logic of practice of any group—"culture"—can be said to exist.

In deference to the word's Latin roots, embodiment is utterly fundamental to Bourdieu's model of habitus. The body is the point of view of the human encounter with the world and the locus of the most consequential practical taxonomies: up/down, left/right, front/back, and male/female, for example. For Bourdieu, the body, exemplified in habitus, is a practical mnemonic, on and in which the foundations of culture are produced and reproduced. Habitus also generates *hexis,* locally distinctive shared ways of being in the world, the complex nonverbals of human practice.

Practical dispositions are not, however, to be understood as rules. Nor are they anything to do with conscious rational

decision making. Habitus is the framework within which humans improvise their way through life, a facilitatory capacity that allows locally specific learned practices and the classificatory architecture of knowledge and cognition to adjust to the demands, possibilities, and impossibilities of actual settings and contexts, in such a way that meaningful, mutually sensible responses emerge and can be acted on. Any particular habitus will be more or less compatible with any specific social field, depending on origins and history. It is in this sense, although this is perhaps the most obscure aspect of Bourdieu's writings on the topic, that habitus can be said to be collective as well as definitively individual.

Bourdieu used this basic model to analyse a range of topics: peasant marriage strategies, the layout of North African houses, the appreciation of high art, formal education, cultural consumption, stratification, and gender domination, to mention only some (see Jenkins 2002). In its appropriation by Anglophone sociology, much of the subtlety of the concept has been diluted, the result being a somewhat mystified version of anthropology's omnibus model of culture. The abiding significance of habitus is likely to be its emphasis on the embodiment of cognition and its evasion of any either/or choice between conscious rationality and the unconscious as the wellsprings of human behaviour.

HALL, STUART

Born in Kingston, Jamaica, Stuart Hall's (b. 1932) contribution has been threefold: He is (1) a founding father of cultural studies, (2) a major, largely synthetic theorist of culture and race, and (3) a leading black public intellectual. He was educated in Jamaica College, an elite school in the West Indies with a long tradition of training professionals

and colonial administrators. He migrated to England in 1951, enrolling as a Rhodes scholar at Merton College, Oxford. Here he became involved in British and Jamaican politics and embarked on a PhD studying the relationship between Europe and America in the novels of Henry James. What he calls "the double conjuncture" of the Allied invasion of Suez and the Soviet repression of the Hungarian Revolution in 1956 provided a fillip to his political activism.

In 1957, he quit Oxford and cofounded and coedited the *University and Left Review (ULR),* a publication that presented "New Left" thinking on politics and the arts. In 1960, the *ULR* was merged with the *New Reasoner,* dominated by an older group of intellectuals, notably John Saville and Edward and Dorothy Thompson, to form the *New Left Review.* Between 1960 and 1962, Hall edited the journal, publishing articles on popular culture, housing, politics, and dissent, especially the Campaign for Nuclear Disarmament. Hall is unusual among intellectuals of his generation in having a background in which prominent media experience preceded an academic career.

In 1962, Hall was appointed to teach media, film, and popular culture at Chelsea College, University of London. He also engaged in collaborative research for the British Film Institute into the popular arts. In 1964, he accepted the post of research fellow at the newly established Centre for Contemporary Cultural Studies at the University of Birmingham. Founded by Richard Hoggart, the Centre sought to examine culture, especially working-class culture, through a mixture of political, sociological, and literary perspectives. Hall succeeded Hoggart as director in 1968.

Under Hall's influence, intellectual labour in the Centre became more theoretical and political. A dialogue between a variety of approaches from continental traditions, including Volosinov's "multiaccented" approach to linguistics, semiotics, Lévi-Strauss, Lacan, Poulantzas, Lukács, Althusser, Gramsci, and many others, was attempted. It was layered on to the native tradition of British *culturalism* that purported to understand "the whole way of life" of the people, as embodied in the writings of Raymond Williams and E. P. Thompson. The model of intellectual labour was borrowed from Gramsci's concept of the *organic intellectual,* which emphasizes the requirement of the intellectual to operate at the cutting edge of new ideas and constitute the transmission belt of knowledge to the working class. The concept gives pronounced importance to the political responsibilities of the intellectual. To some extent, the intellectual labour conducted in the Centre during Hall's time can best be understood as an attempt to fuse elements of continental structuralism and poststructuralism with the domestic tradition of culturalism and socialist humanism. However, by the mid1970s, when arguably the Centre began to produce its most important work, the theoretical rudder behind research and debate was Althusserian "scientific"

structuralist-Marxism uneasily combined with Gramscian culturalism. During this period, Hall and his associates made a number of key interventions into British cultural and political life, notably through innovative and challenging studies of schooling (Hall and Jefferson 1990), ideology (Hall, Lumley, and McLennan 1978), and state formation (Hall, Langan, and Schwarz 1985). Hall (1973) also achieved a minor *success de scandale* in the field of mass communications research, with his encoding/decoding model of the media message. This was an explicitly political reading of the media that attacked professional notions of media objectivity and transparency and sought to elucidate the mechanisms of media manipulation and the demystification of media messages.

However, perhaps the most important publication to emerge was *Policing the Crisis* (Hall et al 1978). This densely argued, consistently politically engaged book combined textual analysis, cultural interpretation, historical analysis, and political commentary to produce a compelling set of arguments about British state formation and cultural regulation. Following Gramsci, but also clearly operating in the Althusserian tradition, the authors presented the unfolding British crisis in politics, society, and culture as the consequence of a shifting "war of position and manoeuvre." Hegemony was depicted as the result of multiple compromises and concessions between the state, the capitalist class, and the working class. The formation of the *representative-interventionist state* is traced back to the 1880s. One of its main preconditions was the creation of a new *social bloc* in culture and the body politic, intent on winning support from the working class. Hegemony is accomplished by a *complex unity* of social, political, and economic alliances. However, following Gramsci, it is theorized as a conditional phenomenon. Hall and his associates argued that this unity was buckling in the 1960s and 1970s under the strain of wage inflation, low economic growth, the high cost of the welfare state, and militant trade unionism. The result was the revitalization of the Right, which was symbolized in the rise of Thatcherism with its candid repudiation of welfarism, stringent controls on wage bargaining, privatization programme, and "heroic" attack on trade union rights. *Policing the Crisis* aligned itself with the struggle for popular democratic socialism. It is perhaps the high-water mark of work in the Centre, and although many of its assumptions and propositions are now challenged, it remains a remarkable achievement.

Although the Centre is primarily remembered for its publications on culture, it was also an innovative training centre. Under Hall's directorship, the hierarchy between staff and students was softened in favour of a collaborative approach to research and publications. In addition to lectures and seminars the subgroup was an essential part of the teaching regime. Subgroups were organized around areas of thematic research in culture, such as policing, the media,

schools, and feminism. Curriculum development and collaborative research was sponsored by partnerships between staff and students. They operated with a self-image of "inventing" cultural studies as they went along, a heady rubric that was legitimated by the relative absence of academic studies of popular culture and that generated a huge amount of intellectual excitement and ferment. A tribute to these methods is the large number of Birmingham alumni who moved on to become key figures in cultural studies both nationally and internationally: Phil Cohen, Hazel Corby, Paul Gilroy, Larry Grossberg, Dick Hebdige, Angela McRobbie, David Morley, Frank Mort, and Paul Willis.

In 1979, Hall left Birmingham to become professor of sociology at the Open University. His thought remained politically oriented and was exploited and developed along three fronts. Firstly, he explored the phenomenon of Thatcherism, especially in relation to its legitimacy with working-class voters, that is, the main victims of cuts in welfare provision and wage restraint. Drawing on the work of Gramsci and Poulantzas, he developed the concept of *authoritarian populism* to refer to voluntary support for policies of nationalism and statism that oppose welfarism and trade union rights. In a series of articles and lectures, he dismantled the popular appeal of Thatcherism and revealed its cultural and historical elisions. At this time, Hall was an extremely important, courageous voice on the Left in Britain, countering the Thatcherite logic that "There is no such thing as society" and "There is no alternative" to the deregulated market.

Secondly, and conversely, his (Hall and Jacques 1990) "New Times" thesis berated the Left for repeating the mantra of class analysis. It stopped short of abandoning the relevance of class in social development. However, in an evident concession to postmodernism, Hall emphasized the significance of fragmentation, globalization, mobility, post-Fordism, the aestheticization of everyday life, and new social movements in decentring traditional concepts of identity, including class identity.

Thirdly, he wrote more systematically about race and ethnicity. He (1992) related racism to the dominance of Western epistemology and its historical expression in colonialism. He identified "new ethnicities" in British society associated with the emergence of black British culture. He introduced the term *hyphenated identity* to describe the status of British-born black immigrants. His work on racism made extensive use of the concepts of diaspora and hybridity borrowed from postcolonialism. He applied the concept of *institutionalized racism* to apply to the taken-for-granted assumptions of racial superiority engrained in legal, social, and political categories. He was also a major participant in the Parekh Report (2000) on the future of multicultural society, a document that included many detailed policies designed to achieve racial justice in work, education, and politics.

Hall's post-Birmingham thinking on politics and social theory was heavily influenced by the linguistic turn in Western Marxism, especially the work of Laclau and Mouffe (1985). The latter, via an engagement with Lacan and Foucault, stressed the "radically contingent" character of social formations and cultural articulations. From them, Hall assigned greater significance to the symbolic in cultural analysis and gravitated towards a view of identity as multiple, discontinuous, fragmented, and always and already, "under erasure." His later work amounts to a critique of identity thinking, especially as it is enunciated in the notion of Western white superiority.

An avaricious thinker, Hall has often committed the mistake of trying to assimilate fashionable new ideas by alloying them to traditional arguments and concepts. His (1986) exposure to poststructuralism and postmodernism has led him to declare that he is now in favour of "Marxism without guarantees," a curious appellation that demonstrates Hall's habit of wanting to have his cake and eat it. The attempt to merge Althusserianism with Gramacianism in the 1970s is another case in point. The structuralist bent in Althusser, which is revealed in his discussion of ideology, interpellation, and the ideological/repressive state apparatus, is in a state of considerable tension with Gramsci's interpretive, contingency-sensitive Marxism. Hall was never going to preside over a happy marriage between these contrary elements, yet he devoted considerable energies to doing so. His appetite for new ideas and antiessentialism resulted in a high degree of slippage, both in the meaning that he attached to key concepts, such as *hegemony, conjuncture,* and *articulation,* and his propositions about social-democratic transformation. His later years have been marked by an attack on identity thinking that is nonetheless attached to a politics of socialism. This leaves Hall's politics awkwardly placed in a wishful state of seeking a rainbow coalition of dissenting, repressed elements whose identity is "always and already" "under erasure."

His commitment to the linguistic turn has left his theoretical work peculiarly bereft of an empirical dimension. His propositions are not based in qualitative fieldwork or quantitative research. He has used political engagement as the pretext for "testing" his ideas, a practice that more empirically minded social scientists would perhaps deem to be luxurious.

Yet Hall's work also resonates a level of general vitality and specific attention to the detail of normative coercion that makes it a valuable resource in the study of culture. His attempt to produce a historically informed reading of culture reached its fullest expression with *Policing the Crisis.* Notwithstanding that, an appreciation of history, theory, and ideology permeates his work on culture and lifts it above what might be called alfresco studies of popular culture that perhaps engage too ingenuously with the enthusiasms of cultural actors. His emphasis on the *social*

imaginary, the category of utopian theorizing about emancipatory politics that mixes social science with the humanities, is also inspirational. In his teaching, Hall championed social inclusion and launched sallies against time-worn hierarchy. In his writing and politics, he railed against ascription and inherited authority, in favour of collaboration and a unity composed of living through and with difference.

HARDING, SANDRA

Currently a professor of social sciences and comparative literature at the University of California, Los Angeles, Sandra Harding also serves as the director of the UCLA Center for the Study of Women. She earned her PhD in philosophy from New York University and spent the first part of her career at the University of Delaware, where she taught philosophy.

Well known and widely influential in connection with feminist standpoint theory, Harding has also played a pivotal role in feminist science studies. In the former arena, Harding stands out for acknowledging that embodiment bears different consequences for boys and men than for girls and women. From their distinctive forms of embodiment flow ramifications not only for the "social relations" typical of each gender but also for the "intellectual life" typical of each (Harding 1994:21). Yet scientific methodology presupposes that researchers are interchangeable (Harding 1991b:51). Both as a feminist critic of the institution of science and as a feminist standpoint theorist, Harding rigorously challenges that presupposition. Her work revolves around a productive rejection of that taken-for-granted tenet of the scientific infrastructure.

Harding's (1990:86) work emphasizes *principled ambivalence,* albeit implicitly most of the time. That concept serves her in a double-sided way. On the one side stand her methodological and feminist principles evocative of keen disenchantment with how science has been institutionalized. On the other side stand the ethical principles pivotal in Harding's work, namely, equality, diversity, and community (both scientific and feminist). She insists, for example, that "the subject of feminist knowledge . . . must be multiple and even contradictory" (1991b:284). Equality and diversity demand no less, and community presupposes such real-world subjects rather than their oversimplified theoretical counterparts.

Like other feminist standpoint theorists, Harding argues that women's diverse and often contradictory positions in various social worlds provide them with distinctive, significant insights. Although that argument broadly undergirds feminist theory as well as other feminist scholarship, she is particularly emphatic about how women's "self-contradictory identities and social locations" (1991a:103) can serve them as epistemological resources.

Harding's work also pays some attention to men's identities and even their feminism. Emphasizing the experiential, practical grounds of gender, she notes that commonplace notions about masculinity largely derive from how often men oversee things, while notions of femininity come mostly from women's caregiving (1990:98). She concludes that engaging in both kinds of practices promotes feminist values and knowledge. Much of her work implies that such practical inclusiveness promotes a kind of multicultural or border-crossing consciousness. Yet such consciousness is not easily won. She explores, for instance, how readily some Euro-American feminist theorists simultaneously "appear to overestimate their own ability to engage in antiracist thought but to underestimate men's ability to engage in feminist thought" (1991b:277).

Ever the critical thinker committed to incorporating the multiple contradictions built into both our everyday lives and our social theories, Harding brings to feminist theory a liveliness of intellect that has imploded academic stances toward gender, science, identity, hierarchy, and social theory itself. Her own overriding goal has been to overhaul science as well as social theory so as "to make sense of women's social experience" (1986:251) Given the pervasive use of gender as a basis of social differentiation and the

division of labor in society, gender stands at the center of Harding's work just as it remains pivotal to how "humans identify themselves as persons, organize social relations, and symbolize meaningful natural and social events and processes" (1986:18).

More than most feminist theorists, Harding establishes forceful parallels between the uses of gender in society and its uses in science and social theory. Her work shows that to illuminate social reality necessitates organizing one's approach around girls' and women's distinctive knowledge. Without centralizing their knowledge, it implies, social theorists are doomed to perpetuate the distortions of science and theory institutionalized on narrowly masculine bases. In her own words, she seeks "an end to androcentrism, not to systematic inquiry." Like other standpoint theorists as well as most feminist theorists, she knows that such a shift will "require far-reaching transformations in the cultural meanings and practices of that inquiry" (1986:10). All the while, however, she insists that standpoint theory is "science-based," even though the science it promulgates leaves behind the male-centered grounds of modern science. (Harding in Hirsh and Olson 1995:25)

HARTSOCK, NANCY

Political theorist and activist Nancy C. M. Hartsock is renowned for her development and ongoing elaboration of feminist standpoint theory and her theoretical articulations concerning power and epistemology in Western culture. At the foundation of Hartsock's social theory are the beliefs that theory plays an important part in political action for social change and that social theorists must respond to and concentrate their energies on problems of political action as they arise in the context of social change. Her social theory works the tensions between theory and praxis, arguing that feminist theory must guide and participate in real-world social, political, and economic change. Her theoretical work examines relationships between theory and praxis, feminism and Marxism, and postmodernism and politics.

Hartsock's theorizing examines how we construct and are constructed by social relations of power and how to intervene in these relations. She thus pays close attention to relations of domination: How are these constructed, maintained, resisted, and transformed, particularly along race, class, and sexuality lines? Questions of power are inseparable from questions of epistemology. That is, how one conceptualizes power always includes specific theoretical assumptions. Therefore, she focuses attention on such questions as how knowledge is constructed, which methods are best for social research, how to create alternative epistemologies and ontologies, and how to understand the relationship of theories of knowledge to lived experience.

Hartsock was born into a lower middle-class family in Utah on February 13, 1943. She earned a BA from Wellesley College, a women's college in Massachusetts, and a PhD from the University of Chicago in political science. Her doctoral dissertation, titled *Politics, Ideology, and Ordinary Language: The Political Thought of Black Community Leaders,* combined her academic and activist work to argue that black community leaders were as much political thinkers and theorists as Locke, Rousseau, Mill, and others. This work launched a career based around the belief that feminist theory is social praxis. Beginning in the 1970s, Hartsock worked as a social activist in the civil rights, student, and antiwar movements in the United States.

Also during the 1970s, Hartsock became involved in the feminist movement emerging both on and off university campuses. She started a consciousness-raising group—a bedrock of second-wave feminism—in 1970. At this time she was hired as the first woman assistant professor at the

University of Michigan in the Department of Political Science. She and her colleagues there began a subfield in political economy with a stated purpose of educating black and women scholars. While on leave in 1973 in Paris, Hartsock taught herself Marxist theory by reading original works by Marx and members of the Frankfurt school. She then moved to Washington, D.C., where she was first exposed to feminist theory in a seminar taught by Charlotte Bunch, a founder of the Furies, a lesbian separatist group. In 1973, with Charlotte Bunch and others, Hartsock founded *Quest: A Feminist Quarterly,* to both connect theory with activism and to explore questions of power and leadership in the context of divisions along lines of race, class, and sexuality. She is the author of *Money, Sex, and Power: Toward a Feminist Historical Materialism* (1983b), *The Feminist Standpoint Revisited* (1998), and coeditor of *Building Feminist Theory* (1981). She is currently professor of political science and women's studies at the University of Washington.

Standpoint epistemology as articulated by Hartsock (1983b:117) reworks Marx's historical materialism from a feminist perspective to explicate the "genderedness of relations of domination and offers the concept of feminist standpoint to account for the gendered form of power relations." In doing so, Hartsock adheres to two central Marxist traditions: that social relations structure (not determine) the ways we understand the world, and that concepts and categories both structure and express the ways we interact with the world. She argues that epistemology develops from material social life. Marxist theory provides alternatives to the Enlightenment account of what counts as truth or knowledge. It also offers a basis for more nuanced understandings of subjectivity and allows for a better understanding of the connections between knowledge and power, particularly privileged knowledge.

Hartsock's most influential contribution to feminist theory is her articulations of and continuous development of standpoint theory. As originally developed in her 1983 article "The Feminist Standpoint: Developing the Ground for a Specifically Feminist Historical Materialism" (1983a), standpoint theory articulates the concept of a feminist standpoint—standpoint produced by a collective subject, or group that is marked as different or inferior in society. Developed through both critique and borrowing of Marx's historical materialism and Lukac's accounts of the proletarian subject, Hartsock argued that material life structures and constrains understandings of social relations. One's position in systems of domination shapes one's understandings of social life. The vision or perspective of those in ruling positions structures the material conditions in which all people must work. Therefore, the vision available to oppressed groups must be struggled for and is an achievement that requires analysis. As an engaged vision, the potential understanding of the oppressed, the adoption

of a standpoint, makes visible the inhumanity of relations among human beings and carries a liberatory potential (a "yearning," in the words of bell hooks). Hartsock's argument is that women's lives contain possibilities for developing critiques of domination and visions of alternative social arrangements. That is, for Hartsock, a feminist standpoint offers a deeper understanding of social life than that available to Marx's and Lukac's proletariate. Women's social experience of power is different from men's social experience and, as a result, is different from men's social theories.

Building on Hartsock's work, feminist standpoint theory argues that "truth claims" originate from and are justified by persons in privileged social positions. The two main assumptions in feminist standpoint theory are that knowledge is grounded in historical sociopolitical locations and that women occupy a social location that affords them a multifaceted access to social phenomena. In making these assertions, feminist standpoint theory challenges the "masculinist" definition of truth and method embodied in modern Western science and epistemology by creating an alternative method grounded in the "truth claims" of women's lives (however diverse those lives are).

As initially articulated in the 1980s, feminist standpoint theory appeared incongruous with postmodernism and poststructuralism in its inability to attend to difference. Early standpoint theorists (i.e., Dorothy Smith and Sandra Harding) argued that women, as a marginalized group, possess a unique perspective from which to see the world. Over the past two decades, standpoint theories have been critiqued and, at times, reformulated by scholars who work in the tradition of material feminism but who are also influenced by postmodernism. The critiques differentially argue that standpoint theories assume embodied knowledge, construct an essentialist view of identity and identity politics, and obscure multiplicity and difference by constructing a universal women's experience, and are unable to see standpoint as constructed and fluid. However, some feminist theorists argue that feminist standpoint theories do attend to difference by defining knowledge as particular rather than universal, truth as situated, perspectival, and discursive, and subjects as constructed, not transcendent (i.e., Susan Hekman). Patricia Hill Collins, Chela Sandoval, and Donna Haraway attempt to resolve some of these assertions with the respective concepts of "the matrix of domination," "situated knowledges," and "oppositional consciousness." In Hartsock's most recent work, *The Feminist Standpoint Revisited and Other Essays* (1998), she revisits standpoint theory in light of these reformulations and other postmodern critiques. Accounting for multiple subjects, Hartsock reasserts her idea of standpoint as a group-based, collective position, not an individual one. In addition, she engages with postmodern theories and asserts her suspicion of postmodernism's rejection of the unified subject at the

precise time of the emergence of other knowledges, such as postcolonialism.

Nancy Hartsock's current work examines the complex dynamics of women, commodification, and globalization. Taking Marx's understanding of the circulation of commodities as a starting pint, she theorizes that women's involvement in the circulation of commodities is much more complex than men's: Women sell their labor power, just as men do, but unlike men, women are involved in the reproduction of labor power, in biological reproduction, and in social reproduction more generally. Furthermore, women are commodities in the way that few men are. Hartsock explores the ways in which dynamics of commodification and the circulation of commodities allow for women's involvement in informal spheres, export processing zones, varieties of trafficking in persons, and allow for their labor to be used to take up the slack when structural adjustment policies are put into effect in both the global North and South.

HAWLEY, AMOS

Amos H. Hawley was born in 1910 in St. Louis, Missouri. He acquired the BA degree from the University of Cincinnati (1936) and the MA (1938) and PhD (1941) degrees from the University of Michigan. He stayed on at the University of Michigan as a faculty member until 1961. Professor Hawley joined the faculty of the University of North Carolina in 1966, becoming Kenan Professor of Sociology in 1970. He is a Fellow of the American Academy of Arts and Sciences, past president of the Population Association of America (1971) and the American Sociological Association (1978). He is the author of over 150 articles and books.

Hawley was the major theorist in human ecology during the period from 1950, when he published *Human Ecology: A Theory of Community Structure,* until the late 1970s, when the population ecology of organizations began to dominate this branch of macrosociology. Human ecology is the study of how populations organize to adapt to their environments. Hawley argued that adaptation to the social and physical environment was always a collective phenomenon for humans, accomplished through social organization. Hawley's perspective is firmly macrosociological in that the relationships among individuals are structures that respond to changes in the social, technical, and physical environment. These structures are independent of the people who inhabit them, have properties that are not reducible to those individuals, and survive generations of successive replacements. Organization can both grow (expanding toward the maximum size that can be supported by the environment at a given technology) and evolve (add information from the environment to create new technology and thus new potential for growth). Hawley was a parsimonious, elegant thinker who believed that a unified theory composed of definitions, assumptions, and hypotheses derived from these elements could apply across systems and time periods. The latest comprehensive statement of his theory was in 1986, in a slim volume entitled *Human Ecology: A Theoretical Essay.*

The human ecology tradition began in the Chicago school, with the work of Robert E. Park and Ernest W. Burgess. Hawley studied under R. D. McKenzie, a Chicago graduate, at the University of Michigan. His early work followed the Chicago school in focusing on spatial distributions in urban environments. Soon, however, he decided that the static, spatial emphasis of that work was less interesting than the study of change, structure, and functioning of the social system in an environmental context. He explicitly borrowed from bioecologists the idea that variation, adaptation, and selection were the processes that shaped any population in interacting with its environment.

Hawley's theory can be summarized in three general propositions covering adaptation, growth, and evolution. The first postulate states that adaptation occurs through the formation of interdependencies among the units in a population. Relationships form to increase the viability of a population in an environment. The second proposition is that system development continues until it reaches the upper limit that can be sustained by the environment, given a certain technology for communication and transportation (the cultural tools most relevant to relationship formation). The evolution proposition suggests that when systems acquire

new information (technology), the process in the first two propositions is resumed until a new equilibrium is reached.

Which aspects of these functional relationships dominated in his theory varied over the course of his career. In his early work, Hawley retained some of the fascination that early human ecologists had held for the spatial arrangement of activities in an urban environment, and how they were related to the physical and technological features like transportation links (river, rail, etc.). He abstracted that earlier concern into a more general conceptualization of an environment that provided combinations of conditions that, although constantly subject to change, were always limited in the opportunities they afforded living populations. The basic processes of ecology for Hawley were the collective, organizing, expansive quality of social groups in an restricted but ever-changing environment. The crowding of organisms subsisting upon limited resources resulted in competition, a struggle for survival. In human ecology, the community is the pattern of symbiotic and commensalistic relations that develop in a population, in its collective response to a habitat. Community organization constitutes the adjustment of the community to that environment. The pattern of relationships in the community as an aggregate represented a collective organization that had properties that could not be derived from the sum of its individual parts.

In later statements of the theory, Hawley's work shifted emphasis from competition to adaptation. The general meaning of change remained the same—it was an irreversible shift in the pattern of relationships among the units in a population. While early statements focused on changes that were prompted by environmental variations over time, later statements gave more attention to internal growth that occurred as a population matured and maximized its use of environmental resources. Thus, competition with other units in the environment became somewhat less important than internally generated developments. Possibly influenced by his colleague Gerhard Lenski at the University of North Carolina, Chapel Hill, Hawley's last theoretical statements emphasized the role of technology (especially communication and transportation modes) in limiting internal adaptation to an environment. New technologies could dramatically expand the types of collective organization and allow populations to grow.

From the beginning, Hawley had argued for a seamless theoretical connection to general ecology—human ecology was a third branch of a tripartite structure that included plant, animal, and human ecologies. In his last book, Hawley details the distinctiveness of humans; he places more emphasis on culture (again, often focusing on the technology of communication and transportation that expands the range of possible interrelationship structures within an environment). In earlier works, human behavior was seen as more parallel to animal behavior. In his last

book, culture is synonymous with the concept of ecosystem. However, even in his last treatments, Hawley focuses on positive, cumulative change in response to technological innovation and environmental shifts.

While he is careful to note that these responses are probabilistic as opposed to deterministic, his formal theory emphasizes large-scale, long-term changes in society in response to impersonal structural forces. Critics have complained that his theory ignores human agency—a feature that many macrosociologists are likely to count an advantage. For example, to Hawley, norms are reflections of systematic behavior patterns evoked by the functional interdependencies that developed in relation to an environment. Processes of stratification and other social arrangements simply reflect functional relations. Therefore, norms had a structural-functional quality that has struck some critics as an overly determined view of human social organization. Hawley might not argue with this assessment: He is a dedicated macrosociologist, and does not want to explain social organization with reference to the characteristics of the units from which it was composed. Rather, he remains steadfastly at the population, organization, and environment level for both causes and outcomes.

HELLER, AGNES

Agnes Heller was born in Budapest, Hungary, in 1929 and is a member of the Budapest School, a loosely connected group of intellectuals whose identity revolves around the association with their former teacher Georg Lukàcs and the experience of "really existing socialism" under the domain of the former Soviet Union. The experience of really existing socialism, analysed by Ferenc Fehér, Agnes Heller, and Görgy Márkus (1983) in *Dictatorship over Needs,* contributed to an understanding and critique of the totalitarian version of modernity, which has been

subsequently accompanied by the experience and critique of the liberal-democratic one. This double experience culminated in Heller's *A Theory of Modernity* (1999).

Heller's critical theory of modernity is also accompanied by a philosophical anthropology grounded in needs and feelings, of which *A Theory of Feelings* (1979) is central. Heller's philosophical anthropology also opens onto a paradigm of social action articulated in terms of ethics, morals, and the self-responsibility of the reflexive and self-authoring subject. Each aspect of her work is underscored by her project of value rationality, which is spelt out in "Towards a Marxist Theory of Value" (1972), *Radical Philosophy* (1984)*,* and *The Power of Shame* (1985). Heller's critical theory and its main concerns can be illuminated through her theory of modernity and, for her, its central value category of freedom.

In Heller's view, modernity is not a problem to be solved, managed, or negated. Nor is it an unfinished project. Rather, it is an unresolvable paradox or double bind. For her, the paradox of modernity stems from its founding principle of the value of freedom—it is a foundation that can provide no foundations (Heller 1999:4, 54).

In a similar position to post-Marxian and post-Parsonian interpretations of modernity, Heller's version is multisdimensional and loosely configured. It does not "fit" together. This entails that the paradox of freedom—or the double bind of modernity—is infused in all of the loosely configured, yet nonetheless constituting, dimensions that are conceptualized by her in terms of the logics of technology, the division of positions, functions, and wealth, and political power and domination. Accompanying these logics are the technical and historical cultural imaginaries and the constituents of contingency and critique. These logics, imaginaries, and constituents interact and compete and resist overall coordination and integration.

What makes modernity especially dynamic, according to Heller, is the way that freedom is mobilized as a project for both contingency and critique. For Heller, one of the principles of modern freedom is the principle of contingency. Drawing on the work of the neosystems theorist Niklas Luhmann, Heller argues that there is no fixed, predetermined telos to a modern person's life and its social location. It is not only that modern social arrangements replace premodern status hierarchies with ones that are determined by functions, but more so that this process is open-ended. Modernity is also the only period in history where all traditions and established norms, rules, and beliefs have been called into question and delegitimated. This critical deconstruction concerns, especially, those rules, norms, and beliefs referring to truth, goodness, and justice, which, by being increasingly subject to immanent and substantive criticism, lose their static character and become dynamic.

Under the weight of contingency and critique, needs, not all of which can be satisfied, expand exponentially. In premodern societies, the context into which one is born is the constant position from which needs are interpreted and understood. For Heller, the contingent nature of modern societies into which human beings are born entails that needs and their interpretation are opened. To be sure, for Heller, all needs in all social and historical contexts are subject to interpretation and evaluation through value categories that indicate whether they are socially recognized and can be satisfied and are viewed, for example, as good or bad, or right or wrong. Values are the social a priori and, as such, provide life with meaning in both positive and negative terms that can also take the form of stories and narratives.

Heller argues that the main interpretative and evaluative framework of needs in modernity is derived from the value of freedom. However, this open-ended freedom through which needs expand and the contingency that accompanies it can be experienced as unease, dissatisfaction. Modern societies are characterised by Heller as dissatisfied societies.

In Heller's view, there are two predominant vantage points from which possible need satisfaction can be interpreted in modernity. One can interpret needs, so she argues, by viewing freedom from a particularistic vantage point. This vantage point entails that needs will be interpreted and evaluated not only according to one's own self-interest but also according to the taken-for-granted norms and rules of the particular context or way of life in which one is contingently situated. For example, need satisfaction may be particularistically interpreted from the vantage points of technical mastery or the accumulation of political power or wealth.

However, needs and the feelings of dissatisfaction that arise when they are not met can also be interpreted from a position that abstracts from a particularistic vantage point. They can be reorientated by reflexively interpreting freedom in universalistic terms. For Heller, the content of this universalistic version of freedom refers to humankind as a whole and as an end in itself (Heller 1984:124). This universalistic interpretation denotes Heller's own value stance, commitment, and utopian horizon. She accords the value of freedom in modernity a double-sided impetus. It is a universalistic value ideal that is instituted and becomes the socially recognised frame of reference. As such, it is a value ideal that social actors themselves can move or, in her terms and following Kierkegaard, leap towards. In leaping towards the value ideal of universalistically interpreted freedom, Heller further argues that modern social actors shift from being particularistic individuals to personalities. In her view, becoming a personality entails that modern social actors become ends for themselves, are unique, can change their contingency into a destiny, have a depth of feeling, and have a constancy and reflexivity regarding the value of freedom. Heller recommends that these two aspects of the cultural value ideal of freedom and personality can come together in a plurality of forms of life and a

community of people who are ends in themselves and treat others also as ends. As such they form social and personal relations based on the principle of symmetrical reciprocity.

Heller's image of freedom as a value ideal combines the historicity of values and philosophical anthropology in order to respond to the dilemma and legacy of the Kantian distinction between the noumena and phenomena. For her, freedom is a historically created, culturally embedded, and shared empirical-universal value, and as such, one of the Archimedean points in modernity, but one that cannot be grounded. It can only be interpreted. Nonetheless, social actors can interpret freedom and judge actions from a universalistic perspective, which provides them with meaning beyond particularism. Yet, modern social actors are not, in the first or final instance, determined by freedom. They leap towards it to become someone beyond their own horizon of needs—a good person. In this way, and in Heller's view, there is always the possibility of not only an interpretative-reflexive relation to needs and values but also a qualitative relation to oneself, to others, and to the world.

HERMENEUTICS

The term *hermeneutics*—the theory or science of interpretation—comes from Hermes, the ancient Greek messenger of the gods. Since the words of the gods were not intelligible to mortals, Hermes had to interpret their meanings and make them accessible to human understanding. The origins of hermeneutics also is associated with Greek poetics and rhetoric. Poetics is the theory of meanings made through words or other symbols, as in the Greek *poieo,* "to make." Rhetoric refers to the art of reaching prudent judgments in matters where absolute knowledge is

impossible. It is therefore an art of verbal persuasion rather than of cognitive domination through definitive proof. Hermeneutics also has roots in the Hebrew interpretation of the Talmud. These various traditions of interpretive knowledge were fused in the West in biblical hermeneutics, which began when early Christian Jewish scholars of the Roman empire combined Greek poetic and rhetorical methods of criticizing texts with the Hebrew tradition of interpreting religious scripture. As religion became the hegemonic ideology in the West, biblical hermeneutics (along with revelation) became the dominant form of knowledge.

Modern hermeneutics begins with Schleiermacher, who codified traditional hermeneutics into a systematic and critical method of biblical interpretation. Wilhelm Dilthey noted that historical knowledge is akin to biblical knowledge insofar as they both depend on the interpretation of written texts. Dilthey thus developed and extended Schleiermacher's critical and systematic biblical hermeneutics to what were then called the historical or human sciences—those disciplines that studied the embodied or objectified expressions of human mind. This included history, of course, but also archaeology, literary criticism, anthropology, sociology and others. Hermeneutic theory and method was further developed by Edmund Husserl, and by Martin Heidegger, who conceived of the natural sciences as symbolic constructions of a sacral Be-ing. Contemporary postmodernists, rhetorical theorists, cultural anthropologists, symbolic interactionists, and deconstructionists also, in their various ways, operate within and extend this tradition.

In contemporary theories of knowledge, hermeneutics usually is opposed to positivism, neopositivism, and rationalism. The positivist approach to knowledge and society has been criticized by neopositivist sociologists and philosophers themselves. For example, Karl Popper and other critical rationalists modified some of the basic assumptions of earlier positivist thought: The idea of causality was qualified by theories of probability, and canons of proof and verifiability were largely replaced by those of disproof and falsifiability. Likewise, Thomas Kuhn stressed the communal aspects of scientific activity and the consensual character of scientific truth.

Such circumspection would seem to safeguard contemporary positivists against criticisms from nonpositivist points of view. However, thinkers in the hermeneutic tradition have challenged the foundationalist assumptions of the positivist method and metaphysic. These critics have argued that the subject matter of social science—human conduct—cannot as such be known through purely objectivist methods and that, indeed, the more objective our observations, the further we are from what we want to know. The views of humans as objects, and of statistical experimentalism, deductive functionalism, or structural linguistics as explanatory ideals, say these critics, beg the very questions that the human studies should address.

The hermeneutic epistemologies that provide the bases of such critiques today include pragmatism, ordinary language analysis, existentialism, phenomenology, the philosophic history and sociology of science, rhetorical theory, and neo-Marxist critical theory. Though sometimes antagonistic to each other, philosophers as diverse as Dewey, Wittgenstein, Dilthey, and Husserl affirmed the basic hermeneutic assumption that commonsense understanding of experience is the framework within which all inquiry must begin and to which it must return. John Dewey spoke of this framework as the social matrix within which emerge unclarified situations that may then be transformed by science into justifiable assertions. Ludwig Wittgenstein referred to knowledge as a "form of life." Edmund Husserl wrote of the "life-world" within which all scientific and even logical concepts originate.

The philosophic opposition between positivism and hermeneutics can be seen in the clash between the scientific or mechanistic image of persons and the image that is manifested in everyday life. This manifest image is expressed most directly when we observe everyday accounts of behavior: "Why does she study hard?" "Because she wants to get into college."/"Why does he walk that way?" "He's trying to look cool." In the positivist view, however, such accounts of behavior couched in ordinary language can never be granted the status of knowledge. Instead, they represent an obstacle to the acquisition of empirically grounded explanations because they refer to mentalistic concepts (such as wanting or trying). The job of positivism is to purge language, at least scientific language, of such usage. Language must be made objective; the word must refer to the thing or to the specifiable relation between things, preferably in an operationalized form.

Difficulties emerge when one attempts to put this principle into effect. A basic problem occurs for positivists when they confuse motion with action, or reflex with conduct. For example, a woman holding her arm out, palm forward, might be warding off a mugger, drying her nail polish, hailing a cab, or admiring a ring. Yet if mind is reduced to body, there is no way to distinguish these actions. Instead, say hermeneutic thinkers, the above instances must be seen as acts, not motions, and hence they cannot be explained in terms of causes. Indeed, the terms of the thing-world of cause and effect do not allow us to know or even name what these actions are and mean. Because actions are essentially normative and bounded by rules in contexts, it is logically impossible to explain human conduct if we restrict ourselves to the vocabulary of physical science. There is no way of deducing from physiology whether an extended arm is a sign for traffic to halt or for Nazis to salute. Instead of having the character of self-evident physical facts (whatever these may be), action must be understood in terms of reasons, rules, and projects, which themselves are problematic constructions. For example, whether a case is to be one of "suicide" or "accidental death" depends upon the reconstruction of a context of meaning and the attribution of an intention. It depends, that is, on hermeneutic interpretation. Thus the very possibility of a social *science,* at least on the positivists' model of physical science, is called into question. In contrast to the positivist model, then, hermeneutics insists that a sufficient explanation of action must include the notion of consciousness, in the sense of intentionality. Indeed, if we allow that intentional description is essential to the understanding of action, it becomes questionable whether positivists, because they disavow the concepts of agency and intentionality, are able to account for human conduct at all.

But hermeneutic thinkers are themselves vulnerable to critique, for in some ways their theories are reverse images of what they scorn. For example, in place of positivism's brute facts as a foundational datum for the human sciences, hermeneutic thought often posits brute interpretations. Social historians of knowledge have linked science to communitarian practices, but they have tended to see this scientific community as abstracted and disconnected from a larger political economic context, much as positivists view science itself. In place of Descartes's a priori cogito of the individual, then, hermeneutic thinkers have tended to posit an a priori collective cogito of the community of social actors. In this reductive hermeneutic, no exterior viewpoint is provided for critically assessing the accounts of agents. Such a hermeneutic can treat understanding and meaning, but it cannot distinguish *mis*understandings, *non*comprehensions, and *false* meanings from correct ones.

By contrast, a dialectical, critical hermeneutic reveals not only the logical limits of positivism, but also the factual limits of subjective idealist social science. Society is not only praxis but also practico-inert. It is in part like nature. To the extent that society is the product of conscious human intentions, a subjective hermeneutics better encompasses what is salient. But history also is made behind the backs and against the wills of even powerful persons. More important, history—especially history of the *longue durée*—is also made before the eyes but below the awareness and intentions of virtually everyone. Language-interpretive social theory does capture what is or can be communicated. But much, perhaps most, of what goes on is not and cannot be stated, and at least part of what is stated misinterprets this unstated and often unmentionable domain. The solution, however, is not to seek an extralinguistic, positivistic philosophy of science to provide transcultural rules of interpretation, because in such philosophies the subject matter of language games and cultures ceases to exist or is reduced to a set of behavioristic signals.

Thus, on the one hand, we see an objectivistic positivism that seeks only laws about facts and a subjectivist hermeneutics that pursues only interpretations of meanings.

Many social thinkers have sought to bridge this chasm, starting perhaps with Max Weber. But critical, dialectical hermeneutic thinkers have themselves perhaps gone furthest in this direction. For example, by returning to the original hermeneutic metaphors of textuality and translation and of language as symbolic action, thinkers such as Kenneth Burke, Pierre Bourdieu, and Richard Harvey Brown have viewed the obdurate, structural, or factitious aspects of social reality as the master plots or grammars of social texts while construing the cultural objects or meanings thereby generated as akin to acts of speech. Humans thus create meaning, but the structures of possible meanings in turn generate what is and can be human. Such an approach preserves the interpretive power of an earlier hermeneutic but also, dialectically and critically, expands the hermeneutic circle to include "forces," "causes," or "factors" that, at least initially, are largely invisible to social actors.

HERRSCHAFT (RULE)

According to general agreement, herrschaft is a basic category of sociological theory, a pivotal concept of political sociology and one, if not *the,* primary object of political science. How herrschaft emerges and elapses, above all how it constitutes itself, are key questions of political life. Who rules and who is being ruled is crucial in political thinking, but the word is often used without reflection or critique.

In general, herrschaft is understood as an asymmetrical social interrelation between one party issuing commands and the other party acting in obedience to orders. In this sense, a person, a group, or an organization can (temporarily) impose subordination upon others and expect that they will comply. It is an institution when characterized by regularity and success. Regardless of whether the ruling entities are represented by persons, or take an anonymous form, they provide a social world of chaos alternating with a stable structure.

Herrschaft is an important element of social order, a field of force around which societal connections and tensions are arranged. In this context, herrschaft is normally understood as a vertical (top-down) relation. However, it can also be regarded as a horizontal relation of equals, where those who rule and those who are ruled coincide and alternate (periodically or constantly). Most doctrines of rule from classical to modern times delineate a social and political order, where a consistent and commanding subject issues orders to specific consignees who obey (or disobey). The political function to come to authoritatively binding decisions, enforced upon the other societal systems, is granted to the ruling system (analogous to the political system in general).

The particular interest of political theory was directed toward the formulation of a typology of modes of herrschaft (aristocracy, monarchy, democracy, technocracy, etc.), initially pictured in a recurring cycle, then in an evolutionary line. In modernity, herrschaft is basically problematic, that is to say, exposed to systematical skepticism and potential overthrow. Questions of participation in and exclusion from herrschaft respectively are being discussed publicly, whereas the assessment of (governmental) power of herrschaft and coordination of (civic) power are of interest in particular. The question is if this political-theoretical concept of herrschaft is still significant for the social world at the beginning of the twenty-first century.

ORIGINS OF THE CONCEPT

Valuable clues to this hardly surveyed topic are offered by the historical development of the concept of herrschaft. In ancient Greece, *arché* (verb: *archein,* e.g., in oligarchy [rule of the few] or anarchy [without rule]) meant beginning/origin/principle as well as rule or government. Archons were military commanders and supreme civil servants. Their capability was the "being able to begin" and, according to classical perception, a specific privilege to rule and a sign of politics as such (Arendt 1965). With the terminology of *krátos/kratein* (force/power/rule, e.g., in aristocracy [rule of the best or the aristocrats], democracy [rule of the people]), an until then unknown awareness of ability evolved since the fifth century B.C., especially in the Attic polity in dramatic literature, in the practical-political reform works, and in the

political theory of Aristotle. The classical concept of herrschaft in the polity marks the moderate center between anarchy and tyranny. (Eu)Nomistic systems, provided qua divine law, were gradually replaced by "cratistical" systems, whereupon democratic forms, forms of rule of the people, established themselves for the first time in world history. Political relations of herrschaft (that is, reasonable and belonging to the public sphere) are differentiated from violent master-servant-circumstances, which are limited to the "economic," that is, home economic sphere.

Herrschaft was a concept of order and reform, born in a crisis, designed to overcome and prevent states of confusion and crisis (or chaotic states without rule). The Roman Republic took up this tradition. In the Latin words *dominium* (property right over goods) and *imperium* (exertion of public force), herrschaft in a political sense is set off against the domestic authority of the paterfamilias, who ruled over persons and inanimate objects (property), as well. The German term *herrschaft* (from *her,* exalted, dignified, then following *herre,* one in high and superior position) still refers to the aspect of domestic authority over family and menial staff as well as free followers. What is meant is a personal and mutual relationship, entitling the following the right to resist should the master fulfill poorly. All traditional forms of herrschaft can still be related to this particular authority of the master, starting with the paterfamilias in the agrarian domestic economy up to sovereigns of an extended and delimited territory. This relationship is an example of the doctrines of authority that led up to the conservative theories of natural law of the eighteenth century usually expressed as an idea of rule in a communal sense (Tönnies [1887]1957). (This concept was unquestioningly associated with the subordination of women.) The *patria potestas,* derived from the home economy, is extended by an official apparatus into a political union. By this, housemates turn into subjects. As a characteristic of the Western societies, a corporative patrimonial system was formed, resisting the attempt of making absolute the central powers and, furthermore, inaugurating a civic control of power and democratic participation. With the establishment of sovereignty, merging anterior singular rights, herrschaft gained a spatial-territorial dimension, giving way to an abstract and rational concept of state in modern times. The underlying separation of private and public is influential in political theory (e.g., of civil society) up to today.

Herrschaft tends to a specific form of representation as well as to a specialization of staffs and formal bureaucracies. Political herrschaft is thus centralizing and eccentric at once, as the role of the sovereign prominently stands out from the repertoire of social roles and claims an exceptional status. In modern times three problems arise from this: (1) the depersonalization of patriarchal, aristocratic, and monarchal herrschaft, (2) the permanent compulsion to legitimize herrschaft, and (3) the problem of bureaucracy.

The process of modernization can be interpreted as an attempt to neutralize herrschaft, in which course the congruity of those ruling and those ruled and the complete elimination of personal (masculine) herrschaft was striven for, through an anonymous, that is, indifferent to persons or gender, rule of law.

CLASSICAL PERSPECTIVES

The political science emerging in this process of modernization itself focused on three basic perspectives. Niccolò Machiavelli, Thomas Hobbes, and others accentuated the aspect of efficient governance and the art of ruling, ensured by a (legitimate) state-run monopoly on force. Out of the perspective of most contract theories, the emphasis was rather placed on the difficulty of the "masters" to obtain acceptance from the free citizens, who agreed upon a (at any time alterable) ruling entity voluntarily. Here, herrschaft is bound to the act of civic agreement. From a class-theoretical point of view, herrschaft is ascribed to a lack of socioeconomic parity, and the utopia of a society requiring no herrschaft at all is picked out as a central theme.

First Perspective

The mainstream opinion refers, above all, to the sociological concept of herrschaft, established by Max Weber at the beginning of the twentieth century and proliferated throughout the world due to the intensive reception of Weber in system theories and theories of social action. Within the basic concepts of sociology, Weber (1968) differentiates amorphous power (as "every chance to enforce one's own will within a social relationship even against antagonism, whatever the chance should be based on") from the *more precise* conception of herrschaft as "the chance to find the obedience of assignable persons for an issued order of specified content." The facts of herrschaft are thus necessarily tied in with "the current existence of *one* who rules over *another* successfully" (Weber 1968). Weber envisages herrschaft as an actor-based and antagonistic relation, institutionalized in the form of leadership, guaranteeing "the inventory and prevalence of its order within a geographical region continuously by exerting and threatening to use physical force on the part of the administrative staffs." Herrschaft is thus closely associated to the state as a "compulsory political organization with a continuous organization (*politischer Anstaltsbetrieb*) . . . , if and insofar as its administrative staff upholds a claim to the monopoly of legitimate use of physical force in the enforcement of its order" (Weber 1968).

The difference between a "true" relation of power and mere use of force lies in the prerequisite "minimum of *intention* to obey as an *interest* (external or internal) in

obeying" (Weber 1968:157; emphasized in the German original) of the one who is ruled. The "motifs of compliance" range from dull habituation to rational consideration. Why people voluntarily give obedience to authority figures, thus accepting (or believing in) the fundamental inequality of those who rule and those who are ruled, was already labeled as the "mystery of rule" (1574) by the philosopher Etienne de la Boëtie. To be ruled in this sense seems to be emanating from a rational calculation of end and means. This is also postulated by the notion of a social contract of individuals making a rational choice and enabling collective action (Coleman 1973).

Out of this leading and predominantly psychological (or socioreligious) perspective on the recognition of herrschaft, Weber classified three types of legitimate herrschaft: First, rational (or legal) herrschaft is based "on the belief in the legality of lawful order (*gesatze Ordnungen*) and the right to claim allegiance (*Anweisungsrecht*) by those who base themselves on the authority of this order"; second, traditional herrschaft is based on "the mundane belief in the sanctity of ever since valid traditions and the legitimacy of those thus called to authority"; third, charismatic herrschaft is based "on the extraordinary devotion to a person's sanctity or heroic power or exemplary personality and the order revealed or created through this."

The three forms of herrschaft are gathered from empirical evidence and claim timeless and universal validity in the abstraction of a pure or idealized type. Weber nevertheless proceeded on modern and thus known conditions so as to work out the evolutionary dynamics in the evolution of forms of herrschaft, the culmination of which—formal rationalization—was to have existed exclusively in the Western hemisphere. In his opinion, the transition from government to persons to the administration of objects (Schluchter 1972) was most likely accomplished through rational-legal herrschaft by "decree," that is through an impersonal and systematic order, fitted with the following three characteristics: formal law, methodical organization of administration, and habitual *Fachmenschentum* (body of professional specialists who base their practice on systematic theoretical knowledge acquired through formal education). Bureaucracy is considered to be *the* specific means to transfer communal action into rational and organized societal action. Bureaucratic systems existed everywhere and at all times. The quality of formal rationalization through an enforcement of the rule of generally binding legal norms for all citizens, created by trained jurists, was typical for the West. Therefore, the most important feature of modern bureaucratic herrschaft is that "statutes" can be altered freely in accordance with the will of political communities and that this is performed in conformity with definite rules and transparent and affirmable procedures. For Weber, the bureaucratic staff of administration was a prominent instrument for the enforcement of rational herrschaft. Along with

this, the bureaucracy's tendency to make itself autonomous becomes apparent. The disquieting question is raised: Who rules the existing bureaucratic apparatus? Weber answers in his political papers with the postulation of a charismatic augmentation and parliamentary supervision of bureaucracy in order to thwart its inherent dynamics.

Second Perspective

With regard to bureaucratic herrschaft, Weber was above all interested in the relationship between the "professional specialists" (*Fachmenschen*), tending toward autonomy, and the external authority of a political leader. According to his concept, the grounds of validity are missing that could answer the old question of why people obey. Rational herrschaft also has a spiritual basis (*intention* to obey and *belief* in legitimacy), yet this political-religious precondition is often converted into administrative terms and ontologized. Thus, the view became prominent that a rational bureaucracy was legitimate ipso facto and consequently also a legal order as such. Those ruled over are mentioned only marginally in the tradition of political thought founded by Weber. Weber is therefore criticized that he has linked the criterion of legitimacy to the forms of rule in such a definite manner, and thus also blended them with order and obedience, that the entire field of cooperative, civic, democratic forms of government with its peculiar rightfulness stayed almost entirely out of his horizon.

The democratic legitimacy of a citizen's society cannot relate to a hierarchical conception of state that is in conformity with rule. It is rather bound to the notion of an articled and constitutional accord of free and equal citizens. At this Weber's critics refer to the "Old European" tradition of thought in the polis outlined in the beginning, which they extend over the horizon of the early civic revolutions and republics, above all in the United States (Arendt 1965). This pointed perception reflects the delusional overreach of bureaucratic herrschaft in the twentieth century. Arendt talked, only seemingly paradoxically, about the no man's rule (*Niemandsherrschaft*) of bureaucracy, bringing about organized irresponsibility of the individual and allowing bondage in its severest form. Authoritarian and dictatorial herrschaft is characterized by a qualitative augmentation of the element of force of the state's apparatus and the walling-off of ruling elites from all forms of democratic participation and supervision. From this, one has to discern totalitarian herrschaft, its substance being a polycratic apparatus of ideology and terror under the control of a charismatic leader. National socialism and Stalinism can both be classified under this heading, despite all dissimilarities. No longer is bureaucracy at the center of this, but rather the totalitarian movement or party, constantly revolutionizing itself and pressing ahead. So as to achieve its objectives, the movement can make use of industrial-bureaucratic methods (as, for example, at the cold-blooded

implementation of the national socialist program of mass destruction), with the described dialectic of rationalization resulting in an extreme. The double experience of totalitarianism in this century has brought the so far most destructive combination of magical charisma and bureaucratic rationality to the world.

Third Perspective

Since early modern times and especially with the onset of the eighteenth century, the legitimacy and justness of herrschaft has been exposed to doubt in principle. The historicization of herrschaft, that is, the relativization of its historical genesis as arbitrary and man-made, affects the recognition of the grounds of validity: Herrschaft must now justify itself permanently and is constantly scheduled to be replaced, if necessary with a revolutionary act of starting anew. With this turn taken, the modern concept of political herrschaft actually evolves, no longer springing from individual qualities and connections, but being a public issue of all equals, which can thus dissociate itself from all forms of domestic violence and can justify no terms of thralldom whatsoever. With the fundamental transformation of herrschaft, only governance in the name of the people is possible; even modern military dictatorships and totalitarian regimes (named "people's democracies") relate to this principle pro forma.

As to the question of inevitableness of herrschaft, there are two schools of thought: One postulates the universality and inevitableness of *arché,* thus restricting itself to the criticism of unjustified herrschaft, and favoring the procedural sound guarantee of its strict temporal limit and supervision of contents (e.g., Dahrendorf 1964), whereas from an anarchistic perspective, herrschaft is criticized as a whole and the project of a society without herrschaft is pursued instead. In anarchistic (or syndicalist) counterculture, modern forms of anarchy, which were to have existed before and outside of Western modern times, are rehabilitated. Anarchism and Marxism are concordant with the notion of a state without rule at the beginning and the end of history. With the destruction of class society and the deceasing of the state as its most important instrument of repression, the phenomenon of herrschaft loses its authorization. In Marxism, however, this is replaced by the rule of labor, that is, the herrschaft of the immediate manufacturer, abolishing the industrial terms of herrschaft in capitalistic company organization. The elaboration of the ruling class has, in addition to its (limited) analytical dimension, the character of being a concept used in contest, bringing the agonal dimension of herrschaft back into play. The dictatorship of the proletariat, designated for the transition period, emerged in the political systems of truly existing socialism and postcolonial one-party systems as a particularistic neopatrimonial system, again exercising herrschaft by persons. The polemics over the political class in Western liberal democracies have also emphasized this personal quality of political elites and established them as a (questionable) norm for legitimate herrschaft.

RECENT TENDENCIES

The deceasing of (state-run) herrschaft, forecast and programmatically striven for by anarchistic and socialistic literature, could as well come about without any revolutionary impetus. Max Weber left hardly any doubt that the future of rational herrschaft was poor due to intrinsic reasons and that the modern attempts to neutralize herrschaft could be foredoomed. On one hand, there is a tendency toward involution of bureaucratic herrschaft, which can be defined in more detail by the (1) deformalization of law, (2) disenchantment of the state, and (3) transition from bureaucracy to specialist rule and technocracy respectively. On the other hand, one cannot but notice a tendency toward repersonalization of herrschaft.

For a long time, the sociology of law stated a renunciation from juridical formalism, that is, to forsake the interior systematics of law by pluralizing, moralizing, and materializing the legal sphere. The loss of the law systems' autonomy as a whole is generally considered possible. This rests on a faulty adaptation of the law system to the changing social environment, whereupon a teleological opening occurred in economic, labor, and social law, as well as in criminal law, associated with the influence of socioscientific disciplines in a narrower sense, than on the failure of the juridical profession. With reference to the consequences it caused, law has to meet more prerequisites of value-oriented rationality, has to be more flexible with regard to situations, and has to be more reflexive. And one could just as well see this tendency as a gain in rationality.

Only seemingly paradoxical, the standardization of formal law is accompanied by regulating further and an (by all means quantitative) increase in the significance of bureaucracy. The expansion of the welfare state and the increase in regulatory state functions have led to a gain of competency for, and a spread of, bureaucracies, but at the same time, caused a widespread pluralization and thus the disenchantment of the state apparatus as a whole. In the course of this relative marginalization, the administrations were no longer separated from societal interests, but reflected this complexity even internally. The state is no longer represented as an oppressor, but acts as a coequal negotiating partner with nongovernmental organizations, without whose cooperation it would suffer the loss of its interventionist and controlling capacity entirely.

Associated with this is the bureaucratic specialists' inevitable loss of competency because of the complex matters of scientific, technical civilization, due to which they have to ask for the advice of external experts (e.g., on the "state of the

art") and have to face up to external critique (e.g., from "ethical commissions," parliamentary hearings, the environmental movement and its opposing experts). The *Fachmenschentum* (body of professional specialists who base their practice on systematic theoretical knowledge acquired through formal education) of state-run bureaucracy fails to manage the complex problems of mass societies and the unintended intended consequences of bureaucratic action.

Relativization and internal fragmentation of the ruling system proceed further than ever imagined by a bureaucracy-centered model. Generally, one can say that the border between politics (as a sphere of the public exercise of herrschaft) and nonpolitics (as private sphere) has become more fluid and more permeable in the process of reflexive modernization (Beck 1992). With this standardization, a level of subpolitics is generated. Modernization theories reflect that the disjunction of spheres has to be qualified and reversed to a considerable degree. The reorganization of state, adjusting herrschaft (or authoritative leadership) to management and transferring control reflexively to the self-organization of a polycentrically networked societal structure in a next step, has major consequences for government studies and policy research, which has corrected its conventional perspective on herrschaft in accordance with participatory politics "from below" as well as by network analysis.

Genuine charismatic herrschaft depends upon the specific qualities of the ruling personality, by virtue of which he or she is set apart from ordinary people and treated as endowed with supernatural, superhuman, or at least specifically exceptional powers or qualities. Above all, such leaders bring about poorly differentiated magic communities.

However, considering charisma, the creative dimension of herrschaft, as well, can be illustrated: In a world, with its inhabitants usually adapted to stability and reproduction, charismatic personalities initiate sudden innovations. In connection with political religiosity, this can also be a feature of posttraditional societies. Charismatic herrschaft is able to link to bureaucratic mass parties as well as to the pacifist or militant countercultures. There is, furthermore, a desire for an existential representation of herrschaft and a representation of herrschaft by persons. At present, this comes to light in three conceptions:

First, in the form of universalistic personalism of modern presidential systems: Democracy's victory in postcommunist and postauthoritative societies of Eastern Europe and South America has generalized charismatic ruling characters of this type, which are today making use of "telecratic" means by way of electronic mass media so as to secure mass loyalty. Forms of national populism and Caesarism, derived from pseudo-charisma, also strengthen the dictates of repersonalization of herrschaft in contemporary mass democracies.

Second, with the inversion of privacy and politics, as postulated by the New Social Movements: In this process, which was accelerated by a change in values, the attention for, especially, the specific gender characteristics of ruling persons increased. From a feminist perspective, masculinity is understood as an essential feature of the apparatus of rule and the state as a "brotherhood," even in its unconscious and formalized components. The term is used to criticize the standard form of patriarchal structures of rule, which have a forming influence on the conservative features of bureaucracy. Generally, the New Social Movements have highlighted the personal qualities of functionaries, by taking up the identity and authenticity as leitmotifs of politics.

Third, in communitarianism: Otto Gierke's theory of associations (*Genossenschaftstheorie*) and the polemics of Otto Hinze against Max Weber's sociology of authority rehabilitated the "Germanic" notion of an association as a counter-concept to the "Roman" idea of herrschaft (and society). Against the ascending degree of the abstraction of herrschaft, this critique stresses the personal and sensual qualities of community ties and is influential in current debates between liberalism and communitarianism.

POSTSTRUCTURALISM

The effort to capture the waning power and the compulsory nature of formal bureaucratic herrschaft, the problems of which were emphasized earlier, can be felt on all sides. This is especially the case in the approach of the poststructuralists. Above all, the work of Michel Foucault (1978) is an attempt to repeal the general matrix of a binary and all-encompassing opposition between rulers and ruled and extending from the top down and reacting on more and more limited groups to the very depths of the social body. One must suppose, rather, that the manifold relations of force that take shape and come into play in the machinery of production, in families, in limited groups and institutions are the basis for wide-ranging effects of cleavage that run through the social body as a whole. Here, the organization of herrschaft does not seem to be a rational system of law, but rather an ensemble of all the diffuse persons and means that can be used in order to exert power. From this conception, there is a line to system theories. In neuronal networks, the synthesis of highly complex and parallel processes of the brain are not attributed to an intelligent authority, but rather interpreted as a self-organizing, "emerging" process of assessment and selection. However, contemporary political theory and sociological diagnosis of time are characterized by a double paradox: While herrschaft becomes ubiquitous and abandons the shell of its central structure, the political elites lose their eccentric character as specialized representatives of herrschaft and at the same time seem to cause a desire for their personal-charismatic reincarnation.

HISTORICAL AND COMPARATIVE THEORY

Historical and comparative theory seeks to identify patterns and causal relationships in long-term social processes, such as the rise of democracy, industrialization, the expansion of the working class, the development of welfare states, or national revolutions.

Patterns and relationships are sought and tested through the detailed study of historical narratives and by examining long-run data describing economic, social, political, cultural, demographic, or other social features over time. Historical and comparative theory thus differs from deductive social theory, which draws conclusions from formal models of social behavior. It also differs from branches of social theory focusing on data from experimental or field observations of social behavior and from theory resting mainly on statistical analysis of survey, demographic, or other data drawn from relatively narrow time frames.

Historical and comparative theory relies heavily on the work of historians and often draws upon archival materials. Yet it does not simply seek to generalize from historical data. Rather, historical and comparative theory is as often concerned with the key *differences* among various social contexts—seeking explanations of why democracy arose in some places but not others or why revolutions are relatively rare—as with broad similarities. Historical and comparative theory seeks to combine an understanding of the social behavior of individuals, groups, and organizations and their responses to various social conditions with identification of specific, contingent, historical facts regarding particular societies and time periods, in order to explain long-term trajectories of social change.

Comparative and historical theory developed with the beginnings of sociology in the nineteenth century. Indeed, the birth of sociology was largely motivated by a problem in comparative and historical theory: How do industrial societies—with their factories, extensive wage labor, representative government, and financial capital—differ in their organization and dynamics from earlier societies dominated by agriculture, peasant labor, aristocratic and monarchical government, and landed wealth, and what is the likely future trajectory of industrial societies?

Historical and comparative analysis of critical historical events, or of issues in politics, economy, and religion, was not new in the nineteenth century. Such comparisons stretch back to the earliest systemic reflections on human societies. Herodotus pointed to differences in the Greek versus Persian political systems and culture to explain the outcome of the Persian Wars; Thucydides similarly explored the fundamental differences between the history and political systems of Sparta and Athens in his history of their great conflict. One can find historical and comparative analysis in the works of later Roman historians, in the social analysis of the fourteenth century Muslim scholar Ibn Khaldun, in the political analysis of Machiavelli and Montesquieu, the economic analysis of Adam Smith, and in the political theory of James Madison. Yet none of these thinkers, nor any before them, had a clear sense of social change as making an unprecedented break with the past. For them, historical and comparative analysis was used to illustrate the variety of organizational forms and their differences, or to identify unchanging characteristics of the human condition and seek solutions to universal problems. The historical and comparative theory launched in the nineteenth century differed from all prior social analysis in seeing history as having a long-term trajectory, in which certain social forms and organizations would permanently give way to others. The task of the new historical and comparative theory, and its distinctive contribution to social theory, was to describe this long-term trajectory, to identify its key motors and turning points, and to project, as best as one could, its future direction.

The most influential founders of this enterprise were Marx and Tocqueville. Both of them treated feudalism not merely as one among many systems of social organization, but as a specifically time-bound mode of social order, which was in the process of being replaced in its entirety by a new social system. Tocqueville believed that he saw that future order in the egalitarian society of nineteenth-century America; Marx believed that he saw that future order in the

factory slums of nineteenth-century Lancashire. Thus Tocqueville, first in his account of the legal, political, and cultural order in America, and then in his account of the reasons for the collapse of feudalism in France, laid out a view of history in which egalitarian impulses would inevitably spread globally and transform societies, producing antifeudal and eventually ethnic conflicts as they did so. Marx, in his accounts of the historical development of capitalism, similarly mapped out a long-term view of history, although in his view it was capitalist practices of production that would inevitably spread globally and transform societies, producing class conflicts.

Succeeding generations of scholars continued to develop theories of these long-term changes. Durkheim and Tonnies stressed changes in the modes of social interaction as key to the change, with preindustrial society based on conformity, and stable, small-scale social structures giving way to industrial society based on individuality, specialization, and far more complex and rapidly changing social relationships. Weber argued that a further critical feature of this change was a long-term and systemic process of rationalization, embracing the economic, political, and ideological organization of social life. Elias pointed to a variety of changes in social interaction as creating a distinctively modern and "civilized" mode of social relations.

It would be incorrect to see these as theories of social progress, if by that is meant continuous improvement of the human condition. Marx (in the medium term) and Tocqueville and Weber (in the longer term) were quite pessimistic about many characteristics of the long-term processes they described. Marx warned of increasing misery for workers under capitalism before their final liberation. Tocqueville feared a "tyranny of the majority" and shrinking individual liberties if egalitarian impulses went unchecked. Weber expressed fears that spontaneity and personal freedom would be hemmed in by increasingly complex, interlocked, and demanding social structures, which could continue to function only at the cost of prescribing ever stricter roles for the individuals who constituted them. What was important to these theorists was correctly identifying the critical trends and driving forces in long-term historical change. None of them saw the transition from agrarian to industrial society as unambiguously good.

In the middle of the twentieth century, historical and comparative theory moved toward a more optimistic synthesis, especially strong in sociology and political science, led by such figures as Talcott Parsons, Seymour Martin Lipset, Gabriel Almond, Alex Inkeles, and Samuel Huntington, known as modernization theory. Borrowing elements from the theories of Tocqueville, Marx, Weber, and Durkheim, modernization theory argued that all societies could be located on a trajectory from "traditional" (i.e., preindustrial) to "modern" social organization. The former was more conformist, hierarchical, hereditary, authoritarian, religious/magical, rural, and poor. The latter was more individual, egalitarian, meritocratic, democratic, secular/rational, urban, and economically productive. Although conflict might attend the transition from traditional to modern forms of social organization, it was argued that movement along this trajectory was the inevitable course of social evolution.

However, actual events soon contradicted the projections of modernization theory. In the communist party-states of Eastern Europe and the Soviet Union, and the military dictatorships of Brazil, Argentina, Spain, and Portugal, authoritarian and conformist regimes persisted for many decades in societies that were otherwise rational, meritocratic, urban, and economically advanced. Moreover, even the most "modern" country in most respects, the United States, instead of becoming more secular, experienced religious revivals and extensive popular religiosity. Fundamentalist religiosity also grew in industrializing, urbanized states in the Middle East such as Iran, Israel, Egypt, and Saudi Arabia. In addition, although in modernization theory violent political upheavals were supposed to occur only against traditional regimes, in societies undergoing the transition from traditional to modern social organization, in the late twentieth century a host of states with modern economies and social structures, including communist party-states, military dictatorships, and populist Presidential regimes—even modern democracies such as Northern Ireland—were toppled by revolutions or wracked by religious and ethnic warfare.

In response to these events, the universal trajectory model of modernization theory was abandoned, and historical and comparative theory set about to more closely examine particular long-term historical processes, with an eye to searching out multiple trajectories and explanations that highlighted historical differences as well as similarities.

One typical line of research was in the historical and comparative theory of revolutions, developed by Barrington Moore Jr., Charles Tilly, Theda Skocpol, and Jack Goldstone. While political scientists and psychologists were seeking a general model of "revolution," asking why ordinary people would adopt rebellious attitudes toward state authority, without much attention to the internal structure of either society or the state, historical and comparative theory sought to identify the key actors, groups, and relationships that had actually created revolutions in specific historical contexts. Comparative and historical theorists were not so much concerned with explaining "revolution," in general, as with explaining the variations in the causes and outcomes of particular revolutions of great historical significance.

Moore argued that Marx had been correct in identifying class conflicts as the motor of revolutions, but had erred in simplifying class structure into a two-party model of bourgeois capitalists versus feudal lords, or workers versus

capitalists. Moore claimed that in the transition from agrarian to industrial societies, the relevant classes included capitalists, landlords, urban workers, and peasants, and that instead of there always being a single line of cleavage and a single outcome, it was possible for various coalitions and conflicts among these actors to arise, with each pattern producing a different historical trajectory and a different outcome. Thus capitalist democracy was only one possible outcome of modernization, arising specifically when capitalists joined with workers to overturn the power of landlords and their control of peasant labor. Where landlords joined with capitalists against workers, or landlords captured political power and so both retained control over peasant labor and dominated capitalists, other, nondemocratic forms of society were likely to emerge even as industrialization took place.

After Moore, further developments in the historical and comparative theory of revolution occurred by adding additional elements. Tilly and Skocpol argued that Moore had neglected important variables. Tilly stressed that revolutionary groups needed organization, and the ability to mobilize substantial resources, if they were to effectively challenge state authorities. Skocpol pointed out the role of the state as an autonomous actor in the formation of revolutionary situations, demonstrating that as much as any class actor, state leaders themselves often faced dilemmas and took actions that catalyzed revolutionary conflicts. Skocpol also argued that revolutionary outcomes were constrained by the social base of the revolutionary movement, and the old regime's level of economic development. Goldstone highlighted the importance of long-term demographic trends in undermining social, political, and economic structures, thus creating conditions in which states became vulnerable, and in which new coalitions of elites and popular groups were likely to form. In contrast to Skocpol, he further argued that the ideologies of revolutionary leaders, and their efforts to keep the allegiance of their followers in the course of revolutionary struggles—and not mainly the revolution's social base—shaped the degree of radicalism or conservatism in postrevolutionary state reconstruction.

The origins and outcomes of revolutions was only one process studied by historical and comparative theorists after the breakdown of modernization theory. However, it was fairly typical of one mode of argumentation in historical and comparative theory. In this mode, studies generally took off from earlier arguments by Marx, Durkheim, Tocqueville, or Weber, enriching those arguments by introducing additional variables or focusing attention on previously neglected relationships. The result was to build richer and more sophisticated explanations for the similarities and differences in the trajectories of a particular class of events or processes.

Another example of this mode is the analysis of state building, in which Tilly examined state development in Europe from 1400 to 1900 and claimed that the variety of state structures, from democratic to authoritarian, resulted from different strategies pursued by state leaders, relying on either the accumulation of financial capital resources or of coercive bureaucratic/military resources or some combination of both. Dietrich Reuschemeyer, Evelyn Stephens, and John Stephens, drawing on comparative studies of state building in Europe and Latin America, added the insight that democratization was unlikely to last unless it was founded on a coalition of workers and elites bound in effective political parties. Skocpol, studying state building in Europe and North America, further presented evidence that the growth of welfare policies in modern states depended on the mobilization not only of workers but also of women seeking to reshape structures of family support.

Yet in addition to this mode of argument, adding factors and mechanisms to enrich and correct existing explanations, historical and comparative theory also has simplifying modes, in which historical trajectories are explained as variations of a single master process. Perhaps the most influential example of this mode of historical and comparative theory is the "world system" theory developed by Wallerstein. This theory explained the rapid growth of European economic and political power in contrast to the rest of the world as the result of Europe's core position in global trading networks, which were intentionally structured so as to convey global production surpluses away from peripheral regions to the system's core.

Wallerstein argued that this process began in the sixteenth century with the importation of bulk grains produced in Germany and Poland into Western Europe, mainly through Antwerp and Amsterdam. This trading circuit reinforced the power of landlords in Eastern Europe, producing a power structure favorable to authoritarian control and preservation of a rural peasantry, while conversely producing opportunities in Western Europe, initially mainly Holland, for the expansion of manufacturing, finance, and long-distance trade. Thus a "core" region developed around the Dutch cities, with growing wealth and diversified commercial enterprise, which drew on a "periphery" in Eastern Europe that supplied raw materials while remaining under more traditional political and economic authority. In the course of the eighteenth and nineteenth centuries, as European trade expanded to include increasing exports from the New World and Asia, the core of the system expanded to include London and the Eastern seaboard of the United States, which became major centers for exporting manufactures in exchange for raw materials produced in the colonial periphery. In the twentieth century, the world-system became truly global, with a Western core in Western Europe and North American, and a smaller Eastern core region in Japan, Singapore, Hong Kong, Taiwan, and South Korea, dominating manufacturing and finance, and the raw-material supplying periphery comprising the rest of the world.

"World-system" theory has spawned a large body of scholarship seeking to demonstrate how such unequal trading patterns account for a host of political and economic relationships throughout history. However, it has not gone unchallenged; Goldstone's comparative analysis of European and Asian economic development from 1500 to 1850 argues that Europe's critical advantage came not from unequal trade but from pioneering breakthroughs in the utilization of steam power, and that unequal trade relations between Europe and East Asia did not develop until *after* Europe used its edge in steam power to dominate global manufacturing and transport. Thus a second mode of theory development in historical and comparative theory is the proposal and testing of hypotheses regarding whether a particular master process is indeed the most important driver of specific historical changes.

Other examples of "master process" models are Collins's model of intellectual development, in which the evolution of philosophical discourse within Europe, China, Japan, and the Islamic world is presented as following the same basic pattern of alternatively focusing and dividing attention in a limited "attention space" supported by a fluctuating material base; Mann's model of the growth in the size and complexity of states from ancient Mesopotamia to the twentieth century as driven by increases in the same four basic means of projecting power (political/administrative, economic, coercive, and ideological); and Eisenstadt's model of the rise and decline of agrarian/bureaucratic empires as resulting from the constitution and dissolution of cultural/political centers through cycles of competition among elites for control of "free resources." These works do *not* argue that all trajectories of social change follow the same course; rather they aim to explain the diverse trajectories of historical societies by showing how the operations of a single master process, working through different conditions in different societies, produced the variety of observed trajectories of change.

A third mode of historical and comparative theorizing is the strategic case study, in which a specific historical case of societal development is explored to cast light on a particular, theoretically framed problem. For example, Seymour Martin Lipset examined labor politics in the United States in order to ask why the development of socialism was so weak in the United States; Robert Bellah examined the cultural belief system of Tokugawa, Japan, in order to ask why Japan had moved more rapidly than other Asian nations in developing industrial capitalism; Neil Smelser studied the effects of the early British factory system on family structure in order to ask how the modernization of production technology interacted with change in other spheres of social life; and John Markoff examined the course of the French Revolution of 1789 in order to ask how much of revolutionary policy was determined by class interests prior to the revolution and how much was the

result of unexpected responses to social and ideological conflict produced by the revolution itself.

Clearly, historical and comparative theory is not uniform in its approach. Indeed, Tilly has attacked historical explanation by means of master processes, as smacking of ill-founded universalism, preferring to see various historical trajectories as generated by different combinations of discrete social mechanisms and relationships. Wallerstein, by contrast, has argued for the need to have sweeping theories to organize the flood of historical facts and to unite historical diversity into comprehensible patterns. In part, this reflects different approaches to projecting future trajectories as well, with Tilly arguing for the difficulty of prediction, given that many different combinations of basic social mechanisms and relationships can arise, while Wallerstein claims to derive a clear vision of the future development of the world-system from his unified theory.

Nonetheless, the most influential recent works in historical and comparative theory share the following characteristics: (1) They acknowledge a variety of historical trajectories in the development of political systems, economic organization, cultural values, and how they combine to constitute particular concrete societies. Indeed, they take the goal of explaining such variety as primary, rather than seeking universal templates for all social change. (2) They generally focus on one aspect or process of social change—e.g., revolution, state building, economic growth, democratization—and seek to explain how that aspect or process originated and developed toward particular outcomes in different societies. (3) They are primarily inductive, developing limited generalities or identifying recurrent patterns among historical trajectories through detailed examination of empirical data on those trajectories.

Historical and comparative theory has been attacked by social scientists from varied directions. On the one hand, experts in statistical methods have argued that the inferential basis of historical and comparative theory is inadequate, since generalizing from a handful of cases—and most works of historical and comparative theory comprehensively examine less than a dozen cases—is logically suspect. Given that chance variation can strongly affect outcomes in small numbers of cases, drawing "large conclusions from small n's" will often be misleading. On the other hand, social theorists who use more deductive methods—such as rational choice theory—have argued that the inductive method of historical and comparative theory is open to biased or incoherent selection of data from the cases under study and thus is incapable of leading to reproducible and cumulative results. Without a shared theory to guide the proposal and testing of hypotheses, each researcher may find his or her own unique way or even get lost in the mass of historical data.

Both of these criticisms, however, misconceive the goals or procedures of historical and comparative theory.

Statistical inference from a small number of cases is only defective if one's goal is to estimate average characteristics in a larger universe of similar cases from which the sample is drawn. Thus if there were some uniform and universal process of "revolution," and we wished to infer the characteristics of all "revolutions" from a small sample, we would have a problem of logical inference. However, historical and comparative theory starts by granting that specific cases of a given phenomena—such as revolution—may vary widely in respect to important characteristics. What is important for the theory is to map and explain those variations. Thus the historical and comparative theory of revolutions may first seek to work out the reasons for the similarities and differences between the French Revolution of 1789, the Russian Revolution of 1917, and the Chinese Revolution of 1949 by analyzing their various constituent social conditions and relationships (e.g., the formation of specific coalitions, the resources of various actors, and the choices they faced). When confronted with another revolution—such as the Iranian Islamic Revolution of 1979—the question is not whether the characteristics of that case fully conform to the characteristics of the other three (which is not likely), but whether the similarities and differences from the other revolutions can in fact be explained by some combination of the conditions and relationships used to explain the variation in the previous cases, or if still other factors need to be introduced. If so, the theory needs to be altered or enriched; but the problem of inferring universal characteristics from a small sample does not arise—that is a wholly different problem, and generally inapplicable to the issues pursued in historical and comparative theory.

In regard to the alternative criticism, it is true that there is a danger that if historical and comparative theory descended into complete and unbridled induction, its results would lack coherence. But again, that is not how historical and comparative theory proceeds. Historical and comparative theory does not select cases, or data within cases, at random. Instead, it generally focuses on major historical processes for which there are prior explanations, generated by historians, other social scientists, or other historical and comparative theorists. Research proceeds by juxtaposing the prior explanations with new cases or combinations of cases and seeking the adequacy of prior explanations. Progress then accrues in one of two paths. Existing explanations may be enriched and made more complex by adding additional factors in order to create new combinations of explanatory factors that will extend the accuracy and/or range of explanation of the cases under study. Or existing theories may be altered or combined to produce a simplifying master process theory that explains the pattern of events within and across cases in terms of variations on a single general process. Either way, the result is progress in accumulating insights, and explanatory breadth, around a shared core of common issues and problems.

Historical and comparative theory has become the primary method of theorizing about large-scale and long-term historical processes. By inductive study of multiple cases of such phenomena as industrialization, state building, democratization, nationalism, and revolutions, and testing propositions regarding how well various combinations of social factors, mechanisms, and master processes account for specific social changes, historical and comparative theory seeks to explain the varying trajectories of such phenomena across societies and over time.

HISTORICAL MATERIALISM

Historical materialism (aka. histomat) is the metatheory of societal development that undergirds the Marxist "research programme" on the genesis, structure, and change of social formations, from primitive communism to the advanced communist society of the future. Although Marx himself modestly described the materialist conception of history as the "guiding thread" of his studies, the materialist conception of history is not simply a heuristic tool for the analysis of history, but presupposes and projects a substantive onto-theo-teleological philosophy of history with a practical intent.

Through a cross-reading of Hegel's dialectical philosophy and Feuerbach's materialist anthropology, the young

Marx initially developed historical materialism as a philosophical anthropology and only later, from 1845–1846 onwards, as a philosophically informed sociological theory of historical development. Marx outlined the principles of historical materialism in systematic fashion only twice: first, in the first part of *The German Ideology* (1845–1846) and next in the famous "Preface" to *Contribution to the Critique of Political Economy* (1859).

In the *Theses on Feuerbach* (1845), which Engels published in 1888 as an appendix to one of his own books on German philosophy, Marx presented in shorthand the philosophical-anthropological foundations of the dialectical theory of historical praxis that subsequently will inform his more systematic sociological formulations of historical materialism, as well as the concrete historical research that is built on it. In an unsurpassed attempt to synthesise the materialist tradition of philosophy (from Democritus to Feuerbach) with the dialectical one (from Heraclites to Hegel), he insists with Feuerbach on the sensuous nature of human activity and adopts a materialist position that puts Hegel "back on his feet." Against Feuerbach he recovers the "rational core" of Hegel and proposes a dialectical correction of Feuerbach's contemplative materialism that is able to take into account the dynamic nature of human activity and history.

While the *German Ideology* (1845–1846) was left to the "gnawing critique of the mice" and remained unpublished until 1888, the result of the philosophical reflection on—and clarification of—the fundamental principles of historical materialism could immediately be felt in the "mature writings" of Marx, to start with the *Communist Manifesto* (1848), where the materialist-dialectical conception of history is presented in terms of the history of class struggle. Although class analysis is part and parcel of the materialist conception of history, it is surprisingly absent from the Preface to *Contribution to the Critique of Political Economy* (1859), the *locus classicus* of historical materialism where Marx ([1859]1971) sums up the general results of his investigations in a justifiably celebrated and controversial passage:

"In the social production of their life, men enter into definite relations that are indispensable and independent of their will, relations of production which correspond to a definite stage of development of their material forces of production. The sum total of these relations of production constitutes the economic structure of society, the real basis, on which rises a legal and political superstructure, and to which correspond definite forms of social consciousness. The mode of production in material life conditions the social, political and intellectual life process in general. It is not the consciousness of men that determines their being, but, on the contrary their social being that determines their consciousness (pp. 20–1).

In this canonical passage, the main tenets of historical materialism are articulated in terms of a complex of relations between the "economic structure of society" and its "ideological superstructure." That the former determines, or better, conditions the latter is the central thesis of historical materialism. The economic structure of society is usually defined in terms of the conjunction of the "forces" and the "relations of production." Referring to all the factors that contribute directly to the process of material production, the "forces of production" include both the means of production (natural resources, tools, and machinery) and labour power (physical strength, skills, and technical knowledge). Relations of production are human relationships of power over persons and productive forces that regulate production and distribution. Together, the relations and the forces of production comprise the mode of production and form the real basis or the ground on which the superstructure of any social formation rests. The superstructure that arises on this basis comprises the legal and political institutions (Althusser's "ideological apparatuses of the state"), as well as the legal, political, religious, or philosophical ideas, theories, and ideologies that are necessary for maintaining the conditions of material production and overall reproduction of the social formation. Although the superstructure is "in the last instance" (Engels [1845–1846]1972:294) determined by the economy, the relative autonomy of the superstructure is not denied thereby: Althusser has shown that the economic determination allows for the dominance of culture, as was the case in the Middle Ages when religion functioned as the first and main instance of determination.

Having articulated the relations of determination in the topological scheme of the basis and superstructure, Marx next introduces the dialectic between the forces and the relations of production as the mechanism of societal development. As the forces of production develop, they enter into contradiction with the existing relations of production (which "turn into their fetters") and the intensification of this contradiction leads to the breakdown of the existing mode of production and its superstructure. This contradiction is resolved in favour of the forces of production, and new, higher relations of production, whose material preconditions have "matured in the womb of the old society itself," emerge that better accommodate the continued growth of society's productive capacities.

In order to avoid the classic fallacies of economism, productivism, reductionism, and determinism with which Marxism is often associated, it should, however, be stressed that the more sociological formulations of historical materialism are embedded in the more philosophical versions and that Marxism itself is a dialectical materialist theory of historical praxis that analyses the "laws of historical development" in order to participate in the revolutionary transformation of the capitalist mode of production.

HISTORICISM

The English term *historicism* came into use at the beginning of the twentieth century as a translation, on one hand, of the German term *Historismus* (as used by Wilhelm Dilthey, Ernst Troeltsch, Friedrich Meinecke, and others), and of the Italian term *storicismo* (Benedetto Croce), on the other. The term *historism* is also frequently used in English, and in German the term *Historizismus* is sometimes found. In both languages, the meaning of the term is often identical, sometimes different, and quite frequently completely opposing. In other words, here one can find an ambiguity and confusion of concepts remarkable even in the cultural sciences.

Originally, the German term *Historismus* denoted the view that ideal (*geistige*), cultural, and social realities cannot be described and explained by means of general theories and therefore cannot be assessed by universal norms either. From their historical nature derives the necessity, it was argued, to understand and judge them in their particularity and individuality. Therein the specific privilege and the essential dignity of these realities can be seen (as in Leopold von Ranke's famous aphorism according to which each epoch was "immediate to god" [*unmittelbar zu Gott*]). If in contrast to this it is referred to the "problems of historicism," as especially in Ernst Troeltsch, the central point is that historicism does imply or must lead to relativism, cognitive or explanatory as well as ethical.

Obviously, negatively connoted is the English term *historicism* in the sense in which Karl Raimund Popper brought it into the discussion. Popper uses it to describe a position that is diametrically opposed to historicism in the sense of a historical relativism. He means the view—represented by Auguste Comte and John Stuart Mill, and then by Karl Marx and the Marxist theorists of history—that the process of history is throughout determined by general laws and that any science of history must therefore rely on these laws in its explanations and predictions. Popper's criticism of this view (in Miller 1985:298) is that the evolution of human society is a "*unique* historical process," and that it is logically impossible to account for unique processes by going back to universal laws. There may be observable and even explainable "trends," but trends, according to Popper, are no laws.

More recently, in certain circles a use of the term *historicism* has become common and dominant that comes close to the meaning of historicism (as relativism) but that is meant in a thoroughly programmatic and affirmative way by its protagonists. Initially, this view arose in literary studies, namely in the United States, before it gained a more widespread influence in the cultural and social sciences, where it provoked vehement controversies. Its credo is closely related to that of postmodernism, and it essentially consists in a radical rejection of an "objective" historical knowledge. This is explained by the peculiarity of historical facts as well as by the historicity of the historical cognition itself.

As far as the new historicism aims at the historical constructedness of ideas and beliefs in general, and the relationship between structures of domination and modes of cultural production in particular, there exists an obvious affinity to what is called ideological analysis in historical cultural sociology, which on its part has been influenced and/or challenged particularly by Marxist thinking. The theoretical and methodological problems posed by the historicity (or historical "reflexivity") and the critical intention of such analyses have led to very fundamental and almost endless discussions in sociology. New historicism seems to have been rather insensitive or uninterested with regard to these problems. This may account for the fact, that, at least in the social sciences, it has not established itself as a really new and durable "paradigm."

HOLLYWOOD FILM

The historical development of Hollywood cinema, including the art and business of filmmaking along with the

popular experience of film viewing, has influenced every aspect of social life in North America—and increasingly around the world—for more than a century. In continuous efforts to reach the widest possible audiences, the Hollywood film industry from the outset sought to create marketable products, to which end it moved to standardize all phases of the manufacturing and distribution of motion pictures. By 1930, the industry, galvanized by the dominant seven studios (MGM, Columbia, Twentieth Century Fox, Warner Brothers, RKO, Paramount, Universal), was able to achieve its goal of a commercially successful popular entertainment medium. In this context, filmmaking evolved through a merger of commercial and aesthetic impulses, with the former typically enjoying the upper hand. The studio system, erected on a foundation of rapidly produced, formulaic pictures for mass audiences, was drawn toward a variety of easily identifiable genres: Westerns, thrillers, horror films, musicals, comedies, dramas, and so forth. This Hollywood synthesis lasted from the 1920s until well into the 1960s. Filmmakers employed narrative traditions taken from literature and drama wedded to technical and managerial techniques that were integral to American capitalism. By the 1930s, Hollywood cinema had become the largest popular entertainment form in the United States, spreading to the rest of the globe during the post-World War II years—a trend later heightened by the video revolution, computer technology, and other elements of economic globalization.

As a general medium, cinema was broadly understood (by producers, viewers, and critics alike) as the most powerfully "realistic" of all cultural media insofar as it was able, through mechanical reproduction, to capture events, actions, and experiences drawn from people's everyday lives and give them larger-than-life representation on celluloid. It fell mainly upon the director to integrate the multiple dimensions of filmmaking into a visibly attractive whole, replete with quickly paced images, star performers, sound effects (after 1929), and compelling story lines. From this standpoint, film was the one medium within which widely diverse art forms could be brought together: photography, theater, writing, acting, music, and editing. While realism was typically the basis upon which filmmakers arrived at an end product, their work also engaged the realm of illusion and fantasy made possible by increasingly sophisticated movie imagery. The great classic directors, later recognized as auteurs—Fritz Lang, Alfred Hitchcock, Billy Wilder, Howard Hawks, Frank Capra, John Ford—achieved their enormous cinematic impact precisely through their capacity to merge "realism" and "formalism" while, for the most part, adhering to the rather strict genre system established by the Hollywood studios. If the film medium was unparalleled in its popular reach, it simultaneously operated to help legitimate dominant American institutions and values: the patriarchal family, conventional

images of male heroism, patriotism, the work ethic, redemptive violence, and of course happy endings. The great power of ideological hegemony exercised by Hollywood filmmaking during the heyday of the studio system cannot be stressed enough.

By the end of World War II, an array of legal, technological, and social developments converged to undermine the structural foundations of the studio system. The federal antitrust suit against Paramount in 1948, combined with the growing power of labor unions and rebellion against factory-like conditions of studio production, encouraged the practice of freelancing within Hollywood filmmaking. The arrival of television in the early 1950s cut deeply into movie attendance revenues, forcing the movie executives to rethink long-standing practices. These and related factors laid the groundwork for erosion of the traditional studio system, paving the way toward a new, more variegated, and creative era of film production that eventually became known as the New Hollywood. The old factory system of filmmaking came to make less sense in a context of rapid economic changes and social explosions that swept the United States during the 1960s and early 1970s. As independent filmmakers gained broadening leverage in Hollywood, the center of power gradually shifted in favor of an entirely new generation of producers and directors with enough reputation and financial backing to create their own artistic styles and challenge many Hollywood conventions, including the genre formulas. The breakup of institutional and cultural restraints associated with the studio system set the stage for more extensive artistic freedom for producers and directors, leading in turn to the simultaneous economic and cultural transformation of Hollywood.

The New Hollywood gave rise to films that were more visually arresting, thematically challenging, and stylistically individualized than what the studio system had generally produced. Films like *Bonnie and Clyde* (1967), *The Graduate* (1968), and *Easy Rider* (1968) set the tone for a new wave of creative, rebellious filmmaking that readily cut across the classical genres, followed by pictures like *The Godfather* (1972) and then blockbusters such as *Jaws* (1975), *Star Wars* (1977), and *Close Encounters of the Third Kind* (1977). The New Hollywood auteurs, led by Francis Ford Coppola, Steven Spielberg, George Lucas, and Martin Scorsese, were typically graduates of the leading film schools, as were the majority of producers, writers, and editors of the period. Creativity, irreverence, and experimental approaches ruled the day, with huge budgets often matched by equally huge box-office revenues for pictures that frequently won praise from critics and mass audiences alike. Coppola (b. 1939) emerged as the vanguard figure of this group, the mentor to an entirely new breed of directors. The architect of the several *Star Wars* episodes, Lucas (b. 1944) eventually came to exercise vast financial and creative influence over the U.S. film industry, emerging as

the CEO of Lucasfilm, the largest independent studio in the world. Other auteurs of the 1970s and beyond—for example Scorsese (b. 1942)—achieved the bulk of their initial auteurial status by boldly affirming the quality of their cinematic art over commercial pressures. Other directors who self-consciously set out to depart from conventional Hollywood filmmaking included Woody Allen, Mike Nichols, Robert Altman, Warren Beatty, and Brian DePalma. But working in a distinctly corporate milieu, it was still much harder for American directors to sustain the kind of independent auteurial status enjoyed by Europeans of the Italian neorealist school or the French New Wave. An industry driven by orderly pursuit of profit and mass influence clearly established limits on creativity and autonomy, meaning that technical flourishes, social themes, and political content of movies would inevitably run up against strict organizational and financial limits. The collapse of the old studio system did not usher in an era of filmmaking free of commercial imperatives even as the new generation of producers, directors, writers, and actors sought to establish new thresholds of artistic creativity. The central objective of the Hollywood film industry remained, as it always had been, to achieve the broadest mass audiences, in the United States and abroad.

The historic turn away from the old studio culture, with its conformist filmmaking and formulaic genres, in the direction of the New Hollywood was made possible by the terrain carved out by creative European directors (Federico Fellini, Vittorio De Sica, Francois Truffaut, and others), along with dramatic changes in American society (the Vietnam War, insurgent social movements, the counterculture). This turn was given its main impetus in the 1970s but continued well into the 1980s and 1990s, culminating in trends toward what can be called postmodern cinema. A more socially conscious, innovative film industry that gained mature expression through the New Hollywood auteurs never really disappeared, even in the midst of growing corporate power throughout the cultural scene. Within a nascent independent filmmaking milieu, and among a good many mainstream filmmakers too, images of social life now tended to be more fluid, open, and subversive, representative of an increasing distrust of power and tradition—hallmarks of the famous postmodern turn in culture generally speaking.

Both within and outside the film legacy, this postmodern shift represents—in its vast complexity and diffuseness—a fundamental trend in American society, first taking hold in the 1970s as a deep response to ongoing structural changes: the post-Fordist economy, globalization, the informational revolution, heightened patterns of consumption, increasing social atomization. This development was readily visible in the spheres of art and architecture, academia, mass media, popular culture, even politics. Perhaps nowhere was it more visible than in the world of cinema that, in its elaborate celebration of images, glamour, and spectacles, arguably contained strong elements of the postmodern ethos from its very beginnings. Film culture always contained strong elements of voyeurism. The well-chronicled history of Hollywood filmmaking has been one long testimony to the immense power of visual images to evoke popular emotional responses, and this would become a central ingredient in postmodern cinema.

While never a main current of the film industry since the 1970s, postmodern cinema engaged some of the most influential directors of the period: Woody Allen, Robert Altman, Martin Scorsese, Ridley Scott, Oliver Stone, Spike Lee, the Coen Brothers, David Lynch, Mike Figgis, and John Waters. As a vital dimension of media culture with its strong emphasis on new modes of technology, commodification, and the society of the spectacle, filmmaking by the turn of the twenty-first century celebrates increasingly diverse, experimental, in some cases subversive forms of aesthetic representation. Despite its location within the larger corporate structure, it often questions established social hierarchies and discourses while at the same time depicting a society (accurately enough) in the midst of turmoil, chaos, fragmentation, and violence—a Hobbesian social order that gives rise to and sustains a popular mood of anxiety, cynicism, and powerlessness, no doubt enhanced by the events of 9/11 and their aftermath.

Postmodern cinema has become undeniably part of a universe of stable references in the form of highly integrated structures, a vast network of economic arrangements, and a global communications system tied to expanding corporate media empires. It is this labyrinthine framework—profit-driven, oligopolistic, global, and ideologically dominant—that so thoroughly establishes and delimits Hollywood filmmaking agendas. This system has dramatically extended and rationalized its operations through the workings of global competition, technological refinement, and assimilation of immensely diverse markets and "constituencies"—a process just taking off at the start of the twenty-first century. The growth of autonomous spaces available for independent and semiindependent cinema within this huge corporate aegis can be understood as part of such a historical context. It is a reality that contrasts with the common view of media culture as monolithic, rigidly commodified, and totally resistant to incursions from outside the fortress. A more nuanced and contextualized understanding of film production can help explain why postmodern cinema, though often culturally subversive, turns out to be so economically assimilated and politically ambiguous—why it can be simultaneously progressive and regressive, experimental and conformist, novel and mainstream.

Postmodern cinema reflects and helps reproduce this milieu through its embrace of disjointed narratives, dystopic images, technological wizardry, and motifs dwelling upon mayhem, ambiguity, death of the classical

hero, and breakdown of dominant values or social relations. These features permeate much creative filmmaking of the period—from *Taxi Driver* to *Pulp Fiction,* from *Who Flew over the Cuckoo's Nest?* to *Thelma and Louise,* from *Blade Runner* to *American Beauty.* They virtually define the films of Allen, Stone, Waters, Quentin Tarantino, and the Coen Brothers. Yet, while such film culture calls into question certain manifestations of class and political power, it simultaneously negates prospects for collective identity and subjectivity required for effective social change; its cultural radicalism is never translated into anything resembling political radicalism. On the contrary, postmodern cinema more often than not encourages a certain flight from politics—a cynical, detached, disempowering attitude toward the entire public sphere typical of an increasingly depoliticized society.

HOLOCAUST

THE HISTORICAL MARKERS OF THE HOLOCAUST

No mass killing has stimulated more historical, theological, or philosophical reflection than the systematic destruction of almost 6 million European Jews. One result of this attention is that it has become the only such massacre to receive its own name. Even thinkers who are ideologically against construing the Holocaust as unique are now constrained by language to designate it so every time they use the term. This inherent uniqueness is a large part of why

social theory, concerned as it is with universal and generalizable propositions, has largely shied away from the subject. On the other hand, the Holocaust has over the last three decades gradually come to be understood as an epoch-making event that plays a defining role in the self-understanding of the Western world. As such, it casts a wide shadow on social theory. The Holocaust gained this symbolic stature not only from the staggering number of people killed but because of the clarity of its genocidal intentions and its unprecedented use of modern industrial means of mass extermination.

The Holocaust thus put modernity, the primary analytic and normative framework for social theory, into question. The way in which it shed light on basic questions of morality, reason, and humanity made it into a paradigmatic test case for the relation of modernity and social theory. For thinkers who take this view (Adorno and Horkheimer 1944; Arendt 1963; Bauman 1989), the mass murder of European Jews by the Nazis must be considered not solely as a German-Jewish tragedy but as a tragedy of modernity itself. In this regard, social theory can help explain the Holocaust and how the Holocaust has called into question several of the core theoretical concepts of social theory.

The term *Holocaust* is somewhat of a misnomer. It originates from the Greek term *holokauston,* which means burnt whole, implying a religious sacrifice. Given that the Nazi mass murder was not a sacrifice, but rather motivated by an anti-Semitic ideology whose main objective was the physical elimination of European Jewry, many prefer to refer to it as a genocide or by the Hebrew word *Shoah.* Nevertheless, Holocaust has remained the central term in the English-speaking world, whence it has spread to other parts of the world, and it is now the most widely used term for the mass murder of Jews in Europe. Nazi Germany also targeted other minorities such as Gypsies and homosexuals, as well as political opponents and large segments of the Slavic population it had subjugated in the course of its military expansion during World War II. But its main focus and most systematic efforts were reserved for the attempt to render Europe *Judenrein* (free of Jews). Approximately 6 million European Jews, out of an initial population of 10 million, perished in the Holocaust.

Amidst Germany's expansionist policies during World War II, the extermination of the Jews was conducted in parallel with a total war of destruction in Eastern Europe. Fully aware that such an endeavor would put strains on Germany's war effort and its resources, the Nazis were eager to find ways to kill such large numbers of people in more efficient ways. Toward that end they employed mobile death squads and specially designed gas chambers in death camps such as Treblinka, Belzec, Majdanek, and Auschwitz. Such camps have become the symbol for the barbarism of the Nazis. Inmates of those camps endured unimaginable sufferings (such as starvation, beatings,

torture, and medical experiments) before they were led into the gas chambers. After the gas killed them, they were burned in nearby furnaces. Prior to being cremated, the Nazis made sure to strip the dead of their last possessions, removing gold teeth from the corpses. The cruelty and obsession with which the Nazis persecuted the Jews is evidenced in the way they heightened their efforts to kill as many as possible when it became evident that Germany was losing the war. Shipping Jews eastward to the camps remained a priority even when these very same trains were needed for critical military purposes. Given the logistical efforts involved in the systematic murder of millions of Jews, the Nazis frequently had to rely on help from the regular German army as well as from willing collaborators from the countries they occupied. Despite the scope of this bureaucratic-industrialized execution, the murder of the Jews did not lead to any significant attempt to halt the death factories. The primacy of killing and destruction has caused many observers to evoke the image of hell, a concept beyond the analytical tools of social theorists.

THE HOLOCAUST AS METAPHYSICAL OR AS GERMAN-JEWISH EVENT

Despite, or maybe because of, the unprecedented nature of the Holocaust, social scientists did not study, let alone explain, how the Holocaust could happen and what its broader implications for the study of human behavior, reason, and morality were. Instead, reactions veered into the metaphysical and neglected the particular historical and German-Jewish components in favor of universalized and general statements. A "metaphysical secret" poses a lesser challenge to the basic assumptions of a field, or so social theorists at the time thought, than the pursuit of explanations for why these very assumptions about human behavior and morality were negated by a historical incident. Can social theory provide explanations, or is the Holocaust a unique event outside of historical and social understanding? Two central themes provide some insight into the relationship of the Holocaust and social inquiry. One is the challenging question of whether the Holocaust is part of modernity or the opposite, a return to barbarism, representing the breakdown of modernity. Another relates to the question of whether the Holocaust should be understood as part of Jewish-German history or rather as a universal event with implications for the understanding of modern society.

While the study of the Holocaust was initially bracketed, both conceptually as well as empirically, social scientists did explore the workings of Nazism. In his writings and radio addresses during World War II, Talcott Parsons sought to understand Nazism as the outcome of Germany's special path to modernity. Here barbarism is the counter-principle of modernity. In the historiography of National-Socialism, this approach is called the *Sonderweg* (special path), that is,

the deviation of Germany from the civilizing path of modern, liberal societies. Especially Parsons's essay of 1942, "Democracy and Social Structure in Pre-Nazi Germany," explains the differences between Germany and Anglo-Saxon democracies in terms of Germany's interdependent feudal, militaristic, bureaucratic, and authoritarian features. One appeal of the National-Socialist movement consisted of its mobilization of the extremely deep-seated romantic tendencies of German society in the service of a violently aggressive political movement, incorporating a fundamentalist revolt against the whole tendency of rationalization in the Western world, with democracy as its deepest institutionalized foundation. These were the specific features of pre-Nazi Germany that differentiated it from that of other Western countries. In *The Germans,* Norbert Elias (1996) followed on this path and analyzed the historical conditions in Germany leading to what he called "the deepest regression into barbarism in the 20th century."

Among the first systematic studies on the Nazi State was Franz Neuman's *Behemoth,* first published in 1942. The book could, of course, not be concerned with the mass killings of the Jews, but it instead explored the functioning of the totalitarian Nazi State, which would in the later work of one of his students, Raul Hilberg (1961), be referred to as the Destruction of European Jewry. Neuman's main thesis, which is central to current global concerns about international law and its enforcement, was that the Nazis were oblivious of international conventions. The Nazis looked at international law as a mixture of British imperialism and rootless Jewish spirit. Consequently, for Hilberg, the abolishment of international law and legal equality was the beginning of the destruction process. Hilberg identified the pillars of the destruction process in the party-elite, bureaucracy, army, and industry, constituting the Behemoth. He never regards those structural elements as reifying ones but emphasizes the creativity of the bureaucrats, their willingness to act. Hilberg's studies, even though intentionally focusing on the perpetrators and not on the victims, presents us with a social analysis of the destruction process, taking action and structure both equally into account.

MODERNITY AND BARBARISM

However, this nation-specific focus remained the exception. Social scientists and theorists turned their attention toward universal (and thus generalizable) features of Nazism. It was within the broader theme of modernity that social theorists started to pay more attention to the Holocaust and its effects on the relationship of modernity and social theory. Looking at some of the principal social theorists who have tackled the phenomenon of the Holocaust, we can identify two ambivalent conceptualizations of modernity. One perceives of modernity as the realization of progress and is firmly embedded in the

Enlightenment ideals; the other focuses on barbarism as the flip side of these processes. A central question that links the two is whether barbarism constitutes a separate breakdown of civilization or whether it is very much part of modern rationalization and bureaucratization itself.

The founding fathers of sociological theory are firmly embedded in the first camp. For them, civilization is the guiding principle of modern society. Barbarism is its counter-principle. Progress and civilization are not merely the outcome of modernity but its constitutive principles. Preindustrial societies are seen as lacking in reason, rationality, and progress, to mention a few of the core ideas of modernization theories that dominated the social sciences after World War II. To be sure, the founding fathers were aware of the costs that modernity could incur: Weber's "Iron Cage," Marx's "alienation," and Durkheim's "anomie," to name but a few, are evidence for the ambivalence with which modernity was perceived. But ultimately, they all stressed the potential of modern society to become the bearer of Enlightenment ideals. Accordingly, most social scientists viewed the Holocaust as an aberration and a perversion of these ideals. In contradistinction, social theory after the Holocaust has been engaged in an ongoing debate about the relationship of barbarism and modernity. Rather than viewing the Holocaust as a deviation from the emancipatory path, barbarism and civilizational breaks are perceived as inherent qualities, and for some even as inevitable outcomes of modernity and Enlightenment. The works of Hannah Arendt, Theodor Adorno, Max Horkheimer, and Zygmunt Bauman exemplify this debate, casting a wide shadow on theoretical discussions of the human condition, morality, the role of reason and rationality, as well as a continuous reassessing of Enlightenment values as such.

According to Adorno's and Horkheimer's study of the *Dialectic of Enlightenment* (1944), barbarism is an immanent quality of modernity, rather than its corruption. In their view, civilizational ruptures inhere, at least potentially, in the processes of rationalization and bureaucratization that characterize modernity. It is the breakdown of reflexivity within modernity that facilitates the destructive potential of modernity. This has little to do with German peculiarities, but is related to the Western process of instrumental reason and Enlightenment.

It was Hannah Arendt who embodied both, the Enlightenment with a strong skepticism, in her political and social theory. An article published in 1950, "Social Science Techniques and the Study of Concentration Camps," provides first clues. Arendt claims that the concentration camps are beyond understanding, if we remain within the conventional social scientific assumptions of rationality. Why? Because, according to her, most of our actions are of utilitarian nature. Totalitarianism, or in this case, the camps, do not fit this utilitarianism. According to Arendt, it seemed as if the Nazis were more concerned with running extermination factories than with winning the war. Her initial thoughts on

the Holocaust were echoed in *The Origins of Totalitarianism* (1951) and *Eichmann in Jerusalem* (1963). The ambivalence between the above mentioned frames of civilization and barbarism remained the primary organizing principle for her thoughts on the Holocaust. For Arendt, the Nazis and Eichmann as its personification represented the breakdown of the Enlightenment and democracy, of critical judgment and of reason. Nazism, for her, was nothing particularly German, but rather a manifestation of totalitarianism. Universalizing the phenomenon did not preclude her from recognizing its singular features. She perceived the uniqueness of the Holocaust not only to consist in the scope and systematic nature of the killings, but in the very attempt to deny humanity as such. Conventional categories of crime become irrelevant, a view that was later incorporated into the legal canon through the concept of "crimes against humanity." Arendt's own ambivalence about whether the Holocaust was beyond comprehension or required a new vocabulary is evidenced in her shifting understanding of the nature of evil. In her work on totalitarianism in 1951, she had called attention to the notion of "radical evil," but by the time she observed the Eichmann trial in 1961, she emphasized the "banality of evil" and Eichmann as its personification.

In his famous *Obedience to Authority,* Stanley Milgram (1973) tried to operationalize Arendt's thesis. As a social psychologist working within a behaviorist framework, his findings were clear-cut: Given the right circumstances, everybody has the potential to turn into an Eichmann, or in Milgram's more specific setting, to administer painful and even deadly electric shocks. The historian Christopher Browning (1992) put this theory to the test in his study titled *Ordinary Men.* Researching a German killing squad in Eastern Europe, Browning argues that bureaucratization diminishes our sense of personal responsibility.

Zygmunt Bauman's (1989) arguments in his book *Modernity and the Holocaust* express a radicalization of the modernity equals barbarization thesis. Here we have traveled from one extreme of the continuum, namely the assumption that barbarism is a counter-principle of modernity, to another extreme, namely Bauman's view that modernity equals barbarism. The Holocaust is no longer a perversion of the principles of rationality but rather its direct outcome, insofar as it provides the necessary logistics for its execution. Furthermore, Bauman suggests that the inability of the social sciences to grasp the essence of the Holocaust is also a function of its sociological approach to morality as such. He objects to a historical understanding of the moral foundations of modern society. He argues that distance between people prevents all moral relations between them. Instead, he stipulates a presocial morality or an unsocialized self based on unconditional responsibility for the other. Consequently, he views modernity not as the foundation of morality but as a main source of its corruption. For Bauman, the lessons of the Holocaust have to lead to a postmodern

ethics, making his arguments part of the postmodern turn. If Arendt focuses on the *human condition,* emphasizing the social and political environment by which morality is circumscribed, Bauman stresses *human nature,* conceived as an ahistorical and ultimately ontological category.

FROM POSTMODERNITY TO REFLEXIVE MODERNITY

Questions of modernity and humanity continue to loom large over attempts to grasp the meanings of the Holocaust. It is, therefore, not surprising that self-critical evaluation rather than metaphysical abdication resonates in a booming literature that focuses, among other things, on questions of representation and the Holocaust in popular culture (e.g., Friedlander 1992) and the role of collective memory and commemoration (e.g., Young 1993). Recent post-Holocaust studies have also paid attention to the role of gender (Ofer and Weitzman 1998), to changing perceptions of the Holocaust and the impact of cosmopolitan memories on the institutionalization of human rights regimes (Levy and Sznaider 2002), as well as on the fate of other minorities (Porter and Hoffman 1999). Together this growing body of literature in Holocaust and comparative genocide studies has made its way into school and university curricula.

What many of these recent works share is an increasingly reflexive perception of modernity. On this view, the project of modernity is realized precisely through the memory of and self-conscious realization of the barbarism that has plagued it since its inception. It is a self-critique of the anticivilizational potential that it contains. By recognizing (and thus acknowledging) its own destructive tendencies, it no longer operates within a rigid dichotomy of modernity and barbarism. The iconographic status of the Holocaust, as the incarnation of evil, has greatly contributed to new political sensibilities as well as to growing scholarly attention to the dynamics of genocide, ethnic cleansing, and the nation-transcending significance of human rights.

HOMANS, GEORGE

American social theorist of the twentieth century, George Homans (1910–1989) was the founder of behavioral sociology, the first and arguably the most prominent sociological exchange theorist, and the architect of a highly controversial approach to theory construction in sociology. Homans was the first sociologist to outline the sociological implications of psychologists' work on learning or behavioral theory, particularly the operant conditioning paradigm of B. F. Skinner. These psychological principles of behavior formed the foundation of his theory of social exchange, which was most fully explicated in *Social Behavior: Its Elementary Forms* ([1961] 1974). A strong methodological individualist who believed that explanations of all social phenomena could be derived from axioms about the behavior of individuals, Homans promoted his conception of theory in a large number of works, including "Contemporary Theory in Sociology" (1964b), "Bringing Men Back In" (1964a), and *The Nature of Social Science* (1967).

In addition to his theoretical contributions, Homans is known for his insightful descriptions of the structure and processes of human groups, particularly his book of the same name, *The Human Group* (1950).

Homans was educated at Harvard, where he became a junior member of the Society of Fellows. The society eschewed traditional graduate training and the PhD, which Homans never received. Originally a student of literature, Homans's first introduction to the discipline of sociology was through the writings of Vilfredo Pareto. After Homans coauthored a book on Pareto, Pitiriim Sorokin invited Homans to become an instructor at Harvard, where he served

on the faculty from 1939 to 1980 (with an interruption for service as a lieutenant commander in the Navy during World War II). Along with Talcott Parsons, Homans was a founding member of the Department of Social Relations at Harvard. After that department's demise, he became the first chair of the newly formed Department of Sociology at Harvard.

During these years, Homans made significant contributions to three major areas of sociological inquiry: the description and analysis of social structures and social processes in small human groups, problems of theory and methods of theory construction, and the development of an exchange theoretic approach based on the principles of behavioral psychology. The first of these contributions took place during his early years of work and was the product of an inductive strategy in which Homans abstracted theoretical generalizations from descriptive studies of actual behaviors of groups in various settings. *The Human Group,* published in 1950, is the exemplar of this period. The second and third contributions took place more or less coterminously, as Homans shifted to a more deductive theoretical strategy and, at the same time, applied this strategy in developing a new theory of social exchange. This theory was first outlined in his 1958 article, "Social Behavior as Exchange," and later elaborated in *Social Behavior: Its Elementary Forms* (1961), which he revised in 1974. Homans's new theoretical strategy emerged from his long-standing criticism of most sociological theory, especially the structural functionalism of Talcott Parsons, Émile Durkheim, and Claude Lévi-Strauss. Homans's own theorizing was marked by several distinct characteristics: an emphasis on the *explanation* of relationships rather than mere categorization, the derivation of lower-order propositions from general axioms, and—most controversial of all—the use of principles from behavioral psychology as the general axioms.

THE EARLY INDUCTIVE WORK ON SMALL GROUPS

In his early work, Homans concentrated on analyzing the structures and processes of relatively small human groups, typically using observational data collected and reported by others. His mentors and colleagues at Harvard introduced him to a number of field studies of both modern and aboriginal human groups, and his long periods at sea while in the Navy gave him an opportunity to reflect upon these studies at length. Homans became convinced that the then dominant view of "cultural uniqueness" was wrong, and that common concepts united these diverse and often geographically distant groups. Upon returning to Harvard, he began to explore these ideas more systematically in *The Human Group.*

Homans approached this task inductively, beginning with the observations of the actual behaviors and activities of people in concrete settings and then developing generalizations from these observations. He organized his analysis around three main concepts and the interrelations among them: activities (what people do in particular situations), interaction (how activity by one person influences activity by another), and sentiments (actions indicative of the internal psychological states of the people involved in activities and interaction). These three elements, which continued in redefined form in Homans's later work, comprised an internal group system; that is, changes in one element tended to produce changes in another. The elements could be organized and elaborated in various ways, producing new forms of organization and group structure.

Five case studies comprise the core of *The Human Group.* They range from a factory work group (the Bank Wiring Room in the Hawthorne Western Electric Plant) to a street gang (the Norton Street Gang described in William Whyte's *Street Corner Society*) to a primitive society (the Tikopia family described in Raymond Firth's famous ethnography) to a New England community. Based on descriptive summaries of these case studies, Homans then abstracted a set of general propositions that described the empirical regularities that he or others had observed. Each summary and set of generalizations built on the previous ones, by attempting to either confirm or qualify the earlier ones, and then adding further generalizations induced from the new case study. The result was a large number of clearly stated generalizations, firmly anchored in empirical observation, that provided a foundation for more abstract theoretical development.

In addition to providing insightful descriptions of group process, *The Human Group* began to reveal Homans's concern with the nature and shortcomings of sociological theory. His own emphasis on the importance of clearly defined concepts, and explanation in the form of testable propositions, was also evident, as was his firm belief in grounding theory in the empirical world.

THE DEVELOPMENT OF HOMANS'S VIEWS ON THEORY

The propositions that Homans developed in *The Human Group* were only the beginning of his theoretical development. Influenced in part by opposition to the sociological theory of his day, and in part by readings in the philosophy of science, Homans gradually turned from induction to deduction and the advocacy of formal, axiomatic theory. Homans's close association with Talcott Parsons at Harvard was instrumental in this development. While Homans admired much of Parsons's work, he was highly critical of his style of theorizing and, more generally, of the structural functionalism then dominant in sociology. He believed that Parsons's "theories" were merely conceptual schemes that named and categorized phenomena while ignoring the *relations* between phenomena. Homans believed that theories should explain phenomena and that explanation required

not only concepts but propositions linking concepts to one another. As he further argued in *The Nature of Social Science,* explanation—and theory—must consist of showing that one or more propositions of a lower order of generality can be deduced, logically, from more abstract propositions at a higher order of generality. The lowest order propositions are those that describe actual events in the empirical world; that is, the kind of propositions that Homans developed in *The Human Group.* Showing that it is possible to deduce an empirical pattern from a set of more general propositions and axioms, Homans argued, is equivalent to explaining the pattern.

The most controversial aspect of Homans's developing views on theory was his argument that psychological, not social, principles must form the axioms from which propositions about social interaction and social institutions are derived. This position reflected the British individualistic tradition of Herbert Spencer and explicitly opposed the French collectivist tradition of Durkheim and Lévi-Strauss. Indeed, some have argued that Homans's views were developed in explicit reaction to the neo-Durkheimian views of Lévi-Strauss. Whereas Durkheim believed that social facts must be explained by other social facts, and that their study comprises the distinct subject matter of sociology, Homans argued that it is impossible to explain *why* social facts cause other social facts without reference to individual behavior. According to Homans's brand of "methodological individualism," social phenomenon are always the result of aggregated individual actions. Social structures and institutions are created and sustained by the behaviors of individuals, and the highest order principles in sociological theories must therefore be about individual behavior. Consequently, Homans argued, it is essential that we bring people and their fundamental patterns of behavior back into sociological analysis.

HOMANS'S THEORY OF SOCIAL EXCHANGE

Homans's own efforts to follow this charge are best exemplified by his first (1961) and second (1974) editions of *Social Behavior: Its Elementary Forms.* In this work, undoubtedly Homans's best known and most important, he developed a theory that envisioned social behavior as "an exchange of activity, tangible or intangible, and more or less rewarding or costly, between at least two persons" (1961:13). Homans saw exchange processes not as the exclusive domain of the economic marketplace but as an integral part of all social life; that is, he argued that all interaction involves individuals exchanging rewards (and punishments) and seeking profits. These rewards include not only the monetary rewards of economic exchange but social and psychological rewards such as status, approval, and satisfaction. Homans's conception of exchange departed in two important ways from the collectivistic tradition of

Lévi-Strauss. First, Homans believed that individual self-interest, not collective or symbolic forces, provided the motivation for social exchange. Second, he believed that exchange theory should emphasize two-party exchanges between individuals, not the generalized exchanges on which Lévi-Strauss had focused. Accordingly, he largely confined his theory to direct exchanges in dyads and small groups.

Homans's aim in this work was to explain how fundamental processes of social behavior, such as conformity, power, and justice, arise out of social exchanges between individuals seeking rewards. Toward this end, he proceeded to show how established empirical propositions about these phenomena (including those developed in *The Human Group)* could be derived from a small number of general propositions—the propositions of behavioral psychology. His trio of key concepts from *The Human Group*—activities, interactions, and sentiments—reappear in *Social Behavior,* redefined for the new exchange framework and integrated with other concepts from behavioral psychology, such as stimulus, reward, punishment, cost, and value. Human activity is directed toward seeking rewards and avoiding punishment, interaction becomes the social exchange of mutually rewarding actions (at some cost), and profits (rewards minus costs) are measured against expectations, producing emotions of anger or pleasure.

The first edition of *Social Behavior* was based primarily on principles of operant psychology developed through animal research, particularly the famous pigeon studies of B. F. Skinner, another of Homans's colleagues at Harvard. This edition most clearly reflects Homans's belief that there is no clear distinction between the behavior of humans and other animals, and that both can be explained by the same principles. As the field of behavioral psychology expanded to include substantial research on humans, Homans also drew on this work. Thus, the 1974 revised edition of *Social Behavior* omitted a chapter on animal learning that was in the first edition and added the role of modeling or vicarious learning.

One of the most distinctive and controversial features of Homans's exchange theory was his belief that nothing emerges in social groups that "cannot be explained by propositions about individuals as individuals, together with the given condition that they happen to be interacting" (1974:12). Thus, he believed no new propositions were necessary to explain social exchange, other than recognizing that human needs are satisfied by other people, and that people reward and punish each other. He did, however, integrate some elementary economic principles into his largely behavioristic approach, specifically some assumptions about rational calculation of the likely outcomes of alternative behaviors. His version of economics was a modified one, however: People try to obtain rewards, but do not necessarily make choices that maximize profits; people do

not always make long-run or rational calculations; and people exchange both tangible and intangible commodities, including such social rewards as approval, advice, status, and compliance.

Homans's integration of operant psychology and micro-economics (and a few ideas from balance theory) produced six propositions that he argued could be used as basic axioms for deriving sociological theory. Briefly stated, these propositions make the following assumptions about human behavior:

1. Persons tend to perform actions the more frequently those actions have been rewarded in the past (Success Proposition).

2. People are more likely to repeat previously rewarded actions in the presence of stimuli that were associated with rewards in the past (Stimulus Proposition).

3. People are more likely to perform actions that produce outcomes they highly value (Value Proposition).

4. The value of a reward declines the more frequently a person has received it in the recent past (Deprivation-Satiation Proposition).

5. Rewards that are less than expected, or punishments that are greater than expected, produce anger and aggression; conversely, rewards that are greater than expected, or punishments that are less than expected, produce pleasure and approving behavior (Aggression-Approval Propositions).

6. Choices between alternative actions are determined by the relative value to a person of the actions' outcomes, multiplied by their perceived probability (Rationality Proposition).

Propositions 1 through 4 restate, as propositions, basic principles of behavioral psychology, particularly the well-known relations between reinforcement, discriminative stimuli, and behavior. They reflect the key assumption of operant learning: that individuals (both human and animal) tend to repeat behaviors that have produced desirable consequences in the past. Proposition 6, on the other hand, reflects the assumption of microeconomics or rational choice theory that individuals rationally calculate and compare probable future payoffs from alternative actions, and make choices based on those calculations. Homans appeared to adopt both assumptions, as have other exchange theorists: Sometimes humans act on the basis of past consequences, without calculation and perhaps even without awareness; at other times humans engage in rational calculation and comparison of probable future outcomes.

Proposition 5 introduces comparisons between expectations and outcomes that are not really part of either operant psychology or microeconomics, although they were based on Skinner's observations of how pigeons reacted when they did not receive expected rewards. (Homans, of course, believed humans would behave the same.) Proposition 5 is of particular importance because it is the basis for one of Homans's most enduring theoretical contributions: the concept of *distributive justice.* Distributive justice is the principle that rewards should be distributed in proportion to investments, or costs; thus, distributive justice obtains when the profits (rewards minus costs) of two persons are equal. If a person receives less (or more) than expected, based on this principle, then injustice obtains. Proposition 5 predicts that a person whose rewards fall below expectations is likely to feel anger and to display some form of aggressive behavior toward either the source or the beneficiary of the injustice.

After introducing these propositions, Homans then applied them to fundamental group processes: power and authority, cooperation and competition, status, justice, leadership, conformity, and, in his last chapter, to institutional processes. His descriptions show the centrality of small groups in social life and the ubiquity of exchange processes in both micro and macro structures. In Homans's view, more complex forms of social organization are built from the same "elementary forms" of social behavior that underlie processes in small groups. Thus, the group is a microcosm of society at large, and the needs of individuals are central to both.

Homans's exchange theory provoked strong criticism from sociologists, both those who were opposed to his behaviorist framework and those who believed he had misused operant principles. First, his "rationality proposition" raised the kinds of questions often directed at rational choice theorists about whether people actually calculate rewards and costs in a rational way. Second, numerous critics charged that his reasoning was tautological. In restating behavioral principles of reinforcement, stimulus discrimination, and satiation, Homans transformed definitions into propositions. For example, reinforcement is defined as a stimulus that increases the frequency of behaviors on which it is contingent; thus, Homans's Success Proposition—which relabels reinforcement as reward—is true by definition. Third, Homans's advocacy of psychological principles as the axioms for sociological theory led, not surprisingly, to charges of reductionism. Homans did not deny the existence of groups, institutions, or emergent properties, but he believed that they must be explained by propositions about the behavior of individuals. Not only did Homans believe in explaining macro phenomena with micro principles, but his deductive systems often took as givens many of the phenomena that sociologists were interested in explaining. For example, in order to apply his propositions, he would

typically make assumptions about what behaviors people in pre- or postindustrial societies reward, what outcomes people in those societies find rewarding, and often what forms of social organization support certain reward structures. His critics charged, consequently, that he was ignoring the very questions that sociologists ought to be addressing. Homans replied that no theory can explain everything.

HUGHES, EVERETT

Everett Hughes (1897–1983), an American sociologist, was a key figure in the transition period between the classical Chicago School of the 1920s and 1930s and the second Chicago School. A Chicago PhD, Hughes began his career in Canada at McGill University in Montreal (1927–1938), where he had a major, career-long impact on French- and English-language sociology, chiefly via *French Canada in Transition* (1943), his study of the industrialization of French Quebec by British and American capital during the 1930s. In 1938, he returned to the University of Chicago, where he remained for most of the rest of his career (1938–1961). While Hughes was not generally regarded as a systematic theorist, there is in his writings a theoretical frame of reference, interpretive institutional ecology (Helmes-Hayes 1998), that was an elaboration of the classical

human ecology approach made famous by his mentor, Robert Park. Interpretive institutional ecology combines aspects of Park's human ecology with the anthropological and sociological functionalism of A. R. Radcliffe-Brown and Émile Durkheim, George Simmel's formalism, and elements of interactionism drawn from W. I. Thomas, and C. H. Cooley. Hughes developed the approach in stages and by accretion over his career and applied it, often piecemeal, in a variety of sociological specializations: race and ethnic relations, work and occupations, education, medicine, and organizations. The significance of Hughes's approach to the history of Chicago sociology is twofold. First, in the 1940s and 1950s, the classical Chicago School split in two. Under the influence of Roderick McKenzie, Amos Hawley, and Philip Hauser, the "mapping" part of human ecology came to look more like factorial ecology and demography. At the same time, some sociologists such as symbolic interactionist Herbert Blumer ignored the ecological aspect of the approach and focused almost exclusively on the face-to-face lifeworlds of individuals and groups. By contrast, Hughes's interpretive institutional ecology retained the dualistic and totalising character of the original. Second, the layered, dualistic character of the perspective allowed Hughes to strike a balance between the so-called scientific and interpretive orientations to the discipline. It also allowed him to employ a variety of research techniques (participant observation, interviews) and data sources (official statistics, archives) in his work. His preferred methodology, however, was fieldwork, and he is famous for training several generations of field workers in Canada and the United States (e.g., Howard Becker).

Interpretive institutional ecology is a multilayered, essentially mesosociological approach that focuses on the typical dynamics and processes of social interaction at three levels of social reality. Its starting point, illustrated in *The Growth of an Institution: The Chicago Real Estate Board,* completed in 1928, and *Boys in White: Culture in Medical School,* published in 1961, is the single institution (a "going concern" or "enterprise") or a small cluster of institutions (an "institutional setting"). Within institutions (e.g., a hospital), people interact via several sets of overlapping, competing, and complementary institutionalised social roles and relationships (doctor/patient, coworker, friend) while pursuing multiple careers—occupational and otherwise (e.g., as doctor and mother). The focus on selves pursuing careers within institutions, especially at work, but elsewhere too (e.g., medical students), is central to the analytic logic of interpretive institutional ecology. It provides an entrée both to the individual self and the structure and history of occupations, institutions, and societies.

The second level of analysis is the macrosociological one. Here Hughes uses ecology and functionalism to analyse the "natural history" of institutions; that is, the typical processes by which they originate, do or do not

become formalized, and then change as they struggle for survival within a set of complex, constantly shifting natural and social environments (physical space, demographics, economic development, government policy). Institutions come into being, Hughes says, because, on the one hand, they satisfy the needs of groups and individuals. They survive, once established, because their members adopt strategies to survive as individuals and to help the organization deal with ecological contingencies. Hughes draws on Durkheim's concept of the division of labour and Radcliffe-Brown's concept of function to describe this process of ecological and functional adaptation. Institutions specialize within society and individuals assume specialized positions within institutions in order to survive. Institutions survive because they serve "functions." The best example of Hughes's macrosociology is the political economy–style analysis of the industrialization of French Quebec that he developed in *French Canada in Transition,* where he described the development of an ethnic division of labour within which French-speaking Quebecers ended up in a dependent and subordinate position in the occupational and class structures of Quebec society because modern, industrial capitalist production relations were imposed from without by foreign (British and American) capitalists.

Hughes's approach contains a microsociology as well. He stresses that institutions are continually "in process," not just because they mindlessly adapt to their external environment but because they are made up of intelligent, reflective, adaptable agents (individual selves) who continuously and actively define and redefine situations, negotiate meanings, assume and reconstruct roles, and pursue careers in order to survive. In so doing, they create internal pressure for institutional change. The major sources of this interpretive aspect of Hughes's perspective are C. H. Cooley, Georg Simmel, and W. I. Thomas. Hughes was influenced by Cooley's work on institutionalisation and the social nature of the self and from Thomas took the notion of "the definition of the situation." His debt to Simmel was twofold: social interaction must be examined in processual terms and the primary theoretical purpose of sociology is the description of the recurring forms of social interaction.

The theoretical-methodological key to Hughes's approach is its focus—in particular, but not exclusively—on the single institution. For Hughes, the institution constitutes the "real world" venue where people deal in a pragmatic way on a daily basis with the questions of meaning construction, the production of social order, and so on that constitute the heart of sociological theory. Institutions are the settings that individuals come under the simultaneous, direct, and conflicting influence of, on the one hand, his or her self that has the experience, freedom, and capacity to construct a lifeworld within and across a set of careers, and, on the other, the constraints placed on that freedom and possibility by the existence of objectively real formal and informal roles, statuses, and interests that are among the defining characteristics of institutions. Hughes grants to agents the freedom to construct social reality, but not with unfettered agency. First, people are subject to forces that they do not know about and could not control as individuals if they did (e.g., demographic and ecological factors). Second, people do not possess equal power to define situations (e.g., workers and bosses). Third, the subjective realities and "definitions of the situation" people construct are often similar because they are chosen from obdurate aspects of culture (e.g., norms, roles) that impose on people's consciousness and will.

HYPERREALITY

Hyperreality is a concept most closely associated with the work of one of today's most preeminent postmodern social theorists, Jean Baudrillard (b. 1929). Most simply, it means more real than real (e.g., the realities depicted in "reality television" shows). However, there is much more to the context and uses of this term that help give it deeper and richer meaning.

For Baudrillard, the contemporary world is one where modernity has given way to implosions, simulations, and a sense of hyperreality. He argues that there is no longer any truth or reality, and so signs no longer stand for anything;

they no longer represent anything that is real. Instead, we live in "the age of simulation" (1983:4). At first, these simulacra are reproductions of actual objects or events. Eventually, these simulacra come to mask and pervert a basic reality, and then to mask the absence of a basic reality, and finally they bear no resemblance at all to anything existing in reality. The simulacra come to refer only to themselves and other simulacra and put "an end to meaning absolutely" (1983:11).

All of these simulacra begin to implode with what is left of reality. In this way, the differentiation that characterized modernity has given way to the dedifferentiation characteristic of a postmodern turn in society. With simulations and reality imploding in on one another, it becomes increasingly difficult to distinguish between that which is real and that which is simulation. Since simulations often seem more real than reality itself, they come to dominate society and people are left without reality, with only hyperreality. Hyperreality is not something that is produced but instead is "that which is always already reproduced" (1993:73).

Baudrillard gives many examples of the hyperreal in today's society: Disney World, where it is cleaner, safer, and people are nicer than in the "real" world; television, which is arguably the ultimate simulation and sensationalizes "reality"; and even all of America itself, where Baudrillard "sought the finished form of the future catastrophe" (1989:5).

Even hyperreality itself has the ability to become hyperreal. Baudrillard speaks of the ecstasy of objects, their propensity to go beyond themselves and proliferate to the highest degree. In other words, the beautiful as more beautiful than the beautiful in fashion, the real as more real than the reality of television, sex as more sexual than the sex in pornography. Thus, ecstasy ends up producing hyperreal hyperreality.

IDEAL TYPE

Max Weber (1864–1920) coined the concept "ideal type" as a methodological device within his brand of "interpretive (*verstehende*) sociology." Both concepts—ideal type and interpretive sociology—have given rise to grave misunderstandings. The word *ideal,* to begin with, has nothing to do with the colloquial adjective *ideal,* as in "He is an ideal husband, she is an ideal teacher." Colloquially *ideal* is a normative value judgment. Weber, however, meant by ideal type what he also called "pure type," a concept that is strictly analytical—an artificial construct that does not contain any value judgment about reality. On the contrary, ideal types are predominantly ruled by the rationality of logic. They are indifferent as to positive or negative value judgments. "There are ideal types of brothels as well as of religions." Moreover, in a typically neo-Kantian vein, he emphasized the fact that an ideal type should not be viewed as a "picture" (*Abbild*) of reality but rather as a willful distortion of it. From a specific point of view, which is always necessarily guided by values, certain dimensions of reality are overemphasized, while other dimensions are on purpose kept in the background.

Weber was philosophically driven by the neo-Kantian question of how one could possibly arrive at a rational, scientifically satisfactory knowledge of a reality which is, as is the case with human behavior, predominantly irrational. His answer is not really satisfactory, as he acknowledges himself, but the best he could think of. An ideal type is in a sense an artificial model. For instance, one constructs types of human behavior that indicate how people would act if they would act in a purely functional-rational manner. Nobody acts in such a way, not even in the world of science or in modern bureaucracy. But that is precisely the point: By comparing reality as we experience it in everyday life predominantly in an irrational manner with the ideal type of

a radically rationally behaving human being, we begin to *understand rationally* this predominantly irrational behavior because of the *difference* between the constructed ideal type and the experienced reality. Ideal types are, in Weber's own words, "conceptual means for the comparison and measurement of reality," which, due to their general character, are able to highlight the particular features of the object under investigation. This throws a specific, typically neo-Kantian light on the notion of an interpretive (*verstehende*) sociology: Understanding (*Verstehen*) is *not* a method but it is the *aim* of Weber's brand of sociology. Its method is the comparison of the constructed ideal types with the experienced reality. There is thus not "a method called Verstehen."

Usually Weber placed concepts that he viewed and used as ideal types between quotation marks. Quite often he also constructed matrices of ideal types. For example, he distinguished four ideal types of human social action based upon four ideal typically distinguishable expectations: (1) "goal-rational behavior" oriented towards an explicit aim; (2) "value-rational behavior" carried by a rational belief in ethical, esthetic, religious, or other values; (3) "affectual behavior" driven by emotional expectations; (4) "traditional behavior" founded upon deeply rooted habits. Equally well known is the ideal typical matrix of (1) traditional; (2) charismatic; (3) legal-rational legitimacy. If one focuses on actual human behavior or the actual exercise of legitimacy in historical reality, one will never find a precise duplication of these ideal types in reality. Yet, by placing the ideal typical and generalized matrix upon reality, which is a historical and experienced reality, one will begin to *understand* its typical developments and its typical constitution and thus its historical particularity.

Weber believed that the ideal typical method could be helpful to the cultural sciences, which, unlike the natural sciences, are dealing with a subject matter—human behavior, social and cultural reality—that is characterized by values

and meanings and by events and phenomena that are particular and unique and in that sense irrational. He refused to abandon the natural-scientific objectivity by surrendering to the subjectivism of empathy (*Einfühlung*), yet he also realized that the neopositivist subjection to the methods of the natural sciences remained highly unsatisfactory when one deals with human beings, human behavior, social and cultural realities. The method of ideal types offered a solution: These conceptual models were natural-scientific in that they were general, in a sense timeless, yet in their confrontation with historical and experienced reality, they yielded cultural-scientific knowledge (understanding) of what is particular, unique, and specific.

There remains an irritating fact. Since they are artificial constructions, ruled by the laws of formal logic, they can in actual fact neither be verified nor be falsified. The only criterion by which they can be judged is their *heuristic use* or *uselessness*. Does the ideal typical matrix yield rational understanding, or does it not? That is the "verifying" or "falsifying" question!

This may well be the crucial test for most of social theory. Tocqueville's "aristocracy" and "democracy," Durkheim's "mechanic" and "organic solidarity," Toennies's "*Gemeinschaft*" and "*Gesellschaft*" Maine's "status" and "contract." These are ideal types that for many decades have helped sociologists grasp rationally the extremely complex, and in many respects irrational, process of modernization. One can easily add contemporary examples of such ideal types. Weber, however, was the first and actually the only theorist who designed an ideal type methodology.

IDENTITY

Identity can be thought of as the cover term for the names humans impute and avow in the course of interacting with others and orienting themselves to their various social worlds. A central principle of interaction between humans, or humans and the other objects that constitute their world, is that interaction is minimally contingent on the identification of the objects involved. In other words, before we can act toward or interact with some object, it must be situated in time and place. To do so is to give the object a name in the sense of classifying it as a member of a particular category (e.g., a soldier, a woman, a man, a chef, a student, and so on). Such naming entails the imputation and/or avowal of identities.

Not all identities are the same, however, as there are at least three types of identity that are featured in the relevant literature on identity in the social sciences: social identity, personal identity, and collective identity. The three types are often interconnected and overlap in the fashion of a Venn diagram. From a sociological standpoint, *social identity* is the foundational or anchoring concept in that it is grounded in and derives from social roles, such as police officer, physician, or mother, or broad social categories, such as gender, racial, ethnic, and national categories. This structural grounding is captured in the parallel concepts of "role identities" and "categorical identities."

Interactionally, social identities can be both imputed or avowed. They are imputed when ego assigns to alter an identity based on alter's presumed category membership (She is a feminist!) or the role alter is thought to be playing (She is a teacher!) or the role ego would like alter to be playing, which is referred to as altercasting (You are my friend, aren't you?). In each of these cases, a social identity is ascribed to others, and interaction is likely to proceed in terms of this identity.

Social identities can also be avowed or claimed, as when ego announces, "I am a Serb" or "I am a wine connoisseur" or "I am a professor." It is because of such category-based avowals that some social psychologists define social identity in terms of self-definitions or identifications associated with social category memberships, or as one's self-concept derived from one's knowledge of membership in a social group, as well as the emotional significance that this membership produces.

But such self-definitions are perhaps more appropriately conceptualized as *personal identities,* which also include aspects of one's biography and life experiences that congeal into relatively distinctive personal attributes that function as pegs upon which social identities can be hung (Goffman 1963). The importance of distinguishing between social and personal identities rests not only on the fact that the latter are self-designations rather than other-attributions, but is also suggested by the observation that individuals sometimes reject other-imputed social identities, especially when they imply social roles or categories that are demeaning and contradictory with an idealized self-concept (Snow and Anderson 1987). Such observations suggest that personal identities may sometimes be grounded in social identities that derive from role incumbency or category-based memberships but without necessarily being determined by those social identities.

The term *self-concept* has been used to explain the negotiation or compromise that is reached between an individual's ideal conception of the self and the information they receive from the social world, with the resulting negotiation capturing the tension that often exists between an individual's social and personal identities. The psychologist Erik Erikson can be read as attempting to conceptualize this tension or discordance with his concept of ego identity, which functions to ensure sameness and continuity in one's identity.

Collective identity, the third major type of identity, overlaps with the kindred concepts of social and personal identities but yet differs from them. It is loosely defined as a shared sense of "we-ness" or "one-ness" that derives from shared statues, attributes, or relations, which may be experienced directly or imagined, and which distinguishes those who comprise the collectivity from one or more perceived sets of others (Polletta and Jasper 2001). Identifying with a collectivity is often based on an individual's social identity, such as identifying as an ethnic minority or a citizen of a particular country, but such category-based associations do not automatically give rise to collective identity. Instead, the development and expression of collective identity is often triggered by contests pitting one group against another, as in the case of the World Cup and the Olympics, by unanticipated events, such as the World Trade Center terrorist attacks of September 11, 2001, or by threats to group or community integrity or viability, as in the case of much social movement activity. A significant part of the power of collective identity comes from the collective solidarity, efficacy, and agency it provides, which individuals are not as likely to experience via their personal or social identities.

DIMENSIONS OF VARIATION

Identities vary not only typologically and contextually but also in terms of a number of contrasting dimensions. These dimensions of variation include salience, commitment, pervasiveness or comprehensiveness, and cohesiveness.

Identity salience refers to the relative importance or prominence of any single identity (e.g., mother, teacher, pastor, student) in relation to other identities, which have been conceptualized as being ordered in a salience hierarchy (Stryker 1980). The higher the placement of the identity within the hierarchy, the greater its prominence and the more likely it will be invoked. The relative salience or prominence of an identity is the result of a number of factors. These factors include the extent to which the individual's own view of self supports the identity, how much the individual's view is supported by relevant others, and the degree to which individuals have committed themselves to the particular content of the identity.

The observation that individuals have differing levels of commitment to various identities suggests the variable concept of *identity commitment.* Identity commitment is related to identity salience in a cause/effect manner: Those identities to which an individual is most highly committed are most likely to be salient in the individual's identity hierarchy. One is committed to an identity to the extent to which one's relationships with others is based on that particular identity (Stryker 1980). For example, a father shows commitment to his parental role as it is the basis of his relationship with his children and influences his relationship with various others, such as his spouse. Therefore, the father identity becomes more salient within his identity hierarchy based on his commitment to this role. To the extent that commitment to that role falters, so will the relative salience of the corresponding identity.

Individual identities also differ in their level of *pervasiveness or comprehensiveness.* Pervasiveness or comprehensiveness (Cornell and Hartman 1998) are parallel terms for the observation that any particular identity may vary considerably in terms of its situational relevance or reach and the corresponding degree to which it contributes to the flow of interaction in various domains of social life. Metaphorically, a relatively pervasive or comprehensive identity can be thought of as a "thick" identity in that its band of influence is quite broad or wide (Cornell and Hartman 1998). For example, Middle Eastern, Islamic immigrants into the United States at the beginning of the twenty-first century may have experienced that their ethnic and religious identities congeal into a pervasive social identity in a majority of their social interactions apart from their contrary interests and respective personal identities.

Finally, individual identities may vary in their level of *cohesiveness.* Identity cohesiveness refers to the extent to which separate identities are tightly or loosely interrelated.

PERSPECTIVES ON IDENTITY

How identity is conceptualized and analyzed is based in large part on one's orienting perspective. There are three broad perspectives in the study of identity: essentialist, dispositional, and constructionist. The *essentialist perspective* reduces the sources of identity to a single determinative attribute regarded as the individual's or collectivity's defining essence. Essentialist perspectives encompass both structural and primordial logics. Structuralists understand identity to be rooted in elements of the social structure, such as in roles, networks, and broader social categories, such as social class, ethnicity, and nationality. Alternatively, primordialists understand identity as deriving essentially from presumed biological givens, such as sex and race. Neither of these essentialist variants ignores historical factors or social changes, but these factors are treated more as intervening variables that affect the relative salience and pervasiveness of the structural or biological roots of identity.

The *dispositional perspective* posits a connection between various personality traits or tendencies and behavioral prospects. This perspective is based on the idea that certain social psychological traits or states predispose individuals to adopt or claim some identities over other possibilities. According to the authoritarian personality thesis, for example, dogmatic and insecure individuals are highly susceptible to identification with extremist social movements. In general, there are at least two major dispositional hypotheses. One is the troubled or spoiled identity thesis, which holds that individuals with unsatisfactory or stigmatized identities are open to and likely to be searching for more satisfactory identities. The other dispositional thesis is that individuals look for and adopt identities that verify their existing identities or self-concepts.

Standing in contrast to both the essentialist and dispositional perspectives is the *constructionist perspective.* It holds that there is considerable indeterminacy between identities and their theorized ascriptive, structural, and personality moorings. From this perspective, identities are regarded as the product of negotiation, interpretation, and presentation rather than biologically preordained, structurally given, or dispositionally determined (Cerulo 1997). Language and interactionally based discursive processes, such as framing, figure prominently in identity construction.

Although the analytic utility and credibility of these perspectives vary among scholars, it is arguable that together they contribute to a fuller understanding of identity than is provided by just one of them. For example, while it is historically indisputable that ethnic and national identities are constructed (Cornell and Hartmann 1998), they are not fabricated whole cloth apart from past and current cultural traditions and structural arrangements and the flow of political events and happenings, which together exercise constraint on the interpretive processes associated with identity construction.

IDENTITY PROCESSES

Identities are acquired, managed or negotiated, and transformed through a variety of social processes that cluster into at least two basic sets. One set of identity processes pertains to the acquisition or adoption and change or transformation of identities. The major associated processes include role transition, identity consolidation, socialization, and conversion. *Role transition* and the change in corresponding role identities are operative as individuals progress through the life course, transitioning, for example, from adolescent to adult, from single to married, from childless to parent. Often associated with such basic life course changes are various rites of passage ceremonies (e.g., bar mitzvahs, confirmations, weddings) that signal and celebrate transition from one core role identity to another. Another form of role transition associated with identity change is role exiting, as when one leaves the priesthood, the convent, or various nonreligious professional occupations (Ebaugh 1987). Not all identity changes are associated with life course role transitions or role exits, however. Sometimes individuals merge two identities into a single salient one through a process of *identity consolidation.* This can involve the blending of two relatively congruent identities, as in the case of the public scholar or student athlete, or two seemingly discrepant identities, as in the case of "Jews for Jesus."

Undergirding many role transitions as well as both group-based new identities and identity consolidations is the process of *socialization,* which involves learning the various behaviors and perspectives associated with particular role identities and the development of the relational commitments that increase or intensify an identity's relative salience. The identities of a sports team member, a fraternity or sorority member, a soldier attached to a particular unit (e.g., platoon, company, division), or even a professional sociologist are difficult to understand apart from the interactive and socialization processes in which their development and salience are grounded. *Conversion,* which can be thought of as a form of socialization, is usually applied to more radical transformations of identity. The hallmark of conversion is the adoption of a new universe of discourse or informing point of view and a corresponding reconstruction of one's biography, such that the old self or identity is jettisoned in favor of a new or dramatically revitalized identity. Such dramatic transformations are typically associated with religious and self-help contexts and organizations, but may also occur in political groups. Whatever the organizational context, the result is the development and adoption of a highly salient and often pervasive identity, so much so that conversion has been conceptualized in part as entailing the "ubiquitous utilization" or "embracement" of a "master identity."

Identities are not only acquired and changed through the processes of role transition, identity consolidation, socialization, and conversion, but they also are managed, sustained, and negotiated through a variety of additional processes. These processes, which constitute the second general set of identity processes, can be thought of as forms of identity work. *Identity work* includes the range of activities individuals and groups engage in to give meaning to themselves by selectively presenting, negotiating, and sustaining identities congruent with their interests (Snow and Anderson 1987). Included among these activities are the construction and display of physical settings and props, as in the case of driving a conspicuously high-end automobile; the arrangement of appearance as exemplified by cosmetic face work; selective association with other individuals and groups, as when making a point of being seen "hanging" with some individuals rather than others; and verbal constructions and assertions, as when chanting at Olympic contests, "USA, USA, USA" or announcing "I am" or "am not" a person of a particular social category. Referred to as

identity talk, this fourth type of identity work has been found to be widely practiced, even among the downtrodden and stigmatized, as in the case of the institutionalized mentally ill and the homeless. Each of these types of identity work can facilitate individual or group embracement of or distancing from imputed or avowed identities (Goffman 1963; Snow and Anderson 1987).

CONTEXT

The stability or fragility of personal, social, and collective identities is historically contingent, with some periods rendering matters of identity much more problematic and fragile than other periods. Sociological and psychological commentators on the relationship between social context and identity have suggested that late modernity is one of those particularly volatile moments (Giddens 1991), as evidenced by, among other things, "identity crises," "dilemmas of identity," "identity politics and movements," and "collective searches for identity."

Underlying this apparent proliferation of identity problems and concerns in so-called late-modernity or postmodernity are numerous well-chronicled sociocultural challenges and changes: state breakdown, increased immigration and refugee flows, multiculturalism, technological advances such as the Internet, globalization, ethnic revitalization, and movements against socioeconomic and political exclusion. The confluence of such factors loosen in some instances and shatter in others the cultural and structural moorings to which identities were once anchored, thus giving rise to the construction, reconstitution, extension, negotiation, and challenge of various combinations and permutations of identities. Because of such factors and trends, it is clear that identity-related issues are particularly relevant to social life as we move deeper into the new century.

IDENTITY POLITICS

Identity politics is a term most frequently used in disciplines with strong roots in poststructuralism—feminist theory, queer theory, and multicultural theory, among others. During the second wave of feminism, and the 1970s and 1980s more generally, there was increasing attention given to those categories of people who had long been left out of the view of study. There was a concern to give voice to those who had long been silenced. Intersections of race, sex, class, sexual orientation, ethnicity, and nationality were among the many identities that began to draw the attention of social scientists. This focus on cultural identities represented a marked shift from the economic and political based analysis that had dominated the sciences to this time. This assertion of the individual, and especially of those individuals who were outside of the social norm, caused great instability in the comfortable split between the personal and the public, the family and the nation, and the state and the civil worlds.

Feminists were among the first to assert that "the personal is political." They gave rise to a notion of identity politics based on the unique social locations of a given individual. The claim to identity was seen as a political assertion rather than a personal claim because identity also brings with it membership in community. In turn, membership demands equality with others in that group, and so those with identities that disrupt the status quo are seen as a threat to the hegemony of the ruling class. Allowing members of a social minority equal claim to social goods would call for a reshaping, often a radical reshaping, of societal values, norms, and even sometimes laws.

A culture of identity politics represents a multicultural approach calling for loyalty to various, and often multiple, categories of one's identity. This challenges the foundations of the modern nation-state, which, it has been argued, is supported by the existence of homogenous group identity. Who is to be included for membership has always been an important social question, but the dawn of the era of identity politics seems to usher in a new hope for those who

have long been left out in the cold of the social world. Feminists, people of color, gays and lesbians, and ethnic minorities are among the many who have been eager to embrace such a politics in order to gain a voice and end their historical silence. At the same time, theorists have recognized the limits of identity politics and the view of personhood and community that it endorses. Identity politics, it is argued, promotes the notion of stable, essential identities and as such privileges difference over the reconciliation of difference. To counter this trend, some theorists have proposed a "relational" politics, which assumes that identity is always the product of relationship and therefore never an essential aspect of a person's identity. In contrast to an identity politics that seeks to assert individuality, relational politics aims to overcome the ever-present threat of interpersonal conflict by privileging the flux relationship and social "conversation" over the stability and privilege of identity.

IMPERIALISM

The term *imperialism* has been used in many ways, but virtually all refer to the coercive incorporation of territories, along with their economies, social formations, and political systems, into wider structures of power dominated by "foreigners." So defined, imperialism is as old as recorded history, and the causes of particular episodes, widely separated in time and space, may be very different. These causes may also be represented differently, depending on the analytical approach: for instance, whether it is that of political economy, historical sociology, realist international relations, or cultural theory.

Nevertheless, some form of economic determination is evident in most studies of imperialism, including work on capitalist imperialism in the modern period, which has attracted the bulk of critical attention. In large part, this is

because Marxian theory has been the dominant approach and has proved extremely influential on historians, social scientists, and cultural theorists concerned with imperialism. The chief exception to this is provided by realist international relations theorists, but even here there are some, like Robert Gilpin and Justin Rosenberg, who have endeavoured to fuse political realism and economic determinism in dealing with issues central to imperialism. Much earlier, Joseph Schumpeter's attempt to trace modern imperialism back to a tenacious feudal overhang has also found an impressive following. But here, too, there has been a tendency to integrate Schumpeter's ideas into a form of economic determination.

Because of the intellectual dominance of Marxism in the treatment of imperialism, we concentrate here on Marxian interpretations, which we classify into four types: original, classical, neo, and post. The concluding section outlines some possible future scenarios that are suggested by these theories.

THE ORIGINAL VERSION

Marx wrote about modern imperialism in two contexts: the origins of European capitalism and its extension to the rest of the world. His analysis of the "primitive accumulation of capital" includes the role that colonialism played in the creation of the capitalist mode of production in Western Europe. The accumulation of nonlanded property through tribute, pillage, slavery, and the slave trade facilitated the employment of land and labour under capitalist relations of production in Europe. Once the system was established, Marx argued, imperialism proper proved indispensable in spreading capitalist relations throughout the globe. Marx claimed that all non-European societies lacked internal dynamism, so that imperialism was essential to introduce progress. On these matters he did not depart significantly from the dominant liberal opinion of the early nineteenth century, as reflected for example in James Mill's writings on India.

In Marx's account of imperialism, it is the general acquisitiveness fostered by capitalism that propels its geographical expansion, rather than its contradictions or any particular conjunctural events. These may play some role in explaining capitalist imperialism, but only with regard to its specific forms and precise chronology. Sometimes capitalism can insinuate itself into existing exchange relationships in precapitalist economies and, by its superior efficiency, transform them into capitalist exchange relations. More frequently, capitalist penetration is impeded or wholly blocked by the operation of precapitalist systems, and in these cases some form of imperial domination and forceful restructuring along capitalist lines is essential for expansion to proceed. In both circumstances, capitalism will ultimately act as a solvent on established modes of production, as well as

creating the basis for economic, cultural, and political modernity. Destruction tends to precede reconstruction not only for obvious reasons of sequencing but also because imperialism itself initially exhibits many precapitalist features, reflecting the imperfect transformation of the metropolitan centres, and these wither only as capitalism is purified on its home ground. Thus, while many of the phenomena associated with precapitalist forms of imperialism remain evident for long periods, including tribute and outright theft, for Marx their significance is totally different from that in precapitalist imperialism. Ultimately, as genuine capitalist expansion into new territories takes place, a duplication of European achievements will occur, including rapid and sustainable economic growth.

While Marx was certainly wrong to view societies outside Europe as a homogeneous, static unity, much of what has occurred in the last 150 years is broadly consistent with his forecasts. Capitalism was spread by imperialism, and it has been associated with fast economic growth, by long-run historical standards. Material progress has been widespread, especially in terms of improved life expectancy, the extension of literacy, and mass urbanisation. Thus, even though Marx's understanding of the non-Western world was seriously flawed, his principal claims about the causes and effects of imperialism remain defensible.

CLASSICAL MARXIAN THEORIES OF IMPERIALISM

The chief limitation of Marx's account of imperialism lies in his treatment of the imperial centres. He shared liberal, Cobdenite beliefs about the anachronism of war as a means of resolving conflict between capitalist states, and he confidently anticipated the erosion of all forms of national identity, so that imperialism itself would disappear as capitalism became universal. Not surprisingly, then, with the appearance of growing tensions between advanced capitalist powers after 1900, his original analysis was revised by some of his followers, notably Rudolf Hilferding, Rosa Luxemburg, Nikolai Bukharin, and Vladimir Ilyich Lenin, in a great debate on the causes and consequences of imperialist rivalry that raged between 1910 and 1917.

None of these classical Marxian theorists denied the truth of what Marx had said about imperialism, but their attention shifted toward explaining intercapitalist conflict, which they believed to result from the centralisation of capital and the exhaustion of new imperialist outlets in non-European regions, so that "late starters" like Germany and Japan had to challenge the established imperialist powers by force. The basic ideas of Hilferding, Bukharin, and Lenin were broadly similar, and owed much to the work of contemporary liberal anti-imperialists, especially J. A. Hobson, whose *Imperialism: A Study* (1902) was widely read in both liberal and Marxian circles. Imperialism was now linked directly to the economic contradictions of advanced European capitalism,

in Hobson's case a strong tendency to underconsumption in the metropolitan countries resulting from the maldistribution of income. (The German Marxist Karl Kautsky had made a similar case as early as 1884 in his analysis of the French colonization of Indochina). Luxemburg took the argument even further in her *Accumulation of Capital* (1913), using Marx's two-sector models of accumulation to claim—wrongly—that the continued expansion of any capitalist economy was in principle impossible without constant access to new noncapitalist markets. Hilferding, Bukharin, and Lenin took a slightly different position, pointing to other causes of economic crisis, including disproportionality between sectors and the falling rate of profit. Hilferding's classic text *Finance Capital* (1910) contained a subtle and eclectic account of Marxian crisis theory. But they all agreed that increasing imperialist rivalry was an unavoidable feature of mature, or "overripe," capitalism.

According to the classical Marxists, these underlying economic causes were translated into domestic and international politics in the following way. The growth of monopoly in advanced capitalism had increasingly fused economic and political structures, aligning each national bourgeoisie with its state, undermining the previously vibrant cosmopolitan disposition of the capitalists and weakening liberal institutions. Capitalist acquisitiveness remained resonant, but it was now projected overwhelmingly outwards, to the world economy. Since almost the entire globe had been colonised, any further expansion of one advanced capitalist state brought it into direct conflict with one or more of the others. A new structural incompatibility within capitalism had matured. The economic forces promoting enhanced global integration remained undiminished, but they were divided between sovereign political authorities that could continue to grow rapidly only at each other's expense. The further development of the productive forces was fettered by the boundaries of existing states, or their empires, and a resolution of this contradiction was possible only through warfare.

As World War I overwhelmed the international socialist movement, Karl Kautsky sought desperately to show that imperialist conflict was not inevitable. Kautsky pointed to the strong possibility of an "ultra-imperialism," a sort of global cartel of the leading capitalist powers that would agree to the peaceful partition of the world and to a harmonious division of the spoils of imperialist penetration. Bukharin and Lenin denied that this was possible, invoking the "law of uneven and combined development." Bukharin's *Imperialism and World Economy* (1915) developed this concept in some depth and was an essential source for Lenin's much more celebrated pamphlet, *Imperialism: the Highest Stage of Capitalism* (1916), published in the following year. Just as cartels were weakened and eventually destroyed by differences in the cost levels and rates of

technical progress in individual companies, they argued, so international agreements between imperialist powers would founder on the conflict between new and dynamic capitalist states and the less progressive, longer-established powers with a large vested interest in the status quo. These arguments, developed during World War I, were vindicated, so many Marxists believed, by the events that led up to World War II.

NEOIMPERIALISM

The apparent relevance of classical theories of imperialism waned after 1945, where the Pax Americana established what Paul Sweezy described as "superimperialism." The United States became the "dominant firm," to pursue the cartel analogy, taming the relations between advanced capitalism states and promoting decolonisation. The principal concern of theorists of imperialism now turned to explaining the apparent failure of imperialism to transform the economic and political structures of the third world. The main thesis of Paul Baran was the "underdevelopment" of the periphery, which, he suggested, had continued after formal decolonisation. Baran, whose influential *Political Economy of Growth* appeared in 1957, saw exit from dependence on the world economy, and emulation of the Soviet model, as prerequisites for genuine development. The problem for the core capitalist states, on the other hand, was to maintain third world incorporation into the circuits of capital, contain the expansion of Sovietised economies, and eliminate nationalist resistance to global market forces. All of this required them repeatedly to apply extra-economic coercion similar to that used in the imperialist era.

Proponents of neoimperialism maintained that much of what Marx and the classical Marxist theorists of imperialism had said was untrue, and this included much of their analysis of conditions within the advanced capitalist states. In particular, they claimed, the European and North American working classes had been substantially incorporated into the system through rising living standards, welfare provisions, and the freedoms afforded by liberal democracy. Baran saw the most significant form of exploitation as the extraction of surplus from the periphery by the core capitalist powers. This was the chief cause of continuing underdevelopment, and it meant that capitalism was polarised internationally, so that nation-states were the principal actors, not social classes. Other Marxian theorists stressed the consequences of "unequal exchange" between North and South. High-wage countries exported commodities containing relatively little labour and imported goods that embodied much larger amounts of low-wage labour. Thus Northern workers had a profound material interest in preserving neoimperialist relations, since their high living standards depended upon it. They had more in common with their own capitalists than with workers in the South.

The evidence on third world development does not obviously refute the neoimperialist analysis. There has been rapid economic progress in many parts of the world but relative or absolute stagnation in Latin America and sub-Saharan Africa and a tendency for advanced capitalist economies to grow faster than the global average. The forces of divergence appear stronger than those of convergence. And military intervention by core states has quashed many attempts to break with the capitalist world market. This was not simply a matter of countering Soviet expansionism, but also targeted a wide variety of movements aiming at independent national development.

The real weakness of neoimperialist theories lies in their exaggeration of the importance of the transfer of surplus from South to North, either through trade or by means of direct investment and the consequent growth of third world debt. No convincing account was ever provided as to why, once extracted, surplus was not used to finance accumulation in the periphery (thereby engendering development) but was instead retained in the core to increase investment and consumption there. True, markets in low-wage regions are restricted by the very fact of their poverty, but this is not inconsistent with the use of cheap labour to produce goods (and, increasingly, services) for export to the metropolitan countries. It was precisely such a process of export-oriented industrialisation that transformed the economies of East and Southeast Asia in the second half of the twentieth century. Moreover, the surplus produced in the South is much too small to account for the prosperity of advanced capitalist areas, which extends far beyond the small "labour aristocracy" that was supposed to share in the proceeds of imperialism in the classical writings of Lenin and before him of Friedrich Engels. The first laws of accumulation are arithmetical, and with core economies now constituting close to three-quarters of world output, it would take an unrealistically large share of the surplus component of the remaining one-quarter to make any substantial difference to the level of mass consumption in the metropolitan regions. This is not to deny that Northern workers benefit from unequal exchange with the South. But the overriding problem for most peripheral economies has been their inability to produce a surplus, or to use it productively, not the fact that it was siphoned off overseas. Better to be part of the system of global exploitation than to remain outside it; better to be Malaysia than Burma, rather China than Chad.

POSTIMPERIALISM

The influence of neoimperialist theories has dwindled with the economic success of the East Asian NICs (newly industrialising countries), the failure of import substitution strategies of industrialisation elsewhere, and the stagnation and eventual collapse of the Soviet Union. Increasingly, Marxists have come to argue that the world is

now postimperialist. Decolonisation has substantially ended foreign domination, generalised the system of states, and elevated the power of the world market, so that the entire globe is now subject to "the dull compulsion of economic forces." In short, the claim is that Marx's original analysis has proved to be broadly correct. Western capitalism has created a world in its own image, where coordination is primarily economic and where cultural homogenisation is proceeding apace. Unlike labour, capital has no homeland, no particular national loyalties, no reason other than profit opportunities to prefer one location to any other. Marx was right about the global dynamism of capitalism but distinctly premature in predicting its downfall. All this was first argued by Bill Warren in his book *Imperialism: Pioneer of Capitalism* (1980)**,** and it has been restated in postmodern terms by Michael Hardt and Antonio Negri (2000). Orthodox liberals and proponents of globalisation would substantially concur, differing only as to implications for radical politics.

AND THE FUTURE?

It is easy to make a persuasive case for the continuing relevance of Marx's original position. The grand design of U.S. strategic planners mapping out the structures they desire for the future world system is entirely consistent with his expectations. Backward capitalism is to be purified of precapitalist remnants and illiberal practices. Advanced capitalist states will cooperate on matters economic and military. Technologies for global surveillance and the projection of armed force on a worldwide scale, already exceedingly highly developed, will improve and be used to generalise the conditions of law and order that already prevail at the core. If this grand plan succeeds, imperialist wars will not recur, and growth rates will be such that income levels converge much more rapidly than they have done hitherto. Institutional differences between capitalist states are already being eroded, and this process will be reinforced. International organisations like the International Monetary Fund (IMF), World Bank, and World Trade Organization (WTO) are increasing their powers and evolving into agencies of world government. The remaining barriers to capital mobility will disappear as property rights become secure, so that the comparative advantages of what are now peripheral economies will constitute a powerful basis for rapid economic development.

It is also very easy to construct a diametrically opposite scenario. Uneven development continues in a context of separate states, many of which remain powerful and particularistic. Monopoly capital forms intimate relationships with domestic political authorities, strengthening the political, institutional, and cultural differences between states and reinforcing the material basis of national loyalties. Integration into the world market remains incomplete, and the lack of jurisdictional unification means that distinct

political units meet at many points of friction. Environmental degradation gives rise to a global Ricardian stagnation, but this induces violent conflict (for example, over water resources) rather than ushering in the peaceful and unchanging "stationary state" anticipated by John Stuart Mill. Differences are resolved by armed force, as in the past. Thus, a persuasive case can be made for the continuing relevance of the classical view of imperialism, as reinterpreted by realist theorists of international relations and by Marxian writers such as Rosenberg and the "world systems" theorist Immanuel Wallerstein.

Nor does this end the indeterminacy. It is not yet possible definitively to reject neoimperialist theory. The forces of polarisation that underpin the divergence in growth rates appear to be very strong, and not easily reversible, so that many of the inequalities present in the world economy could increase still further. Thus, while Marx's original analysis remains convincing, neither a new classical era of imperialist conflicts nor a continuation of neoimperialism can be readily dismissed.

IMPRESSION MANAGEMENT

The term *impression management* is associated with the work of the influential post-World War II sociologist, Erving Goffman (1922–1982). It is central to his dramaturgical

approach, as outlined in *The Presentation of Self in Everyday Life* (1959), in which social interaction is analyzed as a set of theatrical performances. Impression management is an overarching term that characterizes the wide variety of strategies used by people to control the ideas others have about them. It is concerned with the general ways in which people present themselves in public settings. Goffman's work has fostered extensive research in the social sciences (see Brissett and Edgley 1990). Goffman described people as "sign-vehicles" about which others attempt to gather information. Interpreting this information is complicated because some impressions are planted or "given" by the person, while others are unwittingly "given off." Successful impression management therefore involves two things: giving impressions that audiences falsely believe are given off and reading the different types of impressions provided by others. Goffman's dramaturgical work questioned what lay beneath the appearances of American society, and in this sense it contributed to what the philosopher Paul Ricoeur has called the "hermeneutics of suspicion."

Impression management is critical if the prevailing definition of the situation is to be sustained. To this extent, all participants find themselves motivated to sustain each other's presentations of self, even in circumstances where impression management has failed. For this reason, impression management involves a concern for individuals, for the "teams" to which they belong, and to the audiences who observe their performances.

"Actors" or "performers" in Goffman's dramaturgical world are "sincere" if they believe in the parts they play or "cynical" if they do not. Their performances are bolstered by various "fronts" that are intended to sustain a sense of authenticity. These fronts consist of supportive "settings" that serve as stage props and the "personal fronts" of the actors themselves, a term Goffman reserved for all aspects of physical appearance. By these means, performers "dramatically realize" their performances. Audiences are left with an idealized view of not only the performer but of the character who is thought to be portrayed by the performance. This illusion can only be sustained through a process Goffman referred to as "mystification." This describes the different means by which the audience is kept at some distance from performers, who can thereby sustain the performed illusion.

In one sense, impression management describes the performances given front stage by teams, performances which are "knowingly contradicted" backstage. In another sense, however, impression management may be an inescapable feature of all social interaction, and if so, the backstage team behavior is not itself any more real than front stage performances. Rather, it is simply different from and incompatible with front stage presentations of self.

Goffman emphasized that although impression management is often the preserve of the individual, it is also the case that individuals are often acting to preserve the impressions audiences have of the teams to which they belong. To this extent, impression management requires dramaturgical loyalty, discipline, and circumspection. These are necessary to "save the show" (Goffman 1959:222). It is also the case that an audience will often have to save the show itself—and will normally do so willingly. Goffman emphasized this feature of impression management because it reveals the investment that we all have in the staged production of social reality.

Commentators on Goffman's account of impression management have explored three issues: the underlying sense of self it implies, its moral implications, and its empirical ramifications. Goffman's model of self is in a sense a contradictory one. On the one hand, impression management requires each person to be a talented manipulator of social situations and expectations. On the other hand, Goffman was not interested in the internal workings of the person, and stated publicly that his focus was limited simply to each person's publicly observable performances. That is, the analysis of impression management only considers the person as a set of roles and therefore has no broader view concerning the nature of identity. Goffman had no way of considering how we change roles, grow into, or suit them. Thinking about a person's impression management therefore offers a snapshot of social reality, not a film of it. This limitation is part and parcel of dramaturgical analysis in general, and a source of frustration for those interested in individual psychology.

Several commentators—notably MacIntyre (1981) and Glover (1988)—have investigated the moral implications of impression management. They suggest that the actor in Goffman's dramaturgical world is a cynical manipulator, incapable of genuine feelings. The self who manages his or her impressions is a shallow creature without any sense of tradition, culture, or morality. However, it may be more appropriate to suggest that the idea of impression management reveals little or nothing about the self. Goffman's dramaturgical focus is not the self but rather presentations of self.

Both sociologists and psychologists have developed our understanding of impression management through empirical studies. For example, Lofland (1998) among others has developed Goffman's work through her ethnographic investigations of urban life. Among psychologists, a field of study known as IM has emerged to explore impression management through detailed empirical studies (see Tesser and Felson 2000). In summarizing the psychological literature, Tseelon (1992) distinguishes between "essentialist" and "pragmatist" views, suggesting that psychologists have generally assumed that each manager of impressions has an underlying self, whereas sociologists have generally seen the self as a social construction.

INDIVIDUALISM

ANCIENT AND MODERN INDIVIDUALISM

There are two broad definitions of individualism. In political terms, it is a political doctrine associated with liberalism that emphasises the autonomy, importance, and freedom of the individual in relation to society and state. Secondly, it is the culture associated in modern society with private property, consumption, and subjectivity. Individualism is often thought to be an important component of Western culture per se with its origins in both Greco-Roman civilization and Christianity. However, the doctrine had its modern roots in seventeenth-century religious dissent, especially the Protestant sects, and it is interpreted as a fundamental ideology of capitalism. In economic theory, the fictional character Robinson Crusoe is often taken to be the quintessential representative of individualistic capitalism.

As a term of condemnation, *individualisme* was employed in France to criticize the rational individualism of the Enlightenment and the French Revolution. Edmund Burke (1729–1797) believed that individualism and the promotion of individual interests undermined the commonwealth and created an uncivil and unstable society. Nineteenth-century French sociology emphasized the importance of social solidarity against the rise of egoistic forms of individualism, and the sociology of Émile Durkheim (1858–1917) can be interpreted as a sustained intellectual attack on utilitarian individualism represented by Herbert Spencer (1820–1895). Although the analysis of individualism has played a significant analytical role in the development of sociological theory, the ideological and intellectual relationship between individualism and sociology is often contradictory and antagonistic. As a result, understanding the relationship between "the individual" and "the social" remains an ongoing issue in sociological theory. Individualism has also had an important impact on economic theory, because the concept of utility has been important to the development of assumptions about market exchange, consumer sovereignty and consumption preferences, and on political theory where it underpins the contemporary notion of rights.

The modern emphasis on subjectivity, the individual, and privacy is often contrasted with the classical world, where these values were reversed. The "quarrel between the ancients and moderns" compared the respect for public institutions and public space in the ancient world with the emphasis on conscience and individual subjectivity in modern society. Benjamin Constant (1988) argued that the liberty of the ancients, which arose from their active engagement in politics, required them to sacrifice their personal interests to the polis. By contrast, the moderns pursue their personal pleasures and regard politics as merely a means to protect their private lives. The concept of individualism is thus interconnected with a range of other key concepts in social and political theory such as privacy, rights, and social contract. In contemporary thought, individualism is closely associated with privacy, because private space outside the public realm is assumed to be important for cultivating and protecting the individual from political scrutiny and interference. Both privacy and individualism are in turn associated with the liberalism of political philosophers such as John Locke (1632–1704). In liberal political thought, the protection of the rights of individuals is held to be essential to guard against the threat of arbitrary rule and authoritarian regimes. Rights refer to the legal entitlements of free and rational agents, who combine through a social contract to form a state, whose sole purpose is to guarantee their enjoyment of these privileges.

Understanding the origins of individualism typically involves a contrast in social and political theory between the public and the private within the ancient world. In classical Greece, private affairs were often negatively defined in opposition to the public sphere and public duty. The private arena was associated with deprivation (*privatus*) and the public sphere was one of freedom and reason, where citizens congregated for political debate, economic exchange, and entertainment. The autonomous individual could only exist and develop in the public domain. In political philosophy, the contrast between the ancient world and modern society has been an important aspect of the theory of totalitarianism. In *The Origins of Totalitarianism* (1958) Hannah Arendt argued that people in modern society are forced out of a shared public world into a lonely, isolated, and interior space. In their isolation, pressures toward uniformity undermine their individual autonomy, and they are psychologically exposed to totalitarian social forces. The

private space of the Athenian household was governed by the stubborn necessities of life—procreation, production, and consumption. It was only when men left the privacy of the household that they emerged from these biological necessities to participate in politics as free individuals. This clear distinction between private and public in the classical world has been confused in modern times by the emergence of "the social." In modern society, human beings are bound together, but the common threads are paradoxically the private desires of consumption and a common mass culture. In a mass society, the social becomes the basis of mass conformity and the moral calling of the political sinks into petty politics. The pressures from standardized consumer taste slowly undermine individualism.

CONCEPTUAL CLARIFICATION

From this brief sketch of the origins of the debate about individualism, we can see that the notion of individualism has become interconnected with a range of fundamental terms in political and social theory. It is as a result subject to considerable conceptual confusion. It is important to establish a clear distinction between four separate issues (Abercrombie, Hill and Turner 1986). We need to distinguish (1) an emphasis on the individual as an autonomous agent with a distinct identity, (2) individualism as a social and political ideology with various national traditions, (3) individuality as a romantic view of the uniqueness of the person requiring education and cultivation, and (4) individuation as a process whereby people are standardized by a bureaucratic process. There is in addition an epistemological theory (methodological individualism) that argues that all sociological explanations are reducible to the characteristics of individuals. We shall briefly explore these issues before turning more directly to the analysis of individualism in sociological theory.

The cultural emphasis on the individual is seen as a defining characteristic of the West. The idea that Western culture recognized the importance of the individual is often associated with Christian soteriology, where individual salvation has been a fundamental doctrine. In theological terms, the free will of individuals to determine their own religious fate has of course been contentious, but as an evangelical religion, the conversion of individuals has been a prominent aspect of Christianity as a whole. To be saved, the individual had to be distinct, separate, and responsible. Historians have also claimed that the practice of the confessional was a unique aspect of the Western tradition, underwriting the notion that each individual has a separate conscience. The confessional, like devotional reading of scripture in private, developed as an internal and reflexive discourse of the individual consciousness. Despite the processes of secularization, this emphasis on the individual continues as a tradition, for example, in both natural and common law. The individual was critical to the emergence of both natural and human rights. By contrast, Chinese and Japanese cultures do not emphasise the autonomous individual but value social responsibility. Louis Dumont in *Essays on Individualism* (1986) contrasted the hierarchical caste society of India with its emphasis on the social whole over the individual and modern society, where the social whole is subordinated to the individual.

In the European tradition, individualism as a doctrine has been a major aspect of social thought. In *The Political Theory of Possessive Individualism,* C. B. Macpherson (1962) argued that the political philosophy of Locke legitimised private property rights, and hence individualism was a necessary condition for the rise of a capitalist market. The liberalism of later writers such as Jeremy Bentham (1748–1832) and James Mill (1773–1836) was associated with utilitarianism, which proposed that institutions were useful if they contributed to the general happiness of society, but they denied the reality of collective entities. Rights were "nonsense on stilts" (Waldron 1987). For J. S. Mill (1806–1873), individualism had a distinctively political dimension, and defended the rights of the individual to liberty and freedom. He sought to protect individual conscience against the mass opinion of a poorly educated public. An important exposition of individualism was developed by Isaiah Berlin (1909–1997) in *Four Essays on Liberty* (1969), where he argued that "negative liberty" that had occupied political philosophy up to J-J Rousseau (1712–1778) involved freedom from various constraints, whereas the modern notion of positive liberty was concerned with self-realisation and self-development. The notion of positive liberty is not necessarily associated with laissez-faire individualism, which implies that individuals can do what they like, provided their freedom does not constrain the liberties of others.

The development of individualism corresponds closely to the rise of Western capitalism from the early seventeenth century. Max Weber (1864–1920) in *The Protestant Ethic and the Spirit of Capitalism* (1930) showed how Calvinism challenged traditional authority by claiming that the salvation of the individual could not be guaranteed by the institutions of the church such as the sacraments. Each individual would stand alone before God on the day of judgement and would be held responsible for his or her sins. Protestantism fostered a radical version of religious individualism that profoundly shaped Western attitudes towards political and social institutions. The emphasis on the individual and the anxieties that surrounded lack of certain knowledge of salvation was part of a "tragic vision" that in France characterised the Jansenists, the philosophy of Pascal, and the tragedies of Racine (Goldmann 1964). In "early modern religion," the Reformation was a critical turning point, because it made salvation potentially available to everybody, regardless of his or her social status. The

emergence and differentiation of the "individual" from "society" is an important component of the general development of religion.

There are, however, problems with this periodization of individualism. There were obviously variations between different societies and different religious traditions. For example, Alan MacFarlane (1978) has claimed in *The Origins of English Individualism* that English society was individualistic as early as the thirteenth century, where there was an early form of the nuclear family, no extended family, and the separation of the farm and the family, indicating the appearance of a separate economy. These structural conditions favoured the development of individualism before the Puritan revolution. MacFarlane's argument is a useful corrective to the conventional view, but other historians claimed that he underestimated the importance of communal values and community sanctions on individual belief and practice in medieval society. By contrast, there are equally strong arguments that a coherent doctrine of individualism was a product of the secular philosophers of the Enlightenment such as David Hume (1711–1776).

The idea of individuality was part of the Romantic tradition, and in Germany individuality (*Individualitat*) was associated with the cultivation of the sensibility of the individual through education, personal discipline, and travel. In the Romantic tradition, this cultivated singularity (*Eigentumlichkeit*) was contrasted with the cold rationalism of the Enlightenment notion of the individual. Perhaps the most important statement of individuality is to be found in the work of Friedrich Nietzsche, whose criticisms of modern society (or nihilism) called for a revaluation of culture in which the moral standing of the individual depended on the inner cultivation of "the soul" (Thiele 1990). Nietzsche feared that the standardization of modern culture would destroy the autonomous individual, and against modern philistine values he promoted the idea of the Overman (*Ubermensch*), who would constantly struggle to re-create himself in the face of modern ennui and mediocrity.

Individuality was associated with the debate between *Kultur* and *Zivilisation*. Thus, *Kultur* referred to those aspects of society that were highly valued and was associated with the development of individuality, or more precisely personality. Education (*Bildung*) and moral training were fundamental to the social creation of personality and self-discipline. *Bildungskultur* was the pinnacle of national aspiration, the epitome of national self-respect and achievement in German high culture. Culture required cultivating the raw potential of the self in order to produce the educated, disciplined personality. By contrast, *Zivilisation* had a negative significance, referring to the technological growth of a crass commercial society and to the utilitarian tradition of economic individualism. In the early part of the twentieth century, *Zivilisation* was increasingly associated with the negative features of American industrial civilisation

that had destroyed cultivated taste by promoting a commercial society based on popular culture and naive enjoyment. The cultural industry had in America become the entertainment business. Both the Frankfurt School and conservative critics shared this cultural rejection of American civilisation. For example, the legacy of *Bildungskultur* is manifest in criticism of the shallowness of American society and its false individualism in the philosopher Martin Heidegger's objections to modern technology.

Finally, we can recognise a process of standardization in contemporary societies that we can define as individuation, namely the treatment of individuals as uniform and equal objects. The development of modern bureaucracies has played a significant role in the surveillance and control of people through individuation. The key elements of the process are directly related to the growth of social citizenship when people acquire National Insurance numbers, passports, taxation codes, identity cards, permanent addresses, and identity cards. We have also recently seen the development of DNA testing and electronic tagging as methods of control through individuation. The process is paradoxical because citizenship is important for acquiring social benefits and resources, but it is also an aspect of modern regulation. Individuation thus differentiates people by giving them a unique identity (such as a National Insurance number), but at the same time achieves a detailed scrutiny of the individual. This process is closely associated with a sociopolitical context that Michel Foucault has called "governmentality."

INDIVIDUALISM IN SOCIOLOGICAL THEORY

Possessive individualism and laissez-faire individualism have been regarded as an ideological defence of private property, the market, and industrial capitalism. The sociological tradition has interpreted individualism primarily as a radical doctrine that has corrosive effects on the social order, because the idea that every individual has opinions that are important is a threat to tradition and authority. In this respect, individualism is often associated with egoism. Durkheim in *Suicide* (1951) claimed that individualism, egoistic expectations of the business cycle, anomie, and weak social solidarity produced high rates of suicide. Individuals with weak social connections were particularly prone to commit "egoistic suicide." By contrast, the legacy of Max Weber has been associated with "methodological individualism," namely with the view that all sociological concepts refer to or can be reduced to the characteristics of individuals. Weber claimed that he wanted to rid sociology of "collective conceptions" and to develop causal arguments based on the social actions of individuals. Weber's interpretative sociology of action in *Economy and Society* (1978) developed the ideal types of capitalism, bureaucracy, and market to avoid the reification of concepts that

was characteristic of positivistic versions of the social sciences.

The development of sociological theory has involved various attempts to resolve this dilemma of collective and individual concepts of social institutions. Weber, for example, has been criticised for an artificial and historically static construction of the individual and society. In *The Society of Individuals,* Norbert Elias (1991) criticised Weber for his inability to reconcile the analytical tensions between "the individual" and "society." This failure to deal successfully with this artificial division was part of a general weakness of sociological theory. Elias's solution was to analyse the two concepts of individual and society as historical constructs that arise from social processes. The balance between society (we) and the individual (I) is not fixed, and hence what he called "process" or "figurational sociology" was designed to explore the we-I balance in different social configurations such as feudalism or bourgeois society.

In *The Structure of Social Action* (1937), Talcott Parsons developed a systematic criticism of the assumptions of utilitarianism individualism. His argument had two major components. First, if economic actors are rational, then they will act in a self-interested manner to maximise their resources. If these assumptions are correct, then human beings will use force and fraud to achieve their individual ends. Therefore, economic theory cannot explain social order. Secondly, Parsons observed that to solve "the Hobbesian problem of order," economic theory had to introduce additional assumptions such as "the hidden hand of history" or "sentiments" to explain how social order emerged. However, these additional assumptions were not compatible with the initial assumptions about self-interest and maximisation. Parsons's criticisms were important in the development of the sociological tradition that denies "society" is simply an aggregate of self-interested economic actors. Society can only exist where there are shared traditions, cultures, and institutions.

The concept of the social actor in both Weber and Parsons was an analytical construct that emerged from their engagement with economic theory. It is possible to defend both Weber and Parsons against Elias. In his sociology of religion, Weber developed the notions of "personality" and " life orders" in which a personality structure is not a given but is cultivated through education and discipline. "Personality" stands frequently in opposition to the "life orders" of the economy and the state, and with the growth of capitalism, personality is threatened by the regulatory impact of the practical rationality of the secular world. Different cultures have different life orders that produce different personalities. The violent personalities of medieval society are replaced by new life orders that emerge with new social technologies. In his studies of the Protestant sects, Weber examined the historical development of the ascetic personality in relation to the life orders of

emerging capitalism. Weber's articles on European and American sectarianism were part of a larger project on the sociology of life conduct (*Lebensfuhrung*). It is not possible, therefore, to interpret Weber's sociology as yet another conventional dichotomy of the individual and society; the dichotomy for Weber was thoroughly anthropological and historical. Similar arguments might be developed in relation to Parsons, who thought of personality as a type of institution and hence did not conceptualise society as simply a collection of individuals.

TOCQUEVILLE, INDIVIDUALISM, AND AMERICAN CULTURE

There has been a persistent theme in modern sociology arguing that nineteenth-century individualism was undermined by the growth of mass society in the twentieth century. The debate starts with Alexis de Tocqueville (1805–1859), who in *Democracy in America* (1969) believed that the lack of centralised, bureaucratic government in America had encouraged individual initiative and that voluntary associations had flourished to solve local, community problems. Civil society flourished as a result of these associations, and individualism had not been crushed by centralised administration. However, the emphasis on equality, while a revolutionary doctrine, also threatened the individual with mass opinion. Tocqueville's fears for individual opinion in a mass democracy influenced liberals such as Mill towards universal suffrage in Britain.

Critical theorists in the twentieth century continued to study the impact of mass society on individuals. C. Wright Mills (1956) in *The Power Elite* claimed that individuals were increasingly manipulated by public opinion in a society where elites controlled the channels of information. David Riesmann in *The Lonely Crowd* (1950) analysed the American personality as the other-directed character, because it depends on constant approval and affirmation from others. Other-directed personalities are conformist, and hence American society was stagnating. In *The Organization Man* (1956), W. H. Whyte described the company executives of corporate America, who are mobile, disconnected from their local communities, and dedicated to personal achievement within the organization. These organizational commitments encouraged conformity and alienated these executives from family and community. In *Habits of the Heart,* Robert Bellah and his colleagues (1985) undertook an influential study of contemporary attitudes towards politics that was intended to replicate Tocqueville's study. They found that Americans were alienated from politics at a formal level, but their commitment to society was expressed through a multitude of local and informal associations.

Sociology in the 1950s created a picture of social standardization or individuation that apparently undermined the raw individualism of early capitalism. Contemporary

sociological studies have drawn on the theory of postindustrial society to argue that modern patterns of employment, for example, in the service sector, are fragmented and do not require loyalty to the company. Work in the 1990s has become casualised, part time, and discontinuous. The alienated individual of mass society has been replaced by a workforce that has no sense of identity with the company, and many people no longer have an experience of a lifetime career. A sense of stable and continuous identity is eroded by the impact of technology on careers. The implication of these studies of postindustrial work is that the rugged individualism of early capitalism is being replaced by postmodernity. As a result, contemporary social thought has conceptualised the individual as an uncertain, anxiety-ridden personality whose roots in society have been dislocated by the speed of technological change, the erosion of the community, and the secularisation of traditional culture.

As a result, the modern individual is once more disconnected from the community and trapped by a variety of contradictory processes. There is a widespread view in sociology that modern cultures of consumption are subject to global processes of standardization, for example, as a consequence of McDonaldization, and individual preferences are simply manufactured by modern advertising. At the same time, modern cultures are becoming hybrid and differentiated by globalization. Global hybridity and cultural simulation are eroding the national and communal roots of identity. These social processes are producing postmodern individualism in which the emphasis on subjectivity in popular culture occurs alongside a global monopolization of information, the standardization of cultural production and consumption, and the rise of electronic surveillance of individuals, especially deviants and criminals. Postmodern individualism appears, therefore, to be an example of the dangerous public world that was analyzed in Arendt's study of the roots of twentieth-century totalitarianism.

INDUSTRIAL SOCIETY

Industrial society is based on an economic mode of production that relies primarily on machine technology for the production of goods. Although the embryonic origins of the process of industrialization can be traced back to earlier periods—some historians push back to as early as the thirteenth century, while others move the date forward by some centuries—the period between 1750 and 1850 is generally considered to mark a watershed event of world historic importance, as the Industrial Revolution swept first through Britain and then elsewhere in Western Europe and North America. Although critics contend that the term *revolution* is inappropriate insofar as it implies rapid social change of an unprecedented and violent nature, social theorists have tended to side with the view advanced by social historian Eric Hobsbawm (1969), when he contends: "The industrial revolution marks the most fundamental transformation of human life in the history of the world recorded in written documents" (p. 13). Seen in this light, it is parallel in its monumental impact to the shift in preliterate times from hunting and gathering societies to agrarian societies.

Industrial society proved to be extraordinarily dynamic, encouraging rapid and ceaseless technological innovation and mechanization that led to levels of economic productivity never before realized. In a relatively short time, industrial society transformed work as self-sufficient artisans gave way to wage laborers working in the new factory system. This was part of the restructuring of the class structure and a new division of labor, which saw an explosion in the size of the working class and the consolidation of economic

power in the hands of the emergent capitalist industrial class. The factory became the new locus of work, which was increasingly rationalized and subject to new modes of control and surveillance. At the same time, new modes of transportation and communication emerged, signalling the beginning of a process of reducing the impact of geographic distance on economic development. Industrialization was intimately related to urbanization, as the factory system was heavily concentrated in cities. This led to a major demographic transformation of society. The impact of these changes was not confined to the economic realm, but rather reverberated throughout the entire social order. Industrialization led to the rise of mass markets and thus to new patterns of consumption. It impacted politics and culture and penetrated into the intimate realm of domestic life. At the same time, in the interest of obtaining raw materials, cheap labor, and potential new markets for goods, it spurred a process of global penetration into nonindustrial parts of the world.

There were those who clearly benefited from industrialization and those who were losers. The major beneficiaries were the owners of industrial enterprises and the financiers who provided the capital for business ventures. This era witnessed the expansion of the middle class and a rise in its standard of living. Among the losers were the landed aristocracy, who did not sink into oblivion, but in the political struggles of the period saw their dominance erode. The economic viability of the artisans was undermined by industrialization, as the waves of machine-breaking episodes by members of this class between 1810 and 1830 attests. As empirical studies in the nineteenth century such as Friedrich Engels's *The Condition of the Working Class in England* (1844) and Charles Booth's *Life and Labor of the People of London* (1889–1891) indicated, the lives of the urban working class was characterized by low wages and poor work conditions, inadequate housing, crime, disease, and other manifestations of grinding poverty.

PREINDUSTRIAL VERSUS INDUSTRIAL SOCIETY

The birth of sociology occurred during the Industrial Revolution, as intellectuals sought to make sense of the dramatic changes that were sweeping across Western Europe. Among the progenitors of modern sociology, Henri Saint-Simon (1760–1825) is generally credited with first giving substance to the concept of industrial society. He did so by presenting a sharp and essentially ahistorical distinction between feudal society and industrial society. The former he characterized as rooted in tradition, militaristic, and concerned primarily with consumption, while the latter undermined tradition, was peaceful, and centered around production. His approach didn't seek to account for the process of social change that led from one type of society to the next, but rather focused in generally dichotomous terms on the

differences between them. The construction of contrasting typologies would characterize the work of other nineteenth- and early twentieth-century social theorists. This includes Henry Sumner Maine's distinction between societies based on status versus contract, Ferdinand Tönnies's *Gemeinshaft* versus *Gesellschaft,* Herbert Spencer's militant versus industrial, and the most consequential of such typologies, Émile Durkheim's mechanical versus organic.

Durkheim contended that preindustrial and industrial societies can be distinguished by contrasting modes of social solidarity—mechanical for the former, organic for the latter—that in turn reflect differences in the division of labor. Preindustrial societies are characterized as having relatively simple social structures with a minimal amount of labor division. Clans, tribes, villages, and other forms of what Durkheim called "segmented societies" relied minimally, if at all, on external social organizations, instead functioning as small networks for the provision of life's basic necessities. Segmented societies were not economically interdependent to any significant degree. The solidarity that bound people together was connected to the sameness of their lives. People were bonded together by commonly held values or what Durkheim, borrowing from Rousseau, referred to as the "collective conscience" (Durkheim [1893] 1964). In contrast, modern industrial societies are defined by their increasingly complex social structures and by an ever more refined division of labor. Industrial societies necessitate the specialization and compartmentalization of work, and with this arises a growing interdependency. The new reciprocity characteristic of social relations is precisely the quality of industrial societies that establishes the basis for organic solidarity. The differences in the functions performed by societal members produce individual differences, thereby serving as a stimulus to individualism. Industrial society is characterized by heightened complexity and differentiation, an increased dependence on society, and at the same time a growing level of individual autonomy.

Durkheim focused on the social problems that were endemic to industrial societies. In so doing, he sought to distinguish those problems from temporary ones resulting from the rapid transition from preindustrial to industrial society, where the eroding of mechanical solidarity left a vacuum while a new moral order based on organic solidarity had not yet emerged. In combating the problems associated with the two pathologies he saw as most significant—anomie and egoism—he argued that sociology had a role to play in clarifying moral issues and in formulating reform-oriented social policy. His concern for facilitating the emergence of a new moral order consonant with organic solidarity led him to embrace a version of conservative socialism similar to that of Saint-Simon.

A contrasting perspective on industrial society can be seen in the work of two other classic figures in the formative

period of sociology: Karl Marx and Max Weber. It is different in two significant ways. First, it seeks to offer a historical account of the rise of industrial society. Second, while the first approach conceptually decoupled capitalism from industrial society, another line of thinking concerned itself with *capitalist* industrial society.

Marx identified three precapitalist economic formations—Asiatic, ancient, and feudal—as the sum total of historically specific predecessor modes of production. Little attention in his work was paid to the distinctive characters of these modes. Moreover, despite attention paid to the transition from agrarian feudalism to industrial capitalism, discussions concerning the transition from one economic formation to another remains problematic. This is due in no small part to the fact that his primary focus was the capitalist mode of production. Moreover, it was the unique dynamics of capitalism that were of primary concern, and not the dynamics of industrial society in general. He depicts capitalism as a type of industrial society characterized by class divisions that are defined in terms of the private ownership of the means of production by the hegemonic capitalist class. Because capitalists compete with other capitalists, they are forced to constantly upgrade the means of production by introducing technological innovations in order to gain a competitive advantage. In this sense, capitalism proved itself to be the most highly dynamic and productive economic system in history, creating the preconditions for postscarcity societies.

However, there was a darker side to capitalist industrial society. The implication of this system for workers is that they lose the ability to own the fruits of their labor and the capacity to control the labor process. By being forced into the world of wage labor, they are devalued to the level of a commodity—a "thing"—through the process of "universal salability." The major theme in Marx's critique of capitalism in his early writings is that workers suffer from alienation in such a society. Although Marx never repudiated this more philosophical argument, at the forefront of his later economic writings was the concept of exploitation. In the quest for profit, the capitalist invests money not in order to produce something of use value but to make more money. Disputing the idea that profit arises in the exchange between producer and consumer in the marketplace, Marx insisted that it occurs in the sphere of production, in the exchange between the capitalist and the laborer. He rejects the claim of classical economics that the exchange of labor for wages was an equal one, contending instead that for capitalism to function, the exchange was of necessity unequal to the advantage of the capitalist. Surplus value—calculated as the ratio between necessary labor time and surplus labor time—is in Marx's view the ultimate source of profit. In *Capital,* he argued that surplus value should be treated as a measure of the rate of exploitation, which is predicated on the view that the inherent relationship

between capitalist and worker is like that between a vampire and its victim (Marx [1867]1967:257).

Marx was convinced that industrial society could be freed from its capitalist mooring via the revolutionary actions of a class-conscious proletariat, and that by so doing, a new type of socialist industrial society could emerge that would overcome both alienation and exploitation. While he avoided descriptions about exactly how such a society would be structured, it was clearly seen as classless, a situation made possible by transferring the means of production from private to public hands.

By training an economic historian, Weber did devote considerable attention to preindustrial social formations. His major contributions to the study of industrial society are twofold. First, in his *Protestant Ethic and the Spirit of Capitalism* ([1904/1905] 1958), he sought to counter a materialist interpretation of history that he associated either with Marx or with the heirs of Marx. He did so by suggesting that ideas constitute an equally powerful force in shaping patterns of social change. Specifically in this case he contended that there was an elective affinity between the religious ethic that emerged as a consequence of the Protestant Reformation and what he called "the spirit of capitalism." While he did not claim that this was in itself a sufficient account of the rise of industrial capitalism, he did see it as an important part of the puzzle, one overlooked by Marx's materialist theory of social change.

Second, Weber was the first scholar to stress that modern bureaucratic organizations were an essential component of capitalist industrial society. In making this case, he depicted bureaucracy as Janus-faced. On the one hand, it is as central to the modern economy as is the machine, while simultaneously it represents a threat to equality and individual freedom. Weber agreed with Marx's general characterization of the class structure of capitalist society, and he saw the potential for considerable class conflict. However, he did not share Marx's belief that class conflict could provide a way to resolve the central problems of capitalism: exploitation and alienation. The egalitarian and emancipatory aspirations of socialism could not be realized, in his opinion, in no small part because of the necessity of bureaucracy, which entails decision making in terms of a hierarchical chain of command. Replacing a market economy by a command economy, as he saw unfolding in the Soviet Union, would increase bureaucratic decision making rather than reduce it.

THE LOGIC OF INDUSTRIAL DEVELOPMENT

As the orientation of democratic socialist parties and left-wing unions in the most advanced industrial nations became increasingly reformist throughout the first half of the twentieth century, coinciding with the emergence of welfare states, industrial conflict became institutionalized, as reflected

in collective bargaining agreements that recognized and legitimized the union movement while simultaneously defining the goals of organized labor in nonrevolutionary terms. With the Hawthorne studies being perhaps the paradigmatic example, within the social sciences less attention was paid to theories of industrial relations than to applied research into the workplace and worker/management relations. "Scientific management" contributed in significant ways to the rationalization of the work process and the organizational structure of the corporation. One can detect within the arena of industrial relations a divide between sociologists operating from consensus versus conflict perspectives.

Theoretical attention turned to the rising significance of the managerial classes and of professional experts. This could be seen in the first half of the twentieth century in the work of figures such as Thorstein Veblen and Joseph Schumpeter. Veblen viewed the owners of business enterprises as increasingly anachronistic and predatory, and thus not one of the "productive classes." He argued that the development of industry was predicated on its capacity to continually introduce new technological developments, which in turn made necessary the expansion of the cadres of engineers and technicians with expert knowledge. For Veblen, the central struggle of industrial societies would be between the owners driven by pecuniary interests and the experts who promoted industrial interests. Although he wrote about the "soviet of engineers and technicians," it did not appear that he thought of the experts as a revolutionary class. While it is clear that he thought their power in industrial society was as desirable as was the reduction in power of the business classes, Veblen did not actually explore the nature of the relationship between the owners and the experts.

In a parallel analysis, Joseph Schumpeter pitted capitalist entrepreneurs against the managerial class. In his perspective, the entrepreneurial class played a crucial historical role in the formative period of industrialization. Its willingness to take risks in the competitive market made possible a dynamism that promoted the continual enhancement of methods of production. However, its one essential role came to an end as a consequence of its success. Schumpeter treated the bureaucratic corporation as one of the central achievements of the entrepreneurial class. In these organizations, the managerial class came to occupy an increasingly powerful position, and the entrepreneurs became increasingly irrelevant. This shift from owners to managers is what James Burnham called the "managerial revolution," viewed by some commentators as tantamount to a "Second Industrial Revolution." From this perspective, there was considerable support for the view that the political challenges to industrial society had been overcome as a managerial welfare state assumed the role of broker, mediating the competing claims of rival interests in the industrial sector.

At the same time, a group of theorists, shaped to significant extent by evolutionary functionalist theory, began to argue that industrialization as a worldwide process could be seen in terms of convergence. This orientation suggested that there might be different roads to industrialization, with the expectation that the outcomes would nonetheless begin to parallel one another. The idea of convergence prompted the search for universals of industrial development, as could be seen in the work of a variety of influential figures at the middle of the twentieth century, including Raymond Aron, Seymour Martin Lipset, John Kenneth Galbraith, Clark Kerr, and Harold Wilensky.

POSTINDUSTRIAL SOCIETY

Beginning in the 1960s, a growing number of social scientists began to embrace the notion that industrial societies had reached a watershed, setting the stage for the emergence of a novel phase of industrial development. Picking up on earlier themes, they began to attempt to give name to this new society. Peter Drucker, for example, defined it as a "knowledge society," while Ralf Dahrendorf called it a "service class society," Zbigniew Brzezinski the "technetronic era," and still others signalled a sense of rupture by calling it posteconomic, postbourgeois, postscarcity, and so forth.

By far the most influential characterization of contemporary advanced industrial societies is *postindustrial.* This term received theoretical articulation at approximately the same time by Daniel Bell and Alain Touraine. Bell's central claim is that whereas industrial society was a goods-producing society, postindustrial society is knowledge producing. Knowledge is key to directing patterns of innovation and change, as well as for social control. Postindustrial society presumes the existence of a highly educated professional class that possesses the scientific, technical, managerial, and administrative training needed to ensure that the economy will function productively. The viability of postindustrial society depends on whether or not this professional class is in a position to ensure that rational decisions are made and implemented, decisions that stress efficiency, calculability, and control.

Such an economic system requires more highly centralized coordination than was the case in the earlier stages of industrial development. This can only occur when a new symbiotic relationship emerges between the economy and the polity, one in which the state serves as the "cockpit" of the new industrial order. Technological development operates in Bell's view with a logic of its own and is the primary vehicle shaping economic change. Postindustrial society is characterized by appreciably greater control over society and nature, control that establishes the possibility that postindustrial society will also be a postscarcity society.

At the same time, Bell locates the sources for potential social divisions and conflict—due, he contends, to a lack of

synchronicity in the key sectors of society: the economy, polity, and culture. Problems arise because each functions according to different "axial principles." While a postindustrial economy needs to be guided by instrumental rationality, the polity in democratic societies is guided by principles that promote equality and citizen participation. Thus, there is an inherent tension between the need for decision making by meritocratic knowledge elites versus the demand for citizen involvement. Similarly, there is a tension between the axial principles of the economy and the culture, the latter being described in terms of a premium placed on the quest for emotional self-expression and individual fulfilment. Bell does not develop to any significant degree an analysis of the implications of these potential sources of conflict. Although he refers to these as the "cultural contradictions of capitalism," in fact he skirts the issue of the role that capitalism may have played in generating these contradictions. This is because capitalism drops out of his analysis, thus locating him in the theoretical tradition closest to Durkheim.

Touraine's take on postindustrial society begins with the claim that it is a society of "pure change, without structure." This suggests an openness that accords a greater role to agency than one finds in Bell. Touraine agrees with Bell that the state plays an increasingly central role in societal decision making. However, rather than being intrinsic to economic development, he views the state as playing a more central role in effecting social domination. Domination takes three forms: social integration imposed in terms of the requisites of programmed production, the cultural manipulation of needs and attitudes, and the efforts of those key players at the intersection of the corporate and state spheres to enhance their capacity for social control by promoting a situation characterized as "dependent participation." In short, Touraine presents a leftist response to Bell's thesis, one that locates the sources of social conflict not in axial principles but in terms of the struggle between the dominant class—which he defines as the technocracy—and sectors of the dominated classes.

In spite of the manipulative power of the dominant class to marginalize conflict, Touraine has seen in a variety of new social movements—ethnic, feminist, antinuclear, peace, environmental, consumer, and organized labor—the potential for serious challenges to the hegemony of the dominant class. His understanding of the self-production of society is articulated in collective rather than individual terms, with postindustrial society thus being characterized in terms of the struggle for control over the future directions of social change.

Despite the obvious differences between Bell and Touraine, they share one thing in common: Capitalism evaporates from their theories of postindustrial society. In contrast, it has been placed center stage by a variety of currently active theorists rooted in the Marxist and/or Weberian traditions. This is, for example, evident in discussions initiated by British neo-Marxists about what they characterize as the

shift within the sphere of production from "Fordism" to "post-Fordism." Fordism refers to the mechanized production methods associated with the assembly line and the utilization of methods of scientific management. The interventionist state that Bell argued was central to postindustrial society was clearly necessary for Fordist production, entailing both the implementation of Keynesian economic policies and the administration of an expanding welfare state in order to ensure societal stability. However, changes brought about by automation and the global exportation of manufacturing operations to less developed nations where labor costs were considerably lower led to a process of deindustrialization, depicted by economists Barry Bluestone and Bennett Harrison as a systematic process of disinvestment in the manufacturing sector.

Deindustrialization set the stage for the advent of postFordism, a somewhat imprecise term that refers to new manufacturing techniques that rely on flexible, decentralized, specialized, and just-in-time production methods. Industrial enterprises, increasingly reliant on new information technologies, require expanded cadres of knowledge experts, but a much smaller blue-collar workforce. At the same time, the introduction of neo-liberal economic policies—seen most explicitly in the economic policies of Margaret Thatcher in Britain and Ronald Reagan in the United States—signalled a new relationship between the state and the economy. Neo-liberalism involved a frontal assault on the welfare state, with the unbridled competitive market becoming not only the dominant force shaping the economic sphere but also spilling into other sectors of society as well.

With these trends in mind, Scott Lash and John Urry (1987) contend that we are moving into a third stage in the history of capitalist industrial society. If the era of Marx can be seen as the period of liberal capitalism, and the era of Fordist methods as the period of organized capitalism, they suggest that since the 1960s, this second stage has given way to "disorganized capitalism." Moreover, disorganized capitalism resonates with the culture of postmodernity, rather than being at odds with it. In other words, contrary to Bell, Lash and Urry, and similar commentators such as David Harvey and Fredric Jameson, see postmodernity as a reflection of the functional requisites—or the "cultural logic"—of contemporary industrial capitalism.

AN INDUSTRIALIZED GLOBAL ECONOMY

One problematic feature of postindustrial theory is that it focuses on national economies. Thus, the claim that the manufacturing sector has declined at the same time that the information sector has grown is true only at the level of the nation-state. This has led globalization theorists to call for "unbounded" social theories that recognize the expanding reality of global fields of action, networks of

interaction, and organized practices. Though there are varied accounts at present about the contours of a global economy, there is general agreement that new communications and transportation technologies make possible its emergence, facilitating the footlooseness of corporate capitalism.

Some theorists, including Anthony Giddens, view the globalization of industry as occurring haphazardly rather than being shaped to any significant degree by particular collective social actors. Others counter this position by suggesting that an increasingly powerful transnational capitalist class guides the emergence of global capitalism. Leslie Sklair (2001) is perhaps the key spokesperson for the latter position. He contends that this class, operating across national borders and no longer tied to particular nation-states, is intent on creating a global economy without borders. From this perspective, what we are currently witnessing is an unfolding process that is far from complete, but constitutes a qualitative shift in industrial capitalism from an international to a global system. To provide a structure to the changes under way, the transnational capitalist class has created organizations such as the World Bank, the WTO, and the IMF and institutional frameworks such as GATT and NAFTA. In a theoretical argument located within the Marxist tradition, Sklair seeks to counter the anarchical view of globalization by indicating the capacity of the most powerful social actors to impose the sort of order they prefer on the emergent global economic system. At present, theoretical work on economic globalization is only beginning to be translated into research agendas.

INSTITUTIONAL THEORY

Institutional theory examines the processes and mechanisms by which structures, schemas, rules, and routines become established as authoritative guidelines for social behavior. It asks how such systems come into existence, how they diffuse, and what role they play in supplying stability and meaning to social behavior. It also considers how such arrangements deteriorate and collapse, and how their remnants shape successor structures.

One of the dominant theoretical perspectives at the end of the nineteenth century, institutional theory was eclipsed by other approaches during the first half of the twentieth century. In recent decades, however, institutional theory has experienced a remarkable recovery, entering the new century as one of the most vigorous and broad-based theoretical perspectives in the social sciences.

Institutional theory is not a single, unified system of assumptions and propositions, but instead a rather amorphous complex of related ideas—a broad theoretical perspective or family of approaches. Older, nineteenth-century versions built on and incorporated contributions from economists, political scientists, and sociologists. Contemporary versions have drawn renewed energy from developments in cognitive psychology, ethnomethodology, the new cultural studies within anthropology and sociology, evolutionary and transaction-cost economics, and recent advances in social history.

Although diverse, institutional arguments cohere around the central tenet that "institutions matter" in accounting for social behavior. Institutional arguments exhibit a lean common core of assumptions: (1) institutions are governance structures, embodying rules for social conduct, (2) groups and organizations conforming to these rules are accorded legitimacy, a condition contributing to their survival, (3) institutions are characterized by inertia, a tendency to resist change, and (4) history matters, in the sense that past institutional structures constrain and channel new arrangements. Built on this bedrock are diverse approaches that vary along important dimensions: individual actor versus structural approaches, debates over the bases of institutional stability, the role of rational choice versus more relaxed theories of decision making, the relative importance of interests and ideas, and divergent views concerning the appropriate level of analysis.

Contemporary approaches can be roughly categorized into three clusters based primarily on which aspects of governance structures are privileged. Rational-choice theorists emphasize the regulatory aspects of institutions and focus attention on the design and construction of institutional frameworks to support collective action. Normative theorists attend to the ways in which values and commitments generated in interaction shape, undermine, and augment

formal and official regimes. And cultural-cognitive theorists stress the importance of widely shared assumptions and beliefs and the construction of social identities as the underpinnings of social order.

Many substantive arenas have been informed by institutional analysis, including modernization processes at the global level, emergence of international regimes, structuring of organizational fields, competition among organizational forms (or populations), design of organizational structures, and the diffusion of innovations among social entities.

EARLY INSTITUTIONAL THEORISTS

Many of the best known and most influential social theorists working at the turn of the nineteenth century were institutionalists albeit of varying flavors. Economists such as Gustave Schmoller, John R. Commons, and Thorstein Veblen emphasized the importance of examining the historically varying rules governing economic transactions, and suggested that the role of rationality had been overemphasized and that of habit and convention neglected in the examination of economic behavior. These theorists, and their intellectual descendants—including Joseph A. Schumpeter, John Kenneth Galbraith, and Gunnar Myrdal—departed from the assumptions guiding mainstream economists by emphasizing indeterminacy over determinacy in causal models, exogenous over endogenous determinants of preferences, behavioral realism over simplifying assumptions, and a greater interest in examining change and variation over place and time rather than stylized models of economic equilibrium.

Also active at the beginning of the twentieth century were a number of political scientists who examined the construction and functioning of political institutions ranging from the legal structure of constitutional systems to the activities of administrative agencies. Theorists such as John William Burgess, Woodrow Wilson, and Westel Woodbury Willoughby stressed the study of formal political structures, providing configurative descriptions of intricate systems of interlinked rules, rights, and procedures. These efforts were overshadowed and eventually supplanted by the development within political science of the behavioralist approach, which diverted attention from institutional structures to political behavior, including voting, party formation, public opinion, and informal influence.

By far the largest and most influential collection of early institutional scholars were the giants of sociology, including Karl Marx, Émile Durkheim, Max Weber, Herbert Spencer, and Charles Horton Cooley. Particularly in his early work, Marx noted the role played by ideological structures, which rose to provide justification and legitimacy to (exploitative) political and economic systems. Durkheim, primarily in his later work, stressed the pivotal role played by symbolic systems—systems of belief and "collective representations"—that, although a product of human interaction, are experienced by individuals as objective "social facts." These "crystallized" systems, perceived by the individual to be both external and coercive, are social institutions. Weber embraced the institutionalist argument that the study of economic and political systems needs to be historically informed and comparative. His studies on the effects of religious belief systems on economic behavior and on the rise of "rational-legal" administrative systems provided the foundation for decades of productive comparative scholarship relating cultural systems and social structures. Spencer viewed societies as organic systems made up of specialized subsystems, each of which fulfilled its functions through distinctive institutional arrangements. He, along with his intellectual colleague, William Graham Sumner, carried out comparative studies of these institutions as they varied across societies. Cooley emphasized the interdependence of individuals and institutions—the extent to which individuals create great institutions, including language, government, religion, and laws, which, in turn, constrain and guide individual behavior.

More so than was the case in economics or political science, sociologists continued the tradition of institutional research uninterrupted through the twentieth century. Scholars such as Everett C. Hughes, Talcott Parsons, George Herbert Mead, and Alfred Schutz continued to examine the interdependence of institutions and individuals, Hughes and Parsons emphasizing more the macro-micro direction, Mead and Schutz, the micro-macro influences. Much research in arenas as varied as industrial relations, occupational systems, stratification, race relations, marriage and family, and gender takes account of the pervasive influence of institutional frameworks on social life.

MODERN THEORETICAL DEVELOPMENTS

These many threads of institutional scholarship have evolved into three principal contemporary strands of theoretical work: *rational choice* approaches, favored by most economists, many political scientists, and a smaller number of sociologists; *normative* approaches, pursued primarily by sociologists and some political scientists; and *cultural-cognitive* approaches, developed by cultural anthropologists and sociologists and utilized particularly by organizational sociologists and management scholars.

Rational Choice Theory

Institutions are viewed as governance or rule systems created by individuals seeking to promote or protect their own interests. Although institutions regulate and constrain individuals, under some conditions individuals recognize that their goals can be more effectively pursued through

institutional action. This explains why individuals are motivated to construct systems that constrain their own behavior. Early, more heroic versions of rational actors assumed that the individual actor engages in utility-maximizing behavior, guided by stable preferences and possessing complete knowledge of the possible alternatives and the consequences associated with each choice. These have been replaced with models acknowledging that individual rationality is "bounded" by information and calculation limitations. Nevertheless, individuals are seen as intendedly rational, doing the best they can to satisfy their wants. More so than the other approaches, rational choice theory embraces an atomist view, focusing on individual preferences and choices as the basis for explaining social behavior, including the construction and utilization of institutions.

The most widely employed variant of rational choice theory is *transaction cost economics,* inspired by the work of Ronald Coase and elaborated and enriched by Oliver E. Williamson. Building on the earlier insights of Commons, Williamson argues that economic behavior consists fundamentally of transactions—exchanges of values among individuals. To safeguard the interests of the parties, more or less explicit contracts are devised to govern behavior. As the transactions become more complex and the outcomes more uncertain, the cost of negotiating and policing contracts increases. Individuals are motivated to construct governance structures (regulative institutions)—for example, property rights protections, organizational hierarchies, trade associations, political regimes—in order to reduce such transaction costs. The task of the institutional scholar is to determine what types of governance structures are best equipped to address what types of transaction costs.

Transaction cost economics has been employed to address a wide variety of economic problems, including the design of market systems, corporate structures, labor contracts, franchise bidding, antitrust law and enforcement regimes, and the formation of alliances. A growing number of political scientists, including Elinor Ostrom, Terry Moe, Kenneth A. Shepsle, and Barry Weingast, have adapted this theory to account for the regulation and structure of public organization, including the design of treaties and alliances among nations, legislatures, cabinets, committees, and administrative agencies.

Two other subfields of economics also embrace a rational choice perspective in accounting for the design of institutions. *Principal-agent theory* is designed to address situations in which one party, termed the "principal," seeks to achieve some outcome but requires the assistance of others, termed "agents," to carry out necessary activities. The theory provides guidance for the construction of control and incentive systems—regulative institutions—that attempt to align the interests of the cooperating parties. A second approach, *game theory,* conceptualizes the problem of pursuing one's interests in interdependent situations as a set of games between actors. The problem for actors is to construct a payoff matrix (distribution of rewards) that will enable them to achieve their interests with minimal costs. In one influential study, Robert Axelrod employed the Prisoners' Dilemma situation to evaluate the conditions under which individuals who pursue their own self-interest in the absence of a central authority will devise incentives to reinforce cooperative behavior.

Normative Theory

A second cluster of theorists emphasize that institutional systems rest primarily on a normative foundation. Normative systems are composed of shared norms and values that introduce a prescriptive, evaluative, and obligatory dimension into social life. Rules are not simply externally enforced, but internalized by actors. Informal systems of interpersonal ties and mutual obligations are central components of viable institutions.

Long an important tradition in sociology, particularly schools associated with Chicago and Columbia University championed the normative view of institutions. At Chicago, Robert E. Park, Everett C. Hughes, Erving Goffman, and Howard S. Becker carried institutional analysis forward. Most of this work was of an ethnographic character, and much focused on the microprocesses by which individuals attempt to limit the power of institutions, making room for more creative and personal arenas of action. At Columbia, Robert K. Merton provided leadership to an important cluster of organizational sociologists, including Peter M. Blau, James S. Coleman, Alvin W. Gouldner, and Philip Selznick, who examined the interdependence of formal and informal systems of conflict and cooperation. Selznick developed the most explicit theory of institutionalization as the process by which, over time, organizations, created as technical systems, become "infused with value." Vested interests are created, sunk costs exist in the form of capital equipment and member training, allegiance is developed to leaders and values, commitments are made to external parties, and, overall, the behavior of the organizations becomes more predictable and stable. This version of institutional theory has been carried on and enhanced by the work of Jerome Karabel, Charles Perrow, and Arthur Stinchcombe, among others.

Within political science, James G. March and Johan P. Olsen have challenged the turn toward individualistic, utilitarian, and functional arguments characteristic of rational choice theorists to advocate a return to a recognition that important values are embedded in institutional systems. Most social organizations, political and economic, are governed by rules, and most participants within organizations view themselves as carriers/spokespersons for them. Decisions made by these participants are less likely to be governed by a "logic of instrumentality," involving

calculated choices to maximize that individual's utility, than by a "logic of appropriateness." Participants determine the nature of the situation, reflect on the nature of their own role or identity, and act accordingly. Most behavior, most of the time, is governed by routines, procedures, conventions, roles, and rules, as emphasized by the earlier work of Herbert A. Simon.

Historical institutionalism is a related approach pursued by political scientists and political sociologists. This school emphasizes the extent to which existing institutional systems affect subsequent arrangements and directions of change. Thus, decisions made in the early stages of institutional development will continue to influence later decisions; and even when existing systems are overturned, they will affect efforts to devise replacement structures. Such effects reflect "path dependence" in a series of actions, as initial institutional choices have continuing effects on policy choices and governmental performance. Research by Peter A. Hall, Stephen D. Krasner, and Theda Skocpol, among others, document these processes across a wide variety of governmental systems.

Cultural-Cognitive Theory

Cultural-cognitive theory represents the most recently developed conception of institutional structures and processes. The theory draws on the seminal work of Peter L. Berger in phenomenology, the ethnomethodological studies of Harold Garfinkel, and the cultural anthropology of Mary Douglas and Clifford Geertz, who stress the semiotic dimensions of cultural systems. The core elements of institutions from this perspective are the shared conceptions that define the nature of social reality. This reality is developed in social interaction among individuals as they create and share interpretations of what is going on, on both micro and macro levels. Over time, on a micro level, individuals create and come to share common understandings of the nature of their situation (playground, workplace), and these understandings are passed along to others who join the group. Similarly, at more macro levels, people create shared symbols (language) and shared understandings (religion, science) that define social reality, shaping the understandings and cognitive processes of participants.

These ideas have been vigorously pursued by sociologists, who have applied them to the analysis of organizations, organizational populations, nation-states, and, more generally, to the diffusion of innovations among social entities defined as similar. Paul J. DiMaggio, Walter W. Powell, John W. Meyer, and W. Richard Scott, among others, have pursued the development and application of these arguments at the organization level. Meyer and Scott stress the extent to which organizational structure and behavior is shaped not only by technical considerations but also by cultural rules promulgated within their wider environment

regarding "rational" organization. In this view, rationality is often a cultural construction, beliefs taking the form of rules specifying procedures that are asserted to produce desired ends. DiMaggio and Powell delineate the various mechanisms—coercive, normative, and mimetic—by which organizations are induced to embrace these rules, and point out that rules vary across industrial sectors or fields occupied by organizations. Institutional pressures exist in all fields that induce organizations to conform to cultural rules, to become isomorphic to these models in their structures and procedures. Such conformity brings legitimacy, which, in turn, affords access to resources needed to survive.

This work challenges views privileging individual actors as the focus of action. Rather than being agents, individuals are more often subjects: recipients of scripts that they enact as constructions of institutionalized cultural environments. Similarly, individual organizations are viewed not as autonomous, instrumental actors but rather as embedded in, shaped and permeated by, wider institutional environments.

Other sociologists, including Glenn C. Carroll, John Freeman, and Michael T. Hannan, examined the emergence and growth of distinctive types (populations) of organizations. Although early models were based on ecological arguments, as advanced by Amos Hawley and other urban sociologists, that emphasized the role played by competition over resources, Carroll and Hannan recognized that the growth of new populations of organizations was also shaped by the growing acceptance and recognition of these forms as appropriate vehicles of collective action. "Social fitness" was as important as economic efficiency in determining the survival of a new organizational form. The increasing prevalence of an organizational form signals its increasing legitimacy, particular arrangements coming to be seen as the "natural" way to organize to perform certain activities. In addition to the effects of increased density on vital rates of foundlings and failures, other ecologists such as Joel A. C. Baum have examined the role of institutional embeddedness—the effects of numbers of ties between a population of organizations and its institutional environment—in enhancing survival chances of the form.

Meyer and colleagues have applied cultural-cognitive arguments to examine the effect of developments in cultural rules at the world-system level on the characteristics of nation-states and societal systems. As first described by Immanuel Wallerstein, the absence of a unified sovereign for the world system allows greater play for cultural models touted as universal rules. The models are generated and promulgated by a wide range of quasi-governmental and nongovernmental interest groups and associations. Rather than viewing nation-states as independent actors, Meyer and associates, including John Boli, Francisco O. Ramirez, and George M. Thomas, see these units as embedded in a wider, rationalist culture that largely determines the forms

they may assume and the success of their endeavors. What kinds of administrative agencies and programs are adopted by states, what rights are accorded their citizens, how educational systems are structured, what data systems are created to monitor progress—these and many other features more closely reflect the number and range of linkages between a given nation and the world system than that nation's economic development or specific societal needs. These structures and programs are adopted by nation-states to signal that they are legitimate players on the world scene.

Arguments stemming from cultural-cognitive versions of institutional theory have rejuvenated studies of the diffusion of innovations. Early studies of diffusion were informed largely by network theory or by arguments stemming from regulative and normative conceptions of institutions. Cultural-cognitive theory points out that, in order for ideas to flow among entities, those entities must be theorized to be similar and the innovations themselves must be theorized as functionally effective, accounts being devised concerning what components are necessary and how they are aligned to be effective. The more modernity is touted as a desirable general value, the more pressure is placed on units—individuals, organizations, nation-states—to embrace the latest innovation. And the more widely broadcast such innovative models are within a society, the less important specific relational ties or network locations are in accounting for instances of diffusion. Relational models need to take into account the effects of the wider cultural context.

LEVELS OF APPLICATION

Institutional theories have been applied to a wide variety of social phenomena, ranging from interpersonal to world-system levels. Ethnomethodologists conducted detailed studies of the emergence through interaction among workers of informal rules and routines that helped them make sense collectively of their common enterprise. Lynne G. Zucker devised experiments to demonstrate how standards thought to reflect more impersonal organizational roles were more likely to resist change attempts and to be transmitted to successors than standards associated with individual judgments. Game theoretic models also focus on interpersonal systems. Some game theorists embrace a more formalist approach, examining the possibility of designing rule systems that can lead to specified equilibrium outcomes. Others take a more behaviorist stance, examining the emergence of unplanned and unintended social conventions that act to regularize the conduct of participants.

Much research guided by institutional arguments has been conducted at the organization level. Early research by normative theorists such as Selznick examined the ways in which ideological and interpersonal commitments evolving over time between individuals within and external to

organizations constrained degrees of freedom of subsequent action. Selznick's approach spawned an active school of organizational studies as sociologists carried out natural histories of organizations, principally schools and voluntary agencies, to document the ways in which these systems develop distinctive "character structures"—institutionalized routines and scrips that channel and confine action possibilities. More recent managerial research has continued and extended this tradition to examine the development and function of corporate culture. In other research utilizing normative models, following in the tradition of Weber, Reinhard Bendix conducted historical, comparative research on the varying normative underpinnings that legitimate authority systems within organizations. Later scholarship by Mauro Guillén examined factors affecting the diffusion across selected societies of major managerial models, such as scientific management and human relations.

Williamson's transaction cost version of institutional theory has guided much research at the organization level. "Make or buy" decisions—whether to produce goods and services within a firm or to purchase them from others—can be viewed as reflecting more fundamental decisions concerning where to locate the boundaries of the organization. Transaction cost arguments also inform the design of organizational structures—whether to employ a unified or multidivisional model, a hybrid or an alliance structure. Political scientists, as noted, have adapted transaction cost models to guide studies of political structures. In one interesting application, Terry Moe's study of federal agencies in the United States such as the Consumer Product Safety Commission and the Environmental Protection Agency suggests that when there are strong ideological differences between parties, it is rational for politicians to devise inefficient agencies for fear that the opposition could employ an effective agency to pursue its goals.

The advent of cultural-cognitive models has encouraged organizational scholars to shift attention from the individual organization to the organizational population and organizational field level. In order to show that organizations embody cultural models developed and promoted within the environment, wider lenses are required along with comparative and historical studies. Studies of a diverse range of organizational populations—including automobile companies, banks, brewers, day care centers, thrift companies, publishing houses, semiconductor firms, and trade associations—have employed time series (frequently, event-history) data, often extending over the entire history of the form, to examine factors affecting the populations' growth and decline. As previously noted, while early theories focused primarily on competition for scarce material resources, later work has attended to institutional factors affecting population processes.

Organizational field (or community) research attends to wider arenas containing numerous types of interdependent

organizations performing similar or related functions and linked by a common meaning system. Among the fields that have been empirically examined are alternative dispute resolution, art museums, transnational commercial arbitration, environmental regulation in U.S. chemical and petroleum industries, health care systems, mutual fire insurance companies, Norwegian fisheries, radio stations, Scottish knitwear, and solid waste management. Studies examine the emergence of a stable interaction order, shared meanings and institutional logics, a division of labor among organizations exhibiting a limited set of organizational archetypes or models, and overarching governance structures. As they mature, fields are expected to become more highly structured over time, although fields often decline and disintegrate.

Research has also been conducted at the societal level, examining nationwide frameworks around which business or other forms of activity are organized. For example, Neil Fligstein has examined the evolution during the twentieth century of the "field" of largest U.S. corporations. Models of corporate governance have evolved from early periods emphasizing entrepreneurial control to later models of manufacturing, sales, and financial controls. Regulatory policies pursued by the U.S. government have been greatly influential in affecting what models of organizing are selected. Comparative studies by scholars such as Nicole Biggart, Gary G. Hamilton, and Richard Whitley have examined the effects of wider institutional structures and the organization of economic activity in Europe and Asia.

At the international level, political scientists—both rational choice and historical institutionalists—have developed competing versions of regime theory in order to account for the development of rule systems and ordered patterns of interaction between nation-states. Scholars in this area examine the creation and operation of trade agreements, treaties, and broader multipurpose entities such as the European Union. Rational choice theorists examine the motives leading self-interested nation-states to cooperate in establishing such binding institutions as well as the regulatory systems designed to curb opportunism and enforce compliance. Historical institutionalists focus on the effects of prior conditions and experience on regime design and attend to the unexpected, historically contingent evolution of the cooperative framework. Political sociologists have examined the rise in the number and influence of international nongovernmental associations as well as the increasing use of standardization regimes as a substitute for market and bureaucratic controls.

CONTINUING ISSUES, NEW DIRECTIONS

Viewed as a complex of ideas, there seems little doubt but that institutional theory has generated much interest and spawned much productive scholarship, particularly since the 1980s. However, it remains the case that the collection of ideas is distressingly diverse and, as has been detailed, contains inconsistent and conflicting assumptions and arguments. It is not obvious that the differences separating the rational choice, normative, and cultural-cognitive variants of institutional theory will be quickly or easily resolved. In addition to these internal conflicts—family quarrels—institutional arguments share certain common features that critics have identified. Two criticisms are considered and efforts to address them briefly described. First, it is noted that institutional theory is too preoccupied with controls and constraints and neglectful of the importance of choice and innovation. Second, critics point out that institutional theory gives too much attention to stability and not enough to the sources of change.

Constraint and Agency

Throughout the history of social science, there has been an abiding tension between theories that emphasize stability and order and those that emphasize choice and innovation. Institutional theory has consistently emphasized order, although rational choice versions insist that the creation of controlling structures is motivated by self-interest and requires human agency: the ability of actors to "make a difference" in the flow of events. Normative and cultural-cognitive theorists counter by pointing out that actors are always embedded in ongoing social systems that shape their interests and restrict their choices. These positions are combined and somewhat reconciled by Anthony Giddens's theory of structuration. He points out that all behavior is grounded in some ongoing social structure but that this structure is continually being reproduced and altered by participants' behaviors. Structure is both the context for and the product of action. Moreover, structures are constituted so that some occupants are better situated to propose new rules or ways of acting than are others. In short, agency is socially constructed. Not only human, but also social and cultural capital varies over time and place. Whereas early theory and research emphasized commitments and constraints on individual actors and pressures toward isomorphism on organizations, more recent work stresses individual differences in the attributes and relational connections of individuals and organizations. Arguments promulgated by Christine Oliver raise the possibility of strategic action in institutional contexts.

Institutional Change

During the early decades of institutional theory, if institutional change was considered, it was to examine the spread or diffusion of given forms or processes—the study of convergent change—as institutions become more firmly entrenched. More recent theory and research gives increasing

attention to deinstitutionalization and discontinuous change processes. The erosion of beliefs and rules and their replacement by new models and forms may be due to endogenous strains and conflicts or to the intervention of external forces or actors. Change is often initiated by the collective mobilization of disadvantaged actors who challenge existing systems and truths. The examination of such processes is well under way as a result of increasing interaction and collaboration of institutional and social movement scholars. Change also occurs when boundaries buffering social fields or sectors are breached, allowing ideas and actors from one sector to penetrate another. For example, fields long controlled by professional logics—including accounting, medical care, and publishing—have increasingly been destabilized and reorganized under neoliberal market and managerial logics.

Institutionalists have also attended to the three great transformations currently under way in sociopolitical arrangements at the international level: the fall and dismantling of the Soviet Union with its ramification for Eastern Europe; the surprisingly rapid evolution of the common market and the design of new political institutions for Western Europe; and the economic modernization of China and other East Asian countries. Among the common themes in the work of such scholars as David Stark and John L. Campbell are the ways in which previous political and economic institutions continue to influence emerging ones; the extent to which cultural and political processes influence the creation of market regimes; and the innovative ways in which existing social and cultural building blocks are reassembled and redesigned, through processes termed "bricolage," to form new institutions.

INTERNET AND CYBERCULTURE

As the new technologies associated with personal computers have proliferated over the last few decades, along with the emergence of a communications infrastructure designed to allow these computers to support a global network of information and cultural exchange, the resulting Internet has evolved to become an important commercial and noncommercial aspect of everyday life all over the world. "Cyberculture" has become a sort of catchall used to characterize the wide diversity of online Internet experiences available, in both their popular and fringe aspects, and it represents a blossoming transdisciplinary academic field of study that is attempting to chart the Internet's history, theorize the rich array of individual and social meanings that the network affords, and imagine the future developments that may occur as Internet technology comes to dominate social life.

Though it has a variety of historical antecedents, the Internet proper began as a Cold War project in decentralized communications by the U.S. Department of Defense in the 1960s. Named Arpanet (it was the computer network for the DOD's Advanced Research Project Agency), during the 1970s it expanded to become an international communications hub for research specialists in both universities and the military, at which time e-mail (electronic mail) became ubiquitous and Usenet (newsgroups devoted to postings around a specific topic) was created. The term *Internet* was

not itself uttered to describe the network until 1982, and it was not until 1991 that the World Wide Web (WWW or "the Web")—the series of associative multimedia pages that most people now consider iconic of the larger Internet—was established by Tim Berners-Lee. Interestingly, the hypertextual form of the WWW's interlinking pages, as well as its ability to condense vast libraries of information that could be personalized into efficient research and publication tools, had been envisaged as early as 1945 by the scientist Vannevar Bush in his essay "As We May Think." The term *hypertext* was itself coined as early as 1965 by the Internet developer and theorist Ted Nelson.

During the late 1980s, BBS (bulletin board systems) hubs represented the leading edge of the technology fringe in which an underground network of technically sophisticated professional users and computer literate youth proffered a veritable "gift economy" of pictures, simple games, and electronic communication over extremely slow networks. Alongside the rise of the Web during the 1990s, varieties of multiuser dungeons (MUDs) appeared that allowed people to explore basic virtual environments and interact with one another in real time. Corporate culture also increasingly colonized the Internet with Microsoft's Bill Gates, on the one hand, symbolic of a new economic form of computer ideologue/tycoon, and with America Online's "You've got mail!" aesthetic, on the other, indexical of the popular post-1994 boom of the WWW in which mass marketing and electronic commerce have joined communication and research as major activities for Internet users.

By the beginning of the twenty-first century, the Internet has matured to become a multifaceted, socially, and politically complex environment of over 500 million users. While corporate forces rapidly built a larger and speedier Internet for the new millennium, subcultural forces have sought equally to borrow the new online environment for their own sociopolitical intentions. Thus was the case, infamously, with the peer-to-peer (P2P) client Napster, which allowed approximately 60 million users at one point to share and freely trade a variety of multimedia files directly with one another**.** Recently, the Internet phenomenon of blogs (web logs, journals, and diaries) in which so-called bloggers self-publish, trade media stories, and offer a variety of commentary on social life, appears to be the latest version of a noncommercial Internet craze. The related growth of the Indymedia network (http://www .indymedia.org) appears to be one of the most promising current developments for those who aspire to a democratic network of critical and politically informed citizen-users.

Finally, no discussion of Internet cyberculture would be complete without mention of "hacker culture"—technically sophisticated computer users who can establish and/or penetrate networks of secure (i.e., private) information. Computer network hacking has become a major political threat, with governments and corporations increasingly

concerned about the ability of terror groups to compromise systems of classified information and release computer viruses (small programs that arrive via e-mail) that can cause massive disruption of the Internet and its underlying networks. Infamously, in 2002, after a U.S. spy plane was downed over China, groups of Chinese hackers released the Code Red virus into U.S. networks, thereby temporarily crippling Internet activity, business, and governmental operations. Governments and corporations also use the Internet as a way to gather sensitive information on people, however, and so a new collective of pointedly political hackers have banded together under the moniker of "hacktivism" to inform Internet users of potential risks and to protect people from being electronically monitored.

Such recent Internet developments evoke William Gibson's 1984 coining of the science fiction literary genre of *Cyberpunk,* in which hegemonic transnational powers battle for world control through sophisticated virtual networks of information (i.e., cyberspace), and individual hacker rogues attempt to subvert that space for their own ends amidst a sprawling techno-urban dystopia. Gibson, probably more than any other author, is directly responsible for the *cyber* prefix that has come to dominate contemporary digital discourse. Yet it appears to originally hail from Norbert Wiener's 1948 reintroduction of the term in the founding of Cybernetics, the field devoted to the study of communication and control in living beings and human machinery. Other descriptions of the Internet and cyberculture, as in Daniel Bell's notion of the postindustrial "information society," Manuel Castell's similar "network society," and Al Gore's vision of an "information superhighway," reference the cybernetic model of information control, oriented process, and feedback navigation. Marshall McLuhan's idea of an electronic "global village" is also foundational for the field but should not be linked directly to cybernetic origins.

Recently, cyberculture studies has emerged as an important new field of cultural research. David Silver (2000) has produced a useful framework for disciplinary work that outlines three distinct theoretical periods. Initial work on cyberculture tended to be popularizing and introductory. William Gibson's metaphor of the "frontier" figured prominently, and two distinct camps emerged that either celebrated the Internet as digital utopia (e.g., Kevin Kelly, Nicholas Negroponte, Bill Gates) or reviled it as cultural dystopia (e.g., Kirkpatrick Sale, Neil Postman). In the mid-1990s, an academic turn occurred in the field in which the Internet was examined both as a form of virtual democratic community (e.g., Howard Rheingold, John Perry Barlow) and as a space in which to construct and experiment with new online identities (e.g., Sherry Turkle). Finally, contemporary debate surrounds a critical phase of cybercultural studies that seeks to examine questions of access (i.e., "digital divide"), as well as the cultural, political, pedagogical, and economic

factors that frame online interactions, digital discourses, and Internet designs (e.g., Mark Poster, Douglas Kellner, Kevin Robins, and Frank Webster).

Thus, as cyberculture research continues into the next decade, it is expected that questions of race, class, gender, and other differences will be more thoroughly brought to bear in theorizing the Internet and its culture of communication, education, business, and ludic gaming. Additionally, research will begin to be done that analyzes the ecological relationship between an increasingly technological global culture and the corresponding state of the planetary environment upon which it is built and depends.

INTIMACY

Intimacy is a quality of a social interaction based on the reciprocal interpretation of the actors. While there is an emphasis on the intersubjective construction of this quality, the idea of intimacy depends on the collective representation or the symbolic code on how to define, construct, and express intimacy, which varies in different cultures. In modern societies, it is based on an interaction that is both extraordinarily meaningful to the actors and restricted to a small number of persons. Even though intimacy can emerge in brief encounters, it is regarded more likely that intimacy is experienced in subsequent interactions. This shapes a specific type of relationship, an intimate relationship. Social relations tend to become distinctive in either nonpersonal or intimate relations with only very few types in between.

Intimacy and intimate relationships become crucial for the social structure and the creation of social order. Moreover, there is a cultural appreciation of establishing intimate relationships during the course of life. In fact, the emergence of this form of intimacy is closely connected to the evolution of modernity as described by classical and modern theories.

First of all, intimacy occurs simultaneously along with a sociostructural individualization. Émile Durkheim notes that the division of labor leads at the same time to an increase of both dependency among people and autonomy for individuals. This development provides the basis for intense personal relationships.

Georg Simmel explains individualization by the fact that extended group affiliations and social contacts tend to shape a unique pattern for every single person. Consequently, persons become individualized since they do not share the same experiences. Furthermore, he makes the point that social life in the modern metropolis is grounded in the great number of persons living in spatial closeness. This environment creates both freedom and loneliness and, primordially, shapes intellectualistic, distant, relationships. However, it also intensifies emotions due to the extended variety of external and internal stimuli. Simmel also depicts the dyad as a special social form the structure of which mainly consists of the number of persons involved in this relationship. In a "society of two," as Simmel puts it, the relationship rests exclusively on the individuality of the two persons and cannot be maintained by any structure for groups of a larger size.

Generally, intimacy is often connected with modern types of gender and family relations. In particular, neo-Marxian and feminist theories stress the connection with the material world of production and consumption. Intimate relationships among members of the nuclear family shape the essence of the private sphere (Jürgen Habermas). However, the value rationality of intimate relationships is exploited by capitalism and social power, because this sphere functions as a resource for both the re-creation of human labor and a consumer market.

Last, the idea of intimacy is enhanced by the spatial (e.g., private family houses) and temporal (e.g., distinction between work time and leisure or individual time) organization of modern life as well as by the impact of mass media (e.g., novels and romances) and scientific methods (e.g., psychoanalysis to analyze the innermost self) on everyday life.

In contemporary sociological theory, three European sociologists, Anthony Giddens and Ulrich Beck in cooperation with Elisabeth Beck-Gernsheim, paid special attention to the significance of intimacy. While Beck-Gernsheim and Beck stress the impact of modern structures on intimate love relationships, applying many characteristics from the classical concepts of individualization, Giddens emphasizes intimacy as a feature of personal relationships in late modernity.

On the one hand, Beck-Gernsheim and Beck point to the weakened ties to kinships and traditional groups of reference, while on the other hand, they point to chances for

selective affiliations. In modern life, individuals become more independent of personal support and solidarity due to granted rights but also dependent on nonpersonal organizations due to their integration into polity and welfare systems. Additionally, there is an increase in chances to pursue flexible life courses or life styles but also a requirement to make individual choices, including making individual selections of mates. However, this gives rise to the idea that it is difficult to find matching partners and that there is a scarcity of chances to establish intimate relationships.

Anthony Giddens (1992) points out that the character of a modern dyadic relationship is a "pure relationship." It is based on transactional negotiation of personal ties by equals. This means that the relationship itself is a subject of constant reflection and creates a lasting demand wherein it is necessary to discuss all matters of personal importance in order to maintain intimacy. Consensus and agreement on the conditions of the relationship among the intimate partners are crucial. The partners have to "work" on their relationship. While peer groups are hardly supporting factors, professional counseling and the self-help literature become popular. As long as they experience intimacy, the partners are highly committed to each other. Otherwise, a relationship cannot claim to be maintained when this basic quality is no longer experienced. The pure relationship requires autonomous and self-reflective individuals who are able to engage in self-disclosure in order to establish an "authentic" interaction. This implies that models of social roles and status interaction are superseded by the individual creation of structures. In particular, gender roles do not apply to the idea of a pure relationship since they are in contradiction to the required equality of the partners. Consequently, the pure relationship is not restricted to heterosexual partners.

The rise of modern intimacy has an impact on a wide range of personal relationships, especially friendship, marriage, and sexual relations that are either influenced or replaced by the idea of intimate relationships.

IRIGARAY, LUCE

French psychoanalyst and philosopher Luce Irigaray is a central theorist in debates that shape the contours of Western feminist theory, including essentialism/antiessentialism, poststructuralism, psychoanalytic feminism, and issues concerning the sex/gender system and corporeality raised by queer theory and feminist theories of the body. Irigaray's work emphasizes questions concerning relationships among language and bodies, specifically male and female bodies and masculine and feminine language. Her focus is on the female body and how it has been constructed in phallocentric systems of thought, especially Freudian and Lacanian psychoanalysis. In feminist social theory, Irigaray is part of New French Feminism along with Hélène Cixous, Julia Kristeva, and Monique Wittig.

Born in Belgium in 1932, Irigaray moved to France in the 1960s where she received her master's degree and subsequent first doctorate in linguistics. She earned a second doctorate in philosophy at the University of Paris VIII. While in France, she attended several psychoanalytic seminars with Jacque Lacan, and she trained and became a psychoanalyst. Irigaray's work has influenced the feminist movement in France and Italy for several decades. In the 1980s, she spoke in support of the Italian Communist Movement, touring and lecturing in Italy. Irigaray has conducted research over the last decade at the Centre National de Recherche Scientifique in Paris on the difference between the language of women and the language of men, which includes speakers of many different languages.

Central to Irigraray's work is critiquing phallocentric systems of language and culture and theorizing sexual difference as the single most important issue of our age. She theorizes the question of a female or feminine *sexuality* and what a feminine *jouissance* (sexual pleasure) might be when defined on its own terms. In *The Speculum of the Other Woman* (1985), Irigaray provides an analysis and feminist critique of sexual difference in Western thought from Freud (back) to Plato. Using psychoanalytic methods, she argues that throughout the history of Western thought, the feminine and femininity have permanently been excluded from language, representation, and culture. Language has been appropriated by a singular subject—the masculine subject—and defined by its parameters. The exclusion of the feminine and femininity constitutes the foundation of patriarchy upon which phallocentric social relations depend. Here, within the purview of the masculine, master subject, the world looks like him and the feminine as a mere copy of the selfsame but with a lack, reduction, and deficit.

Drawing on Lacanian psychoanalysis, Irigaray proposes the process of specularization as central to the repression of women. As such, Western philosophy or philosophical

speculation is at once specularizing—a mirror back to the self and specular—invoking the presence of an absence coded as feminine. The concept of specularization is used to argue that philosophy, in its blind-spots, does not understand or provide a means to understand sexual difference. Instead, it speaks volumes about "universal sexual indifference" and hom(m)osexualite (a desire for the same). Her goal is to devise a method whereby the masculine does not determine everything and philosophy can change to hear and see and understand the feminine.

Irigaray takes Freud as an example of the "mono-subjective, monosexualized, patriarchal and phallocentric" nature of philosophy. Freud is central to Western philosophy in his analysis of the unconscious, and thus the subject divided. Freud defined sexual difference through the masculine: the One sex. She then travels from Freud back to Plato to illustrate the absence of the feminine upon which Western thought rests.

In *This Sex Which is Not One* (1985), Irigaray questions the assumption that female sexuality is dependent upon male sexuality and asks: Where is female sexuality located? Where does female pleasure reside? What is female desire and how does it look? Irigaray argues that in the Western phallocentric model, the sexuality that gets privileged is based on looking: having a penis, and thus male sexuality, is privileged because the penis can be seen. Female sexuality, in contrast, is based on having nothing, setting up the simple binary opposition of penis/nothing and paralleling the notion of the female as defined by a lack or deficit.

Reworking Freudian theory, Irigaray argues against the idea that women are always trying to fill this lack and fulfill the desire to have a penis (e.g., by having a baby, by finding a husband, or by gaining masculine rights and privileges). Irigaray writes against this Freudian conceptualization by distinguishing between female desire and female pleasure. According to Irigaray, female sexual pleasure, or female *jouissance,* is of a different order, in a different economy than male sexual pleasure, based on the different configurations of female and male bodies. Man must have an instrument with which to touch himself, she argues. If his pleasure is indeed based in the penis, then something else—a hand, a vagina, language—has to touch the penis in order to produce pleasure. Woman, however, touches herself all the time—the structure of the female genitals provides constant autoerotic contact, as "at least two" lips are always pressing against each other and providing pleasure.

From these early books and an analysis of the "One," Irigaray provides an analysis of sexual difference based on how two are different. In doing so, she affirms certain characteristics of the feminine subject—a subject previously deprived of self-representation or self-affection. Mimicry is proposed as a strategy to subvert patriarchy. If woman is the mirror by which the philosopher ensures his own image,

as Irigaray argues, by altering the mirror as concave (a speculum), this image can be reshaped as well. The speculum rather than a flat mirror will bring forward that which has previously been unseen and ignored by the philosopher who desires the same or his own image. Thus, woman, previously not one singular thing or the "nothing" through which the philosopher gains subjective presence, instead emerges as plural, more than one, not one. To listen to the philosopher's claim of a nothing with another ear is to hear a different language of a self that remains unheard in Western thought (i.e., *The Sex Which Is Not One*).

How can Western philosophy then see and hear the feminine? Irigaray argues that while we cannot step outside Western philosophy, we can go inside via the speculum and the method of specularization to alter Western discourse. Irigaray uses the term *Parler femme:* speaking (as) woman to illustrate how to restore feminine genealogies. In *Sexes and Geneologies* (1993) and *Je, Tu, Nous: Toward a Culture of Difference* (1993), Irigaray revises Freud's Oedipus complex and the incest taboo in which the father forbids bodily encounters with the mother (matricide according to Irigaray), sons actively find replacement mothers, and daughters become replacements for others. Irigaray contends that neither mothers nor daughters have a name of their own, a sex of their own, and thus neither can be "identified with respect to the other." In contrast to Lacan, Irigaray argues that the idea of woman as outside or other always threatens subversion, thus transforming masculine Western culture. We must stop killing the mother and exiling daughters as replacements for other sons and instead invent words that speak to mother-daughter relations, thereby restoring feminine genealogies. Here, Irigaray proposes a direct link between women, feminine sexuality, and the body. She grounds the feminine in women's experiences of female sexuality and the body, particularly women's "two lips"—an experience which is plural, dispersed, and multiple. Speaking the feminine, speaking (as) women, can thus transform masculine culture. Writing and speaking as a woman can be a form of subversion.

Finally, Irigaray seeks to create a world of sexuate beings, distinguishing between the Je-elle (I-she) and the je-il (I-he). According to Irigaray, by saying I-she and I-he we make visible that the subject is two. The singular, here, is finally abandoned in favor of two beings and a new understanding of subjectivity and objectivity. In *Democracy Begins Between Two* (2000), Irigaray asserts that we differ from each other but are also different within ourselves. Here, Irigaray affirms the Other and argues that only by being the Other can we change Western culture.

J

JAMESON, FREDERIC

Fredric Jameson is generally considered to be one of the foremost contemporary Marxist literary critics writing in English. He has published a wide range of works analyzing literary and cultural texts and developing his own neo-Marxist theoretical position. A prolific writer, he has assimilated an astonishing number of theoretical discourses into his project and has intervened in many contemporary debates while analyzing a diversity of cultural texts, ranging from the novel to video, from architecture to postmodernism.

Born in 1934, Jameson grew up in southern New Jersey and attended Haverford College, where he majored in French. He then went to Yale, where he received a PhD for a dissertation on Jean-Paul Sartre, which became his first book, *Sartre: Origin of a Style* (1961). After intense study of French literary theory in the 1950s, in the 1960s Jameson began an enduring engagement with Marxian theory. He studied two years in Berlin, where he was deeply influenced by the New Left and antiwar movements. In 1970, he published *Marxism and Form,* which introduced a tradition of dialectical neo-Marxist literary theory to the English-speaking world. Since articulating and critiquing the structuralist project in *The Prison-House of Language* (1972), Jameson has concentrated on developing his own literary and cultural theory in works such as *Fables of Aggression: Wyndham Lewis, the Modernist as Fascist* (1979), *The Political Unconscious: Narrative as a Socially Symbolic Act* (1981), and *Postmodernism, or, The Cultural Logic of Late Capitalism* (1991). Studies of Theodor W. Adorno, *Late Marxism* (1990a) and *Brecht and Method* (2000) continue his intensive work in Marxist theory and aesthetics, and *A Singular Modernity* (2002) engages the debates over the postmodern through critical analysis of discourses of modernity and modernism.

Jameson has characteristically appropriated into his theory a wide range of positions, from structuralism to poststructuralism and from psychoanalysis to postmodernism, producing a highly eclectic and original brand of Marxian literary and cultural theory. Marxism remains the master narrative of Jameson's corpus, a theoretical apparatus and method that utilizes a dual hermeneutic of ideology and utopia to criticize the ideological components of cultural texts while setting forth their utopian dimension, and that helps produce criticism of existing society and visions of a better world. Influenced by Marxist theorist Ernst Bloch, Jameson thus has developed a hermeneutical and utopian version of Marxian cultural and social theory.

Dialectical criticism for Jameson involves thinking that reflexively analyzes categories and methods while carrying out concrete analyses and inquiries. Categories articulate historical content and thus must be read in terms of the historical environment out of which they emerge. For Jameson, dialectical criticism thus involves thinking that reflects on categories and procedures while engaging in specific concrete studies; relational and historical thinking, which contextualizes the object of study in its historical environment; utopian thinking, which compares the existing reality with possible alternatives and finds utopian hope in literature, philosophy, and other cultural texts; and totalizing, synthesizing thinking, which provides a systematic framework for cultural studies and a theory of history within which dialectical criticism can operate. All these aspects are operative throughout Jameson's work, the totalizing element coming more prominently (and controversially) to the fore as his work evolved.

From the 1970s to the present, Jameson has published an increasingly diverse and complex series of theoretical inquiries and cultural studies. One begins to encounter the characteristic range of interests and depth of penetration in his studies of science fiction, film, magical narratives, painting, and both realist and modernist literature. One also encounters articles concerning Marxian cultural politics, imperialism, Palestinian liberation, Marxian teaching methods,

and the revitalization of the Left. Many of the key essays have been collected in *The Ideologies of Theory* (1988), which provide the laboratory for the theoretical project worked out in *The Political Unconscious, Fables of Aggression,* and subsequent texts. These studies should be read together as inseparable parts of a multilevel theory of the interconnections between the history of literary form, modes of subjectivity, and stages of capitalism.

Jameson's theoretical synthesis is presented most systematically in *The Political Unconscious.* The text contains an articulation of Jameson's literary method, a comprehensive inventory of the history of literary forms, and a hidden history of the forms and modes of subjectivity itself, as it traverses through the field of culture and experience. Jameson boldly attempts to establish Marxian criticism as the most all-inclusive theoretical framework as he incorporates a disparate set of competing approaches into his model. He provides an overview of the history of the development of cultural forms and concludes with articulation of a "double hermeneutic" of ideology and utopia—which critiques ideology while preserving utopian moments—as the properly Marxian method of interpretation.

Jameson employs a Lukács-inspired historical narrative to tell how cultural texts contain a "political unconscious," buried narratives and social experiences, which require sophisticated literary hermeneutics in order to be deciphered. One particular narrative of *The Political Unconscious* concerns, in Jameson's striking phrase, "the construction of the bourgeois subject in emergent capitalism and its schizophrenic disintegration in our own time" (p. 9). Key stages in the odyssey of the disintegrating bourgeois subjectivity are articulated in George Gissing, Joseph Conrad, and Wyndham Lewis, a story that will find its culmination in Jameson's account of postmodernism.

Indeed, Jameson's studies on postmodernism are a logical consequence of his theoretical project. Within his analysis, Jameson situates postmodern culture in the framework of a theory of stages of society—based on a neo-Marxian model of stages of capitalist development—and argues that postmodernism is part of a new stage of capitalism. Every theory of postmodernism, he claims, contains an implicit periodization of history and "an implicitly or explicitly political stance on the nature of multinational capitalism today" (1991:3). Following Ernest Mandel's periodization

in his book *Late Capitalism* (1975), Jameson claims that "there have been three fundamental moments in capitalism, each one marking a dialectical expansion over the previous stage. These are market capitalism, the monopoly stage or the stage of imperialism, and our own, wrongly called postindustrial, but what might better be termed multinational, capital" (1991:35). To these forms of society correspond the cultural forms realism, modernism, and postmodernism.

Jameson emerges as a synthetic and eclectic Marxian cultural theorist who attempts to preserve and develop the Marxian theory while analyzing the politics and utopian moments of a stunning diversity of cultural texts. His work expands literary analysis to include popular culture, architecture, theory, and other genres, and thus can be seen as part of the movement toward an interdisciplinary cultural studies as a replacement for canonical literary studies.

K

KRISTEVA, JULIA

Psychoanalytic theorist, linguistic scholar, and philosopher, Julia Kristeva theorizes relations among psychic desire, the body, sexuality, and culture. She has contributed extensively not only to philosophy, linguistics, and psychoanalytic theory but also to literary and cultural theory as well as feminist theory. Her publications explore topics such as the relationship of semiotics and subjectivity (*Revolution of Poetic Language,* 1974), depression and melancholy (*Black Sun,* 1987), maternal experience and abjection (*Powers of Horror,* 1980), national identity and territorial space (*Strangers to Ourselves,* 1989), literature and sensation (*Time and Sense,* 1994), and the practice of psychoanalysis (*New Maladies of the Soul,* 1993).

Kristeva was born in 1941 in Bulgaria. In the mid-1960s at the age of 25, she was granted a doctoral research fellowship that enabled her to emigrate to Paris. In Paris, she worked with Roland Barthes, a central figure in structuralism and literary theory, and Jacques Lacan, a leading psychoanalytic theorist. She was involved in leftist French politics, completed psychoanalytic training, and was inducted into the French *legion d'honeur,* the highest cultural honor in France. She is currently professor of linguistics and humanities at the University of Paris VII and a frequent visiting lecturer at Columbia University.

Kristeva's first major publication, *Revolution of Poetic Language* (written in 1974 as her doctoral dissertation and published in 1984), began her theoretical work in semiotics and psychoanalysis. In this work, she proposes a new semiotics she terms *semanalysis.* Semanalysis argues that meaning is a signifying process rather than a sign system. Semanalysis explores the relationship between language and subjectivity by combining the semiotics of Charles Pierce and Ferdinand de Saussure with the psychoanalysis of Freud, Lacan, and Melanie Klein. Semanalysis asserts that subjectivity is formed in conjunction with language acquisition and use and that all signification is composed of the "semiotic" (*genotext*) and the "symbolic" (*phenotext).*

Incorporating Lacanian psychoanalysis, Kristeva further distinguishes the semiotic as the pre-Oedipal stage of human development and the symbolic as the postoedipal stage. The semiotic, which refers to the bodily drive as it produces signification or meaning, is associated with the rhythms, tones, and movement of signifying practices. As bodily drive, the semiotic is also associated with the maternal body, considered by Kristeva to be the original source of rhythms, tones, and movements for every human being. In this theorization, the semiotic (genotext) represents biophysiological processes constrained by social and cultural norms. The semiotic is prediscursive and cannot be reduced to language systems. In contrast, the symbolic element of signification is associated with the grammar and structure of language. The symbolic (phenotext) element exists within the larger semiotic (genotext) and makes reference possible.

Signification and meaning require both the semiotic and symbolic. The semiotic and the symbolic represented departure points for Kristeva to bring the body back into discourse through the speaking subject. She argues that the speaking subject is a divided subject consisting of a conscious mind containing social constraints and an unconscious mind consisting of biophysiological processes (i.e., Freudian drives). While traditional semiotics could not deal with desire or transgression from social norms, semanalysis rests upon a split subject—a socially-shaped, biological being that is always negotiating inner desire and social norms. Semanalysis launched Kristeva's theoretical work on the connections between mind and body, psyche and soma, nature and culture, and materiality and representation that comprise her scholarship.

In *New Maladies of the Soul* (1993), Kristeva analyzes what she views as a loss of meaning and emptiness in

contemporary life. She asks, Where does the soul reside? Her answer requires her to theorize the space between the biological and social. She argues that the soul mediates between one's body, interactions with others, and representations of oneself. In doing so, she continues her projects of understanding psychic life and theorizing relations between the body and subjectivity. Kristeva argues that drives constitute the bridge between soma and psyche, between the body and representation. She challenges the notion of a unified, fixed subjectivity and argues that the logic of language is already at work at the material level of bodily processes. From Kristeva's perspective, bodily drives make their way into language. Therefore, she insists that bodily drives are discharged in representation and that the logic of signification is already operating in the material body. Kristeva is arguing that subjectivity or identification does not originate in biology; rather, subjectivity is constructed in the symbolic.

Following Melanie Klein and in contrast to Freud and Lacan, Kristeva emphasizes the maternal function and its importance in the development of subjectivity and access to culture and language. Freud and Lacan maintained that the child enters the social by virtue of the paternal function, specifically paternal threats of castration. This is incomprehensible for Kristeva, who believes that if our only motivation for entering the social is fear, more of us would be psychotic. In "Motherhood According to Bellini," written while she was pregnant in 1975 and later published as part of *Desire in Language* (1980), she constructs a theory of maternity. Childbirth is not motivated by penis envy, as Freud argued, but instead pregnancy and childbirth can bring back primal homosexual bonds by reuniting a woman with her own mother. In *Tales of Love* (1983*),* she addresses the Freudian-Lacanian notion that paternal threats provoke the child to exit the safety of the maternal body. Kristeva formulates the maternal body as operating between nature and culture, thus rejecting the reduction of maternity to nature. She argues that mother is primarily a speaking subject, even if she is not the subject or agent of her pregnancy and birth. The maternal body, with its two-in-one or other within, represents all subjective relations. Each one of us is a *subject-in-process,* always negotiating the other within. Like the maternal body, we are never completely the subjects of our own experience. Kristeva's notion of a subject-in-process counters traditional notions of an autonomous unified (masculine) subject.

Kristeva's theoretical work attempts to understand the earliest development of subjectivity, prior to Freud's oedipal situation or Lacan's mirror stage. In *Tales of Love* (1983) and *Desire in Language* (1980), she argues that maternal regulation exists prior to paternal law; therefore, she calls for a new discourse of maternity, beyond religion and science, that acknowledges the importance of the maternal function in the development of subjectivity and in

culture. Kristeva states that the maternal function cannot be reduced to mother, feminine, or woman—anyone can fulfill the maternal function. She makes this claim by arguing that the mother's relation to the infant is a functional relationship of meeting the child's needs. This function is separate from both love and desire. As a woman and a mother, a woman both loves and desires and as such she is a social and speaking being. As a woman and a mother, she is always sexed. But insofar as she fulfills the maternal function, she is not sexed. Thus, the maternal function does not require a particular sexed being; men or women can fulfill this function.

Despite her extensive theorizing on maternity, female sexuality, love and desire, Julia Kristeva and Western feminism have an uneasy relationship. While she is interested in the question of what it means to be a woman, she is equally committed to dismantling all ideologies, including feminist theory. Her theoretical work emphasizes phenomena where language and the psyche are under stress. For Kristeva, precisely these phenomena offer possibilities for transformation. In *Powers of Horror* (1980), she formulates the notion of *abjection* as a psychic operation whereby subjectivity is constituted. Abjection creates women's oppression in patriarchal cultures. Women are reduced to their reproductive/maternal functions, and it becomes necessary for women to abject the maternal function in order to become subjects. This matricide, central to the creation of subjectivity in patriarchal culture, leads to *depressive sexuality* because women are unable to abject the maternal body with which they identify as women. Kristeva argues that in order to escape this matricide, a new discourse of maternity is required, a discourse in which relations between mothers and daughters do not prohibit lesbian love between women.

In *New Maladies of the Soul* (1993), Kristeva theorizes "women's time" and asserts that female subjectivity seems linked to both cyclical time (menstruation, pregnancy, repetition) and monumental time in the sense of eternity through motherhood, reproduction, and the genetic chain. The time of history and language, however, is linear. Her goal is to emphasize the "multiplicity" of female expressions, to avoid essentializing or homogenizing "woman," and to recognize sexual difference. In a singularly interesting move, she projects that a new generation of feminists will have the task of reconciling "maternal" time with linear time. Unless women are able to theorize the continued desire of women to have children, religion, tradition, and mysticism will remain the primary sources of theorizing about this phenomenon.

In dialogue with Western feminism, Kristeva argues that there are three phases of feminist theorizing. She rejects the first phase for what she sees as its attempt to create universal equality and its blind spot to sexual differences. Rather than reject motherhood, Kristeva argues a new discourse of maternity is necessary; real female innovation (in whatever

field) will only come about when maternity, female creation, and the link between them are better understood. She rejects the second phase of feminism for what she sees as its goal to create a uniquely feminine language. Rather than assert that language and culture are patriarchal and must be displaced, she insists that culture and language are the domain of speaking beings and women are primarily speaking beings. She therefore endorses what she sees as the third phase of feminism in which identity, difference, and their relationships are theorized. Here neither identity nor difference is privileged. Instead, multiple identities, including multiple sexual identities, get priority.

L

LABELING THEORY

Labeling theory (also referred to as societal reaction theory) analyzes how social groups create and apply definitions for deviant behavior. The approach examines how deviant labels emerge, how some social groups develop the power to impose deviant labels onto selected others, and the consequences of being labeled deviant.

Sociologist Howard Becker is credited with the most influential formulation of labeling theory, which appears in his book *Outsiders* (1973). According to Becker, deviance is not an intrinsic feature of behavior. Acts and individuals are not inherently deviant until some social groups can successfully define them that way. Labeling theory here builds from the symbolic interactionist tenet that people define and construct their identities from society's perceptions of them. Social groups project rules and definitions onto otherwise neutral behaviors to create deviance. Labeling theory addresses this transformation process and researches its aftermath.

Labeling theorists reject the idea that deviance is an objective phenomenon. They criticize accepting prevailing definitions of deviance as unproblematic and taken-for-granted categories. Labeling theorists instead suggest that deviance is relative and that no universal consensus exists regarding whether any given behavior is deviant. For example, acts defined as self-mutilation, such as branding, may be viewed as deviant or as a proud affirmation of membership in a tribal culture. What is considered deviant also changes over time. Homosexuality is no longer identified officially as a mental disorder in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders,* though it once was.

The relativity of deviance suggests that social groups work actively to enshrine some definitions for what is deviant into law while eliminating competing alternatives.

Labeling theorists investigate the social process of how deviant labels emerge. They refer to those who advocate particular constructions of what is deviant as *moral entrepreneurs.* Agents of social control who enforce the resulting standards are *rule enforcers.* Labeling theorists emphasize researching the motives and tactics that moral entrepreneurs use in their attempts to institutionalize their criteria for deviance.

Labeling theorists see deviance as relative not only in content but also in enforcement. Howard Becker (1973) suggests four categories of labeling. People who do not deviate are *conformists.* People who are labeled deviant even when they do not break the rules are *falsely accused.* People who are caught breaking the rules are *pure deviants.* People who break the rules without getting caught are *secret deviants.* Labeling theorists attempt to explain patterns of selective enforcement of deviant behavior. They reject studying the potential causal motivations of deviant individuals themselves, for example, avarice or mental illness, and focus instead on how authorities may selectively impose a deviant status onto some people but not onto others.

Why does the labeling spotlight shine more brightly on some than on others? Stereotypes about gender, race, class, and who fits preexisting stereotypes of deviants influence the labeling process. Being labeled deviant may depend more on individual demographics than on someone's actual behaviors. Rule enforcers may target particular groups in advance as likely deviants, as in racial profiling, which make any subsequent discoveries of deviance in sync with their initial expectations.

One consequence of labeling people deviant is increasing the likelihood of future deviant behavior. Labeling theorists suggest a sequential shift from *primary* to *secondary deviance.* When people are initially labeled deviant, society treats them differently—with greater suspicion and restrictions— and with lower tolerance for any further offenses. The

pejorative labels ("addict," "juvenile delinquent," "prostitute") that deviants receive may prevent them from being successfully integrated into society. This rejection encourages further deviant behavior, as other deviants may become one's only available companions and illicit activities the only accessible source of income. Deviant labels bestow a stigmatizing master status onto individuals that amplify the potential for subsequent acts of secondary deviance.

How do stigmatized groups respond? Labeling theory emphasizes the reciprocal relations between rule enforcers and those that they label. Some labeled groups may decide to actively organize resistance to their stigmatization, as have various groups of homosexuals, marijuana users, prostitutes, and obese persons. Others may embrace a definition of themselves as *outsiders,* with their secondary deviance developing into full-blown careers in deviance, by committing completely and openly to a deviant identity.

Labeling theorists emphasize that a power inequality exists between those who have the power to impose labels and those who are stigmatized by them. They believe that moral entrepreneurship serves the vested interests of some at the expense of others. Labeling theorists decry an encroachment of social control based on artificial determinations of what is deviant. Some argue, for example, that psychologists and psychiatrists dispense labels for deviance in the guise of medical diagnoses such as attention deficit disorder or mental illness. By labeling these people's behaviors deviant, these professionals can claim a beneficial jurisdiction. Other labeling theorists criticize official statistics of crime and deviance as selective and biased, for example, pointing out that street crimes are emphasized more than "crime in the suites," a distinction that benefits powerful social actors. Some labeling theory adherents advocate decriminalizing "victimless crimes" to lessen the detrimental effects of stigmatizing people who engage in those acts. In turn, some criticize labeling theory for being overly sympathetic to deviants and viewing them as not warranting their social marginalization.

Critics from the Left acknowledge that labeling theory expresses sympathy for marginalized outsiders, but they criticize labeling theory for not paying enough attention to sources of structural power in capitalistic societies that ostensibly embed labels. A methodologically based critique also argues that difficulties in quantifying labeling theory's contributions make empirical tests of the theory problematic. Labeling theory has also been criticized for failing to explain why people initiate acts of deviance and for overestimating the causal impacts that stigmatization has in prompting secondary deviance. Despite these proposed shortcomings, labeling theory remains an influential approach in research and teaching, especially in the sociology of deviance.

LACAN, JACQUES

Jacques Marie Émile Lacan (1901–1981) ranks among the most important and original psychoanalytic thinkers. His career spanned over 50 momentous years of French intellectual history (from Surrealism and phenomenology to structuralism and poststructuralism), while his enormously influential seminar combining a careful rereading of Freud with the elaboration of his own conceptual innovations ran nearly 30 years (1953–1980). By the 1960s, unofficial transcripts of Lacan's seminars were being widely circulated and discussed, and the publication of his massive *Écrits* in 1966 (selections translated into English) was a major intellectual event. Lacan's rebellion against the "ego psychology" of the International Psychoanalytical Association was easily identified with the student revolt of May 1968. He was both critical and supportive of the students. He honored their strike against the university system by suspending his seminar and signing a letter of solidarity, but he also publicly criticized their underlying motivation. "I won't mince my words," he told an audience of student admirers, "What you want is another master." Nevertheless, Lacan's fame and influence continued to grow. In the fall of 1975, he was invited to the United States to deliver highly publicized lectures at Yale, Columbia, and MIT. But perhaps the ultimate validation of his claim to being the French Freud came in 1978 when Lacanian psychoanalysis became the orthodox theory and practice of the new Department of Psychoanalysis at the University of Paris VIII-Vincennes.

Lacan was born in Paris on April 13, 1901. His father, Alfred Lacan, was the Paris sales representative for a large provincial manufacturer of vinegar and other food products. The Lacans lived a comfortable bourgeois existence marred only by stifling Catholic religiosity and constant domestic squabbling between the families of Jacque's parents. During his 1961 seminar, Lacan, who never spoke of his personal life, angrily referred to his paternal grandfather as

an "execrable petit-bourgeois" thanks to whom "I started cursing God at a very precocious age." Nevertheless, young Jacques attended a prestigious Jesuit school, the Collège Stanislas, where he was inculcated with conservative Catholic religious, social, and political values while excelling in religious studies and Latin. He also developed a more independent and subversive passion for Spinoza and Nietzsche.

Lacan took up the study of medicine in 1920 and specialized in psychiatry from 1926. During this period, he began to associate with Surrealist writers and artists. He became a friend of André Breton and Salvador Dali, met James Joyce (later to figure prominently in Lacan's 1975–1976 seminar), and was present at the first public reading of *Ulysses* in the famous bookstore Shakespeare & Co. In 1932, Lacan completed his doctoral thesis on paranoia, a study that influenced the development of Dali's "paranoid-critical" method of representation. During the 1930s, Lacan began to synthesize French psychiatry, the ideas of Freud, and the phenomenological psychology of Eugène Minkowski, Ludwig Binswanger, and Karl Jaspers. Although his relationship with his mentor, the eminent and eccentric psychiatrist Gaëton Gatian de Clérambault, was deeply conflictive (resulting in Lacan's failing his *agrégation,* an event that effectively excluded him from the highest levels of the psychiatric profession), Lacan later claimed Clérambault to be his only real master in psychiatry. Lacan singled out Clérambault's concept of "mental automism" (by which psychosis was explained in terms of external formal elements beyond the conscious control of the subject) as the closest French psychiatry came to a structural analysis of mental functioning. During the 1930s, Lacan began to study the philosophies of G. W. F. Hegel, Martin Heidegger, and Henri Bergson. Lacan also attended several of Marxist political philosopher Alexander Kojève's famous lectures on Hegel's *Phenomenology of Spirit* delivered between 1933 and 1939.

Around the same time that he completed his thesis in psychiatry, Lacan began his training analysis with Rudolph Loewenstein (later an influential proponent of ego psychology in the United States) that continued until 1938. In 1953, Lacan, together with many colleagues, left the official French psychoanalytic society, the Société Parisienne de Psychanalyse, to form a new group, the Société Française de Psychanalyse. After years of continued conflict, primarily over his use of variable-length sessions, Lacan was struck off the list of training analysts of the SFP. This event marked his final break with the International Psychoanalytical Association, and in 1964 Lacan founded his own group, the École Freudienne de Paris (EFP), serving as its sole director until he summarily dissolved it in 1980. Only months before Lacan's death on September 9, 1981, Lacanian psychoanalysis was reorganized as the École de la Cause Freudienne (ECF) directed by Lacan's son-in-law, Jacques-Alain Miller, who also edits the authorized versions of the master's seminars (several volumes are available in English). Acrimonious splits have produced numerous Lacanian associations in France and elsewhere: in addition to Miller's École Européene de Psychanalyse (EEP), the most important are the École Lacanienne de Psychanalyse (ELP) and the Centre de Formation et de Recherches Psychanalytiques (CFRP).

Lacan was a masterful teacher who expressed his major ideas in the form of succinct statements, algorithms, and diagrams. Among the first and most famous is the claim that the unconscious is structured like a language, that is to say, the subject is created in and through language, and the mind, like language, works by means of relationships of association (metonymy) and substitution (metaphor). Following Ferdinand de Saussure, Lacan sees language as a system of signs, constituted by signifiers (S = acoustic images or sounds) and signifieds (s = meanings or ideas). The linguistic system is self-referential and "differential," since the value of each sign depends upon the entire system of signs, that is, upon its difference from all other signs—when we look up a word in a dictionary, we find only more words.

Focusing on how we are constituted as subjects by language, Lacan stresses the primacy of the speech act, of the signifier over the signified:

$$\frac{S}{s}$$

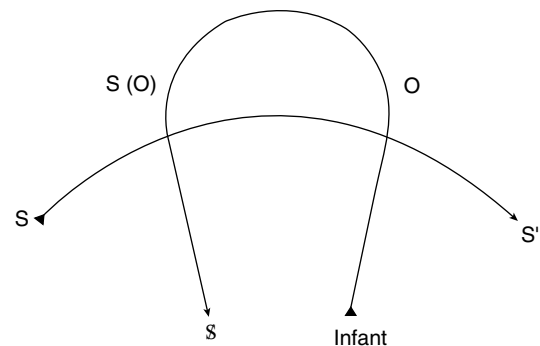
This formula expresses how a flux of signifiers (words) and a flux of signifieds (other words) come to be fixed in a distinct relation of meaning. In developmental terms the infant learns language by making signifiers of the stream of sounds issuing from Mom:


Figure 1   Suture

The vector S-S′ is a stream of words emanating from Mom's mouth. These signifiers will become my native language, but initially they are external or Other to me (thus, language is the discourse of the Other, Mom is the locus of

the code, the one who knows, or is presumed to know, the meaning of it all, hence the use of the capital letter O). As a child I seek to please Mom, but to satisfy her desire I must discover it. Thus, I take some action (vector Infant $\mathcal{S}$) in relation to Mom's noises. My action intersects with Mom's discourse at O, and on the basis of her reaction, I retroactively organize the stream of signifiers into a coherent idea or signified, s(O), the signified of the Other. I learn (am compelled) to articulate my needs, feelings, desires in the language of the Other, and in doing so I presume, without ever being certain, that I am thereby satisfying (m)Other's desire. As the movement of the subject vector suggests, meaning is attained retroactively as I am sewn or "sutured" into the language of the Other. I am also alienated by language. No longer a full subject, unified in my being and my meaning, from now on I am a barred subject, $\mathcal{S}$, whose being is barred from itself by my identification with the system of meanings of the Other. I am either in the realm of authentic being or in the realm of alienated meaning; there is no possibility of being in both realms simultaneously:
Figure 2　Alienation in Language

The language of the Other or the Symbolic Order not only sutures me into a system of meaning, but it is also a Law of Desire that disciplines my most intimate enjoyments and bodily pleasures (what Lacan calls "jouissance"). As a child, I must pass through a process of separation from the emotional intimacy I had with Mom and of identification with the prescriptions and proscriptions of desire imposed by society itself. The Law of Desire is organized around the Phallus within a patriarchal order Lacan calls the Name of the Father. The process by which Dad intervenes in the intimate relationship between myself and Mom results in my giving up my intimacy with Mom and assuming a gendered identity organized around the Phallus, henceforth pursuing objects of desire that are socially acceptable substitutes for the lost jouissance of my relation with Mom (the maternal Thing).

The diagram in Figure 3 is to be read from left to right. As a developing infant, I experience the tension between the signifiers of the social-paternal (Name of the Father)
Figure 3　The Paternal Metaphor

and the intimate-maternal (Desire of the Mother) realms while attempting to hold on to my privileged role as the sole object of Mom's desire (Desire of the Mother) and the jouissance of this relationship (Signified to the Subject). The outcome, of course, is the metaphorical substitution of the desire of society (Name of the Father) for the Desire of the Mother ____ which is repressed, literally unsymbolizable (U), while the emotional satisfactions of the maternal relation are henceforth to be sought in objects organized around the Phallus.

The Phallus both is and is not the male genital. It is the penis insofar as actual sex differences are necessarily involved in the process by which all children separate from Mom and become social, gendered subjects. The process involves the ultimately accurate perception of the child that it is not the sole object of Mom's desire, that the child and Mom are not complete and fulfilled in and by themselves, that Mom is lacking something that I cannot supply, and that something is provided Mom by Dad. What can it be but the penis?

However, the Lacanian Phallus is not the anatomical penis insofar as the Phallus itself is the signifier of a lack; it "stands in for" the lost jouissance but it is not itself that jouissance. The Phallus is not the real Thing, the promised unity of Being and Meaning; it is merely a social construction, a metaphor that never succeeds in actually providing the emotional satisfaction we all seek. Nor is the real Thing a Phallus, a fact Lacan expresses as the difference between "being" and "having" the Phallus. Prior to the Paternal Metaphor, I *was* the Phallus for Mom. However, after accepting my symbolic mandate as a gendered social subject, I can only *have* the Phallus (if I'm gendered male) or attempt to *be* the Phallus for a man (if I'm gendered female).

In short, Lacanian theory describes the working of a patriarchal social order, but it does not, as it is sometimes accused of doing, endorse patriarchy. The Law of Desire is organized around the Phallus, Φ, insofar as we are all socialized within a patriarchal order, but there is no biological essentialism at work. Rather, "masculine" and "feminine" positions are social and logical constructions that Lacan insists are asymmetrical and internally deadlocked. Genders are neither complementary nor are they capable of providing the real Thing, the unity of Being and Meaning. Lacan flatly insists "there is no sexual relation," only the gendered alienation of "formulas of sexuation":

Figure 4 Formulas of Sexuation

The masculine and feminine positions of a patriarchal society are described here in terms of the logic of set theory. With respect to the set of all men, the first formula states, "There is one man who is not subject to the phallic function"; that is, there must be an origin that is external to the set of all men—for patriarchal mythology, a masculine God the Father, for the infant, the all-powerful pre-Oedipal father. The lower formula reads, "All men are subject to the phallic function"; that is to say, all masculine social subjects within the set identify with the phallic Law of Desire. They are all S and firmly identified with the illusory conviction that they have the Phallus.

On the side of the feminine, the formulas are stated in the negative. The upper formula reads, "No single woman is completely beyond the phallic function"; in other words, no woman completely escapes being defined by the masculine Law of Desire. However, the second formula states, "Not all of woman is defined by the phallic function"; there remains something that escapes the masculine-centered system of meaning and resists it. "Woman" is the signifier of an act of repression, a hole or lack at the heart of masculine discourse of the Other, $S(\emptyset)$.

In short, women are not as completely integrated into the Symbolic Order as are men. The notation La states, "The Woman does not exist" for Man, S, except as an enigma. For Man, Woman exists as a fantasmatic object of desire (what Lacan calls object a), an object the masculine order can define only in terms of Man, specifically in terms of a dependent relationship of Woman to Man. In contrast, for Woman, the choices are either to attempt to achieve fulfillment by satisfying a man (being the phallus, Φ, for a Man) or to remain an enigma, a meaningless cipher to the masculine social order of meaning. There is no biological essentialism at work here; as Lacan demonstrates by way of male mystics, males and females may logically assume either a masculine or feminine position. Nor is the content of either position essentialist.

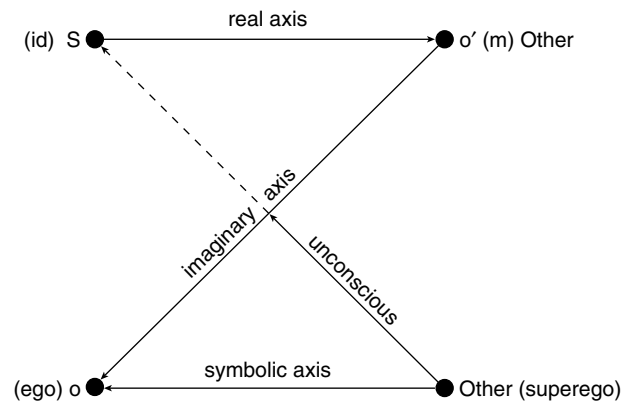
Lacan reconceptualizes the Freudian id, ego, and superego in terms of three modalities or "registers" of human reality: the Real (the unsymbolizable, emotional Being of the Subject), the Imaginary (the realm of conscious representations), and the Symbolic (the realm of language and internalized social prescriptions and proscriptions). Psychically, this schema reverses the positivistic relations of science (truth) and ideology (desire) by equating the truth of the Subject with the Real (unconscious, unsymbolizable) and the Imaginary with illusion or alienation from the truth (consciousness, ego identifications).


Figure 5 Schema L

Lacan represents the development of the Subject in the form of two diagrams, the so-called L and R schemas.

The neonate subject, S, exists in a close, symbiotic relation to Mom, o′ the distinction between itself and Mom is not yet clear and the relation between them is emotionally direct and immediate, that is Real. However, the child eventually grasps himself or herself as distinct from Mom, and this inaugurates the second developmental stage characterized as a binary relationship between Mom, (m)Other and the child as ego, o. Lacan refers to this break in the Real relationship as the Mirror Stage—likening it to the point at which the child comes to see his or her reflection in a mirror as his or her own self and identifying with this image.

The ego is founded upon such identifications, visual and verbal, but Lacan sees these identifications as Imaginary, since the Real of the self is not that image in the mirror nor those cooings and cajolings of Mom. Mom is now the all-powerful, all-knowing (m)Other, the object of identification for the child as ego (imaginary axis), as well as the Real emotional object of desire for the child as id. The child now exists in a binary relationship experienced in narcissistic terms as an unmediated and unequal relation of two selves. The child separates and individuates itself from Mom, but remains in the privileged emotional position of being, at least in fantasy, the sole object of her desire. Mom's desire is a mystery the child seeks to understand and to satisfy,

and in the process it acquires a richer sense of self through innumerable identifications with her and her values.

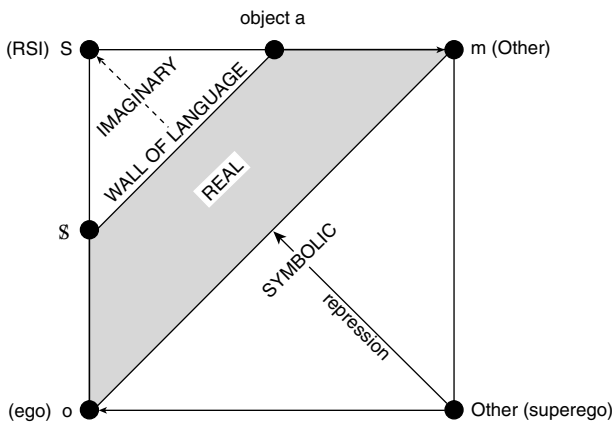
The binary, unmediated relationship between the child and Mom must be interrupted and terminated by a third stage, socialization and sexuation, which we have already described as the Paternal Intervention. Dad embodies the Symbolic Order, O, the Law of Desire that explains and defines Mom's lack in terms of the Phallus, and that compels the child to give up the Real experience of the maternal Thing and to accept socially defined gender roles and objects in return. The discourse and rules of the Other, superego, are internalized by the ego (the symbolic axis) while the pre-Oedipal desire for mother—the intimate Real jouissance of being the phallus for Mom—is repressed. The outcome of the process of subjectification may be represented in a modified form of Lacan's R Schema:


Figure 6   Schema R

The Lacanian subject (RSI) is a totality that only exists as the structural relationship of three distinct yet interdependent registers (Real, Symbolic, and Imaginary). The repressed pre-Oedipal jouissance between Mom, (m)Other, and the narcissistic infant ego, o, constitutes the Real register. In the Symbolic register, the child has internalized its gendered place and function within society and become a social subject, S, alienated or barred from its Real truth, but able to pursue other, substitute objects of desire, objects *a*. The child has become a "signifier for other signifiers," a social subject able to communicate with other social subjects using their common language, the discourse of the Other. However, psychologically speaking, such communication is alienated or "empty" speech devoid of the emotional truth and authenticity of Real or "full" speech (as in the transference of the analytic situation, for example). Empty speech is the realm of the Imaginary register, the realm of an alienated ego that imagines its meaning is its being, an ego that is constituted by the Other, by the history

of the child's identifications with Other images and signifiers (ultimately with an unchanging, "unary" signifier, the child's legal name). The Imaginary realm of the ego, of consciousness, is separated from Real being by a Wall of Language, yet it is Real being that accounts for the incomprehensible feelings and desires the Subject attaches to its interactions with others.

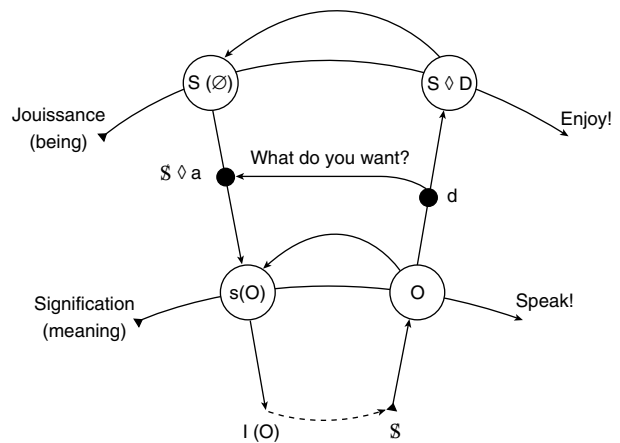
Not only does the Symbolic Order constitute the meaning of the Subject as a signifier for other signifiers, but it also disciplines the Subject's very being, a process Lacan calls Symbolic Castration. Both processes are represented in a simplified version of Lacan's Graph of Desire.


Figure 7   The Graph of Desire

The lower portion of the graph depicts the suturing of the Subject into the system of signification. We have already seen how the infant becomes a Subject, S. Here the Subject is shown learning the Symbolic order and thereby identifying with his or her place and function within it, I(O). Every iteration, every new signification, further inscribes the Subject in the Symbolic Order and expands the ego's concept of itself and of reality. The superego command "Speak!" is both enabling, since the Subject is able to function socially by means of language, but also alienating and disabling, since all speech is that of the Other.

At some point, the subject experiences a certain existential deficiency or lack in the system of meaning. As Mom's desire had been a mystery for the infant, so the meaning of the Symbolic Order itself is a mystery to the Subject. The Subject has a desire for meaning and a desire to do the right thing. Thus he or she asks of the Other, "What do you want?" Since there is no ultimate meaning, since there is no reason for its existence, since the system is completely arbitrary from the perspective of the individual, the Other does not have the answer and the Subject must invent one: the

fantasy, depicted by the formula $\mathcal{S} \lozenge a$ (the Subject desires object a). If the existential question is "Why am I a man?," then the fantasmatic answer may be "To find a woman." Woman in such a case is the fantasy of Man, the reason for his existence. The object, object *a,* is not simply an actual, concrete woman; rather, it is an actual woman upon whom the Subject projects his fantasy. Thus, object *a* is a sublime, fantasmatic quality, something in the object more than the object itself.

Of course, desire is more than an intellectual desire for meaning; it is also a matter of emotion, a matter of jouissance. The upper portion of the graph deals with the being of the Subject—how the body, its pleasures and pains are disciplined by society. The Subject experiences intense pleasures and traumatic pains that Lacan calls jouissance. The experience of jouissance is inexplicable, an unsignifiable hole or a lack in the discourse of the Other, since the discourse of meaning is incommensurable with being. Of course, the parents and later society respond to my enjoyment by making prescriptive and proscriptive demands upon my enjoyment, demands to which I conform out of my desire, *d,* for the desire of the Other.

Thus is produced the Drive, represented by the formula $\mathcal{S} \lozenge D$ (the Subject desires to meet the Demands of the Other). Retroactively, my experience of pleasure is disciplined by the Demand of the Other. My original experience of pleasure is redirected or rechanneled into acceptable forms and onto acceptable objects—that is, signifiers within the Law of Desire organized around the Phallus. Genital sexuality replaces the pre-Oedipal jouissance associated with part objects during infancy and with the intimate jouissance of Mom. Thus at S(Ø), the jouissance that was originally unsignifiable is now signified, but only in the language of the Other's Demand. The Other commands us, "Enjoy!" but only within the Law.

Henceforth, my experience of enjoyment, for example, my relations with women who attract me in certain mysterious ways, serves to reinforce my subordination to the Demand of the Other. Lacan explains the attraction in terms of the fantasy $\mathcal{S} \lozenge a$. Although my jouissance has been disciplined by the Demand of the Other, I have hung on to it unconsciously; it is the mysterious Thing that attracts me to certain women, a little piece of Real enjoyment that I have refused to give up. It is the emotional component of my fantasy; it is the object *a,* the real Thing I project onto certain women, thereby endowing them with the power to attract me. Object *a* is the Real foundation, the fantasmatic support of my identity, and the less I understand it, the more tenaciously I cling to it. Every experience of enjoyment S(Ø) reinforces the fantasy $\mathcal{S} \lozenge a$, the fantasy reinforces the meaning of Other's discourse, s(O), and ultimately my ego identification with the Other, I(O).

Clinically speaking, the goal of Lacanian analysis is to work through the fantasy, to experience the dissolution that attends the disillusion, to understand that "there is no Other of the Other" (there is no external, ultimate locus of the Truth), and to live accordingly. In terms of social theory generally, Lacan's work has been influential in the field of cultural studies and in the social sciences, where it has functioned as a theory of ideology and as a method of ideology critique (often in conjunction with the work of Marxist philosopher Louis Althusser and/or other feminist, postcolonial, or poststructuralist theories).

LATOUR, BRUNO

Bruno Latour (b. 1947), French social theorist of science, technology, and politics, was at the forefront of the development and refinement of actor-network theory (ANT) and the emergence of science and technology studies (STS) in Europe. His work has been influential in North American science studies, and many of his concepts have

traveled across disciplinary divides. Latour was born in Beaune in the Burgundy region of France, to a family noted for their wine production. Educated in Dijon, he was trained in philosophy and received his PhD from the University of Tours in 1975. During his military service, which brought him to North Africa, Latour became interested in developing anthropological models to examine modern knowledge-producing institutions and practices. He has developed a critical perspective on not only the production of knowledge in the natural sciences but the social sciences as well. He is deeply concerned with rethinking the relationships between two of the central organizing concepts of modernity: Nature and Society. Latour argues that both the natural and the social are coproduced over different spaces and at different times, leading to the formation of what he terms "collectives." The collective is not synonymous with society, but rather provides the conditions of possibility for sociality and relations between humans and nonhumans. Latour is critical of the master narratives of modernity, such as progress and transcendence, but he is also skeptical of the claims of radical postmodernists, whom he sees as too pessimistic, and abdicating the work of producing new collectives that could create alternative futures.

Latour's work was introduced in English with the publication of *Laboratory Life* (1979). In this text, Latour and coauthor Steve Woolgar took on the perspective of a "naïve" anthropologist inside of a neuroendocrinological lab in the United States. By "naïve," the authors meant that they would pay close attention to the ongoing day-to-day work of scientists as forms of cultural practices. The authors focused on following the scientists across different domains of activity, including running experiments, writing papers, raising money, and speaking to different audiences. Latour and Woolgar argued that rather than being bounded by the traditional divide of science and society, which dominated functionalist sociological explanations of science (à la Robert Merton), scientists actively constructed the boundary between science and society and utilized either side as a resource, depending on the demands of the situation. Thus, "nature" emerges as a product of laboratory work, not as a precondition. However, the authors did not reduce scientific work to the subject; rather, scientists succeed through establishing links with other powerful actors and accumulating scientific credit (or capital), which must be continually reinvested in order to strengthen and expand their network of links. The network sustains and fortifies the actor, but the network is not reducible to static concepts, such as social structure. Latour and Woolgar pointed out that they are opposed to using the concept of "social factors" to explain science, since that replicates and reverses the very problem they are seeking to overcome, namely how to explicate the activity of science without recourse to nature (or society).

Laboratory Life was one of the first ethnographies of modern bench science. Latour's work at this point coincided with others who were also exploring the worlds of modern science through forms of participant observation, such as German sociologist Karin Knorr Cetina. Knorr Cetina, influenced by symbolic interactionist and phenomenological theories of social action, argued that the scientific method must be understood as a locally produced social practice. Bench scientists produce temporary *stabilizations,* which are often deconstructed by scientists themselves, as they travel through different symbolic economies. Knorr Cetina's ethnographic work, *The Manufacture of Knowledge* (1981), argued for *methodological intersubjectivity,* or establishing a tight contact point with the social phenomenon under investigation, through close observations of lab practices and interactions. This position is closely aligned with Latour and Woolgar's anthropological naïveté.

In his next series of writings, including "Visualization and Cognition: Thinking with Hands and Eyes" (1986), *Science in Action* (1987) and *The Pasteurization of France* (1988), Latour began to examine the deep intertwining of science and politics, as well as to develop a rich conceptual lexicon to describe his epistemology. In revealing the contours of lab culture, Latour had placed emphasis on the processes of *translation.* Translation involves the processes of converting the cacophony of objects and materials used for experiments into relatively simple *inscriptions,* such as graphs or sequences. Inscriptions that are simple, portable, and obdurate, and can be recombined with other inscriptions, comprise what Latour called "immutable mobiles." Immutable mobiles are easily packaged, circulated and proliferated, and tend to accumulate in *centers of calculation.* Inscriptions, and the devices that produce them, are part and parcel of political methods of intervention in the world. In other words, the production of scientific knowledge is not solely a technical enterprise; rather, the processes of scientific knowledge production coconstruct both social and technical orders. In addition, Latour stresses the conflictual aspects of technoscience. Drawing heavily on military metaphors, he emphasizes how scientists must enlist allies and cut off opponents in the struggle over *obligatory points of passage,* or nodes that stabilize a network of *actants,* a term drawn from semiotics that is useful for Latour, as it covers whatever is represented within a network, including both humans and nonhumans.

Latour set out to clarify his politics of science by coining the term *technoscience,* which is a fusion of the words *technology* and *science,* in order to indicate that the disparate and motley collection of actants that make up scientific practice does not easily bifurcate into pure and applied research. This becomes a methodological point for ANT: Sociologists of science and others must

not simply replace internalist explanations of scientific activity, such as great minds or transparent proof, with externalist arguments, such as the force of ideology or the power of capitalism. Since boundaries are constantly being modulated by humans and nonhumans, the analyst should not foreclose a boundary by explaining it through recourse to either social factors or natural facts. Technoscience operates precisely through the simultaneous production of an internal and an external, or both nature and society.

Latour elaborated his technoscientific politics in *We Have Never Been Modern* (1993). Here Latour argues that we can think of modernity as a *constitution;* it is a mechanism for sorting and classifying, but also for power and control. He claims that the concept of "modern" refers to two separate processes: *translation,* which constructs hybrid objects, such as transgenic animals, and *purification,* which is the process that separates humans (Culture) from nonhumans (Nature). The process of translation has accelerated the creation of *quasiobjects* and *quasisubjects* that inhabit modernity. The use of the prefix *quasi-* is important for Latour because it represents the provisional nature of hybrids within networks before they become solidified (or *black-boxed*) as unyielding objects or volitional subjects.

We Have Never Been Modern appeared at the beginning of what was called the science wars, disciplinary (and individual) conflicts over differing representations of science. In a simple sense, the science wars pitted analytic philosophers of science and their allies in the history of science against theorists of knowledge and science (and its consequences) from cultural studies and sociology influenced by poststructuralism, feminism, and/or postmarxism. In response to this skirmish, Latour wrote a series of essays over the 1990s devoted to understanding what was at stake in these debates, compiled in *Pandora's Hope* (1999). Latour argued that the science wars were a symptom of the changing relationships within technoscience. He has continued in this direction with *War of the Worlds* (2002), in which he calls for a *multinatural diplomacy.* He claims that diplomacy is now necessary to acknowledge the war going on not over scientific facts but rather over *states of affairs.* Instead of bringing closure, facts have led to more intense squabbles over what constitutes reality. Latour also argues that the resolution will not be found through multicultural tolerance, since that perspective assumes a plurality of cultures undergirded by a singular Nature. Rather, he emphasizes that it is time to recognize and endorse many possible natures that are part of the process of building new collectives.

LAWLER, EDWARD

Edward J. Lawler, born in 1943, is an American theorist and experimental sociologist. He links properties of social structure to individual perceptions, emotions, and attributions to explain a range of social phenomena. Working primarily within the social exchange tradition of sociology, he has developed numerous theories that relate social structure to bargaining, voluntarism, commitment, emotion, and micro social order. He has authored several books, including *Power and Politics in Organizations* (1980) and *Bargaining: Power, Tactics and Outcomes* (1981) (both with Samuel B. Bacharach). He is the founding editor of *Advances in Group Processes,* the 2002 winner of the Cooley-Mead Award for lifetime achievement, and most recently the Martin P. Catherwood Professor at Cornell University. Lawler is currently the Dean of the School of Industrial and Labor Relations at Cornell.

Lawler adopts a holistic approach to understand links between social structure and human behavior. Ontologically, he begins with the notion that structures of power, dependence, and opportunity exist at the macrolevel and these are "real" in the sense they shape opportunities and constraints for individuals. Structures guide, but do not entirely determine, the course of social interaction. Undergirding this structural orientation is the interactionist assumption that humans perceive, interpret, judge, and emotionally react to the conditions of structure. His theoretical focus is on how relatively macro phenomena (i.e., coalitions, power,

solidarity, order) are created, maintained, and destroyed by relatively microlevel phenomena (i.e., perceptions, cognitions, strategies, emotions). His theorizing synthesizes principles of social networks, organizations, identity, judgment, attribution, and emotion.

Educated at the University of Wisconsin at Madison, Lawler's early career focused on mechanisms wherein power structures and coalition opportunities shape partner perceptions and strategies in negotiation. His early streams of work focused on two interrelated dimensions of power. First, a power-dependence branch emerged to link structural dependence to perceptions of power, and importantly, the strategies people adopt in bargaining. This work was pioneering because it made the negotiation *process* central in social exchange theory. A second branch of Lawler's theorizing dealt with punitive power. Here he brought Richard Emerson's power-dependence theory to bear on notions of deterrence and conflict spiral in political science. From this emerged a theory of bilateral deterrence, which resolved a number of seemingly contradictory findings.

Lawler also has made important strides toward understanding commitment in nested social groups, such as academic units within a college, departments within an organization, or communities within a city. His *theory of affective attachments* embodies four principal ideas. First, structural limitations on choice and freedom provide actors with a general sense of control over their environment. Second, "flexible" choice situations that foster a sense of self-control result in positive emotions, while "inflexible" choice situations that lessen a sense of control result in negative emotions. As such, emotions follow from decision-making autonomy within some larger hierarchical structure. Third, positive emotions tend to strengthen affective ties to collective units, whereas negative emotions tend to dampen affective ties to collective units. A primary theme in Lawler's work is that emotional reactions are a fundamental basis for commitment and solidarity in groups and organizations. Finally, relative to more distant units, social units that are more proximate to the actor tend to receive more credit for choice and positive emotion.

Since the early 1990s, Lawler (along with colleagues Jeongkoo Yoon and Shane Thye) has developed and systematically tested a *theory of relational cohesion* that provides an account of commitment in social exchange relations that incorporates emotions. This theory provides an alternate view of commitment in exchange, compared to traditional accounts that focus on uncertainty reduction and trust. The theory of relational cohesion presumes that actors are driven initially to maximize their self-interest. That is, the theory claims actors exchange initially so they can produce benefits not otherwise attainable. The theory also recognizes, however, that actors have the ability to experience, interpret, and reproduce emotional reactions to exchange outcomes. The orienting idea is that the very act of exchange represents joint social activity, characterized by problems of coordination and uncertainty. As such, when exchange is successful, actors should experience positive emotional reactions; when exchange is unsuccessful, actors should experience negative emotional reactions. Over time, the emotional reactions from joint social activity should determine the bonds individuals form to one another, and to the relation itself.

Many of these ideas are brought together in Lawler's recently developed *affect theory of social exchange,* which places an emoting actor at the very core of social exchange theory. The affect theory asserts that different forms or types of social exchange (e.g., productive, negotiated, reciprocal, and generalized) entail tasks with different degrees of jointness. As such, tasks that involve more jointness ostensibly promote a stronger sense of shared responsibility for the results of exchange. Thus, the theory predicts more jointness and shared responsibility in negotiated exchange (e.g., when A and B jointly decide on how to divide a common good) than in reciprocal exchange (e.g., when A and B give one another unilateral benefits, noncontingently, through time). The theory asserts that shared responsibility, in turn, promotes attributions of emotion to relevant social units, because these are the context for actors' common focus and activity. The theory can help explain when and how social networks of interdependent actors become groups on a cognitive or behavioral level (see Lawler 2001).

LEARNING THEORY

Learning theory is one of several consequentialist modes of explanation in the social sciences, along with functionalism, expected utility, game theory, and conflict theory. In consequentialist explanations, actions are explained in terms of the outcomes they produce. An obvious problem is

that the explanatory logic runs in the opposite direction from the temporal ordering of events. Actions are the explanandum and their outcomes the explanans. This explanatory strategy collapses into teleology unless mechanisms can be identified that bridge the temporal gap. While expected utility theory and game theory posit a forward-looking and analytic causal mechanism, learning theory provides a backward-looking and experiential link.

In forward-looking rationality, the link from actions to their explanatory consequences is the analytical ability of purposive actors to reliably predict the outcomes of alternative choices. With a perfect grasp of the logical or mathematical structure of a well-defined problem and complete information about inputs to the model, the likely consequences of alternative courses of action can be known before the fact. The ideal type is "the neoclassical economic model in which rational agents operating under powerful assumptions about the availability of information and the capability of optimizing can achieve an efficient reallocation of resources among themselves through costless trading" (Axelrod 1997:4). The consequences that matter are not the actual ones (which have not yet occurred), but those that are predicted. Outcomes that arise behind the backs of the actors, such as the unintended collective benefits of the "Invisible Hand," cannot attract the choices that produce them, an insight made famous by Adam Smith.

Forward-looking calculation is mainly applicable to skilled entrepreneurs, political strategists, military leaders, or game theorists. In everyday life, decisions are often highly routine, with little conscious deliberation. These routines can take the form of social norms, protocols, habits, traditions, and rituals. Learning theory explains how these routines emerge, proliferate, and change in the course of consequential social interaction, based on *experience* instead of calculation. In these models, *repetition,* not prediction, brings the future to bear on the present, by recycling the lessons of the past. Through repeated exposure to a recurrent problem, the consequences of alternative courses of action can be iteratively explored, by the individual actor (reinforcement learning) or by a population (evolutionary learning). Individual learning alters the probability distribution of routines competing for an actor's attention. Population learning alters the frequency distribution of routines carried by individuals competing for survival, reproduction, or social influence. Reinforcement learning is not limited to human actors but may be applied to larger entities such as firms or organizations that adapt their behavior in response to environmental feedback. And evolutionary learning is not limited to genetic propagation. In cultural evolution, norms, customs, conventions, and rituals propagate via role modeling, occupational training, social influence, imitation, and vicarious learning.

Whether the process is individual-level reinforcement, genetic propagation, or cultural evolution, the underlying learning principle is the same: adaptation to environmental feedback. Positive outcomes increase the probability that the associated routine will be repeated or reproduced, while negative outcomes reduce it. For example, a firm's problem-solving strategies improve over time through exposure to recurrent choices, under the relentless selection pressure of market competition. Suboptimal routines are removed from the repertoires of actors by learning and imitation, and any residuals are removed from the population by bankruptcy and takeover. The outcomes may not be optimal, but we are often left with well-crafted routines that make their bearers look much smarter than they really are (or need to be), like a veteran outfielder who catches a fly ball as if he or she had calculated its trajectory.

The most elementary principle of learning is simple reinforcement. Thorndike (1898) first formulated the theory of reinforcement as the "Law of Effect," based on the principle that "pleasure stamps in, pain stamps out." If a behavioral response has a favorable outcome, the neural pathways that triggered the behavior are strengthened. This connectionist theory finds contemporary expression in the error back-propagation used in artificial neural networks. These models show how highly complex behavioral responses can be acquired through repeated exposure to a problem.

Reinforcement theory relaxes three key behavioral assumptions in models of forward-looking rationality:

1. Propinquity replaces causality as the link between choices and payoffs.

2. Reward and punishment replace utility as the motivation for choice.

3. Melioration replaces optimization as the basis for the distribution of choices over time.

1. *Propinquity, not causality.* Compared to forward-looking calculation, the law of effect imposes a lighter cognitive load on decision makers by assuming experiential induction rather than logical deduction. Players explore the likely consequences of alternative choices and develop preferences for those associated with better outcomes, even though the association may be coincident, "superstitious," or causally spurious. The outcomes that matter are those that have already occurred, not those that an analytical actor might predict in the future. Anticipated outcomes are but the consciously projected distillations of prior exposure to a recurring problem. Research using fMRI (functional magnetic resonance imaging) supports the view that purposive assessment of means and ends can take place *after* decisions are made, suggesting that "rational choice" may be not so much a theory of decision but a theory of how decisions are rationalized to self and others.

Reinforcement learning applies to both intended and unintended consequences of action. Because repetition, not

foresight, links payoffs back to the choices that produce them, learning models need not assume that the payoffs are the intended consequences of action. Thus, the models can be applied to expressive behaviors that lack a deliberate or instrumental motive. Frank's (1988) evolutionary model of trust and commitment formalizes the backward-looking rationality of emotions like vengeance and sympathy. An angry or frightened actor may not be capable of deliberate and sober optimization of self-interest, yet the response to the stimulus has consequences for the individual, and these in turn can modify the probability that the associated behavior will be repeated.

2. *Reward and punishment, not utility.* Learning theory differs from expected utility theory in positing two distinct cognitive mechanisms that guide decisions toward better outcomes: *approach* (driven by reward) and *avoidance* (driven by punishment). The distinction means that aspiration levels are very important for learning theory. The effect of an outcome depends decisively on whether it is coded as gain or loss, satisfactory or unsatisfactory, pleasant or aversive.

3. *Melioration, not optimization.* Melioration refers to suboptimal gradient climbing when confronted with what Herrnstein and Drazin (1991) call "distributed choice" across recurrent decisions. A good example of distributed choice is the decision whether to cooperate in an iterated Prisoners' Dilemma game. Suppose each side is satisfied when the partner cooperates and dissatisfied when the partner defects. Melioration implies a tendency to repeat choices with satisfactory outcomes even if other choices have higher utility, a behavioral tendency March and Simon (1958) call "satisficing." In contrast, unsatisfactory outcomes induce search for alternative outcomes, including a tendency to revisit alternative choices whose outcomes are even worse, a pattern called "dissatisficing." While satisficing is suboptimal when judged by conventional game-theoretic criteria, it may be more effective in leading actors out of a suboptimal equilibrium than if they were to use more sophisticated decision rules, such as "testing the waters" to see if they could occasionally get away with cheating. Gradient search is highly path dependent and not very good at backing out of evolutionary cul de sacs. Course correction can sometimes steer adaptive individuals to globally optimal solutions, making simple gradient climbers look much smarter than they need to be. Often, however, adaptive actors get stuck in local optima. Both reinforcement and reproduction are biased toward *better* strategies, but they carry no guarantee of finding the highest peak on the adaptive landscape, however relentless the search. Thus, learning theory can be usefully applied to the equilibrium selection problem in game theory. In repeated games (such as an ongoing Prisoners' Dilemma), there is often an indefinitely large number of analytic equilibria. However, not all these equilibria are learnable, either by individuals (via reinforcement) or by populations (via evolution). Learning theory has also been used to identify a

fundamental solution concept for these games—stochastic collusion—based on a random walk from a self-limiting noncooperative equilibrium into a self-reinforcing cooperative equilibrium (Macy and Flache 2002).

LEFEBVRE, HENRI

Henri Lefebvre (1901–1991) was a French Marxist philosopher and sociologist whose prolific and diverse body of work contributed to a critical theory of the various dimensions of human existence under modern capitalism. Despite the fact that Lefebvre was the author of more than 60 books, and that he engaged with and contributed to some of the key theoretical currents of the past century, an appreciation of the full span of his thinking in the English-speaking world remains obscured by the partial and fragmentary state of available translations of his writings. Three principal thematic axes cut across the range of his work: Western Marxism, everyday life, as well as spatiality and the urban. Binding them to one another is his conception of capitalist modernity, which he understands as being shaped by the perpetual tension between modernism (triumphalism, the cult of the new, abstraction, technicism, instrumentalism, homogenization, etc.) and romanticism (tragedy and nostalgia, naturalism, expressivism, authenticity, personal revolt and imagination, etc.).

Lefebvre can be understood as a Western Marxist who, along with other Central or Western European thinkers,

formulated a critique of and alternative to Soviet Marxism's orthodox economism and statism. His stance towards Marxist theory was complicated by and filtered through his difficult relationship with the French Communist Party (PCF), of which he was a member—and at one point, its leading intellectual figure—from 1928 until his break with and eventual expulsion from it nearly three decades later. Influenced by Marx, Hegel, and Nietzsche, his heterodox and pluralist "dialectical materialism" stressed the problematic cultural and existential dimensions of the capitalist mode of production. The humanist thrust of Marx's early writings was important for Lefebvre, who foregrounded and generalized the concept of alienation to the extent that the latter became, in his hands, the defining sociocultural consequence of modern capitalism blocking humankind's authentic self-actualization. From Hegel he derived a dialectical perspective aimed at pinpointing the continuous existence of contradictions, as well as of possibilities of negation and transcendence (*Aufhebung*) amidst the social, while Nietzsche's vitalism was visible in Lefebvre's fascination with the disruptive, transgressive force of human creation. Placing agency and praxis at the heart of Marxism, Lefebvre highlighted the creative and revolutionary drive that underpinned both artistic avant-gardes (particularly Dada, surrealism, and situationism) and radical political struggles against the established social order, such as the 1871 Paris Commune, the May 1968 student revolt, as well as the ecological and urban movements of the 1970s and 1980s.

The second notable aspect of Lefebvre's work is his groundbreaking critique of everyday life, an area that theoretical investigations had hitherto either neglected or analyzed in a purely descriptive fashion (e.g., through phenomenology and ethnography). He contended that, far from being banal or derivative, everyday life was a fundamental arena of social action outside the immediate sphere of production, an arena whose importance was recognized in conjunction with the consolidation of modern society in the twentieth century. On the one hand, Lefebvre conceived of everyday life as impoverished and inauthentic because gradually colonized by the dual dynamics of commodification and bureaucratization, thereby resulting in the rise of a "bureaucratic society of organized consumption." Partly through the symbolic-cum-linguistic media of advertising and marketing, the process of alienation impacts individuals and groups in their daily lives, and thus extends into the cultural and affective domains the condition of socioeconomic domination institutionally established by the capitalist economy and the liberal-democratic state. On the other hand, Lefebvre believed that, since it could never be fully captured by capitalist modernity, everyday life was the soil within which could be imagined substantial forms of resistance and disalienation. Everyday life sustains the collective memory of alternative practices and beliefs, fosters

consciousness of the immanent contradictions of the current social order, and most crucially, nurtures the elaboration and performance of subaltern strategies or spontaneous "moments" of escape from, subversion of, or rupture with the totality of the existing social order (for example, in popular festivals and political revolutions).

Spatiality and the urban constitute the third theme around which Lefebvre's thinking can be organized. For him, space is neither passive nor given, but a vital dimension of social life that is produced through politicoeconomic relations and, moreover, a locus for the exercise of power through which such relations are constituted, reproduced, or contested over time. Lefebvre offers a triadic framework of analysis of the production of space, according to which a society's spatial practice (the perceived) is shaped by the dialectic between its representations of space (the conceived) and its spaces of representation (the lived). While the former refer to the dominant ordering of space, the instrumentalized and homogenizing notions of "abstract space" promoted by technocratic experts and socioeconomic elites, the latter are the alternative counter-sites ("heterotopias") sustaining the unifying "differential space" remembered, experienced, and symbolically imagined in every life (through art, communes, festivals, etc.). Integral to Lefebvre's spatial theory is his analysis of the process of urbanization. Following agricultural and industrial stages of production, the possible advent of a full-blown urban society should be contemplated today—a prospect whose implications cannot be adequately grasped by the technocratic sciences of urbanism, planning, and architecture. Therefore, Lefebvre urges the undertaking of an "urban revolution" that would oppose hegemonic representations of space by mobilizing citizens to defend "the right to the city": a project consisting of participatory self-management, popular appropriation of space, and embrace of the differential, unexpected reality embedded in the urban sociocultural form.

In its many facets, Lefebvre's thought aims to foster a "permanent cultural revolution" that would work toward individual self-realization and collective autonomy. His openness toward multiple acts and places of opposition, creation, and radical transformation place him at the cusp of Marxism and postmarxism. If changing the world is a precondition to changing thought and life, he reminds us that the reverse, in its myriad complexity and rich promise of articulating poesis and praxis, is no less true.

LESBIAN CONTINUUM

The *lesbian continuum* is a term coined by Adrienne Rich (1986) in "Compulsory Heterosexuality and Lesbian Existence." By constructing sexual identity along a gradient, it offers an alternative to traditional binary classifications of sexual identity. This concept was formulated with the intent of including women who do not ordinarily think of themselves as lesbians, specifically women who identify as heterosexuals. One rationale for this concept was to find similarities among heterosexually identified feminists and lesbian-identified feminists in building women-centered community. The notion of a lesbian continuum is used primarily in feminist studies, women studies, lesbian studies, and queer theory.

This continuum conceptualizes lesbian identity as more than desire for particular sorts of sexual intimacies and relationships. In the spirit of the "personal is political," sexual orientation is examined within a feminist framework, and intimate relationships are defined as including much more than sexual intimacy. Furthermore, Rich seeks to give voice to lesbians and women-identified activists as political agents by defining lesbianism as something other than the female counterpart of male homosexuality.

Thus, for Rich, lesbianism is a political, personal, and purposeful commitment that places women in the center and is not dependant upon their relationships to men. Relationships to and connections with other women are the central aspects that Rich uses in defining what it means to be lesbian in a patriarchal society. By defining lesbianism so broadly, Rich aims to reconceive eroticism in female terms. This continuum is also, then, an attempt at redefining sexual and intimate relationships beyond a phallic, goal-orientated conception of sexuality. Joy, empowerment, and self-actualization found in and constructed through being female with other females in resistance to the misogynist construction of what it means to be female are the goals and processes of what Rich means by *being* lesbian.

A positive aspect of this idea is its tendency to call for a more inclusive type of identity politics. Rich's concept encourages organizations to build coalitions across more stringently defined sexual identities. This is important because identity politics has often been exclusionary and less effective as such. However, defining a lesbian as any woman who is women-identified can dilute the self-affirming effects of identity politics.

One controversial aspect of the lesbian continuum has to do with the mainstream marginalization of lesbians and the silence surrounding their sexuality. Historically, lesbians have been considered invisible and silenced since many of their erotic relationships were categorized as mere friendships that could not be anything more. Many argue that to define lesbianism as women who are women identified, thus including heterosexuals and many nonsexual relationships, at best compromises our insights into and at worst negates the possibility of intimate sexual practices between women. This point becomes even more pertinent when feminist and lesbian theories critique hegemonic sexuality as phallically identified and defined.

Another negative aspect of this idea is that it can be used to justify further marginalizing those who are not considered "acceptable" in their sexual practices. This is problematic throughout communities of minorities. Simplistically, the lesbian continuum can be seen as contributing to the divide between sexual minorities who argue they are no different than anyone else and those who claim difference because of who they are sexually. Furthermore, the potential to undermine the binary categorization of heterosexual and homosexual remains unfulfilled since the boundaries are only drawn differently instead of questioning the assumptions that uphold these categories. In light of these arguments, the lesbian continuum can be seen as further justifying puritanical ideas regarding sexual practice and romanticizing, if not prioritizing, nonsexual attachments. It can also be criticized, as Gayle Rubin (1997) does in an interview with Judith Butler in *Feminism Meets Queer Theory,* as contributing to a feminist rhetoric that condemns sexual difference. Rubin uses "sexual difference" as an alternative for the more typical labels of pervert, deviant, and, more positively, the idea of sexual diversity while emphasizing that these differences are constructed as such by the very patriarchal structures and ideas that feminist theories work to combat.

LEVELS OF SOCIAL STRUCTURE

The word *structure* comes from the Latin verb *struo,* to join together, build, arrange, or order. *Struo* is related to the Greek verb *stornymi,* to spread smooth or level (Rosen 1980: 32). Etymologically, structures are constructed unities that exhibit an internal architecture by virtue of having their component parts smoothed out into levels by the reticulating operations of analysis and synthesis. When these operations are performed over the domain of social relationships, intergroup relations, and social institutions, the result is an analytical model of the levels of social structure. By levels of social structure one means the layered demarcation of the elemental and supervening components of a complex association (however defined analytically) into a series of units of increasing scale and complexity. The differentiated and/or encompassing elements, units, and relations constitute a social ontology offered up as a template for further analysis, explanation, and theoretical integration.

Levels of structure can be found in all the sciences. In biology, the series runs as follows: molecule, cell (subsuming cellular organelles), organ, organism, population, species, community, and biotic environment. Each level incorporates the prior one as its working parts in a new relational configuration and exhibits new emergent properties as a consequence of their dynamics. Although many scientists believe that analysis "cuts reality at the joints"—making levels of structure the ontological building blocks of the world—levels schemes undergo dramatic revision over time. Even determining the number of levels is problematic. In the biological series above, some scientists consider cellular organelles a level and population a sublevel, while others see a confusing mixture of two series, the genealogical and the ecological. Particularly in the social sciences, it is wise to think of levels epistemologically—as analytical efforts to break a complex whole into articulated parts until a base of interacting elements is fixed by postulation.

Levels talk in the social sciences ranges from indistinct hand-waving to well-ordered models of the levels of social structure. The latter efforts hue closely to the implicate order of the biological series above. Most begin with a postulated analytical primitive (either an element or a process) that gives rise to the smallest unit of social structure, which is then "aggregated" or "compounded" into the complete series. Alternatively, the most comprehensive unit is demarcated first and the series unfolds by subdivision. Few concepts qualify for this kind of treatment. The most common are family, territory, role, system, and social relationship. Mixed series may represent synthetic efforts or reveal analytical confusion. A metatheoretical literature now exists to evaluate levels schemes (Kontopoulis 1993; Luhmann 1995). Successful efforts accomplish the following tasks. They

- Demarcate the major units and levels of structure of theoretical interest (the social ontology)
- Explain the emergence of more complex units from the dynamics of the antecedent level(s) (upward structuration)
- Describe the internal relations, processes, and systemic effects at each level (system dynamics)
- Explain how antecedent units are transformed by being integrated into more complex units (downward structuration)
- Use the levels scheme in the explanation of social facts

Five groups of models of the levels of social structure, 13 models in all, are presented next. The 13 were selected for their heterogeneity, influence, and ability to illustrate metatheoretical issues. Levels schemes that include social structure as a level of reality without decomposing it into sublevels unique to itself are omitted from consideration, as will be idiosyncratic schemes that incorporate dialectical or dualistic elements or combine vertical and horizontal planes (e.g., Gurvitch 1950). For a discussion of the relationship between levels talk and theory integration, see Ritzer (1981).

1.1 *Household, village, polis:* Aristotle, *Politics,* 335–322 B.C.

1.2 *Family* (household), *gens* (a descent group like a clan), *phratry* (a union of several gentes), *tribe,* and *polis* (city-state): N. D. Fustel de Coulanges, *The Ancient City,* 1864. Mechanism: federation through religious rites.

Aristotle understood that the household and village were *transformed* by being incorporated into the polis: The household's constitutive relations—identified by Aristotle as master and slave, husband and wife, and parent and child—were in the polis subject to new principles of justice. Today this transformative process is called "downward structuration" (Kontopoulis 1993). Finding in ancestor worship the wellsprings of the patriarchal authority and social solidarity that were generalized from one level to the next, Fustel de Coulanges showed how the universalism of the polis allowed new kinds of association such as the guild to form. In rites of consecration he identified a key mechanism of "upward structuration."

1.3 *Horde, family or house, clan, tribe, nation:* Lewis Morgan, *Ancient Society,* 1878. Mechanism: partitioning due to population pressure.

This is virtually the same series as Fustel's, but geared to the anthropological record and postulating the existence of a formless, sexually promiscuous "horde" as the primordial whole from which the family first emerged by subdivision.

As analytical devices, levels schemes strive to multiply units composed of the same basic substance. The driving force behind them is logical order, however, not descriptive accuracy. The horde, which Émile Durkheim recognized as a theoretical fiction, is a classic case of analytical postulation. Variations of Model 1.3 can be found in Durkheim, Henry Sumner Maine, and Herbert Spencer, all of whom saw segmental social organization giving way over time to territorial organization and the ramiform division of labor.

2.1 *Vill, hundred, shire, kingdom:* Anglo-Saxon England.

2.2 *Commune, canton, district, department:* post-Revolutionary France.

2.3 *Precinct, ward, municipality, county, state, federal government:* American federalism.

Juridical and administrative jurisdictions enclose one another in scope and authority while preserving the relative autonomy of the encapsulated units. Once in place, political parties (and other large-scale corporate groups) can align their units into the prevailing territorial structure. The Chinese Communist Party, for example, organized itself from center to periphery as follows: central committee, regional committee, district committee, and village-level party branch. The last was divided into five groups of cadre, each with its own leader, working in the local peasants' association, the women's association, and so on. One can hardly imagine social structure today in the absence of such intraorganizational relationships as diocese and parish, national headquarters and local chapter, and corporation and subsidiary. Nevertheless, social theorists treat territorial jurisdiction as a constitutional backdrop to social organization. They include it as a structural principle or resource, but concentrate on the inter- and intraorganizational dynamics allayed along its spine. Because political and administrative offices are implicated in hierarchies of caste, class, and estate, some analysts treat territorial unit structures as vehicles of social stratification.

2.4 *Domus* (household: headed by a *paterfamilias*), *vicus* (village: priest), *civitas* (city: bishop), *provincia* (district or principality: archbishop), *communitas totius orbis* (Christendom: Pope): The theocratic order of the *corpus mysticum Christi,* twelfth century.

While piggybacking off the territorial-administrative organization of feudal Europe, this ecclesiastic hierarchy overlays a temporal order with a spiritual one, for the purpose of controlling the former normatively. It represents a paradigm for levels schemes that terminate in an immaterial realm of forms or values that, in some fashion, guides or patterns the social series ascending toward or descending from it.

3.1 *Famille, college* (association of three or more persons of like status), *corps* (union of several *colleges*), *communauté* (local community), *république* (commonwealth): Jean Bodin, *Six livres de la République,* 1576.

3.2 *Familia, collegium* (unitary body or corporation), *civitas* (community), *provincia* (province, governed by an assembly of the estates), *republica* (sovereign state): Johannes Althusius, *Politica,* 1614. Mechanisms: contract and consent.

These are two mixed types of levels scheme. Although both rejoin the territorial scheme of the sovereign state, their heightened emphasis on voluntary associations anticipates the emergence of civil society. *Colleges* include guilds, trading associations, and synagogues, while *corps* amount to federations of such entities extending across provinces. Althusius occasionally proclaims that the supervening units spring from a social compact among delegates representing the units on the prior level.

4.1 *Role, collectivity, institution, society:* Parsons's (1959) "four levels of structural organization."

4.2 *Societal values, institutional patterns, collectivities, roles:* Johnson's (1985) "four levels of social structure."

This is the most widely adopted levels scheme in postwar American sociology. Many sociologists still equate macrosociology with the analysis of institutions, and define institutions as an implicate order of organizations, groups, and status positions such as lawyer and client. This scheme is significant in three respects. First, by making "social institutions" the penultimate level of social structure, it liberated structural analysis from the inclination to privilege either kinship or territorial unit structures. Intermediate levels of structure reside *within* institutions, and the number of levels depends on how authority is delegated in each one. Second, the relative equality of institutions differentiates social structure *horizontally* as well as vertically, evoking the image of a catalog of collectivities displayed in coordinate space. Third, the analytical primitive is a patterned set of social actions, a role, not something decomposable into persons. Since roles are comprised of norms, the entire series can be recast as a descending specification of immaterial forms or values, as Model 4.2 illustrates. Both models envelop the social series in a formative cultural one, following Parsons's cybernetic hierarchy of behavioral, personality, social, and cultural systems.

5.1 *Exchange relations, network structures* (sets of connected exchange relations), *groups* (network structures organized for collective action), *corporate groups* (hierarchies of groups incorporated in a division of labor): Cook and Emerson (1984).

5.2 *Social relationships, social networks, intraorganizational relations, interorganizational relations, societal stratification, the world system:* Prendergast and Knottnerus (1994).

In Model 5.1, network structures arise from power-balancing operations in exchange relations, groups from coalition formation in "negatively connected" exchange networks, and corporate groups from "productive exchange" in "positively connected" network structures, which centralizes power. The distinction between positive and negative connection has been shown by David Willer to be an artifact of experimental procedure. Without that interior scaffolding, Model 5.1 make cuts as qualitative as those in Model 5.2. The latter, a synthetic effort, begins broadly with social relationships, then veers toward political economy, in effect positing the polity and economy as primary institutions. Model 5.2 terminates in the open environment of the world system, rather than in a bounded totality called society.

Social structure has always been understood as a phenomenon of levels. The prevalence of levels talk in the history of social thought indicates the power of analysis to disarticulate, smooth out, and unify the domain of observations, interventions, and reflections on patterned social interaction called the theory of social structure.

Like any simplifying device, models of the levels of social structure can occlude as well as amplify perception. While the paradigm of the implicate order—the series of Chinese boxes of greater scale and inclusiveness—has had a long run, many doubt its applicability to the fluid processes of relationship-formation evident in society today. The most popular metaphor for the implicate order today, "nesting," suggests an untidy articulation, with significant overlaps between planes. In "messy and refractory" social structures, Harrison White argues in *Identity and Control* (1992), "[T]here is no tidy atom and embracing world, only complex striations, long strings reptating as in a polymer goo, or in a mineral before it hardens." White draws upon polymer chemistry for metaphors to describe the evolution of the units of social structure he calls disciplines, ties, institutions, and styles. While occasionally calling these "levels," White's main point is the obsolescence of the original, architectural metaphor of levels.

Fashioning alternative metaphors matters less to other critics than analyzing social structures as accomplishments of knowledgeable human agents who discover, implement, and legitimate structural principles of hierarchy, incorporation, and/or loose coupling. This subjective point of view has yet to open up the black box of actors' levels talk, or its derivatives in social theory.

LÉVI-STRAUSS, CLAUDE

Claude Gustave Lévi-Strauss (b. 1908) is the social anthropologist who introduced a new approach, called French structuralism, for the study of kinship, mythology, and art of aboriginal people. Besides anthropology, the new approach has impacted the other social sciences as well as literary, philosophical, linguistic disciplines and the field of comparative religion.

BIOGRAPHICAL AND INTELLECTUAL ITINERARY

Lévi-Strauss was born in Brussels, Belgium, to a French Jewish family as a son of an artist and intellectual. At the age of six he moved with his family to France, where he studied law and philosophy from 1927 to 1931 and frequented the philosophical circle of Jean-Paul Sartre and developed a strong sympathy for Marxism. He had also an extensive exposure to literature and music, both classic and contemporary. After receiving his "aggregation" (a predoctoral degree) in philosophy at the Sorbonne in 1931, he taught philosophy for two years in Secondary Schools

(Lyceums). In 1934, he went to teach sociology at the University of Saõ Pablo in Brazil, where he became interested in anthropology and made several expeditions among the tribal societies of Central Brazil. Military service took him back to France in 1939, and in 1941 he immigrated to the United States to teach as a visiting professor at the New School for Social Research in New York City until 1945; the influence of the structural linguist Roman Jakobson during this period marked a turning point in Lévi-Strauss's intellectual itinerary. After the war, Lévi-Strauss returned to France and become an associate director of the Anthropological Museum (Muse'e de l'Homme) in 1947 and the founder of the influential anthropological journal, *L'Homme.* In 1948, he published *La Vie Familiale et Sociale des Indiens Nambikwara (The Social Life of Nambikwara Indians*) and received a doctorate from the University of Paris. In 1949, he published the seminal work *Les Structures E'le'mentaires de la Parente'* that was republished in revised form in 1967. The work was eventually translated in English in 1969/1990 as *The Elementary Structures of Kinship* by J. H. Bell, J. R. Von Sturmer, and R. Needham, the latter a professor of anthropology at Oxford University and a frequent critic of Lévi-Strauss; the controversies that surrounded the translation of the work is an indication of the technical complexity of the work as well as the difficulty of accurately rendering the "structuralist" nuances of the French text, especially by scholars of different orientation.

In 1950, Lévi-Strauss became director of studies at the Ecole Pratique des Hautes Etudes (until 1974), and in 1952 his *Race et Histoire* was published by the UNESCO (the English translation *Race and History* was published in 1958). He founded the Laboratoire d'Anthropologie Sociale du Centre national de la Recherche Scientifique, de l'École des Hautes Etudes en Sciences Sociales et du Collège de France, which he directed for 25 years. In 1955, he gained wide recognition with his biographical account, the *Tristes Tropiques* (reissued in new French editions in 1973 and in 1984); in this work he explained the origins of his intellectual itinerary and shared his reflections on the humane qualities of aboriginal cultures, which are very tangible at a stage of rudimentary cultural development. The wide appeal of the book produced various English translations as *A Word on the Wane,* as *Tristes Tropiques,* as *Tristes Tropiques: Life in the Brazilian Jungles,* and as *Tristes Tropiques: An Anthropological Study of Primitive Societies in Brazil;* the book saw various reprints. In 1955, he puzzled anthropologists and folklorists with his essay, "The Structural Study of Myth" (see below), where he offered a novel explanation of the Oedipus myth based on his own interpretation and application of the structural linguistic approach of Jacobson and Troubetzkoy. In 1958, he published a collection of essays that was translated in 1963 as *Structural Anthropology,* where he explains his own brand of structuralism, and

especially his notion of structure and structural methodology. In 1959, he was appointed to the prestigious chair of social anthropology at the College de France, where he taught until 1982. In 1962m he continued to revolutionize the field of anthropology with *La Pensée Sauvage* (translated as *The Savage Mind* in 1966 and revised in the French edition in 1968) and *Totémisme Aujourd'hui* (*Totemism*) showing among other things the rigorous and classificatory nature of the concrete logic of aboriginal people. Lévi-Strauss forays into the concrete logic of aboriginal mind culminated in the four volumes of *Mythologiques* (*Introduction to a Science of Mythology*): *Le Cru et le Cuit* (1964, translated as *The Raw and the Cooked*), *Du Miel aux Cendres* (1967, translated as *From Honey to Ashes*), *L'Origine des Manières de Table* (1968, translated as *The Origin of Table Manners*), and *L'Homme Nu* (1971, translated as *The Naked Man*). In this impressive corpus, Lévi-Strauss shows that underlying a great variety of mythological narratives one can identify recurring logical structures that deal with existential issues common to Northern and Southern American Aborigines. In 1973, a second volume of *Anthropologie Structurale* (*Structural Anthropology*) appeared in French containing theoretical and methodological essays as well as essays on mythology, ritual, and humanities; in the same year he was elected to the Academie Francaise. In the two volumes of *La Voie des Masques* (1975, reissued in a revised French edition in 1979 and translated as *The Way of the Masks*), Lévi-Strauss dealt with the art, mythology, and religion of the Northwest Coast Indians. In 1983, he published a collection of essays, *Le Regard E'loigné* (translated as *The View from Afar*), and in 1985 *La Potière Jalousie* (translated as *"The Jealous Potter,* University of Chicago 1988); in the latter book, Lévi-Strauss shows similarities and equivalences in Northern and Southern American Indian myths that deal with themes of marital jealousy, pottery, and origin stories. *Histoire de Lynx* (published in 1991 and translated as *Story of Lynx*) shows how stories of the conflict between the Coyote and Lynx elucidate the role of twins in Amerindian mythology; oppositional dualities of social life are resolved through dualistic processes that underlie origin myths. *Regarder Ecouter Lire* (published in 1993 and translated as *Look, Listen, Read*) is a set of essays on French art, music, and literature and deals with the role of art in Western society. Lévi-Strauss has also published various lectures, interviews (one in 2000), and essays, some of which in cooperation with others. His continuing intellectual vitality is demonstrated by the recently translated essay, "Hourglass Configurations," where he shows that hourglass configurations in shrines and roof frames represent forms of the universe (earth and heaven) that are similar in details in the Far East as well as in America; hence, symbolic transformations are at work not only in mythology but also in architecture. He is currently listed in the Laboratoire de Anthropologie Sociale as honorary professor at the Collège de France, as

honorary director at l'École des Hautes Études en Sciences Sociales, and l'École Pratique des Hautes Études, as well as a member of the French Academy.

ON DEEP STRUCTURE AND STRUCTURAL METHODOLOGY

One of Lévi-Strauss's central contentions is that since both language and mythology are expressions of the human mind, linguistics can provide a methodology to understand the rules according to which mind structures culture.

From the linguists Ferdinand de Saussure, Roman Jakobson, and Nikolai S.Troubetzkoy, Lévi-Strauss took the notion that the meaning of linguistic units is not intrinsic to each unit but derives from the relationships of similarities and differences among their constituent elements. Language is not just an aggregate of elements, but a structured totality governed by its own internal laws; the "structure" of the language does not refer to empirically observable linguistic patterns but to the functional relationships among their constitutive "elements." It follows that the structure of culture is the principle (or logical model) that accounts for the apparently heterogeneous content of culture; however, structure is not a "form" independent of the content but the content itself apprehended at the level of its logical organization (hence, logical structures are real structures). By focusing on the logic underlying the variety of observable cultural systems, one can see underlying structural similarities, differences, and variations among a variety of sociocultural systems; the rules of transformations of one phenomenon into another or the syntax of their transformations constitutes a second order level of structure (Rossi 1974:90). Underlying structures operate at the subempirical level insofar as they consist of relational similarities or differences among the elementary components of the data. The key issue is, then, what kind of methodology is suited for determining the elementary units of cultural data. We know that the starting methodological point for Lévi-Strauss was linguistics. The large number of words present in any language is based on the combination of a few phonemes—phonemes being the smallest segment of sound by which a native speaker can distinguish one word (meaning) from another: in English, *b* and *p* are two phonemes and *bet, pet* are two different words, so *big/pig* and so on). In 1930, Jakobson and Nikolai S. Trubetzkoy showed that the "distinctive features" of phonemes (such as vowels, consonants, and others) are organized in "bundles" of oppositions, like the above example *b* and *p;* it is not sounds as such but the structured combinations of a small number of "distinctive features" of sounds that are the phonological basis of language. Noam Chomsky has argued that there exists a number of complicated rules that govern the formation of phonemic patterns. By analogy (since the issue of the linguistic accuracy of French structuralism is besides

the point) Lévi-Strauss hypothesizes that a myth can be broken down in constituent units (mythemes); the key to understand the overall meaning of the myth is to uncover the way mythemes are organized or relate to each other; the mytheme is the shortest meaningful sentence of the mythological narrative. Through trial and error and intuitive analysis, Lévi-Strauss identifies in the Oedipus myth episodes that overstress family relations (Oedipus marries his mother, Cadmos seeks his sister); he places these elements in column *a*. Lévi-Strauss also detects episodes that underrate family relations (Oedipus kills his father, Eteocles kills his brother); he places these elements in column *b*. Lévi-Strauss also finds episodes describing the killing of monsters that seem to suggest the denial of the mythological origin of humans from underground; these elements are placed in column *c*. Finally, Lévi-Strauss detects names like Labdacos, Laios, and Oedipus that appear to indicate difficulties in standing upright and walking straight, which seems to suggest a mythological origin of humans from the underground; these elements are place in column *d*. The items located in the four columns make sense only when they are considered in relationship to each other: As in social life, both the overstressing (column *a*) and the underrating of family relationships (column *b*) occur, so both mythological knowledge (humans are born from One, the underground—column *c*) and empirical knowledge (humans are born from two people—column *d*) can co-occur. The logical structure of the myth that appears confusing at the level of the surface content of each column becomes very clear when we focus on the relationships of similarity and difference among the four columns: *a* is to *b* as *c* is to *d*. Social life validates cosmology by the similarity of logical structure, that is, by being self-contradictory in a similar way. If Lévi-Strauss is right, the Oedipus myth is an intellectual device for reconciling contradictions and dilemmas in human experience. The humans that are born from an incest are born from one person (from a woman), since cultural rules prohibit incestual relations. But they are also born from two people, a man and a woman, according to biology and empirical knowledge. Isn't this an elegant solution to the (apparently) problematic relationship between science and religion? The burden of disproof of this kind of analysis rests with Lévi-Strauss's opponents, who must show that different logical analyses produce more parsimonious explanations of the myth. One opposition seems to be truly irreconcilable: structural analysis that searches for logical (and real) structures versus empirico-experimental methodology that is anchored on verifiability criteria of knowledge, and hence, is limited to the study of empirically observable structures. Can the latter methodology ever deal with the deep structural meaning of cultural systems? On what verifiable basis can empirical methodology deny the plausibility of a deep structuring of cultural systems after claiming to have identified marvelous structural

laws in the cosmic and biological realms at the atomic and subatomic level?

LÉVI-STRAUSS AND SOCIOLOGY

Levi-Strauss's fascination with deep structures and cultural codes has found some pioneer echoes in sociology through essays by Terry N. Clark, S. N. Eisenstadt, M. Godelier, Charles Lemert, Fred E. Katz, Talcott Parsons, and Arthur L. Stinchombe, among others (see Rossi 1982). Notwithstanding a renewed interest in the sociology of culture, no visible substantive work in sociology has followed this early effort, not even after a dialecticized development of the structural mode of analysis (Rossi 1983, 1993). One is hard pressed to find Lévi-Straussean traces in American sociological analyses, outside of passing references in treatises on the history of sociology and in graduate syllabi on sociological theory. Lévi-Strauss continues to be listed as a representative figure in the tradition of Émile Durkheim and Marcel Mauss that focused on collective representations and their classificatory functions. In American sociology, Lévi-Strauss is usually portrayed as interested in the cognitive aspects and deep meaning (logical structure) that underlie the overt content of symbolic systems. The prevailing trend in American sociology is to focus on the behavioral aspects of social relationships and even on nonrational aspects of culture. However, the scope of this mode of inquiry is severely limited by the stringencies of "quasiscientific" methodology. Will the inner logic of culture (and of the human agency) ever become part of sociological inquiry if the latter remains anchored on these epistemological foundations?

LIBERAL FEMINISM

Rooted in the humanism of the Renaissance and the person-centered, rights-oriented liberalism that emerged in Western thought during the Enlightenment, liberal feminism first found widespread expression during the nineteenth century in Western societies. Liberal feminism is that strand of women-centered ideas and practices focusing on achieving equal rights between female and male citizens as well as equal opportunities and outcomes for similarly situated females and males while deemphasizing the cognitive and psychological differences between females and males. This strand of feminist theory is the most widely known. Neither separatist nor radical, liberal feminism is fundamentally and sometimes passionately reformist. Liberal feminists work within the system. To what extent they identify with the institutional order and in what ways they work for social change within it are matters that differentiate one grouping of liberal feminists from another.

What puts them together on the same broad part of the political spectrum is their feminist articulation of classically liberal notions. Over the past several centuries, liberalism, with its emphasis on political freedom and citizens' rights, became politically foundational in as well as an antecedent condition of modern Western democracies. Becoming hegemonic during the nineteenth century as a centrist ideology, with socialism to its left and conservatism to its right (Wallerstein 1995:1), liberalism was likely a necessary condition for the first-wave feminism that eventually gained Western women the franchise. Among the latent functions of that first wave of feminism was that it made liberal feminism a more or less given ingredient of modern society (Frazer 1998:52).

Characteristically, even in its liberal versions, feminism has consistently criticized the Enlightenment values giving rise to it. Liberalism may have been a necessary condition for the emergence of a viable women's movement, but it was far from sufficient. The very values that liberals propounded were able to gain popular support in part by ignoring issues of gender injustice as well as racial and other forms of institutionalized inequality. The various rights guaranteed to white male citizens were monolithically withheld from their female counterparts as well as their male nonwhite counterparts. From the start, then, feminism was both enabled and constrained by liberal discourses.

Even today, liberal feminism continues to exhibit an ambivalent relationship with the liberalism that helped to spawn it.

All the while, its core assumptions do remain discernibly liberal. Foremost among them are assumptions about the primacy of the individual, generally articulated in one version or another of individualism; the separation (and thus the separability) of the public and private spheres and of the political and social spheres; the rationality of the self-interested, free-willed citizen; and rights protected impartially under the law and legal processes. From a liberal feminist perspective, what these assumptions amount to are male-centered, male-advantaging precepts that need to be reformed in egalitarian directions so as to have really fair systems. The notion of the individual cannot fairly be bereft of the possibility of pregnancy and birthing any more than it can be bereft of some notion of the common good or the person as a community member; the notion of a private sphere reliably and clearly separable from the public sphere must be chastened so as to enable governments to redress the kinds of violence and abuse that occur in intimate relationships, whether family- and household-based or not; the notion of rationality cannot be gender-inclusive without leaving some room for an ethic of care and practices of caregiving alongside concepts of self-interest and personal autonomy; to a substantial extent the law must be seen as a social institution with historically and culturally specific flaws that have to be remediated in order to promote gender equality and justice.

Similarly problematic are liberal presuppositions that, left uncritically accepted, largely operate against women's collective interests. Paramount among these is the presuppositions of hierarchy, which in turn presupposes an unequal distribution of rewards such as income, honor, and power. In a gender-unjust society, liberal feminists accept these presuppositions, just as they accept the aforementioned assumptions. Yet their acceptance rests on a critical, at times ambivalent, consciousness that in turn fuels their commitment to reformist changes that will make the hierarchies less androcentric and the distribution of rewards less biased in favor of males. Thus, liberal feminists withhold their full support from ideas such as meritocracy while working for social changes that more or less guarantee equality of opportunities and outcomes between women and men. Put differently, liberal feminists largely accept the status quo *except for its gender-biased practices and structures.* Instead of attacking or even rejecting the notion of hierarchy or inequality of outcomes, then, liberal feminists critique the observable gender biases of extant hierarchies and the gender-unequal distribution of opportunities and rewards.

Liberal feminists thus have no fundamental quarrel with well-established liberal notions. Their dissatisfaction lies with the gender biases in the social arrangements of those societies that are supposed to function as liberal democracies. To that extent, liberal feminists have been the main proponents of such notions as equal pay for equal work, equal standards for admission to postsecondary education, equal funding of females' and males' athletics in schools, and equality of opportunities for jobs, promotions, and benefits, including pensions and other retirement perquisites.

Among feminist theorists, liberal stances are common, if not predominant, in the Northern Hemisphere. Throughout feminist theory, the conceptual and axiological scaffolding of liberalism is widely operative, albeit in reworked terms with different twists. Barrie Thorne's *Gender Play: Girls and Boys at School* (1993) or Martha Nussbaum's *Women and Human Development* (2001), for example, are illustrative. As Mary F. Rogers (2001) pointed out elsewhere with respect to other studies, such works challenge "some fine print on the social contract, not its fundamental terms." Social theory, with its tradition of social critique, readily accommodates such theorizing. Ultimately, liberal feminist theory serves as a corrective to the gendered character of social theory by counteracting its masculinist underpinnings without insistently challenging its heterosexism, ethnocentrism, or class biases. For the most part, liberal feminist theory tends to reflect the outlook of relatively privileged women from European cultural and political traditions, and thus fails to contest social theory at its roots, even while counteracting its gender biases. Put differently, those feminists who identify themselves along more than one axis of oppression appear to be underrepresented among liberal feminist theorists, where heterosexual, middle-class, white-skin, and able-bodied privilege are more or less taken for granted.

Yet liberal feminist theory is far from uniform. Its theoretical variegations lie along a *liberal continuum* built up around *more* or *less* acceptance of institutionalized hierarchies other than the gender. As Zillah Eisenstein (1981) implies, a liberal feminist continuum includes at least three sets of theorists, namely, *radical liberal* theorists and *status quo liberal* theorists with *progressive liberal* feminist theorists in the middle. To some degree, all these theorists presuppose or even apply liberal notions of "freedom of choice, individualism, and equality of opportunity" while disagreeing about the racial, class, and other biases that they entail (Eisenstein 1981:229). Thorne's and Nussbaum's aforementioned works lie on the middle ground of the liberal continuum, with Nussbaum more firmly positioned among status quo liberal feminists insofar as she explicitly, though not uncritically, invokes universalist values.

Yet full-fledged status quo liberal feminists go much further than that, with the end result that their work gets little attention within feminist theory. Camille Paglia's *Vamps & Tramps* (1994), Elizabeth Fox-Genovese's *Feminism Is Not the Story of My Life* (1996), and Joan

Mandle's *Can We Wear Our Pearls and Still Be Feminists?* (2000) exemplify such theorizing. None of these theorists pays sympathetic attention to lesbians, straight women of color, or any other grouping of women disadvantaged by more than gender. The vocabulary of oppression and domination has no place at this end of the liberal continuum.

At the radical liberal end of the continuum stand those feminist theorists who insist that feminism must be about a great deal more than gender because women make up substantial proportions of nearly every subordinate group in society except prison inmates. What might be called *race-class-and-gender feminists* occupy this part of the continuum. These theorists may address sexuality, age, disability, or other hierarchies, but their main focus is the intersections among race, social class, and gender. Perhaps exemplifying this part of the continuum is Patricia Hill Collins whose work revolves around theorizing an everyday *politics of empowerment* based on resistance to the stereotypes and constraints that African American women, in particular, face. Of late, says Collins (1998), these stereotypes and constraints amount to a *politics of containment* based on less overt, surveillance-driven modes of controlling African American women, whether they be mothers on welfare or professors in academe. Collins (1998:34, 35) also sees racism, mixed with sexism and classism, in current moves toward privatization in the United States as so-called market forces are alleged to be more responsible than policymakers and corporate executives for persistent inequality. With the public sphere more and more functioning as a site of subordination and surveillance, Collins (1998:228, 153) calls for a reoriented and visionary pragmatism as well as critical attention to how oppressive hierarchies are continuously constructed in tandem with one another.

Her focus on the interconnected character of social hierarchies is a hallmark of Collins's work. That concern could move her beyond the liberal continuum, but for the most part it does not. Despite her recurrent attention to social class, sexual orientation, and women of color other than African Americans, Collins does center her framework on African American women and thus around a racially specific grouping of women. That circumstance, plus her failure to challenge hierarchy generically, leaves Collins positioned on the liberal continuum, albeit at its left end.

Most liberal feminist theory lies somewhere between the relative extremes exhibited by sociologists Patricia Hill Collins and Joan Mandle. Regardless of where we look on the liberal feminism continuum, though, challenges to that hegemonic variety of feminist theory abound. These challenges have taken most dramatic shape around postmodernism as an anti-Enlightenment perspective. Further challenges lie with multicultural and postcolonial feminist theorists demanding attention (postmodernist or not) to racial/ethnic and other hierarchies historically created by internal as well as global colonialism. Here works such as

Gayatri Chakravorty Spivak's *A Critique of Postcolonial Reason* (1999) are pivotal. Then, too, theorizing from lesbian (Judith Butler, for example) and psychoanalytic (Jessica Benjamin, for example) perspectives challenges liberal feminist theory. Considered from the vantage point of liberal feminism, these other strands of feminism represent more or less oppositional discourses where liberal feminism represents little more than a critical discourse.

One concern linking these various challenges to liberal feminist theory is their rendering the public/private binary problematic, sometimes problematic enough to warrant discarding the distinction. Carole Pateman (1979) offers one of the most influential, rigorous critiques of this binary. She emphasizes how liberal theorists routinely invoke the "state" in uncritical, taken-for-granted fashion. On that basis, they typically juxtapose the state as an impartial, objective arena anchoring political life with the private sphere as an emotional, subjective arena. Pateman (1979:173) argues that if the political is conceptualized as more than a state-centered arena, the divide between the political and the private spheres dissolves. With it goes the closely related division between the public and the private spheres. Barbara Marshall (1994:9, 10) implies that both binaries function to establish conceptual boundaries around the nation-state and that neither holds up well in the larger problematic concerning the relationship between individuals and their society.

This latter relationship is the generic concern that inspires a great deal of postcolonial as well as lesbian feminist theorizing. Perhaps no other theorist has covered as many bases and carved out a more complex opposition to liberal feminist theory as Shane Phelan, who writes foremostly but far from entirely from a lesbian feminist perspective. The opening sentence of Phelan's first book reads, "Lesbian feminism began with and has fueled itself by the rejection of liberalism." (1989:3) Thereafter, Phelan positions herself among the many contemporary as well as historical thinkers—Hobbes, Rousseau, Hegel, Marx, Nietzsche—whose work is marked as much by their rejection of liberalism as anything else. Like postmodernists and social constructionists, Phelan (1989:4) notes how law and public policy cannot get to the grounds of the institutional order or social life because neither focuses on discourses or language. Worse, liberalism fails to provide any standards, any grounds for articulating the common good, any values capable of illuminating oppression. Its seemingly "neutral rules flow from the denial that a common good beyond the sum of individual desires exists." (Phelan 1989:17) Before long, Phelan (1989:17–18, 20ff.) links liberalism with positivism as systems of thought supposedly promoting impartiality and objectivity.

All of this is more or less standard fare among critics of liberalism. In *Getting Specific* (1994), Phelan adopts a more pointedly postmodernist voice intertwined with her lesbian

feminist one. There she rejects dualistic thinking in favor of an emphasis on liminality, where the boundaries between categories are fluid and unclear. Rejecting the "bait of identity," Phelan emphasizes persons' multiple embodied identities and social positions that often entangle them in contradictions that can become the basis of alliances across their supposed differences. Within this framework, the private and the public spheres bleed into one another as outcomes of the discursive systems and institutionalized hierarchies implied in Pateman's critique. The "private" becomes a sociopolitical fiction that stymies common action and shared commitments while failing to promote citizens' development and well-being.

Yet Phelan does not entirely reject the private/public distinction. Her theorizing is more radical than that. Explicitly in her earlier work and implicitly in her later work, she abjures any wholesale rejection of theories that distinguish between the public and the private realms. (1989:47) Indeed, she (1989:156) holds that the greatest weakness of liberal theory is the kind of agent it presupposes, namely, "the reasonable, liberal man." In the end, then, Phelan (1989:139, 155) says that we must "rethink" the public/private distinction and that we need to retain the "liberal *sentiment*" that whets our civic appetites for all the uncertainties and conflicts characteristic of public life in democratic societies.

Phelan's position reminds us that at its best, critical social theory forswears easy judgments and either/or thinking. So, too, with feminist theory. At its best, it is neither liberal nor radical, neither modernist nor postmodernist, neither psychoanalytic nor Marxian in straightforward, unadulterated ways. Instead, it is variegated to the extent needed to address whatever social complexities and ethical perplexities its promulgators have adopted as their focus. The limitations of liberal feminism hold these and many more lessons that continue to stimulate feminist progress, both within and beyond the academy.

LIFEWORLD

The lifeworld, or the world of everyday life and commonsense realities, is a concept that comes from the work of phenomenologist Edmund Husserl (1859–1938), and has been developed for sociology by the phenomenological sociologist Alfred Schütz (1899–1959). Schütz was concerned with the domain (the world of everyday life, the commonsense world) in which individuals grapple with the consciousness of others while living in their own stream of consciousness. The lifeworld to Schütz represented an intersubjective terrain in which people both created their social realities and were simultaneously constrained by those social and cultural structures already in place. It was in existence long before our birth, but we do have the power to act back upon it. Furthermore, each of us has our own individual lifeworld, although many of the same elements are common to all actors.

In this domain, people operate with what he calls the "natural attitude." That is, they take the world around them for granted. They do not doubt its reality or existence until such time as a problematic situation arises. It is only then that they cease to rely on "recipes" for handling routine situations and must develop creative ways of handling the problems they encounter.

There are six basic characteristics of the lifeworld. First, it involves what Schütz labeled as "wide-awakeness" (1973:213), or the state of consciousness during which actors devote all of their resources and attention to living life. Second, the actors accept without question the existence of the lifeworld. Third, and most important to Schütz's definition of what characterizes the lifeworld, actors do work. Work here is considered any nonphenomenological action taken by the actor with the intent of causing something to happen by virtue of that action. Fourth, the self understood through the work one does comes to be experienced as the total self. Fifth, the lifeworld involves

social actions and interactions that occur in the shared world of communication and social action. Sixth, the timelines of actors intersect with the overarching timeline of society.

Another important social theorist concerned with the concept of the lifeworld is Jürgen Habermas (b. 1929). Although Habermas is focally concerned with free and open communication and communicative action more generally, he has also contributed greatly to the concept of the lifeworld. Habermas contrasts the lifeworld, seen as the world from the perspective of the subject acting within it, with the system, or the world from the perspective of an uninvolved observer. Although two different concepts, Habermas does contend that there is only one society, and that the system and the lifeworld are simply different ways of looking at that singular society.

The lifeworld is where speaker and hearer meet (Habermas is especially interested in communication) and where it is possible for them to reach agreement or understanding. There is a wide range of unspoken presuppositions and mutual understandings that must exist and be mutually understood for such communication to take place.

A major concern for Habermas is what he termed "the colonization of the life-world" (1987). This implies that the system and its (formally) rationalized imperatives are increasingly coming to dominate and do violence to the lifeworld. This "violence" against the lifeworld by the system is most clearly evident in the ways in which communication is restricted and increasingly less directed toward a goal of consensus. In turn, this violence also produces a series of "pathologies" and crises within the lifeworld that cause serious social problems.

The goal of the future, according to Habermas, should be a world in which the system and the lifeworld are able to enrich one another (are recoupled) and neither is dominated by the other. The two ways of looking at society need once again, as they were in primitive society, to become intertwined. The easiest way of achieving this goal is promoting more free and open communication and resisting the increasing rationalization forced upon the lifeworld by the system. This action has already been undertaken by many social movements that arose at the borders between the system and the lifeworld. Habermas also suggests implementing "restraining barriers" that restrict the effects of the system on the lifeworld and "sensors," which would enhance the effects of the lifeworld back on the system. Although he doubts the possibility of saving the lifeworld in the United States, Habermas does hope that Europe has the possibility of creating a world in which both lifeworld and system are able to coexist without doing violence to one another.

LINDENBERG, SIEGWART

Siegwart Michael Lindenberg was born in Munich in 1941 and educated in both Germany and the United States, receiving an MA in sociology from the Mannheim School of Economics in 1966 and a PhD in sociology from Harvard in 1971. His first faculty position was assistant professor of sociology at Princeton from 1969 to 1973. He then moved to Groningen University, where he is currently professor of sociology. While at Groningen University, he cofounded and codirected the Interuniversity Center for Social Science theory and Methodology (ICS), a major research graduate education center focusing on developing and extending formal social theory, and making that theory relevant to public policy issues.

The range of Lindenberg's work is broad, including macro-social analyses of revolts and social revolutions, the role of the state in structuring market economies, determinants of group solidarity, and female labor market participation. It also includes organizational-level analyses of cooperation and conflict in contractual relationships, governance of employment relationships, and contributions to the new institutional economics. Finally, it includes microsocial-level analyses of preferences and preference formation, selective attention, and short- versus long-term rationality. Despite the diversity of these topics, Lindenberg's body of work is based on a tightly integrated theoretic core, and thereby demonstrates the broad scope of this body of theory. The key ingredients of this core are a theory of bounded rationality (Lindenberg 2001a) and a theory of interdependencies and groups (Lindenberg 1997). There is only room to present the former in limited detail.

His analyses depart from the core assumption of behavior as goal-oriented activity, an orientation that places him within the theoretic domain of rational choice. He fleshes out this conception in ways that represent a stark departure from the rational maximizing models of neoclassical economics. A consistent theme running through all of Lindenberg's work is the challenge of reconciling rigor with realism. That is, how to construct models simple enough to remain analytically tractable while not being so unrealistic as to be trivial. To provide guidance in striking an appropriate balance, he introduced what he terms the "method of decreasing abstraction" (Lindenberg 1992a), a

theory construction principle that underlies much of his work. This principle is based on two insights. First, it is incorrect to merely dismiss the economist's conception of rationality as incorrect, because there are identifiable contexts within which it fits quite well, including some of the traditional explanatory domains of economics and even some areas of traditional concern to sociologists. Instead, analyses should identify the contexts in which these simpler, unbounded, conceptions of rationality are appropriate (e.g., generally conditions where information is abundantly available and motives are instrumental) versus contexts in which they break down and more complex bounded concepts of rationality are needed. Second, he emphasizes the need to do more than merely contrast the (generally) unrealistic instrumentally oriented economic view of social actors with an equally (generally but not always) unrealistic stereotype of social actors as oversocialized creatures who absorb their beliefs and preferences from those around them. Instead, he proposes a sequential form of analysis in which simple rational maximizing approaches are the models of first resort. They are given this position of priority because of their superior tractability. If they fail to provide an adequate explanation, as can generally be expected to be the case, the analyst does not then switch to an oversocialized view of actors, but instead draws from a hierarchically arranged menu of options for making the model both more complex and more realistic. In essence, this menu involves fleshing out the vague conception of bounded rationality propounded by Herbert Simon, based on specific mechanisms by which rationality departs from simple optimizing. It is in identifying these mechanisms that Lindenberg made his contributions to microsocial analysis, and it is in applying these principles to larger-scale phenomena that he has made important contributions to organizational and macrosocial analysis. Having these fleshed-out conceptions of bounded rationality also allows one to judge how bounded even the simplest model must be in any particular analysis (using what he calls "the principle of sufficient complexity"; see Lindenberg 2001a).

One mechanism identified by Lindenberg as underlying bounded rationality is selective attention, for which he proposed a theory of "framing" (2001a). Though the theory defies brief exposition, the essential idea is that the multiple goals that could potentially govern behavior compete for control. For example, goals such as earning money, enjoying leisure, helping friends, and fulfilling religious ideals may offer conflicting guides to action. The goal that wins this contest moves to the foreground and thereby determines the frame-governing action, including determining what aspects of the situation are relevant (i.e., selective attention) and what pieces of knowledge become mobilized. As a result, the orientation of action is self-seeking or altruistic, cooperative or competitive. However, the subordinate goals do not wholly lose influence, for depending on their weight relative to the dominant goal, the subordinate goals influence the selection of alternatives, thereby skewing choices in a predictable way from exclusive pursuit of the dominant goal to the direction of the subordinate goals.

This theory of framing has been tested in a variety of contexts, and also provides the basis for analyzing other aspects of bounded rationality, including orientations toward short- or long-term rationality, which is treated as determined by whether the contest to control framing is won by long- or short-term-oriented goals. Of particular interest are three "master frames," that is, abstract dominant goals. The strongest such frame is the *hedonic* frame (with the goal "to feel good/better"), followed in strength by the *gain* frame (with the goal "to improve one's scarce resources"). The a priori weakest frame is the *normative* frame (with the goal "to act appropriately"). A stronger frame will displace an a priori weaker frame unless the latter is supported by social, structural, or institutional flanking arrangement. This allows a new look at institutional analysis (see Lindenberg 1992b). This theory of framing also provided the basis for a more nuanced theory of intrinsic motivation than that which has dominated the social psychological literature (Lindenberg 2001b).

A second basic mechanism upon which Lindenberg focuses is preference formation and change (the so-called theory of social production functions, SPF; see Lindenberg 2001a). Like many of Lindenberg's theories, this takes the form of a hierarchy, in which each level represents resources for higher level goals. The highest-level *substantive* goals are universal, including preferences for subjective, physical, and social well-being. These resemble Gary Becker's concept of general preferences, which are also seen as part of the human condition. Below the highest-level goals are levels of (socially determined) instrumental goals, the most important of which are multifunctional (for example, they serve both physical and social well-being, such as a good partner relationship). Individuals are assumed to seek "improvement" in goal realization rather than "maximization," which renders social reference points essential for goal pursuit. For this reason and because of the socially determined instrumental goals, most preferences are grounded socially rather than psychologically, changing with social conditions. In fact, his theory of bounded rationality can be seen as a theory of "social" rationality (as opposed to "natural" rationality). Though as presented in this manner, Lindenberg's approach to preference change may appear excessively abstract, its applicability to explain macrosocial phenomena is nicely illustrated by the explanation it and his theory of framing provide of revolts and social revolutions (Lindenberg 1989). The basis for revolution, he argues, is created by a state crisis—generally including a fiscal crisis—in which the social production functions are changed to the detriment of multiple groups,

eventually producing a shift of frame. Revolution then becomes, at first, not the product of collective action organized at the group level, but instead, parallel sets of individual collective actions, thereby explaining how revolutions can appear centrally coordinated in the absence of unified leadership or control. In this way, Lindenberg offers a theoretic account of macrolevel social change that is grounded in microlevel social action and cognitive processes, combining action and structure within the one theoretic account.

LOGOCENTRISM

The term *logocentrism* is derived from the Greek word *logos,* which means word, speech, or reason. The term most commonly refers to philosophy's relentless search to find true meaning within the realm of theory and ideas. Concomitant with this search is a disdain for the material world of practice. Synonymous with logocentrism is phonocentrism (the favoring of speech over writing) and the metaphysics of presence (the belief in a reliable, apparent relationship between signifier and signified). The French thinker Jacques Derrida (b. 1930) (along with his deconstructionist followers) developed the concept of logocentrism in an effort to critique, relativize, and contextualize Western philosophy.

One of the main features of the structuralist approach to society and philosophy, as advocated by thinkers such as Claude Lévi-Strauss (b. 1908) and Ferdinand de Saussure (1857–1913), is the discovery of binary oppositions that organize life and how we understand it. Examples of this are reason/superstition, order/chaos, male/female, and so forth. In each one of these binaries, one term is dominant over the other, adding a hierarchical dimension to the structuralist approach. This privileging of one term over the other is another way in which logocentrism is understood.

Logocentrism is not only the privileging of one idea or social category over another but also the favoring of one word over another word, which may imply the favoring of one kind of reasoning or argumentation over another. The structuralists, along with the rest of philosophy and science since Plato, have distanced their writings from literature by claiming to place an authoritative meaning behind the language they use. Reading science or philosophy then becomes theological in the sense that we are constantly in search of what the author "really meant." Given the ambiguities that exist when a reader independently interprets a text, philosophy has always favored speech over the written word, viewing the latter as an unfortunate necessity. In a lecture, for example, one can seemingly explain, field questions, and clarify with ease. Philosophy has always operated in the binary hierarchy of speech over writing but has never realized that both are equally subject to the whims and limitations of language. Meaning can never be truly and reliably expressed if one plays with language (whether spoken or written) enough. This deconstructs yet another binary that has always been assumed as true, namely, meaning over language. Inextricably linked with logocentrism, Derrida calls this disdain for the written word and favoring of the speech act phonocentrism.

Logocentrism implies that the binary oppositions that organize our lives are reliable and descriptive of how things really are. For example, consider the West/East dichotomy. The West has often been associated with progress, science, reason, and culture, while the East is often characterized as backward, mystical, superstitious, and natural. This method of understanding the world has been called the metaphysics of presence. In other words, some form of putatively pure presence (e.g., speech or the male genitalia) is assumed to be superior to its purported binary opposite (e.g., writing or the female sex organs). According to deconstructionists, this metaphysics has always been the basis of philosophical

and scientific thinking. While this mode of thought provides a very easy way to process and view the world, it never adequately describes the complexities of society, and it arbitrarily constructs oppressive hierarchies.

The metaphysics of presence can also be criticized on an even deeper level. If one says, "I exist, here and now," one vocally affirms one's presence. However, there is a minuscule period of time between the thought and its utterance. Therefore, words (signifiers) can never really be descriptive of any particular present (signified). We assume the two different presents as one for sanity's sake, but this is indicative of our desire for coherent and reliable descriptions that can sometimes lead us astray, as exhibited in the West/East example. It is for these reasons that the poststructuralists such as Derrida have aimed to deconstruct and displace the metaphysics of presence, realizing its arbitrary, limited, and oppressive nature.

The exposure of the logocentric nature of philosophy not only reveals the favoring of meaning over language, presence over absence, and speech over writing but also a slew of other hierarchical binary oppositions. Derrida aims to upset these hierarchical relationships by showing that each term is equally necessary, rendering the binary questionable for any descriptive or epistemological purposes. In his view, the two terms of a binary opposition define themselves against each other (which he calls supplementarity), and any hierarchy is therefore merely arbitrary. Derrida favors language, writing, the absent, the empty, punning, metaphor, and wordplay over the absolutism of philosophy in its attempts to discover and describe things like reason, progress, and spirit.

The concepts of logocentrism, phonocentrism, and the metaphysics of presence have all only recently been developed, as the poststructuralist school of thought needed a vocabulary to describe the conditions it sought to critique. However, these terms are subject to the same metaphysics they aim to deconstruct; they too are mere words, subject to the frivolity of language, which can never really adequately describe or represent a true reality. Thinkers like Derrida are aware of this, though. The exposure and deconstruction of logocentrism is not meant to be another grand "end all" narrative of philosophy. It simply aims to heighten our awareness of the world and the methods we use to understand and describe it.

LORDE, AUDRE

Poet, social critic, activist, teacher, and warrior are some of the words that have been used to describe Audre Lorde (1934–1992). Born in New York City to West Indian parents, Lorde's ideas have become crucial to feminist theory and women's studies. As an African American, lesbian feminist, Lorde was marginalized in a variety of communities. Thus, she spent her life fighting against marginalization and the practices that silence marginal voices.

Lorde attended Hunter College from 1951 to 1959, where she majored in literature and philosophy. She earned her master's degree in library science from Columbia University. In 1968, she left her position as head librarian at the University of New York to accept the position as poet-in-residence at Tougaloo College in Mississippi. There, she published her first volume of poetry, *The First Cities.* Later in her career, she held the post of Thomas Hunter Chair of Literature at Hunter College.

Along with her poetry, Lorde wrote much about the sexism in mainstream white culture, African American culture, and in feminist and lesbian movements. Her prose emphasized the importance of stronger voices for black women in general, and all marginalized groups in particular. Lorde cofounded Kitchen Table: Women of Color Press with Barbara Smith, which explicitly focused on publishing works by women of color. She organized the Sisterhood in Support of Sisters in South Africa, established the St. Croix Women's Coalition, and helped to build coalitions between Afro-German and Afro-Dutch women. Lorde was married for eight years and had two children, Elizabeth and Jonathon. She died in 1992 of breast cancer. Shortly before her death, she took the name Gambda Adisa, Warrior: She Who Makes Her Meaning Known, in an African naming ceremony. When she died, she was living in St Croix, Virgin Islands, with her life partner. Over her lifetime, she had won many honors and awards, and since that time she has had literary awards and activist organizations named in her honor.

One can best become acquainted with the themes in Lorde's work through her biomythography, *Zami: A New Spelling of My Name* (1982). Lorde created the term

biomythography to describe how her own life story connects to history, biography, and personal memories. In this work, one learns how Lorde came to develop an ethics of reflexive action and how she regularly sought to break the silences often imposed upon marginalized social groups. In this work, Lorde also challenges static sexual binaries. A superficial analysis of her work can lead one to assume that she is promoting the sort of sexual essentialism that is found in some of Adrienne Rich's work. However, while Lorde does value women-centered relationships, she does not do so at the expense of attributing universal characteristics to members of any human group.

Sister Outsider (1984) is a compilation of some of Lorde's most important essays. These essays are central to contemporary feminist theory and other work concerned with social justice. From this volume, the essay "Poetry Is Not a Luxury" is a standard citation for many who contend that poetry, prose, and other creative forms of self-expression interconnect with political activism and self-reflection. "Uses of the Erotic: The Erotic as Power" is another work that is widely cited in both feminist and queer theory. In this essay, she examines the power that can be found when one embraces one's sexuality. Lorde purposefully uses the word *erotic* because of the debates, then and now, concerning women's sexuality. In feminist theory, there is the contention that sex, pornography, and thus the erotic can never be an avenue of liberation because these terms and actions are defined within a patriarchal and thus misogynist context. As such, there can be no strength found by dwelling in a sexualized body. However, Lorde reclaims the erotic as it is derived from its Greek root, *eros*: "the personification of love in all its aspects—born of Chaos, and personifying creative power and harmony. When I speak of the erotic, then, I speak of it as an assertion of the lifeforce of women" (1984:55). For Lorde, the erotic fuses women's creative powers with their sexuality, making women-identified love a source of empowerment instead of subordination.

Another crucial and often cited essay is "The Master's Tools Will Never Dismantle the Master's House." This essay is used by some feminists to discuss the complexities of agency within a postcolonial framework. She argues here that one cannot expect to destabilize and critique the hegemonic culture and its oppressive forces by using the very tools that this culture has promulgated. In exploring this issue, she points to the unacknowledged racism that had become a part of feminist academic practice, and appeals for more inclusive, affirming visions of feminist theory. She argues for valuing differences and embracing the "other" when building communities, and for a more reflective commitment to the practices of living the motto: "the personal is political."

While Lorde thought of herself foremostly as a poet, her prose is important because it grapples with the complexities of oppression. *The Cancer Journals* (1980) and *Burst of Light* (1991) bring to the fore the question of how politics and structures of power frame our perceptions and, thus, our responses to diseases such as breast cancer. Lorde challenges our common practice of hiding disease and its aftereffects. She challenges the cultural dictates about how women should look and act during and after illness, and works, again, to bring voice to those unable to speak.

Lorde's work continues to influence social theory. For example, in *The Wounded Storyteller: Body, Illness, and Ethics,* Arthur Frank (1995) draws on Lorde's essays about her experience of cancer to illustrate "quest narratives" and their ethical possibilities. He builds upon her call for voices as well as her idea of biomythography. He names the latter "automythology," contending that metaphor and storytelling have in them the power to heal and, therefore, even the most challenging stories must be heard. Allan Johnson (2001) is another who uses Lorde's ideas. In *Privilege, Power, and Difference,* he discusses the complexities of privilege and oppression, and like Lorde, emphasizes the taken-for-granted paths we walk in maintaining the institutions that continue to legitimate inequitable social structures.

The ease with which Lorde's essays, poems, and theory translate into disciplines besides women's studies and feminism is testimony to her keen dedication to promoting social justice and unearthing practices of oppression and silencing. Noteworthy, in particular, is how she contributes to postmodernist and postcolonial genres.

LUHMANN, NIKLAS

Niklas Luhmann (1927–1998) was a German sociologist who gained worldwide reputation for his theory of social

systems. He studied and received a doctoral degree in law, started his professional career in public administration, and became a professor of sociology in Bielefeld—one of Germany's younger reform campuses—in 1968. His devotion to systems theory connects him with Talcott Parsons, who he came to know while studying public administration in Harvard from 1960 to 1961. It is important to stress that Luhmann's understanding of social systems has only a little in common with Parsons's concepts. The reception of systems theory in American sociology is guided by the critique of functionalism in the 1960s and later by Habermas's reading of Luhmann. Whereas earlier controversies have led to the rejection of functionalist thought, Habermas quite unjustifiedly downgrades Luhmann´s social theory to a special tool suitable for analyzing functional subsystems of society (in contrast to what Habermas calls "life-worlds"), disregarding his attempt to develop a social theory that follows Schutz´s (1932) phenomenological sociology.

There are two important lines of argument that explain Luhmann´s relation to Parsons and Schutz. The first concerns the theoretical and methodological status of "meaning" and "understanding," the second is the problem of intersubjectivity. Even though both Parsons and Schutz claimed that it was the perspective of the actor that should guide sociological research, Schutz disputed that Parsons's theory was an analysis *adequate to meaning* (Schutz and Parsons 1977:57ff.). Phenomenological sociology and its interpretive variants have stressed against structural functionalism that sociological explanations must aim at meaningful adequacy. It is hardly known that Luhmann clearly supports Schutz's side in his discussion of Parsons and tries to develop a theory that will help interpretive sociology to find a way of making generalizable observations of modern society.

For Luhmann, there can be no doubt that sociological theories will inevitably lead to some kind of alienation of meaningful first-order expressions because in research individual motives must be subsumed under more general categories to be part of sociological explanations. While many social scientists continue to use Weber´s problematic ideal-type concept, Luhmann (1990:53ff.) believes that the interpretation of action as a means-ends-relation is a far too special and selective view of human behavior to be able to constitute a basic analytical tool. Undoubtedly, the causal relation between means and ends provides evidence to the observer, but it is not fundamental enough to reconstruct the broad ways in which meaning appears in the social world. Instead, Luhmann sees the attribution model of social action as it is applied in social psychology as suitable for achieving meaningful *and* causal (i.e., generalizable) adequacy in sociological research. This model yields four types of conduct out of the interaction of internal versus external, and stable versus variable interpretation. Internal attributions of behavior will appear as action based for example on ability

and/or effort. External attributions are interpreted as "experiences" of the world, for example as luck or fate. Hence, social action is not an ontologically, unquestioned given object of sociological research but a first-order interpretation based on the internal attribution of conduct. It is for this reason that Luhmann (1995:137ff.) places his level of analysis on social systems, or, to be more precise, on communication instead of social action.

From Luhmann´s point of view, systems theory helps distinguish between the mental level, on the one hand, and the social level, on the other hand. This clear distinction reminds us that sociological explanations are—as Weber and Durkheim told us—based on the social rules that govern the attribution of meaning. Mental idiosyncracies are of no interest to sociology. Therefore, the advantage of using systems theory appears as methodological—not only by providing a clear-cut distinction between the social and the mental level but also by breaking down, as Weber had intended by his notion of "social relations," the complex object of "society" into smaller units of observation, which Luhmann calls different kinds of social systems: face-to-face interactions, formal organizations, and functional subsystems of society. Such a theoretical use of the term *system* has nothing in common with Parsons's notion of "action as a system."

Nevertheless, Luhmann's solution of the problem of intersubjectivity must also be understood in the context of the discussions between Parsons and Schutz. From Durkheim, sociology has inherited the difficult task of explaining the social by the social. Even today, there is a lot of uncertainty about this task as sociologists do not seem to have clear-cut distinctions that identify the social as the social and distinguish it from the nonsocial. At first sight, it seems surprising that it should be the phenomenological tradition that could help overcome this difficulty. Husserl's and Schutz's discussion of intersubjectivity is clearly oriented to the self-contained realm of consciousness. From this phenomenological concept of meaning, the problem of intersubjectivity can only be solved by referring to social typifications that selectively represent subjective meaning. However, on this basis, the social can neither be distinguished from the nonsocial nor can the level of intersubjectivity be revealed.

Therefore, Luhmann takes Parsons's side against Schutz in this question and reinterprets phenomenologically the Parsonian distinction between the psychic and the social system. Both systems constitute two separate levels of meaning. Therefore, the distinction between psychic and social systems is not—as in Parsons's AGIL-scheme—meant analytically but rather empirically: Luhmann (1995:12) assumes that there are psychic and social systems in the real world. Both consciousness and communication are based on meaning, but each has its own logic and dynamic. Only communication—and not consciousness—forms the

desired "intersubjective" level of the social at which sociological explanations must be found. This solution of the intersubjectivity problem makes obsolete the struggle between "subjective" and "objective" terminologies. It is closely linked with the tradition of objective hermeneutics and Bourdieu´s analysis of habitus as incorporated social rule structures (Schneider 1991).

Luhmann´s strictly phenomenological understanding of meaningful psychic and social systems makes it inevitable to conceptualize both levels as autopoietically closed systems *at the level of meaning.* Autopoietic closure refers only to meaning, not generally to causal influences from outside. This distinction matches Weber's stress on keeping apart the meaning attributed to behavior and other causal influences on behavior for a complete sociological explanation. As Luhmann (1973:195; 1995:166) never grew tired of underlining, communication-based interactions and organizations are open to external (social, psychological, biological, chemical) conditions and causal influences (e.g., class and educational distributions). From this meaning-based point of view, it is the distinction between meaning and causal influences that opens the realm of genuine sociological analysis.

At the same time, causality itself is an interpretive instrument of social action, not an objective feature of an ontologically given external world. Thus, causality has a twofold meaning in sociological research (Luhmann 1970). On the one hand, there are "objective" causal influences on social action as measured by scientists. On the other hand, it refers to meaningful causal attributions in a situation. Even though there has been widespread criticism of the term *autopoietic closure,* it was rarely considered that this category matches one of the major results of phenomenological theory discussions of the 1960s: sociology interprets a social world that is meaningful. As a selective means of ordering human experience, meaning constitutes sociology's only way of making contact to the social world.

Luhmann's concept of understanding follows Schutz, who had objected against Weber´s methodology that ideal-type understanding is not a privilege of the social scientist. Rather, in everyday life, actors themselves apply interpretive schemes to grasp the meanings of what they do. They possess numerous recipes for responding to each other, but could not explain the inherent knowledge stocks as theories to an observer. Luhmann integrates this idea into his concept of communication. He does not abstract from the perspectives and orientations of the actors. On the contrary, he insists on practical first-order understanding as the object of sociology. Accordingly, communication consists of three combined elements: utterance, information, understanding. The meaning of behavior is constituted by the *communicative* act of *understanding* that follows the actor´s *utterance* of *information* (Luhmann 1995:139ff.). Selective understanding constitutes meaningful social rules

that help actors build up certainty about what to expect in the social world. Luhmann defines meaning phenomenologically as a means of selection. As has been noted recently, his stress of the *selective* character of understanding shows an amazing similarity to developments in expectancy-value models that aim at predicting human behavior in social research.

Luhmann's postulate to ground sociological analysis in communicative attributions paves the way for theoretical and empirical generalizations. He makes three basic statements on the empirical distribution of practical first-order interpretations of behavior: First, in the course of societal evolution, there is a general trend towards more internal attributions, so that today even most sociologists believe that it is quite natural to regard "social action" as the unquestioned object of research. The reason for this is obvious: In modernity, we are increasingly used to see humans as shaping the world. Especially formal organizations are based on the assumption that any kind of conduct can be interpreted as decisions so that people can be held responsible. Whatever kind of causalities and strains our conduct may underlie, the basic trend in modern times is our assumption that the social world is constituted by human action. Attributions to nature and god do not disappear completely but require a highly specialized social context to reach support.

It would be a mistake to assume that all actors can actually shape the world according to their intentions in situations that are attributed internally. Luhmann has always been skeptical towards voluntaristic reifications. The internal attribution of meaning as responsible action is just one suitable way of interpreting the social world. Therefore, freedom does not indicate the absence of causal strains upon human conduct or the final appearance of voluntarism in the social world. Rather, Luhmann sees freedom as a mere correlate of this general trend towards the praxis of internal attribution. It is a reflex of social structure, not the rise of human emancipation from external influences, that makes us describe ourselves as "free individuals." The recent discussion of *individualization* reflects just one more step in this direction. This step seems to concern especially the roles of women who increasingly join the world of educational and work organizations.

Second, in modernity, interpretation of conduct depends on the context of media of exchange. For example, conduct that appeals to "truth" leads to external attributions as experience for both Ego and Alter. We believe that truth must be found by scientists, not produced by social action. In scientific discussions, we will publicly discuss competing accounts of truth while we assume quite naturally that the reason for rival concepts is not our dislike or hate of each other but rather our belief that the rival has not reached the externally given instance of truth. In contrast, conduct in the functional area of "power" accounts for interpretations as action for both Ego and Alter because political

communication (and organizational behavior generally) aims at collectively binding decisions, which, as action, aims at determining ways of action by citizens and members (Luhmann 1997:332ff.).

Third, as Luhmann (1973) shows in a major investigation in the German civil service, attributional preferences and "styles" are distributed according to hierarchical positions in organizations and, therefore, class specific. Civil servants were asked to determine in what they saw the reasons for their own and their colleagues' promotions or the absence of promotions. More specifically, the interviewees had to locate the perceived causes of promotions according to the Heider attribution model. The general result of this study showed that servants were more inclined to attribute promotions internally the higher their position, success, upward mobility, satisfaction, and positive attitudes towards the organization were. Those who reached higher levels prefer internal attributions of their professional careers as resulting from effort and ability. The lower the position, the more servants tended to interpret their life course as externally dominated by fortune, chance, and conduct of others they cannot control—a tendency that has recently found support in longitudinal mobility research.

Luhmann does not, as Parsons might have, take this result to be a proof of the view that in modern society, "effort makes a difference." He preferred to refrain from normative statements of this kind and was content to interpret his findings on German civil servants as supporting attribution theory, which predicts that, just as sociological theory does, attributional preferences are not randomly distributed in society but rather in a socially structured way. It is the elaboration of such "subjective" meaningful preferences that Weber wanted sociologists to pursue by combining social regularities with meaningful rules. From this point on, more theoretically informed empirical investigations would have been desirable. However, Luhmann was not a great fan of the messy business of data collection, and chose to further develop his communication theory and his theory of society.

The term *structure* refers to another dimension of Luhmann's system theory constituting another concept completely different from the Parsonian tradition. Even today, many social theorists use the terms *system* and *structure* in similar ways. Parsons's system theory was concerned with structures and functions necessary to sustain system maintenance. Systems were considered as stable relations of elements in functional interdependence. In this view, structures guarantee the order of the social world and deserve primary sociological interest.

Luhmann's system theory takes a radically differing point of view by downgrading the importance of the term *structure* by defining social systems as meaningful systems of communication. Social systems are not based on structures, but on event-based communicative elements (usually

reduced to "action") that exist only for a moment and then disappear. Therefore, the term *structure* has only a derived status in his systems theory (1995:278). Meaningful structures are produced and reproduced by social attributions of experience and action. In Luhmann's understanding of social systems, communicative events have a kind of "ontological" priority in comparison to structures. This is why he considers his theory of event-based social systems as poststructuralist. Structures exist in social action as meaningful expectations of expectations; there are no structures beyond those expectations that we can experience in the phenomenologically given world. The question as to whether structures are stable in time or in how far they are overlapping in society cannot be answered theoretically but must be analyzed empirically. There is no reason why certain rule expectations should not have a high degree of social and temporal generalization and others may underlie rapid social change. For social theory, it is important not to decide this matter in general terms or, as Parsons did, to maintain contrafactually that there must be more generalized structures if modern society is to be more and more differentiated. Instead, Luhmann wants to provide categories suitable for more detailed empirical research. In contrast to Parsons, Luhmann (1995:75ff.) maintains that (national) societies are not and need not be based on a stable value consensus. On the contrary, our contemporary social world can only be understood as a world society that must deal with the problem of its permanent disintegration, widespread exclusion, and ecological risks never known in this way before. Thus, sociological theory cannot normatively warrant persistence of social order. This makes his social theory highly suitable for comprehending our times in the sense of the new world disorder.

Against the new structuralism as the mainstream in empirical sociological research, Luhmann insists with Weber and Schutz on the meaningful character of structures in the social world. Therefore, interpretive schemes are the primary object of sociological research. However, this kind of reconstructive research into social attribution practices has so far mostly taken place in cognitive psychology.

Unfortunately, Luhmann's (1982) theory of social differentiation belongs to the best known parts of his work in Anglo-Saxon sociology. Much more than Parsons, he views the functional differentiation of society as its primary feature. Some scholars consider Luhmann´s theory of modernity and his seeming obsession with functional differentiation as one-sided. Luhmann was not particularly interested in class stratification, social inequality and intergenerational mobility. He did not dispute that there is still widespread inequality in modern society, but, for Luhmann, (1997:1055ff.), social stratification will hardly help in elaborating upon a general theory of modernity.

LUKÁCS, GYÖRGY

György/Georg Lukács (1885–1971) was a Hungarian philosopher, one of the leading theorists of Western Marxism. Born in 1885 Budapest, he spent long stretches before and during World War I in Heidelberg, Germany, on the fringes of Max Weber's intellectual circle. Lukács returned to Hungary in 1917 and joined the newly formed Communist Party in 1918. In 1919, he became responsible for cultural affairs during the short-lived Hungarian Soviet Republic. After the collapse of the Hungarian Soviet Republic, he emigrated to Vienna, Berlin, and after 1933 to Moscow. Following the sharp condemnation of his theoretical and political views by the Comintern in 1928, he completely withdrew from direct political activity. He returned to Hungary in 1945, but with the consolidation of the Stalinist regime there, he was again forced from public life.

During the Hungarian Revolution of 1956, he was nominated minister of culture in the government of Imre Nagy. Following the Soviet intervention, he was first interned in Romania, then under the condition of "internal emigration" in Budapest. He died in 1971.

Lukács's volume of essays, *History and Class Consciousness* (1923), was the founding text of a new interpretation of the meaning of the Marxian legacy, usually referred to as "Western" Marxism. In it he radically criticised the positivist-scientist interpretation of Marx's theory, prevalent both in the 2nd and the 3rd Internationale. Marxism, for Lukács, offered a solution to the unresolved dilemmas of the Enlightenment and German Classical Idealism, dilemmas that were ultimately rooted in the internal contradictions of bourgeois society. These seemingly abstract speculative difficulties cannot be solved in theory alone, but must be overcome in a practice that radically transcends the horizon of this society. Marxism is the theory of the revolutionary praxis of the proletariat that can abolish its situation as a dominated and exploited class only by abolishing the reified logic of historical development that had reached its culmination in capitalism. Under conditions of reification, individuals and their collectivities become dependent objects of the power of those very social conditions and institutions that they themselves have created in their social—but not collectively organised—activities. Their fate is determined by the laws of separated institutional spheres—first of all the laws of the market, over which they have no control. Overcoming such a situation of reification requires the development of an adequate ("imputed") class consciousness This class consciousness cannot be the mere reflex, or the simple recognition of the economic interests, of the working class. It can only develop in a progressive fusion of the material practice of class struggle and revolutionary theory.

Lukács's pre-Marxist works dealt almost exclusively with problems of literature and aesthetics. He treated, however, the problems of artistic modernity in the context of a broadly conceived cultural crisis. Modernity dissolved any shared framework of a common culture, able to orient the everyday life of the individuals. As such, it was impossible for individuals to endow their life with stable, unique meanings and to achieve genuine mutual understanding. At the same time, in his works of this period—primarily in *The History of the Development of the Modern Drama* (1911) and in *The Theory of the Novel* (1916), he gave new direction to the sociology of literature. He emphasised that the social-historical significance of a work is not primarily located in its explicit or implicit "message," in its meaning-content, but in its form, in the way that it creates this meaning. In the later book, he disclosed the historical grounds and significance of the shift from the classical epic to the novel as the leading genre of a "world abandoned by God." He also followed up the fundamental generic transformation

of the novel form from Cervantes to Dostoyevski as aesthetic solutions to the ever more tragic quest of its hero, the "problematic individual" who is in search of a meaning for his or her own life.

After his Marxist turn, Lukács conceived these cultural antinomies as expressions of much deeper contradictions in human historical development. The concept of reification offered a key to the disclosure of this ground and simultaneously opened up a perspective upon the possibility and conditions of its overcoming.

Reification in Lukács has certain affinities with the Marxian concept of alienation, elaborated primarily in Marx's early manuscripts, at this time unpublished and unknown. Lukács himself arrived at this conception through a philosophical generalisation of the Marxian theory of commodity fetishism that he connected to Weber's critical notion of formal rationalisation.

Reification is the central structuring category of capitalist society. It is both an objective and subjective phenomenon. Objectively, it refers to the transformation of the social world of human relations and institutions into a "second nature" as a realm of dead objectivity with its own laws independent of the will and consciousness of the subjects. Intimately connected with the ever-expanding division of labour and capitalist market economy, it involves the elimination of the qualitative and individual characteristics of all products of human activities, making them standardised and interchangeable commodities, and rendering the labour of their production an abstract activity. Subjectively, it implies the fragmentation and depersonalisation of the individual, the ultimate bearer of conscious rationality. The exercise of reason then becomes equated with the performance of formal operations, allowing the calculative prediction of the behaviour of its object—ultimately amounting to a contemplative attitude. In its totality, reification designates the ever-growing formal rationalisation of all the separated social spheres and institutional units, while their global interaction remains a matter of pure accidents.

Reification of consciousness is an all-encompassing phenomenon—it characterises the immediate, empirical consciousness of the worker no less than that of the capitalist. The difference between them consists in their respective potential to overcome this standpoint of immediacy. The bourgeois is imprisoned in the world of reification that is the realm of its domination. This is because the capitalist can still find forms of activity—both as entrepreneur and as consumer—that it can, at least superficially, regard as the expressions of its free subjectivity. The wage-worker, however, who under the conditions of modernity is also posited as a formally free subject, cannot identify any sphere of its life-activity that it could consider as autonomous, its own. In life, he or she is always a mere object of personal and, above all, impersonal powers exercised upon him or her. The wage worker's recognition of this contradiction, the

consciousness of itself as mere commodity, is the initial step towards the emergence of a mediated, "imputed" consciousness. This consciousness finds its expression in the economic class struggle that, in itself, cannot transcend, or even significantly modify, the structure and the power relations of capitalist society. Precisely through the lessons of its ultimate failure, this consciousness can become a major stimulus furthering the process towards genuine emancipation.

The imputed consciousness of a class represents its maximal cognitive potential, the highest level of insight into social reality that its structural position in society still allows it to achieve as an objective possibility. The imputed class consciousness of the proletariat is the collective recognition of its world historical mission to become the Subject-Object of a history now collectively made. Its actual realisation can only be the outcome of a protracted learning process, the result of a constant interaction between the actual experiences of the class struggle and theoretical insights that both form and inform each other. In *History and Class Consciousness,* Lukács makes strenuous efforts to indicate at least the potential stages of such a process, but in this he undoubtedly fails. Ultimately he "reifies" the notion of imputed consciousness, ascribing to it a separate empirical reality in the form of the Party of a Leninist type as its living and knowing embodiment. Thereby his whole conception also acquires some teleological features, not unlike those assumed by Hegel.

History and Class Consciousness immediately became the object of sustained dogmatic attacks from the side of leading personages of the Russian, Hungarian and German Communist Party. When Lukács emigrated to the USSR, he was forced to renounce the book for its "idealist aberrations." While this was a "self-criticism" under duress, Lukács could acquiesce in it with relative ease, since in the meantime he himself moved away from some of the book's political and theoretical premises.

After his withdrawal from political activity, Lukács similarly abandoned the minefield of Marxist philosophy and general social theory. From the late twenties on, his work was essentially restricted to the field of literary criticism and aesthetics. In his theory of literary realism and its aesthetic generalisation, the conception of the artistic mimesis, he consistently argued for the defetishising capacity of the genuine artwork, in no way identical with its direct, political message.

It was only at the very end of his life that he again returned to the great theoretical issues raised in *History and Class Consciousness.* In the large manuscript *The Ontology of Social Being* (published posthumously in 1976), he again raised—now with a systematic intention—all the great questions that animated the essays of the earlier volume. The central category of this work, that aimed at the general characterisation of the human historical-social form of life as a *sui generis* ontological sphere, a specific way of being,

was that of labour. Labour, as the fundamental form of human activity, represents the fusion of causal determination and conscious teleology. As labouring, objectifying beings, humans are historical and "answering" beings, always acting in the field of some—more narrowly or broadly circumscribed—possibilities, individual and collective alternatives. The work was directed against all those theories—be they existentialist or critical—that transformed alienation into an inescapable human and historical fate. Alienation never can be total—there are always resources for resistance against attempts at the total manipulation of human beings—resources to which the great works of cultural formations, like art and philosophy, bear witness. Lukács, however, could not undertake the intended fundamental revision of this manuscript. It remains, rather, a document of his internal intellectual struggle with those elements of a dogmatic Marxism that during the long decades of an always partial, resisting and external accommodation to the ideological practices of Stalinism, he nevertheless, unwittingly, internalised.

MADNESS

In contemporary language, the term *madness* is often used synonymously with words such as *mental illness* and *psychopathology* to refer to disordered mental states and abnormal behaviors. However, while these terms designate medical and psychological conceptions of internal disorder, the concept of madness as examined in social theory is much more encompassing. Rather than attempting to explain biological or psychological causes of mental illness, social theories of madness try to understand the history of madness and the social mechanisms by which madness has been defined and regulated. From this view, it is assumed that the experience and social engagement with madness changes over time and place. In some religious traditions, madness is understood as demonic possession or divine inspiration. In other contexts, madness has been conceived as mystical experience. And in more contemporary circles, madness has been likened to biological illness, the causes of which are to be found in brain chemistry. In general, social theories of madness have examined problems such as the way that the understanding of madness has changed across societies and cultures; the way in which disciplines such as medicine, psychology, and psychiatry have shaped the meaning of madness and the treatment of the mad in the modern West; the various institutions and technologies, such as the asylum, that have been used in the confinement and treatment of the mad; and the ways in which the mad have described their experiences and challenged conventional understandings of madness.

The focus on the concept of madness also implies a critical stance toward standard definitions and treatments of mental illness. In the late 1950s and 1960s, as a medical model of psychiatry, based in biological explanations of mental illness, gained prominence, a group of psychiatrists, psychologists, and sociologists spoke out against conventional definitions of mental illness, thereby articulating an anti-psychiatry. They argued that mental illness is not a disease like tuberculosis or cancer, but rather, to use Thomas Szasz's terms, it is a problem in living that emerges out of social relationships and particular forms of social organization. In arguing against the medical models of mental illness, antipsychiatry also took a powerful stand against aggressive biological treatments of mental illness. In the 1960s, this emerged as a challenge to techniques such as lobotomy and electroshock therapy, and in the early twenty-first century, this emerges as a challenge to the pervasive use of pharmaceuticals to treat and manage mental health. Indeed, in the most radical versions of this critique, psychiatry and its technologies are not viewed as cures and helpful treatments but rather as a violent means of social control central to the management of modern capitalist societies.

FOUCAULT'S HISTORY OF MADNESS

Michel Foucault's *Madness and Civilization* (1965; published in French as *Folie et déraison: Historie de la folie a l'age classique,* 1961) is a central work in the study of madness and is often cited as a key text in the anti-psychiatry literature. The book is a historical review of the transformation of psychiatric discourses about madness from the Enlightenment to the end of the nineteenth century. Foucault challenges the conventional view that psychiatry has become better able to cure mental illness over time. Instead, he sees psychiatry as a discipline that has used the tools of science and reason to exert increasing control over definitions of madness and the mad.

According to Foucault, in the Middle Ages and the Renaissance, the mad lived freely in plain sight of all people, and their behaviors were interpreted to have rich meanings. The mad said and did things that could be wise or foolish, but most important, the strange actions of the mad signaled the presence of a world beyond this one. The

turning point in Foucault's history of madness comes with the "great confinement." In the seventeenth century, France and other European states created a network of workhouses, madhouses, and prisons to lock up and put to work social misfits, the unemployed, and the mad. It was in the workhouses and madhouses, which were later to become the asylums and mental hospitals of the nineteenth and twentieth centuries, that psychiatry began to define modern madness through systems of classification and treatment. While the discourses of madness have significantly changed across the modern period, a common argument throughout Foucault's analysis is that madness has increasingly lost its capacity to speak for itself. Rather, madness became the silent "other" of reason. That is, madness has been interpreted, regulated, and controlled through reason, and in particular through the deployment of reason in scientific and medical fields. Nevertheless, Foucault suggests that because of the intricate structural relationship between reason and madness (madness is defined through reason, and reason comes to know itself as the opposite of madness), it becomes impossible to conquer or to overcome madness and the threats that it poses to reason. Here, then, Foucault champions the irrationality of madness, and through *Madness and Civilization* aims to recover the silenced history of the mad.

Though very influential, *Madness and Civilization* has also been criticized, most notably for its historical inaccuracies. For example, commenting on Foucault's description of the great confinement, historian Roy Porter argues that this account is simplistic and overgeneralized. While there is evidence that something like a great confinement occurred in France, the same pattern of institutionalization did not occur in other parts of Europe such as Russia and England. The historical sociologist Andrew Scull has made a similar critique. In order to correct historical inaccuracies, Scull has written several histories of psychiatry—especially focused on the emergence of asylums in nineteenth-century England and America—that closely describe institutional and political-economic factors that contributed to the emergence of modern psychiatry and its institutional forms.

MADNESS, SOCIAL CONTROL, AND SOCIAL REVOLUTION

In addition to providing alternative histories and accounts of psychiatry, social theorists argued that madness was a product of, and means of control in, modern societies. In these accounts, madmen and madwomen were often portrayed as pained but revolutionary characters whose madness was a response to oppressive social conditions. This idea was elaborated by the psychiatrist R. D. Laing. In early works such as *The Divided Self* (1959) and *Self and Others* (1961), Laing developed an existential-phenomenological theory of schizophrenia. This theory of schizophrenia challenged reductive psychoanalytic and biological theories of mental illness. In contrast to the medical model that sees schizophrenic delusion and hallucination as meaningless and incomprehensible—the product of biological dysfunction—Laing argued that symptoms of schizophrenia were interpretable and that they usually pointed back to distorted relationships and double-bind scenarios. For Laing, then, schizophrenia was not a product of biological or psychological dysfunction but a response to problems in human relationship, which could ultimately be traced to problems in the larger social fabric. In addition to his examination of microsocial relationships, in books such as *Politics of the Experience* (1969), Laing went "macro" to argue that schizophrenia was a product of an alienating and fragmenting capitalist society. At the same time, Laing's interpretations of the experience of schizophrenia became increasingly esoteric. The so-called sane members of society were dupes of the Western capitalist system. They had unwittingly agreed to live inauthentic existences. In contrast, the schizophrenic, though clearly mad and in a state of suffering, struggled for authenticity in the midst of an alienating society. Indeed, for Laing, the ego-loss, regression, and delusional thinking of schizophrenia were near-mystical experiences that put people in touch with elements of existence denied under the capitalist order.

This heroic vision of schizophrenia has been influential among postmodern social theorists such as Gilles Deleuze and Felix Guattari. In their two-volume series *Schizophrenia and Capitalism* (1972, 1980), Deleuze and Guattari combine the work of Nietzsche and Marx in a critique of modern capitalism and Freudian psychoanalysis. They argue that conventional psychoanalysis is complicit with modern capitalism. Rather than encouraging people to act upon and realize a diversity of desires, psychoanalysis channels desire to that which is acceptable within a modern social order and the family structure (a triad of "mummy-daddy-me") that supports it. This constraint is embodied in the liberal and capitalist ideal of the self-contained, repressed, individual self. In contrast, Deleuze and Guattari envision a self that is continually opened to the multiple flows and forces of desire. In place of psychoanalysis, Deleuze and Guattari propose a "schizoanalysis." Here, the ego-loss of schizophrenia serves as a model for social relations. The schizophrenic, they argue, is not constrained by an internal desire for self-control—a fascism of the self—but rather lives as a "body without organs," a person without definition or desire for definition, always open to the play and transformation afforded by the multiplicity of desire. Social revolution, the challenge to capitalism and state oppression, comes by way of undermining categories essential to the modern self, its supporting philosophies and political-economic arrangements.

The connection between madness, social control, and social change has also been elaborated by feminist theorists. While, as Jane Ussher (1992) argues, the antipsychiatrists

pointed to problems in capitalist society as the source of madness, many feminists pointed to the problem of misogyny. Already in the nineteenth century, Charlotte Perkins Gilman had described relationship between madness and patriarchy in her novel *The Yellow Wallpaper.* Gilman's narrator searches for independence and equal participation in the public sphere but is infantilized and deemed ill by her husband and doctor. In the end, the narrator achieves a perverse freedom when she descends into madness. Here, then, women's madness is both the product of, and an escape from, patriarchy.

In the 1970s, works such as *Women Look at Psychiatry* (Smith & David 1975) and *Women and Madness* (Chesler 1972) echoed Gilman and documented the ways in which psychiatry reproduced patriarchal abuses. For Phyllis Chelser, patriachy operates in the nuclear family but also in the mental asylum and psychotherapy session, where women occupy subservient positions and suffer both psychological and sexual abuse. In a no-win scenario, women who step out of their feminine role to assume aggressive male characteristics are labeled psychotic, and women who fully accept and perform the passive female role are deemed neurotic. Insofar as women's lives and relationships are mediated through men, they remain incapable of developing as individuals. Drawing from Greek mythology, Chesler contrasts the twentieth-century society with Amazonian societies in which women were free to relate to one another as full individuals. A recovery of this Amazonian ideal is Chesler's first hope for women's psychological healing.

Chesler also points out that in patriarchal societies, psychiatry operates by a double standard. Men's deviance is more often labeled criminal, and women's deviance is more often attributed to psychiatric disturbance. Ussher (1992) takes note of this double standard and traces it to the very definition of woman. In a patriarchal society, the discourses of madness operate such that to be woman is to be the "other" to man and reason. Furthermore, in this equation, to be woman is to be mad or at least always vulnerable to madness. In particular, madness and woman are united through biological theories of mental health. Constructions such as postpartum depression, premenstrual syndrome, and menopause cast women's experience of their body and social relationships in medical-psychiatric terms. In this language, women are seen as naturally or biologically predisposed to bouts of strange, unpredictable, moody—that is, mad—behavior. As such, critics of this psychiatric discourse argue that women's freedom from madness can only be achieved through a deconstruction of the categories that have bound madness and femininity for so many years.

THE SOCIAL PSYCHOLOGY OF MADNESS

Social psychologists have also provided social accounts of mental illness through the lens of labeling theory and symbolic interactionism. In *Being Mentally Ill,* Thomas

Scheff (1966) argued against biological accounts of mental illness to claim that mental illness is a social construct that emerges through the labeling of deviant behaviors. The beginning of a social career as a mental patient begins when the label "mentally ill" is applied to certain kinds of behaviors that Scheff calls residual norm violations. In a study titled "On Being Sane in Insane Places," David Rosenhan (1973) applied this labeling theory to understand the inner workings of mental hospitals. A number of pseudopatients surreptitiously gained admittance to mental hospitals across the United States, where they were readily labeled schizophrenic. These pseudopatients found that the label "schizophrenic" shaped all aspects of life in the mental hospital, including the way that even seemingly normal behaviors were interpreted by hospital staff.

Most notably, however, in his book *Asylums* (1961), Erving Goffman provides a detailed analysis of the "moral career" of the mental patient as it unfolds in the mental hospital. Central to his analysis is the idea that the mental hospital is a total institution organized to undermine and attack the patient's sense of self. In the hospital ward system, patients lose their individuality and sense of self-control because all aspects of life are regulated and submitted to communal pressures. Moreover, the most intimate, shameful, and normally hidden aspects of the patient's life are opened up to scrutiny by psychiatrists, nursing staff, and other patients. Through interactions with psychiatric professionals and the creation of case records, the patient's life story is retroactively created. Consistent with the work of labeling theorists, Goffman argues that the mental hospital does not cure mental illness but instead turns the merely deviant into the certifiably mad. Patients resist these institutional attacks upon the integrity of the self by telling counter-stories—what Goffman calls apologia or sad tales. In the end, however, the mental patient's attempt to protect the self against the psychiatric labeling process is futile. The attacks on the self are persistent and deeply institutionalized, and mental patients eventually learn not only that they are mentally ill but that in the mental hospital the self is "a small open city" (p. 165) arbitrarily defined and redefined by social and institutional powers.

DEINSTITUTIONALIZATION
AND THE RISE OF PHARMACEUTICALS

As the history of psychiatry shows, for several hundred years the asylum has assumed a central position in the constitution and regulation of madness. However, beginning in the 1970s, as part of a more general social process called deinstitutionalization, mental hospitals in the United States began to close down en masse. In turn, outpatient facilities and a growing range of psychopharmaceutical medications assumed a prominent role in the treatment and management of mental illness. Where critics of the mental hospital saw

this as a victory over oppressive institutions, sociologists such as Andrew Scull argue that deinstitutionalization is an equally irresponsible and dangerous development. Rather than seeking reform, the state has abandoned responsibility for the mentally ill. By contracting mental health care out to private agencies and relying upon drug treatments, the state has given vulnerable members of society up to the contingencies of the free-market economy.

Deinstitutionalization also signals a more general medicalization of society and psychic life. As psychiatry moves out of the asylum, its means of classification increasingly impact people's everyday understanding of themselves. In this context, where Foucault's early work on *Madness and Civilization* was an inspiration to the antipsychiatry movement, his later, poststructuralist, writing on the relationship between power, knowledge, surveillance, and discipline has now become crucial in understanding the new social life of madness. In particular, the sociologist Nikolas Rose has used Foucault's later work to show how disciplines such as psychology, and psychiatry—the "psy" disciplines—have reshaped the subjectivity and selfhood not only of the mad but of all members of Western culture. Recent attention to the biomedicalization of society has also impacted conceptualizations of madness. Pharmaceuticals such as Prozac and Paxil have become increasingly popular and central to the way that people imagine their inner workings and understand their everyday lives. The category "mentally ill" is no longer reserved for those committed to psychiatric asylums or diagnosed by doctors. Rather, as psychiatric and pharmaceutical discourses proliferate and extend their social reach, members of a society are increasingly compelled to understand their suffering through the languages of illness and deficit. In this, a new morality is emerging whereby the individual is tasked with an unprecedented expectation of control and surveillance. In these discourses, one's knowledge of self and others is increasingly mediated through the delivery and advertising of the drugs and devices to treat illnesses and symptoms newly being defined.

MAISTRE, JOSEPH DE

Joseph de Maistre (1753–1821) was one of the founders of French conservative thought, a powerful critic of Enlightenment rationalism, of democracy, and of the French Revolution in particular. At the same time, however, as a highly sophisticated theorist of social violence and political authority, he was one of the originators of French sociology. Maistre, that is to say, was a *philosophical* conservative: his defense of order against disorder entailed a powerful effort to *theorize* social and political disorder and in that way to find order within human excess itself.

Maistre's greatest importance for the development of social theory is found in his sociology of religion or religious sociology: his sociological account of religious practices, especially in their more extreme forms, which insists that religion, understood in the broadest sense, is the defining foundation of all social organization. The force of his analysis is manifest in its significant influence on such major figures in the sociological tradition as Auguste Comte, Georges Bataille, Carl Schmitt, and René Girard—all of them, like Maistre, working on the blurred and often equivocal borders of religious, social, and political questions. At the same time, Maistre's occasionally exorbitant defense of royal sovereignty and papal infallibility has inspired French reactionary thinkers from monarchists like the young Félicité de Lamennais to fascist sympathizers like Charles Maurras, who have often found in his words justification for discarding his in fact quite moderate practical politics. For perhaps what most defines Maistre's theoretical style is the veritably classical calm with which he responded to the most excessive forms of human behavior. He was a theorist of barbarity, not its advocate.

Maistre was born on April 1, 1753, in Chambéry, the capital of Savoy, a French-speaking province of Piedmont-Sardinia. His family was granted noble status in 1778 for the work of his father, François Xavier, a senator in the Savoy Parlement, in revising the royal constitution. Maistre's youth presaged a conventional provincial life: membership in local religious confraternities followed by legal training in Turin. From 1772 to 1792, he served in the Savoy Parlement, rising to the rank of senator in 1788. Two engagements, however, qualified this outwardly traditional life: Masonry and the Enlightenment. Maistre's personal library was among the largest in Savoy, featuring an unusually high proportion of Enlightenment works alongside a

much smaller number of professional and pious literature; thus, before becoming one of the Enlightenment's staunchest critics, he had been one of its most avid followers. Maistre, moreover, was closely engaged with Masonry between 1772 and 1792. His later dismissal of this involvement as a mere social game seems belied by his initiation into a highly esoteric lodge in 1778, in which he rose to the highest grades. Thus, alongside a professional and religious trajectory squarely located within the *ancien régime,* Maistre took part in some of the most forward-looking intellectual and social movements of his day. This balance was ruptured in 1792, when French revolutionary armies invaded Savoy, broke the traditional framework within which Maistre had lived, and turned him against the enlightened views of his youth.

Thus began 20 years of exile. Maistre seems to have experienced emigration as a liberation from provincial life, an opening onto a wider European world, where he produced all of his major writings. For several years he worked as a correspondent and propagandist for the Sardinian monarchy, living in Switzerland and Northern Italy. It was during this period that he wrote *Considerations on France* (1797), a sociological and religious critique of the revolutionary project. Nonetheless, fellow monarchists viewed him with suspicion from the start, both for his earlier reformist views and for his insistence on recognizing the realities of the French Revolution. In 1802, Maistre was appointed Sardinian ambassador to St. Petersburg (the only remaining source of counterrevolutionary funding other than London), where he frequented the francophone court and salons and wrote his greatest works, notably *The Pope* (1820) and the *Saint-Petersburg Dialogs* (1821). It was only with some reluctance that Maistre left Russia after the defeat of Napoleon. His last years were spent in Turin arranging his children's future and the publication of his works. He died on February 16, 1821.

Maistre's thinking belongs to a particular school of conservative thought known as traditionalism. Simply stated, traditionalism insists that it is tradition and not reason that determines the course of human action. Within the traditionalist argument, it is useful to distinguish between its descriptive and normative claims. The first asserts that it *is* tradition that shapes institutions and behaviors; this broad outlook was central to the development of nineteenth-century historical thinking and has obvious significance for sociology and anthropology. Yet traditionalists insist not merely that the past *does* shape the present but that it *should* do so, and that is what makes it a conservative and often reactionary argument. There are, of course, many versions of just what tradition includes. Maistre's version was, for its day, extraordinarily broad: not only the Catholic monarchy (as with the other great founder of French conservative thought, Louis de Bonald) but also Greek philosophy, Hindu cosmology, Judaism, Islam, and early Christian

heresy. His defense of tradition extended to traditional societies ravaged by Western expansion. The breadth and force of Maistre's traditionalism can be seen in what is perhaps the keystone of all his social theory, his theory of sacrifice.

Maistre was the first to develop a sociologically oriented theory of sacrifice based not only on local tradition (in his case, Judeo-Christian Europe) but also on global religious practices. He thus made use of recently translated Vedic and Mesoamerican sources alongside Greek and Christian authors (among the latter, Origen, the great heterodox neo-Platonist was the great influence). But why sacrifice? Maistre was convinced that social unity ultimately rests upon religion, understood in the broadest sense as the sanctioned source of society's symbolic and imaginary cohesion. This religious order rests in turn upon ritual, upon the communal practice that establishes and reestablishes religious unity. And ritual, finally, rests upon sacrifice, where the symbolic order of religion comes into contact with bare life and restores human disorder to union. The argument reflects the religious bases of Maistre's theory, yet it also demonstrates his effort to find a social logic within religious practices. This assertion of the universal need for sacrificial ritual rests upon specific anthropological claims, claims radically opposed to the Enlightenment's happy view of human nature. For Maistre, human existence is of its nature imbalanced, disordered, and ambivalent. This is what it is to have a body, blood, and life. Thus, in sacrifices, body, life, and blood are spent to redress life's excess and disproportion. This moment of expenditure, however, must have a measure if it is to restore good order, and that is the role of ritual. Regardless of human intentions, however, the balancing continues. That human violence has its measure—this was Maistre's guiding idea on religion, history, and politics. Because disorder has its logic, it is capable of being understood.

Maistre finds this measure of sacrificial violence in two paired ideas, substitution and reversibility. Substitution, since become a staple of religious sociology, concerns the manner in which victims of sacrifice are chosen. The logic of substitution demands, first, that the victim must stand outside the community in order to channel social violence outward and, second, that the victim must, however, resemble that community in order to serve as its representative in the ritual expiation. Thus, Maistre points out that animal victims are always chosen from among the most "human" species. More broadly, substitution explains why marginal social groups, neither inside nor outside the community, are especially vulnerable to its violence. Reversibility, on the other hand, asserts that the innocent victims of sacrifice somehow compensate or redeem the faults of the guilty. The dogma of reversibility is primary, for it alone gives meaning to sacrificial substitution: Only if the innocent pay for the guilty does sacrifice have any meaning at all or even any effect beyond shunting social violence onto convenient victims.

Much of Maistre's writing on social questions consists of the application of this sacrificial paradigm to European institutions, tracing the workings of substitution and reversibility in capital punishment, warfare, and revolutionary violence. In each case, he underlines the way in which inherent human excess and barbarity are channeled, given shape and meaning, through the imposition of customary ritual forms. These ritual forms provide the only means for limiting a social violence that is ultimately ineradicable. Rituals must therefore be defended, violent as they are, if worse violence is not to ensue.

Maistre's sociology of religion provides the basis of his theory of constitutions, which is at bottom a theory of social order and of how it is shaped historically by ritualized behavior and mythological imagination. For Maistre, a constitution is neither a set of legal prescriptions nor even exactly a form of government. It is rather a certain consistency in what is done, thought, and lived within a given society, a cohesive cluster of norms, habits, expectations, and unexamined beliefs inherited from tradition. What distinguishes the English and French constitutions is thus not positive laws but ways of life—how being in France differs from being in England.

Maistre strongly rejected the notion that constitutions must be declared in writing. What holds society together is not its written laws but its tradition, which as a prelogical and symbolic order cannot be wholly reduced to a document. Indeed, social order cannot be the product of legislation, since legislation itself presupposes an existing society. The chief failing of written constitutions is that they bear no sanction, which means they may be unwritten. Only what remains unwritten (custom, belief, tradition) cannot be erased. The essence of a constitutional or fundamental law is precisely that no one has the right to abolish it.

Much of Maistre's criticism of written constitutions is directed against the theory of the social contract, which presents social order as having originated in the rational decisions of contracting individuals, who, as its creators, have the right to annul and reinvent it. Yet, that is to subject social order to passing political whims. Against Locke and Rousseau, Maistre argued that because a constitution is precisely what exceeds the sum of its subjects, it cannot be the product of individuals' decisions. Because its function is to restrain the divergent wills of the population, it cannot have a democratic origin. Indeed, Maistre's theory is designed to remove power from people's hands and to vest it somewhere free from human intervention. While people certainly play a role in the growth of constitutions, they do so in unintentional ways, for fundamental institutions remain precisely what is subtracted from the sphere of conscious decision. Constitutions are rather shaped insensibly over long spans of time by all the complex contingencies of its history. Thus, Maistre adduces the English constitution, which is not the written product of a single rational agreement but rather a complex unity of Roman, Saxon, Danish, and Norman customs, the privileges and prejudices of all social classes, wars, revolutions, and so on.

This historicist argument entails the view that the origins of constitutions cannot be pinpointed. Yet Maistre also implies that the invisibility of the origins of power is actively pursued as a legitimation process essential to social order. While he never states outright that traditional authority is illegitimate (that would be to forsake conservatism), he does assert that the actual origins of established power are always inglorious, hybrid, and bloody. Every order begins in violence, and the question is thus how it becomes legitimate.

The answer is found in what Maistre calls "legitimate usurpation." This refers to the originary violence that establishes legal authority and which thus cannot be justified by any existing legitimacy. The originary usurpation is therefore neither legal nor illegal, legitimate nor illegitimate, but a-legal and a-legitimate. Legitimacy arises as these violent origins recede: The legitimacy of a given power or social order is the invisibility of the violence that precipitated it. Legitimacy derives not from proximity to origins but from distance from them.

Yet if no constitution has pure origins, every constitution relies on a myth of the purity of its origins. The defining feature of the history of a given constitution, then, is that it sutures its past, erases its scandalous contingency, and finally emerges as an unquestionable norm. This is the function of what Maistre calls the "fables" or "political mysteries" surrounding and divinizing the birth of power. Fables they may be, but they are no less precious, for they alone, by eliciting subjects' consent, keep us from falling back into the violence that defines human nature and human history.

Maistre's doctrine of constitutions explains his rejection of the revolutionary project of 1789. Much of the strength of his interpretation of the French Revolution derives from his traditionalist argument, which places revolutionary events firmly within a historicist framework. Unlike most contemporaries on both the Right and the Left, Maistre understood the Revolution not as a momentary act of will, whether good or evil, but rather as the result of a long-term history. He points in particular to the effects of Protestantism, royal absolutism, and the Enlightenment, each of which served to dissolve traditional communal bonds in favor of the individual and the state, and to the failures of the old regime social elites who abandoned responsible guardianship of the political mysteries in favor of flippancy and materialism. The resulting anarchy of opinion and abuse of power, he believed, made a revolution inevitable.

The dissolution of social order and cultural tradition, Maistre argued, returned France to the violent chaos of origins. In his eyes, the Revolution is not a leap forward but a

leap back, not progress but a primitivist return to the most barbarous forms of sacrificial violence, which replaced the beneficent artificiality of custom with the remorseless logic of victimization. The Terror thus becomes a sacrificial crisis, such as inevitably follows the collapse of traditional authority. Yet, as a sacrificial act, the Terror must also be understood as a form of cleansing violence, and the Revolution as a whole, as an outgrowth of French history, must have its place in the evolution of tradition. The victims of revolutionary violence pay the debts of the monarchy, compensate for its excesses. Once the sacrificial dynamic is concluded, Maistre hoped, France would be returned to health.

As an important consequence of this sacrificial model of revolution, Maistre opposed any armed counterrevolution. The revolutionary dynamic must be allowed to play itself out until order restores itself of its own accord. Because the return to traditional order means a restoration of social equilibrium, retribution must be avoided: Revenge would only exacerbate and prolong the crisis. Thus, he forcefully rejected the offer of a position as prosecutor of Savoyard rebels, condemning the bad faith and stupidity of the monarchy's drive for vengeance, which only demonstrated that the royalists themselves had been overcome by the intransigent revolutionary mentality.

Maistre's qualified response to the French Revolution demonstrates that he was more a philosophical conservative than a political reactionary, a theorist of human violence rather than its advocate. While his rejection of democracy consigns him to the monarchic past, his effort to find an order within social disorder remains highly significant for the development of modern social theory, which owes far more to the conservative tradition than is commonly recognized.

MALE GAZE

Laura Mulvey's "Visual Pleasure and Narrative Cinema" (1975) was one of the first scholarly attempts to reference male gaze, the visual and controlling viewpoint associated with hegemonic masculinity and male dominations. Mulvey's pioneering work fused feminist and psychoanalytic theory with theories of film spectatorship as she examined the progression of "looks" in classical narrative cinema. In her classic model of the gaze, Mulvey considered gendered identity and "sexual looking" as elements of "woman as spectacle" for the pleasure of men (p. 10). First, she suggests that the controlling look of the camera itself is voyeuristic and male because most directors are men. Second, the looks exchanged between cinematic characters are structured so that the male characters most often *look* while the female characters are *looked at.* Finally, spectators respond to the standpoints of the camera and characters by identifying with the male and his gaze.

Utilizing Freud, Mulvey also contends that the male unconscious seeks two forms of scopophilia (visual pleasure). Voyeurism, the first of these, seeks to exercise power over its object by marking "her" as "the bearer of guilt" (Mulvey 1975:11). Fetishism, the second form of visual pleasure, marks the female as object of desire at the level of spectacle. A masculine subject emerges through a narcissistic identification with male characters and an objectification of female characters. Thus, woman as passive spectacle and object and man as active voyeur and subject together constitute a proprietary "male gaze."

While Mulvey is credited with the phrase "male gaze," the concept of the gaze is drawn from the psychoanalytic theory of Jacques Lacan. Lacan's gaze acknowledges that "things look at me, and yet I see them" (1977:109). The Lacanian gaze both projects itself onto objects and reads those objects for their meanings. The notion of gaze also informs the thought of Jean-Paul Sarte. As he noted, the look of the Other is the domain of domination and possession.

By aligning knowledge with power, Michel Foucault presented a model for discussing objectification without drawing on existentialism or psychoanalysis. According to Foucault, power constitutes the very subjectivity of the subject. Vision, as a means to objectify, may reinforce as well as help produce patriarchal power relations. In *Discipline and Punish* ([1975] 1995), Foucault discusses Jeremy Bentham's "panopticon," the prison where inmates are continually observable. He treats the panopticon as an example of the controlling gaze, which guards use as a means of constant surveillance. If inmates know that they can be observed at any time, then discipline becomes internalized as they become self-policing subjects. Foucault highlights the power that lies at the root of the gaze. In *The Birth of the Clinic* ([1963] 1994), he declares that "the gaze

that sees" through active vision becomes a "gaze that dominates" (p. 39).

Theorists often distinguish between the look (associated with the eye) and the gaze (associated with the phallus). Of all the sensory organs, vision most readily confirms the separation of subject from object. The spatial dynamics of vision allow for considerable distance, whereas a relative contiguity is usually required between subject and object with all of our other senses.

These and other thinkers portray the male gaze as a socially constructed mode of objectification. The male gaze looks at a female person as an erotic or aesthetic object. Within a regime of institutionalized heterosexuality, women face pressures to make themselves "object and prey" for men (Bartky 1998:72). Sandra Lee Bartky builds on Foucault's insights about the nature of disciplinary society when she asserts that "a panoptical male connoisseur resides within the consciousness of most women" (p. 72). Women learn to appraise themselves through male eyes within a patriarchal culture. The mass media, for example, promote women's bodies as objects of men's desires as a means to satisfy the male gaze (Johnson 1997:38). The gaze is not a mutual reflection, even though both women and men are appraised using male-identified cultural standards. The gaze that appropriates the Other is masculine.

MANN, MICHAEL

Michael Mann is our Max Weber. For one thing, he equals the great German sociologist in range and in command of the historical record. For another, he argues—indeed demonstrates—that social life can only be understood once attention is paid to the interaction of different types of social power. Furthermore, he extends Weber: He adds military power to the political, economic, and ideological types distinguished by his predecessor and goes beyond him in a series of middle range theoretical contributions all his own. Finally, he replaces the rather decisionistic, implicitly authoritarian politics of Weber with modern social democratic principles—in part taken as sociology, in part as prescriptions that he has sought to justify.

Mann was born in 1942 to a lower middle-class family. He attended Manchester Grammar School and then studied history at Oxford—where a lifelong commitment to social-ist values was made, interpreted at the time in the form of loyalty to the British Labour Party. He became a sociologist by accident, but his political values can be seen in the fact that his first three books—*Workers on the Move* (1973), *Consciousness and Action among the Western Working Class* (1973), and *The Working Class and the Labour Market* (coauthored with Bob Blackburn in 1979)— concentrated on the class presumed by Marx to be the agent of a new world. Mann's democratic instincts produced a very convincing picture of the realities of working-class life—as an attempt to manage the complexities of an unfair environment, subject to force and fraud but rarely indoctrinated into any dominant ideology, and essentially without an alternative ideology of its own. There is a sense in which this general view undermines hopes for socialism; certainly Mann's empiricism made him a somewhat marginal figure on the British Left.

These early books appeared whilst Mann lectured at Essex University. Thereafter he moved to the London School of Economics and in 1986 to the University of California, Los Angeles, where he has remained. It is in the latter insti-tutions that his major work has appeared. *The Sources of Social Power,* vol. 1, *From the Beginning to 1760 AD* (1986) was extremely well received (albeit the fact that it is an account of "the rise of the West" is likely to lead to it being ever more criticized), not least since its theoretical contribu-tion necessarily stood out clearly, given the sheer range of material covered. *The Sources of Social Power,* vol. 2, *The Rise of Classes and Nation-States, 1760–1914* (1993) had less success, perhaps because Mann's relentless empiricism produced an account of great complexity. His initial plan to have a first volume on power in agrarian societies followed by a second dealing with power in industrial societies had clearly fallen before the discovery that economic change did not necessarily create movement in other realms. Mann will give us a new volume on power in the twentieth century, but three books will appear before he completes his principal work (with a fourth volume on social theory still being a pos-sibility). *Fascists* (2004) and *Murderous Ethnic Cleansing* (2004) from a pair examining the horrors of the twentieth

century by means of very detailed case studies. Both books are made striking by his insistence on understanding the motivation of people whose actions he loathes; he is particularly impressive in demonstrating that fascism had genuine moral appeal. The material in these books will certainly be used in the third volume of his major work, as will that in a series of essays that doubt the extent of globalization of the world—that is, that argue that geopolitical frames and national interests retain considerable power to structure our future. *Incoherent Empire* (2003) is a political intervention deeply critical of American foreign policy.

Mann's initial starting point was anti-Parsonian: Societies are less "systems" than places where different sources of social power interact. Negatively, Mann suggested that we rarely have unitary identities. This was wholly salutary in showing that classical sociological theory reified the nation-state—thereby failing to understand most of the historical record. Positively, Mann's purpose has been that of explaining why a particular source of power gained dominance at a particular moment of history—as was the case, for instance, with ideological power both at the time of the emergence of world religions and in modernity in the case of the two revolutionary forces of bolshevism and fascism. Notable contributions have been made to understanding the four sources of power upon which his work depends, perhaps especially in the case of ideology, where Mann offers an anti-idealist view concentrating on the means of communication. At a more specific level, three contributions are, as noted, especially novel and noteworthy. First, his sociology of nationalism is the most sophisticated to date, stressing as it does the impact of micromotivation and of macroconditioning by geopolitical forces. Second, no scholar has shown more thoroughly the ways in which social movements—whether of gender, nation, or class—gain their character as the result of the nature of the regimes with which they interact. Finally, his notion of caging—of the attempts by states to enclose actors, from feudal lords to capitalists, capable of living in larger societies together with the ways in which those so enclosed come to identify with their bars—is extremely suggestive, a truly useful tool for sociological thought.

Mann is sometimes mistakenly taken to be an analytic historian. In fact, he seeks to expand sociological theory by considering nothing less than the complete historical record. He is perhaps less convincing on distributive than on collective power—and this despite analyses of ethnic cleansing and of state power in general. Nonetheless, his work renews the classic sociological questions more than that of any other living sociologist. His work is demanding, but it is likely in the long run to be extremely influential.

MANNHEIM, KARL

Karl Mannheim was born in Budapest, Hungary, on March 27, 1893, into a middle-class Jewish family. He received a doctorate in philosophy from the University of Budapest and early in his academic career worked under the renowned Marxist György Lukács. Following the takeover of Hungary in 1919 by a communist, anti-Semitic regime, Mannheim was forced to relocate to Heidelberg, Germany. It was here that he met his future wife and fellow academic (with a doctorate in psychology), Juliska Lang. In 1930, he was appointed to the position of director of the College of Sociology at Goethe University in Frankfurt, sharing a building with the famed Institute of Social Research and its critical theorists. Again, however, when Hitler came to power, anti-Semitism forced Mannheim to flee his home in 1933 for England. He lectured at the London School of Economics and later held a full professorship at the University of London. Suffering from a heart defect from birth, Mannheim died on January 9, 1947, at the age of 53.

It might seem as though Mannheim was cursed from birth; however, many of his "curses" turned out to be blessings in disguise, at least for his intellectual career. Although his Jewish background forced him to relocate many times, this relocation helped expose him to a variety of ideas. There is a marked transition in his work from philosophy (Hungary) to sociology (Germany) and finally to the application of sociology (England). It was also his refugee status that probably led him to one of his most formative ideas, the "socially unattached intelligentsia" (discussed later).

Although Mannheim is not considered by many to be an important figure in sociology, a number of aspects about his career and contribution to the field run counter to this argument. Most important, Mannheim is the person primarily responsible for the creation of the subfield of the sociology of knowledge. Additionally, it was Mannheim's persistence that helped this subfield establish itself, and it is considered an important area of study today.

Given the early guidance of Lukács, it is no wonder that one sees a heavy Marxian influence on Mannheim's work. In fact, he credits Marx with creating the forerunner to the sociology of knowledge with his theories on ideology. The key to distinguishing Mannheim from Marx, however, is that Mannheim created the sociology of knowledge largely in opposition to Marx's theories of ideology. Thus, although Marx believed that ideologies were consciously undertaken distortions of reality that sought to benefit the ruling economic class, Mannheim believed that many distortions are not conscious but rather emerge from certain social blocs and consequently are one-sided and appear to reflect self-interestedly the interests of that class. Such ideologies, however, are not necessarily rooted in economics (e.g., they can be based on generations, political viewpoints, or race) and are not necessarily blatant attempts at hegemonic control. Consequently, Mannheim defined the sociology of knowledge as the study of "the relationship between human thought and the conditions of existence in general" (1936:277).

Another distinguishing feature of Mannheim's approach was that it was markedly sociological (as opposed to ideological). For example, he favored an extrinsic perspective, one available primarily to "unbiased" sociologists, as opposed to an intrinsic perspective that tends more frequently to create biased interpretations. Furthermore, he believed that the individual actor is the mediator between the purely empirical social world and knowledge. This reflected Mannheim's concern with existentialism and the social determination of knowledge.

Mannheim had a great interest in using empirical research in the sociology of knowledge. He was not, however, a positivist. He found value in phenomenology and sought to integrate a more Marxist approach with phenomenology. He also favored using a historical approach to discover the social roots of knowledge and how the relationship between ideas and their sources in the social world change over time.

Reflecting an early interest in a sort of metatheory, Mannheim did a sociology of the sociology of knowledge. For example, he argued that only during the unique social situation of the time (specifically heterogeneous, dynamic thought and the increased potential for social mobility) could the sociology of knowledge have arisen. It was especially a rise in social mobility that spawned such an interest in this topic as more people came into contact with a wider variety of other types of people and ideas. Mannheim clarified this, however, by stating that only vertical mobility led to this interest. Unlike horizontal mobility, which leads people to see that other people think differently but not to question their own ways of thinking, vertical mobility causes people to view some ideas as having more social worth than others. This is particularly important in situations where those ideas emanating from the lower social strata rise to the same level as those with origins in the controlling strata.

Another important distinction made by Mannheim is between relativism and relationism. Relativism is the idea that everything is relative to everything else and hence nothing can ever be used as a standard by which to judge anything else. Relationism, however, is the idea that everything is related to everything else in one way or another on a vertical and horizontal level and there is the possibility of determining right from wrong in a given social situation and particular historical moment. Mannheim favored relationism, as it is a more dynamic concept that solves the intellectual crisis of not being able to know the truth, yet still leaves room to adjust what is "true" to the circumstances of a given time and place.

Based on his ideas on relativism and relationism, Mannheim further posited that the sociology of knowledge could be used either evaluatively or nonevaluatively. For example, an evaluation can be made of something if it is seen as maladjusted. Mannheim outlined three conditions that might lead to such a maladjustment: the persistence of norms that are no longer applicable to the contemporary situation, adhering to absolutes that although they may have had value in one social setting are no longer valuable in the current social setting, and attempting to analyze present realities with forms of knowledge that are not capable of making sense of them.

The intelligentsia is a group of people who were of particular interest to Mannheim. This is because he envisioned their task as making sense of the world for the rest of society. Unlike other societies throughout history, the contemporary world has an intelligentsia that is relatively socially unattached. In other words, they are derived from a wider range of social strata and are more loosely connected to one another than in previous times. This has had a contradictory effect in that although there are now innumerable competing ideas arising from the intelligentsia and it is harder to find a solid "truth," the newfound interdisciplinary perspective has also allowed the members of that group to move beyond the need to find such a definitive answer. In particular, the sociologist is heralded as the solution to the problem of intellectual chaos.

Another key concept in the sociology of knowledge is that of the Weltanschauung, or the organized entirety of ideas of a given time period or social group, which, in turn, is derived from a series of reciprocally, mutually related parts. Although the Weltanschauung is emergent and so greater than the sum of its individual parts, any one of those parts can be analyzed in isolation to give us an idea of the larger whole. It is the documentary meaning, which is derived from the "document" of a cultural product, that allows us to get a sense of the larger whole. This is opposed to the expressive meaning, which is found in the intentions of the actor, and the objective meaning, which is inherent in

the object. The documentary meaning, then, is most useful not when it helps us to understand an idea in isolation but rather when it helps us to understand its role within the larger Weltanschauung. Thus, Mannheim also sees the sociology of knowledge as a unique subdiscipline interested in the dependence of each idea or location on the unique social group from which it arose and sets about determining the historical evolution of a given idea system.

One of Mannheim's most important and best-known works is *Ideology and Utopia* (1936). An ideology for Mannheim is a type of Weltanschauung that obscures the present by attempting to make sense of it through the past. Ideologies are most widely propagated by those in power who wish to maintain the status quo. A further distinction is the difference between particular ideologies, which are the ideas of a particular group we are not in favor of and are deliberate distortions, and total ideologies, which belong to an entire sociohistorical bloc and are not generally viewed as purposeful distortions. This is a further difference between Marx and Mannheim. The former was concerned only with particular ideologies, while the latter introduced total ideologies as a subject of the sociology of knowledge.

In contrast to ideologies, utopias make sense of the present by transcending it in a futuristic orientation. They are most commonly espoused by those seeking revolution and social change. Furthermore, they have the ability to affect action and give rise to change. The consequence of change, however, is often that the utopia becomes the ideas of the new ruling class and is transformed into an ideology that then gives birth to another utopian idea system. One of Mannheim's greatest fears was a decline in utopias and their revolutionary possibilities for change.

It is difficult to differentiate between an ideology and a utopia. They are generally, in fact, labels that come from an opposing group. It is often the success or failure of an idea system and those who promote it that determines how it will be classified. Thus, Mannheim suggested that the only true way to know the difference was through the clearer vision of historical hindsight. In the meantime, however, the job of the sociologist of knowledge is not to determine what is an ideology and what is a utopia but rather to unmask the distortions in, and sources of, a given system of ideas.

This leads to the question, From where do ideas emerge? Mannheim's general answer is that they emerge from competition with other ideas. This competition between ideas is crucial to change and growth. It is also another way in which both the production of ideologies and utopias is ensured, as not only ideas but also the groups behind those ideas compete for control.

Paralleling a worry of Max Weber, Mannheim was concerned that the world is becoming increasingly disenchanted. That is, there is a decline in both utopias and ideologies. There is, however, hope as those groups that still feel unfulfilled in their desires remain a potential source of

enchantment and reenchantment. Additionally, the idea of "socially unattached intellectuals" comes up again as the group with the greatest potential to understand, lead, and revolutionize society.

Another of Weber's influences is seen in Mannheim's work on rationality and irrationality and on the further subdivision of these into substantial (more phenomenological) and functional (more empirical) levels. Substantial rationality occurs when thought shows signs of insight into the interdependent nature of factors in a particular situation; it is creative and original. Substantial irrationality occurs when there is falseness or no thought at all, as with thinking dominated by impulses, drives, and emotions. Functional rationality is largely efficient in that it is an action (or series of actions) that leads to, or moves toward, the realization of a predetermined goal. Functional irrationality is all else that disrupts the functionality of a system. It should be noted, however, that that which is deemed functionally irrational by one group may be deemed functionally rational by another. For example, slavery was functionally irrational for blacks in the South but functionally rational for their white owners.

Similar to Weber's concept of an iron cage and Ritzer's theory of McDonaldization, Mannheim sees a danger associated with increasing rationality. For example, self-rationalization leads individuals to control their feelings and impulses in order to achieve an outside goal. Even further than that, however, is self-observation, which seeks to actually transform the self in order to become more rational. The increase in functional rationalization, and related types, can have the negative effect of reducing substantial rationality.

His later years in England saw Mannheim's interest in applying sociology to the real world grow as he sought to offer a means of planning and reconstructing the social world. He offered a system of "democratic planning" as opposed to either laissez-faire or totalitarian methods. This democratic planning would, in fact, be a kind of "control of control" that would prevent situations like the rise of the Nazi regime in Germany from recurring. Mannheim did not offer a formal, grand theoretical plan to restructure society but rather offered guidelines for what such planning should include. Most important, he argued that any plan should not be stagnant or one-sided but should instead rest on the interdependence of all viewpoints and be open to dynamism and criticism. The key to ensuring this, he posited, was an integrated approach to education that would teach all of us to accept and honor the viewpoints and fundamental rights of others.

Although Mannheim clearly made many great contributions to the field of sociology, his work has at least as many critics as supporters. One of the strongest criticisms is that although he is revered as the founder of the sociology of knowledge, he never offered a formal definition of what

exactly he meant by "knowledge." Similarly, Mannheim often used other terms and phrases, many of them contradictory, to describe his area of interest. Additionally, he was not very clear about the actual relationship between knowledge and society. Regardless of these criticisms, however, there can be little doubt that Karl Mannheim made a lasting contribution to the discipline of sociology and the ways in which those in many fields understand the production, use, and origin of knowledge.

MARKOVSKY, BARRY

Barry Markovsky (b. 1956) is a social theorist and proponent of integrating theory with empirical research to develop social structural theories that span multiple levels of analysis. His theoretical work has contributed to the explanation of such diverse social phenomena as power, influence, status, legitimacy, equity and justice, and social solidarity.

Markovsky's approach to social theory was shaped by his training in theory construction at Stanford University and especially by his mentor, Bernard P. Cohen, whose influential book, *Developing Sociological Knowledge* (1989), provides techniques for sociologists who do empirical research to build testable theories. The theory construction approach sees theory not as a separate subfield of sociology but rather as a part of sociological methodology that can be practiced by all sociologists. Theoretical and empirical methods are integrated into theoretical research programs that both develop theories and cumulate knowledge.

From the beginning of his career, Markovsky has made important contributions to established theoretical research programs. Joseph Berger and his colleagues developed status characteristics theory to explain how macro social structure is imported into small groups to shape the behavior of individuals working together. Markovsky joined the research team while still a graduate student and led the development of research explaining how the imported social structure of work groups reproduces itself as individuals leave the group and are replaced by others.

Theory construction uses the tools of symbolic logic and mathematics to explicate causal relationships among social variables. Markovsky contributed to metatheory (theorizing about how theories are developed) by showing that an adequate social theory necessarily involves analysis at multiple social levels. While macro social structure cannot be reduced to microinteraction among individuals, neither are the two independent systems.

Markovsky conceived social structure in ways that span levels of analysis to establish new theoretical research programs. With David Willer and other colleagues, he developed network exchange theory, which has quantified the effects of social structure on the power of individuals in networks. Even in small groups, social structure can often produce larger effects on behavior than can the characteristics of individuals. In other networks, however, social structural effects are dampened, allowing individual propensities freer reign. Network exchange theory explains how the pattern of structural relationships that represent any particular network determines the power of the various positions within that network. Moreover, as the theory has developed through empirical validation of its various aspects, it can accurately predict the relative power of different network positions.

In perhaps his most dramatic demonstration of the relationship among social processes at different levels of analysis, Markovsky showed that social structure has physiological effects on feelings of injustice that can then alter social interaction among individuals in ways predicted by theories of equity and distributive justice. By explaining physiological reactions as consequences of social structure as well as causes of social behavior, he presaged recent research on complex interactions between social processes and physiological development.

The best illustration of Markovsky's structural approach to social theory construction may be the theory of group solidarity that he developed with Edward Lawler. Durkheim initiated the sociological study of group solidarity as the affective ties that bind individuals to groups. He proposed that mechanical solidarity emerges from the positive emotion engendered by group members engaged in similar activities, while organic solidarity emerges less strongly from the interdependence of group members created by the division of labor. Modern theories of group

solidarity such as those of Michael Hechter and James Coleman had focused on the interdependence that is characteristic of organic solidarity. These "utilitarian" theories proposed that solidarity exists to the extent that a rational actor would contribute resources to the group. Thus, they emphasize group norms and sanctions against free-riding members that provide incentives to contribute to the group. Markovsky and Lawler's theory formalized the earlier understanding of group solidarity as primarily emotional in origin, the group-feeling that emerges as members work together. These theories suggest that solidarity results when affective bonds tie members to a group over and above the prospect of individual material gain.

To precisely define solidarity, Markovsky and Lawler's theory first separated it from the related concept of group cohesion, the forces that bind a group together. They define *cohesion* as the degree to which members are directly related to other members, that is, the "reachability" of the group. *Solidarity* is then specified to obtain in groups that have high reachability and unity of structure. That is, solidary groups have direct relations among group members and a relative absence of cliques or subgroups. Note how well this formal definition captures Durkheim's original conception of mechanical solidarity as arising in communal groups where all members interact directly with each other as they work on the same tasks. By precisely defining solidarity in relation to the structural properties of groups, the theory gained access to the powerful mathematical tools being developed to analyze properties of naturally occurring social networks. The theory then proposes ways in which emotions engendered during interactions among group members result in individuals forming affective ties to the group as an entity in itself.

Markovsky also contributed to the development of computer simulation as a theoretical tool to help guide social research. Computer simulation as practiced in the social sciences can be primarily empirical, using a continuing stream of data to build models of social phenomena, modeling the economy, for example. Markovsky, however, promotes simulation as a way to specify the assumptions and propositions of a theory by creating virtual actors that embody them. Then as a computer simulation runs, its results represent predictions of the theory. The advantage is that the computer can keep track of the relationships and sequence of interactions among the actors producing testable predictions rigorously derived from the theory. In contrast, a human theorist—unable to manage the complex relationships of many variables through a sequence of interactions—must make intuitive leaps to reach such conclusions. Markovsky's X-Net simulator for exchange networks embodies the theoretical elements of network exchange theory to make predictions about the amount of resources that various network positions can acquire through a series of exchanges. Another advantage of computer simulation for theorists is its flexibility.

A theorist can change one element of the theory and then, by running the simulation, quickly see how that change will alter the theory's predictions. The X-Net simulator proved its worth to the development of network exchange theory as it was extended to predict power more precisely in network structures that produce subtle power differences among network positions.

MARX, KARL

Karl Marx (1818–1883) is widely known as the founder of scientific socialism, a revolutionary critic, in his own words, "of all that exists." Born in Trier, close to the home of the French Revolution, formally educated at Bonn and Berlin, he was initially one of the Young Left Hegelians. His early political journalism led to exile in Brussels, Paris, then finally in London. The circuit was fateful, from German philosophy to French socialism and British political economy. While Lenin later popularised the idea that Marx's work was a combination of German idealism, French utopian socialism, and British radical political economy, it may be more useful to view these as items on an itinerary. Certainly Marx's travel and life path was essential to the development of his thought, even if much of it was unplanned. The *Paris Manuscripts* of 1844 have the radical

flavour of Paris as much as the ruminations of the *Grundrisse* (written between 1857 and 1858) ([1953]1973) are evocative of Marx's years spent working in the silence of the Reading Room of the British Museum. Marx was an outsider, whose life took him from the Rhineland to the homeland of the Industrial Revolution in league with his comrade, Friedrich Engels, who was a textiles manufacturer, a capitalist in Manchester. Engels's life experience of the factory production process, as well as his friendship and financial support, were crucial to the fulfillment of Marx's project. There would have been no Marxism without Engels.

Marx's work was much more than German philosophy, French socialism, and British political economy, and while his theory can be characterised as the critique of political economy, bourgeois society, and capital, there are various other aspects that elude Lenin's easy additive formula. Marx was as deeply influenced by the French Romantic Enlighteners such as Rousseau as by the German Romantics such as Schiller. He was as profoundly struck by the philosophical materialism of Feuerbach and even more influenced by the idealism of Hegel. His prose style is animated by Goethe and Shakespeare. His cultural universe, along with that of the German Enlightenment, was formed by the images of classical antiquity and especially by the work of Aristotle. Even as late as *Capital* (1867)*,* Marx is still working in the wake of Aristotle's images of value and of the human as a political creature, or city dweller. Marx's social theory is a brilliant synthesis of Western and critical culture, though its focus is at once specific as it is general: capitalist production itself. Capital, and capitalist production, are at the centre of Marx's work.

If German philosophy opens the stage, and French politics brings Marx to socialism, then it is the critique of political economy that sustains his work from 1844 on. Marx's major works in the critique of political economy—the *Paris Manuscripts,* the *Grundrisse,* the 1859 *Contribution to a Critique of Political Economy,* and *Capital* (1867)—can be seen as ongoing instalments in the research program that dominated his life from 1844. Of course, for Marx, it was a political program too. For knowledge was revolutionary, and the purpose even of the heavy tomes of *Capital* was to bring on the revolution. The *Paris Manuscripts* saw Marx establish the basic ethical problem of capitalism as private property. The basic problem with capitalism was not that it exploited workers economically by extracting surplus value from them, though it did this too. The real problem was that *alienation* denied the possibility of human autonomy, whether in the act of labour, in the appropriation of its material result, in the alienation from other actors or from the species of humankind. The limit of Marx's argument is that it posits an anthropological holism for humans as the image of all things. The implication of the *Paris Manuscripts* is that socialism would involve some kind of return or recovery of

an original state or condition, where the division of labour could be rolled back and specialization overcome. Marx's early work contains a kind of romantic antimodernism. The positive aspect of Marx's early humanism lies in its insistence that social institutions and the prospect of social change result from willed human activity. Humankind solves only such problems as it sets itself. The urgency of this sense is apparent in Marx's famous Eleventh Thesis on Feuerbach—"the philosophers have interpreted the world, thus far, the point, however, is to change it." This was the Marx who later most fully inspired the Western Marxists, such as Gramsci and Lukács, just as the image of alienation hit home on its first English translation into the 1960s to coincide with the radicalism of the social movements that also valued dreams of autonomy and freedom above all else.

By the time of the *Grundrisse,* and after the failure of the 1848 revolutions, urged on by *The Communist Manifesto* of 1848, Marx shifted the focus of revolutionary change from agents to structure, from proletariat to the revolutionary logic of capital itself. *The Communist Manifesto* is a key juncture here, for its mood shifts from condemnation of capitalism to the celebration of its revolutionary dynamo. From this point on, it becomes clear that capitalism for Marx is the precondition of socialism, not its negation. Marx is never without ambivalence, however, and so it is also here, in the *Manifesto,* that Marx revives Goethe's image of the sorcerer's apprentice, indicating a capitalist world not only out of control but beyond control.

The 1859 *Contribution* is best read as a prelude to *Capital.* Its most notorious feature is its *Preface,* where Marx indicates the project of what later is identified as historical materialism. More powerfully, the *Preface* indicates Marx's turn away from Hegel, away from the idea of civil society as a distinct sphere of activity or enquiry, and his turn into political economy itself as the key to social explanation. As Marx puts it, he now believes that the anatomy of bourgeois society is to be found in political economy. In the cruder language of later Marxists, economic base determined political superstructure; economy determined politics and culture. This was a vital moment in the development of Marx's social theory. It signalled the turn away from politics or culture into economy or production. This was the moment of the birth of economism. It was also a significant methodological step in the direction of monocausal explanation. Modernity, for Marx, henceforth meant capital, and this became the lasting strength and weakness of his legacy. Into the twenty-first century, the power of capital via globalization would be overwhelming, as would the larger theoretical sense that modernity was multifocal, vitally propelled not only by capitalism but also by the state and civil society, where only state and civil society might still hope to civilize capitalism.

In the *Grundrisse,* we watch Marx in his theoretical laboratory, puzzling over method, money, the transition from

feudalism to capitalism, and pondering the possibilities of a technologically driven transition from capitalism to socialism via automation. But *Capital* remains his greatest work, the pinnacle of his achievement, at least in its first volume, the only one published under Marx's authority in Marx's lifetime. In *Capital,* structure rules; this is a lifetime away from the passionate prose protesting alienation of the *Paris Manuscripts,* where the sensuous suffering of human creatures dominates. *Capital* is a work of the finest precision, logic, and choreography. Marx plays with Hegelian imagery, shifting as the text proceeds from the level of appearance (the commodity) to that of essence (the capitalist production process). His point in this elaborate form of presentation is that there is a logic of capital and a best single interpretative way into the labyrinth of bourgeois society. The image of the single commodity leads to the brilliant idea of the fetishism of commodities. Whatever the changes across the path of Marx's work, these consistencies persist. Marx's early encounter with Feuerbach leaves him ever aware of the problem of human projection, where we ascribe to what we create (God, capital) the power to create us. Authorship or agency become subsumed in structure. Marx's journey in *Capital* leads through phenomenological appearance to the descent, as in Dante's *Inferno,* into the living hell of the factory. History, or civil society or state, only enters marginally here, in the tenth chapter on the struggles over the length of the working day or the seventh part on enclosure and the primitive accumulation of capitalist relations. Then, remarkably, socialist revolution arrives unannounced in chapter 32 of *Capital.* This is the lyrical passage where the negations are negated, and the expropriations expropriated, the death knell of private property is sounded. Socialism arrives from within the heart of the capitalist vampire.

Perhaps the arrival of socialism as the culmination of *Capital* is less surprising read immanently than contextually, against the larger body of Marx's work. Marx's sense is that the internal logic of capital, toward self-valorization, is also a logic of self-destruction. The idea of "creative destruction" is associated formally with the work of Joseph Schumpeter, but it is also already active in Marx's thinking in *The Communist Manifesto* and *Capital.* Socialism is immanent within capitalist production. This is the conceptual origin of what later becomes known as "automatic Marxism," the idea that socialism is the rational kernel within capitalism, whether emerging through capitalist collapse, through the tendency of the profit rate to fall, through the development of automation, or through the development of proletarian cooperation within the factory. These later Marxian axioms are, however, clearly at variance with the ethical imperative in the early work, where socialism or social change is conceivable only as the result of willed human action or praxis. The later Marx still believes that the emancipation of the working class can only be the work of the working class itself, but the image of action is framed by that of structure, history, or capital. The distinction between systemic evolution and proletarian revolution becomes blurred.

These tensions between the logic of the work of the early Marx and that of the later Marx became controversial into the 1960s with the English-language translation of Marx's early works. The general tension in debate among Marxists then was described as that between humanism and structure. Structuralist Marxism became intellectually dominant, not least because of its scientific credentials and the failure of the events of May 1968 to become fully revolutionary. Althusser claimed that the earlier Marx was not only a liberal but a different kind of thinker whose later work depended on intellectual rupture after the works of transition such as *The German Ideology* (1845). The question now arose whether Marxism was science or ideology. Marx and Engels liked to think of theirs as scientific socialism, as opposed to the blueprinting desires of their utopian opponents. Marx's work can be associated with the image of *Wissenschaft,* a nonpositivist cultural sensibility that indicates that knowledge is a work of craft and not of proclaiming the truth. At the same time, aspects of his later work bear undeniable resemblance to positivism as we know it in the lawlike sense, claiming to detect the future of humanity through the extrapolation of economic trends such as the concentration of capital and the polarization of classes. Even the 1848 *Communist Manifesto* is structured on the logic of necessity, here indicated by the polarization of bourgeoisie and proletariat into warring camps. As the even younger Marx put it, it was not for him a question of what the proletariat chose but what it was compelled to do.

By the 1980s, Structuralist Marxism had been overtaken by poststructuralism. Humanist Marxism became the object of ridicule in these circles, castigated for the naïveté of the idea that humans create their world. The very idea of humanism became laughable. The mature Marx replaced the young Marx, now to be replaced by Nietzsche, or more literally by Foucault.

A third perspective in the young versus mature Marx controversy asserted continuity, though more along conceptual than political lines. Alienation, for example, could be viewed as an earlier version of the idea of community fetishism. Marx's work could be viewed in its continuity not only as the critique of political economy but as the critique of ideology.

The early Marx criticises bourgeois ideology as false, a representation of the particular interest of the bourgeoisie as though it were general, or universal. Later, in *Capital,* the idea of commodity fetishism also addresses the problem of the way in which capitalist ideology or culture naturalises the existing order of things. At the same time, there is a shift of emphasis from the idea of praxis or sensuous human activity to that of structure across Marx's work and

a corresponding shift from a primary to a secondary emphasis on the role of ideology. For the later Marx, it is the case that bourgeois society reproduces itself less through ideas than through the dull compulsions of everyday life. On this view, the problem is less that capitalism needs to dupe its bearers into inner consent than that there are simply no alternative options available. Capitalism is not the main modern game, it is the only game. The issue is less that we deeply believe in capitalism than that we know no alternatives. For Marx, and those who immediately follow him, however, the alternative is latent within capitalism as socialism itself. The shifts of emphasis across Marx's work remain clear. The early Marx focussed on politics and journalism; the later Marx, on political economy and science. The early Marx focussed on alienation, the later Marx on commodification or reification (the latter becoming a key clue for Lukács). The early Marx privileged activity, or anthropology; the later valued structure. The early Marx was a voluntarist; the later was a structuralist.

There are many Marxes, both in Marx's work and especially for us, who come later. The humanist and ethical impulse of the early Marx was valued politically by the Marx Renaissance in Eastern Europe in work of critics like Heller and Bauman, whose goals were emancipation from the communist regimes that claimed to speak in Marx's name. The later Marx was refigured intellectually as structuralism, where together with Saussure and Freud, Marx's *Capital* was taken as a theory of the commodity sign and the capitalist structure behind it. At the same time, there were other Marxes in Marx's own work. There is the Marx of Rousseau, insisting on direct democracy, or of Schiller, denouncing the fragmentation of the specialized division of labour. There is the classical Marx with Aristotle, denouncing the idea that a shoe is made for exchange, rather than for wearing or spitting at the very idea of the division of labour, insisting that to subdivide a person is to execute that person. There is the Marx (and Engels) of *The German Ideology,* puzzling over anthropology both in its philosophical and physical senses. There is the Marx of the late *Ethnological Notebooks* (1879–1880)*,* now reading Russian, whose thought-processes are so cosmopolitan that he shifts between four languages in one sentence of writing. There is Marx the historian, where some of his finest interpretative moments are registered, for example, in *The Eighteenth Brumaire* (1852), in images of antiquity and masking that pervade in an anticipation of the idea of the invention of tradition. Elsewhere, for example in *The Civil War in France* (1871), Marx both essays contemporary history and shows his hand politically, claiming the Paris Commune as a limited model of socialism.

The question of Marx's political theory is less clear than is his social theory. Marx's social theory begins with the critique of political economy and ends up within it. His political theory is closer in its general sentiments to Rousseau's enthusiasm for direct democracy. His reflections on the state vary, from the cruder instrumentalist view that the state is merely the tool of the ruling class, to the more nuanced view that it is space for middle-class reformers such as the factory inspectors in *Capital,* or the idea that the state is contested and has its own interests in *The Eighteenth Brumaire.* What is notable here is that the more historically engaged Marx's work becomes, the more classes appear above and beyond the two-class model of the *Manifesto,* and the more complex the role of the state accordingly becomes. If Marx does not have a single, coherent theory of the state, nor does he have a clear theory of politics. His earliest journalism suggests the politics of reform. *The Communist Manifesto* announces the arrival of the Communist Party, but this is a small group of like-minded individuals, not a modern organized party; it precedes the mass party as an organizational form. The Communist Party as Marx conceives it theoretically is the same as the class. As is later the case in the spontaneism of Rosa Luxemburg, the party is the mass, is the class.

This is a hiatus in Marx's thinking that is never resolved. After his death, the German social democrats develop the organised mass party form, and the bolsheviks counterpose the vanguard or combat party to it. Marx has no concept of the vanguard or dictatorial combat party. His use of the image of dictatorship of the proletariat is a metaphor, reminiscent of the Roman history he grew up with in Trier. His model of local democracy, developed in *The Civil War in France,* is based on the three *R*s of socialist democracy: rota, recall and relativity (rotation of leaders who are open to recall and paid wage relativity with ordinary workers). Marx has no theory of representative democracy, though he does endorse the idea of an electoral path to socialism late in life, an idea that Engels carries on and Kautsky builds into the culture of classical German social democracy.

By default, there are three avenues of change suggested in different parts of Marx's work. The first, and most powerful, is indicated through the critique of political economy that culminates in *Capital.* Here socialism is the evolutionary stage that follows capitalism, and emerges from within it, embryonically. Organic language, even gynecological, is powerful in Marx's work. The second, which coexists with this image of evolution and also comes to fruition in *Capital,* is the path where proletarian consciousness emerges in and through the production process—cooperation of labour on the factory floor leads to self-management, to the regime of the direct producers. The third, and most troubling, indication of the path of possible change connects consciousness less directly to the proletariat than to the intellectuals who understand capitalism theoretically through the prism of scientific socialism. By the time of the 1859 *Preface,* Marx seems to understand social change as occurring in that moment when structure and agency coincide. If socialists make history but not just as

they please, then socialists—proletarians and intellectuals together—make history when the time for socialism is ripe.

Marx never resolves this question of consciousness, or agency versus structure. If Marxism offers the correct reading of history, and the necessity of socialism is written into the very order of things, why bother with social science at all? Whatever the scientific claims of Marxism, its status as utopia persists. Indeed, there are at least five different images of utopia spread across Marx's work, changing as its own colour does from red or green to grey, as Marx becomes increasingly reconciled to industrialism across the path of his work. The *Paris Manuscripts* contain the image of utopia as the labour of craft. In *The German Ideology,* Marx and Engels offer a second utopia, where they play with the utopia of Fourier in the famous imagery where one could be hunter, herder, fisher, and critic across the path of a single day without ever becoming just one of these. Here the image is that human society should be based on difference, sensuality, and horticulture, Renaissance Man rather than Sparta. By the *Grundrisse,* Marx begins to anticipate a third utopia, shifting freedom beyond labour and into creation itself; automation makes it possible to glimpse utopia beyond labour. By the third volume of *Capital,* later again, Marx confirms in a fourth image of utopia this sense that freedom exists beyond the necessity of putting food on the table. Labour gives way to capital just as freedom gives way to necessity. Labour has to be minimized, rather than returned to its medieval form on this latter account. Marx's utopia, finally, makes peace with industrialism in *Capital* rather than seeking to overthrow it. Thus, the Marx that appealed so deeply to the student movement of the 1960s was the early Marx, the countercultural Marx, whereas the Marx of the intellectuals in the French Communist Party was the author of *Capital,* who showed how hard it was to change the world.

The fifth final, and suggestive, image of utopia in Marx is more provisional. It comes in the form of a theoretical dispensation to his Russian followers who, late in his life, wrote asking Marx's advice. Would they have to wait a hundred years more for the development of capitalism in Russia before their great-grandchildren could make socialism there? Probably, in retrospect, Marx should have remained theoretically consistent with the logic of his position, for which socialism necessarily followed capitalism, even more emphatically at the end of his life. The advice that he gave to his Russian followers was more politically supportive than it was theoretically consistent. Marx's letters to Vera Zasulich indicated that perhaps the Russians could short-circuit the process of capitalist development through the alternative development of the traditional collective form of property holding, the mir. The image of a local Russian socialism is implicit retrospectively in Lenin's New Economic Policy in 1921. Then Stalin—in this at least a good Westernizer—began the ruthless path of Soviet forced industrialization and collectivization into the later 1920s. The figure of Marx now became an icon for a regime that forced labour and destroyed freedom rather than cultivating creativity of any human kind, which did more damage to its people in the name of primitive socialist accumulation than the developmental path of pioneering British capitalism ever achieved.

Marx's political legacy follows out through the tradition of classical social democracy. Hijacked by the bolsheviks after 1917, Marxism became globally synonymous with communism of the Soviet kind. Marx's work, which had emerged as a critical theory via the critique of political economy, was transformed by the bolsheviks into an ideology of state power for the modernizing project of third world regimes. Marx's critical legacy was maintained on the margin, by libertarians and social democrats, and extended later by the legacies of Western Marxism and critical theory. *Post-Marxism* became its caricature into the new century, after the collapse of the Soviet empire and the emergence of turbo capitalism under the aura of globalization. The post-Marxists are often entirely orthodox; they presume that Marx and Engels already grasped the essential reality of our contemporary world, today, within the prose imagery of *The Communist Manifesto.* They agree that Marx's best diagnosis is summed up in the maxim "All that is solid melts into air." But this is a mistranslation, both in the literal and the historical or theoretical sense. Rather, Marx says in the German original that all that stands, estatelike, disappears like vapour. The image is specific, and refers to capitalism's dissolution of feudalism, not to a universal axiom concerning the imperative of change. The more powerful image in *The Communist Manifesto* remains that of the sorcerer's apprentice. The power of the critique of capital, alienation, and commodification make it impossible to imagine modern social theory without Marx, even as we now imagine modernity differently into a new millennium.

MARXISM

Marxism is the organized movements and theories established in Karl Marx's name, claiming to follow and set into practice his theories after his death in 1883. Marx is reputed to have said, in disgust at the quality of thinking of his French followers, that if these were Marxists, then he was not a Marxist at all. Marx and Engels nevertheless set about seeking to establish Marxism as a scientific rather than merely utopian socialism, and set out equally to place Marxism as the leading force in the formative international workingmen's movement. The history of Marxism is caught up with the history of the four internationals.

During his later life in exile in Britain, Marx's influence on the German social democrats took time to consolidate. The combined German Marxist party was formed in 1875. By the turn of the twentieth century, the German social democrats had become the first mass political party in the world and the subject of Roberto Michels's pioneering study in political sociology, *Political Parties.* It was a Marxist party, a party claiming to follow Marx. During Marx's lifetime, the more immediate object of struggle was the First or Workingmen's International. It was replaced by the Second International in 1889. As the German Social Democratic Party came to dominate global Marxism in this period, so did it dominate the Second International. The Second International collapsed in 1914, when German social democrats voted in parliament for war credits for World War I. With their successful seizure of state power in October 1917, the bolsheviks replaced the German social democrats as the dominant Marxist movement and in turn established the Third Communist International in 1921. Under Stalin, the Comintern became the arm of Soviet imperialism and was disbanded by Stalin in 1943 as a peace gesture to the Allies. In 1938, Leon Trotsky, the great bolshevik revolutionary forced by Stalin into exile in Mexico, proclaimed the Fourth International. International Trotskyism, taking its cue from Trotsky's 1938 *Transitional Program for Socialist Revolution,* proceeded to split multiply across the remainder of the twentieth century, often over the question whether to work within the larger socialist or labour parties or to work independently or follow other successful revolutionary movements such as those in Cuba or Nicaragua. The collapse of the Soviet Union in 1991 is widely interpreted as indicating the end not only of communism or socialism but also of Marxism, though Marxism as a theory has become a permanent fixture in the academy, and its presence as the remaining critique of dominant global capitalism persists.

Marxism as a movement or series of movements has been different and had a distinctive fate than any other such social theory. The social theories of Durkheim and Weber generated no isms or ideologies to follow them. The only other social theorist to have a public influence in any way comparable to Marx was Freud, not at the level of state power or politics, but in the extraordinary spread of psychoanalysis, particularly in America. Marx's work, which proclaimed itself as a critique of ideology, follows the peculiar historical path in which it becomes an ideology, first of reform or opposition with the German social democrats, then of revolution and state power with the bolsheviks. By the 1930s, Soviet Marxism became the face of the most brutal state power alongside the Nazis, though it is important to recognise that there were always those Marxists who repudiated bolshevism from the start, and others who paid with their lives for standing against Stalinism in the name of Marxism and socialism. Marxism has always been a contested legacy.

The history and significance of Marxism after Marx is by no means limited to the Internationals, though it is often connected to them. German or classical social democracy, and then bolshevism or communism, became major historic facts and institutions of the twentieth century. Viewed as a social theory or set of social theories, Marxism proliferated in various ways as critiques of the world rather than as ideologies of movements seeking to change it and institutionalise alternative regimes of state power. While there is a long tradition of conservative thinking that views Marx's work as the necessary and sufficient precondition of Soviet communism, there is also an alternative stream for which Marxism is best understood as critical theory, for which the Frankfurt school is the exemplary tradition. For the critical theory of the Frankfurt school, Marxism was a German movement whose moment was lost in the failure of the labour movement to preempt Hitler and begin to install international socialism first. Viewed from the perspective of Gramsci or later, Habermas, the central weakness in Marx's theory was its economism, or its lack of theory of politics. Marx's Eleventh Thesis on Feuerbach insisted that the point was not to interpret the world but to change it. But how? And who were the actors responsible for initiating change? Marx's fatal decision to locate the anatomy of civil society in political economy resulted in the assertion of the necessity of proletarian revolution, and ascribed the role of revolutionary agent to the proletariat, whether they wanted it or not. Socialism, counterposed to capitalism, subsumed the idea of democracy to itself but failed to specify the

mechanisms by which democracy could be promoted and extended. The standard Marxist contempt for representative democracy always left these Marxists on the outside.

The classical Marxists of the German Social Democratic Party followed Marx's economistic sensibility, for which socialism followed capitalism as evening follows day. The German social democrats, especially Karl Kautsky, who became its leading theorist and codifier, read Marx as Darwin and viewed Marxism as an evolutionary theory: first feudalism, then capitalism, within which would mature and finally emerge socialism, by definition an industrialized large-scale utopia. Capitalism was merely a husk, a cover for the next stage. This meant, for Kautsky, that the German social democrats were a revolutionary but not a revolution-making party (his predecessor, August Bebel, was fond of the view that socialism would fall into the laps of socialists like ripe fruit). Social democracy in Germany became an alternative culture, a society within a society, a project of internal institution building rather than revolution. For Kautsky, the long-term scenario was one in which class polarization would naturally divide the two great classes, bourgeoisie and proletariat, diminishing the numbers of the former as it increased those of the latter, to the point at which the vast majority of the population would be not only proletarian but also socialist, for here the continuity of identity was presumed. This kind of "maturational socialism" by the 1890s resulted in the culture of fatalism that called out the Revisionist controversy, in which the major actors were not Kautsky, who sat in the middle, but Eduard Bernstein, arguing for reform, and Rosa Luxemburg, advocating revolution. Bernstein's diagnosis of the situation for socialists was exactly the opposite of Kautsky's: There was no process of class polarization, the middle class was growing rather than shrinking, capitalist crises did not worsen, socialist revolution was not around the corner, and therefore the challenges of democratic politics moved centre stage.

Bernstein's was a rare voice, arguing that socialism was desirable rather than necessary: Its prospects depended not on guarantees of necessity or assurances that capitalism would collapse but on the expression and articulation of popular will (what Gramsci would later call "counterhegemony"). The pragmatic Bernstein, witnessing the inconsistency between the Social Democratic Party's revolutionary rhetoric and its reformist practice, argued for bringing rhetoric into line with practice. Rosa Luxemburg argued to the contrary, that if practice failed to live up to revolutionary claims, then practice should move left, not theory accommodated right. The dispute was as telling as it was lively, for it served to highlight Marx's fateful legacy: The SPD had no theory of transformative politics. Bernstein argued, by default, for the introduction of a politics of citizenship, which looked to his opponents and others like the substitution of liberalism for Marxism. Bernstein was

ridiculed as a reformer, and charged with Fabianism to boot. The controversy was dual in nature. It involved not only reformism but also revisionism. To call practically for reforms was one thing. To insist that the theoretical tradition of revolutionary Marxism be revised, brought formally into line with this reformism, was another. Bernstein sought both to pursue political reform and to reform or revise Marxist orthodoxy, to mainstream Marxism as social democracy. Luxemburg had little better to offer, except for the telling critique that an accumulation of reforms would not add up to the qualitative social change that Marxism had stood for, this accompanied by a spontaneist insistence that the mass would indeed rise as a class, where no vanguard party would be necessary. Luxemburg remained revolutionary to the end; she remained a vehement critic of bolshevism, of Lenin's dictatorship, and of what she called Soviet barracks socialism.

Kautsky was practically the victor of the reform versus revolution debate, as its result by default was to restate the status quo: Social democracy was a revolutionary but not a revolution-making party. The contradiction was crowned in the 1890 Erfurt Program, where Kautsky's revolutionary maximum program was followed by Bernstein's minimum program, with no transitional program in between. The impasse was broken by the bolsheviks, with the theory and practice of the revolutionary combat party exemplified in the October Revolution. The German social democrats were eclipsed globally by the success of the bolsheviks in 1917 and then destroyed locally by the Nazis after their rise to power in 1933. The greatest institution of classical or European Marxism was no more. Its strongest, indirect legacy was to occur elsewhere, by transmission, in Sweden, where the Swedish Social Democratic Party, guided by the para-Keynesian ideas of Ernst Wigforss, became the natural party of government, opening the way to the project of wage earners' funds via Rudolf Meidner into the 1980s. [The Swedish Social Democrats had a clearer sense of purpose than their German teachers ever achieved. Their sense of mission was, first, to pursue political democracy or citizenship, then social democracy or social rights, and last, economic democracy, or social ownership. Theirs was a Marxist program that put muscle on T. H. Marshall's 1950 statement *Citizenship and Social Class,* and was only to be eroded by the new wave of globalization into the 1980s.]

Lenin had imbibed social democracy from Plekhanov, the Russian equivalent of Kautsky. As late as 1899, Lenin still argued forcefully in *The Development of Capitalism in Russia* that capitalism came before socialism, and must do so; there were no shortcuts to socialism. Lenin was a social democrat, and his party was called the Russian Social Democratic Party. The breach in this position arrived in 1902, in *What Is to Be Done,* where Lenin introduced the idea of the revolutionary combat party. Doubtless conditions in Russia did not favour the early emergence of liberal

democracy; but Lenin turned the small vanguard party of activists into a virtue. The party was the solution to the problem of the missing theory of politics in Marx. It was only in 1917, however, that Lenin finally decided the time to seize power was ripe; the other bolshevik leaders demanded they wait, and Trotsky did not become a bolshevik until mid-1917, earlier showing solidarity with the Mensheviks, whose theory and politics were closer to those of the mainstream German social democrats. Lenin's political flexibility saw him argue for both the seizure of power in 1917 and for the introduction of capitalist economic elements in the New Economic Policy of 1921. The period of War Communism intervened.

The young Trotsky had argued a position similar to Luxemburg's, railing against Lenin's dictatorial style in his 1904 *Our Political Tasks.* In the 1905 revolution, his politics were more like Gramsci's in his conciliar period with the occupation of the factories of Turin in 1918. This most intellectual of Marxists, Trotsky favoured the intellectual climate of Vienna until becoming more bolshevik than the bolsheviks after 1917. His exceptional skills as military commissar during the civil war did not translate into ordinary political corridor skills; he was exiled by Stalin in 1927 and murdered on Stalin's orders in Mexico in 1940. Trotskyism became the standard halfway house for disillusioned bolsheviks. Having pioneered Marxist historical sociology in the fine volume of essays *1905,* Trotsky also generated one of the most powerful if ultimately unconvincing works of Marxist political sociology in his critique of the Soviet Union, *The Revolution Betrayed,* which claimed that the U.S.S.R. was in transition from capitalism to socialism, more socialist than not, as its property forms had been nationalized and it formally remained a workers' state, even if deformed in its institutions and political life. Trotsky's embrace of bolshevism saw him accept the single most central principle, which he hitherto vehemently rejected—the centrality of the party. As he later was to put it, none of the bolsheviks could be right against the Party; this was a matter of "my party, right or wrong." Trotsky became the most bolshevik of bolsheviks, arguing for the militarization of labour and the Americanization of bolshevism, waxing lyrical in *Literature and Revolution* for the developmentalist utopia where humans and nature would be engineered to perfection. Marginalized politically, Trotsky was left with these fantasies while Stalin actually set about forcing industrialization and collectivation onto the Russians.

Into the 1930s, Stalinism became the dominant form of Marxism in the Soviet Union, the Third International, and the international Marxist movement. The Comintern became the global tool of Soviet power, and Stalinism became the dominant left ideology. Stalin insisted on the possibility of the construction of "socialism in one country," resisted by Trotsky, reviving the earlier slogan of Permanent Revolution, for which socialism would be international or it

would not be at all, while all revolutions that commenced as bourgeois in the twentieth century would be compelled to become socialist in character. Plainly, Stalin's sense of realpolitik was more acute than Trotsky's, but the extent of the crimes to which Stalin was prepared to go, not least in engineering famine in the Ukraine in the name of attacking the middle peasantry and escalating the levels of incarceration in prison camps opened by Lenin, placed Stalin on a level of barbarism similar to that achieved by Hitler, perhaps worse. Marxist theory under Stalin was reduced to the hackneyed clichés of dialectical materialism and historical materialism, indicating alleged laws of nature and society that must be obeyed. Socialism entered its blackest moment. There were always voices of dissent, but too many socialists were suckers for the image of success implied and the aura conferred by Soviet state power. Stalinism was criticised and opposed by Trotskyists, earlier by the left opposition of Kollontai, by left radicals like Victor Serge and Ante Ciliga, by the council communists from Anton Pannekoek in Holland to Paul Mattick in the United States, by the Frankfurt school and Korsch, in a more compromised way by Western Marxist Lukács, whose peace with bolshevism was made early and adhered to.

Western Marxism, so-called after the fact, refers to the thinking of Europeans such as Gramsci, Lukács, and Korsch. If the axis of world Marxism had shifted to the East with the bolsheviks, and even if bolshevism was for these theorists exemplary in its activism, a new sense emerged that bolshevism could not serve as a universal model. In the East, in Russia, the old regime was rotten and could be knocked over. In the West, it was dug in, implicating individuals and classes as consumers and voters. As Lukács argued in *History and Class Consciousness,* the founding text of Western and Weberian Marxism, reification ruled in the West. To change the Western world would depend on understanding how it worked, and how in particular culture socialized individuals into accepting it. The revolution in the West would be slow. Within the communist sphere of influence, the Italian communist leader after Gramsci, Palmiro Togliatti, proclaimed polycentrism or the multiplicity of communisms into the 1950s, and alternative variations on the communist theme were exercised by Kardelji in Yugoslavia as socialist self-management, under Imre Nagy in Hungary and in Poland. Dissident reform communists emerged in each of these experiences, opening the way to the East European critical theory of the Budapest school and the Polish radicals including Zygmunt Bauman. Radical Trotskyists broke with Trotsky to form Socialisme ou Barbarie with Castoriadis and Lefort in France, differently with Michel Pablo in Algeria, C. L. R. James and Raya Dunayevskaya in the United States. Communism in America never held the appeal of Marxism, though some great thinkers like W. E. B. Du Bois joined the Communist Party of the United States of America.

Other American intellectuals supported Marxism and then turned. Among the more powerful thinkers involved were Sidney Hook, Max Eastman, and Daniel Bell. American Marxism was strong in political economy, as in the work of Paul Baran and Paul Sweezy on capitalism and imperialism, and later in the world systems analysis of Immanuel Wallerstein and his cothinkers. Maverick sociologists connecting Marx to the mainstream included C. Wright Mills and Alvin Gouldner. The intellectual influence of Trotskyism as the party and nonparty loyal Marxist opposition was extraordinary. Its ambit included figures of extraordinary appeal, like Trotsky's biographer, Isaac Deutscher, American Trotskyists such as Irving Howe, and a whole generation of writers and theorists such as Perry Anderson connected with the British *New Left Review.* The Marxist economist most influential on the work of Fredric Jameson, Ernest Mandel, was a lifelong Trotskyist activist. Alternative trends flowered in Paris via the influence of Lefebvre, and earlier, Hyppolite and Kojeve, who pioneered the French reading of Hegel's *Phenomenology* and influenced a whole generation that would later become largely structuralists.

The Soviet hegemony over the Left was only really loosened by the Chinese Revolution in 1949 and the emergence of a serious rival Stalinism or Marxism-Leninism with Mao Zedong Thought. Marxism appealed to the Western Left, it seems, not least because of its apparent romanticism or exoticism. The image of intellectuals forced to engage in backbreaking field labour in the so-called Cultural Revolution was perversely attractive to those who at the comfort of their metropolitan distance imagined this to be a new social experiment in overcoming the division between mental and manual labour. Romantic intellectuals of the Left have long harbored sympathies for the idea of the revolution, the revolutionary rupture as new beginning, whether in the new calendar of the French Revolution or the Year Zero of Pol Pot's Kampuchean disaster two centuries later. The connections were more than incidental—Pol Pot's theorist, Khieu Samphan, learned his Marxism in Paris. In terms of the politics of Marxist social theory, Maoism offered the communist insiders an apparently radical precedent from within the tradition with which to criticise Soviet Stalinism. For even despite his precipitous voluntarism, Stalin believed that economy ruled. Khrushchev inherited his sense that Soviet communism would beat capitalism by economic indicators. Mao, in comparison, argued that politics should be placed in charge—better red than expert.

Whether leading French Marxists like Louis Althusser really believed in the superiority of Mao Zedong Thought or not, the precedent provided by Chinese "purism" gave them a radical stick with which to beat stodgy Soviet Stalinists like Brezhnev, whose corruption became legendary. For all the distaste Althusser had for humanist Marxists like Sartre, this was one thing they had in common. Third world Marxism appealed. In Sartre's case, the most striking filiation was with Frantz Fanon's advocacy of therapeutic anticolonial violence in *The Wretched of the Earth.* Here the logic was as simple as it was devastating. If civilization, or capitalism or imperialism destroys us, then the only solution is self-evident: We from the margins have to destroy it first, or before there is any further damage. Marxists from the West, even Trotsky, had always stood against individual acts of violence and terror, on the grounds that it was the system that needed changing. Kill the tsar, and there was always a little tsar behind him. Decolonization brought with it a sense of moral urgency where, as for Fanon, the sense of emancipation was more directly caught up with the capacity or need physically to remove the master. Sartre sympathised; others, like Camus and Orwell, were horrified. For them, the very idea of exemplary violence spoke only of the reproduction of terror, not release from it. By the 1960s, the old working-class movement of the centres was looking bourgeois, complacent, and incorporated. Such was the message of Marcuse's widely influential *One Dimensional Man.* Marx had ascribed the role of social actor to the proletariat; Lukács built a theory around this. If the working class failed to act, then given the necessity of socialism, another actor must logically step up to fill its place. By the sixties, the proletariat had become a systemic insider for radical Marxists; the change agent would have to be outsiders, the equivalent of the lumpen proletariat, the social scum, or proletariat in rags derided by Marx as agents of reaction rather than revolution. The transference of authority from the nineteenth-century proletariat to the late twentieth-century marginals made sense, but only within the limited logic of a politics where collective interests, or their absence, were presumed to be the key motivational force explaining social change. Thus, the wretched truly became the inheritors of the world. Third worldism shifted hemispheres after 1959, to take in enthusiasm for the Cuban Revolution, though its dynamics were different and less ideologically driven. Cuba never quite had the appeal of China for Western radicals; support for Cuba was often more a matter of solidarity with a small power on the doorstep against the might of the United States. The retrospective enthusiasm for Che Guevara as a lost icon is similar in stature only to the cult of Trotsky and, photographically, to the cult of Jimi Hendrix.

As labour had become integrated into capitalist society especially after World War II, so did the social democratic parties become integrated as systems managers of the mixed economies. The German social democrats gave up all formal or rhetorical connection to Marxism after 1959, though Marxists and Trotskyists continued to work through its youth sections. The same process occurred in the labour parties of Britain, Australia, and New Zealand. Marxism as a theory revived into the sixties, with the translation of

Marx's early *Paris Manuscripts,* Marcuse's *One Dimensional Man,* and books by Andre Gorz, Harry Braverman, and the American Monthly Review school. Journals proliferated, such as *Studies on the Left, Telos, Socialist Register, Marxism Today,* and *New Left Review.* Gorz revived the old German Social Democratic Revisionist debate, practically, by introducing arguments for what he called "revolutionary reforms," which sounded like Bernstein's project of accumulating reforms but claimed to escalate them together in a spirit closer to Gramsci's. Later, into the 1980s, these hopes helped fuel Left popular arguments for an Alternative Economic Strategy, which would consolidate and extend the national basis of social democratic reform by developing industry policy and self-management. *New Left Review* became a meter of Marxist theory, beginning with a more humanist and local phase, partly driven by the Peace and Nuclear Disarmament Movement, through to the headier days of Vietnam. The fare shifted from thinkers like Sartre to tougher French communists such as Althusser. Within the Marxist tradition of social theory, this marked a reversal, back to the image of scientific socialism.

Althusser's politics were those identified with Mao and Lenin, but his intellectual imperatives were closer to Lacan, Spinoza, Montesquieu, and Rousseau. His arrival coincided with the structuralist wave, when thinkers such as Lévi-Strauss, Foucault, and Lacan became extraordinarily influential in Paris, and, by English relay, throughout its intellectual dependencies. Structuralism did not break in America until the arrival of its literary turn, in deconstruction, and via Yale and then through the American travels of Foucault. Marxist structuralism was a peculiar mix of these structural orientations, which were often explicitly denied by thinkers such as Althusser, and the more conventional period communist interests in Gramsci, Lenin (but not, in Paris, Trotsky, who belonged to the Trotskyists), and Mao, together with the powerful image of the Cultural Revolution. Freud sat in the back of this grouping, as structuralist Marxism's interest in culture and consciousness included curiosity concerning psychology and the mind. How did capitalism subject us, make us subjects of its processes, make us love consumption? How could we break out of capitalism? The moment of break, apparently, came in 1968, when student strikes in Paris drew 10 million workers onto the streets; but the Communist Party leadership, wary of adventurism, failed to push the masses forward, and de Gaulle eventually sent the workers back to their homes with increased wage packets. May 1968 encapsulated the whole problem, for Marxists. It proved that the capitalist world could stop and that extraordinary creative energies might be released as a result; and it proved that, once the party was over, the world would go back to capitalist business as usual. Perhaps May 1968 was the last chance at *revolution;* perhaps it represented larger historical forces of modernization and smaller cultural moments of efflourescence. Whatever the case, the French Communist Party made it plain that it did not want to lead a revolution. The leading communist parties, those of France and Italy (followed by Spain), had become, in period talk, social-democratized. They were managerial institutions, working a particular cultural and economic constituency connected to radical intellectuals and the working-class movement, whose purpose was like the labour parties to protect their interests and advance them where this could be done without risks of repercussion.

The image of social democracy they called up was somewhere between the fin-de-siècle achievements of the German society within a society and the postwar German image of sound corporate management and growth. The Latin communist parties made their last bid for increased power into the seventies in the form of the French Union of the Left and the Italian Historic Compromise. The French Union of the Left involved a coalition with the French Socialist Party, from which the Communist Party had split in 1920. The Italian Historic Compromise was partly referred back to the Gramscian idea of historic bloc, expanded to take in all larger political parties in an alliance of national popular unity. Generically, this movement became known as Eurocommunism, to set it apart from Soviet communism. The initiative at first stalled and was then taken over by changes in the Soviet Union under Gorbachev, which saw communism marginalized as a world force. Perhaps this was inevitable, as communism represented a global attempt on the part of the bolsheviks and then Stalin and his followers to universalize the particular experience of the Russian Revolution. It was the phenomenon of the Russian Revolution that prompted Max Weber to comment to his younger friend, Lukács, that this experience would set socialism back one hundred years.

Marxism, itself the product of intellectuals as much as the workers' movement, lives on in a cultural form in universities and their milieu, not least as post-Marxism. Indeed, Marxism has become part of the popular culture it articulated, in the sense that economy rules, and globalization with it. What has gone is the idea that Marxism offers an alternative way of life, rather than a critique of actually existing capitalism. Marxism as a social theory remains influential in the critique of capitalism and imperialism; through its influence in sociology, not least in league with the insights of Weber that were connected by Lukács and driven on by the Critical Theory of the Frankfurt school; in cultural studies, via Gramsci, geography via Lefebvre, and so on. In less explicit ways, the influence of Marxism can be encountered in mediated forms in the sociology of Pierre Bourdieu, where cultural capital reflects capital in Marx's sense, and social action is circumscribed still by senses of economic interest, as in the sociology of Alain Touraine, where the idea of a single central social actor or subject for

each phase of societal development still echoes Marx, long after the dream of revolution has evaporated.

MATERNAL THINKING

A term coined by Sara Ruddick (1980; 1995), maternal thinking refers to the values, intellectual capacities, and metaphysical attitudes that may arise from the daily work of mothering children, whether that work is done by women or men or by biological or adoptive mothers. In developing this concept, Ruddick drew on the philosophical traditions of Wittgenstein, Winch, and Habermas, which treat thought as arising from social practice. At the same time, she contributed to the strong current within 1970s and 1980s feminist scholarship that highlights the value of activities conventionally associated with women.

Maternal practice, Ruddick argues, is governed by three universal but culturally and historically shaped "demands" of children. First, children demand preservation. Protecting a child in the face of life's fragility produces the attitude of "holding," of viewing the world with an eye toward keeping the child safe, knowing one cannot completely control the environment. Second, children demand nurturance. Helping the child grow physically, intellectually, and emotionally requires the capacity to welcome and understand complex, unpredictable change, both in children and in oneself. Third, children demand training so that they may achieve social acceptance. Fostering the child's moral and social development requires cultivating openness to the child's potential, including the child's potential difference from oneself. A mother also needs to model conscientiousness, resisting blind acceptance of her community's values.

Ruddick emphasizes that mothers are not inherently peaceful; some mothers neglect or abuse their children, and many mothers support the military actions of their sons, lovers, and states. Nonetheless, she proposes that maternal thought can be a resource for peacemaking. Drawing on the ideas of Gandhi and Martin Luther King Jr., she identifies four principles that may arise from efforts to protect, nurture, and train children: renouncing violence against the vulnerable, resisting injustice in one's home or community, seeking reconciliation while holding people responsible for their actions, and keeping the peace when justice has been attained.

The greatest challenge for maternal thought is moving beyond protecting, nurturing, and training one's own children at the expense of others, thereby perpetuating racism, classism, and other forms of injustice and violence. And yet Ruddick finds that maternal thought can be a resource for a broader politics of resistance. For example, the Madres of Argentina, who resisted their government's kidnapping, torturing, and murdering of "the disappeared," connected their fight for their children to the violence others suffer worldwide. Ruddick also claims that when mothers develop a feminist consciousness, they come to see clearly the harm they have suffered as well as inflicted on others, and they may come to understand connections between those forms of violence and state-sponsored violence. While feminism itself does not necessarily oppose all forms of violence, a maternal politics informed by feminism encourages the extension of local concerns to a global concern for all children.

In theorizing maternal thinking, Ruddick claims universality not for mothers' situations but for children's demands for preservation, nurturance, and training. She also acknowledges that she theorizes as a white, heterosexual, partnered, middle-class American woman. Some feminist critics, however, find that Ruddick's theorizing slips too easily into generalizing from privileged mothers' circumstances. Patricia Hill Collins, for instance, developed the concept of *motherwork* based on the experiences of poor and working-class mothers of color in American society. These mothers struggle for their children's survival, teach their children to preserve their identities in a racist society, and fight for empowerment in a society that exploits their labor.

Other feminist scholars who focus on women's social locations modify rather than criticize the concept of maternal thinking. For example, Nancy Scheper-Hughes (1996) explores maternal thinking under conditions of severe deprivation in Brazil. Rather than seeking to preserve life, extremely impoverished mothers develop the mental habit of "letting go," of resigning themselves to the deaths of infants who "need" or "want" to die. Scheper-Hughes finds

a convergence between this form of maternal thinking and military thinking in that both develop a concept of acceptable death.

Eva Kittay (1999) takes up the issue not of mothers' radically different circumstances but of children's, pointing out that Ruddick's concept of maternal thinking presupposes an "intact" child. When a child is severely disabled, the work of preservation persists for the child's entire life. The work of fostering development requires imagining not eventual independence but development of *this* child's capabilities. This may mean, for example, enhancing the child's capacity for joy. The work of training requires negotiating the child's social acceptance. This may mean both normalizing the child and accepting what is normal for *this* child. It may also mean challenging institutionalized discrimination so that others may accept the child as he or she is. In theorizing maternal thinking in this way, Kittay seeks concepts of equality and justice that include the fact of dependency in our society and that respect the work of caring for dependents. In her recent work, Ruddick commends this revision of the concept of maternal thinking.

MATRIX OF DOMINATION

First introduced by the sociologist Patricia Hill Collins, the matrix of domination is a concept that draws attention to the inherent complexity of privilege as it operates in social systems and shapes people's lives. The basic idea is that various forms of privilege—such as those based on race, gender, class, ethnicity, or sexual orientation—do not exist independently of one another in the social world or people's experience of themselves. Instead, various forms of privilege are related to one another in ways that make it difficult, if not impossible, to understand one without paying attention to its connection to the others.

In the simplest sense, in our lives as individuals, there is no social situation in which people perceive and treat us in terms of a single characteristic such as being white or female or gay. For example, people are unlikely to experience me as simply a man or a white person but instead will form complex impressions based on a larger set of characteristics. Even if their attention is drawn to some particular aspect of my social identity—such as my gender—they will nonetheless experience me as a man of a certain race and class and sexual orientation, not as some kind of "generic" man who is at that moment neutral or invisible in relation to other characteristics related to privilege.

The complexity of social identity in relation to privilege makes it likely that people will belong to both privileged and subordinate categories at the same time. Some people—such as middle-class, straight, white Anglo men—may belong only to privileged groups, while others—such as lower-class lesbian women of color—may belong only to subordinate groups. But most people—such as working-class white men or professional women of color—will fall somewhere in between, making for complex and sometimes confusing lives. Working-class white men, for example, may be acutely aware of their subordinate position in the class system but oblivious to their access to male privilege and white privilege. Not only that, but their acute awareness of class disadvantage may make them bristle at the idea that they have access to any form of privilege.

This combination of defensiveness and blindness to privilege is a frequent source of conflict and division as subordinate groups try to organize against their own oppression. The women's movement, for example, continues to struggle with the perception among women of color that their interests are routinely subordinated to those of white women, especially white women of the upper middle and upper classes.

The matrix of domination also points to the complexity of privilege on the level of social systems, where various forms of privilege intersect in complex and powerful ways. Many people believe, for example, that the origins of racism and white privilege are primarily a matter of race itself—going back as far as human awareness of racial differences—and are rooted in an inherent human tendency to fear those unlike themselves. The history of racism, however, shows that the origins of white privilege and whiteness as a social identity are fairly recent and cannot be separated from the development of capitalism and the social class system among whites in the United States during the nineteenth century. At the core of white privilege and racism was the institution of slavery, driven primarily by the desire among whites for rapid economic growth and by the development of technology such as the cotton gin that made the massive enslavement of Africans a lucrative enterprise.

The various forms of white racism that accompanied slavery—the devaluing and oppression of African Americans and the violence directed at them—were primarily ways to justify and enforce a system of economic exploitation based on race.

The connection between race and class is more complex than this, however. The white working class was encouraged to incorporate whiteness into their social identity as a mark of superiority and pride. This was done in large part to compensate them for their oppression as workers under the industrial capitalist system, thereby defusing discontent that might otherwise erupt in rebellion against capitalism and class privilege.

Racism also had the effect of dividing the working class along racial lines so that white workers were encouraged to focus suspicion and hostility on people of color rather than on the capitalist class. When white unions went on strike, for example, owners often resorted to the tactic of using people of color as strikebreakers both to resume production and redirect white hostility.

Class and race continue to interact in powerful ways. Much of the opposition to affirmative action, for example, comes from white male working- and middle-class workers who experience people of color and white women not as allies in a class struggle but as competitors and adversaries defined by race and gender.

In these and other ways, the concept of the matrix of domination clarifies the complexity of privilege as it shapes both individual identity and the distribution of wealth, power, and prestige in social systems. It focuses attention less on individual sources of privilege and oppression in isolation from one another than on interlocking systems with multiple dimensions. In this way, it draws attention to the problem of privilege itself—regardless of the form it takes—as one of the most powerful sources of division, injustice, and unnecessary suffering in the human experience.

McDONALDIZATION

According to George Ritzer, with whom the academic use of the term originates, McDonaldization is "the process by which the principles of the fast-food restaurant are coming to dominate more and more sectors of American society as well as the rest of the world" (Ritzer 1993:1). As such, McDonaldization does not refer to the spread of McDonald's restaurants throughout the world, and nor does it refer to the fact that more and more areas of life are copying McDonald's. It is undoubtedly the case that the latter happens, but it is only part of what Ritzer means by McDonaldization. Instead, McDonaldization refers to the diffusion of the principles that the restaurants exemplify.

Ritzer sees McDonaldization as an aspect of the continuing rationalization of more and more areas of social life. This process has been identified by many of the early classical sociologists like Max Weber. The term was devised in large part as a medium for helping students and others to understand the process of rationalization. The process of McDonaldization draws on a number of developments that precede the emergence of fast-food restaurants. Ritzer singles out scientific management, Fordism, and bureaucracy for special mention as precursors of McDonaldization. The first of these, which was expounded by Frederick Winslow Taylor at the turn of the twentieth century, called for the breaking down of work tasks into minute components, which were then reassembled in the most efficient combination. Fordism was influential in the spread of McDonaldization in building upon scientific management by recognizing the need for fragmented jobs to be linked together so that a standardized product could be manufactured through a continuous production flow. Regarding the notion of bureaucracy, McDonaldization takes inspiration from the regulation of organizational behaviour through rules and regulations as well as through tight managerial control. Thus, these three influences, all of which are features of creeping rationalization, are seminal influences on the process of McDonaldization, though they predate the first McDonald's restaurant by many decades.

McDonaldization has to do with the spread of *the principles* of the fast-food restaurant. As such, McDonald's merely acts as a symbol for these developments. It is, of course, a very high-profile symbol, but the point is that McDonald's itself only exemplifies the principles. Ritzer outlines four dimensions of McDonaldization, all of which can readily be seen in a McDonald's restaurant:

Efficiency. This refers to the implementation of the optimum means for a given end. A McDonald's restaurant is efficient in a number of ways but particularly in the sense that it is geared to allowing a large number of people to be supplied with food. It is efficient from the point of view of both the restaurant and the consumer.

Calculability. This means an emphasis on things that can be counted. In the specific case of McDonald's restaurants, this is revealed in a number of ways. The restaurants used to proclaim the number of millions and later billions of burgers that McDonald's had sold. But more significantly for Ritzer, they convey the impression that the consumer is getting a *large* amount of food for a *small* expenditure of money (e.g., Big Mac).

Predictability. When you go into a McDonald's restaurant, anywhere in the world, you will not encounter any great surprises. Minor national variations are sometimes introduced, but by and large, the menu will be familiar to anyone who knows McDonald's fare. Not only that, but if you do order a Big Mac, it will be the same in terms of size, contents, taste, appearance, wrapping, and even how it was cooked and put together as one bought anywhere else.

Control through nonhuman technology. Both customers and workers are controlled through nonhuman technologies. Customers in a McDonald's restaurant are controlled through the queuing system, whilst workers are controlled through production technologies that measure the precise amount of ketchup or the cooking time.

McDonaldization is evident not just in the spread of such principles in fast-food restaurants but in its diffusion in many spheres of modern life. Thus, Ritzer and various other writers have considered its flow into areas such as theme parks, higher education, sport, health care, shopping, tourism, and even birth and death (Ritzer 2000, 2002; Smart 1999). Of particular interest is Ritzer's (1998) suggestion that American sociology has been mechanized. For example, it exhibits predictability by virtue of the standardized format of journal articles, which are further rationalized by the peer review process, while the computer and software, as nonhuman technology, control the writing process. One might add that the growing use of online reading of journal articles constrains the reader too.

Ritzer writes very much as a critic of McDonaldization, though he also displays a grudging admiration for it. The critical hue is apparent in his identification of what he terms "the irrationality of rationality" in relation to McDonaldization. The irrationality of rationality seems to serve as a further dimension of McDonaldization in some of Ritzer's writings. The point is that frequently McDonaldization leads to the *opposites* of the four features. In other words, it frequently leads to *in*efficiency, *un*predictability, *in*calculability, and *loss* of control. In the case of the rationalized jobs that are so central to McDonaldization, the irrationality of rationality is revealed in the fact that McDonaldized work is invariably dehumanizing. This in turn leads to a high labor turnover and frequently to difficulty in finding replacements.

McDonaldization has been criticized on several counts. It is sometimes accused of not taking the perspective of the user into account and of instead placing the emphasis on Ritzer's own views about others' experiences. He has been accused of providing a simplistic view of the globalization process that takes little notice of local adaptations to the global spread of McDonaldization's principles. It is also sometimes suggested that Ritzer minimizes the role and significance of countervailing trends, such as post-Fordism with its implications of variety and customization in place of standardization and the mass market.

Ritzer's writings on McDonaldization have provided a provocative concept that encapsulates several trends in modern society but in a manner that is accessible beyond the academy.

MEAD, GEORGE HERBERT

George Herbert Mead (1863–1931) was a philosopher who had been influenced initially by positivistic psychology but eventually developed a unique perspective that combined the pragmatism of John Dewey, Charles Sanders Peirce, and Josiah Royce into a social psychology with elements of the biological and evolutionary sciences. Some pertinent details of Mead's life are worth reviewing as a backdrop to understanding what led him to develop this novel position.

Mead, born in 1863 in South Hadley, Massachusetts, had been exposed to both religion and higher education

throughout his formative years. His father, Hiram, was chair in Sacred Rhetoric and Pastoral Theology at Oberlin College beginning in 1869. Mead's mother also taught at Oberlin, and she was devoted to ensuring that young George was guided through a daily routine of prayer, study, and good works. Although Oberlin College was well known for its religious orthodoxy, it also emphasized the social obligations of living as a Christian, and this included a rather "radical" commitment to the emancipation of blacks and women (Joas 1985:15).

Given this set of circumstances, it was already decided that George would himself attend Oberlin College, where he received his bachelor's degree in 1883. Because Darwinism was in full ascendancy as an intellectual worldview at the time Mead began his university studies, he was confronted with the seeming contradiction between a life devoted to Christian charity informed by the word of God, on one hand, and the secular "truths" represented in Darwinism and Spencerian evolutionism, on the other. Early on, then, Mead showed a concern for the sources of moral values in a rapidly secularizing world, and, as we shall see, much of his mature, later work was dedicated to working out this issue.

After college, Mead tried several things, including teaching grade school, working in railroad construction, and working as a surveyor and a private tutor (Miller 1973). None of these were rewarding, however, and in 1887 he returned to secular education by enrolling in graduate school at Harvard University. The spirit of social reform of the era lent a certain respectability to professors who felt inclined to engage in social advocacy, and Mead was drawn to Harvard faculty who shared this sentiment, including Josiah Royce, George Palmer, William James, and close friend and fellow graduate student Henry Castle (Wallace 1967). (Mead never actually studied with James, but did tutor his children [Joas 1985:17]). At Harvard, Mead initially was interested primarily in philosophy, psychology, and languages, including Greek, Latin, German, and French.

A year later, after winning a prestigious Harvard scholarship that allowed him to study abroad, Mead had decided that the study of physiological psychology would be useful insofar as this field promised to deliver empirical insights into all manner of human behavior, including the genesis and development of human morals and values. At the time, Wilhelm Wundt, at the University of Leipzig in Germany, had established an experimental laboratory for testing the propositions of physiological psychology, and Mead studied there during the winter semester of 1888/1889. A year later, Mead transferred to the University of Berlin, where he studied with Wilhelm Dilthey, among others. This was important insofar as Mead's enthusiasm for the positivistic orientation of physiological psychological was tempered somewhat by the more "descriptive" psychology espoused by Dilthey, one that utilized the interpretive methods of the humanistic sciences (Joas 1985:18).

Although still without an advanced degree, Mead returned to the United States in 1891 and accepted an instructor position at the University of Michigan to teach philosophy and physiological psychology. It was there also that Mead met his lifelong friend and colleague, John Dewey. Dewey, who shared with Mead an abiding concern with social democracy and morality, was teaching courses in ethics and psychology at Michigan, and it was in these courses and more informal contacts that Mead began putting together the theoretical approach that was to become social behaviorism.

SOCIOLOGY AND PRAGMATISM

In 1894, Dewey agreed to become head of the philosophy department at the University of Chicago, and he brought with him Mead, who was given the rank of assistant professor of philosophy. What Mead had needed all along to bring together the many disparate strands of his training was a philosophical focus, and this came in the form of pragmatism, a perspective that was sponsored by many of the Chicago faculty with whom Mead worked and studied, including Dewey, James Tufts, and James Angell (Miller 1973:xxii). Pragmatism is an American movement in philosophy, founded by C. S. Peirce and William James, marked by the doctrine that "truth" is preeminently to be tested by the practical consequences of belief. From this perspective, history and the human condition are neither the result of mechanical necessity (as in positivism or as implied in the spatiotemporal framework of physics) nor the movement toward a known or fixed goal (as in Platonism or Hegelianism), but instead is a process conditioned by human thinking and action (Miller 1973:xxiv). In other words, rather than positing the intervention of external forces, pragmatism focuses on flesh-and-blood human beings doing things together in the here and now to create and modify a shared reality, an ongoing social world. Mead (1929–1930) favored pragmatism because he felt both neo-Hegelianism and Darwinism, positing master trends seemingly decoupled from the willful actions and interventions of human beings, were incompatible with democracy.

Mead would remain at Chicago until his death in 1931. During the decade before his death, sociologists at the university started noticing his work because it seemed to represent a new and important type of social psychology, one that emphasized the importance of the social environment in helping to shape and form the individual (Cook 1993). Hence, many within sociology embraced Mead as one of their own. Sociologists, as well as many economists, psychologists, education researchers, and even theologians at Chicago, felt that the pragmatic social psychology Mead and his associates in the philosophy program were

developing promised to resolve all philosophical questions through analyses of practical action.

For sociologists, most importantly, Mead's work seemed to resolve—or at least cast in a new light—the question of how the impulsive, biological organism acquired the capacity for self-awareness, purposive behavior, and moral discrimination (McKinney 1955). In developing such concepts as the social act, the self, and mind and thinking (all of these to be discussed more fully below), Mead forcefully argued that meaning is neither biologically given nor simply a psychical addition to an act. Rather, meaning arises in and through social acts and social relations, where human beings actively participate in the meaningful construction of their world through the exchanging of significant symbols, whether verbally through language or nonverbally through gestures. Through the medium of society—the organization of perspectives of real individuals—the impulsive organism becomes a rational actor (McKinney 1955:149). This perspective became immensely influential within sociology, leading directly to the development of symbolic interactionism as fashioned by Herbert Blumer and other of Mead's students.

THE SOCIAL ACT: THE PRECONDITION OF CONSCIOUSNESS

As we have seen, although Mead was a social psychologist whose writings sociologists at the University of Chicago and elsewhere deemed relevant to their own work, he was also a social behaviorist because of the seriousness with which he viewed the writings of Charles Darwin, even though he ultimately rejected Darwin's functionalist psychology, which asserted that consciousness is a precondition of the social act. Mead (1934:18) argued instead that the social act is the *precondition* of consciousness. Elements of both Mead's social psychology and social behaviorism led him to an interest in physiological psychology, and it should be reiterated that that interest arose because he was convinced that philosophical problems could be clarified and given empirical referent with help from the biological and evolutionary sciences (Joas 1985). The biological sciences were important to Mead to the extent that philosophers (with the exception of the pragmatists) and social scientists had tended to neglect corporality, or the body, in developing explanations of social behavior.

This concern is forcefully illustrated in *The Philosophy of the Act* (1938), where Mead argued that it was important to deal conceptually with two aspects of human perception of the social world and objects (including self and fellow human beings) contained therein. On one hand, there is perception arising out of immediate experience, namely, situations in which an organism makes no differentiation between itself (its body) and objects as seen or manipulated by it within immediate perceptual range. In effect, immediate experience is equated with bodily activity, where the organism deals directly with things rather than with signs of things (Tibbetts 1975:224–5). On the other hand, there is perception that arises through reflective analysis (or intelligence), whereby human beings make clear distinctions between that which lies within the experiencing subject (subjectivity) and that which lies outside the subject (objectivity, represented by other physical or social objects and one's own body).

MIND AND BEHAVIORISM

Mead raises this classic subject-object dualism, however, not merely to reaffirm its long-standing position in descriptions of the human condition in philosophy, the humanities, and the sciences but to suggest that there is never really any way of going beyond, or leaving behind, the brute reality of the physical realm within which human beings conduct their social activities. Although it is true that the evolutionary adaptation and upgrading of the human brain provides for complex symbolic communication that elevates humans above the animal level, and because of this it becomes important to take account of internal perceptual experience, it should never be forgotten or overlooked that humans are social animals as well, and hence attention to behavioral activity taking place via organism-environment transactions is equally important to the social analyst (Feffer 1990; Tibbetts 1975.)

This reflects, in essence, a debate between a purely physiological or behavioristic approach to explaining human behavior (as represented in Darwin or John B. Watson) and the social psychological behaviorism that Mead was attempting to develop. As a type of positivistic theory, behaviorism suggests that one may develop general explanations about human behavior if one assumes that human beings—like other animals—respond to external stimuli in the same way. That is, human beings will repeat behavior that is pleasurable or rewarding and desist from or try to avoid behaviors that are painful. This is known as the stimulus-response (S-R) theory, namely, that as sentient life-forms, human beings are predictable insofar as pleasurable stimuli will produce certain forms of concrete, observable behavior and painful stimuli will produce other types.

The more interpretive, social psychological theory that Mead was developing, in contrast, influenced by Dilthey and Dewey among others, suggests that the behaviorist or S-R approach leaves one crucial element out of its explanation: human cognition. From the social psychological perspective, the S-R approach is overly deterministic in that it sees human beings as empty vessels being buffeted about by various external stimuli. This, Mead would contend, is simply not an accurate portrayal of human behavior. Between the external stimulus (S) and the response (R) of the organism to that stimulus is the cognitive process at

work within the organism (O), whereby the organism *interprets* what the stimulus *means*. As Cook (1993:75) has noted, in emphasizing "mind," and the internal conversation between the "I" and the "me" that takes place with any meaningful human social action, Mead argues that the standard behavioristic explanation of human behavior—which was dominant in psychology and the social sciences at the time Mead was writing—renders human beings as merely passive recipients of external stimuli. Rather than human beings receiving external stimuli in such mechanical fashion and responding to these stimuli in predictable ways, human beings are constantly adjusting themselves to objects in the social environment—which includes inanimate objects, living organisms, other human beings, and one's self—through a mindful process of taking into account these objects and taking the role of, or attitude of, these others. As such, mind is a temporal extension of the environment of the organism. As Miller (1973:203) goes on to explain, because human beings are conscious of their intentions prior to acting and as they reflexively monitor their behavior, they can either continue on with the intended course of action or modify it as the situation warrants. In essence, this control over behavior reflects the social component of the mind.

Thinking, as mindful activity, involves a conversation between the objects immediately available in the social environment (representing the "generalized other" or the "me") and the person (the "I").

REFLEXIVITY AND THE SELF

To reiterate this element of his social psychology, Mead argues that the essential condition for the appearance of mind is that the individual, in acting toward and adjusting to objects in the social environment, also takes into account himself as an object in relation to the other objects present. Hence, a self arises, one in which knowledge of the thinking self accompanies the "brute" realities of the physical organism moving about in space and time (Mead 1938:367–8).

This most essential characteristic of mind and mindful activity, which serves to separate humans from lower animals, is accomplished via the human capacity for reflexivity or "reflexiveness." Reflexivity was especially important both to Charles H. Cooley's "looking glass self" and of course to Mead in developing the concepts of mind and self. In Cooley, persons develop a sense of self by seeing themselves in the reflection of others' attitudes and behaviors toward them. Likewise, Mead argued that it is by means of reflexiveness—the turning back of the experience of the individual upon himself or herself—that persons are able to take the attitude of the other toward them. "Reflexiveness," according to Mead (1934:134), "is the essential condition, within the social process, for the development of

mind." The human being is an object to himself or herself, or, similarly, the human being may become the object of his or her own action (Blumer 1969:62). However, this self-interaction is not merely an internal, psychological phenomenon but a *social* process out of which arises the self. As Blumer (1969:63) explains, the "ego" as such is not a self; "it would be a self only by becoming reflexive, that is to say, acting toward or on itself." Mind and self are not simply givens in the biological makeup of human beings; they arise out of participation in group life (Blumer 1981:140). In suggesting a convergence of Cooley and Mead on the concept of reflexivity, however, it should be noted that Mead (1956:293–307) distanced himself from what he considered to be Cooley's overemphasis on consciousness and "psychophysical parallelism" represented in ordinary psychology.

As we have seen, Mead emphasizes that the self—to be distinguished from the physiological organism—is not given at birth but arises through developmental stages through social experiences and activities. Most important, the self is an *object* to itself, which thereby distinguishes it from other objects as well as from the physical body. But how does a self become an object to itself? The self is experienced as an object not directly but indirectly from the particular standpoints of other members of the same social group. Before becoming a subject to himself or herself, the person first becomes an object to himself or herself, and this is accomplished by taking the attitudes of other individuals involved in the same groups or shared social activities (Mead 1934:138). In essence, the self is a social structure that arises in and through communication and social experience.

PLAY, GAME, AND THE GENERALIZED OTHER

An important set of background factors in the genesis of the self includes the activities of play and game. The *play stage* occurs early in the lives of children when they typically begin to play with imaginary friends or take on various roles such as mother, father, police officer, teacher, or even cartoon characters. The importance of communication and the significant symbol are obviously important here, to the extent that "when a child assumes a role he has in himself the stimuli which call out that particular response or group of responses" (Mead 1934:150). In other words, the child is aware of and can use on some level a set of stimuli that call out in the child the sort of responses they call out in others. When simultaneously playing the roles of teacher and student, for example, the child may call roll as the teacher and respond with a "Here" or "Present" as the names of each child in the class are read. Saying something as one character is the stimulus that calls out a response for the next character, and that response in turn is a stimulus for the next response or set of responses. As this conversation

of gestures progresses, a certain organized structure arises in the child and his or her "others." This organized structure is in essence the first glimpse of a developing self. Rather than straight S-R in the behavioristic sense, a self develops as conversations between a number of role personae are engaged by the individual, thereby emphasizing cognition and mind, reflecting in essence the improved S-O-R pattern of stimulus-organism-response.

The fuller development of the self, however, does not occur until the child has reached the *game stage.* In order to participate in organized games, the child must be able to take the attitude of everyone else involved in the game. For example, in a simple game such as hide-and-seek, the child must be able to take the attitude of those in one of two distinct roles, namely, hider or seeker. In more complex games typical of organized sports, the child must be able to take the role of multiple positions simultaneously. For example, in order to play the game of baseball competently, a person must be able to anticipate what each position on the field will do at the crack of the bat. By doing this, by putting himself or herself in the shoes of everyone else on the team, the person develops a highly organized set of responses (rules) by which he or she is now able to look back upon himself or herself from the vantage point of all the other positions.

Through the process of socialization, as we continue to move out beyond the limited experiences of family and peer groups to a wide assortment of persons and social situations that mark life in a modern, culturally diverse society, we continue to take on the attitudes of diverse individuals and groups and to reflect back upon our selves from their vantage points. This organized community or social group that delivers to the individual his or her unity of self Mead termed the "generalized other." In essence, the attitude of the generalized other is the attitude of the whole community (Mead 1934:154).

THE SOCIAL NATURE
OF ETHICAL CONDUCT

Ethics and human values were issues that Mead kept at the forefront throughout the development of his theoretical system. As Morris (1934:xxxi) has suggested, "Mead, in common with all pragmatists since James, held an interest theory of values: that is good which satisfies an interest or impulse." Kant's categorical imperative is paradigmatic of a philosophical—rather than an empirical or "scientific"—approach to the question of ethical behavior and values, and as we have seen, Mead was attracted to science and the promise of empirical evidence as a way of overcoming the "speculative" insights of idealistic systems of thought, whether in the guise of social philosophy or theology. Even so, for the most part, contemporary symbolic interactionists (such as Blumer) who consider Mead (along with James,

Dewey, and Cooley) to be the intellectual founders of the perspective take to heart Kant's universalizing notion of the categorical imperative. Indeed, Mead's generalized other finds close affinity to Kant's categorical imperative. For example, Mead (1934:386) once stated, "One should act with reference to all of the interests that are involved: that is what we could call a 'categorical imperative.'"

Hegel was opposed to Kant's "reflective philosophy," and especially the famous distinction Kant made between noumena and phenomena. Noumena are "things-in-themselves," and these are distinguished from "phenomena," which are those objects that like-minded persons—whether scientists or laypersons—come to some agreement over and treat as if they were objectively "real" and hence knowable. As Mead (1934:379) emphasized, Kant assumed human beings are rational to the extent that in determining the conditions of our existence, we take into account (ideally) the attitude of the entire community. Where Mead attempted to go beyond Kant is by suggesting that morality or sociability is not something that arises out of individual activity or thinking that presumably takes into account the actions of others (society)—this was the same mistake Cooley made in equating the self to attitudes (pure reflection) rather than actions or social process—because this gives universality only to the *form* of the judgment of "ought." But as Mead (1934:379–80) states, "However, we recognize that not only the form of the judgment is universal but the *content* also—that the end itself can be universalized" (emphasis added). In this "kingdom of ends," Kant assumes that human beings apply rationality to the form of their acts in pursuing the "ought," which cumulatively produces moral behavior and the good life. Mead went further than Kant insofar as Kant is unable to state the end in terms of the object of desire of the individual.

The question then becomes, How are we to determine the sort of ends toward which our actions should be directed if we are to preserve an ethical way of life? For this Mead turns away from Kant and toward Dewey. Well before Mead began writing about the self, Dewey had been exploring the philosophical implications of human sociability and cooperation. From Mead's perspective, Dewey and the pragmatists offered a way of establishing the natural origins of social cooperation without invoking Darwin, Kant, or the utilitarians. Mead's theory of the social self is in essence an effort to explain the social nature of ethical conduct not in strictly behavioristic or individualistic terms. For Mead, communication—which is the major tool through which cooperation and shared social worlds are forged—does not arise out of competition ("survival of the fittest") nor in imitation (Tarde), but in constructive cooperation. Rather than a prudent strategy for individual survival or dominance, sociability was actually present with the appearance of language. Rather than the lower-level conversation of gestures in which animals engage, human desires are laden

with emotions, and the significant symbols that arise in human communication externalize these otherwise private or internal plans of action. According to Mead's theory of self, it is through the response of others that we become aware of our own attitudes and selves. Importantly, we cannot know ourselves without first being involved in symbolic communication with others. But since sociability is already implicated in human communication—from the pragmatic perspective, communication is a "tool" that persons "use" in everyday life—it precedes conscious rationality (Feffer 1990:242).

CONCLUSION

Mead's years at Chicago were marked by wider efforts at social amelioration and the progressive agenda of social restoration. His interest in pragmatism was not only theoretical; for example, he served as treasurer of Jane Addams's social settlement at Hull House, one of the most visible example of the kind of moral consciousness that could be assured through good works. Rather than bringing an external set of standards to bear, workers at Hull House and the burgeoning social services more generally achieved the philosophical "ought" through work in the community and neighborhoods wherever needs were most acute. For Mead, the settlement house effort reflected how the community ought to form a new moral judgment (Cook 1993:102). Indeed, nearly all members of the philosophy department at the University of Chicago—with Dewey and Mead leading the way—participated in the social reform movements sweeping across Chicago and the rest of the country beginning in the late 1800s.

The basis of human cooperation is at the heart of Mead's theory of self: Knowledge of the other's role, although a necessary but not sufficient condition, is the starting point of ethical reciprocity (Feffer 1990:252). Role taking is not only something that occurs naturally in the human condition; it also provides a means by which human beings are able to cooperate and ideally realize the democratic ideals of the just and good life. For example, the notion of "rights" makes sense only to the extent that self-consciousness arises as we take on the attitude of others, that is, as we assume the attitude of assent of all members of the community (the "generalized other"). Mead held out hope that this generalized other would expand outward from communities to nation-states and eventually to the global level. As he (1959:195) stated, "The World Court and the League of Nations are other such social objects that sketch out common plans of action if there are national selves that can realize themselves in the collaborating attitudes of others."

MEANS OF CONSUMPTION

When studying the capitalist economy from a conflict perspective, attention has historically been focused on issues relating to the means of production. According to Karl Marx, classes are defined by their relationship to the means of production. Control of the means of production is a key to power, and private ownership of the means of production underpins class oppression and exploitation. Clearly, production is an important part of the capitalist

economy and an important part of a sociological analysis of capitalism.

Marx's work, while focused on production, does not neglect consumption. Basic consumption, from the Marxist perspective, is utilization of use-values either in productive consumption or individual consumption. Instruments of labor, tools, and raw materials (the means of production) are used up in productive consumption—the product of which is the final good itself. Individual consumption is the process in which products are used to satisfy human needs or wants directly.

Marx understood the term *means of consumption* as "commodities that possess a form in which they enter individual consumption of the capitalist and working class" ([1884]1981:471). Marx's definition of the term focuses on the end products of the production process, though he makes a distinction between the consumption of different classes, suggesting that subsistence consumption ("necessary means of consumption") is characteristic of the working class, whereas consumption of luxury goods is the privilege of the exploiting capitalist class, which exchanges the surplus-value denied to the laborers for its consumption excesses.

From Marx's perspective, capitalism is poisonous to human creativity. Under capitalism, humans strive to make money in order to survive and to consume, but mass consumption of mass-produced commodities is not a creative process. It is, however, a critical function for the capitalist system. A condition of production in capitalism is "[t]he discovery, creation and satisfaction of new needs arising from society itself. . . . [Capitalism involves] the developing of a constantly expanding and more comprehensive system of different kinds of labor, different kinds of production, to which a constantly enriched system of needs corresponds" (Marx [1857–1858]1973:409)

Consequently, Marx's own definition of the means of consumption as commodities that possess a form in which they enter individual consumption falls short. That is, it focuses on the end product that flows into the marketplace. It does not attend to the way that "new needs," which ensure that the end products of consumption realize their use value and enrich the capitalist class, are ever more efficiently made accessible and desirable to individual consumers.

Sociologist George Ritzer has expanded Marx's concept of the means of consumption. Ritzer argues that a focus on the means of consumption is particularly pertinent in modern society because "in recent years, to the degree that production and consumption can be clearly separated, production has grown increasingly less important (for example, fewer workers are involved in goods production), especially in the United States, whereas consumption has grown in importance" (1999:55). Ritzer distinguishes between the end product (the commodity itself that "enter[s] individual consumption") and the means of consumption that facilitate the consumption of goods—for instance, the shopping mall, the theme park, or the Las Vegas casino.

For Ritzer, the "new means of consumption" are "those things that make it possible for people to acquire goods and services and for the same people to be controlled and exploited as consumers" (1999:57), and he points out that the new means of consumption are a phenomenon particularly characteristic of the post–World War II era, a time period when consumer incomes and appetites are on the rise. A place like a mall offers the consumer buying options and opportunities, but at the same time, it is part of a system of consumer control, as consumers are seduced into buying what they do not need, thinking that they need what they only want and spending beyond their means, all of which enrich those who control the means of production.

The concept of the new means of consumption integrates ideas from German sociologist Max Weber about rationalization, enchantment, and disenchantment. The Weberian perspective holds that premodern societies were more "enchanted" than modern societies. Earlier, societies or communities, which were often small and relatively homogenous, operated on ideas that were magical and mystical. These entities were guided by substantive rather than formal rationality. That is, individuals and societies defined and pursued goals based on abstract teachings, such as the ideals and ideas of religion. Even early capitalism was linked to an enchanted world: The early Calvinists, who gave birth to the "Protestant ethic" that spurred capitalism, saw economic success as leading to salvation. They searched for signs to guide them in their quest. While they were constructing a "rational" economic system, they also were powerfully influenced by magical thinking.

Modern capitalism loses enchantment. It is a highly rationalized system. Highly rationalized systems are characterized by efficiency, predictability, calculability, and control, none of which are magical. Enchantment, however, is important to the control of consumers: Consumption is, at least in part, a response to a dream or fantasy about the item being consumed and its effect. Being in an enchanted setting can foster spending, and the "new means of consumption" attempt to "reenchant" rationalized settings. This is done through the creation of spectacular consumption venues. For instance, Disney simulates a kind of childhood dream world (think of the Magical Kingdom), Nike Town is a sports fantasy, Las Vegas aims to bring to a single city the dazzle of Egyptian pyramids, New York's towering buildings, and Paris's Eiffel Tower. Even the Internet features "magical" consumption sites that lure children in particular, combining games and visual stimulation with entreaties to purchase products with a click of the computer mouse. These new means of consumption ensure that a central part of the "entertainment" experience is consumption itself, opportunities for which abound and are integrated into the "fun."

The dual concepts of the means of production and the new means of consumption are important to a broad analysis and understanding of the modern capitalist economy, in which the central role of production has shifted to open up a more pivotal role for consumption.

MEANS OF PRODUCTION

In Marxist theory, the "means of production" characteristic of a society is fundamental to understanding all other political, economic, and social relations. The means of production consist of a combination of "subjects" and "instruments" of labor. Subjects of labor are "the things worked on" because they are the literal subject of the productive effort. Raw materials are an example of subjects of labor. The oil pumped out of the ground or the trees that are harvested in forests are raw materials. So too are slabs of lumber, though the slabs of lumber are themselves the product of an earlier labor process. Instruments of labor include tools that "work on" the subjects of labor such as the lathes that turn the lumber into bowls or the mechanical robots that bolt the door to a car on the assembly line.

The means of production is more than a description of the production process. For Marx, it is the key source of conflict in class relations because if one class of people owns the means of production and another class creates the products through their labor, then the stage is set for class conflict. Marx and Engels observe in *The Communist Manifesto* (1983) that "the history of all hitherto existing society is the history of class struggles" (p. 108). Throughout history, classes have stood "in constant opposition to one another" because of the conflict inherent between the owners of the means of production and the people who work for the owners (p. 109). Class conflict emerges directly from oppression by those who own the means of production of those who do not. Under feudalism, class struggle takes place between the landowners and the serfs or peasants. The transformation from feudalism to capitalism changes the class structure and gives birth to "two great hostile camps, [to] two great classes directly facing each other: Bourgeoisie and Proletariat" (p. 109). These classes are defined by their relationship to the means of production: The former owns the means of production and the latter must work for the owners in order to survive.

In capitalism, labor power and the means of production are purchased by the capitalist, who sets the exploitative productive process in motion. Capitalists control production and the resulting product is their property: They expropriate the surplus value of the product. That is, the worker is paid less than the value of his or her work—the difference between what is paid and the value produced is "surplus value." In "Wages, Price and Profit" (1983), Marx writes that "The *surplus value,* or that part of the total value of the commodity in which the *surplus labor* or *unpaid labor* of the working man is realized, I call *Profit. . . .* [T]he very fact of the possession of the *instruments of labor* enables the employing capitalist to produce *a surplus value,* or what comes to the same, *to appropriate to himself a certain amount of unpaid labor.*" (p. 61). Expropriation of surplus value by the bourgeoisie exploits the workers who produce but do not own the fruits of their labor.

Proletarians cannot produce for themselves because they do not own the materials and implements that make up the means of production. Proletarians own their own labor power, which they are "free" to sell and are compelled to sell in order to survive. Because capitalists only pay the proletarians subsistence wages in order to protect their own profits, the proletarians and their class cannot gather enough money to purchase their own means of production and they are tied to the exploitative conditions set down by the capitalist owner. The fundamental interests of capitalists and workers are in stark opposition to one another.

Karl Marx predicted that as capitalism progressed, fewer people would have the opportunity to own the means of production and competition would push more people into the proletariat to labor as wage workers toiling for the profit of others. As he writes in "Wage Labour and Capital" (1983), "The capitalist takes the worker into his workshop or factory, where all the things necessary for work—raw materials, auxiliary materials (coal, dyes, etc.), tools, machines—are already to be found. Here the worker begins to drudge" (p. 147). The consolidation of capital in the hands of an elite was predicted to contribute to the conditions leading to an ultimate revolution of oppressed proletarians who would usher in socialism and resolve the fundamental contradiction between the public process of production and the private ownership of the means of production. The socialist order would eliminate the private ownership of the means of production and end the exploitation of the working classes, into whose hands the means of production would pass.

While Marx's predicted revolution has not been realized in advanced industrial societies, his work continues to offer a

critical perspective on modern capitalism. Marx recognized the consolidation of capital as a process in capitalism. In the United States, for instance, ownership of automobile, media, and a host of other industries is concentrated in the hands of a small elite. Small, family-owned pharmacies and hardware shops, a staple in many towns and cities in the past, have been increasingly replaced by large chain stores, with which they cannot compete. Marx predicted that even members of the professions would become wage laborers. In modern society, fewer physicians, for instance, own their own means of production (having private practices) because intense competition has pushed more doctors into the service of health maintenance organizations, which set their wages and the conditions of their work.

Marx's concept of the means of production is important to an understanding of economic and social relations historically and today. While modes and means of production change across time and space, Marx maintains that those who own the means of production exploit, by definition, those who do not. Consequently, conflict is inevitable until the abolition of private property. This concept remains an important analytical tool for constructing a critical perspective on capitalist society.

MEDIA CRITIQUE

Media critique derives from two major concerns: the content of the media and its impact on audiences. It is no surprise, then, to find that the social sciences and the media share a great deal of history and a number of preoccupations to do with modernity, technical innovation, and the complexification of daily life. The social sciences have divided and refashioned people and societies, as have media practice and critique, and frequently in related ways. Each operates in the context of divisions of labor and commercial and governmental determinations.

In the twentieth century, with the maturation and standardization of social science method and its uptake by the U.S. military, commercial, and governmental worlds, media audiences have come to be conceived as empirical entities that can be known via research instruments derived from sociology, demography, psychology, and marketing. Such concerns have been coupled with a secondary concentration on content. Texts too are conceived as empirical entities that can be known via research instruments derived from sociology and literary criticism. Critiques of the media have come from within discourses of the social derived from the psy-complexes (psychoanalysis, psychology, and psychiatry), sociology, economics, communication studies, anthropology, and the humanities (literature, cinema studies, media studies, and cultural studies). The six principal forms of critique are (1) the borrowing of ethnography from sociology and anthropology to investigate the experiences of audiences, (2) the use of experimentation and testing methods from psychology to establish cause-and-effect relations between media consumption and subsequent conduct, (3) the adaptation of content analysis from sociology to evaluate programming in terms of generic patterns, such as representations of violence, (4) the adoption of textual analysis from literary and critical theory, Marxism, and linguistics to identify the ideological tenor of content, (5) the application of textual and audience interpretation from psychoanalysis to speculate on psychic processes, and (6) the deployment of political economy to examine ownership, control, regulation, and international exchange.

Following an illustration of the shared history of modernity, social sciences, and the media, certain developments across methods and disciplines that have both exercised the media and been exercised by them are summarized, prior to the focus on two key components of media critique: audiences and texts. For the most part, first world theory will be referred to, albeit in a way that depends on, and feeds into, third world media practice and theory.

THE MODERN AND THE MEDIA

In the nineteenth century, it was taken as read in the West that media audiences were active, given their frequently unruly conduct at cultural events such as theatre and sport. But the emergence of public education, which took as its project uplifting and hence disciplining the working class, shifted that rhetoric. This was achieved via literary criticism (distinguishing morally, intellectually, or socially "improving" texts from others) and psychology (distinguishing mentally, intellectually, or socially compliant populations from others). Social psychology emerged because

of anxieties about "the crowd" in a rapidly urbanizing Western Europe. Elite theorists from both Right and Left feared that newly literate publics would be vulnerable to manipulation by media demagogues (Miller 2003). This notion of the suddenly enfranchised being bamboozled by the unscrupulously fluent has recurred throughout the modern period. It inevitably leads to a primary research and policy emphasis on audiences and texts: where they came from, how many there were, what they were made up of, and what happened because of them.

These criticisms were articulated to the arrival of new technologies. Consider the advent of telegraphy in the nineteenth century. It enabled a massive increase in the velocity of information flowing across the United States. Newspaper journalism became less deliberative and more instantaneous, which drew critiques of the shift from public affairs to popular *minutiae.* As the telegraph became connected with the new dissociabilities and insensitivities of modern life, its permissive connection to the production and circulation of truth was brought into question, singled out for the way its relay of market sensitivities disturbed business operators. Nineteenth-century neurological experts attributed their increased business to the telegraph and such factors as the growth of periodical literature, science, and education for women. The telegraph's presence in saloons enabled a huge expansion in working-class betting on sporting events. While its generic messages of goodwill for such events as birthdays became highly marketable and standardized, the prospect of individual marks—seemingly enhanced through popular education—was devastated by the very industrialization that had produced it. Through the latter part of the nineteenth century, the United States and Western Europe saw spirited debate over whether the new popular genres such as newspapers, crime stories, and novels would breed anarchic readers lacking respect for the traditionally literate classes. The mass media posed a threat to established elites by enabling working people to become independently minded and informed, and distracted from the one true path of servitude. It was feared that this *Leserevolution* would produce chaotic, permissive practices of reading in place of the continuing study of a few important hermeneutic texts by the elite's intellectual fraction. By the 1920s, the spread of the car and the radio were thought to have produced a technical and moral deskilling of the workforce, with ease and automation displacing thrift and responsibility, and emotions experienced through simulation. The evidence lay in women's use of cosmetics and men's taste for action adventure films. By 1940, the telephone had been decreed responsible by critics for the abolition of loneliness, the emergence of the city, the decline of the country, the growth spurt of the skyscraper, the democratization of everyday life, and the destruction of the family.

Broadcasting was more frightening and promising, more contagious and withering, than the essentially private life of reading and talking. Not surprisingly, the excitement about broadcasting increased many times when images were added to sounds. As television came close to realization, it attracted particularly intense critical speculation. Rudolf Arnheim's 1935 "Forecast of Television" predicted that the new device would offer viewers simultaneous global experiences, transmitting railway disasters, professorial addresses, town meetings, boxing title-fights, dance bands, carnivals, and aerial mountain views—a spectacular montage of Broadway and Vesuvius. A common vision would surpass linguistic competence and interpretation. "[T]he wide world itself enter[ing] . . . our room" via TV might even bring global peace with it, by showing spectators that "we are located as one among many." But this was no naive welcome. Arnheim warned that "[t]elevision is a new, hard test of our wisdom." The emergent medium's easy access to knowledge would either enrich or impoverish its viewers, manufacturing an informed public, vibrant and active—or an indolent audience, domesticated and private (Arnheim 1969:160–63). Today's model would be accusations that an "MTV generation" or "Internet surfers" can process trivia exquisitely but lack powers of concentration and the capacity to separate important knowledge from dross. Same discourse, new object.

These concerns are perhaps best expressed in ideas about the media as cultural industries, "which employ the characteristic modes of production and organization of industrial corporations to produce and disseminate symbols in the form of cultural goods and services, generally, although not exclusively, as commodities" (Garnham 1987:25). The idea that culture industries "impress . . . the same stamp on everything" derives from the 1930s and 1940s Frankfurt school critical theorists Theodor Adorno and Max Horkheimer (1977). Their theory of production-line culture says that because demand is dispersed and supply is realized, management operates via an administrative logic. This is socially acceptable because it is said to reflect the already-established and -revealed preferences of consumers, a reaction to their tastes and desires. But for Adorno and Horkheimer, such an account denies a cycle of power. They see consumers as manipulated through the mobilization of cultural technology by those at the economic apex of production. Whenever it is claimed that technology has an innate logic, this is an instance of "domination" masquerading as choice in a "society alienated from itself." Coercion is mistaken for free will. Culture becomes one more industrial process subordinated to the dominant economic forces within society calling for standardization. The one element that might stand against this leveling sameness is "individual consciousness." But that consciousness has itself been customized to the requirements of the economy and media production. As the following two sections indicate, these anxieties attained particular focus when they were turned onto audiences and texts.

AUDIENCE

Concerns about audiences include psychological, socio-logical, educational, consumer, criminological, and politi-cal promises and anxieties. These have been prevalent since silent cinema's faith in "the moving picture man as a local social force . . . the mere formula of [whose] activities" keeps the public well-tempered (Lindsay 1970:243); through 1930s social research into the impact of cinema on U.S. youth via the Payne Studies that helped to institution-alize symbolic interactionsim (Blumer 1933); to post–World War II anthropological concerns about Hollywood's intrication of education and entertainment and the need for counter-knowledge among the public; moral panics about links between media violence and real violence; and later, the impact of first world media on third world people.

Testing the relationship between the media and their consumers has produced two main forms of analysis: spectatorship theory and audience research. Spectatorship theory speculates about the effects on people of films, using psychoanalysis to explore how supposedly universal inter-nal struggles over the formation of subjectivity are enacted onscreen and in the psyches of watchers. The spectator is understood as a narratively inscribed concept that can be known via a combination of textual analysis and Freudianism.

Psychoanalytic film theory argues that the gaze in film "belongs" to the heterosexual male viewer and his onscreen brothers. The cinema is seen as a sexual technology, a site where practices that construct sex and desire through such techniques as confession, concealment, and the drive for truthful knowledge about motivation, character, and occa-sion. The reproducibility of virtuosic performance provided by electronic technology has produced an era of performa-tivity. Both simultaneity of instant reception and longevity of recorded life come with electronic media. The technology of visual reproduction enables a multiplicity of personalized perspectives inside a world of commodity reproduction. This position has been criticized for neglecting both women's active address and engagement with film, and cru-cial social differences within genders that are not about the getting of sexuality, but are to do with race and class.

Conversely, audience research is primarily concerned with questioning, testing, and measuring the number and conduct of people seated before media texts. Audiences participate in the most global (but local), communal (yet individual), and time-consuming practice of making mean-ing in the history of the world. The concept and the occa-sion of being an audience are links between society and person, at the same time as viewing and listening involve solitary interpretation as well as collective behavior. Production executives invoke the audience to measure suc-cess and claim knowledge of what people want. Regulators do it to organize administration, psychologists to produce

proofs, and lobby groups to change content. Hence the link to panics about education, violence, and apathy supposedly engendered by the media and routinely investigated by the state, psychology, Marxism, neoconservatism, the church, liberal feminism, and others. The audience as consumer, student, felon, voter, and idiot engages such groups. This is Harold Garfinkel's ([1967]1992) notion of the "cultural dope," a mythic figure "who produces the stable features of the society by acting in compliance with preestablished and legitimate alternatives of action that the common culture provides." The "common sense rationalities . . . of here and now situations" used by people are obscured by this conde-scending categorization (p. 68). When the audience is invoked as a category by the industry or its critics and regulators, it immediately becomes such a "dope."

Two accounts of the audience are dominant in academia, public policy, and social activism. In their different ways, each is an effects model, in that they both assume the media *do* things *to* people, with the citizen understood as an audi-ence member at risk of becoming a "dope," abjuring both interpersonal responsibility and national culture. The first model is the *domestic* effects model, or DEM. Dominant in the United States and exported around the world, it is typi-cally applied without consideration of place and is univer-salist and psychological.

The DEM offers analysis and critique of such crucial citizenship questions as education and civic order. It views the media as forces that can either direct or pervert the citizen-consumer. Entering young minds hypodermically, the media both enable and imperil learning and may even drive the citizen to violence through aggressive and misog-ynistic images and narratives. The DEM is found at a vari-ety of sites, including laboratories, clinics, prisons, schools, newspapers, psychology journals, media organizations' research and publicity departments, everyday talk, program-classification regulations, conference papers, parliamentary debates, and state-of-our-youth or state-of-our-civil-society moral panics. The DEM is embodied in the nationwide U.S. media theatrics that ensue after mass school shootings, ques-tioning the role of violent images (not hyper-Protestantism, straight white masculinity, a risk society, or easy access to firearms) in creating violent people.

The second means of constituting dopes is a *global* effects model, or GEM. The GEM, primarily utilized in non-U.S. discourse, is specific and political rather than uni-versalist and psychological. Whereas the DEM focuses on the cognition and emotion of individual human subjects via observation and experimentation, the GEM looks to the knowledge of custom and patriotic feeling exhibited by collective human subjects, the grout of national culture. In place of psychology, it is concerned with politics. The media do not make you a well- or an ill-educated person, a wild or a self-controlled one. Rather, they make you a knowledgeable and loyal national subject, or a naïf who is

ignorant of local tradition and history. Cultural belonging, not psychic wholeness, is the touchstone of the GEM. Instead of measuring responses electronically or behaviorally, as its domestic counterpart does, the GEM interrogates the geopolitical origin of media texts and the themes and styles they embody, with particular attention to the putatively nation-building genres of drama, news, sport, and current affairs. GEM adherents hold that local citizens should control the media because their loyalty can be counted on in the event of war, while in the case of fiction, that only locally sensitized producers make narratives that are true to tradition and custom. This model is found in the discourses of cultural imperialism, everyday talk, broadcast and telecommunications policy, unions, international organizations, newspapers, heritage, cultural diplomacy, and postindustrial service-sector planning (see Dorfman and Mattelart 2000; Schiller 1969).

The DEM suffers from all the disadvantages of ideal-typical psychological reasoning. It relies on methodological individualism, thereby failing to account for cultural norms and politics, let alone the arcs of history that establish patterns of imagery and response inside politics, war, ideology, and discourse. Each massively costly laboratory test of media effects, based on, as the refrain goes, "a large university in the Midwest," is countered by a similar experiment, with conflicting results. As politicians, grant givers, and jeremiad-wielding pundits call for more and more research to prove that TV or electronic games make you stupid, violent, and apathetic—or the opposite—academics line up at the trough to indulge their contempt for popular culture and ordinary life and their rent-seeking urge for public money. The DEM never interrogates its own conditions of existence—namely, that governments and the media use it to account for social problems, and that the domestic screen's capacity for private viewing troubles those authorities who desire surveillance of popular culture. As for the GEM, its concentration on national culture denies the potentially liberatory and pleasurable nature of different takes on the popular, forgets the internal differentiation of publics, valorizes frequently oppressive and/or unrepresentative local bourgeoisies in the name of maintaining and developing national culture, and ignores the demographic realities of its "own" terrain.

The DEM/GEM share the dominant ethos of U.S. communication studies, in contradistinction to more populist, qualitative theorists like Marshall McLuhan (1974), who argue for intense differentiation between the media. Whereas radio, he said, was a "hot medium" because it contained a vast array of data that led the audience in a definite direction that was explicitly defined, TV was "cool," as it left so much up to the viewer to sort out (p. 31). The latter perspective offered a way in to research too via three other model audiences: the all-powerful consumer (invented and loved by policymakers, desired and feared by corporations), the all-powerful interpreter (invented and loved by utopic cultural critics, tolerated and used by corporations), and the all-powerful closed-circuit surveyor (invented and loved by the state and corporations, feared and loathed by dystopic cultural critics). These models have a common origin. In lieu of citizen building, their logic is the construction and control of consumers. These perspectives pick up on Garfinkel's cultural-dope insight and take the reverse position from rat-catching psy-doomsayers. Instead of issuing jeremiads, this line claims that audiences, like neoclassical economics consumers, are so clever and able that they make their own meanings, outwitting institutions of the state, academia, and capitalism that seek to measure and control them. Néstor García Canclini (2001) notes in this context that "We Latin Americans presumably learned to be citizens through our relationship to Europe; our relationship to the United States will, however, reduce us to consumers" (p. 1).

TEXT

At the level of the text, media critique divides between systematic forms, such as content analysis and semiotics, and more impressionistic methods, such as psychoanalysis and thematic interpretation. Content analysis is chiefly undertaken within sociology and communication studies, and it has been put to a variety of purposes. For example, a violence index has been created to compare the frequency and type of depictions of violence on U.S. TV news and drama with actual crime statistics. Content analysis of media texts has also been applied to representations of gender and race (Tuchman, Daniels, and Benet 1978).

Semiotics was systematized for cinema by Christian Metz (1974) and has since been deployed, using a variety of other linguistically based norms, to explain many other media. Examples of such systematic approaches to form and style can be found in narratology. Narratives tell stories through an aetiological chain of cause-and-effect via a linear trajectory from the establishment of questions or problems to their resolution. A film moves from a presumed state of normalcy, or equilibrium, for the characters, prior to the text, to a disequilibrium set up in the opening of that text, and then through a series of maneuvers that results in the achievement of a goal and a new equilibrium. Classical narrative cinema focuses on central characters, their attitudes to the events going on around them and their participation in conflicts. The success or otherwise of films frequently depends on their ability to engage dual forms of verisimilitude—looking like a familiar genre, and also resembling the mental processes of ordinary human experience.

Much academic narratology is linked to formalism, which divides narratives in two. The *fabula* or story concerns the chronological unfolding of relations between characters, or actants. This is the immanent structure of the story, the spirit-within that impels a text forward. When that basis becomes orchestrated, it is transformed into a *syuzhet,*

or plot (the movement from what is told to how to tell it). The *syuzhet* animates the *fabula* via an array of artistic devices, such as parallelism, retardation, defamiliarization, and so on: in short, sources of aesthetic pleasure that do not simply move the narrative forward. Understanding a narrative is more than following the trajectory of a story. It depends on reading a film horizontally as well as vertically—the narrative thread only makes partial sense of a text, along with an attempt to remember, for example, the overall conduct of a specific character.

Methods of narration are influenced by the use of camera, and here questions of style arise. Subjective narration, which clearly locates the vantage point or enunciation within a character in the diegesis, often involves point-of-view shooting, whereas hidden enunciation is mimetic and favors objective camera. In subjective narration, the camera takes on the function of that character's vision in the text. Conversely, omniscient and objective narration are frequently achieved through a point-of-view that comes from nowhere, outside the action and seemingly without a particular perspective or form of knowledge. But this narration can be interpreted to bring out the site of enunciation, if we examine factors such as the height of the camera. The eye-level shot is taken with the camera horizontal to the ground as if it were in the room in human form, but without being seen, or reacting to what occurs in front of it. The high-angle shot is taken from above the action. It can emphasize the insignificance of the human actants as opposed to commercial, natural, or architectural features in the frame. Conversely, low-angle shots are tilted up to cover the action, which can inflect it with a certain glow as well as highlighting size and speed.

Consider the above in the light of how the class analysis of film may involve a number of moves: literally observing how a class acts on screen—its clothing, gesture, movement, work, leisure, home life; seeing who controls the means of communication behind a film—technicians, producers, directors, censors, shareholders; analyzing the ideological message of stories—personal transcendence versus collective solidarity, the legitimacy of capitalist freedoms, or the compensations in family and community for social inequality; and noting which interests are served by government-sponsored national film industries—local bourgeoisies, men, whites, distributors, the people. In textual terms, those films that foreground class through theme or identification do not exhaust the list of films ready for class readings. Patterns of speech or costume may not only signify the immediate referent of social position but go beyond that to the trappings, logic, and operation of capitalism: how the clothes were made, or the housing conditions that go along with the accent. We might think here of the James Bond series' obsession with small differentiations of social position through food, alcohol, cars, and the way that hotel staff and other employees are easily ordered about. Some of us deem it important that Sean Connery

orders the Dom Perignon '52 and George Lazenby the '57. The price paid for attending a film (exchange value) takes over from the desires exhibited in the actual practical utility of what is being purchased (use value). This price expresses the momentary monetary value of that need, rather than its lasting utility. The notion of built-in obsolescence and value bestowed via a market is in fact a key to all commodities, popular or otherwise. They elicit desire by wooing consumers, glancing at them sexually, and smelling and looking nice in ways that are borrowed from romantic love but then reverse that relationship: People learn about correct forms of romantic love from commodities, such as love scenes in movies.

CONCLUSION

Perhaps the most significant innovation in recent media critique has been a radical historicization of context, such that the analysis of audiences and texts must now be supplemented by an account that details the conditions under which a text is made, circulated, received, interpreted, and criticized. The life of any media text is a passage across space and time, a life remade again and again by institutions, discourses, and practices of distribution and reception—in short, all the shifts and shocks that characterize the existence of cultural commodities, their ongoing renewal as the temporary property of varied, productive workers and publics, and their stasis as the abiding property of businesspeople.

The crucial link between theories of audiences and texts—one that abjures the idea of the dope—may come from such specifications. For instance, Jacqueline Bobo's (1995) analysis of black women viewers of *The Color Purple* shows how their process of watching the film, discussing it, and reading the novel drew them back to Alice Walker's writing, with all three processes invoking their historical experience in ways quite unparalleled in dominant culture—a far cry from critics' dismissal of the movie. These women "sifted through the incongruent parts of the film and reacted favorably to elements with which they could identify" (p. 3).

This is the abiding lesson of media critique: Each medium's promiscuity points every day and in every way toward social reality. The media are three things, all at once: *recorders* of reality (the unstaged event), *manufacturers* of reality (the staged and edited event), and *part of* reality (reading the paper as a bedroom event on a Sunday morn, or attending a protest event over sexual, racial, or religious stereotyping). As media forms proliferate and change, their intermingling with social change ensures an ongoing link between social theory and media critique.

MERTON, ROBERT

Robert K. Merton is among the most influential sociologists of the twentieth century. He is the founder of a sophisticated variety of structural functionalism, the originator of modern sociology of science, and a prolific contributor to the conceptual and theoretical resources of several sociological disciplines.

He was born on July 4, 1910, in Philadelphia, and died February 24, 2003 in New York. He graduated from Temple College in 1931 and pursued graduate study at Harvard University, where in 1936 he defended a doctoral dissertation on *Science, Technology and Society in Seventeenth-Century England.* Merton's thesis about the influence of puritan, pietist religion on the emergence of experimental natural science is still vigorously debated. In 1941 he moved to Columbia University, where he was to remain on the faculty of the Sociology Department for 38 years until his retirement. He has received the highest forms of academic recognition, among them 24 honorary doctoral degrees. In 1994, the president of the United States granted him the top academic honor, the National Medal of Science. His books have gone through multiple foreign editions, with *Social Theory and Social Structure* ([1949] 1968) appearing in more than 20 languages. In the Books of the Century contest organized in 1998 by the International Sociological Association (ISA), this volume was among the top five, which also included work by Max Weber and Émile Durkheim.

Merton is often referred to as a modern sociological classic for two main reasons: first, he made a lasting substantive contribution to general sociological theory, as well as some more specific theoretical contributions to various sociological subdisciplines (in particular the sociology of science and the sociology of deviance, where strong Mertonian schools are still operating), and, second, he exemplified a unique, classical style of sociological theorizing and concept formation.

Merton has elaborated two theoretical orientations: functional analysis and structural analysis. For him, functionalism meant the practice of interpreting data by establishing their consequences for the larger structures in which they are implicated. In 1949 he published his famous paradigm for functional analysis, where he outlined a flexible, undogmatic, deeply revised version of functionalism that allowed for the conceptualization of social conflict and social change. He put an emphasis not only on functions but also on dysfunctions of various components in the social system, and what he called "the variable balance of functional consequences." He argued that the components of a social system may appear not only in harmonious but also in conflictual relations. The effect of a specific balance is not necessarily equilibrium, order, and continuity (as in the earlier structural functionalism), but sometimes disequilibrium, disorder, disorganization, and consequently social change. A quarter century later in 1975, he wrote an important paper, "Structural Analysis in Sociology" (in Merton 1986), which presented a correlative sociological orientation, emphasizing the network of relationships within which components of the system are located. Structural analysis is a natural, complementary outgrowth of functional analysis. Whereas functional analysis specifies the

consequences of a social phenomenon for its differentiated structural context, structural analysis searches for the determinants of the phenomenon in its structural milieu. The best example of Merton's structural functional analysis is his famous theory of anomie. Understood as a structural condition of dissociation between cultural demands of success and the actual opportunities for success, anomie is shown to generate various forms of deviant conduct—innovation, ritualism, retreatism or rebellion—depending on the wider structural context within which it appears ([1938] 1996:132–52). In turn, these various ways of departing from established normative order have different effects on the functioning of the whole system, sometimes leading to social change. Obviously, both orientations refer to the different sides of the same coin: they scrutinise two vectors of the same relationship, between a social phenomenon and its structural setting.

Merton's thought is deeply rooted in the classical sociological tradition of the nineteenth century, which he synthesizes and extends. He attains balanced, intermediate positions on various traditional issues and unravels entangled premises to reach their rational core. He has a strong aversion to extremes. The most famous illustration of this is his strategy of middle range theory based on the rejection of both narrow empiricism and abstract, scholastic theorizing. The systematic quality of his work is emphasized by the repeated use of what he calls "paradigms," introduced long before and different in meaning from Thomas Kuhn's famous use of the term. By paradigm Merton meant heuristic schemes intended to introduce a measure of order and lucidity into qualitative and discursive sociological analysis by codifying the results of prior inquiry and specifying the directions of further research. This allows him to introduce a further measure of order and systematization into the classical heritage. The synthesis becomes much more than a summary of earlier ideas. It brings about their selective and critical reformulation and cumulation.

Central to Merton's contributions are his introduction of neologisms to identify and designate new sociologically significant aspects of social life. A number of these have entered the vocabularies not only of social science but the vernacular of everyday life. These include manifest and latent functions, dysfunctions, self-fulfilling prophecy, homophily and heterophily, status-sets and role-sets, opportunity structures, anticipatory socialization, reference group behavior, middle-range theories, sociological ambivalence, local and cosmopolitan influentials, obliteration by incorporation, and many others.

Merton's most important service to the development of contemporary sociology is his vindication of the classical style of doing sociology and its heritage of theoretical ideas. In his work, paradigms of classical thought gain new vitality, as they are shown to be fruitful both in the explanatory sense, as means for solving the puzzles confronting social actors, and in the heuristic sense, as means of raising new questions and suggesting new puzzles for solution.

METATHEORY

The prefix *meta* connotes "after," "about," and "beyond," and is often used to describe "second-order" studies. Let S denote a given type of phenomena. The study of S constitutes the first-order study S_1, and the study of S_1 constitutes the second-order study S_2. Second-order studies are thus the study of studies. However, not all studies of studies fall into the category of metastudy. A given S_1 can be a legitimate subject of such fields as history, literature, logic, and philosophy. Metastudy differs from other types of second-order studies in that it entails a high level of reflexivity embodied in the critical self-examination by those engaged in the first-order studies. Examples of discipline-wide metastudies include metaphysics, metaanalysis, metaethnography, and metasociology.

Metastudies are mostly conducted to examine the problems encountered in the first-order studies. Thomas Kuhn, an eminent philosopher of science, pointed out that science progresses in a succession of paradigm replacement, which takes place in a discipline when the existing research tradition has failed to meet the challenges of emergent research problems. Metastudies are the conscious efforts made by the practitioners of a troubled field to reexamine, reflect on, and redirect the stalled first-order studies in the field. In other words, metastudy is "a reflective return to the foundation of science and the making explicit of the hypotheses and operations which make it possible" (Bourdieu 1971:181).

Metatheory is a subtype of metastudy that focuses on the examination of theory and theorizing. The rise of metatheory in social science was primarily the result of the persistent failure of social science to uncover the general laws of society that can be used for social prediction, design, and engineering. Such failure had been initially attributed to the deficiencies in the methodology of theorizing, which led to the emergence of a theory construction movement aiming to model social theorizing after theory formation in natural science. When the allegedly improved techniques of theory construction again failed to produce the desired outcome, social scientists began to look beyond the issues of methodology to engage in metatheoretical reflections.

While metatheorizing takes place in virtually all fields of social science, it has been particularly common in sociology. The prevalence of metatheorizing in sociology is believed to be related to the following factors. First, sociological phenomena are culturally diverse and historically specific, such that they disallow the formation of nomological or deductive theories. Second, sociologists themselves are members of the society they attempt to theorize, and the vested interests and engrained values the theorists hold impede their efforts to attain scientific objectivity in theorization. Third, sociological theory is constitutive of social reality, for the acceptance of a theory can transform what that theory bears on. The combination of these three factors has made metatheorizing a constant condition of theory construction in sociology.

The beginning of metatheorizing in sociology can be traced to the work of Auguste Comte, who announced the birth of sociology in his metaphysical reflections on the trajectory of the progress of human knowledge. Paul Furfey (1965) played an important role in defining a unique disciplinary space for metasociology, which consisted of a metatheoretical component. Metatheorizing as a distinctive subfield within sociology was formalized in the early 1990s. In 1988, George Ritzer published an article in *Sociological Theory,* delineating for the first time the parameters of metatheory as a subdomain in sociology. The subsequent years witnessed the publication of a series of articles and books on the same subject, which gave rise to the coming of age of sociological metatheorizing.

Ritzer (1988) divides sociological metatheorizing into three basic types, labeled respectively as M_u, M_p, and M_o. M_u, which stands for "metatheorizing for better understanding of extant theory," comprises four subtypes, each representing a different analytic dimension. The internal-intellectual dimension involves the mapping of the cognitive structures of sociological theory using a variety of conceptual tools, such as "levels," "paradigms," and "micro-macro" linkages. The internal-social dimension involves the study of the social networks of sociologists in order to understand the social dynamics of "doing theory" in the real world. The external-intellectual dimension involves examining the influence of other academic fields on the formation of sociological theory. And the external-social dimension involves making sense of sociological theory in the context of the larger society, for example, linking the underlying features of a theory to the characteristics of the sociohistorical setting in which the theory was created. M_p, which stands for "metatheorizing as a prelude to theory development," critically assesses the existing body of theoretical literature for purposes of creating new theories. Such literature reviews differ from exegetical commentaries in that they are normally regarded as an integral part of theory construction. Finally, M_o, which stands for "metatheorizing in order to establish overarching sociological perspectives," aims to develop general theoretical orientations that serve as "frames of reference" for specific sociological research. Positivist, hermeneutic, critical, and postmodern perspectives are the four major metatheoretical orientations in sociology today.

Metatheorizing has been criticized by some scholars as a nonproductive or even counterproductive intellectual exercise. It has been described as consisting of mere commentaries on the works of the past and philosophical debates over unresolvable issues. These charges are not entirely unfounded, but they are not fair criticisms of metatheorizing as a whole, for as is true of any other field of academic endeavors, there are good as well as bad practices in metatheorizing. As a form of reflexive returns upon the practice of theorizing, metatheory has proved to be indispensable to the construction of theories that are useful for guiding social practice in the human lifeworld.

MICRO-MACRO INTEGRATION

One of the most important developments in recent sociological theory has been the move toward an integration of

microlevels and macrolevels of analysis. This does not mean to imply that there was a hard and fast line between microlevel and macrolevel perspectives previously, it was indeed a continuum, but rather that the integration of the two has come to be a larger focus than either one of them individually. It was this primary focus on either micro or macro theories that was one of the major splits in sociology until the 1980s, when the integration first became a focal interest.

Ironically, the founding fathers of sociology (Marx, Durkheim, Weber, Simmel) were concerned with linking the micro to the macro and vice versa in their theories. Marx was clearly interested in the ways in which the capitalist society affected individual workers and their lives. Durkheim was interested in how the collective conscience manifested itself in individual-level consciousness. Weber was pessimistic about the strengthening iron cage of society and its effects, especially the imposition of limitations on the individual. Finally, Simmel was concerned with the tragedy of culture, or the growing distance between macrolevel, or objective, culture, and microlevel, or subjective, culture. It was in the years following their deaths that the emphasis these founding four had placed on the micro-macro linkage slowly eroded and a strong distinction between micro and macro sociology emerged.

Macrolevel theories that took center stage during the last century included forms of neo-Marxian theory (Engels), structural functionalism (Parsons), network theory (White, Boorman, and Breiger), structuralism (Mayhew), and conflict theory (Dahrendorf). Microlevel theories that developed alongside these included exchange theory (Homans), ethnomethodology (Garfinkel), and symbolic interactionism (Mead, Blumer).

However, during the 1980s and 1990s, there was a notable turn in the work of sociology toward more integration. Two approaches were taken toward this goal. The first involved integrating existing micro- and macrolevel theories. The second was to develop new theories to deal with the linkage between micro- and macrolevels. There is clearly a marked difference of approach here, but both had the same goal of a new sociology that would, much like it had in the beginning, be concerned with the relationship between micro- and macrolevel phenomenon.

It would be helpful now to give a few examples of attempts at micro-macro integration. George Ritzer (1979, 1981) has developed an integrated sociological paradigm that is based on a fourfold table outlining what he sees as the four major levels of sociological analysis. The table involves a horizontal continuum from objective to subjective and a vertical continuum from macroscopic to microscopic. This creates four quadrants for social analysis: macro-objective (society, law, language, bureaucracy), macro-subjective (culture, norms, values), micro-objective (patterns of behavior, action, interaction), and micro-subjective (beliefs, perceptions, various facets of the social construction of reality). Although Ritzer argues that each of these levels is important in and of itself, the most important analysis lies in the dialectical relationship among and between the four levels.

Another prominent theorist, Jeffrey Alexander, has also created an attempt to integrate micro- and macrolevel sociology by offering what he believes is the "new 'theoretical logic' of sociology" (1982:xv). Alexander's multidimensional sociology, as he terms it, most directly refers to his view of levels of social analysis in multiple dimensions. Like Ritzer, Alexander creates a fourfold table, but with slightly different continua. The horizontal for him is a continuum representing the problem of action. Alexander envisions action ranging from an instrumental, or materialist, level to a normative, or idealist one. The vertical is a range depicting levels of order from a collective, externally created order to an individual, internally created one. The intersection of these continua create four distinct levels of social analysis: collective-instrumental (material structures), collective-normative (norms), individual-instrumental (rational action), and individual-normative (voluntary agency). These are not much different from those created in the paradigm by Ritzer, except in the emphasis Alexander gives to the collective-normative level. Alexander is critical of both levels involving the individual, as he says that they are unable to deal with any unique characteristics of collective phenomena. He is also critical of the collective-instrumental level because it eliminates much chance of individual freedom. Alexander believes that the collective-normative order, however, allows for both an understanding of social order and macrolevel phenomenon while still leaving room for individual autonomy and maneuverability.

James Coleman (1986, 1987) also sought to deal with the issue of micro-macro integration by creating a model that sought to deal with the micro- to macrolevel problem. Coleman uses Weber's work on the Protestant ethic as an illustrative example and envisions macrolevel phenomena (e.g., a religious doctrine) affecting the microlevel (individual values), which in turn affects another aspect of the microlevel (orientations to economic behavior), which in turn again affects the macrolevel (producing the capitalist system). This model is weak, however, in that it does not allow for a dialectical relationship and grants priority to micro- to macrolevel influence.

Allen Liska (1990) sought to correct the problems in Coleman's theory by adding a direction of influence from macrolevel phenomena to other macrolevel phenomena. He also outlines three potential ways for describing the macro level: as an aggregation, or the sum total of individual components resulting in a group characteristic; structural, or the relationship between individual members of a group, and global, or what are generally termed emergent

properties such as language. The implication is that those theorists who focus on the macrolevel should incorporate more of a focus on aggregation, and those who focus on the microlevel should include more contextual factors.

Randall Collins is another social theorist to take on the task of integrating micro- and macrolevel phenomenon, although he grants heavy priority to the microlevel. In fact, Collins's major essay on the topic was titled "On the Microfoundations of Macrosociology," and he himself calls his effort a "radical microsociology" (1981a, 1981b). Collins believes that all macrolevel phenomena can be understood as combinations of microlevel phenomena. His focus is on interaction, chains of interaction, and the "marketplace" where such interaction takes place. This theory is similar, at least in one sense, to Coleman's in that it is limited by only trying to explain how the micro affects the macro.

Although the distinction between micro and macro is generally thought of in terms of American sociology (see Ritzer and Goodman 2004), at least one European theorist, Norbert Elias, has attempted to solve this dilemma as well. Elias (1978, 1986) was a German theorist (who did most of his work in England and the Netherlands) who did most of his major work during the 1930s. His major contribution to the question of micro-macro integration came in his concept of the figuration. The concept of a figuration was developed to ease the differences between the concept of the "individual" and "society." Figurations are processes (Elias preferred the term *process sociology* to refer to his work) that involve the interweaving of individuals. They are neither more than, nor less than, these interrelationships, but instead they are those interrelationships. They are not planned and occur at every level of society. Elias does not deal with either individuals or society as autonomous entities but instead with "the relationship between people perceived as individuals and people perceived as societies" (1986:23). He views individuals as open and interdependent and believes that the reasons they come together to form specific figurations should be the key question in sociology.

Overall, there have been a number of attempts to integrate the micro- and macrolevels of theory and the work of their representative theorists since the early 1980s (although some did seek to answer this question even prior to that). Hearkening back to similar efforts made by some of sociology's most prominent figures, recent theorists have sought to show how both levels merit attention but that the greatest level of focus should be on the ways in which they interact with one another.

MILLS, C. WRIGHT

C. Wright Mills (1916–1962), the prolific and controversial American sociologist, is best known for his work on the structure and distribution of power in the United States and his critique of theory and method in mainstream sociology. Between 1940 and 1962, he authored or edited twelve books, published nearly 200 articles, commentaries, and reviews, and was working on several major projects when he died of a heart attack at age 45.

Mills was born in Waco, Texas, to a doting mother and a father who was a rising insurance salesman. Mills describes himself as a shy and introverted youngster who admired his father's intelligence and integrity. He was sent to Texas

A&M but transferred to the University of Texas, Austin, where he studied philosophy and economics.

Mills left Texas with both a BA and an MA for the interdisciplinary program at the University of Wisconsin in the 1940s, where he worked most closely with Hans Gerth, a German émigré influenced by the Frankfurt school, with its varying blends of Marx, Weber, and Freud. Several commentators suggest that Mills's work is a unique blend of midwestern populism, American pragmatism, and German sociology.

Mills defined himself as a political radical in the early 1940s by the time he came out of graduate school to take an assistant professor position in sociology at the University of Maryland. He moved in left political circles when he relocated to New York in 1945, where he worked at the Bureau of Applied Research and then joined the Columbia faculty in 1946, working his way to an appointment as full professor in 1956.

Mills's first major book, the *New Men of Power* (1948), assessed the radical political potential of union leaders and found it limited. Mills soon thereafter abandoned the Marxian hope for the working class as the key agent of major social change, calling it a "labor metaphysic." *White Collar* (1952) soon followed, a comparison of the old middle class of small businesspeople with the new middle class of white-collar employees, seeing the latter as trapped between unions and big business, politically dependent and directionless, and driven by a new status. He later described the book as an attempt to make sense of his experience in New York; others thought the experiences of salespeople like his father influenced this work.

Mills next folded his analyses of union leaders and white-collar workers into his major empirical and theoretical work, *The Power Elite* (1956), which rejected both pluralist and Marxist analyses of the American power structure in favor of an institutional analysis that placed power in the hands of an increasingly intermingled leadership group based at the top of large corporations, the executive branch, and the military services. This "power elite" shared similar experiences in managing large institutions and their desire to keep the system running smoothly. The people at the top did what they wanted to, and were increasingly irresponsible, practicing a "higher immorality."

The book received strong reactions from those Mills criticized as well as more disinterested observers, and made Mills into something of a celebrity. He then wrote a little-known reply that became the basis for *The Sociological Imagination* (1959). Mills attacked the overly abstract "grand theories," and in particular the work of Talcott Parsons, the leading theorist of the day. For Mills, Parsons's ahistorical attempt to classify concepts in order to develop a general theory provided little if any understanding of social reality or pressing social issues. Mills also was very critical of the use of a narrow survey method

he called "abstracted empiricism," arguing that it tends to lead to mundane research of no consequence in creating a theory or understanding of social problems. Instead, Mills spoke of the need to define sociology as the intersection of biography and history, employ a wide range of methods, strive for intellectual craftsmanship, and engage the general public on the basis of both rational values and solid social science.

At the same time, Mills began to try to make political sense of the post-Stalin Soviet Union and other political changes. He wrote what he called his "pamphlets," *The Causes of World War III* (1958), an attack on the Cold Warriors for "crackpot realism," and *Listen, Yankee* (1960), an attempt to keep the United States from crushing the Cuban Revolution. In 1960 he wrote a "Letter to the New Left" in Great Britain and then published a revised version in 1961 for the American New Left, which viewed him as one of their key inspirations.

Still, he continued his academic work as a sociologist. He had decided he had to come to terms with Marxism, and the result was his last book, *The Marxists* (1963), in which he criticized the "sophisticated Marxists" for trying to save a failed model. He nonetheless declared himself a "plain Marxist," meaning he worked in the spirit of Marx and used his method to create the kind of model that would capture current historical realities.

Mills's place in sociology is hard to assess, partly due to his self-presentation as a rebel and dissenter. By refusing to work with graduate students at Columbia in the 1950s because he thought they were too set in their thinking, there were few new sociologists to further develop his theoretical ideas. In addition, although often claimed by young radical sociologists as the "father of radical sociology," it was mainly Mills's critique of mainstream sociology, not his theoretical insights, that had the greatest impact on radical sociological research.

Nevertheless, when all is said and done, several of Mills's early essays remain classics that continue to be cited in the literature. Some of the ideas and findings in the *Power Elite* have been assimilated into mainstream political sociology. Many of his key ideas, such as the power elite and the sociological imagination, are widely employed. *The Sociological Imagination* continues to be used in sociology courses to inspire students to think for themselves and see the exciting possibilities that exist within sociology for understanding—and even changing—society. Most of all, though, Mills will endure as a symbol of the upstart, hard-working iconoclast who jumps through all the academic hoops, challenges the mainstream of the discipline, and attempts to reach larger publics on the basis of both his values and ideas.

MINNICH, ELIZABETH

Elizabeth Minnich, a graduate faculty member at the Union Institute in Cincinnati, is the author of *Transforming Knowledge* (1990). This study pivots around issues of curricular transformation in particular and knowledge construction in general. Educated in the liberal arts at Sarah Lawrence College (BA) and in philosophy at the New School for Social Research (MA and PhD), now named New School University, Minnich situates herself theoretically between modernism and postmodernism. She argues, for instance, that the "heady postmodern attack on universals *per se*" may be misguided inasmuch as "it may not be universals that are the problem but . . . *faulty* universals and the particularities they frame" (p. 56)

Arguing that equality entails not sameness but the "right to be different," Minnich goes on to argue that "[f]aulty generalizations by those in power create and express not dualisms, but hierarchical monism" (p. 70). By hierarchical monism she means that "supposedly parallel categories . . . do not name parallel groups; the categories are indeed paired, but they are not expressions of a complementary dualism, nor even an oppositional one." Paired categories, such as women/men, refer not to anything "separate but equal" but to hierarchies that socially construct not only difference but also inequality. Worse, one category in these hierarchical pairs gets represented as the "real thing" (p. 73) with the other category being some lesser version of that thing, whether it be theologian, citizen, or assembly line worker.

On these (and other) bases, Minnich returns to faulty generalizations. She says their theoretical damage gets done through "circular reasoning in which the *sources* of standards, justifications, interpretations, reappear as *examples* of that which is best, most easily justified, most richly interpreted by those standards" (p. 84). Middle-class standards of cleanliness, child rearing, and religiosity, for example, are often used to denigrate and regulate the lives of lower-income persons and families. Middle-income experts of all sorts promulgate those standards that in turn are used to bolster and justify their own moral and political authority. Closer to home is the substantial segregation

of feminist theory in textbooks and curricula, as if it is an inferior version of theory or social theory. Minnich's work shows how social realities such as feminist theory get represented as specialized versions of social theory, as if scholars get more insights into social realities from masculinist than from feminist texts.

In the end, Minnich deems it unnecessary to "undo all universals" (pp. 180–81). Instead, she urges that we "particularize accurately" so as "to demystify the functions of power and hierarchy." In her view, that strategy enables us "to cease turning difference into deviance" and equality into sameness, while also enabling us "to live and work with more complexity and fineness of feeling and comprehension, taste and judgment" (p. 184).

MODERNITY

The term *modern* and its derivatives are not new, and they are ambiguous in their meanings, especially if one considers the globe's competing worldviews and cosmologies. Whereas modernity has had for some time a positive connotation in the West, particularly among the more educated classes, the same cannot be said about the notion as understood in other parts of the world, where, until very recently in their long cultural histories, the cardinal virtues of social and intellectual life have always been stability, continuity, and predictability. The very notion that "change is natural and good," accepted almost without reflection by many citizens of Western nations for the last several centuries, has been wholly repugnant, even inconceivable, to those billions of Asians and Africans who devoutly followed the doctrines of Confucius, Buddha, Hinduism, or Islam. The famous Chinese curse "May you live in interesting times" wryly captures this widespread human sentiment. This basic contradiction between worldviews, perhaps more than any other single factor, has sparked the repeated cultural and political conflicts among cultural zones of the world, where, in most other ways, life might have been viewed in similar, even sympathetic, terms. Thus, the concept of modernity is not of merely analytic or academic interest. Considered broadly, it contains one of the major keys toward understanding why geopolitical and cultural instability has become the standard condition of

international affairs, particularly during the last two centuries. If static certitude characterized the ancient civilizations in Egypt, Persia, China, and India, dynamic shifts in actions and meanings identify "the way we live now" (to borrow Anthony Trollope's title from 1875).

The question of what exactly *modernity* means—when it began, how it has developed, where it leads—has perplexed intellectual historians for decades, if not centuries. A platitude holds that whatever is "modern" ("from the fifth century Latin term *modernus* which was used to distinguish a Christian present from a Roman, pagan past" [Smart 1990:17]) is always relative to any period of interest. For instance, Henry Fielding's *Tom Jones* seemed to its readers stunningly "modern" in 1749, so much so that Edward Gibbon in his *Autobiography* (1794) claimed that this "exquisite picture of human manners" would outlast the mighty Austrian empire in significance. The unrivalled eleventh edition of the *Encyclopaedia Britannica* argued in 1910 that "the methods of fiction have grown more sophisticated since his day . . . but the traces of *Tom Jones* are still discernible in most of our manlier modern fiction." Now, though, the novel (and famous filmed version) seems trapped in almost formulaic predictability, and as such bears the marks of an art form that is no longer in any ordinary sense "modern."

Yet a purely relativistic viewpoint does not take one very far in understanding the concept, even if "that gallery of echoes called modern thought" (Durant 2001:24) proves to be entirely derivative rather than original in nature. There are indeed authoritative analyses, which over the years have proposed signposts on the road to (Western) modernity that still bear consideration, even after the ideological onslaught called "postmodernism." John Herman Randall's beloved textbook, *The Making of the Modern Mind* (published in 1926 when he was 27), is one such standard interpretation. Whereas today even informed readers might cite 1500 as the earliest possible date for the origin of what is modern, Randall seconds Charles Homer Haskins's famous claim (*The Renaissance of the 12th Century*) that it began much earlier: "The chief pathfinder of this *via moderna,* William of Ockham [1300?–1349?], left his pupils in control not only in Oxford but in Paris itself, the former stronghold of the Thomists. The new modernism stood for a skeptical empiricism that completely demolished in the fourteenth century the great systems so carefully erected the century before. Gone were all the necessities of reason, all metaphysical entities and distinctions. *Nothing could be accounted real in nature that was not an observed fact or relation between facts. Experience was the only test of physical truth*" (Randall [1926]1976:211–12; emphasis added). It would seem that William of Ockham had anticipated the major premises of Francis Bacon's scientific method by 300 years and of Descartes's empirically based rationalist philosophy by 350. Moreover, his understanding

of verifiable truth, often considered the hallmark of modern thinking, coincides with those common among Enlightenment *philosophes* 500 years after his death. During a time in Europe commonly thought to be trapped by the iron grip of Catholic orthodoxy, its two most important universities were home to viewpoints we would now see as distinctly modern.

In 1950, another celebrated historian of ideas, Crane Brinton, offered a subtler analysis of the transition from the medieval to the modern, which is closer to current verdicts than Randall's. For him modernity was first indicated by "an awareness of a shared newness, of a way of life different from that of one's forebears—and by 1700 awareness of a way of life felt by many to be much *better* than that of their forebears—this is in itself one of the clearest marks of our modern culture." He understood that the relationship between the medieval and modern worldviews is distinguished only with great difficulty, that "we cannot define *modern* neatly . . . we face the problem of disentangling *modern* from *medieval.*" Distinguishing one epoch from another simply reflects "our rhetorical habit of thinking" more than actual, demonstrable sociopolitical change: "The modern is not a sunrise ending the medieval night. The modern is not the child of the medieval, nor even the medieval grown to manhood" (p. 256). More precisely, Brinton believed that "the medieval view of life was altered into the eighteenth-century view of life. This eighteenth-century view of life, though modified in the last two centuries, is still at bottom *our* view of life, especially in the United States. The late fifteenth, the sixteenth, and the seventeenth centuries are from this point of view essentially *transitional,* essentially the years of preparation for the Enlightenment" (pp. 258–9). Though often voiced with less conviction, this has become the more or less standard view among social theorists and other intellectual historians in the half century since Brinton wrote.

In 1923, Virginia Woolf ([1923]1984) famously observed, "I will hazard a second assertion, which is more disputable perhaps, to the effect that on or about December, 1910, human character changed. . . . And when human relations change there is at the same time a change in religion, conduct, politics, and literature. Let us agree to place one of these changes about the year 1910" (pp. 194–5). From an entirely different cultural tradition, Theodor Adorno anointed 1850 as the beginning of the modern period, at least for the things he cared and knew the most about: Western literature, music, philosophy, and the social theories that sprang up to interpret them during the mid-twentieth century. More provocatively, Oscar Wilde had argued in 1891 that "[p]ure modernity of form is always somewhat vulgarising. It cannot help being so. The public imagine that, because they are interested in their immediate surroundings, Art should be interested in them also, and should take them as her subject-matter. But the mere fact

that they are interested in these things makes them unsuitable subjects for Art. . . . Modernity of form and modernity of subject matter are entirely and absolutely wrong" (pp. 18–19). Less flamboyantly and more rigorously grounded, the contemporary historian Paul Johnson (1991) decides in his weighty treatment, *The Birth of the Modern,* that "[m]odernity was conceived in the 1780s" (p. xvii). He then illustrates to his own satisfaction that 1815 through 1830 were the pivotal years, at least in the West, during which time the idea of modernity lost its purely theoretical quality and succeeded in transforming an encyclopedic range of social and political practices. Another trustworthy historian not long before had observed that "a case can be made for calling the seventeenth century the first 'modern' century, ushering in the new Modern Age, that in certain respects has still not run its course. The grounds for giving the seventeenth century a modern label are partly psychological, namely that during those years educated people in increasing numbers began to think of themselves consciously as 'Moderns,' as distinguished from 'Ancients' (Baum 1977:27). Seconding this judgment, John Crowe Ransom (1984) held that even "Milton felt the impact of modernity which is perennial in every generation; or, if it is not, of the rather handsome degree of modernity which was current in his day" (p. 70), that is, between 1608 and 1674.

Less dramatic but more precise than all such postulations, the indispensable *Oxford English Dictionary* claims that the word itself is pronounced "moden," without an *r,* and that it originates from *modo* ("just now"), and by analogy from the Latin, *hodiernus,* in turn from *hodie* ("today"). Hakewill wrote in the dictionary in 1635, "Yea but I vilifie the present times, you say, whiles I expect a flourishing State to succeed; bee it so, yet this is not to vilifie modernity, as you pretend," the first identified instance of its use in this way. Historians claim that the onset of "the modern period," at least in the Occident, may have begun in 1455 when Gutenberg printed his Bible and a flood of books shortly engulfed the literate world; it may have begun with the projection technique of mapmaking created by Gerardus Mercator in 1569, or the equally important invention of the maritime chronometer in 1735 by John "Longitude" Harrison, making long sea journeys less dangerous; perhaps it began when North and South America were stumbled upon by European navigators in the late sixteenth century; or modernity may have been inaugurated with the discovery of certain fundamental medical facts, like William Harvey's analysis of the circulatory system in 1628.

Another common argument holds that Descartes established modernity for the intellectual class in 1641 when he published his treatise on epistemology and was firmly anchored by the time Kant offered his revolutionary *Critique of Pure Reason* to the learned world in 1785. Equally plausible, historians of science would claim that modernity in its most profound sense grew out of advances in technical practices and theorizing beginning with the astronomical pronouncements of Copernicus (1514), Kepler (1596), and Galileo (1632), or the general "scientific method" as laid out by Bacon in 1605. As Hegel ([1840]1995) put it, "What Cicero said of Socrates may be said of Bacon, that he brought Philosophy down to the world, to the homes and everyday lives of men" (p. 175).

Among literary scholars, "modernism" (which is not necessarily synonymous with either "modern" or "modernity," nor surely "modernization") can be dated by the poems of Baudelaire (1857) and Rimbaud (1870), the writings of Ezra Pound prior to the Great War, the first novels of James Joyce (1910–1922), or the journal *Blast,* edited by Wyndham Lewis just following the First World War. Naturally, historians of photography, film, music, dance, and all the other arts can pinpoint when modernity began for them and their particular mode of expression, and none of them would agree, of course. Alternatively, military historians might hold that the first "modern" wars occurred during the last quarter of the nineteenth century, when new and unprecedentedly ferocious weapons were initially fielded (high explosives, 70-mile range artillery, the machine gun, the battleship, poison gas, the tank, and so on).

Thus, as we have now seen, both scholars and the literati have tried to summarize the multivalent phenomenon of modernity for at least two centuries. Many of their conclusions, taken in the round, have been concisely restated by Richard Tarnas (1991) in a widely read popularization, where he summarizes the entire process: "And so between the fifteenth and seventeenth centuries, the West saw the emergence of a newly self-conscious and autonomous human being—curious about the world, confident in his own judgments, skeptical of orthodoxies, rebellious against authority, responsible for his own beliefs and actions, enamored of the classical past but even more committed to a greater future, proud of his humanity, conscious of his distinctness from nature, aware of his artistic powers as individual creator, assured of his intellectual capacity to comprehend and control nature, and altogether less dependent on an omnipotent God. The emergence of the modern mind, rooted in the rebellion against the medieval Church and the ancient authorities, and yet dependent upon and developing from both these matrices . . . established the more individualistic, skeptical, and secular spirit of the modern age. Out of that profound cultural transformation, science emerged as the West's new faith" (p. 282). For Tarnas, there are eight (partially redundant) foundational beliefs and practices that created the modern world, including (1) the godless impersonality of the universe, i.e., *deus absconditus,* (2) secular materialism triumphing over sacred spiritualism (3) science's victory over religion, (4) the struggle between subjective mind and objective world and the desirability of nature being dominated by humankind, (5) irrational emotionality held to be inferior to

rational control ("the modern cosmos was now comprehensible in principle by man's rational and empirical faculties alone, while other aspects of human nature—emotional, aesthetic, ethical, volitional, relational, imaginative, epiphanic—were generally regarded as irrelevant or distortional for an objective understanding of the world"; p. 287), (6) the conviction that our mechanistic universe lacks "deeper" meaning, (7) the amoral, natural, evolutionary theory displaced ethics, and (8) a secular utopia via the domination of nature became preferable to a supernatural afterlife (pp. 282–90). Though one could quibble whether these are exhaustive, Tarnas has surely found the largest themes of a purely intellectual nature as the medieval became the modern over time. What he did not treat, of course, are the sheerly demographic, sociopolitical, or military causatives that also fed into this overheated cultural pot during the last several centuries.

All that said, though, it is nonetheless difficult now for us to determine exactly what constituted modernity for Hakewill in 1635, yet following his inauguration of the term, a great many thinkers and artists have chimed in with their own thoughts on the matter. Hegel surely deserves a hearing, since his ideas influenced nearly every subsequent social theorist and philosopher who discussed the issue, either as followers of his ideas or as repudiators. Habermas's (1987) opinion is typical: "Hegel was the first philosopher to develop a clear concept of modernity" (p. 4). Hegel's (1995) least ambiguous statements appear in his *Lectures on the History of Philosophy* delivered in Berlin during the 1820s. Here modernity is characterized as "the opposition between thought and Being, the comprehending of whose unity from this time forward constitutes the interest of all philosophies. Here thought is more independent, and thus we now abandon its unity with theology." More generally, "All that is speculative is pared and smoothed down in order to bring it under experience" (pp. 160, 162). Along with nearly everybody writing since, he holds that "with Descartes, the philosophy of modern times as abstract thought properly speaking begins" (p. 166). More important, particularly as his ideas influenced Marx and many others, is the closely paired sociological observation that "no one can suffice for himself; he must seek to act in connection with others. The modern world is this essential power of connection, and it implies the fact that it is clearly necessary for the individual to enter into these relations of external existence; only a common mode of existence is possible in any calling or condition" (p. 169). For Hegel, then, modernity means not only severing ties with theology and giving Descartes credit for opening the rationalist escape from mythologized thinking. It also includes embracing one's role as a Burger—a citizen or bourgeois member of society—because postfeudal social relations (meaning a *relatively* unconstrained give and take) had finally become possible in parts of Europe and North America. The need for "connection with others" and a "common mode of existence" illustrates Hegel's vital point that for the first time in Western history (except for a brief moment in Athens), people could speak to each other as political equals in what came to be called "the public sphere." Not only could they do so, but increasingly they were expected to do so as part of the "social contract." This development in citizen participation, along with the possession of private property, both under a published code of rights (for adult males, at least), became the political foundation on which modernity rested.

Yet there are many other ways to understand the meaning of modernity, viewed either as a great collective achievement or as an ambivalent, even dangerous, experiment in Western hubris. A hint of this nagging worry about its "ultimate meaning" is apparent in Kristeva's (1981) remark: "Modernity is characterized as the first epoch in human history in which human beings attempt to live without religion" (p. 33). While hardly any longer intellectually surprising—and also an exaggeration empirically speaking—such a realization continues existentially to bother many denizens of the modern period, since ethically correct behavior can no longer be tied to doctrinal directives in the way it is imagined to have been done during the Middle Ages. To move through life with nothing more concrete for guidance than so-called situational ethics is a frightening, even debilitating, prospect for many people—which is perhaps why Kristeva writes "*attempt* to live without religion," as if doing so altogether has not been an entirely successful enterprise.

Perhaps the most thoroughgoing and profound sense of despair at the cost modernity has wrung from the certainties of religiosity was voiced by Kierkegaard (1967–1978) in the 1840s. His critique of "the modern temper" is brittle and brilliant: "In contrast to what was said about possession in the Middle Ages and times like that, that there were individuals who sold themselves to the devil, I have an urge to write a book: *Possession and Obsession in Modern Times,* and show how people *en masse* abandon themselves to it, how it is now carried on *en masse.* This is why people run together in flocks—so that natural and animal rage will grip a person, so that he feels stimulated, inflamed and *ausser sich*" [beside himself] (1968: vol. 4:4178). Not only did Kierkegaard find reprehensible the manic conformity and mob behavior typical of his era, but he also saw in these new developments a generalized abdication from moral autonomy and that strong sense of self with which his father's Pietism had inculcated him as a boy, and from which he never really escaped. His most famous diatribes against modernity as he witnessed it appear in *The Present Age* ([1846]1978)*,* a long review-essay that wandered far from its assignment: "The present age is essentially a sensible, reflecting age, devoid of passion, flaring up in superficial, short-lived enthusiasm and prudently relaxing

in indolence" (p. 63). On one hand, he found modern times to be a sad era of collective manias and animal thoughtlessness, yet on the other, he bridled at the smug, passionless dullards who constituted the Danish bourgeoisie among whom he lived. Both ailments of the soul, he thought, were due to a lack of scruples and enough resolution to live by them. He also earned permanent obloquy from the liberal mindset when he blasted equality as a pointless societal goal and one that would inevitably lead to individual slavery at the behest of social organization: "The dialectic of the present age is oriented to equality, and is most logical implementation, albeit abortive, is leveling, the negative unity of the negative mutual reciprocity of individuals (p. 79).

Kierkegaard's denunciation of modernity, in style and substance, did not begin with him nor end with his death in 1855. A very recent example, somewhat less florid and impassioned but similar in tone, comes from John Lukacs (2002), an American historian. Proclaiming "It's the End of the Modern Age," Lukacs states that "the widespread usage and application of the adjective to life and art, such as 'modern woman,' 'modern design,' 'modern architecture,' 'modern art,' and so on, appeared mostly in the 1895–1925 period" (p. B11). He further believes that a series of readily identifiable periods and the qualities that made each distinctive from the others have exhausted themselves. He explains: "During these past 10 years (not *fin de siècle: fin d'une ère*), my conviction hardened further, into an unquestioning belief not only that the entire age, and the civilization to which I have belonged, are passing but that we are living through—if not already beyond—its very end. I am writing about the so-called Modern Age." Historians as much as social theorists enjoy pontificating about "the end of" this and the "origin of" that, yet Lukacs's argument cannot easily be dismissed. In his view, "the Modern Age (or at least its two centuries before 1914)" ought to be thought of principally as "the Bourgeois Age," which he describes as follows: "[It] was the Age of the State; the Age of Money; the Age of Industry; the Age of the Cities; the Age of Privacy; the Age of the Family; the Age of Schooling; the Age of the Book; the Age of Representation; the Age of Science; and the age of an evolving historical consciousness. Except for the last two, all of those primacies are now fading and declining fast" (pp. B7, B8, B11). Sentiments such as these might be interpreted as the disillusioned swan song of an elderly student of cultural change, yet Lukacs is hardly alone in believing that globalized consciousness, economics, and militarization have rendered what he calls "the Bourgeois Age" permanently irrelevant to the human future, particularly in the richer countries.

Of course, postmodernists—from whom Lukacs distances himself—have been arguing a similar position for at least 25 years. The most famous among this disparate group, Jean-Francois Lyotard (1984), gives his versions of why "modernity" is over and a new social formation is in place, and he does it by contrasting his view with that of his archrival: "Jürgen Habermas thinks that if modernity has failed, it is in allowing the totality of life to be splintered into independent specialties which are left to the narrow competence of experts, while the concrete individual experiences 'desublimated meaning' and 'destructured form,' not as a liberation but in the mode of that immense *ennui* which Baudelaire described over a century ago (p. 72). The heated debate between Habermas and his French adversaries about the political meaning of the postmodernist credo is complex, but the gist revolves around the former's continued faith in the Enlightenment, in reasoned action and communication, and in a neo-Kantian ethics predicated on individual autonomy and resistance to prepackaged ethical formulae, spooned to citizens through mass media. For the postmodernists, the rational horse is out of the behavioral barn, and it makes no sense to call out for its return. As Lyotard put it: "Is the aim of the project of modernity the constitution of sociocultural unity within which all the elements of daily life and of thought would take their places as in an organic whole? or does the passage that has to be charted between heterogeneous language games—those of cognition, of ethics, of politics—belong to a different order from that? . . . Modernity, in whatever age it appears, cannot exist without a shattering of belief and without discovery of the 'lack of reality' of reality, together with the invention of other realities" (pp. 72–73, 77). It is these "other realities," of course, that are of primary interest to Lyotard, but which Habermas finds politically debilitating, even irresponsible. It is troubling, to say the least, that a major philosopher of cultural change should apparently praise a reality that "lacks reality," even if one is clear on his intended meaning. For modernity, as Tarnas pointed out above, rests first of all on a social agent who can readily distinguish what is "empirically" real (e.g., political-economic interests) from what is unreal (e.g., supernatural beliefs and yearnings). When the "border lands" (a favorite postmodernist metaphor) become blurred between the real and unreal, the true and false, the past and future, then social action of a responsible type—the Enlightenment style that Hegel, Marx, or Habermas would appreciate—becomes extremely difficult to manage. Perhaps this is the gist of what has been said lately by Lyotard, Derrida, and others who think similarly.

Not since the Second World War has a French/German intellectual and cultural split been so keen and obvious in its ramifications as in this case. And because of the fireworks involved, it has drawn widespread attention. Recently, one noted British political theorist, Alan Ryan (2003), had this to say: "Habermas's wish for a 'modern' Germany brings us to the point at which his politics and his philosophy meet. Habermas's political views are, viewed from a sufficient distance, quite simple, though in close-up

they are anything but. He is—and this is why the comparison with Dewey is inescapable—a theorist of 'modernity'; in shorthand, that means he thinks that the modern social and political world is fated to operate without philosophical or religious reassurance, that there can be no transcendental guarantees that what we take to be true, good, beautiful, and just really are so. To philosophers like Heidegger, the absence of transcendental guarantees was a source of anguish. To Dewey, it was just a fact about the world" (p. 46). By working Dewey into the equation, Ryan manages to hint at a possible "solution" to the dilemma posed by the modern era. If religious anchors to morally correct action have been lost to the heavy seas of modernist thought and the sometimes dreadful historical events to which they helped give rise, one can either retreat nostalgically to some form of ersatz religiosity or can accept the foundationless condition of secular life, much as Voltaire did, and bravely carry on, free of any illusions. Except, perhaps, for the singular and essential illusion that one can indeed persevere without the aid of transcendental guarantees. Mark Lilla (2002) recently captured this set of phenomena succinctly: "Throughout the nineteenth century, Hegel had been understood, correctly or not, as having discovered a rational process in world history that would culminate in the modern bureaucratic state, bourgeois civil society, a Protestant civil religion, a capitalist economy, technological advances, and, of course, Hegel's own philosophy. This was the prophecy, and when it was first distilled from Hegel's works it was welcomed throughout Germany. As the prophecy approached fulfillment near the end of the nineteenth century, horror set in and a deep cultural reaction followed. Expressionism, antimodernism, primitivism, irrationalism, fascination with myth and the occult—a Pandora's box of movements and tendencies was opened. The horror was genuine: if Hegel and his epigones were right, the whole of human experience had been explained rationally and historically, anesthetizing the human spirit and foreclosing the experience of anything genuinely new, personal or sacred. It meant in Max Weber's chilling phrase, 'the disenchantment of the world'" (p. 61).

The conviction that modernity, despite all its patent advantages over the medieval, necessarily brought with it an intimidating, fearsome prospect for humanity's future, was first detailed by a social theorist in 1887. In that year Ferdinand Tönnies published *Gemeinschaft und Gesellschaft,* a highly influential tract that caused Durkheim to push theorizing in precisely the opposite direction as hard as he could—celebrating rather than disparaging major social change in his time. Simultaneously, it also motivated Weber to word carefully his reflections about the process leading to what Lilla called "disenchantment," a loose translation of *Entzauberung:* the removal of magic from the world. Tönnies moved from his native German village to Berlin and back, and during this hegira he

experienced the same urban anomie that Durkheim had identified while studying suicide from his position in France. Tönnies ([1887]2001) summarizes his theory: "The theory of *Gesellschaft* takes as its starting point a group of people who, as in *Gemeinschaft,* live peacefully alongside one another, but in this case without being essentially united—indeed, on the contrary, they are essentially detached. In *Gemeinschaft* they stay together in spite of everything that separates them; in *Gesellschaft* they remain separate in spite of everything that unites them. As a result, there are no activities taking place which are derived from an *a priori* and predetermined unity and which therefore express the will and spirit of this unity through any individual who performs them. Nothing happens in *Gesellschaft* that is more important for the individual's wider group than it is for himself. On the contrary, everyone is out for himself alone and living in a state of tension against everyone else" (p. 52). This brilliant and bitter denunciation of contemporary urban life served as a backbone to twentieth-century social thought, even if unattributed to its author. Virtually every subsequent theorist assumed the essential validity of this viewpoint, even as they altered its terminology to suit their own purposes.

Yet there were strong voices of dissent, most notably Georg Simmel's. For him (as for Marx, for whom the bucolic life was the preserve of society's least intelligent members), urbanity opened salutary opportunities for thought and action that had been previously unimagined. And the money economy, vilified by Marx and many others on the Left, Simmel also understood to be a motor of endless change, experimentation, and a generalized enlargement of social possibility. He was perfectly aware of its dangers to the social fabric and wrote perceptively about the condition of urban poverty amidst great wealth. Nevertheless, on balance, Simmel thought that modernity brought with it freedom from any number of shackles, social and intellectual, and was therefore to be embraced, not repelled. Moreover, he believed (as did Weber) that wishing for a nostalgic return to *Gemeinschaft* would accomplish little, since the forces of rationalization, once unleashed, could never again be contained. As Simmel (1971) put it, in his inimitably speculative style: "The dynamic vital character of the modern life-feeling, and the fact that it is manifest to us as a form of vital *movement,* consumed in a continuous flux in spite of all persistence and faithfulness, and adhering to a rhythm that is always new—this runs counter to the Greek's sense of substance and its eternal outline. The great task of modern man—to comprehend the eternal as something which immediately dwells within the transient, without its having to forfeit anything for being transplanted from the transcendental to the earthly plane—is alien to him [the Greek] through and through." For Simmel, the key difference between Greek and modern thinking is that "the former involves a much slighter theoretical awareness of the creativity of the soul."

And in summary, "[T]he great problem of the modern spirit comes forward here as well: to find a place for everything which transcends the givenness of vital phenomena within those phenomena themselves, instead of transposing it to a spatial beyond (pp. 238, 243).

In short, modernity offers boundless chances for humans to create and re-create their environments and themselves; it also makes available, as Goethe's Faust learned 200 years ago, an equal likelihood for catastrophe, for the individual in their most private moments, as well as the megalopolis wherein they struggle to survive.

MOLM, LINDA

Linda D. Molm (b. 1948) is an American sociologist who has examined fundamental processes within social exchange relations. After receiving her BA in 1970 from the University of North Dakota, Molm completed her doctorate in sociology at the University of North Carolina, Chapel Hill, in 1976. Her interest in social exchange theory first blossomed in the late 1970s. Since that time, she has engaged in three systematic research programs that have significantly increased our understanding of social exchange processes. Molm's systematic approach to the growth and testing of theory has resulted in the elaboration and proliferation of exchange theory. In particular, her theoretical contributions have focused on the power-dependence tradition within exchange theory. While each of Molm's three research programs has separately made contributions to power-dependence theory, together they constitute an impressive intellectual contribution to this tradition. Her first research program undertaken between the 1970s and 1980s examined the development, maintenance, and disruption of social exchange relations. From the 1980s to the 1990s, she examined the role and use of coercive power in exchange relations. The book that resulted from this research, *Coercive Power in Social Exchange* (1997), was recognized with the 1998 Theory Prize. Finally, her most recent research program has begun the process of comparing reciprocal and negotiated forms of social exchange.

Molm's three research programs on exchange theory have shared several common features. Perhaps one of the most important features distinguishing her research programs from other exchange traditions has been her focus

on reciprocal exchange relations. Several classical social exchange theorists, including Homans and Blau, developed their theories around a conception of social exchange as a reciprocal exchange. Molm's research stands apart from the work of other contemporary exchange researchers in its focus on the reciprocal form of exchange. In addition, her research has examined not only issues of power in social relations but also other fundamental issues of concern to the classical theorists such as risk, trust, and fairness (Molm, Takahashi, and Peterson 2000). While many other exchange researchers have maintained their focus on issues of power in social exchange, Molm's research has dealt with a wider array of topics of concern in social exchange. This broader focus has expanded the potential scope of social life to which exchange theory can be applied and exemplifies yet another contribution of Molm's work.

While the overarching contributions of Molm's three research programs are significant, additional consideration must also be given to the individual contributions of each research program. Her first research program began in the late 1970s by examining the development of social exchange relations over time and under differing structural conditions. This research program progressed to study the maintenance and disruption of exchange relations. The systematic nature of Molm's theoretical development is evidenced by her initial emphasis on dyadic exchange relations. Her later research programs expand on the structures of exchange relations analyzed. Results from several studies demonstrated the inherent fragility of reciprocal exchange relations. Additionally, she found that changes in reward structure produce very different effects than the same structures in the absence of change.

Building on this initial research program, Molm transitioned to the study of larger structures of exchange networks, although her focus continued to be on the analysis of the exchange relationship. This second systematic research program, for which she is currently best known, examined the effects of coercive power in social exchange, and her work on this topic culminated in an award-winning book (Molm 1997). Also referred to as punishment power, coercive power indicates one's control over negatively valued outcomes, whereas reward power refers to control over positively valued outcomes. The main theoretical contribution of this research program was to expand the scope of power-dependence theory to include coercive power. Through her systematic study of coercive power, Molm found that interactional dynamics would be dominated by reward power when both reward and coercive power are present. In this extension of power-dependence theory, Molm argued for an expansion of the concept of power to include strategic power use. Earlier research had considered power use to be an inevitable consequence of structural power differences, whereas Molm found coercive power to be used in a strategic manner. The third key finding from

this research was about the importance of risk as a constraint on the use of coercion in exchanges.

Molm's current research program builds on her previous work by relating differences between forms of exchange to the concept of risk as well as issues of power and justice. This comparison between negotiated and reciprocal forms of exchange illuminate the differences between exchanges where the terms are explicitly bargained and exchanges where actors initiate exchange without explicit knowledge of their partner's intention to reciprocate. While still in its initial stages, this research program has yielded several significant findings. First, the research has demonstrated that the relation between the structure of power and power use depends on the form of exchange, reciprocal or negotiated. In addition, the form of exchange determines the inherent risks actors face, as well as actors' responses to this risk, including affective responses. Finally, the form of exchange affects actors' feelings of trust, commitment, liking, and fairness. In this ongoing research program, Molm will continue to compare these two forms of exchange, and her future findings will likely continue in her tradition of making important contributions to power-dependence theory.

MONTESQUIEU, CHARLES LOUIS DE SECONDAT

Charles Louis de Secondat, Baron de Montesquieu (1689–1755), was born near Bordeaux into an aristocratic family. With the death of his father in 1713, he became the lord of the family estate, and with the death of an uncle a couple of years later, he became a baron and President à Mortier of the Parlement in Bordeaux—a post that he would later sell, claiming his interests in law were more theoretical than practical. His first major work, *The Persian Letters* (1721), was a literary success, and he became the

darling of several exclusive Parisian circles. After extensive travels in Europe, Montesquieu wrote a historical study titled *Considerations on the Causes of the Greatness of the Romans and on their Decline* (1734). His most important work, and the one that will be considered here, was *The Spirit of the Laws* (1748), a vast, sprawling work, composed of 31 books and the product of 15 years of labor, the last few years marked by failing eyesight. The fact that this work was condemned by the church did not prevent Montesquieu from becoming director of the Académie Française during the year prior to his death. His last work, an "Essay on Taste," was written for the *Encyclopédie* edited by Diderot and D'Alembert.

The Spirit of the Laws is often considered the inaugural work of a specifically *social* science, not just because of its content—the reestablishment of political thought on the basis of an analysis of all known societies—but above all, because of its method. Émile Durkheim (and later, Louis Althusser) claimed that Montesquieu was the first to apply "social" laws to the study of society, rather than juridical, political laws (considered as tainted by a teleological, and thus metaphysical bias). A close reading of *The Spirit of the Laws,* however, reveals a more complex picture.

In the opening paragraph, Montesquieu establishes a hierarchy of laws corresponding to the chain of beings: at the top are the laws regulating God's actions, then the laws of matter, followed by angelic moral laws, the bestial laws of passion, and at the bottom, positive human laws. This hierarchy, unlike more traditional hierarchies, is based not on degrees of moral perfection but on degrees of determinacy. Humans are at the bottom because they are the least determined of beings, for they alone are subject to every type of law. Human societies are subject to the "laws" of climate, geography, population, material culture, commerce, mores, morality, religion, sentiment, and reason. The effects of the interaction of all these laws, in all their complexity, are potentially limitless. Humans, being subject to a surfeit of different lawlike determinations, do not necessarily obey any of these laws. As such, they cannot, by themselves, provide collective existence with a principle of order, coherence, or truth; at most these laws provide a post hoc principle of intelligibility. This is the source of Montesquieu's much vaunted empiricism. One is not limited to the study of those "facts" that suggest collective life is orderly, meaningful, or just. One can study all the facts because they can all be rendered comprehensible when related to general laws.

This excess of lawlike determinations provides humans with their margin of freedom. Humans, Montesquieu insists, are the only beings capable of deluding themselves, even to the point of ignoring the most basic exigencies. Such "symbolic" freedom also enables humans to re-present these multiple general laws and to reflexively refashion them into meaningful wholes, notably through the establishment of

the political-juridical sphere with its positive laws. The recourse to the latter is made all the more imperative by the need to confront the violence that Montesquieu claims (in opposition to Hobbes) arises with the emergence of social life. The empire of positive laws, however, cannot but remain fragile. Not only do the multiple, "social" determinations threaten to deflect or counter the intentions of the legislator, but these determinations mould the political laws from within. For they contribute to the formation of the "general spirit" that underlies the laws and gives them their force. As such, the leverage afforded positive laws remains limited and context dependent. Montesquieu constantly seeks to give advice to the legislator, but most of this advice consists of warnings about legislative hubris.

Once the "epistemological" foundations have been established in Book 1, Montesquieu must systematically think the multiplicity of "social" facts in relation to a limited number of political forms. In Books 2 through 13 he begins with the political forms and examines their internal consistency in relation to their underlying "spirits," which provide a sort of condensate of the different lawlike determinations. In Books 12 to 25 he changes directions, and examines all the "social" factors, moving from the most material (climate) to the most ideal (religion), in relation to their impact on the political realm. In the last six books, he returns to the problematic of positive law.

There are three basic political types or forms: republics, monarchies, and despotism. Prior to Montesquieu, despotism was seen not as a type of political regime but as, at best, the corruption of a regime type. For the forms of power appeared inconceivable outside the laws that sustain them—and despotism is lawless. By granting despotism full categorical dignity, Montesquieu produces a revolution in the conception of power. Not only does he separate power from positive law, but he suggests that, left to itself, power seeks to overcome the restrictions of the law in pursuit of its own unlimited dominion. Despotism, in effect, reveals the essence of power and, as such, haunts all political formations, carrying forward the violence of society's origins into the relations of rule. Indeed, Montesquieu stresses that despotism is not just the most primitive but the most common form of regime.

Henceforth, the problem is not to create a "good power," that is, a power that lives up to the law of its concept. Nor is it to eliminate power; that would only render positive law powerless. Rather the problem is to contain power. Positive law by itself is not up to the task, as its dependence on power renders it too vulnerable. A "means" must be found to buttress the law if it is to restrain power's unlimited expansion. In principle, every nondespotic regime has, in its own manner, established such a means. The system of checks and balances, whose elaboration had such an influence on the American founding fathers, is but the most famous.

If power negates the law under despotism, the relation of power to law is rendered positive in the other regime types. In republics, particularly democratic republics, power and law are equated by being generalized and fused within the figure of the citizen. In monarchies, by contrast, the separation of law and power is maximized; for feudal law, the basis of modern monarchies, was only established, according to Montesquieu, when monarchic power was at its nadir, thus permitting the establishment of "intermediary bodies." This same relation of power to law provides a key to the comprehension of the "spirits" corresponding to the regime types. In despotism, the spirit is fear—the fear resulting from the violence of a will unbounded by the law. At the same time, the despotic will corresponds to an original, narcissistic self-love that would submit everything to its own desire. In republics, whose spirit is virtue (understood as the law's internalization), the love of self is replaced by a love of the law, or of the community established by the law. With monarchies and their spirit of honor, one returns to self-love, but this time a self-love mediated by the recognition of the other and, thereby, tied to the norms of a social code. In the creation of a self-image that, in the name of honor, would resist an excessive dependence on both monarchical favor and the letter of the law, Montesquieu detects the emergence of a certain individual freedom.

Montesquieu extends his comparison of regime types along several dimensions, and according to a multitude of factors. Consider, to give but one example, what he says about how each type institutes its temporal dimension. Despotic regimes appear indifferent to time: in their violence, they tend toward their self-destruction, but in their artlessness, they constantly reemerge. Democratic republics, by contrast, would arrest time. Once the original legislative genius (a Solon, Lycurgus, or William Penn) has established the constitution, time would be frozen under the sign of the law. Monarchies alone bear a relation to time that supposes historical continuity. In the much misinterpreted last two books, Montesquieu examines the origins of the European monarchies, which he sees as the bearers of "Western exceptionalism." Unlike much of the Enlightenment, he does not attribute the singularity of the West to the heritage of the classical world, whether republican or imperial. Nor, unlike the aristocratic opposition, does he attribute it to the influence of the Germanic invasions per se. Instead, he looks to the evolution of feudalism for the emergence of a law, and with this law, an institutional structure, that developed relatively independently of the place of political power represented by the monarch.

Within each of the major regime types, Montesquieu discovers important variations. China, for example, presents the paradox of a moderate despotism. With its ritualized civility, it constantly re-creates from below the social bond that the despotic will would erode from above. Commercial republics, to provide another example, temper the bellicosity, asceticism, and egalitarianism of the "purer" type of democratic republic. The most important variation, however, is presented by England, which, even as it is characterized as a republic disguised as a monarchy, appears less as a mixed regime than a regime sui generis. The object of the English regime, Montesquieu states, is liberty, even "extreme liberty." The "constitution," which counters power with power through a system of checks and balances, is only one of the preconditions of this liberty. Another precondition is the rise of a conflictual politics, which, in turn, supposes a partial deidentification with the place of power on the part of a populace jealous of its liberty. At a more general level, Montesquieu points to the unprecedented energies released by the emergence of a new form of individualism characterized by a general restlessness. And on a darker note, he speaks—in direct contrast to the joie de vivre of the French—of the signs of a collapse of sociality and the spread of melancholia.

Within contemporary social theory, Montesquieu's name remains honored, but *The Spirit of the Laws* is little read, and rarely in its entirety. This is a pity. It was, arguably, the first work in which the discovery of the "social" is clearly discernible. Moreover, it suggests that this discovery first emerged as a division internal to the "political," as the latter's delineation of its own other. For a specifically social analysis appears here as the consequence of political theory's critique of the limits of its own abstraction and volition. Montesquieu was not, contrary to Durkheim, the precursor of the scientific study of society, seeking to replace political theory with social science. Nor did he oppose the political and social as two mortally hostile domains (as, in very different terms, did Marx and Hannah Arendt). He was far more interested in articulating the relation between the two domains in their difference, and he did so with a subtlety, sobriety, and imagination that to this day remains unparalleled.

MORALITY AND AESTHETIC JUDGEMENT

What is at stake in the relationship of morality and aesthetic judgement is the hospitality of nature to the aesthetic ends of humanity. The affiliation of morality (the rational self-determination of the will) and aesthetic judgement (the designation of nature or its artistic representation as beautiful or sublime) emerged as a pressing concern within Enlightenment philosophy. The core of the Enlightenment project as it developed in its English, French, and German forms was an absolute faith in the capacity of reason to overcome the prejudice and superstition of the Middle Ages, to establish moral, political, and normative systems that would liberate humanity from its dependence on unquestioned forms of authority, and to establish by science and experimentation the rational order that underlies the affairs of humans. The importance of aesthetic experience in this project is the possibility it offers of unifying the apparently disparate realms of history and nature: of showing that the unfolding of human affairs toward the ultimate ends of peace, security, and universal recognition is inscribed in the rational order of the world. Thus, insofar as the Enlightenment project attempted to expound a unity between the ultimate ends for which human beings were created, the aesthetic experience we have of nature was understood as configuring, or symbolizing, the moral integrity of the human will.

The exemplary text here is Immanuel Kant's *Critique of Aesthetic Judgement* (1790). In the first part of the book, "The Analytic of the Beautiful," Kant attempted to set out the a priori conditions of the judgement of taste—the estimation of an object or its artistic representation as beautiful. For Kant, this judgement is independent of all interest, presents itself as a demand for the assent of all men, and follows not from the theoretical cognition of the object but from a certain harmony of the faculties of understanding and intuition. The feeling of delight that arises from my contemplation of a beautiful object, in other words, immediately refers my judgement to the intelligibility of nature, and so to a common sense of the aesthetic possessed by all rational beings. Insofar as I am moved to apply the concept of the beautiful to those objects that produce in me the feeling of delight, I can be said to be responding to a purposiveness in nature that exceeds the mere excitation of sensory interest. The tasteful contemplation of a nude, for example, would arise from its formal characteristics of line and symmetry and not from the immoral desires that the female body is wont to provoke. Both my disinterested pleasure in the beautiful and the pure desire I experience in the moral law, therefore, are related to what is literally unrepresentable: the supersensible conditions of unity and finality that cannot be schematized by the understanding. Thus, the acquisition of taste allows me to apprehend the real of sense as the embodiment of a divine purpose (the idea of nature), and to recognize its beauty as the symbol of the moral law.

The second part of *The Critique of Aesthetic Judgement,* "The Analytic of the Sublime," is also concerned with the purposiveness of nature—although this time the feelings provoked are disturbing rather than pleasurable, and gesture beyond the regulative organization of taste. For Kant, the subject's encounter with the awesome magnitudes (a storm at sea, a snow-capped mountain range) through which nature signifies its totality produces a sense of terror at the loss of the serial time that is the imagination's a priori principle. The immediate (or reproductive) synthesis of the magnitudes that reason demands of the imagination in the presence of the sublime does violence to the successive (or compositional) time that is the condition of phenomenal experience. Yet for Kant, this feeling of terror is not unmixed; for it is simultaneous with a sense of exultation in reason's capacity to conceive of nature as an intelligible totality. Imagination, in other words, experiences metaphysical distress at its loss of reproductive intuition; for serial time, which conditions the synthesis of sense-data by the understanding, is threatened by the overwhelming simultaneity of compositional magnitudes. Reason, on the other hand, feels a certain exultation at its capacity to recognize the intelligibility of nature. Thus for Kant the sublime copresence of pleasure and pain that arises within the cognitive subject refers its freedom beyond mere sensory satisfaction and toward the higher moral ends for which humanity was created (peace, cooperation, universal respect).

In *The German Ideology* (1847), Karl Marx implicated the aesthetics in the general determination of bourgeois culture to mystify and reconfigure the fundamental conflicts of capitalism. Kant's affiliation of aesthetic sensibility, moral culture, and historical progress, therefore, appeared as an ideological form that is complicit with the radical individualism of civil society. This relationship between the tasteful reproduction of reality and the persistence of a certain moral self-satisfaction was taken up by Max Horkheimer and Theodor Adorno in *Dialectic of Enlightenment* (1944). In a powerful elaboration of Marx's ideology thesis, they argued that new media technologies had all but completed the integration of the masses into the rationalized economy of capitalist production. The films, television, and radio programmes produced by what Horkheimer and Adorno called "culture industries"

presented the satisfactions of corporate capitalism (cheap cars, convenience foods, fashionable clothes) as universally desirable. Popular culture, in other words, simply reproduces the unity of mass taste with the satisfaction it receives in the consumption of mass-produced commodities. The broadcast media that Horkheimer and Adorno discuss in *Dialectic of Enlightenment,* therefore, function to reify the human ties in which culture originates: The individuality each of us values so highly becomes no more than a reflection of the standardized ideals of masculinity, heroism, sexuality, and beauty presented in Hollywood films. The kitsch romanticism of popular aesthetics functions to obscure the rationalized-functionalized-technological organization of human relationships and so to suspend the possibility of moral judgements on the reifying powers of corporate capitalism.

Walter Benjamin, in his essay "The Work of Art in the Age of Mechanical Reproduction" (1939), however, argued that new image technologies—particularly film—opened a sphere of representation whose relationship to the masses is originally political. His claim is that the kinaesthetic register of film marks a departure from conventional standards of artistic creativity, standards that seek to preserve the *aura* of things, and opens the possibility of mass reflection on the technological body of human society. Art, for Benjamin, has always been characterized by a loss of the distance that sustains direct perception of beautiful and sublime objects; for insofar as it accomplishes its representation precisely by evoking what is no longer present to the viewer, it has from the beginning involved processes that mediate the aura of the object. Modern technologies like film and photography, however, have fundamentally transformed the artifice of art: They no longer seek to preserve the distance that is assumed in the perception of the beautiful and the sublime; rather, their capacity to anatomize objects through close-up shots, slow motion, and multiple camera angles destroys the aura of the people and objects that are represented. What is significant here is the transformation of the viewing community that is entailed in this shift toward technological reproducibility: for once the image has been intensified and disseminated in the medium of film, its reception is no longer limited to those who have the taste and leisure to appreciate artistic representations of the good society. For Benjamin, therefore, a moral politics could not simply recapitulate timeless images of bourgeois taste (as in the interior scenes of bourgeois art), nor should it seek to present itself through the technological revitalization of aura (the fundamental intention of Nazi propaganda films). Rather, its morality would consist in responding to the exigencies of the present: in provoking the masses to imagine the possibilities of dwelling, habitation, community, and participation that are opened by new technological means.

Benjamin and Adorno's remarks on the fate of the aesthetic have been taken up in the modernity-postmodernity debate that has occupied the social sciences for the last 20 years. On the Adornian side of the debate, a number of theorists have sought to extend the culture industry thesis to the increasing media saturation of postmodern societies. Fredric Jameson in *Postmodernity, or The Cultural Logic of Late Capitalism* (1991) analyses the loss of transformative power that the image undergoes as new technologies remove every trace of moral, political, and existential significance from its reproduction. Postmodernist art, he argues, is utterly depthless; it has, without irony, reproduced the style of the pop video and the Hollywood B-movie and is now incapable of provoking any kind of moral or political reflection in the masses. This decline of the image into depthless simulacra of love, sex, and beauty is taken up by Zygmunt Bauman in *Postmodern Ethics* (1993). He argues that in our media-saturated world, we confront each other merely as surfaces; I notice you only if you amuse or arouse me and vice versa. Any sense of ethical responsibility tends to be dissipated in the aesthetic distraction that constantly traverses the masses in postmodern societies. The consequences of this distraction are addressed by Keith Tester in *Media, Culture, and Morality* (1994). He argues, echoing Adorno's remarks on cultural criticism, that modern cultural studies reflect the trivial aestheticism they purport to criticize: Their obsession with style, fashion, and consumption is ultimately a symptom of the collapse of culture into the amorality of the market. In his later work, especially *Moral Culture* (1997), Tester examines the impact of the mass media on our capacity to think, feel, and act morally, and in particular how television has turned us into bystanders who remain indifferent to images of war, famine, and genocide.

On the Benjaminian side of the debate, Jean-Francois Lyotard has argued that the technological expansion of capital cannot consign art exclusively to the realm of the kitsch and the decorative. In *The Differend: Phrases in Dispute* (1988), he claims that the feelings of agitation that belong to the experience of the sublime are increasingly provoked by the disordered economy of capitalism. As the system expands through the use of digital, informatic, and computer technologies, the self is dispersed across radically heterogeneous regimes of discourse: Each of us experiences the dissidence between the economic demands of work, the affective demands of family and interpersonal relationships, the political demands of citizenship. For Lyotard, these conflicts are characterized by their radical unresolvability: There is no universal language into which it is possible to translate the conflicts between race, gender, democracy, and economy. This unresolvability is what marks the return of a certain affiliation between morality and the sublime. For Lyotard, the violence through which capital has subjected every form of cultural and ethnic difference to the demands of frictionless technological production engenders unforeseeable moments of *shock* that are akin to the sublime agitation described by Kant. The postmodern artist, then, has a responsibility (which cannot be totally erased by the temptations of the art market) to express this disarming experience: to respond to those

others who are silenced in the aesthetic and linguistic regimes of liberal capitalism.

N

NATIONALISM

Social theory has approached nationalism most as a political ideology structuring relations of power and conflict. It has focused on nationalism's relationship to ethnic violence and war, on the production of beliefs that one's own country is the best, and on the invocation of national unity to override internal differences. It has seen nationalism first through bellicose international relations and second through projects by which elites attempt to mobilize mass support. This has been an influential view both among scholars of nationalism (such as Michael Hechter) and among general social theorists (such as Jürgen Habermas) who have tended to see nationalism largely as a problem to be overcome.

A second strain of social theory, associated with modernization theory and anticipated by both Weber and Durkheim, has seen nation building as a crucial component of developing an effective modern society, one capable of political stability and economic development. Nationalism, as the ideology associated with such nation building, is thus important to a phase on the process of becoming modern and also a normal reflection of industrialization and state formation. Ernst Gellner, Charles Tilly, and Michael Mann are key representatives. But however normal to a developmental phase nationalism may be, all see it as also deeply implicated in power relations and conflicts and prone to problematic manipulation by state elites.

These first two lines of theory both emphasize politics and the state and treat nationalism mainly as a feature of the modern era. A third strain of social theory recognizes the role of nationalism in politics and conflict but stresses also its more positive contributions to the production of culture, the preservation of historical memory, and the formation of group solidarity. Many of the most influential theorists in this group also place much greater stress on the sources of

nationalism in ancient ethnicities that provide the basis for identities prior to any specific political mobilization. Anthony Smith is the foremost representative of this view. A related point is that nationalism ought not to be approached only through its most extreme manifestations, but also grasped in its more banal forms—in a variety of ceremonial events, for example, and the organization of athletic competitions. These contribute not only to specific group loyalties but to the reproduction of the general view that the world is organized in terms of nations and national identities.

Here the study of nationalism as a topic of social theory intersects with the more reflexive question of how nationalism has shaped a crucial unit of analysis in social theory, that of society. While "sociality" may be universal to human life, the idea of discrete, bounded, and integrally unitary "societies" is more historically specific. It appears in strong form as one of the characteristic, even definitive, features of the modern era.

This reflects political features—as, for example, both state control over borders and intensification of state administration internally help to produce the idea of bounded and unified societies, and as arguments for political legitimacy increasingly claim ascent from the people rather than descent from God or inherited office. It also reflects cultural features, although many of these are not ancient inheritances but modern inventions or reforms, such as linguistic standardization, common educational systems, museums as vehicles of representation, and the introduction of national media. In one of the most influential recent studies of nationalism, Benedict Anderson (1991) has described it as productive of "imagined communities." By this he means that nations are produced centrally by cultural practices that encourage members to situate their own identities and self-understandings within a nation. Reading the same news, for example, not only provides people with common information, and common

images of "us" and "them" but helps to reproduce a collective narrative in which the manifold different events and activities reported fit together like narrative threads in a novel and interweaves them all with the life of the reader. Practices and institutions of state administration are central to this production of nations as categories of understanding—imagining—but they are not exhaustive of it, and those who wield state power do not entirely control it.

To simplify the field, then, we can see four main themes in theories of nationalism (which may be combined in different ways by different authors): (1) nationalism as a source or form of conflict, (2) nationalism as a source of political integration, (3) nationalism as a reform and appropriation of ethnic inheritance, (4) nationalism as a new cultural creation. These themes are deployed in debates over "civic" versus "ethnic" nationalism and over the "modernity" or "primordiality" of nations. But before we turn to debates within the field, we should consider further the underlying problem of nationalism as a source and a shaper of the notion of society itself.

NATIONALISM AND THE PRODUCTION OF "SOCIETIES"

Human beings have always lived in groups. The nature of these groups has, however, varied considerably. They range from families and small bands through clans and other larger kin organizations to villages, kingdoms, and empires; they include religions and cultures, occupational groups and castes, nations, and more recently, even global society to the extent that it knits all humanity into a single group. In most of these cases, the self-understanding of members is crucial to the existence of the group—a kingdom, a religion, or a caste is both an "objective" collection of people and pattern of social organization and a "subjective" way in which people understand how they belong together and should interact. This is clearly true of the idea of nation. Without the subjective component of self-understanding, nations could not exist. Moreover, once the idea of nation exists, it can be used to organize not just self-understanding but categorizations of others.

The most basic meaning of nationalism is the use of this way of categorizing human populations, both as a way of looking at the world as a whole and as a way of establishing group identity from within. In addition, nationalism usually refers not just to using the category of nation to conceptualize social groups but also to holding that national identities and groups are of basic importance (and often that loyalty to one's own nation should be a commanding value). Nationalism is thus simultaneously a way of constructing groups and a normative claim. The two sides come together in ideas about who properly belongs together in a society and in arguments that members have moral obligations to the nation as a whole—perhaps even to kill on its behalf or die for it in a war.

Nationalism, then, is the use of the category "nation" to organize perceptions of basic human identities, grouping people together with fellow nationals and distinguishing them from members of other nations. It is influential as a way of helping to produce solidarity within national categories, as a way of determining how specific groups should be treated (for example, in terms of voting rights or visas and passports), and as a way of seeing the world as a whole. We see this representation in the different-colored territories on globes and maps, and in the organization of the United Nations. At the same time, clearly the boundaries of nations are both less fixed and more permeable than nationalists commonly recognize.

Central to nationalist discourse is the idea that there should be a match between a nation and a sovereign state; indeed, the nation (usually understood as prepolitical and always already there in historical terms) constitutes the ground of the legitimacy of the state. Kedourie (1993) has argued, for example, that nationalism was invented in Europe at the beginning of the nineteenth century. In his view, it "pretends to supply a criterion for the determination of the unit of population proper to enjoy a government exclusively its own, for the legitimate exercise of power in the state, and for the right organization of a society of states" (p. 1). The core elements of the doctrine are simple: Humanity is naturally divided into nations; nations are known by certain empirically identifiable characteristics; and the only legitimate type of government is national self-government.

Gellner (1983) likewise avers that nationalism is "a political principle, which holds that the political and the national unit should be congruent" (p. 5). Yet nationalism is not merely a "political principle." It depends also on reproduction through banal practices such as Olympic competitions (Billig 1995) and imaginative construction, for example, in museums, censuses, and habits of reading (Anderson 1991). And, of course, whether or not ethnicity explains nationalism, it facilitates national integration and identification.

A variety of claims are made about what constitutes "proper" nations. For example, they are held ideally to have common and distinct territories, common and distinct national cultures (including especially languages), and sovereign states of their own. It is very difficult to define nations in terms of these claims, however, since there are exceptions to almost all of them. To take language as an example, there are both nations whose members speak multiple languages (Switzerland), and languages spoken by members of different nations (English). Likewise, nationalist ideologies may hold that all members share distinctive common descent, constituting in effect a large kin group, but this is not definitive of nations in general. Nations are organized at a scale and with an internal diversity of membership that transcends kinship. No definition

of *nation* (or of its correlative terms such as *nationalism* and *nationality*) has ever gained general acceptance.

In this sense, nationalism is a "discursive formation." It is a way of speaking that shapes our consciousness but also is problematic enough that it keeps generating more issues and questions. As a discursive formation, nationalism is implicated in the widespread if problematic treatment of societies as bounded, integral, wholes with distinctive identities, cultures, and institutions. Charles Tilly, Rogers Brubaker, and most important, Pierre Bourdieu have all called for a relational approach, by contrast to ideas about clear collective identities. Their critiques have hardly ended the problematic usage, partly because it is so deeply embedded in the way we speak and think. This is not an unmotivated error by social scientists; it is a participation, perhaps unwitting, in the nationalist rhetoric that pervades public life and contemporary culture.

ETHNIC AND CIVIC NATIONALISM

The category of nation has ancient roots. Both the term and two of its distinctive modern meanings were in play in the Roman Empire. For the Romans, the term referred to descent groups (usually understood to have common language and culture as well). But the Romans commonly used such ethnic categorizations to designate those who were not Roman citizens. National origins, in this sense, were what differentiated those conquered by or at war with Romans from those fully incorporated into the Roman state, not what Romans claimed as the source of their own unity. But in the very distinction, we see two sides of the discourse of nations ever since: first, an attribution of common ethnicity (culture and/or biological descent) and an idea of common membership of a state (citizenship, and more generally respect for laws and standards of behavior, which can be adopted, not only inherited).

These two sides to the idea of nation shape an enduring debate over the extent to which a legitimate people should or must be ethnically defined, or can or should be civically constituted and what the implications of each might be. Ethnic nationalist claims, based on race, kinship, language, or common culture, have been widespread throughout the modern era. They sometimes extend beyond the construction of identity to the reproduction of enmity, demands that members place the nation ahead of other loyalties, and attempts to purge territories of those defined as foreign. As a result, ethnic nationalism is often associated with ethnic violence and projects of ethnic cleansing or genocide. However, ethnic solidarity is also seen by many as basic to national identity as such and thus to the notion of the nation-state. While this notion is as much contested as defended, it remains influential.

In such usage, ethnic nationalism is commonly opposed to civic nationalism. The latter is understood as the loyalty of individual citizens to a state based purely on political identity. Habermas (1998) has theorized this as "constitutional patriotism," stressing the extent to which political loyalty is to a set of institutional arrangements rather than a prepolitical culture or other extrapolitical solidarity. Ethnic nationalism, in such usage, refers precisely to rooting political identity and obligation in the existence of a prepolitical collective unit—the nation—which achieves political subjectivity by virtue of the state. The legitimacy of the state, in turn, is judged by reference to the interests of the nation.

The contrast of ethnic to civic nationalism is heavily influenced by that of Germany to France. The contrast has been enduring and has resulted in different understandings of citizenship. France has been much more willing, for example, to use legal mechanisms to grant immigrants French citizenship, while Germany—equally open to immigration in numerical terms—has generally refused its immigrants German citizenship unless they are already ethnic Germans (Brubaker 1992). Other countries vary on the same dimension (and in Europe, the European Union is developing a mainly civic, assimilationist legal framework), but it is important to recognize that the difference is one of proportion and ideological emphasis. As Smith (1986) has remarked that all nations are shaped by both territorial and ethnic approaches to identity, and all represent an uneasy confluence of "civic" and "genealogical" or ethnic models of sociocultural organization. Not all scholars accept the distinction or hold it to be sharp; those who do use it often attribute ethnic nationalism to countries that are "late modernizers" (see p. 149).

Central to the idea of civic nationalism is the possibility for citizens to adopt national identity by choice. This is most commonly discussed in terms of the assimilation of individual immigrants into nation-states; civic nations can in principle be open to anyone who agrees to follow their laws. Citizenship in the state is seen as primary rather than prior membership in a descent group or cultural tradition. The distinction is fuzzy, however, as a rhetoric of civic nationalism and citizenship can mask underlying commitments to particularistic cultural or racial definitions of what counts as a "proper" or good citizen. Thus (in a recently prominent example) even law-abiding Muslims may not seem sufficiently French to many, and conversely the French state may pass laws ostensibly enforcing neutrality on religion but in fact expressing particular ethnocultural mores. It is particularly difficult to frame rationales for limits on immigration in civic nationalist terms without falling back on ethnic nationalism.

At the same time, the civic nationalist tradition contains another thread. This is the notion that the nation itself is made, is a product of collective action. This is symbolized by revolutions and the founding of new states (which may include more or less successful efforts to call forth national solidarities). The idea of choice here is not simply that of

individual membership but of collective determination of
the form and content of the nation itself—the effort to take
control of culture as a historical project rather than merely
receiving it as inheritance. When the revolutionary French
National Assembly reformed the calendar and systems of
measurement, thus, it was engaged not merely in adminis-
tration of the state but in an effort to make a certain sort of
nation—one with a more modern, rational culture. And,
of course, the tension between attempting to make a new
culture and preserve the old has been played out in the
educational system ever since.

While much nationalist ideology has claimed definitive
ethnic roots, social scientists are divided on the question,
and most prominent twentieth-century analysts of national-
ism have sought to challenge the explanation of nationalism
by ethnicity. Kohn (1944) stresses the crucial role of
modern politics, especially the idea of sovereignty.
Hobsbawm (1990) treats nationalism as a kind of second-
order political movement based on a false consciousness
that ethnicity helps to produce but cannot explain because
the deeper roots lie in political economy, not culture.
The dominant approach in contemporary scholarship
approaches nationalism largely as an ideological reflection
of state formation (Mann 1993; Tilly 1990). Gellner (1983)
emphasizes industrialization and also stresses the number
of cases of failed or absent nationalisms: ethnic groups
which mounted either little or no attempt to become nations
in the modern sense. This suggests that even if ethnicity
plays a role, it cannot be a sufficient explanation (although
one imagines the nineteenth-century German romantics
would simply reply that there are strong, historic nations
and weak ones destined to fade from the historic stage).
Hayes (1931) argues for seeing nationalism as a sort of reli-
gion. Hechter (2000) analyzes it in terms of strategic indi-
vidual action aimed at maximizing mostly economic and
political benefits. Kedourie (1993) approaches nationalism
as an ideology and attempts to debunk nationalism by
showing the untenability of the German romantic cultural-
ethnic claims. Indeed, in their different ways, all these
thinkers have sought to debunk the common claims nation-
alists themselves make to long-established ethnic identities.

Against this backdrop, Smith (1986) acknowledges that
nations cannot be seen as primordial or natural but nonethe-
less argues that they are rooted in relatively ancient
histories. Smith argues that the origins of modern national-
ism lie in the successful bureaucratization of aristocratic
ethnie (ethnic community), which were able to transform
themselves into genuine nations only in the West. In the
West, territorial centralization and consolidation went hand
in hand with a growing cultural standardization. Nations,
Smith thus suggests, are long-term processes, continually
reenacted and reconstructed; they require ethnic cores,
homelands, heroes and golden ages if they are to survive.
"Modern nations and nationalism have only extended and

deepened the meanings and scope of older ethnic concepts
and structures" (p. 216). Nationalism brings some degree of
universalization, but even modern "civic" nations do not
fully transcend ethnicity or ethnic sentiments. Consider the
fact that France is the primary example of civic national-
ism, and yet imagine France without French culture: lan-
guage, cheeses, styles of social theory, and all.

The ethnic similarities and bonds that contribute to the
formation of nations may indeed be important and long
standing, but in themselves they do not fully constitute
either particular nations or the modern idea of nation. While
some critics of ethnic explanations of nationalism empha-
size the influence of state formation or other "master vari-
ables," a number assert that nations are created by
nationalism—by this particular form of discourse, political
rhetoric, or ideology—not merely passively present and
awaiting the contingent address of nationalists (Anderson
1991; Chatterjee 1986; Gellner 1983; Kedourie 1993).

An emphasis on preexisting ethnicity—even where this
is rightly identified—is unable to shed much light on why
so many modern movements, policies, ideologies, and con-
flicts are constituted within the discourse of nationalism.
Indeed, as Gellner (1983:8–18, 61) has suggested, the very
self-recognition of ethnicities or cultures as defining identi-
ties is distinctively modern. Walker Connor (1994) uses a
similar point to distinguish ethnic groups as "potential
nations" from real nations: "While an ethnic group may,
therefore, be other-defined, the nation must be self-defined"
(p. 103).

Explanations of nationalism, thus, need to address the
contemporary conditions that make it effective in people's
lives, their attempts to orient themselves in the world, and
their actions. Such conditions are, of course, subject to
change, and nationalist constructions are apt to change with
them. Thus, Indian nationalists from the nineteenth century
through Nehru were able to make a meaningful (although
hardly seamless or uncontested) unity of the welter of sub-
continental identities as part of their struggle against the
British. The departure of the British from India changed the
meaning of Congress nationalism, however, as this became
the program of an Indian state, not of those outside official
politics who resisted an alien regime. Among other effects
of this, a rhetorical space was opened up for "communal"
and other sectional claims that were less readily brought
forward in the colonial period (Chatterjee 1994). Similarly,
the proliferation of nationalisms in Eastern Europe atten-
dant on the collapse of communist rule involved a "refram-
ing" of older national identities and nationalist projects; the
nationalisms of the 1990s were neither altogether new nor
simply resumptions of those that predated communism
(Brubaker 1996). The opposition between primordiality
and "mere invention" leaves open a very wide range of his-
toricities within which national and other traditions can
exert real force. As Renan ([1871]1990) famously stressed,

nationalist histories are matters of forgetting as well as remembering, including forgotten the "deeds of violence which took place at the origin of all political formations" (p. 11).

Nationalism is partly a matter of narrative construction, the production (and reproduction and revision) of narratives locating the nation's place in history. As Anderson (1991) puts it, nations move through historical time as persons move through biographical time; each may figure in stories like characters in a novel. This is one reason why the continuity of ethnic identities alone does not adequately explain nationalism: The narrative constructions in which it is cast change and potentially transform the meaning of whatever ethnic commonalties may exist. Ironically, the writing of linear historical narratives of national development and claims to primordial national identity often proceed hand in hand. Indeed, the writing of national historical narratives is so embedded in the discourse of nationalism that it almost always depends rhetorically on the presumption of some kind of preexisting national identity in order to give the story a beginning. A claim to primordial national identity is, in fact, a version of nationalist historical narrative.

MODERNITY VERSUS PRIMORDIALITY

A long-running debate in the literature on nationalism pits arguments that it is an extension of ancient ethnicity (Smith 1986) against those who argue that it is essentially modern (Gellner 1983; Greenfeld 1992; Hobsbawm 1990). Majority scholarly opinion tends toward the latter view, although explanations differ. "Modernists" variously see nationalism rooted in industrialization (Gellner 1983), state formation (Mann 1993; Tilly 1990), the rise of new communications media and genres of collective imagination (Anderson 1991; Deutsch 1966), and the development of new rhetorics for collective identity and capacities for collective action (Calhoun 1997). While many favor specific factors as primary explanations, most recognize that several causes are interrelated.

Many nationalists but few scholars see nationalism as ubiquitous in history and simply the "normal" way of organizing large-scale collective identity. Most social scientists point, rather, to the variety of political and cultural forms common before the modern era—empires and great religions, for example—and the transformations wrought by the rise of a new kind of intensive state administration, cultural integration, popular political participation, and international relations. Many of these social scientists argue that nations and nationalism in their modern sense are both new. In particular, they would argue that ethnicity as a way of organizing collective identity underwent at the least a substantial reorganization when it began to be deployed as part of ethnonationalist rhetoric in the modern era. Others, however, including notably Anthony Smith and John Armstrong,

argue that there is more continuity in the ethnic core of nations, although they too would agree that modernity transformed—if it did not outright create—nationalism.

The attraction of a claimed ethnic foundation to nations lies largely in the implication that nationhood is in some sense primordial and natural. Nationalists typically claim that their nations are simply given and immutable rather than constructions of recent historical action or tendentious contemporary claims. Much early scholarly writing on nations and nationalism shared in this view and sought to discover which were the "true" ethnic foundations of nationhood. It is no doubt ideologically effective to claim that a nation has existed since time immemorial or that its traditions have been passed down intact from heroic founders. In no case, however, does historical or social science research support such a claim. All nations are historically created.

Noting this, one line of research emphasizes the manipulation of popular sentiments by the more or less cynical production of national culture by intellectuals and state-building elites. Hobsbawm and Ranger (1983), for example, have collected numerous examples of the ways in which apparently definitive cultural markers of national identity can in fact be traced to specific acts of creation embedded in political (or sometimes marketing) projects rather than reflecting preexisting ethnicity. The Scots tartan kilt is a famous example, dating not from the mists of primordial Highland history but from eighteenth-century resistance to Anglicization (Trevor-Roper 1983) and early nineteenth-century romantic celebrations of a no-longer-troubling ethnic Scottishness. Likewise, nineteenth-century Serbian and Croatian intellectuals strove to divide their common Serbo-Croatian language into two distinct vernaculars with separate literary traditions. But as this example makes clear, it is not obvious that because the "traditions" of nationalism are "invented," they are somehow less real or valid. Anderson (1996) finds the same fault with Gellner: "Gellner is so anxious to show that nationalism masquerades under false pretences that he assimilates 'invention' to 'fabrication' and 'falsity,' rather than to 'imagining' and 'creation'" (p. 6).

Hobsbawm and Ranger (1983) imply that long-standing, "primordial" tradition would somehow count as legitimate, while by contrast various nationalist traditions are of recent and perhaps manipulative creation. Many ideologues do claim origins at the dawn of history, but few scholars have doubted that cultural traditions are constantly renewed. What so-called primordialists have argued is that certain identities and traditions—especially those of ethnicity—are experienced as primordial. Sociologically, thus, what matters is less the antiquity of the contents of tradition than the efficacy of the process by which certain beliefs and understandings are constituted as unquestioned, immediate knowledge. This has more to do with current bases for the reproduction of culture than with history as such. Ethnicity

or cultural traditions are bases for nationalism because they effectively constitute historical memory, because they inculcate it as "prejudice," not because the historical origins they claim are accurate (prejudice means not just prior to judgment, but constituting the condition of judgment.). Moreover, all traditions are "invented" (or at least in a more diffuse sense, created); none are truly primordial. This was acknowledged, although rather weakly, even by some of the functionalists who emphasized the notion of primordiality and the "givenness" of cultural identities and traditions (see especially Geertz 1963). All such traditions also are potentially contested and subject to continual reshaping, whether explicit or hidden. Some claims about nationality may fail to persuade because they are too manifestly manipulated by creators or because the myth being proffered does not speak to the circumstances and practical commitments of the people in question.

Notions of nations as acting subjects are distinctively modern, part of a new way of constructing collective identity. This said, there is no scholarly agreement about when nationalism began. Greenfeld (1992) dates it from the English Civil War, Anderson (1991) from Latin American independence movements, Alter (1989) from the French Revolution, and Breuilly (1993) and Kedourie (1993) both from German romanticism and reaction to the French Revolution. Calhoun (1997) suggests that rather than trying to identify a single point of origin, scholars should see nationalism as drawing together several different threads of historical change. As a discursive formation, it took on increasingly clear form through the early modern period and was fully in play by the Napoleonic era.

CONCLUSION

The idea of nation became a more fundamental building block of social life during the early modern period, especially the eighteenth and nineteenth centuries. While it is fruitless to search for a precise origin point for modern nationalism, it is possible to identify some of the social changes and conditions that helped to make it important.

First, nationalism reflected a growing scale of social organization, larger than cities (which had previously been primary units of belonging and common culture for elites), villages, or kin groups. This was made possible partly by improved communication that enabled larger populations to interact with greater density—a matter simultaneously of roads, the spread of literacy, and wars that brought large populations together in common military organization and movements (Deutsch 1966). It was also facilitated by increased integration of trade among different regions within contiguous territories and by the mobilization of new kinds of military and state power.

Second, nationalism constituted a new ideology about primary identities. In this it competed not only with localism and family but with religion (Anderson 1991; Hayes 1931). In fact, nationalism was often furthered by religious movements and wars—notably in the wake of the reformation—and national self-understandings were frequently religiously inflected (as in the Catholicism of Poland or the Protestantism of England). But nationalism involved a kind of secular faith and a primary loyalty to the nation that was and is distinct from any religion that may intertwine with it.

Third, nationalism grew hand in hand with modern states and was basic to a new way of claiming political legitimacy. States furthered social integration among their subjects by building roads, mobilizing militaries, sponsoring education, and standardizing languages (Breuilly 1993). But they also were shaped by a cultural change that introduced a new, stronger idea of "the people" who were both governed by and served by a state. Indeed, the idea of the state as providing necessary services for the "commonwealth" was basic, and with it came the notion that the legitimacy of the state depended on its serving its people effectively, being recognized by them, or both. This placed a new stress on the question of who the people might be. The notions that they were those who happened to have been born into the domain of a monarch or who conquered in war were clearly inadequate. The idea of nation came to the forefront. It represented the "people" of a country as an internally unified group with common interests and the capacity to act.

The last point is crucial. The idea of nation not only laid claim to history or common identity. It purported to describe (or construct) a collective actor: "we the people," as articulated in the U.S. Constitution or the French people who collectively stormed the Bastille and joined in the levée en masse.

The constitution of nations—not only in dramatic revolutionary acts of founding but in the formation of common culture and political identities—is one of the pivotal features of the modern era. It is part of the organization of political participation and loyalty, of culture and identity, of the way history is taught and the way wars are fought. It not only shapes practical political identity and ideology, it also shapes the very idea of society in which much social theory is rooted.

NEGOTIATED ORDER

Negotiated order is a theoretical perspective developed primarily by Anselm Strauss (1917–1996), who argued that virtually all social order is negotiated order. To accomplish tasks in social settings, people chiefly negotiate with each other. Through ongoing processes of negotiation, social actors alternately create, maintain, transform, and are constrained by, social structures. The negotiated-order perspective provides a means to understand the processes involved in both structural change and stability and to identify the social structures and conditions that shape those processes. It also permits researchers to address one of the central concerns in sociology—the link between individuals and society—by specifying how social actors respond to and changed social structure, whether they act on their own behalf or as organizational representatives.

The negotiated-order perspective enables researchers to examine patterned negotiations between social actors embedded in organizations and between organizations, occupations, professions, industries, markets, social worlds, or nations. Negotiations occur whenever acting units encounter ambiguity or uncertainty, when they define organizational routines differently, when they differ in their approach to problems, or when they create exceptions or loopholes for previously established rules and policies. When social actors settle on new practices, those patterns become part of the stable structure or "organizational background" that guides future negotiations. The perspective thus encourages researchers to incorporate historical data in their analyses by investigating how structural conditions arose in the past and observing how those conditions influence present negotiations.

Strauss (1978) offered this description of negotiated order at the organizational level:

> The negotiated order on any given day could be conceived of as the sum total of the organization's rules and policies, along with whatever agreements, understandings, pacts, contracts, and other working arrangements currently [operate]. These include agreements at every level of the organization, of every clique and coalition, and include covert as well as overt agreements. (pp. 5–6)

With roots in the symbolic interactionist tradition, Strauss and his colleagues conceived of negotiated order as a critical response to structural-functionalist characterizations of social structure as immutable and as exerting a one-way influence on social behavior. They wanted to document and analyze social change by placing negotiation in the forefront without sacrificing respect for social structure.

While the perspective claims that practically all social orders are negotiated orders, this does not make structure a fictional concept, nor does it make stability impossible, despite some critics' charges that negotiated order overemphasizes indeterminacy. Proponents argue that not all aspects of society can be negotiated at any given time, but they also contend that stability in organizational life cannot be taken at face value—people must work together continuously to achieve and then maintain it. Moreover, they charge that because social conditions change through a negotiated process, any current arrangement that participants treat as inviolate may be the product of past negotiations. Simply examining a professional organized sport and comparing its rules and structure with the original game will demonstrate how today's stability was achieved through yesterday's negotiation and exchange.

The negotiated-order perspective provides a conceptual framework for studying *mesostructure* (see Maines 1982), a term that represents the intermediate social realm where individual action and social structure meet and where social orders are developed and invested with meaning. Negotiations occur within a *negotiation context,* which is defined as a set of structural conditions that surround and directly affect the content, process, and consequences of negotiations. Past negotiations may shape future courses of action, modify structural conditions, or undergo a process of *sedimentation,* whereby they join the set of standard operating procedures and become part of the social structure. Enveloping the negotiation context is a *structural context,* which consists of larger social patterns and interlocking demographic, economic, and political conditions. A structural context may influence multiple negotiation contexts for a given organization or for interconnected organizations. For example, if one looks at the corrupt practice of insider trading in the stock market, the structural context would include the regulatory policies of the U.S. Securities and Exchange Commission established via sedimentation from previous negotiation processes; policies and patterns of trade developed in publicly held firms; organizational and market conditions that inspire marketable information; the divisions of labor and workers' relationships that operate in law, banking, and brokerage firms; the web of investor relations in the marketplace; and the political climate surrounding the organizations and individuals involved in trade.

In this perspective, negotiation concerns interpersonal, not intrapersonal, interactions. Negotiation may be defined narrowly, as in brokering agreements, mediating, and bargaining, or loosely, as in compromising, making concessions, and colluding. Alternatives to negotiation may occur as well, such as manipulation or persuasion, sometimes even to the exclusion of negotiation. This invites a reasonable theoretical and methodological complaint about the negotiated-order perspective: Just what is, and what isn't,

negotiation? When laying the groundwork for the perspective, Strauss gently criticized contemporary theorists for either omitting negotiation altogether as an important consideration or for focusing so narrowly on certain kinds of negotiations that they excluded significant transactions between social actors or acting units.

Although Strauss and his colleagues deliberately created a broad definition of negotiation to accommodate diverse social and organizational interactions, negotiated-order researchers differ in whether they define negotiation generically or specifically. Consequently, they may publish contradictory or inconsistent findings depending on how they operationalize the concept of negotiation. For example, while one researcher may define the absence of face-to-face communication between coworkers of different ranks and occupations as an example of a lack of negotiation, another researcher might assume that their cooperative working arrangements resulted from previous negotiations or "silent bargains" that became routine and taken-for-granted. Through previous negotiations, coworkers may base their actions on what they think others want, or how they imagine others will respond, such as to retaliate. Researchers may also disagree on whether one must observe active negotiations firsthand or accept respondents' or other researchers' reports that negotiations occur.

Although the definition of negotiation may be unclear, using the perspective enables researchers to carefully and closely analyze the conditions that modify negotiations in the surrounding negotiation context. Factors that matter in analyzing how, when, where, and why negotiations take place in a social setting can be grouped by the characteristics of participants, negotiations, issues, and alternatives.

Regarding the characteristics of negotiation participants, researchers need to identify which social actors get to negotiate, their experience with negotiation, what loyalties they maintain to different groups or identities, what cultural backgrounds they come from, what they stand to lose or gain from negotiation, and what degree of power, authority, and autonomy they possess in relation to other participants. To further understand negotiators, researchers may examine how social actors develop their negotiation skills and how they perceive their surroundings. Just how negotiators interpret the social setting, other participants, and situational constraints such as organizational rules and policies will influence the negotiation context. When different participants do not share assumptions about who has more power, what is open to negotiation, or just what they need to negotiate, their differing perceptions complicate the negotiation process.

Characteristics of negotiations themselves also inform the negotiation context. Negotiations may exhibit particular patterns in timing and composition, such as whether they occur singly, repeatedly, in combination with others, and so forth. They may also differ in their visibility to members of

the social setting, even to negotiation participants, if one or more sides have hidden agendas. Negotiations may consist of particular kinds of subprocesses, such as renegotiation after a party violates an agreement or a new issue appears, or trade-offs, concessions, and payoffs to keep negotiations open and ongoing.

Characteristics of the issues involved in negotiations compose another aspect of the negotiation context. Issues may differ on the basis of their meaning, complexity, priority, and legitimacy to participants, all of which may contribute to the process of negotiation. For example, if an issue matters more to one party than to another, it may add to that party's urgency to negotiate at the same time that it weakens their bargaining position with the other party, who may try to stall the process in order to magnify their relative power. Or when organizational members negotiate with each other and represent different occupations, divergent organizational goals, or different cultural backgrounds, they may disagree on the significance of particular issues, especially if they favor some participants over others. Even the organization's legitimacy in the eyes of the public may become a dominant issue around which participants negotiate. Issues may be interconnected—the death penalty, for example—such that participants cannot negotiate on one concern without addressing others.

The last set of factors that may bear on the negotiation context—and on each of the other factors discussed previously—concerns the availability of alternatives to negotiation. Alternatives may consist of persuasion, manipulation, appealing to the rules or to a higher authority, or coercion. These options seem to relate closely to the distribution of power between participants in the social setting or between negotiating organizations. The alternatives may also shape how, and if, any negotiation occurs. Researchers of political processes may be particularly interested in analyzing under what conditions negotiation assumes a higher priority than alternatives like coercion, oppression, or rebellion.

Factors in the structural context—which encompass multiple negotiation contexts—can also be organized and studied along similar lines as those in the negotiation context when examining negotiations between complex organizations. When organizations of various size, power, composition, experience, ideological commitments, and goals negotiate with each other at the same time that they negotiate internally, structural conditions that influence their negotiations multiply quickly. Proponents of the negotiated-order perspective argue that when researchers fail to analyze those interlocking processes of negotiation, they ultimately fall short of understanding the product: social order.

Although the studies that adopt the negotiated-order perspective vary in scale from interpersonal to interorganizational negotiations and cover a wide variety of substantive areas, most applications of the perspective contribute to a few main areas of sociological interest. On the basis of the

publication record to date, researchers have employed the negotiated-order perspective most often in the areas of work, occupations, and professions; simple and complex organizations, including the shared theoretical ground between negotiated order and organizational theory; and in social worlds/arenas theory, which joins the negotiated-order perspective with the study of collective action, social movements, and organizations.

The emphases on occupations, professions, and organizations originated with research published in 1963 by Strauss and his colleagues Leonard Schatzman, Danuta Ehrlich, Rue Bucher, and Melvin Sabshin, who studied the interactions of personnel and patients at two psychiatric hospitals. Through their observations, Strauss and his colleagues recognized hospitals as "professionalized locales" in which members of professional and nonprofessional groups hold different ideologies, aims, and statuses but nevertheless manage to work together as a whole. The authors drew attention to the multiple and repeated transactions between hospital participants that helped shape their collective understanding of rules and policies as "structure." This approach by Strauss and his colleagues displayed a strong departure from contemporaneous studies of formal organization that downplayed internal changes and interactions.

Although many researchers have continued to examine negotiated order in hospital settings, in alternative health organizations, among workers in health-related occupations, or between different health-related organizations, far more studies have examined organizations and occupations outside the health care field. Research settings have included families, communities, schools, prisons, factories, restaurants, accounting firms, universities, and government agencies. Other researchers have focused their attention on the machinations of particular industries and markets, such as liquor and automobiles; social institutions, such as politics, law, and marriage and family; or complex social relationships, such as the division of labor and criminal activity.

Some applications of negotiated order follow a more microsociological bent, examining situated negotiation between social actors in the process of accomplishing specific work-related tasks. Researchers have analyzed transcripts of interactions between coworkers or between clients and service providers to capture unfolding processes of negotiation. Some of these studies blur the boundary between the concept of negotiated order and Goffman's concept of "interaction order," which addresses face-to-face interaction, often guided by actors' shared assumptions about how to act in given situations.

Collectively, these different applications of negotiated order demonstrate the strengths of the perspective in working with multiple levels of analysis and substantive areas. Despite the demonstrated utility of negotiated order—the perspective offers a powerful and practical link between micro- and macrosociology and provides a clear framework

for studying the connections between individual action and social structure—researchers have not developed it further in a cumulative sense. The perspective's influence remains limited, even in interactionist and organizational sociology, where it seems most useful.

Within the symbolic interactionist perspective, more researchers have adopted a social constructionist (or reality constructionist) than a negotiated-order approach. Although the negotiated-order perspective shares the assumption that social structures arise through a process of social construction, and social constructionists agree that reality may be negotiated, the emphasis on negotiation skirts an interactionist concern with the reproduction of inequality and the consequences of an unequal distribution of power for social actors. Inequality itself may be understood simultaneously as a negotiated order, a coerced order, and a manipulated order—all possibilities that Strauss argued could operate alongside each other—but few researchers have answered the call to investigate how they may overlap in society.

In organizational sociology, applications of other theoretical perspectives far outnumber negotiated order and have effectively excluded the negotiated-order perspective. Three theoretical approaches bear mention regarding the common ground they share with negotiated order: social network theory, organizational ecology, and institutional theory. Social network theory offers powerful models for examining the strategic positioning of social actors or organizations in a network structure and enables researchers to attend to social structural constraints and exchanges between network participants. Organizational ecology, like the negotiated-order perspective, examines the structural and environmental contexts in which organizations operate and offers the opportunity to observe patterns in interorganizational cooperation and competition. Institutional theory emphasizes the importance of social structure, process, and historical change and enables researchers to study how organizations impinge on each other. What these perspectives primarily offer, beyond their theoretical and methodological sophistication, is the flexibility to consider exchanges other than negotiation, no matter how that concept is defined. However, they lack the interactionist sensibility of negotiated order; they do not exhibit a strong concern for how social actors collectively maintain, conform to, and change social structure.

The strongest development of the negotiated-order perspective appears in Strauss's social worlds/arenas theory. *Social worlds* comprise groups that share particular concerns or activities and mobilize their resources to act collectively, but not necessarily cooperatively (sciences, industries, religions, media, etc.). Multiple social worlds may be joined by their participation in an *arena* of concern (HIV research, environmental issues, legal actions, wars, etc.). Several former students and colleagues of Anselm Strauss (Adele E. Clarke, Joan Fujimura, and Susan Leigh

Star) have melded social worlds/arenas research with social studies of science and, more generally, with science and technology studies. By honoring a Strauss dictum to "study the unstudied," they focus on a central concern of the negotiated-order perspective—to understand how social change occurs and to accurately track how social actors and groups accomplish it—in a variety of scientific and technological contexts.

Adele E. Clarke (1998) has studied the origins and transformations of twentieth-century reproductive science by examining the involvements of actors representing different worlds such as scientists from diverse academic disciplines; research sponsors; consumers; markets; and contraceptive manufacturers, advocates, and opponents. She and her colleagues have also called attention to elements of scientific infrastructure that intersect social worlds, studying the growth and development of research materials and tools on which scientists and students depend (Clarke and Fujimura 1992) and that, like scientific knowledge itself, arise through a collective process of conflict, negotiation, and exchange.

Taking an ecological approach to work, knowledge, and organizations, Susan Leigh Star has explored how the nature and character of seemingly mundane infrastructure (computer networks, electronic codes, information standards, power supplies, legal codes, etc.), can influence the structural conditions in both negotiated order and social worlds/arena research. Along with James R. Griesemer (Star and Griesemer 1989), she introduced the analytic concept of *boundary objects,* which can be understood as social objects that connect multiple social worlds and facilitate collective action. Boundary objects have a common structure that permits translation between social worlds, yet in each particular social world, members adapt and modify them to suit their local needs.

Joan H. Fujimura (1992) has advanced a conceptual companion to boundary objects, *standardized packages,* which are more structured and concrete in that they combine theory and a set of methodological practices that do not vary from one social world to another. For example, Fujimura applied the concept of standardized packages to analyze how recombinant DNA technologies from molecular biology, combined with oncogene theory, came to dominate cancer research. She demonstrated that standardized packages contribute to negotiated order when they act as interfaces for social worlds and form an infrastructure that changes and constrains the practices, skills, and knowledge in each social world. Thus, science itself—facts, theories, and methodologies—is profitably understood as a collection of negotiated orders.

NEO-KANTIANISM

At the end of the nineteenth century, various philosophers critical of Hegel's metaphysics, Nietzsche's vitalism, and Marx's materialism, proposed to return to Kant's epistemology, focusing on the problematic relationship between knowledge and reality, concepts and experience. This so-called neo-Kantianism was also prompted by the emerging social sciences, psychology and sociology in the first place, and their search for a logic and methodology that could match those of the natural sciences. Neo-Kantianism was an influential stream of thought and research until 1933 when the rise of Nazism put an end to it. After World War II, it was surpassed by French and German existentialism, Anglo-Saxon analytical philosophy, and phenomenology.

Neo-Kantianism is a label for often vastly different currents of thought and research, but usually two main schools are distinguished: the Marburg School and the South-West German, or Baden School. Wilhelm Windelband (1846–1916) is generally viewed as the founder of the latter. He commanded a comprehensive knowledge of the history of philosophy and was a fierce opponent of speculative, metaphysical systems of philosophical thought. He searched above all for a logic of the sciences

(*Wissenschaftslehre*) that would avoid the pitfall of scientism or positivism, which models such a logic after the natural sciences. In his view, the world of historical values and meanings (i.e., the world of the *Geist*) needed method of scientific scrutiny that differs from the way nature ought to be investigated. In other words, there is not an essential difference between *Geisteswissenschaft* and *Naturwissenschaft* (i.e., between humanity and science) but, rather, a logical and methodological difference. In *Geisteswissenschaft,* history in the first place, there is a focus on what is unique, different, and individual. It is a predominantly descriptive, *idiographic* approach of reality. In *Naturwissenschaft,* the focus is rather on what is general, repetitive, and lawlike. This is a *nomothetic* approach to reality. Windelband's successor, Heinrich Rickert (1863–1936), elaborated this idea in the much broader context of a philosophy of values. To avoid the introduction of psychology into the logic and methodology of social sciences, as was recurrently done by his contemporaries, Rickert proposed to replace the word *Geisteswissenschaft* by the concept of *Kulturwissenschaft. Geist* after all, is easily associated with "psyche" or "soul," while *Kultur* refers to the immaterial reality of values and meanings. The basic idea of his rather complex logic is that the natural-scientific approach, characterized by the search for general laws of development, will run up against its limits the moment one has to deal with values and meanings, which, after all, function within specific, historically unique, and individual contexts. His *opus magnum, The Limits of Concept Formation in Natural Sciences: A Logical Introduction to the Historical Sciences* (1896–1902), is an attempt to design a methodology for the historical discipline and the related "cultural sciences." In Rickert's view, social sciences such as psychology and sociology can legitimately be executed in a natural-scientific manner and thus search for general laws of psychic and social developments, but the moment they also want to focus on values and meanings—that is, on culture— they will have to work with individualizing, historical methods. This idea had a decisive influence on the logic and methodology of Max Weber, who always tried to combine a generalizing, "natural scientific" approach (see his *Economy and Society*) with an individualizing, historical method (see his essays on the economic ethics of the world religions).

The main philosopher of the Marburg School was Ernst Cassirer (1874–1945). His knowledge was that of a Renaissance man, since he was an expert in mathematics, physics, religion, magic, esoteric philosophies, linguistics, and the history of philosophy. It drives him far beyond the philosophy of Kant, whose critique of reason he broadened into a critique of culture. He also extended Kant's epistemology into a historical and comparative analysis of the evolutionary development of human knowledge. Language (speech), religion, myth, magic, art, and science are analyzed and compared as various specimens of knowledge. Despite

vast differences, they share a similar function, since they are expressions of man's ability to gain knowledge of reality by means of *symbolic forms.* That is, human beings do not just experience reality but supply their experiences with meaning and apply words, names, and concepts to them, which are accompanied by various acts and actions. These words, names, and concepts—coined by speech, myths, magical formulas, religious doctrines, and scientific theories—are symbolic forms whose function it is not only to constitute human knowledge but, in a sense, also to construct reality. Cassirer developed this basic idea in the three volumes of his *opus magnum, Philosophy of Symbolic Forms* (1923–1929).

Rickert's philosophy of values and logic of the natural and cultural sciences was rather abstract, rationalistic, and radically opposed to the vitalism of Nietzsche, Bergson, Dilthey, and others. His fame declined rapidly after World War I, when students were no longer eager to delve into detailed epistemological debates. It was, rather, Rickert's student and family friend Martin Heidegger who satisfied their thirst for an existentialist approach to their surrounding world. Ludwig Wittgenstein's scathing attacks on traditional philosophical thought and Karl Popper's critique of historicism contributed also to the fact that Rickert is almost completely forgotten today. However, as to social theory, his influence on Max Weber's methodology of the social sciences should not be underestimated. Moreover, present postmodernist vitalism still meets in Rickert's philosophy of values a formidable opponent who should not be dismissed too easily. Cassirer's neo-Kantian legacy, on the other hand, has remained influential throughout the decades after World War II. As to social theory, his philosophy of symbolic forms will remind many sociologists of George Herbert Mead's "social behaviorism," or "symbolic interactionism." In view of the "linguistic turn" of philosophy, which has always been important for the social sciences as well, Cassirer's approach to language (speech) still deserves attention far beyond the boundaries of philosophy.

NETWORK EXCHANGE THEORY

An important aspect of social life is the way valued resources are allocated and exchanged among people and groups. Network Exchange Theory (NET) investigates phenomena of this type. It was formulated as a way to understand and predict how a network's shape affects the power of some members to accumulate resources at the expense of others. NET is constructed as a *formal* theory in that all its most important terms are clearly defined, all its central claims are expressed in the form of explicit axioms, and it employs a system of logic that permits anyone—or even a computer program—to derive its predictions.

To date, most of the research inspired by NET has been in the form of careful experimental tests conducted under controlled laboratory conditions. Nevertheless, the scope of the theory is sufficiently broad that it can be used to help interpret a wide range of natural social phenomena. For example, one may study decision-making power in adolescents' friendship networks as it is affected by each member's location in the network and by his or her desire to avoid being excluded. At the group level, the study of organizational power may be informed by considering the structure of relationships between firms competing within the same industry.

BACKGROUND

The intellectual roots of NET can be traced to the classical sociological theories of Karl Marx and Max Weber. Two more recent sources provided the direct inspiration, however: David Willer's "elementary theory" (ET) and Richard Emerson's "power-dependence theory" (PDT). Although offering different basic assumptions and, at times, mutually contradictory predictions, ET and PDT address issues of structural power using a "bottom-up"

approach—that is, from a foundation composed of explicit assumptions concerning how individuals make choices in social contexts. Both theories tackle the question of how a social *actor* (person or group) interacting with others to obtain valued *resources* realizes advantages or disadvantages due to the pattern or *structure of relationships* with other actors. Thus, in its own way, each theory focuses on how power—or powerlessness—can arise based on one's social position rather than on one's personal qualities.

Emerson applied his PDT to simple social structures; however, his collaborators at the University of Washington also played a crucial role in extending PDT into the realm of exchange networks. In an influential article published in 1983, Karen Cook, Richard Emerson, Mary Gillmore, and Toshio Yamagishi used PDT to help interpret the ways that actors affect one another directly and indirectly in exchange network contexts. The basic PDT argument is that the power of Actor A over Actor B is greater to the extent that B has low dependence on resources that A controls and that alternative sources for B are readily available. The authors were especially interested in the implications for power and dependence when multiple A–B relationships overlapped, such as in a network of the form shown in Figure 1. If exchange processes in each relationship are permitted to unfold independently, then A has no special advantage by virtue of its central location. However, the moment that events in one "branch" of this little structure affect exchanges in the other branch, it becomes more than just a pair of overlapping A–B exchange relationships: It is an integrated *exchange system.* Researchers at the University of Washington were especially interested in what transpires under a "1-exchange rule"—that is, in cases where both Bs want to obtain resources through negotiations with A, while A may negotiate and exchange with either B *but not with both* in a given period of time. PDT could then predict that A has power over the Bs and that A will achieve higher profit than either of the Bs every time an exchange occurs.
Figure 1. A "Branch" Approach

Before 1983, PDT lacked an explicit and general model for analyzing exchange networks. Ideally, such a formulation would permit one to evaluate networks of any shape and size, allowing investigators systematically to derive predictions for relative power and exchange profits. Along with their PDT-based interpretations of several specific exchange networks, the University of Washington group published the first experimentally tested mathematical model for predicting the relative power levels of different positions in exchange networks.

In contrast to the PDT approach that inspired it, the *vulnerability model* for exchange network analysis was considerably more explicit, objective, and testable. The model was so named because it equated a given position's power with the vulnerability of resource flows to the position's removal from the network: The more disruptive a position's hypothetical removal, the greater its predicted power to garner resources through exchange with others. The vulnerability model demonstrated an ability to predict the ordering of exchange profits in laboratory experiments using the 1-exchange rule—cases where traditional centrality-based measures for social networks failed. In retrospect, the model also proved to be seminal as indicated by the wave of competing theories that arose over the ensuing years.

NET was among the earliest theories to contest the vulnerability model, emerging as an outgrowth of ET several years after the appearance of the vulnerability model. At the time the vulnerability model was published, ET offered a typology of social relationships (including exchange, conflict, and coercion) and general principles governing social transactions, along with some tools for predicting the relative power associated with positions in small exchange networks.

Just as PDT provided the intellectual backdrop for the vulnerability model, ET played a similar role with respect to the newly developed NET. Viewing network exchange processes through the lens of ET suggested a simple approach: All else being equal, actors are assumed to have more power when they are in positions with numerous ties to other positions, but less power to the extent that they are connected to positions that are high in power. The task was to devise a set of rules—a mathematical model—essentially to automate the process of taking into account characteristics of positions' network environments to determine their relative advantages and disadvantages for accumulating resources from exchanges. The result, described next, was the first experimentally tested alternative to the vulnerability model.

FIRST VERSION OF NET

The first version of NET was published in 1988 by Barry Markovsky, David Willer, and Travis Patton. It was designed specifically to correct limitations that its authors discovered in the vulnerability model. This included rectifying logically impossible vulnerability predictions, providing *scope conditions* to clarify and delimit the applicability of the theory, and extending the theory to some new phenomena, such as networks that break apart and networks that have distinct substructures.

NET has several components, but at its heart is a mathematical model called the *graph-theoretic power index*

(GPI). Graph theory is a branch of mathematics concerned with the logical and numerical properties of *graphs,* which, in the context of this theory, consist of sets of points or *nodes* linked by sets of lines or *edges.* For NET's purposes, graph theory suggested ways to calculate power in social exchanges by treating networks as graphs, positions as nodes, and potential exchange relations as edges.

To illustrate the GPI, consider the star network in Figure 2. A GPI value must be calculated for all positions in the network to determine each position's power relative to those around it. As noted earlier, a key aspect of structural power is the number of direct links or "1-paths" to other positions. C_1, C_2, and C_3 each has one such connection, whereas each B has two and A has three. Continuing the process, the GPI tallies the number of nonoverlapping 2-paths stemming from each position. For example, there are two 2-paths stemming from B_1, including B_1—A—B_2 and B_1—A—B_3. Because these paths from B_1 overlap at A, only one of them is added to the tally of 2-paths. The situation is the same for B_2 and for B_3, each of which also has one nonoverlapping 2-path. A has three separate 2-paths, and each C has one. Continuing this analysis, A does not have any 3-paths; however, each B has one nonoverlapping 3-path, as does each C. Finally, each C has one 4-path.
Figure 2. A "Star" Network

All the path counts are summarized in Table 1. The GPI is obtained by summing these values, where odd-length beneficial paths are counted as positive and even-length detrimental paths are counted as negative. As indicated in the table, the power in this network resides in the B positions. This occurs because the four actors in the C and A positions seek to exchange with only three Bs. The *structure* favors the Bs: None of them is necessarily excluded from exchange, but one of the other four has to be excluded. This means that the Cs and A must compete among themselves by making increasingly attractive offers to the Bs, much to their own detriment.

Table 1 Path Analysis for the Star Network

Position	1-paths (+)	2-paths (−)	3-paths (+)	4-paths (−)	GPI
A	3	3			0
B	2	1	1		2
C	1	1	1	1	0

The T network in Figure 3 has some interesting properties that helped establish a direct test of GPI against vulnerability. The two theories make different predictions for the relative power of positions in the T. The axioms of NET specify conditions under which one is to apply a repeated or *iterated* procedure to identify breaks in the network—that is, exchange relations that go unused because one or both of its members benefit more by not exchanging in the relationship. The result is that some networks are predicted to split apart into smaller networks. In the T network, the first iteration of GPI produces the values shown in the upper portion of Table 2. The theory claims that C will seek exchanges with D because of its lower GPI, but not so with B because of its higher GPI. Therefore, the network breaks, and the GPI is recalculated separately for the A_1–B–A_2 line and the C–D dyad. Now, as shown in the bottom portion of Table 2, B has power over the As, and C and D exchange with each other at equal power. Vulnerability predicted equal and high power for B, C, and D and was silent in regard to the breakup of the network. Experimental tests confirmed NET's predictions.
Figure 3. A "T" Network

Thus far, all the discussion of vulnerability and NET's GPI has assumed a 1-exchange rule governing exchanges. An additional feature of NET's first version was the generalization of this rule so as to permit any given number of exchanges. The theory predicted—and experiments found—that such rule changes could radically alter a network's distribution of power and resources, and could produce new complexities, such as overlapping, analytically distinct subnetworks within a larger network.

Table 2   Path Analysis for the T Network

Position	1-paths (+)	2-paths (−)	3-paths (+)	GPI
		1st iteration		
A	1	1	1	1
B	3	1		2
C	2	1		1
D	1	1	1	1
		2nd iteration (no B–C tie)		
A	1	1		0
B	2			2
C	1			1
D	1			1

LATER VERSIONS

NET has developed along a number of fronts since its first appearance in 1988. For example, two different approaches were developed to predict the effects of structural power by modeling the negotiation behavior of actors responding only to their local network environments. One of these, the X-Net computer simulation, allows the user to explore virtually a limitless combination of network structures, exchange rules, and decision strategies, many of which would be difficult or impossible to study in laboratory experiments or in natural settings. X-Net simulations were instrumental in the discovery of a *weak power* phenomenon, which later was verified experimentally. In contrast to situations like those in Figures 1–3 where the structurally favored positions can accrue virtually all available resources, some networks manifest a weaker and more subtle basis for power. For example, X-Net simulations found slight but consistent power advantages for the A positions in the B_1–A_1–A_2–B_2 line network. Later these simulation results were verified experimentally and accommodated by a refinement of NET's axioms. Weak power turns out to be very important because, among other reasons, profit distributions in weak power structures are more prone than strong power structures (such as the branch) to being altered by the strategic actions of individual actors.

The other actor-level approach used to predict exchange network phenomena is the *resistance* model for dyadic bargaining developed by Douglas Heckathorn and David Willer in the early 1980s. Willer and his colleagues have adapted this mathematical model for the analysis of a variety of exchange network phenomena. An actor's resistance to a given exchange offer is represented as the ratio of two differences: the best conceivable outcome minus the actual offer, and the actual offer minus the worst possible (or "confrontation") outcome. A compromise and an exchange between two actors are assumed to occur at the mutual offer for which resistance is equal for both actors. In network settings, some actors must conduct multiple negotiations simultaneously. Therefore, the values that are plugged into the resistance model are selected in a manner that takes into account any contingencies introduced by virtue of the added relations. For instance, in the branch (Figure 1), A's expected conflict outcome when negotiating with B_1 would be the profit A would anticipate receiving from B_2 should negotiations with B_1 reach a stalemate.

The theory has also expanded to accommodate different kinds of network connections. In general, *exclusive* connections exist when a position needs or wants fewer exchanges than it has connections to others. An example is a new car buyer with multiple dealers vying for her business. *Inclusive* connections exist when a position needs or wants a combination of exchanges with others before it may obtain resources. For instance, a manufacturer must exchange money for a combination of raw materials needed to assemble its product for subsequent distribution. Finally, in *null* connections, negotiations and exchanges are independent across relations. NET has developed several techniques for dealing with these different types of connections and with more complex situations involving combinations of different types within the same network.

NET continues to spawn a variety of new theoretical lines designed to solve more specialized problems and to increase the theory's precision. There are now models for decomposing and analyzing more complex and subtle networks, and others for predicting the long-run probabilities of exchange occurring in any two linked positions. One of NET's refinements takes into account actors' misperceptions of their structural power. Another variant allows members of a network to manipulate the structure itself. There is even a computer program that automates the systematic comparison of predictions from two or more theories to potentially an unlimited number of different network configurations, informing the user of test cases that differentiate the theories.

RECENT WORK

Power and status are related but distinct social processes, both of which depend on social relations for their existence and both of which have an impact on the actors in those relations. Since the late 1990s, NET researchers have been building and testing theoretical bridges that help to understand interactions between power and status. For example, power based on structural advantages in exchange networks can be used to gain social status, along with the honor, esteem, and capacity to influence others that is accorded to the status-advantaged. Conversely, status affects power. Research has shown that goods possessed by those of higher status are viewed by others as having higher value than the same goods possessed by lower-status actors. The result is that in social

exchange settings, greater power accrues to those with higher status.

One other research area bears mention. Some experiments and simulations conducted in conjunction with NET have suggested possible links to *complexity theory*—an emerging multidisciplinary field that deals with systems containing large numbers of interacting elements that respond to feedback from dynamic environments. Complex systems are characterized by spontaneous and surprising *macrophenomena* that emerge from *microprocesses* without the benefit of any "top-down" guidance or plan, and some networks do in fact exhibit odd exchange patterns not predicted by current theory. As the scope of NET continues to expand and to address more complicated structures and exchange conditions, the likelihood seems high that NET will continue to develop its bridge to complexity theory.

COMPETING THEORIES AND CRITICAL TESTS

As is the case with any scientific theory, NET always will be a work in progress. The developers of NET have encouraged and welcomed competing formulations, both among themselves and from other theoretical traditions. When NET theorists suggest new or alternative axioms to one another, their collective analysis helps to improve the theory by filtering out weaknesses such as untenable assumptions or ambiguous terms. When new competing theories appear outside the NET program, they also help to stimulate improvements by suggesting new phenomena to address, new empirical tests to conduct, and new ways to solve intellectual puzzles.

With the publication of the first version of NET in 1988, there soon followed a number of alternatives from different researchers working through a variety of theoretical perspectives. Those perspectives included game theory, expected value theory, power-dependence theory, identity theory, and rational choice theory. Predictions from these theories are very similar or identical for most networks. However, owing to their different fundamental assumptions, it is always possible to identify specific test cases in which a given theory's predictions depart from those of one or more of the other theories. NET researchers have identified such cases and subjected their theory to critical testing against the alternative predictions. In all such tests, NET has performed no worse than any alternative theory and has shown superior accuracy in the great majority of specific comparisons with those alternatives.

NETWORK THEORY

Network theory is based on the idea that human behavior can be most fully accounted for by an understanding of the structure of social relations within which actors are situated. Network theorists assume that these structures have a more profound impact on behavior than do norms, values, or other subjective states. Network theory is distinct from network analysis, which is a set of techniques that apply network theoretical ideas. This essay will focus on the former, although it will include references to the latter.

THE ROOTS OF NETWORK THEORY

Network theory is a branch of structural sociology. In structural sociology, human action is viewed as a function of the constraints and opportunities provided by forces that exist outside the individual. The roots of structural sociology go back to the works of Karl Marx, Émile Durkheim, and Georg Simmel, but the approach emerged in contemporary sociology in reaction to the dominance of the earlier normative approach. The structural critique of the normative approach is examined in this section, followed by a discussion showing how network theory constitutes a unique version of structural sociology.

Normative Sociology in the Mid-Twentieth Century

Sociology in the West, especially in the United States, was dominated between the 1930s and the early 1970s by a perspective variously termed the *normative, order,* or *functionalist* approach. In this view, societies were seen as largely stable entities held together by shared values (generalized beliefs) and norms (expectations of behavior). The primary proponent of this approach, which drew on one version of Durkheimian theory, was Talcott Parsons. The shared values and norms at the root of this approach

were viewed as learned through socialization, primarily from family, school, and the larger culture. For norms to operate effectively, it was necessary that they be internalized—that is, taken for granted. Without the existence of internalized norms, the only way to maintain social order was by an intensive system of monitoring. Such a system was ultimately unworkable, however, since without internalized norms there were no assurances that the monitors themselves would behave appropriately.

Given the importance of shared norms and values, the empirical research that emerged from this model focused heavily on the attitudes of individuals, which were assumed to reflect the values that they held. This led to the proliferation of survey research, which dominated much sociology in the West in the period after World War II. Sociology, which had begun as the study of social structure, increasingly focused on distributions of individual characteristics and attitudes.

A primary difficulty with the normative model was that it was extremely difficult to verify the existence of internalized norms. First, a number of studies indicated that attitudes and behavior were often not highly correlated. Second, even when actors behaved in accordance with accepted norms, it was rarely possible to know whether the behavior resulted from the internalization of the norms or from a fear of sanctions. When someone refrains from stealing something, for example, is it because he or she has internalized the norm that stealing is wrong or because he or she fears the possibility of being caught?

One possible way to address these problems would be to conduct interviews with respondents in an attempt to uncover the motives behind their behavior. This approach assumes that motives are knowable or reasonably decipherable, however; yet actors' awareness of their motives, which often exist at several different levels of consciousness, is frequently unclear. It also assumes that certain motives will produce a consequent set of behaviors, without taking into account the potential obstacles to such behavior. Simply because a majority of voters favor a certain policy, for example, does not ensure that they will either organize politically to pursue the policy or that even if they do organize, they will successfully achieve their goals. To assume a connection between collective beliefs and political outcomes thus requires a leap of logic that may have little empirical foundation. It may be more fruitful to examine the opportunities and constraints that facilitate or impede such outcomes.

Structural Sociology

The empirical and logical problems with the normative approach led sociologists during the 1970s to turn toward more structural explanations of behavior. Structural sociology is based on the idea that social structures have a more pronounced effect on human behavior than do cultural norms or other subjective phenomena. This approach has its roots in Marx's statement, in *A Contribution to the Critique of Political Economy* that "it is not the consciousness of [people] that determines their existence, but, on the contrary, their social existence determines their consciousness" (p. 43) as well as in Simmel's concern with the formal properties of social life. The structural critique of normative sociology had a significant impact on a range of substantive areas. In the study of social movements, for example, models focusing on the subjective feelings of frustration as the source of movement activity were replaced by those that emphasized the resources available to actors. In the study of development, models focusing on the cultures of underdeveloped nations as explanations for their poverty were replaced by those that emphasized the resistance these nations faced from developed countries. Models of cross-group interaction that focused on personal preferences were replaced by those that emphasized the size distributions of the various groups. In each of these cases, the primary determinant of behavior and outcomes was sought in forces beyond the individual. For example, in explaining social interaction Peter Blau, in *Inequality and Heterogeneity* (1977), suggested that when one group contained 90 percent of the population and a second group only 10 percent, members of the minority would be considerably more likely to interact with those of a different group than would members of the majority, irrespective of personal preferences, simply on the basis of the greater number of nongroup members in the population. In accounting for why strike activity increased during periods of wage growth, Edward Shorter and Charles Tilly, in *Strikes in France, 1830–1968* (1974), argued that the cause was not the rising expectations created by improved conditions but, rather, that wage increases tended to occur during periods of labor shortages, when worker leverage was highest.

Although to many sociologists the structural accounts of behavior provided a more fruitful set of theoretical explanations than did the more subjective orientation of the normative model, these accounts shared a problem of their own: They continued to treat human actors in primarily attributional terms. Blau's focus, for example, was on distributions of variables such as class, income, gender, or race. Actors were viewed primarily in categorical terms, such as capitalist or worker, male or female. This focus, although useful, concealed the fact that actors operate within social structures, or regularized patterns of interaction, that exert a significant influence on their behavior. The focus on attributes often obscured the fact that the categories and boundaries by which sociologists traditionally classified social groups are rarely fixed or clear. Social relations crosscut and transcend individual attributes. Members of socially defined racial or gender groups vary considerably in the nature of their social relations. Even those with

comparable levels of education and income may have widely varying opportunities depending on the nature of their social ties. The focus on social relations, as distinct from aggregated categories of actors, required an alternative theoretical approach.

NETWORK THEORY

As noted earlier, network theory is closely linked with the methodological approach known as network analysis. Network analysis has its roots in the sociometry of psychiatrist J. L. Moreno, who, in the 1930s, pioneered the idea of drawing graphs that represented social ties among actors. In the 1950s and 1960s, British anthropologists John Barnes, Elizabeth Bott, and J. Clyde Mitchell used the term *social networks* to describe webs of interactions among villagers. Network analysis became the study of the effects of patterns of social relations on human behavior. The classical theoretical roots of this approach go back to Durkheim and Simmel. In *The Division of Labor in Society,* Durkheim (1893) argued that the basis of social order in complex societies could be found in the interdependence among actors, which was both cause and consequence of the increased intensity of interaction. Simmel argued that the number of actors in a group affected the nature of the social relations in the group by altering patterns of interaction. In one of his best-known discussions, Simmel (1950) showed that a two-person situation, the dyad, contains only one social relation but the addition of one person into the interaction not only triples the number of relations, thus significantly complicating the group process, but also alters the relation between the original two actors. The addition of each new actor causes the number of possible relations in a group to increase geometrically. This explains in part why it becomes so difficult to maintain cohesion as the size of a group increases.

The theoretical basis of the study of social networks in contemporary sociology is generally attributed to Harrison White, who relied heavily on the anthropologist S. F. Nadel. White's basic principle was that the structure of relations between actors determines the content of those relations. This can be seen by comparing two simple three-person groups. In Group 1, Actors A, B, and C each can communicate with one another. In Group 2, Actors A and B can each communicate with C, but not directly with one another. In network theory, the relations in Group 1 will be egalitarian in character because no single actor has an advantage over any of the others in terms of communication paths. The relations in Group 2 will be asymmetric in nature, however, because C controls the path of access between A and B, giving C an advantage over both actors. The content of the A-C relation in Group 2 is thus very different from that of the A-C relation in Group 1. The difference is accounted for by the different structures of the two groups.

White's theoretical project went well beyond the general point about structure determining content. One of White's primary goals was to reconceptualize the sociological concept of the role in relational terms. In normative sociology, roles were viewed as positions occupied by social actors that had associated sets of culturally prescribed behaviors. "Boss," "teacher," and "mother" were examples of social roles, each of which possessed a set of scripts, or norms. White argued that although roles were indeed characterized by specific scripts, these norms did not define the role. Rather, roles actually represented similar positions in a structure of social relations. In Group 2 from the previous example, Actors A and B play the same role because they are in identical structural positions in the network.

White originally operationalized the concept of a role in terms of what Francois Lorrain and he (1971) called "structural equivalence," defined as a situation in which actors share identical relations with all other actors in the system. Actors A and B are structurally equivalent in Group 2 because both have a relationship with Actor C. In a larger group, two actors are viewed as structurally equivalent to the extent that they have relations (such as friendship ties) and nonrelations to the same other actors. One problem with using structural equivalence to capture the concept of a role is that it requires actors to be tied to exactly the same alters (other actors in the situation). Imagine a third group, identical in structure to Group 2 except that we have three new Actors, D, E, and F, where D and E are each tied to F but not to one another. Actor F in this group is in the same structural position as actor C in Group 2, but Actors F and C are not structurally equivalent because they are not tied to the same alters. In an early critique of White's formulation, Christopher Winship (1988) suggested the need to use a less restrictive conception of equivalence to capture the idea of a social role. Winship, and scholars such as Stephen Borgatti and Martin Everett (1989), devised new definitions of equivalence that identified Actors F and C as playing the same role.

In addition to the emphasis on the structure of the network, network theorists have also distinguished the ties by which actors are connected. In a seminal formulation, Mark Granovetter (1973) argued that the stronger the relation between two actors, the more likely that both were tied to the same alters. Two close friends are more likely to have the same other friends than are two casual acquaintances, for example. This meant that actors who were strongly tied were more likely to be in the same communication paths. Actors are therefore more likely to receive new and unique information from their casual, or weak, ties than from their strong ties. Granovetter used this formulation to argue that the rapid spread of rumors and other information is most likely to occur through weak rather than strong ties.

Granovetter's distinction between strong and weak ties was important because it turned attention to the processes

by which information diffused in social groups. This, along with White's concept of structural equivalence, helped spawn a protracted debate over the nature of social influence. We examine this debate in the following section.

Cohesion Versus Equivalence

One of the central questions with which network theory has dealt is the spread of ideas and behaviors. In traditional network theory, information is seen as diffusing through direct communication paths. In a classic study of the adoption of a new drug, tetracycline, by physicians in four Illinois communities, James Coleman, Elihu Katz, and Herbert Menzel (*Medical Innovation* 1966) found that the adoption process flowed through social network ties between physicians. A given physician was likely to adopt the drug when one with whom he regularly communicated had himself previously adopted it. This finding, and numerous ones like it, suggested that cohesive relations between actors was the source of the diffusion of practices.

In a subsequent formulation, however, Ronald Burt (1987) argued that in addition to being influenced by those with whom one has cohesive ties, social actors are likely to be influenced by their competitive relations with those who occupy similar social positions. Structurally equivalent actors, as we have seen, share relations with the same alters. In this sense, they are substitutable—that is, they are redundant from the point of view of the alters with whom they are tied. The alters gain no more information from relating to both actors than they do from relating with only one of them. Members of industries that purchase steel may benefit from the existence of multiple steel producers, but they need not buy from both simultaneously and, in fact, can use their leverage to divide the steelmakers. This suggests that structurally equivalent actors are likely to be competitive with one another. If this is the case, if one actor adopts a behavior, its structurally equivalent peers are likely to follow suit. In this formulation, behavior diffuses among structurally equivalent actors rather than through cohesive ones. It is possible that structurally equivalent actors adopt the same behaviors because they share cohesive relations with the same alters and are being directly influenced by them in the same ways. Which of these alternative interpretations is more accurate has not been resolved. Considerable evidence exists to suggest that diffusion of behavior proceeds via both processes.

NETWORK THEORIES OF ACTION

Much of the early work in social network theory operated with a broadly rational choice theory of action, in which human action was viewed as a response to interests rather than emotions or sentiment. The reason for this is not surprising. The structural critique of normative sociology emphasized the difficulty of relying on internalized norms as a source of behavior. Structural sociologists preferred to focus on the fear of sanctions rather than on the internalization of norms as the reason for behaving in a normatively prescribed fashion. In most early network studies, the rational choice assumptions were implicit. They were made explicit by Burt, in his 1982 treatise, *Toward a Structural Theory of Action,* and by Granovetter in his 1985 article, "Economic Action and Social Structure: The Problem of Embeddedness."

Burt proposed a model in which social structure has both direct and indirect effects on action, the latter through its effects on actor interests. He distinguished three types of action: atomistic, normative, and structural. Atomistic action is the form posited by neoclassical economists, in which actor preferences are assumed to be exogenous and fixed, and action can be understood entirely as a function of these individual preferences. Normative action is roughly the form described above, in which action is motivated by values and beliefs. Structural action is driven by interests that are endogenously formed on the basis of actors' positions in social structures. Actors that are structurally equivalent, in Burt's view, will have similar interests and will therefore behave similarly. Burt views the concept of structural action as capturing the best features of both the normative and atomistic models: the normative model's focus on the social context within which action occurs, and the atomistic model's deductive rigor. A conception of interest-directed action within social structural constraints is Burt's solution to the problems posed by both traditional approaches. To gain this analytic leverage, Burt relies on an interest-driven conception of action consistent with rational choice principles, in which actors weigh the costs and benefits of various actions and proceed accordingly.

Granovetter's (1985) discussion in "Economic Action and Social Structure" parallels Burt's. Granovetter criticizes economists for using an "undersocialized" conception of action (a notion similar to Burt's concept of atomistic action) and criticizes many sociologists for using an "oversocialized" conception (a notion similar to Burt's concept of normative action). Consistent with other network formulations, Granovetter argues that behavior is best understood in terms of the social relations within which actors operate. In market transactions, opportunistic behavior is most likely to occur between strangers and one-time business partners, whereas more cooperative behavior is most likely to occur between those who have ongoing transactions and who, as a result, have developed feelings of trust. Despite Granovetter's view of trust as a largely affective phenomenon, he remains reluctant to dispense with the assumption of rationality. "While the assumption of rational action must always be problematic, it is a good working hypothesis that should not be easily abandoned. What looks to the analyst like nonrational behavior may be quite sensible

when situational constraints . . . are fully appreciated" (p. 506). For many network theorists, then, actors can be treated as rational, while operating within social structural constraints.

A more recent network approach developed by Harrison White includes an alternative theory of action. In *Identity and Control* (1992), White argues that actors must be treated as constellations of identities, each of which seeks a predictable and tractable environment for itself. Social structures are characterized by a differentiated set of roles, and actors succeed by seeking unique niches for themselves within these structures. In part, White's model parallels that of Burt, for whom joint occupancy of a position is viewed as a disadvantage because the structurally equivalent actors are potential substitutes for one another. In addition to seeking a unique niche, however, White's actors also seek to create ambiguity for those with whom they are socially tied, while maintaining predictability for themselves. One means by which actors create ambiguity among their alters is to maintain a central position between clusters of otherwise disconnected groups. In this situation, those directly tied to ego (an actor) are disconnected from one another, but these alters are themselves embedded in dense networks. The lack of connection among the alters allows ego to control the flow of information, keeping the alters in a perpetual state of confusion.

This formulation is consistent with Burt's concept of "structural holes" (*Structural Holes* 1992). A structural hole is a position in which a single actor has ties to disconnected alters, who themselves are densely connected. As in White's model, an occupant of a structural hole experiences an advantage because each of its ties provides unique information, whereas many of its alters' ties provide redundant information. To the extent that actors can occupy relatively unique positions while their alters occupy "crowded" positions, they will experience benefits, or, as in White's model, gain control over their environments. Burt has shown that members of industries that are highly concentrated and whose trading partners are highly competitive enjoy relatively high profit margins. He has also shown that corporate managers who occupy sparse personal networks experience more rapid promotions than those who occupy dense personal networks.

The strategy of controlling the flow of information and maintaining a state of confusion among one's alters has been termed "robust action" by Padgett and Ansell (1993). In a study of the rise of Cosimo de' Medici in Renaissance Florence, Padgett and Ansell attribute Cosimo's success to his ability to avoid making his intentions known, as well as his skill at keeping his options open (what they call "flexible opportunism") and creating ambiguity for others. "Contrary to Machiavelli's portrait in *The Prince* of effective leaders as decisive and goal oriented, eyewitness accounts describe Cosimo de' Medici as an indecipherable sphinx" (p. 1262), Padgett and Ansell write.

One could argue that this conception of action is compatible with a rational choice model. There is no reason that actors could not act rationally to render their opponents' goals manifest while simultaneously creating confusion about their own goals. Where robust action deviates from a rational choice model of action is in its eschewing of the importance of goals. As Padgett and Ansell (1993) note, "Crucial for maintaining discretion is *not* to pursue any specific goals" (p. 1264, emphasis in the original). Rational actor models normally begin with such an assumption. Still, as Padgett and Ansell show, it was that he occupied a structural hole in the networks among Florentine elite families that allowed Cosimo to be successful in this strategy.

CRITICISMS OF NETWORK THEORY

Given its origins in a critique of well-known approaches within sociology, it is not surprising that network theory has itself been subjected to a number of criticisms. The two most prominently identified difficulties with the theory have revolved around its alleged failure to consider the importance of culture and its allegedly underdeveloped conception of human agency. Both concerns speak to a more general issue about how we account for the origins of social networks.

Networks and Culture

By focusing on the opportunities and constraints created by social structures, structural and network sociologists gained considerable analytical and predictive power. At the same time, network theorists have tended to ignore or minimize the role of subjective factors in human behavior. This has created difficulties for many applications of network theory. Some of these problems involve measurement, such as the question of how researchers identify the content of the ties that constitute the social networks they study. Equally important have been the meanings that actors attribute to various events, which, according to critics, network theorists often take for granted.

One example, raised by Emirbayer and Goodwin (1994) in their critique of network theory, comes from Doug McAdam's study of participation in the Freedom Summer project, a program during the civil rights movement in which activists from around the United States spent a summer in Mississippi helping to register African American voters. In attempting to explain why some applicants who were accepted for the program ultimately participated while others did not, McAdam (1986) shows that because virtually all applicants strongly supported the civil rights movement on normative grounds, ideology cannot account for participation. Rather, the primary determinants of participation were whether an applicant was a member of multiple movement organizations and whether he or she had

friends who were also participating. In criticizing McAdam's argument, Emirbayer and Goodwin (1994) assert that without the strong normative commitment to the movement's ideals in the first place, the networks that later affected individual participation would not have been established. Normative commitments may therefore be causally prior to the formation of social networks. Emirbayer and Goodwin raise a similar criticism of Padgett and Ansell's (1993) study of Cosimo de' Medici. A major basis for the Medicis' accession to power was the relabeling of the earlier ruling family groups, who had previously been characterized as "public citizens of the state," as "oligarchs," which occurred after they attempted to politically repress the previously neutral "new men." Emirbayer and Goodwin argue that it was only because of the powerful meanings associated with terms such as public citizens and oligarchs that the significance of this relabeling can be understood.

Certainly, taking into account the processes by which norms and meanings were established might have lent further richness to the McAdam (1986) and Padgett and Ansell (1993) studies. Whether either would have provided additional explanatory power is less clear. To demonstrate this, it would be necessary for critics to show that taking these norms and meanings into account might have actually reduced or nullified the predictive power of the social structural factors identified in both studies. Simply pointing out that exogenous factors have prior causes is by itself an inadequate basis for critique.

In response to critiques such as those by Emirbayer and Goodwin, network theorists have begun to pay more attention to the role of both culture and subjectivity in human action. Culture for network theorists is a set of practices and meanings constructed within structures of social relations. A meaning system emerges, in this view, through either direct social interaction, as in the cohesion model, or shared positions in a social structure, as in the structural equivalence model. These formulations have been successful in accounting for social attitudes (Erickson 1988). They have been less successful in accounting for shared meanings that are not associated with either direct or indirect network ties. How can one account for the fact that social workers in a wide number of locales will share certain political views, for example, despite operating in very different social networks? One approach to handling this issue is to use the concept of role equivalence. Role-equivalent actors are those, such as Actors F and C in the earlier example, that share the same type of position even in otherwise unconnected social structures. At this writing, there is not nearly as much evidence of homogeneity among role-equivalent actors as there is for cohesive and structurally equivalent ones. The idea that shared meanings across networks are associated with shared network roles remains a promising means of accounting for the construction of meaning. Network theorists have been unable to account for the

origins of the meanings themselves, but simply treating these meanings as exogenous, as cultural sociologists have tended to do, also fails to account for their origin.

Networks and Attributes

An alternative cultural critique of network theory has been raised by Brint (1992). Brint argues that even if attributes have been socially constructed in networks, the meanings associated with them often take on lives of their own. Race, for example, could be viewed in network terms as a set of categories that were socially constructed as a means of exploitation or exclusion. Once race becomes recognized as a category, however, it may have an independent effect on behavior. Those who share characteristics of disadvantaged racial categories may be denied access to existing networks that would be permitted to members of privileged racial categories. In this sense, the formation of or changes in networks can be viewed as endogenous to previously existing attributional factors.

Brint's critique raises important issues that network theory has not fully addressed. The network argument that categories must be seen as social constructions themselves is a powerful alternative to approaches that treat these variables as if they were immutable traits. It is also true, as network theorists note, that there are enormous variations in outcomes within these categories that network analyses are well suited to capture. A study by Petersen, Saporta, and Seidel (2000), for example, showed that the discriminatory behavior by a firm against minorities and women could be explained by network ties. Minorities and women who had network connections with members of the firm faced no disadvantages based on their racial or gender status. The disadvantages faced by minorities and women were due primarily to their disadvantaged network positions. Petersen et al. are unable to account for why minorities and women experience disadvantaged network positions in the first place, and in that sense Brint is correct that these categories may have independent effects. The solution to this problem appears to be a synthesis, in which network ties and categorical factors are viewed as interacting. This will be a fruitful approach as long as researchers are able to analytically distinguish the roles of both factors in explaining social phenomena.

Networks and Agency

Network researchers have focused primarily on the effects of social structures on various outcomes. Action has therefore most often been viewed as a consequence of structure. Contrary to some critics, however, network theorists have paid considerable attention to the issue of agency. In Burt's earlier work, discussed above, structure was viewed as affecting both interests and action, but the model

included a feedback loop in which action then operated back on the structure. In his more recent work, Burt (1992) has argued that structural holes can be actively created by actors, by strategically selecting nonredundant ties. Burt's earlier model was criticized because it still gave analytical precedence to the structure (see Ira J. Cohen, *Structuration Theory,* 1989), and both models are open to the criticism that Burt does not develop an explicit analytical framework for the role of agency. White (1992), in *Identity and Control,* makes an explicit attempt to build human agency into his framework through a focus on narratives. Identity, White's key concept, involves "any source of action . . . to which observers can attribute meaning" (p. 6). The search for control, an attempt to make one's environment predictable, is the primary engine of his model. As does Burt, White views the narratives through which identity is constituted as embedded in social structures, and as with Burt, White has been criticized for this. Whereas White argues that culture cannot be separated from social networks but is inextricably linked with them, Emirbayer and Goodwin (1994) argue that culture must be treated as having its own internal logic and structure, one that constrains action by placing limits on possible courses of action. Ultimately, however, Emirbayer and Goodwin argue that any empirical event must be viewed as structured "*simultaneously* by the dynamics of societal as well as cultural structures" (p. 1443, emphasis in the original). One's position in this debate may hinge on whether it is possible to gain superior analytical leverage from viewing one phenomenon as endogenous to another, even as one understands that in theory, both are operating simultaneously. The limits that culture places on possible courses of action ultimately have their origins in the social communities that defined those courses.

CONCLUSION

The study of social networks has been viewed more as a series of techniques than as a theory in its own right. Those who have practiced the approach have adopted a wide range of theoretical models, from rational choice theory to social constructionist approaches. In recent years, more attention has been given to the theoretical principles behind the network approach, both by practitioners and critics. The debates described here provide evidence that these theoretical principles remain contested. There is no shortage of issues that require attention, but the analysis of social networks has become far more than a set of methodological tools.

O
OUTSIDER-WITHIN

The concept of the outsider-within has been developed most fully by Patricia Hill Collins. Two of Collins's works, *Fighting Words: Black Women and the Search for Justice* (1998) and *Black Feminist Thought: Knowledge, Consciousness, and the Politics of Empowerment* (1990)*,* are considered by many to be classics of feminist theory. In these works, Collins explores the unique social location of black women as a historically situated group, and explores the power relations inherent in the construction of knowledge that help influence a notion of critical theory. This is part of one of the broader themes found in both texts—that knowledge is inextricably connected to power. Collins analyzes social theory in this context and notes that "[f]ar from being neutral, the very meaning and use of the term social theory represents a contested terrain" (1998:ix).

Attending a predominately white school, and being black herself, Collins came to understand what it was like to be on the "inside" and yet still remain an outsider. Although her concept of an outsider-within has grown and changed over time, the core of the idea has always remained the same. Originally, the term was used to describe the location of individuals who find themselves in the border space between groups; that is, who no longer have clear membership in any one group. Collins disliked this usage, however, as she felt it reduced the concept to an identity construct that too closely resembled the "marginal man" found in early sociology. In more recent years, Collins has used this term to "describe social locations or border spaces occupied by groups of unequal power" (1998:5). These locations contain a number of contradictions for the individuals who occupy them. They appear to be members of the more powerful group because they have the necessary qualifications for and surface level rights of member standing. However, this does not necessarily mean

that they have all of the *real* rights and privileges afforded to formal members. Collins uses African Americans in the United States as exemplars of this situation; they have citizenship rights but they are often treated as second-class citizens.

In addition to the definition cited previously, Collins's concept of the outsider-within also states that "[u]nder conditions of social injustice, the outsider-within location describes a particular knowledge/power relationship, one of gaining knowledge about or of a dominant group without gaining the full power accorded to members of that group" (1998:6). In *Fighting Words,* Collins points out that it is the multiplicity of oppressions that help distinguish the knowledge developed from an outsider-within location from the knowledge of both elite locations and oppositional locations. She uses the term "hidden transcripts" from the work of James Scott to describe the type of information that is granted only to members inside of a group (1998:7).

Collins's search for justice begins with a group-based approach. Although she recognizes the importance of individuals, she views justice as something that can only be achieved on a group level. This is not to say that Collins wishes to make broad generalizations about groups of people. Quite the contrary, she advocates focusing on the unique social location of individuals based on the intersection of their various social positions (class, gender, race, sexual orientation, etc.). However, she argues that without a sense of a collectivity, a critical social theory that expresses the realities confronting a particular group cannot exist.

Collins is interested in the ways in which the standpoint of many minorities (black women are her particular concern) have been excluded from most social theory. Part of her interest in developing the concept of the outsider-within came from her desire to create a body of knowledge that was specific to black women and their unique social location in order to insert an identity into the stream of theoretical consciousness that had long been missing. She believes that social theory is both knowledge and lived institutional

practices that attempt to answer the questions and concerns facing groups based in specific political, social, and historical situations. Thus, it does not derive from the ivory tower of the intellectuals but rather from actual groups of people in specific institutional settings. They are the ones who legitimate such theory and whose concerns should be reflected in such theory. This ideology demonstrates Collins's concern with placing outsider groups at the core of her analysis.

Collins also hopes that the idea of an outsider-within will carry a political message. By making black women visible, Collins hopes to create "issues where absence has long been the norm" (1998:105). Her final line in *Fighting Words* is perhaps the best summary of Collins's view on social theory and justice: "If critical social theory manages to move people toward justice, then it has made a very important difference" (1998:251).

P

PARADIGM

A paradigm is a fundamental image of the subject matter within a science. It serves to define what should be studied, what questions should be asked, how they should be asked, and what rules should be followed in interpreting the answers obtained. The paradigm is the broadest unit of consensus within a science and serves to differentiate one scientific community (*or subcommunity*) from another. It subsumes, defines, and interrelates the exemplars, theories, and methods and instruments that exist within it.

The most famous use of the paradigm concept is that of Thomas Kuhn. As influential as the concept, and the theory of scientific revolutions in which it is embedded, were, there is great ambiguity in the way Kuhn used the concept. One critic found 21 *different* definitions in his original work. This very ambiguity may have helped to make the concept influential since it could be interpreted and used in many different ways.

The definition offered above is consistent with at least one of Kuhn's definitions, his sense of a paradigm as what he called a "disciplinary matrix." Some take issue with this definition, claiming that the idea of a disciplinary matrix was an early conceptualization and that later Kuhn defined paradigms *as* exemplars, that is, as concrete solutions to scientific problems and puzzles. They have in mind definitive laboratory experiments that serve as models for scientists who work in a given tradition.

The later Kuhn did seem to want to restrict the paradigm concept to concrete solutions to puzzles, but this idea works best when applied to the hard sciences where breakthroughs in the lab do serve as models for others. However, few social sciences have much in the way of laboratory research. Exemplars, at least used in this way, will not help us get a better sense of the structure of the social sciences and the ways in which they change. Indeed, the theory of scientific

revolutions, of which the paradigm is a central component, has little applicability to the social science where few, if any, "revolutions," at least in the Kuhnian sense, occur. Social sciences may change dramatically and suddenly but it is rarely the result of dramatic new laboratory developments.

For Kuhn, the dominance of a paradigm allows for "normal science" as the paradigm is fleshed out (but not questioned in any fundamental way). Change occurs as normal science leads to findings that cannot be explained by the dominant paradigm. As these anomalies mount, a crisis phase is reached and the science moves toward a situation where a new paradigm can arise that will better explain both what the old paradigm did as well as most, if not all, of the anomalies. Once the new paradigm is in a position of preeminence, the stage is set for the process to recur.

If, as is the case with the social sciences, there is no dominant paradigm, but multiple paradigms, then the process described by Kuhn is called into question. Anomalies require the existence of an agreed-upon paradigm, and without one it is hard to see how anomalous findings will come about, let alone create a crisis. Rather, the crisis for the social sciences is the coexistence of multiple paradigms in basic disagreement.

In the mid-1970s, when the paradigm concept was at the height of its influence, sociology was characterized by three basic paradigms—the "social facts," "social definition," and "social behavior" paradigms. These differed fundamentally in their image of the subject matter of sociology, with the social facts paradigm focusing on large-scale social structures and institutions, the social definition paradigm on the way people construct their social worlds and act and interact on the basis of those constructions, and the social behavior paradigm on behavior that is less dependent on social constructions. Given these differences in image of the subject matter, adherents of each paradigm have different exemplars, here defined as orientations and bodies of work that serve as icons and models for

practitioners within each paradigm. To the social factist it is the work of Émile Durkheim (who created the term "social fact"), to the social definitionist it is that of Max Weber on social action, and to the social behaviorist it is the work of the preeminent psychological behaviorist, B. F. Skinner. Based on these differences in image of the subject matter and exemplar, those within each paradigm tend to develop and use different methods and theories that fit best with that image of what is to be studied and with the basic orientation of the exemplar. Thus, sociology tended to be characterized by three distinct paradigms, each with its own set of images, exemplars, theories, and methods. These paradigms tended to be deeply at odds with one another, questioning each other's focus and most basic assumptions. This prevented researchers from doing the normal science that is a prerequisite to the development of a paradigm, to the uncovering of anomalies, and to scientific revolutions.

Fields change, and sociology's paradigmatic status is quite different today. The fortunes of extant paradigms wax and wane and new ones come to the fore. In the case of sociology, it has become harder to identify the leading paradigms, with the result that the field looks more chaotic than it did several decades ago. Yet, there are disadvantages to the hegemony of a limited number of paradigms (debilitating conflict over basic assumptions) and advantages to a more chaotic science (scientists are less restricted by paradigmatic allegiances). Thus, we must not simply assume that the decline in paradigm hegemony, and the increase in chaos, is counterproductive, especially for a field like sociology already characterized by multiple paradigms.

The paradigm concept, and the theory of scientific revolutions of which it is part, remains an important touchstone for anyone interested in a better understanding of the structure of scientific fields, including, and perhaps especially, the social sciences.

PARETO, VILFREDO

Vilfredo Pareto (1848–1923) is best known for his views that the rationalizations people use for their behavior change, while their reasons or motivations do not; that the successful use of power justifies itself; and that elites rule sometimes by the use of force and sometimes by cunning.

Few theorists have elicited more intense reactions than Pareto. One writer calls him "the adversary of humanitarian democracy" (Zeitlin 1994:192). Another describes him as "a humanist who fought ceaselessly for democracy [and] for freedom of any sort" (Lopreato in Pareto [1916]1980:xx). Why such differing interpretations? The answer lies in Pareto's changing responses to the times in which he lived and others' fragmentary knowledge of his work.

Vilfredo Pareto was born in Paris to an Italian political-exile father and a French mother. When Vilfredo was a small boy, the family moved back to Italy, where he became imbued with humanitarian/democratic ideals.

The powerhunger of Europe's leaders, culminating in World War I, was paralleled by Pareto's increasing cynicism about political life. The cynical portions of his work became known in the West before his earlier works, and his writings about fascism, especially that of Mussolini in Italy, were misunderstood as sympathetic with the brutal totalitarianism that developed in Italy after Pareto's death.

Not only did events in Europe affect Pareto's view of society and politics, but so did his personal life. In 1882, he ran for office in Florence, and was defeated by a government-supported candidate. This defeat he attributed to the corrupt practices of Italy's ruling elite. Soon thereafter, his friend Maffeo Pantaleoni was forced to resign his teaching post because he had criticized a customs duty on wine. Pareto considered himself partly to blame because he had quoted Pantaleoni's incriminating article in print.

In 1893, Pareto was appointed to the chair of political economy at Lausanne, where he taught for 20 years. In 1901, he inherited a substantial fortune and moved to a villa at Celigny. Later that year, his wife ran off with a servant—a deeply disturbing experience for Pareto. After that, he came to be known in intellectual circles as "the hermit of Celigny," although he continued to entertain his friends, including both Pantaleoni and theorist Robert Michels.

PARETO'S CENTRAL THEORIES

Pareto was greatly influenced by the work of another Italian, Niccolo Machiavelli. In *The Prince* (1532), Machiavelli had set for himself the problem of discovering "the best means available to princes for holding their power" (Pareto [1916]1980:254). Although Machiavelli argues that princes *should* stay in power, the methods he described included deceit and force, as well as the use of argument. Pareto thought that Machiavelli's insights helped to explain history and society.

Residues and Derivations

The core and most controversial portion of Pareto's work was his general theory of residues and derivations. Put simply, residues are the reasons or motives for behavior, while derivations are the excuses (justifications, rationalizations) we give for our actions.

By residues Pareto meant the bases of human action. He used the term interchangeably with instinct, need, motive, and especially with sentiment (Pareto [1916]1980:xxxi). Of these "springs of human action," six are most important: (1) the instinct for combinations (change), (2) persistence of aggregates (nonchange), (3) self-expression or activity—the need to do something, to express ourselves, (4) sociality or sociability, (5) integrity or integration with one's social setting, and (6) sex residues (Pareto [1916]1980:120–22).

Although all these had a place in Pareto's theory, the first two—change and nonchange—were central. Just as human beings exhibit an intermingling of the residues for new combinations and persistence, so societies are characterized by both change and nonchange, with some dominated by one or the other. In the course of human history, the residues never change, since they are the bases for all human action.

While the mix of residues differs, the residues themselves never change; they are the essential underlying motives and sentiments. What change, according to Pareto, are the derivations—the intellectual systems of justification with which individuals camouflage their motives in order to appear rational. Derivations are the reasons we give for behaving as we do, or for wanting someone else to behave in a certain way. One's explanation is almost always a rationalization, argued Pareto, seldom expressing the real reason for basis for behavior. "Man, although impelled to act by non-logical motives, likes to tie his actions to certain principles; he therefore invents these *a posteriori* in order to justify his actions" (Pareto [1901]1968:27).

Examples of derivations can be seen in the persuasive mechanisms people use to get others to behave in certain ways. One is an appeal to human authority: "Because I said so" or "Because I am your mother." Another is metaphysical, appealing to external authority: "Because God will punish you if you don't." Pareto noted that people often state their aims in such terms, while the practical purpose is their own, or their society's, welfare and prosperity. Finally, people offer verbal proofs: "Vote for me because I favor democracy and will work for the people." Here reliance is on catch-phrases such as "democracy" and "work for the people," with the hope that no one will ask what is actually meant.

The relationship between residues and derivations involves the problem of logic and illogic. Logic, according to Pareto, is derived from success. If we act in a way that brings about the outcome we desire, we have acted logically. Logic is not based on confessing or even recognizing our real motives; it is based on doing/saying whatever gets us what we want. A by-product of this view, drawing upon Machiavelli, is Pareto's political cynicism. An effective derivation is logical; believing one's own message while failing in one's aim is illogical. Politically, then, cynical or hypocritical political leaders who do not believe their own message are more logical. This is because the ability to change their viewpoint to suit an audience is more likely to bring success. True believers act illogically, because they are incapable of altering what they say to fit the situation. Thus, hypocrisy may be necessary to be successful in politics—and success, for Pareto, is logical. Pareto believed that the majority of politicians are nonlogical, because they believe what they say (especially if they repeat it enough times).

The Circulation of Elites

According to Pareto, "[S]ociety is always governed by a small number of men, by an elite, even when it seems to have a completely democratic organization" (Pareto [1906] 1971:312). Both democracy and mass revolution were inconceivable to Pareto. "Almost all revolutions have been the work, not of the common people, but of the aristocracy" (1906:92). However, sometimes the poorer classes "derive some advantage, as a by-product, from the struggle between elites" ([1906]1971:301).

Pareto suggested that elites may use force or cunning to achieve their aims, but a new elite ordinarily takes control by force. Then, as their authority is legitimated or legalized, they are followed by perpetuators or administrators, shrewd but cowardly individuals who are easily overthrown by new violence, either from abroad or from within. These administrators are "timid but often honest souls who believe in the efficacy of the law against force of arms. They are constantly declining in vigor" and, as Karl Marx would say, are busy digging their own graves (Pareto [1916]1980:342, 384).

These mechanisms result in the circulation of elites, as "lions" are followed by "foxes"—that is, as leadership by force is followed by leadership by cunning. *Circulation* does not imply historical change or progress, but going around and around.

Why do elites continue to circulate? The weakening of those in power is not so much a result of their becoming lazy and unconcerned as it is a result of their inherent conservatism. Their support for, or conservation of, a system that is becoming increasingly anachronistic leaves them open to overthrow by a forceful new elite with (supposedly) new ideas.

Usually the lions and foxes simply take turns feeding on the sheep—the masses. As Pareto put it: "The world has always belonged to the strong. . . . Men only respect those who make themselves respected. Whoever becomes a lamb will find a wolf to eat them" (Bucolo 1980:125). If the masses threaten to cause trouble for the elite in power, Machiavelli had said, they will be either cajoled or exterminated (Machiavelli 1532). Pareto's version was that the masses would be absorbed or eliminated—bought off or wiped out.

In short, Pareto's theory of political elites was that they use derivations to seek and hold power, circulate between lions and foxes, and keep the masses under control by absorption or elimination.

The Nature of Society, Humans, and Change

Pareto's ideology changed gradually during his life. He began as a cautious liberal. But his position altered from the liberal notion of tinkering with the world to make it better, to the belief that nothing could be done to improve the world. It is clear that, during the last 25 years of his life, he became increasingly conservative—though he would call himself a nonideological realist—about society and power.

Over time, then, Pareto became cynical about human nature. He did not say that humans are evil, but rather that in seeking power they camouflage their motives to seem more altruistic than they are. Pareto did not see society as good or evil but as a mixture of primarily self-seeking actors and actions. He saw history and change as resulting from the combination of unchanging residues and the circulation of elites. He would doubtless argue that the combination of his view of cynicism, hypocrisy, and nonchange made him not a conservative but a realist.

As for gender, Pareto believed that patriarchy was the natural and universal social form among civilized peoples. Pareto had little time for the equality claims of feminists. Like some present-day commentators, Pareto believed that feminists were hysterical women "in want of a mate," who persecuted "women who have lovers simply because they have been unable to find men of their own" (Pareto [1916]1935, vol. 2:696). He also contended that feminism could only arise when a society is wealthy.

Pareto viewed women as naturally fickle and promiscuous. He was scathing about the reformist assumption that capitalism was the primary cause of prostitution. Whatever the economic context, Pareto insisted that there would be women willing to sell themselves: "The woman of the petty bourgeoisie sells herself to get a stylish hat, the society woman sells herself to get a string of pearls—but they both sell themselves" (Pareto [1916]1935, vol. 3:1318). Pareto's misogynistic views, as already noted, had some basis in his personal experience.

Pareto's Economic Theories

Though Pareto's views of society and elites were his primary foci, he also sought to understand economics. Although few economists have adopted it, Pareto used the term *ophelimity* to mean the pleasure that a certain quantity of a thing affords an individual. According to Pareto, differences in ophelimity are due to differences in taste, coupled with the obstacles encountered in gratifying one's tastes. Markets and prices do not by themselves determine economic behavior, but depend on "the opposition of tastes and obstacles" ([1906]1971:152). The more intense and widespread the taste for an item, and the more obstacles to obtaining it, the higher its value and its price.

Another important part of Pareto's economic theory is capital, of which he listed three kinds. *Land capital* is immovable property that can be mined or developed. *Mobile* capital includes machines, transport means, household goods, and money. *Human capital* is "the cost of production of a human being . . . what is strictly necessary to keep him alive and train him" (Pareto [1906]1971:300). The concept of human capital has been expanded in economics, but Pareto was one of the earliest writers to recognize its importance. These three forms of capital are used in the free market system to increase one's bargaining position relative to others.

Although individual economic behavior was of some interest to Pareto, he was more concerned with economic systems, their upswings and downswings. According to his analysis, upswings result when entrepreneurs expand production by transferring savings into development, often using credit. Investors likewise extend themselves to have a part in a productive boom. Downswings occur when markets become glutted and/or stagnate (because tastes are satisfied with few obstacles for the individual) and the producers and investors reduce and retrench (Pareto [1906]1971:321–83).

According to Pareto, "[I]t is customary to assume that man will be guided in his choice exclusively by consideration of his own advantage, of his self-interest" (Pareto [1906]1971:105. This premise for human behavior was later expanded into exchange theories, which argue that humans seek the most profit at the least cost.

PARETO IN THE COMMUNITY OF SCHOLARS

Pareto's relation to other theorists begins with Gaetano Mosca, who published *The Ruling Class* (1884) 20 years

before Pareto's *Manual of Political Economy* appeared. When Pareto's book appeared, it was apparent to many, but especially to Mosca, that Pareto's discussion of elites paralleled Mosca's. In fact, he accused Pareto of having "copied shamelessly." Pareto's response was to eliminate the few references to Mosca in a subsequent printing of his book.

Pareto's criticism of Karl Marx began, as did that of most non-Marxists, with a rejection of the inevitable final revolution. Whereas Marx had seen the "history of all hitherto existing societies" as class conflict, Pareto wrote that "the history of man is the history of the continuous replacement of certain elites: as one ascends, another declines (Pareto [1901]1968:36).

Pareto's criticisms often had a sarcastic, cutting edge to them. He was critical of those like Émile Durkheim, who thought a new morality could be built on scientific principles and understanding. People do not and never will operate thus, Pareto wrote, but will excuse and rationalize their behaviors. He criticized not just revolutionaries or radicals, such as Marxists, but later in life he also criticized liberal humanitarians who thought society could be made better by tinkering with it. Pareto was also critical of evolutionary thinking that assumed progress and improvement. Society, he said, never changes much, and when it does make progress, as toward freedom, it is an indirect result of elites' striving for personal goals.

All in all, Pareto appeared to gain satisfaction from criticizing the work of his colleagues as based upon their derivations. He wrote to his friend Pantaleoni: "Not because of any merit of my own, but because of the circumstances in which I found myself, I have no prejudices of any kind . . . which hinder others to do scholarly work in this field. I am not tied to any party, any religion, or any sect; therefore, I entertain no preconceived ideas about phenomena" (Pareto in de Rosa 1962). He was understandably unpopular among those committed to an ideology or cause, and among scholars in general.

In summary, Pareto's insights included, first, his "contribution" to the fascist concept of order and control. Following Machiavelli, he argued that power is inevitable, is its own justification, is based on the best use of derivations, and is usually cynical when employed correctly and successfully. Second, He pointed out the illogic in human behavior, distinguishing motives, or residues, from the reasons people give and often believe. The central issue raised by Pareto's theory is whether society is primarily the result of an ideological overlay of rationalizations. Third, Pareto argued that elites merely circulate between lions and foxes while feeding on the sheep or masses.

Pareto saw himself as the only real theorist, the rest being ideologues. His critics would say he was not a theorist at all, because he explained nothing regarding the course of human history. Given that the residues never change, he was dealing with constants, with only superficial derivations changing as people think up new rationalizations.

PARK, ROBERT

A journalist and sociologist, Robert Park (1864–1944) was one of the charismatic figures around whom the Chicago School of urban sociology coalesced in the 1920s and 1930s. Influenced by Georg Simmel's conception of sociology as the study of patterns in human behavior that result from the "formal" properties of social interaction, Park added a dash of Herbert Spencer's social Darwinism and envisioned society as an ecological order where individuals cooperate and compete in the struggle for survival. Before joining the Chicago department at the age of 50, Park worked as a newspaper reporter in Minneapolis, Detroit, New York, and Chicago and later as a public relations consultant for Booker T. Washington and the Tuskegee Institute. These settings helped forge his substantive interests: in cities, the press, and in the lives of members of racial and ethnic minority groups. He is best remembered today for his PhD dissertation, *The Crowd and the Public* (1904), an early attempt at formulating a theory of social movements; for three essays—"The City" (1915), "The Urban Community as a Spatial Pattern and a Moral Order" (1926), and "The City as a Social Laboratory" (1929)—which

laid out the research agenda of the Chicago School; for his theory that immigration initiates a "race relations cycle" beginning with contact and competition between a majority and minority group, proceeding through a conflict and then accommodation stage, and ending with the minority group's eventual assimilation; and for giving intellectual succor to students like Nels Anderson, Horace Cayton, Frederic Thrasher, and Lewis Wirth, whose ethnographic investigations of Chicago became classics in their own right.

LIFE AND CAREER

Park was born in Pennsylvania but spent his formative years in the town of Red Wing, Minnesota, the fourth child of Hiram and Theodosia Park, a grocer and school-teacher, respectively. Park was not a studious child; he passed his days in play, characteristically crossing ethnic divides to befriend children from Red Wing's Swedish and Norwegian immigrant communities. Despite his poor academic showing, Park went on to the University of Minnesota and then transferred after a year to the University of Michigan, where he received a degree in philosophy in 1887, coming under the influence of John Dewey, who was at that point more a Hegelian than a pragmatist.

Park had been a reporter for the student newspaper at Michigan. Upon graduation he entered the newspaper business, working briefly for a short-lived paper affiliated with Dewey and then for various big-city commercial presses. In 1894, he married Clara Cahill, an artist and writer, and in 1898 the couple moved to Cambridge, Massachusetts, where Park took an MA in philosophy from Harvard, studying with William James. Park took to heart James's critiques of dogmatic philosophies that have no practical bearing on human affairs, and was impressed by James's willingness to fold into philosophy the real-world experiences that people from all walks of life had shared with him. (For a reading of Park that places more emphasis than I do here on his pragmatist roots, see Joas 1993.)

Led in this way from philosophy to social science, Park became intent on studying social psychology and making it the basis for a doctoral dissertation on the press. He moved with his family to Germany, which remained, even at the turn of the century, a mecca for those wishing to learn how to approach the human sciences empirically. Simmel's courses in sociology at the University of Berlin held tremendous interest for Park, and left a permanent imprint on his thinking, but he wrote his dissertation under the direction of Wilhelm Windelband, a neo-Kantian philosopher and historian of science. On returning to the United States, however, Park found himself despairing of spending more time in ivory towers, and declined an offer from Albion Small, the chair of sociology at the University of Chicago, to teach there on a temporary basis. Instead, he took a job as press secretary for the Congo Reform Association, whose goal was to publicize the brutality of Belgian colonial rule. This was an odd job for Park to have taken, for, despite his desire to return to the "real world," his days as a reporter had left him with serious misgivings about the motivations and consequences of social reform activity. His tenure at the association was predictably brief. In 1905, he was hired away by Washington. Traveling frequently between Tuskegee, Alabama, and his family's home in Massachusetts, and often accompanying Washington on fact-finding expeditions and publicity tours, Park became intimately acquainted with the problems faced by African Americans in the post-Reconstruction South, and cowrote with (or ghost authored for) the busy Washington numerous articles, tracts, and books.

In 1913, however, the opportunity again arose to join the Chicago department, which had begun to gain a reputation as a leading American center for sociological research. Perhaps sensing that this would be his last chance at academic respectability, Park took the job. He quickly developed intellectual friendships with W. I. Thomas, who, like Park, had drunk deeply from the well of American pragmatism, and with Ernest Burgess, with whom Park would coauthor the immensely popular *An Introduction to the Science of Sociology* (1921), a sourcebook of readings from which an entire generation of sociologists learned the field. Park was productive at Chicago, especially for someone who had started his academic career so late. During his more than 20 years there, he wrote five books (depending on how you count), more than 50 articles, and supervised scores of doctoral dissertations, the introductions to which he was often called upon to write after they were published. His interests ranged widely and helped set the agenda for his extensive travels, both in the United States and abroad—travels that reinforced his desire to understand patterns in ethnic and racial interaction. He retired from Chicago in 1934 and took a position at Fisk University in Atlanta, a historically black college where one of Park's former students, Charles Johnson, taught. Park continued working on various sociological projects, including an autobiography that was never completed, until his death in 1944.

MAJOR THEORETICAL THEMES

Although not always remembered as a contributor to sociological theory, Park in fact made important theoretical advances at both the presuppositional and substantive levels—advances that were obscured by the unsystematic and essayistic style of his writing. At the presuppositional level, Park was hardly alone among sociologists of his day in incorporating evolutionary themes into his thinking. What made his approach distinctive, however, was the insistence that social-ecological environments are characterized by processes of both cooperation *and* competition.

Park recognized two primary forms of cooperation: on one hand, urbanization and an advanced division of labor create situations of economic interdependence in modern societies; on the other hand, institutions—ranging from the family to the press—help integrate actors into a common moral and symbolic order. As for social competition, Park saw it centering on struggles for "dominance," which may occur at different levels: the individual competes with others for employment in the limited number of satisfying vocations, neighborhoods vie to become centers of social power in cities, established institutions jockey with not yet established ones for legitimacy, and so on. According to Park, cooperative and competitive social processes often unfold in recurring patterns of "succession." Park's most famous example of succession was drawn from research on population patterns in Chicago, where immigrants regularly moved from city centers outward as they established more secure footholds in their new country.

Methodological precepts followed from these presuppositions. Park's interest in studying social processes relating to "symbiosis"—or the interaction of different entities in a social ecosystem—as they play out over time ruled out in advance any static approach. Instead, Park sought to re-create "natural histories" of the individuals, groups, and institutions he wrote about, that is, accounts in which their present condition can be explained as a function of their complex social-ecological trajectories. Park believed that recovering such trajectories requires a multimethodological way of proceeding in which a wide range of factual material is used to understand actors from the viewpoints from which they themselves perceived their situations at crucial junctures. (This insistence, which owed a great debt to George Herbert Mead, a longtime acquaintance of Park and later colleague of his at Chicago, was then programmatized by Park's student, Herbert Blumer, and became one of the bases for symbolic interactionism.) In light of these concerns, Park saw in-depth life history interviews, participant observation in unfamiliar social worlds, probing and imaginative reportage, and—given the concern with spatiality inherent in the notion of social ecology—the making of social maps, as the most fruitful methods of social research. It was these he employed in his own empirical investigations—of the immigrant press, for example, or in his classic essay on "The Natural History of the Newspaper" (1923). Drummed into the heads of his graduate students, these methods became synonymous with Chicago sociology.

At the level of substantive theory, Park's most significant contributions were to extend Simmel's work on urbanism and to turn his process-oriented eye toward racial and ethnic relations. In both of these domains, his earlier interest in social psychology loomed large. The anonymity and intensity of urban life, he argued, combined with the fact that in cities, relationships of dependence often center on monetary exchange, has a profoundly detraditionalizing effect, breaking up informal patterns of social control, especially among newly arrived immigrants subject to the potentially conflicting demands of assimilation versus ethno-political loyalty. In Park's view, this meant that the city environment is inherently an unstable equilibrium. The downside of this, as he saw it, is that cities thereby become prone to crime and vice, to social crises, and to the irrationality of the mob. But the upside—and for Park this was more than adequate compensation—is that cities are also red-hot centers of social and cultural ferment and experimentation, places where new institutions, ideas, and artistic forms are likely to arise, both out of need (given endemic crises demanding resolution) and because a conscience freed from the strictures of traditional morality is a conscience primed for creativity. Cities thus represented, for Park, the leading edge of modernization and social change, and he directed his students to pay special attention to them.

Park's theory of a race relations cycle in immigration, for its part, has been out of fashion for some time, on the grounds that it posits assimilation to the norms and values of the host society as desirable and inevitable, whereas the accumulated empirical evidence suggests that immigrant groups, in the second generation and beyond, often retain key features of their ethnic heritage and modify the culture of their host countries as much as they are modified by it. These charges are not without merit. Park did regard assimilation as both thoroughgoing and desirable. For example, in his 1914 paper "Racial Assimilation in Secondary Groups with Particular Reference to the Negro," Park asserted that "[t]he immigrant readily takes over the language, manners, the social ritual, and outward forms of his adopted country"—a process he coded as good because, as he saw it, the women and men who were thus "emancipat[ed]" from their traditional practices would thereby gain the "room and freedom for the expansion and development of . . . [their] individual aptitudes" (1914:607). He did not, however, view the race relations cycle as an iron law—indeed, he explicitly noted that the assimilation process may become blocked for those groups whose members bear "a distinctive racial hallmark" (1914:611), or for a variety of institutional reasons discussed in *The Immigrant Press and Its Control* (1922), a book written on the heels of the first Red Scare. His reputation among contemporary scholars of immigration may also be bolstered slightly by pointing out that with the exception of Karl Marx, Park was virtually alone among classical and postclassical theorists in stressing the complex relationship between immigration and colonialism, recognizing this to be the proper context for understanding the race relations cycle in the United States and Europe.

PARSONS, TALCOTT

The contribution of Talcott Parsons (1902–1979) to sociology can be differentiated into three theoretical elements: (1) a theory of order, (2) a theory of society as a production process, and (3) a theory of societal evolution.

THE THEORY OF ORDER

Parsons's theory of order starts with his analysis of Hobbes's problem of order in his seminal work, *The Structure of Social Action* ([1937]1968). Hobbes's question was how social order in the sense of mutually expectable behavior and expectations of two or more actors in a situation is possible under the condition that each actor is free in choosing goals and means to attain his or her goals. Hobbes's prediction for such a situation was the war of all against all (state of nature). According to Hobbes, recognizing this dilemma and striving for survival should suffice to lead everybody to the conclusion of concluding a contract with each other to build a central authority with a monopoly of power, which is in charge of establishing and enforcing rules defining rights and obligations so that social order will be guaranteed. In order to exclude destabilization, the subjects of the authority have no right to resistance, and the founding of the authority in the belief in God's will should help to avoid any questioning of it.

Parsons's criticism of Hobbes's solution says that it leads to the utilitarian dilemma. If there is no precontractual bond between the individuals, there is no reason why they should step out of the situation to see and enact a solution to their problem from the external position of an observer. Within their situation, there is no mutual trust on which to rely in order to conclude a contract that would deprive them of their own sanctioning power. Thus, there are only two extreme solutions to the problem: a very unstable coincidence of interests, which provides for accidental order, or external constraint that produces compulsory order. Both are types of what Parsons calls factual order. Neither type is stable in itself. Accidental order possibly endures for moments of time only, while compulsory order provokes counterforce and is always in danger of resulting in a spiral of force and counterforce. Thus, according to Parsons, a purely positivistic theory of action, which conceives of action as being merely guided by freely chosen goals and means to attain these goals under given external conditions, is unable to provide a satisfying answer to the question of how social order is possible.

It is at this point that Parsons introduces his "normative" solution to the problem of order. He distinguishes normative order from purely factual order in the sense that it relies on precontractual commonly shared values and norms. There must be minimal bonds between people in order to share a minimal set of values and norms. Under this condition, they learn to subordinate their I-perspective to a we-perspective and to reconcile individual interests within a common frame of reference. In order to do so, they need to share a feeling of mutual belongingness, which is furthered by external demarcation and minimal internal homogeneity of the society. For Parsons, it goes without saying that such preconditions of commonly shared norms cannot come about by the convergence of individual interests or by external constraint. They follow their own logic of production, namely, external demarcation and internal homogenization; the differentiation between a sacred core of unchangeable values and norms and a profane periphery of changeable technical rules in Durkheim's sense; the recurrent reinforcement and re-creation of the validity of values and norms in commonly shared rituals; inclusion of members in such rituals; the identification of members with the social unit (group, organization, society); socialization of new members through identification with representatives of the social unit; legitimation of more specific norms and practices by reference to more general values and norms. We have to account for these prerequisites as regards the

existence of commonly shared values and norms if we want to understand and explain a concretely existing social order.

For Parsons, the "normative" solution to the problem of order, however, does not mean that any concrete social order is only the result of norm constitution outside the effects of interests and power. To do so would result in the counterposition to positivism, which is idealism according to nineteenth-century German philosophy. Idealism tries to understand human action and social order as an "emanation" of ideas and pure reason and leads to the dilemma of having to choose between the two extreme poles of a purely ideal order coming about through the realization of reason, or a purely traditionalist conformistic order existing in a closed community without any change. A concrete order is, as a rule, neither purely factual nor purely normative in character, but rather the result of the interpenetration of normative and conditional factors. This is the way in which Parsons resolves the contradiction between positivism and idealism in his "voluntaristic" theory of action. This means that the outlined processes of norm constitution penetrate the satisfaction of interests and the application of power and vice versa.

An example might explain how this kind of order building has to be conceived of. According to Max Weber, the marriage of ascetic Protestantism and modern capitalism has resolved the contradiction between the traditional religious ethics of brotherhood and the unbrotherly world of business, market competition, and market exchange between strangers through the establishment of what can be called *business ethics,* which is located in the zone of interpenetration (overlap) of ethics and business. It is both ethics and business, namely, the ethics of business, and has to be distinguished from the pure ethics of brotherhood and the pure satisfaction of business interests. The new business ethics is put into law in trade, corporation, competition, and contract law. According to Weber, the new thing about business ethics, trade, corporation, competition, and contract law is that they break down the differentiation between in-group and out-group morality. Formerly, the ethics of brotherhood prevailed within the community, whereas outside the community there was unbrotherliness, force, deceit, and mistrust. With the establishment of business ethics and economic law, the interaction within communities and between members of different communities became guided by identical norms. Market and business penetrate the community, turning members of a closed community into self-responsible individuals; the formation of a wider and more abstract community of a common faith and of economic law penetrates the market to turn insecurity, mistrust, deceit, and force into ethically and legally regulated, predictable, and trustful business activity. The new economic order is both the result of expanding markets and expanding ethical and legal regulation. This is exactly what we can call the interpenetration of normative and conditional factors in the production of a concrete social order in terms of Parsons's voluntaristic theory of action.

The question as to whether Parsons completely discarded his voluntaristic theory of action, when he turned to functionalism and systems theory, resulting in the publication of *The Social System* in 1951, has been frequently debated. At least, the parallel publication of *Toward a General Theory of Action* in 1951 (Parsons and Shils 1951) gives clear evidence that there was no intention to do so. Also, Parsons's final collection of essays, *Action Theory and the Human Condition,* published in 1978, refers to action theory in its title. It is, however, also clear that action theory was complemented by analytical functionalism and systems theory and that theoretical problems were now expressed in terms of the new theoretical language. Nevertheless, what can be maintained is the continuing importance of the problem of order and of its solution in terms of Parsons's voluntaristic theory of action. In *The Social System,* Parsons introduces three systems in order to analyze human action and its order: the social system composed of interactions, the personality system composed of need dispositions, and the cultural system composed of symbols with meaning (language, values, norms, expressive symbols, cognitions). The problem of order now occurs in three different forms: as double contingency of actions within social systems, as motivational problem in the relationship between social and personality systems, and as legitimation in the relationship between social and cultural systems.

THE THEORY OF SOCIETY AS AN ONGOING PRODUCTION PROCESS

In the further development of his systems theory, Parsons introduced a fourth action subsystem, which was originally called behavioral organism and was then renamed behavioral system following the advice of Victor and Charles Lidz. The four subsystems make up the complete action system. Each one of them fulfills a specific function within the four-function paradigm (AGIL scheme) introduced in the *Working Papers in the Theory of Action* (Parsons, Bales, and Shils 1953), which became later on systematized by way of crossing two dichotomies: instrumental versus consummatory and internal versus external orientation of action: Adaptation (A), Goal-attainment (G), Integration (I), Latent pattern maintenance (L).

Providing for adaptation, the behavioral system is the organizational unit of learning in the broadest sense, from simple conditioning up to reflective abstraction. The interpenetration of the behavioral system with the personality system ensures a change of the personality through learning and direction of learning by personal goal setting, its interpenetration with the social system provides for collective learning and for the social organization of learning, its

interpenetration with the cultural system induces cultural change on one hand, and the cultural framing of learning processes on the other hand.

Parsons elaborated his model of the action system in two directions. In *Economy and Society,* Parsons and Smelser (1956) subdivided the social system into the four functional subsystems, which were eventually named the economic system (A), the political system (G), the societal community (I), and the fiduciary system (L). In his late work collected in *Action Theory and the Human Condition* (1978), Parsons embedded the action system into the system of the human condition: physicochemical system (A), organic system (G), action system (I), and telic system (L). The production, reproduction, renewal, and transformation of order is now a problem of the balanced fulfillment of the specific functions by the subsystems and of their balanced interpenetration. The latter is outlined in a theoretical model of the double interchange of factors and products between the functional subsystems, which is carried out by generalized media of interchange (or communication): (A) money, (G) power, (I) influence, (L) value commitments for the social system; (A) intelligence, (G) performance capacity, (I) affect, (L) definition of the situation for the action system; (A) empirical ordering, (G) health, (I) meaning, (L) transcendental ordering for the human condition.

Here, we enter the domain of Parsons's theory of society as an ongoing production process, which includes value creation, ups and downs, and inflationary-deflationary spirals. We might explain this model with the example of the political system as the societal subsystem, which is specialized in the production and implementation of collectively binding decisions in order to accomplish societal goals. To fulfill this societal function, it needs to generate power, because power is exactly that means, which allows the enforcement of collectively binding decisions, though a plurality of alternative decisions is always articulated and desired by groups and individuals who intend to oppose. According to Max Weber's ([1922]1976:28) definition, power is the chance to enforce one's will against resistance. The ultimate means needed to enforce collectively binding decisions is the establishment of a monopoly of physical force by the state, which authorized representatives of the state can apply in case of resistance.

What is crucial and what represents the voluntaristic solution of the problem of order in the production model is the fact that the generation of political power is not self-sufficient, but needs extra-political resources in order to be stabilized and enhanced. And these extra-political resources must be produced through procedures following their own logic. Financial resources have to be produced according to economic laws and cannot be produced politically, as the failure of the socialist regime of the Soviet Union has demonstrated (mobilization of money). Support has to be produced by processes of inclusion and participation in decision making (mobilization of influence). Legitimacy has to be produced by processes of consensus-formation in public discourse (mobilization of value commitments). Parsons represents this political production process in a model of the double interchange of factors and products carried out on the basis of specialized media of interchange.

What is furthermore crucial is the involvement of generalized media of interchange (communication) in the societal (political) production process. The specific features of the media help to advance this process far beyond the limits of what would be an economic barter business, or direct political application of force, or particularistic solidarity, or traditional consensus of a shared lifeworld. The media are generalizations of more concretely effective means of motivating action.

The media are of a symbolic nature. Money symbolizes purchasable goods and services, power signifies enforceable collectively binding decisions, influence means cooperation that can be mobilized, value-commitments design the consent available. They are generated and applied according to institutionalized norms: money/economic law, political power/constitution, influence/order of competencies, value-commitments/rules of public discourse (Parsons 1969a, 1969b, 1969c).

The media allow for credit lending and a corresponding process of value creation. The voters invest their votes in political parties as in banks, which, in their turn, invest the votes they received in governmental programs. The return for the party-bank is enhanced support as a result of successful programs, for the voters it is farther-reaching, collectively binding decisions that they could not achieve on their own account. In this political process of value-creation, zero-sum conditions of power are overcome. The power of one group of voters does not rule out the power of other groups of voters, because the range of collectively binding decisions is continually extended so that a growing spectrum of desired decisions is being served. There are measures of functioning of the production process, which is effectiveness as value principle and compliance as coordination standard for political power.

The dynamic nature of the production process implies waves of ups and downs and inflationary-deflationary spirals. An inflation of political power occurs when there is an overinvestment of support so that desires for political decisions run beyond the limits of production. The return for votes is diminishing in this case. The result is declining trust in political investments, which might lead to the growing recall of investments like the running recall of investments in banks. Investments are shifted to secure units, over which one has direct control (one's own group). This implies deflation with diminishing power available for party-banks, which, therefore, cannot invest in farther-reaching programs. The effect is a shrinking capability of political production. Parsons gives an interpretation of

McCarthyism in the United States in the 1950s, which applies the model of an inflationary-deflationary spiral. The end of World War II had increased the external and internal power of the United States government enormously. The investment of voters in supporting the government was insecure in its return, because it could not be predicted what the government would do with its increased power. Senator McCarthy made use of this insecurity and turned it into a basic mistrust in incumbents of authority positions of any kind that they would deviate from true American values and support communism. As a result, it was intended to establish close control on incumbents of authority positions so that the scope of decision making beyond immediate return was shrinking. The inflation of power turned into a deflationary spiral, which, however, came to a halt, when the constricting effects of McCarthy's position were realized and increasingly opposed to across party lines.

In an article on an empirical survey on voting behavior, published by Berelson, Lazarsfeld, and McPhee (1954), Parsons explains what he conceives as a balanced production of leadership responsibility and political decisions in the interchange between the political system and the societal community in the American society. There is a double interchange of factors producing specific enforcement power and products providing for general leadership power. Interest demands are articulated by groups in the societal community and transmitted to the political system through influence; political decisions are transmitted from the political system to the societal community through political power. Support from groups in the societal community is turned into power in the political system via elections; leadership responsibility is taken by the government on this basis and turned into influence to convince people and groups in the societal community of the preference for certain political programs.

According to Parsons, the political production process has to keep balance between three sets of opposing requirements: (1) stability versus flexibility, (2) consensus versus conflict, and (3) conservation and progression. In his analysis of the empirical voting study, he gives the following explanation on how this balance is achieved in the American political system.

Stability versus flexibility. The consequences of political decisions are far too complex so that not even experts would be able to predict their outcome. Thus, there would be chaos if voters tried to vote on the basis of rational grounds. This is prevented by the fact that a majority of voters decide on "nonrational" grounds simply in line with group alliances within their milieus. Their traditionalism is the guarantor of predictability and stability in the system. The resulting danger of rigidity is counteracted by the voting of people, who are not firmly included in a one-dimensional milieu but are socially less included or experience

cross-cutting loyalty demands from different group memberships. They change their party preference more often than the average voter from one election to the other or during the campaign for an election. In the "normal" case of inclusion, they will shift toward the majority, which is emerging during a campaign. In the "pathological" case of alienation, they withdraw from voting or support radical movements opposing the system in general.

Consensus versus conflict. The polarization between the conservative Republicans and the liberal Democrats is embedded in a consensus on the rules of the game, in commonly shared values of the constitution, in mutual trust to let the winner of an election lead the nation for the next term and in cross-cutting memberships.

Conservation versus progression. The Republicans represent the principle of conservation, which implies less inclination to change the given parameters of society (especially the economy) through political intervention, whereas the Democrats stand for the wish to change society in the direction of the basic constitutional values, especially to provide for more inclusion of marginalized people and justice through political intervention. Progress on the basis of enduring structures is particularly possible, since changes carried out by the legislation of one government are mostly not revoked by the next government, even if its members had opposed it severely in the legislation process.

THE THEORY OF SOCIETAL EVOLUTION

Approaching Parsons's theory of the evolution of societies, we might start with his representation of the voluntaristic model of the interpenetration of normative and conditional factors in his functional systems theory in terms of the cybernetic hierarchy of conditions and control, where energy is high and information is low at the bottom, but energy is low and information high on top in the order of the systems, from the adaptation system at the bottom via the goal-attainment system and the integration system up to the latent pattern maintenance system on top.

According to our example of the interpenetration of ethics and business, we could say that the expansion of markets via the creation of the European single market conditions disturbance in the political system (G) of the member states of the European Union by making their regulation of the economy ineffective and causing corresponding political alienation in the electorate; it also breaks up the solidarity structure (I) of the member states and produces a rift between the winners and losers of this modernization process; and it creates legitimation deficits (L), because the established notion of justice as approaching equal living conditions for the whole national community through redistribution is challenged by increasing pressure

from the market in the direction of a greater spread of income. The disturbance caused by the expansion of markets in the political systems, societal communities, and fiduciary systems of cultural communication in the nation-states calls for restructuring activities from the top down to the regulation of the economy in the new multilevel system of European Union, nation-states, regions, and local communities by way of building a multilevel polity (G), transnational solidarity, and reinclusion of marginalized groups (I) and consensus on a new idea of justice, which would go in the direction of a more individualized conceptualization in the sense of providing for equal opportunity and fairness (L).

We might also apply Parsons's scheme of pattern variables to describe this transformation. It decomposes Tönnies's dichotomy of community and society and Durkheim's dichotomy of mechanical and organic solidarity to allow for a greater variety of compositions of the elements.

We could say that the organization of the national welfare state preserved elements of community and mechanical solidarity, whereas the evolution of the European multilevel system makes a step forward toward an extended society and organic solidarity. However, this does not completely rule out the maintenance of elements of community and mechanical solidarity in the new system, particularly within the smaller units of family, but also local communities, regions, and even nation-states. The establishment of some basic mechanical solidarity of commonly shared feelings of belongingness is also possible on the European level and helps to stabilize the multilevel system.

Applying his AGIL scheme to societal evolution, Parsons (1966, 1971) outlines four basic dimensions of this process: (A) adaptive upgrading, (G) structural differentiation, (I) inclusion, and (L) value generalization. In our example of European integration, the European single market provides for adaptive upgrading because of the economy's enhanced performance. It necessitates structural differentiation of institutions in the multilevel system; it also requires complementation through the inclusion of groups in the periphery excluded thus far, and of newly marginalized groups in the center, that is, the resolution of conflicts between winners and losers of modernization. Finally, there is a need for value generalization in the sense that notions of justice as partaking collectively in produced wealth are being replaced by a notion of justice as equal opportunity and fairness.

In his book *Societies* (1966), Parsons presents an outline of evolution according to the four basic dimensions by looking at the advancements of archaic societies (Egypt and Mesopotamia) compared to primitive societies, and of the historical empires (China, India, and the Roman Empire) compared to archaic societies, and he also highlights the advancements produced by the "seedbed societies" of Israel and Greece that were taken up later on in the emergence of modern Western societies.

In *The System of Modern Societies* (1971), he describes the major advancements achieved by the Reformation, the Enlightenment, and the crystallization of the system in Northwestern Europe, and concludes with an account of the special achievements of American society and a look at countermovements against modernization. He also dares the prediction that the Soviet system cannot be regarded as a stable type of modern society.

In an article on "Evolutionary Universals in Society" (1967), he provides a brief description of institutional inventions, which can be called evolutionary universals in the sense that they further evolution. First prerequisites are religion, language, kinship systems, and technology. Evolutionary universals are social stratification, cultural legitimation, bureaucratic organization, money and the market complex, generalized universalistic norms, and democratic association.

According to his analysis in *The System of Modern Societies* (1971), three major revolutions have brought about major breakthroughs in modernity: the industrial revolution (A), the democratic revolution (G), and the educational revolution (I, L). The process involves consecutive steps in the establishment of civil, political, and social rights, according to Marshall's analysis of the development of citizenship in the United Kingdom. Though the development in Britain was not replicated everywhere in the same way, it is nevertheless of a paradigmatic nature, because it presents a model of what Parsons calls a modern societal community, which establishes a solidarity of citizenship beyond any primordial group membership. In Parsons's eyes, it is the peculiar achievement of the United States to develop such a pluralistic, yet integrated, societal community even further. In an analysis of ethnicity, however, he sees this achievement in danger of regression due to the return to primary ethnic solidarity as a reaction to the insecurity of status enhanced by rapid social change. This is what has become the controversy on multiculturalism and group rights versus pluralism and individual rights (Parsons 1977).

Evolutionary advancement is not guaranteed. There is always the danger of retrogression. Parsons's major example of this is Nazi Germany. According to his explanation, the modernization of science, technology, economy, and administration was not complemented by a concomitant modernization of social structure, political organization, and culture. There were strong tensions between modern technical rationality and traditionalistic social structure and culture, which caused a longing for the return to the securities of *Gemeinschaft* that was successfully promoted by the Nazi movement.

CONCLUDING REMARKS

Talcott Parsons's contributions to sociological theory can be subdivided into the three elements of a theory of

order, a theory of society as a production process, and a theory of societal evolution. It is still worthy of application, refinement, renewal, and extension. It is fair to say that its potential still calls for efforts of realization.

PATRIARCHY

Patriarchy is the seemingly ubiquitous system of sex-based oppression that is incorporated throughout society. It refers to the power differential between men and women in society that allows men to dominate and control women. It is not the unanticipated consequence of capitalism or some other social arrangement but rather a purposeful system held in place by those who are reaping the benefits of its unjust systematic abuse of women.

Several types of feminism have grappled with the issue of patriarchy. Psychoanalytic feminists believe that all men everywhere are responsible for enforcing patriarchy in their daily lives and that women do little to challenge them. This branch of feminism offers two reasons for the dilemma. First, they posit that men strive to maintain the system because they fear death. Women do not have such an intense fear of death because they are more closely linked to the process of reproduction and life-giving. This causes men to try to control the reproductive abilities of women and women themselves to try to create objects that will immortalize them (monuments, belief systems, nuclear bombs, etc.) and to distance themselves as far as possible from signs of their own mortality (sexuality, disease, birth, etc.).

The second explanation for patriarchy put forth by psychoanalytic feminists is related to the experiences of early childhood personality formation. They assume that people are forever attempting to balance (but never quite can) their own quest for individualism with the need to belong to something larger than themselves. They also assume that the earliest, and most crucial, stages of emotional development occur primarily with the mother figure (whether the biological mother or not is irrelevant). At these early stages, especially prior to the formation of linguistic skills, infants are dependent upon the mother for happiness as well as frustrated and angered by her punishment or lack of cooperation in satisfying desires. Infants have ambivalent feelings toward the father figure since he is only an occasional being with whom they have interaction and on whom they rarely depend to satisfy some need. This causes males to grow up and use women for emotional fulfillment and to also seek to manipulate them for their own satisfaction.

Women grow up with ambivalent feelings about themselves as women and seek to reenact the role of mother with their male counterparts. Hence, psychoanalytic feminism explains patriarchy as rooted in the anxious energy exerted by men out of fear of their own death as well as their ambivalent feelings toward their mothers. Women are not inclined to oppose the system because they lack a similar emotional energy to resist.

Radical feminism is another branch of feminist thought that seeks to explain patriarchy. They hold the belief that women everywhere should be valued positively and that women everywhere are violently oppressed by the system of patriarchy. They see patriarchy as the most oppressive system of domination in society, even more so than racism, heterosexism, or class. They believe that patriarchy manifests itself violently throughout society, whether it is through the physical infliction of harm or more ideological violence such as the idealized and nearly unattainable image of the perfect female body, ideas about women's sexuality, practices related to motherhood and pregnancy, or in the devaluing of household labor. Overt physical violence, however, is the most important of these forms to radical feminists. They believe that rape, prostitution, hysterectomies, and other forms of physical violence against women are at the core of patriarchal oppressive practices. Men maintain this system because of the advantages it brings to them. They are able to use women to pass on their genes, do their household labor, and serve as signifiers of their own social status. Radical feminists suggest two strategies for resisting patriarchy. The first is to band together in a "sisterhood" and oppose domination wherever and whenever it is present. The second is to retreat into all-female communities. This latter alternative represents the particularly vibrant strand of radical lesbian feminists.

Cultural feminists are primarily concerned with the ways in which women are different from men. Unlike psychoanalytic feminists, they are not concerned with where these differences came from, and unlike radical feminists, they are not necessarily concerned with arguing that women are always the victims of violence. What they do argue is that women have a different way of being and that this way, one which is generally seen as more moral and caring than that of men, might be a better base for society. They view patriarchy as the current system of male domination and argue that women's greater capacity for nurturance and caring would serve as a better model for social organization.

Liberal feminists, unlike cultural feminists, claim that women can claim an equality with men because of their shared capacity for morality. They do not claim that one is better than the other but rather that the two are equal. This equality, however, is not expressed under the tyrannical system of patriarchy that seeks to dominate women through falsely constructed ideas about what is "natural." Liberal feminists seek to use the state and an appeal to the public's sense of moral reason to undo the system of sex inequality inherently pervasive under patriarchy.

Socialist feminism also seeks to deal with patriarchy, particularly as it relates to the capitalist system. Growing out of the writings of Marx and Engels, socialist feminists seek to unite feminist concerns with Marxian class analysis. This relationship has been termed an "uneasy marriage" (Hartmann 1981), as it is often the case that women's concerns are merely added to the issues of class domination rather than being presented as an independent, though interrelated, issue. Socialist feminists argue that it was with the advent of property relations that women first came to be exploited as men began seeing women as objects to be owned and controlled. Using historical materialism as a base, capitalist patriarchy is thus defined as the union of oppressions under the capitalist system and the system of patriarchy.

Capitalism and patriarchy are seen as mutually reinforcing systems of domination. For example, women being kept in the private sphere ensures that there is always a reserve army of labor, a necessity for keeping labor costs low. It also allows for the reproduction of the worker at no cost to the system, as women's work at home is unpaid. Patriarchy clearly benefits from this same separation of public and private spheres, as it keeps women from earning their own incomes and hence maintains their dependence on men. Patriarchy also permits women to be sexually harassed on the job and in other public places, which acts as a deterrent to their seeking jobs in the public sphere and hence keeps them in the homes where they can be most easily exploited. This form of sex oppression reinforces both patriarchal and capitalist ideologies. The generally lower wages of women for equal work, if they are able to make it into the workplace at all, is another means of maintaining the status quo of male domination.

While all of these arguments are valuable insights into the concept of patriarchy, most of them (with the exception of radical feminism) assume heterosexuality. This assumed heterosexuality is a weak spot for many of these theories, as they fail to adequately deal with the arrangements found in same-sex relationships. An analysis into the workings of gay male and lesbian relationships and the ways in which patriarchy enacts itself in those situations would help enhance the quality and strength of the argument against patriarchy. This is not to say that such an endeavor has not been undertaken already. Indeed, many have been interested in this issue since the early days of the Stonewall Revolution and before, but the place of same-sex relationships is undoubtedly one of the key areas for further development for those wishing to combat patriarchal oppression.

PHENOMENOLOGY

In the course of their everyday activities, people do not doubt the validity of the world that surrounds them. But from the philosophical point of view, this validity, which is quasi "automatically" given to us, presents a problem. How does our consciousness gain the reality of the world that we take for granted in our "natural attitude"? Phenomenology, as developed by Edmund Husserl, is a philosophical school of thought that intends to clarify this problem by describing how the constitution of reality in the acts of our consciousness occurs. Thus, phenomenology aims at basic processes bestowing meaning on the human world, and its results are significant for those crucial questions of social theory asking how actors construct and interpret their reality and how they define situations to give orientation to their actions. Accordingly, in the field of social theory, phenomenological thought is fundamental for the interpretative approaches in the theory of action, for the sociology of knowledge, culture, language, and—in general—for constitutive theories of society.

PHENOMENOLOGY AS A RIGOROUS SCIENCE AND AS THE SCIENCE OF THE LIFEWORLD

The concept of phenomenology was primarily developed by the philosopher Edmund Husserl in the first decades of the twentieth century He was born in 1859 in a German Jewish family in Prostejov, Moravia, which was a part of the Austro-Hungarian empire and which is currently a part of the Czech Republic. He studied mathematics and philosophy at Leipzig, Berlin, and Vienna and taught philosophy at the Universities of Halle, Göttingen, and Freiburg, where he died in 1938. The genesis of his work can be divided into three periods: (1) investigation of the philosophical presuppositions of logical thought, (2) investigations into the meaning of establishing acts of consciousness, and (3) the theory of lifeworld.

Husserl begins with a critical assessment of the contemporary currents of philosophical thought. At that time, the philosophical thought concerning the starting points that form our knowledge were divided into approaches stressing methodological (neo-Kantianism) or logical (Frege, Vienna Circle) operations, on one hand, and the originality of lived experience (philosophy of life—Dilthey, Bergson), on the other. Husserl's conception cuts across the boundaries separating those positions. His programmatic aim was to make the "characteristic correlation between ideal objects (*ideale Gegenstände*) of the purely logical sphere and subjectively lived experience as constitutive action (*bildendes Tun*) a topic of research" (Biemel 1959). This aim, which sounds purely philosophical, had an enormous impact on the state of discussion at that time, since it helped to bridge the gap between the logical systematic approach to epistemological problems and its opposite, the analysis of consciousness as a stream of lived experience where intuitive introspection is the preferred method. Husserl, who had started out as a mathematician, emphasized the self-evident necessity of pure logic for any science. At the same time, however, he demonstrated that logic itself required a philosophical foundation in order to illuminate the context of meaning in which logical thought takes place. He conceived consciousness as a stream of acts that always are "intentional," that is, that always are correlated with a reality that they are able to grasp. Thinking means for him primarily "thinking of something," so that the "empty" formal mode of thought represented by pure logic needs to be seen as a secondary derivation from those primary acts. Husserl is interested in the structure of acts of consciousness that, as intentional experience (*intentionales Erleben*), always represents a unity of content and form of experience and hence is the basis of the human approach to reality in its every mode (Husserl 1975–1984 2:9, 401). This does not mean that he would neglect the significance of logic for the sciences and scientific procedures. But if it is to claim to be a rigorous science providing a foundation of all individual sciences, philosophy must achieve both: It must employ pure logic and at the same time be able to clarify its basis in the stream of intentional consciousness itself.

In the second period of his work, Husserl (1976) develops a specific method for this enterprise called the "phenomenological reduction" (*epoché*). He is concerned with investigating experiences as meaning establishing acts of

consciousness and looks for a method to make them evident. He suggests putting the self-evident validity of the experiences "into brackets" and reflecting on the acts of consciousness that constitute that taken-for-granted self-evidence itself. Husserl contends that to reveal those acts would mean to disclose the processes in our consciousness that endow our experience with meaning, that is, which do construct all the "facts" given in our mind. By the means of the *epoché,* an experience is viewed as a phenomenon as it is happening and as it is constituted in the acts of consciousness that makes this phenomenon what it is for us. The phenomenological procedure is intended to reveal the self-givenness of experiences, that is to say, to let them appear as they really are. That is what Husserl means by his famous appeal, "Return to the things themselves" (Husserl 1975–1984 2:1, 6). Hence, Husserl not only demonstrated that logic and lived experience do not contradict one another, but also showed that they are closely intertwined and that we can get direct evidence about it when we use phenomenology as a deep reflective philosophical method. Thus, Husserl's phenomenological analysis of the constitutive acts of our consciousness appeared to indicate the way to the clarification of all scientific knowledge and, in addition, opened up an area of research that apparently contained the conditions for the constitution of all human knowledge. He believed that it must be possible by means of the phenomenological reduction to reveal the self-givenness of basic structures and processes of meaning establishment, which constitutes the condition of possibility of the validity of the world and must hence be regarded as an a priori of this validity. He was convinced that a consistently conducted phenomenological analysis would not only reveal the meaning-establishing acts of our consciousness but can also reach a level of abstraction on which its results would gain a transcendental validity.

Thus, he suggested conceiving the phenomenological reduction as a three-step procedure. The first step would transform our specific experience into a "phenomenon" showing the acts necessary to constitute the experience as an "empirical" content of mind (for example, a table). In the second step, we would vary all possible forms of that experience and its constitutive acts to find out the typical structures that cannot be ignored if the experience (of a table) should keep its identity instead of changing into an experience of something else (a chair). So while imagining all possible forms of tables, we also become aware of typical features that are invariant for our object of imagination and that distinguishes it from all other possible objects. Husserl calls these typical structures "eidetic structures," and the procedure for how to reveal them is called the "eidetic variation."

Starting from those typical eidetic structures of consciousness, we can now reflect on the necessary conditions of consciousness to create meaningful and valid experiences that have to be given before any experiencing can start, that is "a priori." With this step, we reach the level of a transcendental consciousness belonging to transcendental ego, which refers to the general structure representing the precondition of knowledge. In this way, Husserl (1965) supposed that he had completed the transition to philosophy as a universal, rigorous, and radical science and that he could shed light on both the foundation of knowledge in the prescientific "natural attitude" of humans and the scientific constitution of knowledge. He was convinced that phenomenological analysis meets the requirements of the sciences of nature with regard to the foundation of a theory of science by clarifying the basis of meaning of the validity of pure logic. At the same time, it would also provide a philosophical foundation of the cultural sciences showing the basic structure of meaning constitution in the "natural attitude" that underlies any constitution of knowledge, any attempt to interpret and understand the world.

But which fundamental features of the meaning constitution do appear through the prism of the phenomenological reduction? While the results of phenomenological analysis discussed above represent the structural features of consciousness and belong to the field of phenomenological research called the "static phenomenology," Husserl (1950) also developed a "genetic" phenomenological approach within "constitutive phenomenology" that stresses the temporal, processing character of consciousness and its activity. He distinguished between "active" and "passive" genesis as two types of meaning constitution. In the active constitution, we combine our experiences and create our cultural reality in its various shapes. The acts of the passive constitution are those on which our active thought is based and which are to be seen as its universal preconditions. In both cases, Husserl concentrates again on the general, that is, transcendental level of meaningful constitution of reality. Here he disclosed the temporality proper to the stream of consciousness (1966) that allows for the synthesis of separate perceptions into complex objects of thought as well as for their duration and identity in mental processes (due to this temporality—for example—we do not perceive a series of separate tones but a continuous melody that can be recognized again). As temporal objects, the "facts" and operations of our mind are always transitive and therefore changeable constructions. Secondly, there is a basic form of our lived experience based on the temporality of consciousness that Husserl (1976) calls the "noetic-noematical" structure of experience. He holds that all experience always consists of two inseparable parts: its intentional content (noema) and the specific attitude of consciousness we adopt in the moment of perception (noesis); for example, the experience of an apple becomes different if we perceive it with the feeling of hunger or in an aesthetic attitude. That means again that the contents of our consciousness are not mere "fact" but always interpreted constructions whose meaning depends on temporal configuration of their constitution.

The reflexivity and thus the cultural and historical plasticity of our consciousness is mainly based on its temporality and noetic-noematical structure. But there are not only mental acts that bestow meaning on objects of lived experience. One of the substantial sources constituting the meaning of reality for the subject is its body. From the embodied experience of reality emerges the conception of our life space in which our body represents the central point of a coordinates' system that situates ourselves in the world and leads our actions. It is also embodiment that provides a prerequisite for the reflexivity of consciousness. The experience of reflexivity results here from experiencing my own movement, on one hand, as it is experienced inwardly in kinesthesia and, on the other hand, as a movement of something that happens in the outside world. I can observe myself in one way or another; I am not clearly bound to an experience in a fixed way, but rather can take up one position or another toward it. I can exist in several conditions simultaneously, and live in more than one possibility. Husserl is, of course, aware of the fact that the conditions forming the validity of meaningful experiences cannot be described adequately as the achievement of a solitary subject. To the universal features of consciousness, creating the validity of meaningful experiences in the active genesis that phenomenological reduction can reveal, it also belongs that there are different others in the world whose meaningful acts are to be understood. One of the substantial features of the meaningful constitution of human reality consists therefore in its intersubjectivity.

The search for a solution to the problem of intersubjectivity, that is, how sociocultural knowledge is shared and the understanding of others is possible, led Husserl to his concept of lifeworld to which the final period of his work is devoted (1954). He defined the lifeworld as "a realm of original evidence" representing a transcendental structure of knowledge that is generated intersubjectively in the "natural attitude" (pp. 126–35). The concept of lifeworld, again, aims in a radicalized manner at the questions that Husserl tried to solve before. The "natural attitude" is seen here as the original mode of the human approach to the reality preceding science or philosophy and thus forming the basis of meaning for all human knowledge. It is the meaning structure of this attitude that results in a typology of the lifeworld that Husserl investigates by means of phenomenological reduction, and it is also this structure on which scientific knowledge is based. The philosophical foundation of sciences can therefore only take place by the means of radical reflection on evidence from the lifeworld.

Hence, phenomenology in this last period of Husserl's work must be understood as a science of lifeworld. But this reformulation of the task of phenomenology entails a radicalisation of Husserl's concept of the foundation of science. He contends that in their formalised and abstract form, modern sciences have become estranged from their lifeworldly task, that is, from contributing to an understanding of the world, and have the opposite effect, that of obscuring a satisfactory worldview by repressing their lifeworldly origins (1954–1995). In order to integrate the sciences into the framework of their original humanistic purpose, we have to disclose their roots in the structure of lifeworld again. The aim of phenomenological philosophy in this sense is not to create a new system of knowledge to be implemented into society but rather to provide methods based on the *epoché* that would disclose the structure of the intersubjective, sociocultural lifeworld, that is, which would reveal the general patterns according to which people do make sense of their world. Thus, the phenomenological theory of lifeworld in Husserl's sense aims at three tasks: (1) clarification of the conditions of the intersubjective constitution of knowledge in the "natural attitude," (2) foundation of science on the basis of these conditions, and (3) a criticism of the alienated shape of sciences that results from the modernisation of society.

THE IMPACT OF PHENOMENOLOGY ON PHILOSOPHY AND SOCIAL AND CULTURAL SCIENCES

Due to its aims, phenomenology was widely perceived in the cultural and social sciences as a research programme requiring a new basic orientation in many disciplines and opening new perspectives as well as new fields of investigation. Husserl's thoughts influenced psychology and psychiatry (Ludwig Binswanger, Karl Bühler, Karl Jaspers), mathematics (Oskar Becker), linguistics (Roman Jacobson), anthropology (Frederik J. J. Buytendijk), jurisprudence (Gerhard Husserl), and sociology (Alfred Schütz). The impact of Husserl's approach was, of course crucial for the development of philosophy itself. Generations of his followers formed an influential international "Phenomenological movement" (Spiegelberg 1965), which spread phenomenological thought to Eastern Europe (Roman Ingarden in Poland, Jan Patocka in Czechoslovakia, Gustav Spet in Russia), Japan (Kitaro Nishida), and the United States (Dorion Cairns, Aron Gurwitsch). The reception of his works influenced numerous philosophers who shaped the thought of the twentieth century: the "fundamental ontology" of Martin Heidegger, the philosophy of embodiment of Maurice Merleau-Ponty, the existentialism of Jean-Paul Sartre, Ortega y Gasset's philosophy, as well as the hermeneutics of Hans-Georg Gadamer. Especially in France, Husserl's and Heidegger's approaches inspired a series of influential thinkers, such as Jean-Francois Lyotard, Paul Ricoeur, Emmanuel Levinas, Jacques Lacan, and Jacques Derrida, and offered a framework in which poststructuralist and postmodern thinking was developed. Currently, phenomenological philosophy finds creative continuation in France (Marc Richir, Michel Henry), in Germany (Bernhard

Waldenfels, Klaus Held, Elisabeth Ströker, Thomas Seebohm), in Spain (Javier San Martín, Maria Luz Pintos), in the United States (Lester Embree, Joseph J. Kockelmans, Don Ihde, John Drummond, Anna-Teresa Tymieniecka, Robert Sokolowski), in Argentina (Roberto Walton), and in Japan (Wataru Hiromatsu, Hiroshi Ichikawa, and Tani Toru).

The phenomenological approach has also provided a substantial impulse for the development of social theory. One of the most encompassing attempts to synthesise phenomenological thinking with the results of human sciences occurred in the field of "philosophical anthropology" represented by Max Scheler and Helmuth Plessner in the first decades of the twentieth century in Germany. Scheler traces the constitution of meaningful human reality to cognitive as well as the organic conditions of mankind and posited sociality as the creative process mediating between those two poles of the human existence. As a consequence of this, he conceived all forms of human knowledge as a social construction and formulated an extended concept of the sociology of knowledge. He is the first scholar who coined this term. Plessner radicalised Scheler's concept and tried to describe the "natural artificiality" of humans as a result of their natural history.

The critical intention of the lifeworld concept, which described the alienating tendencies of modernity, provided an opportunity for engagement with Marxian thought. Marx's early critique of capitalism as a restrictive social system preventing humankind from unfolding its natural conditions corresponds with the Husserlian criticism of modernity. This congruency gave birth to a "phenomenological Marxism" in the 1960s and in the 1970s (in the work of Enzo Paci, Lucien Goldmann, Pier-Aldo Rovatti, Paul Piccone, and Tran Duc Thao). This tendency was intensified by the reformulation of phenomenology in the work of Martin Heidegger (1977). Heidegger changed the basic question of Husserlian phenomenology, which asked how the world becomes valid for us, into an ontological question asking about the conditions of the being of humankind and its reality itself. He defined the mode of everyday existence as a necessary but alienated one and distinguished it from a proper existential mode that can be only gained if individuals could change their praxis and deconstruct the everyday surface of their existence. It was Herbert Marcuse, one of the leading personalities of the Frankfort school and a disciple of both Husserl and Heidegger, who synthesised the Husserlian and Heideggerian impulses with Marxian concepts and developed a radical critique of capitalism as a one-dimensional society based on alienating mass culture, science, politics, and economy. His theory strongly influenced the student protest movement in Germany and France in the 1960s and the 1970s.

Husserl's efforts to disclose the meaningful structure of the lifeworld as well as the processes of its constitution paralleled the search for interpretative approaches in the sociology initiated by Max Weber's and Georg Simmel's cultural conception of society as a context of meaningful action. If sociology is to describe society as something meaningful that always is interpreted and understood by its members, then Husserl points the way by drawing attention to the fact that the basis of constitution of meaning is to be found in the everyday practical reality of the lifeworld, that is, in the process of establishing intersubjectively valid meaning by the actors themselves in their everyday life. This mutual interest of the sociological and philosophical perspectives contains the original basis for the intrinsic affinity of phenomenology and interpretative sociology from which "phenomenological sociology," based on the work of Alfred Schütz, was to emerge. Schütz's primary intention was to give a philosophical and methodological foundation to Max Weber's concept of interpretative sociology. For this purpose, he developed a "phenomenology of mundane sociality" (Schütz 1932). He adopts the Husserlian idea of a lifeworld as a basic meaning structure of reality constituted by subjects in their "natural attitude," but he adds to the consideration of the meaning constitution in the acts of consciousness also the analysis of the meaning constitution in the everyday action and its practices themselves. Lifeworld in the sense of a meaningful social reality is then seen as a result of processes of interaction and communication. In the field of methodology, Schütz applied Husserl's idea of founding sciences on the meaning structure of the lifeworld and formulated the "postulate of adequacy," urging scientific concepts in sociology to respect the features of everyday knowledge of actors. Called "phenomenological sociology" (Psathas 1973) or "sociology of everyday life," the Schützian approach has gained paradigmatic relevance in the interpretative social sciences as well as in the theory of action since the second half of the twentieth century. In the United States, where a theoretical alternative to the Parsonian system theory was sought, the Schützian concept served as a starting point for new approaches in sociological theory focussing on the constitution of social reality in everyday practices of actions. Due to the reception of Schütz's theory since the 1960s, the attention of sociology was drawn to inquiries into everyday interaction and communication as well as to the insight that society has to be considered as a construction produced in these processes. Sociologists influenced by Schütz started to examine the practices of everyday action, communication, and interpretation from which social reality emerges. Harold Garfinkel's ethnomethodology, aimed at the formal properties of everyday practices, led to a series of case studies covering a wide range of everyday life in society and its institutions. Examinations of everyday communication in continuation of this research were provided by Emmanuel A. Schegloff and Harvey Sacks, whose conversation analysis became a widespread

method in qualitative sociological research. Aron Cicourel's cognitive sociology reveals the constructed character of data in social institutions as well as in science and thus initiated a series of studies in the sociology of organisation and the sociology of science. Also, Erving Goffman's investigations into the logic of everyday interaction draws inspiration from phenomenological theory. The social construction of reality was conceived by Peter L. Berger and Thomas Luckmann (1966) as a general process by which cultural worlds emerge. Their work gave new impulse to both the sociology of knowledge and the sociology of culture (reconceived now in terms of mundane phenomenology). In this context, the Schützian impact can be seen in the sociology of language and in the sociology of religion (Berger, Luckmann). The spread and the empirical application of the Schützian approach enforced the search for qualitative research methods. In addition to ethnomethodology and conversation analysis, this search led to a refinement in the techniques of narrative interviews and in biographical research. At the present time, phenomenologically oriented approaches in social theory as well as in social research are at work in the United States (George Psathas, Egon Bittner, Edward Rose), in Japan (Kazuhisa Hishihara, Hisashi Nasu, Mototaka Mori, Yoshikuni Yatani), in England (Christian Heath), in France (Daniel Cefai), in Switzerland (Thomas Eberle), and in Germany (Thomas Luckmann, Hansfried Kellner, Richard Grathoff, Ilja Srubar, and Walter L. Bühl), where the phenomenological approach developed into a variety of theoretical contributions to methods and research fields. The ongoing research in the sociology of knowledge, culture, communication, and language (Thomas Luckmann, Roland Hitzler, Hubert Knoblauch, Angela Keppler, Bruno Hildenbrand, Jörg Bergmann, Ilja Srubar) was paralleled by methodological reflection and has led to new concepts of social hermeneutics (Hans-Georg Soeffner), social ethnography (Anne Honer) and social geography (Benno Werlen).

Once established in the 1970s, the phenomenological paradigm influenced the mainstream of sociological theorizing. *Lifeworld* in the sense of a basic level of social reality provided by humans in their "natural" intercourse became one of the central terms in social theory and was widely accepted as a concept allowing for an approach to the culture strata of social reality (Clifford Geertz, Zygmunt Bauman). The Husserlian opposition of lifeworld and formalised science often transformed in this perspective to an opposition between social reality formed in informal spontaneous interactions and social systems structured by powers of political and economic institutions. Along these lines, Jürgen Habermas contrasts the lifeworld as a basic stratum of social reality where spontaneous communication takes place to the "system" understood as societal structures where alienating pressures of domination and economics prevail. In a similar manner, Anthony Giddens distinguishes in his theory of social structuration between social and systemic integration and suggests conceiving the processes of social integration as everyday practices in the sense of the phenomenological paradigm. Pierre Bourdieu's work, which—similar to Anthony Giddens's—seeks to overcome the gap between the microlevel theories of action and the macrolevel of systemic approaches, also draws important impulses from phenomenological sociology. His concept of "*le sens pratique*" leading to everyday actions as well as his idea of "habitus," as embodied patterns of social structure forming the individual preferences to collective lifestyles, emerge from the phenomenological ideas of the lifewordly "natural attitude" and of embodiment as a basic feature of a meaningful human approach to reality. The phenomenological conception of meaning constitution reformulated in the sense of an autopoiesis (self-creation) of social and psychic systems also influenced the development of the contemporary system theory in sociology (Niklas Luhmann). Luhmann's "radical constructivism" conceives the psychic, as well as the social systems, as meaning-processing structures. Husserl's description of meaning constitution in the activity of consciousness represents for Luhmann a paradigm of the systemic self-generation of reality that is proper to the psychic systems, while parallel self-creating processes based on communication are fundamental to social systems. Thus, the evolution of societies is only explainable as a coevolution of both the conscious and the communicative self-creation of reality. Even if many of the authors mentioned above transcend the field of "phenomenological sociology," the results of the phenomenological paradigm are deeply embedded in contemporary sociology.

PHILOSOPHICAL ANTHROPOLOGY

In contrast to empirical, biological, as well as cultural and social anthropology, the aim of philosophical anthropology is to take up and tie together the results of such empirical research to come to fundamental and comprehensive statements on the peculiar nature and form of the existence of humans. Important contributions to philosophical anthropology have been made by Johann Gottfried Herder and in particular by Immanuel Kant (*Anthropologie in pragmatischer Hinsicht abgefasst* 1798) and Ludwig Feuerbach, who for his part adopted pivotal themes from French Enlightenment thinkers (Helvetius, d'Holbach, D'Alembert, Voltaire). Ludwig Feuerbach's criticism and inversion of theology became decisive for the Marxian perspective, especially Marxist anthropology.

In Feuerbach and Marx and later in the work of Friedrich Nietzsche, anthropology is regarded not as a part of philosophy but as the only possible "primary philosophy." As such, philosophical anthropology takes the part of the traditional ontology (in terms of an onto-theology) or metaphysics: "The new philosophy makes man . . . the *only, universal* and *most prominent* subject of philosophy—the anthropology thus . . . an universal science" (Feuerbach *Werke:*3:319). In this a tendency is expressed that has become a characteristic principle for modern philosophy as a whole, namely, in Martin Heidegger's (1963) words, to conduct reasoning "starting from man and towards man" (p. 86).

This far-reaching intention loses its predominance in the philosophical anthropology of the twentieth century. Here, above all, the works of Max Scheler (*Die Stellung des Menschen im Kosmos* [Man's Place in Nature]), Helmut Plessner (*Die Stufen des Organischen und der Mensch* [Man and the Stages of the Organic]) and Arnold Gehlen (*Der Mensch. Seine Natur und seine Stellung in der Welt* [Man: His Nature and His Place in the World]) have to be mentioned. Their influence on sociological theorizing all in all was not as strong as could have been expected for material reasons. For the most part, this may be explained by the fact that these works were not translated into English or only with great delay. However, especially phenomenological sociology was inspired substantially by the thinking of Helmut Plessner, while the anthropology of Arnold Gehlen and the theory of institutions founded on Gehlen's work became seminal for one of the most influential works of twentieth-century sociological theory, Peter L. Berger's and Thomas Luckmann's *The Social Construction of Reality.* Furthermore, this anthropology supplied decisive philosophical presuppositions for Niklas Luhmann's "functional structural" theory of social systems, especially with its assumption of an essential openness to the world (*Weltoffenheit*) and of homo sapiens as a "deficient being" (*Maengelwesen*).

The pivotal axiom of philosophical anthropology was already formulated by Herder, when he spoke of man as the "nondetermined" animal. This living being can only exist if it behaves toward itself and toward the reality surrounding it and if it defines and interprets itself and its world. In this sense, Gehlen says, "By nature man is a cultural being." Similarly, Ernst Cassirer has defined man by extending the traditional designation of man as animal rationale and by describing him as "animal symbolicum" (meaning, a symbol-using animal).

The destination, even constraint, to culture is, according to the concurring insight of philosophical anthropology, not to be added to the naturalness of humanity; rather, it is intended if not demanded by this naturalness (defined by eccentricity, reduction of instinct, abundance of impetus, brain of great volume, upright walk). In this respect, philosophical anthropology contradicts a dualism of body and soul, as it has, deriving from Descartes, dominated modern philosophy for a long time. Likewise, philosophical

anthropology opposes old and new variants of an anthropological reductionism, where humans are explained either exclusively by their animality (as recently in certain directions of sociobiology or molecular biology) or is understood in the way of machines which they themselves have created. The latter also arose very early (cf. Jean d'Alembert's "l'homme machine") and refers nowadays above all to research on artificial intelligence and the development of intelligent machines (robots) inspired by it.

The criticism of philosophical anthropology is directed against a view according to which one could reach in this way at last a substantial, definite, and absorptive definition of humanity. Seen from its perspective, it is a question of a possible but by no means exclusive and concluding kind of self-interpretation of humanity that has its own reasons and merits but also its specific preconditions, limits, and problematic implications.

Philosophical anthropology stands in a peculiar relation of affinity and rivalry with the philosophy of existence, which, too, following its predecessor Søren Kierkegaard, emerged in the first half of the twentieth century (Karl Jaspers, Martin Heidegger, Jean-Paul Sartre). Because the philosophy of existence does not treat humanity on the whole and in general but the particular existing human being, it issues a challenge for sociology. This challenge has rarely been picked up in sociology so far, most of all by the mediation of recent French social theories (Michel Foucault, Jacques Derrida, etc.), who themselves are frequently assigned to a "historical anthropology."

POLITICAL ECONOMY

Until about 1880, the term *political economy* encompassed the area of social thought subsequently known as economics, and a great deal besides. More recently, it has acquired a range of different meanings. With the rise to dominance of neoclassical economics in the twentieth century, it was used increasingly in reference to nonneoclassical economics, and particularly to Marxian theory. Heterodox economists have largely concurred, describing their own work as political economy in order to distinguish it from the mainstream. However, in recent decades, orthodoxy itself has come to embrace what it regards as legitimate political economies that seek to explain institutions, including those of politics, along with government policies, in terms of rational choice theory. This entry concentrates on Marxian political economy, which is still the predominant reference of the term. It begins with the classical predecessors of Marx and ends with an outline of the development of political economies within neoclassical theory.

Classical political economy emerged toward the end of the seventeenth century and flourished in the eighteenth century with the work of the Physiocrats in France and their Scottish contemporaries, above all Adam Smith, whose *Wealth of Nations* (1776) was a major landmark. It reached its peak in the early nineteenth century with Ricardo's great *Principles of Political Economy and Taxation* (1817). These classical writers concentrated their attention on the production and distribution of the means of subsistence. They explained the evolution of modern economies in terms of the fundamental conflict between the different social classes in a predominantly agricultural society where the producers enjoyed a bare minimum standard of living and the surplus product was shared between landlords and capitalist farmers. The size of the surplus, relative to total output, set a maximum limit on the rate of growth; actual growth depended on the relative shares of thrifty capitalists and prodigal landlords. In most versions of classical political economy, the rate of profit on capital was expected to fall, and with it the rate of economic growth; Ricardo and

many of his contemporaries anticipated an eventual stationary state, where growth would simply peter out. This classical vision of political economy, formalized and extended to deal with industrial production and much else, was rehabilitated after 1960 by theorists influenced by the Cambridge-Italian economist Piero Sraffa (Kurz and Salvadori 1995).

Marx saw himself as the heir of classical political economy. He argued that, beginning in the 1820s, honest scientific investigation had increasingly given way to apologetics, as economists' emphasis shifted from questions of production, distribution, and accumulation toward the much less important issues of individual consumption decisions and market relationships. For this reason, he paid little attention to post-Ricardian economic thought, but no doubt, he would have condemned the neoclassical economics that rose to dominance after 1880 as evidence of continuing intellectual decay. "Vulgar economy," for Marx, was both ideologically driven and superficial in nature. Classical political economy, in contrast, had represented an honest and profound attempt to understand the operation of the capitalist mode of production, penetrating beneath the surface world of mere appearances to expose the underlying reality.

Marx defined the subject matter of the political economy of capitalism as the production, distribution, consumption, and exchange of commodities, which are useful products of human labour destined for sale on markets rather than for direct use. Moreover, in Marxian political economy, production is privileged in its explanatory status over the other categories. This is true not only for the explanation of distribution, consumption, and exchange, but also for the nature of the state and forms of social consciousness. Here there is a continuation and significant refinement of Adam Smith's "four stages theory of history" and a sharp difference with neoclassical economics, which privileges consumption and exchange and has until very recently ignored most other matters of concern to political economy.

HISTORICAL MATERIALISM

According to the principle of historical materialism, the relations that define the economic system, and the institutions of politics and the law, as well as the dominant forms of social consciousness, are all ultimately determined by the requirements of the productive forces, which consist of means of production and human labour power. The productive relations are relations of power, and usually also of ownership, over the productive forces. Three propositions are central to historical materialism. The development thesis states that human creative intelligence, reacting to scarcity, makes the productive forces develop over time. The primacy thesis asserts that it is the level of development reached by the productive forces that explains the nature of the productive relations, which in turn account for the nature of the superstructure (noneconomic institutions such as the legal system and the state). Most important for the dynamic of history, the fettering thesis states that, when the productive relations become a shackle on the development of the productive forces, they will change in order to break the fetters.

Marx distinguished several modes of production, characterised by the different ways in which surplus labour was performed and the resulting surplus product was appropriated. In primitive communism, there was little or no surplus and no class stratification. In classical antiquity, the critical social relation was that between slaves and slave-owners, while under the feudal mode of production, surplus labour was extracted through the serf's obligation to work, without remuneration, for several days each week on the lord's land. In none of these early modes of production were market relations of overriding importance; the production of commodities was not central to the way in which they operated. In classical antiquity and feudalism, the exploitation of the producers was directly observable. Capitalism, by contrast, is defined by the dominance of commodity production and above all by the fact that human labour power has itself become a commodity. This gives rise to the appearance that every hour of work is paid for, concealing the underlying reality of surplus labour, which is now produced in the form of surplus value (see below).

The theory of historical materialism maintains that the classical, feudal, and capitalist modes of production followed each other in chronological sequence, each serving at first to develop the forces of production but eventually becoming a fetter upon them. Capitalism would in its turn give way to socialism/communism, which, Marx believed, constituted the final stage in the unfettering of human productive potential, with the eventual abolition of the market and the direct regulation of production by society in accordance with genuine human needs. This claim has proved extremely contentious, however, and the remainder of this entry is devoted to the political economy of capitalism, which has been the core of all Marxian theory.

There are two additional areas of controversy. The first is Marx's assertion that there was a unique *Asiatic mode of production,* which he invoked to explain the allegedly unchanging nature of Indian and Chinese society for many centuries prior to the impact of European colonisation. The second is the suggestion that classless, *simple,* or *petty commodity production* constituted a further mode of production, either during the transition from feudalism to capitalism in Western Europe or (a much more ambitious claim, associated more closely with Friedrich Engels than with Marx) in many parts of the world for millennia prior to the emergence of capitalism.

CAPITALISM

Most of the central features of the capitalist mode of production were identified by Marx and Engels as early as

1848 in the *Communist Manifesto,* and their analysis has formed the basis for all subsequent developments in Marxian political economy. These core features are: exploitation; alienation and fetishism; compulsion to accumulate; concentration and centralisation of capital; constant revolutionising of the means of production; global expansion; social and economic polarisation; intensification of class conflict; increasingly severe economic crises, accompanied by the growth of a reserve army of unemployed workers; development of socialist relations within capitalism; and the eventual replacement of capitalism by socialism/communism through proletarian revolution.

The defining characteristic of capitalism is the relationship between wage labourers and capitalists: capital is defined as a social relation, not as a sum of value or a collection of machines and buildings. In this relationship, workers are not only exploited, that is, forced to perform surplus labour or required to work for longer than would be necessary to produce the means of subsistence that they need to keep them alive and able to work, but they are also alienated, in the sense that the products of their labour have escaped their control and have instead become external forces that increasingly dominate their own producers. Marx sometimes referred to alienation as human self-estrangement, meaning by this that although people exist in a social world of their own collective making, they relate to it only as strangers. They do not control their own lives but instead are, predominantly, the puppets of structural forces. Alienation is an objective social condition. Its reflection in human consciousness takes the form of commodity fetishism, a distorted view of the economic world in which historically contingent social relations are seen as the natural properties of things. "Vulgar economy," with its exaggerated emphasis upon consumption and its marginal productivity theory of income distribution, is one influential example of this fetishism of commodities.

All premodern legal, political, religious, and cultural constraints on competition are progressively eliminated as capitalism develops and the pressure on individual capitalists intensifies. Machine production drives out the earlier technology of manufacturing (literally, making things by hand), so that the economic advantages of large-scale production are increasingly evident and the processes of concentration and centralisation of capital accelerate. Individual units of capital become larger, and the number of capitalists able to survive in any branch of industry diminishes. Peasants, petty traders, and small handicraft producers disappear as the polarisation of society between large capitalists and propertyless wage labourers becomes more and more extreme. Increasingly, this occurs on a global scale, as capitalists pursue a world market for their commodities.

Hours of work increase, as do the intensity of labour and the workers' experience of alienation. Real wages may fall, remain constant, or even rise somewhat, but relative to profits they continually decline, and the insecurity of proletarian existence grows. This is the material basis for increasingly acute class conflict, which is accentuated by the socialising effects of the factory system. Working-class radicalism is further provoked by periodic economic crises, which throw many of them out of work and demonstrate that capitalism has itself now become a fetter on the development of the productive forces. Its own technology and social organisation point unerringly toward the socialist/communist future that will be realised, sooner rather than later, through proletarian revolution.

This vision of the capitalist mode of production has guided all subsequent work in Marxian political economy, although there has inevitably been dissent on many specific issues. Marx and (especially) Engels were forced to reassess their expectations concerning the increasing severity of economic crises and the pauperisation and homogenisation of the working class, and also to consider the possibility (for example, in Russia) that peasants rather than proletarians might be the first to create a socialist future. From the 1890s, revisionists like Eduard Bernstein argued that peaceful, piecemeal reform of the capitalist system would not only benefit the workers but also permit a gradual and nonviolent transition to democratic socialism. They were opposed by more orthodox Marxists, some of the most important of whom, including Karl Kautsky and Rudolf Hilferding, later came to accept much of the revisionist position. In the 1920s, Hilferding finally identified a new stage of development, which he termed "organised capitalism," in which the most objectionable features of competitive capitalism had been superseded by the growth of monopoly, increased trade union power, and government regulation of the market in the interests of the working class.

Against them, the revolutionaries, such as Vladimir Ilych Lenin and Rosa Luxemburg, maintained that capitalism had reached the new and much more dangerous stage of imperialism, in which the means of violence monopolised by the state were used by capitalists to suppress the working class at home and to extend their reach across the globe. In Stalinist orthodoxy, these ideas were crystallised in the conception of state monopoly capitalism as the last, decadent, and by far the most vicious stage of the capitalist mode of production. Echoes of both the reformist and the revolutionary positions can be found in the post-1945 literature on the stages of capitalist development, including Paul Baran's and Paul Sweezy's analysis of monopoly capital, Ernest Mandel's notion of late capitalism, and the work of the French regulation school.

VALUE AND EXPLOITATION

Marx attempted to formalise his vision of capitalism into a systematic model of accumulation and crisis. For this he

needed a theory of value so that the fundamental relationships could be expressed in a clear and coherent manner. The *qualitative* dimension of Marx's value theory expresses the profound but frequently neglected truth that a social division of labour underpins each individual act of market exchange. People relate to each other not merely through buying and selling in the marketplace but also, and more fundamentally, by cooperating in a social process of production. Since the physical properties of commodities differ, the only quality that they have in common is that they are products of human labour, and this defines their value. The *quantitative* dimension of Marx's theory of value is concerned with the magnitude of value. This, he argued, depends on the amount of labour embodied in a commodity, although this need not and in fact normally will not equal the price at which the commodity is actually sold.

Marx distinguished dead from living labour, where dead labour is contained in the produced means of production (machinery and raw materials) that are used in the course of production. Only part of the workers' living labour is paid for; their unpaid or surplus labour is what produces surplus value (s), which is in turn the source of profit, interest, and rent. Capital has two components. The first is constant capital (c), the value of which is merely transferred from the means of production to the final product without increasing in quantity. The second is variable capital (v), embodied in the wage-goods consumed by the workers, which expands its value during production because of the performance of surplus labour. Thus the value of any particular commodity has three components, *c, v,* and *s,* and the same is true of the total product of society as a whole.

Some of the difficulties with this quantitative labour theory of value were acknowledged by Marx himself, in particular the problems associated with the payment of rent, the distinction between productive and unproductive activities, the application of the law of value to the market for labour power, and the continuing diversity of the working class in terms of its skills and capabilities. Even more troublesome was the so-called transformation problem. Competition in the market for labour power would tend to equalize the rate of exploitation ($e = s/v$) in all industries, but there was no reason to suppose that the ratio of constant to variable capital (which Marx termed the organic composition of capital, $k = c/v$) would also be equalized. This would lead to differences in the rate of profit (r) between industries, since $r = s/(c + v) = (s/v)/(c/v) + (v/v) = e/k + 1$. In a competitive capitalist economy, however, such differences are inconsistent with the free mobility of capital. Marx's solution was to distinguish the labour value of a commodity from the price of production at which it was actually sold and also to distinguish the profits accruing to individual capitalists from the surplus value produced by their workers. In industries with an above-average organic composition of capital, price of production would exceed

value, and profits would be greater than surplus value; the reverse would be true if the organic composition was below the average. In aggregate, though, the sum of values would equal the sum of prices, and more important, the sum of profits would equal the sum of surplus value. Marx concluded that value determined price and surplus value determined profit, even though competition inevitably transformed the first of these categories into the second.

There are well-known objections to Marx's solution to the transformation problem, and many subsequent writers have attempted to improve on it. The reformulation of Ricardian economics by Piero Sraffa pointed the way to a more satisfactory solution to the transformation problem than Marx was able to provide but also suggested the irrelevance of the entire discussion, since a theory of value founded on the objective conditions of production rather than on the subjective preferences of individuals does not require that any reference be made to labour values, and the existence of exploitation can be established independently of the notion of surplus value. These claims remain profoundly controversial.

ACCUMULATION AND CRISIS

In Volume 2 of *Capital,* Marx used his value categories to set out a formal model of capital accumulation and to explain why the process of accumulation necessarily involved cyclical crises. He distinguished two sectors, one producing capital goods and the other consumer goods; sometimes he drew a further distinction between wage-goods and luxuries. His models of simple reproduction (zero growth) and expanded reproduction (positive growth) reveal that the rate of accumulation depends on the proportion of surplus value that capitalists decide or are compelled to devote to accumulation, and also on the rate of profit. Marx's objective here was not to demonstrate that smooth growth was likely but precisely the opposite: to show why it is not likely to occur.

Specific numerical relations between the sectors are necessary (but not sufficient) for smooth growth to occur; disproportionality will lead to crises, perhaps in the form of underconsumption, which occurs when the incomes of the working class are too small to allow wage-goods to be purchased at prices that realise the surplus value (profit) contained in them. Interpreted as a contradiction of the capitalist mode of production, underconsumption was probably the majority view among the Marxian political economists of the Second and Third Internationals. It survived after 1945 through the work of Josef Steindl and of Paul Baran and Paul Sweezy.

An alternative (and inconsistent) account, also found in Marx, is in terms of cyclical movements in the rate of exploitation due to fluctuations in the size of the reserve army of the unemployed. In boom conditions, when

unemployment falls, real wages tend to rise and the pace of work slackens. This reduces both the rate of exploitation and the rate of profit, causing capitalists to cut back on accumulation, thereby provoking a realization crisis of a different nature from that produced by underconsumption. In 1967, Richard Goodwin formalised Marx's insights into a mathematical model of the business cycle that represents one of the earliest examples of chaotic dynamics in political economy. Less formal arguments were often used by Marxists to explain the profit squeeze crisis of the later 1960s/early 1970s.

In Volume 3 of *Capital,* Marx developed a model of the falling rate of profit that was inspired by that of Ricardo but was also very different. Ricardo had relied on the Malthusian population principle, together with diminishing returns in agriculture, to generate a falling rate of profit. Marx emphasized rising productivity, reflected in a tendency for the organic composition of capital to increase more rapidly than the rate of exploitation. His analysis was neglected by later generations of Marxian political economists, with a few notable exceptions such as Henryk Grossmann, but it was revived in the 1970s and given an essentialist twist, in which the falling rate of profit was seen as an inescapable necessity in any advanced capitalist economy. Powerful objections were raised to this, and to Marx's less dogmatic prognosis, by critics like Natalie Moszkowska, Joan Robinson, Ronald Meek, and Nobuo Okishio.

If the rate of profit does tend to fall, either because of a rising organic composition or a declining rate of exploitation or persistent underconsumption, this will eventually result in a falling rate of accumulation, which would vindicate the fettering thesis that is central to historical materialism. But this again remains very contentious.

NEOCLASSICAL POLITICAL ECONOMY

Marx ignored neoclassical economics, and Marxists subsequently have continued the neglect, believing it to be superficial and ideological. For their part, neoclassicals have reciprocated in kind, claiming that it is they who are genuinely scientific and regarding Marxism as an (unappealing) political project riddled with analytic errors and empirical inaccuracies. Moreover, there has been a marked difference in focus, with neoclassicals traditionally ignoring the problems at the heart of Marxian political economy and concentrating instead on the equilibria achievable by optimising consumers and producers operating in well-developed markets. Typically, neoclassicals have paid no attention to how actual markets have emerged and changed, or with what class structures and political forms they have been associated, and neoclassicals have also tended to believe markets are capable of fully reconciling diverse interests and coordinating action. However, in the latter half of the twentieth century, and particularly since the 1970s,

neoclassical economics has evolved various forms of political economy. Three strands are now evident.

First, the approach associated with Gary Becker and James Buchanan centres on the belief that rational choice in the context of scarcity is the most important quality in all human action. Hence, the concepts and theorems of traditional neoclassicism are not limited to economic analysis narrowly understood, but constitute a science of society, including politics. All social processes are considered analogues of the market, and the basic results of established neoclassical theory are generalised beyond the contexts of their original formulation.

Second, beginning with Kenneth Arrow and Mancur Olson, there has been a broader appreciation of the importance of public and collective goods, along with the significance of nonmarket provisioning institutions. Arrow's *Social Choice and Individual Values* (1951) used neoclassical reasoning to argue inter alia that genuine liberal democracy was incapable of consistent decision making unless preferences took restricted forms. The relevance for political economy is obvious, and a massive amount of research has since been devoted to elaborating, extending, and amending Arrow's results. The influence of Mancur Olson's *Logic of Collective Action* (1965) has, if anything, been even more substantial, discussing as it does the circumstances in which atomised and rational individuals can cooperate in collective action to achieve common interests, and when they are most likely to fail to do so. Olson himself used his theory very innovatively, analysing, among many other problems, the emergence of the state, the development of democracy, and the collapse of communism.

Third, two concepts—transactions costs and asymmetric information—previously on the margins of neoclassical economics have been elevated into the core by Oliver Williamson and Joseph Stiglitz. This has brought major changes to conclusions about the types of integration achievable through markets and the efficiency of various nonmarket processes. Transactions costs, as distinct from production costs, are those associated with mechanisms of coordination, such as hierarchical command, markets, and networks, as well as coercion and violence, and they can be appealed to as important determinants of the different and changing mixtures of these institutions evident in all societies throughout history. The closely related idea of asymmetric information refers to circumstances in which different people interested in transacting with each other have different information about what is to be exchanged, and this can be used to account for the different institutional forms in a way similar to that provided by a direct appeal to differential transactions costs.

As a consequence of these developments, neoclassical economics has generated political economies in which economic phenomena are held to be significant determinants of the political arrangements characterising different societies.

They have also affected Marxism, with the emergence in the 1970s of a "rational choice Marxism" that attempted to marry the rational choice perspective of neoclassical economics with the problems typically treated by Marxism. Nonetheless, it remains the case that the bulk of Marxists, and also the majority of neoclassicals, would repudiate the union.

POPULAR MUSIC

Popular music describes music intended for consumption by a mass public, containing imagery and voicing feelings, needs, and desires of ordinary people, mostly about interpersonal love or loss. It also comments on, or protests, aspects of personal existence or public policy (or its lack). Most commonly, the term refers to music as a cultural commodity, created by professional musicians, recorded by and marketed by media corporations, to be sold to the mass public. Originally, the term denoted an authentic expressive creation by nonprofessional musicians, now sometimes called folk music (or related categories of country or blues or ethnic music), opposed to studio, professional, high, classical, or art music. Rarely in the twentieth and twenty-first centuries does popular music occur in an unmediated form. All popular music is influenced by earlier models. As early as the sixteenth century, sheet music for sale existed in the form of "broadside" cheap printed songs on single sheets of paper, designed to be sung by anyone, some selling as many as 2.5 million copies.

Before the twentieth century, a supposed "traditional culture" served as background for a musical culture in which authentic traditional music was transmitted via oral means, without writing or mechanical/electronic recording. In the regional folk, country, and blues traditions in the United States, such oral transmissions occurred in the nineteenth and early twentieth centuries, but since the spread of recordings for home use and advent of radio in the 1920s, most "popular" music has reflected their influences. Instead of gathering to hear songs played or sung by family members, learned via oral transmission (or from printed sheet music), people listened to radio broadcasts of singers, such as Bing Crosby, or the Grand Ol' Opry. The latter radio program began on radio station WSM, Nashville, Tennessee, in 1925, representing an idealized, nostalgic public notion of a southern and rural American regional culture, itself in the process of erosion and change.

Erosion of U.S. regional musical culture was a complex process. Phonograph records in the South, from the beginning of recording, sold to markets wanting to hear their own kinds of music. As early as 1923, U.S. record companies sent talent scouts to comb the South for local musicians, who were recorded and sold to black and white populations in those areas and marketed to other areas of the country. The complex process of mediation of allegedly natural or authentic or folk forms of popular music is illustrated by the primitive black bluesman Howlin Wolf (Chester Burnett), born in the Mississippi Delta region in 1910, becoming known during the 1940s in Memphis for his distinctive falsetto moan, once thought to have been acquired via the oral transmission process in his original home, the Delta. Yet Wolf said he developed his style through emulating the blue yodel on records of *white* singer Jimmy Rodgers, known as the singing brakeman, who dominated the popular music industry in the years 1927 to his death in 1933, virtually creating a national style of popular country music, recorded in northeastern studios by RCA Victor and sold across the nation on Victor 78 RPM records. Rodgers was the first major country music performer to use unidentified sidemen in the studio, including jazz great Louis Armstrong, establishing the common pattern in popular music of "the star" and anonymous accompaniment. Rodgers's career illustrates the complex process of mediation of "natural" and "folk" forms of popular music, providing an example of ethnic cross-influence and interaction, all based on a process of oral and aural transmission, combining personal appearances in local settings with the individualized listening via phonograph records and radio (and, later, from the 1940s on, via television) that continue into the twenty-first century on HBO and MTV.

Popular music in the present era is a part of a complex cultural process: its products highly mediated cultural commodities, yet not imposed on an unsuspecting public by

what T.W. Adorno once called "the culture industries." Popular music, no matter how commodified, has, like other cultural commodities, always been directed by its creators and distributors at the preferences of particular demographic sectors of the larger population. Its market, like the market for popular film, is complex and difficult to predict. While records cost much less than movies, more than 60 percent of commercial recordings are heard by nobody—never bought or played on the air; only a small percentage of the rest cover their cost of production. Only 1 percent to 2 percent of releases generate major sales and significant revenue for companies. Most songs played on radio are heard by a small percentage of listeners. Once heard, a still smaller percentage of recordings are actually bought. Only then, as mass popular musical commodities, are they available for use in personal efforts at self-definition or identity creation, and—perhaps unconsciously, among smaller numbers—as part of a quest for free space and affective emotional alternatives. Popular music is also used in creating community, responding to and critiquing the stresses and anxieties of social transformation, in nostalgic reflecting back on the erosion and loss of earlier ways of life, or—in a minority of cases—as a form of cultural resistance.

Popular music, as one part of a process of making and use of popular culture, reveals tensions and conflict over things preferred and those to be transformed. This process encompasses relations, on the surface, appearing purely personal, but reflecting deeper social transformations and conflicts over broader conceptions of society. Given the $40 *billion* business it has become, popular music must contain, within its commodified creations for sale, currents and tensions within the larger culture and society. Through individual styles of diverse performers, a diversity of images and feelings permit audiences to utilize it in ways both containing and fulfilling their desires. Through fantasy and substitute imagery, it strategically satisfies via "symbolic containment structures" of popular songs or integrated collections of songs (once called albums) now on a single compact disc (CD) or retrospective, multidisc collections.

Popular music is an interactional form of expressive activity—an ongoing struggle between artist and corporation, and corporation and consumer. Within the limits defined by "product" judged by its purveyors as potentially profitable, the listener/consumer may create a world of meaning by manipulating and using the imagery in the music heard. Artist creativity in the twenty-first century is mediated through larger, ever fewer global corporations marketing recordings, and through radio and television disc and video playlists, and concert ticket sales, increasingly sold through integrated radio/concert ticket companies. Audience needs are similarly mediated, yet a degree of reciprocity exists; how much is a matter of dispute among scholars. Frith (1981), in *Sound Effects,* noted that realist approaches assume that media operate with transparency, communicating the meaning of artists but suggesting that ownership affects what the audience hears. Constructivist approaches stress the way media corporations construct reality for the audience, stressing that the ideological meaning of popular music lies in the way it is commercially produced, in its commodity form. Such oppositions recall the position of Adorno versus Walter Benjamin's (1973) notion in "The Work of Art in the Age of Mechanical Reproduction" that the ideological meaning of popular artifacts (popular music, in this case) is decided in the process of consumption—meaning that popular music becomes what people make of it. Adorno saw media corporations imposing meaning on passive listeners.

Such elitist versus creative subject approaches reveal divergent tendencies in the analysis of the meanings of popular music, evident in the explosive energies of the varieties of rock music in the 1960s through the 1980s and in emergent hip-hop/rap subcultures in the 1990s and into the twenty-first century. Popular music has a fundamentally paradoxical and contradictory character as both creative expression and commodity. It has potentials for liberation and domination, providing opportunities for creativity and resistance, yet its meanings are "squeezed out" between conflicting pressures: on one hand, of publishers and manufacturers, each following the obsolescence principle, constantly promoting new artists and crazes; on the other, youth (and succeeding generations) seeking a medium to express their experience in the contemporary world, to resist the dominant culture, to define their own unique identities. In popular music, this contradiction exists in a particularly intensified form. Popular musical artists must—to make any money—take account of it, some adopting tried commercial formulas, others insisting on being pure artists and cultural revolutionaries whose productions are not diluted by commercial pressures, nor corrupted, bought off, or bought out. This distinctive paradox of popular music reached its nadir (or peak) in 1970, when Columbia Records widely advertised their recordings with the slogan, "The Revolution is on Columbia Records."

PORNOGRAPHY AND CULTURAL STUDIES

Pornography is a hotly debated area in academic feminist circles, with the pro-pornography feminists arguing that the pornographic text is polysemic with emancipatory value to develop transgressive desire (see Strossen 1995). The anti-pornography feminists, on the other hand, argue that pornography causes harm to women in both the production and consumption of pornographic material (see Dworkin 1981). To suggest that there was disagreement among the writers is to minimize the enormous differences between the various camps as to the definition, nature, effects, and legal status of pornography. Some of the central points of contention concern the nature of human agency, social structure, and cultural production. Those feminists who have adopted an anti-pornography position posit a social structure, which conditions, limits, and determines human agency. While not adopting a wholly social determinist position, anti-pornography feminists see women's lives as patterned and structured by macrosystems of domination that work to provide the pornography industry with a steady flow of bodies that can be used as raw material in the production of pornography. The anti-pornography feminists thus call for an analysis of pornography production that foregrounds systems of inequality where a ruling class has the power to own and control the means of material and cultural production.

The main focus of this discussion is to highlight the ways in which the debates within media studies can be applied to the study of pornography. Critical media studies scholars such as Kellner (2003) have for some time argued that cultural studies in the United States has lost its political edge by focusing primarily on the text rather than on the social and economic contexts of media production. The original project of cultural studies, developed at the University of Birmingham in England, was to create an area of study that would foreground the political economy of communication in order to develop a theory of dominance in industrial capitalist societies that would lead to social change. According to critical media scholars in this country, the political potential of cultural studies has been replaced with an apolitical approach that ignores wider questions of power and social change.

Political questions about the nature of cultural production are at the forefront of the academic study of the political economy of communication. These theorists, like the anti-pornography feminists, see the society as marked by inequality, oppression, and domination, where domination is seen as those practices used by the ruling class to control the conditions of production. Built into the analysis is a social activist agenda that calls for a transformation in both the material and the ideological levels of human experience, and while classical Marxism has privileged the former, contemporary Marxist critics have called for an analysis that links the material conditions of a society to its systems and processes of signification and representation.

In his article on the future of media studies, McChesney (2000) criticizes media studies for abandoning the central questions that a political economy of media raises. The result, he argues, is that much of communication research ignores the structural factors that influence the production of media content. This same criticism can be leveled against the pro-pornography scholarship in that the focus of analysis is the text rather than the context of pornography production. This is not to argue that a close reading of the text and the study of audience pleasures have little to offer the study of pornography, but that the privileging of these two areas of research fails to examine the political process involved in the production, distribution, and consumption of media texts (McChesney, 2000). Moreover, it is not enough to say that much of the contemporary research on pornography is uninterested in questions of political economy, but rather, that it actually trivializes this line of inquiry. In those few academic books that do look at how pornography is produced, there is a tendency to limit the discussion to either a first-person account by a "sex-worker" (usually Nina Hartley) or to focus on woman-owned or woman-produced pornography. While this type of research does shed light on the workings of the various sectors of the industry, it cannot stand in for a critical macrolevel approach that explores how capitalism, patriarchy, racism, and first-world economic domination provides the economic and cultural space for international, mass-scale pornography production. To focus only on those women who have the resources to produce and distribute pornography is as limited as looking at worker-controlled cooperatives to explore how labor is organized under capitalism.

The anti-pornography feminists are one of the few groups to take seriously how the production of pornography is tied to larger systems of inequality. These feminists explore the nature of pornography production using theories and methods developed within a critical paradigm that explores how pornography production produces and reproduces the unequal systems of relations that define women as a subordinate class. The picture that is beginning to emerge from this research is one of international trafficking in women that suggests that poor women (particularly of color) may well be the ones whose location in the nexus of class, gender, and race relations allow for the continuation of an industry that some first-world members of the intellectual and financial elite see as beneficial to women. In terms of

production, from the limited research, it would seem that the making of pornography is anything but positive for the actual women whose bodies are used as the raw material in pornography. Women who have worked within the industry often speak of a system of sexual slavery that preys on poor women, abused women, and young women running away from sexually abusive households. Evelina Giobbe (1995), director of education and public policy at Whisper, works with women who have been used in the making of pornography, and argues that most of the women come from backgrounds of poverty, abuse, and parental deprivation, and were forced into the pornography industry as teenagers.

To foreground the lives of the women who are used in pornography presents a very different view of the pornography industry. Without a scholarly analysis of the political economy of pornography, the pro-pornography position is truncated, depoliticized, and ultimately serves the interests of those in power.

One of the major underlying projects of critical media studies is to provide an intellectual and theoretical framework for both individual empowerment and social and political change (Kellner 2003). This radical potential of critical media studies makes it particularly compatible with a feminist analysis that seeks also, through consciousness raising, theoretical debates, political organizing, and educational practices, to transform the material and ideological relations of patriarchy. Because critical media studies take as a founding principle the ways in which theory and politics are connected to the control of knowledge, they call for the linking of theory with activism. In this way, a feminist analysis of pornography that is located in critical media studies needs to include a strategy for change that will ultimately deny the pornographers access to women by changing those conditions that force women to "choose" pornography as the only means of "employment."

The debate thus needs to shift to a new level where we take seriously the systems of inequality that define the nature of the production of pornography. This calls for new research methods and strategies that critical media scholars use to explore how media is produced within a global capitalist framework. This will not only provide a more sophisticated understanding of pornography but will also encourage critical media theory to include discussions of gender and race since much of this scholarship foregrounds class as *the* system of inequality. It is abundantly clear that we can no longer understand how class inequality functions without a theoretical and empirical analysis of how class, gender, and race work together to produce multiple social and material locations for individuals and groups. Critical cultural studies are well situated to take on this task and to become an example of how academics can ask questions and provide answers that engage with the reality of the world, the world where the majority of the population is

exploited, dehumanized, and rendered worthless for the sake of increased profits for multinational industries such as pornography.

POSITIVISM

Positivism, in its most general sense, is a doctrine that maintains that the study of the human or social world should be organised according to the same principles as the study of the physical or natural world. In simple terms, positivism maintains that the social sciences should be modelled on the natural sciences. This broad definition encompasses numerous variants, depending first on what are taken to be the characteristic features of the natural sciences and second on which of these features are to be applied in the social sciences. Accordingly, a very wide range of social theories have been designated positivist, even though they show little similarity in terms of notions of data, mode of analysis, or explanatory objective.

Historically, the popularity of positivism has waxed and waned as enthusiasm for science has fluctuated, most notably from the optimism 150 years ago that science provided the basis for the progressive understanding and control of the natural and social worlds to the current pessimism about science's part in the despoliation of the natural environment and degradation of the human condition. Particularly influential on positivism's rise and fall has

been the varying strength of the counter doctrine, which maintains that the social world—the actions and interactions of human beings—cannot be studied according to scientific principles. This counter doctrine too has taken a variety of forms, depending on what properties of individual people or social collectivities are considered to be beyond scientific analysis.

THE EARLY ROOTS

Positivism has its origin in the eighteenth-century French Enlightenment, the doctrine being a key component of what is now known as the modernist project, which was founded on the belief that human endeavours—especially the rational pursuit of empirical scientific inquiries—would generate knowledge that could be deployed for human betterment. The term *positivism* was coined by Auguste Comte to describe the ideas, largely drawn from earlier thinkers, that he set out in a series of lectures and which were later published in the six-volume *Cours de philosophie positive* (1830–1842). From his conspectus of the sciences, Comte believed he had established a law of three stages through which knowledge in all disciplines necessarily progresses. In the first, theological stage, people explain by appeal to divine agents. In the second, metaphysical stage, explanations are proposed in terms of abstract forces and powers. In the third and final, scientific or positive stage, explanations eschew appeal to mysterious abstractions and are instead cast in terms of invariable natural laws relating observable phenomena and events, with Newton's laws of motion being the paradigmatic case. Different disciplines pass through the three stages at different rates, and therefore fall into a natural hierarchy, with the highest and most complex taking the longest to arrive at the positive stage. The queen of the sciences, argued Comte, is sociology, for its laws guide the application of the lower sciences for the benefit of humanity. The *Cours* is, in effect, a sustained argument that a natural science of society, comprising a set of laws tested against experience, is both possible and necessary for progress. Societal disorder can be overcome, Comte proposed, once the laws of society have been scientifically established so that people can accommodate to them. In this way, order and progress can be jointly pursued.

There are three core themes in Comte's positivism: first, the notion that historical progress is built on advances in scientific knowledge; second, an empiricist theory of knowledge (or epistemology) according to which all sound or positive knowledge is based ultimately on observation (as opposed to divine decree or human reason alone); and third, a unity of science thesis, according to which all disciplines, natural and social, can be integrated into a unified system of natural laws.

In the later part of the nineteenth century, the evolutionary social theory of Herbert Spencer became popular, forming part of the social Darwinist movement that extended ideas from evolutionary biology to the social sciences. Although explicitly dissenting from some of Comte's philosophy, Spencer is commonly identified as having bolstered the positivist spirit of the age and as having been a significant forerunner of twentieth-century positivism. He was committed to the central tenet of positivism, the unification of the natural and social sciences, in his case under the principle of natural evolution. He believed that all causes have multiple effects, with the result that all domains—the natural, biological, and human—become increasingly differentiated. Historical progress is a result of competition between individuals with different characteristics; the struggle of each differentiated individual against the others powers the internal dynamic of the natural and social worlds, just as Charles Darwin (1809–1892) had accounted for the dynamic of the biological world in *On the Origin of the Species* published in 1859. This theory of progress differs sharply from Comte's—in which increasing harmony is achieved by subjugating individuals to the scientific laws of society. In opposition to this collectivist approach, Spencer's is an individualistic theory, in accord with the laissez-faire ethos of his day. He argued against intervening in the natural historical competitive evolutionary process in the attempt to address inequalities. However, as the destructive social effects of unregulated competition were highlighted by the poverty surveys conducted by social reformers in the early twentieth century, laissez-faire doctrines lost support and interest in Spencer's sociology had all but disappeared by the 1930s.

Meanwhile, Comte's ideas had become institutionalised in French universities at the beginning of the twentieth century through Émile Durkheim's sociology, which adopted the central themes of the unity of the sciences, an empiricist epistemology and the application of knowledge for the progressive benefit of humankind. To these, Durkheim added a further strand—statistics, or the collection and analysis of quantitative descriptions of social facts. While Durkheim's own analyses were relatively unsophisticated, statistics became embedded in academic social sciences over the first half of the twentieth century. Particularly influential in this development were the heads of the newly established university social studies departments in the United States who sought to demonstrate that their emerging disciplines were scientific by encouraging the dispassionate and rigorous application of statistical methods to precisely measured social facts. Many also believed that numerical data was objective and therefore statistical analysis value-free. The view that science can be unified through the impartial collection and statistical manipulation of quantitative data in all disciplines, natural and social, has become a common way of characterising what has been called professional practice positivism. It is a view that has been constantly challenged on both technical and epistemological grounds.

LOGICAL POSITIVISM

There was a remarkable resurgence of interest in positivist philosophy in the 1920s and 1930s, centring on a group of philosophers, scientists, and mathematicians who became known as the Vienna Circle. They were committed to two of the core themes of the earlier positivism: the unification of the sciences and empiricism. Again, the initial impetus was to ensure that all disciplines would become scientific, and the group's efforts were directed at utilising recent advances in logic to analyse how legitimate scientific knowledge could be demarcated from unscientific ideas. However, although keen that only genuine scientific knowledge be used to guide action, they did not attempt to formulate general theories of progress because they did not believe it possible to argue from what is—which is what science tells us—to what ought to be. In other words, they believed that science is morally neutral; advances in science could be of benefit but were not necessarily so. To emphasise this difference from earlier positivism, the Circle gave their work the name logical positivism. Philosophy, including logic, was to concern itself solely with clarifying the abstract form of science, rather than with its substance. Positive philosophy was, therefore, to be separated from social philosophy, including arguments about what social arrangements are desirable and what constitutes progress.

Logical positivists were able to incorporate logic into science because, although logical truths are a priori—meaning that they are known to be true without appeal to experience—they are analytic, in the sense that they are not about experience. In this way, the logical positivists could retain their commitment to empiricism: Science is composed of empirical statements about the natural and social worlds, of course, but also logical propositions (including mathematical expressions) about the relations between empirical statements. The inclusion in science of logical propositions does not jeopardise empiricism—the requirement that knowledge be grounded in experience—since this applies only to knowledge of facts and not to the analytic propositions of logic that do not purport to describe the world.

The logical positivists' approach can be illustrated by Carl G. Hempel's analysis of scientific explanation: Formally an explanation consists of a statement describing an event (the explanandum) that is explained by deducing it from a set of other statements (the explanans), including a covering law and a set of initial conditions. For example, to recast part of Durkheim's explanation of suicide rates, the high rate of suicide experienced in a particular province is explained by deducing it from the initial condition that the province is experiencing rapid economic development together with the covering laws (1) that sudden economic success is accompanied by high levels of anomie (this latter being Durkheim's term for the situation in which the norms that guided behaviour in more straightened times no longer

apply) and (2) that anomie encourages suicide. This Hempelian deductive-nomological schema is the basis for unifying the sciences since it offers a formal model for explanations in all disciplines.

Because laws form a crucial role in scientific explanations, the logical positivists devoted considerable effort to elucidating the nature of laws. There were two related problems to solve. First, in order to guarantee that the explanandum is deducible from the explanans, the law included in the latter must be an unrestricted universal statement, of the form that all As, without exception, are also Bs. Second, in order to distinguish universal laws from mere accidental generalisations, the former must incorporate a relation between antecedent and consequent that is stronger than mere covariation. Both these are versions of the problem of induction, which is particularly acute for empiricists. First, no matter how extensive our observations of As that are Bs, this cannot conclusively establish that all As are Bs, only that those hitherto examined are. Second, whenever something extra, beyond covariation, is proposed as characteristic of laws but not accidental generalisations, it is mostly something that is beyond immediate observation, which violates the commitment to empiricism. This is the case, for example, when the distinguishing feature of laws is said to be that they express causal connections.

Although the logical positivists pursued several inventive approaches to these problems, a widely adopted way of avoiding them was most fully developed by Karl Popper, who communicated with the logical positivists but distanced himself from their philosophy. He proposed that universal laws have a provisional character, being accepted as true only until proved false. Science proceeds by trial and error—by the hypothetico-deductive method, which involves conjecturing a hypothetical universal law, deducing from it an expected observation and then investigating empirically whether or not this expectation is fulfilled. If it is, we continue to subscribe to the law, whereas if it is not, the putative law is rejected as false. In this way, laws are corroborated by our experience but never verified, that is, never demonstrated to be true for all time. Science progresses by the gradual elimination of falsified conjectures. What is crucial for the sciences—social and natural—is that their conjectured explanatory laws are falsifiable, that is, can be subject to empirical test. Conjectures that are not falsifiable are to be expunged from science. The sciences are to be unified around a body of falsifiable but not yet falsified laws.

The importance for social theory of logical positivism and Popper's philosophy was that for a period in the middle of the twentieth century, they became the received view about the nature of science. It became widely believed that the deductive-nomological schema was not merely a theory about scientific explanation but instead a description of natural scientists' objectives. In a similar fashion, Popper's

hypothetico-deductive procedure was treated not as a theory of scientific progress but as a description of natural scientists' practical inquiries. As a result, the unity of science thesis was stated in terms of requiring social theorists to use hypothetico-deductive methods to corroborate general laws and cast their explanations in the deductive-nomological form. To this end, in many substantive areas, quantitative inquiries using statistical techniques were undertaken in order to establish the strengths of relationships between variables and the likelihood that relationships found in samples existed in the populations from which the samples were drawn. In effect, statistical analyses were directed to separating laws from accidental generalisations (or spurious correlations) and to corroborating laws.

POSTPOSITIVISM

The positivist hegemony in the social sciences had always been precarious and at no time has it been free of challenges from rival doctrines. The tenuous dominance achieved in the mid-twentieth century disintegrated under increasing pressure from several directions over the following years. A sustained attack came in the 1950s, when the Frankfurt school of critical theorists articulated a Hegelian-Marxist critique, arguing that natural and social scientific knowledge, like all products of human activity, serves sectional interests rather than being value-free. In positivism's case, the interest is in technical control, which is as invidious as class oppression, and which can be overcome only by a radical transformation of society to overcome inequalities.

A second source of pressure on mid-twentieth-century positivism was the rejection of empiricism for failing to account adequately for the part played by theory in science. Realist philosophers argued that this was better captured by an epistemology that allowed a place for modelling the underlying structures and their powers, beyond the reach of immediate experience, that are causally responsible for the observable outcomes of their operation. The paradigmatic case is the structure of atoms being causally responsible for the observed behaviour of gases, liquids, and solids. One advantage of the realist conception of science is that it provides a solution to the persistent problem within empiricism—noted above—of satisfactorily distinguishing causal laws from accidental generalisations. Although first invoked as a philosophy of the natural sciences, realism was extended to social sciences as a way of retaining the unity of science while at the same time rejecting other strands of positivism, in particular its empiricism. Realist social scientists argued that underlying structures, for example of the sort identified by Marx, are generative mechanisms that have a determinate effect on social relations.

But the unity of science thesis in both its positivist and realist guises came under extensive criticism, especially

from social theorists interested in the meaningfulness of social practices, who took the view that it is actors' culturally specific conceptions of their own and others' activities that guide their actions and interactions, rather than these being either law-governed or generated by underlying causal structures. To make sense of social practices, the social theorist's task is to obtain an understanding of the locally embedded meanings in terms intelligible to the actors involved. The unity of science is rejected: Because the social world, unlike the natural world, is pervaded by meanings, there is a radical division between the social and the natural sciences, with the former concerned to elucidate the situated meanings of actions and not to seek laws. Empirical studies focus on the interactions between people in particular milieux, using ethnographic fieldwork techniques, to understand, for example, the processing of sudden deaths by the police and coroners' courts that produces suicide rates. This interpretivist perspective draws on several sources. One is the earlier hermeneutic tradition, which had influenced Max Weber at the beginning of the twentieth century. It stressed that the method of *verstehen,* or interpretive understanding, is central to the study of human activities because it provides access to the meanings of those activities shared by the people engaged in them. The interpretivist perspective drew further support from ordinary language philosophy, which flowered in the mid-century in opposition to positivist philosophy and which focused on the customary uses of languages within particular linguistic communities. This approach was extended to the social sciences by Peter Winch, who argued that rather than applying the methods of the natural sciences, they should be concerned to grasp the rules that guide social practices, enabling the meanings those practices have to the actors involved to be understood. The interpretivist perspective was also inspired by symbolic interactionism that had its origin in the Chicago school community studies of the 1920s and 1930s. These used participant observation, life histories, and depth interviews to discover how, in their everyday interactions, people constructed, negotiated, and modified the meanings they gave to their activities.

By the end of the twentieth century, the various strands of the interpretivist approach were commonly seen as contributing to social constructionism. which, in its most radical guise, proposes that all human activities are contingent practices whose sense is constructed in the to and fro of social intercourse. This applies to our representations of the natural and social world too: The natural and social sciences are products of their historical and social environment, and they could have been quite different in different circumstances. This marks a loss of faith in the modernist project: No longer does it seem that any philosophy of science can be legitimated by appeal to a universal standard, that science can be successfully separated from ideology, or that scientific knowledge can provide the basis

for progress. Postmodernism therefore presents positivism with a potent challenge.

POSITIVISMUSSTREIT (THE POSITIVIST DISPUTE)

The term *Positivismusstreit* was coined by Theodor Adorno to characterize a dispute that started formally at a meeting of the German Sociological Association in Tübingen in 1961 and that shook the sociological community in Germany from the 1960s to the early 1970s including the revolts around 1968. In addition to Adorno, this dispute included the most prestigious social thinkers such as Hans Albert, Ralf Dahrendorf, Jürgen Habermas, Harald Pilot, Karl R. Popper, and later Niklas Luhmann. In effect, the dispute is ongoing, and may possibly never end, as it is a fundamental dispute about the paradigms within social thought. In effect, it continues a dispute that started at the beginning of the twentieth century and was known as the Methodenstreit (dispute over methodology), and in which the most prestigious German social scientists of that time were engaged, like Max Weber and Gustav Schmoller.

Actually Adorno's term is misleading because the main protagonists on the other side did not understand themselves as positivists. For example, Karl R. Popper, probably the most well known among the participants, was never a member of the Vienna Circle, which launched the debate in the 1920s and 1930s. They gave their approach the name of logical positivism and may therefore be called neopositivists. They had developed rather distinctive arguments in comparison to the original school of positivism. Hans Albert agrees with this typification in regard to himself, though he designates his own methodology as Kritischer Rationalismus (Critical Rationalism). But certainly neither Ralf Dahrendorf nor Niklas Luhmann can be subsumed under this heading. As a result, Hans-Joachim Dahms (1994) summarizes the dispute as a multifront one: the

Frankfurt school against logical positivism, American pragmatism and critical rationalism. The debate was continued namely by Jürgen Habermas and Niklas Luhmann—then the younger generation—in a book under the title *Theorie der Gesellschaft oder Sozialtechnologie* (Theory of Society or Social Technology) in 1971.

What is so important about this dispute? Is it only a German ideological dispute? It is interesting to see that some of the most influential social theorists took part in the ongoing dispute. This includes work by Anthony Giddens (1974, 1978) and three volumes by Peter Halfpenny and Peter McMylor (1994). This dispute is described in all dictionaries and encyclopedias, and in Germany it is even included in encyclopedias intended for the lay public. However, in the English-language encyclopedias and dictionaries it shows up only within an article on "positivism" as such.

In part we may explain the resurgence of the debate on positivism in postwar Germany by attending to the difficult situation there. Different schools, both inside and outside of Germany, were fighting for hegemony after National Socialism. Remigrants like Theodor W. Adorno and Max Horkheimer, but also René König, and emigrants like Karl R. Popper fought against those such as Helmut Schelsky who had survived the war with a chair in occupied Strasbourg. In 1949, while still in exile, René König wrote a book with the title *Soziologie heute* (Sociology Today). Several years later, in 1959, Helmut Schelsky responded to this book by providing his definition of German sociology. The conflict was also about the role and character of the German Sociological Association and who should preside over it. It is necessary to understand this struggle for influence in order to understand the dispute over positivism in Germany. This also makes it understandable why Adorno chose—consciously or unconsciously—a misleading title.

A second dimension, which is relevant to understanding the dispute, is the political situation in Germany in the 1960s. A widespread social revolt from Berkeley through to Paris and Frankfurt to Berlin made it such that sociology became a sort of central intellectual tool to understand exploitation and social conflicts and contribute to the possibility of emancipation. In opposition to the call for social change, "critical rationalism" became a sort of fundamental credo for a large number of politicians, who wanted to organize society like a company. The former German chancellor Helmut Schmidt was a protagonist of this kind of politics and governance. In addition, even today German sociology is much more grounded in philosophy than the Anglo-Saxon sociology ever was. So it does not seem to be a hazard that the Frankfurt school is classified in the United States under the label social philosophy and not sociology.

The main arguments made by the representatives of the Frankfurt school are as follows: (1) a Critical Theory of Society has to understand the totality of society as a life context, which is always approached through an a priori concept

of reality, because social phenomena cannot be isolated from the societal totality; therefore (2) sociological theory construction has to start from a prescientific experience of society, and the relation between theory and experience cannot be reduced to a controlled and reproducible ex-post check of hypotheses; (3) social theory has to describe "historical laws of movement" (*historische Bewegungsgesetze*); and (4) social theory has as its very reason to contribute to the emancipation of society and the acting individual.

The protagonists of critical rationalism counterargue that (1) the notion "societal totality" is an empty concept as long as it is not clear how the social phenomena can be structured and checked through hypothesis testing. An a priori understanding may be a false theory, which again has to be checked and criticized; (2) experience is at best a critical instance but nothing that can be a basis of cognition; (3) it is impossible to predict the development of history, as this depends on our knowledge, and it is logically impossible to forecast the future of knowledge (cf. Popper's critique of "historicism"); (4) to change the whole society is an impossible exercise in holistic planning and has for that reason to be refuted; and finally (5) the ideal of *Wertfreiheit* (value freedom) does not mean the negligence of interests and values in the research process but the recognition of "objective truth" as the leading value (Klima 1995:506–507).

Since the 1970s and 1980s, both positivism and the Frankfurt school increasingly came under attack from different sides: from philosophy (Ludwig J. J. Wittgenstein, Paul Feyerabend), from French postmodernists (Jean Baudrillard, Michel Foucault, Jacques Lacan, François Lyotard), and from feminists (Sandra Harding; for more details see Halfpenny and McMylor 1994).

What remains of the positivist dispute today? There is no doubt that today's mainstream social sciences are still dominated by different variants of neopositivism, especially in the Anglo-Saxon world. Their utilitarian, pragmatic orientation, the dominance of the natural sciences—which in English reserve only for themselves the title of science; the other disciplines are just arts and/or humanities—make it difficult to realize a critical theory of society. Not that this is a new situation. Even in Germany, where philosophical approaches to sociology are more common, the Frankfurt school has always been in the minority because of their anti- and postpositivist approaches.

Nevertheless, both positions have a similar aim: to contribute to the goals of the Enlightenment—though with different means and paradigms. Since the 1970s, Claus Offe has tried to overcome the fundamental differences between these two schools of thought through a compromise. However, it is only very recently that this seems like a possibility due to Bent Flyvbjerg's rediscovery of the Aristotelian principle of *phronesis,* that is, the search for a "good society." *Phronesis* is placed between *episteme,* the basis for the arts and humanities, and *techne,* the basis for

natural sciences and technologies. *Phronesis* has its own logic and methodology, which overcomes the now outdated dichotomy, and by this it also aims to overcome the problems central to the positivist dispute.

POSTCOLONIALISM

There is no agreed-upon definition of postcolonialism, as it is a highly complex and contested arena of thought and

practice. Postcolonial discourse constitutes a transdisciplinary arena of critical discourse that is most generally associated with developing theories and activisms related to globalization and the politics of representation (race, class, gender/sexuality, ethnicity, nationalisms, religion) as well as to economic, political, social, and psychic dimensions of colonization, neocolonialism, recolonization, and postcolonial conditions. Furthermore, it includes the advancement of liberatory and resistant politics that support decolonization and engages subaltern experience, which involves the perspectives of dominated, marginalized, oppressed, and subordinated peoples.

Many scholars argue that the development of postcolonial culture must be understood within the historical and imperialist context of the European colonialism of the so-called third world or, as many postcolonial theorists describe it, the "tricontinental" (i.e., the southern continents of Latin America, Africa, and Asia), that began over 500 years ago. This violent history of colonization involved massive appropriation of land and territories, slavery, institutionalized racism, enforced migration, murder, torture, genocide, obliteration of cultures, and the imposition of Eurocentric, ideological sociopolitical, economic, and cultural values of the colonizers. This process escalated during the imperialist expansion of the eighteenth, nineteenth, and early twentieth centuries. And although political, cultural, and economic reforms characterized many of the former colonies, which gained independence after the Second World War, one of the most deleterious effects of the multileveled process of colonization has been the development and implementation of a global supercapitalist economic system that is primarily controlled by the West and ultimately mediates all global relations.

Given this context, it is hardly surprising that much of colonial and postcolonial critique emerges before, during, and after the numerous struggles for liberation and decolonization in the twentieth century and employs a critical Marxian perspective, which translates from and transforms classical Western Marxist analysis. Hence, much postcolonialist critique involves the advancement of Marxian analysis that is developed from the perspective and position of the colonized and is situated within the complexities of relations that define the postcolonial experiences and realities. There is a strong focus on the kinds of cultural politics associated with the ideas and practice of cultural revolutions within primarily the tricontinents, which espoused resistance and devised strategies to combat ideological forces of colonialism and neocolonialism. Thus, one of its distinctions from orthodox, European Marxism is identified, by many postcolonial scholars, as "combining critique of objective material conditions with detailed analysis of their subjective effects" (Young 2001:5).

However, some critics argue that an overemphasis on the subjective dimensions of colonization and decolonization in postcolonial discourse is given primacy over the material and concrete conditions, such as class. Yet it is this concern with the dialectics of the relations between the "self" and "other" and the "subjective with the objective" that distinguishes anticolonialist writings and postcolonial critique from more one-dimensional theories of oppression. Indeed, a central feature of anticolonial and postcolonial thought is the recognition that colonization is a sophisticated and multileveled ideological process, which operates both externally and internally. In reality, colonization is not restricted to physical deprivation, legal inequality, economic exploitation, and classist, racist, and sexist unofficial or official assumptions.

In fact, there is a psychopathological dimension of colonization that was described by Frantz Fanon (1967) as "psychic alienation." Fanon, a psychoanalyst and revolutionary anticolonial scholar from Martinique, worked in colonial Algeria and later joined the Front de Liberation National. He employed the Hegelian "master/slave dialectic" that depicts the contradictory relationship between the dominator and dominated, in which the master needs to be recognized by the slave as the master and hence convince the slave of her or his inherent inferiority and "otherness"—to depict the relationship between colonizer and colonized. It is in this sense that the colonized become their own oppressor, in that they exert the colonizers' imaginary suppositions of inferiority upon their own self-esteem. In this sense, it involves the objectification and dehumanization of the colonized.

Moreover, Fanon and, later, Paulo Freire (1972), argued that the colonizer, through the use of "tokens," or the aid of "collaborators," what postcolonial scholar Homi Bhaba (1994) describes as "mimic men" or women, ensures that the colonized remain in a "false" or "imaginary" consciousness. They not only reinforce the master's ideological values but often occupy a place of honor and power within the colonizers' regime. Hence, it is only through critical consciousness, what Brazilian educator and anticolonial pedagogue Paulo Freire called *conscientizacao,* that psychic and material decolonization can begin to take place. Therefore, anticolonial and postcolonial scholars are especially concerned with both the theoretical and practical dimensions of dialectics as an empowering process of decolonization in which the "colonized Self" can be liberated from the "tyrannical Other" and hence achieve liberation as well as "authentic individuality." It is important to note, as Edward Said (in Eagleton, Jameson, and Said 1990) reminds us, that this transformation of social consciousness must transcend and go beyond national consciousness, which often retains or develops colonized dimensions.

The topic of imperialisms' effects on both colonization and anticolonial resistance is a significant dimension of postcolonial analyses and critique of the kinds of master narratives that mediate sociopolitical, economic, and cultural relations, as well as help construct and transform

the politics of representation. Much of this postcolonial work is associated with arenas of literary criticism and, to a lesser extent, deconstruction theory with its emphasis on nonessentialism and the arbitrary, rather than the fixed, nature of language. Many postcolonial critics are deconstructing normalized assumptions about the nature of language and texts by critiquing the cultural imperialism that underlies this discourse as well as resisting and reappropriating imperial literature and ideological frameworks. Hence, they criticize the kinds of master narratives that characterize dominant white, Christian, Western, patriarchal, heterosexual thought and discourse (sometimes described as "the canon") that are produced and reinforced by both the dominant and the collaborator.

Moreover, anticolonialist and postcolonial critics are especially concerned with the provocation, authentification, and celebration of the "voice" of the "Other." Such narratives capture the multiplicities of differences and diversities of the subaltern, who have been silenced for too long under colonialist and neocolonialist constraints and practices. These discourses resituate colonized people within the location of the center, rather than the margins of the local and global world. Such postcolonial works have been especially evident within feminist domains, in particular in the criticisms and writings of women of color, who, in part, challenge the notion of the essentialization of women as a universal category. Indeed, critical feminists like Jacqui Alexander and Chandra Mohanty (1997) and bell hooks (1994) point out that the identities of marginalized women and/or othered peoples are constructed by the dominant ideology. Much of this kind of postcolonial critique has been expressed in terms of "a third space" or "borderland" epistemologies or standpoints that recognize and highlight the experiences and practices of sexism, racism, classicism, and homophobia within the context of cultural, historical, geographic, national, political, economic, and social differences at both local and global levels. Hence, the dialectics of divergent and shared experiences frames the resistant and global coalition politics of many postcolonial critics. Postcolonial research and activist work seek thus to resist and transform the legacies and realities of colonial, neocolonial, and postcolonial conditions.

POST-MARXISM

If Marxism is what comes after Marx, post-Marxism is what comes after Marxism as a theory and practice in its organised and relatively disciplined form characteristic of the twentieth century. Post-Marxism can be seen as an ex post facto category referring to developments in and after Marxism with the 1980s crisis of Marxism, the collapse of Eurocommunism, and the collapse of the Soviet empire. Post-Marxism is highly varied and contradictory in nature; it corresponds with the postmodern sense that anything goes, in theory, that any theory goes with any other theory. At the same time, post-Marxism can be more Marxist than the Marxists. The idea of post-Marxism has a complicated semantic relationship with the idea of the postmodern. Just as postmodern theory can place the emphasis on either of the two terms against the other—some postmoderns have a stronger sense of being post, or after, others of remaining in reviving modernity or modernism—so with post-Marxism. Some views in this field are more vehemently post, or after Marx or Marxism; others revive Marx or Marxism as a universal theory of the modern.

The historical semantics involved are also suggestive. In the first place, the idea of post-Marx is either truistic or ironic: We are, of course, after Marx; even the Marxists are after Marx. The "post" refers to the sense that something significant has changed since Marx; yet post-Marxism also seems often to involve a Marxist orthodoxy of a kind less frequently encountered since the 1930s or 1960s. The idea of post-Marxism therefore logically follows that of the postmodern, but with these further refractions, that Marxism (or Marx's theory) is thought to be the fundamental critique of modernity. If Marx is the great modern or modernist, and we are now after modernism, then we are also after Marx, so we must all be post-Marxist. More specifically, if, as in the Soviet experience, Marx and Marxism are identified with a particular, failed, alternative path to modernity, then for the peoples of the old Soviet empire we are definitionally post-Marxist, because postcommunist. In addition,

the idea of post-Marxism can be aligned with the earlier sociological notion of postindustrialism and the more recent category of poststructuralism, where pluralism claimed to replace the alleged monism of structure.

So where does the post-Marxist move begin, theoretically? One obvious point indicating the shift beyond Marxism is in the work of Michel Foucault, or at least its reception, in the Foucault effect. One aspect of the Foucault effect is the opening up of orthodox Marxism to methodological pluralism. Even if Foucault's power ontology is ultimately misleading, Foucault practically pluralises power. Beyond the economic sphere or the point of production, there are other institutions based on different aspects of power, on the model of Bentham's Panopticon rather than the image of the factory in Marx's *Capital*. Foucault's effect for orthodox Marxists in the 1970s and after is a belated echo of the Weber effect on nascent critical theory in the1920s, where rationalisation or bureaucratisation is a world historic problem alongside commodification, alienation, or capitalism. It is impossible, however, to imagine the Foucault effect or the extraordinary hegemony of his influence without contemplating the incredible influence of French Marxism in this period. Foucault happened, for the Anglo Left, because he followed Louis Althusser. If Foucault was German, his influence would have been negligible. While Foucault's reception in the United States was mediated differently, in terms of the history of systems of thought and especially with reference to law, discourse, and sexuality, in Great Britain and Australia, Foucault was presented as what came next for Marxists after the crisis of Marxism.

Althusser is the crucial connection here, as his Marxism managed to combine the most orthodox of Leninist and then Maoist claims with an importation of thinkers completely unholy for communism, from Freud and Lacan to Spinoza and Montesquieu. The apparently random nature of this mix, compared, say, to the more coherent integration of different themes in the work of Henri Lefebvre, itself prefigures what is now often called post-Marxism—on the one hand, a stubborn orthodoxy, on the other, a rough use of whatever theory passes by. This is the beginning of a trend that results in post-Marxism, exemplified in the work of Slavoj Žižek, where Lacan meets Hitchcock and Marx is coupled with Lenin. There was an alternative prospect in the 1970s connected with the project of Nicos Poulantzas, where the challenge in principle at least was to integrate the Weberian insights of Foucault and the realization of the centrality of democracy into a more originally orthodox Marxist framework. Instead, the work of Foucault was too often accommodated into Marxism for its occasional radical insights to prevail. Foucault met Marx and Althusser on at least one ground: the unshiftability of structure.

An alternative path of development for post-Marxism could be plotted out through the work of Jean Baudrillard. Baudrillard's (1975) first great work to become available in the English language was *The Mirror of Production,* a kind of Marxian critique of Marx. Here the alternative French legacies of Surrealism and Situationism seemed to be far more potentially generative than the weary clichés of orthodox Marxism. Baudrillard's trajectory through anthropology into culture and culture studies signals another kind of post-Marxist route, increasingly influential with the rise of cultural studies itself. For if the world seemed to consist of surfaces and random issues, then theory, and Marxism, should also be so. Post-Marxism, in this way, has more impact on cultural studies than on sociology; alternatively, its presence can be observed in geography, where Marx has just arrived, and radical political economy, where he has been revived.

An alternative path again can be connected to the work of another lapsed Marxist, Jean-François Lyotard. Lyotard's (1984) *Postmodern Condition* claimed to criticise grand narratives in general, but in Paris there was one narrative grander than all others, Marxism itself. The argument for the plurality of voices coincided with the rise of identity politics. The alternative to the stern orthodoxy of Marxism was a playful academic politics, with as many voices as the Tower of Babel. The connection with the postmodern here was undeniable. Marxism was modernism par excellence.

The presence of post-Marxism in sociology is more limited. This reflects the mixed reception of the postmodern in sociology, as well as territory disputes with cultural studies. The work of Zygmunt Bauman is one obvious candidate for the description of postmodern and post-Marxist sociology: Postmodern, because his work takes the postmodern seriously, at least at the level of a sociological phenomenon to be explained; post-Marxist, because his intellectual formation was Marxist up until his exile from Poland in 1969, and remains so afterward, in the broad sense that Marx's questions and key concerns—capitalism, consumption, reification—remain frames for his own work. Bauman's own critical categories can be applied here, stretched from his own working distinction between a postmodern sociology and a sociology of postmodernity. The first, postmodern sociology, enters and embraces the postmodern labyrinth. The second, a sociology of postmodernity, takes on the phenomena of the postmodern from the perspective of a critical sociology. By extension, there will also be a post-Marxist sociology, a sociology where the horizons of post-Marxism frame the task of sociology, and a sociology of post-Marxism, whose project would be not only to enter but also to interpret and then exit from post-Marxism.

If we view some of the fields of the post-Marxist regionally, some of its differences emerge. Eastern and Central Europe is a primary field for post-Marxist activity. Bauman's work is a central example of a project that is more closely defined as post-Marxist than postmodern, with the distinction that the emphasis in post-Marxism is on

the Marxist in the context of a broad sympathy for classical sociology, critical theory, and continental philosophy. The work of the so-called Budapest school is another central project. Agnes Heller and Ferenc Feher both responded early to the European sense of being postmodern or post-histoire. Heller's trajectory, like Bauman's in its lineage though distinct in its detail, is also best described as post-Marxist rather than postmodern. The connection with the Weberian Marxism of Lukács means that, in Heller's case, the significance of Foucault is less marked. The work of Foucault can, however, be seen to have a significant impact on Bauman's (1982) work in exile, in *Memories of Class,* as a complement to Marx's factory-based critique. In France, Lefebvre pioneered the post-Marxist road by creatively building on Marxian themes with other materials from Surrealism to Nietzsche. One of his leading books here was called *Beyond Marxism* (1970)*,* which might also in post-Marxist spirit be rendered as "With Marx, Against Marx." The influence of Althusser was never so high in Paris as beyond, via the work of its English importers. Other thinkers living in France who pioneered post-Marxism include Cornelius Castoriadis, who long before Baudrillard took the attitude that if you could be a Marxist or a revolutionary, then the only path was the revolutionary one; in order to be a Marxist in spirit, you had to be a post-Marxist, after Marx.

In Italy, where for the ultra-Left Gramsci was part of the problem of sclerotic communism, the most prominent post-Marxist is Antonio Negri*,* though here the anomalous nature of the term is apparent in full light: Negri is also the most orthodox of automatic Marxists, following the tradition where it is capital and capitalism itself that is the most revolutionary force on the planet, and will revolutionize the planet. The phenomenal success of Hardt and Negri's (2000) *Empire* needs to be seen in this context. Negri's work emerges out of the context of the Italian ultra Left of the 1960s and 1970s. The key word of this movement was its claim to workers' autonomy; often known as the *autonomista,* they advocated workerism, a kind of revolutionary syndicalism after Marx. The emphasis on workers' autonomy or voluntarism went together with an automatic Marxism, where capitalism was viewed as necessarily containing and heading toward socialism. The result, in a book like *Empire,* is a kind of magical Marxism. Where others earlier viewed capitalism as doing socialism's work, globalization here is viewed as a kind of socialization from within. Capital and empire here are autopoetic machines of power. Capital ravishes the planet but prepares the way for socialism in so doing. Proletarian struggles nevertheless persist in constituting the motor of capitalist development. The primary task, however, is not getting into but getting out of modernity. Information technology, which involves immaterial labour, in this way of thinking offers potential for a kind of spontaneous and elementary communism. The

contradiction in the argument is familiar: On the one hand, capitalism revolutionizes itself; on the other, socialism is the result of the conscious action of the new workers. The post-Marxist contradiction is the old Marxian contradiction revisited. These arguments seem to appeal to the remaining American radicals who want to insist both on the necessity of socialism and the centrality of intellectual militancy.

In the United Kingdom, Gramsci has been one of the connectors to post-Marxism. The most influential text here is that by Ernesto Laclau and Chantal Mouffe (1985), *Hegemony and Socialist Strategy,* itself an exemplary text in the sense that it juxtaposes the orthodox wisdom of Marx's 1859 Preface with Lacan and Wittgenstein. If anything goes, why not? The conduct of social theory becomes an eclectic mix, with the distinction for post-Marxism that the mix involves this combination of Marxian axioms and cultural theses from afar. Here, in *Hegemony and Socialist Strategy* at least, the emphasis is post-Marxist in equal proportions. A more synthetic approach is that taken by Stuart Hall*,* whose work in this sense places the emphasis on the Marxist rather than the post. Yet the very idea of "a Marxism without guarantees" places Hall firmly in the revisionist, or extensionist stream, for what was orthodox Marxism if not a theory of necessary guarantees? In the United Kingdom, one striking spinoff of post-Marxism was the adoption of the "New Times" motif by the Left magazine *Marxism Today* prior to its collapse into New Labour. Here the politics of post-Marxism took an alternative route to the new vanguard indicated earlier by bolshevism. As in the case of the modernization of the Australian Labor Party before it, Marxist intellectuals left the Communist Party and joined forces with the new revisionism of Blair. Gramsci's New Prince was no longer the Communist Party but the new Labour Party. A distinct trajectory followed Althusser out through Foucault into political theory (Barry Hindess) or via a return to the British radical thought of Cole and Laski toward the project of associative democracy (Paul Hirst).

In the United States, the influence of Althusser was more narrow, and that of Foucault more broad than in the United Kingdom or Australia. The broad appeal of Marxism into the 1930s shifted elsewhere, into pragmatism. Marxism showed considerable influence in the 1960s revival of critical theory via phenomenology, as in the journal *Telos.* America had its maverick Trotskyists, including the Hegelian Marxists who made up the Johnson-Forrest Tendency of the Socialist Workers Party, whose most eminent intellectual leaders were C. L. R. James and Raya Dunayevskaya. Dunayevskaya was emphatically Marxist, finding all kinds of new secrets in the less popular texts of Marx. James made a greater impact as an incipient postcolonial than as a post-Marxist, though he had also followed the earlier Marxian clue that socialism was the invading society within capitalism, the theme followed through by Hardt and Negri in *Empire.* Today, the followers

of post-Marxism are scattered around places like western Massachusetts and North Carolina. A leading journal here is *Rethinking Marx,* sometimes abbreviated as *Remarx.* A leading book is *The End of Capitalism as We Knew It* (1996) by Catherine Gibson-Graham. The most influential Marxist intellectual writing on culture today, Fredric Jameson*,* is equally a candidate for the prize of post-Marxism, though his trajectory is more consistently aligned to the melancholic element of critical theory than to French Marxism. Perhaps the most exemplary case of post-Marxism in the mixed sense is Žižek. Žižek's mix of bolshevism and psychoanalysis is wilfully provocative and iconoclastic. Combining a strong sense of humour, sparkling prose, and vernacular example from film and television, Žižek manages nevertheless to remain a bolshevik comic in a decisively postbolshevik world. In his essay in *Revolution at the Gates* (2002)*,* as in Hardt and Negri's *Empire,* Lenin is reconstructed as a nice guy who stumbled into bolshevism, but whose practice remains exemplary. Žižek postmodernizes Marxism by putting Lenin into cyberspace. Where Lenin in 1917 called for socialism = electrification and Soviets, Žižek calls for socialism as free access to the Internet and Soviets.

The irony of post-Marxism abounds. As with the postmodern, Marxists cannot be after themselves. The awkwardness of the category reflects the long and ambivalent relationship between Marxism and intellectual revisionism. An ever-changing world needs a changing theory. Marxism has to be open to revision; this is what compelled Western Marxists like Lukács and Korsch to insist that Marxism was a method, not a set of axioms, and which led Gramsci not to talk about Marxism but to do it by applying it to the local, Italian situation. In terms of social theory, the controversy over post-Marxism or revision indicates the fundamental nature of the Marxist claim to universal or total knowledge. Through its twentieth-century history as a social theory, Marxists have sought out supplements to strengthen Marx's work or to make it comprehensive—or to cover its lack—Darwin, Hegel, Freud. In sociology they have added Weber, in philosophy analytic or rational choice categories; for Althusser, Freud and structuralism, for Žižek, Lacan. Viewed from a distance, this theoretical will-to-synthesise in order to strengthen Marxism looks like an attempt to save Marxist theory against the world. In the long run, post-Marxism will surely be known as Marxism. An alternative approach, more often adopted by Marxist historians like Eric Hobsbawm or Bernard Smith, is to wear Marxism as a light cloak, to seek to apply it historically and comparatively. A more generalised cultural approach would be to acknowledge that Marxism emerged from European modernity and allow it to return there, to cease to be Marxist, truly to be after Marx.

POSTMODERNISM

The current historical moment goes by a variety of names, including postmodern, postnational, global, transnational, postindustrial, late capitalist, and the society of the spectacle. The ingredients of postmodernism and the postmodern self are given in three key cultural identities, those derived from the performances that define gender, social class, race and ethnicity. The patriarchal, and all too often racist, contemporary cultures of the world ideologically code the self and its meanings in terms of the meanings brought to these three cultural identities. The postmodern self has become a sign of itself, a double dramaturgical reflection anchored in media representations, on one side, and everyday life, on the other. All too often this self is reduced to its essential markers, which carry the traces of these three terms.

The postmodern terrain is defined almost exclusively in visual terms, including the display, the icon, the representations of the real seen through the camera's eyes, captured on videotape, and given in the moving picture. The search for the meaning of the postmodern moment is a study in looking. It can be no other way. This is a televisual, cinematic age.

Classical sociological ways of representing and writing about society require radical transformation. If sociology and the other human disciplines are to remain in touch with the worlds of lived experience in this new century, then new ways of inscribing and reading the social must be found (Lemert 1997; Lyon 1999).

DEFINING AND WRITING THE POSTMODERN

The postmodern as postmodernism is four things at the same time. First, it describes a sequence of historical

moments from World War II to the present. These moments include the Vietnam War, the two Gulf Wars, the worldwide economic recessions of the 1970s and 1980s, the rise to power of conservative or neoliberal political regimes in Europe and America, the failure of the Left to mount an effective attack against these regimes, the collapse in the international labor movement, the emergence of a new, conservative politics of health and morality centering on sexuality and the family, totalitarian regimes in Europe, Asia, Latin America, and South Africa, the breakdown of the Cold War and the emergence of glasnost, and increased worldwide racism.

Second, the postmodern references the multinational forms of late capitalism that have introduced new cultural logics and new forms of communication and representation into the world economic and cultural systems. Third, it describes a movement in the visual arts, architecture, cinema, popular music, and social theory that goes against the grain of classic realist and modernist formations. Fourth, it references a form of theorizing and writing about the social that is antifoundational, postpositivist, interpretive, and critical.

Postmodern theorizing is preoccupied with the visual society, its representations, cultural logics, and the new types of personal troubles (AIDS, homelessness, drug addiction, family and public violence) and public problems that define the current age. At the most abstract level, the cultural logics of late capitalism define the postmodern moment (Jameson 1991).

But postmodernism is more than a series of economic formations. The postmodern society is a cinematic, dramaturgical production. Film and television have transformed American, and perhaps all other societies touched by the camera, into video, visual cultures. Representations of the real have become stand-ins for actual, lived experience. Three implications follow from the dramaturgical view of contemporary life.

First, reality is a staged, social production. Second, the real is now judged against its staged, cinematic-video counterpart. Third, the metaphor of the dramaturgical society or "life as theater" has now become interactional reality. The theatrical aspects of the dramaturgical metaphor have not "only creeped into everyday life" (Goffman 1959:254), they have taken it over. Art not only mirrors life, it structures and reproduces it. The postmodern society is a dramaturgical society.

Accordingly, the postmodern scene is a series of cultural formations that impinge upon, shape, and define contemporary human group life. These formations are anchored in a series of institutional sites, including the mass media, the economy and the polity, the academy, and popular culture itself. In these sites, interacting individuals come in contact with postmodernism, which, like the air we breathe, is everywhere around us: in the omnipresent camera whenever lives and money exchange hands, in the sprawling urban shopping malls, in the evening televised news, in soap operas and situation comedies, in the doctor's office and the police station, at the computer terminal.

The cultural formations of postmodernism do not have a direct, unmediated effect on the worlds of lived experience. The meanings of postmodernism are mediated and filtered through existing systems of interpretation. These meanings may be incorporated into a group's ongoing flow of experience and become part of their collective vocabulary and memory (i.e., the New York postmodern art scene during the 1970s and 1980s). Here the postmodern supports and strengthens a group's scheme of life. On the other hand, the multiple, conflicting cultural meanings of postmodernism may be judged to have no relevance to what the members of a group do, and hence be rejected (i.e., the rejection of postmodernism by mainstream American sociologists). Still other groups may incorporate portions of the postmodern and reject its other features (i.e., the cultural conservatives who value nostalgia). In this case, the postmodern will have a disjunctive effect, settling into one part of a group's way of life, without incorporation into its overall interpretive scheme. For still other groups, postmodernism may disrupt a way of life and even undermine it, as when postmodernists in the academy challenge the traditional literary canons of Western civilization and propose radical new reading lists that express the positions of racial, ethnic, and gender minorities.

In writing about this historical moment, the sociologist understands that there is no privileged position of absolute spectator, for how can the postmodern self write about itself when the very postmodern stuff it is made of conditions what it says, sees, feels, and hears? Of course, any hint of objectivity predicated on the privileged position of the absolute spectator must be relinquished. As an observer of the postmodern scene, I must recognize that I am grafted into every action and situation I write about. My point of contact with the contemporary postmodern world is the origin of my insights into this world.

THE TERM *POSTMODERN*

The term *postmodern* is a paradoxical oxymoron with a short history. How can something be post, or after the modern, when the modern represents the present, or recent moment (Hassan 1985:121). What comes after the present but another present, or period in history, which is a continuation of the present? It is a paradoxical oxymoron because it comes at the end of a series of other "post-isms," most important, poststructuralism, that amorphous theoretical formation that has theorized language, meaning, and textuality after the semiotic-structural revolution inspired by Saussure (1959). In a sense, postmodernism should have come first, for it describes the very conditions of experience these

earlier isms responded to. Predictably, as postmodernism emerges as a distinct theoretical formation, it comes under attack from the very perspectives it seeks to surround and make sense of.

Users of the word are attempting to describe fields of political, cultural, aesthetic, scientific, and moral experiences that are distinctly different from those that were taken for granted in an earlier historical, commonly called modern or Enlightenment, phase of world history. It is not possible to give a precise date to the beginning of the post-modern period, as Virginia Woolf did for modernism, which she said began "in or about December, 1910" (Hassan 1985:122), although we may with, Hassan (p. 122), "woefully imagine that postmodernism began 'in or about September, 1939.'"

For present purposes, postmodernism will be defined as the cultural logic of late capitalism (see Jameson 1991). I intend the following meanings with this phrase. First, I reference the self-reflective working through of a multitude of contradictory meanings and understandings concerning human experience and its aesthetic, sociological, media, and textual representations in the current historical moment. This is commonly called intertextuality. Second, I ask, after Mills (1959), "[W]hat varieties of men, women [and children] now prevail in this . . . period" (p. 7), what personal troubles and public issues define this epoch, and how are these troubles and lived experiences represented in the cultural texts that cultural experts like sociologists, anthropologists, journalists, politicians, philosophers, and artists write?

Third, by cultural logic, I designate the logics of use, utility, exchange, and status or prestige value (Baudrillard 1981:66), which surround the production, distribution, and consumption of cultural commodities in the present moment, including human experience. That is, how are cultural objects transformed into instruments, commodities, symbols, and signs that circulate in fields of productive and conspicuous consumption (Baudrillard 1981:125–26)? A political economy of signs, unique to late capitalism, now mediates the worlds of cultural objects and lived experience. A double ideology of prestige and work ethic invades the signs that surround the objects that are consumed in this culture (Baudrillard 1981:32–3). This ideology is stitched into the linguistic fabrics of everyday life. More deeply, this ideology is now communicated via the print and electronic media in a way that transcends pure production and consumption. The new cold universe of the TV screen becomes a site where, as one skips from channel to channel, multiple texts split and fracture the self and its images. A near obscene, ecstasy of communication, which has eliminated all boundaries between the public and private self, is experienced. The viewer quietly sits with a channel switcher in hand, moving from one world to another, controlling a universe of experiences emanating from the cold screen that just sits and stares (gazes) back.

Fourth, by late capitalism is meant contemporary multinational, state-sponsored capitalist activities that cross-cut political regimes and national boundaries. Late capitalism corresponds to Baudrillard's (1983:25–6, 83) fourth historical order, the hyperreal, or the fourth order of the simulacrum (the previous three historical orders being pre-Renaissance, Renaissance, and the Industrial Age, and the previous regimes of representation being the orders of: sign = reality (pre-Renaissance), the counterfeit (Renaissance), and the simulation (Industrial Revolution).

This extended definition views postmodernism as a worldview, or unique set of structured experiences, shaped by late capitalism and given expression in new artistic, representational, and theoretical practices. Postmodernism may not be what we want it to be, but it is, as Jameson (1991:56) and Lemert (1997:xiii) argue, a condition that is no longer an option.

POSTMODERNIST FEMINISM

Like ecofeminism, postmodernist feminism is an amalgam of two distinct perspectives. This strand of feminist theory combines postmodernist with feminist standpoints, albeit in diverse shapes. The result is extremely powerful expressions of resistance to or rejection of Enlightenment notions, especially universalism, human nature, and

sociopolitical progress. Postmodernist feminists join other postmodernists in rejecting or at least radically chastening these notions, and they bring to postmodernism women-centered concerns that go so far as to problematize the very notion "woman."

By rendering the identity and the concept of woman problematic, postmodernist feminists illustrate some of the key theoretical underpinnings of postmodernism. To wit, postmodernist feminists argue that no universal identity or reality undergirds "woman." From their perspective, theorizing as if this category represents some universal status results in theorizing away the multitude of differences gathered together and erased under this conceptual aegis. For postmodernist feminists, then, there is no female "nature" any more than there is a single, unitary human nature throughout human history and across human societies. Furthermore, postmodernist feminism rejects or substantially refashions the tales of progress for girls and women implied in modernist narratives of progress for humankind. Aware of all those girls and women around the globe whose lives have worsened as "progress" supposedly marched on, these feminist theorists resist the erasure of differences that sustains misbegotten dreams and perpetuates biased theorizing.

Postmodernist theorizing among feminists exhibits the same propensities toward ambiguity, irony, and paradox found elsewhere in the world of postmodernism. These feminist theorists also exhibit a parallel feel for how localized and embedded knowledge inevitably is. Thus, they criticize the exaggerated claims of other scholars, particularly around issues of objectivity as well as generalizability.

Three postmodernist feminist theorists whose ideas have wielded widespread influence are Judith Butler, Donna Haraway, and Laurel Richardson. Some of Butler's (1990) most important work theorizes about the cultural "intelligibility" of only some few identities, so that other identities get rendered as nothing more than deviations reflective of what is perverse, maladapted, or abnormal. Butler treats identity as a performative phenomenon heavily regulated within institutionalized regimes that construct some enactments as "real"—that is, intelligible—versions of a given identity and other enactments as something *other than* versions of that identity. For example, "womanhood" is recognizable only within socially regulated boundaries. Some versions hardly get seen at all. Some women's behavior, then, gets recognized as little more than self-centeredness, man hating, opinionated stridency, or bitchiness rather than versions of womanliness. Butler (1992:15–16) argues that "part of the project of postmodernism . . . is to call into question the ways in which such 'examples' and 'paradigms' serve to subordinate and erase that which they seek to explain." More generally, Butler (1992:15–16) treats identity as something normative, regulatory, and exclusionary.

For Haraway (1993:257, 258), feminist postmodernism or postmodernist feminism revolves around "politics and epistemologies of location, positioning, and situating" as well as around a rejection of universalism. Her feminism greatly favors what is partial and limited as the key to claims that are rational and meaningful. Haraway (1990:190–91) considers irony more than a rhetorical tool. For her, it is also a political strategy that revolves around serving as a "valid witness" who is modest as well as allied with diverse other witnesses. Best known perhaps for her contributions to feminist science studies as well as feminist epistemology more generally, Haraway has greatly affected how feminist theorists think about issues of knowledge construction, including scientific methodology and scientific writing.

Richardson's (1997:55) "feminist-postmodernist practice" rests on seeing that feminist theorists themselves have built up a number of crucial quasi-narratives emanating from the goals of social change and cultural transformation. Richardson casts her critical consciousness on these as well as other narratives. In large measure, her work revolves around questions about representation, including issues of voice, ethics, and genre as well as issues of hierarchy and power. Perhaps more than any other English-language social theorist, Richardson has interrogated writing practices not only for their biases and erasures but also for their transformative promise.

Richardson's interrogation has included bold experiments with diverse genres in her own theoretical work. Her creative, critical explorations of literary and other genres for writing social theory put Richardson in the company of other feminist theorists insistent on bursting representational limits. For example, two feminist social theorists—Katherine Gibson and Julie Graham—have published their collaborative work using the pseudonym "J. K. Gibson-Graham" and then proceeded to use a lot of first-person *singular* voice. (Gibson-Graham 1996) Ultimately, what Richardson and these other postmodernist feminists are theorizing is how narrative conventions constrain what can be said, who is authorized to say it, and who can expect to read it in meaningful, effective ways. Not surprisingly, many feminist theorists are critical of or ambivalent toward postmodernism. Often uncomfortable with and sometimes confused about postmodernists' stances toward modernist values such as equality, some feminist theorists advocate skepticism toward postmodernist approaches. Gibson-Graham (1996:236) argues, for example, that postmodernism may have burst a lot of epistemological limits but has at the same time "shackled" politics. Still, Gibson-Graham's (p. 241) stance sufficiently illuminates possibilities such as politicizing the very project of "discursive destabilization" that informs much postmodernist work.

POSTSOCIAL

Postsocial analysis attempts to develop an understanding of current changes of social forms and of sociality in general. Broadly speaking, what postsocial theory aspires to is the analysis and discussion of an environment in which the social principles and structures we have known hitherto are emptying out and other elements and relationships are taking their place. While it may be correct that human beings are by nature social animals, forms of sociality are nonetheless changing, and the change may be pronounced in periods of cumulative historical transitions. The term *postsocial* shines an analytic light on contemporary transitions that challenge core concepts of human interaction and solidarity and that point beyond a period of high social formation to one of more limited sociality and alternative forms of binding self and other. Postsocial developments are sustained by changes in the structure of the self; these changes are captured by models that break with Meadian and Freudian ideas proposed during a period of high sociality and that emphasize the autoaffective side of the self and its nonsocial engagements. The notion *postsocial* refers to the massive expansion of object worlds in the social world and to the rise of work and leisure environments that promote and demand relations with objects. A postsocial environment is one where objects displace human beings as relationship partners and embedding environments, or where they increasingly mediate human relationships, making the latter dependent upon the former. Postsociality also implies a shift in the collective imagination from social and political preoccupations to other topics. We no longer seek salvation in society but elsewhere—in the biological sciences, in financial futures, in information knowledge. What some of these areas promise can be captured by the idea of life rather than by that of society and by the notion of enhancement rather than that of salvation.

SOCIALITY AS A HISTORICAL PHENOMENON: EXPANSIONS AND RETRACTIONS

The current retraction of social principles and structures is not the first in recent history. One of the great legacies of classical social thought is the idea that the development of modern society involved the collapse of community and the loss of social tradition. Yet what followed was not an asocial or nonsocial environment but a period of high social formation—a period when the welfare state was established, societies became societies of (complex) organizations and structures, and social thinking took off in ways that stimulated institutional changes.

The first region of expansion of social principles during the course of the nineteenth century and throughout the early decades of the twentieth was that of social policies, and this was linked to the rise of the nation-state. Social policies as we know them today derive from what Wittrock and Wagner (1996) call the "nationalization of social responsibility" (p. 98ff.)—the formulation of social rights alongside individual rights and the positing of the state as the "natural container" and provider of labor regulations, pension and welfare provisions, unemployment insurance, and public education. A second region of expansion, connected to the first, was that of social thinking and social imagination. A corollary of the institutionalization of social policies were new concepts of the forces that determine human destiny: They were now more likely to be thought of as impersonal, social forces. Rather than assuming the automatic adaptation of individuals to changing environmental conditions, these ideas focused on the prevailing imbalances and their social causes: the social causes of occupational accidents would be an example (Rabinbach 1996). Sociology played an important role in bringing about the shift in mentality through which individuals came to be seen as the bearers of the individual costs of collective structures. When Mills (1959) argued for a "sociological imagination," he tried to capture in one concept the phenomenon of societal processes that individuals do not recognize but that affect and change their lives. A third area of expansion of social principles and structures was that of social organization. The rise of the nation-state implied the rise of bureaucratic institutions. The growth of industrial production brought with it the emergence of the factory and

the modern corporation. The advent of universal health care became embodied in the clinic, and modern science in the research university and laboratory. Industrial, nation-state societies are unthinkable without complex modern organizations. Complex organizations are localized social arrangements serving to manage work and services in collective frameworks by social structural means. A fourth area of expansion was that of social structure. The class differentiation of modern society is itself an outgrowth of the Industrial Revolution and its political consequences as well as of processes of social and political measurement and categorization.

It is central to our experience today, however, that these expansions of social principles and of socially constituted environments have come to a halt. In many European countries and in the United States, the welfare state, with all its manifestations of social policy and collective insurance against individual disaster, is in the process of being "overhauled"; some would say "dismantled." Thatcherism in Britain and "neo-liberalism" in general could be viewed as a partially successful attempt to contest some of the social rights acquired in the previous half century (Urry 2000:165). Social explanations and social thinking run up against, among other things, biological and economic accounts of human behavior against which they have to prove their worth. The mobilization of a social imagination was an attempt to identify the collective basis for individuals' predicaments and dispositions to react. This collective basis is now more likely to be found in the similarity of the genetic makeup of socially unrelated members of the population. Social structures and social relations also seem to be losing some of their hold. The individual of industrialized society had already been portrayed as a "homeless mind"—an uprooted, confused, and inchoate self, whose predicaments contributed to the expansion of social principles discussed before (Berger, Berger, and Kellner 1974). But well into the twentieth century, this self appeared to be sustained by traditional family relations. What analysts see disintegrating today are these "primordial social relations" (Lasch 1978). When complex organizations are dissolved into networks, some of the layered structural depth of the hierarchically organized social systems that organizations used to represent gets lost on the way. The global architecture of financial markets, for example, is enabled and supported by complex technological rather than social organizational systems. The expansion of societies to global forms does not imply further expansions of social complexity. The installation of a "world-society" would seem to be feasible with the help of individuals and electronically mediated interaction structures, and perhaps becomes plausible only in relation to such structures. The concept of society itself, geared as it is to the nation-state and to horizontal concepts of social structure, loses much of its plausibility in an era of globalization.

Postsocial transitions of this kind imply that social forms as we knew them have become flattened, narrowed, and thinned out; they imply that the social is retracting, in all of the senses just described. What sociologists have posited, accordingly, is a further boost to individualization (e.g., Beck 1992). This interpretation is not wrong in pinpointing subject-centered rather than collective structures as being on the rise in contemporary cultures. But it is nonetheless one-sided in looking at current transitions only from the perspective of a loss of human relationships and received forms of the social. What postsocial theory offers in the stead of the scenario of simple "desocialization" is the analysis of alternative forms of binding self and other, changes in the structure of the self that accommodates these forms, and forms of social imagination that subordinate sociality to new promises and concerns.

SOCIAL AND POSTSOCIAL SELVES: FROM THE INNER CENSOR TO STRUCTURES OF WANTING

The core model of the "social" self of the period of high sociality is the idea of the self as composed of an ego and an internalized "other" that represents society and functions as an inner censor. In Mead, the inner censor is called the "generalized other"; it is closely coupled to the intrasubjective conformist past of the self and the self as an object, which Mead calls the "me." At the opposite end of this side of the self lies the "I," the spontaneous, unpredictable, disobeying self. The "I" has the power to construct reality cognitively, and by redefining situations, can break away from the "me" and the norms of society. The "me" and the "generalized other" can be likened to Peirce's "you"; Peirce held the "you" to be a critical self that represented society and to which all thought was addressed. These notions are also roughly similar to Freud's "super-ego," the rule-carrier that functions as a regulative principle in an internal dynamic of morality and deviance. In Mead's theory, the self first originates from such a dynamic. It arises from role taking, from taking the perspective of the other first interpersonally, when engaged with a close caretaker, and then also intrapersonally.

This "I-you-me" system of the social self and its most sophisticated version (Wiley 1994:34ff., 44ff.) can be contrasted with a second model that understands the self not as a relation between the individual and society but as a structure of wantings in relation to continually renewed lacks. This notion of the self can be derived from Lacan, among others (Wiley 1994:33). Like Freud, Lacan is concerned with what "drives" the subject, but he derives this wanting not as Freud did from an instinctual impulse whose ultimate goal is a reduction in bodily tension but rather from the mirror stage of a young child's development. In this phase, the child becomes impressed with the wholeness of his or

her image in the mirror and with the appearance of definite boundaries and control—while realizing that she or he is none of these things in actual experience. Wanting or desire is born in envy of the perfection of the image in the mirror (or of the mirroring response of the parents); the lack is permanent, since there will always be a distance between the subjective experience of a lack in our existence and the image in the mirror, or the apparent wholeness of others (Alford 1991:36ff.).

The two conceptions may seem similar in that both emphasize the discrepancy between the "I" and a model, but they are in fact quite different. From the idea of the self as composed of an inner censor results an ego subjected to feelings of guilt, experiencing rebellion, and attempting to "live up to" social expectations. In contrast, the self as a permanently reiterated lack gives rise to the desire, also permanent, to eliminate the lack. The former model would seem to result in actions that are perpetually curtailed as an ego attempts to adapt them to internalized norms; it will also result in deviant actions that transgress boundaries of which the actor is well aware. The second model yields actions spurred on by the unfulfillability of lacks, or by new wants opening up simultaneously with the (partial) fulfillment of old ones. In the first model, the actors' free fall from society is continually broken as they catch themselves (or are caught by others) in compliance with social rules and traditions, and return to their ontological security. In the second case, no society of this sort is in place any longer to provide ontological security. The "you" is the idealized self in the mirror or the perfect other. The actor would seem to be freed from guilt complexes; but he or she is like a vagrant perpetually searching, stringing together objects of satisfaction and dismantling the structure again as he or she moves on to other goals.

This search system is autoaffective and self-sustaining, indeed self-energizing; as a structure of wanting, the self is extended through continually renewed and discovered lacks that renew its motivation and affectivity. The Meadian "I-you-me" system neglects the autoaffective side of the self, which is not its self-love but its willingness to become engaged in circuits that renew wanting. What we need to retain from the Lacanian "mirror" stage is the idea of a self that is susceptible to such autoaffective pursuits. We need not find the mirror stage itself plausible as a description of what actually happens to the infant when it first recognizes itself in a mirror. In contemporary society, the mirror is exteriorized in a media, image, and knowledge culture; it is no longer either a physical mirror or the caretakers' activity of "back-projecting," their activity of "reflecting," like a mirror, the child's being in relation to parental idealizations and expectations. Instead, the mirror response is articulated by the media and professional image industries that project images and stage "wholeness." The mirror is also present in the "cathedrals of consumption" Ritzer (1999:8ff.) analyzes

in the shopping malls and other places that offer enchanted displays of possible selves.

In a media, image, and knowledge culture that continually reactivates a lack-wanting dynamic, the reflexive (mirror image) self may describe contemporary selves better than the "I-you-me" system and may in fact be in the process of displacing and reshaping it. In this sense, a media, image, and knowledge culture is also a postsocial culture that stimulates and sustains postsocial selves. The seeming fit of the lack-wanting model with contemporary life may also result from the problems of primordial social relations, which no longer offer the kind of normative guidance and tight structures of control that are needed to give rise to an inner censor and a dynamic of guilt and rebellion, compliance, and transgression. The liberalization of partnership and family life that Lasch (1978) and Beck (1992), among others, describe, the detraditionalization of education and the individualization of choice, all conspire to prevent a strong "I-you-me" dynamic founded on the internalization of a censor. Mead, Freud, and others who contributed to the "I-you-me" model were not only proposing abstract theories of the self. Their conceptions were also rooted in existence, in particular patterns of attachment and socialization that are no longer dominant in contemporary society.

BINDING WORK AND THE BINDING OF SELF AND OTHER

If a media and image culture plays into postsocial trends, so does a knowledge culture. The self that is caught in a lack-wanting dynamic can easily be tied to the "wanting" objects of knowledge-oriented environments. This extends questions of postsocial development to contexts of work and brings up the issue of nonhuman objects.

A knowledge society is characterized by professional work that can hardly be seen as corresponding to the Marxian notion of alienated labor. Industrial ("instrumental," "alienated") labor has been characterized in terms of its machinelike functionality where the action of the worker becomes an intrinsic part of a machine process, its lack of uniqueness or general reproducibility by anyone with comparable training, its measurability, the divisibility of the work into components that seem freely exchangeable, and the separation of means from ends such that the work is abstract and divorced from the product (Berger et al. 1974:24, 39). The logic of the production process may also dictate the management of social relations and cause the identity of others at the workplace as well as one's own identity to become divided and anonymized. But in today's Western societies, under 20 percent of the workforce are employed in the production sector. An increasing percentage of employees work in knowledge-based industries and services that include the image industries and science and

education. These industries and services are marked by a complexification of the work process rather than by job simplification and rationalization: sophisticated instruments replace simple machines, performance criteria relate not so much to speed, quantity, and large volume than to quality, innovation, and personalized service, there are fewer specific rules and room and demand for human agency, and an emphasis on information seeking and the upgrading of knowledge (Hage and Powers 1992:50ff.). The objects of this work are not only the goal and output of activities but things to which workers relate; they make relational demands and offer relational opportunities to those who deal with them. As objects of innovation and inquiry, they are characteristically open, question-generating, and complex. They are processes and projections rather than definitive things (Rheinberger 1992). Work with them reveals them by increasing rather than reducing the questions they raise. In this sense, they are the polar opposite of tools like hammers and drills. These tools and instruments are like closed boxes. Objects of knowledge-based work, on the other hand, are more reminiscent of open drawers filled with folders extending indefinitely into the depth of a dark closet. Since objects of knowledge are always in the process of being materially defined, they continually acquire new properties and change the ones they have. But this also means that these objects cannot quite ever be fully attained, that they are, if you wish, never quite themselves. What we encounter in the work process are stand-ins for a more basic lack of object.

The open, unfolding character of such objects uniquely matches the "structures of wanting" by which the postsocial self was characterized: Objects provide for the continuation of a chain of wantings through the signs they give off of what they still lack, and subjects (experts) provide for the possibility of the continuation of these objects by attempting to define and articulate them. This basic mutuality binds self and object. Object relations of this sort imply a level of reciprocity, perspective-taking, and at times solidarity (exemplified in Knorr Cetina 1997) between human subjects and nonhuman objects. Intimate object relationships of this sort may also be realized in industrial work, but they would seem to be far more of a structural requirement— and a source of innovation—of knowledge-based work. It is difficult to imagine a successful scientist or a high-tech specialist who is not intimately involved with his or her object of work. These involvements illustrate object relations as forms of binding self and other. As the respective work environments expand and encroach upon home life, object-relations may substitute for and mediate human relations. Objects may also be the risk winners in the context of the increased relationship risks in human relationships. Empirical studies suggest that for many in these industries, work is by no means a negative experience, but rather the place where they feel emotionally more at home than in their actual home life (Hochschild 1997).

Object relations have expanded into the domain of consumption, an area that takes us back to the working of the media and image industries but that can also be considered in the light of the objects involved. Objects that are acquired to be used also make relational demands, offer binding sites for desires, and display similar qualities to those in knowledge-based work environments. Many consumer objects have a dual structure in that these objects can simultaneously be ready-to-hand usable things and, absent objects of inquiry, developed further by technological research (cars, computers), artistic design (fashion, commercials), or analysis (finance). This duality repeats itself when a device like a computer is on the one hand "ready" to be used but also retains an interior indefiniteness of being—a potential for further discovery and exploration involving a relational engagement of the subject with the object. In addition, a subject that develops an intrinsic relationship with a consumer object like a car, a computer, or a fashionable outfit will be lured into further pursuits by the referential nexus of objects and their continuous transmutation into more attractive successor versions. Thus, consumption illustrates the sense in which objects not only attract a person's desire but allow wanting to continue, by giving it its serial, chainlike structure.

Object relations tend to involve more than a formal correspondence between a self as a chain of wanting and the transmutational character of postindustrial objects. They are enriched by a semiotic dimension (an object signaling what it still lacks and a subject interpreting these signals), role-taking (subjects putting themselves in the position of the object), crossover (objects occupying a subject's mind), and flow experience (the subject becoming a "flow" of concentrated object experience). All these dimensions together account for the lure of object relations. The different relational components are marked by an interspecies reciprocity of a subject doing one thing and an object "reciprocating" with another. Postsocial binding is a form of liminal sociality, when compared with human binding.

THE CULTURE OF LIFE AND THE RISE OF A LIFE-CENTERED IMAGINATION

Object relations as construed above point away from a human-centered picture of society and back to nature and the material world. On the subject's side, they point not only to a temporalized self—pursuing wants in object worlds—but also to the possibility that this self is closer to material objects and to "nature" than the enlightenment concept of humans, that has been foundational for sociology, suggested. As assumptions about rationality give way to research into human cognition, homo sapiens loses IQ and gains emotions and visceral definition (Elster 1998). He or she also gains openness and "transmutability"— through technological, biological, genetic, and surgical as

well as psychological enhancements and alterations. Just as the notion of an object in a knowledge and media era no longer fits in with received concepts of objects as fixed material things, so the notion of a subject no longer fits in with received notions of humans as defined by reason, intentions, and agency and perhaps inner conflicts, as the main characteristics of interest to the social sciences. The postsocial subject is also a posthumanist subject. Yet it is part of a "culture of life," by which is meant a culture capacitated by and centered on material, technological, and informational processes.

The expansion of a social imagination had involved, since the Enlightenment, hopes for the perfectibility of human society in terms of equality, peace, justice, and social welfare, with the high point being Marxist visions of a socialist revolution. These ideas have not disappeared with the retraction of social principles and the collapse of Marxism. But the promise and hope and the excess imagination that went into visions of social salvation have been extended to other areas where they find progressive inspiration. What has become thinkable today is the perfectibility of life—through life enhancement on the individual level, but also through the biopolitics of populations, through the protection and reflexive manipulation of nature, through the idea of intergenerational (rather than distributional) justice. The notion of life can serve as a metaphor and anchoring concept that illustrates a cultural turn to nature and how it replaces the culture of the social. "Life" bridges divisions between the natural, the human, and the information sciences and stands for an open-ended series of phenomenological, biological, economic, and other significations and processes. In the social sciences, "life" thinking is illustrated by those areas that have turned the individual and its search for Ego and "I"-related pleasures and affirmations into topics of investigation. But from a broader perspective, many areas focusing upon the subject can be seen to play into life-centered thinking—and in the social sciences today, the phantasized unit is more the subject than society. Theories of identity and identity politics and of the self and subjectivity provide examples of such trends, as do ideas embodied in the vast numbers of self-help books derived from psychology that counsel individuals about how to enhance their lives. Hope and promise in reference to individual life also come from finance, where excess imagination—supported by the profession of financial analysts—is invested in financial scenarios as ways of enriching the self and the life course. What feeds into this situation are institutional changes in pension schemes that have moved from solidarity-based principles, where income from the working population is redistributed to retirees, to personal investment schemes where one plans and pays for one's retirement benefits over the course of a lifetime. One massive source of life-centered thinking is the life sciences themselves. They produce a stream of research

that inspires imaginative elaborations of the human individual as enriched by genetic, biological, and technological supplements and upgrades. These ideas relate to the enhancement of life through preimplantation genetic diagnosis and screening, germ-line engineering (genetic changes that can be passed down to an individual's offspring), psychotropic drugs that improve emotions and self-esteem, biotechnological means of enhancing the life span, and human cloning. The ideas suggest the perfectibility of individual life, but they also strongly implicate unrelated populations, those sharing particular genes, exposures, or histories of adaptation to environmental conditions, and benefiting in the aggregate from genetic measures and drugs. On a more conceptual and theoretical level, a return to human nature-based theories of rights and justice can be associated with life-centered ideas (Fukuyama 2002), as can Heidegger's temporal notions of human existence as "being towards death" and vitalist concepts (Lash 2003) that can be linked to Bergson and Tarde. The lack-wanting temporalized self and its processual, transmuting objects captures dimensions of this vitality. A theoretical notion used in several fields is that of flow. Though authors define flow differently, with concepts ranging from flow as a state of consciousness and experience to that of information as flow, the notion captures the dynamic dimensions and temporal structuring that "life" suggests.

LIMINAL SOCIALITY

For neo-Marxist thinkers, post-Fordist knowledge-based systems appropriate workers' lives rather than their labor, with work encroaching upon and difficult to distinguish from free time and coinciding with the individual's lifetime. The life-enhancement literature, bioethical controversies about the rights to genetically and technologically enrich lives and gene lines, and the literature depicting individuals lured into object pursuits and searching for optimal experience would suggest individuals and populations deeply involved in the appropriation of their lives and those of their offspring. Conflicts over the "appropriation of life" (Lash 2003) rather than over the appropriation of surplus value—between economic agents, individuals, *and* the state and nonhuman objects (such as viruses)—may well be what defines postsocial environments. But the divides may not run along traditional lines; for example, many of the individuals mentioned pursue their wants in structural cooperation and collusion with (rather than in structural opposition to) their corporate environments—with the knowledge firms and services in which they work, or with the media, image, and aesthetic industries that collect individual pursuits in sports, fashion, and design into marketable lifestyles. In knowledge areas, the new constellation is one of knowledge workers empowered by object relations and finding additional embeddedness in epistemic communities that collect

around object worlds. In areas of self-testing "edgework" (extreme sports, high-speed trading, etc.), individuals also appear to gain empowerment from their engagements and show a similar tendency to aggregate in object-focused groups. Human relations may take second place vis-à-vis these engagements. The welfare state, with its goals of social solidarity and redistribution, also operates in terms of a logic orthogonal to a culture of life. It is geared to horizontal social structural divisions rather than to intra- and intergenerational life, skeptical vis-à-vis some of the newly feasible life advantages, and dedicated to the provision of services that often seem deficient in the light of projected and phantasized technological possibilities and the powers of collective human, nonhuman, and hybrid agents.

Postsocial systems include sociality, but in reconfigured, specialized, more mediated, and limited ways, as liminal forms of sociality. Postsocial relations are human ties triangulated with object relations and forming only with respect to these relations. A postsocial system may be one where information structures have replaced previous forms of social coordination, as when sophisticated hardware and software systems substitute for social networks and enable expanded, accelerated, and intensified global financial markets. Postsocial is what one might call a level of intersubjectivity that is no longer based on face-to-face interaction and may in fact not involve interaction at all but rather "communities of time" formed by the joint observation of common, electronically transmitted content. Postsocial systems may arise around the sort of relatedness enabled by the Internet, for which the characteristics that have traditionally defined human relationships (feelings of obligation and trust, etc.) are not constitutive or even relevant. Postsocial forms are not rich in sociality in the old sense, but they may be rich in other ways, and the challenge is to analyze and theorize these constellations.

POSTSTRUCTURALISM

Poststructuralism is a loosely connected set of reflections on and extensions and critiques of structuralism that emerged mostly in France in the mid-1960s. Poststructuralism does not advocate a wholesale rejection of the premises and arguments of structuralism; rather, poststructuralist thought is best viewed as a sequel to the structuralist works of Ferdinand de Saussure and Claude

Lévi-Strauss. It is most often associated with the work of thinkers such as Roland Barthes, Hélène Cixous, Gilles Deleuze, Jacques Derrida, Michel Foucault, Luce Irigaray, Julia Kristeva, and Richard Rorty, although few of these theorists apply the term to their work. Poststructuralism is known primarily for its critiques of humanism, essentialism, and foundationalism; its rejection of the search for absolute meanings and lawlike generalizations; its decentering of the subject and the death of the author; and its skeptical attitude toward the so-called project of modernity.

Structuralism, as exemplified in the linguistics of Ferdinand de Saussure, the anthropology of Claude Lévi-Strauss, and the early literary theory of Roland Barthes, sought to create a theoretical apparatus that would become a foundation for rigorous analysis and research in all of the human and social sciences. Structuralism propounds four basic tenets. First, it rejects the argument that all meanings, practices, and actions can be understood in terms of and are propelled by subjective consciousness. Second, structuralism holds that meanings, practices, and actions can be explained only by studying the relations among elements in structures or systems. Third, structuralism views the binary opposition as the key to understanding structural relationships among elements (e.g., signifier/signified, raw/cooked, male/female). Finally, structuralists tend to be concerned mainly with synchronic analysis, that is, studying the relations among elements of a structure at a moment in time. Poststructuralists generally agree with the first tenet, but for various reasons to be explored in what follows, reject the others. For present purposes, the work of Jacques Derrida and Michel Foucault best illustrates the poststructuralist critique of structuralism.

Derrida's most trenchant critique of structuralism takes issue with the second and third tenets of structuralist thought. Derrida argues that the structuralist view of language as a stable system that can be studied only by reference to the relations among its elements relies on a number of untenable assumptions. The most problematic of these assumptions is what Derrida calls logocentrism, which is, moreover, a problematic assumption of most of Western thought. Logocentrism is a term that describes the tendency of Western thinkers to privilege one term in a binary opposition over the other term, thus creating a hierarchy that organizes thought (e.g., speech over writing, male over female, reason over superstition). This hierarchy then appears to be a stable and natural one that has its roots in a stable system of language and its elements. Derrida aims to upset these hierarchical relationships by showing that binary oppositions are rarely exhaustive and mutually exclusive, and are often contradictory, rendering the binary useless for any descriptive or epistemological purposes. In addition, the two terms of a binary opposition define themselves against each other (which he calls supplementarity), and any hierarchy is therefore merely arbitrary. Derrida's

project can be described as the deconstruction of logocentrism, which involves breaking down the ways in which logocentrism operates in order to dismantle its hegemony in Western society. In short, Derrida takes aim at the assumed stability of language and the ways in which structuralists construct binary oppositions.

Foucault's early work on the archaeology of knowledge, particularly *The Order of Things* (1966), proceeds in structuralist fashion and actually praises structuralism for providing the human sciences with a theoretical framework for analysis that discards the centrality of meaning and action based on subjective consciousness and its representations. The "death of man," according to Foucault, opens up opportunities for social science to think about phenomena of life, language, and labor without encountering the many philosophical pitfalls of subjectivity. Foucault's archaeology of knowledge also demonstrates the early influence of structuralism in his work insofar as it represents a search for the rules that govern what can be said in any particular discourse at a given historical moment.

While Foucault's *The Order of Things* and other archaeological works employ structuralist methods and underscore the ingenuity of structuralist thinking, they also provide many reflections on the shortcomings of structuralist thought. The most important critique of structuralism, for present purposes, concerns its inability to explain how systems and structures change over time. Foucault considered himself a historian of systems of thought, and, as a historian, he was interested in how systems and structures change (change over time is diachronic), while structuralism limits itself to studying the relations among elements of structures in synchronic fashion, that is, at one moment in time.

In order to ask and answer questions about historical change, then, Foucault began to develop a method of inquiry that became known as the genealogy of power, which is exemplified in his book *Discipline and Punish* (1979). Adopting a genealogical method provides a way to approach historical problematizations of knowledge and governing. A genealogical method, according to Foucault, studies events, but not the events of traditional political history or the history of great men; rather, genealogy may take the formation and articulation of a problem (e.g., how a society deals with those who have violated its laws) as its event. Genealogy focuses on problems, moreover, in order to study the heterogeneous lines of descent that form assemblages of practices, the multitude of problematizing discourses that such practices generate, and the regimes of truth that these practices and problematizing discourses instantiate. In addition, Foucault characterized the genealogy of power as a "history of the present." This does not, however, imply that the present is a necessary outcome of past historical events. Instead, it tries to make use of history to understand the present and to demonstrate the contingency

of what has transpired historically. The genealogy of power is therefore often viewed as a form of social criticism.

Foucault's genealogy of power contends that power and knowledge are inextricably linked. This is known as the power/knowledge nexus. Critical to Foucault's genealogy is the contention that power is a source of dynamism that is productive (i.e., not simply repressive) and dispersed throughout society into many local centers. Through this lens of power, Foucault traces the ways in which early modern European states responded to such problems of governing as criminality, the practices of punishment and social control that emerged as ways of dealing with criminality, and the bodies of knowledge (e.g., penology, criminology, and other social sciences) that emerged alongside these practices. Foucault adds that, while power is pervasive, it always meets some form of resistance. While Foucault's genealogy of power does not indict bodies of knowledge that emerge from practices of power as false or invalid (some of them may even state universally objective truths), it does challenge scholars and practitioners to consider alternative practices and discourses in order to counter the established regimes of truth and practice.

POWER

In its broadest sense, *power* refers to the capacity to produce effects on the world, to bring about changes in it. The entity or agent possessing this capacity may be natural, organic, or human. Thus, we speak of the power of windstorms, electric grids, and animals, including human beings. Both Thomas Hobbes's definition of power as "man's present means to any future apparent good" and Bertrand Russell's as "the production of intended effects" refer solely to humans and are therefore relevant to the social sciences, Russell's on the assumption that humans alone are capable of full intentionality, that is, of conscious purposive action. Hobbes identified power with the possession of "means" to achieve desired ends (or "goods"), whether they are employed to that effect or not, but like Russell he restricted power, at least implicitly, to intended action. Russell's definition by contrast specifies only the actual exercise of power rather than regarding power as a *capacity* or *potential* when not exercised. These limits are overcome by defining human power broadly as any capacity for action that produces effects or outcomes and then proceeding to enumerate the diverse forms it may take. Such a definition recognizes the possession, or latent existence, of power when it is not actually being exercised, nor does it exclude the unintended effects of an action. These may on occasion be more consequential than those intended, although since most human conduct involves intended action, unintended effects are often one of its by-products.

Power as the production of effects by some persons on others clearly includes social interaction with at least a minimal mutuality or reciprocity of influence, which indeed *defines* social interaction. "Power" and "influence" are here synonymous. Asymmetrical power "over" other people exists when an actor regularly produces more and greater effects on others than the reverse, although so long as there is some reciprocal response by the subordinate party, it is a *social* rather than a physical relation affecting only a person's body, as in bodily obstruction or confinement or violence and the infliction of pain. Such regular *social* power relations are clearly a primary concern of the social sciences.

Power may be exercised over few or many persons; its scope, the spheres of life and range of actions of the power subject it governs, may be narrow or comprehensive; it may be limited or intensive in its effects, that is, relatively unrestricted in the kinds of effects it produces from life-and-death concerns to minor adjustments of behavior. Power described as "absolute" is highly comprehensive and intensive but is likely to be low in extensiveness, even limited to a single person, as in the power of a master over a slave (Aristotle's original example of unrestricted power), a parent over an infant or small child, or a jailer over a prison inmate, although such dyadic power relations are usually regulated by law and custom. The extremely comprehensive, intensive, and extensive power exercised in the twentieth century by several states with large populations, notably Nazi Germany and Soviet Russia, came to be described as "totalitarian" and was regarded as identifying a new and altogether unprecedented kind of political regime dependent

on recently invented technologies of surveillance and communication able to penetrate and intervene in the private lives of its subjects. The enforcement of ritual affirmations of such regimes (as in "Heil Hitler" salutes) by all citizens had the effect of cowing potential dissidents into silence and the appearance of passive acquiescence.

The phrase *naked power* is often used to mean the imposition or threat of sanctions, that is, of some penalty or deprivation for noncompliance with an order. In popular usage the term *power* often misleadingly carries at least a faint suggestion of coercion that is lacking in the case of such cognates as *influence* or *authority*. The broader definition advanced here eliminates that restrictive implication. Compliance with an order or directive achieved through the offering in exchange of rewards rather than the imposition of penalties, in short the inducement of obedience by "positive" rather than "negative" sanctions, is also a form of power, although once "rewards" have become habitual, like wages or salaries for regular work, their threatened or actual withdrawal is apt to be experienced as economic coercion. A person's compliance with another's directive out of a felt sense of obligation to obey is clearly a separate and distinct form of power, often called "legitimate authority," or even "authority" *tout simple,* and contrasted with coercion and positive inducement. The obligation to obey is a corollary of the power holder's right, often enough obligation, to direct or command. Even *persuasion,* which implicitly appears to presuppose in form the equality of the interacting parties, becomes a power relation when one party possesses much greater persuasive abilities than another. The collective power of mass persuasion possessed by modern communications media—newspapers, cinema, radio and television, even billboards in public places, et al.—is undeniable in modern society. *Manipulation,* defined as the concealment of the power holder's intention from the power subject, is also a form of power, one that may involve acting on the environment to induce a desired response without necessarily engaging in face-to-face social interaction at all.

The right or obligation to command and the corollary obligation to obey are vested in positions or roles that are part of the structure of social institutions. They typically form a hierarchy, or in military parlance, a chain of command. The emergence of managerial or directive roles, exercising power when different activities performed by many separate people need to be coordinated to achieve a desired goal, is inevitable. Sheer assembled but undifferentiated aggregates of people forming crowds, mobs, mass demonstrations, and audiences have certainly played crucial parts in history, notably in revolutions, but their survival in contrast to that of major institutions is inherently contingent and transitory. Markets, strikes of labor, and elections are institutionalized procedures enabling dispersed aggregates of people to exercise collective power despite the very limited power of any single individual member.

Western thinkers since at least Plato's attribution to Thrasymachus of "justice is the interest of the stronger" in *The Republic,* including Machiavelli, Hobbes, and the early twentieth-century Italian thinkers labeled the neo-Machiavellians, have insisted on the primacy of coercive force in all politics. Marx and Weber have sometimes been too one-sidedly assigned to this tradition, although their views of power were more complex. Yet even Machiavelli, the most famous or at least notorious of these figures, regarded love as well as fear as necessary to secure the power of princes, though he thought fear more essential. Max Weber's definition of power as the ability to enforce one's will even in the face of conflict or resistance, which certainly indicates coercion, has probably been the most widely accepted definition among sociologists and has often been assimilated to the cynical realist canon, although his "even" implies that command—obedience relations need not be based on force or threatened force. Moreover, Weber is also famous for having identified three forms of the "legitimation" of power: traditional, rational-legal, and charismatic, which have been widely adopted and elaborated by later social scientists. Tradition appeals to custom rooted in the practices of "eternal yesterday"; rational-legal authority is based on the need to coordinate specialized roles in large organizations or on imputed expertise or greater knowledge in the case of the professions ("doctor's orders"); charismatic authority is belief in a particular individual's prophetic mission or destiny. Weber's definition of the state as that agency possessing "a monopoly of the legitimate use of force" in society explicitly combines coercion and legitimacy. The definition suggests diverse motives for obeying political power, a "fear-love" mix in Machiavellian terms, distributed among a plurality of different subjects yet also conceivably coexisting in the breasts of single individuals. Totalitarian regimes have been described as ruling through "terror and propaganda," which clearly connotes a combination of threats of force and appeals to legitimacy.

Highly differentiated and complex modern societies include many different power-wielding roles distributed among its institutions. Whether the holders of power constitute a coherent group or power elite promoting either their own distinctive values and interests or those of a larger group forming a ruling class are essentially contested issues rooted in ideological conflicts unlikely ever to be definitively resolved to everyone's satisfaction. When power is broadly defined simply as the *power to* satisfy wants, inequality in the distribution of material wealth and social prestige or status is obviously a phenomenon of power, as Weber recognized, although its individual beneficiaries need not exercise direct power over anyone else. The Marxist conception of class domination takes this for

granted while assuming that many or most subjects possess *false consciousness,* a term that acknowledges, if invidiously, the legitimacy of power in their eyes. Marxism asserts the primacy of economic power in regarding the state as the mere executive organ of an economic ruling class. The autonomy of political power is thereby denied or minimized, although it has been stressed by thinkers from Machiavelli to Weber, who have by no means denied the frequent interdependence of economic and political power. Autonomous political power is maximized by autocratic rulers, from the absolute monarchs of the past to modern dictators who have often been military leaders directly controlling armed forces. Constitutional democracies with regular elections based on universal suffrage allow the many component groups in complex urbanized societies to influence and shape political decisions.

Power is often grouped with material wealth and prestige or status as a universal object of striving. Aspirants to power are said to be driven by a "will to power," a "power lust" or "power drive" just as deeply rooted in human nature as economic self-interest and the wish for approval from others. While there undoubtedly are such persons, it is doubtful that commanding and forbidding are widely desired in and of themselves because of the intrinsic satisfactions they afford rather than for their instrumental value in serving widely varied aims and purposes. Defined as *power to,* as any means to any desired end, power is certainly universally desired, if rarely for its own sake as a direct source of pleasure. Power is not therefore a psychological desideratum on the same plane as material wealth and prestige or status, although it may be sought as a means of attaining wealth or status and as a source of status and social honor in its own right. In institutionalized social roles, the exercise of power over others is a normative requirement of the role itself, although the fact that it involves personal judgments not reducible to sheer routine decision making makes it prone to abuse by being diverted to serve the power holder's own personal interests or that of unauthorized others. Nor is there an "instinct" of submission motivating the obedience of subordinates correlative to the alleged will to power, the two motives either separating two distinct psychological classes of individuals or coexisting in the psyches of single persons.

Its susceptibility to abuse and in its extreme forms to tyranny accounts for power often being described as a necessary evil. Yet it might just as plausibly be labeled a necessary good, for the many achievements of advanced modern societies that benefit humanity could not exist in the absence of marked institutionalized inequalities of power by no means limited to the sovereignty of states.

POWER-DEPENDENCE RELATIONS

Power-dependence relations refers to exchange relations between actors, emphasizing the dynamics of power in those relations. The term comes from a seminal 1962 article by Richard Emerson that introduced the relationship between power and dependence in exchange relations as a key element of the perspective in sociology known as exchange theory, and the cornerstone of most approaches to the study of exchange in networks. The analysis of power and dependence in exchange relations is applicable to any realm of social interaction in which entities exchange. Consequently, it has been used and developed in a number of areas of sociology. This includes relations between parents and between parents and children in studies of the family; relations between employees and between bosses and employees within formal organizations; relations between formal organizations; relations between managed care organizations, physicians, and patients; and relations between political actors.

The relationship between power and dependence in an exchange relation may be stated as a simple power-dependence principle: *In an exchange relation between two actors, the actor who is least dependent has the most power.* An actor is an entity, typically a person or organization, that has likes it acts to obtain and dislikes it acts to avoid. An exchange relation is a tie between two actors in which each does something to benefit the other and that exists for that reason. *Power* is a term many scholars have defined and used differently. However, in the statement of the power-dependence principle, power means power *over* the exchange partner, or the ability to affect the partner's behavior. *Dependence* refers to the degree to which a particular exchange partner has control over the supply to its partner

of its partner's likes and dislikes. Another version of the power-dependence principle is the principle of least interest: *In a relationship between two actors, the actor with the least interest in the relationship has the most power.*

The explanation for the power-dependence principle is not difficult. Let us assume that the more an actor wants something, the more cost the actor will be willing to bear to get it. Then the more Actor B wants what Actor A provides, the more cost B will be willing to bear to get it; and the more superior A is as a source of what B wants, the more B will be willing to bear the cost of doing what A wants. In other words, the more dependent B is on A, the more power A has over B. In his 1962 article, Emerson points out the two roots of dependence: the importance to A of what B can provide and the availability to A of alternative sources for what B provides. Dependence is greater the more what B provides is valued and the less alternative sources are available.

Emerson next took the important and influential step of extending study of power-dependence relations to study of networks of such relations. In these exchange networks, the network structure is the source of variation in the dependence of exchange partners. According to the power-dependence principle, this in turn causes variation in power. For example, consider a simple three-person exchange network: A linked to B linked to C (diagrammatically, A—B—C), in which A and C are alternative sources of the same good for B. Alternatively, the exchange in question could be spending time together, for example, on a date. In this network, B has two sources of its desired good, while its two partners have only one source each, B. This makes B less dependent on them than they are on B and hence gives B more power. Stemming from the theoretical and empirical work of Emerson and his colleague Karen Cook, the study of exchange networks has been an active and productive area of research for several decades.

In early work on power-dependence relations, several ancillary issues arose. With subsequent emphasis on exchange networks and structural sources of dependence and power, some of these early issues have had little attention, although they have not been settled. One such issue concerns what happens to power when it is used. If using power entails satisfying the exchange partner's dependence, then using power may diminish it. However, under some circumstances, that may not be the case. This issue clearly is important for understanding power in exchange relations over the long term and needs further investigation.

Another such issue concerns value: What do actors value, how much, and why? What makes goods and resources mutually substitutable to an actor, and to what extent? How does that affect dependence and thus power? Emerson discussed some of these questions in his 1972 chapters and was working on them further at the time of his premature death. Since value—likes and dislikes—is an important root of dependence, understanding value is crucial for understanding power-dependence relations. Nevertheless, work and progress in this area has been relatively scanty.

Finally, coercion is one issue that has seen extensive work and development, primarily by Linda Molm and her students and associates. Exchange may involve coercion, in that what one or both parties offer and give the other may be not some good or reward but instead relief from punishment. The coercive exchange relation is indeed a power-dependence relation, but what creates the dependence is current punishment or a credible threat, perhaps involving prior occurrence of punishment. The dynamics of power-dependence relations involving coercion and of exchange networks incorporating such relations can be quite different from the dynamics of those involving only goods.

PRAGMATISM

Pragmatism is the distinctive contribution of American thought to philosophy. It is a movement that attracted much attention in the early part of the twentieth century, went into decline, and reemerged in the last part of the century. Part of the difficulty in defining pragmatism is that misconceptions of what pragmatism means have abounded since its beginning, and continue in today's "neopragmatism."

Pragmatism is a method of philosophy begun by Charles Sanders Peirce (1839–1914), popularized by William James (1842–1910), and associated with two other major early representatives, John Dewey (1859–1952) and George Herbert Mead (1863–1931). Pragmatism was defined in 1878 by Peirce ([1878]1992) as follows: "Consider what effects that might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object" (p. 132).

William James's book *Pragmatism* ([1907]1977) gathered together lectures he had been giving on the subject since 1898 and launched a much broader interest in pragmatism and also controversy concerning what the philosophy means. Most early critics took James as the representative of pragmatism, yet Peirce claimed that James misunderstood his definition in holding the meaning of a concept to be the actual conduct it produces rather than the conceivable conduct. Early European critics such as Georg Simmel, Émile Durkheim, and Max Horkheimer took pragmatism to be an example of an American mentality that reduced truth to mere expediency, to what James unfortunately once expressed as "the cash value of an act." There has also been a tendency to confuse the philosophy with the everyday meaning of the word *pragmatic* as expedient, yet Peirce, citing Kant, was careful to distinguish *pragmatic* from *practical.*

PRAGMATIC OR PRACTICAL?

James was interested in the experiencing individual, for whom practical events marked the test of ideas. As he put it in *Pragmatism:* "The whole function of philosophy ought to be to find out what definite difference it will make to you and me, at definite instants of our life, if this world-formula or that world-formula be the true one" ([1907]1977:379). Philosophy is taken by James to be a means for practical life, whereas for Peirce, pragmatism was a method for attaining clarity of ideas within a normative conception of logic, that is, within the norms of continuing, self-correcting inquiry directed toward truth. Logical meaning, for Peirce, is not found in "definite instants of our life" but in the context of the community of self-correcting inquiry. And truth is that opinion the community would reach, given sufficient inquiry, and which is known fallibly by individuals.

The earliest roots of pragmatism are to be found in the remarkable series of papers from around 1868, published when Peirce was 29 years old. In "Some Consequences of Four Incapacities," and its four denials of Cartesianism, he destroyed the Cartesian foundations of modern philosophy. Against Descartes's attempt to base science on the indubitable foundations of immediate knowledge, Peirce argued that we have no powers of *introspection* or of *intuition,*

using these terms in their technical logical sense as meaning direct, unmediated, dyadic knowledge. Cognitions are instead determined by previous cognitions, and all cognitions are inferences or mediate signs that, in turn, address interpreting signs. The possibility of scientific truth does not derive from indubitable foundations but by the self-correcting process of interpretation. Peirce, who rejected foundationalism, proposed a regulative ideal of an unlimited community of inquirers, capable of inquiry into the indefinite future as a basis for fallible, objective knowledge. It is within this context of a general community of interpretation that the "conceivable consequences" of pragmatic meaning are to be found.

Peirce's pragmatism must be understood within his conceptions of semiotic (doctrine of signs) and of inquiry, as must his separation of it from practical life. Peirce differed from the other pragmatists in keeping theory separate from practice, not out of elitism, but because in this master scientist's view, the scientific method is not vital enough to run society or one's individual life. In his view, practical decisions often need to be based on beliefs and gut feelings, which produce the "definite difference" of James, whereas theoretical life can only be based on fallible *opinions,* always subject to correction within the unlimited community of inquiry. Pragmatic meaning is found, as he put it elsewhere, not in a particular experiment but in *experimental phenomena,* not in "any particular event that did happen to somebody in the dead past, but what *surely will* happen to everybody in the living future who shall fulfill certain conditions" (1931–1938, vol. 5, para. 425).

The term *conceivable* marks the difference between Peirce's and James's pragmatic maxims. In reducing Peirce's "conceivable consequences" to consequences, James seemed not to understand why conceivable consequences are not exhausted by actual instances, and why "pragmatic," in the philosophical sense, is very different from "practical," in the everyday sense.

What works today, in a practical sense, may not work tomorrow, and may not work tomorrow because conceivable consequences not yet actualized today came to fruition, and may yet come to further fruition. "Ye may know them by their fruits," is pragmatic, when one considers those fruits as conceivable consequences, capable of further fruition, that is, as general.

The pragmatic meaning of a stop sign is that it will determine consequences in general and not simply the individual autos that stop. It is also the autos that would stop, that is, the conceivable consequences. For these reasons, Peirce attempted to distinguish his own original version of pragmatism from the one James popularized and that others, such as F. C. S. Schiller and Giovanni Papini, drew their own versions from. So he renamed his original version *pragmaticism,* a term, he added, "ugly enough to be safe from kidnappers."

PRAGMATISM AS GENERAL OUTLOOK

Peirce and James first met as students at Harvard University, yet neither held PhDs. Peirce had a master's degree in chemistry and James received an MD. John Dewey received one of the first PhDs in philosophy in the United States from Johns Hopkins University in 1884, where he studied briefly with Peirce. Dewey met Mead, who received a PhD from Harvard, when they taught briefly at the University of Michigan, and a few years later, after being named chairman of philosophy, psychology, and pedagogy at the University of Chicago, brought Mead there. Late in his life, penniless, Peirce added a middle name of "Santiago"—St. James—in thanks to a fund James put together on his behalf.

One sees a broad range of topics in the writings of these four "classic" pragmatists, in contrast to the growing demands for technical "specialization" that marked the course of academic philosophy. But when these early pragmatists are invoked, it is usually not only for their particular doctrines of pragmatism but rather their larger philosophical outlooks in general that are included as "pragmatist thought" and that do share some similarities. So the term *pragmatism* is often used to describe the broader philosophical movement, including Peirce's doctrine of signs, Dewey's philosophy of "instrumentalism," and Mead's developmental model of the self.

Pragmatism in general was an attempt to undercut the Cartesian-Kantian problem of starting with a subject and an object and then figuring out how to put them together. It denied that knowledge was reducible either to a knowing subject or to an immediate sensation of an object, thus rejecting rationalism and the sensationalism of British empiricism. Pragmatism denied the myth of a private and asocially constituted subject or object by locating meaning in the vital tissue of the generalized community. It began instead with triadic mediated sign-acts, from which could be prescinded a "subject" and an "object." Objectivity is thus thoroughly social and mediate, rather than individual and immediate.

Though James may have been short on philosophical rigor, his writings brimmed with ideas and vigor. In *Pragmatism,* for example, he set out in the opening chapter his distinction between *tough-minded* and *tender-minded* outlooks. In his *Principles of Psychology* (1890), he coined the term *stream of consciousness,* and he developed the idea of "The Moral Equivalent of War" in 1910 in an essay of that title, a mobilization for a kind of peace corps.

In his later work, James developed his philosophy in *The Will to Believe* (1897), in which truth again is viewed from the experiencing individual, and in *A Pluralistic Universe* (1909), where he emphasized multiple perspectives over a "monistic" theory of truth. Against what he saw as a "block universe" in idealism, James argued for a pluralistic and open-ended universe that would allow for the qualitative uniqueness of experience.

All four pragmatists carved out phenomenological aspects of their theories. Peirce literally founded a phenomenology around the same time as Edmund Husserl, though he settled on the term *phaneroscopy* to avoid confusing it with Hegel's *Phenomenology of Spirit.* James began with the phenomenon of religious experience rather than belief or authority in his study of *The Varieties of Religious Experience* (1902). Qualitative immediacy is an element of communicative conduct in Dewey's and Mead's theories of aesthetic experience, of the problematic situation, of Mead's discussions of the place of emergence and novelty, and of his work *The Philosophy of the Present* (1932)*,* of Peirce and Dewey's discussions of the first stage of inquiry—Peirce's "abductive inference" and Dewey's "problem finding"—and of Peirce, James, and Mead's discussions of the "I" as an element of the "I" "me" internal dialogue that constitutes thought.

James and Dewey, the chief public spokespersons for pragmatism, were also powerful manifestations of the modernist impulse in the early twentieth century. Their ardent optimism, pluralism, and situationalism showed new ways to reconceive mind as vitally continuous with nature, experience, and conduct. Dewey was the most widely known public philosopher in America in the first half of the twentieth century, and social reform was a central preoccupation of his public philosophy. He had become associated with Jane Addams and Ellen Gates Starr and their social settlement Hull House in the 1890s, which they founded in Chicago shortly before Dewey arrived there. Mead shared Dewey's interests in social reform and the possibilities for reconstructing democratic life in America. Though his work was hardly known outside academic circles, Mead became a mainstay in sociology, even as Dewey's reputation went with pragmatism into eclipse in mid-century philosophy. Through his student Herbert Blumer, philosopher and social psychologist Mead became a representative of "Chicago sociology" and what Blumer termed "symbolic interactionism."

It should be noted that all four pragmatists were active as psychologists: Peirce and James were active in experimental psychology, and Dewey and Mead were interested in developmental psychology, and specifically in the "genetic epistemology" movement in America in the 1890s and on. Dewey published a key functional psychology article in 1896, "The Reflex Arc in Psychology." There he argued that the stimulus-response arc model needed to be reconceived functionally as a "circuit, a continual reconstitution," rather than an arc, in which both stimulus and response occur within a mediating organic coordination rather than as only externally related. This kind of argument reappears in his later turn to the context of the situation and in his late view of meaning as transaction.

Mead is perhaps most known to sociologists for his developmental theory of the self, which involves a progressive internalization of the other, beginning in a "conversation of gestures," through a level of "play" involving specific others, and culminating in a "generalized other," an inner representation of community who is "me" in that internal dialogue of "I" and "me" that comprises the self of self-consciousness. In Mead's view, it is the internalized "attitudes" and values of the community, and not only a specific role model, that mark the fully developed human self.

The human ability to engage in gestural conversations retains its preconscious animal sensing and emotional communicative origins while yet embedded in the inner representation of social life that is the generalized other. Mead termed this representation "the significant symbol," which is a gesture, sign, or word simultaneously addressed to the self and another individual.

Communicative mind is a semiotic process for Mead and the other pragmatists, involving neural processes, though not reducible to them. Mind is viewed not as internal to the brain but as in transaction with its environment. Mind, as the communicative organ of the self, involves the further interpretations and pragmatic consequences it engenders.

ECLIPSE AND REEMERGENCE

Part of the confusion over pragmatism has to do with the peculiar history of thought in the twentieth century as philosophy became institutionalized in American universities and as scientific modernism swept away American philosophy. Though he was Mead's former student and editor of the publication of Mead's lectures, *Mind, Self, and Society* (1934), Charles Morris believed that logical positivism and its claim to dyadic knowledge based in "thing-sentences" (or semantic reference) provided philosophical foundations more scientific than pragmatism. The open-ended Chicago pragmatism of Dewey and Mead, centering on the human being within a live social environment—a human capable of criticism, cultivation, emergence, and continued growth in the community of interpretation—was replaced in the 1930s at the University of Chicago by the closed positivist dream of the completion of philosophy personified by Morris and Viennese refugee Rudolph Carnap, and later by the even more stringent technicalism of analytic philosophy that in turn replaced positivism.

In his 1938 monograph *Foundations of a Theory of Signs,* Morris systematically reduced Peirce's triadic view of signs to a dyadic-based positivism without acknowledgment of Peirce or of Peirce's logical arguments for signs as triadic inferences (as Dewey pointed out in an essay written when he was in his late 80s), although Morris did acknowledge Peirce a couple of decades later. A number of Morris's inverted Peircean semiotic terms, such as "pragmatics," have become institutionalized, despite their reversal of Peirce's definitions. To use Peirce's term *pragmatism,* and then claim originality for the term *pragmatics* as a specifically semiotical term, without describing the relation of Peirce's pragmatism to semiotic, or how Morris's view radically departed from the source terms he uses—claiming that it is about "the relations of signs to their users," as though the users are not also signs—amounts to the further "kidnapping" of the meaning of pragmatism.

Philosophical pragmatism resurfaced as a significant part of intellectual life in the last decades of the twentieth century. What had been a body of thought reduced largely to the influence of Mead in academic social science, and passing references to James, Dewey, and Peirce, reemerged with significance for semiotics, philosophy, literary criticism, and other disciplines. There are ongoing collected works projects for all four pragmatists.

James's and Dewey's situationally based philosophies now seemed to provide a vital alternative to the narrowly positivist/language analysis world in which academic philosophy had become enclosed in the Anglo-American context. Strangely enough, Mead's fortunes rose in the 1940s and 1950s in sociology just as his work and that of the other pragmatists were being eclipsed in philosophy. Symbolic interactionism had functioned in mid-century to keep the Meadian stream of pragmatic thought flowing, though it lost sight of the other pragmatists. Now Mead has begun to be taken seriously by philosophers again.

NEOPRAGMATISM

Jürgen Habermas and Richard Rorty are two widely discussed thinkers closely associated with the renewal of interest in pragmatism. Both are heavily influenced by the "linguistic turn"—by the dominant postwar Anglo-American "language analysis" (out of which Rorty in particular derives)—and both are contributors to attempts to link Anglo-American and continental philosophies.

Influenced both by his colleague Karl-Otto Apel's inquiry into Peirce and the tendency of critical theorists, such as Max Horkheimer, to view pragmatism as positivism, Habermas depicted the pragmatisms of Charles Peirce and John Dewey in his early work *Knowledge and Human Interests* (1971), as having critical potential, yet as ultimately ingredients in the development of modern positivism. He viewed pragmatism from a Kantian and Weberian standpoint as a doctrine of inferential inquiry legitimized by transcendental structures of instrumental action.

Habermas missed Peirce's crucial rejection of Kant's transcendental philosophy: To put it tersely in Kantian terms, science is not the "synthesis" of the immediate, as Kant thought, but rather the "analysis" of the mediate, of signs. Habermas also imposed a Weberian concept of strategic, "instrumental action" that was alien to Peirce's community

of interpretation framework and that of the other pragmatists as well, including Dewey's "instrumentalism."

Nevertheless, the explosion of interest in Habermas, in connection with Apel's inquiries, also sparked interest in pragmatism both in Europe and America. Apel, who translated Peirce into German, helped to show how Peirce's rejection of foundationalism had, in effect, transformed Kant's transcendental subject into a "transcendental" unlimited community of inquirers as the limit of knowledge. Apel's reintroduction of the term *transcendental,* in its technical sense, to Peirce's philosophy is problematic, since Peirce believed that the pragmatic maxim denied Kant's concept of incognizable things-in-themselves and thereby the concept of transcendental underpinnings.

Habermas's appreciation of pragmatism grew since those early works, and he attempted to develop a "theory of communicative action," based on a concept of "linguistically generated intersubjectivity" influenced in part by Mead. Although Habermas sought to come to terms with the body of pragmatism as a whole, his theory of communicative action remains grounded in Kantian dichotomies at variance with the pragmatic tradition.

Rorty claims to be a pragmatist influenced by Dewey, as well as such seemingly distant sources as Martin Heidegger and Ludwig Wittgenstein. The pragmatic vision Rorty extols is that of philosophy as conversation instead of a quest for truth or wisdom. In his book *Consequences of Pragmatism* (1982), Rorty depicted pragmatism as a doctrine rooted in a conception of inquiry, but inquiry as unconstrained conventional conversation.

Rorty's pragmatist bears an uncanny resemblance to the language game approach of later Wittgenstein and his rejection of his early "picture theory of knowledge." The pragmatists also rejected such foundationalism, beginning with Peirce's bold anti-Cartesian articles of the late 1860s and culminating with Dewey and Bentley's *Knowing and the Known* in 1949, but they did so by articulating a fallibilist, experiential model of inquiry that showed, in contrast to Rorty's statement, how the "nature of objects" and the evolutionary biosocial genius of the human mind tempered or constrained inquiry toward truth and "self-knowledge."

Despite Rorty's claim of being a pragmatist, a number of his leading ideas are at odds with pragmatism. Peirce, James, Dewey, and Mead were all genuinely interested in exploring the place of biology in human conduct, yet Rorty denies the influence of biology. Peirce, Dewey, and Mead developed theories of meaning that involved more than conventional signification, yet Rorty views signs as purely conventional. The four earlier pragmatists all viewed experience as an element of conduct, yet Rorty (1989) limits conduct to conventional or contingent meaning, claiming that people are solely products of socialization—"There is nothing to people except what has been socialized into them." (p. 177). Unlike Dewey, Rorty denies continuity between the self and its community.

Finally, pragmatism is at heart a philosophy of purport, yet Rorty's postmodern outlook denies authentic purposiveness, viewing meaning as sets of conventions. Meaning is simply what one happens to believe, subject to arbitrary "redescriptions," and the pragmatic criterion of consequences is undone.

Despite shortcomings in contemporary neopragmatism, the ongoing reengagement with the earlier pragmatists shows that significant consequences for social theory are still being discovered.

PROCEDURAL JUSTICE

Any interaction among people involves procedures or processes through which the people involved coordinate their actions. Procedural justice is the study of

people's subjective evaluations of the justice of those procedures—whether they are fair or unfair, ethical or unethical, and otherwise accord with people's standards of fair processes for interaction and decision making. Procedural justice is usually distinguished from subjective assessments of the fairness of outcomes (distributive justice) and the degree to which people feel that they are gaining or losing resources in the group (outcome favorability).

The procedures found in groups, organizations, and societies have several key elements. First, there are those aspects of interaction linked to problem solving or decision making—that is, to managing group tasks. Second, there are the broader interpersonal dynamics of people's interactions with others—that is, the socioemotional aspects of procedure. Both aspects of procedures can be distinguished conceptually from the outcomes of group interaction and decision making, although in practice the procedures of a group and the outcomes it arrives at are typically found to be related.

Group procedures can potentially be evaluated objectively by considering the quality or content of interactions within a group, or they can be evaluated subjectively by asking people to report about their judgments about particular procedures. The distinction involved is that objective evaluations are linked to what actually occurs within the group, while subjective evaluations examine people's judgments and evaluations. Objective and subjective procedural assessments are typically studied separately, although procedures can be evaluated against both objective and subjective criterion at the same time.

Irrespective of whether they are making objective or subjective evaluations, people can potentially evaluate procedures along many dimensions, dimensions such as their speed, their accuracy, their degree of bias, and so on. Within social psychology, a large literature has developed that focuses on evaluations of procedural justice. This literature focuses on one key dimension of procedures—their justice or fairness. In the procedural justice literature, people are typically asked to evaluate a procedure along a general continuum of fairness-unfairness.

Procedural justice studies can focus on the objective features of procedures that are associated with their subjective fairness. Thibaut and Walker's (1975) classic work on procedural justice, for example, is concerned with the fairness of two forms of trial procedures—the adversarial and the inquisitorial. Their work codes features such as the actual impact of bias on decisions to determine which procedures have objective features, like neutrality, that the researchers associate with fairness. This leads to evaluations of the objective quality of different procedures, when judged against performance criterion identified by the researchers.

In contrast, the subjective study of procedural justice explores people's evaluations of the fairness of procedures. It is concerned with what people judge to be a fair

process or procedure (Lind and Tyler 1988; Tyler 2000; Tyler et al. 1997). Such subjective evaluations may or may not be linked to particular objective characteristics of procedures. While both aspects of procedural justice have been studied by psychologists, most of the recent work on procedural justice has focused on subjective evaluations of fairness.

WHY IS PROCEDURAL JUSTICE IMPORTANT?

Subjective procedural justice judgments have been the focus of a great deal of research attention by psychologists because they have been found to be a key antecedent of many types of cooperative behavior in groups, organizations, and societies. The viability of groups depends upon the cooperation of the people within them. Furthermore, people are found to vary widely in their degree of cooperation. This makes the question of what motivates cooperation a key one for groups, organizations, and societies. Two literatures focus on the issue of cooperation and explore the motivations underlying cooperation: the literature on regulation and that on performance.

The literature on regulation is concerned with bringing people's behavior into line with group rules and the decisions of group authorities. Because social life requires people to follow social guidelines, the effective exercise of authority must involve the ability to motivate rule-following behavior. While important, regulation is not the only form of cooperation that groups need. The second literature focuses on performance—the ability to motivate people to engage in positive actions that help to promote the group's goals. For example, in addition to not stealing from their workplace, employees also need to do their jobs well. Cooperation of both types can be studied in the context of cooperation with particular decisions, or as a general level of everyday cooperation with the group.

Regulation

One reason that people might cooperate is that they receive desirable rewards for cooperating and/or fear sanctioning from the group for not cooperating. Such instrumental motivations are found to be effective in motivating cooperation in a wide variety of social settings, and shape both reactions to particular decisions and everyday behavior in groups. Studies suggest, however, that instrumental mechanisms have only a weak influence on behavior. In addition, they do not promote voluntary cooperation. People cooperate when they feel that their behavior is linked to whether they will be rewarded and sanctioned, but not when their behavior is not being observed or when authorities lack the ability to effectively dispense rewards and sanctions.

An alternative reason that people might cooperate is that they are motivated by their sense of justice to accept what

they feel is fair, even if it is not what they want. The basic problem of social regulation is that everyone cannot have everything they want at the same time. Hence, people must sometimes defer to others and receive less than they desire. People's views about what is just or fair are a social mechanism through which interaction among people and groups is enabled because they provide guidelines for appropriate forms of cooperation with others. Social justice provides a set of shared values that minimizes social conflicts and contributes to the continuation of productive interactions among people.

The question is whether justice is effective in resolving conflicts and disagreements when people cannot have everything they want. Underlying the potential contribution of justice to the resolution of social conflicts is a view of human nature that suggests that people will defer their personal needs and interests when they feel that doing so is just. In other words, the belief that justice has the power to influence people's feelings and actions. Norms of social justice effectively resolve coordination problems when people accept them and defer to decisions that give the people involved less than they want, as well as being motivated to contribute to groups and relationships in which they experience justice. To the degree that people defer because allocation decisions are fair, justice is an important factor in creating and maintaining social harmony.

Research on procedural justice suggests that social justice can act as a mechanism for resolving social conflicts. The results of procedural justice research are optimistic about the ability of social authorities to bridge differences in interests and values and find differences that the parties to a dispute will accept. Furthermore, the findings of procedural justice research suggest how authorities should act to pursue such procedural justice strategies.

Thibaut and Walker (1975) presented the first systematic set of experiments designed to show the impact of procedural justice. Their studies demonstrate that people's assessments of the fairness of third-party decision-making procedures shape their satisfaction with their outcomes. This finding has been widely confirmed in subsequent laboratory studies of procedural justice (Lind and Tyler 1988). The original hope of Thibaut and Walker was that the willingness of all the parties to a dispute to accept decisions that they view as fairly arrived at would provide a mechanism through which social conflicts could be resolved.

Subsequent laboratory and field studies have supported the finding that when third-party decisions are fairly made, people are more willing to voluntarily accept them. What is striking is that the procedural justice effects are widely found in studies of real disputes, in real settings, involving actual disputants. Procedural justice judgments are found to have an especially important role in shaping adherence to agreements over time. For example, the procedural fairness of initial mediation sessions is the primary determinant of whether people were adhering to mediation agreements six months later.

Similarly, procedural justice is central to gaining deference to social rules over time. For example, Paternoster and his colleagues (1997) interviewed men who had dealt with police officers called to their homes because they were abusing their wives (i.e., due to domestic violence). They explored which aspects of police behavior during the initial call predicted subsequent compliance with the law against domestic violence among the men interviewed. It was found that those men who felt fairly treated during the initial encounter with the police adhered to the law in the future. Interestingly, procedural justice judgments during this initial encounter with the police were more powerful predictors of subsequent law-abiding behavior than were factors such as whether the police arrested the men during the initial contact, fined them, and/or took them into the police station.

Beyond the acceptance of decisions, procedural justice also shapes people's values concerning the legitimacy of the authorities and institutions with which they are dealing, and through such feelings, their willingness to defer to those authorities and institutions. Studies of the legitimacy of authority suggest that people decide how much to defer to authorities and to their decisions primarily by assessing the fairness of their decision-making procedures. Hence, using fair decision-making procedures is the key to developing, maintaining, and enhancing the legitimacy of rules and authorities and gaining voluntary deference to social rules.

Performance

The importance of procedural justice is not confined to the arena of regulation, and more recent research on procedural justice has moved beyond an early focus on regulation to a broader focus on a variety of types of cooperative behavior. The findings of this work demonstrate that when people experience procedural fairness, they are also found to be more cooperative and to work harder on behalf of groups (Tyler and Blader 2000). Groups generally benefit when those within them engage in voluntary cooperative actions that help the group, and research suggests that people voluntarily cooperate with groups when they judge that group decisions are being made fairly. Fair decision-making procedures encourage voluntary cooperation with groups because they lead to supportive attitudes, that is, identification with and loyalty and commitment toward groups.

MODELS OF SOCIAL COORDINATION

These findings are hopeful and optimistic. They demonstrate that providing people with procedural justice can be

an important and viable mechanism for gaining deference to decisions made by authorities. This effect occurs across a variety of settings, including both hierarchical and non-hierarchical situations, in political, legal, managerial, inter-personal, familial, and educational settings and when important issues of outcomes and treatment are involved. Hence, conflict resolution efforts can gain viability through the use of fair decision-making procedures.

Procedural justice is especially important because it is central to creating and maintaining internal values that support voluntary cooperative behavior on the part of the members of groups. The importance of developing and maintaining such values is increasingly being recognized, as social scientists recognize the limits of strategies of conflict resolution that are based upon seeking to shape the rewards and punishments received by the parties to a dispute. Because social science thinking has been dominated by rational choice models of the person, command and control, deterrence, or social control strategies have dominated discussions about social regulation during the past several decades. These models focus upon the individual as a calculative actor, thinking, feeling, and behaving in terms of potential rewards and costs in the individual's immediate environment.

Increasingly, social scientists have recognized the limits of instrumental approaches to managing conflict. In political and legal settings, authorities have recognized that both regulation (Tyler 1990) and the encouragement of voluntary civic behavior (Green and Shapiro 1994) are difficult when authorities can only rely upon their ability to reward and/or punish citizens. Similarly, organizational theorists are recognizing the difficulties of managing employees using command and control strategies (Pfeffer 1994).

The alternative to command and control approaches are approaches that focus upon the development and maintenance of internal values. If people have internal values that lead them to voluntarily defer to authorities and act to help the group, then authorities need to seek to compel such behavior through promises of reward or threats of punishment. In other words, the recognition of the importance of creating a "civic culture" or an "organizational culture" that supports the development and maintenance of internal values among group members is increasing as the limits of command and control approaches to managing conflict become increasingly clear. To manage effectively, authorities need the consent and cooperation of those being governed. Procedural justice is central to both developing and maintaining (1) judgments that authorities are legitimate and (2) feelings of commitment and identification with groups, organizations, and societies.

CRITERIA OF PROCEDURAL FAIRNESS

To utilize these findings, it is important to consider what people mean by a fair procedure. What characteristics lead to procedural fairness? Studies typically find seven, eight, or even more elements that contribute to assessments of their fairness. However, four elements of procedures are the primary factors that contribute to judgments about their fairness: opportunities for participation, a neutral forum, trustworthy authorities, and treatment with dignity and respect.

People feel more fairly treated if they are allowed to participate in the resolution of their problems or conflicts. The positive effects of participation have been widely found, beginning in the work of Thibaut and Walker (1975). Furthermore, people value participation even when they think that their participation is not shaping outcomes. People are primarily interested in sharing in the discussion over the case, not in controlling decisions about how to handle it. Instead, people often look to authorities to make decisions about which legal or managerial principles govern resolution of their dispute. In other words, they expect authorities to make final decisions about how to act based upon what they have said.

People are also influenced by judgments about neutrality—the honesty, impartiality, and objectivity of the authorities with whom they deal. They believe that authorities should not allow their personal values and biases to enter into their decisions, which should be made based upon rules and facts. Basically, people seek a level playing field in which no one is unfairly disadvantaged. If they believe that the authorities are following impartial rules and making factual, objective decisions, they think procedures are fairer.

Another factor shaping people's views about the fairness of a procedure is their assessment of the motives of the third-party authority responsible for resolving the case. People recognize that third parties typically have considerable discretion to implement formal procedures in varying ways, and they are concerned about the motivation underlying the decisions made by the authority with whom they are dealing. They judge whether that person is benevolent and caring, is concerned about their situation and their concerns and needs, considers their arguments, tries to do what is right for them, and tries to be fair.

Studies suggest that people also value having respect shown for their rights and for their status within society. They are very concerned that, in the process of dealing with authorities, their dignity as people and as members of the society is recognized and acknowledged. Since it is essentially unrelated to the outcomes they receive, the importance that people place upon this affirmation of their status is especially relevant to conflict resolution. More than any other issue, treatment with dignity and respect is something that authorities can give to everyone with whom they deal.

PROFESSIONS

Professions are occupations that claim control over specific tasks through the mastery of abstract knowledge. Most theoretical development in the professions has focused on defining professional work, explaining the rise and dominance of professional groups, developing models of professional organization, and discussing systems of professions and knowledge claims.

Control over abstract knowledge confers legitimacy on professional groups, and this legitimacy usually translates into social prestige, power, and rewards for professionals. A key to understanding professions is the knowledge claims that professional groups make. These are rhetorical and institutional claims that professionals have exclusive control over specific tasks because the professional has mastered the abstract knowledge necessary to understand when, where, how, and under what conditions specific tasks will be performed.

In addition to knowledge claims, professions usually claim control over a specific task domain. A task domain is a set of specific behaviors and activities that can be linked, directly or indirectly, to the abstract knowledge claims of the profession. The combination of abstract and esoteric

knowledge and monopoly or near monopoly over a task domain means that professionals usually have considerable autonomy over their work tasks. Whether this autonomy over the execution of tasks translates into the ability to determine the terms and conditions of work is one of the major long-term research problems addressed by students of the professions.

In the ideal-typical profession, control over a specific task domain and the abstract nature of knowledge claims place clients in dependent positions relative to professionals. In exchange for autonomy and control, professions are expected to require their incumbents to act in the best interests of their clients and the broader culture. These expectations often are embodied in codes of ethics that require professionals to act in the best interests of their clients or in accordance with abstract ideals (respect for the law, justice, fiduciary responsibility, etc.).

Professional work usually addresses some culturally important value (legal rights, health, scientific progress, safety, etc.). The fact that clients usually approach professionals at times when these values seem most salient to them increases the dependency of clients on professional practitioners.

Most professions are organized into professional associations that protect the interests of professionals by regulating the terms and conditions of work and developing codes of conduct that regulate behavior. Professional associations also regulate the qualifications necessary to enter the profession, and many professions have competency tests (bar exams and medical board exams being the two most prominent examples) that determine when would-be practitioners are ready to assume professional roles.

TRAIT THEORIES AND DEFINITIONS OF PROFESSIONS

Most early attempts to define professions developed sets of traits or characteristics that separate professions from other occupations. These treatments are referred to as trait theories of professions. While differing in their specific emphasis, there has been a common focus on eight broadly conceived characteristics that distinguish professions: (1) knowledge based on theory and substantively complex techniques, (2) mastery of knowledge that requires a long period of university-based training that socializes trainees into the culture and symbols of the profession, (3) tasks that speak to relevant and key social values that are inherently valuable to societies, (4) practitioners that are oriented toward clients' welfare and service to the profession, (5) task performance characterized by a high degree of autonomy, (6) practitioners that exhibit long-term commitments to their work, (7) practitioners who enjoy a well-developed sense of community, and (8) a well-developed code of ethics that guides practitioner behavior and defines

the profession's core values. Occupations are evaluated based on their conformity to this, or some other, list of traits. Trait theories of professions were popular in the 1950s and 1960s and were identified with structural functionalist desires for precise definitions of professional activities.

Trait explanations do not explain the development of professions very well, nor do they outline a detailed process of change in the professions. Instead, they provide a set of institutional markers whose appearance or disappearance would signal change in the status and relative power of specific occupational groups. They provide a set of places or practices to observe when studying potential changes in professional life.

Since the 1970s, students of the professions have grown dissatisfied with trait theories of professions. There has been relatively little agreement about which traits are critical and which are superfluous for professional development. Most trait theories were silent regarding the manipulative actions taken by professions and professionals themselves to enhance their own power and prestige. Some observers have questioned whether the ability or inability to conform to a list of professional traits is influenced by forces outside of the functional importance of the knowledge professions allegedly control. Others questioned whether codes of ethics were actually adhered to or whether such codes are ploys to avoid scrutiny and control by outside observers.

THEORIES EXPLAINING THE RISE AND DOMINANCE OF PROFESSIONS

Recent theoretical development in the study of the professions often focuses on the rise and dominance of professions as institutions. Professions as macrolevel institutions represent distinct and identifiable structures of knowledge, expertise, work, and labor markets with distinct norms, practices, ideologies, and organizational forms. These theories explain the rise and dominance of professions by focusing on the knowledge systems or power relationships that shape these institutions.

Liberal/technocratic theories explain the rise of professions as a by-product of distinct role demands created by postindustrial capitalism. These theories claim that increasing technological complexity leads to the creation of highly specialized roles and a search for qualified people to fill them. The process of filling and enacting these roles produces a technocratic professional elite that applies their knowledge to a broad spectrum of problems. Modernity in this context is characterized by the susceptibility of ever-wider sets of problems to technocratic solutions.

While much liberal/technocratic writing sounds decidedly functionalist, some theorists offer other interpretations within the liberal/technocratic framework. Some authors speak with great concern about the creation of a globalized,

highly technocratic economy that produces alarming levels of social inequality and social dislocation. These writers point to social and community dislocation, residential segregation, and the concentration of the poor and unemployed in forgotten sections of the inner city as some of the consequences of a technologically sophisticated economy that demands a highly educated workforce. Globally, nations compete for scarce pools of highly educated labor, producing a brain drain from the less developed world to the developed world that is linked to rising residential, cultural, and social segregation in urban areas. Some writers even speak of the creation of a "global overclass" of economically prosperous, highly educated scientists, technicians, and financiers who share a common, segregated, elite subculture.

Other, less apocalyptic issues addressed by liberal/technocratic models include whether there are changing social and cultural links between professionals and other highly educated workers. The purpose of these inquiries is to investigate whether professionals and experts are starting to occupy distinctive positions in the social structure of advanced capitalism. Most of these investigations discuss the existence of a *new class* of economically prosperous, postmaterialist, socially liberal citizens with distinctive worldviews and political orientations. These orientations do not easily fit into traditional conservative or liberal political ideologies. The empirical evidence for the existence of this new class is considerable, though writers and commentators disagree about the social and political implications.

Criticisms of early versions of liberal/technocratic theories focused on the benign roles assigned to technology and economic development as a creator of professional roles. These theories were criticized for the (seemingly) unconscious development of role demands to which professionals were the natural and inevitable solution. Scholarship in the sociology of work since the 1970s has questioned whether many aspects of the contemporary division of labor are natural or inevitable, nor is there an easy one-to-one relationship between specific technologies and specific methods for organizing work tasks. More recent scholarship on the new class is not prone to this criticism. Most writers examining the political and social distinctiveness (or lack thereof) of professionals and expert workers are agnostic concerning the existence of professional roles, and focus on the consequences of occupying these roles for other dimensions of social life. Some writers in this latter group examine whether professional roles are under attack and whether defense of professional "life space" constitutes a basis for distinctive political organizations.

POWER THEORIES OF THE PROFESSIONS

Power theories of professions focus on the prerogatives and status accruing to professionals. Within this group there is considerable variation in basic themes and implications.

All power theories begin with the observation that professionals possess considerable power and social status. However, power theories are skeptical that professional status and prerogatives flow from the mere possession of expert knowledge. Instead, rewards flow from attempts by professionals from the exercise of social control or the extraction of economic and social benefits from consumers. However, power theories vary in their evaluation of who benefits from the monopolization of professional knowledge and whether professional knowledge constitutes a distinctive, superior way to understand the increasingly technical problems of late modernity.

Some power theories locate professional power within the organization of professional associations. Professional associations attempt to exert control over the supply and production of new professionals as well as control over the locations and conditions of professional work. Professional associations often exert control by enforcing stringent educational requirements that bear only a marginal relationship to the performance of professional roles. Attempts to create licensed monopolies also are used to regulate the supply of professionals, driving up prices and limiting practice to accepted, established methods. These theories assume that professional groups extract financial and social benefits from their knowledge for the benefit of professionals themselves.

A variant of this first group of theories claims that the organization of professional work exerts a different social closure function. In addition to restricting the supply of professionals in order to keep demand and fees high, this variant of power theories claims that educational and licensing requirements are part of a larger agenda to limit professional practice to high-status groups: whites, men, and (in an earlier age) Protestants. This group of theories views the rewards that accrue to the professions as a by-product of high-status occupants. These variants of power theories are used to explain gender and racial inequality within subfields of the professions in addition to examining the relatively privileged position of professionals themselves.

Another variant of this first group of theories explains inequality among subspecialties within the professions themselves. These theories point to increasingly skewed distributions of rewards in the direction of glamorous and visible subspecialties and away from routine, frontline work that is more indicative of the "service ideal" that most professions ascribe. The high status of medical specialties that engage in drastic interventions against life-threatening disease relative to the low status of preventative care, health promotion, and public health is cited as evidence of this trend, as are the wide differences in rewards between public interest and constitutional law relative to corporate legal practice.

Marxist variants of power theories would locate the source of the status, rewards, and prerogatives of professions outside of professional associations. Instead, they point to structures of professional incentives that are tilted toward specialties that serve the rich and powerful. The funding of professional research and financial rewards in the form of fees encourage professionals to take up subspecialties with paying, relatively affluent customers. In their minds, this explains the skewed distribution of professional activity away from the provision of basic services that benefit most members of society toward activities that protect or enhance the safety, health, or convenience of elites.

Still other variants of power theories question whether professional knowledge is distinctive or valuable. These variants of power theory have a decidedly postmodern cast to them, and question the very existence of professional knowledge as a tool of power and domination. These variants of power theory go beyond the question of whether the organization of professional service delivery is distorting the distribution of professional and societal rewards. Instead, these theories cast a critical eye on the knowledge claims of professionals and claim that professional dominance of specific task domains privileges scientific and technical knowledge at the expense of intuitive, practical, grounded practice. The effect of the expansion of professional expertise to ever-expanding areas of life is the political and social disenfranchisement of nonprivileged, nonprofessional groups.

While the historical trend in theorizing the professions is to explain the growth in professional power and prerogatives, there is distinctive theorizing within the power tradition that claims that those prerogatives and powers are being eroded. This group of scholars asks whether the control and prerogatives of professional work have shifted from professionals themselves and toward dominating, superordinate organizations that do not represent the interests of professionals. These scholars suggest that professional prerogatives have been under attack by an increasingly skeptical public and by other occupational groups who seek to control service costs. This variant of power theory claims that an increasingly educated, reflexive, knowledge-consuming, and organized set of consumers and third-party payers are seeking to reorganize professional services to streamline service delivery and lower its cost. Almost all of these reorganization attempts seek to limit professional discretion and autonomy, and connections often are made to the deskilling and proletarianization of skilled craft workers in earlier historical periods.

Power theories focus our attention on the activities of professionals themselves and the economically powerful and influential interests and benefactors that finance much leading-edge professional activity. These theories tend to ignore the actions or desires of average consumers, or assume that these tastes are easily manipulated. Furthermore, power theories often make it sound as if professional manipulation of the symbolic environment around them is

easy and their success assured. The more recent development of scholarship explaining attacks on and the reorganization of professional work (both from modernist and postmodernist perspectives) serves as a useful counterpoint to the focus on professional dominance.

MODELS OF PROFESSIONAL ORGANIZATIONS

Theories that focus on the organizational settings where professional work takes place have developed several ideal-typical terms to describe professional work organizations. The classic mode of professional practice is summarized under the head of the autonomous professional organization. Autonomous professional organizations are dominated by professionals who maintain authority and control over the terms and conditions of work and evaluate themselves as a group. The traditional, freestanding law firm or group medical practice is a classic example of an autonomous professional organization. In these organizational types, partners or senior professionals hire other professionals and work in a freestanding, collegial setting where peer group decision making is the norm, status differences between professionals are minimized, and all nonprofessional employees are subordinate to those with recognized professional status.

Heteronymous professional organizations are work settings where considerable control is exercised over professional work. Managed care organizations and other health care plans that review and attempt to control the behavior of professionals and house attorneys practicing law within large corporations are examples of heteronymous work organizations. Some commentators have speculated that heteronymous work organizations for professionals are increasing in dominance, given some of the trends observed by students of the declining power of professional groups. Finally, conjoint organizations involve professionals and administrators operating in separate domains of expertise and sharing the benefits that derive from collaboration. There are relatively few examples of such organizations in the literature, though university relationships between faculty and administrators and relationships between administrators and researchers in research institutes and think-tanks come the closest to this organizational form.

SYSTEMS OF PROFESSIONS AND KNOWLEDGE CLAIMS

Most recent theorizing and research on the professions has focused on systems of professions and knowledge claims. This newer tradition does not focus on a specific profession but instead focuses on entire groups of professions making competing claims to the same task domain, or on the entire system of professional claims within a specific culture or society.

This perspective focuses on the ability to claim jurisdiction over specific task domains in competition with other occupational groups. Here the emphasis is not on the rationales or explanations given to consumers or the relationship between professionals and the interests of dominant elites. Instead, this perspective focuses on boundary disputes over task domains (doctors and nurses, traditional medicine and holistic approaches to healing, lawyers and accountants, accountants and managers, etc.). These competitions (and their outcomes) eventually determine the relative prestige of professional groups. Very prestigious occupations almost never have their task domains challenged and do not have trouble winning challenges when they do occur. But far more numerous are occupations where professional prerogatives and task domains are continually challenged (e.g., teachers, nurses, pharmacists, and psychologists). By watching and studying these competitions, researchers can study how task domains are controlled and how challenges to the conventional organization of professional work transpires.

A variant of this focus on the system of professions can be found in the theory of countervailing powers. Here, the dynamics of change in the status of professions is linked to a given profession's location in a field of institutional and cultural actors. A profession may gain dominance by subjugating the needs of other groups that, over time, will mobilize their own resources and connections to counter this dominance.

PSYCHOANALYSIS AND SOCIAL THEORY

FREUD AND SOCIAL THEORY

Since its origins, psychoanalysis has been inextricably linked with the history of twentieth-century social theory. Sigmund Freud, the founder of psychoanalysis, responded to unprecedented events in his own political culture, particularly World War I, the resurgence in Austria of anti-Semitism, and the rise of Nazism, fascism, and other mass movements, and applied his developing science to a theory of society. Psychoanalysis is predicated on a fully elaborated set of postulates concerning human nature, a metapsychology that describes the inner world of a human being as governed by both rational and nonrational impulses. In various writings beginning in the 1920s, Freud sought to explain the ways in which the psychological makeup of the individual, rather than helping to realize it, limited the achievement of reason in the social world.

The theorist of the unconscious described the special problem faced by "civilization" that required for its survival the thwarting of human instinct. Developing in particular a theory of the death drive, or Thanatos, Freud explored its expression in individuals, its necessary repression by social systems, and the pathology that can derive from it, to explain the mass politics with which he was confronted. Here Freud appears to be a more modern Thomas Hobbes, suggesting that social institutions are required to limit, restrict, and restrain these fundamentally antisocial inclinations of individuals. Consistent with Freud's elaboration of an individual's intrapsychic conflict that requires repression of pleasure on behalf of a reality principle, he posits that the social order too insists upon repression of instinct, and as such, society, from the family to the state, inserts itself as the agency of individual domination.

Unlike Hobbes, who posits an identity of interest between the needs of the individual (i.e., to prevent premature death through the war of one against all) and the interests of the sovereign (i.e., in place to preserve the Leviathan), Freud identifies an inherent conflict between the needs or requirements of social institutions and their capacity to distort or pervert individual possibility. Here, more like Nietzsche than Hobbes, Freud insists that society, rather than establishing the conditions for human self-realization, can impede them. While civilization ensures greater happiness for the species, because without it disease, war, and earlier death would be more common, society nonetheless interferes with a person's pleasure principle*,* creating a social being at war with authority and, as that authority becomes internalized, at war with itself.

This is the Freudian conundrum: Individuals are dependent upon a social world that makes possible instinctual gratification. Nonetheless, they find themselves in a struggle against social power that requires of them excessive restriction both of libidinal or erotic and aggressive impulses. The result is the internalization of external authority in the form of moral conscience, generating often an overly repressive form of self-discipline and restraint. Because of these contending sentiments and imperatives, the lived experience of individuals is defined by the production of ambivalence and dominated by the experience of guilt. Love and hate coexist, directed at times at oneself, at others, and at the social world that enables those feelings. While the victory of a reality principle over pleasure alone is the aim, the result often is pathology. The individual drive to satisfaction with socially imposed restrictions on gratification defines the dialectical relationship that, for Freud, is a permanent feature of the world in which we live and is always fraught with the possibility for failure. While much of Freud's career was devoted to exploring the ways in which psychological illness was a product of an individual's inability to successfully navigate the waters of pleasure and restraint with which he or she was confronted, Freud's later writings increasingly turned to the inextricable connection between the death drive of individuals and the forces of social order and constraint that colluded in the simultaneous production of excessive repression and pathology.

Freud, in the end, remains agnostic as to whether the emancipatory potential of the individual might ever be achieved despite the requirements of a collectivity that requires a surplus of repression. Writing in *Civilization and Its Discontents* ([1930]1975)*,* Freud states, "A good part of the struggles of mankind centre around the single task of finding an expedient accommodation—one, that is, that will bring happiness—between the claim of the individual and the cultural claims of the group; and one of the problems that touches the fate of humanity is whether such an accommodation can be reached by means of some particular form of civilization or whether this conflict is irreconcilable" (p. 96). And while Freud, writing in the interwar years, assumes an understandably despairing tone about our capacity to construct collective institutions that balance group needs with personal self-expressiveness, psychoanalysis firmly established its centrality to understanding the relationship between individual and society and, more pointedly, laid the theoretical terms for a twentieth-century preoccupation with the tension between social constraint and human potentiality.

CRITICAL THEORY

Freud's anthropological claims about the human being were first taken up outside psychoanalysis by members of the Institute for Social Research, later known as the Frankfurt School of Critical Theory. In the late 1920s and early 1930s, a generation of scholars—Max

Horkheimer, Leo Loewenthal, Erich Fromm, and Theodore Adorno—interested in breaking out of an instrumental utilitarianism then characteristic of Marxist thought sought to marry the psychology of Freud to the economics and philosophy of Marx. Because of their interest in applying psychoanalysis to social theory, the early members of the school were successful in having an Institute of Psychoanalysis established in Frankfurt in 1929, and created the first formal relationship of its kind between a Freudian training center and a university. The result, for a time, was a vigorous exchange between psychoanalytic practitioners, visiting psychoanalysts, and members of the Institute of Social Research, establishing a model of interaction between clinicians and intellectuals rarely paralleled anywhere since. Throughout the century and currently, those who identify with the Frankfurt School and its intellectual and political legacy, including Herbert Marcuse, Jürgen Habermas, Jessica Benjamin, and Axel Honneth, have been the most insistent interlocutors of psychoanalysis, continuing to critically engage the field for its social and political implications.

Ironically, while Freud in the early 1930s became interested in specifying the contours of the death drive and its collaboration with societal forces demanding excessive restraint, these first-generation Frankfurt school theorists, in a bold effort to wrap anticapitalist, antistatist and antifascist politics around a psychology of human emancipation, were drawn to psychoanalytic ideas that offered a vision of the postcapitalist individual, when alienation—including psychological estrangement—might be overcome. Thus, Freud was criticized for his new emphasis on Thanatos with the critical theorists rejecting this shade of antihumanism in his thought. The presence of the death drive implied that the forces of domination might be justified in demanding its repression. Horkheimer insisted rather that Thanatos was a historically specific expression of impulses existing in modern capitalist society, now carried forth by individuals. While quarrelling with Freud in this regard, he nonetheless embraced fully Freud's insistence on the nonidentity between society and psychology, the irreducibility of the social to the psychological and vice versa. Freud's most fundamental contribution, he argued, lay in his demonstration of a stratum of human existence—the unconscious—that was out of reach of the totalizing effects of society. The Freudian unconscious became a theoretical bulwark against a sense of total defeat as the forces of society, through the 1930s and 1940s, seemed to overwhelm any indications of human capacity for resistance. The extent to which individual unconscious stands as a line of last defense against a totalizing system of societal domination remains a central node of contemporary theoretical controversy involving psychoanalytic thinkers, those that identify with the critical theory school, as well as contemporary postmodern and poststructural theorists.

As a result of Nazism, the Frankfurt school was forced to relocate; most of its members moved to New York, renaming the school as the International Institute for Social Research and housed at Columbia University. Other members, while still affiliated, emigrated farther west to California. In America, Adorno, Horkheimer, and Marcuse continued to demonstrate the centrality of Freud to their thinking. Adorno, for example, influenced by the psychoanalytic writings of Fromm and Wilhelm Reich, who were attempting to explain mass support for fascism, turned his attention in the 1940s to a study of anti-Semitism that later expanded to an explanation of psychological authoritarianism. Linking up with empirical researchers at Berkeley, Adorno (1950) published *The Authoritarian Personality,* where he argued that authoritarianism is a consequence of a publicly expressed ethnocentric ideology overlaid on a conflicted personality structure created by punitive child-rearing practices and inconsistent parental affection. And in a kind of companion piece, Adorno (1951) published "Freudian Theory and the Pattern of Fascist Propaganda." He argued here that mass movements, in addition to being understood from the bottom up, or from the perspective of individuals' pathology helping to foster authoritarianism, require an appreciation of the ways in which propaganda skillfully fosters from the top down primitive identifications with the leader and with the group. As political events of the 1940s and 1950s unfolded, the nonidentity principle, while not explicitly abandoned, was being seriously undermined: Was there any aspect of the individual unconscious invulnerable to external manipulation? Adorno and others were finding it more difficult to understand the unconscious as anything more than a function of political and social repression. Adorno was to call both the culture industry and fascist propaganda "psychoanalysis in reverse," and their capacity to subdue the individual through primitive psychological mechanisms extraordinarily impressive.

But with the publication of *The Authoritarian Personality,* a psychoanalytically informed critical theory became wedded for a time to American empirical social science, and the critical theoretical issues raised by the findings were subsumed to the question of the validity and reliability of its quantitative findings and statistical measures. The controversy over the volume was effectively drained of any political meaning; almost instantly, it was subject to considerable scrutiny, with strong criticisms directed especially at its empirical findings. The result was a setback for the institutionalization of a critical psychoanalytic theory within American social science. The institute reopened in Germany in 1949, and Horkheimer and Adorno returned to Frankfurt.

In contrast to Horkheimer and Adorno, who sought to discover in Freud support for an increasingly pessimistic formulation of the possibilities of social transformation, Herbert Marcuse offered a utopian reconciliation between Freud and Marx. Marcuse, who remained in America,

published in 1955 *Eros and Civilization: A Philosophical Inquiry into Freud.* He argues that the erotic instinct, Eros, has produced the material and technical preconditions necessary to end scarcity in society. But advanced industrial society, characterized by people's mastery over the natural world, also resulted in their estrangement from nature. For Marcuse, the death instinct expresses this form of alienation, a negation of what he terms the Nirvana principle, that is, the oceanic feeling of oneness with the world. Like other critical theorists' historicized treatments of Thanatos, Marcuse identifies the death instinct as the source of people's unhappiness. Yet in contradistinction, he identifies the death drive as a human being's quest to reunite with inorganic nature, and insists that by re-eroticizing a person's relation both to other people and to nature it is possible to overcome alienated labor. Invoking a less pessimistic reading of Freud, Marcuse conceptualizes the possibility of a convergence between the pleasure and Nirvana principle. The sexual tyranny of the genitals, Marcuse proclaims, is the expression of a historically specific form of estrangement. Polymorphous perversity, in contrast—the eroticization of all of life itself—constitutes a possibility now, for the first time. The shift from production to consumption in modern capitalism, Marcuse argues, promotes the conditions by which the repressive needs of an industrializing society has given way to a more liberated consumer society. The individual personality has become freed—never before possible in human history—of the requirement of excessive repression. *Eros and Civilization,* while profoundly utopian, was also inherently political: Overcome the performance principle imposed by advanced industrial civilization, Marcuse proclaims, and a fulfilling, playful, and eroticized life will emerge.

Norman O. Brown (1959), writing *Life against Death: The Psychoanalytic Meaning of History* shortly after *Eros and Civilization,* struck a complementary chord. An American scholar who was not a member of the Frankfurt school, Brown nonetheless similarly politicizes Freud by suggesting that human sociability possesses a regressive, backward-looking, death-driven character because of human beings' unwillingness to acknowledge the reality of mortality. By uncovering the powerful role of the death instinct, Brown argues, Freud now enables a conception of a healthy human being: The human neurosis is now, for the first time, made conscious and, therefore, eradicable. Together, for a time, with Marcuse and Brown its commanding officers, a new American school of psychoanalytically informed political criticism appeared to be emerging.

But psychoanalysis as political critique gave way to a kind of mystical celebration of the erotic and communal. Marcuse's and Brown's subsequent writings became read as celebrations for an eroticized collectivity, utopian visions capable of being realized through the strength of communalism. Contributing to an apolitical celebration of the sensuous,

Marcuse's (1964) *One-Dimensional Man* and Brown's (1966) *Love's Body* in the 1960s were treated as complementary pieces (despite Marcuse's own efforts to differentiate between them), with each assuming a cultlike status to a countercultural and communitarian politics that was more cultural than political. The identification in public thinking between Freud and claims for nonrepressive sexuality is reminiscent of Freud's reception in turn-of-the-century Vienna: psychoanalysis as synonymous with free love. Psychoanalysis as political critique was eclipsed. Its fate in America was now tied to that of the counterculturalism of the 1960s.

In 1971, Jürgen Habermas, a third-generation critical theorist writing in Germany, published *Knowledge and Human Interests.* He describes psychoanalysis as an exemplar of "undistorted communication," in which the presuppositions of both parties to a communicative exchange are subject to reflexive examination. Reflecting perhaps a more hopeful climate in Western Europe, Habermas identifies a rationalistic and emancipatory core to the practice of psychoanalysis— "the only tangible example of a science incorporating methodical self-reflection"—and employs it as a normative model for social communication. While criticized for minimizing the significance of the asymmetries of power between analyst and analysand, Habermas nonetheless, on behalf of emancipatory possibility, describes in the relationship between analyst and analysand a model of communicative action demonstrably achievable, capable of challenging systemic structures of power and domination. Habermas's turn toward communication signaled a broader theoretical reorientation to language that extended beyond critical theory, which included the ideas of the psychoanalyst Jacques Lacan, who described the unconscious as structured like a language. But while Lacan became a central figure in postmodern and poststructural social theory, Habermas stood firm against the deconstructive turn, imagining instead nondistorted communication as a vehicle to transform subjective irrationalities held privately by individuals into an objectively grounded and reflexive radical democracy. By describing a concrete possibility for emancipatory practice, Habermas remains true to his critical theory origins, resisting wholesale abandonment of an emancipatory social project. Indeed, throughout the last several decades, he has been among the most prominent stalwarts against abandoning a commitment toward the realization of reason and promoting Enlightenment ideals in social life.

At the same time, Habermas also makes clear the limits of his interest in aligning his emancipatory interest to psychoanalysis, a discipline that similarly harbors utopian aspirations. He writes pointedly against the psychoanalytic theorizing of Cornelius Castoriadis, a French analyst contemporary with Habermas. Castoriadis (1997) asserts the "monadic core of the subject," that is, an unconscious untouched by the social world, and identifies the psychoanalytic project of "making the unconscious conscious" with an emancipatory "project of autonomy." Habermas

distances himself from psychoanalysis by insisting on the primacy of the intersubjective—not the subjective—and the sufficiency of knowing the subject through the language being spoken between social members. He disclaims any interest in the Freudian unconscious. There is an irony, as Joel Whitebook (1997) notes, that in a postmodern political environment hostile to claims about reason's potential for human emancipation, Habermas rejects the substantive claims of a discipline that shares with him a similar belief in the possibilities of reason. Yet Habermas remains consistent with his earlier writings, insisting that psychoanalysis is of interest only for its epistemological stance toward self-discovery and its claims that genuine communication is possible as countervailing possibility despite existing structures of asymmetric power and authority.

More recently, the writings of Jessica Benjamin (1995) and Axel Honneth (1996), in contrast, reveal a substantive involvement with psychoanalytic ideas, ones intended to specify the specific contours of emancipatory possibility in the modern world. Reviving the substantive engagement with psychoanalysis in the early years of critical theory, they each reestablish the link between a progressive social theory and a depth-psychological understanding of the human being. Moving beyond the monistic theorizing of Freud (and Castoriadis, as well), both draw heavily upon the writings of D. W. Winnicott, an English psychoanalyst, writing in the 1950s and 1960s. Winnicott describes the developmental process of the individual as one moving from absolute dependency, at the time of birth, toward independence. This process is not foreordained but is an achievement requiring a *good-enough environment* that enables the individual to develop "the capacity to be alone." Winnicott captures the link between healthy individual development and a providing social world, internalized in the person, characterized by a community of loving and caring others.

The struggle for recognition—being known and knowing others through love, respect, and self-esteem—describes for Honneth and Benjamin an imperative that defines the human project in a social world. Recognition as a concept draws upon both Hegel and post-Freudian psychoanalytic thought, and its achievement can become derailed as a result of interpersonal failures (the focus especially for Benjamin) linked to inadequacies in the social environment. At the same time, recognition also establishes normative criteria upon which contemporary societies and the social relations they engender are understood as deficient. The grounds for transformative political action are defined by the struggle to produce the conditions that enable recognition.

AMERICAN STRUCTURAL FUNCTIONALISM AND SOCIAL SCIENCE

Among American theorists of the twentieth century, Talcott Parsons, more than any other, has been interested in integrating Freudian thought within a fully elaborated social theory. Parsons identifies as the central sociological question the problem of social order—the Hobbesian problem—or how potentially egoistic and conflictual aspects of human nature are inhibited so as not to destroy stable social relationships. In synthesizing the writings of Weber, Durkheim, Pareto, and other European theorists, Parsons identifies various structural arrangements that function in order to generate order, including the deployment of legal and political authority and the institutionalization of patterns of lawful economic competition. But he argues, in addition, that social order possesses a crucial affective component, a primary attachment of individuals to goals and rules of social action that link them both to the particular social relations of families and to more generalized normative models of rule-governed behavior. Parsons utilizes psychoanalysis both for a "theory of action," in which individual motivation is understood as intrinsically necessary to social structure, and a theory of how, through the process of socialization, social actors internalize cultural symbols and values. Within social theory, Parsons argues, a remarkable convergence occurs between Durkheim, who, beginning from the social whole, theorizes about the ways in which individuals internalize collective norms and values, and Freud, who, starting from the individual personality and the acquisition of the superego, theorizes about the internalization of collective norms and values in the individual. For Parsons, seeking a grand, synthetic theory of society, the fundamental differences between Durkheim, who denies individual monism, and Freud, who built a science based upon it, are of far less interest than the ways in which the former turned to the problem of individual internalization and the latter moved toward a theory of object-relations to each produce a rendering of the articulation of the social whole through its individual participants.

Writing about psychoanalysis and theory mostly in the 1950s and early 1960s, Parsons offered a complex theory of the interchange between personality and social structure that was far less critical and pessimistic than those writing in the tradition of critical theory. While documenting the sources within the individual personality for social strain, Parsonian theory nonetheless emphasizes the complementarity between individual and society, social institutions as mediating agencies, and the mutually reinforcing forces that produce and reproduce social order. The result is a theory of social structure and function whose analytical focus is to describe the forces that naturally move a society and individuals toward equilibrium and stasis rather than those that account for conflicting interests between individual and society.

Various students of Parsons have built upon his work to further develop a psychoanalytically informed social science. Philip Slater (1963), for example, in an article that appeared in the *American Sociological Review,* argues that

while social systems depend upon libidinal diffusion, social anxiety encourages regressive impulses that threaten the social collectivity. Here he offers his response to Freud's concern with the power of Thanatos in social life. Particular institutions, Slater claims, like the incest taboo, marriage, and socialization necessarily counteract those threatening impulses and attempt to preserve libidinal attachments to the broader collectivity. And Neil Smelser, Parsons's research assistant for his most explicitly psychoanalytic book, *Family, Socialization and Interaction Processes* (1955), undertook a full clinical training in psychoanalysis. During the course of Smelser's own career as a sociologist at the University of California, Berkeley, he has considered psychoanalysis and its relation to sociology both in terms of the epistemological and methodological obstacles to interdisciplinarity and the rethinking of defense mechanisms in light of an elaborated understanding of the social contexts in which they operate. His engagement with these themes culminated in *The Social Edges of Psychoanalysis* (1998), a collection of his psychoanalytic-sociological essays. In 1997, Smelser delivered as a presidential address to the American Sociological Association, "The Rational and the Ambivalent in the Social Sciences." Not since 1939 on the occasion of Freud's death when the *American Journal of Sociology* devoted an entire issue to Freud and sociology has psychoanalysis been as prominently represented in the field.

These metathemes of civilization, Thanatos, and guilt have not been the only ones in which social theory has engaged psychoanalysis. Since the 1913 publication of *Totem and Taboo,* where Freud declares the birth of culture as a result of the killing of the primal father, anthropologists have been in dialogue with psychoanalysis, at a more microlevel, concerning culture, its meaning, and the relation between cultural forms and its carriers. The dialogue, at times, has paralleled that of metatheory, especially as it has focused on issues, for example, of the universality of the Oedipal complex and other bioevolutionary and instinctual universals underlying culture. But less controversial for psychological anthropology are the Freudian-inspired ideas of the pervasiveness in all cultures of sexuality, aggressivity, attachment, and loss, and the interest in understanding their cross-cultural variation. Significant debates are ongoing about the interrelation between individual personality and cultural forms. Do socialization practices reflect the disciplining of individuals to conform to specific cultural or social forms? Or does the reality of instinctual needs driven by the individual—even the child—require a more complex understanding of the dynamic relation between personality and culture? How might one better understand the interpenetration of conflictual intrapsychic patterns alongside the presence of a multivalent culture? These themes have been explicitly explored in, for example, Jean Briggs's (1998) *Inuit Morality Play: The Emotional Education of a Three Year Old.* A Durkheimian-inspired understanding

that social and cultural organization precedes the individual and creates and shapes the individual's worldview and orientation to social action, in short, vies with a Weberian nominalist effort to characterize individuals ideal-typically. As Gannath Obeyeskere (1990) in *The Work of Culture* observes in support of this latter rendering, anthropology is an enterprise that, in order to explain cultural forms and their transformations over time, requires holding an idea of the interpenetration between a personal symbol—based on the personal life and experience of individuals—and the cultural symbol that helps to shape for individuals their experiences of social reality. Here, external reality and individual perception are not easily parsed, an insight profoundly indebted to Freudian psychoanalysis and one that requires the anthropological quest to generalize ideal-typically about the "native's point of view."

POSTSTRUCTURALISM, POSTMODERNISM, AND FEMINISM

The publication in 1974 of Juliet Mitchell's *Psychoanalysis and Feminism: A Radical Reassessment of Freudian Psychoanalysis* marked the resurgence of psychoanalysis as political critique, and psychoanalytic ideas now remain as an integral component in contemporary feminist criticism. Indeed, through feminist discourse, psychoanalysis persists as a key contributor to contemporary social theory. *Psychoanalysis and Feminism* signaled to those interested in feminism, by a writer whose credentials were already well established as a feminist, that psychoanalysis could not be ignored in a social analysis of the sources of sexual oppression. The broadly based receptivity of contemporary psychoanalytic writings, as in the works of Nancy Chodorow, Jessica Benjamin, Jacqueline Rose, Helene Cixous, Luce Irigaray, Julia Kristeva, and Judith Butler, were enhanced by Mitchell's assertion of the significance of psychoanalytic thought in feminist social analysis.

Mitchell reinterpreted Parsons's model of unconscious identifications and gender roles as fruitful difference and complementarity to be, rather, a description of socially enforced deficit and inequality. She is a British socialist influenced by Lacan and the French Marxist Althusser, who argued that Freud, despite clear evidence of his own misogyny, nonetheless provided the theoretical basis to understand how masculinity, femininity, heterosexuality, and gender become deeply inscribed in the individual psyche. Psychoanalysis demonstrates the cultural basis of patriarchy, not its naturalness; it also explains, Mitchell argues, the reasons for its deep resistance to change. At the same time, the psychological basis for sexual domination provides a theory for its radical undoing, though mindful of the power of the idea in reproducing gendered inequality.

Yet the widespread invocation of psychoanalysis on behalf of a feminist social analysis implied no unanimity in

terms of its application: It has rather helped to define the terms of the debate. On the one side, engaging directly with Mitchell's work are feminists, largely in Europe, who understand sexual domination as a function of language and discourse and as hinging on the perception and acceptance of unequal genital difference: the phallus and its lack. Building upon Foucault, Althusser, and Lacan, the prism of explanation for domination is the historical development of gender dualism in which man is viewed as self-determining and autonomous and woman as Other. Language itself encodes definitions of gendered identity; as Lacan argues, entry to the symbolic realm is subordination to a structure of distinctions that position individuals almost irretrievably in a cognitive prison in which only certain thoughts and desires are thinkable. Psychodynamically, the Oedipal father is decisive in reinscribing sexual difference and establishing phallic primacy from one generation to the next. The works of Irigaray, Cixous, and others are reactions against the formulation of women as lack, but they nonetheless provide an alternative linguistic rendering to account for gendered difference. Still interested in the Oedipal triangle and the failure of mothers to resist the passing on of male domination, these authors assert nonetheless the possibility for "women's language" and "writing the body" that valorizes feminine experience and the female body.

North American feminists provide an alternative theory to explain gender domination, though one no less inspired by psychoanalysis. But unlike the Lacanian and neo-Lacanians described, these writers rely on Freudian and post-Freudian insights on the pre-Oedipal object relations ties, especially between child and mother—"the first bond," to help explain gendered inequality. Nancy Chodorow (1978), in *The Reproduction of Mothering,* describes the intense identification that occurs, in isolated middle-class mother-dominated child-rearing families, between mothers and daughters, creating in girls a more fluid and relational sense of selfhood, as compared to boys, and establishing in girls the capacities and desires for mothering. Boys tend to more sharply individuate themselves against their mothers, simultaneously becoming more autonomous and emotionally constrained. Jessica Benjamin (1995) in *The Bonds of Love, Psychoanalysis, Feminism and the Problem of Domination* similarly focuses on the pre-Oedipal experience, emphasizing the writings of Winnicott rather than Freud's, to explore the psychological persistence of gendered inequality in a social environment that, in all other respects, celebrates formal equality. Domination, she argues, is a complex social process deeply intertwined in family life, sexual relations, and other social institutions, and has it roots in the earliest patterns of relatedness between mothers, fathers, and boys and girls. Dorothy Dinnerstein and Carol Gilligan too share in this perspective in which pre-Oedipal gender relations are identified as crucial dimensions of social inequality.

CONCLUSION

The relation between psychoanalysis and contemporary social theory remains a vexed one. In one respect, postmodernism and poststructuralism reject a conception of a generalized human nature, the idea of an immutable psychic structure, a sense of the "knowability" of an individual, as well as a concept of the singularity of the self. But while in certain ways Freudian psychoanalysis has been an easy foil by which to articulate a more relativistic, contextually based, skeptical, and multivalent understanding of the person and his or her relation to the social world, it has not withered in the face of its detractors. In fact, it has demonstrated over the last century a rather remarkable resilience, revealing a dynamic capacity to address similar challenges within its own discursive frame. Thus, an emphasis on a one-person psychology has given way to elaborated conceptions of intersubjectivity, drive, or instinct theory to object-relatedness, the primacy of the Oedipal triangle in defining the parameters of the adult personality to pre-Oedipal dyadic patterns. To current epistemological challenges about historical objectivity and certainty, it has offered its own reformulations, inspired by Freud himself but also employing post-Freudian analysts, about memory and the reconstruction of the past. In sum, as a result of its own adaptability to new understandings and sets of concerns, psychoanalysis has proven to be an inestimable resource for present-day social theory. Indeed, as contemporary theory increasingly turns toward issues of selfhood, identity, intimacy, and sexuality in the postmodern condition—questions that directly engage the relation of the individual to the social world—it is now no longer conceivable to consider social theory without psychoanalysis as a dimension of it. Beyond that, psychoanalysis helps frame the question that has organized theoretical argument throughout the twentieth century and into the twenty-first: Is the individual unconscious a deposit of the cultural and social world that surrounds it, or does it possess imaginary possibility, relatively immune to social determinations, that is capable of transforming the social world on behalf of the human being? This is the question Freud originally posed, and in various respecifications, it continues today to structure theoretical controversy.

PUBLIC SPHERE

The public sphere describes a space of reasoned debate about politics and the state. The public sphere is the arena of political participation in which ideas, alternatives, opinions, and other forms of discourse take shape. We can recall the ideas of John Stuart Mill in *On Liberty* to think of the public sphere as the space in which persons come to join a contest over true, partially true, and wrong ideas about how the state and politics should address the major issues of the day. Along with debate, the public sphere also encompasses the arena of political action, by both individuals and groups. In modern democracy, the public sphere is, in particular, the arena of social movement activity, as collective action seeks to bring issues to the fore that have hitherto been excluded from, or at least marginalized in, the important political debates of the day. As a space of collective action, the public sphere encompasses both narrative and textual discourse (which includes speech, journalism, letters, articles, broadsheets, songs, popular theater, etc.) and performative actions that communicate about politics (which includes all the forms of contentious demonstration or protest that remain civil, even if civil disobedience, and peaceful).

The contemporary theory of the public sphere is rooted in the work of the Frankfurt School and critical theory. Jürgen Habermas's 1962 dissertation, *The Structural Transformation of the Public Sphere: An Inquiry into a Category of Bourgeois Society,* provided a clear history of the development of public debate about politics in various European settings in the eighteenth and nineteenth centuries. Great Britain was the case in which the public sphere developed earliest and most fully, and Habermas traces the emergence of debate in salons, letter writing, and other venues. He identifies the public sphere as a space opened up by private citizens who took control of political debate from the state. Habermas identifies a free public sphere open to the participation of all comers as a prerequisite of democracy; indeed democracy is staked on the equality of entry and participation in the public sphere. Yet, by the 1950s, Habermas concluded that the mechanisms of communication in the public sphere were increasingly controlled by a few, small corporate concerns. The advent of big media threatened (in the late 1950s) a privatization of the public sphere, privileging the concerns of big media and corporate power. Public debate and with it liberal democracy, Habermas concluded, were under grave threat.

Habermas's work was well ahead of its time. These are the debates that emerged in the Anglo-American world only after the 1970s. Habermas's dissertation was not translated into English until 1989, and discussion of the public sphere in the Anglo-American world remained somewhat muted until then. Meanwhile, Habermas continued to develop his interest in the communicative politics of public interaction; moreover, he was searching for ways to understand the potential for public politics and social transformation in the contemporary era. Through the 1970s and 1980s, he developed the theory of communicative action, as a way of understanding how public politics could proceed to empower ordinary people even in a situation where the mass media really reflected the views of a small corporate oligarchy and sought to control and constrain public debate (the opposite of the public sphere's origins in free, equal, and reasoned debate).

In 1989, Habermas's original 1962 dissertation on the public sphere was translated into English, sparking a major debate in the Anglo-American world. Social theorists and researchers of women's and other minority political communities took issue with Habermas's formulation of the open public sphere as a critical component of modern democracy. These critics noted that the public sphere that Habermas had discussed was in fact a highly exclusionary arena of politics, confined mainly to male, bourgeois, European (white), actors, leaving out of the story of the development of democracy other actors, who included the

vast majority of the population in Great Britain and other Western democracies—nonpropertied or less affluent males, the working class, women, members of the African and other diasporas, youth, homosexuals, and other marginalized groups. Yet these critics by and large remained open to the notion that public spheres were important to the development of democracy, and Habermas responded in the 1990s by formulating what he called a "discourse-centered" theory of democracy that embraced the pluralist notion of dominant and popular public spheres that, along with the action of social movements, pushed democracy along even while the bourgeois public sphere had been, according to his earlier analysis, largely co-opted by private, market forces in the mass media.

Other researchers began to develop empirical analyses of the kinds of historical and documentary evidence that supported a thesis claiming that the public sphere was a crucial feature of modern democracy. By the late 1990s, the public sphere literature had broadened to include not only the dominant public sphere controlled by privately owned mass media but also the actions of social movements and other collective actors that created popular and oppositional public spheres that described the actions of "counterpublics" striving for inclusion in public politics. Understandings of the public sphere by this point now included not only media studies but also social movement studies, feminist theory, African American and Afro-diaspora politics, queer theory, and studies of popular movements and collective action in general.

These developments in public sphere studies were matched in the real world of politics by the "Third Wave" democratizations in Southern Europe, Latin America, and across the developing world. The Third Wave began in the mid-1970s in Southern Europe, exploded in the 1980s across Latin America, and in the 1980s and 1990s came to affect countries across the developing world. Latin American analysts, in particular, have been keenly aware of how movements to develop public politics were key forces that helped to destabilize military regimes and hasten their exit from power. At this time, we see the reemergence of civil society in writings on democratization and transitions from authoritarian rule, which is matched by the emphasis on voluntary organization and civil society in both the analysis of and political discourse of neoliberalism, the political philosophy and program that emerged from the Thatcher and Reagan administrations in Great Britain and the United States, respectively. In development programs supported by the World Bank in the developing countries, for example, we see an emphasis on the participation of persons affected by development through civil society and social movement organizations in a way that explicitly acknowledges the role of public politics in the implementation and success of policies.

Q
QUEER THEORY

Queer theory has its roots in poststructuralism and literary deconstructionism. Hence, the works of Foucault, Derrida, and Lacan are seen as largely influential. Queer theory is tied to the rise in multicultural theory in sociology. Both of these in turn owe much to the rise of postmodern social theory in helping to give voice where none had previously been present.

The rise of poststructuralism played an especially important role in setting the stage for queer theory. Counterintuitively, one reason for this is that poststructuralism leaves a lot of unanswered questions. In fact, poststructuralists delight in their belief that there is no single answer to any question. While this may be frustrating to many, it is also a source of joy and freedom for many others. It promotes the tearing apart of existing social theories by subjecting them to harsh critical analysis and ultimately stimulates many to be revised, re-envisioned, and improved, thereby leading to a strengthening of such theories. Poststructuralism also has the positive side effect of promoting the idea that all social phenomena can, and should, be deconstructed. This idea is similar to the mainstream sociological goal of debunking social myths and shows how poststructuralism can provide many valuable insights for those who have been oppressed, ignored, or silenced by social theory.

One of the key contributors to poststructuralism, as well as one of the most influential founders of queer theory, is Michel Foucault. Specifically, two of Foucault's main ideas—"archaeology of knowledge" (1966) and "genealogy of power" (1969)—have had the greatest influence. The archaeology of knowledge represents a search for the universal rules that govern what can be said in a particular discourse at a given historical moment. Foucault's goal is not to develop a traditional understanding of these documents but rather to describe them, analyze them, and organize them. He does not believe that one can, or even should, pinpoint origins. The focus should be on analyzing what actually is, not where it came from. This idea has been readily adopted by queer theorists as they also frequently proceed with a goal of understanding, not defining.

A genealogy of power for Foucault represents his concern with what he saw as the inextricable linkage between knowledge and power. Genealogy as a method of intellectual history is very distinct in that it does not seek to describe things based on the lawlike ways they unfold or even on their arrival at a given historical goal. Instead it outlines their trajectories, which are seen as open-ended, thereby allowing for a multiplicity of pathways. Thus, everything is relational and contingent. Genealogy also implies an inherent criticism toward the way things are perceived to be "naturally" (i.e., men and women, heterosexuals and homosexuals, etc.). This idea has become a cornerstone of relational politics and queer theory alike as they seek to disrupt notions of essence and "natural" identity.

The genealogy of power also demonstrates an interest in how people regulate themselves and other members of society through the production and control of knowledge. Although Foucault is interested in the ways in which the power derived from knowledge is used to dominate society by members of the ruling class, he does not see those elites as consciously exerting their rule. Instead, he is more interested in the structure between knowledge and power than with the actors and their positions within that structure.

It was not until the groundbreaking work of Michel Foucault ([1978]1980) that the topic of sexuality, and homosexuality in particular, was given much attention in academic environments. The founding fathers of sociology had paid little, if any, attention to such issues. There was, however, some interest in topics related to sexuality and homosexuality prior to Foucault, although much of it took place outside the discipline of sociology. Alfred Kinsey and

Sigmund Freud, for example, both explored various tenets of sexuality and disrupted many of the traditional ways of thinking about the issues related to the topic. It was not until the work of Foucault, however, and especially in the late 1980s, that an independent area of queer theory first began to take hold in the academy.

The onset of the public attention given to the AIDS epidemic, combined with liberalizing attitudes toward homosexuality, fostered an environment in which lesbian and gay studies were finally able to take hold in academic settings. It was during this time (roughly the mid to late 1980s) that many in academia sought to stake out the boundaries of what it meant to be gay or lesbian and wanted to advance causes that related specifically to these identities. This parallels the rise of interest in identity politics that was also occurring at this time. However, a transition similar to the one that turned interest from identity politics to relational politics also occurred in lesbian and gay studies leading to the emergence of a field of queer theory.

The term "queer theory" was specifically chosen by those in the field over "lesbian and gay studies" because of the fixed identity and exclusivity the latter term seemed to imply. One of the goals of those interested in the topics that would become queer theory was to displace many of the commonly held notions about lesbian and gay people and to, in fact, destabilize those categories of identity. Hence, an area known as lesbian and gay studies would seem contradictory and confining. Such a limited term would also seem to exclude many who have found refuge in queer theory, such as transsexuals, transvestites, sadists, fetishists, and others whose sexuality has been labeled deviant.

The use of the word *queer* carried a negative connotation for many decades. Since the Stonewall Revolution of 1969, however, a number of gay and lesbian advocacy groups have made gallant strides in reclaiming the word and transforming it into a neutral, if not positive, term. It has since come to represent not that which is different in an inherently negative way but, rather, that which is different in a unique, liberating way. Groups such as ACT UP (AIDS Coalition to Unleash Power), which rallied in support of bringing increased attention to the AIDS epidemic, were particularly influential in this battle.

Although it is hard to define any particular identifying characteristics of queer theory (in fact, most queer theorists would abhor such an attempt), Arlene Stein and Ken Plummer (1996) have noted several "hallmarks" of queer theory. First, there is a conceptualization of sexuality in a way that views sexual power located in different aspects of social life. This power is given form discursively and is enforced and reinforced through the policing of boundaries and polarizing binary divides. Second, there is an attempt to displace categories of sex, gender, and sexuality. A lot of work has been done in queer theory to call into question the uneasy concept of identity in general and, more specifically, how we claim to know identity. Third, many in the field reject civil rights strategies "in favor of a politics of carnival, transgression, and parody which leads to deconstruction, decentering, revisionist readings, and an anti-assimilationist politics" (p. 134). Fourth, there is no opposition to doing work in areas not normally thought of as related to sexuality, and there is a desire to reinterpret texts through "queer readings," which are viewed as heterosexualized or not sexualized at all.

The emergence of queer theory led to an understanding of the identity of the homosexual that is both comparable to and contrastable with the identity of the heterosexual. It also allowed for the homosexual to be taken as a subject in and of itself. Queer theory is often seen as a standpoint theory, one that is particular to the viewpoint of sexuality, and most usually homosexuality. It seeks to insert the social location and viewpoint of homosexuals and others labeled as sexual deviants into the mainstream of social theory.

Queer theory is more complex than this, however, and Steven Seidman (1994) would argue that what sets queer theory apart is its rejection of any single unifying identity. Instead, individuals are seen as composed of multiple identities that are all unstable and always shifting. In this way, Seidman believes that queer theory is moving away from a theory of the homosexual and in the direction of a more general social theory, especially a more general postmodern social theory.

Diana Fuss (1989, 1991) is another theorist who is pushing to move queer theory beyond simply a heterosexual/homosexual dichotomy. Fuss believes that the "interior" of an identity is primarily constituted by reference to its "exterior," or that which it is not. Hence, she argues that heterosexuality and homosexuality are each given meaning only by virtue of their relationship to the other; they are what they are because of what they are not. Fuss believes that asserting an identity as queer only helps to validate the existing dichotomy and its consequent oppression. She contends that a more relational approach should be taken to issues of sexuality.

Jennifer Terry (1995) argues that the category of homosexual has always been thought of as something that lies distinctly separated from and most generally opposed to the category of heterosexual. Terry also speaks to how the body is an important factor in maintaining this distinction. Homosexuals have been maintained at a safe distance from heterosexuals first through an implication of biological differences, then with Kinsey through statistical differences (although Kinsey's distinctions brought up the unsettling problem of the possibility of anyone being capable of being a homosexual), and finally back full circle to many modern-day arguments that homosexuality is indeed biologically determined. "It would appear that a century-old tendency toward binary thinking that separates a friendly 'us' from a dangerous 'them' makes great use of the body as a site wherein difference is imagined to materialize" (p. 163).

Scientists and laypeople alike have been interested in how to determine if one is gay or straight since the term *homosexual* first appeared in Germany around 1869 (Terry 1995:131). It seemed immediately necessary to make clear who was and, more important, who was not a homosexual. As noted above, scientists originally, and once again in recent years, turned to the physical body for signs of determining sexual orientation. Although they are no longer searching for signs of degeneracy (at least not as often as before), they are still using the body as a means of making definite determinations of sexual orientation (through things such as the search for the gay gene or assertions that gay men have larger fingers, etc.). Terry argues that the body is still considered an important source of information for trying to determine the sexuality of individuals and that this information is then used to categorize and, often, oppress them.

The nonscientific community has more commonly relied on another means of determining sexual identity—namely, gender. In fact, Seidman (2002) argues that gender is the principle means for determining sexual identity in contemporary American society. In addition, Butler (1990) sees the equation of sex equals gender equals sexuality as the dominant paradigm in most of America, and she seeks to unsettle this cultural fallacy. She makes the sex/gender/sexuality connection in the examples of employment and sexual harassment by saying,

> Gay people, for instance, may be discriminated against in positions of employment because they fail to "appear" in accordance with accepted gender norms. And the sexual harassment of gay people may well take place not in the service of shoring up gender hierarchy, but in promoting gender normativity. (p. xiii)

Whatever methods are used to identify homosexual individuals, the goal is almost always the same—to keep the dividing line between heterosexuality and homosexuality clear and present.

Eve Kosofsky Sedgwick is one of the pioneering queer theorists who has helped conceptualize this dividing line between straight and gay. In her book *The Epistemology of the Closet*, Sedgwick (1990) explores the concept of the closet, which she believes is "the defining structure for gay oppression in this century" (p. 48). The closet is paired against "coming out" as two concepts that have come to respectively represent the secrecy and revelation of almost any "identity" that is seen as politically charged. In particular, these ideas seek to crystallize the identity of the homosexual. The term homosexual itself has been resistant to efforts of deconstructionists, not because it is particularly significant to those who are categorized under its label but because it is considered invaluable to those who wish to categorize themselves outside that label.

Another innovative idea derived from Sedgwick's piece is that one can never truly be out of the closet. No matter

how many times people reveal themselves and their "true identity" (a concept she clearly does not agree with in the first place), they will still most likely find themselves in situations in the future in which it will be necessary to do so again. Hence, the process of coming out is a never-ending one. Another important question posed by Sedgwick is coming out to where? After people come out of the closet, where does this leave them?

Similar to Foucault's interest in the genealogy of power, the relevance of coming out also constitutes a knowledge-power relationship for Sedgwick. The ideas are based on secrecy and outings. It creates possibilities for others to gain power by using knowledge of one's sexuality against him or her. It can also lead to other forms of power found in knowledge that are not reducible to other understandings of a knowledge-power relationship.

Another of the most influential queer theorists, and also one of the most influential feminist theorists and social theorists more generally, is Judith Butler. For Butler (1997), sexuality is simply a performance based on repetition. Compulsory heterosexuality, through its constant repetition and enactment (even many times by those who are not heterosexual), has come to lay claim to titles of what it means to be "natural" or "normal." In this way, homosexuality is seen as a copy, albeit a far inferior copy, of heterosexuality. However, since Butler views all sexuality as a repetitive performance, there can be no original template and hence no inferior version. She argues against the idea that the performance of sexuality is in any way an expression of "a psychic reality that precedes it" (p. 309).

Sexuality, then, is considered a form of drag. Individuals do not always consciously "perform" their sexuality, but there is a performance going on nonetheless. This idea led Butler to offer something of a solution to the crisis of compulsory heterosexuality. She posits the idea of a "repetitive disruption," which would be one way that sexuality could work against identity. In this way, although no true stable identity would come to light, there would be the hope "of letting that which cannot fully appear in any performance persist in its disruptive promise" (p. 313).

For Butler (1993), as for many other queer theorists, the use of the term queer, because it can be so broadly defined and so easily co-opted by a wide spectrum of "identities," more often implies an anti-identity, or even a nonidentity, than a stable, discernable group of people. Butler believes that it is this sense of a nonidentity that helps make the use of the term queer so effective because it calls into question our sense of what constitutes an identity at all. In this way, the term queer and the broader concept of a queer theory are both ideas that have no predictable direction because they are in a constant state of formation and reformation.

Overall, queer theory has sought to do what many other newly emergent disciplines have sought to do—disrupt the

accepted hierarchies of privilege and dispel myths related to identity. In fact, queer theory has sought to dispel the notion of identity in its totality. It is difficult to predict exactly where queer theory will be led in the future, but it seems apparent that it has already made a number of inroads into the established world of academia and that it has provided insights considered invaluable to academics and laypeople alike.

R

RADICAL FEMINISM

This strand of feminist ideas and practices has as its hallmarks a disdain for, if not rejection of, hierarchy and a commitment to cultural as well as political transformation. Seeking more than the reformist measures associated with liberal feminism, radical feminism can be seen as revolutionary or at least aiming at wholesale rather than piecemeal social change. During the nineteenth and early twentieth centuries, such feminist luminaries as Lucretia Mott, Sojourner Truth, Matilda Joslyn Cage, Angelina and Sarah Grimke, Ida Wells-Barnett, and Charlotte Perkins Gilman forged strong grounds for radical feminist theory. Their work was pivotal in, though not typical of, the *first wave* of feminism during that time period, which began receding from public attention as Western women's right to vote gained constitutional stature.

During the 1960s, radical feminism found renewed, powerful expression in Western societies. In the hands of theorists such as Eve Figes, Shulamith Firestone, and Kate Millet, radical feminism took a shape that both linked it with and distinguished it from New Left politics. During the 1970s and early 1980s, this *second wave* of feminist expression produced pathbreaking works such as Sheila Rowbotham's *Women, Resistance, and Revolution* (1972), Ti-Grace Atkinson's *Amazon Odyssey* (1974), Adrienne Rich's *Of Woman Born: Motherhood as Experience and Institution* (1976), Susan Griffin's *Pornography and Silence* (1981), and Kathleen Barry's *Female Sexual Slavery* (1984). Figures such as Gayle Rubin and Mary Daly emerged as still other influential purveyors of a feminist vocabulary built up around the notions of oppression, exploitation, patriarchy, domination, and resistance. Unlike their liberal feminist counterparts, these radical theorists emphasized transgressive and subversive tactics for overhauling social structure. They built their frameworks around the understanding that *the personal is political*—that is, that power pervades human association and shapes the structures wherein some groups, such as men, dominate and oppress other groups, such as women. From their perspective, the personal and interpersonal levels demand critique and transformation just as thoroughly as large-scale organizations and the institutional order do.

One of the best-known radical feminists who emerged during this period is Angela Y. Davis. Her political activism brought her notoriety in many circles. The publication of *Women, Race & Class* (1981) gained her attention in academic circles. Davis's book includes an incisive survey of the class and racial biases that had infiltrated first-wave feminism. Alongside her historically grounded critique Davis offers a parallel critique of her contemporary radical feminists. In the antirape movement spearheaded by radical feminists, for example, Davis finds considerable racism centering on stereotypes of African American men as rapists. Working mostly from a Marxian perspective, Davis links women's and other groups' political struggles and treats them all as necessitating the defeat of monopoly capitalism. From her perspective, femininity is above all an ideology of inferiority produced primarily by industrialization, which displaced women's productive labor in and around the household. Eradicating that ideology, then, means eradicating the conditions of its genesis and development.

More than 15 years later Davis published *Blues Legacies and Black Feminism* (1998), which focuses on how working-class African American women's feminism found powerful expression in their contributions to blues music. Centering on the works of Bessie Smith, Gertrude "Ma" Rainey, and Billie Holiday, this study provides rich empirical grounds illustrative of Davis's earlier contentions about the linkages among race, class, and gender in capitalist economies. At the same time, it offers historical insights into African American women's contributions to feminism that amount to a cultural and political legacy that bears further investigation.

Although Davis herself introduced few, if any, new terms into the feminist vocabulary, one colorful contribution of radical feminist theorists has been their distinctive vocabulary, which includes a variety of neologisms. Daly can scarcely be outdone on this front. With *Gyn/Ecology: The Metaethics of Radical Feminism* (1978) she introduced a variety of hard-hitting terms such as *anti-androcrat* and *Amazon Voyager* unlikely to win respect in mainstream contexts, including academe where she herself labored as a feminist theologian. Robin Morgan (1982:8, 106) introduced the notion of "sexual fundamentalism," which involves suppressing sexuality or denying its joyful character, and emphasized how women have gotten saddled with religion in lieu of philosophy and morality in lieu of ethics as well as other male-serving displacements that further feminine inferiorization. Ann Ferguson added to the vocabulary of male dominance and oppression the notion of "gyandry," aimed at valorizing distinctively female resources. Much in the spirit of radical feminism, Ferguson (1991:211) argued that the "gynandrous" ideal is preferable to the "androgynous" one because femininity itself has to be appreciated in order to promote an "autonomous yet caring" personhood that transcends the limits of androgyny within patriarchal systems. In all this work, although more explicitly in some, women's desires and sexuality and pleasure get priority alongside women's other rights and needs.

Widely portrayed as man hating and male bashing, radical feminists deny the efficacy of gaining women's rights and equality by relying primarily or even heavily on the law and public policy. The world of everyday life thus commands a lot of their theoretical and practical attention. As radical feminist Andrea Dworkin (2002) puts it, "The worst immorality is in living a trivial life because one is afraid to face any other kind of life" (p. 202). What Annie Rogers (1974) has called *ordinary courage* thus lies at the core of what radical feminism presupposes not only in theory but also in practice.

RATIONAL CHOICE

Rational choice's emergence within sociology began with the pioneering work of James Coleman in the 1960s. Drawing on the "purposive action framework" (see *The Mathematics of Collective Action,* 1973), he proposed an analysis of collective action that was eventually extended into analyses of social norms, marriage markets, status systems, and educational attainment (*Foundations of Social Theory,* 1990). His work established the theme that continued to define rational choice sociology, a focus on explaining macro-social phenomena in ways grounded in micro-social choices of social actors. As thus conceived, rational choice has two essential features. The first is a view of social action as purposive; thus behavior is oriented by a system of values, aims, or goals. The second is a commitment to some form of methodological individualism wherein social structures and institutions are viewed as the products of social action.

Coleman's approach to rational choice sociology drew directly on neoclassical economic theory. He viewed a wide range of phenomena in market terms. For example, a marriage system can be viewed as a market for mates in which those with highly valued attributes have the greatest value in the marriage market. Similarly, a status system can be viewed as a market for access to individuals with highly valued attributes. High-status people gravitate toward one another, thereby defining the upper reaches of the stratification system, and lower-status people have no choice but to settle for one another and thereby define the lower levels. This emphasis on market models carried over to Coleman's proposals for institutional design. The problem he addressed was the diminishing portion of the gross domestic product going to homes with children resulting from the increasing proportion of single-parent households. He proposed resolving this problem by creating a micromarket in child care services, in which families would earn governmental payments based on to their ability to raise effectively functioning children. The intended effect was to strengthen the incentives for families to invest in their children while also providing them with the resources to do so. Therefore, one form of market failure—a failure of the marriage market to provide adequately for the needs of children—was to be resolved through creating a secondary market. This approach resembles the economic approach to institutional design. For example, the failure of the mortgage market that contributed to the Great Depression of the 1930s led to the creation of a governmentally administered secondary mortgage market.

During this early phase, contributions to rational choice grew quietly, with contributions from a growing number of scholars. These include Anthony Oberschall's (1973) analyses of social movements, Heckathorn's (1983) analyses of

bargaining and networks of collective action, Pamela Oliver's (1980) work on the organizational processes underlying collective action, Karl-Dieter Opp's (1982) analyses of norms and social movements, and Lindenberg's studies of sharing groups (1982). While sharing Coleman's focus on explaining macro-social phenomena in ways grounded in micro-social choices of social actors, these works were grounded, not in microeconomic theory but, rather, either in various forms of social psychology, which had long been dominated by rational choice perspectives, or in game theory.

A second phase in rational choice's emergence within sociology began in the mid-1980s with the publication of two programmatic statements that called for its expansion (Coleman 1986; Hechter 1983). These statements emphasized the continuity between rational choice and traditional approaches to theorizing. For example, Coleman approvingly described Weber's explanation of bureaucratic, traditional, and charismatic forms of organization in terms of a microfoundation of purposive action. Weber was thereby embraced as the first rational choice sociologist. These programmatic statements were also critical of traditional approaches to theorizing in sociology and emphasized the unique contribution that rational choice could offer by providing a more nuanced means for analyzing the link between macro- and micro-social levels.

The essential theme in these statements, although not expressed in precisely these terms, was that the lessons from the collapse of structural functionalism had not been learned. For the widely condemned view of social actors as oversocialized had been replaced by a functionally equivalent "structural embeddedness paradigm" that viewed actors as mere puppets of the culture or structure in which they were embedded. The problem with this approach is that it precludes upward causation, from the micro- to the macrosocial levels. In contrast, the distinctive contribution of rational choice is to provide a framework within which the role of agency can be fully appreciated through analyzing the reciprocal process by which actors both transform the contexts within which they act and are, in turn, shaped by those structures.

The chapters in Hechter's (1983) book demonstrated the viability of this approach to a broad range of areas of macrosociology and social science theory in other disciplines. These include Mary Brinton's analysis of the Japanese family, Douglass North's analysis of institutional change, and Hechter's analysis of highly solidary groups such as charismatically organized religious sects using an expanded form of power-dependence theory. During this period, the growth of rational choice sociology was reflected in institutional developments such as the founding of the journal *Rationality and Society* in 1989 and the formation of a rational choice section in the American Sociological Association in 1994.

This period was also characterized by a vigorous debate between proponents (e.g., see Coleman and Fararo 1992) and critics (e.g., see England and Kilbourne 1990), a debate that also occurred within political science (see Friedman, *The Rational Choice Controversy,* 1995; Green and Shapiro, *Pathologies of Rational Choice Theory,* 1994) where the adoption of rational choice perspectives had occurred earlier. The harshest critiques came from postmodernists and some feminists who equated rational choice with what they saw as pernicious values. For example, Seidman (1991) portrayed a hypothetical rational choice scholar who was confronted by the criticism that the theory "devalues expressive, relational, feminine, and democratic values," as responding with the following statement: "As a utilitarian individualist who believes that male elites should rule the key social institutions, the social and moral implications of this discourse are fully consistent with [my] values" (p. 189). Thus Seidman depicts the rational choice scholar as a self-proclaimed elitist, sexist, and enemy of democracy.

Owing to this debate, four traditional critiques of rational choice came increasingly to be recognized as misconceptions. First, rational choice is not wedded to a grim view of actors as ruthless opportunists. Indeed, much sociological rational choice analysis focuses on altruistic and other nonegoistic behaviors (Hechter, *Principles of Group Solidarity,* 1987; Mansbridge, *Beyond Self-Interest,* 1990). Second, rational choice is not wedded to any particular political position. Rational choice scholars range from free-market conservatives (James Buchanan) through political moderates (James Coleman) to Marxists (Jon Elster [1990] and John Roemer). Third, rational choice theory does not require that actions have only intended consequences; indeed, primary emphasis has been placed on analyzing social dilemmas, such as the prisoner's dilemma, in which individually rational actions combine to produce a collective loss. Finally, rational choice is not an alien import, but as emphasized by Coleman and others (Swedberg, *Max Weber and the Idea of Economic Sociology,* 1998), it has deep roots within sociology, in particular the methodological individualism of Weber.

A third phase in rational choice's emergence within sociology began in the mid 1990s when it became apparent that the hopes of some, and the fears of others, were disappointed. Rational choice did not sweep the discipline. Instead, it took its place as one among many alternative approaches in general sociological theory. Significantly, this development occurred at a time when the decline of general sociological theory was continuing, because for decades the principal focus of intellectual action within the discipline had been shifting to substantive fields such as inequality, organizations, and political sociology. It is within these more intellectually active fields that rational choice has continued to expand. It has also become increasingly interdisciplinary,

drawing on and contributing to the works of scholars from economics, political science, anthropology, law, and philosophy. This expansion has also been accompanied by a shift in the microfoundation of rational choice theory toward less reliance on microeconomics and social psychology and greater reliance on varying forms of game theory.

This expansion continued in the area in which rational choice first became prominent, social movements and collective action. Marwell and Oliver (*The Critical Mass in Collective Action,* 1993) had argued that contrary to conventional wisdom (see Olson, *The Logic of Collective Action,* 1965), increases in both group size and heterogeneity promotes collective action. This occurred, they argued, because the larger and more diverse a group, the greater would be the number of individuals with an especially strong interest in promoting collective action. This group would then serve as a "critical mass," which would trigger the emergence of collective action. This analysis considered only a single way in which collective action could be organized, voluntary cooperation in which each individual chooses independently whether to contribute to the collective endeavor. They therefore ignored selective incentives.

In contrast, Heckathorn (2002) showed that depending on the circumstances, heterogeneity can either promote collective action or it can cause the group to fragment into mutually antagonistic factions. The latter can occur when what is for some a collective good is for others a collective bad or when costs of contribution vary. Such cases are common in real-world collective action problems. For example, when environmentalists promote regulation to protect what they see as valuable and fragile ecosystems, the affected industries often complain about loss of jobs. The analysis further showed that polarization is especially likely when collective action is organized through selective incentives. For selective incentives compel even those who lack any interest in the collective good to contribute and thereby provide those individuals with an incentive to mobilize in opposition. This was an issue Marwell and Oliver did not consider, because they considered only voluntary contributions. However, public policies reflect recognition of the potentially divisive nature of selective incentives. Politicians are frequently reluctant to support use of public funds for controversial programs. For example, in New York, state-sanctioned needle exchanges do not receive public funds. They operate through private donations. This ensures that individuals who oppose these exchanges will not be taxed to support a program they do not agree with and thereby weakens their incentive to mobilize in opposition to the exchanges. This example illustrates the cumulative nature of theoretic development made possible by the theoretic coherence and constancy of the rational choice paradigm. For a detailed discussion and analysis of this cumulative development in collective action theories see Marwell and Oliver (2002).

Rational choice analysis also expanded to other core areas, including stratification. Roger Gould (2002) began by observing that analyses of stratification fall within two rival camps. Some view stratification as deriving from a system of domination, in which those occupying positions of power use it to maintain their privileges. Others view stratification in more meritocratic terms, as reflecting differing endowments of socially valued attributes. Gould constructed a model broad enough to encompass both models yet specific enough to provide testable hypotheses regarding when one or the other model, or a blend of the two, could be expected to apply. This was achieved by conceptualizing stratification as arising from two distinct processes. First, consistent with the assumption of bounded rationality, judging the attributes of others always involves uncertainty. Therefore, the judgments of others provide useful information through a relational signaling process. However, he showed that operation of this mechanism alone would trigger a positive feedback process that would produce implausibly high levels of stratification in which those with initial status advantages would gain ever-higher status. He then introduced a second opposing mechanism wherein offering recognition that is unreciprocated entails a risk of being placed in a socially inferior position. The resulting multimechanism model was tested and found considerable empirical support using several social network-based data sets. Gould's analysis shows how rational choice theory can provide the basis for theoretic integration of opposing models drawn from mainstream sociology into a consistent and coherent integrative model.

Rational choice theories of emotions have also been proposed. In complementary analyses, Robert Frank (*Passions Within Reason*, 1988) and Jack Hirshleifer (1993) argue that negative emotions such as anger serve to ensure the credibility of threats, while positive emotions such as love and affection serve to ensure the credibility of promises to cooperate. More generally, emotions resolve the "commitment" problem that arises when actors could benefit by entering binding commitments that they also would be tempted to violate. Frank and Hirshleifer's analyses draw on evolutionary game models of the sort popularized by Robert Axelrod's (1984) *Evolution of Cooperation.* They provide a game theoretically grounded account of both the conditions under which emotions are elicited and the form of emotions that arise in each setting, establishing in this way the link between emotions and rational action. Emotions serve somewhat like the bindings that prevented Ulysses from rushing toward the Sirens. Emotions block actions that are rational within a narrow time frame but irrational when more distant consequences are considered. In this way emotions confer survival advantages. This view contrasts sharply with the stereotypical view of emotions as producers of impulsive and irrational behavior. In the Frank and Hirshleifer models, emotions allow us to act in ways

compatible with our long-term interests, rescuing us from short-term maximizing that would be to our long-term detriment.

The Frank and Hirshleifer models provide complementary accounts of the role of emotions. Hirshleifer focuses on fundamental processes, such as the distinction between "affections," somewhat stable patterns of benevolence or malevolence such as love or hate, and "passions," transient orientations such as anger and gratitude that are triggered by specific acts. In contrast, Frank focuses on the structural implications of his account of emotions. He shows that when emotions are incorporated into economic models, a variety of new phenomena become explicable. These range from charitable giving and trust to the market failures that have led to government regulation of workplace safety, working hours, minimum wages, and savings for retirement.

Economic sociology has emerged as major area within sociology and also for applications of rational choice. This development results, in part, from the collapse of the Soviet Union in 1989 and associated events in East Asia that expanded the scope of economic sociology by eliminating all but a handful of noncapitalist economies. More important, it initiated a vast natural experiment on market transition. Many classic works in economic sociology, including Weber's *The Protestant Ethic and the Spirit of Capitalism* and Polanyi's *The Great Transformation,* examined the emergence of capitalism in Western societies. However, after 1989, market transition could be studied using contemporary intellectual and analytic tools. The result has been a growing body of rational choice-based work on market transition (Nee and Matthews 1996) that has substantially enriched the empirical literature in economic sociology. Important themes in the market transition literature include the displacement of political capital as the organizing principle of production by economic, human, and social capital, and debates about whether the transition process will produce market systems that converge or remain distinct.

Rational choice-based economic sociology has, in a sense, reversed what had originally been seen as the relationship between rational choice and economic theory. Whereas the earliest work in sociological rational choice relied on microeconomic theory as a foundation, in contrast, economic sociology focuses on what is left out of market models, including the webs of norms and the hierarchies in which markets are embedded and upon which they rely to establish and secure systems of property rights and define norms of economic conduct. Therefore, the analyses of markets on which economics has specialized is supplemented by analyses of hierarchies and norms, institutional forms about which sociologists have much to contribute intellectually.

Other areas in which rational choice sociology is expanding include gangs (Jankowski, *Islands in the Street: Gangs and American Urban Society,* 1991), medical sociology (Heckathorn 2002), sociology of education (Morgan 1998), organizations (Miller, *Managerial Dilemmas,* 1992), socialization (Yamaguchi 1998), preference change (Hechter et al., 1993; Lindenberg and Frey 1993), institutional analysis (Brinton and Nee 1998), the sociology of religion (Stark 1999), the family (Brinton 1993), trust (Cook, *Trust in Society*, 2001; Gautschi, *Trust and Exchange,* 2002), narrative analysis (Anthony et al. 1994; Kiser 1996; also see Bates et al., *Analytic Narratives,* 1998), immigration and assimilation (Alba and Nee, *Remaking the American Mainstream,* 2003), and historical analysis (Brustein, *The Logic of Evil,* 1996; Hopcroft, *Regions, Institutions, and Agrarian Change in European History,* 1999). Consequently, whereas rational choice as a part of general sociological theory has remained durable, its contributions are increasingly being made in the substantive areas in which the discipline has long been most intellectually dynamic.

As rational choice extends into the discipline's substantive areas, a clear theoretic core remains that renders the approach distinctive and provides the basis for communication among scholars working in disparate areas. This derives from the requirement that the criteria governing the choices of social actors be made *explicit.* It might seem that making an assumption explicit would be a minor matter. However, it has important implications, for it imposes a common structure on rational choice models. Each must specify a core set of theoretic terms, including (1) the set of actors who function as players in the system; (2) the alternatives available to each actor; (3) the set of outcomes that are feasible in the system, given each actor's alternatives; (4) the preferences of each actor over the set of feasible outcomes; and (5) the expectations of actors regarding system parameters. Rational choice models can also vary along many dimensions. They may be expressed mathematically or discursively; they can correspond to one-shot games in which an actor makes only a single choice or to processual models in which each actor's choices affect the conditions under which the actor and others will make subsequent choices; they may assume materially based instrumental preferences or include preferences for social approval, altruism, or justice; they may assume that information is complete (i.e., knowing the structure of the game, including others' preferences), perfect (i.e., also knowing others strategies), or incomplete and reflect either risk (i.e., knowing the probability of occurrence for each uncertain event) or uncertainty (i.e., not knowing these probabilities); they may include individual actors, corporate actors, or a combination of both types of actors. Despite such variations, because of the common structure of rational choice theories, they share a common theoretic vocabulary. This common vocabulary permits rational choice to function as the interlingua of the social sciences and ensures that theoretic developments in one substantive area will have implications

in other substantive areas, both within sociology and across social science disciplines.

RATIONALIZATION

The concept of rationalization as it is used in social science and social theory refers in general to complex processes in which beliefs and actions become more coherent, consistent, systematic, and goal oriented. It is often used to describe and account for large-scale social and historical processes, such as the increasing secularization of

society or the transformation from a traditional autarchic agrarian economy to a modern market-oriented industrial economy. Rationalization in these instances may involve the elimination of magic and superstition from religious belief systems in favor of the methodical systematization of rational beliefs and ethical norms. Or it may entail the shift from wasteful and hidebound labor practices to more efficient, calculable, and technologically adept modes of production. Rationalization can thus be both a social and a mental or intellectual process. In either case it involves organizing belief and action so as to maximize the probability of achieving a defined end: attaining a rational belief system and methodical way of life or attaining an economic system oriented toward improving the standard of living and increasing the production of wealth.

The concept of rationalization can also be used to describe and account for the internal logic of significant changes in belief systems, ideational forms, and action orientations. In this respect, what becomes most important is the increasing logical consistency and systematic coherence within a set of beliefs or a pattern of action. To gauge consistency, it is often useful to distinguish between formal and substantive rationalization of belief systems or moral and legal principles. In general, formal rationalization has to do with the logical consistency of rules or procedures and their application, while substantive rationalization is a matter of providing logical clarity to the content of a norm and its meaning. In addition, it is useful to recognize that when applied to action orientations, rationalization can be especially pronounced when a pattern of action is consistently goal oriented, purposeful, or instrumental, thus requiring a precise matching of means with ends and a calculation of intended and unintended consequences.

When employing the concept of rationalization, whether in its historical-developmental or logical sense, one should note that it is not identical to or synonymous with the notion of rationality. That is, a rationalization process or logic may be rational from one point of view but entirely irrational from another contrasting standpoint. This contradiction is particularly apparent when the different points of view are economic or political on one hand and ethical or aesthetic on the other. For example, technical rationalization leading to more efficient productivity may be rational if the economic goal is solely to increase wealth but entirely irrational if the ethical goal is exclusively the conservation and protection of endangered environmental goods. Or the formal requirement of "equal treatment" regardless of class, race, ethnicity, or gender may clash with the substantive aim of correcting a particular social injustice based on one of these differentiating ascriptive characteristics. The modern world is replete with these kinds of opposed standpoints and contradictions.

In social theory, the leading ideas about rationalization were introduced in their most striking form in the thought of

Max Weber (1864–1920). In his early work on agrarian economies, Weber was concerned with transitions from less developed to more highly developed economies. Building on an older language of economic types and developmental stages, he began to speak of a rationalization process characterized by structural differentiation in social organization, functional specialization in the division of labor, technological innovations, and a tendency toward secularization of culture. He saw that rationalization in these senses could occur internal to a specific sphere of activity in a given society, such as the economy of the large estates, the *Gutswirtschaft,* of eastern Germany, where economic, social, and political transformation was triggered in large part by technological innovations and the competitive pressures of grain production for an international market. In this instance, rationalized capitalism based on wage labor, oriented to the calculation of profit, and chained to the logic of competitive markets tended to undermine and supplant the older and traditionalist patriarchal systems of social and economic organization.

Weber considered the traditional forms of production and exchange doomed over the long term, as did a number of other political economists, including Karl Marx and Friedrich Engels. Like Marx and Engels, he thought the forces of capitalist production would eventually penetrate into the farthest reaches of the globe and affect every culture and civilization. The question was not whether it would occur, but how, when, where, and in what sequence. In the case of his own Germany, Weber recognized that politically powerful groups, such as the owners of the large estates in the eastern provinces, the Junkers, could attempt to resist and redirect such development. He believed, however, that such efforts would tend to increase rather than resolve economic and social tensions, and thus impede successful development. In an effort to counter resistance and educate skeptical contemporaries, as a young scholar Weber even devoted considerable attention to explaining the operation of the stock market as an efficient institutionalized mechanism for dealing fairly in an international competitive environment with commodity prices and capital accumulation. Later during World War I, much of his political writing about Germany sought to analyze the legacy of resistance to economic change and the prospects for recasting the national constitutional order and its basis in the socio-economic system.

Starting with these ideas about rationalization in the economic sphere, particularly as reflected in the development of capitalist modes of production in the West, Weber began to elaborate this grand theme in a number of ways. When discussing the categories of social action in *Economy and Society* (Weber 1968), for example, he postulated four possible action orientations: instrumental, or goal oriented; value oriented; traditional; and affective. His discussion of charisma and charismatic authority attached to the last

orientation, while the first (*Zweckrationalität* was his important term) gave him a powerful tool for understanding a particular type of rationalization that appeared to become increasingly dominant in the modern world and seemed opposed to the personal gifts associated with charisma. These notions were elaborated further and from a somewhat different historical point of view, addressed to the origins of particular forms of rationality, in *The Protestant Ethic and the Spirit of Capitalism* (Weber 1958a) and his later essays in the sociology of religion.

In these latter texts, much of Weber's most engaged thinking converges in one central location, the essay translated by Hans Gerth and C. Wright Mills as "Religious Rejections of the World and Their Directions" (Weber 1946), or more literally "Intermediate Reflections" ("Zwischenbetrachtung"). Noting that the world of human affairs can be conceptualized as consisting of different life orders or spheres of value—principally the ethical, economic, political, aesthetic, erotic, and intellectual—Weber suggested that each of these orders could be subject to the forces of rationalization, although in different ways, at different rates, and in different directions. (Paradoxically, each could also be reinterpreted and exploited *in opposition to* perceived threats of rationalization.) There was what he called an internal and lawlike autonomy, a logic to these orders that could be seen in increasing coherence and consistency in relation to postulated goals or ends. Economic examples, such as the introduction of wages and double-entry bookkeeping to calculate profit and loss more precisely, provide perhaps the most obvious instances of the application of instrumental, purposive, or goal-oriented rationality to a particular order. But this type of internal logic can take hold also even in religious ethics, with the development of a systematic and rational theology to deal consistently with problems of morality and belief, including in all the great world religions solutions to the challenge of theodicy. So it is also with the aesthetic and erotic spheres, the political order, and of course science itself, the sphere of knowledge and intellectual mastery of the world.

Weber wrote with great insight and imagination about a number of these orders himself. His theory of the origins of modern capitalism, tracing the "elective affinity" between an ascetic religious ethic emphasizing mastery of the self and the world (the Protestant ethic) and the spirit of capitalist enterprise is the most famous instance of rationalization associated with his contributions to social science. In this case, Weber explored the controversial connection between rationalization in the ethical realm and rationalization in the economic sphere and based on his investigations postulated *historical association* between the two, although not a causal connection. Historically, he found a social carrier of the new rationalist ethos in the voluntaristic Protestant sects, where a notion of vocation or calling encouraged mastery of the material world. For Weber, this concatenation

of circumstances accounted for the specific sites and eras in which modern capitalism emerged in world civilization. Although the sources for its emergence had long since disappeared, capitalism's legacy was for Weber the most powerful and fateful force in the modern world.

In addition, Weber's well-known theory of bureaucracy and the development of the modern administrative state was cast in terms of a historic and consequential rationalization of the political order, particularly in the West, where principles of rulership, authority, legitimacy, rule of law, and citizenship became institutionalized in particular political and legal arrangements. In Weber's view, expressed most concisely in one of his last speeches and essays, "Politics as a Vocation," the leading characteristics of bureaucratization in the modern state—specialization of tasks and jurisdictions, specialized training of salaried employees in a lifetime career, procedural rules for decision making, hierarchy of command, emphasis on achievement norms and impartial application of rules, and the tendency to monopolize information in recorded files—represented one of the most powerful instances of rationalization in the modern age. While sharply critical of this trend and concerned about its consequences for individual liberty, he saw it as an inevitable and irreversible outgrowth of the demands placed on the modern state to provide security and defense, social welfare and health, the means of communication, access to education, and a seemingly endless array of other public goods and services. He also understood that bureaucratization would be extended everywhere, into the modern business enterprise, the corporation, political parties, labor unions, hospitals and clinics, schools and universities, the workplace—indeed any kind of human association, whether voluntary or compulsory, that required organization in order to be effective. Like the forces of rational capitalism, bureaucracy seemed to Weber an inevitable consequence of the pervasive rationalization of the modern world, the extension everywhere of instrumentally oriented systems of action.

One of Weber's most unusual contributions was his exploration of the aesthetic value sphere, particularly the Western musical aesthetic. This untitled work was left incomplete and published posthumously. Indeed, Weber planned to write more extensively on art, architecture, and literature in an effort to investigate the rationalization of the contents of culture. This larger intention was never realized, however, aside from scattered remarks on the rationalization of style in art and architecture and in a monograph on music. In the comparative study of music, he elaborated a view of occidental harmonic rationalization proceeding with the solution to the symmetrical division of the octave with tempered intonation, a corresponding system for compositional notation, polyphonic harmonies, and the evolving technology of particular instruments. He also pointed out that elements of tonality and instrumentation had been affected by political and religious considerations, not solely

by aesthetic principles. In modern occidental music, the forces of rationalization were particularly transparent, he thought: evident in the continuing exploration of atonality, dissonance, new instruments, electronic technologies, and even the incorporation of contrasting tonal systems.

Last, with regard to science, intellectual inquiry and the pursuit of knowledge, Weber added one capstone to his life work on rationalization, summed up in the notion of disenchantment, or more literally, demagification (*Entzauberung*). In one of his last essays, the revised 1917 speech "Science as a Vocation" and in the 1920 introduction to the *Collected Essays on the Sociology of Religion* (the *Religionssoziologie*), Weber developed the view that a long-term historical process of intellectualization had been at work in Western civilization in which magical and mysterious forces had been progressively mastered by calculation and technical means. This trend is of course exemplified by the revolution in science and technology, dating especially from the seventeenth century. In fact, rationalization today has come to mean most fundamentally the production and application of scientific and technical knowledge, invading virtually every sphere of life. It is as if no cultural enclaves and protected zones can truly avoid the march of scientific rationalism. Thus, as Weber recognized, disenchantment must also be understood as an existential condition capable of provoking cultural and political expressions of regret, loss, nostalgia, resistance, and efforts at reenchantment. Although choosing to cast his lot with science and the pursuit of knowledge, Weber recognized in the countercultural movements of his own time the kind of deep discontent that could be produced by the disenchantment of the world. In the twenty-first century, these discontents are as pronounced as they ever were in Weber's era, and they will undoubtedly remain so.

The significant rationalization themes developed in Weber's writings have been taken up subsequently in a number of different ways. One line of thought, developed early in the work of Norbert Elias and later in some of the writings of Michel Foucault and Pierre Bourdieu, has investigated the evolution of civilization, the civilizing process, and the rationalization of manners, morals, cultural lifestyles, norms of civility, and modes of discipline. Much of this work has been motivated by a desire to understand the ways in which socialization occurs and the social forms emerge that make up what we call civilization. By tracing the reciprocal interaction between socioeconomic and political forces on one hand and individual conduct on the other, one is able to unmask the sources of control and their justifications, whether through the long sweep of history or in discrete contemporary contexts. These analyses of civilization always raise questions about rationalization processes and are often highly critical of its consequences for the modern human condition.

Another important critical direction has been charted by those representatives of the Frankfurt School of social theory, such as Walter Benjamin, Theodor Adorno, and Max Horkheimer, who developed a form of cultural criticism with Marxist roots. For example, in his celebrated essay from the 1930s, "The Work of Art in the Age of Mechanical Reproduction," Benjamin (1969) explored the ways in which technical innovations and new media, such as film and photography, had begun to rationalize the production and commodification of art and our sense of what art is, how it functions, and what the artist as producer's relationship is to the consumers of art. Like Benjamin, Adorno and Horkheimer also perceived a radical break, a rupture in cultural practices. In *Dialectic of Enlightenment* (Horkheimer and Adorno 1987), they extended this perception to an analysis of the capacity for rational technique to turn against itself, for rationalization to become irrational and form an encompassing totality. Theirs was an argument that both revealed the ruthless domination of technique in a homogenized "culture industry" and exposed the self-destructive dynamic of scientific progress. Instead of liberating creative powers, disenchantment had in this bleak view become repressive and totalizing. It would take a new movement of the dialectic to point toward avenues of escape from the impasse, as Herbert Marcuse and others argued politically in the 1960s.

Within the critical theory tradition of the Frankfurt School, undoubtedly the most systematic and comprehensive theoretical treatment of rationalization has come from the prolific social theorist, Jürgen Habermas. Much of his thinking on the subject is stated in his two-volume work *The Theory of Communicative Action* (Habermas 1984). Building on Weber's notion of instrumental or purposive rationality, he sets out to show that this form of rationalization has been extended into every domain, colonizing the human lifeworld and affecting cognitive, ethical, and aesthetic modes of communication. What Weber called life orders or value spheres, Habermas conceives as rationalization complexes, of which three are primary: science, morality, and art. Each is aligned with different interests—cognitive-instrumental, moral-practical, and aesthetic-expressive—and each is responsive to different claims for validity: propositional truth, normative rightness, and subjective truthfulness. Like Weber, he acknowledges the potency of instrumental rationality among the different competing forms of rationality, and he realizes that rationalization can proceed in quite different ways within each complex. But in contrast to Weber, he develops the notion that immanent within these rationalization processes is the possibility for the emergence of a transformative emancipatory project.

In this regard the most original aspect of Habermas's treatment of rationalization is his invention and argument for the rationality of what he calls communicative action and the critical reasoning that he constructs on a basic distinction between labor and interaction. In his terminology, labor embodies strategic calculations and instrumental rationality, and it is oriented toward success, power, and control over

nature. It is what Weber has in mind when he writes about instrumental rationality and its expression in bureaucratic organizations. Interaction, on the other hand, embodies communicative rationality and is oriented to the realization of the rational potential of communication. For Habermas, the latter potential can be made visible in a theory of communicative competence that establishes the possibility of intersubjectivity and uncoerced and undistorted communication. To achieve this possibility obviously requires a public process of expressing opinion and forming consensus, and it is thus a possibility realizable only with democratic norms.

Habermas insists that our understanding of rationalization must be broadened to include communicative action and communicative competence. In his view, only with this expanded understanding will it be possible to envisage a rational and just society in which instrumental rationality is controlled and directed by human reason. The challenge for his position, notwithstanding its rigor and depth of argumentation, remains one of showing that in the face of rationalization in its instrumental sense, as adumbrated with such persistence by Weber, there can be a just social order that meets the test of rationality in its most comprehensive communicative sense.

At the beginning of the twenty-first century, the scientific and public discussions of rationalization take numerous different forms and are dispersed variously in economic and cultural sociology, art history and criticism, organization studies and theory, studies of development and modernization, investigations of the state, discussions of the environment and sustainability, and the most recent attempts to deal with the global economy. There is continuing interest in applications to particular spheres of modern life—the economy, the polity, the cultural sphere—that are very much in the spirit of Weber. There is renewed interest in understanding efforts at reenchantment of the world in new social movements. Needless to say, the long-standing critical discussion of capitalist development that began in the nineteenth century will continue in the spirited exchanges over globalization and its discontents. However they are depicted, the many faces of rationalization will be with us far into the future.

REFORM

In Western societies, political reform comprises attempts to expand the reach of politics. Social and economic progress is said to depend on the repoliticization (reform) of productive and distributive outcomes, which, since the Enlightenment, have been subject mainly to individual, entrepreneurial, and market-driven decision-making criteria. Consequently, reform is an assertion of the efficacy of collective, deliberative, and democratic efforts to ameliorate, transform, or disrupt the processes and the tendencies implied by an unregulated capitalist "mode of accumulation." The possibilities of reform presuppose that political development and political capacities are not as "structurally" constrained by economic conditions as radicals and political pessimists have feared. Reform, therefore, elevates political will, Machiavellianism, and sedulous institution building to an importance admitted by neither its liberal nor radical opponents. Its claim is that political arrangements can be constructed to reassert some of the political

autonomy lost in the social experiments of economic-liberal rationalism.

The many rationales for political reform produced by social science, particularly antiliberal political economy, all imply that the scope for politics increases as economic development releases us from the realm of necessity. Wealth and democracy are seen as mutually reinforcing. Unregulated capitalist economies are seen as flawed by their chronic propensity to underuse important resources (most significantly, labour) and thereby to produce lower standards of living than are technically possible. In other words, reformists assume there are nonvolitional conditions tending to enhance the impact of distinctively political (and collectively mandated) decisions and correspondingly to diminish the province of unregulated (or privately initiated) activity, while facilitating economic prosperity. This presumption seems warranted, since the proportion of total income appropriated and spent by governments has increased from about 10 percent to about 40 percent over the past century. More significant than the empirical reality is the question why.

Arguments for an expanded role for political activism predate capitalist modernism and the classical era. Systematic and principled state support for industry development characterized the mercantilist era and the city-states of the fifteenth century when synergies flowing from advances in science, knowledge, and technological advance were first recognized. "Renaissance" or neomercantilist economic doctrines today continue to insist that free-trade ideologies emerged not as the justification or blueprint for development but as a way of frustrating the leading industrialized countries' challengers. (Britain, whose early productive supremacy was based on the strength of its navy and its access to cheap raw materials from abroad, was particularly anxious to keep continental economies undeveloped.) In the nineteenth century, Friedrich List in Germany popularized the idea of industry protection (learned from the Americans under Alexander Hamilton) and initiated an antiliberal strand of developmental doctrine that claimed that free trade would impoverish those nations at lower levels of affluence that engaged with it. Commensurately, much contemporary "reformism" has taken the form of attempts to construct state institutions to foster national development in a still-developing economic environment where affluence is nonetheless not guaranteed by its capitalist qualities alone.

A generation later, the mature political economy of Karl Marx's *Capital* unwittingly contributed to reformists' efforts by demonstrating that the underlying social relations of capitalism (private property relations, market mechanisms of allocation, profitability criteria, commodity production, the commodification of labour, and undemocratic control of production) would not always remain the best underwriters of wealth creation. Political interventions of various sorts could be expected to emerge as antiliberal

forces sought to impose their preferences on what would otherwise be autonomous processes of capital accumulation or as business itself sought state assistance (for example, to regularize conflicts or markets or intersectoral problems). Conventionally, only the first of these forms of interventions have been referred to as "reform." Perhaps surprisingly, Marxism has usually been loath to champion the reforms its analysis has prefigured.

By the 1890s, the rationales for reform had begun to diversify considerably, with sociology, anthropology, Christian social thought, and institutionalism all suggesting that interferences with the market processes of development and adjustment were not aberrant but inevitable. From this time, the discursive dimensions of arguments for and against reform began to assume an intellectually significant role. Liberals struggled, for the most part successfully, to create a climate wherein market outcomes would be seen as natural while societal preferences (for equality or security or democratic engagement or civic amenity or even just faster rates of development than autonomous market mechanisms would normally allow) were deemed illegitimate. Their opponents, sometimes nascent leftists, sometimes conservative antiliberals, became marginalized in their endeavours to insist that tradition and prejudice and rigidity and national peculiarity and collective proclivity and other forms of antirationalism could not be so easily dismissed as expendable and antiprogressive. Émile Durkheim, for example, argued that economic activity was always underwritten, even constituted, by noneconomic conditions such as the general spiritual and cultural well-being of the populace. This implied that institutions (not necessarily state institutions) to monitor morality or professional integrity or social integration were justified and might be economically beneficial, even if they imposed constraints on private behaviour and private organizations. Reform efforts would then be oriented both to proposing functionally important social controls on certain types of activity and to building institutions able to devise and implement policy that could try to achieve explicitly deliberated outcomes.

Controls on private entrepreneurial activity had been advocated by what is now known as the "social economy" tradition in economic analysis, largely associated with papal encyclicals in the nineteenth and early twentieth centuries. The churches confirmed the sanctity of private property, inheritance, and subsidiarity, but they nonetheless insisted that winners should accept obligations to losers and that trade unions (and attempts to secure industrial or workplace democracy) were legitimate organizational responses to the undemocratic nature of the capitalist division of labour. Their hostility to the commodification of labour has been notable and influential. Such themes also permeate institutional political economy with Thorstein Veblen, for instance, arguing that work and labour should not be seen as a "disutility," the burdensome price to pay for income.

Rather, effort and inventiveness were necessary for humanity, with most people developing an "instinct for workmanship," the collective willingness to be productive and competent. Consequently public processes would be needed to ensure that work was as well remunerated, safe, meaningful, democratic, and socially oriented as possible. Such aspirations and accomplishments are frequently seen by liberals as inflexibilities.

Max Weber, too, insisted that even though rationalistic processes were hallmarks of the Enlightenment's dismantling of arbitrary decision making, people were entitled, through political processes, to discard "formally rational" (rule-based) outcomes if they were adjudged to be substantively irrational. Reform then would involve reestablishing public competences able to secure outcomes that would not otherwise occur. These are increasingly referred to as state capacity. Weber developed a form of enquiry initially associated with List in the 1840s and the German "Historical School" from then until the 1890s that opened up one of the great methodological fissures in the history of social science and that marks the divergent approaches to reform still. On one hand, economic rationalism, shared by liberals and Marxists alike, bases analysis and prescription on the belief that knowledge of abstract processes (such as the logic of the market or the logic of accumulation) define the structure and development and consequences of actual economies. On the other hand, antirationalists have always maintained that more empirical methods—based, for example, on observation of historical legacies, existing institutions, and political preferences—need to be fostered, without presuming that social impediments to markets are unwarranted.

Joseph Schumpeter's and Karl Polanyi's writings in the first half of the twentieth century extended these ideas, thereby also broadening the sociological underpinnings of the reform project—for example, by defending the appropriateness of large (as opposed to competitive) organization in the public and private spheres. "Bigness" was seen as an effect of economies of scale (efficiencies) in both production and service provision. Meanwhile, the licence of welfare state development, a means of effecting income security, was defended in the name of the "self-protection of society" and the resulting decommodified provision helped to sever the link between individual success and living standards. Together the changes implied by this rethinking of the connections between economy and society (denying causal primacy to the former) set the scene for the post-1945 emergence of the concept and reality of the "mixed economy."

Keynesian economic management is probably the most well-known reformist intervention into the capitalist economy. However, insofar as national macroeconomic management necessitated a public commitment to countercyclical policy and the "socialization of investment" (both intended to ameliorate recession), it was not honoured. Keynesianism's real test came not during the 1945 to 1974 long boom, when near full employment in the rich countries was guaranteed by spontaneous and demographic conditions, but in the subsequent recession, after 1974, when (global) structural change caused the return of mass unemployment and the institutional underdevelopment of the previous decades allowed no prophylactic. John Maynard Keynes's expectations from the 1930s, that civilized nations would never again permit unmediated economic forces to wreak havoc, was proven overly optimistic. From the experience of "bastard Keynesianism" in the 1950s and 1960s and from the subsequent anti-Keynesian era, we must conclude that reforms do not necessarily stick, that "path dependency" is weaker than often imagined, and that the "default position" in global economic policy making is usually a liberal one.

The struggle for reform is an aspect of the perennial conflict between social democratic extenders and conservative defenders of state activism, on one hand, and liberal opponents and Marxist sceptics of deliberative and interventionist policy making, on the other.

Reform in both theory and practice is underanalyzed and underdeveloped largely because of the intellectual influence throughout most of the twentieth century of Marxian approaches to political economy that emphasized the self-determining character of capital accumulation and the implied impotence of a distinctive or autonomous realm of democratic politics. Nonetheless, a reformist strand of Marxism can be construed, in accordance with Marx's mature political economy. From this viewpoint, capital accumulation, investment, growth, and development depend on political (and social) infrastructure that can be provided only collectively—that is, according to a political rather than an economic logic. This argument differs from that which postulates a "role" for the "capitalist state" as primarily to secure the economic conditions for a (class-biased) accumulation process. Consequently, politicization of economic activity, organized by left political parties or trade unions or public bureaucracies or corporatist arrangements composed by elements of each, may be both genuinely democratic and sufficiently compatible with macroeconomic success to withstand the political obstacles it is likely to encounter. Indeed, the contradictions embedded in a "normally" functioning capitalist economy may become dysfunctional enough to allow conscious political action (including state building) to reverse the usual power imbalance between controllers of capital and the democratic impulse. Reform, then, is the attempt to ensure that the undemocratic nature of private economic life is transformed—against the objections of liberals who insist the transformation is undesirable and the dogmatic Marxists who maintain it's impossible.

Thanks to its a priori hostility toward crucial aspects of modern democratic development—the "capitalist state" is something more intractable than a state or political realm in

capitalist society—large parts of the Marxist tradition have remained sceptical of the possibilities of political reform, asserting that the structural logic of the economy renders an independent, majoritarian democratic polity unlikely. In this respect, Marxist orthodoxy has neglected one of the central observations of Marx's political economy—namely, that crisis tendencies are usually not determinant but are confronted by "countertendencies," which may be spontaneous, as Polanyi implied, or deliberated, as "reformists" suppose. In either case, reformist political possibilities depend on the potential of the countertendencies to economic crisis to frustrate the market logic. Marxists have usually been dismissive of state efforts to "manage" the economy (particularly during recession or structural change), state attempts to ensure or to hasten accumulation (normally under the rubric of industry policy), state policies that "decommodify" the provision of services or infrastructure, state development of public enterprise (with distinctive political responsibilities), and state sponsorship of nonmarket auspices for economic development. While Marx doubted that governments would typically choose, or be able, to enact such interventions, they have in fact characterized modern economic development in all the countries of advanced capitalism. Yet their emergence does not violate the analysis of capitalist development he provided.

The tradition of social democratic reform, then, particularly when its orientation has been analytical and progressive rather than opportunistic and electoral, has seen both political possibilities and political responsibilities in the exploitation of structural changes such as the century-long trend toward big government in capitalist societies. It is this that has allowed a concomitant extension of social provision outside the market (for example, through taxation-financed health and education and income replacement expenditures). More arguably, the encroachment of national or macrolevel or long-term criteria onto decision making that, in conventional liberal democratic polities, would remain unconsolidated in the private sector, is both a means to and an outcome of political reform. By broadening the range of collective input into economic decision making (particularly with respect to structural change that otherwise occurs in capricious or unwanted ways), increased government spending facilitates a significant decommodification of social provision. It has allowed a considerable measure of democratization, constructed a platform from which those political movements or social forces opposed to liberalism can mount successful campaigns for further democratization, and transformed the relations between economic conditions and their sociopolitical environment in such a way that outcomes are improved. An underlying presumption in social democratic strategies to transform the auspices under which economic decisions are made is that both private interests and collective outcomes

are advanced by state interventions that successfully maximize the rate of capital accumulation or achieve full employment or eliminate recession or usurp the labour market or replace market calculation by deliberated arrangements.

Reform proposals aim either to shift the balance between market determination and politicized determination of economic outcomes or to prevent erosion of the "social embeddedness" of the economy. These are the concerns of political economy and economic sociology. From each tradition, state building or institution building is advocated. The most acknowledged instances of public institutions are those required to subject investment, income distribution, the "labour market," corporate governance, and civic amenity to democratic process. The reformist purpose behind these five institution-building responsibilities in modern polities is, respectively, to control the boom-bust cycles of capitalism, to avert the possibilities of inflationary conflicts over wages and profits, to politicize the remuneration and deployment of labour, to increase community participation in what are really society's productive organizations, and to generalize the societal decencies that law and public authority can ensure. In these cases, the imagined "new political institutions" would most likely be corporatist; that is, decision making would be by functionally important institutions, usually intermediated with or in collusion with other functionally important institutions (commonly, peak organizations of labour and capital, interacting on a routine basis with state institutions). Much of the contemporary effort to create such unorthodox networks and arrangements has been categorized as constituting "social capital," implying that, like physical and financial capital, the nonmaterial bases of economic progress are ineliminable but also deliberative and with a stream of future benefits that can be bequeathed to future generations.

Contemporary contributions to reformist theory have come not from the social democratic left but from notionally conservative neo-Weberian or statist critics of liberalization and globalization. The theory of state capacity, with its overtones of List, draws from observations that domestic political processes have been influential in helping "late industrializers" catch up and can be expected always to play a role in industrial upgrading. Industry policy and closely regulated relationships between financial and productive sectors within capitalist economies are typical means for the enhancement of the "infrastructural power" of the state. State capacity therefore implies that global or market determinants of economic change do not necessarily account for ultimate outcomes; political institutions can be definitive. Of course, as with other instances of policy reform, such public capacities may not withstand the resistances they are subjected to both from within and outside the polity. Political achievements are always contingent, provisional, and readily dismantled.

So a final caution: Over recent decades, the term *reform,* particularly in the context of microeconomic reform, competition policy reform, and labour market reform, has been applied to attempts by governments to reverse the reforms of the past. Advisedly though, such politically inspired policy efforts are more accurately seen as part of the normal oscillation between interventionist and noninterventionist proclivities of social movements, public institutions, and policy elites. Like politics generally, reformist politics is best characterized as humanity's recurrent attempt to control its destiny, not the equally recurrent attempt to ensure that the state smoothes the path only for what would have happened anyway.

REIFICATION

The concept of reification is closely associated with the thinking of Karl Marx (especially his idea of "fetishism of commodities") and Marxian theory, especially the work of György Lukács. However, it has long since come to be accepted and used by a wide range of social theorists because of its utility in thinking about the modern social world.

Reification is based on the idea that people create their social worlds, especially larger social structures and institutions. However, over time, people come to lose sight of this fact, or are led to lose sight of it by those who control the larger structures and institutions. Instead, these structures and institutions come to be seen by people as "things" (hence, "thingification" is often used as synonymous with reification) that exist independently of the actors who created them. In other words, they are seen as having a life of their own. Instead of being in control of these larger entities, people see themselves as being controlled by them. Even when people perceive these structures and institutions as malfunctioning, and even oppressive, they feel that there is little that they can do about them and the problems they create.

In the end, this becomes more than merely a matter of peoples' perceptions. Because they think and act as if they are in the thrall of these larger entities, they eventually come to be controlled by them. These entities, especially those who control them, come to see themselves as, and eventually come to be, independent and capable of acting on people without their consent or knowledge. Instead of actively creating and controlling large structures and institutions, people come to be created (through socialization) and controlled (through social control mechanisms) by them.

Reification is closely related to Marxian thinking on class, especially false consciousness. That is, agents, especially as a collectivity, with class consciousness would never lose control over, let alone be controlled by, large social entities. However, because they lack such class consciousness, people fall prey to the process of reification. Instead of class consciousness, people have false consciousness, especially in this case the false belief that they are controlled by larger structures and institutions rather than being in control of them.

The solution, at least in Marxian theory, lies in praxis, in this case the retaking of control over these reified phenomena, the destruction of them, or both. This, in turn, requires the development of class consciousness. "True" class consciousness would emerge in tandem with the praxis oriented to gaining control over reified structures. Once they are under the control of people who have class consciousness, it would be impossible, at least from the point of view of Marxian theory, for reified structures and institutions to reemerge.

Given its roots in Marxian theory, the economy is the central arena of the process of reification, and the market is the prime example of it. The market is nothing more than the sum total of the actions of agents who participate in it. Thus, the labor market and the stock market are nothing more than the sum total of the actions of buyers and sellers of labor power or stocks. However, in capitalist society we have become accustomed to thinking of these markets as "things," as structures that have dynamics of their own. They are seen as not only acting independently but in determining what people do. That is, in the case of the labor market, people accept unemployment, low-paying work, or alienating jobs because of the operation of the market. Similarly, stocks are seen as going up or down because of the "market"—the market did this or that—and not because of the actions taken by people who *are* the market.

While it has its roots in Marxian thinking on economics and economic structures, it is easy to see how the idea of reification can be extended to all social structures and institutions in all types of societies, not just capitalist societies. Thus, one could have thought of structures and institutions in the former Soviet Union as being reified. While the Soviet Union is long gone, it remains possible and useful to think of social structures and institutions in the twenty-first century, in modern and even postmodern society, as being reified.

RELATIONAL COHESION

Relational cohesion is a testable theory that explains how a network of social exchange produces more cohesion and commitment in some relations than in others. Cohesion and commitment develop in particular relations because exchanging valued outcomes with others produces emotions—that is, individuals feel good or feel bad as a result. If the exchange is successful, they feel good (e.g., pleased, satisfied, enthused, excited); if it is unsuccessful, they feel bad (e.g., sad, depressed, dissatisfied). The theory of relational cohesion specifies the conditions under which individuals associate these emotions with their relationship or group affiliation. Positive emotions from exchange thereby strengthen relations, whereas negative emotions weaken relations. The theory was formulated and tested by Edward J. Lawler and his colleagues, Jeongkoo Yoon and Shane Thye. It has important implications for when and why people stay in relations that produce fewer rewards than available elsewhere, why they invest more time and effort in some relations than others, and why norms and trust are stronger in some relations.

Relational cohesion has a structural basis. Following Richard Emerson, the structure involves a network with three or more actors; power dependence is a key dimension of this structure. The original idea for relational cohesion theory can be traced to Emerson's structural definition of cohesion as the degree of mutual dependence between a pair of actors in a network. Relational cohesion theory expands this structural definition by adding relative dependence (degree of equality or inequality). Structural cohesion is greater if individuals are mutually dependent and equally dependent on each other.

Relational cohesion is defined as the degree that actors perceive their relation as a distinct object apart from self and other. This definition of relational cohesion implies that actors consciously or unconsciously perceive their relationship to one another as real. The social constructionist theory of Peter Berger and Thomas Luckmann terms this the *objectification* of a social unit. Similarly, the social identity theory of Henri Tajfel would portray this as *psychological group formation*. If the relation is real to actors, it operates as a *third force* in the social situation, and individuals orient their behavior in part to their relation, not just to each other or to the task they are doing. This means they will conform to the norms of that relation, trust each other more, and develop a commitment to their relationship. Commitment is defined as behavior that reflects an individual's attachment to a social unit (relation, group, organization); it is the outcome or result predicted by the theory of relational cohesion.

In relational cohesion theory, individual emotions or feelings mediate the effects of structure (network, power dependence) on relational cohesion and commitment behavior. Four key points of the theory are as follows: First, social structures tend to produce varying rates or frequencies of exchange among a set of actors. Actors choose relations that they expect to provide them the greatest benefit, and the network structure determines the incentives for particular relations to form. Choosing exchange partners in a network is fundamentally a rational choice process. Repeated exchange by the same individuals forms an exchange relation. Second, success at exchange has positive emotional effects. When people exchange items of value with another, it gives them an *emotional buzz*. If they fail at efforts to exchange, then they experience an *emotional down*. Third, positive emotions or feelings make the relation itself more salient and an object of attachment for actors. Repeated exchange produces repeated positive feelings that, in turn, underlie the sense of a cohesive, unifying relation. The emotions enhance cohesion in the exchange relation formed. Fourth, the theory of relational cohesion, as elaborated by a subsequent affect theory of exchange, predicts that emotions generate relational cohesion to the degree that individuals have a sense of shared responsibility for the success at exchange—for example, if actors believe it is hard to differentiate their individual contributions to the joint effort. Under such conditions, individual feelings from exchange are more closely associated with relational or group affiliations, and feelings about these affiliations are affected, accordingly. The mechanisms

linking network properties to commitment, therefore, involve an *exchange to emotion to cohesion* process. This is the heart of the theory of relational cohesion.

Relational cohesion affects an individual's commitment to a relation or group. Three forms of commitment behavior have been explicitly studied: (1) staying in the relation despite equal or better alternatives, (2) providing benefits or giving gifts to another without strings attached, and (3) engaging in risky behavior that opens one to malfeasance or exploitation by the other. Research on relational cohesion confirms that more frequent exchange produces more positive emotions, more positive emotions produce a more cohesive relation, and greater cohesion generates more commitment behaviors of these types. There is strong and consistent empirical support for the theory of relational cohesion.

Generalizing further, relational cohesion theory suggests that people experience positive or negative emotions or feelings when they interact with others to accomplish joint tasks. If the emotions are positive and experienced repeatedly, they attribute these emotions in part to their relationship or common group membership, especially if they perceive a joint task and shared responsibility. The commitment to their relation, therefore, has an emotional or affective basis. These effects are strongest when the social structure creates equal and high mutual dependence between the actors. They also are strongest when social exchange has a productive form in which two or more actors are collaborating on a joint effort and weakest when the social exchange has a generalized form in which actors give benefits to different persons than they receive benefits from. Negotiated and reciprocal forms of exchange produce degrees of cohesion and commitment that fall between productive and generalized forms.

RELIGION

Sociology of religion experienced renewed vigor in the last quarter of the twentieth century, paralleling a coincident resurgence of traditional religion in much, although not all, of the world. For several decades in the middle of the century, years bracketed by the emergence of Talcott Parsons as a social theorist in the 1930s and the campaign of Jimmy Carter for U.S. president in the 1970s, Western social theorists broadly assumed that traditional religion was fated either to retreat into insignificance or to merge into the universalistic value system of modern society. Such assumptions became untenable in view of the growing public confidence of evangelicalism and corresponding malaise of liberal Protestantism in the United States and the rise of militant Islam in the Middle East. Soon, theorists' attention was drawn to the worldwide rise of Islamism and Pentecostalism, Evangelicalism's close cousin, and "fundamentalist" variants of all faiths. Some assertively "progressive," yet recognizably religious forces, such as the civil rights and sanctuary movements in the United States, also gained notice. Religion as conventionally defined—beliefs and practices centered on communal devotion to a god or some other representation of sacredness—was back on theorists' agenda. This article will briefly discuss the theoretical issue of defining "religion," will then unpack at length the elaborate but frequently unsatisfactory debate over "secularization," and will conclude with theorists' attempts to understand the role of religion as one among many persistent societal and cultural complexes in contemporary society.

DEFINING RELIGION

Durkheim's classic definition, paraphrased above, is always the starting point for sociologists, especially his recognition that religion involves at least two dimensions, a cognitive or propositional one and a ritual or behavioral one. He deferred to commonsense social constructions to the extent of accepting Buddhism as a religion, despite the absence of theism in its classic formulations. Thus, for Durkheim, not theism but "the sacred" must be the defining characteristic of the phenomenon. He also insisted that religion pertained to a moral community: a "private religion" would be a contradiction in terms. Durkheim's influence was not least in setting off extensive discussion on what came to be called "substantive" versus "functional" definitions of religion, the former corresponding to Durkheim's "sacred"—what religion *is*—and the latter to his "community"—what religion *does*. In the middle of the century, the possibility that the future might belong to one or another of the warring political ideologies of the time gave theorists

reason to assess the potential of movements such as fascism or communism as functional successors to the religions of the past. By the end of the century, however, those possibilities seemed increasingly remote, and conceptual attention reverted to the substantive question of what it is that defines religion. The desideratum was a definition that would encompass not only the conventionally recognized world religions (i.e., Christianity, Islam, Buddhism, Hinduism, Judaism, etc.) but also newer, smaller, more indigenous and more subaltern religions such as Scientology, Wicca, Voodoo, and Shamanism. As with Durkheim, at issue was whether attributes such as gods (or goddesses), the supernatural, and the sacred could sufficiently capture this diversity without privileging one or another variant. Just as "god" may be a limiting concept confined to the Abrahamic faiths, so also "the sacred" may carry its own theological baggage. Recently, Rodney Stark, in *One True God* (2001), has proposed not a new definition but a proposition that only religions with a personal, monotheistic god have power to shape history. In this view, some religions, especially the Abrahamic faiths, are more powerful than others, especially Buddhism. Many of those who oppose Stark's formulation of rational choice theory (see below) would agree at least that there is something distinctive about religion by definition that should not be lost in the urge to generalize about all human activity. The result of these two discussions (i.e., the one in regard to Durkheim's definition of religion, the other in regard to the critique of rational choice theory) is that for the purposes of social theory, religion remains what it is conventionally taken to mean.

DEBATING SECULARIZATION VERSUS PERSISTENT RELIGION

The religious resurgence that began to be noticed in the 1970s did not settle the issue of the ultimate fate of religion in the modern world. For one thing, at the same time that religion seemed to have renewed vigor in the United States and much of the third world, its apparent decline became all the more precipitous in most of Europe. Those predicting religion's imminent demise have not retreated in the face of those who are convinced of religion's staying power, and it is easy to gain the (nonetheless superficial) impression that contemporary sociology of religion boils down to a debate over something called secularization theory. This lengthy section will examine three aspects of this contentious literature: (1) efforts to clarify debate by specifying the meaning of the concept of secularization, (2) efforts to explain the persistence of religion through the alternative theory of rational choice, and (3) efforts to specify paradigms of religious systems as contexts for the play of dynamics such as secularization and religious "markets."

Conceptualizing Secularization. Theorists of secularization have rightly protested that they do not and need not insist that religion will ultimately disappear. They are no more responsible for Marx's vision that religion will be abolished along with its basic cause, class oppression, than the discipline of sociology is for Durkheim's intemperate assertion that society is the true object of worship. Stemming from the theories of both Durkheim and Weber, secularization is properly understood as the process of religion's diminishing social significance, and it can be understood and measured in several ways.

Historically, the first meaning of the concept was the separation of church and state, according to which one of the first and most thoroughly secularized nations was none other than the United States, at least at the federal level. Yet if the sociological concept were so delimited, there would be no debate, and secularization would be a definitional truth. The debatable empirical claim, shared by some theorists of secularization and some religious authorities, is that separation of church and state must ultimately lead to the diminution of religion. More broadly, secularization is taken by sociologist Frank Lechner to mean the increasing *differentiation* of religion from other spheres of society, not only the polity but also education, the economy, the professions, and civil society generally, which are rendered autonomous from religion in the process of secularization. Much work has been done in this vein to document secularization of the American system of higher education from its initially religious roots.

Eventually, in this perspective, religion will pertain only to the household. Furthermore, as the authority of patriarchal household heads erodes, religion will be embraced only by individuals, for whom in turn, because of the differentiation of religion from other social spheres, religion will ultimately have no other than the psychological function of being a source of solace and personal exploration. This is secularization as *privatization,* which, by Durkheim's definition, means the evisceration of religion at its core.

Other theorists, such as Peter Berger (1969), tended to approach the matter social psychologically, where secularization is identified with decreasing assent to religious doctrines, or, more simply, increasing unbelief. Insofar as religious belief systems are inherently precarious—based as they admittedly are on evidence of things hoped for but not seen—they are made plausible only through socially elaborate mechanisms by which the faithful are enmeshed in networks and practices of cobelievers and insulated from unbelievers and those who adhere to different faiths. As a society becomes more pluralistic through exploration and migration and its culture more rational through scientific and scholarly development, and as mass media spread awareness of all these novelties, religion loses its *plausibility structures.* Widespread defection is the expected result.

Structural differentiation and societal pluralism being two components of modernity, it is therefore proposed at the grandest level of analysis that modernity is inimical to religion, or, more precisely, predictive of secularization. One response to the *prima facie* contradiction to this proposition posed by the case of societies, like the United States, characterized by both modernity and high levels of self-reported religious belief and practice, is to separate out these two aspects of secularization. Thus, some theorists maintain that secularization applies, through differentiation, at the level of public institutions and public discourse but, plausibility theory to the contrary notwithstanding, not at the level of personal belief. In this manner, jurist Stephen Carter claims that a public "culture of disbelief" coexists in the United States with a pattern of private piety. Accordingly, one definition of secularization is diminished scope for religious authority instead of diminished religious belief.

The strengths of the secularization perspective are precisely its attention to conceptualization. Its typical weaknesses are the vagueness of its propositions (e.g., modernity is conducive to secularism) and its frequent failure to specify a baseline of comparison to modern conditions (e.g., merely assuming that the past was a time of greater religiosity than the present). If it is proposed that modernity is inimical to religion, when did "modernity" begin and when are its alleged effects supposed to set in? Too often a study is said to evince support of secularization theory when it demonstrates that one or another aspect of religion in a modern society is weaker than, by some unspecified standard, it supposedly used to be or still, if religion were powerful, ought to be. Exponents of secularization have responded to such criticisms by specifying the causal force not as a global social property such as modernity but as a property that varies across discrete units (e.g., rates of religious pluralism in U.S. counties). They have also sought to marshal time series data on religious social indicators (e.g., religious attendance over time).

Theories of Rational Choice. Some of the recent improvements in the secularization perspective have come in response to a competing perspective, rational choice theory (RCT) applied to religion. Indeed, some methodological techniques employed by secularization theorists were pioneered by exponents of RCT. Thus, it is a mistake to see RCT as only an alternative to secularization and the manifest conflict between them as zero sum. RCT has a different agenda. Whereas secularization theorists struggle to find ways to speak of the diminished role of religion in contemporary society that they observe or fully expect to observe, exponents of RCT use their approach to explain upward *and* downward variations in religious phenomena in the same society as well as variable levels of religious activity across different societies.

RCT emerged in the 1980s from two sources, neoclassical economics and U.S. religious history. Economist Laurence Iannaccone offered an elaborate formal explanation of why it makes sense for sectarians to take on what might seem to be gratuitous burdens. Sociologists Roger Finke and Rodney Stark used 100-year-old U.S. census data from religious denominations to refute the proposition, derived from secularization theory, that religious pluralism depresses religious participation. (Some years later, sociologist Daniel Olson demonstrated both errors in Finke and Stark's specific findings and the futility of the general pluralism-by-participation research program based on ecological-level denominational data. That program is fatally flawed by multicollinearity: In effect, the data sources did not allow the independent and dependent variables to be specified in a sufficiently mutually exclusive manner. Meanwhile, however, a large literature had emerged both in support of and critical of the proposition that pluralism promotes religious vitality.) By the mid-1990s, two of RCT's most influential statements had appeared, Finke and Stark's explanation of religious mobilization in the nineteenth-century United States as a function of the competition of sects in a *religious market* and Iannaccone's claim that religiously conservative groups grow because of, not despite, their *strictness.*

In common with the secularization perspective, RCT has its micro, or social psychological, and macro, or structural, sides, which in RCT are called *demand-side* and *supply-side* perspectives. Stark has led the way in proposing that religious demand, pertaining to the human condition, is more or less constant across time and space. (Stark's proposition of constant demand is consistent with the assumption of classical economics that wants are given.) It follows that variation in religious involvement (e.g., church attendance) provides no evidence of variation in religious interest. Instead, religious pluralism promotes religious involvement by offering outlets for different kinds of (not levels of) religious tastes. Downswings in religious involvement are similarly attributed to the effects of religious monopolization. Finke explained the widespread post-1960s decline in Catholic religious vocations as a consequence not of lack of faith on the part of would-be recruits but of church-imposed diminution of the specially honored status of clergy and religious. Implicit in RCT from the beginning of its development, and occasionally made explicit, is the idea that no special psychology distinguishes religious people. Far from being vulnerable to erosion once all the facts are known, as secularization theorists presuppose, religious involvement makes rational sense.

The supply-side perspective focuses on the ways that religious leaders, ranging from entrepreneurs to large bureaucratic firms, respond to the incentives made available to them as rational actors by a less or more regulated religious market. When support is guaranteed by the state, or when there is no competition, religious suppliers will have no incentive to reach out to extant or potential clients. The

result, in state church or monopolistic regimes, is a low level of religious activity across the society. But when state support is unavailable or cut off by disestablishment, and barriers to entry are lowered, there is ample incentive for aggressive religious firms to mobilize the population on a voluntary basis. As seen in the flurry of religious activity in the early republican period of U.S. history (the half-century after the revolution), the result of disestablishment may be a flourishing religious system. Recently, supply-side thinking has been applied by political scientist Anthony Gill to the situation of the Catholic Church in various Latin American countries, where the bishops who adopt the Church's "preferential option for the poor" are said to do so because they face competition from Protestant rivals for the allegiance of the poor.

The strengths of RCT are its attention to the formulation of testable propositions, its attention to variation in religious activity, and its stimulus for the theoretically informed use of survey and census data. In Robert Merton's sense, RCT is truly a sociological theory, and there can be no doubt that its arrival on the scene has contributed to the health of the research field. Its weaknesses are the frequent looseness of its empirical operationalizations; the implausibility, to some, the unattractiveness of its presuppositions; and its lack of attention to scope conditions. Critics have questioned whether, for example, the churches Iannaccone and his followers would call "strict" are properly so called. (This critique, in turn, has spawned studies to define what additional properties of such churches, including their possible "distinctiveness," may be conducive to their growth.) Many have called into question the assumption that individuals make religious choices in the same way that they make economic choices, and some have complained that the influential assumption that they do so itself tends to erode what would otherwise be their disinterested devotion to their faiths. RCT, it is said, contributes to the individualization and instrumentalization of social life that is already too rampant in the postmodern world.

Paradigms or Conceptual Maps of Religious Systems. Doubts about the unspecified scope conditions of RCT have led some scholars to propose that inquiry is needed into the attributes of religious systems that make RCT's religious market viable. Following received sociological wisdom that a market is an institution and that an "unregulated market" is therefore a contradiction in terms, they have asked how the kind of open religious market that surely does characterize the United States comes about. Perhaps the religious market is a specifically American phenomenon. But theorists have equally questioned whether secularization theory can make sense in societies that have historically lacked a monopolistic state church. Noticing that most proponents of secularization theory are Europeans, they suspect that secularization is just European religious history writ large.

In such manner, Stephen Warner (1993) proposed that most of RCT is an aspect of a *new paradigm* that is emerging specifically for the understanding of U.S. religion, and Grace Davie (2002) has proposed that secularization theory applies only to Europe as an "exceptional case" in a world of varied *conceptual maps* for religion. (In the past two decades, Peter Berger, author in the 1960s of some of the most influential statements of secularization theory, has himself come to think that the theory is limited to the case of Western Europe.)

Learning from religious historians that religious activity in the United States flourished in the wake of postrevolutionary disestablishment, Warner recognized that pluralism and vitality in U.S. religion was not so much the product of a newly opened market as a precondition of it. Colonists with conflicting, often assertive, religious identities had previously settled in different regions of the nation-to-be. Thus, the religious establishments that some of them passed into law were already plural prior to disestablishment, and the majoritarian electoral system the new nation quickly evolved made no provision for political representation of minorities. Cultural pluralism was greatly augmented by immigration from more and more European, then East Asian and Middle Eastern countries. Even "involuntary migrants" from Africa, and later Latin America, eventually found social space for cultural expression in religious institutions of their own devising. Thus, the U.S. paradigm is not that of a primitive, unregulated religious market. It is that of a society with high levels of religious interest and high levels of diversity that find expression through and reinforce a developed, open religious market.

For her part, Davie finds a continuing pattern of "believing without belonging" in Britain, a society in which, true to the secularization perspective, the church has lost much of the significance it once had, but an "unchurched" society more than a truly secular one. Britain may well be one of many "post-Christian" societies in Europe, but these societies are decidedly post-*Christian,* with more or less suspicion of new or non-Christian religious movements, little inclination to disestablish the church, persisting involvement in religious rites of passage, and moderately high levels of religious belief. While Europeans do little to support their churches, they regard them positively as significant "public utilities," letting someone else, quite often the state, do the work of maintaining them. In that sense, these Europeans adhere to what Davie calls *vicarious religion.* Exceptional cases within Europe—the continuing high levels of both religious activity and belief in Ireland, Poland, and Greece—are due to the harnessing of religion to national feeling in these countries (in contrast one might say, to the historic divorce of religion and nationalism in France, Italy, and Turkey).

Regardless of its complexity, the European conceptual map should not automatically be applied elsewhere. The

basic historical condition behind it—the Constantinian paradigm of a state church commanding the allegiance of the entire population in a given territory—is itself distinctly European, a legacy of the Roman Empire. Those parts of Latin America where a colonized and superficially evangelized population was once presided over by a monopoly church and are now being mobilized by Pentecostal movements—Brazil and Guatemala come to mind—may perhaps be understood as in transition between the European and the American paradigms, but religious systems elsewhere in the world—Africa, East Asia, South Asia, and the Middle East—require their own conceptual maps. India, to take just one case of a country with extraordinarily high levels of both religious activity and religious diversity, cannot be understood in terms of either secularization or religious market theory. An Indian paradigm is overdue.

RELIGION AS AN ORGANIZATIONAL AND CULTURAL COMPLEX

Relieved, temporarily at least, of the burden of defending or dismissing religion's role as a persisting feature of modern society, social scientists are free to explain structural and cultural aspects of religion using general social theory, as well as to contribute to the development of theory using religion as a case study. Within the field of sociology, Paul DiMaggio has argued that sociologists of religion have much to learn from organizational theory, and Christian Smith that social movement theory has much to learn from students of religion. The fact that U.S. religious institutions are major employers with highly varied rules of recruitment and career trajectories and often meticulous record-keeping systems makes the sociology of the clergy a fertile nongovernmental subfield within the sociology of occupations and professions. The 300,000 local religious assemblies ("congregations") in the United States are now a prime research field for students of voluntary associations, including theorists of social capital. That congregations tend to be homogeneous makes them a convenient site for the application of the theory of homophily to race and ethnic differentiation. One source of the successful effort in the 1990s to organize a section of the American Sociological Association devoted to sociology of religion was indeed the conviction that the social scientific study of religion should not be relegated to an intellectual ghetto, where the ambitions of religion to chart the future would be either nurtured or discouraged. Religion is here to stay for the long time being, part of the world that social theorists are obliged to understand.

In a noted exercise in organizational sociology, Mark Chaves draws on the theoretical school known as the *new institutionalism* to understand why it is that some American denominations grant full formal leadership credentials to qualified women (they "ordain women"), while others do not. Chaves shows that the practical issue of supply and demand for clergy labor has little correlation with whether women's contributions are welcomed. Instead, regardless of whether the decision to open or close ordination to women is formally based in scriptural authority or the sacramental role of clergy, it functions symbolically as a signal to maintain the legitimacy of the institution in the eyes of allied churches whose goodwill is needed. In this instance, social theory explains how churches behave the way other complex organizations are thought to do.

But religious institutions can be theorized as having their own structural dynamics. While secularization theorists point to recent declines in mainline Protestantism as vindication of their expectations, political scientist Robert Putnam, in *Bowling Alone* (2000), considers the possibility that the relative strength of conservative Protestant churches may be an exception to the post-1960s decline of nearly every other form of voluntary association in the United States, a general pattern he calls "bowling alone." Religion is different. Sociologist Nancy Ammerman studies ways that religious institutions, most of which specialize in the production of what Putnam calls *bonding social capital,* internal solidarity, also reach outside themselves to produce *bridging social capital* to the benefit of the society.

The "cultural turn" in social theory has involved religion as well as other cultural complexes. One of the most influential recent studies of culture is *Habits of the Heart*, whose authors conducted depth interviews on topics such as occupation, civic participation, and family, as well as religion, to learn not so much how Americans think about these aspects of their lives but how they talk about them. Arguing that the languages American use to speak of their social involvements derive from different streams in American culture, the authors tried to show that, across the board, instrumental and expressive languages (where things are viewed as "rewarding" or "feeling good") increasingly trump republican and Biblical languages (where talk is about one's "duty" and "God's will"). Theorists have discerned such linguistic devolution even in evangelical Protestant sermons (or teachings, as they are often called), where the urge to be relevant in the interest of attracting participants may dilute truly religious language. Nonetheless, because of religious pluralism (and social stratification), countercultural discourses flourish. According to sociologist Mary Pattillo-McCoy, the black church, filled with expressions of collective obligation and God's power, serves as a template for secular social activism in the African American community.

Combining structural and cultural perspectives, sociologist Michael P. Young, in his account of the rise of the antislavery and temperance movements in the antebellum

United States, offers amendments to the *contentious politics* and *life politics* perspectives in the study of social movements. These two influential movements emerged, Young shows, in interaction not with the state, which was in a period of weakness in the 1830s, but with Protestant religious institutions. Informed by the cultural schemas of both elite northern churches and populist sects, adherents of these movements intended to bring about not only structural but also personal change. Studies of American religious cultures by priest-sociologist Andrew Greeley, among others, have pointed to the contribution of distinctively Catholic themes of "communalism" and "incarnational theology" to liberal politics. In these instances, the study of religion contributes to the understanding of the role of culture in shaping society.

Various of the studies mentioned in this section might be invoked to bolster one or another of the major perspectives discussed earlier (secularization, rational choice, and new paradigm). Yet such is not their primary significance for religion and social theory, a nexus that is now emancipated from the never-ending, frequently ideological and even theological, problematic of the fate of religion in modern society.

RELIGION IN FRENCH SOCIAL THEORY

The problem of religion and society has been central to French social thought from the time of the seventeenth-century religious philosopher Blaise Pascal. It becomes particularly prominent during the period after the French Revolution in the work of figures such as Auguste Comte and Joseph de Maistre. In the twentieth century, religion, magic, myth, and related topics became central concerns for figures such as Émile Durkheim, Marcel Mauss, Henri Hubert, and their school as well as other French or Francophone authors such as Arnold van Gennep, Lucien Lévy-Bruhl, and Henri Bergson. A variety of other more recent writers, including Georges Bataille, Claude Lévi-Strauss, and Lucien Goldmann have renewed this interest in differing ways.

Important sociological insights concerning the role of religious experience in social existence are already found in Pascal's *Pensées* (written during the years before his death in 1662). There, he discusses topics such as the Christian roots of the idea of the dualism of human nature, the role of popular social diversions as a defense against existential reflection about ultimate religious concerns, the tensions between religious belief and social status claims, and the relationship between religion and scientific thought. He also presents an early version of what has come to be known as the "rational choice" perspective on religion in his theory of the necessity of a wager in favor of belief in God and eternal life. Pascal's emphasis on the reasons of the heart as the root of religious sensibility found a later echo in Rousseau and other French thinkers. In general, his theological discussions of the aforementioned issues posed challenges for later thinkers such as Émile Durkheim, who were interested in providing sociological answers to questions such as the dualism of human nature.

French Enlightenment thinkers generally attacked religion in the name of the powers of a human reason rooted in nature. However, religion and related moral issues remained on the theoretical agendas of many thinkers of this period. Voltaire investigated the history of customs and morals in a manner compatible with current historical sociology. Montesquieu presaged Max Weber's later work by noting the interesting congruence of religion, democracy, and industrial development in England. Rousseau supplemented the purely secular rationality of the Enlightenment with the idea of a new cult, which he called "civil religion" and which would bind the citizen to the state by more than the powers of either self-interest or pure reason.

The turmoil in French politics, society, and culture during the half century after the revolution of 1789 led to an

even wider quest for new principles of order, including a critique of the Enlightenment and a quest for new religious and moral ideals. The result was a proliferation of utopian and counterutopian proposals from the left as well as the right of the political spectrum. Those writers once described by Frank Manuel as the "prophets of Paris" (e.g., Saint-Simon, Comte, Fourier, Cabet, and others), combined new ideals with versions of established religious ideas and organization drawn from a newly renovated Christianity. The result was a startling array of utopian amalgams, including Saint-Simon's "new Christianity," Fourier's designs for utopian communities called "phalanxes," and Auguste Comte's positivism and religion of humanity.

Saint-Simon sought to create a "new Christianity" better suited to the needs of a society of scientific, industrial, and technical specialists. His former secretary, Auguste Comte, became an independent theorist and proposed a sweeping theory of three stages of historical development. This theory argued that human thought evolved from theological to metaphysical to positive thought. In the process, he detailed the internal progress of the theological stage, from primitive fetishism to polytheism and, finally, to a mature monotheism. In his early philosophic synthesis, the *Cours de Philosophie Positive* (1830–1846), Comte emphasized the need to transcend religious and metaphysical thinking in favor of a more positive (i.e., scientific) approach to knowledge and social reform. However, his later work embodies a new religious standpoint, emphasizing the reform of society through the ideal of altruism, the worship of the Great Being, and the creation of a new Religion of Humanity, in which mankind would celebrate the accomplishments of its best and brightest by means of a calendar of yearly rites. This Church of Humanity combined elements of the older Roman Catholic veneration of saints with modern humanistic ideals and provides a theoretical rationale for more recent efforts to elevate notable public figures to quasi-religious standing (e.g., birthdays of Abraham Lincoln, Martin Luther King, and others).

By contrast, critics of revolution and utopia, such as Joseph de Maistre, drew on religious traditions to struggle against what they viewed as the inevitable excesses emerging from an exclusive reliance on human reason. The ideas of Maistre and the later Comte were similar in some respects, partly because of Comte's influence on Maistre, but also because of their shared attachment to Roman Catholicism as the archetype of a church organization and a model for the creation of sociomoral integration. For Maistre, only a traditional religious organization could root a society with sufficient strength and depth to avoid what he saw as the destructive potential of revolutionary change. In his view, political constitutions derived not from human reason, but from divine authority. Maistre found this authority and support for social stability especially in the Papacy and the Roman Catholic Church.

Other French thinkers also saw a positive role for religion in society. Alexis de Tocqueville, in his two-volume work, *Democracy in America* (1835, 1840), analyzed the role of religion in American society and distinguished between the role of Protestantism and Catholicism in modern society. In his view, religion could, under given historical conditions, function to support modern democracy rather than be a bulwark of reaction. He thought Protestantism was compatible with the development of modernity. Since most Americans were Protestants, there existed a common religious and cultural inheritance in churches and sects that promoted moral discipline and social order. Protestant congregationalism also served as a workshop for democratic participation, and the multiplicity of Protestant sects helped advance not only the separation of church and state, but also the social organization of Americans by serving as the prototype of all voluntary associations. By contrast, Tocqueville found none of these conditions in the old regime in France, where church, state, and aristocracy combined to thwart the growth of the democratic spirit.

In the later nineteenth century, the examination of religion's role in society shifted to the study of earlier historical periods and to primitive societies. For example, Numa Denis Fustel de Coulanges, in his influential work on *The Ancient City* (1864), compared the history of religion, social institutions, and political organization in Greece and Rome. His treatment of the changing relationships between religion and social and political organization as well as his use of the comparative method made the book an important reference point for later French sociologists and historians such as Émile Durkheim and Marc Bloch. Fustel's history was written in a republican spirit and emphasized the dangers to individual freedom posed by increasingly centralized political organization. Fustel generally saw the changes in religious belief and practice as the driving force behind political change. In his view, the earliest religion of the Greeks and Romans was a familial cult, or cult of male ancestors. This cult provided the basis for social and legal authority, succession to property, and stability of the family space. With each subsequent stage in the development of society, there necessarily occurred a change in religious practice. The formation of the *polis* involved the creation of gods of the city, while the formation of larger empires was paralleled not only by the cult of the divinity of the emperor, but also the rise of new religions such as Christianity and a variety of mystery cults which would, in the future, satisfy the growing need for a more personal and individual religiosity. In general, Fustel saw the increasing growth of the political circle from family to *polis* to empire as involving a concomitant decrease in individual freedom. Only with Christianity is a new religious and political principle introduced.

The major breakthrough in the study of religion in French social theory came in the twentieth century with the work of Émile Durkheim and the school of sociology that

emerged around the journal *L'Année Sociologique.* This group included not only Durkheim but also Marcel Mauss, Henri Hubert, Celestin Bouglé, Robert Hertz, and several others. The sociology of religion was one of their main interests. They studied the main categories of religious beliefs and rites such as the sacred, sacrifice, magic, sin and expiation, prayer and oral rites, and others. They emphasized the social roots of religion but also the influence of religion on social institutions, thought, and conduct. Mauss and Hubert wrote together on *Sacrifice* (1899) and on the *General Theory of Magic* (1904), while Mauss separately investigated topics such as prayer, or oral rites. Bouglé examined the religious ideas that supported the hierarchical caste system of India and strongly influenced the theories of later investigators of India such as Louis Dumont. A younger member of the school, Robert Hertz, published a highly influential investigation on the preeminence of the right hand, or religious polarity, as well as a study of the collective representation of death He was also interested in folklore. His study of sin and expiation in religions was left unfinished when he died in fighting at the front in World War I. Only the introduction was published posthumously by Mauss. Maurice Halbwachs, who focused on the study of collective memory, authored a study of the legendary topography of the Gospels in the holy land. In general, the work of the Durkheim school was part of a broader contemporaneous Francophone analysis of religion that included the work of the Belgian anthropologist, Arnold van Gennep, whose analysis of "liminality" in his book on *The Rites of Passage* (1909) became a major influence on the work of later figures such as Victor Turner.

Durkheim's own mature theory of religion was developed in his book, *The Elementary Forms of Religious Life* (1912). There, he defined religion as a system of beliefs and practices concerning the sacred, ones that united those who followed them into a moral community called a church. In the process of examining the social origins and functions of the principle rites and beliefs of primitive religion, he also claimed to discover the social roots of the fundamental categories of human understanding (i.e., time, space, causality, etc.). Durkheim's influential study combined a substantive definition of religion, in terms of the opposition between the sacred and the profane, with a functionalist view of its social effects in causing social integration. Durkheim also distinguished between religion and magic by emphasizing that religion forms church and is an inherently collective phenomenon, while magic involves a clientele attached to the rites of an individual practitioner.

Henri Bergson was a Nobel Prize–Winning French philosopher whose book *The Two Sources of Morality and Religion* (1932) both criticized Durkheim's purely sociological conception of religion and offered an alternate view rooted in Bergson's vitalistic philosophy. Bergson argued that there were two forms of religion, the static and the dynamic. The former established religious myth and ritual as institutions necessary for the coherent organization of society. However, dynamic religion, which Bergson viewed as the vital source of religious sentiment and new religious ideas, emerged from the inner flow of individual consciousness. It was more directly related to mystical experiences and an openness to love of fellow human beings as well as to God.

Claude Lévi-Strauss combined Mauss's ideas with perspectives drawn from comparative linguistics, Freud, and other sources to create a new and influential theory of structuralism. Although he applied his new framework initially to the study of kinship structures, he increasingly focused his attention on the comparative study of mythology, a field that was also being developed in France by other investigators such as George Dumezeil. At the same time, Mircea Eliade, who was Romanian by birth and upbringing, but wrote extensively in French, advanced a broadly comparative historical phenomenology of religion that attempted to identify, through a method of generalizing comparison, the fundamental forms of the sacred manifested in all societies. Similarly, Georges Bataille provided another view of religion that emphasized the relationships between violence and the sacred. While the social theory of religion has not figured as prominently in recent French thought, exceptions can be found in Lucien Goldmann's *The Hidden God* (1959), a study of Pascal's thought from the standpoint of a genetic structuralism that draws inspiration simultaneously from Marxism and Piaget, and in the later investigations of Foucault into sexuality, the self, and religious thought.

REVOLUTION

Revolution: in modern times, the fact or idea of violent, abrupt, or radical change. In the philosophical discourse of modernity, the idea of revolution is associated with sociology's

view that contemporary institutions and culture are the result of the three great revolutions—the French, American, and Industrial. The idea of revolution has a long premodern history, where its meaning is connected less to rupture or break and more to the sense of circular or cyclical meaning or movement. From the Greeks to the Renaissance, revolution is more like its physical or mechanical counterpart, indicating the complete turn of a wheel or a full cycle of the seasons. Here, revolution alternates with restoration, indicating a cyclical conception of time. Modernity inaugurates a new conception of revolution as rupture, absolute innovation, which rests on a linear or stadial, progressivist or evolutionary conception of time.

The sensibility of sociology is that more actually changed in the period since the Great Revolutions than across the longer time span of the many centuries before. The French Revolution, in the sociological imagination, saw the application or pursuit of Enlightenment or humanist principles, where the self emerged as a project, and the prospect of geographical and, especially, social mobility meant that individuals and society could in principle be made in their own image. Hard lines of estate or status were replaced with class structures, which could in principle be transversed. The third estate, or the people, could pit their collective will against the state, kings, and clerics. Socialism, democracy, and the prospect of social engineering became practical values. Liberty, fraternity, and equality would be established as social goals, and their achievement would be viewed as within human reach.

The connotations of the American Revolution were less connected to this sense of rupture with the tradition of aristocracy or feudalism and more celebrative of the idea of establishing a new republic in the New World, where the initial founding project of the 13 colonies of New England would come together as the United States and democracy and liberalism would flourish. The founding of the American colonies and the American Revolution was imagined as a clean break into the field of pure modernity, a view that in different ways influenced modern social theory from Locke through Tocqueville to Weber. As historians from Marx observed, however, those who set out to make the world anew often reached back to old or ancient symbols to do so. They set out actively to make the future in the image of the past. This sensibility, which is connected to the more recent idea articulated by Eric Hobsbawm of the invention of tradition, helps explain the presence of Greek and Roman motifs and design in great experiments such as the construction of Washington D.C. These connections between past and future indicate that even the new, ruptural sense of revolution associated with modernity was never itself complete but still drew on these older cyclical senses of revolution as repetition.

If in retrospect these senses of social and political revolution associated with the French and American events

exaggerate the ruptural sense of change, the image of the Industrial Revolution retains its power as an indicator of degree of extraordinary change over the period of a century from, say, 1800 to 1900. While the idea of the Industrial Revolution as an overnight change has long been dismissed, the extent of the change and its consequences are beyond question. By the end of the twentieth century, the idea of industrial revolution was often subsumed to that of technological revolution, a revolution in permanence, suggesting either revolution upon revolution in the modern manner or ongoing cyclical revolution in the traditional sense, or some combination of both. Together with the sense of a revolution in culture, not least as afforded by the informational revolution, we live today in the West with a sense that nothing can or ought to stay the same. Revolution in this sense has been normalized, or at least we have come to think of the idea as second nature. Perhaps revolution has simply lost its meaning in everyday use, in response to the heightened sense that change is the only thing now that stays the same.

If the Industrial Revolution opened the way to the sense of permanent technological revolution, then the French and American Revolutions opened a phase where political revolution, democracy and dictatorship became normalized or predictable features of modern politics. Later in the nineteenth century, magazines ran columns with titles such as "The Week's Revolutions." Political instability was the immediate face of modern times. The key connecting idea was that of socialism. While the French Revolution was often cast as the great bourgeois revolution, the arrival of socialist doctrine into the nineteenth century resulted in the frequent identification of socialism and revolution. The French Revolution was often viewed not only as a bourgeois revolution but as the first breath of socialist revolution. The Bolsheviks conducted the Russian Revolution in the shadow of the French Revolution as the metanarrative legitimating their project. The spirit of Jacobinism became a major frame of reference for both the Bolsheviks and their opponents—Lenin cast, for example, as Robespierre, the Great Terror as the precedent for Red Terror. Both the democratic and the socialist project were grounded in the French Revolution. Socialist demands could be directed against tradition, crossing over with the democratic movement as in Chartism in England or against the new and iniquitous results of the Industrial Revolution, as in machine breaking or Luddism. The emergence of Political Economy saw the appearance of the discourse of value. Who produced this new industrial wealth, and who claimed it?—so that the rights of labour became part of political discussion. One powerful argument, which fed into Marxism, indicated that labour should retain or cover the right to the whole of its product.

Prior to the emergence of mass parliamentary democracy later in the nineteenth century, the appeals of revolution were

obvious. If the powerful could not be expected voluntarily to relinquish their privileges, the poor would have to take them for themselves. Significant revolutions occurred across Europe in 1848, in 1871 with the Paris Commune, 1905 and 1917 in Russia. The Russian Revolution generated its own controversies. Was October the beginning of a process of world revolution, or a specific and containable event? Trotsky and others had argued for the idea of Permanent Revolution in 1905, and Trotsky returned to this theme in 1930, staking his claim against Stalin's slogan of socialism in one country. In Trotsky's thinking socialist revolution could not be brooked. Revolutions would be telescoped. Revolution must be permanent in two senses; if it commenced as bourgeois, it would result in socialist revolution, and if it commenced in one country it must spread to the next, until the whole planet was socialist.

The more prominent revolutions of the interwar period were Nazi or fascist, in Italy and especially in Germany. The idea that fascism was a popular revolutionary movement took some time to make an impact on the consciousness of Marxists, who imagined hitherto that the Left had some kind of monopoly on revolutionary credentials, which made fascism counterrevolutionary by definition. The period after the Great War saw revolutions or insurrections break out across Europe, although the great remaining symbolic events of revolution took place in 1949 in China and 1959 in Cuba. The Soviet Union enacted revolution from above, at the point of the bayonet, through Eastern Europe after 1945. The citizens of Eastern and Central Europe asserted their own revolutionary demands for autonomy in East Germany in 1953, Hungary and Poland in 1956, Czechoslovakia and beyond in 1968, all to be defeated by Soviet tanks. The May events in Paris 1968 and elsewhere in Europe are often thought of as revolutionary. The great period of coerced labour and chaotic politics in China went under the name of the Great Proletarian Cultural Revolution, for here the question arose how revolutionaries could renew their power and legitimacy as revolutionaries once the initial carnival of the revolution was over. The Chinese students made something like their own revolution in Tienanmien Square in 1991. The greatest revolution of our own time was the so-called Velvet Revolution following Gorbachev's reforms from 1989 to 1991, with the reunification of Germany and the collapse of the old Soviet Empire. If the idea of technological or cultural revolution has become normalized, the idea of political revolution has since evaporated, recycled as nostalgia for Bolshevism as a fashion item.

The connection of revolution to Marxism remains strong and significant, however, not least because of Marx's ambivalence about capitalism. Reform or revolution? Capitalism, for Marx, needed to be revolutionized, socialized, but it was also at the same time itself the most revolutionary force in history. This was one theoretical source of the great revisionist controversy of the German Social Democrats, resting in this unresolved contradiction in the work of Marx himself. Was capitalism itself revolutionary, would socialism arrive automatically by itself from within the womb of capitalism, or did the revolutionary party have to make it? Marx's failure to resolve this issue gave pretext to the Bolsheviks, who returned to the idea of the conspiratorial or Jacobin party in order to keep history moving. Marx's own work portrayed socialism as a qualitatively new society and yet as one whose economic dynamics were capitalist, for they represented the growth capacity of the ever-expanding productive forces that would break through the old, capitalist relations of private ownership of property. Yet as generations of scholars and activists have pointed out, all revolutions made in the name of Marxism have occurred not in the homelands of capitalist Europe or America, but in lands where the peasantry rather than the proletariat was numerically dominant.

With the Bolshevik seizure of power in 1917 Marxism not only became a state ideology but became an ideology of economic modernization, for Marx had insisted that socialism could not be based on the universalization of poverty, and the Bolsheviks agreed. Where Kautsky and the other Social Democrats followed Marx in waiting, the Bolsheviks set out to force history, to generate the communist version of primitive industrial accumulation, forcing peasants into the proletariat or against the wall. The contradiction of Marx's legacy allowed both Bolsheviks and Social Democrats to claim that they were his faithful followers. If Marx had fueled the giganticism of Kautsky, where socialist industry would be even bigger than capitalism, he also called out Lenin's *State and Revolution,* where the idea of utopia jostled with the administrative image of socialism as the post office writ large. The early Marx imagined revolution as a purgative process, from whence humanity liberated would start again, perhaps in the image of the small working community like a guild, perhaps in that classical utopian space where time would stand still, stasis prevail.

The early Marx connected the idea of revolution necessarily to its bearer, the revolutionary proletariat. The revolution would not occur because the proletariat would be convinced that it was a good idea; it was, rather, inscribed into its very existence, as the last class, the class after aristocracy and bourgeoisie, after whom there would be no more classes and, by implication, no future revolutions; after the rupture of proletarian revolution, the real history of humanity would begin. For this reason, however, Marx had no need of a theory of organisation. The party was the mass, the class. There was no party outside the revolutionary proletariat, whose vocation it was to be revolutionary. Thus, Marx wrote, in the statutes of the First International (International Workingmen's Association), that socialism could only be the results of the efforts of the workers themselves. Leaders could not substitute themselves or their desires for the masses. The infamous idea of proletarian

dictatorship, to be identified by the Bolsheviks with their own reign, in Marx stood for an interregnum, a transitional interval opening the door from socialism to the higher state of communism. Marx's embrace of political economy indicates a shift in his thinking about revolution, for henceforth the argument does not start with claims as to the revolutionary subject or bearer but, rather, with assertions as to capitalism's revolutionary dynamic and self-destructive capacities. Revolution shifts in the early Marx, from the political sphere or superstructure to political economy or structure in the later Marx.

In the 1859 *Contribution to the Critique of Political Economy,* revolution results from the contradiction between the ever-expanding dynamic of productive forces and capitalist social relations, which constrain production. Then, alternatively, in *Capital,* the tendency for profit rate to fall leads to the self-destruction of capitalism and the emergence of the collective labourer as its new master, which inaugurates the social regime of the associated producers. Alternatively again, in the *Grundrisse,* it is technology in the specific form of automation that enables labour to step aside from production except as its minder so that freedom emerges beyond labour rather than through it. Here, the proletariat is the beneficiary of the further path of capitalist industrial development, now in its socialist form, rather than the central and necessary actor whose political revolution calls the new order out.

In the early work, Marx has the proletariat initiate socialism as an act of conscious will. This is the spirit that later informs Western Marxism, and especially the work of Gramsci. By the *Communist Manifesto* of 1848, the opening tension in Marx's theory of revolution is already apparent. The *Manifesto* opens with the strong claim that it is class struggle rather than economic development that dominates history. Yet Marx's project is also to link the future of the proletariat and socialist revolution to historical necessity, this connection offering Marx's theory the scientific edge over alternative left-wing utopias based on nothing but desire. The *Manifesto* offers the theorem of class polarization between proletarian and bourgeois forces, viewed practically as opposed military camps. Yet within pages, Marx is singing his hymn for the extraordinary achievements of capitalism, the extraordinary force that knows no limits, that is itself redeemably revolutionary, even if its power overwhelms its bearers, making of the bourgeoisie nothing more than the sorcerer's apprentice. This is the prompt for a different, non-Marxian approach like that of Joseph Schumpeter in *Capitalism, Socialism and Democracy,* where capitalist dynamism is viewed as the major force of creative destruction in modernity. This is clearly one implication of Marx's hymn in the *Communist Manifesto* that it is capitalism rather than socialism that is really revolutionary.

Thus, the embracing of the image of Marx on parts of Wall Street into the 1990s, where Marx is hailed not as the fomenter of socialism but as the great advocate of capitalism

as revolution. More recently, this trend has opened the way for critics such as Luc Boltanski and Jeremy Rifkin's argument that there is a new kind of capitalism, which takes some of the old romantic or bohemian impulse into the spirit of capitalism. On all accounts, socialism here is a lost cause, except in the sense that socialism was viewed by some, such as Kautsky in his middle period, as the icing on the cake of capitalist development. Plainly capitalism even in its revolutionary impetus fails historically to generate socialism from within, although this view has recently been revived by post-Marxists. The victorious view of capitalism, like the old-fashioned view of Marx, however, indicates its own limits even as it draws attention to modernity as capitalism. This is a view of modernity that reduces the field to capitalism or economy; it works against the legacy of complexity introduced into the analysis of capitalism as modernity by Max Weber, and developed by later critical theory, Habermas and Heller, or differently in Luhmann. Capitalism here is granted great complexity and even protean capacities itself, but state bureaucracy and rationalisation here are all subsumed to capitalism as complex in itself. The logic of this view appeals, as globalization reinforces the sense that capitalism is the only form of economic organization available to us after 1989.

The counterargument, that capitalism is only ever part of modernity, continues to inform not only the methodological pluralism of critical theory but also the tradition of comparative historical sociology, where the key contributions on the theme of revolution include works such as Barrington Moore's *Social Origins of Dictatorship and Democracy* and Theda Skocpol's *States and Social Revolutions.* The alternative legacy, suggested by Hannah Arendt's *On Revolution,* saw revolution as an Atlantic project connected with the pursuit of freedom, where the American example was more pure than the French, with its distraction into the politics of social provision. If capitalism has really taken over the idea of revolution, then the only freedom left to us will be capitalist freedom.

THE RHETORICAL TURN IN SOCIAL THEORY

During the past two decades, the "linguistic" or "rhetorical" turn has emerged as an important intellectual movement in the human and social sciences. It has become a commonplace that society can be viewed as a text and that social and cultural reality, and the sciences themselves, are linguistic constructions. In this view, reality and truth are formed through practices of representation and interpretation by speakers and their publics. This view can be located in the contexts of sociolinguistics, sociology of knowledge, poststructuralism, feminist theory, critical rhetoric of inquiry, and social studies of science, as well as several other intellectual traditions. All these tendencies of thought reject the simple bifurcations of reason and persuasion, discovery and invention, or of thought and its expressions. Instead, knowledge, and human experience itself, are viewed as poetically and politically constituted, "made" by human communicative action that develops historically and is institutionalized politically.

In this view, realistic representations become true descriptions not by correspondence to noumenal objects, but by conformity to orthodox practices of writing and reading. These practices are largely guided by root metaphors that define the basic character of a world and all that it might contain. Indeed, insofar as a representation is regarded as objectively true, it is viewed that way because its metaphors and methods of construction have become so familiar that they operate transparently. Absolutist conceptions of truth are made plausible only by those modes of metaphoric representation that have "made it" socially and thence deny their necessary partiality.

Thus, for those who follow the rhetorical turn, distinctions between fact and fiction are softened because both are seen as the products of, and sources for, communicative action; both are viewed as representations of reality that also represent various groups, interests, ideologies, and historical impositions. By untangling the relationship between objectivistic, metaphoric, and political practices, rhetorical (that is, poetic and political) analysis helps us gain insight into the ways in which the true has been fashioned and could be refashioned anew.

In the presence of such a relativization of formerly privileged discourses of truth, many people feel nostalgia for a lost foundation for lawlike knowledge or ethical absolutes. That is, even after metaphoric or deconstructive criticism has done its work, we still are faced with the challenge of establishing cognitive authority and inventing affirmative values as central elements of any rational moral polity. The research program of the linguistic turn, therefore, includes the critical assessment of the deconstructivist, rhetorical effort to date, a clearer understanding of its dialectical relationship to intelligibility within historical communities of discourse, and an analysis of how academic discourses both reflect and influence their larger political contexts of production. In other words, rhetorically oriented social thinkers need to analyze the methods by which people encode and create what is taken as real, normal, and to be accepted without question and even without awareness. In this sense, the "new rhetoric" goes beyond classical rhetorical theory in three ways. It makes the ontological claims that representation and communication help to make that which is represented and communicated. It extends the scope of rhetoric to all representation, not merely political or public address. And it is critical in showing how anything stated could be otherwise represented.

Such a research program has the potential to radicalize the methods, objects, and very conceptions of the academic enterprise. In particular, the rhetorical transvaluation of epistemology wrenches us away from our most treasured beliefs about the constitution of science, knowledge, and even reason itself. It does so by leading us to question the traditional foundations of knowledge and scientific inquiry; then it invites us to adopt a linguistically reflexive posture as we are subsequently faced with redefining, metatheoretically, what theory and research are and should be.

In the modernist and especially positivist periods, our understanding of how science and knowledge were constituted relied on an assumed polarity and hierarchy between truth and its media of expression. Foundationalist epistemology and modern scientific method insisted that objective truth existed independently of any symbols that might be used to convey it. In this bifurcation, reason was authoritatively superior to its own external systems of expression. Since the Enlightenment, science has thrived on the self-endorsing assumption that the "metaphoric" by definition is separate from the true, ontologically and epistemologically. By contrast, rhetorical approach subverts the authority of modernist philosophy of science by radically conflating the traditionally bifurcated hierarchies of truth and expression, *doxa* and *episteme,* rationality and language, appearance and reality, and meaning and metaphor. It does so by focusing on the *how* rather than the *what* of knowledge, its poetic and political enablements rather than its logical and empirical entailments.

Through such shifts of focus, the rhetorical turn relocates knowledge in the act of symbolic construction, and knowledge

is no longer regarded as that which symbols subserviently convey. Humans *enact* truth not by legislating it scientifically, but by performing it discursively, in science, in politics, and in everyday life. Our knowledge of truth is not based on some extralinguistic rationality, because rationality itself is demystified and reconstituted as a historical construction and deployment guided by root metaphors that themselves have no ultimate referent or foundation.

Accordingly, the image of knowledge and research is shifted from explanation and verification to a conversation of scholars (rhetors and dialecticians) who seek to guide and persuade themselves and each other through discourses soaked with metaphors. This picture of the scholarly enterprise suggests that critique of theory and method must be permanently immanent precisely because theories and methods themselves cannot be universalized, since their intelligibility and elaboration is possible only within some basic metaphor. This view requires us to acknowledge our own linguistic constitution—ourselves as subjects and our fields as disciplinary objects—and then to maintain and apply the consciousness and the practice of linguistically reflective awareness.

What is the relationship, then, between this metaphoric perspective and the *telos* of nonideological, emancipatory discourse? That is, can rhetorically sensitive social theory also contribute to a more reflexive, more enlightened polity? An adequate paradigm for democratic civic communication must join efficiency in managing complex systems with self-understanding and significance in the lifeworld. That is, it must enable us to govern our polities in a rational manner to ensure collective survival, while providing us with meaning and dignity in our existential experience of ourselves. Hence, such a discourse must be adequate not only on the level of science and technique but also on the level of ethics and politics. After we have deconstructed traditional humanism and traditional science in terms of their metaphoric encodements, we still confront these challenges. But with what intellectual resources and with what disciplinary strategies? What additional problems are we likely to confront? How might they be usefully framed and resolved?

The view of scientific and social realities as rhetorical constructions helps us to address such questions. First, it allows us to abandon the views both of social structures as objective entities acting on individuals, and of subjective agents inventing their worlds out of conscious intentions. Instead, both structure and consciousness are seen as practical, historical accomplishments, brought about through everyday communicative action, the result of rhetorical and dialectical struggles over the nature and meaning of reality.

In this discursive view, language is not a natural fact of daily life or a mere epiphenomenon of forces and relations of production. Instead, language expresses and enables a social "covenant." As de Saussure (1965) put it, this covenant is

the social side of language, [which operates] outside the individual, who can never create or modify it by himself; it exists only by virtue of a sort of contract signed by the members of the community. The community is necessary . . . ; by himself the individual cannot fix a single value. Each time I say [a] word I renew its substance. (pp. 14, 113, 109)

In such a manner, absolutist dichotomies of structure and agency or of base and superstructure may be dissolved in the metaphor of society as textual enactment. The structure (language) is both a constraint and a resource for performance (speech). The semiotic moment of this approach deals effectively with structure; its hermeneutic moment addresses meaning and action. Both these dimensions—syntactics and grammatics, on one hand, and semantics and pragmatics on the other—are contained and logically consisted within the image of social reality and knowledge as metaphoric.

The discursive approach also abandons the distorting notion of disciplines as well as of positivist and hermeneutic dichotomies within these disciplines. Instead, it enables us to slice modes of argumentation differently and to understand the construction of theories as itself the deployment of various rhetorical strategies. Such an approach highlights the presuppositions and metalogics of all forms of knowledge and thus brings values back to the fore.

Indeed, in abandoning the antirhetorical rhetoric of positivism, the rhetorical turn recovers the ancient function of social thought as a moral and political practice. In this view, in constructing theories, we should attend not only to logical propositions and empirical contents but also to linguistic methods and existential functions. We then see the metaphoric dimension of all knowledges as an integral part of their truth or falsity to social life. When seen metaphorically, such truth is also an implicit call to action. Its existential *telos* is self-understanding, critique, and emancipation. Positivists have sought to silence this existential dimension of knowledge by treating it as an object external to society that makes no personal moral claim on us. But different knowledges also convey different existential truths. And unlike propositional truth, existential truth is not merely to be cross-examined. Instead, when it speaks, we ourselves become the "object," for it is we who are addressed.

RIEFF, PHILIP

An American social theorist and analyst of culture, Philip Rieff (b. 1922) is best known for two acclaimed books on Freud and his influence on twentieth-century culture, *Freud: The Mind of the Moralist* (1959) and *The Triumph of the Therapeutic: Uses of Faith after Freud* (1966), and as the editor of the 10-volume edition, *The Collected Papers of Sigmund Freud* (1963). Educated at the University of Chicago and for many years a member of the sociology faculty at the University of Pennsylvania (1961–1993), Rieff is a wide-ranging theorist who has focused on developing a concept of culture that draws heavily from the humanities and religious sources. Within the discipline of sociology, Rieff is most deeply indebted to the works of Max Weber and Charles Horton Cooley. Broadly speaking, Rieff has explored the implications of the rise of psychology for Western culture and the decline of cultures of faith. More specifically, Rieff can fairly lay claim to having originated the concept of "therapeutic culture" and tracing its emergence in Western societies. In his later writings, Rieff has attempted to advance a moral theory of culture that is notable for its uncompromising critique of therapeutic culture and that is closely linked to his efforts to clarify a concept of the sacred.

Rieff's early work, which culminated with the publication of *Freud: The Mind of the Moralist,* argued that Freud, more than any other modern intellectual figure, charted the spiritual course of the twentieth century for America and Europe because he was "the first completely irreligious moralist . . . without even a moralizing message" ([1959] 1979:xi). As a secular guide to the conduct of life, Freud exemplified the strange new ideal of "psychological man" who has nothing left to affirm except the self. Offering neither religious nor political salvation, Freud counseled that individuals should strive for no ethical heights but, rather,

settle for training in an "ethic of honesty" that teaches a certain detachment from communal ideals and tolerance toward the irresolvable complexities of the self. According to Rieff, the Freudian ethic demanded lucid insight rather than sincere action, self-awareness rather than heroic commitment, to escape the dialectic of hope and despair, illusion and disillusion, to which human beings are prone. Rieff points out that in practice, however, Freud's cautious, stoic ethic became popularized into therapeutic doctrines of liberation from normative constraints—sexual, political, and otherwise—which Freud never intended.

In *The Triumph of the Therapeutic,* Rieff proceeded to clarify how "the analytic attitude" of Freud was corrupted and abandoned by seminal cultural figures directly influenced by Freud, such as C. G. Jung, Wilhelm Reich, and D. H. Lawrence, who were the predecessors of a full-blown therapeutic culture, which Rieff saw emerge in the 1960s. Although Rieff wrote largely in defense of Freud's analytic attitude against those who advocated some variety of therapeutic liberation, the ironic and irenic style of *The Triumph of the Therapeutic* sometimes leaves readers in doubt as to where the author stands. In subsequent writings, Rieff leaves little doubt that he rejects not only the triumphant therapeutic culture but also Freud's analytic attitude, which he holds at least partially responsible for the therapeutic revolution.

Fellow Teachers (1973) and other central works of the 1970s, such as "The Impossible Culture: Wilde as a Modern Prophet" ([1970] 1982–83) and the 1978 epilogue to the third edition of *Freud: The Mind of the Moralist,* exhibit much more explicit condemnations of therapeutic culture and (especially in the latter work) even Freud himself. But they also build on earlier attempts to formulate a theory of culture in terms of controlling and releasing motifs, which is pivotal to Rieff's theoretical project.

In the works of the 1970s, Rieff regularly begins to identify the primary controlling forms of all high cultures as "interdicts," the secondary releasing forms as "remissions," and outright violations of interdicts as "transgressions." Every viable culture is thereby conceived of as achieving an intricate balance of dominant, implicitly understood "shalt nots" and subordinate remissions, an ingenious symbolic system of limitations and permissions, that make individuals intelligible and trustworthy to one another. "In point of psychiatric and historical fact, it is *no,* rather than *yes,* upon which all culture and inner development of character, depend" (*The Feeling Intellect,* p. 284). Consequently, it is when the *yeses* expand, growing increasingly subversive and eventually transgressive, overwhelming the interdictory *no's,* that a culture may be said to be in crisis. According to Rieff, we are living through such a period of crisis today that is particularly acute because not only is there no new system of interdicts on the cultural horizon but our therapeutic culture rejects interdictory forms as a matter of principle.

Much of Rieff's *oeuvre* from the 1970s, 1980s, and 1990s remains unpublished, including his magnum opus *Sacred Order and Social Order.* But from the work, which has been published and various public lectures, it is clear that beginning in the 1970s, Rieff launched a sustained intellectual effort to develop a cross-cultural theory of the sacred. Central to this effort has been his attempt to counter the compelling psychological theories of Freud and his predecessor Nietzsche with his own analytic arsenal of concepts. By appropriating, in particular, pivotal Freudian concepts such as "repression," "negation," and "sense of guilt," Rieff has attempted to turn the brilliant psychological reductionism of the predecessors of therapeutic culture against its inadvertent founders. Beyond this, Rieff has given powerful hints of a comprehensive theory of sacred order.

At present, Rieff's influence on social theory and the discipline of sociology is restricted to a relatively small group of scholars who are familiar with his work, within sociology probably most significantly represented by James Davison Hunter and his students. Outside the discipline, Rieff's influence has been more widespread, as evidenced in works by figures such as historian Christopher Lasch (*The Culture of Narcissism*), philosopher Alasdair MacIntyre (*After Virtue*), and others who explore the relations between morality and society. Indeed, Rieff could easily be characterized as what is now commonly termed a "public intellectual." But as an intellectual, Rieff has consistently adopted a stance of opposition toward the very model of the public intellectual in the twentieth century, which was inspired by *les philosophes* and arose from the Dreyfus Affair, because of the intellectual's close affiliation with the "remissive" world of public celebrity and political power. In its dual opposition to narrow academic specialization and intellectual celebrity, Rieff's work stands out as an unusual effort to employ social theory in defense of the interdictory forms that he sees as inseparable from all high cultures.

RISK SOCIETY

What do events as different as Chernobyl, global warming, mad cow disease, the debate about the human genome, the Asian financial crisis, and the September 11, 2001, terrorist attacks have in common? They signify different dimensions and dynamics of (global) risk society.

Premodern dangers were attributed to nature, gods, and demons. Risk is a modern concept. It presumes decision making and inherently contains the concept of control. As soon as we speak in terms of "risk," we are talking about calculating the incalculable, colonizing the future. In this sense, calculating risks is part of the master narrative of (first) modernity. In Europe, this victorious march culminates in the development and organisation of the welfare state, which bases its legitimacy on its capacity to protect its citizens against dangers of all sorts. But what happens in risk society is that we enter a world of *uncontrollable risk.* "Uncontrollable risk" is a contradiction in terms. And yet it is the only apt description for the second-order, *un*natural, human-made, manufactured uncertainties and hazards beyond boundaries we are confronted with in (second) reflexive modernity.

Risk society does not arise from the fact that everyday life has generally become more dangerous. It is not a matter of the *increase,* but rather of the *de-bounding* of uncontrollable risks. This de-bounding is three-dimensional: spatial, temporal, and social. In the spatial dimension, we see ourselves confronted with risks that do not take nation-state boundaries, or any other boundaries for that matter, into account: climate change, air pollution, and the ozone hole affect everyone (if not all in the same way). Similarly, in the temporal dimension, the long latency period of dangers—such as, for example, in the elimination of nuclear waste or the consequences of genetically manipulated food—escapes the prevailing procedures used when dealing with industrial dangers. Finally, in the social dimension, the incorporation of both jeopardizing potentials and the related liability question lead to a problem—namely, that it is difficult to determine, in a legally relevant manner, who "causes" environmental pollution or a financial crisis and who is responsible; these are mainly due to the combined effects of the actions of many individuals ("organized irresponsibility"). This then also means that the boundaries of private insurability dissolve, since it is based on the fundamental potential for compensation of damages and on the

possibility of estimating their probability by means of quantitative risk calculation. So the hidden central issue in risk society is *how to feign control over the incontrollable*— in politics, law, science, technology, economy, and everyday life (Adam, Beck, and van Loon 2000; Allan 2003; Beck 1999; Giddens 1994; Latour 2003).

We can differentiate between at least three different axes of conflict in risk society. The first axis is that of *ecological* conflicts, which are by their very essence global. The second is *global financial* crises, which, during the first stage of modernity, can be individualised and nationalised. Financial risks threaten or devalue personal property (capital, jobs) so they are more individualized than ecological risks; if there is a collective definition, it tends to be a national one. And the third, which suddenly broke upon us on September 11, 2001, is the threat of global terror networks, which empower governments and states. Terrorism raises the question of who defines the identity of a "transnational terrorist." Neither judges nor international courts do, but the governments of powerful states do. They empower themselves by defining who is their enemy. Terrorist enemy images are de-territorialized, de-nationalized, and flexible state constructions that legitimate global interventions by military powers.

When we say these risks are global, this should not be equated with a homogenisation of the world—that is, that all regions and cultures are now equally affected by a uniform set of nonquantifiable, uncontrollable risks in the areas of ecology, economy, and power. On the contrary, global risks are per se unequally distributed. They unfold in different ways in every concrete formation, mediated by different historical backgrounds and cultural and political patterns. In the so-called periphery, global risk society appears *not* as an *endogenous* process, which can be fought by means of autonomous national decision making but rather as an *exogenous* process propelled by decisions made in other countries, especially in the so-called centre. People feel like the helpless hostages of this process insofar as corrections are virtually impossible at the national level. One area in which the difference is especially marked is in the experience of global financial crises, whereby entire regions on the periphery can be plunged into depressions that citizens of the centre do not even register as crises. Moreover, ecological and terrorist network threats also flourish with particular virulence under the weak states that define the periphery.

There is a dialectical relation between the unequal experience of being victimized by global risks and the transborder nature of the problems. But it is the transnational aspect, which makes cooperation indispensable to their solution, that truly gives them their global nature. The collapse of global financial markets or climatic change affects regions quite differently. But that doesn't change the principle that everyone is affected, and everyone can

potentially be affected in a much worse manner. Thus, in a way, these problems endow each country with a common global interest, which means that the globalized public reflection ("mass media") of global risk conflicts produces the basis of a global community of fate. Furthermore, it is also intellectually obvious that global problems have only global solutions and demand global cooperation. But between the potential of global cooperation and its realization lie a host of risk conflicts. And yet these conflicts still serve an *integrative* and enlightenment function, because they make it increasingly clear that global solutions must be found and that these cannot be found through war but only through negotiation and contract.

A further distinction can be made, however, between ecological and financial threats on one hand and the threat of global terrorist networks on the other. Ecological and financial conflicts fit the model of modernity's self-endangerment. They both clearly result from the accumulation and distribution of "bads" that were tied up with the production of goods. They result from society's central decisions but as unintentional side effects of those decisions. Terrorist activity, on the other hand, is intentionally bad. It aims to produce the effects that the other crises produce unintentionally. Thus, the principle of *intention* replaces the principle of *accident*. Active trust becomes active mistrust. The context of individual risk is replaced by the context of systemic risks. Private insurance is (partly) replaced by state insurance. The power of definition of experts has been replaced by that of states and intelligence agencies, and the pluralization of expert rationalities has turned into the simplification of enemy images. It is the very flexible hybrid character of the "transnational terrorist enemy" representation that ultimately reinforces the hegemony of already powerful states.

Having outlined their differences, it should be no surprise that the three kinds of global risk—ecological, financial, and terrorist threat—also interact. And terrorism again is the focal point. On one hand, the dangers from terrorism increase exponentially with technical progress. Advances in financial and communication technology are what made global terrorism possible in the first place. And the same innovations that have individualized financial risks have also *individualized war.*

But the most horrifying connection is that all the risk conflicts stored away as potential could now be intentionally unleashed. Every advance from gene technology to nanotechnology opens a "Pandora's box" that could be used as a terrorist's tool kit. Thus, the terrorist threat has made everyone into a disaster movie scriptwriter, now condemned to imagine the effects of a homemade atomic bomb assembled with the help of gene technology or nanotechnology and so on. But this is a one-sided view. It ignores the new terrain. In an age where trust and faith in God, class, nation, and government have declined considerably,

humanity's common fear has proved the last resource for making new bonds.

RITZER, GEORGE

George Ritzer (b. 1940) is Distinguished University Professor of Sociology at the University of Maryland. His most important work has been in sociological theory, especially metatheory, and the application and development of theory in the sociology of consumption. Outside sociology, George Ritzer is best known for his term, *McDonaldization.* He has other and perhaps stronger claims to significance in sociology, but this article will begin with McDonaldization, because it is one of the few recent ideas that have originated in sociology and connected with a general intellectual public.

As Ritzer recognized, McDonald's has become a key symbol that connects the process of socialization through mundane activities (our childhood experiences of dining out) to global capitalist developments (the golden arches as one of the most prominent signs of American imperialism). However, Ritzer argues that the *process* of McDonaldization is of greater importance than the actual McDonald's. As described in *The McDonaldization of Society,* this process means a focus on efficiency, calculability, predictability, and control, but it is accompanied by the seemingly inevitable irrationality of rationality. McDonald's is the epitome of this, but McDonaldization is a process that is increasingly evident in a wide range of settings (e.g., the McDonaldization of education, the church, the health system, criminal justice, and so on).

The idea of McDonaldization is an elaboration of Max Weber's theory of rationalization. For Weber, the bureaucracy was the embodiment of the increasing formal rationality of the modern world, but Ritzer argues that the bureaucracy's vanguard role has been taken over by the fast-food restaurant. Like the bureaucracy before it, the fast-food restaurant both exemplifies this rationalization in its organizational form and, at the same time, constitutes one of the main vectors for its further dissemination. The bureaucracy allowed formal rationality to dominate our political and economic life. The fast-food restaurant opens up the realm of mundane activities and personal taste.

McDonaldization provides a key point from which to understand Ritzer's evolution as a theorist. Before McDonaldization, Ritzer was mainly concerned with delineating the existence of multiple paradigms in sociology and encouraging their integration. McDonaldization is, in part, an outgrowth of this work, since it integrates Weber's theory of rationalization with Marx's theory of capitalism, as well as neo-Marxist work on control. However, despite its deep roots in classical sociology, there is something new in Ritzer's concept. The rationalization of consumer organizations is different from the rationalization of administrative and production organizations. Therefore, McDonaldization can be seen not only as an outgrowth of Ritzer's early work but also as the beginning of his more recent interest in consumption.

Ritzer's early work in sociological theory concerned metatheory—that is, the systematic study of the underlying structure of sociological theories. *Sociology: A Multiple Paradigm Science* was an assessment of Thomas Kuhn's idea of paradigms and an application of this concept to sociology. Ritzer argued that sociology is divided into three fundamental paradigms. The social facts paradigm focuses on large social structures and external social constraints such as norms and values. The social definition paradigm focuses on the way in which actors define their social situation. The social behavior paradigm focuses on the social causes and effects of the unthinking behavior of individuals. This examination of paradigms allowed Ritzer to look at fundamental commonalities between seemingly disparate theories, as well as identify theorists who "bridged" these paradigms.

This led to Ritzer's proposal for an integrated paradigm for sociology. He maintained that the three paradigms could be seen as dealing with the major "levels" of social reality, which Ritzer delineated through the juxtaposition of the macroscopic-microscopic and objective-subjective continua. His integrated paradigm, designed to complement extant paradigms, deals with the interrelationships among *all* these levels. This work, completed by the early 1980s, anticipated the rise in interest in micro-macro and agency-structure integration in late twentieth-century social theory.

In *Metatheorizing in Sociology,* Ritzer established three distinct uses of metatheory: to attain a deeper understanding of sociological theory; as a prelude to theory development; and as a source of new metatheories. He also introduced a fourfold typology for a deeper understanding of sociological theories using the dimensions of internal-external and intellectual-social influences. We can use this tool to understand Ritzer's theories. He had no strong

allegiance to any theoretical approach (internal-intellectual) because he got his Ph.D. at Cornell University in industrial and labor relations and therefore was not socialized in any particular sociological school (internal-social). His professional career began at the same time as Kuhn's book was having an impact on philosophy and science studies (external-intellectual) and as the dominant sociological school, structural functionalism, was unraveling (external-social). This provided Ritzer with a relatively unique standpoint from which to understand and compare sociological theories. This metatheoretical approach can also be seen in the eclecticism that characterizes his textbooks on sociological theory.

Ritzer's more recent work involves theorizing about consumer culture. Both *Expressing America* and *The McDonaldization Thesis* can be seen as attempts to bring more theoretical resources to the understanding of consumer culture. In *Expressing,* Ritzer draws on C. W. Mills and Georg Simmel to understand the effects of credit cards on society. In *The McDonaldization Thesis* he draws on Karl Mannheim to further understand McDonaldization. However, it is in his book *Enchanting a Disenchanted World* that Ritzer outlines the challenge that consumer culture presents to social theory.

McDonaldization had originally been intended as a fairly straightforward application of Weber's theory of rationalization to current problems. One of the most important tenets of Weber's theory is that rationalization leads to an increasing disenchantment of our view of the world. The world is demystified, less magical, a more predictable and calculable place. For Weber, this has certain psychological and moral disadvantages, but it does not really interfere with the workings of the rationalized systems themselves. Ritzer shows that for consumer culture, disenchantment becomes a central problem for the system. Continued consumption requires enchantment and belief in the promise of magic. Disenchanted production and administrative systems can run quite well; disenchanted consumption systems cannot. Ritzer examines the ways in which disenchanted consumption systems attempt to reenchant their practices.

This recognition of the centrality of consumption in modern society led Ritzer to cofound the *Journal of Consumer Culture* with Don Slater and to propose in his latest book, *The Globalization of Nothing,* a daring new theory that the spread of consumer culture is accompanied by the dominance of a social form that is centrally conceived and controlled while being relatively devoid of substantive content. He creates a new term, "grobalization," to complement the popular idea of glocalization in globalization theory and focuses on the growing proliferation of nothing in consumer culture throughout much of the world. Building on Marc Augé's concept of nonplaces (e.g., a shopping mall), he develops the ideas of nonthings (e.g.,

Gucci bags), nonpeople (e.g., Disney "cast members"), and nonservices (those of ATMs), and he argues that all are being increasingly grobalized.

ROLE THEORY

The term *role theory* refers to an expansive and variegated body of analyses examining the linkages between social organization, culture, and the performances that humans give while engaged in interaction. Contemporary role theory within sociology is the progeny of two dominant theoretical traditions in social psychology—structural role theory and symbolic interactionism. Recent theorizing within postmodern, feminist, and critical-dramaturgical perspectives in role theory have integrated the insights of both traditions, creating a hybrid emphasizing the political, economic, and cultural as well as performative aspects of social roles. Building on the early insights of anthropologist Ralph Linton, structural role theory provided a conventional definition of *role* as the duties and obligations associated with a single position or "status" and defined the way in which one carried out his or her role, a "role performance." For Linton, interaction was governed by the role expectations of actors' respective statuses. The fundamental proposition of the structural role theory is that shared

expectations serve as a cultural script or blueprint that ensures conformity because it is either obtrusive in the social context, has been internalized by actors before they enter into it, or both. A decidedly sociological variant of structural role theory was provided by Talcott Parsons in his theory of "informational control." Parsons theorized roles as the crucial social mechanism that positioned individuals in social structure but, more important, inculcated culture as individuals were socialized into them.

One of the most reliable sociological findings is that people's attitudes and behaviors vary according to the social position they occupy in the social structure. Contemporary research in the *social structure and personality* paradigm within sociological social psychology has provided evidence of the linkage between social class, parental values, and the psychological attributes of children. The questions historically addressed within social science—How is society organized? How is social order possible? How is prediction of behavior possible? How and why people are constrained?—are answered by structural role theory, which emphasizes that "status" or structural position is the fundamental, constituent element of social organization determining the allocation of social roles. Exploring the linkage between adult work experiences and childhood development, Mortimer, Lorence, and Kumka (1986) write: "Social class . . . determines the conditions of occupational life to which the individual is exposed. Men who have self-directed work activities value self-direction in themselves as well as in their children" (p. 188). Structural role theorists argue that social organization and interactional regularity are possible because of cultural consensus regarding role expectations. While this feature of social life may lead to people feeling constrained in the way that they enact various roles, habituated behavior also produces an "economy of effort." Hence, the prediction of behavior becomes possible for social scientists as the actors in everyday life "construct predictability."

Structural role theory, then, views individuals largely as conformists. A central criticism leveled at the theory is that it does not adequately explain deviance in terms other than psychologistic ones. Other problems also remain. Biddle (1986) observed that not all roles may be associated with identified social positions. In friendship groups, status structures may be precariously absent or minimal and roles may be shared. Moreover, norms may or may not be shared within an entire social system, and thus they may or may not lead to conformity or sanctioning. Symbolic interactionists have traditionally eschewed asking questions concerning the stability of personality characteristics, criticizing early structural role theory for, as Dennis Wrong argued, providing an "overly socialized" conception of human behavior. Instead, symbolic interactionists have focused on the ways in which roles are molded and adapted in the course of a performance—that is, interaction. Following the work of

sociologists such as Herbert Blumer and Ralph Turner, psychologists Paul Secord and Carl Backman have emphasized a less deterministic view of human action. These scholars conceive of interaction as an interpretive process in which meanings evolve and change over the course of interaction. Roles are viewed as emerging out of the interactional process. Interpersonal negotiation leads to shared role definitions, which, in turn, lead to stable, individual behavior. As a symbolic interactionist role theory, this approach focuses on the roles of individual actors and the way in which roles evolve through social interaction. Roles are thought to "reflect norms, attitudes, contextual demands, negotiation, and the evolving definition of the situation as understood by the actors" (Biddle 1986:71). Role-taking and role-making processes are central to understanding this approach.

ROLE TAKING AND ROLE MAKING

Responding meaningfully to our interaction partners requires us to "take the role of the other"—that is, to anticipate communicative as well as nonverbal action on the part of others. Social philosopher George Herbert Mead viewed roles as strategies for coping that evolve as individuals interact with other persons. Mead emphasized the need for a "reciprocity of perspectives," or understanding the perspective of others ("role taking"), if lines of interaction are to be effectively aligned with others. Relying on the insights of Mead and phenomenologist Alfred Schütz, sociologists Peter Berger and Thomas Luckmann theorized that role taking proceeds on the basis of typifications—that is, definitions about the "type," character, or nature of the person we encounter. Knowing the status of a person, we immediately attempt to take the role or perspective of that person. If we know that we will be at a dinner gathering with a medical doctor, a social worker, and a pianist, we come to that gathering with certain role expectations of these individuals, given the positions they occupy. We might think of possible topics of conversation that would be appropriate to discuss with these individuals. We are perhaps most aware of role-taking processes when we fail at interaction and commit a social blunder.

While role playing presupposes the ability of people to take the role of the other, *role making* entails constructing, changing, adapting, and modifying a role in the course of a role performance. Formal rules may govern and limit the kind and degree of innovation in a performance, but outside of highly bureaucratized institutions such as the military, hospitals, convents, or monasteries, where performances may be marked by rigid enforcement, most roles allow for some degree of improvisation and creativity.

In Turner's approach, interaction is always a tentative process, as the individual tests the conception the other has of her role. Turner critiqued structural role theory as

emphasizing only one way in which role-taking and role-playing processes may occur—through conformity, expectation, and approval. For Turner (1962), role processes are interactive. However, problems exist for this theory, as well, to the degree that it neglects the constraining effects of the role framework provided by groups. Indeed, as Biddle (1986) notes, little attention is given to actors' expectations for other persons or to the structural constraints placed on expectations and roles.

THE LANGUAGE OF ROLE

In their discussion of the nature and history of role theory, Thomas and Biddle (1966) examine role metaphors—"the use and extension of which have greatly increased the articulateness of the role language" (p. 13). A clear example is the dramaturgical metaphor. Analyzing social interaction as if it were a theatrical performance, sociologist Erving Goffman's approach relies heavily on the concept of role. Indeed, the dramaturgical model of human behavior has inspired metaphorical concepts such as role enactment, role playing, role taking, altercasting, front, presentation of self, mask, and persona. In his analysis of fantasy games involving the construction of fictitious roles, Gary Alan Fine (1983) used Goffman's concept of "keying" in demonstrating how fantasy role gamers transform the "everyday" quality of their surroundings into theater as they move their game pieces around the board. The term "upkeying" is appropriated by Fine to describe the fanciful flight from the frame of everyday reality and entry into the role of a make-believe character that gamers socially construct as they play such games as *Dungeons and Dragons.* "Down-keying," in the context of fantasy role-playing games, denotes the process of social psychologically exiting the game frame and returning to the conventional frame of everyday reality.

But to what degree do people personally identify with their roles? In what ways do roles become salient for people as they define their own identity and see, think, talk, and act in the social world? When the roles that people perform are ones that completely saturate the way they think, see themselves, and interact with others, they are engaged in *role engulfment.* Role engulfment was readily observed among the fantasy game players studied by Fine (1983). Gamers playing *Dungeons and Dragons* spent much time constructing fictitious characters through role playing, embracing the role so strongly that they would use the identity outside of the game context when penning letters. Moreover, according to some of the players' parents, fantasy gamers "had become so thoroughly engrossed that they had difficulty retreating back into everyday life and conventional morality." Groups concerned that the game promoted "mind control" argued that students should not be allowed to play the game (Martin and Fine 1991:112).

If role engulfment defines a state in which a role is all encompassing, it is also true that people may disassociate themselves from the roles that they play. *Role distance* refers to the inner separation that people feel from the role they are playing as they disinvest themselves in its performance. As performers engage in role distance, they may directly or inadvertently indicate that they are not to be identified with the role they are playing. As Peter Berger (1963) commented, every strongly coercive situation will produce "the playing of a role tongue-in-cheek, without really meaning it. . . . this kind of duplicity is the only way by which human dignity can be maintained" (p. 135).

In her field research on women prison guards working in all-male prisons, Lyn Zimmer (1987) found that women resisted some elements of the guard role as it was traditionally performed by men. While most aspects of their role performance were indistinguishable from their male counterparts, female guards relied on skills at relational work and eschewed coercive strategies, such as rescinding privileges, commonly used by male guards. By making small concessions, women humanized the guard role, transforming some of their contact with prisoners into times when they could provide counseling, help prisoners write letters, or help inmates search for jobs as they anticipated parole. While female guards received lower performance reviews and less staff support for failing to enact a more masculine script in the guard role, this adaptation garnered higher degrees of compliance from the prisoners.

As Zimmer's study reveals, the degree to which people resist the requirements of their role is quite variable and depends, in part, on their assessment of the "objective" features of the context over which they may have no control. Female guards resisted and transformed the guard role until it was transparent that they would receive little or no assistance from their male counterparts even in dangerous situations. As role players resist the unpleasant aspects of their role, that resistance may take a variety of forms. Where the consequences of resistance may be acutely felt, resistance may only be internal, in the form of distancing oneself from the role. Secondary adjustments may be used as performers begin to sense that the opportunity for role making is small and that they are "stuck" in the role. Where more autonomy in role playing is realized, actors may engage in role making, transforming features of the role in ways that are more humanizing. The shift, in recent years, from structural role theory to more interactionist understandings of role dynamics allows for more complete and dynamic conceptions of this crucial sociological concept.

ROLE THEORY: AREAS OF STUDY

Gender Roles. In gender analyses of both family and work settings, emphasis is commonly placed on role specialization,

role conflict, and socialization. In recent years, feminist research has focused on the effects of changing occupational roles as women have challenged male-dominated structures in the division of household labor as well as in the workforce. Arlie Hochschild, in her book *The Second Shift* (1989), demonstrated that while in the role of homemaker, the workload of working women was exacerbated as husbands refused to create a more equitable distribution of household chores by altering their own roles. More recently, Scott Coltrane (1998) found that while household work regarding children is shared more or less equally by women and men, some chores continue to be allocated according to very traditional gender roles: Women still do most of the clothes care, while men do lawn care.

Ethnic Roles. Research on race and ethnicity has focused on children's socialization into a "race role." Joan Ferrante (2000), for example, observing the play of Palestinian children noted that the most popular part to play in the children's game is that of Israeli soldier, because the role is one on which power and status in everyday life is conferred. Focusing on the dramaturgical repertoire required of young black men, Brent Staples noted that white racism forces young black men to play accommodating roles. At night, to avoid being hassled by police or confronted by frightened, hostile white pedestrians like subway shooter Bernard Goetz, young black men use several strategies: They increase the physical distance between themselves and white pedestrians they may be following; they allow lobbies of buildings to clear rather than be caught alone with a white person; and, they allow sufficient physical space on train and subway platforms. *In toto,* the weight of the culture is on black men to develop and use interactional strategies that alleviate white fear of the stereotypical role they are presumed to play—one that is dangerous, criminal, and suspect.

Class Roles. Another process elucidated by role theory is social class. Children are socialized into social class and learn the class role. Robert Granfield's (1991) study of working-class students at Harvard Law School uncovered two distinct options that working-class students may exercise in playing the student role. Students may engage in "covering"—that is, trying to fit in without revealing their working-class roots. Yet this strategy may be plagued with "disidentifiers." Students may not be able to afford the clothes that don the same labels as their classmates, their diction may be deficient when speaking, or their social graces may be suspect as they attend mixers with faculty, parents, and other students. By contrast, working-class students may, instead, play the role of "working-class hero" demonstrating that, whatever upward social mobility they may experience, ideologically, they embraced their working-class roots. Wearing flannel shirts, talking about labor issues, and demonstrating that their aspirations include

fighting for workers' causes are included in the repertoire of the working-class law student.

THE POSTMODERN SHIFT

In recent years, the work of sociologists and psychologists has increasingly emphasized the concept of identity rather than role. Postmodern theories, in particular, have shifted the theoretical focus from roles to identity, emphasizing the fractious and segmented nature of both the performance demands governing the self and the cultural narratives used in constructing and understanding it (see especially the work of psychologist Kenneth Gergen as well as the work of sociologists Jaber Gubrium and James Holstein). Changes in the structure of society reflect (and partially account for) this theoretical shift. Ralph Turner's (1962) masterful analysis observed that, in premodern and modern societies, the self is expressed in and through a given role performance; it is affirmed as people live up to the institutional expectations for their role. Yet the levels of mass production and consumerism achieved under industrial capitalism increased the possibility as well as the cultural expectations for greater consumption and personal expression through it. According to Turner—and more recently, postmodern theories of the self—greater levels of consumption are accompanied by a cultural shift in the locus of self from institutionally based roles to its expression in impulse. New cultural movements such as the self-help movement provide increasing attention on the self, creating narratives and vocabularies that glorify it in a culture of narcissism. The focus on the expression of the self as identity, as a cultural and social object, and on the signifiers that accompany it now characterizes much of the contemporary theoretical work being done in the area of role theory.

RORTY, RICHARD

Rorty, Richard (b. 1931), American pragmatist and self-described bourgeois, liberal ironist, established himself as philosophy's "anti-philosopher" in his 1979 book *Philosophy and the Mirror of Nature.* In this work, Rorty critiques the epistemological and metaphysical foundations of modern philosophy and, in particular, rejects the belief of knowledge as representation. According to Rorty, we should be critical of epistemology because it is the equivalent of foundationalism and suspicious of metaphysics because it amounts to essentialism. There is no universal truth for Rorty, and we should be weary of any discipline, especially philosophy, that attempts to provide a theory of knowledge to ground science, art, politics, or morality. Thus, Rorty's pragmatism is informed by an antirepresentationalism, antifoundationalism, and anti-essentialism, which is captured in all his work from the *Philosophy and the Mirror of Nature* (1979), through his *Philosophical Papers,* volumes one (1991), two (1991), and three (1998), to *Contingency, Irony, and Solidarity* (1989).

Rorty is not alone in his rejection of knowledge as representation, and in *Philosophy and the Mirror of Nature,* he discusses who he feels are the three most important philosophers—Ludwig Wittgenstein, Martin Heidegger, and James Dewey—that also realized that the mind was not merely a mirror of nature. Wittgenstein, Heidegger, and Dewey recognized that language is contingent. Thus, the vocabulary employed by philosophers during the Enlightenment is specific to their own time and place, and we therefore need to invent a new vocabulary to describe our own historical experiences. This is another critical theme that informs much of Rorty's writings as he hopes that hermeneutics, especially conversation, will provide the space for social justification and, possibly, agreement. In particular, Rorty is indebted to Wittgenstein for understanding language as a tool, not a mirror; to Heidegger for the historicist notion that there is no knowing subject that is the source of truth; and especially to Dewey for conceiving of knowledge as social practice. Rorty describes Wittgenstein, Heidegger, and Dewey as "edifying" philosophers who engaged in "abnormal discourse" and were "reactive" and "destructive" rather than "systematic." Their philosophies offer parodies instead of arguments and aim at "continuing a conversation rather than discovering a truth." This is critical, for Rorty himself provides what could be characterized as an edifying philosophy, which hopes to disrupt the reader into questioning his or her taken-for-granted attitudes and through this practice of questioning become new human beings.

Rorty perhaps best articulates what he means by pragmatism in an essay from *Consequences of Pragmatism* (1982) titled "Pragmatism, Relativism, and Irrationalism." Rorty describes three characteristics of pragmatism, including its anti-essentialist understanding of truth, language, and knowledge; its rejection of the distinction between morality and science; and its belief in contingency. This last point, according to Rorty, is the most important because it means that no constraints exist in our attempts to understand the social world and ourselves except those we encounter with our conversational partners. However, conversational constraints, Rorty informs us, cannot be anticipated. Therefore, we are never precisely certain when we have reached the truth, or even if in conversation we have come closer to the truth. Instead, we have to accept the contingent nature of conversation as having no beginning and no end and that success in conversation means continuing to converse. Although Rorty's notion of conversation sounds similar to Jürgen Habermas's ideal speech situation, Rorty reminds us that Habermas qualifies his conversation as one that is "undistorted." According to Rorty, Habermas treads into a transcendental realm by delineating principles of what constitutes undistorted conversation. For Rorty, these principles will not do because as a pragmatist he believes only those engaged in conversation have the capacity to agree on what *undistorted* means according to their own criteria. Rorty admits that this understanding

of conversation is ethnocentric but believes that we can attempt to justify our beliefs only to those who already share them.

Rorty, true to spirit of the early American pragmatists, is optimistic about the prospects for human solidarity and the possibility of what he calls a liberal utopia. However, as he discusses in *Contingency, Irony, and Solidarity* (1989), the only way to achieve this utopia is to relinquish the modern quest of uniting the public and the private. For Rorty, there exists an irreconcilable tension between an individual's public struggle for social justice and private project of self-creation. Therefore, to live in a just and free society, we need to allow individuals to realize their aesthetic projects of self-creation in the private realm as long as these individual efforts do not cause harm to others. This is the goal of what Rorty calls the "liberal ironist." Liberals are those individuals who believe that inflicting harm or cruelty on others is the most base thing we can do, while ironists are those who understand the contingency of their beliefs and desires. Liberal ironists, according to Rorty, realize that human solidarity is a goal to be achieved through imagination, not inquiry, because it is only through imagination that we can feel the pain of others. Rorty hopes that if we increase our sensitivity to the pain of others, then it will be more difficult for us to marginalize them and we will, indeed, begin to see them as fellow sufferers.

ROUSSEAU, JEAN-JACQUES

Jean-Jacques Rousseau (1712–1778) was born of parents of modest means in 1712 in Geneva, a city that he quit as an adolescent but to which he would occasionally return, both physically and spiritually. He led a rather picaresque early life, working variously as a servant, private tutor, music copyist, and ambassador's secretary, eventually making his way to Paris, where he consorted with the *philosophes.* In 1749, while walking to Vincennes, he had an "illumination" that was to result in the *Discourse on the Arts and Sciences* and subsequent notoriety. A steady stream of writings extended his fame across Europe, although the controversial nature of these writings meant that he was often on the move, a tendency exacerbated by increasing signs of paranoia as he advanced in age. He died in 1778 in his final refuge in Ermenonville. At the height of the French Revolution, his remains were transferred to the Panthéon, only to be removed and scattered with the Bourbon Restoration.

Jean-Jacques Rousseau is an enigma. He has been variously described as a figure of the Enlightenment and as its critic, as an individualist and a collectivist, a democrat and a totalitarian, the founding figure of the modern cult of the inner life, and the posthumous "author" of the French Revolution. Such very different judgments stem in part from the diversity of his writings, which can be grouped into the following categories: historical anthropology (*Discourse on the Origin of Inequality, Essay on the Origin of Languages*), political theory (*The Social Contract, Discourse on Political Economy*) and political practice (*The Government of Poland, Constitutional Project for Corsica*), education (*Emile*), the arts (*Discourse on the Arts and Sciences, Letter to M. Alembert on the Theatre*), fiction (*Julie or La Nouvelle Hélöise*), autobiography, introspection, and self-justification (*The Confessions, Reveries of the Solitary Walker, Rousseau Judge of Jean-Jacques*), not to mention his writings on botany and music (or his musical and operatic compositions). But such very different judgments also stem from the fact that the same works have been subjected to the most contradictory interpretations. Rousseau's writings are infinitely rich and complex, subject to considerable internal tensions.

If one adopts the perspective of a specifically social theory, one might begin by noting that the widespread use of the term *social* in the nineteenth century owed much to the fame of *The Social Contract*. This work, however, is decidedly more a work of political than social theory. The society of the social contract is an exclusively political society: For it is formed by a political act, held together by a political will, and ordered relative to political ends. Moreover, the members of this society must present themselves exclusively as citizens, not as social actors. And yet Rousseau radicalizes the premises of contract theory to the point where the political constitution of society begins to implode. It is at this point of implosion that Rousseau can be read, retrospectively, as a social theorist.

The social contract forms, and is formed by, the general will, which in turn establishes the general laws that constitute the collective order and constitute it as a just order. This contract is established both between individuals (as a decision to live together under the same laws) and within each individual (as a decision to live according to the law). With

the contract, all citizens agree to alienate their entire "natural" liberty to the collective body, and they acquire in return, through their participation in that body, a properly social or, better, political liberty. This latter liberty implies not just a principle of collective self-determination as given by the general will, but a principle of individual self-determination: For once one has left the presocial state and become self-conscious, one will want to be free to determine one's own law (as well as the general law). The two laws, individual and collective, coincide in principle. Otherwise individuals would not agree to the terms of the contract, even as there could be no individual law without the "social" state formed by the contract. The fact that the general will is to be truly general, deriving from and applying to everyone equally, determines its three principal characteristics: its inalienability, indivisibility, and infallibility. It is inalienable in that it cannot be transferred to a less general will, as in the case of its representation. It is indivisible, insofar as it cannot be general if divided against itself. And it is infallible in that its generality guarantees its rightness (the empirical will of all, should it fail to present the general interest, would not be truly general if everyone knew what that interest was). These claims must be understood as having an axiomatic nature, as belonging to the social contract's definitional logic. As the contract and the will formed by the contract are, by reason of their generality, entirely abstract, it is not immediately clear what their relation is to empirical reality and its particulars.

This definitional logic implies at least two radical innovations relative to the tradition of contract theory exemplified by Hobbes and Locke. First, it pushes contract theory in a radically democratic direction. Being inalienable, the sovereign general will belongs to everyone at all times, not just at its origins. (Although one must be careful to understand in what sense Rousseau's contract is democratic. The general will refers to political society, not to government; the former establishes the general laws, while the latter, composed exclusively of the executive and judicial functions, is limited to particular decrees. Political society, then, is necessarily and directly democratic, but government—understood as a delegation of power and not as a representation of the sovereign will—can be monarchic, aristocratic, or democratic.) Second, the distinction between nature and culture is radicalized so as to emphasize the mutability of the human condition. In the state of nature protohumans are without language, morality, self-consciousness, or consistent relations with others, while their desires are restricted to needs that can be satisfied without toil. Consequently, even though nature's impulse can never be entirely extinguished, social existence entails a radical historicity. Note that even as the social contract marks the transition from the state of nature, its preconditions (e.g., language, morality, and reason) can emerge only after the transition's completion. Moreover, in *The Discourse on Inequality,* Rousseau claims

that the self-sufficient, harmonious character of the state of nature could only have been disrupted by a catastrophic accident that introduces traits—notably the egoism of *amour propre* and the division of property—that undermine the contract's ethical content. All this only renders the question of the social contract's status relative to empirical reality all the more problematic.

Rousseau is quite aware that the definitional axioms of the social contract cannot but appear as absurd paradoxes. He constantly speaks of the obstacles to the contract's realization, and sometimes he speaks of them as insuperable. What then is the status of the social contract? Some have interpreted it as a utopia, the most perfect society, the end product of the species' perfectibility, where all the tensions between the individual and collective, nature and culture, reason and passion, virtue and happiness, have been overcome. Others have seen the society of the contract less as a utopia than as a second-best solution to civilization's discontents, an alienated response to an alienated world. Thus, they note that, while the general will seeks to limit *amour propre,* social inequalities, and private property, it cannot eliminate them. Still others would understand the social contract as an ideal form in Plato's sense, one that necessarily underlies all collective life, but whose empirical manifestation is always, to one degree or another, corrupt. All the interpretations pose a disjunction between the ideal collectivity constituted by the contract and all real collectivities. It is relative to this disjunction or, more precisely, to the subsequent instability, that one can speak of the implosion of the idea of society's specifically political constitution. And it is in relation to this implosion, which here takes on a heightened, almost self-conscious character, that one can speak of the social dimension in Rousseau's thought. This dimension allows of several possible approaches.

The first would be to read Rousseau's social theory, as drawn largely from his historical anthropology, against the political theory of the contract, treating the former as pointing to the obstacles to the latter's realization. Here, the social dimension of his thought would consist of his critique of the division of labor, private property, the power differentials in the political and judicial structures, and the growth of the egoistic passions. These themes could be woven into a narrative of humanity's fall from a state of natural grace and the betrayal of the social state's promise. In short, Rousseau as a social theorist would be identical to Rousseau as a critic of bourgeois society.

A second strategy would draw attention to what might be called the social supplement necessary to realize the political "solution." Rousseau often appears to claim that it is extremely difficult, even impossible, to realize the social contract politically—that is, by the development of a consensus based on reason. Whether because of ignorance or immorality, little is to be expected from really existing public opinion. The people require "guidance," and this

guidance will be all the more effective if it employs methods that "trick" the general will's claim to encompass the participation of all in full consciousness. One can point to the figure of the legislator as a sort of extra-political *deus ex machina,* who breaks through the circle of civilizational alienation while adapting contractual principles to local circumstances. And one can describe all the infrapolitical instruments that the legislator employs to inscribe the contract's clauses in the citizens' hearts, if not their minds. The social dimension of Rousseau's theory, then, would speak to his discussion of identity formation, civil religion, the patriotic rites and ceremonies of emulation, and more generally, all the half-submerged institutional and civilizational mechanisms that seem to underpin every conscious, volitional consensus. Such a discussion would open onto larger ethical questions concerning a pedagogy of freedom where, unbeknownst to oneself, one is made to be free. The *Émile* provides particularly rich resources in this regard.

A third and final approach would read the social theory into the tensions, if not the seeming impossibility of a purely political "solution." If the social contract appears in the form of an exchange, it can never be upheld solely on the basis of a purely rational calculation. As a moral relation, the social bond is underwritten by the sentiment of virtue. And virtue is the expression of both the individual's absolute moral autonomy and his or her desire to submit to (as well as the duty to uphold) the general law of the community. This double character of virtue follows from the definitional axiomatics of the social contract. And yet if the definition appears clear, Rousseau's work vents the very real tensions that such a doubled sentiment implies. Sometimes virtue appears in the purely individual terms of an authenticity of feelings rooted in an inner nature (the phylogenetic equivalent of the ontogenetic state of nature). But the love of self (*amour de soi*) and sense of pity characteristic of the natural state barely imply a relation with others, let alone a moral or ethical relation. In other words, virtue here appears fundamentally asocial. At other times, virtue appears in the most austere terms of social heteronomy, demanding the sacrifice of one's desires, happiness, and even children in the name of patriotism. One suspects that, given these two virtues, the conflict between individual and community cannot but exist even in the best of societies. And this conflict between the individual and collectivity is repeated within the individual who is torn between his or her asocial nature, social passions, and political obligations. It is as though, once individuals become aware of themselves in relation to others, they develop the social passions of an *amour propre* (as borne by imaginary fears, dreams of omnipotence, and desires for domination) that resist the demands of both inner conscience and external duty. Social theory here, then, would insinuate itself between the natural individual and the political whole, and speak to the impossibility of living entirely comfortably within either.

Not only have the *Émile* and *The Nouvelle Héloïse* been seen as illustrating the tensions between nature and culture, conscience and public opinion, individual desire and communal imperatives with exceptional psychological acuity, both books have been variously interpreted as providing, relative to these conflicts, a genuine resolution, a "magical" resolution, and the (unconscious or conscious) demonstration of the impossibility of any resolution. But however one interprets these works, what is certain is that in Rousseau's personal life, these conflicts were never resolved. Instead, within the darkness of a developing paranoia, he retreated from a seemingly hostile world into a solitude from which he could proclaim an inner goodness that only a virtuous posterity would recognize.

RUBIN, GAYLE

Gayle Rubin (b. 1949) has been writing articles that have energized gender studies and feminist theory since the 1960s. Her research is pivotal to studies in queer theory, and her essays continue to be republished, translated, cited, and referenced. While studying at the University of Michigan in the late 1960s, she constructed a major in women's studies by taking advantage of the open-ended honors program. The thesis she worked on for this major later became the often cited essay, "The Traffic in Women:

Notes on the 'Political Economy' of Sex." She earned her PhD in anthropology and continues to teach and write. She is also a longtime activist in gay and lesbian politics.

Rubin's (1975) essay, *Traffic,* examines Levi-Strauss' kinship models and shows how women have been constructed as commodities to be traded and owned by husbands, brothers, and fathers. She extensively analyzes what Adrienne Rich describes with the concept "compulsory heterosexuality." In arguing that "kinship systems do not merely exchange women. They exchange sexual access, genealogical statuses, lineage names and ancestors, rights and people—men, women, and children—in concrete systems of social relationships" (Rubin 1975:177), she makes concrete the economic and political oppressions that women face historically and currently on a daily basis. Furthermore, *Traffic* examines the way that Freudian and Lacanian binary theoretical models support the political institutions and power structures that are born from these oppressive kinship relations. Her purpose here, as well as in much of her work, is to deconstruct how these power inequities and underlying assumptions continue to shape and codify the way we build our social and, thus, sexual selves.

"Thinking Sex: Notes for a Radical Theory of the Politics of Sexuality" (1984) continues to examine how sexuality and sexual identity is constructed. In contrast to her previous work, this essay is more focused on how deviance and difference is constructed and legally maintained. Here, she roots sexual oppression in historical contexts and, in the tradition of Michel Foucault, shows how medical and legal institutions construct and maintain sexual difference for political ends. In particular, this essay is useful for its discussion of the concept of sexual essentialism. Sexual essentialism is the idea that our sexual selves and our experience of sexual difference are innate and biologically determined. Sexual essentialism tends to demonize those who reject the hegemonic model of acceptable sexual practices. Finally, it maps out a sex hierarchy, or what Rubin (1984) refers to as the "charmed circle" and "the outer limits." In this hierarchy, acceptable sexual practices are those that are "heterosexual, married, monogamous, procreative, non-commercial, in pairs, in a relationship, same generation, in private, no pornography, bodies only, vanilla" (p. 13).

Rubin is an advocate for the sexual others who are marginalized and criminalized in our current heterosexist culture. Furthermore, Rubin examines how feminist theory and gay and lesbian activists themselves have contributed to this marginalization in their attack on sadomasochism, pornography, sex professionals, pedophiles, and transsexuals and transgendered persons. Her essay "Of Catamites and Kings" (1992) takes up the oppressive practices that exist within feminism and lesbian feminism when those who self-identify as butch/femme are attacked. Here, she brings voice and agency to those who typically are vilified and in doing so traces the history by which these voices have been silenced. She illustrates how "playing with" dominant categories of sexual identities can actually disrupt the very premises that these identities rely on for their continued legitimation. More generally, she shows that the ongoing attacks from both the dominant culture and the feminist and lesbian communities maintain the oppressive forces that work to constrain all persons.

Rubin has also worked within these communities for voice and change. She is one of the founders of Samois, the first sadomasochist feminist lesbian organization, which published *Coming to Power: Writings and Graphics on Lesbian S/M* (1981). This anthology is particularly pertinent for its combination of activists' and academics' writings on sexuality and power. In this collection, Rubin's essay "The Leather Menace: Comments on Politics and S/M" continues to examine the ways that certain sexual practices are legitimately maintained and prioritized while others are designated as deviant and dangerous. She shows how this practice contributes to larger oppressive practices and that privilege and power are contained in concepts of sexual freedom of speech and the possibilities of consent. In this work, she calls for a politics of sexuality and otherness that allows for sexual diversity. She argues that sexual diversity, as well as all forms of diversity, is crucial to the continuing fight against totalizing tendencies that strain toward homogeneity.

RUDDICK, SARA

Sara Ruddick (b. 1935), an American philosopher and feminist theorist, is best known for theorizing maternal practice, maternal thinking, and feminist maternal peace politics. She wrote the influential article "Maternal Thinking" (1980), where she argues that maternal practice, like the practice of any discipline, has the capacity to produce distinct forms of thought. She developed this idea further in *Maternal Thinking: Toward a Politics of Peace* (1995), arguing that maternal thought is a resource for a feminist politics of peace. In these and other works, Ruddick treats mothers as thinking persons and maternal thought as potentially valuable to community, national, and global relations. In so doing, she debunks traditions in Western thought that elevate abstract reason over anything defined as particularistic, emotional, bodily, or feminine. Educated in the 1950s and 1960s at Vassar, Radcliffe, and Harvard, Ruddick taught philosophy and feminist theory for many years at Eugene Lang College at the New School University in New York City.

Challenges to Western thought's sexist bifurcations pervade Ruddick's first two books, both coedited collections on the place of chosen work in women's lives: *Working It Out: 23 Women Writers, Artists, Scientists, and Scholars Talk about Their Lives and Work* (1977), and *Between Women: Biographers, Novelists, Critics, Teachers, and Artists Write about Their Work on Women* (1984). In autobiographical essays in these books, Ruddick describes her educational and academic experiences as sometimes exhilarating but as alienating her from anything womanly and eventually rendering her unable to write. Her compelling experiences as a mother, the deep pleasure she took in Virginia Woolf's writing, and the support of a feminist community helped her to integrate love and work and to embrace intellectual writing. This integration is apparent throughout her work.

In *Maternal Thinking* and more recent work, including articles on fatherhood, Ruddick articulates the gendered character of mothering and of caring work in general. She resists biological determinism, insisting that men are as capable as women of caring for children and developing maternal thought. Nonetheless, she rejects gender-neutral terms such as *parenting*. While she recognizes the risks of acknowledging sexual difference, she argues that denying the gendered character of care work holds more serious dangers. Ruddick also theorizes giving birth as at once different from and connected to mothering. She proposes that the experience of pregnancy and birth may give rise to *natal reflection,* characterized by active waiting, chosen pain, and a distinct conception of self and other.

Since *Maternal Thinking,* Ruddick has been concerned with the complexities of an ethics of care. In "Care as Labor and Relationship" (1998), she argues that care must be theorized not only as work, which was her focus in *Maternal Thinking* and which tends to overemphasize its burdens, but also as relationship, which emphasizes the wide range of emotions that caregivers and care recipients feel. The complexities of an ethics of care, and its relationship to an ethics of justice, also show up in Ruddick's articles on adolescent motherhood and assault and domination in families. She tackles these issues again in *Mother Troubles* (1999), which addresses the scapegoating of "bad" mothers and mothers' responsibility for the harm they sometimes inflict on children.

Ruddick's recent writing on peace politics also demonstrates the complexities inherent in theorizing urgent social problems. In " 'Woman of Peace' " (1998), she suggests that contemporary global relations compel peace feminists to consider whether violence is sometimes necessary. She acknowledges that feminists disagree because of their radically different locations and vulnerabilities in relation to threats of violence. She articulates rather than resolves conflicts within peace feminism, conflicts created by tensions among identities that have inspired peace feminists in the past (mourning mother, outsider, peacemaker). Most recently, Ruddick (2003) has formulated the particular evil embodied in the September 11, 2001, attacks, connecting it to and distinguishing it from other historical and contemporary forms of terror.

S

SACRED AND PROFANE

The sociological concepts of the sacred and the profane have their main roots in the theories of Émile Durkheim. The source of modern religion was one of the most important questions for Durkheim. However, a modern world that was highly secularized and characterized by competing ideologies made this a very difficult issue with which to deal. To overcome these difficulties, Durkheim studied primitive societies and the sources of religion within them. Given his core methodological orientation that only one social fact can cause another social fact, Durkheim reached the conclusion that primitive religion (and hence modern religion) was created by society itself. Society (through individuals) is able to create religion by differentiating between what is considered sacred, those things set apart from everyday life and deemed forbidden, and what is considered profane, or basically everything not so defined (the mundane, utilitarian). Those things that are profane, however, can be transformed into that which is sacred if they come to be viewed with an attitude of respect, reverence, mystery, and a general awe—in other words, if they come to be associated with the same attitudes as those linked to that which is sacred.

According to Durkheim, the differentiation between the sacred and the profane is the basis for the development of religion. Other conditions—beliefs, religious rites, and a church—are also necessary; however, the true essence of religion is found in what society deems sacred. Therefore, an extension of this argument would imply that what is sacred (the church, religious symbols, and even God) and what is society are one and the same. This view contributed to Durkheim's opposition to any form of social revolution and to his efforts to promote social reforms that would improve the functioning of society.

Durkheim believed that religion and God come from some superior moral power but that could not be a supernatural power. Rather, it is society that is the superior power at the base of these phenomena. Society is a power greater than we are that transcends us and makes demands on us. One of the ways that society exercises power over us is through its representations, and God and religion are such representations. Thus, to Durkheim, God is nothing more than society transfigured and expressed symbolically.

SAINT-SIMON, CLAUDE-HENRI DE

Among the social theorists exerting influence since the early nineteenth century, Claude-Henri Comte de Saint-Simon (1760–1825) remains prominent. He was the first to forecast our modern industrial societies. He provided guidance and insight for both the social sciences and the practice of politics and economics. He therefore became not only a "founding father of sociology" and an early advocate of socialism, but he also enriched technocratic thinking and "managerial philosophies." He also advocated European unification.

As a French officer, Saint-Simon fought in the American independence war: a "crucial experience" for him. After returning to France, he also appreciated the great revolution, even though he was imprisoned for several months. Speculations made him a rich man, but he soon became

impoverished due to wasteful spending and sponsorship. He enlarged his knowledge as an autodidact and lived in numerous social settings, including proletarian neighbourhoods. In 1815, he worked as librarian at the Paris "Arsenal" collections. Later, he lived as a publicist, supported by private sponsors, and finally rallied a close group of pupils.

Saint-Simon's numerous papers—composed between 1802 and 1825—form a confusing conglomerate. They mostly lacked the formal scientific standard, but they provided new findings and insights.

Saint-Simon was a son of the Enlightenment and the revolution, opponent of the antiquated "Ancien Régime," a progress optimist, and a friend of the working class. His works centered on the following central ideas. First, Saint-Simon advocated a *unity of the sciences.* He argued that all sciences should emanate and operate from the deductions of history and observation. Especially the new social sciences ("Science Politique") must apply scientific procedures. This is vital for the future of mankind and peace.

Second, in his understanding of social development and progress, Saint-Simon contributed his own model to the theories that schematize the social history of humanity. His developmental scheme—which Auguste Comte largely adopted—distinguishes three stages: (1) a "theological" stage that includes fetishism, polytheism, and monotheism; (2) a "negative" stage that includes metaphysics, religious criticism, and the elimination of obsolete social models and ideas; and (3) a final "positive" stage in which the senses are controlled through scientific knowledge. Furthermore, he argued that in social history, "organic" periods alternate with periods of "crises" that prepare the movement to higher stages. The crises are based on the tremendous inadequacy of previous social systems and often result in revolutions.

A third important idea contributed by Saint-Simon is that social analysis requires a clear distinction between the elements of productive work and parasitic factors. It is important to apply the related findings to social strata, classes, and occupational functions. Saint-Simon used the image of drones and bees. The distinction was effectively expressed in his utopian masterpiece, the so-called Parable (*L'Organisateur,* 1819), wherein he compares the loss of thousands of excellent performers in all sectors with the one of needless dignitaries and idle parasites. The first case would present a disaster for prosperity; the second would be irrelevant.

Saint-Simon identified productive work with industrial work: An industrial man works to produce goods or to provide the society with means for the satisfaction of needs and wants. This definition of industry includes all kinds of mental or physical productive work, regardless of the sector, the sciences as well as literature and arts included.

Fourth, even though Saint-Simon offered utopian visions of society, his was not an egalitarian utopianism. In arguing that "Not everyone can be in the lead" (*L'Industrie*, 1817),

he suggested that some people in a society occupy elite positions. This applies not only to social development but also within the individual social structures. The importance lies in the special significance of particular social functions. In certain societies, the leading role of warriors and priests was just as ordinary and important as the top functions of economic leaders, scientists, and engineers in modern societies. Those performances and activities required by a society shall be rewarded with both material remunerations and social appreciation. With regard to political governments ("a necessary evil to fight the worst threat: anarchy"), Saint-Simon had various utopian visions.

Finally, for Saint-Simon a modern industrial society is a kind of an *extensive fabricating organization,* to which everybody has to contribute. He argued that it was necessary to acquire the support of the "poorest class with the highest number of members," especially the emerging working class proletariat. The entire society has need of solidarity that can be ensured only by general and effective moral conceptions. In this regard, Saint-Simon focuses on a renewed Christianity. His last, unfinished writing "Nouveau Christianisme" (1825) was a contribution to this end.

Saint-Simon's conceptions were mainly disseminated by his pupils. Auguste Comte, who assisted the master from 1817 to 1824, extensively worked out the main ideas of his teacher and gave them a scientifically readable structure. He had first idolized Saint-Simon, then—after the breach in 1824—totally ignored him. But questions of priority are secondary; Comte retains his own rank.

The school, editorial community, and bizarre sect of the so-called Saint-Simonians (the most famous sect leaders included Saint-Amand Bazard and Barthélémi-Prosper Enfantin) had the same significance for the distribution of Saint-Simon's ideas. These ideas contributed to the articulation of an early socialism. Saint-Simon had never disliked private property, as long as it remained productive. However, in the eighteenth and nineteenth centuries, private property—and therewith the hereditary right to private property—was considered a problem, which some Saint-Simonians wanted to abolish. These Saint-Simonians also discussed women's rights and the problems of civil marriage. The writings and magazines of the Saint-Simonians (most notably the *Globe*) impressed Europe, but in this, Saint-Simon's name was sometimes misused to advocate extreme social postulates and pseudoreligious sect activities. The so-called doctrine of Saint-Simon, which the above circle disseminated, is often mistaken for his own works.

Outside of France, Saint-Simon's influence can mainly be seen in Germany and England. Marx and Engels referred to Saint-Simon, especially with regard to the terms *class* and *class conflict*, which they radicalized. John Stuart Mill also refers to him, and Herbert Spencer's work reflects some of his ideas. Practically, Saint-Simon's ideas have

affected fields as diverse as railroad construction, banking (credit business), and corporate philosophies.

SARTRE, JEAN-PAUL

Jean-Paul Sartre (1905–1980) was a French existentialist; a Marxist philosopher, dramatist, and novelist; and a major political figure on the French Left during the 1950s and 1960s. His chief works of relevance for social theory include *L'ego et la Transcendance* (The Ego and Transcendence, 1937), *l'Être et le Néant* (*Being and Nothingness*, 1943), "l'Existentialisme est un humanisme" ("Existentialism and Humanism," 1946), and *Critique de la Raison Dialectique* (Critique of Dialectical Reason—Vol. 1, 1960; Vol. 2, 1985). He was also the founder-editor of the journal *Temps Modernes.* His most important philosophical influences were French Hegelianism and the phenomenology of Husserl and Heidegger.

Sartre's existentialism, which he developed over the first part of his life, achieved a wide popularity, especially through his novels (*La Nausée* [Nausea], 1938), and *l'Age de la Raison* (The Age of Reason, 1945), and plays (*les Mouches* [The Flies], 1943; *Huis Clos* [No Exit], 1944). It was underpinned, at the same time, by a complex philosophy that he continually developed. Very different philosophers can be lumped together under the label "existentialist," and about the only thing they have in common is summed up in the slogan "existence precedes essence," the direct opposite of Descartes' "I think, therefore I am." We cannot assume anything about the nature of human beings; there is no a priori essence or human nature from which we can derive an understanding of human thought and action.

Sartre's early work is concerned with developing an ontology, a philosophy of Being. What is Being? And what sort of Being exists in the world? In keeping with Heidegger's (1962) *Being and Time.* Being—a subjectless verb—is to be distinguished from beings, or particular entities, and is to be studied through the rigorous inspection of human consciousness. Sartre developed a critique, however, of Husserl and his pupil, Heidegger, that led him to posit a radical freedom and a radical individualism. For Husserl, consciousness *constituted* its object, just as, for modern social constructionists, language or discourse constitutes its objects. Sartre argued that if this was the case, then consciousness could only ever be conscious of itself. Yet consciousness is always consciousness *of* something, a relation to something else. This something else must transcend the individual ego. He argued that consciousness was a "Nothingness," a hole in the solidity of Being. Consciousness (the "for-itself") is only a relationship to Being (the "in-itself"); most important, Being cannot determine consciousness—there is nothing between the two, no channel through which Being can seep into consciousness, no causal mechanism by means of which it can determine actions and thoughts. Consciousness itself is negation. If I look around my study and think that I would like to change it in some way, I am negating what is there and positing something different in a free act that is not determined by anything operating on my consciousness. This ability to negate is my freedom. There is a sense in which my freedom is an unbearable burden and I seek to lose it in my relationship with Being. My consciousness and freedom are always in relation to a situation. I have no choice but to choose a relation to the situation in which I find myself. I am condemned to be free. Even if I am hung upside down and left to die, I must adopt a relationship to the situation of my death. This choice is not something I think about or decide on; it does not happen at a cognitive level, but at a prereflective level. Consciousness is split. The prereflective is seen by Sartre as a flight toward Being, a solidity that can never be achieved, and the relationship between the reflective and prereflective is like that between two mirrors, constantly reflecting each other. Consciousness has no content; there is no unconscious, and it relates to everything, including the ego, the self, and language, as external objects.

There is, however, another form of Being in Sartre's ontology. In addition to Being-for-itself and Being-in-itself, there is Being-for-others. For myself, my future is always open; I am able to make choices. In the eyes of others, I am a physical object. What for me are possibilities in my life are for them probabilities; I experience my body as something that I live and that can be an object for me but that is not me. Others see my body as me, and in this exterior reduction of me to my body is the source of shame through which I experience the Other. We have three fundamental reactions to the Other, each of which fails. The first is love: I want to be a privileged object for the Other, and I must seduce the other but he or she must give love freely; this is one contradiction. If I win the other's love, then he or she becomes a privileged object for me, and I am thrown back

onto my own subjectivity, which I was trying to escape. This is a second contradiction, and the two together lead to a breakdown in love. My second possible attitude to the Other is indifference. I refuse to recognise his or Being-for-itself as a transcendent power, although I am haunted by it and by my fear of it. Sartre sees sexual desire as an attempt to capture the consciousness of the other and subdue it, but immediately after the sex act, I become aware again of the Other's transcendence. Finally, I am left with hatred; I can destroy the other, but I cannot destroy the fact that he or she has existed and seen me as an object and that he or she has seen my shame. Thus, all relationships fail; we cannot avoid experiencing ourselves as shameful objects for other people: In the words of a character in *Huis Clos* (No Exit), "Hell is other people."

Sartre's concept of radical freedom also implies an ethics of responsibility. If choice is inescapable, one must take responsibility for one's prereflective choices. This is perhaps best understood through its opposite—"bad faith." Bad faith involves the denial of choice, in the sense of denying to myself that I am doing something—allowing myself to be seduced, choosing to be a bad lover, denying my responsibility for my relationship to Being and the Being of the Other.

In addition to his philosophical contributions, Sartre's work also has relevance for social theory. This is at first sight paradoxical, since his existentialism was deeply opposed to social ontologising, particularly of the kind associated with classical French sociology. (In *The Watchdogs,* Sartre's friend Paul Nizan gives a good picture of the "New Sorbonne," dominated by the moralistic spirit of Durkheim and neo-Kantianism, against which radical students in the 1920s were rebelling.) Yet Sartre's relation to social theory is not just that of a challenging critic. His thought adds a dimension, by identifying a level of experience that we cannot see from the outside. The social theorist—at least, of the kind that strives for scientific objectivity—is always the Other, turning the people who are studied into objects, perhaps shameful objects. Not only may such theory be unable to grasp the immediate experience of those we study, it may not even recognise that our objects have such immediate experiences.

Especially important, however, for social theory is the line of thinking that begins with Sartre's early discussion of the "situation" and the "project," ideas that were to be developed in his later work into a sophisticated theory of action and social action. At first, as elaborated in *Being and Nothingness,* these notions were used to describe the exercise of our individual freedom. I am born into the world, and I find myself in a situation that I have not chosen; I have to choose what I do about this—I cannot not choose—I have to negate this situation and posit something else, choosing from what the situation offers me. I cannot choose *ex nihilo;* sometimes, the situation offers me very limited

choices but I nonetheless have to choose. But after and as a result of the Second World War, Sartre became more concerned with real situations in which people had to make real choices rather than with the ontological foundations of choice. This shift in focus is reflected in the two volumes of *The Critique of Dialectical Reason.*

Sartre was a prolific writer, and it is impossible to deal with the details of his development in a short article. The most important influences that led to his development of an elaborate social philosophy and theory were political. From 1940 to 1941, he was imprisoned in a German prisoner of war camp, escaped, and then attempted to set up a resistance group when he returned to Paris. After the war, he tried with others to set up a left-wing political party (*Rassemblement Démocratique Révolutionnaire*), which would provide an alternative to the Communist Party and the American-backed Right. In the 1950s, he became involved in the movement against the repressive, anti-independentist, French policy in Algeria. Over this time, he became a prominent public figure, a role in France often occupied by philosophers. He also broke with Albert Camus, another prominent French existentialist, over the question of political engagement. He was clearly on the radical Left and found himself sometimes very close to the Communist Party, not because of any Stalinist sympathies but because of his detestation for what he saw as the political and moral bankruptcy of the anticommunists. For the rest of his life, he maintained this radical allegiance. He campaigned against the Vietnam War, joined the student revolt in 1968, and then remained active in the far Left. When he died, tens of thousands of people attended his funeral.

Sartre's later philosophy, which attempted to combine Marxism with an existentialist standpoint, was addressed, however, not only to the question of freedom and political choice in the face of capitalist alienation. Like most other socialist intellectuals in Western Europe he was concerned to understand the failures of communism in Eastern Europe as well as the apparent emptiness and rigidity of intellectual life in the communist movement. He kept his concern with the way we might individually and collectively understand and transcend our situation, but he felt he had to come to grips with collective life and social institutions in a way that his earlier philosophy did not allow. This led him to develop a typology of forms of social being, their implications for human freedom, and what was involved in the passage from one to the other. At one end of the scale was the *series,* an inessential group like a bus queue in which each individual was only externally connected to the others. Then came the *group-in-fusion,* in which individuals were transitorily combined for the achievement of some common task, like a hunting party. Next came the *pledge group,* in which each was subordinated to the "we" it constituted and participated in the group subordination of other individuals. At the end of the sequence was the *collective* or true community,

in which the condition of the freedom of each was the freedom of all. The problem of freedom in a social context was defined in terms of the dialectic between individual freedom and the *practico-inert,* constituted, as in Marx's account of capital as dead labour weighing on the living, by the institutional sedimentation of past praxis and its constricting effects on present praxis.

As he moves from his earlier to his later work, Sartre struggles to move from the ontological to the ontic, from Being in general, to concrete-historical circumstances, attempting in various ways to overcome the original dualism. His early philosophy was criticised precisely for this dualism, particularly by his political and philosophical (as well as personal) colleague Simone de Beauvoir, who was later to develop a subtle phenomenology of personal and interpersonal perception focused on women as "the other sex." In *Being and Nothingness* Sartre talked briefly about a "We-subject" and "Us-object," but these terms were not sustainable given the ideas that had preceded. When he returned to the problem in the two volumes of *The Critique,* it was clear that he recognised the weight of the earlier criticisms.

His intellectual and political conflicts with the French Communist Party, one of the most Stalinist in Europe, led to a philosophical attempt to provide a philosophical foundation for Marxism not as a body of rigid truths, but as a flexible form of thinking about the world, able to produce new knowledge and understanding and able to act as a practical guide in a politics of collective self-transcendence. His attempts were still in the framework of his original ontology, the in-Itself and the for-Itself, but one modification (in the second volume) was that he talked of them enveloping each other—each providing the limit or boundary for the other. The for-Itself was no longer the complete negation and transcendence of the in-Itself, but neither was the latter a determinant of the former. Even if the world does not force my action, I have tot take notice. Sartre called this position "ontological realism."

However, most of his later work was concerned with History, with a capital "H." It was a philosophy of history, an attempt to understand how history is possible, how it is intelligible as a movement from past to future; in other words, it is concerned with the relative rather than the absolute of ontology. He was also concerned with dialectical thought, sometimes reified as "the" dialectic but taken by Sartre as the basis of open and creative thinking about the world. Dialectical thinking moves to and fro consistently between the part and the whole. It is the process through which all understanding takes place, and the notion of totality is at the centre. To understand the sentence I have just written, I must move from word to the whole sentence and back again. Understanding history involves the same movement, from event to whole. Here, we move back to the original concern with ontology, but Sartre's later argument re-thinks being in the light of "the dialectic," taken to be at

once a human product, the form of human thinking, and the structure of human praxis. Generally, in the *Critique of Dialectical Reason* (Vol. 2), praxis replaces the for-Itself. Praxis is best understood as human action in its widest sense, the way in which the for-Itself lives its activities and its situation as a whole. Praxis plays the same role as, but has a wider compass than, labour in the philosophy of the early Marx. Praxis is "totalising." When I act on my situation, I implicitly draw together all its aspects. Even if I only act on one part of it, the whole is changed because the parts are related to each other through the whole.

Sartre's postwar dominance of the French intellectual scene was challenged by structuralists like Lévi-Strauss in the late 1950s and early 1960s and by poststructuralists in the late 60s. Althusser attacked Sartre's rendering of Marxism as a humanism; Derrida criticised his humanist interpretation of the early Heidegger. Sartre has been out of fashion since then, and although recent translations may revive interest, his later work has been little examined.

SAUSSURE, FERDINAND DE

Ferdinand de Saussure was born in Switzerland in 1857. Saussure's scientific precocity was evident at an early age. In either 1872 or 1874, at the age of 15 or 17, he wrote a piece titled "Essai pour Reduire les Mots du Grec, du Latin & de l'Allemand a un Petiti Nombre de Racines" [Essay for Reducing the Words of Greek, Latin, & German to a small

Number of Roots] (see Saussure 1978). From 1876 to 1880, he studied at the University of Lepizig, where he was taught and influenced by leading exponents of the neogrammarian school, such as Curtius, Ostoff, and Brugmann. In 1879, at the age of 21, Saussure published his monograph, the *Mémoire* (see below) while he was a student at the University of Leipzig. During the period 1881 to 1882, Saussure completed his doctoral thesis in the Faculty of Philosophy at the University of Leipzig. His thesis was titled "De l'Emploi du Génitif Absolu en Sanscrite" [On the Use of the Absolute Genitive in Sanskrit]. In 1880, Saussure left Leipzig for Paris, where he taught at the *Ecole des Hautes Etudes* and was involved in the activities of the *Société de Linguistique de Paris.* He remained in Paris until 1891. In that year, he returned to Geneva to take up his appointment as chair professor in general linguistics at the University of Geneva. Saussure remained in Geneva until his death in 1913.

THE RECEPTION OF SAUSSURE IN THE LIGHT OF THE 1916 EDITION OF THE *COURS DE LINGUISTIQUE GÉNÉRALE* (*CLG*)

The reception of Saussure's work has been largely based on the posthumously published edition of the *Cours de Linguistique Générale* (1916) [hereafter *CLG*] that was edited and published by Charles Bally and Albert Sechehaye in collaboration with Albert Riedlinger. Significantly, Riedlinger was the only one of these three individuals who actually attended and made notes on the lectures on general linguistics that Saussure gave between 1907 and 1909 at the University of Geneva. The significance of this fact lies in the way in which so many of the interpretations and assumptions about Saussure's thinking have been based on a text that, thanks to the editorial hands of Bally and Sechehaye, has substantially played down, altered, or omitted important aspects of the lectures, and their organization, that Saussure gave to his students at the University of Geneva. Readers may refer to the reviews of *CLG* by Jules Ronjat (1916), André Oltramare (1916), and J. Wackernagel (1922) for a sense of the early reception of the 1916 edition.

Moreover, a substantial body of previously unpublished notes and manuscripts by Saussure on diverse areas of research that occupied him at various stages throughout his career, as well as new editions of the *CLG,* based on the notes of the students who attended the lectures, have helped to shed light on a much richer, more complex, more diverse, and more dynamic thinker than the posthumous version of the *CLG* that was bequeathed to posterity by Bally and Sechehaye in 1916.

In the following sections, Saussure's work will be examined in terms of a number of different thematic areas that representing the major areas in the development of his thinking about language, seen as a semiological system of signs.

THE MÉMOIRE SUR LE SYSTÈME PRIMITIF DES VOYELLES DANS LES LANGUES INDOEUROPÉENNES

Saussure's *Mémoire sur le Système Primitif des Voyelles dans les Langues Indoeuropéennes* [Memory on the Primitive System of the Vowels in the Indo-European Languages] (1879) is the only monograph that Saussure published during his lifetime. In some respects, it is a further development of his 1877 article "Essai D'une Distinction des Différentes *a* Indoeuropéens" [Essay Concerning a Distinction of the Different Indo-European *a*]. In that article, Saussure assigned the *e* vowel to both Indo-European and to the prehistorical phase of Sanskrit on the basis of a number of negative observations concerning the correspondences between the vowels *a* and *o* in the Western European languages and the vowels *i* and *u* in Indo-Iranian (see "'Sistema' e 'fonema' nel primo Saussure" [System and Phoneme in the Early Saussure], Vincenzi 1976:232).

Saussure wrote his *Mémoire* during the period 1877 to 1878 at the age of 20 to 21, while he was studying at the University of Leipzig. The use of the term *system* closely follows the use of this term in the theoretical tradition established by the work of Curtius, Schleicher, and Brugmann on the Indo-European vowel system (Vincenzi 1976). In citing these scholars in the opening pages of the *Mémoire,* Saussure uses the term system in the sense of a "schema" or "framework" for the purposes of comparing the relations between the Indo-European languages, including the various stages of their evolution.

Saussure was concerned with trying to establish the early vowel system by using a pan-synchronic approach to languages as a basis for comparison. He analyzed both phonetic and morphological data, in particular the *ablaut,* to establish the primitive vowel system of the Indo-European languages. He was not concerned with questions regarding the historical origins of the phonemes *o* and *e* or with determining whether Sanskrit was the oldest among the sister languages.

Saussure's *Mémoire* was innovatory in the way in which he sought *morphophonemic* evidence of changes in the *ablaut.* In other words, he sought to reveal the relationships between the phonetic *and* morphological levels rather than isolating the phonetic value, as his predecessors in comparative linguistics had done. Saussure's approach therefore focused on the ways in which sounds function and have values *qua* linguistic units in relation to other levels of linguistic organization (Saussure 1972:326–27). Kruszewski ([1880] forthcoming), in his review of both Brugmann's article "Nasalis Sonans in der Indo-Germanischen Grundsprache" [A Syllable Forming Nasal in the Indo-Germanic Protolanguage] (1876) and Saussure's *Mémoire,* was perhaps the first to properly grasp and appreciate the significance of Saussure's insights.

In adopting this approach, Saussure began the task of defining languages as systems based on differential and relational terms rather than on the basis of the material properties of their phonetic substance. The *Mémoire* is significant for the break that it represents with the atomistic and substance-based approaches of nineteenth-century comparative linguistics at the same time that it is a work thoroughly steeped in the practices of historical and comparative linguistics, especially the neogrammarian school whose leading exponents included Curtius, Ostoff, Brugmann, and Paul.

There is no suggestion in the *Mémoire* that Saussure was consciously developing a radical new approach to the study of language as semiological system. Rather, Saussure's insistence on looking beyond the material characteristics of linguistic sounds to examine intrinsic levels of their properly linguistic (morphophonemic) organization on the basis of the position of each element in a system of interrelated terms is itself a departure from the analytical criteria that were generally practiced at the time by his contemporaries. With hindsight, we can say that this approach represents an important early stage in the development of Saussure's semiological theory of language.

A FURTHER NOTE ON THE PHONEME IN SAUSSURE'S THEORETICAL THINKING: IMPLICATIONS FOR THE DEFINITION OF THE LINGUISTIC SIGN

Saussure's thinking about the phoneme was very probably influenced by Baudouin de Courtenay's (1895) distinction between sounds and functional linguistic units (see De Mauro's comments in Saussure 1972:306, note 6; Koerner *Ferdinand de Saussure: Origin and Development of His Linguistic Thought in Western Studies of Language,* 1973: 135, 142) as well as the neogrammarian, Eduard Sievers (*Grundzüge der Phonetik* [Principles of Phonetics] 1876; see Koerner 1973:125–29). Saussure's use of the term *phoneme* is different from the modern sense, which is more directly traceable to the phonological studies of Prague School linguists such as Trubetzkoy (*Principles of Phonology* [1939]1971). In Saussure's (1879) *Mémoire,* a phoneme is a *material* unit of sound; it refers to the material characteristics of the signifier. In the first course in general linguistics, Saussure succinctly defines the phoneme as follows: "Le phoneme = son/acte phonatoire [the phoneme = sound/act of phonation]" (1993, p. 29). The phoneme, in this view, is a unit of sound as seen from the point of view of its articulatory dynamics (*l'acte phonatoire*). It refers to the concrete level of material segments into which speech sounds can be analyzed rather than to the more abstract level of the functional differentiations that constitute a given language system and which are, in any case, always abstracted from concrete speech sounds in *parole* (specific instances of language as speech).

In the section on phonology in the third course in general linguistics, Saussure (1993) makes a distinction between "les sons de la parole" [the sounds of speech] (p. 262) and the "impressions acoustiques" [acoustic impressions] that belong to *la langue* [the language system] (p. 262). The term "impression acoustique" is subsequently changed to "image acoustique" [acoustic image] in the later section of the third course titled "Nature du Signe Linguistique" [Nature of the Linguistic Sign] (285). Here, Saussure says, "L'image acoustique n'est pas le son materiel, c'est l'empreinte psychique du son" [The acoustic image is not the material sound, it is the psychic imprint of the sound] (285). It is the "image acoustique," which is related to the "concept" by an associative link in the creation of the linguistic sign. The more abstract and psychic definition of the "image acoustique" that Saussure makes here, as distinct from the material character of the phoneme in his definition, may be seen as a more likely precursor of the categorical theory of the phoneme that was later developed in the structuralist phonology of the Prague School (see also Komatsu's "Introduction" in Saussure 1993:3).

In any case, the importance of Saussure's innovative approach in the *Mémoire* lies in his understanding that the phonetic and morphological levels of linguistic organization are distinct and that phonetic distinctions function to specify meaningful distinctions on the morphological level.

THE HARVARD MANUSCRIPTS: NOTES TOWARD A TREATISE ON *PHONÉTIQUE*

Jakobson ("Saussure's Unpublished Reflexions on Phonemes" [1969]) first drew attention to the existence in the Houghton Library of Harvard University of a large body of manuscripts known as the Harvard Manuscripts. The manuscripts are catalogued in the Houghton Library of Harvard University as bMS Fr 266 (1)–(9). These manuscripts consist of some 638 sheets and 995 pages of material. In addition to the Saussurean manuscripts catalogued by Godel (see *Les Sources Manuscrites du Cours de Linguistique Générale de F. de Saussure* [1957]; "Inventaire des Manuscrits de F. de Saussure Remis à la Bibliothèque Publique et Universitaire de Genève" [1960]) and stored in the *Bibliotheque Publique et Universitaire* in Geneva, the Harvard Manuscripts constitute an important resource in the study of Saussure's thinking.

The Harvard Manuscripts mainly date from Saussure's earlier years, including the 10-year period of his stay in Paris prior to his return to Geneva in 1891. Marchese argues, on the basis of the authors cited by Saussure, that the most likely period for the writing of the greater part of these manuscripts was between 1881 and 1885 ("Introduction," in Saussure 1995:xiv). The manuscripts that have been catalogued as bMS Fr 266 (8), consisting of 177 pages of unpublished material, bear the handwritten

title *Phonétique* [Phonetics] and are generally believed to be notes and reflections for a treatise on phonetics that Saussure never completed (Jakobson 1969; Saussure 1995:xi).

A critical edition of the complete manuscripts catalogued as bMS Fr 266 (8) has been published by Maria Pia Marchese (Saussure 1995). Selected excerpts with interpretative commentary from the entire collection have been published by Parret ("Les Manuscripts Saussuriens de Harvard" [The Harvard Saussure Manuscripts] 1993). Both Jakobson and Marchese concur that one of the prime motivations for the material Saussure wrote with a view to publishing a treatise on phonetics was to respond to Osthoff's (1881) criticisms of Saussure's *Mémoire.*

The importance of the Harvard Manuscripts lies, in part, in the light they shed on the further development of Saussure's theoretical thinking on Indo-European and articulatory phonetics since the publication of his *Mémoire.* The major themes of the Harvard Manuscripts may be summarized as follows: (1) the study of the functional roles of the Indo-European phonemes in relation to the opposition between consonants and sonants, (2) the syllabic basis of articulation, (3) the concept of the phoneme as "unité phonétique" [phonetic unit], (4) the form and substance of speech sounds, (5) the combining of phonemes in *parole;* (6) the role of the voice and of the ear, (7) the physiological and physical dimensions of speech sounds, (8) intention and will as agencies that modulate speech sounds in *parole,* and (9) the diverse temporal spheres of *parole.*

In the other manuscripts in this collection, Saussure's notes cover many diverse topics. These include (1) the Armenian *kh* final, (2) the Sanskrit genitive, (3) the absolute genitive, (4) Vedic literature, (5) a discussion of a book by Paul Oltramare (*Histoire des Idées Théosophiques dans l'Inde, Vol. 1, La Théosophie Brahmanique* [*History of Theosophical Ideas in India,* Vol. I, *Brahman Theosophy*] 1907) on ancient Indian theosophy, (6) the Indo-European *a,* (7) the Vedic and Hindu mythology, (8) ancient Greek linguistics, and (9) a draft of Saussure's doctoral thesis (see also Parret "Réflexions Saussuriennes sur le Temps et le Moi' [Saussurean reflections on time and the me], 1995).

The publication by Marchese in 1995 of a critical edition of the complete manuscript bMS Fr 266 (8), entitled *Phonétique,* provides Saussure scholars with an important opportunity to better comprehend and assess the evolution of Saussure's semiological theory of speech sounds both in relation to his previous thinking on Indo-European vocalism in his *Mémoire,* as well as in relation to the later treatment of the phoneme in the *Cours.* In the *Mémoire,* Saussure first developed his systemic conception of phonemes as functional terms whose values derive from their place in an overall system. In manuscript bMS Fr 266 (8), Saussure defines his semiological phonetics as follows:

semiological phonetics:

it is concerned with sounds and the succession of sounds existing in each idiom in so far as they have a value for an idea (acoustico-psychological cycle). (Saussure 1995:120)

As the discussion of the "image acoustique" in the previous section showed, the play of oppositions between acoustic images (previously "acoustic impressions") in *la langue,* rather than the material sounds uttered in acts of *parole,* constitutes a system of values and, when associated with what Saussure variously refers to as ideas or concepts, forms the signs of the language system. Both acoustic images and ideas have values in *langue.* On this basis, Saussure proposes a semiological phonetics, as defined in the above quotation, whereby acoustic impressions or images function to distinguish one idea from another at the same time that they enable the ear to distinguish one material sound from another in virtue of the principles of classification intrinsic to *la langue* (see Saussure 1993:263; see also section 7).

SAUSSURE'S ANALYSIS OF AND THEORETICAL REFLECTIONS ON THE GERMANIC LEGENDS

Saussure's extensive notes on the Germanic legends are preserved and catalogued in the *Bibliothèque Publique et Universitaire* in Geneva with the following numbers: ms. fr 3952.4 122v-122r; ms. fr. 3958.1–8; ms. fr. 3959.1–9; ms. fr. 3959.10; and ms. fr. 3959.11. A critical edition of Saussure's notes, with editorial commentary, has been prepared by Marinetti and Meli (Saussure 1986). The editorial work of Marinetti and Meli constitutes a significant step in the recovery of previously unpublished material by Saussure and in a form that renders this important body of research, undertaken by Saussure during the period roughly from late 1903 to 1910 and possibly even until his death in 1913, accessible to Saussure scholars.

In the first instance, Saussure's interest is empirical: His basic hypothesis is that the legends are based on and traceable to historical events (see Prosdocimi, "Sul Saussure delle Leggende Germaniche" [On the Saussure of the Germanic Legends] [1983]; see also Meli 'Per una Lettura Degl'inediti di F. de Saussure sulle Leggende Germaniche' [For a Reading of Saussure's Unpublished Works on the Germanic Legends] in Saussure 1986:451–502, 457). Saussure uses a technique that he calls "approximation" to establish connections between original historical events and the legends that have their genesis, as Prosdocimi points out, in "an historical research that Saussure intends to carry out on Geneva and its surroundings" (Saussere 1986:42–43). Saussure uses the analytical technique of "coincidences" to establish relations of identity between the events, characters,

and so on described in the legends and the historical events that form the original basis of the legends (see, for example, fragment 3858.7.34v-35r, in Saussure 1986:141; see also Saussure 1986:388). On this basis, Saussure proposes transformational processes of "transposition" and "substitution" whereby particular historical elements are integrated into the legends on the basis of larger-scale social processes. Other processes described by Saussure include the "displacement" of, for example, places and the phenomenon of *oubli* [forgetting] attributable to the individual tellers of particular versions of a given legend.

According to Meli, the theoretical observations made by Saussure on his analysis of the legends are "sporadic and marginal reflections," which "regard the theory and not the method" (Saussure 1986:459). Meli (Saussure 1986) cites a contradiction in Saussure's notes regarding the transposition of names and the transposition of biographical details to back up his point. However, it is difficult to see how Saussure's admittedly infrequent theoretical observations in his notes on the Germanic legends are not in some way intrinsically related to the very many rich and dense analytical observations that he makes about his corpus.

First, Saussure's analyses of the processes of transposition, substitution, and displacement are quintessentially intertextual processes, even though Saussure never uses the term *intertextuality*. These processes are not simply empirical questions that regard a particular analytical method for establishing the coincidences between historical material and mythical material. Histories—spoken and written—of historical events are themselves texts, as are stories about and mythical transformations of these events. The inherently intertextual character of these processes has important consequences for the second point, as discussed below.

Second, Saussure's analytical technique, in actual fact, raises important theoretical questions concerning the ways in which semiological processes across different timescales both influence and amplify the ways in which actors and events in real historical events in the distant past themselves have semiological significance in other times and places. This fact entails the intersection of very diverse timescales such that it becomes difficult to neatly distinguish one timescale from another. In other words, Saussure's analysis shows how the historical and the mythical timescales interpenetrate, thereby showing that the very notion of history, at least in the Western European tradition, implies a complex diversity of semiological scales in a given sociocultural system. This much is evident in the following reflection that Saussure makes on the notion of the symbol with reference to an author's epic account of a battle between two armies that gets transformed over time into a duel between two chieftains:

> The duel between chieftain A and chieftain B (inevitably) becomes symbolic since this particular combat represents the overall result of the battle, perhaps the conquest of vast tracts of land, and a political and geographical upheaval, but a *symbolic intention* did not exist during this time at any moment. The reduction of the battle to a duel is a natural fact of semiological transmission, produced by a temporal duration between tales. (Saussure 1986:129–30 [italics in original])

Saussure's discussion of the role of the symbol in the legends shows that these cannot simply be reduced to historical events that once took place in some distant time and place. Nor is the resulting mythical transformation of this event reducible to the objective scientific study of ancient systems of belief. Instead, the processes of symbolization that Saussure refers to show how myth is a more abstract system of meanings for which objective historical events constitute the raw material. The symbolic transformations of this raw material—themselves processes of "semiological transmission"—are abstract symbolic resources that provide answers concerning the meanings and values of concrete human experiences on other timescales and in other situations far removed from the original historical event on its timescale. That, surely, is a key aspect of the significance of myth. Saussure's theoretical interpellations, far from being "marginal," would appear to have grasped very well the significance of this for a semiological theory of textual processes and their transformations over time.

Without having recourse to notions such as "Saussure, precursor of Propp" in the development of narratological theory, as suggested by Avalle (*Ontology of the Sign in Saussure* 1986), it seems not unreasonable to claim that both the method adopted by Saussure and the theoretical observations that he makes concerning the results obtained by this method demonstrate his emerging awareness of the semiological character of the Germanic legends *qua* texts that belong to a complex intertextual system on multiple timescales. The objects of his analysis are thus revealed to be complex systems of interacting signs and their respective functions. Moreover, words and whole texts can be used as symbols whose implications cannot be fixed in the word or symbol itself. Rather, the implications of the symbol are emergent properties that become apparent only over time in the context of a particular sociocultural community with its collective history and memory. Saussure (1986) draws attention to this emergent, time-bound property of symbols as follows: "The identity of a symbol can never be fixed from the moment that it is a symbol, that is to say, directed to the social mass that fixes its value at each instant" (p. 30). Speaking of the identity of symbols, Saussure also observes:

> Each of the characters [*personnages*] is a symbol of which one can see vary—exactly as in the case of the rune—a) the name, b) its position vis-à-vis others, c) the

characteristics, d) the function, the actions. If a *name* is transposed, it may follow that some of the actions are transposed, and, reciprocally, or that the entire plot changes because of an accident of this kind. (p. 31; emphasis in original)

THE COURSES IN GENERAL LINGUISTICS AND THE DERIVATION OF *LA LANGUE* AS THE OBJECT OF STUDY FOR A SEMIOLOGICAL SCIENCE OF SIGNS IN SOCIAL LIFE

Saussure gave his three courses in general linguistics at the University of Geneva from 1907 to 1911. In 1916, Saussure's colleagues, Charles Bally and Albert Sechehaye, published their edition of *CLG*. This edition was to remain overridingly influential for some decades after its publication in spite of the many lacunae and editorial liberties that they took with the students' notes of Saussure's lectures, which Sechehaye collated for the preparation of the 1916 edition. Both the publication of Godel's *Sources Manuscrites* (1957) and Engler's *Édition Critique* (Saussure 1967–1968) reveal the many discrepancies between the editorial legacy of Bally and Sechehaye's 1916 text and the students' notes. The third course (1911) is the basis of the 1916 edition of *CLG* published by Bally and Sechehaye, although Saussure's ordering and organization of his material, as presented in his lectures, was significantly altered by the editors of the 1916 edition.

The changes introduced by Bally and Sechehaye were due to the editors' decision above all to present a general theory of *la langue,* whereas Part 1 of Saussure's third course began with a series of reflections on the geographical diversity of *les langues* and the causes of this diversity. Only in the second part of this course did Saussure present his general theory of *la langue.* Sechehaye's *Collation* of the students' notes as the basis for the 1916 edition clearly reflects the editors' intention to reorganize Saussure's third course along lines that clearly conformed to the requirements of the editors rather than to accurate transmission of what Saussure's students had annotated.

Harris (*Saussure and His Interpreters,* 2001:19–20) points out that the decision of the editors of the 1916 edition to drastically scale down Saussure's survey of the history and description of the Indo-European languages has important consequences both for the latter-day perception of the importance that Saussure assigned to the body of knowledge accumulated throughout the nineteenth century by the comparative philologists and for the definition of "general linguistics" that Saussure and his students took for granted. While the proportion assigned to the survey of comparative philology varies over the three courses, there can be no doubt, Harris (2001:21–22) argues, that Saussure appeals to an already established body of facts about the Indo-European languages as the starting point for his

development of a general linguistics on semiological grounds as an academic discipline.

Indeed, Saussure (1993) begins the first course on a cautious note by declaring, in effect, that that it would be premature to begin with an "interior" definition of linguistics as "la science du language ou des langues" [the science of language or of language systems] (p. 11). It should be clear that Saussure's notion of general linguistics does not start out by claiming that language is distinct from other domains of knowledge or that the linguistic description should necessarily be pitched at such a high level of generality so as to cover all languages or that certain linguistic facts (e.g., grammatical mood) are universally valid for all languages. Rather, the epithet "general" appeals in the first instance to an accepted body of facts about the Indo-European languages to which the linguist can appeal and around which a certain scientific consensus has gathered.

Instead, Saussure (1993) announces that the first course will begin by defining linguistics from the outside (*de l'extérieur*) (p. 11). Saussure then provides a brief survey of linguistics in relation to ethnology, philology, logic, and sociology before then embarking on a discussion of the errors of linguistic analysis in relation to the confusion between "corruption" and linguistic change and the distortions that written documents have brought about in the study of "le signe parlé" [the spoken sign] (p. 15).

Harris (2001:28–30) also points out that Saussure's distinction between *langue* and *parole,* rather than having its basis in an independent reflection on "les faits de langage" [the facts of language], can be traced to Saussure's discussion in the first course of the processes of analogical change (see also Thibault, *Re-Reading Saussure,* 1997:92–93, 104–105).

According to Saussure (1993), analogical change is, above all, a grammatical process. On the emergence of the form *je trouve* [I find], he makes the following observations:

> Everything is grammatical in the phenomenon of analogy, but in the grammatical operation two aspects must be distinguished: the comprehension of the relationship between the forms that are compared (generating, inspiring forms) and secondly the product that they suggest, the form which is engendered, inspired, which is the *x* in the proportion: *nous poussons*: *je pousse = nous trouvons → je trouve,* ↔ (*je treuve*). (pp. 90–91)

The newly engendered form—*je trouve,* in Saussure's example—is created on analogy with already existing forms in the language system. Moreover, the new form, as Saussure (1993) remarks, "avant d'être produite est d'abord voulue pour répondre à une idée precise que j'ai dans l'esprit: le première personne du singulier" [before being produced is first of all wanted in order to respond to a precise idea that I have in my mind: the first person singular]

(p. 90). The new form is, in other words, coupled with an idea that one has in mind, that of the French "first person singular." This observation further shows that there is no fixed relationship between forms and ideas in Saussure's theory. A particular idea such as first person singular—in actual fact, a term or value in the French language system—can be decoupled from its usual coupling to a particular (grammatical) form—*je treuve*—and recoupled to a new form on analogy with already existing forms which can be said to "generate" or to "inspire" the new form.

Analogy is shown to be a powerful semiological resource for the creation of new signs through the generation of new couplings of ideas and forms. It is therefore a source of variation and of new meanings in a given language system. Saussure's discussion also shows that grammatical units such as *je trouve* are themselves signs composed of the coupling of an idea with a grammatical form. Therefore, the definition of the linguistic sign is not confined to couplings of acoustic images (signifiers) and concepts (signifieds) but also includes relationships between grammatical forms and meanings.

Saussure (1993) clarifies and renders more apparent the opposition between the two spheres—*langue* and *parole*—by opposing them within the individual (p. 91).

Each individual is in possession of an individual *langue,* which is located in the "sphère intérieure de l'individu" [interior sphere of the individual] (Saussure 1993:92). By the same token, *la langue qua* object of linguistic analysis can be derived from the sum of the individual language systems in this interior sphere of each individual speaker (p. 92). *La langue* in this second sense can be seen as being distributed across the individuals who use a given language. Each individual's *langue* is also social because it has gotten into the individual's interior (the brain) in the first place through the mediating effects of usage in the "sphère extérieure de la parole" [exterior sphere of speech].

Harris (2001:15–16) reports a puzzle that worried Riedlinger concerning Saussure's distinction between a social *parole* and an individual *langue,* as presented in Saussure's first course (Saussure 1993:92). Saussure's formulation here appears to contradict the notion of an individual *parole* and a *social* langue. Saussure (1993:91) had previously pointed out in the same discussion that *le langage,* from which the opposition between *langue* and *parole* is derived, is itself social. *Parole* is the exterior means whereby individuals participate in social discourse; in this sense it is social. Each individual has also interiorized a version of *la langue* in his or her brain. In this sense, *langue* is individual. However, Saussure is careful to point out that this individual *langue* only gets inside the individual in the first place through the social activity of the individual's participation in acts of *parole*. In this sense, *la langue* is also social because it is analytically derived from the sum of the many individual *langues* as the distributed product of these

in a given society at the same time that it is seen as being located in individuals through the mediating effects of social usage in the sphere of *parole*. While it is true that Saussure extended and further modified his distinction in the third course in his description of "le circuit de la parole" [the speech circuit] (pp. 277–80), the distinctions he makes in the first course between *langue* and *parole*, *individual* and *social*, and *interior* and *exterior* suggest a much more complex and dynamic epistemology of language than one based on static oppositions between the two terms in each of these pairs.

On the evidence of Saussure's discussion of the processes of analogical change in the first course, Saussure, Harris (2001:29–30) argues, derives the distinction between *langue* and *parole*. As Saussure (1993) goes on to say in the section of the first course, titled "Le classement intérieure" [Interior classification], which follows the section discussed above, *la langue* constitutes a principle of order and classification whereby forms are associated with ideas (pp. 92–93). The alternative would be, Saussure says, "un chaos dans chaque tête" [a chaos in each head] (p. 92). Saussure speaks of two types of association at work in *la langue:* (1) between form and idea and (2) the association of form with form (p. 93).

Without exploring this further here, we begin to see how the establishment of *la langue* as the object of study of his semiological science of signs has its basis in a consideration of the ways in which innovations in *parole* are "une force transformatrice de la langue" [a transformative force in the language system] (Saussure 1993:89). One could say that "a momentary forgetting" of the old form by a given language user in a particular act of *parole* on its here-now timescale provides the basis for more far-reaching transformations in *la langue* on its far greater evolutionary timescale (p. 89).

In parallel fashion, we saw in the previous section on the Germanic legends that an epic author's recount of a battle between two armies in Saussure's example may, in successive retellings over time, become a duel between two chiefs and so on, without presupposing a specific "symbolic intention" on the part of the teller. Thus, transformative processes of "transposition," "substitution," "displacement," and "oubli" [forgetting] of the original historical material can lead to changes both in specific legends as well as in entire intertextual systems of legends.

This process of "semiological transmission," Saussure pointed out, depends on the duration of time between tales in the process of transforming the historical event into a legend, as part of a system whose symbolic values can vary just as the processes of analogical change can lead to variation in the relations of association between forms and idea and between forms and forms, and therefore to the entire system of values, on the evolutionary timescale of the language system.

This suggests that Saussure's research on the Germanic legends and his development of a semiological theory of *la langue* are informed by the same social-semiological concerns at least insofar as both are concerned with the emergence of values and changes in these values through the agencies of both time and what Saussure calls "la masse sociale" [the social mass].

SCHELER, MAX

Max Scheler (1874–1928) was a German philosopher and social theorist, who significantly contributed to the anthropological and phenomenological turn in German philosophy at the beginning of the last century. Scheler studied philosophy and sociology under Dilthey, Simmel, and Eucken in Munich, Berlin, and Jena. Influenced also by the work of Brentano, Husserl, Heidegger, and Nietzsche, Scheler taught at Jena, Munich, Göttingen, Cologne, and Frankfurt/M. While his actual contribution to the laying of new foundations of contemporary European philosophy is often underestimated in the light of his influential contemporaries Husserl and Heidegger, it was Scheler who most vividly pursued an application of the new philosophical framework beyond the confines of narrow philosophical debate. He applied phenomenological thinking to subjects and topics as varied as values, capitalism, sympathy, elites, world age, Christianity, and Buddhism, as well as pacifism and feminism, to name just a few. Especially during the First World War, Scheler engaged in the political debate, not just in writing. His rather patriotic position during that time leaves room for interpretation. However, some years later, Scheler was one of the few scholars who warned of the dangers of the Nazi movement, which once in power suppressed his work. Despite a spread of interests and his rather nonsystematic and aphoristic style of writing, all Scheler's thoughts radiate toward a central issue: What defines human personality, and what is the position of human existence within this world? In pursuit of an answer, Scheler developed a distinctly nontranscendental and

contextual understanding of human nature and existence. Much of his persistent enthusiasm for this issue has to be seen against the background of a continuous engagement with Catholic religion. His most influential works are *Formalism in Ethics and Non-Formal Ethics of Values* (1916), his attempt to outline an applied phenomenology; *Man's Place in Nature* (1928), in which he sets out his philosophical anthropology; and *The Forms of Knowledge and Society* (1925). Scheler is the philosopher of "love" and "sympathy" who stresses the role of the emotional as constituting for the human milieu. But at the same time, he maintains the importance of "world-openness" as the uniquely human potential to reach outside a given environment. With his emphasis on the emotional, Scheler distinctly moves away from a pre-Kantian and Kantian understanding of human nature as defined by reason and intellect, while with his emphasis on milieu, he attempts to understand humans not as beings above nature but as intrinsically embedded in this world via certain historical and cultural environs. In developing his ideas concerning the human milieu, Scheler also made a significant contribution to the sociology of knowledge through reemphasizing the role of situated practical knowledge(s) as opposed to universal scientific knowledge. Scheler managed only to sketch out his ideas of a phenomenolgically based philosophical anthropology, as his life, marked by intellectual as well as emotional restlessness, came to a premature end at the age of 54. His work has influenced thinkers such as Cassirer, Heidegger, Berdyaev, Gehlen, and Mannheim. Outside Germany, he had lasting influence in the Spanish-speaking world, mainly through the mediation of the work of Ortega y Gasset.

Scheler's thinking focuses around a nonformal understanding of values as a way to understand human personality and society. According to Scheler, human action and behavior is guided by an "ordered rank of values," which is given by the "intuitive evidence of preference" and not accessible through logical deduction. As such, the "ordo amoris," as Scheler famously called this frame of value preferences, has a priori character in two directions. First, value evidence is given beyond any contingent experience. For example, we continue to cherish the idea of friendship despite having been let down by a friend. Second, acts based on love and sympathy are immediate responses to the world that cannot be referred back to intellectual decision making. For example, a child might spontaneously interrupt game play to give his or her mother a kiss. The "emotional a priori" offered by Scheler thus differs distinctly from Kant's "formal a priori" in that it is not rooted in the universal law of human mind or reason but instead is immediately given before any acts of rationality. Moreover, while the rank of values as such remains stable, the actual patterns of intuitive preference and putting after of values in practical life change with historic development and across different social and cultural environments. This again stands in stark contrast to Kant's a priori, which relies on universal knowledge deriving from universal logical necessity. What we find in Scheler's argument is thus an implicit criticism of Kantian metaphysic as Eurocentristic despite its universal claim.

While Scheler's argument concerning the role of values for human existence is carried by a philosophical drive, many of his insights are of sociological significance. So he argues that the "macrocosm" of ranked values is mirrored and reflected in the "microcosm" of those frames of reference that guide social units and individuals in daily life. Thus, the "milieu" in which we conduct our everyday lives is structured by a constant "ethos" or "disposition" through which we relate to our surroundings, effectively providing the "alphabet" of the lifeworld. As such, "milieu" in Scheler's sense implies a stable configuration of meaning and action that we carry around with us and that effectively takes in more *and at the same time* less than the immediate environment. It takes in more, insofar as it relates to distant and absent things and happenings, and less insofar as it filters out elements in our immediate surroundings that are of no practical relevance to us. In its knowledge structure, the milieu is described by Scheler as a "relative natural view of the world." It is *natural* in that it provides structures of meaning that are given without question and incapable of justification. It is *relative* insofar as the contents of these frames of reference differ for coexisting milieus as well as across historical epochs. Moreover, human milieus, according to Scheler, are not fixated and static but have to be actively maintained under changing external conditions. Scheler further outlines this crucial distinction between human milieu and animal environment in his anthropological writings. Here, he stresses that as a "person" possessing "spirit" beyond "instinct" and "practical intelligence," we are able to transcend our milieu, even if only momentarily. This human capacity of "self-transcendence" manifests itself, for example, in the capabilities of humor and irony. This is what Scheler refers to as "world-openness," describing the tendency of human beings to reach outside any given environment.

SCHÜTZ, ALFRED

Austrian-born phenomenologist and social theorist Alfred Schütz made charting the structures of the lifeworld his life's work. In the course of this endeavor, he added a host of terms to the vocabulary of social science, including "typification," "in-order-to and because-motives," "course-of-action and personal ideal types," "multiple realities," "finite provinces of meaning," and "the social distribution of knowledge." Following his death in 1959, his devoted students published his collected papers, unfinished manuscripts, and an intellectual biography; arranged to have his first book translated into English (Schütz 1967); and integrated his concepts into a new theoretical perspective called social constructionism (Berger and Luckmann 1966). A number of scholars in Europe and America continue to undertake phenomenological research in the Schützian style. A group of economists explores Schütz's relationship to the Austrian school of economics while applying his analyses of temporality and the ideal type to the reform of the neoclassical paradigm. Many contemporary social theorists incorporate Schützian concepts into their own distinctive systems of thought.

Born into an affluent Viennese family in 1899, Schütz—he would drop the umlaut after immigrating to New York City in 1939—received a rigorous classical education at the Esterhazy Gymnasium, where he distinguished himself as a pianist and student of European musical history and literature. After service in the First World War, he abandoned his hopes for a career in music for one in international law and finance. Completing his degree on an accelerated schedule, he served as executive secretary for the Austrian Bankers Association in Vienna for seven years before joining a private bank as an attorney in 1929. Schütz remained in banking until 1956, by which time he had been teaching at the émigré-staffed New School for Social Research for 12 years.

Schütz's three major intellectual mentors were French philosopher Henri Bergson, sociologist Max Weber, and Edmund Husserl, the founder of phenomenology. Weber had taught one semester at the University of Vienna in 1918, just before Schütz matriculated there, and greatly impressed the economics faculty, particularly Ludwig von Mises. After Schütz completed his degree in 1922, Mises invited him to join his private seminar, where the issues of objectivity, historicism, apriorism, *Verstehen* (understanding), holism, and methodological individualism were debated by a host of brilliant figures, many of whom became lifelong friends of Schütz's. During the 10 years that he participated in the seminar, Schütz tried to reconcile the inconsistencies in Weber's use of the term "subjective meaning" and to show how the methods of *Verstehen* and the ideal type can yield objective knowledge in the disciplines that take human action as their foundation. He first tried, unsuccessfully, to use Bergson's analyses of "duration" and memory as the bridge from subjective to objective meaning, then found in Husserl's analysis of internal time-consciousness the starting point he needed. After reading parts of it in the seminar, Schütz published *Die Sinnhafte Aufbau der socialen Welt: Eine Einleitung in die verstehende Soziologie* (*The Meaningful Construction of the Social World: An Introduction to Interpretive Sociology*) in 1932.

The discovery of duration, internal time-consciousness, or the stream of consciousness (as William James called it) was central to Schütz's account of subjective meaning. Subjective meaning arises through the retrospective unification of segments of a perennial, heterogeneous flux of sensations, perceptions, and reactions into experiences of this or that "type." Only through disciplined reflection can one disentangle the layers of anticipation and interpretation involved in the typification of the simplest experience and reconstruct the stages through which a given phenomenon is constituted in its typicality. In Husserl's formulation, meaning arises through a "monothetic glance" over the "polythetic" flux that preceded it. The crucial fact is the temporal one: Meaning always arises *retrospectively*. Even one's prospective intentions are linguistically formulated in the future perfect tense—as actions one *will have executed* in the anticipated way.

This discovery allowed Schütz's to clarify Weber's methodological concepts. According to Weber, the social scientist-observer understands the subjective meaning that an actor attaches to his or her action when he or she realizes that the actor intends to accomplish a certain end by the observed efforts. On the contrary, Schütz argued, the alleged subjective meaning is only a hypothetical formulation of the actor's in-order-to motive. The lived experience of another is inaccessible to the social scientist, for he or she can apprehend neither the polythetic stages nor the monothetic glance that unified the intention subjectively. Moreover, the social scientist brings to observation analytical and methodological imperatives alien to the actor's own meaning constitution. History, sociology, law, and economics can adopt the subjective point of view only in the formal sense of using analytical models that refer back to the shared typifications that actors use to make sense of their own experience.

By eliminating the residual romantic-emphatic elements in Weber's methodology, Schütz felt he had resolved the

long-standing conflict between the "individualizing" and "generalizing" cultural sciences—they employ personal and course-of-action ideal types of different levels of concreteness—and, in the process, validated Husserl's conception of phenomenology as a science of the foundations of the sciences. The book's publication led to an invitation to meet Husserl in person and to a lifelong affiliation with the phenomenological movement. But the book was poorly understood by Weber scholars and had little effect on the methodological debates of the day, save for a few students of Mises who realized that ideal types provided a better account of the basic concepts and laws of economics than did "intellectual intuition."

Alfred Schütz was the kind of thinker who returned repeatedly to a core set of intellectual problems. The transcendental turn in phenomenology, which Husserl pursued from 1913 to 1935, was one. Schütz's misgivings about this project were vindicated in 1938 when Husserl turned back to the lifeworld, the world of commonsense realities. Pragmatism was another. Schütz's most sustained exploration of pragmatism can be found in the unfinished manuscript, *Reflections on the Problem of Relevance* (1970). A series of papers on the methodology of the social sciences—the most famous being "Common-Sense and Scientific Interpretation of Human Action"—fleshed out and updated the lessons of his first book. Another series of papers on "The Stranger," "The Well-Informed Citizen," and "The Homecomer" recalled his early enthusiasm for Georg Simmel's studies of social types. The last series, along with "Making Music Together," represent Schütz's most important contributions to interpretive sociology.

As individually profound and influential as these essays were, they distracted Schütz from the task he first envisioned in 1932—to trace the multidimensional, multistoried meaning-structures of the lifeworld back to the constitutive operations of mundane subjectivity. He further advanced this project in the essays "On Multiple Realities" and "Symbol, Reality and Society," but was unable to complete it. As his health began to fail in 1957, he outlined a final work that could do no more than summarize his progress to date. Thomas Luckmann faithfully and lovingly executed his teacher's plan in *The Structures of the Life-World*.

The Structures of the Life-World represents Schütz's foremost contribution to intellectual history. Following Husserl's "law of oriented constitution," Schütz analyzed the commonsense realities of everyday life into layers of meaning extending outward from a primordial "null point"—a mundane ego representing pragmatic subjectivity as such. The resulting stratifications of the lifeworld—temporal, spatial, social, and signative—incorporate all of Schütz's familiar concepts so that the reader can clearly see the unity of his life's work.

One of the most original and beloved figures of twentieth-century social theory, Alfred Schütz will long be remembered as the inspiring mentor of the social constructionist perspective. His intellectual achievements were rarely appreciated on their own terms, however, for reasons he well understood: The requirements of theory construction in the social sciences preclude systematic inquiry into the cascading syntheses that make analysis and inference possible. Even as Schütz's writings were becoming widely available in the 1960s and 1970s, the rival paradigms of structuralism and poststructuralism ceased to look to human subjectivity for the origin of meaning, but to systems of contrasting signs and discursive practices.

THE SCOTTISH ENLIGHTENMENT

The Scottish Enlightenment refers to a historical event in northern Britain between approximately 1740 and 1790 that found expression in a significant body of literature embedded in changing political and economic conditions; novel institutional developments such as clubs, societies and academies; and a concurrent efflorescence of associational relations and public communication comparable to what characterised the Enlightenment elsewhere in Europe. The intellectual achievement of eighteenth-century Scotland was so considerable that it not only impressed contemporaries such as Benjamin Franklin, Thomas Jefferson, and Immanuel Kant but is today still regarded as having been responsible for the remarkable distinction that Scotland attained among the countries that participated in the Enlightenment.

The vast intellectual literature containing the basic ideas of the Scottish Enlightenment was produced by different generations of authors over a 50-year period but found its most characteristic focus roughly in the third quarter of the century during which a whole series of famous titles were published by David Hume (1711–1776), William Robertson (1721–1793), Adam Smith (1723–1790), Adam Ferguson (1723–1816), John Millar (1735–1801), and others. While this literature as a whole represented virtually the full range of modern knowledge, from experimental natural science and medicine through philosophy to what Hume referred to as "the moral subjects" or "the science of man" and later after Condorcet came to be called "the social sciences," it is interesting to note here that it is particularly the latter branch of this literature that has retained its relevance and significance. At times, it indeed seemed as though the larger part of this social theoretic literature had fallen into oblivion, yet a certain line of continuity can be observed, and somewhat unexpectedly, the second half of the twentieth century has inaugurated a veritable renaissance in Scottish Enlightenment studies.

FRAMEWORKS OF INTERPRETATION

The contemporary interest in the social theory of the Scottish Enlightenment is by no means due, as some suggest, solely to the resurgence since the late 1970s of the New Right in the guise of neoconservatism and neoliberal economics and politics. It is indeed indisputable that some authors approach the Scottish intellectual heritage from within this interpretative framework, yet there is ample evidence that other factors also have been relevant.

From a social scientific point of view, it is obvious that the demise of positivism and the growing postempiricist emphasis on the history and sociology of science have played their part in generating a heightened concern with the Scottish Enlightenment. Since the 1960s, these developments were followed by an increasing impatience with textbook disciplinary histories and a renewed desire to clarify the foundations of the social sciences. This epistemological and methodological shift in emphasis has thus sharpened the sensitivity of historically minded social scientists toward theoretical options, approaches, or traditions that are lesser known or have become marginalized, suppressed, excluded, or even eclipsed.

Perhaps the most important force behind the increased interest in the Scottish Enlightenment, however, is the recent momentous transformation of historical consciousness. Against its background, an alternative political-ideological framework of interpretation has arisen that, far from a narrow neoliberalism, somehow brings together the liberal focus on rights and the republican stress on participation with the discursive or deliberative concern with the mediation of potentially contrary values and interests under fragile conditions of existence.

THE FORMATION OF NORMS AND THE CONSTITUTION OF NORMATIVE ORDERS

The difference between these two contrary frameworks for the interpretation of the Scottish Enlightenment is indicative of something of theoretical importance. It concerns the question of the formation of norms and the constitution of normative orders or regimes that lies at the heart of the contribution of the Scottish authors.

According to neoliberalism, which sees its own free-market capitalist position as the culmination point of the Scottish understanding, patterns of behaviour are spontaneously generated as by-products or unintended consequences of other activities and related contingent factors that then, to the extent that they benefit a significant number, become stabilised through the self-regulative maintenance of relations between the component parts. The economist Friedrich von Hayek defended precisely this view of the Scottish Enlightenment and, on that basis, concluded that since markets emerge spontaneously, they should indefinitely be left to regulate themselves recursively, regardless of the consequences. Inspired by Hayek, Louis Schneider sought to offer a functionalist interpretation of the sociology of the Scottish authors, while Ronald Hamowy insisted that the core of the Scottish contribution to sociology is represented by their view of spontaneous order.

This functionalist perspective indeed finds a foothold in Adam Smith's political economy in which he traced the emergence of the modern capitalist economic system, as well as more generally in the Scottish emphasis on benefit or utility over authority. Extrapolating Hume's analysis of local trade relations into the idea of a national economy by focusing on the intelligible form of the system, Smith ([1776]1976) for instance showed in *An Inquiry into the Nature and Causes of the Wealth of Nations* how supply and demand, or production and consumption, represent an autonomous and self-regulating mechanism at the core of the modern system of commerce which gives rise to the market price—a "system of natural liberty" that establishes and maintains itself "of its own accord" (IV.ix.51).

Contrary to the neoliberal interpretation, however, Smith ([1776]1976) went considerably further than this systemic logic of self-regulation. Over and above an autonomous economic system, Smith considered also the possibility of economic and social crisis and the concomitant need for intervention in the self-regulative mechanism of the economy in order to secure the "natural price" (I.vii.7) in the sense of the socially and ethically minimum wage consistent with a developed economy. In this case, he invoked the collective normative standard of what he called "common humanity" (I.viii.24) rather than simply insisting on individual benefit or utility. Under certain circumstances, then, the systemic logic of self-regulation calls for interruption by the social logic of self-organisation. In this latter respect,

Adam Ferguson and John Millar went far beyond Smith and thus, by implication, drew a line between economics and sociology.

FROM "COMMERCIAL SOCIETY" TO "CIVIL SOCIETY"

Although Smith ([1776]1976) effectively refused to conceive of "commercial society" (I.vi., I.vii., IV.i) strictly in systems theoretical terms, his focus nevertheless remained fixed on the economic system and its environment. The limits of his position were defined by the fact that he was fundamentally tied to John Locke's (1632–1704) economic or "mercantile" (Smith [1776]1976:IV.i.3) model of society and, hence, belonged to the Lockean tradition in the conceptualisation of society or the "L-stream," as Charles Taylor called it. Ferguson and Millar differed from Smith in that they took the social route much more emphatically. In fact, many regard them as the first authors to have recognised social reality as such and to have dealt with it in its own right. That this sociological concern with the historically variable "state of society" had been prefigured by Hume, who exhibited an interest in the "moral subjects" since his first book *A Treatise of Human Nature* ([1739–1740] 1964) and continued to ask moral philosophical questions about society, by no means detracts from the achievement of these authors.

While ascribing a socially significant self-reflective capacity to the individual under such titles as "sympathy" and "impartial spectator" (Smith [1759]1982:I.i.1, I.i.5.8), Smith consistently kept to the English individualist tradition that, at least since Thomas Hobbes (1588–1679), saw the individual as self-loving, egoistic and self-interested. Ferguson and Millar, by contrast, not only followed their Scottish predecessors such as Francis Hutcheson who took a social turn beyond the Earl of Shaftesbury but also adopted more specifically the view of their French example, Montesquieu, that human beings are social by nature. To this they added one of their most characteristic insights: that human beings are capable of both learning and the development of their latent capacities within the social structures into which they were incorporated. Although being vehemently against the Hobbesian "selfish system," Ferguson and Millar nevertheless did not allow this opposition to mislead them into accepting a collectivism that reduces or obliterates the individual, as for instance Auguste Comte would do in the nineteenth century. For them, the individual as active agent and bearer of rights retained importance, but they incorporated it into a genuinely sociological concept of society.

Rather than equating social reality or society simply with Smith's "commercial society," Ferguson and Millar drew in addition also on Montesquieu's sociopolitical model put forward in 1748 in *The Spirit of the Laws* with its characteristic emphasis on politically mediated cultural and social differences, inequalities, conflicts, and power balances. To conceive sociologically of society as "civil society," as Ferguson ([1767]1966) famously called it, they thus creatively combined the "L-stream" and the "M-stream." For Ferguson and Millar, therefore, modern society was by no means exclusively a prepolitical economic complex that regulated itself recursively, but more fully a dynamic set of social relations, characterised by cultural, social, and power difference and inequalities leading to tensions, contradictions, ambiguities, and conflicts that those involved were required to organise themselves. A logic of self-regulation carried by an autonomous system was embedded in and complemented by a logic of self-organisation for which the rights-bearing, active members of society took responsibility. Ferguson and Millar's understanding of both history and of the study of society reflects their twofold Lockean-Montesquieuian conception of civil society.

THEORETICAL HISTORY OF THE "NATURAL HISTORY" OF CIVIL SOCIETY

The most striking feature of the social theory of the Scottish Enlightenment is its historical orientation. Ferguson's *An Essay on the History of Civil Society* ([1767] 1966) gives paradigmatic expression to this Scottish sensibility and program, but it receives even more explicit elaboration in the writings of Millar, from his *The Origin of the Distinction of Ranks* ([1771]1806) to his *An Historical View of the English Government* ([1787]1803). Not only did they regard society as having its own history, what they called its "natural history," but they also put forward their own characteristic type of social scientific study of that history, what they called "theoretical history."

Proceeding from certain assumptions about the nature of human beings, both Ferguson and Millar regarded society as acquiring structural and institutional features through a process of historical development that unfolds and accumulates largely of its own accord. Due to lack of imagination, inadequate anticipation of the future, unconscious adaptation to circumstances, individual actions having incalculable social ramifications, and involuntary production of unintended outcomes and consequences, society has a "natural history" (Millar [1771]1806:11) that runs its course with a minimum of purposiveness and without a script. Government, parliamentary procedure, civil laws, and institutions in general, all arose in this manner in the historical process, mediated by "custom," conflicting "projects and schemes," and the given "circumstances" (Ferguson [1767] 1966:122–23). Millar agreed fully with Ferguson's ([1767] 1966) observation that societies "stumble upon establishments, which are indeed the result of human action, but not the execution of any human design" (p. 122). In spite of

such imputation of low rationality to history and high complexity to society, however, both Ferguson and Millar nevertheless emphasised the importance of public opinion, active participation in public life, and deliberate action in politics—with Millar, for instance, supporting the American War of Independence and the French Revolution. Whereas this twofold emphasis led Schneider to the discovery of an unresolved tension in the Scottish contribution, Habermas more acutely appreciated that the sociology of the Scottish Enlightenment had both a conservative and a critical side. In fact, this duality was a characteristic feature of their theoretical history. While assuming the achievements of the natural history of society, both Ferguson and Millar insisted on the possibility of, and need for, the critique of modern society, including existing institutions and authorities. Their critical focus was trained in particular on the division of labour and its negative social consequences, as in the case of Ferguson, and on ecclesiastical institutions and private and public abuses of power made possible by the class structure, as in the case of Millar. A clear distinction has to be drawn, therefore, between the Scottish authors' understanding of the natural history of society, on one hand, and their view of how to study that history and for what purpose, on the other.

The Scots' characteristic concern was a type of social scientific investigation for which they did not yet have an appropriate name. Millar had a clear idea of what was intended when he referred to himself as a "philosophical historian" (cited in Lehmann 1960:135). What he had in mind was in the first instance a social theorist who seeks to discover a pattern in, and thus to account for, the facts made available by the historian. In addition, he was convinced that this theoretical activity should be discharged in a critical and public way so as to provide the educator, the politician, and the public with some basis for the determination of the desired direction of development. In want of a fitting name, Dugald Stewart (1854) therefore proposed to call it provisionally "Theoretical or Conjectural History" (p. 34).

The social science of the Scottish Enlightenment presupposed the indigenous British traditions of empirical science, as represented by Bacon, Newton, and Hume, and of moral philosophy and civil jurisprudence, as put forward by Cumberland, Shaftesbury, Carmichael, Hutcheson, Berkeley, and Hume. The most conspicuous influence on their "theoretical history," however, was Montesquieu, the most widely read French Enlightenment thinker, whom they regarded as the Bacon of their own science. Montesquieu himself can be regarded as an early theoretical historian—or sociologist, as Raymond Aron suggests—in the sense of an author who explicitly sought to make history theoretically intelligible. Ferguson freely admitted that not only his point of view but much of his information also depended directly on the Frenchman. And Millar identified the latter unambiguously as the fountainhead of the

program of the Scottish Enlightenment, which Smith, Ferguson, and he himself were pursuing:

> Upon this subject he [Smith] followed the plan that seems to be suggested by Montesquieu; endeavouring to trace the gradual progress of jurisprudence, both public and private, from the rudest to the most refined ages, and to point out the effects of those arts which contribute to subsistence, and to the accumulation of property, in producing correspondent improvements or alterations in law and government. (Stewart 1854:12)

This passage outlining the Scottish program of social theory could be taken as paradigmatic reference point of a range of more or less prominent conflicting twentieth-century interpretations of its direction and value.

MODERNITY

It is generally accepted that the Scottish Enlightenment is one of a number of events that marked the historical moment when modern society emerged, which implies that there is an intrinsic relation between social theory and modernity. Given this connection, the different commentators' interpretations of the social theory of the Scottish Enlightenment obviously correlate with their respective periodizations and theories of modernity.

The most widely accepted interpretation in the history of social theory, generally speaking, links modernity with what Eric Hobsbawm called the "dual revolution"—that is, the political dispensation inaugurated by the French Revolution and the rise of industrial capitalism in the wake of the Industrial Revolution. Since the Scottish Enlightenment had occurred largely prior to the culmination of the great transition in the dual revolution, however, the defining moment in Scottish history, the Union of Parliaments of 1707, became the reference point for contrary interpretations.

Starting from the deep unpopularity of the Union in Scotland itself and drawing on classical republicanism, many authors have interpreted the Scottish Enlightenment as a defence of the independent, virtuous Scottish citizen against the modern Whig order resting on the pillars of patronage, office, and credit that was imposed from London. In opposition to this perspective drawn from political theory in the sense of classical republicanism stressing "virtue," others have sought instead to present Scottish social theory from an economic angle stressing "wealth" instead. From this point of view, it was either part of the attempt to overcome the barbarous and parochial nature of Scottish life by associating with the socioeconomic order introduced by the Whig oligarchy or an ideological articulation and justification of the commercial capitalism of the British bourgeoisie. As against these alternatives, a third interpretative paradigm has been put forward according to

which the continental tradition of civil jurisprudence or modernized natural law was central to Scottish social theory in a way that distinguished it sharply from English thought. Instead of virtue or wealth, the predominant semantics in this case was shaped by law and included not only words such as *rights, liberty*, and *constitution* but also *politeness* and *taste*, which give the distinction between the rude and the polished a completely different sense than in the case of the earlier commercial-liberal interpretation. Rather than either a political or an economic theory of the emergence of modernity, Eriksson put forward a cultural-intellectual theory, but instead of law, his focus is on science. To make sense of the social theory of the Scottish Enlightenment, therefore, he traces modernity back to the line of development leading from Galileo through Bacon and Descartes to Newton. According to this scientistic interpretation, the latter's theory of gravity led Smith, followed by Ferguson and Millar, to transpose "subsistence" into the core conceptual category of social theory.

From a contemporary perspective, it is apparent that the preceding political, economic, cultural-jurisprudential, and cultural-scientific interpretations each indeed strikes on a plausible dimension of the social theory of the Scottish Enlightenment, yet represents a one-sided reading because it rests on a single-factor theory of modernity. To do justice to the multidimensional nature of the work of the Scottish authors, by contrast, it has become clear that it is necessary to see early modernity in its integrity. The different dimensions must be seen in their dialectical interrelation. An increasingly accepted way of doing this is to see the Scottish Enlightenment as having formed part of and having been an outgrowth of the Europe-wide practical discourse of the time about how the survival of society could be secured and social solidarity created through rights in the face of the domination, violence, and disorder emanating from a range of forces. Among the latter were the dissolution of the religious worldview and fragmentation of its institutional underpinnings and communal basis, the process of state formation, the differentiation of civil society from the state, the emergence of capitalism, and the development of technology and science. Taking into account the interplay of these dynamic forces, particularly the contradiction of capitalism and democracy within civil society, both Ferguson and Millar regarded society as becoming visible in the tensions, ambiguities, contradictions, and conflicts that emerge from the struggle against dominating and depleting forces, on one hand, and for the realization of freedom and inclusion, on the other. For them, society was the "scene in which the parties contend for power, privilege and equality" (Ferguson [1767]1966:135), yet one in which a more equitable and just arrangement and a more complete existence could be achieved through law, the distribution of rights, constitutionalism, and, hence, active participation, public spiritedness, and public opinion (Ferguson [1767]1966:136, 154–67, 190–91, 261–72; Millar [1771]1806:230–42).

CONTEMPORARY RELEVANCE

A standard feature of scholarship on the Scottish Enlightenment, which is also present in the majority of the above interpretations, is the assumption that a stage theory of the progress of society from a savage or rude to a civil or polished state forms a core component of the social theory of Smith, Ferguson, and Millar. Although it has under the influence of Ronald Meek come to be called the "four stages theory," this does not apply to Ferguson, who identified only three stages, and applies only with difficulty to Millar, who worked with a flexible three- to four-stage concept. As is apparent today, however, the major problem with twentieth-century interpreters is that they read Scottish social theory from a nineteenth-century liberal, socialist, and evolutionary point of view, thus imputing to it not merely an inappropriately strong concept of progress but indeed the untenable assumptions of the philosophy of history. The prerevolutionary Enlightenment, including the stage theorists, did not yet dispose over a concept of universal history and progress transposed into a temporal utopia projected into the future but, rather, assumed a dualistic and cyclical viewpoint and entertained nearly as much cultural pessimism as optimism. The Scottish authors, particularly the leading social theorists Ferguson and Millar, therefore combined a deep-seated sense of the possibility of decline and decay of societies with the conviction that the pursuit of public good and happiness was nevertheless worthwhile. Considering society in a historically grounded and politically informed way, they were sensitive to the unavoidability of contingency, openness, and uncertainty. Far from progress being a foregone conclusion, it was a question of how society dealt with both ineliminable internal class and status differences and external political, economic, and other exigencies.

It is precisely in the particular historical consciousness of authors such as Ferguson and Millar that the contemporary relevance of the social theory of the Scottish Enlightenment is to be found. Beyond the historical consciousness of universality of the past two centuries with its emphasis on unmitigated notions of development, progress, evolution, and the realization of universality, our newfound late twentieth- and early twenty-first-century consciousness of generality or globality, marked as it is by its stress on the simultaneity and connectedness of different forms of life under fragile conditions of existence, reproduces, albeit in its own particular form, the consciousness of generality characteristic of the late eighteenth-century Scottish authors. Their awareness of the vicissitudes and fragility of society and our forced acknowledgement of, for instance, the ecology crisis, the hollowing out of the nation-state, the

privatisation of violence, and the vulnerability of the world financial system at the end of high modernity, are bringing us together in such a way that we are compelled to recognise today that we need to be much more modest and, hence, sensitive to differences, contradictions, and ambiguities under conditions of an open history, contingency, and uncertainty than our predecessors had been during the past 200 years.

SECULARIZATION

The word *secularization* comes from the Latin *sæculum,* which could be taken to mean an age (or era) but also, at least by the fourth and fifth centuries, "the world," probably as an extension of the idea of a "spirit of an age." By this date, too, the word had already developed an ambiguous meaning. It could be used to mean something like unending time (the phrases "world without end" or "forever and ever" that still often appear at the end of formal Christian prayers are translations of the Latin *in sæcula sæculorum*), or the world "out there" (monastic priests, who were "enclosed" and under a formal "rule of life," were distinguished from "secular" clergy, meaning the parish clergy who served the people "out in the world"), but it was also used to mean a life or lifestyle that is at odds with God (thus, people would enter monastic life to flee "the world"). Later the term would come to be used to distinguish between civil and ecclesiastical law, lands, and possessions. In the nineteenth century, the term was adopted by the British freethinker G. J. Holyoake, who founded the Secular Society as a group committed to a just world order and moral program of individual action that would address human problems without the use of supernatural explanations. Hence, the term had an increasingly negative use by the time it was adapted into social science: Secularization conceptualized and gave "scientific" status to the advance of secularism.

The term *secularization* was introduced by Max Weber, but ever so lightly, in his Protestant Ethic essays and was adapted by his sometime associate Ernst Troeltsch. To the extent that one may reference a single integrating focus in a body of work as extensive as Max Weber's corpus, it must be said to be that of *rationalität,* or *the processes of the rationalization of action,* the specific form of *social change* that enabled the "modern world" to come into being. Weber was interested in how it was that methods of rational calculation had come to dominate virtually the entirety of modern life. He referred to this as the "spirit of capitalism." His studies convinced him that, from the sixteenth century forward, a process had been occurring in Western civilization as a result of which one after another sphere of life had become subject to the belief that explanations for events could be found within worldly experience and the application of human reason.

The consequence of this worldview was that explanations referring to forces outside this world were constantly being laid aside. The flip side of rationalization

Weber termed *Entzauberung*—a word usually translated as *disenchantment,* although perhaps more accurately rendered de-magi-fication or de-mystery-ization. Disenchantment did not simply mean that people did not believe in the old mysteries of religion but, rather, that the concept of mystery or "the mysterious" was itself devalued. Mystery was seen not as something to be entered into but something to be conquered by human reason, ingenuity, and the products of technology. Weber gave the name secularization to this double-sided rationalization-disenchantment process in religion. Secularization was both the process and the result of the process; however, it is also the case that the term occurs only rarely in Weber's writing.

It is not clear that Weber himself considered secularization to be a specific domain of the sociology of religion. In his essay "Science as a Vocation," *intellectualization* is used as a virtual synonym; hence, it could be argued that secularization ought to be more properly considered an aspect of the sociology of knowledge—to deal with questions of *epistemology,* the ways people "know" or the conditions on which we receive "knowledge" of "the ways the world works." Weber's claim is that appeals to divine authority have lost credibility relative to the past as providing sure knowledge for social action and that practical economic considerations (contrasted to a heavenly bank account) have come to play an increasing role in measuring the worth of knowledge. At most, "the religious point of view" will be treated as one among many competing claims to authority. Priests, ministers, rabbis, and mullahs are less sought after for solving world problems than economists, physicists, and political scientists, while psychologists, social workers, and medical doctors are the societally recognized experts at the individual or microsocial level. Mark Chaves, for example, explicates secularization along these lines in referring to it as a "declining scope of religious authority."

SECULARIZATION IN AMERICA

Secularization did not become a significant concept in American sociology until the late 1950s. An important figure in this development was the popular essayist Will Herberg, whose work had circulation beyond the academy and was at the same time not tightly bound by the canons of scholarship that characterized academic sociology. In spite of a cautionary article by Larry Shiner as early as 1967 about the muddled meanings that had come to be attached to the term—hence his suggestion that "we drop the word entirely"—by the early 1970s, secularization was the reigning dogma in the field for understanding the contemporary religion-and-society nexus.

Twenty years would pass between Shiner's expression of reservations about secularization "theory" and the next major assault on the thesis. In between, Bryan Wilson, Peter Berger, Thomas Luckmann, and Karel Dobbelaere would become the principal proponents of the concept. Not insignificantly, Wilson, Luckmann, and Dobbelaere are Europeans, and Berger is a European emigré to the United States. All were products of a European Christian intellectual heritage and educational system that, we might now say, romanticized the religious past of their nations. Among them, only Berger has now fully recanted his earlier position, perhaps a sign of a fuller Americanization. Even now, the most aggressive proponent of the concept is the British sociologist Steve Bruce.

In his 1986 presidential address to the Southern Sociological Society, Jeffrey Hadden presented a clear, comprehensive, and trenchant analysis of the weakness of secularization theory—both in its genesis and its predicted outcomes. The core of his argument is that in and from its genesis secularization constituted a "*doctrine* more than a theory" based on "presuppositions that . . . represent a taken-for-granted *ideology*" of social scientists "rather than a systematic set of interrelated propositions"; over time in social scientific circles (which continued to widen in their influence), "*the idea of secularization became sacralized,*" that is, a belief system accepted "on faith" (Hadden 1987:588). Even more than a statement about the present, the ideology of secularization relies on beliefs about the past.

The second thrust of Hadden's attack is a fourfold challenge: (1) Secularization theory is internally weak in its logical structure—basically Shiner's 1967 critique. (2) Such secularization *theory* as does exist is unsupported by data after more than 20 years of research. (3) New religious movements (NRMs) have appeared and persisted in the most supposedly secularized societies. And finally, (4) religion has emerged as a vital force in the world political order. These four points are the heart of the contemporary critique of the secularization concept.

In the boldest terms, as Shiner (1967) points out, however, secularization theory's claims mean the "decline of religion"—that is, religion's "previously accepted symbols, doctrines and institutions lose their prestige and influence. The culmination of secularization would be a religionless society" (p. 209). Rodney Stark, perhaps the preeminent contemporary critic of secularization theory, also fully accepts this definition as paradigmatic of secularization theory, and it is this one with which he takes issue.

Two important observations arise here: The first is that *secularization,* secularity, or the secular *is always relative to* some definition of *religion* or the religious. As Edward Bailey (1998) writes, the meaning of secular "keeps changing yet remains consistent. It always means, simply, the opposite of 'religious'—whatever that means" (p. 18). This not only suggests that the "definition of religion question" is not an arcane philosophical debate, but it also shows how premises can influence evidence and outcomes, hence why it is important to examine premises carefully. The second

observation is that the "truth" of secularization claims depends on *historical* evidence. If we say, "people are less religious now than they were a hundred years ago," we have not only invoked some presumed definition of religion, but we have also said that we know how religious people were 100 years ago.

THE MEANING OF CHANGE

All the propositions advanced by secularization theorists share a common presupposition—namely, that there has been an enormously significant *change* in the ways in which society and religion have interacted in the past from the ways they do now.

At the purely descriptive level, secularization may be said to refer to the process of the separation of state and church in Europe, which was much more complex than it was in the United States. Olivier Tschannen (1991:397) has provided a graph that summarizes the "exemplary infrastructure" or "primitive cognitive apparatus" that may be derived from the efforts of various secularization theorists. Application of his map shows that the one element they have in common is that of institutional *differentiation.* According to Ralf Dahrendorf, for example, the entire European social system was characterized by a state of *superimposition* wherein one institutional system overlay another and each had a hand in the other. Church, state, education, health and welfare, the law, and the like were so intertwined that sundering them caused a significant shock to all sectors of the system, from which religion was not immune. The United States, by contrast, was characterized by relative pluralism from its earliest years. Church and state were constitutionally separated, and free-market, *laissez-faire* economics circumscribed the role of the state as far as other institutional sectors of the social system were concerned. Nevertheless, even in the United States a view has grown that "religion" is in decline.

There is no question that in most of the Western world there has been at least sufficient separation of church and state, the primary locus of differentiation, that people are capable of living their lives apart from direct "interference" on the part of religion and that people may choose among various religions without suffering civil disabilities. If this is all that is meant by secularization, then there is no debate over "the secularization thesis." But if this is all that secularization meant, there would also have been far less excitement about the topic. It would not have been so much something to investigate as simply something to state as a factual condition (or as not existing in other parts of the world). Indeed, on this basis, one could develop a fairly simple classification system of those societies that had or had not been legally "secularized" in much the same way that we can determine whether or not a business has been incorporated or is a partnership or a sole proprietorship.

There is no doubt that the separation of church and state has consequences for religious organizations and for the lives of individual citizens. At the organizational level, for example, a previously established religion may lose tax support; on the other hand, other religious organizations gain free access to the religious "market"—that is, other religions get to operate on an equal basis. Whether or not this means the decline of religion, therefore, becomes an empirical question. Individuals no longer may be required to pay taxes to support religion, and they may also be required to conform to certain state norms. These may open or close religious options and freedoms, as people can choose to support or reject religious alternatives.

The principal thrust in secularization theory has, however, been stronger than simply church-state issues or the scope of religious authority. It has been a claim that, in the face of scientific rationality, religion's influence on all aspects of life—from personal habits to social institutions—is in dramatic decline. Regardless of the sociostructural level of the argument, the underlying assumption is that "people" are becoming "less religious." Many social theorists doubted that modernity could combine religious traditions with the overpowering impersonal features of our time: scientific research, humanistic education, high-technology multinational capitalism, bureaucratic organizational life, and so on. Reacting on the basis of a functional definition of religion, religion appeared to these theorists denuded of almost all the functions it had previously appeared to perform. In this view, religion harked back to some prior level of human evolution and was now uselessly appended to the modern cultural repertoire. People today are awed by human achievements, not divine forces; societies of the future would be constructed around these, not antiquity's notion of the "sacred."

The underlying religious myth of secularization theory, as Stark notes, is that in "the past" people were significantly more religious than they are today. That is, that in the past there was a solidary Age of Faith in which "the world was filled with the sacred." According to this myth, the Age of Faith gave way to the Age of Reason. Europeans and Euro-Americans often point to the medieval era as the site of the Age of Faith. Yet there is a growing consensus among historians that both the Catholic Middle Ages and the Protestant Age of Reformation are creations of nineteenth-century Europe, when the new mass media and the schooling of the entire population made the Christianization of everyone a reality. In short, the Age of Faith myth reflects an educational process that did not begin to occur until about 200 years ago. What happened in that process was that precisely as a serious attempt was made to "Christianize" the entire population, a counterattempt at resistance also emerged. The "Age of Faith," if it ever existed, did so for at most a few decades of the nineteenth century.

PLURALISM

What can we say of secularization now? We can say that over time our epistemologies have changed, that our ideas of "the ways the world works" have changed, and that these have entailed corresponding shifts of emphasis in global explanatory structures or bases on which we attribute credibility or truth. When we consider the relatively short history of the scientific worldview, it is not surprising that its epistemology has not fully jelled; furthermore, the phenomenon of globalization creates a contestation among religious epistemologies themselves that, although it has analogs in the past, is unprecedented in its scope today.

The theory of secularization as a self-limiting process as proposed by Stark and Bainbridge, however, can help us to understand some of the important social dynamics that lie behind religious developments in our own day. In many respects, secularization theory was an attempt to account for how *pluralism* was reshaping the religious map—both geographically and cognitively; that is, there is a world religious ferment of contesting epistemologies going on without limit around the globe. Contemporary pluralism means that far more religious worldviews are in immediate competition with each other than has ever been the case in the past. Whereas the United States could once settle on a shared "Judeo-Christian" ethic, its religious map now must accommodate Muslims and Buddhists in increasing numbers.

Furthermore, the nature of pluralism is multiplicative. Each "new" religion (or newly imported religion) spawns more new religions, and as some secularization theorists rightly noted, ever-increasing pluralism does undermine the element of absolute certainty that has been claimed by at least some religions, although new religions will simultaneously continue to arise making precisely this claim. That is, the more one becomes aware of more and more religions competing in a marketplace-like setting, the harder it becomes to assert that any one religion contains all truth and that others must be all wrong. While it is certainly possible to make "better" and "worse" type comparisons, all-or-nothing rigidity simply does not hold up.

Religious (or, more broadly, ideological) pluralism clearly creates a marketplace of ideas wherein absolute claims for ultimacy are always at some degree of risk. This gives rise to a model of religious competition or marketplace, and in a double sense. Not only is there competition among religions themselves, but there is also the freedom on the part of buyers (people) to pick and choose among the ideological wares different religions proffer. This has been referred to as "religion à la carte" and the result as *bricolage*. The outcome of increased competition is clearly a shifting of market shares. However, Finke and Stark have shown that the reality of increasing religious competition in American cities was not a decrease in religious mobilization but an increase. Stark has also shown that this increase

extended to rural areas but that these changes were often unreported because newer, "marginal" churches were not counted in religious censuses. European religious activity follows this pattern least well, perhaps because the state-church tradition there has created a mind-set to which any and all religion is simply a less desirable "good" than it is elsewhere, due to its having been taken for granted for so long, hence so closely identified with a taken-for-granted culture. With certain notable exceptions, European religious participation has been historically low; yet curiously, for example, European immigrants to the United States generally acted quickly to re-create the church of their homeland, and along with their immediate descendants were *much more* religious (or at least organizationally active) than was the custom in their countries of origin.

That people are more likely to want their religion à la carte does not necessarily mean that they are "less religious." The metaphor is helpful: People who order meals à la carte often actually spend more than they would have if they bought a *prix fixe* meal. What choosing à la carte does mean is that people do not simply take whatever is dished out to them. However, it should not be assumed that as a result they will eat irresponsibly—three desserts and no veggies. People may just as often use the *carte* to choose wisely, passing over rich sauces and heavy starches. Certainly it is true, as Chaves has noted, that the authority of religious officers is reduced in this process; on the other hand, it must be remembered that religious officers are nothing but layfolk who have become supercharged by a religious message. The quality of motivation that leads to becoming a religious officer may change, but in fact this may again result in more rather than less: Consider the surplus of (male and female, married and single, straight and gay) priests in the Episcopal church, compared with the shortage of (celibate) priests in the Roman Catholic church where hierarchical clerical authority is still maximized. Episcopal church membership has shrunk while its number of clergy has grown, whereas Roman Catholic membership has grown while its number of clergy has shrunk.

With respect to the secularization thesis, then, two aspects of pluralism must be taken into consideration. On one hand, there is a substantial body of evidence that pluralism of belief—including disbelief—has been an option throughout history that is simply intensified by globalization. On the other hand, pluralism forces us to make a distinction between secularization and what might be called "de-Christianization": That is, new religious movements may emerge or other world traditions may gain dominance over Christianity in the West. Leaving Christianity for another religion is not secularization. *Religious change* of course has occurred, and this will have consequences for the societies in which it takes place.

The underlying assumption of secularization theory that pluralism thus challenges is the idea that "religion" is

something fixed. Instead, sociologists need to recognize the tentativeness and fragility of religious structures of meaning. Religious concepts easily lend themselves to reification. As ideational systems, religions are always in interaction with material culture, social structure, other cultural systems, and individual personalities. The theological bias of secularization theory within the sociology of religion (especially via Troeltsch and Herberg) has underwritten conceptions of "religion" as essentially fixed rather than essentially variable. *Sociologically,* however, there is far more reason to conceive religion as variable—indeed, whereas among social institutions religion deals uniquely with a nonempirical, "uncontrollable" referent, religion is *infinitely* variable in a way that other action orientations are not. Theological, rather than sociological, presuppositions and prejudices warrant the notion of religious fixity; thus, sociological theories of religion need to be attentive to change as *inherent* in religion, just as change is in other institutional spheres and cultural dimensions, precisely because religion is a sociocultural institution.

SELF AND SELF-CONCEPT

At the end of the nineteenth century, the Harvard psychologist William James laid down a cornerstone of modern self theory. In his 1890 *Principles of Psychology,* James distinguished between the *self as knower* (the I) and the *self as object known* (the Me, or self-concept). This formulation offered a language for talking about matters that had been obscured by reifications such as psyche, mind, soul, spirit, and ego. Following James, the self could be seen as both a process—acts of perception and knowing—and the outcome of that process—knowledge about the knower. James's distinction remains basic to self theory today.

The origins of self theory lie in human prehistory. As our hominid ancestors sought to explain the world around them, they likewise struggled to explain themselves. The world of dreams, images, thoughts, and feelings was perhaps no less troubling a mystery than the outer world of animals, plants, weather, and landscape. Where did these inner forces come from, and how did they relate to the outer world? What made one person different from another? To wrestle with these questions was to begin to theorize about the self.

Reflecting on the capacities, dispositions, and inner processes that make us human may thus be as old as consciousness. By the time such reflections began to be recorded, people surely had been thinking about human nature for ages. When Socrates (470–399 BCE) urged "know thyself," he presumed an intellectual framework within which disciplined introspection made sense. The Socratic admonition leaves open, however, the question of precisely what it is we should seek to know. And that is the question that has occupied subsequent social theorists.

To try to identify a history of thought regarding the self raises, first, the question of whether there exists a body of thought that constitutes a coherent tradition of theorizing about the self. By modern standards of scholarship, the answer is no, at least prior to the nineteenth century. Before then, one can find a great deal of philosophical and theological discourse about the inner processes—or, more often, "essences"—that constitute human nature. Absent is conceptual consensus or continuity. Psyche, soul, spirit, mind, proprium, and ego may all be answers to roughly the same question, but the answers, cast in such disparate terms, refuse to add up.

A major shift in thinking began to appear in the eighteenth century. Before this, Leibniz, Descartes, and other rationalist philosophers of the sixteenth- and seventeenth-century Renaissance period embraced a neoclassical view of the human being. In this view, the mind—that which made us self-aware and uniquely human—is an indisputably natural, indeed axiomatic, feature of individuals. This was expressed in Descartes's famous dictum: *I think, therefore I am.* By the end of the nineteenth century,

however, this dictum was supplanted by one that has remained foundational ever since: *I am social, therefore I can think.*

This shift had vast implications for theorizing about the self as a social phenomenon and a matter for empirical study. The eighteenth-century Scottish moral philosophers, notably David Hume and Adam Smith, drew attention to how social life engendered the moral habits and sentiments that make us human. Hume and Smith (and later Marx, Weber, and Durkheim) saw how capitalist industrialization was altering social relationships, giving rise to new categories and groups, creating new moral strains, and in these ways, generating new patterns of thought. In light of such changes, it was no longer tenable to see the human mind as insulated from social life. The inner processes that make us human were coming to be seen as inexorably linked to the organization of social life.

James's contribution opened the way to deeper understandings of these connections between self and society. In James's view, the self as object known—what he called the *Me*—becomes more complex as society becomes more complex. The more different ways it is possible to exist in a given society—materially, socially, and spiritually—the more different ways we can know ourselves. The complexity of the Me is also enhanced by the multiple relationships that can exist between individuals and groups. As James (1890) put it in a key passage,

> Properly speaking, a man has as many social selves as there are individuals who recognize him and carry an image of him in their mind. To wound any one of these his images is to wound him. But as the individuals who carry the images fall naturally into classes, we may practically say that he has as many different social selves as there are distinct *groups* of persons about whose opinion he cares. (p. 294)

This passage foreshadows Charles Horton Cooley's notion of the *looking-glass self,* which refers to self-conceptions that derive from imagining how others judge us. The emphasis on feelings attached to self-images also foreshadows Erving Goffman's discussion of the self as a virtual reality created in interaction. Further implied is a central idea of reference group theory: Behavior is aimed at pleasing the audiences that most powerfully affect our self-conceptions.

Following in the pragmatist tradition, John Dewey and George H. Mead built on James's ideas concerning the social nature of the self. Dewey emphasized the "I" as a conditioned subjectivity: a configuration of habits shaped by our relationships with others and by our choices in response to the moral dilemmas inherent in social life. Dewey's contribution was thus to highlight the self as both a social product and an agent of its own making. Mead drew

on James, Dewey, and Cooley, powerfully and creatively extending their ideas (see Mead [1934] *Mind, Self, and Society*). Mead's profound contributions lay in theorizing about the development of the self, the role of language in this process, and the relationship between mind and self.

Although Mead adopted James's "I" and "Me" terminology and sometimes referred to these as alternating phases of the self, Mead uniquely conceived of the self as an internalization of the social process of communication. According to Mead, this process entails the use of significant symbols, which are those that evoke, by virtue of learned convention, a similar response in the user and the perceiver. Using such symbols requires taking the perspective of the other—that is, sympathetically imagining the other's response to the symbol (be it gestural, oral, or textual). Taking the perspective of the other implies, in turn, the ability to look back on oneself as an object. To do this—to act and then, in the next moment, perceive the meaning of that act from the standpoint of an other—is, for Mead, what it means for an individual to have a self.

In Mead's view, the self is not inborn but emergent. This occurs as the child learns to use language (rather than impulsive cries and gestures) to evoke responses in others. To use language in this way requires perspective taking, which in turn enables perception of oneself as actor/object. As the child masters the use of language to evoke precise responses in others, the child also learns to carry on the process imaginarily. The unfolding of this internal conversation—in which one's acts, the reactions of others, and one's reactions to those reactions are represented in consciousness—is the process that constitutes the self. Further development occurs as the individual gains facility with language and the ability to take the perspectives of diverse others. Adult development is achieved when individuals are able to take the perspective of a community, or what Mead called the *generalized other.*

Mead's view also distinguishes self from mind. Rather than use the static term *mind*, Mead preferred to speak of *minded behavior,* by which he meant behavior that was not merely impulsive but was mediated by internal representations—imagery—of external objects and completed acts. Mead argued that the highly complex human nervous system enables the internal representation and imaginary manipulation of complex external states. This use of imagery and cognitive manipulation occurs "in the field of mind," wherein also arises the process of self as described above. A prominent feature in the field of mind is the Me—the person as a social object—which is taken into account, along with other persons and objects, in forming minded behavior, or what contemporary symbolic interactionists call a "line of action."

James and Mead are the giants of classic social theorizing about the self. They conceived the self as distinct from and not reducible to psyche, spirit, mind, or ego. Both theorists

also linked the self—as process and object—to social life. The distinction between self as knower and self as object known also has been enormously important for later work on the self. It would be fair to say that twentieth-century social-psychological study of the self is not merely indebted to James and Mead, but barely imaginable without them.

CONTEMPORARY THEMES

Beginning early in the twentieth century, the self has been one of the most heavily studied topics in social psychology. Review articles began to appear in the early 1900s (e.g., Mary Calkins [1919]). Yet most of the theoretical and empirical work on the self throughout the century can be seen as moving along paths cut by classical self theorists. Four themes, or focal concerns, thus continue to dominate self theory: (1) the nature of the self as knower; (2) the content, causes, and consequences of self-conceptions; (3) the interactive construction of virtual selves through expressive and interpretive behavior; and (4) the etiology of the self.

Until the 1980s, little effort was made to further theorize the self as knower. It was as if this aspect of the self, the *I* of James's formulation, simply had to be assumed rather than explained. The cognitive revolution in psychology changed this. Under the influence of ideas associated with computer science, the brain was now seen as a kind of organic computer, and mind as "software" that ran on this organic platform. Some social psychologists, mostly in psychology, took this computer metaphor seriously and used it to reconceive the self as knower.

In this view, the self as knower is theorized as a *schema.* A schema is not static but rather, as Greenwald and Pratkanis (1984) define it, "an active, self-monitoring knowledge structure" (p. 142). A knowledge structure that can assimilate information, manipulate that information using a stable set of algorithms, and then modify itself as a result, is, in essence, a highly sophisticated computer program. Theorists who take this approach treat the self as a program for which the original code is not directly accessible. The empirical task, then, is to observe how the program functions—that is, how the self as knower processes information—and thereby infer its hidden operating logic.

Perhaps because it seemed more empirically accessible, far more attention has been paid to the self as object known, or what is now called the *self-concept.* Theorists have thus sought to specify, first, the content of the self-concept—that is, the kinds of knowledge we have about ourselves. We know ourselves, for example, in terms of public and private roles, categorical and group identities, and a set of character traits. Study of the content of the self-concept has also examined the organization of this knowledge. Some theorists have suggested, for example, that the self-concept is a theory we have about ourselves—a theory consisting of axioms, first-order propositions, and a host of logical implications.

Also recognized as key parts of the self-concept are *self-evaluations* and *self-esteem.* Although the self, like any object, can be evaluated in many ways, it has been suggested that the two main dimensions of self-evaluation, in Western societies, are competence (also referred to as self-efficacy) and morality (also referred to as self-worth). Self-esteem is then often defined as the affective response to these evaluations. Theorists have also posited two kinds of self-esteem: (1) "global," referring to chronic, generalized feelings of positive or negative self-regard, and (2) "situational," referring to more transitory feelings about the self that are influenced by events in a particular context.

Among all the concepts associated with self theory, self-esteem has gained the greatest currency in popular culture (see Hewitt 1998). Folk psychologists and moral entrepreneurs often invoke self-esteem as the cause of all manner of behaviors, good and bad. Crime, teenage pregnancy, unemployment, and failure in school have been alleged to result from low self-esteem. The obvious solution is then held to be *raising* self-esteem. Research has consistently found, however, that self-esteem is of only slight predictive value, relative to situational variables, when trying to explain social behavior.

The self-concept is universally seen as social in origin. Roles and identities derive from one's place in a social order; the meanings of identities are socially constructed and situationally variable; terms for character traits, as well as criteria for applying them, are aspects of culture; standards for self-evaluation are likewise socially learned. This view suggests that the self-concept is not only a product of social life but that its shape and content mirror the culture and social organization in which an individual develops. There is also agreement that the self-concept is formed by, and remains subject to the influence of, feedback from others (reflected appraisals); the ways we measure ourselves against others (social comparisons); and our observations of what we do and make happen (self-perceptions).

Three self-concept motives have been posited to explain how the self-concept shapes behavior. The tendency to behave in ways that affirm central identities is attributed to a *self-consistency* or *self-verification motive.* The tendency to behave in ways that generate positive reflected appraisals (from important audiences), favorable social comparisons, and perceptions of morality and competence is attributed to a *self-esteem motive.* And the tendency to behave in ways that produce observable and valued effects on the world is attributed to a *self-efficacy motive.* Theorists have thus sought to understand the self-concept not only as a social product but also as a social force.

A different approach to the self is found in theoretical work associated with the dramaturgical and semiotic perspectives. In the dramaturgical view, associated with Erving Goffman, the self is a "dramatic [or rhetorical] effect," that is, an attribution of character that is interactively

constructed through expressive and interpretive behavior. The only self that matters, in other words, is the one attributed to us based on our acts of signification, because this is the self to which others respond. Other than presuming a concern for protecting the feelings attached to cherished self-images, the dramaturgical perspective has little to say about cognition or self-conceptions. The semiotic perspective similarly focuses on expressive behavior, analyzing the signifying acts (sometimes called *identity work*) through which virtual selves are created in interaction.

A related approach that also treats the self as a linguistic construction points to what Kenneth Gergen calls "narratives of the self." In this view, similar to the dramaturgical, the self is an impression, a virtual reality, created in our minds and the minds of others. This impression, however, is created not only through situated expressive behavior and reactions to that behavior but through lifelong storytelling about ourselves. Who we are is thus seen as a result of how we selectively weave the purported facts of biography into stories about ourselves. Studies of the narrative construction of the self have examined cultural templates for biographical storytelling and the interactive creation of self-narratives in therapeutic groups.

In the 1980s, there emerged a strain of self theory influenced by postmodernist social theory more generally (see Elliott 2001). The core argument was that as social life had become more fast-paced, fluid, fragmented, and soaked in media images, the self had changed correspondingly. According to postmodernist self theory, the idea of a solid, stable self as the basis of personhood is passé. "The postmodern self," as Gecas and Burke (1995) described it in a critical review of the literature, is "decentered, relational, contingent, illusory, and lacking any core or essence" (p. 57). Some theorists went so far as to argue that the self had disappeared. Critics of the postmodernist view granted that changes in society could produce changes in self-conceptions and experiences of personhood but preferred to treat any such changes as matters for empirical study rather than accepting the self's demise by theoretical fiat.

At the start of the new century, studies of the self and self-concept continue to move along the paths outlined above. Researchers remain concerned with how culture and social structure shape the self and with how the self in turn shapes thought and behavior. Narrative approaches to studying self and identity seem to be gaining ground relative to older approaches based on experiments and surveys. At the other end of the spectrum, an emerging neurobiological perspective aims to theorize the relationship between the organization of neural networks in the brain and the emergence of self-consciousness. Each path carries on the ageless human project of understanding the self as knower and as object never fully known.

SEMIOLOGY

Semiology has its modern origins in the linguistic theory of Ferdinand de Saussure, especially in the various versions of his *Cours de Linguistique Générale* [*Course in General Linguistics*] ([1916] 1971). Some of the basic principles expounded by Saussure are also discussed by classical writers such as Plato and Aristotle, although neither of these thinkers explicitly set out to develop a science of semiology as such. In the present discussion, the term *semiology* will refer to those developments that stem from Saussure in the early twentieth century and that have contributed to the further development of Saussure's thinking. The term semiology is to be distinguished from the term *semiotics*. The latter term, at least in its modern usage, is traceable to the work of the American philosopher Charles Sanders Peirce and will not be discussed here. Increasingly, the term semiotics, irrespective of the Peircean lineage, has become the more widely used term.

In Saussure's conception, semiology is the study of systems of signs. According to the notes compiled by Riedlinger and Constantin of Saussure's third *Cours de Linguistique Générale* (Saussure 1993), semiology is defined as "studies of signs and their life in human societies"

(p. 282), Saussure's inauguration of this new science depends on establishing an object of study—the language system, or *la langue*—in order that the language system may take its place among "the human facts" [*les faits humains*] (p. 282). For reasons that the various texts of the *Cours* do not make explicit, Saussure subsumes the study of the language system and of other sign systems (e.g., writing, maritime signals, sign language) under psychology, more particularly social psychology. It is interesting to compare Saussure's classification with the observations made by Claparède (1916) in his review of the *Cours de Linguistique Générale* Claparède, who was professor of Psychology at the University of Geneva, states: "Whereas Saussure recognizes that 'all is psychology in the language system,' he distinguishes, however, linguistics from psychology in an absolute manner" (p. 94). According to Saussure (1993), "The set of socially ratified associations [between acoustic images and ideas] that constitute the language system have their seat in the brain; it is a set of realities similar to other psychic realities" (p. 282). In this sense, an essentially social phenomenon—the language system—may be said to have a psychological reality for the individual by virtue of the associations between acoustic images and ideas that each individual stores in his or her brain. A further reason for locating semiology as a branch of (social) psychology may have to do with Saussure's concern to find an academic home for the newly launched semiological study of signs.

The most essential fact about the language system *qua* semiological system is that it is a system of signs. Saussure does not offer any systematic analysis of the other sign systems that he mentions as candidates for inclusion in his newly inaugurated science of semiology. He does, however, enter into a discussion of systems of writing in relation to the ways in which, according to Saussure, writing has impeded the development of the study of the *la langue.* Nevertheless, Saussure does not develop a corresponding semiology of writing (*écriture*), based on the visual-spatial character of written signs (see Harris 2001; Thibault 1996a, 1996b). For Saussure (1993), semiology is, above all, the study of "systems of arbitrary signs, of which the language system is the principal example" (p. 288). In Saussure's famous definition, "The linguistic sign rests on an association made by the mind between two very different things, but which are both psychic and within the subject: an acoustic image is associated with a concept" (p. 285). Rather than designating a material object (tree, horse), which is outside the subject, or a material sound that one hears, the sign is an association of the two terms—acoustic image and concept—linked by the same psychic association within the individual. This fact is demonstrated, Saussure points out, by the ways in which we can both "pronounce (and hear) an interior discourse" without moving the lips. Inner language [*langage intérieur*] (Saussure 1993:287)

occurs because a socially ratified language system makes possible this relationship of association between the two immaterial terms that make up the linguistic sign in the minds of the individuals who speak a given language, either in silent inner speech or in externalised speech with others.

Saussure's semiological theory of sign systems is founded on two critically important concepts. The first of these is the *arbitrary* character of the linguistic sign. The second is the concept of *value*. These two concepts will now be discussed.

ARBITRARINESS AND THE STRATIFIED NATURE OF LINGUISTIC SIGNS

The linguistic sign is arbitrary in the following way: "The concept *sœur* [sister] for example is not linked in any interior way (relationship) with the sequence of sounds s + ö + r that forms the corresponding acoustic image" (Saussure 1993:287). Signs of writing, Saussure says, also have this same arbitrary character (p. 288). More generally, Saussure points out that the future science of semiology will have to see "if it must be concerned with arbitrary signs or others" (p. 288). In any case, the primary domain of semiology, in Saussure's view, will be "systems of arbitrary signs, of which the language system is the principal example" (p. 288). Saussure further clarifies the arbitrary nature of the relationship between acoustic image and concept as follows: "as having nothing in it [the word] which particularly ties it to its concept" (p. 288). That is, there is no necessary or naturalistic relationship between a particular word and the concept that it signifies. It is important to bear in mind here that, for Saussure, the relationship between acoustic image and concept is an *internal* one between two aspects of one overall linguistic form.

Subsequent theorizing in some influential branches of linguistics often yielded different readings of Saussure's formulation. Many linguists have made a distinction between form and meaning. The relationship between these two levels is then said to be arbitrary in the sense that it is not motivated by any natural link between them on the assumption that the two levels of form and meaning are constitutively separable. The relationship between the linguistic levels of phonology and lexicogrammar is said to be arbitrary in this sense. This line of argumentation follows from theorizing about language in which meaning is separated from and seen as not systematically related to linguistic form. According to another variant of this thinking, the relationship between form and meaning is arbitrary in the sense that there is no naturalistic or necessary correspondence or resemblance between linguistic form and the real-world object or event that the form designates. There is, in this view, no naturalistic resemblance between, say, the word *butterfly* and the real-world insects that we see flying about gardens, parks, fields, and forests.

It is arguable that neither of these definitions of arbitrariness exactly captures the meaning it has in the texts deriving from Saussure's courses in Geneva. First, Saussure did not make a distinction between "form" and "meaning" in the way that later formal linguists did. Rather, both dimensions of the linguistic sign in his definition—that is, acoustic image (signifier) and concept (signified)—are aspects of linguistic form in the language system from which they derive. Secondly, Saussure's definition of the sign is not about the external relation between a given sign and the real-world object that it names. Rather, Saussure is at pains to stress that it is about the internal relationship of association between the two different dimensions of the sign's organization, as described above. It was on this basis that Saussure (1993) rejected the view of the sign as a nomenclature for naming objects in the external world (pp. 285–86).

This second reading of arbitrariness as referring to an external relationship between sign and object essentially states a banality and is, for this reason, of no great interest to linguistic theory. Linguists seek to understand the ways in which different levels of linguistic organization are systematically and functionally motivated in relation to each other. Different levels of linguistic organization such as phonology, morphology, lexicogrammar, and semantics are very often functionally and, therefore, semiologically motivated in relation to each other. Motivation in this sense follows from the fact that language and other sign systems are, as we shall see below, systems for making meanings in the contexts with which semiological (linguistic, etc.) forms are integrated and that, in part, they create in use.

To be sure, Saussure's claim that there is no naturalistic or necessary relationship between speech sounds and meaning is substantially correct. However, concrete speech sounds are not the same as phonological organization, although they are related. Phonology is an abstract level of linguistic organization that integrates with grammar and functions to make meaningful distinctions in grammar, among the other things that phonology does. There is a *functionally motivated*, rather than arbitrary, relationship between these two levels.

Rather than simply treat phonemes, say, as the constituent parts, or the building blocks, of morphemes, we can say that the level of phonology realizes the level of grammar. For example, in English, syllables (a phonological [articulatory] unit) frequently, although not always, correlate with morpheme and word boundaries on the lexicogrammatical level. One such example in English is syllable closure by the consonant / ʤ / in words such as *bridge* / brıʤ /, *bridgehead* / briDhed /, cabbage / kæbıʤ /, caged / keıʤd /, *hedgehog* / heʤhɒg /, *ranger* / reınʤəʳ /, *ridge* / rıʤ /, and *ridged* / rıʤd /. Typically, a syllable closed by / ʤ / indicates the *end* of a morpheme or a word, as shown:

brıʤ	rıʤ	d	heʤ	hɒg
SYLLABLE	SYLLABLE	SYLLABLE	SYLLABLE	SYLLABLE
morph-finality	morph-finality		morph-finality	

Here is a second example of the functional relationship between phonology and lexicogrammar. In tone languages such as Mandarin Chinese (Pǔtōnghuà), a tonal feature from the phonological system integrates with an entire grammatical unit by extending over its entire length so as to determine its meaning. For example,

bā (level) = eight
bá (rising) = pull out, uproot
bǎ (falling-rising) = to handle, to grip
bà (falling) = dad

The Chinese examples also show us that the tonal feature is not a discrete particle. Instead, it spreads or extends over the entire grammatical unit and cannot be restricted to any single part of the overall unit.
Figure 1   Prosodic Extension of the Tonal Feature [LEVEL] over an Entire Syllable Comprising a Consonant and Vowel to Indicate the Meaning [EIGHT] of the Grammatical Unit that Is Realized by the Phonological One

In Figure 1, the horizontal [gray shading] in the diagram represents both the extended nature of the tone over the entire duration of the two phonemes in the syllable as well as the feature [LEVEL] of this particular tone. The arrow indicates that the prosodic extension of the tonal feature has directionality in time.

In the English examples above, we see how the correlation of the syllable closure by a consonant with a morpheme or word indicates a specific lexicogrammatical domain. In the Chinese examples, the phonological feature—the tone—extends over the duration of an entire lexicogrammatical domain and, in combination with the given lexicogrammatical domain, specifies the meaning of that domain—the given lexeme—in the above examples.

Phonological units are not simply empty formal means for the construction of units on other levels. Instead, they make their own distinctive contribution, on their own level,

to the meaning of the units that they help to constitute on other levels. The functionally motivated (nonarbitrary) relationship between units and relations on different levels works in two directions. That is, functions (meanings) and the formal means of their expression are mutually determining. Thus, the grammatical relation "morpheme finality" is realized by the phonological feature "syllable closure by consonant" at the same time that the latter realizes the former. There is, then, a two-way and functionally motivated relationship between the two levels.

Saussure's insistence on the arbitrary character of the linguistic sign no doubt stems, in spite of some qualifying observations, from his focus on *langue* as a relatively homogeneous and well-defined system, which is separated from actual uses of language (*parole*). It can also be related to the absence of a properly worked-out distinction between phonetics and phonology in the modern sense, as well as to the fact that grammatical relations above the level of the word are scarcely considered at all in his Geneva lectures. All these distinctions were to await future developments in twentieth-century linguistics.

In the functionalist perspectives inspired by semiological principles, all levels of linguistic organisation contribute to and function in meaningful ways both on their own level of organization and in relation to other levels of organization, including the discourse context. In a functionalist perspective of this kind, linguistic forms serve the purposes of language users in discourse. Language is not an end in itself, as in formal accounts, but is integrated with the semiotic activities—both internal and external—of language. The forms of a language have evolved in ways that enable integration of this kind to occur. Formal theories of language are essentially nonsemiological. They both separate an abstract language system from the contexts in which language is used and further claim that syntax is autonomous with respect to semantics.

Rather than simply treat phonemes, say, as the smaller-scale constituents—the building blocks—of the next biggest level (i.e., morphemes) as formal linguists do, we can say that phonemes function in the larger-scale contexts—morphemes, words—to which they are integrated to differentiate meaningful distinctions on that level. Thus, the phonological differentiation between the phonemes / p / and / b / in the pair / pɪt :: bɪt / differentiates the meanings of these two words. Likewise, the graphological distinction between the written letter shapes [i] and [y] differentiates the meaning of the two written words *bite* and *byte* even though the two words have the same phonological representation—phonetically / baɪt /—for speakers of English. This does not, of course, mean that in the spoken language, they are the same word.

In some respects, Saussure's definition of the linguistic sign more closely corresponds to the protolinguistic signs that infants create in the early stages of their prelinguistic development. A protolinguistic sign consists of an elementary signifier and a signified. There is no grammar between these two levels. Protolinguistic signs are integrated to their contexts in ways that are situation dependent: Their meaning depends on their relation to the here-now situation in which they are articulated. Protolinguistic signs cannot be deconstructed into different meaningful components—for example, ordering of elements, articulatory shape (vowels and consonants), prosodic contour, different mood and modality choices, different experiential contents, and so on—which can be independently varied and recombined in other ways in other signs. In protolanguage, there is a fixed correlation between a simple signifier and a simple signified.

Now, Saussure is clearly not talking about infant protolanguage as such. The point is that his theory of the sign correctly captures the way in which signs embody different layers of organization, but he does not show that each of the two levels of signifier and signified in the linguistic sign is itself internally stratified.

Thus, Saussure's signifier (acoustic image) is internally stratified into phonetics and phonology. Phonology is a purely abstract level of linguistic form in which sounds are organized into a language-specific system. Phonetics refers to the articulatory and acoustic properties of speech sounds from the points of view of their production and perception by the human body. The relationship between the sounds we actually produce and perceive tends to stand in a functionally motivated relationship to the more abstract system of phonological categories. The phonological system selects which features of the many degrees of topological freedom—the dynamical continuously varying features—of actual speech sounds will be criterial for distinguishing one sound from another or for assigning two or more perhaps very different articulations to the same abstract phonological category. It therefore selects which patterns from among the many possible patterns on the articulatory level will be significant on its level at the same time that it constrains the degrees of freedom of the lower level so that few patterns get selected. There is no direct correspondence between the actual sounds uttered and heard and the phonological categories to which they are assigned. Instead, their assignment to this or that category depends on the ways in which a given combination of articulatory features is integrated to its larger-scale linguistic context.

A similar point can be made with respect to the visual shapes that we arrange in particular visual-spatial configurations on treated surfaces of various kinds in writing. Saussure did not develop a semiological theory of writing comparable to his semiological theory of the spoken language system (see Harris 2001). However, the written signifiers in alphabetic languages such as English or Italian can be stratified into two levels of organization on analogous, although not identical, lines, as follows. First, a highly

limited set of written shapes, including their upper- and lowercase variants (26 of each in the English alphabet), along with various punctuation signs, and so on, can be traced or copied onto a surface by somatic or extra-somatic means. Second, this limited inventory of visual forms—the letters of the alphabet—can be combined into larger visual-spatial configurations on different scalar levels of organization, such as letter clusters, orthographic words, phrases, sentences, paragraphs, and so on.

In other words, an abstract graphology systematizes the visual-spatial organization of letters into letter clusters, orthographic words, and so on, to allow these visual-spatial configurations to be integrated with the level of lexicogrammar in functionally motivated ways specific to a given language. Clearly, both written English and written Italian use many of the same visual shapes (letters) in their respective alphabets. However, the principles of their combination into larger-scale units, such as letter clusters, words, and so on, depend on more abstract principles of organization that can be explained in terms of the different principles that operate on the *graphological* level of organization of the two written language systems and how this, in turn, is integrated into the lexicogrammar of the two languages. This graphological level refers to purely visual-spatial principles of organization and must be distinguished from the (different) principles of organization that pertain to the sounds of the spoken language.

Likewise, the signified (concept) is stratified into the two levels of lexicogrammar and semantics. The relationship between the semantics and the grammar is also functionally motivated. Consider the following clause: *On October 1, 1949, Chairman Mao Zedong proclaimed the founding of the People's Republic of China at a grand inauguration ceremony held in Tiananmen Square, Beijing.* This clause consists of the following sequence of grammatical items: prepositional phrase + nominal group + verb + nominal group + prepositional phrase in the clause. Each item in the sequence also expresses a semantic function. This sequence realizes the following configuration of semantic functions: [Circumstance: Time]^[Participant: Sayer]^[Process: Verbal]^ [Participant: Verbiage]^[Circumstance: Location]. The relationship between the sequence of grammatical items and the semantic configuration this realizes is functionally motivated: The grammar of the clause organizes the event as a configuration of two circumstances, a process, and the participants involved in that process. It does so in ways that correspond to our sense that our experience of the world can be analysed and interpreted in terms of component parts and how they play a role in the larger wholes to which they belong. Thus, the clause in question construes the given situation as a verbal action in which one of the participants performs and in so doing brings into being the other participant—that is, that which is said (semantically, the functional role of Verbiage). Moreover, this situation is further

analysed in terms of both time and location circumstances specifying when it took place and where.

Saussure instates *langue* as a social fact, yet he does not show how a language is constrained by the ways in which it is used by human beings in a wide range of different kinds of social contexts. Instead, the emphasis is on the relatively homogeneous character of *langue* as a system of reciprocally defining differences. For Saussure, the system of differences is indifferent to the constraints emanating from particular forms of social organization and their associated meaning-making practices. *Langue* is described in a note to the diagram illustrating the separation of *langue* from *parole* in relation to *langage* in the Riedlinger-Constantin notes to the third *Course* as follows: "Social code, organizing language [*langage*] and forming the tool necessary for the exercise of the language faculty" (Saussure 1993:280). Saussure's insistence on the intrinsically social and semiological character of *langue* notwithstanding, it is not difficult to see how his characterization of *langue* as an object which is "definable and separable from the totality of language acts" and which can be studied separately from the "other elements of *langage*" (p. 281) has also led to the formalist and essentially nonsemiological project in much of twentieth-century linguistics. In that project, language has been seen as a stable and autonomous system of purely formal constraints, usually formalised as rules for explaining constraints on formal patterns.

SAUSSURE'S SEMIOLOGICAL THEORY OF VALUE AND THE RELATIONAL CHARACTER OF SIGNS

Semiology, in Saussure's (1993) definition, is a science concerned with values that are "arbitrarily fixable" (p. 326) in contrast with those values that have their roots in things. Moreover, *langue* is a system that must be considered as a totality (p. 329). These two aspects of Saussure's conception of linguistic value must be seen together if we are to understand the importance of his notion of linguistic value. Saussure defines value as follows: "The language system represents a system in which all the terms appear to be linked by relations. . . . The value of a word will only result from the coexistence of different terms. The value is the counterpart of coexisting terms" (pp. 358–59).

The value of a given term in the language system is defined in terms of its differential relationships with the other terms with which it contrasts in that system. The language system is a system of differences in this sense. The differences that pertain to a given language system may be said to be the semiologically salient differences recognized and used by the members of a given social group. The meaning of a given sign is a function of its position in relation to the other signs in the same system. The sign has neither meaning nor value in itself.

When Saussure (1993) points out that "the purely conceptual mass of our ideas, the mass separated from the language system represents a sort of unformed cloud" (p. 362), he is showing how a typological system of categorical differences—that is, the terms and their respective values—in a language system can emerge from and, in turn, give meaning to the continuously varying, topological domain or substrate of what he calls "ideas" (see Thibault 1997:164–73). The semiological principle of value thus has the potential to contextualize the phenomena of human experience in and through the system of semiotically salient differences that characterize a particular language system. Saussure's semiological theory of value shows the relational character of signs, although he did not build on this radically important insight to develop a semiological theory that is both relational *and* fully contextual.

The system of differences so postulated is, as Saussure recognized, an abstraction from actual uses of language in *parole*. It is the system of the *possible* kinds of meanings that language users can make in the various types of social contexts and social relationships in which language is used. This system of possible kinds of meanings can then be connected to the various ways in which meanings are actually made, in which types of contexts, and by which social participants. In such a theory, it would be possible to specify how signs contrast with each other in ways that depend on the wider contexts in which they function in the making and negotiating of meanings in human life. This is a step that Saussure did not actually take, although it is one that a social-semiological theory of language would need to make to account for the "life of signs in human societies."

The differential basis of the semiological notion of value can be illustrated with reference to the system of Mood in English grammar, as set out in Figure 2.
The system of MOOD in English is a grammatical system based on an initial "choice" between either *indicative* or *imperative*. The horizontal (right to left) dimension entails a move in delicacy (specificity) such that the selection of a given less delicate feature (e.g., indicative) becomes the point of entry for the selection of a still more delicate (more specific) feature (e.g., *declarative* and then *exclamative*). The selection of the feature or term indicative entails a choice between the terms indicative or *interrogative*. When the term indicative is selected, then either declarative or interrogative must be selected. If the subsystem declarative is then entered, a choice is made between either *affirm* or *exclaim*. Thus, the network orders the terms in this subsystem of English grammar as a set of increasingly delicate features that contrast with and therefore mutually define each other in terms of their respective values. This set of contrasts does not specify the meanings that particular uses of the mood options have, although it does exercise its own constraints on the kinds of meanings that can be made when selections from the MOOD system are used in particular contexts. The meanings can be determined only by the ways in which they are used in particular contexts.

The same general principle can be illustrated with reference to the system of contrasting terms or features that constitute the system I shall call [EYEBROW MOVEMENT], itself a subsystem of the larger system of [FACIAL EXPRESSION]. Figure 3 shows that the choice of the [EYEBROW MOVEMENT] system entails the simultaneous selection of choices from the three subsystems of "distance apart," "movement," and "duration."

Figure 2   Basic Mood Options in English, Seen as a Network of Contrasting Terms
Figure 3   Eyebrow Movement System, Showing Contrasting Features in Relation to Three Simultaneously Accessed Subsystems

The [EYEBROW MOVEMENT] system can, therefore, be characterized as a clustering of the three closely related subsystems mentioned above. Thus, the subsystem distance apart shows a systematic contrast between eyebrows "drawn together" and eyebrows "not drawn together." These contrasting features are potentially meaningful each in their own right, as well as in combination with selections of features from other subsystems in the [EYEBROW MOVEMENT] system, the [FACIAL EXPRESSION] system as a whole, or with selections from other semiological systems such as language. For example, an interrogative clause selected from the English mood system may be combined with "raised eyebrows," which is a selection from the "movement" subsystem, to produce a more complex syntagmatic structure, the meaning of which is something like [ASK QUESTION/EXPRESSS DOUBT/SEEK ATTENTION, etc.]. The two selections from the two different semiological systems co-contextualize each other as parts in a more complex, multimodal syntagm.

The distinctions I have made here between terms like declarative mood and interrogative mood in language and eyebrows raised and eyebrows not raised in the eyebrow movement system are formal resources that have a range of possible meanings. The network notation that I have adopted here is a means of formalising the ways in which these terms and their respective values derive from their place in a system of contrasting terms. The basic logic is the same in the two cases. The forms are the means in and through which meanings are made. There is no suggestion that the forms have fixed, already preexisting meanings. The semiological principle of value allows for the fact that forms and meanings may be uncoupled to create new couplings of forms and meanings in different contexts. This possibility is intrinsic to Saussure's relational theory of semiological value. Obviously, the eyebrow system is considerably more restricted in its possibilities for meaning making than is the vastly more complex system of a given language. Yet, even here we can see this principle at work. For example, raised eyebrows may be coupled to the meanings question, seek attention, express doubt in different contexts, and in combination with other signs from the larger facial expression system, or from other semiological systems such as language.

DISCOURSE, CONTEXT, AND THE MODERN SCIENCE OF SIGNS BASED ON SEMIOLOGICAL PRINCIPLES

The modern "science of signs" that has its roots in Saussure's semiology is based on text and discourse rather than on single signs. Moreover, language is no longer the sole or even necessarily the primary object of study. Increasingly, the functionalist principles outlined above have been extended to the study of the kinds of semiological partnerships that occur in discourse between language and other sign systems. Language—spoken and written—is always integrated with other sign systems—gesture, facial expressions, visual images, sound, spatial relations, body movement—and never occurs on its own. Texts or discourses, in relation to their contexts, are seen as complex systems of systems of interrelated signs that serve many different simultaneous and overlapping functions. Moreover, texts and discourses are not static entities. Rather, they are dynamical meaning-making processes in and through which social agents make meanings in contextually relevant and constrained ways. They do so by integrating the material signifiers in the here-now of bodily activity to other processes, activities, happenings, and so on, on other space-time scales, beyond the here-now scale of the text *qua* material artifact, or signifier.

Rather than simple couplings of atomistic signifiers to their signifieds, texts are seen as semiotic-material artifacts for mediating and integrating the local, smaller timescales of real-time meaning-making activity to more global, larger timescales in some social-semiological system. In ways that Saussure's relational conception of the sign foreshadowed, yet did not fully develop, signs are *made*, not given in advance, through these processes of contextual integration across different scalar levels of semiological and material organization.

SEXUALITY AND THE SUBJECT

The study of sexuality is a vital area of contemporary social theory. During the course of the twentieth century, in Western society, thinking on sexuality shifted from a conception of sex as a biological, essential, and fixed aspect of human "nature" to theorizations of sexuality as a social construct, shaped and regulated through cultural discourses and other social formations.

In large part, this shift was a direct result of feminist challenges to a binary understanding of gender that traditionally rested on fixed, mutually opposed categories of "male" and "female." A number of feminist scholars pointed to the lack of clear-cut biological differences between the two sexes; and increasingly, gender was theorized to be an ideological enterprise rather than a natural fact. The French feminist Simone de Beauvoir (1908–1986) catalyzed these debates when she famously wrote, "One is not born a woman, but rather becomes one." Her argument for the social construction of gender was taken up by feminists seeking to attack the gendered power differences that were at the heart of women's oppression. Yet these theoretical breakthroughs led to a quandary: If the category is eradicated, how then can women unite for political action against oppressions based on that category? The problem is one of a politics of identity. Debates within the feminist movement continue to hinge on whether women share certain "essential" characteristics or whether "woman" is a socially constructed category.

Radically questioning these essentialized categorizations of gender has had powerful implications for the related notion of *sexuality*. The ways in which medical and legal definitions of gender impinge on sexuality offer an understanding of sexuality, too, as shifting and ideologically driven rather than natural or essential. As a result of such theorization, the idea of sexuality has changed from a binary conception of hetero- versus homosexual to the more pluralistic notion of *sexualities* that are not biologically determined. In this area, as well, debates rage over whether sexuality is genetically based, whether it is a matter of individual agency, or whether it is ideologically directed. These theoretical discussions have powerful implications for our understanding of identity or subjectivity, because gender and sexuality are constitutive elements in the formulation of the self.

In these debates over essentialism and social constructionism, there has been a growing recognition of the mechanisms of ideology through which gender and sexuality are given meaning in society. The field of feminist cultural studies focuses on the analysis of representations of gender and sexuality and their interactions with social processes and human behaviors. As part of such analyses, the related functions of race, ethnicity, nationality, class, age, and other social vectors have been noted. The social struggles and movements of the mid-twentieth century were especially significant in revealing the multiple imbrications of anti-hegemonic identity politics. Thus, feminist analysis, which in its early manifestations was centrally concerned with gender and power, now seeks to account for the variety of factors that work together to construct hierarchies of power and privilege in society. Gay and lesbian theorists and critical race theorists have also engaged in multiperspectival approaches to understanding power and oppression and how cultural discourses and texts reproduce hierarchies of class, gender, race, and sexuality.

On all these fronts, sexuality offers a powerful lens through which the mechanisms of society can be investigated. The ways in which sexuality is tied to subjectivity or individual identity can shed light on social configurations and processes; there is a dialectic at work between the sexualized self and its social environment that raises important issues of gender, race, class, and power.

THE EMERGENCE OF SEXUALITY

The term *sexuality* itself is barely a century old; and just as the term entered social discourse, sexuality began to be linked with individual personalities and behaviors. Since classical times, sexual practices had been recognized and categorized, but only in the late 1800s did sexuality become linked with personhood or subjectivity. Terms like *homosexual, transvestite,* and *sadist* entered the parlance then; prior to that time, sex was a medical and biological function. Medical scientists had catalogued and named various sexual practices and "perversions," which were seen as biological or genetic attributes. The science of *sexology* was thus born. Much attention was paid during the course of the nineteenth century to crafting legal and medical definitions and explanations for sexual practices. It was only later that sexuality began to be understood as being psychologically significant.

Toward the middle of the nineteenth century, sexologists began to consider sexuality in terms of "abnormality" or "perversion"; these concepts alluded to sexual practices that had been deemed socially and morally unacceptable and that were characterized as illnesses attributed to hidden psychological drives as well as genetic or anatomical defects. Richard von Krafft-Ebing's (1814–1902) encyclopedic book, *Psychopathia Sexualis* (1886), was a highly influential catalog of sexual mental disease: Early editions of this book presented sexual perversions as curable deviancies, but later ones shifted to arguments that sexual deviance was involuntary and irremediable. The debates around sexuality in this period tended to center on homosexuality, its causes and correctives; these sexological discussions offered definitions of masculinity and femininity in socially prescriptive formulations that had legal and

cultural implications. The writings of the sexologists wavered among various positions on sexuality, often deeming it at once an unchangeable instinct and a condition that could be cured through therapeutic intervention. The work of the British sexologist Havelock Ellis (1859–1939) is notable in that it addressed sexuality as normal, healthy, and complex. His seven-volume opus, *Studies in the Psychology of Sex* (published between 1897 and 1928), are his best-known work and were a precursor to Albert Kinsey's later investigations; the work did much to depathologize many sexual practices, although it was uneven in many ways. Ellis also advanced the notion that sexual deviations were socially constructed, although he characterized white male heterosexuality as normative.

On the whole, however, the work of the sexologists was centered on taxonomies and classifications of sexual behaviors. These systems of classification brought into circulation the terms *homosexual, heterosexual,* and *bisexual* and then confined the understanding of sexuality to the homo/hetero binarism that later (particularly feminist and gay/lesbian) scholars repudiated. In addition, these taxonomies tended to privilege heterosexual, monogamous relations as the norm against which all other sexual activities were characterized as deviant. Even later versions of such sexology, carried out by Albert Kinsey in the 1940s and 1950s, and William Masters and Virginia Johnson in the 1960s, strayed little from these early positions, defining sexuality as biological and physical, susceptible to external influences and capable of being changed by medical intervention.

PSYCHOANALYSIS, SEX, AND THE SUBJECT

Coming on the heels of the taxonomic sexology that developed in the 1800s, the invention of psychoanalysis near the turn of the twentieth century was instrumental in radically repositioning sexuality in relation to individual identity or subjectivity, and developments from psychoanalysis most substantively challenged the sexological and essentialized conceptions of sex. Later critiques of psychoanalysis and the rise of social constructionism led to the analysis of social forces through which subjects are constituted. The emergence of feminist scholarship, queer theory, postmodernism, and deconstructionism broached central questions regarding the linkages between sexuality, subjectivity, and cultural, ideological, and discursive formations. Some of these questions are as follows: How are subjects *sexed* or made sexual? Are gender and sexuality synonymous? What is the relationship of gender identity to subjectivity? What is the relationship of sexual identity to subjectivity? To what extent is sexual identity socially determined? And conversely, to what extent do sexual identities and practices shape society?

The psychoanalytic theory of Sigmund Freud (1856–1939) offered the first insights into the nexus between sexuality and subjectivity. Generally speaking, Freud's conceptualization of the human psyche in terms of the unconscious destabilized Enlightenment notions of a rational, autonomous subject. This *Cartesian* subject (so called because it was most closely associated with the writings of French philosopher René Descartes, 1596–1650) had formed the basis of centuries of philosophy on the human condition: its basic premise (that *reason,* or the human capacity to understand one's own existence, defined the self) had given rise to formal theories of society such as liberalism, idealism, and humanism; modern conceptions of democracy stemmed from the Enlightenment notion of a centered being whose capacities of reason, consciousness, and action impelled him or her toward the pursuit of knowledge, happiness, and freedom. This being, or *subject,* was also an *agent*—that is, an individual with the power to act independently. The power of self-governing action came from an innate essence, a capacity for rational autonomy that separated humankind from beasts.

Freud's conception of the subject presented a radical challenge to the very core of those ideas. Freud explicated the human psyche in terms of the conscious and the unconscious. In his writings, these concepts are variously labeled conscious, unconscious, and subconscious—or later, id, ego, and superego. The latter terms do not directly correspond to the former but, rather, represent a more developed theorization of the human personality, in which the id refers to unconscious drives and impulses, while the ego and superego operate between the subject's external and internal worlds, negotiating the borders of the conscious and unconscious. The *consciousness* that defined and animated the Cartesian subject was in Freud's view only the superficial functioning of a self motivated by unconscious desires and drives. In Freud's conception, the conscious is not aware of the workings of the unconscious; rather, it operates in constant and incognizant interplay with it. The ego or the *conscious* channels energies that Freud termed *libidinous:* These are pleasure-seeking drives, primarily sexual, that play out in the ego's relationships with external and internal objects and functions.

These concepts are crucial to understanding Freud's theories of sexuality and the subject, as well as the various revisions thereof that followed from scholarly critiques of his ideas. To Freud, libidinal energies shape the contours of the self; the ego develops in relation to the subject's relations with itself and others. Freud's early writings on sexual development centered on the repression of various libidinous desires.

To Freud, sexuality was a primary force underlying human behavior and psychology. His early theories of sexual development were predicated on a progressive attention to various erotogenic zones of the body. These theories were premised on notions of infantile sexuality and erotic desires felt by a child for its parents, which were repressed

by society. The various sexual repressions experienced at each stage of development, and their attendant anxieties, guided the development of the human psyche, in Freud's formulation. The ways in which these sexual desires were expressed or repressed were posited by Freud to explain subsequent behaviors and pathologies. Freud later offered theories of society grounded in parallel notions of the repression of sexual/libidinal urges.

Thus, for Freud, sexuality shaped the contours of the unconscious and was the primary factor in understanding human development. While his theories have been the target of substantial criticism and challenge, in large part because of the apparent misogyny underlying his problematization of female sexuality, his work has also contributed a great deal to contemporary understandings of sexuality. Yet it should be noted that his work centered on the analysis of male sexuality and identity development, and when he dealt with girls and women, his ideas were undertheorized and largely devaluative. While some feminist scholars have brought to light these aspects of Freud's analyses, others have made some attempts to recuperate Freudian theory in relation to female sexuality, arguing that he was describing rather than endorsing the conditions of patriarchy.

Freud's theories were notably advanced by the French psychologist Jacques Lacan (1901–1981), whose rethinking of Freudian concepts are key to contemporary formulations of sex and subjectivity. Lacan posited the emergence of the subject to be tied to what he termed "the mirror stage"—the moment at which an infant recognizes himself or herself in a reflection. According to Lacanian psychology, this moment of recognition serves to unify an identity that previously was fragmented; this unification is corporeal as well as psychic. In the mirror stage, the infant's subjectivity is formed into a cohesive whole. The body is thus irrevocably bound up with the psyche; the recognition of the physical contours of the body leads to a recognition of the self.

But Lacan also wrote that the integrity of the self and the body can only be sustained in terms of the social discourse that sexually differentiates bodies into *male* and *female* and then organizes them within a gendered system of power. This social discourse is played out through language. Lacan refers to this discursive system as the "symbolic order." The symbolic is organized in terms of social structures, such as the taboo on incest, that regulate all human relationships. The symbolic is a patriarchial system that exercises authority through the "phallus," Lacan's term for hegemonic masculine power. In Lacan's view, language shapes sexuality and subjectivity together, and sexuality binds subjects to culture. Thus, the Lacanian view of sexuality and the subject offered a bridge between psychoanalysis and social theory.

Freudian and Lacanian theories of sex and the subject are the point of entry for the considerations of sexuality and society that followed throughout the twentieth century and into the twenty-first. As Juliet Mitchell (1974) expresses it, "Psychoanalysis gives us the concepts with which we can comprehend how ideology functions; closely connected with this, it further offers an analysis of the place and meaning of sexuality and of gender differences within society" (p. xx). Both masculinist and heterosexist at their core, Freud's and Lacan's ideas provide a baseline to which later theorizations refer.

Feminist scholars, in particular, have developed notions of sexuality and the subject beyond psychoanalysis, working to connect the interiorized processes of sexuality posited by psychoanalytic theory with the sociological structures that intersect and act on them. For feminist writers, there is an action agenda at the heart of such investigations: The emancipatory goals of social change and the dissolution of gender inequity are tied to feminist projects. Feminisms share this orientation with other theoretical strands such as Marxism, critical race theories, ethnic studies, and gay and lesbian studies. Sexuality and the subject have been addressed from all of these perspectives, and these critiques have troubled and complicated our understandings of the role of desire in contemporary social formations.

On one hand, some feminist psychoanalysts criticize psychoanalytic theory for its inability to provide a model for social change, but others support it for its insights into how femininity is inculcated by patriarchal society. A key aspect of such reflections on psychoanalytical constructions of sex and the subject is the shift toward understanding sexuality as a sociocultural construction as well as in terms of individual internal traumas; the struggle to link the two approaches is a hallmark of more recent considerations of sexuality.

SEXUALITY AND DISCOURSE

Perhaps the most significant break with psychoanalytic schools of thought on sexuality came from the French philosopher Michel Foucault (1926–1984), whose three volumes on the history of Western sexuality postulate that discourses on sexuality and their importance in shaping knowledge are functions of power. From the perspective of gay politics, Foucault argues that desire has been produced through various historicized discourses; the ways in which sexuality is articulated socially in a sense determines how it manifests itself. These multiple articulations serve to constrain and delimit sexuality, as well as to enable new forms of sexuality to emerge; thus, the sexual body is the site on which hierarchies of power are played out. Sex, then, is neither *natural* nor *repressed* by society; rather, what Foucault calls the *machinery* of sex tells us much about the social order.

Contemporary theorists of sex and sexuality build on Foucault and psychoanalytical theorists to invent new

understandings of sexuality in society. Judith Butler's engagement with the sexed body and its relationship to gender is a reformulation of Freud, Lacan, and feminist theorists such as Luce Irigaray and Julia Kristeva. Like Foucault, Butler sees sexuality as well as bodies themselves as discursive effects; bodies and their sexuality, she writes, cannot be dissociated from the regulatory norms that provide their context and determine their meanings. Her most crucial point is that identity, or subjectivity, is achieved as an effect of assuming a sexual location and that this assumption of a sexual identity is performative in that it repeats the behaviors governed by discourse. Yet this idea does not prohibit resistance to such socially determined constraints; in assuming a sexual identity, another is discarded, and that discarded or *abject* identity offers the seeds of resistance and change.

Susan Bordo, too, tracks Foucault in her examinations of femininity and masculinity in Western culture. Bordo sees discourse as vital in shaping the body and its functioning. She argues that the discursive meanings and significations of the body have serious, and often dangerous, material impacts. The cultural emphasis on the heterosexual desirability of the slender body and its privileged position in popular representation, for example, can be a contributing factor to the incidence of eating disorders in Western societies and to the maintenance and reproduction of existing power relations.

Gay and lesbian scholars contemplate sexuality and subjectivity in similarly complex ways. In these writings, the argument that social conditions and discourse shape sexual identification is countered by the notion that sexuality is an inherent and instinctual *orientation.* The sociopolitical implications of various theorizations of sex and subjectivity are clear in these works. Homophobia, social stigma, and political action are tied to how sexual identity can be understood. Representation is, again, a key factor in the privileging of heterosexuality and the marginalization of alternative sexualities, although increasing challenges from gay, lesbian, bisexual, and other activists mark cultural texts as contested terrain in which existing social struggles are reproduced and conflicting political discourses are reflected.

The issue of race further complicates the question of sexuality in society. Again, building on Foucault, critical race theorists recognize that discourses of sexuality reify power hierarchies. The early sexologists privileged white male heterosexuality as the moral ideal, characterizing the sexuality of women, Jews, and people of color as wanton and degraded. Sociocultural discourses of sex have since then conflated deviance with physical signs of difference, especially race. Cultural tropes of racial Otherness, such as exoticization, hypersexualization, and pathologization, again reinscribe power differentials in society. Within racial minority groups, aberrance from the heterosexual norm is also problematic.

In part, the sexual behaviors ascribed to various racial, class, and gender categories of people are circulated via cultural representation. The idea that all cultural representations are political is a major theme of the cultural theories of the last few decades. In particular, feminist and other oppositional social activists have attacked the stereotypes and biased images of their groups. These critiques of sexism, racism, homophobia, and other biases made it clear that images and representations are never innocent of political effect: Positive, negative, or ambiguous depictions of social groups can counter or reinforce social oppression. Early interventions in the politics of representation concentrated primarily on *images of* particular social groups, decrying negative images and affirming more progressive ones. The limitations of such approaches quickly became apparent, and by the 1970s, more sophisticated analyses began emerging of how texts position audiences, of how narratives, scenes, and images can be ideological instruments. In the 1980s, the turn toward audiences offered more complex notions of meaning making, recognizing audiences as active creators of meaning from texts rather than passive victims of manipulation. Thus, a dialectical relationship between audience and text was posited, with implications for subjectivity: Engagement with cultural texts was theorized to shape ideas of selfhood. Reading culture began to be seen as a political event. Representations were interpreted not just as replications of the real but as constructions of complex technical, narrative, and ideological apparatuses. The politics of representation focused on both the ideological encoding of textual messages and their decoding by audiences.

In this vein, feminist cultural studies have investigated sexual texts and audiences as corollaries of power, yet within the field there are widely ranging perspectives on representation, sexuality, and subjectivity. Radical feminist views on sexuality take the position that women are objectified and dehumanized in mainstream mass cultural representations of sex and that these representations not only place women in danger of sexual violence but influence both men and women to accept or even condone such violence. Such texts have also been criticized for their reinforcement of the hetero/homosexual binarism, their racism, and their preclusion of more progressive formulations of sex. But other voices defend mainstream representations of sexuality, either as a free-speech issue or by situating women and sexual minorities as active and knowledgeable consumers and producers of these texts.

Feminist activism and the gay and lesbian social movements of the late twentieth century are in part sociosexual configurations that have opened up alternative sexologies, one's that challenge the orthodoxy of the sexual tradition. The intellectual and political discourses that have arisen from these movements are redefining sexuality and subjectivity in an ongoing sense. Thus, sexuality can be understood as a

historicized term that emerged in a moment when medical science and taxonomy were on the rise and continue to be central to the understanding of human social life. Sexuality is also a significant component of media culture that cultural studies attempts to critically engage.

It is possible that the concept of *sexuality* itself may fade with future social shifts. But at this point in time, it remains a key axis of identification and organization in contemporary societies.

SIMMEL, GEORG

WORK AND BIOGRAPHY

Georg Simmel (1858–1918) was a philosopher, although sociologists consider him a founder of the humanist branch of sociology and recognize his contributions to an interpretive approach to the study of society. Contemporary theorists are deeply indebted to him as is amply documented by the frequent references to his work in recent publications. His theoretical method is rooted in his philosophy of life. From that he develops four epistemological approaches: pragmatism, constructivism, interactionism, and evolutionism. These serve as the context for Simmel's heuristic tools: (1) dealing with perspectives as realities, (2) seeing mental constructs as bridges across the gap between the subjective and the objective, (3) the dialectic of form and content, and (4) the tension between center and periphery. Simmel applies his unique method of study to various topics, including a famous analysis of "the stranger," a book-length investigation of money, the theoretical topic of historical materialism, and culture as it appears in music and in religion.

From 1858 until 1914, his home was Berlin. He spent the last four years of his life, however, which coincided with World War I, as a full professor at the University of Strasbourg. He died there of liver cancer on September 26, 1918 (not on September 28, as several sources report). Simmel was of Jewish origin and belonged to a Protestant church. He grew up the youngest of seven children and received a sizable inheritance after the death of his father. This allowed him to pursue his natural inclinations toward intellectual autonomy.

Simmel earned his doctorate degree from the University of Berlin, which enjoyed considerable international reputation then. Among those intellectuals who came from abroad to study there were George Herbert Mead and Robert Ezra Park. In Berlin, as well as elsewhere in Austria, Germany, and other parts of Europe, it had been—and still is—the tradition not to promote a scholar from within his or her department to the rank of full professor. This old custom, by which intellectual inbreeding was to be minimized, excluded Simmel from eligibility for a professorship at the university where he had been a student, a PhD candidate, and a *Privatdozent.* That is one of the reasons why Max Weber tried to get him a professorship at Heidelberg, which failed, most likely due to anti-Semitic prejudices.

PHILOSOPHY OF LIFE

After Simmel was diagnosed with liver cancer, knowing that his days were numbered, he completed his philosophy of life and presented it in his *Lebensanschauung: Vier metaphysische Kapitel (Life-anschauung: Four Metaphysical Chapters)* in 1918. Simmel's sociology is consistently based on this philosophy. He appears to pick up and modify statements by Plato, Spinoza, and Kant. These greats help Simmel to find his own position, which he then compares with the work of Goethe, Marx, Schopenhauer, Nietzsche, and others: To Simmel, reality is too vast and complex for the human mind to grasp. The only chance humans have is to create tools for selecting, describing, and placing in context segments of reality that correspond to their interests and emotions. The construction of ideal types as recommended by Max Weber is for Simmel essentially all we ever do: Scholarship is—whether admitted or not—the creation of heuristic tools. This insight and the message that reality is socially constructed have their origin in Simmel's epistemology.

Simmel incorporates Marx's concept of alienation into his philosophy of life. Mental activity can be defined as

producing something that is self-significant and self-regulating ("*eigenbedeutsam und eigengesetzlich*" [Simmel 1918:25]) and, accordingly, has the potential of becoming alien to its origin. Life then cannot be seen in any way other than as the subject continually grasping for the unfamiliar and bringing forth from itself that which becomes alien. While Marx considers that a deplorable defect of capitalist society, Simmel sees in it the inevitable mark of the human condition in general. Like in a parent-child relation, the mental product can be seen as emancipated rather than alienated. It is not a runaway extension of the subject who made it but, instead, may legitimately stand by itself. This is what Simmel calls "*Mehr-als-Leben-Sein*" ("to be more than life" [Simmel 1918:25]).

Simmel cannot be counted among philosophical idealists. Their view, according to which the world is what one sees, is not acceptable to him because it makes all that transcends life an illusion. Instead, Simmel wants to accept what is out there as objective reality in its own right, facing us *prima facie* as alien and yet as created by a life we can identify with. This method leads him to a dualism that "not only does not contradict the unity of life but rather is the way in which unity exists" (Simmel 1918:25). Thus, Simmel's philosophy of life is founded on a human type of existence which *finds* itself in *transcending* itself and which bestows form (or *gestalt*) on its individuality that will enable the person continually to reach across its boundaries (Simmel 1918:27).

EPISTEMOLOGICAL APPROACHES AND HEURISTIC TOOLS

Pragmatism

The search for reliable insight can only be successful if the subject who strives for knowledge is active. What is demanded is autonomous and potentially creative conduct. Building on Kant, Simmel creates the epistemology of an active human being, an approach that William James was to name pragmatism. Because in the process of acting, the interests of the subject flow into the process of gaining knowledge, Simmel sees as the central concern of Kant's system not *thinking* but the *will*. What matters to Simmel is this: A given body of knowledge must be assumed to guide and command action, even if its validity cannot be tested, let alone proven. No matter how far removed that knowledge may be from objective reality, it will produce action, and nobody can deny that then the results will be real. Since sociology is (also) the study of human conduct, the pragmatist approach as suggested by Simmel makes it plausible to assign types of knowledge a status of potential reality not according to what has preceded it but, rather, according to what action may potentially result from it.

Constructivism

From Simmel's point of view, ideas are on one hand simply conceptual products that are postulated. They are created *ad hoc* as tools of thought, like Max Weber's ideal types. On the other hand, they also serve the purpose of "understanding the existence of a truth" (Simmel 1910:106), a truth that therefore must exist, whether grasped by humans or not. Thus, Simmel's epistemology is caught up in the conflict of accepting the realm of ideas as only the product of human creation on one hand yet on the other hand anticipating that ideas will provide access to an objective truth. It is therefore incorrect to call Simmel a relativist. He did not see before his eyes a multiplicity of possible ultimate values but, rather, many presentations of the one. What must be constructed then is not the truth, but tools needed to access it. The "You" we encounter in everyday life is Simmel's most persuasive example: It is both a true person whom in his or her uniqueness nobody will ever fully grasp *and* a social construction that is necessary to enable interaction. The same applies to the "I": Individuals to not *really* know themselves beyond construction! In interpersonal dialogue then, the criticism "you do not know me, you only form an image of me" is in Simmel's view a rebellion against the inevitable.

Interactionism

If the heuristic aspect of reality is a *social* construction, it is constructed in interaction. The forms and processes of interaction are to be studied as sources of reality. The most widely known application is Simmel's concept of the stranger (*der Fremde,* see below). He is the alien who represents another reality in our own midst. Simmel defines the stranger in terms of "a particular form of interaction" (Simmel 1908:685). Elements of closeness and distance are both present. The interaction between native and stranger represents a rather exceptional and particularly interesting quality of an encounter.

Evolutionism

Throughout Simmel's writings, there are frequent indications that he pursues the notion of social and cultural evolution. Given the other three components of his method, that does *not* mean that to him there is an ultimate reality that evolves. All Simmel assumes is a dynamic aspect of the sphere of human constructs: society and culture. A convincing substantive area of scholarly work to which Simmel's evolutionism can be applied is his research on religion (Simmel 1997). Any answer to the question of whether there is a sacred absolute in the beyond and what it may be like, lies clearly outside the competence of empirical scholarship. The sociologist of religion can neither confirm nor deny any statement for or against the reality of

any god or deities. But the bodies of religious knowledge, the holy scriptures, the theological teachings and similar creations of faithful humans can be studied as heuristic tools that have been constructed for the purpose of relating to the beyond in a more or less satisfactory fashion (while leaving entirely open the possibility that there may be nothing in the beyond). Simmel assumes that in the history of humankind there is an evolution of the way in which humans go about creating and using such tools.

Four Heuristic Tools

Simmel and G. H. Mead (Mead 1927) agreed to give reality status to perspectives. To Simmel, the central perspectives are art, religion, and scholarship. The totality of the world can be seen and experienced from each of these, and it is absurd to find them competing with each other. Simmel calls the reality in which humans create art, religion, or scholarship the *third realm* because it mediates between the other two: the subject and the object. Again, the study of religion is a good illustration (Simmel 1997). Simmel's first heuristic tool, viewing religion not as an ensemble of things but as a specific *perspective,* and the second tool, according to which religion is a reality of its own, capable of *bridging the rift* between the subjective and the objective, are connected by him with yet a third heuristic device: the *dialectic of form and content.*

Simmel uses *historical materialism* as an example of this relation between form and content (Simmel 1977; see below). He interprets this Marxian philosophy as deriving the *content* of historical life from the *forms* of the economy. Examples of *content* are law, philosophy, and religion; these are determined by the *form* in which humans organize their food supply. Simmel criticizes historical materialism by pointing out that one sector of human life is exaggerated to the point of appearing as its sole content. This view, however, is unfit to grasp historical change: According to Simmel, history advances through the process in which form and content are transmuted into one another. The continuity of history would not be possible unless the same content (e.g., government) were to appear in different forms (e.g., aristocracy, dictatorship, democracy) or unless the same form (e.g., autocratic leadership) were to shape various contents (e.g., family, state, church).

A fourth heuristic tool is Simmel's description of the relationship between *center* and *periphery*. Simmel writes that human beings are free to the extent that the center of an individual determines his or her periphery. What is unique and utterly personal would fill the center; that which many people have in common can be only peripheral to the individual. Simmel observes that Christian churches have tended to emphasize that which all or many believers have in common rather than encouraging each individual to let its unique talents bring fruit.

APPLICATIONS OF HIS METHOD

The Stranger

Simmel's reflections on being a stranger are based on the concept of two separate populations. Originally, each population inhabits its own living space. The individual newcomer is regarded as an alien insofar as he or she is seen as a representative of the other group. Confrontation with the whole of the other group would be considered threatening, but contact with an individual representative is interesting, perhaps instructive—in any case, out of the ordinary. The stranger is not "the wanderer who comes today and goes tomorrow; he is the one who comes today and stays tomorrow—the potential wanderer, as it were" (Simmel 1908:685).

The advent of the stranger shatters native society's illusion of being universal. Self-satisfied society witnesses how the stranger who has joined it unexpectedly cannot be forced to acquiesce to its order. In the presence of the stranger, a supposedly universal orientation is revealed as locally restricted and provincial. Thus, the stranger has both a destructive and constructive effect, as a representative of alternative patterns of thought and an initiator of social change. He or she destroys for many what Karl Mannheim called life's instruments of concealment and illusion. The stranger is initially and principally an individual who is not integrated into the host society, and very often one who does not wish for such integration. In many historical instances, he or she will compensate for the burden this places on him or her with a strong belief in predestination or divine election.

Money

The *Philosophy of Money* (1907) is primarily a reflection on highly complex forms of interaction. The social principle of culture by which interactions between subjects invest objects with values acquires a concrete form in money. People shape sensory impressions into objects, and this allows them to experience reality. People's distance or detachment from objects means that, in their wish to overcome this distance, they experience the value of an object. In exchanging objects, they assess the expectations of the individuals involved of overcoming the distance and compare values. They thereby become aware of the value relations of the goods exchanged. These relations then become separated from the goods whose comparison they originated from and appear as an independent factor: They are given the form of money: Money thus becomes the expression of the "interdependence of people, their relativity, by which the satisfaction of one person's wishes is always dependent on another person" (Simmel 1907:134).

Money is the most general form of social relationship. The conscious mind, occupied with the social construction

of reality, invests money with such a well-defined sense of independent existence that we forget in the course of every-day life that the origin and effect of money is an expression of the interdependence of people. Where interpersonal relationships are not social, where individuals are not interactive and do not enter into exchanges with one another but instead treat each other as objects, money becomes meaningless. In Simmel's opinion, the same applies to law. Law is nothing but an empty abstraction until it becomes the form of a living relationship. People can treat each other rightfully or do each other wrong only if they are interacting with one another. "In reality, law is merely a relationship between people and is executed only in the interests, objectives or power play" (Simmel 1907:95).

Simmel considers the money economy with ambivalence. On one hand, it facilitates an ever-increasing degree of substantialization and, at the same time, greater internalization. Money (as relationship) becomes the "guardian of the innermost depths" (Simmel 1907:532). But whether it allows the person concerned to become more refined, unique, and differentiated or, conversely, makes him or her into a tyrant over other people—precisely because of the easiness with which it is obtained—has nothing to do with money but with people. Here, too, the money economy appears in its formal relationship to socialist conditions. Both forms of relationship—that of money and of socialism—are expected to bring the same blessing: "deliverance from the individual struggle for existence" (Simmel 1907:532). They can be substituted one for the other: Whoever has money does not need socialism.

Historical Materialism

"Historical Materialism," a Misnomer

Simmel first contends that the followers of historical materialism have not labeled it correctly. The name is misleading because it raises incorrect ideas about the character of this theory. What the idea seems to offer is a unitary psychological interpretation of historical occurrences. The theory has nothing to do with metaphysical materialism but, rather, is compatible with every monistic or dualistic opinion about the essence of physical processes. Therefore, materialism could only mean here that history, in the final analysis, depends on inorganic energies. However, this contradicts the generic content of the theory, according to which history is "psychologically motivated" (Simmel 1977:185). The unfortunate defect of being falsely named does not take away Simmel's admiration for its heuristic potential. It is the grandeur of the theory that it wants to make visible the driving force behind the oppositions and changes of history, a force that, by its elementary simplicity, is qualified to portray unity in the total, immense bustling of historical life. It is nothing but "a psychological hypothesis" (Simmel

1977:186). A psychological hypothesis, however, cannot sensibly be called "historical materialism."

Obscuring the Process of Formation

Simmel acknowledges historical materialism as a system of heuristic tools, and he concedes, in the terminology of Max Weber, its ability to construct useful ideal types. But Marxian theory is firmly tied to the claim of presenting a true picture of reality. It is to Simmel therefore just another form of historical *realism,* and as such contradicts Simmel's constructionist premises. According to Simmel, there is hardly another approach that shows with such clarity the process by which the gradual mental formation of the data is carried out. A picture of reality emerges like a portrait that is created one-sidedly—polemically one could say, as a caricature of reality. Therefore, the claim presented in the name of historical materialism is not acceptable methodologically. In its context, the preeminence of the economic realm is stated, not to create a heuristic instrument for gaining knowledge but, rather, because the reality of economics is seen as the factual foundation of all other occurrences. Here, the point is reached beyond which Simmel cannot accept historical materialism.

Music

Simmel quotes Darwin's statement that "'musical utterances represent one of the foundations for the development of language'" (Simmel 1882:261). Simmel's opposition to this thesis is disarmingly simple: "Were that the case, then it would not be understandable why man ever should have progressed to speech, since he was able after all to express everything in tones" (Simmel 1882:263). This more amusing than convincing line of reasoning is then augmented with a reference to the "speechless song" that would have to exist if Darwin's thesis were correct, but that Simmel can find nowhere with the exception of yodeling. If the speechless song "would be that much more natural than language, would it not have survived at least at the lowest level of culture, such that he (man) somehow, sometime breaks out in that 'speechless yodel'?" (Simmel 1882:263). Since Simmel finds, despite wide-ranging research in the materials of cultural history and of ethnology, everywhere (except for the yodeling in parts of Bavaria and Switzerland) the combination of text and song, not song without language, he is convinced that music did not precede language in evolution but, rather, that language came first. One may or may not find the content of this question interesting. Essentially, this is the method of the early Simmel:

1. He sees culture in the tradition of the theory of progeny as having developed in evolutionary steps, and he speaks in this connection also about "early man" and

language as that bridge that "leads the animal to the human being" (Simmel 1882:265). He picks up the impulses originally emanating from Darwin and applies them to philosophy; from the start, he orients the method of his own work accordingly.

2. Generating objective culture in the process of formation is another topic in Simmel's article on music. The model along which he thinks through this problem is that of interaction or, in the language of Dilthey and Simmel, the *Wechselwirkung* between the lead singer and a group of listeners who are emotionally touched by the song. Members of the group react to the presentation of the individual singer by spontaneously singing along: This is still pure subjectivity; the song of the first singer as such is entirely irrelevant. What carries an effect here is the emotion that is thereby stirred up, which could just as well have been produced by almost any other causal source. Ever so gradually, when objectivity has gained a little more headway and when at the same time the sense for melodic tunes has found its track, one will, aroused by a song, sing along (Simmel 1882:286). The transformation of subjective experience into objective culture is seen by Simmel as an evolutionary process. Both concerns—the process of formation and evolutionism—are connected without contradiction.

3. A third perspective that can be drawn on to demonstrate the continuity in Simmel's method is that of the dynamics of exchange between sensory experience and mental formation in the life of the subject. In an alternating exchange over time between them, these two ways of gaining knowledge continue to grow side by side. In a circular course, which Simmel says begins with sensory perception, pure thinking develops out of experiences, and this again feeds into new experiences. This ring-shaped movement always leads the subject through the empirical world. Vital-emotional feelings are being shaped into forms and these in turn create and reinforce emotional moods. For Simmel, the social aspect of the process of formation is placed alongside the process of objectification in accordance with his epistemological position. The former he illustrates with the example of a lead singer and the group of listeners who are spontaneously aroused to sing along, the latter with the exchange between subjective emotional mood and the song as an objective form of art. These basic threads of his theory of the process of formation are linked with the evolutionist approach.

Religion

Simmel writes in a letter to Martin Buber on April 10, 1916,

Dear Doctor! Thank you cordially for sending me your book. . . . Also I have some reservations with regard to the way you describe the religiosity of the Jews,

however beautiful and deep it may be. It seems to me that what you describe is the essence of religiosity always and everywhere. (Buber 1972:426–27)

Simmel prepares scholarship for a global perspective on religion. Like society, religion is possible because the content of the conscious mind is not merely a reflection on something untouched by such reflection but itself contributes to the shaping of reality. If religion is compared to society, they are not different in principle; religion is a specific social formation. The initiative to create religious experiences by means of the formative process does not emanate from an outer-worldly sphere but from the shared experience of social life. Religion is reality because it is not disprovable; the religious person tends to experience things in such a way that they cannot be any different from what his religiousness allows them to be.

Simmel compares the creative act of love, which enables love itself to generate a new form, and the creative act of the religious person, which is necessary for the content of faith to become factual (Simmel 1997:163). Of course, faith is linked to concrete phenomena that are open to varying interpretations. Yet religious feelings and faith are never a necessary conclusion to be drawn from the facts, as seeking to prove the existence of God. The adoption of faith is always a free choice; in fact, the question of whether a person is able to adopt such faith is a question of his or her own experiences and feelings.

SIMMEL'S LEGACY

Reliable translations and interpretations of Simmel's works into English have been published by Donald N. Levine (1977), Guy Oakes (Simmel 1977), and others. Tamotsu Shibutani (1955) and Anselm Strauss (1959) helped correct the notion that Simmel's method was formal sociology or useful only in microsociological research. In *The Social Construction of Reality,* Berger and Luckmann (1966) refer to Simmel in six different places, but the most impressive application and continuation of Simmel's work has been presented in Erving Goffman's *Frame Analysis* (1974). Simmel's *form* becomes Goffman's *frame.* In addition, Neil J. Smelser (1995) sums up Simmel's achievements in his Georg Simmel Lectures, and the methodological impetus that the field owes to Simmel lives on in the theoretical reflections on individualization and globalization by authors like Anthony Giddens and Ulrich Beck. Simmel will continue to be one of the most important authors for all humanities. This is true because hardly anyone else foresaw the enormous changes in culture, politics, and social conditions in general that would occur in the course of the twentieth century. It is also true because he discovered a new way of thinking, one that made this premonition of dramatic change possible.

What makes the work of Simmel enlightening as well as frustrating is his attitude toward reality. In opposition to those who declare dreaming as dangerous in school and college teaching and who would rely on hard facts only, Simmel points out that it would be a dangerous dream precisely to assume that anyone can reproduce reality without manipulating it in the process. His point of view, of course, hinges entirely on the evaluation of our faculty of perception. If we believe that sooner or later humans will have registered and clearly presented everything that is worth knowing because that, after all, is the goal of scholarship, then we must reject Simmel as an unwelcome source of doubt. If, however, one assumes that reality is so all encompassing and complex that individuals will always need to introduce their own interests in selecting data, then we can learn from him.

Simmel's work has been controversial from the start. In the tradition of Spinoza, he confronted the dogmatism of some philosophers with fresh insights into human nature that were subsequently accepted by Max Scheler and others. Simmel preferred to see sociology in the companionship of philosophy, history, social psychology, and other humanities. This meant of course that to him sociology is *not* a distant relative to physics, biology, or physiology. As a philosopher of ethics (*Moralwissenschaft*), he proposed a dynamic approach to human behavior and was conscious of the relevance of human emotions. Thus, he antagonized those who view human behavior as subject to eternal or never-changing codes of conduct. He is a precursor to Max Weber and Erving Goffman, and he influenced many other scholars. He also created a version of pragmatism that is similar to the one Charles S. Peirce, William James, and John Dewey developed later.

Simmel's critics suggest that the diversity of his subject matter is confusing. Thus, many claim that sociologically he did not know what he was doing. They point out that Simmel simply drifted from one area of interest to the next. This implies the absence of any systematic order in his scholarly activities. However, if we see Simmel as a scholar who spent his entire life searching for a method that would fit the study of culture and society, we can dispel this negative impression. The diversity of Simmel's topics is the way he *tested his epistemology.* Once he succeeded in devising the proper method for social inquiry, it proved fruitful in his investigations on the stranger, the adventurer (Wanderer 1995), the poor (Draghici 2001), art, love, and religion. Decades before Berger and Luckmann (1966), the message that reality is socially constructed is clearly evident in Simmel's writings.

SIMULATION

Simulation refers to a theory proposing the absolute loss of reality in contemporary society. Often associated with postmodernism, the theory's major protagonist, Jean Baudrillard, moved from an attempt to update Marxism to a refusal of all political doctrines on the grounds of the fundamentally illusory nature of society and meaning. Reacting against the structuralist school, Baudrillard proposed that what is perceived as the social is really an effect of the self-replication of a code. The term *code* derives from structural linguistics, where it denotes the unit of discourse; from genetics; and from information science. Amalgamating these concepts with a residual Marxism and with the media theory of Marshall MacLuhan, Baudrillard proposed that the equivalence of commodities in exchange implied the equivalence of signs in communication. Just as commodities had been freed from use-value in consumerism, so signs had been freed of the necessity of reference to reality. In historical stages, signification had moved from masking reality to masking its absence and, finally, to circulating without reference to reality at all. Both value and meaning proliferate without distinction, de-realizing the world and devaluing all values. The economics of production have been superseded by those of equivalence in which, since all differences are suppressed, all specificity and therefore all reality also disappear. In a nod to Guy Debord, Baudrillard suggests that the era of the spectacle is over, superseded by that of the hyperreal.

The concept of hyperreality has had the broadest use of the terms developed in simulation theory. In Plato's *Republic,* the term *simulacrum* (or its Greek equivalent *eidolon*) was used to define an extreme degree of removal from the foundations of reality: The ideal table was imitated by the real carpenter, but the painter who made an image of the result was no longer in touch with the ideal, and his work was therefore not a representation (like the carpenter's) but a simulacrum. In Baudrillard, the use-value of commodities, what distinguishes them as real, has disappeared first under exchange value but now under sign-value, so that the original use is so remote as to have vanished. Since the definition of the real is that which can be represented, but since all representation is serial in form, the real has become indistinguishable from its representations, distinguishable if at all only by its startling resemblance to itself. The real that is already an imitation and a representation, and one now lacking an original, becomes subject to a spiral of self-realizing code, producing ever more extravagant and ever less grounded figurations and hallucinations.

One of Baudrillard's examples is public opinion: on one hand, an artefact of the questions asked, on the other the sole proof of the existence of a public that otherwise has no presence in the social world. The opinion poll thus achieves a greater degree of reality than the public whose opinion it supposedly expresses. At the same time, there can be no question of an ideological analysis of opinion polls, since there is by definition no reality behind them that would give the lie to the ideological. Like the perfect recording of music that has only ever existed as a technological mediation, the media and social technologies of simulation abolish the distance between audience and performer, observer and observed, even ruler and ruled, on which meaning and political action are premised. As a result, global politics enters the age of the stalemated Cold War.

Warfare appears as the source of simulation in the work of urbanist Paul Virilio. The twentieth-century development of strategies of camouflage, disinformation, propaganda, and surveillance has entered ("endo-colonised") modern societies. Characteristic of militarization is the acceleration of daily life, an acceleration that, for Virilio, results in the loss of dimensionality. On one hand, distance technologies like rockets, radar, telephony, and television reduce space to the vanishingly small. At the same time, the time left by nuclear weaponry or Internet news services for a political decision-making process is now negligible and, consequently, responses must be automated. The result is a near-static population surrounded by a frenetically rapid communications and transport infrastructure. From TV set via commuter automobile to office computer, contemporary citizens are functionally immobilized, while windscreens and windows merely reduplicate the moving landscapes of TV. German media historian Friedrich Kittler advances the militarization thesis in case studies, including an analysis of the encryption protecting large areas of consumer computer hard drives from the consumers. User-friendly interfaces actively dissuade and eventually refuse permission to users wishing to reach these protected zones, resulting in a relationship in which most computers run their consumers rather than vice versa. In Kittler's work, the mechanization of media technologies parallels and induces the divorce of signification from reference, and of discourse from dialogue, again resulting in the simulation of society and the loss of its reality. In a more politically informed manner, Dutch media theorist Geert Lovink argues that there is no point in seeking the power "behind" media, since the media themselves not only have power, but because apathetic slumping in front of a screen is now a job requirement, they are power.

When, in 1991, Baudrillard published a series of articles arguing that the Gulf War had not taken place, the concept of simulation became public property. At the heart of the argument were a series of axioms. Most obviously, this was a media war and therefore a war of disinformation. Moreover, it was a war waged without political objective, merely as a warning not to start a "real" war. Finally, the restoration of Saddam Hussein to power proved to Baudrillard that no one wanted to believe the war had happened and that the dead

were merely props designed to prove that something had happened when in fact it had not. Baudrillard's tactic here was to exaggerate the rhetoric of clean, surgical, minimal war to the point at which the very existence of combat disappears under the weight of its representations.

In terms developed by the Slovenian psychoanalyst Slavoj Žižek, the problem is that reality ceases to be available to consciousness when consciousness is instead entranced by the concept of reality. Like the French philosopher Gilles Deleuze, Žižek counters Baudrillard's nihilism with the argument that the concept of origin, of a reality that exceeds and denies human knowledge, is itself simulacral, but where Deleuze finds here a Nietzschean rationale for foundational, ontological repetition, Žižek sees a more Hegelian dialectic in which the acceleration of unreality may lead to the reemergence of reality in a new guise.

A rather different interpretation appears in the work of Italian semiotician (and celebrated novelist) Umberto Eco, for whom hyperreality refers to the imitation of imitations; for example, the fake Michaelangelos decorating North American graveyards. Eco offers a critical theory of simulation in arguing that, while simulation may govern the lexicon of signification, it does not govern the encyclopedic structures of common sense, which is why it is possible to raise a critique and to discern the excesses of imitations without originals. While this recourse to common sense is vulnerable to both Baudrillard's and Virilio's beliefs that without individuality and therefore community, there can be no common sense, Eco's argument is that the central role of signification is to communicate, not to represent. In this milder form, hyperreality and simulation are portrayed as symptoms of a collapsing of reality and representation in a period when the powers of media become as real as the events they depict, while increasingly, political statements, wars, protests, and even crimes are stage managed to be circulated as media events. In this variant, it is not so much that reality has disappeared but, rather, that the nature of reality and of social relations with it have changed as signification and communication become both more prevalent and more commercialised and commodified. More extreme statements of simulation theory concerning the death of the social and the end of history can then be seen as themselves simulacra, in which, however, lies an analytic tool of some power, the democratization and universalization of systematic doubt.
