Perhaps Aristotle believes that continence is not a firm and stable state. Even if some people manage to act correctly despite their wayward appetites, they are always, he might suppose, in danger of lapsing into incontinence, and so they do not reliably produce the right actions even if they have a good record. Perhaps Aristotle assumes that if we act continently often enough, we will turn into virtuous people because the appetites that we overcome will gradually weaken. This seems a rather arbitrary assumption, however. Even if our wayward desires weaken because they are repeatedly denied satisfaction, we might have a persistent feeling of regret and reluctance about having to forgo their satisfaction, even in cases where we ought not to regret forgoing it. Surely someone who always managed to restrain his greedy or cruel or angry impulses, but always resented having to do it, would not have an appetitive part in harmony with the rational part? Aristotle, then, ought to deny that repeated acts of continence manifest virtue.

Stable continence falls short of virtue because continent and incontinent people lack the right election. Aristotle insists that the right election requires a virtuous state of character (1139a33–5; 1144a20–2), and that the right end appears only to the virtuous person (1144a29–b1; 1145a4–6). The virtuous person differs from the continent and the incontinent not simply in stability, but also in the election each of them makes at a particular time; neither the continent nor the incontinent person is capable of the virtuous person's election.[46] This election comes from 'good deliberation' (*euboulia*), which requires the correct grasp of the end and true deliberation from it. The identity of a particular election is determined not only by the particular action (paying a debt, helping the victim of an accident) but also by the deliberation that produces it, which includes the reason for which one elects it now, and would or would not elect it in different circumstances.

This conception of the identity of an election allows Aristotle to notice differences between elections that may from some points of view appear the same. Both the brave person and the imperfectly brave person may elect to face this particular moderate danger because bravery requires them to face it. The imperfectly brave person, however, is not convinced that it

[45] 'The third condition is in accordance with the character of a state—namely, that someone acts firmly, i.e. constantly as far as he himself is concerned, and immovably, i.e., disturbed by nothing external on a particular occasion, because he has the virtuous election and acts in accordance with it' (*in EN* ii 4 §283).

[46] We might take this claim to embody a non-standard use of 'election'. In some cases (we might say) Aristotle uses it to refer to something that happens on a particular occasion, but in other cases he identifies an agent's election with his general and fixed outlook or attitude. In the first sense of 'election', the incontinent, the continent, and the virtuous person all make the same election, and Aristotle is right to say that the incontinent has the right election. In the second sense, only the virtuous person has the right election, since the other agents lack the appropriately fixed attitude. More probably, Aristotle has the same sense of 'election' in mind throughout, and he always refers to a choice made at a particular time.

would be best to stand firm even in greater danger; his reasoning is different from the brave person's because the counterfactuals he accepts are different. The virtuous person accepts the right conclusion for all and only the right reasons, whereas the imperfectly virtuous people accept it for some of the right and some of the wrong reasons.

These features of deliberation suggest how the virtuous differ from imperfect people. Aquinas examines degrees of imperfection at some length, especially in his distinctions between sin and vice.

294. The Sources of Sin

Since a sin is a blameworthy action, Aquinas looks for the causes of actions that warrant blame without proceeding from vice. In each case he wants to show that when ignorance plays a causal role in sin, it is not the ignorance itself that is the source of the sinfulness of the action; the sinfulness results from some mistaken choice or failure to choose, and so belongs to the will.

Since Aquinas supposes that normal people have the resources to reach the right conclusions about action, he has to show why they fail to use these resources. The three different causes he mentions are ignorance, passion, and 'deliberate fault' (certa malitia).[47] In each case he affirms the primacy of the will as the source of responsibility, and therefore the crucial contributor to the sin.

In his discussion of ignorance Aquinas seeks to separate the excusing ignorance of particular facts from the ignorance that results from negligence or deliberate error. Sin does not result if the agent cannot overcome the ignorance, or it concerns something that he cannot reasonably be expected (tenetur) to know (1-2 q76 a2). Ignorance is a source of sin if we can reasonably be expected to know the specific thing we are ignorant of, and we have failed to acquire the relevant knowledge either by deliberate refusal or by negligence (q74 a5; q76 a3).

These comments about ignorance suggest that an appeal to ignorance cannot be the complete explanation of sin. For Aquinas suggests that blameworthy ignorance must be traced back to a cause that is distinct from ignorance—either to deliberate failure or to negligence.[48] To understand the cause of these failures we must consider the condition of the will or the passions that underlies them.

This analysis connects sin with virtue and vice, and, still more fundamentally, with the will and rational agency. Aquinas would face a serious difficulty if reasonable views about the nature and sources of moral errors could not be shown to fit his views about the will and its relation to reason and passion. His rationalist and eudaemonist conception of the will invites objections from two different directions: (1) We suppose that passions can be the source both of errors and of right actions. Aquinas has to explain how this can be so, given that he regards the passions as subject to the will, and takes the consent of the will

[47] Fearon in BF xxv renders 'certa malitia' by 'resolute malice'. q78 a1 obj1 explains 'ex certa malitia' by 'ex industria' = 'on purpose'. *Mal.* q3 a12 identifies 'ex malitia' with 'ex certa scientia'.

[48] See §262.

to be necessary for voluntary action. (2) We do not suppose, however, that error can be attributed exclusively to the passions, or that the difference between right and wrong action can be simply identified with the difference between guidance by passion and guidance by will and reason. For we suppose that we can make a deliberate and knowing choice of the wrong action, not under the influence of any passion.

Aquinas answers the first objection through his account of sin resulting from passion. He answers the second through his account of sin resulting from deliberate fault. In both cases he argues that the source of the error lies in a mistake by the will. Either the temporary influence of a passion attracts the will to an object that we would normally reject, or we make a mistake about the constituents of the good, even when we are not under the immediate influence of passion. Aquinas' view of the will explains not only what a virtue is and how we acquire virtue, but also how we fail to acquire it and how we lapse from it.

295. Passion and Sin: The Problem of Incontinence[49]

Sometimes the condition of the will that underlies blameworthy ignorance is the result of passion. Aquinas needs to explain this claim so that it fits his views about will and responsibility. He does not argue, for instance, that the passions cause sin by compelling us to follow them. Since sins are voluntary, the will is their primary subject; the other subjects of sin are powers that can be moved or restrained by the will (q74 a2–3). This claim about the will suggests that (as we have noticed) a parallel account of the subject of virtue would be more plausible than the account Aquinas actually offers.[50]

The will can be moved by the passions indirectly (q77 a1 ad2). Sometimes they distract us. Sometimes they attract us by presenting something that looks good, even though further examination would show that it is not good on the whole (q77 a1). If our will were entirely overcome by the passions, so that we could not use reason at all to guide our actions, we would not be responsible for our actions and there would be no sin (unless we were responsible for allowing the passions to overcome us) (q77 a7; 2–2 q150 a4). Though passion may diminish the sin (q77 a6), it does not remove it, as long as the will has the appropriate causal role. The passions cannot be the subject of mortal sin; for mortal sin requires us to aim at the wrong end, which is proper to the will (1-2 q74 a4).[51] The passions contribute to sin by presenting something attractive that invites the will to consent.

We might suppose, however, that incontinence is voluntary and blameworthy action in which we act on passion against a settled judgment of practical reason. Aquinas can accept this description only if it is suitably qualified. If the incontinent action is, as he believes, voluntary, it must depend on the consent of the will. But how can the will consent to something other than the apparently greater good? Aquinas answers these questions by defending a modified Socratic account of incontinence (1-2 q77 a2; 2–2 q155 a3; 156 a1). Misdirected passion misleads our reason and will, so that we do not recognize the

[49] Saarinen, *WWMT* 118–31, examines Aquinas' views in their historical context.

[50] On the subject of virtue see §287.

[51] On mortal sin see §299n80.

overall badness of what we are doing. Incontinents, therefore, elect badly, because appetite influences them to change their election.[52]

Both the continent and the incontinent person lack the correct desire for the end (1-2 q58 a3 ad2; a5). Continent people grasp the end correctly, since their rational part works correctly.[53] But (as we saw in discussing Aristotle) not every sort of correct grasp of the end ensures the right sort of desire for the end. Continent people lack the right desire for the end, because their sensory desire is defective.[54] They face the demands of reason reluctantly, because their reason is somewhat clouded by the attractiveness of the goals presented by non-rational desires. Since they value the objects of their non-rational desires more than they should, they lack the right desire for the end, even though they desire (in one way) the right end. Similarly, incontinent people lack the right principles because of disordered non-rational desires (q58 a5).

This account might lead us to attribute to Aquinas a more sentimentalist view than he intends. He does not mean that in order to grasp ends correctly, we must add non-rational desire to rational desire. Nor does he suppose that non-rational desire forces us to abandon our plans; if it did, incontinent actions would not be voluntary. He suggests that the incontinent person knows the right universal principle, but the principle is corrupted in a particular case by some passion.

When the principle is corrupted, incontinents still do what they believe to be good, but sensory appetite (concupiscentia) affects beliefs about what is good; the object of appetite 'seems to be good, even though it is contrary to the universal judgment of reason' (q58 a5). Their appetite hinders them from considering the facts that would lead them to draw the appropriate conclusion in the particular case.[55] Since the resulting incontinent action is voluntary, the hindrance caused by passion does not make reason entirely ineffective. The

[52] 'In the one who does something through appetite, as the incontinent does, the previous will by which he was repudiating what he has the appetite for does not remain, but it [or 'he'?] is changed towards willing what he was previously repudiating. Accordingly, . . . what is done through appetite is in no way involuntary. For the incontinent in relation to appetite acts counter to what he was previously proposing, but not counter to what he now wills . . . . (1-2 q6 a7 ad2). 'If appetite were to destroy knowledge altogether, as happens with those who become mad because of appetite, it would follow that appetite would take away the voluntary. . . . But sometimes in actions done through appetite knowledge is not completely destroyed, because the capacity to know is not destroyed entirely, but only the actual consideration in some particular possible act. Nevertheless, this itself is voluntary, in as much as what is in the capacity of the will is said to be voluntary, such as not acting, and not willing, and similarly not considering; for the will can resist the passion . . .' (ad3). 'Again, similarly, reason has the same state in both, since both the continent and the incontinent have correct reason, and each of them, while outside passion, elects on purpose not to follow his illicit appetites. But the first difference between them is found in their election, because the continent person, though he undergoes strong pleasures and appetites, elects not to follow them, because of reason, whereas the incontinent person elects to follow them, the contradiction of reason not hindering (non obstante contradictione rationis). Hence continence must reside in that power of the soul, whose act is election, and that power is the will . . .' (2-2 q155 a3). '. . . these passions, however strong they may be, are not the sufficient cause of incontinence, but only the occasion, since, so long as the use of reason remains, a human being can always resist his passions. . . . The cause of incontinence in itself belongs to the soul, which does not resist a passion by reason' (2-2 q156 a1). At *in EN* §439 (quia non immanet propriae [L; proprie, M] electioni propter concupiscentiam) Aquinas adds his own gloss to what Aristotle says, to show that Aristotle need not be denying that the incontinent acts on election.

[53] He attributes 'perfectio rationalis partis' to the continent; cf. 'quantumcumque rationalis pars sit perfecta' (q58 a3 ad2).

[54] . . . si appetitus sensitivus, quem movet rationalis pars, non sit perfectus (q58 a3 ad2).

[55] Cf. q77 a2: non considerat in particulari id quod scit in universali, inquantum passio impedit talem considerationem. See §250 on consideration.

incontinent's passion 'binds' reason (q77 a2 ad4), but this type of binding does not exclude consent and election.[56]

Aquinas is committed, therefore, to some elements of a Socratic account of incontinence. Incontinents, as he conceives them, do not know perfectly well that what they do is worse, all things considered, than some other available action. Many critics have argued that Socrates' denial of this knowledge to the incontinent person 'conflicts with the appearances'.[57] Many of these critics have added that the Aristotelian version of the Socratic position—knowledge in general, but ignorance in the particular case—retains the least credible aspect of the Socratic position. The same question arises about Aquinas' solution. If, however, he had agreed that incontinent people know that what they do is the worse option, he would have to concede either that they act contrary to the consent of the will, or that their will consents to what they know to be worse. The first concession implies that incontinents are not responsible for incontinent actions. The second concession undermines Aquinas' conception of the will and of the basis of human freedom.[58]

296. How Incontinence is Based on Consent

He defends his view of incontinence by arguing that since incontinent action is voluntary, it results from mistaken election.[59] But he does not mean that (for instance) the incontinent person temporarily believes that it is best, all things considered, to seduce his neighbour's wife, or to get himself drunk. If someone sins as a result of passion, '<his> purpose tends towards a good end, even though this purpose is interrupted for the moment because of passion' (q78 a4). He retains the correct end, but temporarily fails to pursue it, without electing the incontinent action as the best overall. His reason is 'bound', but this is the kind of binding that does not take away the use of reason, and therefore does not make our action involuntary.[60] Since incontinents act voluntarily, their action is explained by their

[56] On the two kinds of binding see §253.

[57] In commenting on this passage (*EN* 1145b27–31) Aquinas says: 'For we see clearly that some people do what they know to be bad. And if it is true that they sin because of ignorance that arises in them while they are in a passion—appetite or anger, say—it is best to inquire what sort of ignorance this is.' By adding to Aristotle, Aquinas alludes to his own view of Aristotle's solution.

[58] On this point about freedom Scotus rejects Aquinas' view; see §§360–1.

[59] Since vicious people also act on mistaken election, we might suppose that incontinents are temporarily vicious, differing from vicious people only because the mistaken election does not last as long. This supposition is explored by Kent, 'Transitory'.

[60] See *2Sent* d39 q3 a2 ad5 = P vi 741b: A defect in the conclusion of a practical syllogism arises 'from the force of passions that submerge and (as it were) bind the judgment of reason in a particular case, so that it does not actually consider this nor its opposite, but the will follows the pleasant thing that sense proposes'. Passion absorbs reason in considering some particular, so that the incontinent 'when he comes to this particular, since the state of correct reason has been bound through appetite, the person cannot advance to actual correct consideration about particulars' (*3Sent* d31 q1 a1 = P vii 333a, punctuation altered). Cf. *3Sent* d17 q1 a4 sc2. This is a temporary binding by passion (cf. *Iob* vii 4 = P xiv 33a) that does not take away voluntariness and sin (*Iob* xii 2 = P xiv 54a). Cf. *SG* iii 108 §2834. Extreme pleasure binds reason in a way or impedes it, just as in drunk people who have the use of reason bound or impeded (1-2 q33 a3; cf. q34 a1 ad1; *Mal.* q3 a8 = M 509a). People who are partly drunk get angry, tamquam habentes iudicium rationis, sed impeditum (1-2 q46 a4 ad3). Aquinas seems to distinguish the binding of people who are asleep or insane or drunk from the binding that is present in incontinents (though he is not completely clear about this; cf. *Mal.* q3 a9 = M 511b). In cases of voluntary error, it is up to us to prevent the binding of reason by passion (*Mal.* q3 a10, ad1, 2). Sometimes the

will and election, but not in the ordinary way. When we sin from passion, we sin 'electing (eligens), but not from election'. We elect to follow the mistaken suggestion of the passion in a direction that we would not take if the passion had not suggested it to us.[61]

Aquinas perhaps means to contrast two judgments: (1) It is best all things considered to do what my passion tells me (and it tells me to do x). (2) Doing x is best all things considered here and now (and my passion tells me to do x). When we sin from passion, we make the first sort of judgment, but not the second. The passion—my desire for revenge, for instance—does not alter my conception of the good so that I really think it better to take revenge even at the cost of all the resulting evils. But revenge is attractive enough to make me think it is all right to listen to my passion on this occasion rather than to follow my conception of the good. If I choose to ignore the content of my conception of the good, my choice reflects my views about my ultimate end and about when it is necessary or desirable to act on deliberation about the good. Such choices confirm Aquinas' distinction between actions that we do 'electing' and those we do 'from election'. What the incontinent elects as best is not seducing the wife of one's neighbour, but following the suggestion of the passion. He allows himself to be persuaded that it is best to follow his passion here and now, because he attends more to the attractiveness of the object of the passion than to the demands of his conception of the good.

Incontinents are not to be blamed simply for listening to a current passion; for that may sometimes be a sensible thing to do. It is wise to attend to our passions if they help us to identify what matters when we try to deliberate.[62] They may do this even when they conflict with our initial rational judgment; if, for instance, we are vividly aware of the suffering inflicted by our (as we supposed) just punishment, we may have a good reason to follow our current reaction, and to think again about whether the punishment is really just.

Incontinents are mistaken because they listen to the wrong sort of passion. We attend to our reluctance to inflict severe suffering because we assume that such reluctance is generally appropriate; but we would be wrong to attend to our dislike of the person to whom we think we owe an apology. The incontinent person is at fault for his willingness to follow a passion

passion binds the reason in such a way that it causes an election; here it cannot be the source of involuntary action (*Mal.* q3 a12 ad12 = M 516b). Aquinas introduces binding in his account of Aristotle on incontinence. See *in EN* vii 3 §1347; 6 §1394; 10 §1460.

[61] In these cases 'the election is the first principle of sinning, given that it is caused from passion; and for that reason such a person is not said to sin from election, though he sins electing' (*Mal.* q3 a12 ad11). The passion 'causes the election in so far as it binds reason for the moment' (*Mal.* q3 a12 ad12). 'It is one thing to sin electing and another to sin from election. For one who sins from passion, sins electing but not from election, because election is not in him the first principle of his sin, but he is induced from passion to elect what he would not elect if he were outside the passion' (1-2 q78 a4 ad3). 'Now in the intemperate person the will turns towards sin from its own election, which proceeds from a state acquired through habituation, whereas in the incontinent the will turns towards sin from some passion' (2-2 q156 a3). 'Now in both the incontinent and the intemperate person, ignorance arises from desire being turned towards something, either through passion, as in the incontinent, or through a state [of character], as in the intemperate person. Nevertheless greater ignorance is caused in this way in the intemperate than in the incontinent. In one respect as regards duration, since in the incontinent this ignorance lasts only while the passion lasts . . . In another respect the ignorance of the intemperate person is greater as regards what he does not know. For the ignorance of the incontinent person concerns some particular object of election, in so far as he thinks that this is now to be elected; but the intemperate person is ignorant about the end itself, inasmuch as he judges this thing good, to follow his appetites without restraint. Hence the Philosopher says that "the incontinent is better than the intemperate person, because the best principle is preserved in him", namely the right estimate of the end' (2-2 q156 a3 ad1). See also §255 on indirectly voluntary actions.

[62] See above §289.

without examination; he complacently assumes that it is all right to follow this passion, even though it inclines him to do what he thinks is worse on the basis of his deliberation. His assumption is made easier by the immediate attractiveness of an action suggested by a passion.[63]

We can now see how the incontinent's judgment is temporarily warped by passion, even though he has also formed a judgment that opposes the suggestion of his passions. We can see something similar in other cases where we elect a procedure rather than an action. If I decide to do whatever you decide on, I may still think it best to follow this procedure, even if I also deliberate directly about the action on my own account and think it would be better not to do it. This apparent conflict of judgments corresponds, in Aquinas' view, to the condition of the incontinent.

His account of action suggests an alternative or supplement to this claim that the incontinent acts 'electing but not from election'. The passions are sources of voluntary action in so far as the will consents to them.[64] Since Aquinas thinks consent differs from election in requiring only the judgment that a proposed action is satisfactory (placet) rather than the judgment that it is best, we might suggest that the incontinent judges only that it is all right to do what passion suggests, even though he also judges that it would be best all things considered not to get drunk now.

We can also understand this attitude by considering inter-personal cases. If a child asks a parent for another sweet, the parent may judge that it is better overall not to give the sweet, but none the less suppose it is all right to give way to the child's demand, if the child is being a nuisance. Further reflexion might convince the parent that it would be better not to give way, but to put up with the nuisance, and she may even be aware of this, but at the moment she may be so fed up with the child's complaints that she thinks it is all right to give way to them.[65]

We might take this role of consent to show that we need not assume an election whenever we choose one action over another. Alternatively, we might say that it gives the minimal conditions in which we elect one action over another; we elect x over y provided that we consent to x when our passions suggest doing x. This role for consent explains how the will of the incontinent person is engaged, even if he does not view his action as the best available in the circumstances.

Aquinas' account of consent suggests yet a further possible role for the will. We have taken consent to require the judgment that the action consented to is satisfactory or acceptable. But he does not always require consent to include this positive judgment. Sometimes he suggests that we can consent to x simply by failing to dissent from x when we have the opportunity. This 'tacit' or 'negative' consent may fit the role of the will in incontinent action. Even if the incontinent person does not judge it to be best, or even satisfactory, to follow his appetite, perhaps his will is capable of intervening to prevent the incontinent action, but consents negatively by non-intervention.

[63] On the relation between this distinction and Green's claims about the will see Green, *PE* §147.

[64] 'Sometimes, however, the passion is not great enough to take away the use of reason altogether; and then reason can shut out the passion, by turning to other thoughts, or it can prevent it from having its effect, because one's limbs are not applied to action except by the consent of reason, as stated above. And so such a passion does not excuse from sin altogether' (1-2 q77 a7).

[65] On prematurely ceasing deliberation see §262.

Negative consent should not include every failure to intervene in a choice. Failure to intervene might be explained in various ways—inattention, psychological compulsion, indifference to overall good. None of these explanations fits Aquinas' view of negative consent. In the incontinent's negative consent, non-intervention results from some deliberative failure. Incontinents (in Aquinas' view) have failed to make clear to themselves why it is bad to follow the policy of acquiescence in the suggestions made by appetites in these circumstances. He still appeals to ignorance; incontinents would not act as they do if they had clearly seen what is wrong with the policy that they follow.

This account explains why common sense is right to believe that incontinents know that what they are doing is wrong; for Aquinas agrees that they can act against an explicit judgment that what they are doing is worse all things considered. This judgment comes from their deliberation focussed directly on the action. Common sense, however, does not distinguish this judgment from a judgment on whether it is all right to go along with the passions on this occasion. In Aquinas' view, incontinents consent to going along with the passions; their consent comes from deliberation about the procedure rather than the action. The difference between these two questions for deliberation shows why common sense might be right about the incontinent's attitude to one question, without considering the other question. Aquinas alters and expands Aristotle's account to allow a more credible analysis of the incontinent person's choice.

297. Deliberate Fault

Sin through deliberate fault seems to be similar to sin through passion in so far as it results from 'disorder' or 'misdirection' (inordinatio, 1-2 q78 a1) that leads to the choice of a lesser good over a greater. If one's consent leads to sin, the good that the will consents to is the lesser good, so that the will is disordered. Aquinas' description of sin through deliberate fault suggests that the passions play some role in presenting the lesser good that the disordered will pursues. But if we sin through deliberate fault, our pursuit of a lesser good is not simply the result of an occurrent passion that diverts us from our normal way of comparing different goods; the movement towards sin is proper to the will.[66] In this case we cannot plead the excuse of a misdirected passion misleading us on a particular occasion (ad horam). We have a mistaken conception of the composition of the end, and we follow this conception even when we are not being influenced by a passion. Sinners from deliberate fault may still value the higher goods, but they value lower goods more than they should, and they are prepared to risk a loss of higher goods to keep the lower goods (q78 a1).[67]

Intellectual error is part of this sin, but not its cause. Our intellectual error would be the cause if we reflected on the components of happiness and reached the wrong answer—if, for instance, we concluded that fornication is not a sin (*Mal.* q2 a3 ad9). Deliberate fault,

[66] 'A sin from deliberate fault is more serious than a sin from passion, for three reasons. First, because, as sin consists chiefly in will, to the extent that the movement of sin is more proper to the will, to that extent, other things being equal, a sin is more serious. Now when one sins from deliberate fault, the movement of sin is more proper to the will, which is moved towards evil from itself . . . ' (1-2 q78 a4).

[67] See §319.

however, results from a misdirected affection for something that warps our conception of the good.[68] The judgment of intellect is warped by our antecedent and unquestioned preferences.[69] We deliberate on the right occasions, but we stop when we have reached a good that ought not to stop our deliberation; we ought to look for reasons that might tell against pursuing this immediately attractive good, but we do not bother to look for them. We stop when our misguided affection makes it sufficiently attractive to us to persuade us that no further deliberation is needed (*SG* iii 10 §1950).[70]

Different roles of passion and consent divide venial (i.e., pardonable) from mortal sins.[71] Sudden motions of the passions may be undesirable, but they are simply venial sins, because they include no consent.[72] Consent to the object of a passion makes a sin mortal (1-2 q77 a8). Deliberation and consent determine whether we have turned away from the right conception of the ultimate end.[73] Some sins are mortal in their genus, because no one could undertake them without having a warped conception of the ultimate good; still, simply thinking of them is not a mortal sin. If we also elect them, we sin mortally.[74] In suggesting that the choice of immoral action involves a false conception of the end, Aquinas implies that the right conception of the ultimate end requires recognition of the non-instrumental value of morally virtuous action; that is why the virtuous person and the sinner do not disagree simply about the choice of means to an end.

The division between venial and mortal sin, as Aquinas conceives it, does not imply that all mortal sins are sins from deliberate fault. Sins resulting from passion may also be mortal, since they result in voluntary action when the will consents to them. In sins from passion and in sins from deliberate fault, deliberation is prematurely halted and diverted. In sins from passion this is because of the suddenness of the passion. In sins from deliberate fault, deliberation stops too soon because it is warped even when we are not subject to a sudden passion. In both cases, we do not complete deliberation as we should.

298. Sin and Vice

Aquinas believes that sin from deliberate fault is compatible with the absence of vice. The misdirection of the will involved in deliberate fault may be intermittent or partial, so that it does not turn the will completely in the wrong direction (q78 a3). In the vicious person 'the will is inclined towards sinning from its own election, which proceeds from a state acquired through habituation' (2-2 q156 a3). The first clause does not distinguish vice from deliberate fault; the distinction lies in the second clause, mentioning a state acquired through repetition and habituation.

Is the difference between deliberate fault and vice just a matter of frequency? Could a non-vicious person's sin from deliberate fault be just as bad as a vicious person's, and involve

[68] 'When someone has a misdirected affection for something, the judgment of intellect is impeded in a particular object of election because of misdirected affection. And thus the defect (vitium) is not in cognition but in affection. And that is why one who sins in this way is not said to sin out of ignorance, but in ignorance, as is said in *Ethics* III' (*Mal*. q2 a3 ad9).

[74] See 2-2 q35 a3; q36 a3, ad1; q37 a1; q38 a1.

an equally corrupt will, so that it would fail to be vicious simply because it was not habitual? Or must the non-vicious person's election be less corrupt than the vicious person's?

Mere frequency does not mark the right division.[75] If someone's election at a particular time is so bad that it is committed to all the actual and counterfactual choices of a vicious person, for the vicious person's reasons, then the agent has turned so far in the vicious direction that he seems to have become vicious. If he is capable of returning to the virtuous person's outlook, virtue and vice are not as permanent as Aristotle takes them to be. Even if the agent does not change his state of character in these cases, the distinction between a sinful condition and a vicious state is not very important, since they may both include the same misdirection of the will.

It is more plausible to claim that sin from deliberate fault involves a misdirected election that is different from the incontinent person's election, but still not as bad as the vicious person's. The relevant differences may not be obvious if we think of an election too narrowly as a choice of a single action. From this point of view, someone who sins from deliberate fault seems quite similar to the vicious person. Suppose, for instance, that a public official takes a bribe to allow a firm to pollute the water supply. He recognizes that he violates the responsibilities of his office and damages the health of his fellow-citizens, but definitely decides that he is willing to take the bribe under these conditions. Someone who is willing to do this shows himself to be different from an incontinent person (who gives way to a sudden temptation), and different from a person with misguided affections (who turns a blind eye to the pollution to protect the reputation of his daughter, who has stolen from the firm).

Still, his election is different from the vicious person's. For an election is the product of deliberation, and different sequences of deliberation result in different elections, even if the elections settle on the same action.[76] An agent's deliberation represents the reasons that weigh with him, and the value he attaches to the pursuit of different ends. Someone could form the wrong election about this particular action, by mistakenly thinking that in these circumstances the gain from taking the bribe is great enough to justify an unjust action; but he need not believe, as the vicious person does, that considerations of justice count for little or nothing in comparison with the rewards of injustice. His threshold for preferring the gains of an unjust action is lower than it should be, but not as low as it would be in a genuinely unjust person.

This description of the non-vicious person who sins from deliberate fault helps to explain why this sort of sin does not completely destroy the virtue that is opposed to it. Even if someone reaches the wrong conclusion on a particular occasion, he may not act for all the wrong reasons that move a vicious person, and may not share the vicious person's indifference to the right reasons. The error that leads the official to think it is all right to take a bribe on this occasion does not by itself show that he would, say, be indifferent if his subordinates failed to do their jobs properly; he need not have lost all the attitudes characteristic of a just person. He is inconsistent in defending his own wrongdoing while trying to prevent wrongdoing by others; this inconsistency distinguishes him from the thoroughly unjust person. Sinning from deliberate fault does not require the whole state

[75] Arpaly, *UV* 93–8, discusses relevant questions about frequency and stability.

[76] On deliberation and election see Aristotle's discussion of good deliberation in *EN* vi 9, and the next note.

and outlook of the vicious person; if we deliberate wrongly on a particular occasion, or on a specific type of occasion, we still may not reject all the patterns of deliberation that are characteristic of the virtuous person.

299. Sin and Virtue

For these reasons, we might agree with Aquinas in suggesting that sin, even beyond continence and incontinence, is consistent with the absence of vice. This is a plausible addition to Aristotle, suggesting how we ought to conceive some of the conditions intermediate between virtue and vice. It is more surprising that Aquinas takes all the types of sins he distinguishes, including sin from deliberate fault, to be compatible with the presence of virtue. If he is right about this, not everyone who commits sin is in a condition between virtue and vice; some may be virtuous.

Aquinas argues that sin is compatible with acquired virtues because virtues are states that do not necessarily produce their appropriate effects in the appropriate circumstances. Instead 'a man uses it [sc. the state] when he wills' (1-2 q71 a4). Aquinas, agreeing with a comment by Averroes, seems to be treating virtues as though they conformed to the principle that Aristotle lays down for rational capacities, that they can be used in opposite ways. A vicious person who sins need not always sin from deliberate fault, but sometimes may simply be swayed by passion, and sometimes may even do a virtuous action, 'because his reason is not completely corrupted through the bad state, but some of it remains undamaged' (1-2 q78 a2). Similarly, we may suppose, our will may be correctly directed far enough to form a virtuous state, but still be imperfect enough to elect not to exercise that state on a particular occasion.

This parallel between virtue and vice is difficult to reconcile with Aristotle's and Aquinas' conception of the moral virtues. Aristotle does not treat the virtues as a mere set of capacities that are so detached from one's will that one can still decide whether to exercise them or not. On the contrary, the virtues constitute a determinate way of using one's rational capacities. Aquinas brings out this feature of the virtues even more clearly than Aristotle does, in so far as he approves the description of virtuous action as 'the good use of freewill' (q55 a1 ad2) and of the virtues as the states that produce this good use. In describing virtues as states, Aquinas says correctly that they direct our rational capacities to the right actualizations (q55 a1); this is why we need states as well as capacities (cf. q49 a4). Aquinas' claim about virtue and sin seems to reduce virtue to one of the rational capacities that it was supposed to direct towards the right actualization, as though some further virtue were needed to ensure the right use of the virtue.

We might be especially doubtful about his suggestion that we decide whether or not to exercise our virtue. We can understand the claim that we decide whether or not to exercise our medical knowledge or our knowledge of French. We consider whether this is the right occasion, and we might be right or wrong in our estimate of the occasion. We might also decide to use our knowledge well or badly. But these are the points on which Aristotle contrasts a craft with a virtue. Aquinas seems to revert to the view that virtues can be used well or badly.

Against these objections, we might defend Aquinas' position as a realistic conception of virtue. If a virtue is a relatively permanent condition, it may persist despite a relatively isolated error; for a single error does not necessarily destroy the accumulated tendencies and dispositions that have been built up in a virtuous person's character. Perhaps the virtuous person ought to be allowed to lapse occasionally without being demoted to an intermediate position between virtue and vice.

This claim seems defensible independently of Aquinas' suggestion that we can decide whether or not to exercise our virtue. The most plausible way to explain occasional lapses is to say not that we decide not to exercise our virtue in this case, but that we fail to think about this case in the way a virtuous person would, and in the way in which we normally think about such cases. In thinking this way, we do not show our decision about how to use the virtue we have; we betray the fact that we lack the complete virtue, though we have enough of the virtue to make us brave (for instance), rather than vicious or intermediate between virtue and vice.

This way of understanding virtue is not Aristotle's way, but we might defend it by appeal to Aristotle. The virtuous person's election requires good deliberation, which requires not only the correct conclusion, but the conclusion resulting from the right reasoning (*EN* 1142b22–4).[77] Correct reasoning requires a grasp of the right reasons for the action, and hence of the changes in circumstances that would or would not require a different action. Someone who faces danger for the right reasons knows that she still ought to face it if she were offered a bribe to avoid it, but ought not to face it out of mere bravado if nothing worthwhile would be gained by facing it. In this respect, the demand for acting on the right reasons captures the sort of commitment that Kant captures in his account of the good will.[78]

Most people do not completely meet these demands. Many of us are willing to face a moderate degree of danger, enough to keep us from cowardice in ordinary circumstances, but we would not necessarily be willing to face the special dangers that many Germans during the Third Reich might have had to face in order to protect their Jewish neighbours from harm. Still, even though we lack the degree of commitment that the complete virtue demands, we might not agree that we all entirely lack the virtue of bravery.

This reflexion on ordinary human limitations supports Aquinas' view that a specific virtue does not prevent some of the sins contrary to the virtue. To be free of these limitations is to have a 'heroic' virtue.[79] Such a virtue is a gift of the Holy Spirit, not an achievement of our unaided effort. In denying that acquired virtues exclude the sins opposed to them, Aquinas fits his treatment of the Aristotelian virtues into his theological outlook. But his claims are independently plausible. If we recognize the 'normal' circumstances in which we expect someone's commitment to a virtue to be firm and stable, we can allow a virtue to someone who has this sort of stable commitment, without ruling out the possibility of lapses.

[77] Aquinas, *in EN* vi 8 §1230, takes Aristotle to be speaking of finding the right end but pursuing it through the wrong means (malam viam: L text); this is a misunderstanding of *ho men dei* (quod oportet) and *di'hou* (per quod) in the text. Hence he illustrates the point with an example of someone who steals to help a poor man. §1231 tries to explain away the oddity of treating the end as the conclusion and the means as the middle term. Contrast the explanation offered in Irwin, *EN*, on vi 9.5. Aquinas agrees with Albert, *SE* vi 14 §560.

[78] See Kant, *G* 398–400.

[79] See 1-2 q54 a3; q68 a2; 2–2 q159 a2 ad1; 3a q7 a2 ad2.

Though Aquinas allows virtue to co-exist with sin, he does not allow virtues to exist without one another. On this point he accepts the reciprocity of the virtues.[80] Since the loss of any one virtue expels prudence, and prudence is required for any of the virtues, the loss of any one virtue expels all the others 'as far as concerns the complete and formal being of virtue'. All that remains in that case is 'tendencies (inclinationes) towards acts of the virtues, acts which do not have the character (ratio) of virtue' (1-2 q73 a1 ad2).[81]

Perhaps Aquinas' belief in the fallibility of virtue would be more plausible if he did not connect it so closely with his claim that frequency of failure separates sin from vice. An 'isolated' error does not convict an agent of vice, but 'isolation' may not be simply a matter of frequency. If someone has acted fairly and justly in cases where he has had little temptation to act unfairly, but he sins from deliberate fault on the few occasions on which he gains something by unfairness, we might reasonably conclude that he is unjust. Even though he has lapsed on only a few occasions, these are occasions that normally face a just person and are of the sort that the virtue is designed to cope with.

By contrast, if someone acts justly in the situations that normally provide a test of someone's commitment to justice, but lapses when he faces some unusual temptation, or he is unprepared, has his attention distracted, or is in some other condition making it more than normally difficult to act justly, we might conclude that he is still just, though he has the bad luck to be in one of these conditions more often than most people are. The second person's lapses are more isolated from his character than the first person's lapses are, even though they may be more frequent.

Aquinas may be wrong, then, to focus on frequency and rarity of lapses as the basis for distinguishing sin from vice. He ought to focus on actions that do or do not tend to destroy the state of character that a virtuous agent has built up. Frequency is often a rough guide to such actions, but, as we can see if we consider some cases, it is not the right basis for drawing the relevant distinctions.

300. The General Tendency of Aquinas' View of Virtue

Aquinas' discussion of sin and vice is a test case for his claims about the will and virtue. This is one of the most obscure areas of Aristotle's discussion; Aquinas tries to clarify Aristotle by appeal to aspects of the will that he emphasizes more strongly than Aristotle does. In particular he relies on his account of the relations between the passions and the will. He does not remove all the obscurities in Aristotle, partly because his conception of consent and election is obscure on some points. Still, a reasonable interpretation of his remarks on consent explains sin and vice also. In examining vice as well as virtue, Aquinas demonstrates the explanatory power of his account of agency.

[80] 'One act even of mortal sin does not remove the state of acquired virtue. But if the acts are multiplied so much that the contrary state is produced, then the state of <the> acquired virtue is expelled. And when this <one> virtue has been expelled, prudence is expelled; for when a human being acts against any one of the virtues, he acts against prudence' (q73 a1 ad2).

[81] On the reciprocity of the virtues see §325.

His account of moral virtue emphasizes the aspect of Aristotle's account that connects virtue with correct election.[82] Aquinas has not only Aristotle's reasons, but also some reasons of his own, for emphasizing this feature of the virtues. The virtues are states that express freewill, and human beings have freewill in so far as they deliberate and elect; hence the virtues embody a distinct form of deliberation and election. Aquinas' claims about action and freedom agree with Aristotle's claim that correct election is the mark of moral virtue.

Aquinas, no less than Aristotle, has to explain why the moral virtues are essentially forms of correct deliberation and election, if they are so closely connected with the passions. The passions do not move us to free action without the consent of the will; they are elements of moral virtues in so far as they are subject to the consent of the will. To decide whether Aquinas makes Aristotle's position better or worse, we need to decide whether his views about consent capture the ways in which passions contribute to the goodness or badness of actions and characters.

While these views on the will and on election determine Aquinas' general theory of the moral virtues, he does not always seem to follow them. We have seen why it is difficult to reconcile his views on the importance of the will and correct election with his claim that the passions, as opposed to the will, are the subjects of some moral virtues. He would follow his general theory more consistently if he allowed both will and passion to be the subject of each virtue that involves the regulation of passion. This view that allows two subjects seems to fit better than Aquinas' actual view fits with the specific remarks he makes about the virtues and passions.

The claim that virtue consists in correct deliberation and election requires a credible account of the relevant sort of deliberation. Aquinas seeks this account through his discussion of prudence, which opens further questions about his view of practical reason.

[82] See §111.

21

AQUINAS: NATURAL LAW

301. Questions Raised by Natural Law

Our discussion of the moral virtues has led us to some questions about Aquinas' conception of practical reason. But before we can examine these questions, we need to consider an aspect of his moral theory that may appear to lead him in a different direction.

So far we have presented his approach to morality as a teleological theory; it begins from an account of the rational will aiming at the ultimate end and deliberating about the actions that achieve it. This deliberation results in the formation of the will and the passions in specific states of character aiming at the ultimate end.

But Aquinas also treats morality as a set of principles specifying the requirements of natural law.[1] He finds an Aristotelian source for his doctrine of natural law. Aristotle divides natural from legal justice; according to Aquinas, natural justice is embodied in the principles of natural law.[2] Jurists tend to speak of natural right (ius) only when they refer to the nature common to human beings and other animals. When they refer to a human being's nature as human 'in so far as he discerns wrong (turpe) and right (honestum) in accordance with reason', they speak of the right (ius) of nations; but Aquinas insists that both aspects of a human being's nature are included under natural justice (*in EN* v 12 §1019). The principles that he mentions here are those he normally includes under natural law; they are universally valid and (in a way to be further explained) universally known (*ST* 1-2 q94 a4).

Mediaeval discussion of natural law is derived from Stoic sources. Christian writers use Stoic claims to interpret St Paul's remarks on the Gentiles who are a 'law to themselves'.[3] Their discussion of natural law develops independently of any reference to Aristotle. Aquinas, however, combines it with his exposition of Aristotelian ethics. He implies that questions

[1] 'Just as the human soul has a natural state by which it comes to know the principles of theoretical sciences, a state we call understanding of principles, so also it has a natural state that possesses the first principles of matters of action, principles which are natural principles of natural right (ius). And this state belongs to universal conscience (synderesim)' (*Ver.* q16 a1). On the relation of ius and lex see 2-2 q57 a1 ad2. Cf. Suarez, *Leg.* i 2.4.

[2] '. . . in practical matters there are some principles naturally known, indemonstrable principles of a sort and <principles> close (propinqua) to these, such as that evil is to be avoided, no one is to be unjustly injured, theft is not to be committed, and so on' (*in EN* v 12 §1018).

[3] On *Rm.* 2:14 and earlier discussions see §§206 and §232. On discussions of natural law before Aquinas see Lottin, *PM* ii, ch. 3.

about natural law belong to an inquiry into natural justice. He connects St Paul's claims with his own doctrine of conscience and practical reason.[4] On the strength of St Paul's description of the Gentiles, Aquinas argues that conscience makes us aware of a natural law.[5]

This conception of morality as consisting in principles of a universal natural law may seem to conflict with the self-centred eudaemonism of a teleological conception of the virtues. Prescription independent of our desires seems to conflict with the dependence of the virtues on our desire for happiness. If this is Aquinas' view of natural law, his moral theory includes important non-teleological elements. If natural law is independent of eudaemonist practical reason, Aquinas recognizes an independent source of moral principles, and so raises questions about conflict and priority.

We will see, however, that Aquinas does not intend his doctrine of natural law to introduce any conflict with the eudaemonist aspects of his claims about the virtues. On the contrary, it both relies on and supports his general account of the will and of rational action. It will be useful to discuss his view of natural law before turning to his account of practical reason and of the morally right.

302. Questions about Law

Aquinas' claims about natural law depend on his general treatment of law. The Treatise on Law follows the Treatise on Vices and Sins, because law is one of God's means for leading us back from sin to God. Aquinas describes how sin obscures and distorts our grasp of moral

[4] 'He commends in them [sc. the Gentiles] the observance of the law, when he says "they do naturally the things contained in the law", that is to say, the things that the law commands, namely as far as concerns moral precepts, which are from the dictate of natural reason, just as it is also said about Job that he was just, upright and God-fearing, and avoiding evil. . . . "naturally" can be taken to mean "through the natural law showing them what is to be done", according to that passage "Many say: 'Who will show us good things?'. Imprinted [upon us is the light of your countenance, O Lord]", which is the light of natural reason, in which is the image of God. . . . He shows their worthiness, namely in the fact that, while not having a law of this particular sort, they are a law to themselves, namely to the extent that they carry out the duty of the law bearing on themselves, by instructing themselves and leading themselves towards good, because, as the Philosopher says, "law is discourse that has compulsion, proceeding from a certain sort of prudence and understanding". [*EN* 1180a21; contrast the translation at *in EN* x 14 §1505.] And that is why it is said that "law is not laid down for a just person" [*1Tim.* 1:9]—that is to say, he is not compelled by external law—"but" it is laid down "for unjust people", who need to be compelled externally. And this is the highest degree of worthiness (dignitas) in human beings, namely that they are led not by others but by themselves towards good' (*in Rom.* ii 3). On *1Tim.* 1:9 cf. *SG* iii 128 §3008.

In the passage omitted here Aquinas discusses Augustine's first interpretation (Ambrosiaster's) of the passage in *Romans*. See §226. He says: 'But as to his saying "naturally", a question arises. For it seems to support the Pelagians, who said that a human being by his natural [abilities] can observe all the precepts of the law. Hence "naturally" should be explained as meaning "through nature reformed by grace". For he is speaking of Gentiles converted to faith, who by the help of the grace of Christ had begun to observe the moral [precepts] of the law.' Augustine's first interpretation does not commit Paul to claims about natural law. But most of Aquinas' exposition relies on the second interpretation he offers (a development of Augustine's second interpretation), which takes Paul to attribute some awareness of morality to everyone.

At 'Imprinted . . .' Aquinas quotes the first word of *Psalms* 4:7. His Vulg. Psalter, reading 'imprinted' (signatum), follows LXX (*esêmeiôthê*). The same verse is quoted by Augustine in *S et L*. Sanderson, *DOC* 4.12, notes that he will avoid reliance on this verse, since other people's use of it rests on a defective translation.

[5] He quotes the Gloss on the passage in *Romans*: 'Though they [sc. the Gentiles] have not got the written law, still they have the natural law, by which anyone understands and is conscious to himself (sibi conscius est) what is good and what is evil' (1-2 q91 a2 sc). He also quotes the passage at 1-2 q109 a4 obj1; *Virt*. a8 obj3; *Ver*. q11 a2 obj5; q17 a1 sc2. He alludes to it at 1a q79 a13; *Quodl*. q3 a26 = P ix 504b. On the highest degree of dignitas, which consists in following the law without coercion, see *SG* iii 128 §3008: '[They] are a law to themselves, since they have charity, which inclines them in place of a law and makes them act generously (liberaliter)'.

principles, especially when we face particular situations and choices to which the principles are relevant.[6] To overcome these effects of sin, God instructs us through law and helps us through grace,[7] and among the laws that God has given to instruct us is the natural law.

Aquinas discusses the necessary conditions for a law and the way in which natural law satisfies them. His discussion is cautious, and not entirely unambiguous. It results in considerable dispute among later Scholastics who discuss the relation of morality to natural law and the way in which natural law is law.

At this point in the *Summa*, we have learnt about moral virtues and the principles of practical reason. When Aquinas tells us that these are the content of a natural law, we might take him in either of two ways: (a) An inflationary view: These are not only principles of practical reason, but also precepts of a natural law; because they are precepts of a law, they have some practical significance that they would not have otherwise. (b) A deflationary view: By being principles of practical reason they count as precepts of a natural law; on the correct understanding of law, that is all it takes for them to be a sort of law. Their being a law adds nothing to the practical significance they already have as principles of practical reason.

These two views of natural law correspond to two ways of connecting morality and law. (1) We might regard law as a social institution, involving a recognized legislator issuing orders demanding compliance, and we might try to understand morality as consisting of the orders issued by some legislator. In that case we assimilate moral principles to our prior understanding of law and legal principles. (2) We might begin from our understanding of moral principles, and try to form a conception of law that allows us to understand moral principles as a sort of law. In that case, we assimilate some laws to our prior understanding of moral principles.

If Aquinas uses the first direction of argument, he takes morality to consist essentially and fundamentally in the requirements of some law, and therefore may reasonably be called a 'natural law moralist'. Some 17th-century moralists, and especially Cumberland, Locke, and Pufendorf, are natural law moralists in this sense. We might suppose that Aquinas agrees with them in making legal obligations and demands fundamental in morality. If that is his view, he departs from an Aristotelian view of morality.[8]

If, however, Aquinas uses the second direction of argument, he does not conclude that morality is fundamentally law. His identification of morality with one kind of law clarifies the nature of one kind of law by reference to morality; it does not explain morality by reference to law.

His initial remarks might reasonably suggest that he holds an inflationary view, and that his account of morality as law rests on an antecedent understanding of law. In his view, law is a rule[9] that involves commands, moves agents to action, imposes obligation, and requires publication.[10] If these features of law essentially involve legislation and a legislator, natural

[6] See §313 below.

[7] 'For the external principle moving us towards the good is God, who both instructs us through law and helps us through grace' (1-2 q90 pref.) Jordan, 'Scientia' 90, discusses the position of the Treatise on Law in *ST* 1–2. See also Westberg, *RPR* 229–30.

[8] This is the conclusion of Anscombe, 'Modern'.

[9] 1-2 q90 a1: 'Law is some sort of (quaedam) rule and measure of acts, in accordance with which someone is led towards acting or is restrained from acting; for law (lex) is spoken of from binding (ligare), because it binds (obligat) one to acting'.

[10] q90 a4: 'A law is imposed on others by way of a rule and measure. Now a rule or measure is imposed by being applied to those who ought to be regulated and measured by it. Hence, in order for a law to acquire the power of obliging that is proper to a law, it is necessary that it be applied to the human beings who ought (debent) to be regulated by it.

law essentially involves legislation and a legislator. To see whether he takes these features to imply legislation, we need to consider the components of his account of a law.

303. Law and Obligation

The specific way in which law moves to action is 'obliging' or 'binding' to action (q90 a1).[11] When Aquinas speaks of our being 'bound' or 'obliged' he often seems to have in mind some specific act of binding. In this sense he speaks of an obligation resulting from a promise (2-2 q88 a1), including the vows made at one's baptism or in entering into some specific condition of life.[12] In all these cases obligation seems to presuppose an act of obliging. If, then, natural law necessarily obliges, it should involve some specific act of obliging by God and our awareness of it as coming from this source.[13]

In contrast to this narrow use of 'oblige', Aquinas uses 'ought' (debere) and 'duty' (debitum) in cases where they do not seem to rest on any act of obliging. A duty or something due (debitum) implies a 'need' or 'exigence' (1a q21 a1 ad3). Aquinas distinguishes what is due morally from what is due legally. When something is due legally, it involves constraint by a law; this is what he normally calls 'obligation'. What is due morally is demanded by moral rightness; it does not result from anyone's act of imposing an obligation.[14] A moral duty results from 'the appropriateness of the thing' (convenientia rei) (1-2 q60 a3).[15]

Aquinas does not identify a duty of justice with a duty that we are obliged (obligari) to perform; he identifies it with a duty that we can reasonably be compelled by law to perform, so that when we are compelled by law, we are obliged. Hence he tends to use 'due' or

Such application is made by its being brought to their notice by the publication itself. Therefore publication is necessary for the law to obtain its power.'

[11] Something that is moved by natural necessity cannot be bound; fire, for instance, is not bound to move upwards (*Ver.* q17 a3 c). Conscience binds us only in so far as it gives us knowledge of a law made by a superior, and specifically of a divine law (*Ver.* q17 a3 c = M 332b). 'A human being does not make a law for himself, but through the act of his cognition, by which he recognizes (cognoscit) a law made by another, he is bound to fulfilling the law' (q17 a3 ad1). Similarly, the discussion of the question whether a mistaken conscience obliges (1-2 q19 a5) seems to assume that conscience presents its demand as a command of God (esp. ad2). See also *2Sent.* d39 q3 a3 ad3; *Ver.* q17 a4, esp. ad2.

[12] See 2-2 q185 a5; Supp. q43 a2; q61 a3.

[13] Suarez relies on this inference in order to suggest that Aquinas agrees with him in taking natural law to involve a divine command. See, e.g., *Leg.* ii 6.10.

[14] 'The legal due is that which one is constrained by law (lege adstringitur) to render; and this due is chiefly the concern of justice, which is the principal virtue. On the other hand, the moral due is what someone owes (debet) out of the rightness (honestas) of virtue: and since a due implies necessity, this kind of due has two degrees. For one due is so necessary that without it rightness in morality (honestas morum) cannot be maintained; and this has more of the character of due. . . . There is another due that is necessary in the sense that it conduces to greater rightness, although without it rightness may be maintained. This due is the concern of generosity, affability or friendship, or the like, all of which . . . have little of the character of the due' (2-2 q80 a1).

[15] Sometimes Aquinas distinguishes legal from moral justice, in accordance with (respectively) 'a rule of a determining law' and 'a rule of reason' that involves something due (2-2 q58 a11). Within the morally due, we must also distinguish what is strictly required (tamquam necessarium) and 'prescribed' (praeceptum) from what is better and 'mandated' (mandatum) (1-2 q99 a5; cf. 2-2 q23 a3 ad1). In the second case of the morally due, what is due is due 'not out of a necessity of justice, but because of a certain moral equity, as in the case of benefits received in return for nothing' (2-2 q31 a3 ad3). In the case of what is due by justice, 'someone may be bound (obligari potest) by a fixed contract', but in the second case something is due out of friendship, 'and to this due civil obligation does not apply' (q78 a2 ad2). In the case of the legally due, someone can be compelled by law, whereas the morally due is due 'out of some sort of moral goodness (honestate)' (q102 a2; cf. q117 a5 ad1; q118 a3 ad2). Moral goodness is relevant even when nothing is due as a matter of justice (q106 a1 ad2; a4 ad1; q114 a2).

'ought' (debere) to cover the broad area of moral requirements in general, and to use 'oblige' when he is thinking of a duty as imposed by law. This, however, is a tendency rather than an absolute rule; for the broad scope of 'law' allows a broad scope to 'obligation' as well.[16]

The distinction between duty and obligation clarifies the sort of moral requirement that applies to God. God is not under any obligations, because no one imposes them on God. Still, something is due to God's creatures, if it is needed to fulfil their nature (q111 a1 ad2). God has duties, and these have an important role in Aquinas' account of justification and salvation. God does not owe us existence; he gives it to us out of 'pure generosity'.[17] God does not owe grace or glory to us, except on the assumption that he has ordered things this way; but he owes it to himself to fulfill his own ordering (q114 a1).[18]

Aquinas believes that these duties hold because of facts distinct from any act of imposition by a legislator. The natural law rests on these sorts of duties, rather than any imposed obligation. The special relation of rational creatures to the eternal law does not consist in our recognition of the eternal law as a command of a superior. We share in divine providence by exercising foresight for ourselves and for others (q91 a2). We share in the divine reason in so far as our own reason is naturally illuminated so that we distinguish good from bad.[19] This participation in the eternal law, in discriminating good from bad and having foresight for oneself and others, constitutes natural law.[20]

Aquinas, therefore, does not take all law to involve an obligation that requires an act of will by an imposer. The necessary connexion between law and obligation is fulfilled by a principle that presents requirements (debita).

304. Law, Reason, and Ends

But even if obligation does not require imposition, Aquinas also agrees that law prescribes and prohibits. Does this feature of law imply acts of prescription and prohibition by a commander expressing will?

Aquinas argues that, since commanding belongs to reason, law must belong to reason. Since a law involves a 'rule' (or 'standard', regula) and a 'measure' (mensura), and a rule

[16] Contrast Suarez, *Leg*. i 11.2.

[17] *SG* ii 44 $1217: 'God . . . from no debt, but from sheer generosity, brought things into being'. In the proper sense, creation does not involve justice, because justice requires the existence of someone to whom something is due; 'but if justice is understood broadly, we can say that there is justice in the creation of things, to the extent that it fits divine goodness' (ii 28) Cf. 1a q21 a3.

[18] 'To each is due what is his own. Now what is directed to someone is what is said to be his own. Thus the servant is of <i.e., belongs to> the master, and not conversely; for what is free is whatever is its own cause. In the word "debt", therefore, is implied some direction of requirement or necessity of something in relation to the thing to which it is directed. . . . in the divine operations debt may be regarded in two ways, either in so far as something is owed to God, or in so far as something is owed to a created thing. And in both ways God renders what is owed. . . . God exercises justice, when he gives to each thing what is owed to it according to the character (ratio) of its nature and condition. . . . And although God in this way gives what is owed to each thing, still God himself is not also a debtor, since he is not directed to other things, but rather other things are directed to him.' (1a q21 a1 ad3).

[19] 'the light of natural reason, by which light we distinguish what is good and bad, which belongs to natural law . . .' (q91 a2).

[20] Cajetan's commentary supports this general view. He maintains that the relevant standard (regula) of action comes from the intellect (ad 1–2 q90 = L vii 150). He treats God's providence as a measure and a binding standard (regula obligatoria; ad q91 a1 = 153), expressed in the divine law, which is given to human beings to govern themselves (ad q93 a3 = 165). He does not suggest that any divine command is needed for natural law to be a binding standard.

and measure involves reason, law involves reason.[21] 'Rule' might suggest a standard that is created by a legislative act of making a rule; such a standard might be expressed in the imperative mood. But Aquinas has a different sort of 'rule' or 'standard' in mind. A legislated rule addressed to tenants in a building might say: 'Tenants must respect the right of other tenants to peace and quiet at night'. The standard underlying this legislated rule is the right of tenants to peace and quiet. This is the sort of standard that Aquinas has in mind; it may be the basis of a legislative act, but it is not itself the result of a legislative act.[22]

In his view, reason is the rule and measure of human actions. This rule distinguishes genuinely human actions from those acts of a human being that are not properly human actions.[23] Reason is the measure of human actions because human actions differ from other movements in so far as reason 'fixes' or 'presents' (praestituere) the end. It fixes the end by directing us towards (ordinare ad) the end.[24] The standard grasped by reason is the one that practical reason relies on in directing one's action to an end. The standard that is distinctive of law is a rational standard. Hence law, in contrast to an arbitrary act of will, is the product of reason.[25]

Similarly, Aquinas rejects the apparently plausible inference from the fact that law commands to the conclusion that it requires the expression of the will of a commander; for he claims, as he claimed earlier, that commanding belongs to reason rather than will (1-2 q17 a1).[26] The commanding function of law is fulfilled by directing our action (cf. *Ver.* q22 a12 ad4), through either an indicative or an imperative declaration (intimare). It does not require an explicit attempt to move anyone to action, since indicative declarations do not include this explicit attempt. A command by reason presupposes an act of the will, because it succeeds in moving us to action only if we will an end to which the command is relevant; but the command itself need not contain any attempt to move us to action.[27]

This broad conception of commands explains why Aquinas, following Aristotle, says that prudence is 'prescriptive' (praeceptiva), but belongs to practical reason (1-2 q57 a6). Similarly, he agrees that a law is a command, but he does not understand a command as a

[21] 'Law is some sort of (quaedam) rule and measure of acts, in accordance with which someone is led towards acting or is restrained from acting; for law (lex) is spoken of from binding (ligare), because it binds (obligat) one to acting. Now the rule and measure of human acts is reason, which is the first principle of human acts, as is clear from what has been said above. For it belongs to reason to direct towards an end, which is the first principle in things to be done, according to the Philosopher. Now in any given genus whatever is the principle is the rule and measure of that genus: for instance, unity in the genus of numbers, and the first motion in the genus of motions. Hence the remaining possibility is that law is something that belongs to reason' (1-2 q90 a1).

[22] On Aquinas' use of 'regula' see Suarez, *Leg.* ii 5.6. He comments on the broad use of 'mensura' and 'regula' in 2-2 q141 a6 and ad1, and he argues that this use is too broad to be the sense intended in speaking of a law.

[23] See 1-2 q6 intro, quoted at §239n17.

[24] praestituere: 1-2 q66 a3 ad3; 2-2 q47 a6 ad3. Aquinas claims that the end is the first principle in things to be done (in agendis). To see how this claim is consistent with the claim that reason is the first principle of human acts (actuum), we need to distinguish two claims: (i) The starting point in deciding what I am to do (in agendis) is the end, since practical reason has to deliberate towards the end. (ii) But the starting point of distinctively human action is reason, because the rational presentation of a more proximate end directed towards the ultimate end is the source of distinctively human action.

[25] 'Reason has its power of moving from the will . . .; for from the fact that one wills the end, reason commands about the things towards the end. But in order that the will about the things commanded may have the character of law, it needs to be regulated by some sort of reason. And in this way it is to be understood that the will of the sovereign has the force of law; otherwise the sovereign's will would be iniquity rather than law' (q90 a1 ad3).

[26] Cf. *4Sent* d15 q4 a1 sol.1 = P vii 756b–757a. See §246.

[27] On the significance of Aquinas' broad conception of command cf. Suarez, *Leg.* i 4.14; ii 6.3.

simple expression of will. He understands it as the rational direction (ordinare)[28] of oneself towards an end and towards one's conclusion about what needs to be done to achieve the end.

Aquinas, therefore, agrees that a law binds and obliges. But he does not infer that law involves the will either of the commander or of the commanded. A law consists in its being true that one ought to do x, on the assumption that one wills y. This law moves us only if we will y, but the law exists whether or not the commander or the commanded wills y, and whether or not the commander wills the commanded to pursue y.

So far Aquinas has argued that a law exists if reason presents an end and the means to it. He has not suggested that it requires a command in addition to the rational presentation of an end and the means. His discussion of law and a common good confirms this connexion between law and goal-directed reasoning. Since practical reason directs us towards the ultimate end, this is also the concern of law (q90 a2). Law involves practical thought, and hence deliberation aimed at one's own happiness. It is directed to a common good rather than to one's individual good, because a common good is a more 'perfect' or 'complete' good.[29] In turning to the end pursued by law, we do not turn away from individual happiness, but we complete it.

Aquinas' remarks, therefore, distinguish law from any legislative act proceeding from the will of a legislator. If the existence of rational agents who guide their actions by rational presentation of ends and deliberation about means to these ends constitutes the existence of a natural law, the existence of a legislator issuing commands is not necessary.

305. Law and Publication

The last condition that apparently connects law with acts of legislation is the demand for publication. Aquinas argues that publication (promulgatio) is necessary for law, and that natural law is published because God has placed it in human minds (q90 a4 ad1).[30] Does he imply that God's action is necessary for the existence of a natural law? How else could it have been published to all human minds?

We have reason to doubt whether he implies this, if we examine his conditions for publication. He claims that publication requires a law to be applied to those who ought (debent) to be regulated by it. But one might take this in either of two ways: (1) Unless someone has performed an act of publishing to us, no law applies to us. (2) Unless we are in the cognitive situation of having had a law published to us, no law applies to us.

[28] On ordinare cf. 2-2 q81 a5.

[29] See 1-2 q9 a1; q19 a10; q83 a1 ad5; *SG* iii 17 §1994; 39 §2168; 146 §3196.

[30] 1-2 q90 a4: '. . . a law is imposed on others by way of a rule and measure. Now a rule or measure is imposed by being applied to those who are regulated and measured. Hence, in order for a law to acquire the power of obliging that is proper to a law, it is necessary that it be applied to the human beings who ought (debent) to be regulated in accordance with it. Such application is made by its being brought to their notice from the publication itself. Hence publication is necessary for the law to have its power. Thus from the four preceding articles, the definition of law may be gathered: and it is nothing else than a directing of reason to a common good, by the one who has care of the community, which has been published.' ad1: 'The publication of the natural law is from the very fact that God placed it in the minds of human beings to be recognized (cognoscendam) naturally'.

Aquinas intends the second claim. A law is brought to our notice (deducitur in notitiam), and God has done this by placing the natural law in us 'to be recognized' (cognoscendam) naturally. Publication does not require that we actually know it, but only that it is available for us to know. We would be bound by the law if we were in the right cognitive condition to come to know the law, even if no one had put us in this condition. Aquinas does not suggest that I am obliged to do x only if someone tells me that he wants me to do x, or that I am obliged to do x only if I recognize that someone is telling me that he wants me to do x. His conditions allow publication without a publisher. In that case we have a further reason to suppose that natural law exists if there are rational beings who are capable of grasping rational principles to direct their actions towards ends.

306. Eternal Law and Natural Law

But even if the natural law does not essentially include any act of commanding or promulgation, it is essentially connected to the eternal law that is grasped by the mind of God. Must it not, therefore, include some divine mental act, even if it is not an act of commanding or publishing?

Aquinas argues that there is an eternal law in God's reason (q91 a1), and that there is a natural law in human beings, in so far as they share in the eternal law in a special way, by exercising foresight for themselves and others (q91 a2).[31] If rational creatures simply conformed to the eternal law, it would not thereby be present in them. It is present in them because they have foresight for themselves and others. This foresight is a law because it is a rule of reason directing them towards the appropriate end. Rational beings are conscious of the natural law, and so are a law to themselves. The specific natural inclination that manifests our share of divine providence is our concern for the welfare of ourselves and others. God has this sort of foresight for us and for every part of creation; we share in it in so far as we have some foresight for ourselves and others.[32]

The natural law in us, therefore, is our disposition to deliberate with reference to our own ultimate end. We direct our actions towards the ultimate end through natural law, because that is how we exercise providence for ourselves.[33] We are a law to ourselves, and we have the natural law in ourselves, because we direct our actions towards our happiness.[34]

[31] Quoted in next note.

[32] '. . . it is obvious that all things share in some way in the eternal law, namely to the extent that from its impression on them they have a tendency towards the acts and ends proper to them. Among other things, however, a rational creature is subject to divine providence in a more excellent way, to the extent that it itself acquires a share in providence, by exercising foresight (providens) for itself and others. Thus it shares in eternal reason, through which it has a natural inclination to the required (debitum) action and end. And in a rational creature this participation in the eternal law is called the natural law' (1-2 q91 a2). On providence and prudence cf. *Ver.* q5 a1 ad6: 'For the eternal law should be considered to be in God in the way in which naturally recognized principles of action are understood to be in us, from which we advance in deliberating and electing; and this is prudence or forethought (providentia). And so the law of our intellect is related to prudence as a principle <is related to a conclusion> in a demonstration.'

[33] 'For all reasoning is derived from principles that are naturally known, and all desire of means to an end is derived from natural desire for the ultimate end. And so it is also necessary that the first directing of our acts towards the end comes about through natural law' (q91 a2 ad2).

[34] Cf. *4Sent.* d33 q1 a1 = P vii 967a, quoted in n56.

Attention to natural law, therefore, does not turn us away from the eudaemonist outlook that has been characteristic of the *Summa* so far. It leads us back to the analysis of will, reason, and action that underlies Aquinas' claims about rational aiming and happiness.

Aquinas' conception of natural law is therefore reductive and deflationary in one respect. He does not take our awareness of the natural law to be a new source of moral insight distinct from our reflexion on our happiness; nor does he take it to provide distinct grounds for virtuous action, apart from those that have already appeared to practical reason. He has argued that, on a reasonable understanding of law, his discussion of the virtues and practical reason shows that we are aware of a natural law within us. To recognize this natural law, we need not recognize God as a legislator. Aquinas certainly believes in God as a legislator, but he does not take the truth of this belief to be essential to the existence of natural law.

It is less clear whether Aquinas believes that natural law is wholly external to the reason and will of rational agents. If natural law essentially includes precepts, and precepts essentially include an exercise of command (imperium), natural law essentially includes the act of reason that is required for command. Though precepts need not be in imperative form (in the narrow sense in which we normally understand it), they must apparently consist in something more than the existence of the facts that are grasped by rational agents.

Aquinas' position therefore seems to distinguish—though only implicitly—the facts grasped by rational agents from the rational agents' grasping of them, and seems to require both of these for the existence of natural law. But the facts themselves, independently of any command of God, provide rational agents with reasons for acting. Hence, when Aquinas discusses the precepts of the natural law, he mentions the natural facts that provide reasons for us to grasp. Though these facts do not seem to be sufficient for natural law, they are sufficient to make it true that we ought (debere) to act in certain ways.[35]

307. The Natural Law and the Will of God

This explanation of natural law separates the existence of natural law in human beings from the instructions of any legislator. None the less, Aquinas believes that the natural law is also divine law. It comes from God in two ways: (1) God has created us with this nature, these natural inclinations, and this natural grasp of the principles of natural law. (2) God wills that we obey the natural law, and commands us to obey it; moreover, we are required (teneri) by the natural law to conform our will to the will of God (1-2 q19 a9-10; *Ver.* q23 a7).

These two aspects of natural law are necessarily connected with Aquinas' conception of the nature and will of God. It is impossible, within Aquinas' conception of God, for God to create us as we are without commanding us to obey the principles that we grasp naturally and are naturally inclined to follow. For the natural law prescribes what is right and good for us, and God, being good, necessarily wills what is right and good for the creatures he has created.[36] Given that we have been created with the nature we have, we benefit from

[35] See further Suarez, *Leg.* ii 9.4.

[36] '. . . since a debt paid out of divine justice is either owed to God or owed to some creature, neither sort of debt can be omitted in any work of God. For God cannot do anything that is not appropriate to his wisdom and goodness; and this is the way in which . . . anything is owed to God. And similarly, whatever he does in created things he does in

being commanded to obey the natural law, and so, given God's nature, God cannot fail to will that we obey the natural law, and cannot fail to command us to obey it. The apparent possibility of God's creating us and not commanding us to obey the natural law is merely apparent; it appears possible only if we do not know enough about the nature of God.

Aquinas, therefore, emphasizes that God does not make it right to observe natural law by willing it, but prescribes actions that are already right in themselves, not right simply as a result of God's prescription.[37] Actions are right in themselves because they promote the end of human life; that is why God commands them.[38] God's will to prescribe the observance of the natural law rests on God's understanding of the fact that the natural law expresses what is good and bad for human beings because of their nature.[39]

The necessary connexion between God's will and God's understanding of what is naturally good for human beings does not limit God's freedom. If God creates the world because God sees it is good to do so, and if God commands us to follow the natural law because God sees it is good to command creatures to do what suits their nature, God's freedom is not thereby restricted.

accordance with appropriate direction and proportion, in which the character of justice consists. Thus justice must be in all God's works' (1a q21 a4).

[37] 'For the precept is of two sorts—i.e., of natural and of positive right (ius). The things prohibited by a precept of natural right are those that are bad in their own right (secundum se). But those prohibited by precepts of positive right are those that can be occasions of bad things; or else the things prescribed (praecipiuntur) are things that direct towards virtue, which the legislator aims to bring about' (*4Sent* d15 q3 a1 sol 4 = P vii 729a).

[38] 'An action is said to be bad in its own right. And this is true in so far as the action disagrees with correctness of reason. For each nature has in it a natural tendency towards its end; and thereby there is in reason a natural correctness through which it tends towards the end; and thereby whatever leads away from that end disagrees with reason. And because the natural law is the <law> in accordance with which reason is correct, that is why Augustine says . . . that something is called a sin in so far as it disagrees with the eternal law, whose expression is this very natural law. And so, the more an action leads away from the end of human life, the more serious is a sin in its own right' (*2Sent* d42 q2 a5). Aquinas cites Augustine, *Faust.* xxii 27 (also discussed in 1-2 q71 a6; see §292), which explicitly refers only to eternal law (factum vel dictum vel concupitum aliquid contra legem aeternam), but warrants Aquinas' reference to the natural law, by introducing the connexion between eternal law and natural order: 'The eternal law is divine reason or the will of God, commanding the conservation of natural order, and forbidding its disturbance. We must, then, ask what the natural order is in a human being.'

[39] '. . . the things prescribed by divine law have correctness not only because they are laid down by law, but also in accord with nature. (1) For by the precepts of the divine law the human mind is subordinated to God, and all the other things in a human being are subordinated to reason. But this is just what natural direction (ordo) requires, that the inferior be subject to the superior. Therefore the things commanded by the divine law are in themselves naturally correct. (2) Human beings by divine providence are allotted a natural criterion of reason (naturale iudicatorium rationis) as the principle of their proper activities. Now natural principles are directed to things that are naturally. Therefore there are activities naturally appropriate (convenientes) to a human being that are correct in their own right, and not merely as being laid down by law. (3) Whatever things have a definite nature, these things must have definite activities appropriate to that nature: for the proper activity of each thing follows its nature. Now it is settled that the nature of human beings is definite. There must therefore be certain activities that in themselves are appropriate to a human being. (4) Wherever something is natural to a given subject, any other thing without which the first thing cannot be had must also be natural; for nature does not fail in necessities. Now it is natural to a human being to be a social animal; this is shown from the fact that one human being alone is not sufficient for all the things that are necessary for human life. Therefore the things without which human society cannot be preserved are naturally appropriate to a human being. Such things are securing to every person what is his own, and refraining from acts of injustice (iniuriis). Some things, therefore, among human actions are naturally correct. . . . It is clear, therefore, that good and bad in human actions are not only in accord with the laying down of law, but in accord with natural direction (ordinem). That is why it is said in a Psalm "The judgments of the Lord are righteous, justified in themselves" [*Ps.* 18:10]. But this rules out the position of those who say that things are just and correct only by the laying down of a law' (*SG* iii 129 §§3009–13, 3017–19). 'Iudicatorium' is also translated by 'judgment', 'code', 'tribunal'. M ad §3011 cites *ST* 1-2 q 71 a6 ad4; *Ver.* q17 a1 obj5 ad5; *ST* 1a q79 a13. On this chapter see also §274.

Human beings act freely in so far as they follow their ultimate end; but their ultimate end is external to them, since they receive it from God. Moreover, facts about goodness and badness are external to any particular human agent, in so far as they exist independently of any individual. The good that God aims at is not external to God in this way, and so God is not determined by the good in the way that human beings are. The relevant good is God's own goodness, and it is not external to God in the way that the human good is external to human beings.[40]

God is omnipotent in so far as God's rational will is not restrained by anything external.[41] But this does not mean that God is free to change himself. In particular God is not free not to have the sort of will that prefers the good; for if God lacked such a will, God would be less perfect than he is. God does not will of necessity everything that he wills (1a q19 a3); he could have created a better world than the one he chose to create (q25 a6).[42] Still, God is not free not to choose what seems to him better all things considered. On this point Aquinas is an intellectualist about God's freedom.[43]

The will of God is not subject to the eternal law; for it is itself the eternal law.[44] Particular aspects of creation result from God's willing to carry out some plan that God's reason grasps as part of the eternal law. But God's will, God's reason, and the eternal law are not three independent things. Given God's simplicity and eternity, they are three ways of referring to the same thing. God's will is not compelled by something external to and independent of it. Divine freedom, therefore, does not require God's will to be capable of changing the eternal law. The eternal law expresses God's free will.

These facts about God imply that the rightness and goodness of the principles of natural law are not independent of God; since it is necessary that God wills what is right and good, the principles of natural law would not be right and good if God did not will them. Still, they are not constituted or created by God's will. For God's will necessarily recognizes right and good that are not created by his will.

The relation between the first principle and the subordinate principles of natural law presupposes that natural rightness is distinct from the will of God. It is not always obvious how the higher principles of natural law justify one or another specific subordinate principle. But the task of reaching subordinate principles is not simply a task for legislation, human or divine. It is a task for rational inquiry and discovery. Neither a human nor a divine legislator

[40] 'And so as concerns things divinely willed, we should recognize that there is something that it is absolutely necessary for God to will, but this is not true of all the things God wills. For the divine will has a necessary relation to its own goodness, which is its proper object. Hence God of necessity wills the being of his goodness, just as our will of necessity wills happiness . . . But God wills things apart from himself in so far as they are directed to his goodness as towards their end' (1a q19 a3).

[41] '. . . anything that can have the character of being is included among the absolutely possible things, in respect of which God is said to be omnipotent. Now nothing is opposed to the character of being, except non-being. Therefore, whatever implies being and non-being at the same time is inconsistent with the character of the absolutely possible thing that is subject to the divine omnipotence' (1a q25 a3).

[42] Difficulties in Aquinas' position are explored by Kretzmann, *MT* 217–25; *MC* 130–41; 'General'; 'Particular'. Cf. §§347, 396.

[43] On intellectualism see §268.

[44] '. . . since the will of God is his very essence, it is subject neither to the divine government, nor to the eternal law, but is the same thing as the eternal law. In another way we can speak of the divine will, as concerns the things themselves that God wills about creatures; these things are subject to the eternal law, in so far as their concept [ratio] is in divine wisdom' (1-2 q93 a4 ad1). Cf. q91 a1c, ad1.

is free to legislate as he pleases about rightness and goodness, because the relevant facts are independent of legislative acts. The scope for pure legislation is limited to the area of the civil law, where the general requirements of human nature and human society do not give us a reason to prefer one option over another. At the higher levels of natural law, God is not sovereign over it in the sense of being free to change it at will.

Though God is not free to violate the natural law or to refrain from commanding its observance, God's legislative role is not confined to endorsing the provisions of natural law. God also commands actions that are not commanded by natural law, which it would not be wrong to omit if they had not been commanded. Violation of such a command is 'bad because it is prohibited' (malum quia prohibitum) rather than 'prohibited because it is bad' (prohibitum quia malum), whereas violations of natural law are prohibited because they are bad.[45]

In allowing that God's legislation can make some actions wrong that would not otherwise be wrong, Aquinas does not retract his view that right and wrong are prior to God's legislative will. God's right to legislate and our obligation to obey God's legislation presuppose a principle, independent of God's legislative will, that prescribes obedience to the legitimate commands of a legislator. The wrongness—prior to God's legislation—of disobeying God is presupposed by the possibility of God's legislation making specific actions right or wrong.

308. What is Natural about Natural Law?

We have now seen what Aquinas does and does not mean by speaking of natural law as a kind of law. We have considered the different reasons that might be given for attributing to him the view that it consists essentially in acts of divine legislation, and we have found that none of these reasons is cogent. He discusses the features of law that seem to refer to acts of legislation (obligation, rule, command, publication), and argues that they do not imply any acts of legislation, but belong to the natural law in so far as it belongs to the nature of rational agents. In this respect, Aquinas reduces facts about natural law to facts about rational agents.

[45] Violations of natural law are bad without prohibition, and therefore are prohibited because they are bad. Violations of divine positive law, however, are bad only because they are prohibited. See 1-2 q71 a6 ad4 (we can speak of every sin being bad because it is forbidden by natural law from the very fact that it is misdirected (inordinatum)); 2-2 q57 a2 ad3 (both divine and human law include things that are naturaliter iusta, whose violation is prohibited because it is bad, and things that are bad because prohibited); *in 1Tim*. 1.3 = P x 588b (what conflicts with natural law is bad in its own right, whereas what conflicts with positive law is bad because prohibited). Some sins are sinful only because they are prohibited, and would not otherwise be sinful. The most significant of these sins is the sin of Eve and Adam in eating the apple. See *2Sent* d21 q2 a2 sc1 = P vi 575b (Adam sinned by doing what was bad only because it was prohibited). Many, however, sin by doing what is bad in both ways, both in its own right and because it is prohibited. On Adam's sin see §412; *Mal*. q2 a6 = M 480b (some actions are sins only because prohibited); q2 a9 ad4 = M 487a (in things that are bad in their own right, not only because they are prohibited, disobedience is not the whole evil; hence sins can differ in degree in accordance with the good that one loses); *CT* 188 (eating from the tree of knowledge of good and evil was not prohibited because it was antecedently bad, but God commanded human beings to observe this moderate prohibition simply on the ground that God prohibited the eating). Similarly, some ways to salvation are required only because they are commanded. See *in Ioann*. 13.2 §6 = P x 529b (Jesus' washing of Peter's feet was necessary for salvation only because it was prescribed).

What, then, makes natural law natural? It is different, as the Stoics argue, from any positive law. It is also different, as the Christian Fathers insist, from the revealed law that we know from the Scriptures.[46] It is not separate from the divine law, since it is part of the eternal law; but it is not the whole of the divine law. Aquinas begins with the aspects of divine law that we know naturally, before he proceeds to explain why we also need the revealed law of the Pentateuch and the Gospel.

In calling natural law natural, he makes at least three claims about its status: (1) He refers to our way of knowing the law. To know the precepts of positive law, we need specific information about a particular community, but to know the precepts of the natural law we need no special education or information. We have the relevant knowledge by nature, without education or training, and no matter how bad our education and training may be. Our natural knowledge of the natural law is the basis for acquiring knowledge of further practical principles (1-2 q91 a3). Different people are aware of these first principles of practical reason to different extents, and with different degrees of explicitness; but since we all grasp them in some way, we naturally participate in the eternal law (q91 a2).[47] Our awareness of the first principles of natural law is meant to explain how it is possible for us to guide our action correctly by reason and will. (2) The natural law is natural not only because of how we know it, but also because of its content. It applies to us in virtue of our nature. The principles of natural law are the correct principles for us to follow as the sorts of creatures we are with the natures we have. In so far as we know the principles of the natural law, we learn something about our nature and about what is suitable for us.[48] (3) This law is natural for us in so far as we naturally follow it. We naturally participate in the eternal law not only by knowing what is suitable for our nature, but also by naturally behaving in accordance with it. This is why Aquinas claims that the precepts of the natural law are revealed in our natural inclinations (q91 a2).

It is not logically necessary for one and the same law to have all these features. Natural knowledge (or some degree of cognition) of a truth does not make it a truth about our nature. We might, for instance, have been born with some innate cognition of arithmetic or some innate awareness of a quality-space of colours, but our innate cognition would not necessarily be about our nature; we would not necessarily understand arithmetic or colours better by reflexion on our nature. It seems logically possible for God to give us natural knowledge of practical principles that are similarly unrelated to our nature. In such an apparently possible world, the principles that prescribe what is suitable for our nature might be unknown to us; or else we might be able to learn about them without knowing them naturally, and we might discover that they are quite different from the principles that we know naturally. Again, knowledge—whether natural or not—of the principles that suit our nature seems to be consistent with the absence of any inclination to act on them. Apparently, we might be aware of what suits our nature, but—because of some perversity in our will—be disinclined to act on it.

[46] See Lactantius, quoted in §197. Cf. §206.

[47] This claim about natural awareness of the law does not undermine the claim that rational agents differ from non-rational in being guided by reason and will, as opposed to natural desire (q91 a2 obj2; ad2; ad 2 quoted above n33).

[48] See *SG* iii 129, quoted above n39.

Aquinas believes our world is a bit like these worlds, in so far as our knowledge and our inclination are imperfect. Original sin leaves us with misdirected desires that tend to obscure our knowledge and to pervert our inclinations and actions. This imperfection in our nature means that we cannot simply discover what is naturally suitable for us by an indiscriminate survey of our natural beliefs and inclinations. If we took these as our guides, we would treat the impulses of our misdirected desires as impulses towards what is naturally suitable. To avoid the distorting effects of misdirected desires, we must rely on our knowledge of human nature and the ultimate human end, and use this to identify the natural beliefs and inclinations that tell us what is suitable for our nature. In the *Summa* Aquinas discusses sin immediately before law, so that we recognize some of the tendencies of misdirected desires, and do not identify them with the requirements of our nature.

With these qualifications and reservations, Aquinas takes the three aspects of the naturalness of the natural law to be connected. He appeals to natural beliefs and inclinations in order to support his claims about what is naturally suitable, though these appeals are not left to stand on their own without support from the rest of his ethical theory. To justify his claims about the coincidence of these three features in natural law, he has to show that some set of principles meets all his three conditions; they must be naturally known, they must be about what suits our nature, and we must have a natural inclination to follow them.

309. The Relevance of Natural Law

The precepts of natural law ought to specify the content of the natural inclinations that make us aware of what is suitable for our nature. But they seem quite heterogeneous. Some of them seem to be nearly tautologies, or at least conceptual or analytic truths. We might say this about 'Good is to be done and evil is to be avoided'. Others, such as 'Theft must not be committed' (*in EN* v 12 §1018) seem to have more moral content; they seem to be moral rules corresponding to parts of the Decalogue (1-2 q100 a1, 3). Aquinas recognizes this variety in precepts of natural law, and arranges them in order, claiming that the more specific are derived from the higher principles. We must understand both the character of the higher principles and the sort of derivation he has in mind.

The very first precept of natural law is the principle that good is to be done; the other precepts are founded on this one.[49] This principle is not a mere tautology. It connects the discussion of natural law with Aquinas' exposition of the good as the ultimate end. For rational agents, good is what is to be done, in so far as they have wills that aim at their objects as good, not as merely attractive. We will something as good in so far as we choose it for some reason beyond the mere fact that we desire it. We choose for reasons independent of desire in so far as we assess particular goods with reference to one another in our conception of the ultimate good.[50] In claiming that his principle about the good is the very first principle of natural law, Aquinas implies that all the prescriptions of the natural law must fit the teleological structure that he has described in his discussion of the ultimate end.

The claim that moral principles are provisions of natural law does not require us to cast our moral reasoning in quasi-legal form. If Aquinas had intended this, it would have been

[49] See §272; Bradley, *ATHG* 282–8, 312–13. [50] See §275.

appropriate to mention natural law at the beginning of his ethical argument, rather than waiting until he has presented an account of the virtues. He seems to introduce natural law so that we can understand something about what we have already discovered without reference to natural law.

The point of referring to natural law is most easily seen if we consider the difference between rational and non-rational creatures (q91 a2).[51] The specific natural inclination that manifests our share of divine providence is our own concern for the welfare of ourselves and others. God has this sort of foresight for us and for every part of creation; we share in it through our own foresight for ourselves and others. The sort of foresight that gives us a share in the natural law is not simply concern for the future; it is concern for ourselves that is based on awareness of our nature and what is suitable for it. Non-rational creatures simply follow their natural tendencies and conform to their nature in that way. Rational creatures are aware of the natural law, in so far as they can become aware of their nature and of what it requires; this is how they exercise foresight for themselves. Aquinas claims, then, that in reflecting on the final good, the will, the passions, and so on, we discover our nature and what is suitable for it, and thereby discover the law of our nature.

Aquinas has therefore pursued his reductive treatment of moral theory in his discussion of natural law. Reflexion on rational agency is the rational basis for understanding not only happiness and the virtues, but also the requirements of natural law. A proper understanding of natural law reveals its requirements in the features of rational agency that we have already understood through the earlier inquiries in the Prima Secundae.

This is an informative, even a controversial, claim if it is intended to rule out other explanations or interpretations of what we learn about in the ethical reflexion of the Prima Secundae. It conflicts with Nietzsche's view that our ethical views, and the psychological views connected with them, express an illusion about ourselves.[52] Aquinas also rejects the view that our ethical views simply reflect our preference for this conception of ourselves, and do not tell us anything further about how we really are. In claiming that we conform to natural law, we claim to know something about how we are, and to express this in our ethical choices. Hence the virtues we recognize are appropriate for the sort of creature that we are; they are not simply expressions of one among many views of ourselves.

Aquinas already asserts this connexion between nature and rational desire at the beginning of the Prima Secundae; his formal criteria for happiness anticipate his claims about natural law. He argues that our ultimate end is not the satisfaction of our desires, but the perfection of ourselves; we aim at what we value as the perfection of our nature. In the discussion of natural law, Aquinas adds that our aiming at our perfection is not completely misguided. In conceiving ourselves as rational agents who aim at our perfection we correctly grasp our own nature.[53]

If this is what Aquinas means in invoking natural law, he imposes a constraint on acceptable moral systems. Our nature does not determine that one specific system rather than another is the right one. To find the right one for people at a particular time or place, we must consider not only the fact that we are rational agents of a certain sort, but also the

[51] Quoted above n32. [52] See Nietzsche, *TI* vii 1 = PN 501.

[53] On Aquinas' naturalism see Finnis, *Aq*, ch. 7, esp. 88, 101–2.

fact that we are in particular conditions that may distinguish us from people at other times or places. Still, our nature imposes some moral constraints that we must recognize if we are to explain how different circumstances matter. We may decide, for instance, that in some circumstances we ought to ration food and in others we ought to ration water. Natural law requires neither rationing of food nor rationing of water; but we need to refer to a natural need for food and drink if we are to justify rationing in particular circumstances, by appeal to some principle requiring equitable distribution of resources needed to meet basic needs.

310. The First Principle of Natural Law

Natural law does not present a new kind of moral consideration, lying outside deliberation about happiness. On the contrary, the presence of natural law in human beings consists in their being rational agents pursuing their final good. When Aquinas tells us that the precept that good is to be pursued and evil avoided is the first principle of natural law, he means that we regard other principles as correct in so far as they prescribe actions that promote the final good, and that if we knew they did not promote the final good, we would no longer regard these actions as required.

The natural law prescribes the actions of all the virtues, in so far as it prescribes action in accordance with nature.[54] What is natural for human beings is what accords with their nature as rational beings. This is the sort of action towards which human beings have a natural inclination, which they form because of a natural judgment or 'natural criterion of reason' (*SG* iii 129).[55] Our reason for obeying the natural law is not that God orders us to obey it, as though we were regarding it simply as a divine command based on no further reason. It is, as Butler says, the law of our nature; it would be suitable for our nature whether or not God commanded us to do it. We can confirm that our natural inclinations lead us to what is suitable for our nature, by comparing their tendencies with an account of human nature. This is what Aquinas does in the *Summa*.[56]

[54] 'If we speak of virtuous actions in so far as they are virtuous, in this way all virtuous actions belong to the law of nature. For it has been said that everything to which a human being is inclined in accordance with his nature belongs to the law of nature. Moreover, everything is naturally inclined to the activity that is suitable for it in accordance with its form, as fire, for instance, is inclined to heating. Hence, since rational animal is the form proper to a human being, every human being has a natural inclination towards action in accordance with reason. And this is action in accordance with virtue' (1-2 q94 a3).

[55] The passage is quoted in full in n39. On this account of rightness see §334; Suarez, *Bon*. ii.2.11 = 295a.

[56] 'All things have present in them naturally principles by which they not only can carry out their characteristic actions, but by which they make them appropriate (convenientes) to their end, whether they are actions that follow on a thing from the nature of its genus, or they follow from the nature of its species.... But because a human being, among the other animals, has cognition of the character (ratio) of the end and the proportion of the action to end, that is why the natural conception placed in him to direct (dirigatur) him towards acting appropriately is called natural law (lex) or natural right (ius)... The natural law, therefore, is nothing other than the conception naturally placed in a human being, by which he is directed towards acting appropriately in the actions characteristic of him, whether they belong to him from the nature of the genus (e.g., generating, eating, and so on), or from the nature of his species (e.g., reasoning, and so on). For everything that makes an action inappropriate to the end that nature aims at in an action is said to be against the law of nature. For an action may be inappropriate to the principal or to the secondary end; and this may happen in two ways. (1) In one way, from something that altogether impedes the end, as too much or too little eating impedes bodily health, as the principal end of eating, and impedes fitness for getting on with one's work, which is the secondary end. (2) In another way, from something that makes the attainment of the primary or secondary end difficult or less suitable,

The role of our natural inclinations, however, is not purely epistemic; they do not simply inform us about what is suitable for our nature, but they actually fulfil our nature. When we reflect on the actions we do by natural inclination, we discover that they include the rational activities that direct other inclinations. By natural inclination we exercise foresight for ourselves; this is the participation in divine providence that defines rational agents.[57]

How much knowledge of natural law is contained or implied in the knowledge that belongs to every rational agent? Aquinas claims that natural inclination leads us not only to the first principle, that good is to be pursued and evil avoided, but also to some more definite principles. He divides these secondary principles into four groups: (1) The highest precepts. (2) Precepts (such as those in the Decalogue) easily reached from the highest precepts. (3) Subordinate precepts requiring more reflexion, derived as conclusions from premisses. (4) Precepts derived as determinations rather than conclusions.

311. Natural Inclinations and the Highest Precepts of Natural Law

The highest precepts are immediately derived from the first principle, in accordance with the order of natural inclinations: 'Therefore, according to the order of natural inclinations is the order of precepts of the law of nature' (1-2 q94 a2). Different natural inclinations rest on different aspects of our nature. (a) The inclination that results in precepts about self-preservation rests on the nature we share with all other natural substances. (b) The inclination that results in precepts about the satisfaction and control of bodily appetites rests on the nature we share with other animals. (c) The inclination that results in precepts about social life rests on our nature as rational animals (q94 a2; a4; q95 a4).

It is not easy, however, to see how much content Aquinas wants to attribute to the common and first principles of natural law.[58] Sometimes they appear to be very general

e.g., excessive eating, in so far as it happens at a time when it ought not to. If, therefore, an action is inappropriate to an end, as altogether prohibiting the principal end, it is directly prohibited through the law of nature by the first precepts of the law of nature, which are in matters of action as common conceptions are in theoretical matters. If, on the other hand, it is unsuitable to an end of some secondary sort, or even to a primary end, as making the attainment of the end difficult or less suitable, it is prohibited not by the first precepts of the law of nature, but by the second, which are derived from the first, just as conclusions in theoretical matters gain their credibility from principles known through themselves' (*4Sent.* d33 q1 a1 = P vii 967a).

[57] The essential connexion between being a rational agent and grasping the natural law is revealed in Aquinas' explanation of why no one, not even ourselves, teaches us the natural law: 'Those who attain to works of virtue without an external instructor or legislator are said to be a law to themselves; "When the Gentiles, who have not the law, do naturally the things that belong to the law, . . . they are a law to themselves". Therefore he also who acquires knowledge through himself ought to be called his own teacher' (*Ver.* q11 a2 obj 5). (On the passage from *Romans* see n4 above.) But he rejects the suggestion, on the ground that A cannot teach A unless the aspect of A that teaches is distinguishable from the aspect of A that is taught. In the case of the natural law, A could teach A only if both the teaching A and the taught A were a rational agent. Since any rational agent must already grasp the natural law, and thereby be a law to himself, no agent who is a law to himself can be taught the natural law: 'A law in matters of action has the same character as a principle has in matters of speculation, but not the same character as a teacher. Hence it does not follow that if someone is a law to himself, he can be a teacher to himself' (*Ver.* q11 a2 ad5).

[58] These principles '. . . need no further publication than that they are written in natural reason as known through themselves, such as that one ought to do evil to no human being, and others of this sort' (q100 a3).

and formal, prescribing that (for instance) we act in accordance with reason, but leaving it for further inquiry to decide what is involved in acting in accordance with reason.[59] But sometimes they seem to have more definite content. Aquinas claims that a prohibition on killing is derived from the prohibition on harming, which in turn is derived from the unreasonableness of harming (q95 a2). The principle from which the specific precepts are derived is the principle about human nature and especially about the naturally social character of human beings (q95 a4).

Aquinas seems to mean that the principle of acting in accordance with reason is most directly derived from the principle that good is to be done and evil avoided, and that the principle of not harming is derived from the principle of acting in accordance with reason. The principle of not harming seems to have some definite content that is absent from the principle of acting in accordance with reason. Aquinas seems to rely on a connexion between the rational and the social nature of human beings.

We may grasp his argument better if we recall that he does not simply appeal to needs, desires, and sentiments that human beings share. He appeals to the rational agency that we share. Morality, as he understands it, is the application of rational agency to the different aspects of human life. The application of rational agency proceeds through one's conception of one's final good. The appeal to human nature does not rely on a conception of happiness as the fulfilment of one's desires. Aquinas argues that this is a mistaken conception of happiness, because my ultimate end as a rational agent is not simply the satisfaction of my desires. I pursue my perfection, in so far as I seek to satisfy the desires that are worth satisfying. I do not want my ultimate ends to be things that I simply happen to prefer.

This makes a difference to our understanding of the appeal to 'natural inclinations'. If we appeal to all unlearnt impulses or desires in anyone, some of these seem inappropriate to provide a moral norm or standard. Even if we appeal to the impulses that are statistically more widespread in the human species, we still seem to commit ourselves to morally doubtful conclusions.[60] Aquinas believes that natural and widespread impulses are to be shaped and redirected by the training that forms moral virtues; he could not reasonably take untrained natural impulses to set goals for morality.

Aquinas' claims about natural inclinations need to be interpreted in the light of his conception of agency. He thinks of human nature as essentially rational, and therefore as requiring the application of rational agency to choices.[61] His argument from natural inclinations appeals to these aspects of rational agency.

[59] 'All hold this to be right and true, that one should act in accordance with reason. Now from this principle it follows as an appropriate conclusion, that deposits are to be returned, and this indeed is true in most cases; but it is possible for it to happen in a particular case that it would be harmful, and therefore unreasonable, if deposits were returned, if, for instance someone asked for <something to be returned> in order to attack his country' (q94 a4). Cf. 2-2 q47 a7: 'And this end is presented (praestitutus) to a human being in accordance with natural reason; for natural reason prescribes to each person that he should act in accordance with reason'. This is apparently a reference to synderesis; cf. q47 a6 ad1. See §317.

[60] For an example of a morally questionable appeal to nature see 2-2 q154 a11.

[61] As Aquinas makes clear in speaking of the 'order' of natural inclinations (q94 a2), the application of rational agency does not disregard the aspects of human beings that make them living organisms and make them animals.

312. Rational Agency and Social Nature

If we rely on Aquinas' claims about rational agency, we can understand his claims about our inclination towards society.[62] We might think he refers to a natural desire for social life, and that the various principles of justice and so on seek to achieve this natural desire. This would be an insecure starting point.[63] For we might infer that the strength of my desire for the end determines the weight of my reason to pursue the means to the end, so that people who care less about social life have less reason to care about the good of others.

This is not Aquinas' argument. He believes that a rational agent's perfection requires social life in which one is concerned about the good of others in the same way as one's own. Can we understand this in the light of Aquinas' claims about perfection?

In Aquinas' view, we cannot be free in relation to our ends unless we can regard them as matters for deliberation as opposed to mere preference. This sort of freedom is valuable to us, because our ends seem to matter to us for some reason beyond the mere fact that we prefer them; that is why we aim at perfection. Once we recognize that we care about perfection, not simply about the satisfaction of preferences, we also notice that my preferring this end—its being my end in particular—is not a sufficient reason for pursuing it. There must also be something to be said for it beyond the fact that I care about it.[64] In this sense my desire for my happiness turns out not to be entirely self-centred, once I understand that happiness requires reasons that go beyond my preferences.

The demand for reasons going beyond my preferences affects my adoption of one end over another, by accepting one conception of happiness over another. But it also affects my relations to other rational agents. To find a reason for preferring one end to another is to find a good that is good antecedently to my desiring it; my desire rests on an external reason that does not depend on my desires. External reasons are good reasons not because they seem good to me, but because they are good reasons that must seem good to a qualified judge who does not share my initial desires. This is how reason-based ends differ from preference-based ends.

In caring about my own perfection, and not simply about the satisfaction of my own preferences, I have to recognize other rational agents as agents who can recognize a good reason for preferring one end over another. Aquinas is right to suppose that my natural inclination—properly understood—towards my own good as a rational agent also implies an inclination towards social life. I have to respect the judgments of others to some degree, since I regard their judgments as being possibly relevant to my decisions about the ends it would be best for me to pursue. This kind of respect for others places us in a rational community with them.

[62] 'Thirdly, a human being has a tendency towards a good in accordance with the nature of reason, which is proper to him. Thus he has a natural tendency towards grasping the truth about God, and towards living in society. And on this ground the things that refer to this sort of tendency belong to the natural law; for instance, to avoid ignorance, not to offend those he ought to interact with, and other things of this sort that refer to this' (q94 a2). At the end of the first sentence the antecedent of 'which' might be 'tendency', 'nature', or 'reason'.

[63] The insecurity of appeals to natural desires becomes clear in Pufendorf's attack on appeals to natural sociability at *JNG* vii 1.3.

[64] See *2Sent*. d3 q4 a1 ad2 = P vi 427a; Finnis, *Aq*. 111.

One might object that this sort of respect for other people's judgment falls short of the sort of respect for their needs and interests that is necessary for a 'natural inclination to live in society' (as Aquinas puts it). It seems quite possible to respect another person's judgment, and even to regard it as a source of insight into one's own good, while being entirely indifferent to the other person's interests.

We might answer that the two forms of respect are distinct, but connected. I have more reason to respect and to trust another person's judgment if we treat each other with mutual respect. If I depend on you, and you treat me purely as your instrument, I have some reason to give you the sorts of answers that you will want to hear; you are more likely to hear my honest opinion if I am not entirely dependent on your favour. We are more likely to recognize other people's views as counting for something in their own right if we all recognize one another as counting for something in our own right.[65]

This argument for connecting two forms of respect concedes that my planning for my own life on the basis of my judgments about my good is quite independent of what other people do. If we reject this concession, we can strengthen the argument for connecting a rational community with a moral community. For more of my life is subject to rational agency if I care about others for their own sakes, not simply as means to the satisfaction of my preferences. Non-instrumental concern for others promotes my own perfection, as Aquinas conceives it, since they are rational agents with whom I can deliberate about what ends are worth pursuing.

If my concern for others is purely instrumental, they have no reason to believe that any plans of mine involving them count for anything more than my preferences about them; my plans for them do not necessarily define ends that they have any reason to care about for themselves. But if we are concerned about one another for our own sakes, our lives can all embody ends that we all recognize as worth pursuing for some reason apart from our preferences. In that case, my life is not guided simply by my preferences; it is guided by preferences grounded in reasons that can be recognized as such by all rational agents. If I simply regard other people as means to achieving my aims, I can give no reason for them to prefer my aims to theirs, and so we have reason to cooperate only as long as our aims happen to coincide. When I care about others for their own sakes, however, we are capable of sharing deliberations that take account of reasons that we can all accept. Hence the conclusions of our deliberation have a rational claim on us all.

These arguments about the inclination to society go beyond anything that Aquinas explicitly defends. But they indicate how one might connect his claims about natural law with his conception of rational agency. Moreover, they are relevant to the claims that he presents more fully in his arguments for friendship and justice.[66]

The claims about inclinations and nature show that Aquinas' claims about the basis of natural law in human nature do not rely on an empirical survey of prevalent human desires. They rely on distinctive features of his conception of rational agents and their ultimate end. This is the conception that we need to keep in mind in examining his attempts to derive precepts of natural law from the basic principles.

[65] Cf. Hegel's views on different sorts of recognition, discussed by Neuhouser, *FHST*, ch. 3.

[66] See §337.

313. Derived Principles of Natural Law

The awareness of our nature that is embodied in our natural inclinations allows us to form more specific precepts that tell us what is required by the inclination to society. Given the specific needs of a human society, we can see why we need the precepts of the Decalogue.[67] The precept against killing is derived from the precept against harming (q95 a2), and the law of nations—i.e., the laws and institutions found universally in different nations—is derived from the law of nature 'by means of a conclusion that is not very far removed from the principles' (q95 a4 ad1). The principle from which the specific precepts are derived is the principle about human nature and especially about the naturally social character of human beings. The needs of a human community explain the provisions for property, exchange, and so on that are found, in one form or another, in different human societies.[68]

Aquinas contrasts the precepts of the Decalogue with the common principles from which they are derived. The Decalogue itself does not state the common principles, but states the most general guides to action that can be derived from them.[69] The common principles provide the first level of natural law, and the Decalogue the second level. The precepts of the law of nations also belong to the second level. They are less obvious than the precept against killing, but they are more obvious than those that 'by the diligent inquiry of wise people (sapientes) are found to accord with reason' (q100 a3). Reflexion on the needs of a human community tells us that (e.g.) every community needs to assure some protection, security, and support for human social life, but it does not tell us exactly how these aims are to be fulfilled in specific circumstances.

When we add more specific detail, we can reach a third level of precepts. In contrast to the precepts of the Decalogue, precepts at the third level demand more reflexion if we are to see that they are required by natural law (q100 a1, 3). The non-obvious consequences of the common principles include some important areas of morality. Aquinas has to explain why the Decalogue does not include duties to oneself, but confines itself to duties to God and to one's neighbour. He offers different explanations: (1) The requirements of natural law are obscured by sin in the case of precepts about loving others, but not in the case of precepts of self-love. (2) True self-love is included in the love of God and one's neighbour. (3) Everyone easily recognizes that we have duties (debita) to God and our neighbour, but not everyone easily recognizes that we have duties to ourselves; 'for at first sight it appears that everyone is free in those matters that refer to himself' (q100 a5 ad1; 2-2 q122 a1).

[67] 'For some things in human actions are so explicit that immediately, with slight consideration, they can be approved or rejected through those common and first principles. . . . For there are some things that the natural reason of any human being at all at once through itself judges to be things to be done or not to be done, such as Honour your father and your mother, and Do not kill, Do not steal' (q100 a1).

[68] '. . . it belongs to the character (ratio) of human law, to be derived from the law of nature, as is clear from what has been said. On this basis positive right (ius) is divided into the right of nations and civil right—namely, on the basis of the two ways in which something may be derived from the law of nature, as stated above. For to the right of nations belong those things that are derived from the law of nature as conclusions from principles—such as just purchases, sales, and other things of this sort, without which human beings cannot live together. This concerns the law of nature, because a human being is naturally a social animal, as is proved in *Politics* i' (q95 a4). Aquinas' account of the law of nations is discussed and modified by Suarez, *Leg*. ii 20.2.

[69] As Aquinas puts it, the Decalogue contains the common principles in the sense in which an immediate conclusion contains its premisses (q100 a3).

Since the Decalogue includes only precepts that are easily recognized,[70] it does not include precepts of self-love.[71]

To accept precepts at this third level, people need instruction from the wise, and so these precepts are excluded from the list in the Decalogue. The reference to the wise (sapientes) suggests that we recognize that we have duties of self-love (as opposed to self-regarding reasons for it) only through the sort of 'diligent inquiry' that traces the more remote consequences of the common principles of natural law.

Precepts at the fourth level are reached less directly from the natural law. They are not derived from the first principles as conclusions from premisses, but are 'determinations' rather than 'derivations', because they specify one among a number of possible ways of fulfilling a requirement of natural law. The natural law requires, for instance, that wrongdoers should be punished, but it does not require that they should receive this or that punishment. When we lay down a specific punishment, we 'determine' a requirement of natural law, by stating a specific way, not itself required by natural law, of fulfilling the generic requirement of natural law (1-2 q95 a2; a4 ad1).

Aquinas sharply distinguishes this fourth group of precepts from the third. People do not agree without reflexion that the natural law requires us to recognize duties of self-love. But once we reflect appropriately, we see that these are required by the natural law; they are not optional or alterable. In reflecting about punishment or about taxation, by contrast, we will not (Aquinas assumes) reach the conclusion that imprisonment for five years is the only just punishment for a specific type of offence, or that direct rather than indirect taxation is always uniquely just.

The fourth group of precepts belongs to civil, not to natural law (q95 a4 ad1). The first group belongs to natural law. It is less clear what Aquinas believes about the second and third groups. He distinguishes the law of nations from natural law while claiming that it is derived from natural law.[72] But he does not seem to take this view of duties to oneself; they do not seem to be any less a requirement of natural law simply because they are not obviously required by it. Perhaps Aquinas believes that all of these precepts belong to natural law, in the sense that they can be justified by derivation, simple or complicated, from the first principles of natural law.

Does Aquinas' division of the different precepts derived from the common principles give us a clear idea of how the subordinate principles are to be derived, by easy inference or diligent inquiry? He suggests that the different basic inclinations of human nature indicate to us that we need provisions for the preservation of life, for relations between men and women and parents and children, and for our relations to a community and to God (q94 a2). From these, he suggests, we can understand why we need the different provisions that are embodied in the precepts derived from natural law.[73]

The sort of argument, then, that is needed to discover what is required by natural law seems similar to the sort of argument that is needed to show that one or another state of character is a virtue; the results of each type of inquiry ought to overlap. They cannot coincide

[70] Cf. 2-2 q56 a1; 1-2 q100 a3.

[71] On duties to oneself see Butler, *D6*.

[72] Aquinas discusses the question further in 2-2 q57 a3.

[73] Contrast Scotus' introduction of the divine will in formulating these principles, §384.

exactly, since Aquinas' discussion of the precepts derived from natural law is concerned with duties (debita) that are owed by one person to another person or to the community or to God; a search for these precepts will not necessarily include everything that is included in the virtues in quite the same order. Aquinas remarks, for instance, that self-regarding precepts are more difficult to recognize as duties, but our awareness of them is less dimmed by sin than is the awareness of other-regarding precepts. We more readily recognize them as the source of virtues if we are arguing from the ultimate end to the virtuous character.

314. Dispensations and Exceptions

This division of precepts of the natural law helps Aquinas to resolve an apparent difficulty for his view that natural law is independent of divine commands. Any Christian moralist has to explain cases where God has apparently given 'dispensations' from obedience to the natural law. On God's orders, Abraham prepared to kill Isaac, the Israelites plundered the Egyptians, and Hosea married a prostitute. In these cases God appears to have permitted or even instructed someone to violate a moral law. These cases appear to be dispensations from the natural law, since God seems to gives permission to break the natural law.[74] Are these really dispensations, and do they show that God is sovereign over the natural law?

We need to distinguish dispensation, which creates an exemption from a rule, from moral reflexion, which discovers an exception to a generalization. A dispensation creates an exception simply by declaring it, whereas the discovery of an exception depends on deliberation and argument, rather than an act of declaration. Only a properly constituted authority can dispense from a rule, whereas anyone in principle can discover an exception; the truth of the discovery of an exception does not depend on who discovered it, but the validity of a dispensation depends on who dispenses. If the regulations of a university require a professor to return from a leave of absence after at most two years, university officials may still dispense her from this requirement, if, for instance, she holds some public office. In doing this they do not alter the regulation. The professor would not have created a valid exemption without dispensation by the appropriate authority; reasoning about the point of the regulation and the value of disregarding it would not have not have shown that the regulation did not hold in all cases. Whether or not the officials acted wisely, the dispensation is valid if they are empowered to dispense from this regulation. But if we are to find a genuine exception to a generalization, we need to deliberate wisely, and it does not matter who finds it.

Aquinas agrees that God has the power to dispense from some laws, since positive law allows dispensation. God granted the Hebrews polygamy, concubinage, and divorce through a dispensation from the usual requirements of divine law (*SG* iii 125 §2986). A dispensation for a particular case does not change the law, and does not alter the fact that the law is violated; the law remains the same, but in this case the violation is permitted. These dispensations all dispense from the requirements of divine positive law.

[74] On the treatment of dispensations before Aquinas see Lottin, *PM* ii 99–100. Peter Lombard, *3Sent.* d37 c.5 defends the plunder of the Egyptians by claiming that it was not theft, because it fulfilled a divine command. He cites Augustine, *in Exod.* 39; *Faust.* 71.

But if we go further, and ascribe to God the power of dispensation from natural law, we destroy Aquinas' account of the rightness of natural law. If God can dispense from natural moral law, God must be sovereign over it. If his giving permission to violate the law makes it all right to violate it, the wrongness of violating the law in other cases must be the fact that it involves disobedience to a command. If wrongness consisted in something more than disobedience to God, God's permission to do the action could not change the action from being wrong to being right.[75] If his dispensation makes the action right, it must have been wrong only because God prohibited it (malum quia prohibitum).

Aquinas believes that we are committed to these false conclusions about natural law and the will of God if we allow that God dispenses people from obedience to the natural law.[76] God did not dispense Abraham from obedience to the natural law, since God did not instruct Abraham to violate the natural law. If God told Abraham to prepare to sacrifice Isaac, Abraham's obedience did not violate the natural law, even though he would have violated it if he had prepared to sacrifice Isaac without God's instruction (1-2 q100 a8 ad3).[77]

The alleged 'dispensations', therefore, do not exercise God's sovereign will, but manifest God's wisdom. Since God understands the natural law better than we do, God is right in instructing us to act in ways that in other circumstances would be morally wrong. The lower precepts of the natural law cannot be stated in generalizations that hold without exception and that we can immediately apply to practice without further moral reflexion. The generalizations that we formulate and legitimately rely on may none the less have exceptions. Sometimes we can discover these exceptions for ourselves, but sometimes we ought to rely on God to reveal them to us. It was not up to Abraham to decide for himself when he ought to prepare to kill an innocent person. But when we have reason to believe we have been given God's instructions about a particular case, we have reason to believe that the generalization we normally accept has an exception, since God's instructions are infallibly correct.

In denying that these exceptional cases are genuine dispensations, Aquinas makes it clear that he identifies the natural law with the truths grasped by God's wisdom, not with commands coming from God's legislative will. The fact that God commands the observance of the natural law gives us a reason to observe it, distinct from the reason derived from the

[75] On apparent 'change' in secondary precepts see 1-2 q94 a4; *in EN* v lec. 12; *3Sent.* d37 q1 a3 sol. = P vii 425b.

[76] On dispensations see *3Sent.* d37 q1 a4 = P vii 436–7. On Scotus' treatment in *3Sent.* d37 see §383. Cajetan comments in ad 1-2 q100 a8 = L vii 216–17. See Boler, 'Exceptions'.

[77] 'Now the precepts of the Decalogue contain the very aim (intentio) of the legislator, namely God. For the precepts of the first table, which direct us to God, contain the very direction (ordo) to the common and final good, which is God. And the precepts of the second table contain the very direction of justice that is to be observed among human beings, namely that nothing that ought not to be done (indebitum) should be done to anyone, and that what is owed (debitum) should be rendered to each . . . . Consequently the precepts of the Decalogue are altogether indispensable' (1-2 q100 a8). 'Consequently when the children of Israel, by God's command, took away the spoils of the Egyptians, this was not theft, because it was owed to them, according to God's judgment. Similarly, when Abraham consented to kill his son, he did not consent to murder, because it was required (debitum) by the command of God, who is lord of life and death, that his son should be killed. . . . In this way, therefore, the precepts of the Decalogue, as far as concerns the character of justice that they contain, are unchangeable. But as far as concerns some determination by application to individual actions—for instance, that this or that is murder, theft or adultery, or not—this is changeable' (1-2 q100 a8 ad3). On the immutability of the natural law see also 1-2 q94 a5 ad2; 2-2 q64 a6 ad1; q104 a4 ad2; q154 a2 ad2. Aquinas' position is discussed at length by Suarez, *Leg.* ii 15.16–28. Suarez argues that in each case of an apparent dispensation, the subject-matter or the circumstances differ, so that the action that would otherwise be a theft is not a theft (see esp. his helpful example of annulling, rather than dispensing from, a promise, §27).

fact that it is the law suitable for our nature. Suitability to our nature gives both God and us the basic reason for acceptance of the natural law.

315. Misunderstandings of Natural Law

Later moralists, both inside and outside mediaeval Aristotelianism, continue the discussion of natural law, and many of them continue the discussion of questions raised by Aquinas, To approach this later debate on natural law, it is useful to draw some preliminary conclusions about Aquinas' position.

We have found so far that Aquinas is not a 'natural law moralist', since he does not try to explain morality from some prior conception of law.[78] His view about the connexion of moral principles to natural law does not imply that ethics should be cast in legal form—that, for instance, the actions required by each of the virtues can be fully expressed in a set of rules that are determinate enough to serve as guides for action applicable to particular cases. Aquinas believes that some specific legal precepts can be defended by appeal to natural law, but he does not commit himself to the further claim that a definite set of such precepts specifies the entire content of the virtues.

According to Aquinas, natural law does not introduce a new understanding of the nature of moral obligation, or some attempt to explain moral requirements as a type of legal requirements.[79] One might reasonably interpret Aquinas in these ways, if one simply noticed his use of legal terms in his discussion of natural law. But if one also attends to his application of these legal terms to the natural law, one sees the error in such an interpretation. For he argues that the demands of the virtues are precepts of natural law. To see this, we have to expand our conception of law; Aquinas does not expect us to apply our previous conception of a law to morality. In this respect his account of natural law is reductive.

Aquinas' appeal to natural law is therefore important and controversial; it claims that our basic ethical principles must correspond to the requirements of our nature, and that we have some idea of what these requirements are. It does not, however, imply that we ought to learn to be virtuous by learning a set of rules and applying them to action. Nor does it imply that the right moral system is ultimately deontological, resting on a set of principles requiring types of action or states of character without reference to any further goal.

If the introduction of natural law had these implications, it would depart sharply from an Aristotelian approach to ethics, and we might seek historical explanations of such a departure. We might, for instance, appeal to the influence of ways of thinking inspired by the Decalogue. Such an explanation may explain why other people attach importance to natural law, but it is irrelevant to Aquinas. His appeal to natural law does not imply any deviation from the fundamentally teleological aspects of Aristotelian ethics. His explanation of law and natural law seeks to show that the Aristotelian framework can readily incorporate reasonable claims about natural law.

One might suppose that a conception of morality as law binding rational agents as such is sharply opposed to the teleological and eudaemonist conception of agency and morality

[78] See §302.

[79] See Anscombe, 'Modern', discussed at §114.

that we normally attribute to Aristotle.[80] But Aquinas does not see any opposition; for he believes that his eudaemonist discussion of the final good explains to us the principles that he introduces in his discussion of natural law.

[80] Schneewind, *IA* 20: 'But Thomas departs from Aristotle in holding that the laws of the virtues can be formulated and used in practical reasoning. There are laws containing precepts for all the virtues and thus providing rational guidance where we need it (1-2 q65 a3; cf. 1-2 q94 a3). Thomas does not invoke the Aristotelian insight of the virtuous agent as our final guide. For him, the virtues are basically habits of obedience to laws.' See also 287: '. . . St Thomas subordinated the virtues to the laws of nature'. Schneewind may intend to claim both (i) that Aquinas' attitude to the virtues is deontological, whereas Aristotle's is teleological, and (ii) that he accepts general rules, whereas Aristotle is a particularist. Or he may intend (ii) alone.

22

AQUINAS: PRACTICAL REASON AND PRUDENCE

316. Virtue, Will, and Practical Reason

Examination of Aquinas' account of natural law brings us back to some questions about practical reason that faced us in our discussion of the virtues and vices. He suggests that the content of the subordinate principles of the natural law has to be discovered by reasoning that leads us to the whole content of the virtues. His account of the virtues accords a similar role to practical reason. He claims that virtues belong to passions that conform to reason, and hence conform to a good will. Since practical reason directs the passions, it should fix the appropriate ends of action.

The account of virtue that accords primacy to will and practical reason fits into Aquinas' claims about the will. He argues that it is distinctive of rational agents to choose freely, by deliberation in the light of the ultimate end. If the moral virtues manifest this freedom, they include an appropriate place for deliberation and practical reason. If the characteristics that distinguish the virtuous person from the vicious could not be traced to deliberation and will, we would not be exercising our freedom in forming our moral character.

Is Aquinas entitled to the claims that he makes for practical reason in his account of virtue and passion? We have already noticed a difficulty.[1] The most obvious exercise of practical reason is deliberation; deliberation is confined to means, and does not extend to ends; hence prudence, the deliberative virtue of practical intellect, is also concerned with means, and not with ends.

Questions about the scope of prudence take us back to our discussion of Aristotle. If we suppose that, in Aristotle's view, pre-rational habituation of the non-rational parts gives us virtue of character, which determines our ends, we attribute to him an anti-rationalist view that subordinates prudence to a non-rational grasp of ends.[2] But Aristotle's claim that

[1] See §288.

[2] This pre-rational habituation is only part of what Aristotle has in mind when he speaks of *ethismos*, which also includes the development of prudence. See §87. Bradley, *ATHG* 237–9, holds that an anti-rationalist interpretation of Aristotle is correct, at least 'if we choose to remain within the limits set by the texts and not to read between the lines' (238), and so he finds a sharp contrast with Aquinas' position.

deliberation and prudence are confined to means to ends does not support an anti-rationalist view. Aquinas, following Aristotle, takes 'means to ends' (ea quae sunt ad finem) to include parts and constituents of ends. We can deliberate about which ends to pursue by asking how they contribute to a more ultimate end. Hence we can elect the virtues, and the actions expressing them, so as to choose them for their own sakes.

These claims about deliberation do not resolve all the difficulties about practical reason and prudence. How can deliberation reach the conclusions that the virtuous person reaches? Since instrumental deliberation rests on causal reasoning, we can understand how such deliberation is correct or incorrect. Deliberation about constituents is not so easy to understand. We can illustrate it by giving simple examples—deliberating about what would constitute a good meal or an enjoyable holiday—but we might doubt whether such examples show that deliberation has the scope Aquinas claims for it. In these simple examples, we need some fairly clear idea of what would be a good meal or an enjoyable holiday, in order to deliberate about its constituents. But in the case that interests Aquinas, our initial idea of the ultimate end does not seem clear enough for us to find its constituents by deliberation. We want our conception of the ultimate end presupposed by deliberation to be definite enough to provide a starting point for deliberation, and also to be indefinite enough to preserve freedom. But if it is definite enough for deliberation to start, must it not be definite enough to introduce some element in our character that is beyond our deliberative control?

In Aquinas' view, deliberation begins from an appropriate conception of the ultimate end. This conception is clear enough for the virtuous person to get the right answer about the constituents of the end, but it is also indefinite enough to leave the choice of virtuous ends in our control. Does he offer a plausible defence of this view?

In clarifying Aquinas' views on these questions, we will also clarify his views on the rational character of the will. Aquinas conceives the will as rational desire. In asserting the primacy of the will against the passions, he asserts the primacy of rational against irrational desire; but he does not intend to assert the primacy of reason over desire. A proper conception of the will must include both a cognitive and a desiring element; and we must neither assume that all rational desire is simply the product of instrumental reasoning directed towards a non-rational desire nor reduce the desire in rational desire to a mere product or epiphenomenon of practical reason. He claims that the will is, on the one hand, rational desire and, on the other, rational by participation in reason.

Aquinas, then, does not want to reduce will to practical reason, or to suggest that practical reason motivates without desire. This extreme rationalist position would reduce virtue to knowledge, as Socrates did (*ST* 1-2 q58 a2). In opposing this extreme rationalist view, Aquinas urges that something needs to be added to knowledge if we are to explain the role of practical reason in a human being's action.

The anti-rationalist position of Hutcheson and Hume claims that the different specific ends people pursue reflect their different desires, inclinations, and attitudes, and must ultimately be explained by these, rather than by their different rational beliefs about anything.[3] Anti-rationalists might agree with Aquinas' claim that reason is needed to grasp ultimate ends;

[3] See Hutcheson, *IMS* 123.

but they must interpret this to mean that we need reason to recognize what in fact we pursue as our ultimate end. This function for reason is simply the task of recognizing a fact about the actual structure and tendency of our desires; it does not require the will to be moved towards this end by any sort of reason.

It would be just about possible to interpret Aquinas as a sort of anti-rationalist, if we focussed exclusively on his claims about our grasp of the ultimate end; for he agrees that we do not have any choice about whether to prescribe the pursuit of this to the will. We must consider whether this aspect of his view implies a severe restriction on the scope of practical reason.

317. Universal Conscience and the Ultimate End

The functions of deliberation depend on a non-deliberative grasp of principles, parallel to the function of theoretical intellect in grasping principles. Theoretical intellect grasps the principles of theoretical sciences intuitively, without any further inferential justification; and Aquinas believes that this intuitive grasp of principles has a practical non-deliberative counterpart. The correct ends for human life are fixed (determinati, 2-2 q47 a15), and are the objects of our natural inclination (1-2 q51 a1; q63 a1; *Ver.* q18 a7 ad7), but grasped by practical reason. This practical reason that grasps the end is different from the practical reason that follows the desire for the end and finds means to that end. Only the second sort of practical reason belongs to prudence.[4] These two functions of practical reason deal, respectively, with universal and particular principles.[5]

This division between two roles of practical reason has no explicit Aristotelian support, but it is a reasonable expansion of Aristotle. For we need some account of how we can form the ends that are characteristic of the virtuous person. To answer this question, Aquinas introduces synderesis ('universal conscience'), which is the specific disposition of practical reason that grasps the first principles.[6] He claims that these principles are the first principles of natural law.

Aquinas inherits a conception of synderesis originally from Jerome. Discussions of Jerome treat synderesis as a universal grasp of basic moral principles that is present in us all, no matter how bad we become. It explains why even bad people retain their capacity to recognize the wrongness of what they are doing.[7] Aquinas tries to explain this capacity

[4] '. . . reason, in so far as it grasps the end, precedes desire for the end (cf. q12 a1 ad1, 3), but desire for the end precedes reason reasoning towards electing the things that are towards the end, which belongs to prudence' (1-2 q58 a5 ad1).

[5] 'About the universal principles of things to be done a human being is rightly disposed through the natural understanding of principles, through which a human being cognizes that nothing bad is to be done, or also (vel etiam) through some practical science. But this is not enough for reasoning correctly about particulars' (1-2 q58 a5). Cajetan ad loc (= L vi 378 §viii) takes 'or also' to introduce prudence as scientia, contrasted with intellectus of the principles.

[6] 'Synderesis' should perhaps be translated 'observance'; see Lampe, *PGL* s.v. *suntêrêsis*, §2. Synderesis is a topic of discussion in mediaeval philosophy independent of reflexion on Aristotle; Aquinas is the first writer to connect the discussion systematically with Aristotle. See Lottin, *PM* ii 103; Potts, *CMP* 10; Crowe, *CPNL* 123–7 (who argues against reading 'synderesis' in Jerome).

[7] Jerome introduces synderesis in his discussion of *Ezekiel* 1:5–10. He mentions that many people take the face of the eagle to represent a fourth part of the soul that is superior to the other three Platonic parts. It displays 'sparks as of the appearance of shining bronze' (scintillae quasi aspectus aeris candentis, 1:7). Jerome identifies the sparks with *synteresis*,

through an Aristotelian account of practical reason. He follows his predecessors in citing Aristotle's claim that all intellect is correct (*DA* 433a26; *in DA* iii 15 §§826–7).[8] Since Aristotle could not reasonably claim that every exercise of practical intellect is correct, he must, in Aquinas' view, be thinking of practical intellect applied to ultimate principles.[9] This is where he needs an infallible grasp of principles. In the theoretical sciences, the truth of conclusions derived from the principles depends on the correctness of our grasp of principles. Equally, we must grasp the principles of practical reason.[10] The practical principles that guide our natural inclination are naturally known, as the first principles of theoretical sciences are (1-2 q63 a1; 2-2 q47 a6). The special faculty that grasps ultimate practical principles is synderesis (1a q79 a12).

Aquinas, therefore, identifies synderesis with the Aristotelian intellect that grasps first principles.[11] He believes that Aristotle himself recognizes this function for practical intellect. Synderesis is always correct because it grasps the ultimate first principles, and we cannot be mistaken about them. Hence it can fulfil its function—as described by Jerome on Cain—of 'protesting against evil' (remurmurare malo).

Earlier writers use 'conscientia' to apply indifferently to our grasp of ultimate principles and to our grasp of what we should do in this or that particular situation. Aquinas

a capacity, present even in bad people, to grasp the rightness and wrongness of particular actions: '. . . that spark of conscience (scintilla conscientiae) which was not extinguished in the breast of Cain after he was turned out of Paradise, and by which we discern that we sin, when we are overcome by pleasures or frenzy and sometimes even deceived by a likeness of reason itself' (Jerome, *in Ezech*. 1.7). Jerome believes that conscience is not effective in everyone; he cites *Jeremiah* 3:3, 'Yet you have the forehead of a whore; you refuse to be ashamed'. But he treats it as a moral capacity superior even to reason. Jerome's comment becomes part of mediaeval discussion on conscience because Peter Lombard cites it among authorities for the view that a human being naturally wills good; he takes Jerome to refer to 'the superior spark of reason' (*3Sent*. d39). Aquinas refers to Jerome at *Ver*. q16 a1 obj1; a3 sc2.

[8] For earlier evidence see Lottin, *PM* ii 132, 167. Aquinas' predecessors cite this claim without trying to integrate universal conscience into an account of Aristotle on practical reason, but Aquinas tries to show how Aristotle's outlook includes universal conscience.

[9] Aristotle himself probably does not recognize a role for non-inferential 'understanding' (*nous*) in grasping ultimate practical principles. One might appeal to *EN* 1143a35–b5 to argue that he recognizes such a role. Aquinas, however, wisely avoids this interpretation of the passage; see *in EN* vi 9 §§1247–55.

[10] 'And so, in human actions also, in order for some correctness in them to be possible, it is necessary for there to be some permanent principle that has unchangeable correctness, a principle by reference to which all actions are examined, so that this permanent principle resists everything evil and assents to everything good. And this principle is synderesis, whose task it is to protest against evil and to tend towards good' (*Ver*. q16 a2).

[11] '. . . so also in practical reason some things preexist as principles naturally known; and of this sort are the ends of the moral virtues, because the end in things to be done is related as the principle is in theoretical matters, as was said above. [See 2-2 q23 a7 ad2; 1-2 q57 a4.] Some things are in practical reason as conclusions; this is the character of the things towards the end, which we arrive at from the ends themselves. These are the concern of prudence, applying universal principles to particular conclusions about things to be done. And thus it does not belong to prudence to fix the end for the moral virtues, but only to arrange about the means to the end' (2-2 q47 a6). 'What fixes the end for the moral virtues is the natural reason which is called universal conscience' (q47 a6 ad1). 'And so, just as in theoretical reason there are innate principles of demonstrations, so also in practical reason there are innate ends that are connatural to a human being. And so about these <principle> sthere is no state of possession that is acquired or infused, but one that is natural, as universal conscience is, in whose place the Philosopher places understanding in matters of action. . . . [P]rudence is in practical reason in so far as it treats of things that are towards the end. But because the natural tendency towards an end comes from the one who constitutes (praestituente) nature, who assigns this sort of direction to nature, for that reason the natural tendency of the will towards the end is not from reason, unless in accord with a natural communication, by which it results that desire joined with reason tends naturally to conforming itself to reason as standard (regulae). And from this it results that the will tends naturally towards the end that is naturally placed in reason' (*3Sent* d33 q2 a4 sol.4 = P vii 365a). Aquinas says nothing in support of this interpretation of Aristotle in his commentary on the relevant part of the *EN*.

believes that this broad use of 'conscientia' is confusing. We should confine it to our grasp of particulars, and use 'synderesis' for our grasp of the ultimate principles. To capture Aquinas' distinction, we may render 'synderesis' by 'universal conscience' and 'conscientia' by 'particular conscience'. The distinction helps to clarify Jerome's view. When Jerome says that conscience can be overcome, he refers to the failure of particular conscience to recognize that a particular action, or a specific type of action, is wrong. The spark of conscience that is not extinguished in anyone is universal conscience.[12]

Practical intellect, exercised in universal conscience, is prior to the desire for the end, since apprehension precedes desire (1-2 q58 a5 ad1); but the desire for the end precedes the election of the means, which concerns prudence. Virtue aims at the right end not because of prudence, but because of universal conscience. The truths that concern universal conscience are sharply contrasted with those that concern prudence; for the right ends of human life are 'fixed' or 'definite' (2-2 q47 a15), whereas the means to these ends are not fixed, and hence are subject to the deliberative virtue of prudence.[13]

How should we connect this moral insight belonging to universal conscience with the moral convictions that we form through the moral virtues? If universal conscience is a source of moral principles independent of the moral virtues, Aquinas seems to recognize two distinct, and possibly conflicting, sources of moral principles. The moral virtues have a eudaemonist focus; the right actions depend on the different ways in which the will ought to control the passions for the ultimate good of the agent. If universal conscience is a separate source of moral principles, it may lack this eudaemonist focus.

Moreover, Aquinas' doctrine of universal conscience may well appear to require a strongly rationalist and non-deliberative interpretation or reconstruction of Aristotle's views on practical reason.[14] The rational understanding that belongs to universal conscience is non-deliberative, and so is distinct from the understanding that belongs to prudence. Aquinas' appeal to an analogy with theoretical demonstration suggests that he may be substituting a deductive for a deliberative account of practical reason. If he does this, he takes practical reason to be analogous to theoretical reason in ways that Aristotle does not seem to contemplate. Unlike Aristotle, he appeals to self-evident basic ethical principles and to derivative principles that are (apparently) to be deduced from them.

If he attributes this role to universal conscience, Aquinas correspondingly reduces the role of deliberation in practical reason. The only function that Aristotle explicitly attributes to practical reason is deliberation, but it has often been supposed that this cannot be the only function he has in mind. Aquinas may be influenced by this argument: (1) Deliberation is about means to ends and has to assume some initial grasp of ends. (2) This initial grasp of ends must be a function of practical reason. (3) Hence it must be intuitive rather than deliberative. (4) Hence it must consist in a grasp of self-evident principles. We need to see whether Aquinas' remarks on universal conscience imply this strongly foundationalist and demonstrative picture of practical reason.

[12] See *2Sent* d39 q3 a1 = P vi 740a; *Ver.* q17 a2 = M 331a.

[13] See 2-2 q47 a15: sed ea quae sunt ad finem in rebus humanis non sunt determinata.

[14] On synderesis and Aristotelian practical intellect cf. Bradley, *ATHG* 240. He finds a sharp contrast between Aristotle and Aquinas partly because he holds an anti-rationalist view of Aristotle on desire and practical reason. See §89.

318. How Universal Conscience Grasps Natural Law

To see where Aquinas stands on these questions, we may consider his views on the relation of universal conscience to natural law. We saw that he follows St Paul in taking human beings to be a law to themselves, because of their universal knowledge of natural law. He also agrees with St Paul in attributing this universal knowledge to conscience, but he tries to be more precise.

The sources that he discusses use 'conscientia' (or the underlying Greek *suneidêsis*) indiscriminately. To clarify their views, he needs to say whether a given remark refers to particular or to universal conscience. When Damascene describes conscience as the law of our intellect (*Ver.* q17 a1 sc1), Aquinas applies the description to universal rather than particular conscience.[15] Similarly, he takes St Paul's remarks on conscience to mean that universal conscience grasps the natural law, whereas particular conscience applies the principles of the natural law to actions.[16]

This connexion of the natural law with universal conscience helps to explain how rational agents necessarily grasp the natural law. For universal conscience differs from particular conscience in being infallible and inextinguishable.[17] The source of moral error is not the loss or corruption of universal conscience, but the errors we make in applying it in the exercise of particular conscience. The first principle of natural law is grasped infallibly and inextinguishably by everyone.

It is difficult to say how many of the precepts of natural law are within the proper scope of universal conscience. On the one hand, universal conscience is infallible in everyone. On the other hand, it protests at evil-doing, as it does in Cain. But these two features are difficult to reconcile. For if it is infallible, it cannot include any of the mistakes that lead the bad person astray; hence its principles need to be very general and schematic. But if it protests, it must include precepts that are specific enough to expose the bad person's errors.[18]

Universal conscience does not extend to precepts of natural law at the lower levels.[19] The fourth class, determinations of natural law, are not requirements of natural law itself. The third class, consisting of the less obvious derived precepts, are not first principles of natural law, whereas universal conscience is confined to first principles.

It is difficult to decide whether universal conscience grasps all the precepts at the first and second levels. Precepts at the second level, including the Decalogue, are obvious consequences of the principles of natural law, but they are not the most obvious precepts of all, since they are derived from precepts prohibiting harm.[20] But Aquinas sometimes seems to imply that universal conscience does not grasp precepts at either of these levels. Some people do not accept them; if they fell within the scope of universal conscience, then,

[15] 'It should be said that conscience is the law of our intellect because it is the judgment of reason, derived from natural law', *Ver.* q17 a1 ad sc1. See also a2 ad4; *ST* 1a q79 a13.

[16] 'One is said to be conscious to oneself through the natural law in the way of speaking in which one is said to consider in accordance with principles, but [one is said to be conscious to oneself] through conscience in the way of speaking in which one is said to consider by the very act of consideration' (*Ver.* q17 a1 ad sc2; cf. a2 ad6).

[17] See *Ver.* q16 a2, quoted in n10 above.

[18] On the extent of infallible moral knowledge see *in DA* iii 15 §826; *in EN* v 12 §1018; *2Sent.* d24 q2 a3.

[19] See §314.

[20] 'The precepts of the Decalogue are first precepts of law, and precepts to which natural reason assents at once as most obvious' (2-2 q122 a1). See Finnis, *NLNR* 51.

apparently, universal conscience would be mistaken in these people, and would not be infallible, as Aquinas claims it is. People's grasp of the natural law does not always lead them to the right conclusions, even on simple moral questions.[21] That is why the written law is needed to correct the natural law.

To explain the extent of error, Aquinas distinguishes the common first principles, which are always valid and always recognized by everyone, from the secondary precepts, which have exceptions and are not always recognized by everyone. The common first principle of acting in accordance with reason is always valid and always recognized, and hence never lost through error. The precept of returning deposits follows from this common first principle as a precept valid for most cases; but it has some exceptions, and people can be in error about it.[22] Passions or bad habits or a bad natural condition may distort one's grasp of a secondary precept; the Germans, for instance, found nothing wrong in theft 'even though it is expressly contrary to the law of nature' (1-2 q94 a4).[23] In these cases, apparently, we go wrong because we do not accept a principle, not because we fail to see how our principle applies to this case.

Aquinas suggests that the destructible precepts are those that have exceptions. The rule of restoring deposits has genuine exceptions, and we need to reason about the cases in which it ought not to be followed (q94 a4). Since there is room for such reasoning, there is also room for us to mislead ourselves into thinking the principle is never valid, or that the exceptions are so numerous that we need not restore deposits except when it suits us. The true belief that the precept has exceptions gives an opening for the sophistical and self-serving reasoning (explicit or implicit) that challenges the precept even on the occasions when it should be observed.

319. Why Universal Conscience is Indestructible

To clarify Aquinas' claims about the scope of universal conscience, we may examine his claim about indestructibility. Acceptance of the very first principle, that good is to be done and evil avoided, is not a merely anthropological or psychological fact, but a defining feature of a rational agent. Similarly, someone who did not accept any principle of acting in accord with reason would be unwilling to consider an action with reference to what is good all things considered; and someone who did not consider actions from this point of view would not be a rational agent at all.

The indestructible principles, then, seem to be those that are necessary for being a rational agent open to moral evaluation. These are indestructible in a rational agent, because their destruction would transform a rational agent into something else. If we became entirely indifferent to questions about the overall goodness of her actions, we would no longer be agents open to moral assessment. However vicious a rational agent becomes, some principles cannot be destroyed in him. An agent in whom they were destroyed would no longer be morally vicious, but would display some non-moral type of badness that would not

[21] '. . . the law of nature in some people's hearts, as it concerns some matters, is corrupted to the extent that they regard as good things that are naturally bad' (q94 a5 ad1).

[22] Scotus exploits these exceptions to argue for divine dispensations. See §379.

[23] Cf. q94 a6; q99 a2 ad2.

reflect a bad state of character. Since universal conscience grasps this universal aspect of the natural law, it cannot be destroyed, even in vicious people.[24] It does not grasp the precepts of the Decalogue. The wrongness of theft is obvious not to all those who think about it, but only to those whose thought is free of corrupting influences (such as those that affected Caesar's Germans). The precepts that are obvious to everyone who thinks about them are the higher precepts about acting according to reason and (perhaps) about refraining from harm. These are the principles whose acceptance is a condition of being a rational agent.

Aquinas has a good reason, therefore, for believing that universal conscience is infallible and indestructible in everyone. His belief does not rest on optimism about the moral sensitivity of every human being; it rests on conditions for rational agency. These are the same conditions that Aquinas develops and clarifies in his account of the will, of responsibility, and of the virtues. Rational agents, as he understands them, have an indestructible grasp of these conditions. His account of universal conscience does not introduce a new claim about human moral knowledge; he simply returns to the basic characteristics of a rational will.

This explanation of indestructibility supports Aquinas' view that universal conscience grasps the first principles of natural law. The awareness of natural law is also indestructible; everyone has some grasp of it, just by being a rational agent. He does not believe that the indestructibility of the natural law is merely contingently connected to being a rational agent. Since he takes the connexion to be necessary, he believes it is captured in the teleological character of rational agency.

But this austere conception of universal conscience faces an objection. Universal conscience protests at evil-doing, but the precepts that it grasps seem too schematic to protest at anything. Could Cain not have accepted all the highest principles of the natural law, and still have claimed to be justified on this occasion in killing Abel? If universal conscience is indestructible in rational agents because it is necessary for rational agency, it is present even in rational agents who make the wickedest conceivable choices. It can protest against these choices only if they violate the conditions of rational agency; but Cain's choice seems to be compatible with being a rational agent.

Aquinas might reply that if Cain is a rational agent, he has some regard for human society and for other rational agents. He does not believe in general that other people should simply be treated either as mere resources for securing his ends or as mere obstacles in his way. But he thinks he is allowed to make an exception to his general attitude because of his rivalry with Abel, even though he could not justify this exception if he were challenged. Evildoers do not really act on the basis of a considered conception that connects their action with the ultimate practical principles they accept. On the contrary, they fail to act on their ultimate principles, and their failure is to be explained by the bad influences—passion, custom, and so on—that Aquinas mentions. Cain killed Abel because he resented Abel's success, and

[24] 'And in this way it is impossible for universal conscience to be destroyed in the universal case, but it is extinguished in a particular case whenever someone sins in election. For the power of appetite or of some other passion so absorbs reason that in election universal conscience does not apply the universal judgment to the particular action. But this does not extinguish universal conscience without qualification, but in a particular respect' (*Ver.* q16 a3). 'He is indeed corrupted about the principles of things to be done, not indeed in the universal, but in the particular thing to be done—namely, in so far as reason is abased through the state of vice, so that he does not apply the universal judgment in electing its particular thing to be done' (*Ver.* q16 a3 ad3).

failed to subdue his sinful desire (*Gen*. 4:7).[25] He did not attempt to justify what he had done; he did not even admit he had done it.[26] Cain acted on the good presented to him by passion, not on the good implied by his ultimate convictions or assumptions about good and evil.

The vicious person accepts the correct principles grasped by universal conscience. His error is the result, as Aquinas says, of 'the custom of sinning'.[27] The error is 'about particulars', in the sense that it is about specific and determinate ends; but it is not confined, as incontinence is, to particular occasions (1-2 q77 a2). The vicious person is wrong about the specific ends that are worth pursuing. His convictions do not result from a serious effort to reach a rational conception of the good from the ultimate practical principles grasped by universal conscience; they result from ignoring these principles and their implications, because at the moment some particular goods seem immediately attractive.

This description clarifies the protesting function of universal conscience. The vicious person does not always recognize that his action violates the ultimate practical principles he accepts; but he accepts principles whose clear implications forbid the vicious actions he chooses. The 'protest' of universal conscience is silent; the vicious person would see his error if he considered the clear implications of the ultimate principles he accepts. Like Cain, the vicious person does not try to justify his actions by reference to ultimate practical principles. He does not, for instance, believe he has some good reason that he can defend to other people for stealing or killing, and he does not deny that human society requires a prohibition on killing or stealing; he simply does not face these questions when he forms a conception of the good under the influence of his passions.

Even the vicious person, therefore, grasps the common first principles. Some of the principles embodied in the Decalogue are obvious consequences of the common first principles, and people naturally recognize them as consequences, but not everyone consistently accepts them. Those who do not accept them are diverted from the normal and natural course of reasoning because their reason is depraved 'from passion, or from bad customs or from a bad natural state' (q94 a4). The common principles cannot be destroyed from human hearts in their universal character, but the natural law can be destroyed 'in a particular action to be done (operabili), in so far as reason is impeded from applying a common principle to a particular action to be done, because of appetite or some other passion' (q94 a6).[28]

We noticed earlier that Aquinas' appeal to universal conscience and natural law might be taken to suggest a strongly deductive picture of practical reason, filling a gap in Aristotle's account by appeal to ultimate principles intuitively known, from which other practical principles are reached by deduction. We can now see, however, that this would be a mistaken interpretation of Aquinas; the principles grasped by universal conscience are necessary features of rational agency. They lack the sort of moral content that would allow us to say that we grasp basic moral principles by intuition and deduction. If Aquinas had claimed

[25] 'But if <you act> badly, sin will at once be at the door; but its desire will be under you, and you will master it' (*Gen*. 4:7 Vulg.).

[26] See *Gen*. 4:9; 'I do not know; am I my brother's keeper?'

[27] See 1-2 q99 a2 ad2; *Mal*. q3 a12 = M 516a.

[28] Both of these deficiencies, in applying the most common principles and in recognizing the principles derived from them, make it appropriate for divine law to enjoin on us even the principles that we can know by reason (1-2 q99 a2 ad2). The divine law need not cover the principles that are not obscured by sin, but it must cover those that are obscured by sin, even if these principles are obvious to anyone who reflects clearly without being biased by a tendency to sin (1-2 q100 a5 ad1; 2-2 q22 a1 ad1).

that, for instance, we know the precepts of the Decalogue by intuition and can therefore treat them as ethical axioms, he would be adding an important claim to Aristotle that would turn Aristotle's theory in a definitely intuitionist direction. This, however, is not Aquinas' view of the Decalogue; for he suggests that our tendency to draw mistaken conclusions from the most common principles is the reason why God revealed the Decalogue to us (q99 a2 ad2). If he had supposed that we have non-inferential knowledge of principles at the level of the Decalogue, he would not have given this explanation of our tendency to error.

Since universal conscience is infallible and indestructible, it does not grasp the specific end that guides the virtuous person. The end grasped by universal conscience is common to virtuous and vicious people, whereas the virtuous person has a more detailed conception of this end, ruling out the exceptions that vicious people allow themselves. Aquinas' claims about the proximate end of the virtuous and the vicious person show that the vicious person's error does not consist simply in his misdirected appetites; it also consists in deliberative error that prevents him from seeing that the virtuous person's end is the way to achieve happiness.

Something must mediate, therefore, between universal conscience and the virtuous end.[29] Since the natural law includes specific principles that are not within the scope of universal conscience, we need the intellectual virtue that grasps them. The prescription of universal conscience commits us to the further principle: 'It is reasonable to impose whatever control over appetite is needed for action in accordance with reason'. But this principle does not identify a specific and determinate type of control over appetite. To find the more specific principles that identify the right kinds of actions, we need to proceed 'by rational inquiry' (per rationis inquisitionem, 1-2 q94 a3). To see where the vicious person goes wrong, we need to examine the type of 'rational inquiry' that Aquinas introduces to discover the principles of the virtues.

320. How Prudence Discovers Ends

The intellectual virtue that allows us to engage in this rational inquiry successfully is prudence. If prudence is a deliberative virtue, the rational inquiry that takes us from the universal to the specifically virtuous end is deliberative inquiry. But this conclusion may surprise us if we remember that deliberation is restricted to discovering means to ends. If this restricted role for deliberation prevents it from discovering specific ends that embody

[29] 'For just as reason in theoretical matters is derived from principles known through themselves, the state possessing which is called understanding (intellectus), so also it is necessary that practical reason be derived from principles known through themselves, e.g., that what is bad is not to be done, that the precepts of God are to be obeyed, and so on for other cases; and the state possessing these is called universal conscience. For this reason I say that universal conscience is distinguished from practical reason not through the substance of the capacity, but through the state, which is in a certain way innate in our mind from the very light of the active intellect, in the same way as the state that possesses theoretical principles (e.g., that every whole is greater than its part, and so on) <is innate in our mind>' (*2Sent*. d24 q2 a3 = P vi 600b). 'This very thing that is being conformed to correct reason is the proper end of each moral virtue. For temperance aims at (intendit) this, namely that a human being should not deviate from reason because of appetites; and similarly <the aim of> bravery is that a human being should not deviate from the correct judgment of reason because of fear or rashness. And this end is fixed for a human being in accordance with natural reason; for natural reason instructs each person to act in accordance with reason' (2-2 q47 a7).

universal ends, some non-deliberative function of prudence is needed for the formation of the specifically virtuous end.[30]

To see what function Aquinas intends for prudence, we should see how he describes the inquiry that discovers the virtuous end. The vicious person has only the 'prudence of the flesh' that is mentioned by St Paul, whereas the virtuous person has genuine prudence, the 'prudence of the spirit'.[31] Since genuine prudence 'arranges' the different ways in which the different virtues achieve the mean that consists in acting in accord with reason, prudence finds the virtuous end.[32]

The specific end of the virtuous person is the proximate as opposed to the ultimate end of virtue. The proximate end is an object of election, in so far as it is chosen as a way to realize the ultimate end. Since Aristotle claims that virtue makes the end right, Aquinas says that aiming at the correct end is an act of moral virtue 'principally'. But since the aiming is a result of the correct election, it must be a result of deliberation, which is the basis of election. Since prudence is the deliberative virtue, correct aiming is an act of prudence 'originally', since it results from the exercise of prudence. Prudence does not simply find ways to achieve the virtuous end in specific types of cases; it also discovers the virtuous end by deliberation, and thereby fixes the end for virtue.[33] Deliberation finds 'the things towards' the universal end of acting in accordance with reason. If we find the way to achieve the universal end, we have

[30] This argument may influence Westberg, *RPR* 165–7.

[31] *Rm.* 8:6 (Vulg.), 'for the prudence of the flesh (prudentia carnis: Gk *phronêma sarkos*) is death'. See 2-2 q47 a13.

[32] '. . . prudence is correct reason about matters for action, as the Philosopher says in *Ethics* VI (c.4). Now correct reason about things to be done presupposes one thing, and produces three things. For it presupposes the end, which counts as (sicut) the principle in things to be done, just as theoretical reason presupposes principles from which it demonstrates. But correct reason in matters of action produces three things: First, it deliberates correctly; secondly it judges correctly about the results of deliberation; thirdly, it prescribes (praecipit) correctly and steadily (constanter) what has been reached by deliberation. And so for the prudence of the flesh it is required that someone presupposes as the end what is pleasing to the flesh, and that he deliberates about, and judges about, and prescribes, the things that are appropriate for this end . . . Prudence of the spirit is spoken of, in accordance with what has been said, when someone, having presupposed the end of spiritual good, deliberates, judges, and prescribes the things that are appropriately directed to this end' (*in Rm.* 8:1 = P xiii 76b). The role ascribed to prudence here applies to the acquired virtues, as opposed to the infused virtues.

[33] '. . . For the perfection of a moral virtue three things are necessary. The first is the presentation of the end. The second is the tendency towards the end that has been presented. The third is election of the things towards the end. Now the proximate end of human life is the good of reason in common; hence Dionysius says that human evil is to be against reason. That is why the aim in all moral virtues is to lead passions and actions to the correctness of reason. Now correctness of reason is natural; hence the presentation of the end belongs to natural reason and precedes prudence, just as the understanding of principles precedes scientific knowledge (scientiam). That is why the Philosopher says, in Ethics VI, that prudence has as its principles the ends of the virtues. But this good of reason is determined in so far as a mean in actions and passions is constituted by the right (debitam) proportion of circumstances, which prudence brings about. And so the mean of moral virtue, as is said in Ethics II, is in accord with correct reason, which is prudence; and so in a certain way prudence presents the end to the moral virtues, and its action is mixed in their actions. But the tendency towards that end belongs to moral virtue which consents to the good of reason in the natural way (per modum naturae); this tendency towards the end is called election, in so far as the proximate end is directed towards the ultimate end. And that is why the Philosopher says, in Ethics II, that moral virtue makes the election correct. But the discernment of the things by which we can achieve this good of reason, in actions and in passions, is an act of prudence; hence the presentation of the end precedes the act of prudence and of moral virtue; but the tendency towards the end, or correct election of the proximate end, is an act of moral virtue principally, but of prudence originally. Hence the Philosopher says that correctness of election belongs to the other virtues from prudence, just as correctness in natural aiming comes from divine wisdom directing nature. And in accord with this the action of prudence is also mixed in the actions of the other virtues. For just as the natural tendency <towards an end> comes from natural reason, so also the tendency of moral virtue comes from prudence; but election is of the things towards the end, in so far as election involves (importat) a precept of reason about pursuing these things' (*3Sent.* d33 q2 a3 = P vii 362a).

found the distinctive end of the virtuous person.[34] Neither virtue nor prudence presents (praestituere) the universal end, but prudence finds the things 'towards' it.[35] It presents the specifically virtuous end as a result of deliberation about how to realize the universal end presented by universal conscience.[36]

Some of Aquinas' successors mark the different roles of prudence by identifying two different type of prudence. 'Universal' prudence takes us from the universal end to the specifically virtuous end. It begins from the precept of acting in accordance with reason and reaches the conclusion that we should (for instance) modify our tendency to fear so that we are ready to face danger in the right causes. From this deliberation we conclude that we should cultivate bravery. 'Particular' prudence takes us from the specifically virtuous end to the right actions. It assumes that bravery is a virtue, and considers what it would be brave to do in these circumstances.[37] Though Aquinas himself does not explicitly distinguish universal from particular prudence, he recognizes the two different tasks for prudence that underlie this division. He attributes to prudence the scope that is assumed by those who speak of the two types of prudence.

Prudence, therefore, directs all the moral virtues.[38] This directing does not extend simply to the choice of means to the ends of the different virtues; this is the task of particular prudence. It also includes the fixing or 'presenting' (praestituere) or 'determining' (determinare) of the end. The specific determination that he mentions is the determination of the mean that constitutes moral virtue; this determination is a task for universal prudence.[39] Prudence discovers the right proximate end, a specific sort of mean, by reflexion on the common end. The presentation of the proximate end precedes the discovery of the right action by particular prudence, but it does not precede every operation of prudence; it presupposes that universal prudence has discovered the proximate end by reflexion on the ultimate end.[40]

[34] 'But in what way and through what things a human being in acting is to reach the mean of reason—this belongs to the arrangement [dispositionem; v.l. 'rationem'] made by prudence. For, granted that reaching the mean is the end of moral virtue, still the mean is found by the right arrangement of the things that are towards the end' (2-2 q47 a7).

[35] 'The end does not belong to the moral virtues as themselves presenting the end, but because they tend towards the end that is presented by natural reason. They are helped to do this through prudence, which prepares the way for them, by arranging (disponendo) the things that are towards the end. Hence the remaining possibility is that prudence is nobler than the moral virtues and sets them in motion. But universal conscience sets prudence in motion, just as understanding of principles sets science in motion' (2-2 q47 a6 ad3).

[36] On prudence and the Decalogue see 2-2 q56 a1.

[37] Evidence of this development is traced by Lottin, *PM* iv 551–626. He mentions James of Viterbo (561); Henry of Ghent, *Quodl.* v 17; xii q14; Godfrey of Fontaines, *Quodl.* ii 11; the Paris MAs (626).

[38] 'Prudence directs the moral virtues not only in electing the things towards the end, but also in presenting the end. For the end of each moral virtue is to attain the mean in its proper matter; and this mean is determined in accord with the correct reason of prudence' (1-2 q66 a3 ad3). See also 1-2 q21 a2 ad2; q58 a2 ad4; 2-2 q119 a3 ad3.

[39] Hughes, BF xxiii 209n, seeks to explain why this claim is not in conflict with the passages on prudence as concerned with means (1-2 q57 a4; 2-2 q47 a6): 'Prudence presupposes a right attitude, *appetitus*, to moral ends, then prescribes where these are to be found here and now'. This answer seems to underestimate the role that Aquinas has in mind in this passage (which is not simply concerned with finding the mean here and now), and fails to ask how the 'right attitude' can be formed without some prior contribution by prudence. One might have looked for clarification of Aquinas' remark about fixing the end in his comments on Aristotle's claim that prudence is the 'true apprehension (*hupolêpsis*) of the end', *EN* 1142b33. But he reproduces the passage without comment at *in EN* vi 8 §1233. See §324n1.

[40] '. . . it is necessary that through reason, which prudence perfects and makes correct, the end should be presented (praestituere) to the other virtues—not only the common end, but also the proximate end, which is to attain the mean in the proper subject-matter <of a virtue>. Now a mean is determined in accordance with correct reason, as is said in *Ethics* II. Secondly, through correct reason comes the tendency of the virtues towards their proper end, which is aiming at the end in acquired virtues, in so far as from actions regulated by reason the state of virtue causing the aim just mentioned is

This account of the prudent person's deliberation explains the division of labour that is implied in the claim that virtue grasps the end and prudence finds the means. While this division of labour implies two distinct roles, it does not imply that either is prior to or independent of the other. On the contrary, the grasp of the end that is proper to virtue is the product of the grasp of the means that is proper to universal prudence. For the 'means' grasped by universal prudence specify the schematic ultimate end, and so they are suitable ends for the virtuous person. While a virtuous person acts because of the good that is characteristic of his specific virtue, he also pursues the ultimate end. The good specific to a virtue is its proximate end, and universal prudence discovers this by reference to the ultimate end (2-2 q123 a7).[41]

We need not suppose, then, that universal prudence reaches the specifically virtuous end from the universal end by some non-deliberative process. Aquinas' account of the ultimate end, deliberation, and election explains how prudence discovers a specific end by deliberation. He relies on a function of deliberation that he needs in his argument about freedom, happiness, and the virtues.

Our necessary desire for the ultimate end does not severely restrict the scope of practical reason. The desire that is presupposed is schematic; it aims at an end with a certain structure, but leaves the discovery of the content to further rational reflexion. The schematic, structural desire for the ultimate end is not distinctive of virtue, since it is common to all rational agents, and is not subject to their will; it is necessary for rational and free agency. Similarly, universal conscience is not a non-deliberative capacity for reaching the ends of the virtuous person. For universal conscience is common to virtuous and vicious people; it recognizes the common end of acting in accord with reason, but it does not specify this common end as the virtuous end.

Nor does Aquinas fill any gaps in his account of deliberation by appeal to natural law. He does not appeal to our innate awareness of general moral principles in order to explain how we reach the ends distinctive of the virtues. The first principle of natural law is the general form of rational agency that belongs to universal conscience. To reach more specific principles, we need rational inquiry, which is the task of deliberation and prudence. Different conceptions of the good result from different views about goods that are 'means' to the ultimate end. Happiness is 'constituted' of these goods and 'consists' in them.[42] In finding the means to the ultimate end we find the proximate end for the virtues.

This conclusion fits Aquinas' general views about rational agency and will, and the view of freedom that rests on his conception of agency. Freedom and virtue require rational agents who aim at a conception of the ultimate end; for deliberation would not be essentially comparative and essentially focussed on the overall good unless it were based on desires with the appropriate structure. But this structure still leaves it open to agents to fix the more determinate ends they will pursue. Rational agents fix these ends by their rational capacities, in contrast to non-rational agents who are 'determined to one end'.

brought about; and with reference to this, prudence is said to be the mother of the virtues. Thirdly, through prudence the way is made correct for each virtue, which tends towards <the correct> end in so far as through deliberation and election the useful is separated from the harmful in relation to the end of the virtue; and with reference to this, prudence is said to be the mediator and guardian of the virtues' (*3Sent*. d33 q2 a5 sol. = P vii 366a).

[41] Cf. *in EN* iii 15 §549.

[42] See 1-2 q1 a5 ad1; a6 ad2.

Aquinas uses this point to reconcile Aristotle's belief that election is confined to means with his claim that virtue makes the election right. An objector argues that in making the election right virtue must itself elect, and that since what virtue makes right is the end, it must be possible to elect ends, and not only means (1-2 q13 a3 obj1). In reply Aquinas allows that virtue elects, and that ends are subject to election, but he repeats that only means can be elected. The ends that virtue grasps are subject to election because they are directed towards the ultimate end.[43] Since we can elect ends that are directed towards the ultimate end (q13 a3 ad2), we can elect virtues through deliberation. Since our necessary pursuit of happiness does not make us aware of what happiness actually consists in, we can acquire merit by following the right view of what happiness consists in.[44]

These passages on deliberation and happiness explain how universal prudence takes us from the universal end grasped by natural reason to the specifically virtuous end. Prudence considers those things by which one achieves happiness;[45] to consider this question adequately, it must deliberate about different possible conceptions of happiness.

Just as Aristotle sometimes obscures the central role of deliberation in his account of prudence and the virtues, Aquinas sometimes obscures it too, though he clarifies it more than Aristotle does. His Aristotelian claims about virtue grasping the end, and his non-Aristotelian claims about natural law and universal conscience, might understandably encourage us to assign a more limited role to deliberation and to prudence than we have found in Aquinas. But the extended role that we have found fits his account of will, happiness, and virtue. This role helps to explain features of morality through features of rational agency.

321. How Prudence Forms the Virtuous Motive

Since prudence discovers the specifically virtuous end, it is needed for the correct election involved in acting virtuously. Prudence ensures the right motive for the action; for the prudent person's deliberation about happiness results in the right determinate conception of happiness, and this conception forms the end of the virtuous person's actions. Aquinas follows Aristotle not only in claiming that prudence requires the moral virtues (1-2 q57 a4; q58 a3; a5), but also in claiming that they require prudence (q57 a5; q58 a4). His reason for the second claim is Aristotelian. Moral virtue requires not only the right action, but also the right way of doing it. The right way of doing it must proceed from reason, not only from impulse or passion (q57 a5);[46] to proceed from reason it must proceed from correct election.

If correct election were concerned only with relatively low-level, technical choices, it would not be an obviously necessary condition for virtue. To say that virtue requires the right election would be to claim that agents who know the right sorts of things to pursue, but just lack the causal information needed to find them, cannot be virtuous. But this is not what Aquinas means. When he claims that virtue requires correct election, as opposed to

[43] '. . . the ends proper to the virtues are directed towards happiness as the ultimate end; and in this way there can be election of them' (q13 a3 ad1).

[44] See *Ver.* q22 a7, quoted at §273.

[45] ea quibus pervenitur ad felicitatem, 1-2 q66 a5 ad2.

[46] On this condition see §285.

impulse or passion, he means that reason produces the appropriate motive for choosing the virtuous action.[47] If we are guided by prudence, we do the generous action, say, for the right reason, and not simply because we have a generous impulse (q24 a3 ad1; q77 a6 ad2). The distinctive feature of the right reason is not the fact that it rests on correct causal information, but the fact that the person acting on the right reason cares about the appropriate aspect of the virtuous action (cf. q65 a1; q19 a7 ad2). Those who do the generous action from the right motive are not generous because they believe that the generous action will have precisely this effect on the other person, but because they act on their settled conviction about the value of this sort of action. Their conviction expresses the agent's conception of the ends worth pursuing, not simply her views about the most effective way to reach the ends she has set herself. That is why prudence is necessary for the perfection of the reason that is involved in election, and so necessary for moral virtue (q58 a4 ad1). The correct election of the virtuous person rests on a true conception of the ends worth pursuing, and prudence forms this conception.

This conclusion reconciles Aquinas' views about virtue with his views about freedom, responsibility, and practical reason. He believes that we are free to be either virtuous or vicious and are responsible for being one or the other. In his view, freedom belongs to the will in so far as it is capable of acting on the results of deliberation about alternatives.[48] This deliberation about alternatives cannot be applied to the ultimate end itself, since we are not free to accept or reject it. Nor can it be applied to the principles grasped by universal conscience, since we are not free to accept or reject these if they are indestructible in rational agents. Neither of these apparent restrictions on freedom, however, is a real restriction; each specifies the conditions for being a rational agent, which are also the conditions for being free.

If the determinate principles characteristic of the moral virtues were grasped by universal conscience, we would not be free to accept or reject them. Aquinas, however, believes that we are free to choose between virtue and vice, and therefore to choose the distinctive end of virtue or vice. His account of freedom implies that these ends are open to deliberation. If they are within the scope of prudence, then they are open to deliberation, and hence open to our free choice.

This implication of Aquinas' views on freedom shows how his different claims support one another if the specifically virtuous end is reached by deliberation, and how they threaten one another if he accepts some other account of how we reach the specifically virtuous end. Both an anti-rationalist account, attributing the right ends to the training of non-rational passions, and a non-deliberative rationalist account, attributing them to intuitive knowledge of principles, make it difficult to see how Aquinas' claims about the will, freedom, virtue, and practical reason cohere in the way he intends them to.[49] If the right ends are discovered by prudence, deliberating from the universal end and reaching the specifically virtuous end, Aquinas' position is coherent and intelligible.

[47] '. . . the motion of virtue has its origin in reason and its terminus in desire, in so far as it is moved by reason. That is why in the definition of moral virtue it is said, in *Ethics* ii, that it is "a state involving election, consisting in a mean that is determined by reason, as the wise person will determine it".' (1-2 q59 a1). The Latin version uses 'sapiens' to translate *phronimos* here, but Aquinas takes it to refer to prudence (*in EN* ii 7 §323).

[48] See §286. [49] On mortal v. venial sin see §297.

322. Objections to Aquinas' View

Ought Aquinas to have assigned such a broad role to prudence? We may wonder whether universal and particular prudence are inseparable aspects of a single virtue or separable virtues. We might suppose that someone could be good at one of these deliberative tasks and bad at the other, so that the two virtues must be separable. We might even doubt whether universal prudence is a virtue of a moral agent at all. It seems to belong to a moral theorist who is considering what states of character are virtues and how to produce them; these are the questions that both Aristotle and Aquinas answer. But the ability to find the right answers at this high level does not seem to guarantee the ability or the experience that we need to find answers about what to do in particular situations. Equally, we might suppose that a virtuous person who has the right ends and knows what to do about them in particular situations could nonetheless lack the knowledge that would answer the theorist's questions.

This issue about the universal prudence of the moral theorist and the particular prudence of the virtuous agent already arises for the reader of Aristotle. The *Ethics* is a work of political science, political science is the same state as prudence, and prudence is deliberative. The theorist who writes the *Ethics* seems to display the same deliberative virtue that the virtuous agent displays in deciding what to do here and now.[50]

To defend his belief in the unity of prudence, Aquinas needs to show that the higher-level deliberation fixing the specifically virtuous end makes a morally significant difference to the action or motive of the virtuous person. If he is right, we must be able to see that something relevant to the moral evaluation of the action or agent depends on the presence or absence of universal prudence. We might hope to find morally relevant effects of universal prudence if we examine Aquinas' detailed discussions of individual virtues of character. Universal prudence matters in virtuous agents, if these agents are not allowed simply to take the specifically virtuous end for granted, but must also have some conception of why it is the right end to accept. If Aquinas describes this conception in any detail, he will also make it clear what sort of deliberation leads us from the universal end to the specifically virtuous end.

323. Natural Law, Universal Conscience, and Prudence

We may now review Aquinas' discussion of natural law, universal conscience, and practical reason, to see how they affect his theory. Both natural law and universal conscience are mandatory topics of discussion for him, since they are recognized by moralists who do not accept his Aristotelian assumptions and framework.[51] If he had no room for them within an Aristotelian account, he would have acknowledged the failure of an Aristotelian account to capture these recognized aspects of morality and moral understanding.

He reaffirms his Aristotelian account. The roles of universal conscience and of natural law fit his view that the central element in the Aristotelian position is the account of a rational agent as necessarily pursuing a final good and deliberating about its composition. Universal conscience is not a source of moral principles unavailable to a rational agent who tries to

[50] On this issue in Aristotle see §98. [51] See §301.

deliberate about the means to happiness; it makes us rational agents who have a conception of a final good that is open to deliberation. Similarly, the first principle of natural law does not add a further constraint on the deliberation of a rational agent about his own good; it simply expresses a necessary feature of this rational agent. The subordinate principles of natural law are reached by deliberation about happiness, and therefore they are the proper concern of prudence.

If we agree with Aquinas on these points, we agree that true moral principles are the conclusions of a rational agent's correct deliberation about her own happiness. Deliberation about happiness is essential to free rational agents. The principles that such agents implicitly accept in being concerned with their own happiness are strong enough to vindicate the moral virtues, as Aquinas conceives them.

Though this position is Aristotelian, Aquinas has no explicit Aristotelian precedent for his claim that deliberation about happiness is an essential feature of a rational agent and of a free agent. In his explanation of claims about rational agency and freedom through features of deliberation about happiness, he extends and develops Aristotelian claims, though not in an un-Aristotelian direction. The central role that Aquinas attributes to deliberation about happiness requires him to assign a large role to prudence. He emphasizes those remarks in Aristotle that favour a wider role for prudence over those that favour a narrower role.

In contrast to this Aristotelian and eudaemonist position, claims about universal conscience and natural law might seem to force Aquinas in a different direction. But he argues that they do not. All reasonable claims about moral insight derived from these sources can be understood, in his view, within the deliberative account of practical reason. This deliberative account expresses Aquinas' reductive claim that there is nothing more to the understanding of morality than the understanding of rational agency. His views on practical reason, prudence, universal conscience, and natural law, all support the reductive claim.

23

AQUINAS: THE CANON OF THE VIRTUES

324. The Unity of Prudence

How much can we learn from universal prudence, as Aquinas conceives it? In his view, universal conscience grasps the common principles of natural law, but it does not specify the virtues that fulfill the natural law. It recognizes that good is to be done and evil avoided, and that we achieve the good in acting in accordance with reason. But we need further rational inquiry to discover that the precept of acting in accordance with reason requires the cardinal virtues. This inquiry is the task of universal prudence, which reaches the specifically virtuous end by deliberation in the light of the ultimate end.

Since we are rational agents who also have passions, we need virtues that conform our passions to our wills and conform both passions and wills to a true conception of the ultimate end. Since we aim at our perfection, and not simply at the maximum coherent satisfaction of our desires, virtue does not consist in guiding our passions by a conception of the good that aims at the satisfaction of these same passions.

Aquinas' claims about prudence commit him to a further claim about the general character of a virtue. He believes that universal prudence (reaching the specifically virtuous end by deliberation from the ultimate end) is the same virtue as particular prudence (reaching the virtuous action by deliberation from the specifically virtuous end). Hence he believes in the 'vertical unity' of universal and particular prudence. Moreover, he believes that the same prudence is needed for each of the virtues of character, so that he believes in the 'horizontal unity' of prudence. Virtuous people have the right conception of the end for the sake of which they do their different virtuous actions; the right conception of this end, as Aristotle insists, is prudence (*EN* 1142b31–3).[1]

Since prudence is horizontally and vertically unified, it is concerned with 'the whole of human life' (*in EN* vi 4 §1163), and the end it grasps is 'the common end of all of human life' (*in EN* vi 8 §1233). We must grasp this common end to form the right conception of

[1] In *in EN* vi 8 §1233 Aquinas clearly takes 'the end' to be the antecedent 'of which prudence is the true apprehension' in *EN* 1142b33. Some interpreters of Aristotle suppose, implausibly, that the antecedent is 'what is expedient towards the end'.

the end that guides practical reasoning (*EN* 1144a31–6; cf. *in EN* vi 10 §1273–4). Aquinas attributes belief in this common end to Aristotle, and takes it to underlie Aristotle's belief in the unity of prudence.[2] Since all the virtues aim at this common end, they need a horizontally and vertically unified prudence to tell them how to achieve their aim. The unity of prudence, therefore, is not a merely generic unity that would allow the existence of mutually independent species.

325. The Reciprocity of the Virtues

These claims about the unity of prudence imply that discovery of the virtues requires prudence. Aquinas therefore affirms one part of the traditional belief in the reciprocity of the virtues (RV).[3] The virtues are connected in so far as they are all about passions and actions that are connected to one another (*ST* 1-2 q65 a1 ad3; *Virt. Card.* a2 ad4). A stronger connexion is their connexion with the common end of human life; the correct conception of this single common end is required for every virtue.[4]

This aspect of RV follows from Aquinas' conception of the ultimate end. His initial conception is purely formal, in the sense that it does not yet specify some definite way of life or traits of character. But it imposes a non-trivial structure on ends and on deliberation. To pursue a final good is to seek to combine different ends in some mutually-supporting system that achieves the perfection of the agent. The traits and actions required by each virtue must contribute to this system of ends. This aspect of RV, therefore, follows from Aquinas' basic claims about rational agency. The relation between prudence and the perfection of the passions secures the other half of RV, the necessity of virtue for prudence (1-2 q58 a5).[5] We need our passions perfected if we are to focus steadily and without distraction on the right end.

In committing himself to RV, Aquinas implies that each virtue relies on the same universal and particular prudence in the virtuous agent and that the specific perfection of the passions required by each virtue is necessary for prudence. Some of Aquinas' predecessors and successors reject RV;[6] Scotus and Ockham argue against it at length. Some aspects

[2] 'He says "being one", because, if there were different prudences concerned with the matters of different moral virtues, just as there are different kinds of artifacts, it would be quite possible for one moral virtue to exist without another, each of them having a prudence corresponding to it. But this cannot be the case, because the principles of prudence are the same for the whole matter of morals, so that everything is derived from the standard of reason. And that is why because of the unity of prudence all the moral virtues are connected with one another' (*in EN* vi 11 §1288).

[3] On RV see §12 (Socrates); §49 (Plato); §116 (Aristotle); §185 (Stoics). It becomes a topic of discussion in mediaeval ethics because of Augustine; see §229. Some predecessors of Aquinas who discuss this issue are cited by Lottin, *PM* iii 209–23.

[4] See *3Sent.* d36 q1 a1 = P vii 415b: 'For each virtue operates because of the good of virtue. Hence if one aims at the good of virtue, as is appropriate for the virtuous person, one does not turn one's aim away from that end. Hence the Philosopher says that the wasteful person, who spends without concern for the good, easily turns away to any evil.' Cf. ad2, ad3. Lottin, *PM* iii 233. This is how Godfrey of Fontaines defends the unity of prudence and argues from it for RV. See Lottin, *PM* iv 590; 600.

[5] Discussed in §316.

[6] Some moralists accept RV in the case of infused moral virtues; when charity is infused by divine grace, the other virtues are infused at the same time. But this feature of the infused virtues makes it seem more plausible to deny RV in the case of the acquired virtues. See Lombard, *3Sent.* d36 c1; Bonaventure, *3Sent.* d36 a1 q1 (affirming the connexion for the infused virtues); q3 (denying it for the acquired virtues) = OO iii 790–9; Aquinas, *3Sent.* d36 q1 a2 = P vii 416.

of Aquinas' defence are better postponed until we have examined the objections; but a preliminary discussion will help us to follow the later debate.

326. Objections to the Reciprocity of the Virtues

According to RV, a perfectly virtuous agent would have all the virtues. But the very idea of such an agent may seem to rest on a misunderstanding of the character of the virtues.[7] It is difficult to see how the virtues of a Greek hoplite could co-exist with those of a mediaeval monk and with those of a twenty-first century social worker. But RV appears no more plausible if it is applied only to the virtues recognized at a particular time; why should every set of virtues in every society and culture be linked in the way required by RV?

In any case, RV seems to conflict with fairly obvious facts. The best people we can think of, from our own time or other times, do not seem to exemplify all the virtues. Perhaps they would have had less of the virtues they had if they had also tried to form other virtues. The idea that everyone should ideally display all the same 'required' virtues may seem both unrealistic and unattractive; perhaps the varieties and imperfections of different people's moral characters actually add appealing diversity to human life.

These objections to RV are especially compelling if the virtues are remedial conditions that counteract different specific tendencies for things to go wrong. If we suffer from our proclivity to excessive fear and excessive pleasure, we need bravery to counteract one proclivity and temperance to counteract the other. If we tend to take a biased view of other people's claims, we need justice. If we tend to be indifferent to the needs of others, we need benevolence.[8] The judgments that shape our conception of the virtues are judgments about the different things that can go wrong.

This remedial conception of the virtues conflicts with the conception of perfect virtue that supports RV. If different virtues counteract different dangers, they may be separable and may conflict, just as different medicines prescribed for different diseases may have conflicting effects.[9] If the virtues are piecemeal remedies for specific dangers and threats, the complete development of each virtue may not incorporate the other virtues. If we acquire different virtues, we may have to choose between conflicting goods, so that we face an inevitable loss whatever we choose.[10]

If different virtues apply conflicting remedies to different flaws, one person ought not to aim at them all. And so Aristotle's assumption that we cannot have too much of a virtue appears to ignore a remedial view. Even if a single person can or should cultivate all the virtues, they may not be internally related in a perfectly virtuous person. Perhaps the demands of justice or honesty should not incorporate the demands of generosity or kindness.

[7] See Strawson, 'Social' 27–9; Flanagan, *VMP* 10–11f.

[8] This view is developed by Warnock, *OM*, ch. 6; he rejects RV, 87. Foot, *VV* 10, also accepts a remedial view, and rejects RV, 17.

[9] Aquinas remarks that 'a medicine that would be adapted to one disease would be harmful to the second . . . and what would be a suitable medicine for one sin might provide an incentive to the second' (*ST* Suppl. q9 a2).

[10] '. . . so far from forming a unity in the sense that Aristotle and Aquinas believed they did, the virtues actually conflict with each other: which is to say that if someone has one of them he inevitably fails to have some other' (Foot, 'Dilemma' 57).

To see whether these are well-founded objections to RV, we need to consider whether Aquinas has good reasons for insisting that each virtue incorporates prudence. He takes universal prudence to grasp a set of principles that express the requirements of all the virtues.[11]

327. From the Ultimate End to the Cardinal Virtues

To show that prudence is unified, Aquinas needs to show that universal prudence, deliberating from the universal end, discovers the specific ends of each of the virtues, and that these ends are connected in such a way that understanding of one requires understanding of the others in their relation to the ultimate good.

Has Aquinas given deliberation too large a task, and too indefinite a starting point? We might agree that agents such as us need passions and wills guided by reason and virtue if they are to pursue their good correctly, but we might still have no clear view about what the virtues are—whether, for instance, they include the control of appetites or the formation of rational plans for the maximum satisfaction of appetites. As Aquinas remarks, we might agree that the human good requires us to act in accordance with reason, but still not agree that acting in accordance with reason requires temperance and bravery, as he understands them. It seems still more obvious that we might agree about acting in accordance with reason, but deny that such action includes action for the good of others that does not provide some antecedently-desired good for ourselves.

If our deliberation is to reach a definite result, do we perhaps need some principles, accepted apart from deliberation, that constrain the process of deliberation and introduce some definite moral content? Scotus and Ockham derive these further principles from the revealed will of God.[12] Others might derive them from some definite social facts, or collective preferences, or contingent psychological traits, that apply to some group of actual human beings but cannot be derived from Aquinas' general claims about rational agency. Any of these attempts to constrain deliberation rejects Aquinas' attempt to explain the virtues by reference to rational agency.

Aquinas believes that deliberation about one's ultimate end yields not only an account of virtue, but also a sufficiently detailed account of the virtues. Deliberation shows that the moral precepts of the Decalogue are required by the virtues, and that we have reason to care about the interests of other people for their own sakes. The considerations he has appealed to so far seem to him to support a detailed account of the virtues.

This detailed account is mostly presented in the Secunda Secundae. This Part discusses a bewildering variety of virtues and vices. Moreover, it clearly belongs to moral theology more than to moral philosophy, since it presupposes the supernatural additions (infused virtues, and so on) to the acquired moral virtues. Still, its main structure and aims are fairly clear; it tries to answer some of the questions about the virtues that we might ask when we reflect on the ultimate end, prudence, and deliberation.

[11] *in EN* vi 11 §1288, quoted in n2.

[12] Ockham agrees with Aquinas in recognizing non-positive and positive elements of morality. But he takes the positive elements to include higher principles that Aquinas regards as non-positive. See §395.

The main argument rests on Aquinas' claim that the matter of morality is derived from the four distinct cardinal virtues.[13] In his view, the various traits that we recognize as virtues are either aspects or applications of the cardinal virtues. They have a definite structure that shows how they meet some general requirements of rational agency.[14]

328. The Nature of a Cardinal Virtue

The cardinal virtues express the 'perfect character of virtue, which requires correctness of desire' (1-2 q61 a1). They are not necessary for every virtuous action, since not all virtuous action requires correct desire, and a mere capacity to perform some virtuous action does not imply the possession of a cardinal virtue. Aquinas' distinction between virtuous action and acting virtuously supports his claim that prudence is necessary for being a virtuous person (cf. q56 a3; q57 a5), and hence supports his defence of the reciprocity of the virtues.

To act virtuously, according to Aquinas, we must act on the cardinal virtues, no matter what special virtue we display in a particular action. Some virtues are cardinal (*cardinales*, from *cardo*, 'hinge') because they are those 'in which the moral life turns and is founded in a certain way'. The moral life is founded on them because that is the life proper to a human being, in contrast to a non-rational animal or an angel; this is the life of practical reason, the 'active life, which consists in the exercise of moral virtues'. Aquinas infers the generic features of such a life from Aristotle's account of acting virtuously (*EN* ii 4; *Virt. Card.* a1).[15] Aristotle's demand for knowledge introduces prudence;[16] his demand for correct election for the right end introduces justice; and his demand for firm and unshakeable election introduces temperance and bravery (2-2 q123 a11). Prudence is relevant because it provides the appropriate prescriptive (praeceptiva) knowledge, justice because it directs a person's actions to the right end, temperance and bravery because they produce the appropriate control (moderatio) and firmness.

These claims do not fit the passage in Aristotle that Aquinas cites, but they fit Aristotle's intentions in his account of virtue as a whole. The reference to prudence fits Aristotle's remark that the mean must be determined by the reason by which the prudent person would determine it. The demand for the right end fits Aristotle's claim that we need the right election. Firmness and control fit his demand for a firm and unchanging state. Firmness and constancy depend on the condition of our non-rational desires and passions; if they are misdirected, they will make us waver even if we make the correct (in some ways) election on occasions where strong passions are not involved.

We discover the virtues by examining the 'formal principle', which is the good of reason. This consists, first of all, in consideration by reason itself, and, secondly, in the direction of

[13] See *3Sent.* d33 q2 a1 sol.4 = P vii 359ab.

[14] Jordan, 'Scientia' 91–5, discusses the organization of *ST* 2–2, and emphasizes Aquinas' innovation in making the cardinal virtues the principle of organization.

[15] He cites *Proverbs* 26:14 ('As a door turns on its hinge, so does an idler in his bed') as his Scriptural authority for the term 'cardinal', and he cites Ambrose as his patristic authority for the use of 'cardinal' for the canon of four virtues. See *Card.* a1; *ST* 1-2 q61 a1 sc; *3Sent.* d33 q2 a1 sol.2 = P vii 358b.

[16] Aquinas' interpretation does not fit; Aristotle seems to be demanding simply the sort of knowledge that is necessary for voluntariness. Aquinas recognizes this point about the passage in 2-2 q58 a1. At *in EN* ii 4 §283 he does not introduce his own interpretation of the demand for knowledge.

other things by reason. These other things are actions and passions; the passions are those that can turn us away in bad directions or prevent us from going in good directions. We need prudence (for consideration by reason), justice (for right action), and temperance and bravery (for the proper regulation of potentially distracting and inhibiting passions). The same conclusion results if we consider the subject of the different aspects of the right formal principle. One subject has to be the rational part, of which prudence is the virtue. Another has to be the part that is rational by participation, and this is divided into the will, the spirited part, and the appetitive part (1-2 q61 a2).[17]

The cardinal virtues, therefore, are generic and pervasive; we do not need to look for particular occasions on which we are exercising prudence or temperance, say, as opposed to some other virtue. This feature seems to distinguish them from a virtue such as generosity or wit; if we are not in the right situation, we cannot display wit, but if we are in any situation that calls for any of the virtues, the appropriate action displays the formal principles of the different cardinal virtues (cf. 2-2 q123 a11; q141 a7).

Aquinas' view that the cardinal virtues mark pervasive features of all virtuous action is defensible by appeal to Aristotle; but it is more characteristic of Stoicism.[18] The Stoics claim that in every virtuous action we act in accordance with each of the cardinal virtues, even though we exercise some specific virtue in a way in which we do not exercise all the others. Aquinas argues that the four virtues are different specific virtues, so that we exercise temperance (e.g.) on particular occasions on which we do not (in the same way) exercise other virtues as well. This emphasis on the different occasions for the exercise of the four virtues is more clearly Aristotelian than Stoic, though the Stoics also admit that not all of the virtues are always exercised in the same way.

329. 'Principal' Displays of the Cardinal Virtues

Aquinas claims that the cardinal status of these four virtues supports and justifies the Aristotelian view that they are different specific virtues displayed in distinct ranges of action. The goodness of the pervasive virtues is displayed 'principally' or 'especially' in different ranges of action.[19] Whenever we act virtuously, we must display the appropriate firmness, but we especially display it in facing the danger of death; hence it is appropriately displayed in bravery, which is the virtue concerned with facing this danger. A similar argument applies to temperance. The claim that these are special or 'principal' displays of the relevant pervasive virtues supports the claim that these are distinct virtues with their own range of actions.

[17] For objections to this classification see §290.

[18] Ambrose relies on the Stoic division in *Off*. He argues that the saints of the Old Testament display the cardinal virtues: 'What duty (officium) belonging to the principal virtues was lacking in these men?' (i 115). In his view, the types of duties originate (nacsuntur) in the four virtues (116). He uses Stoic arguments to show that each of the cardinal virtues deals with questions that can be answered only by appeal to the other cardinal virtues (i 126–9). See Davidson, ad i 115. On the treatment of the cardinal virtues in early Christian writers and in mediaeval writers before Aquinas see Lottin, *PM* iii, ch. 12 (see esp. 154). The four virtues are mentioned in *Wisdom* 8:7 (referring to wisdom): 'And if anyone loves justice, her labours are virtues; for she teaches temperance and prudence, justice and bravery, and nothing is more useful in life for human beings than these'. On *4 Macc.* see §203.

[19] See 1-2 q61 a3; 2–2 q123 a11; 141 a7; *Virt. Card.* a1.

These are 'special' or 'principal' displays in two ways: (1) These are cases in which it is especially difficult to display the pervasive virtue of (say) bravery, because the danger of death is especially likely to impede us from following the right course of action. (2) These are cases in which it is especially important to display the pervasive virtue; our moral lives will go to pieces if we cannot manage to exercise firmness in this area.

These two points sometimes pick out the same actions; the difficulty and importance of restraining certain fears may partly explain why we need a virtue that restrains them. But the most difficult actions are not always the most important. A gymnast may show a principal or outstanding degree of physical agility in doing something that is especially difficult, but it may not be important for other people to cultivate precisely this degree of agility. Similarly, we may not all need the firmness of the people who face death in battle bravely, if most us need not face that situation; perhaps we ought to cultivate firmness in sticking to our convictions on the appropriate occasions, if that trait affects much more of most people's lives.

Aquinas does not always separate these two types of 'principal' exercise of the virtues. Sometimes he mentions difficulty (2-2 q123 a11), but sometimes he has importance in mind. He argues that prudence, rather than other virtues of practical intellect, is cardinal, because it makes the decisive difference to our action (*Virt. Card.* a1 = M 815a). In the case of the pleasures of touch, which concern temperance, he mentions that desires for these pleasures are strong (2-2 q141 a4) and that they involve the necessities of life (q141 a5); these two facts give two reasons for taking temperance to be a cardinal virtue.[20]

The case of justice highlights the issue about difficulty and importance. It seems to be more difficult to exercise virtue when we have to consider the interests of others than when we have to consider only ourselves. On this ground, pursuit of the right end may be said to be 'principally' shown in other-directed action. Is such action also a 'principal' manifestation in the other sense, that it is especially important? That depends on whether concern for the good of others is especially important; we apparently need to be convinced on this point before we can be convinced that justice, as Aquinas understands it, is really a cardinal virtue.

Aquinas has good reason to treat the cardinal virtues, in the broad sense, as pervasive features of acting virtuously. He also has good reason to recognize some cardinal virtues in his narrower sense, as specific virtues with their different range of actions; for some specific ranges of actions may be more relevant than others to achieving the pervasive virtues. In agreeing with Aquinas on this point we need not also agree that he has the right account of what the cardinal virtues (in the narrow sense) are.

Indeed, we need not even agree that the same things are cardinal virtues in all times and places. Perhaps bravery, understood as firmness in facing death in battle, was once a cardinal virtue, but ceased to be one as circumstances changed. If we reach this conclusion, we recognize one merit of Aquinas' account: he offers us a reasonable basis for deciding whether a virtue is really cardinal, and therefore a reasonable basis for disagreeing with his conclusion about the cardinal status of a particular trait.

[20] '... on the one hand, because such pleasures are more natural to us, and therefore it is more difficult to refrain from them and to restrain appetite for them; on the other hand, because their objects are more necessary for the present life' (2-2 q141 a7).

330. The Range of a Cardinal Virtue[21]

Aquinas attributes a wide scope to each cardinal virtue. Bravery, for instance, is concerned with fears and confidence, but more specifically with the fear of death, not simply because it is difficult not to be moved by the fear of death, but also because love of one's own life is natural (2-2 q123 a4 ad2). Since the love of life is natural, it is both difficult and important to control one's fear of death; hence this is a 'principal' exercise of bravery in both senses.

Aquinas agrees with Aristotle's claim that bravery is properly concerned with the danger of death in war, not with all danger of death equally. He distinguishes those dangers that result from our pursuing a good from those that happen to us whether or not we are pursuing a good, and he argues that dangers of the first sort are especially appropriate concerns of a virtue. The danger of death resulting from illness or storms or robbers or (Aquinas might have added) earthquakes or road accidents 'do not seem to threaten someone directly because of the fact that he is pursuing some good' (2-2 q123 a5). They happen to us anyhow, and we do not avoid them by becoming less active in the pursuit of goods. We expose ourselves, however, to the danger of death in war precisely because we 'defend the common good through a just war'; we would be less exposed if we failed to defend the common good in this way. This is a good reason for claiming that we need a state of character that is not deterred from active pursuit of the relevant good by the danger of death in war; for (Aquinas assumes) the fact that we expose ourselves to this danger is not a sufficient reason to give up the pursuit.

Once we see Aquinas' reasons for picking out the danger of death in war as a special concern of bravery, we can see why other dangers might also be relevant. Even the dangers he initially dismissed may be proper concerns of bravery in the right circumstances. We may face the danger of death from disease if we continue to visit a friend who suffers from an infectious disease, and we may face danger from shipwreck or robbers if we 'pursue some pious undertaking' (e.g., a pilgrimage). In training people to face the danger of death in war bravely, we should also train them to see the same reasons for facing the danger of shipwreck or illness. Death in war, therefore, need not be the exclusive or primary focus of bravery. It is a 'principal' case because it illustrates the type of danger that is the primary focus of bravery, and why it is primary; but other types of danger may also be relevant to bravery.

If Aquinas believes that bravery embraces all the dangers that might wrongly deter us from the appropriate pursuit of good, is his conception unrealistically broad? Some people might be good at facing one sort of danger without being good at facing others. Are we to deny that someone is brave if he is completely fearless in war, but weak and vacillating if it will cost him something to stick to his convictions? Someone might display both characteristics in the same area. A general, for instance, might be unafraid of the danger of death in battle, but might still be afraid to change his strategy, because he is afraid to admit he has failed and to expose himself to criticism and humiliation.[22] Does he display one sort of bravery and

[21] On Green and Aquinas on Aristotelian virtues see §113; Green, *PE* §253. On Aquinas' treatment of bravery see Walsh in BF xlii, Appx. Ambrose argues for a broad conception of bravery in *Off.* i 175–209. He rejects the view that bravery belongs primarily to aggressive war. He mentions not only the warriors of the Old Testament but also the Christian martyrs.

[22] Cf. Hector's fear of Polydamas' reproaches, *Iliad* xxii 98–110.

lack another? Or does his fear show that he is not brave? Perhaps we cannot expect firmness in facing every sort of danger that might threaten our pursuit of a good.

Aquinas might reasonably reply that his discussion of the cardinal virtues is not meant to describe features of every virtuous action, but to describe necessary conditions of acting virtuously—the sort of action that proceeds from a virtuous character. Perhaps we could be trained to face one sort of danger without being trained to face others that are equally important for the pursuit of the good. But if we did not see the point of resisting all the dangers that would wrongly impede us in the pursuit of the good, we would not see the point of bravery, and we would not be brave.

The demand that a brave person should see the point of brave action and bravery clarifies and supports Aquinas' belief in the horizontal and vertical unity of prudence. To see what dangers ought to be faced, and hence to see the point of facing this or that danger, we need to connect facing danger with the human good, and thereby to connect the specifically virtuous end with the universal end of human beings. Universal prudence grasps this connexion, and shows why the ends promoted by bravery are promoted by other virtues as well.

If Aquinas is right, people who see the point of resisting all these dangers may still be better at resisting some than at resisting others. Even if we have been trained to resist all sorts of dangers, we may be more used to some than to others. Unfamiliar dangers may produce the 'sudden motions' of passion that are especially difficult to resist.[23] Even if we have the appropriate virtue, we may need to get used to the sound of gunfire in a battle, or to the sight of blood in a hospital, before we can face the situation appropriately. Aquinas' claims about the extent of bravery do not imply that brave people can resist every sort of danger the first time they encounter it.

Aquinas' argument about facing danger in war makes it easier to recognize bravery in cases that Aristotle does not even contemplate. Martyrdom, for instance, is an expression (actus) of bravery (2-2 q124 a2). From Aristotle's point of view, it might appear inferior to death in battle, since it is rather passive, and does not involve the active prosecution of one's ends that Aristotle regards as characteristic of brave actions; hence it seems to belong with death in a shipwreck, which is not a primary concern of bravery (*EN* 1115a35–b6). But Aquinas' account of why bravery is a virtue shows that active prosecution is not necessary. After the remark that in shipwrecks and so on death is not fine (*kalon*, 1115b4–6), Aquinas suggests that it is brave and praiseworthy to face death when something good results from one's death.[24] Martyrdom meets this condition for bravery. Martyrs pursue the good by resisting danger; since the good they pursue in this case is the supreme good, their resistance to danger expresses bravery.

This example shows how Aquinas' account of a cardinal virtue helps him towards an appropriately flexible account of the scope of each virtue. His belief that bravery is a cardinal virtue and that it requires these specific actions rests on his conception of the human good and of the actions needed to achieve it. If we find some error at these points in his position, we may take a different view about which virtues are cardinal, and what actions they require. His appeals to universal prudence give us the means to endorse or to correct his views. It is

[23] On sudden motions see §§253, 289.

[24] 'neque ex morte aliguid bonum sequitur' (sc. in shipwrecks, etc.), *in EN* iii 14 §542. 'Bonum' renders *kalon*; see §332 below.

reasonable to draw the lines between the virtues where he draws them, and to single out some actions as principal exercises of the virtues. If his account needs to be corrected, he shows us how to correct it.

331. Subordinate Virtues

Aquinas believes that other recognized virtues can be classified as either integral or subjective or potential parts of the cardinal virtues.[25] The integral parts 'must concur to produce a perfect act of that virtue' (2-2 q48 a1), and so are aspects of the virtue, inseparable from it in the way that beams and foundations are inseparable from a house. The subjective parts are species of the virtue—for instance, the types of prudence that are displayed in different areas (2-2 q48 a1). The potential parts are 'annexed virtues that are directed towards some secondary acts or materials, as not having the whole power of the principal virtue' (q48 a1). They apply the virtue to areas that are less difficult than the areas of the primary exercises of the virtues.

Aquinas' description of these potential parts assumes that the cardinal virtues are pervasive features of acting virtuously. Though the potential parts of each cardinal virtue are less difficult to exercise than the principal cardinal virtue itself, they are inseparable from the principal virtue; we cannot have magnanimity, for instance, without bravery. The circumstances in which magnanimity maintains firmness are less difficult than those in which bravery maintains firmness, but since they require the same sort of firmness for the same reasons, magnanimity is a part of bravery.[26]

By organizing the virtues around the cardinal virtues, Aquinas argues that the virtues do not conflict, and especially that recognized 'pagan' virtues do not conflict with 'Christian' virtues. His treatment of magnanimity and humility illustrates his strategy. Once we see the relation of these subordinate virtues to their cardinal virtues, we see that they do not conflict. Magnanimity strengthens us in the pursuit of appropriately great actions, while humility restrains us from the distractions that would result from illusions about our own importance; hence we need both magnanimity and humility to pursue the right ends without distraction.[27]

If we object to magnanimity because it includes contempt for others, Aquinas answers that this contempt is contempt for the evil aims of others. Such contempt prevents the magnanimous person from accepting or acquiescing in the evil projects of others, and so he needs it if he is to be independent enough to stick to the right course of action. This contempt for others is not opposed to humility; for we can honour other people in so far as they display the gifts of God, and we can recognize our own failure to use the gifts we have received from God.[28] Determination to use our gifts for great results, and rejection of the

[25] 2-2 q48 a1; cf. q79; q80; q128; q143.

[26] '. . . magnanimity agrees with bravery in so far as it confirms the mind about something difficult. But it falls short of bravery in this point, that it confirms the mind in something about which it is easier to preserve this firmness' (2-2 q129 a5).

[27] 'That is why a double virtue is necessary in relation to desire for a difficult good. One is needed to control (temperare) and to restrain the mind from an uncontrolled (immoderate) pursuit of high objects; and this belongs to the virtue of humility. The other is needed to strengthen the mind against despair, and urge it on after great things in accordance with correct reason; and this is magnanimity' (2-2 q161 a1).

[28] Humility does not require false modesty. Aquinas (if he is the author of the prayer) prays that he will be 'humilem sine fictione', P xxiv 242a.

evil aims of others that would impede the proper use of our gifts and theirs, are two aspects of magnanimity.[29] In recognizing our own failure to use all our gifts, and in appreciating the gifts shown by others, we display aspects of humility.[30] Neither magnanimity nor humility can do its proper work without the other.

Humility also prevents a false sense of self-importance. This is why it does not always reject the sorts of actions that would sometimes show a lack of self-respect. Sometimes 'abject' services are required by charity, and in these cases a person without false self-importance will not refuse to do them.[31] Hence it is not abject to belong to a mendicant religious order, even though it would be abject to beg from others simply from disinclination to support oneself (*SG* iii 135).[32] Humble people do not refuse the abject course of action in the right circumstances, though they do not accept it indiscriminately.

The connexion between magnanimity and humility answers some objections to RV. We might well cite these two virtues to show why virtues sometimes conflict, and why traits required by one impede traits required by another. Aquinas answers that this appearance of conflict may mislead us about the relation between the two virtues. We can see that they do not conflict once we understand the circumstances in which contempt for others or belief in our own unworthiness is appropriate; for the two virtues have the same aim, and do not conflict, but complement each other. Recognition of the connexion between the virtues involves universal prudence, since it refers to the universal end promoted by the specific ends of the different virtues.

This example suggests how the cardinal virtues, as Aquinas understands them, make the other virtues intelligible. The subordinate virtues promote or facilitate or protect the goods pursued by the cardinal virtues. This arrangement of the subordinate virtues allows Aquinas' theory to be flexible. Different circumstances might produce different threats to the goods pursued by the cardinal virtues, so that the same subordinate virtues might have different contents, or different traits might actually become subordinate virtues. Aquinas' account shows why in different circumstances a particular subordinate virtue needs to be cultivated.

[29] Cf. 2-2 q21 a1 sc.

[30] 'In a human being one finds something great, which he possesses through the gift of God, and something defective, which belongs to him from the weakness of nature. Magnanimity, therefore, makes a human being think himself worthy of great things from consideration of the gifts he possesses from God. For instance, if he has great virtue of mind, magnanimity makes him pursue perfect works of virtue . . . Humility, however, makes a human being think little of himself from consideration of his own deficiency. Similarly, magnanimity despises others in so far as they fall short of God's gifts; for it does not think so much of others as to do anything inappropriate for their sake. But humility honours others and thinks them superior, inasmuch as it looks upon something of God's gifts in them. . . . And in this way it is evident that magnanimity and humility are not contraries, though they seem to aim towards contraries, because they proceed in accordance with different considerations' (2-2 q129 a3 ad4). The attitude that Aquinas describes here is endorsed by Paul at *Rm*. 12:3; '. . . not to think of yourself more highly than you ought to think, but to think with sober judgment (*sôphronein*)'.

[31] 'It is not, therefore, characteristic of humility, but of stupidity, if one accepts whatever is abject, but <it is characteristic of humility> if one does not refuse because of its abjectness what is necessary to do because of virtue. For instance, if charity demands that one carry out some abject task for one's neighbours, because of his humility one does not refuse to do this' (*SG* iii 135 §3097).

[32] MacIntyre, *DRA* xi, mentions this aspect of humility (in 'a prayer composed by Aquinas in which he asks God to grant that he may happily share with those in need what he has, while humbly asking for what he needs from those who have') in order to contrast Aquinas' outlook with Aristotle's views on magnanimity ('a prayer that in effect, though not by Aquninas's own intention, asks that we may not share some of the attitudes of Aristotle's *megalopsychos*'). He develops this contrast later (127). He may be referring to the prayer (of dubious authorship) in *P* xxiv 241b (da bonum quod non habeo ab habentibus humiliter quaerere).

Prudence and temperance, for instance, do not always require saving money for tomorrow. If the rate of inflation is high, someone who merely saves impoverishes himself, and would be better advised to take a less conservative attitude to short-term financial risk. In these circumstances the attitude conventionally recognized as 'prudent' may be ill-advised; but the virtue of prudence is not ill-advised. On the contrary, prudence advises a less conservative attitude to risk in these circumstances. The virtue of prudence, as Aquinas understands it, helps us to see why one subordinate virtue ought to be replaced by another.

His theory explains not only why certain traits are virtuous at a particular time, but also why it would be reasonable for subordinate virtues to change over time, within the constraints of the same cardinal virtues. He includes some details about the specific traits and actions required of virtuous people, and about the social roles and institutions that support these requirements. If we reject these details, we do not necessarily reject Aquinas' theory of the virtues. If he relies on some subordinate social or psychological assumption that either was always false or is no longer true, an objection to the details may not undermine the theory.[33] Once we understand the theoretical aspects of his account of the virtues, we can distinguish the acceptable from the unacceptable conclusions. If Aquinas' theory of the virtues works, it ought to allow us to argue effectively about the content and application of the virtues; if we can use his theory to give good reasons for rejecting his conclusions, we have vindicated the most important parts of his theory.

This point is relevant not only for the philosophical assessment of Aquinas' theory but also for understanding its historical fortunes. It was criticized, not surprisingly, for the particular description of rules and requirements that reflect its historical circumstances.[34] But the rejection of Aquinas' specific virtues does not justify the rejection of his theory of the cardinal virtues and subordinate virtues, and the way he tries to derive these from his conception of rational agency. We need to consider more closely whether the historically influential criticisms of Aquinas go beyond criticism of relatively superficial details that do not affect the main theoretical issues.

332. Moral Goodness in Latin Sources

We may accept Aquinas' claim that prudence, bravery, and temperance underlie any action that we can take to proceed from a moral virtue. But this is not enough to show that deliberative prudence supports the moral virtues, as he conceives them. For he takes the virtues to aim not at every sort of good, but at the morally good (1-2 q18). This requires conformity with reason (q18 a5; a8; a9; a9 ad2; *Mal.* q7 a6).[35] Reason directs actions to the common end of human life (q21 a2 ad2). This common end requires concern for the good of others, and hence for justice (q21 a3). Hence a morally good action is praiseworthy, in so far

[33] Aquinas' discussion of usury in 2-2 q78 offers an example of such assumptions. He qualifies the general prohibition with the conditions set out in a2–3. The development of discussions of usury in moral theology is described by Jonsen and Toulmin, *AC*, ch. 9 It is summarized by Davis, *MPT* ii 373–7, who mentions 'extrinsic titles' that justify the taking of interest on a loan (e.g., loss sustained by the lender, or real and unusual risk incurred by the lender).

[34] For Machiavelli's objections to the Christian character of the virtues that Aquinas describes see §407. Hume expresses rather similar objections in speaking of the 'monkish' virtues, *Inq.* ix 3.

[35] On good and moral good see Bradley, *ATHG* 277.

as it is in the power of the will; it is correct (rectus), in so far as it is directed to the appropriate end; and it is meritorious, in so far as it conforms to justice in relation to another (q21 a3).

We might reasonably expect Aquinas to say more about the general character of moral goodness. In particular we might expect an Aristotelian theory to recognize Aristotle's claim that the moral virtues are distinguished by their concern for the fine (*kalon*). Aquinas' treatment of this claim connects Aristotelian and Stoic treatments of the fine with modern views on moral goodness and rightness, and so it deserves some discussion. But the connexion is not as simple as we might expect it to be, and we need to trace some of the details.

Latin writers on Stoicism follow Cicero in translating '*kalon*' by 'honestum' in moral contexts.[36] Ambrose, for instance, follows Cicero in distinguishing the honestum from the useful (*Off.* i 27–8), and in believing that, properly understood, the honestum and the useful coincide (ii 28; iii 9, 13, 44, 52, 60, 63); we achieve what is genuinely useful if and only if considerations of the honestum outweigh (praeponderare) all others (iii 66). The honestum is the general character shared by the four cardinal virtues (e.g., i 175, 182, 191, 210–11, 258; ii 1), and the source of all duties (ii 22). Ambrose implicitly distinguishes the honestum from beauty, for which he uses 'pulchrum' (i 83), but he recognizes that the honestum has a beauty of its own (iii 57). He connects the honestum with the seemly and appropriate (decorum) (i 219; iii 52, 54, 88, 118), and with what accords with nature (iii 28).[37] In his view, the Scriptures agree with the philosophers in claiming that only what is honestum is good (ii 8, 18; iii 29, 37,[38] 84–91, 96–9, 125–6).

But though Ambrose follows Cicero in using 'honestum' for the Greek '*kalon*', to mark moral goodness, not all translators agree with him. The translators of the Vulgate render '*kalon*' by 'bonum'.[39] One might defend their decision by observing that Ambrose uses 'honestum' to refer to the good that matters most from the moral and religious point of view; in calling something 'honestum' we recognize it as the most important good. At any rate, whatever may have been the reasons for the translation adopted by the Vulgate, their choice may have influenced the translators of Aristotle's *Ethics*; for in almost all

[36] See §180. [37] He justifies the connexion with nature by saying that God made all things 'very good', iii 28.

[38] On Ambrose's discussion of Gyges' ring see §50.

[39] Vulg. OT has 'bonum' where LXX has '*kalon*'. The effects of its rendering of NT passages are still visible in English versions. Rheims, being a translation of Vulg., uses 'good' in these passages, and the AV follows it. Jesus tells the disciples to let their light shine before men so that 'men may see your good works and glorify your Father who is in heaven' (*Mt.* 5:16). Paul finds that 'when I would do good, evil is present with me' (*Rm.* 7:21). He tells the Galatians not to be 'weary in well-doing' (*Gal.* 6:9 NRSV: 'doing what is right'). In all these cases, and in many others, the Latin renders '*kalon*' by 'bonum', and many English versions follow it. They do not always do this. Paul tells the Romans not to return evil for evil, but to take thought for things that are *kala* in the sight of everyone (*Rm.* 12:17). Vulg., as usual, has '*bona*', but AV recognizes '*kala*', and renders 'Provide things honest in the sight of all men', following the English practice of using 'honest' to render '*kalon*'. See Empson, *SCW* 185–6. He mentions cases where earlier English versions have 'honest' and AV replaces it. The practice of Vulg. is even more surprising when one notices that it occasionally uses 'honestum', but not to translate '*kalon*'. When Paul urges the Romans to cast away the works of darkness and put on the armour of light, he tells them to walk '*euschêmonôs*', 'decently' as in the day. Here Vulg. translates by '*honeste*', and Rheims and AV have 'honestly' (*Rm.* 13:13). The use of 'honestum' here is quite reasonable; but it would be at least as reasonable in many of the passages where 'bonum' renders '*kalon*'. Vulg. shows why translators of Aristotle seeking help with Greek philosophical vocabulary might understandably suppose that 'bonum', rather than 'honestum', is the appropriate rendering of '*kalon*', and that therefore no distinction needs to be drawn between the *agathon* and the *kalon*. They also follow Vulg. in using 'honestum' to render '*euschêmon*' (see Aquinas, *in EN*, iv.16 §859, commenting on §608, which uses 'honestas' to render '*euschêmosunê*' in 1128a25).

the places in the *Ethics* where Aristotle uses '*kalon*', the mediaeval Latin translators use 'bonum'.[40]

This translation creates more difficulties for readers of Aristotle than for readers of the Bible, because Aristotle sometimes tries to distinguish features of the *kalon* from features of other sorts of goods.[41] The mediaeval translation conceals some of Aristotle's distinctive claims about the *kalon* from Aquinas. Aristotle often remarks that action for the sake of the *kalon* is characteristic of the virtuous person. In these passages the Latin version says that the virtuous person acts for the sake of the good (e.g., *EN* 1116a28; b3; Aquinas, *in EN* iii 9, §§373, 375). Since everyone acts for the sake of the good, the Latin version changes an apparently distinctive feature of the virtuous person into a feature that virtuous and non-virtuous people share. Aquinas often follows the Latin version in using 'bonum' where Aristotle has '*kalon*', and so he misses the fact that Aristotle is saying something about the *kalon*.[42]

Often, however, the translation fails to conceal Aristotle's point from Aquinas. For he often recognizes that Aristotle is talking about the honestum. In these passages Aristotle uses '*kalon*', but the Latin (as usual) has 'bonum'. Aquinas paraphrases Aristotle's remarks about the *kalon* by speaking of the honestum. These places are less numerous than the places where he simply uses 'bonum', but they are numerous enough to require some explanation.[43] Consideration of the context in Aristotle suggests to Aquinas that Aristotle is speaking of the honestum. The suggestion cannot come entirely from Aristotle, if Aquinas does not know that Aristotle uses '*kalon*' in these passages. Probably, then, he relies on some conception of the honestum that he finds in a non-Aristotelian source.

[40] See, e.g., 1094b15, 1099a27, 1100b27, 30, 1104b31, 1110b15, 1114b6, 1115a30, b23, 1116a11, b3, 1117a8, 1120a27, 1122b6, 1168a33, 1169a6–b1. At 1099a22 and 1123b8 the translation used by Aquinas has 'pulchrum'. The earlier translations are in *Aristoteles Latinus* xxvi 1–3 (see the Greek–Latin index in fasc. 5). Sometimes 'honestus' is used for '*sôphrôn*' (e.g., 1102b30) and once 'honestas' renders '*epieikeia*' (1121b14). Mercken, *GCNEA i* 64, remarks that Grosseteste seeks 'to find for each Greek word a corresponding one in Latin'. Just as Grosseteste fails to provide a distinctive equivalent for '*kalon*' in his translation of the *Ethics*, he fails to provide one in his translation of the Greek commentaries of Eustratius and others (edited by Mercken). The same practice in translating '*kalon*' is followed outside the *Ethics*; see, e.g., Aquinas, *in Met*. xii 7 §2522. Perhaps Grosseteste was influenced by his Greek-speaking informants, since '*kalon*' in later Greek has a broader use than in Classical and Hellenistic Greek.

[41] The choice of 'bonum' to render '*kalon*' in Aristotle's *Ethics* is defensible, but also questionable. The translator has to weigh three maxims for a good translation: (a) Use the same Latin word to render the same Greek word. (b) Use different Latin words to render different Greek words. (c) Use a Latin word that provides a plausible rendering of a given Greek term in a particular context. Latin translators could follow the first two maxims if they always used 'honestum' for '*kalon*' and always used 'bonum' for '*agathon*'. This practice, however, would violate the third maxim, because 'honestum' is an unnatural and misleading rendering when '*kalon*' refers to beauty. The mediaeval Latin translators decide to use one term 'bonum', which does not appear as unnatural as 'honestum' would appear in passages that refer to beauty. Their choice violates the second maxim, since it fails to distinguish '*kalon*' from '*agathon*' in contexts where one ought to distinguish them. Renaissance translators deal with Aristotle's different uses of '*kalon*' by using 'pulchrum' and 'honestum' according to the apparent force of '*kalon*' in different passages, and so violate the first maxim. For Lambinus' decisions see, e.g., his renderings of 1116a28, b3, 1120a12, 23–4.

[42] When Aristotle says that even in adversity the *kalon* 'shines through' (*EN* 1100b30), Aquinas says that the good shines even in misfortune (*in EN* i 16 §195). When Aristotle says that virtuous actions are *kalon*, and done for the sake of the *kalon* (*EN* 1120a23–4), Aquinas makes the boring remark that they are good and done for the sake of the good (*in EN* iv 2 §666). In many other places he does not know that 'bonum' conceals occurrences of '*kalon*'.

[43] Aquinas probably does not rely on definite information about the Greek text, obtained from someone who had consulted it directly. If he had such information, why does he not use it in places where it would have been relevant? Had he known that Aristotle said that virtuous actions are *kalon* and done for the sake of the *kalon*, he would have had good reason to introduce the honestum into his paraphrase of the relevant passage (*in EN* §666 on 1120a23–4; see n42); but he does not introduce it here.

The most probable immediate source is Albert's commentary on the *Ethics*; for Albert also lacks direct access to the Greek, but still takes Aristotle to discuss the honestum.[44] Albert takes his conception of the honestum from Stoic sources, and applies it to Aristotle. He accepts Cicero's account of the honestum as what attracts us by its own power, apart from any further utility, and so he infers that it most deserves to be called good without qualification (simpliciter); for it does not appeal to us simply because it is useful for satisfying some prior desire.[45] For the same reason it is the only unqualified good, in contrast to the goods of fortune that in some circumstances are bad (*SE* v 2 = 314.22–34). Since it is the unqualified good, the honestum rather than the pleasant is the basis of choiceworthiness, and so our desire for it is rational rather than appetitive (non per modum concupiscentiae, sed per modum amicitiae, *SE* x 2 = 713.11–15). Hence the honestum is not the same in essence as the pleasant, though it always involves pleasure (*SE* x 2 = 713.37–44). All virtue, therefore, has as its object this one kind of good, the honestum.[46]

Since Albert notices that Cicero finds the honestum especially in the best form of friendship (*SE* viii 3 = 601.29–58),[47] he takes Aristotle's conception of the friendship of virtue to involve the honestum (*SE* viii 1 = 592.61–9). Cicero contrasts concern for the honestum with exclusive concern for one's own advantage;[48] Albert connects this contrast with Aristotle's contrast between friendship for utility or pleasure and friendship that involves concern for the other for the other's own sake.[49] The connexion between the honestum and unselfish action also explains why justice involves the honestum. In Albert's view, 'everything just, in so far as it is just, is also honestum'.[50] These remarks on the honestum in the 'questions' section of the commentary explain Albert's judgment that in various places Aristotle refers to the honestum.[51]

[44] The commentary *Super Ethica* (cited as *SE*, from Albert, *OO* xiv.1–2) is taken by its editors to be the one that Aquinas is said to have helped to edit. See Preface to xiv 1, pp. v–vi. On the influence of Albert on Aquinas' commentary see Gauthier, *EN* i 1, 122–3; L xlvii 1, 235–57; Bourke 'Ethics'; Doig, *APCE* 24–33 and ch. 2. Albert includes both a 'literal exposition' and a series of 'questions' that discuss philosophical issues raised by the text, but not necessarily discussed by Aristotle. Aquinas includes only the literal exposition, without the questions; one might say that the 'questions' section of his commentary appears in the *Summa*. (See Gauthier, *EN* i. 1, 131.) Albert's questions make clear the assumptions about the honestum that guide him in mentioning it at various places in his literal exposition. Passages where both Albert and Aquinas mention the honestum include 65.22 on 1104b31 (Aquinas §273); 282.53–4 on 1127a6 (§827); 594.96 on 1155a29 (§1544); 647.37 on 1162b35 (§1737); 684.61 on 1168a10 (§1848); 688.54 on 1169a–b1 (§1881). Passages where Aquinas mentions it and Albert does not mention it include 1094b14 (Aquinas §33); 1115a12 (§533); 1121b9–10 (§695); 1122b6 (§714); 1126b29 (§§824–5); 1168a33 (§1857); 1175b29 (§2051); 1176b8 (§2070).

[45] See *SE* i 9 = 50.66–8, from Cic. *Inv.* ii 157. See also *De bono in genere* q5 a1 ad2 = *OO* xxviii 72.51: the honestum is 'what is sought because of itself' (cf. 33.15–18, 62.22–30); *De prudentia* q1 a3 ad5 = xxviii 230.72–4: the honestum is 'what attracts us by its power and draws us by its proper and natural worthiness that it presents'.

[46] *De bono in genere*, q5 a1 ad1 = *OO* xxviii 71.73. Cf. Cic. *Inv.* ii 159.

[47] Cic. *Amic.* 44.

[48] Cicero acknowledges that the two types of concern sometimes coincide; *Inv.* ii 157.

[49] This is why he believes that the actions Aristotle discusses in his account of good self-love must be honestum actions; he calls them first 'bonae operationes', but then 'honestae operationes' (*SE* ix 10 = 688.40–55).

[50] See *De iustitia* q2 a1 ad8 = *OO* xxviii 282–79–85. Cf. Cic. *Amic.* 51. At 281.8–11 Albert ascribes to Cicero the account of law (lex) as 'written right (ius) prescribing the honestum and prohibiting the contrary'. On the sources of this definition see note to *OO* xxviii 46.69–47.2.

[51] In his other commentary, the *Ethica* (= *Opera*, ed. Borgnet, vii), Albert does not provide the same explicit discussion of the honestum. But some of his remarks show that he presupposes the sort of view that he develops explicitly in *Super Ethica*.. He treats the division of goods into the honestum, utile, and delectabile as familiar (i 3.6 = 38a). He does not mention the honestum at the point where Aristotle introduces the threefold division in Book ii (ii 8 = 162). But he introduces the honestum prominently into the discussion of friendship. See viii 1 = 518a: 'Further, not only is friendship about things necessary for life—for in that case it would only be useful—but it is also a good in its own right and

333. The Honestum in Aquinas' Commentary

Albert's comments help us to see why Aquinas believes that Aristotle discusses the honestum. Aquinas does not detect a reference to the honestum in every place where Aristotle speaks of the *kalon*; often he follows the Latin version in using 'bonum'.[52] But nearly every place where he uses 'honestum' marks an occurrence of '*kalon*', and he captures the main points of Aristotle's use of '*kalon*'. He relies on (i) the contrast between good and pleasant, (ii) claims about praiseworthiness, and (iii) claims about disinterestedness. When he detects a mention of the honestum, he seems to have one of these three features in mind. We may illustrate his reasoning by surveying some places in his commentary on the *Ethics* where he speaks of the honestum.

Aristotle remarks that fine and just things (*kala kai dikaia*) that are the concern of political science are subject to difference and variation, so that some people think they are conventional, and not natural (*EN* 1094b14–16). Aristotle replies that goods also display the same variation. Since the Latin version renders '*kala*' by '*bona*', it suggests that Aristotle first makes an observation about good and just things, and then proceeds to make an observation about good things treated as a separate class.[53] A commentator might find this curiously repetitive. But Aquinas avoids attributing this repetition to Aristotle by recognizing that the first lot of *bona* are 'virtuous actions, which he here calls just' (*in EN* §33). When he comments on difference and variation, he says: 'For some things which by some are counted just and right (honesta) are by some <counted> unjust and wrong' (§33). Since Aquinas' 'just and right' reverses the order of the Greek phrase '*kala kai dikaia*' used by Aristotle, he probably does not intend it as a translation of Aristotle, but as an explanation of the type of good and just things that he has in mind. Aristotle's reference to political science may have suggested to Aquinas that Aristotle has morally right actions in mind. Aristotle's use of '*kalon*' in this passage confirms Aquinas' judgment.[54]

Aristotle distinguishes three objects of choice that the virtuous person gets right and others get wrong: the *kalon*, the advantageous (*sumpheron*), and the pleasant (*hêdu*) (1104b30–1). The Latin, as usual, uses 'bonum' for '*kalon*', and uses 'malum' to render '*aischron*' (though it sometimes uses 'turpe', the normal opposite to 'honestum'). Aquinas, however, glosses

honestum. A sign of this is the fact that it is proper to the good to be praiseworthy. For we praise friend-lovers, that is to say, lovers of deliberative friendship; so that friend-loving seems to all to have the character of honestum goods, and is loved in its own right.' Cf. viii 2 = 519b: 'The honestum good and the pleasant good are ends, but the honestum is an end in relation to reason, whereas pleasure <is an end> in relation to sense, or in relation to nature generally'. The best kind of friendship is founded on the honestum (ix 3.2 = 588b). The two commentaries are discussed by Dunbabin, 'Albertus'.

[52] Nor does every mention of the honestum in Aquinas' commentary correspond to a mention of the *kalon* by Aristotle. For one exception see *in EN* §1552, discussed below.

[53] See 'Talem autem quendam errorem habent et bona . . . ' *in EN* §16.

[54] Next he comes to Aristotle's claim that good things display the same sort of variation as we find in fine and just things. He reads it (as the Latin suggests) as a claim about good things displaying the same sort of variation as we find in good and just things. He infers that the second occurrence of '*bona*' refers to a subset of goods, and so he suggests that Aristotle refers to external goods ('bona exteriora', §34). He is probably wrong about this; the second example of goods that Aristotle offers is bravery (1094b19), which is not a merely external good. Aquinas deals with this difficulty by suggesting that 'bravery' here simply refers to bodily strength ('fortitudo corporalis', §34). Here he follows Albert and Eustratius (20.29–21.14). Since Eustratius already had the same idea when he read the Greek text, we cannot attribute Aquinas' exegesis simply to his reliance on the Latin. None the less, had he known where Aristotle uses '*kalon*' rather than '*agathon*', he might have thought differently about the remark on goods.

'bonum' by 'honestum' ('bonum, id est honestum', §273). To explain Aristotle's claim that the *kalon* is pleasant, Aquinas suggests that the honestum is pleasant in so far as it is in accord with reason ('secundum quod est conveniens rationi', §275).

The fact that Aristotle, as rendered into Latin, mentions three objects of choice of which the good is only one might suggest to a reader that 'good' refers to a subset of goods and not to all goods (since all objects of choice are goods in some way); in that case, it would be easy to infer that the relevant subset of goods are the honesta. In Book viii Aristotle mentions the good (*agathon*), the pleasant, and the advantageous as objects of love (*philêta*), and, after dismissing the advantageous as a merely instrumental object, identifies the good and the pleasant as the ends that are objects of love (1155b18–21). The division in Book ii appears to be parallel to that in Book viii, except that Book ii has '*kalon*' instead of '*agathon*'.

Aquinas sees the possible relevance of this passage in Book viii. For when he comes to comment on it, he explains it just as he explains the passage in Book ii, supposing that where the Latin text has 'bonum', Aristotle actually has the honestum in mind (§1552, per se bonum, id est honestum). Aquinas' suggestion that Aristotle is thinking of the honestum gives us some reason to attribute to him the argument that we have already noticed—that if Aristotle treats the good as only one object of desire, he must have in mind some proper subset of goods.

In the first five chapters of Book iii Aristotle several times mentions the *kalon*.[55] In all of these passages the Latin has 'bonum', and Aquinas follows it. In some passages the Latin uses 'turpe' (usually the opposite of 'honestum') as the opposite of 'bonum', so that a reader might suspect that the honestum is involved. Even here Aquinas does not take the hint offered by 'turpe'.[56] But sometimes he recognizes that Aristotle uses 'turpe' to refer to vicious behaviour. To illustrate Aristotle's claim that some things are so shameful (turpe) that we should refuse to do them at any price, he cites St Laurence, who endured being roasted on the gridiron rather than sacrifice to idols (§395).[57]

The section of the *Ethics* that discusses the particular virtues often refers to the special connexion between virtue, acting virtuously, and acting for the sake of the *kalon*. Aquinas misses several of these references.[58] But sometimes he captures them. Aristotle says that there are some things we ought to fear, and fearing them is *kalon*, while not fearing them is *aischron* (1115a12–13). Aquinas comments that in some cases fear is honestum (§533). The

[55] See *EN* 1110a21; b9; 1112b17; 1113b9; 1114b7.

[56] See *in EN* §§388–9, 393, 403–4, on 1110a4–8, 19–22, b9–15. Perhaps Aquinas fails to take the hint because he does not suppose that in this discussion 'turpe' always refers to moral wrongness. This is clear from his interpretation of Aristotle's remark that people are sometimes praised for 'enduring something *aischron* or painful as the price of great and *kala* things' (*EN* 1110a19–22). Aquinas does not take Aristotle to mean that people are praised for doing something vicious to promote some good; the 'shameful' (turpe) things he has in mind, according to Aquinas, involve humiliation rather than sin (*in EN* §393). Since he believes that Aristotle does not intend 'turpe' to refer to moral wrongness, he misses the hint that Aristotle is also referring to the honestum.

[57] Aquinas overlooks some interpretative issues that would arise for him if he had been aware of Aristotle's use of '*kalon*'. In his discussion of deliberation, for instance, Aristotle remarks that when several means to our end are open, we look for the 'easiest and finest (*kallista*)' means (1112b16–17). In using 'finest' here, Aristotle may well intend to point out that we must use moral criteria, as well as criteria of mere efficiency, in identifying possible means. This possibility does not strike Aquinas.

[58] Aristotle says it is characteristic of virtue to do good rather than receive it and to do *kalon* actions rather than to refrain from *aischron* actions (1120a12–13). Though the Latin uses 'turpe' rather than 'malum' where the Greek has '*aischron*', Aquinas says nothing about the honestum in this context (see §661). Similarly, he simply follows the Latin in other remarks about the *kalon*.

context helps him, since Aristotle goes on to say that the person with these appropriate fears is decent and has the proper sort of shame (*epieikês kai aidêmôn*). When Aristotle says brave people act for the sake of the *kalon*, Aquinas realizes that he does not simply intend the uninformative claim that they act for the sake of the good, but must mean that they act for some more specific end peculiar to their virtue (1115b23; §§549–50).[59]

Aristotle sometimes remarks that attention to the *kalon* is the hallmark of the virtues (see above on §661); the magnificent person, for instance, spends money for the sake of the *kalon*, because that is common to the virtues (1122b6–7). In Aquinas' paraphrase this person spends 'for the sake of the bonum honestum as an end; for acting for the sake of good is common to all the virtues'. The 'for . . . ' clause makes it clear that Aquinas takes Aristotle to have mentioned the bonum. He does not explain why he introduces the honestum.

Aristotle mentions the *kalon* several times in discussing friendship.[60] When he says friendship is not only necessary, but also *kalon* (1155a29), Aquinas comments that it is something good, that is to say, praiseworthy and honestum (§1544). He clearly supposes that the text he is explaining has 'bonum'; but Aristotle's remark about praiseworthiness suggests to him that the honestum is the relevant good. Similarly, when Aristotle remarks that people wish *kalon* things, but decide on advantageous things (1162b35), Aquinas takes him to say that people approve honestum things (§1737). Aristotle's example of something *kalon* is A's doing a good turn for B without expectation of return from B; his example of something advantageous is receiving a good turn from another. Aquinas notices that the first example illustrates the honestum. For the same reason, he mentions the honestum in his discussion of Aristotle's remark that the benefactor's action is *kalon* for the benefactor, but merely advantageous for the beneficiary (1168a9–12; §§1848–50).

Aquinas marks Aristotle's comment that the good person is normally supposed to act because of the *kalon*, and not for his own sake (1168a33–5). As before, the contrast between acting for the *kalon* and acting for one's own advantage suggests to Aquinas that the honestum is being discussed (§1857).[61] Similarly, when Aristotle says the virtuous person seeks to gain the *kalon* in preference to 'contested' goods (1169a20–5), Aquinas infers that Aristotle refers to the honestum (§§1878, 1881).[62] When Aristotle says that some appetites (*epithumiai*) for *kalon* things are praiseworthy, Aquinas mentions the honestum (1175b29 §2051); the reference to praiseworthiness gives him the clue. Similarly, Aristotle's contrast between the *kalon*, which is choiceworthy in itself, and pleasant amusement suggests to Aquinas that the honestum is relevant (1176b8 §2070).

[59] He does not mention the honestum here. But he mentions it in his discussion of the lower grades of bravery (§564). In the discussion of generosity, Aquinas passes over occurrences of *kalon* without comment, except when he remarks that extravagant people decline towards pleasure because they do not direct their lives to the bonum honestum (1121b9–10; §695). Perhaps he introduces the honestum because Aristotle mentions the good and the pleasant as the two possible aims of one's life. As before, Aquinas assumes that when Aristotle refers to pleasure and to good as ends, he has in mind some specific type of good (since pleasure is also a good, and pursued for the sake of the good); the non-instrumental good contrasted with pleasure is the honestum.

[60] When Aristotle says friendship promotes *kalon* actions (1155a15), Aquinas simply speaks of good actions (§1540).

[61] In two further places that mention the *kalon* Aquinas says nothing about the honestum (1169a6 §1873; 1169a8 §1874). This is surprising; for the first passage contains the contrast between the *kalon* and the advantageous, which usually prompts Aquinas to mention the honestum, and in the second passage Aristotle claims that when everyone strains to achieve the *kalon*, the common good is advanced.

[62] In Book x Aquinas sometimes accepts the 'bonum' of the Latin version without further comment (1179a5, 11; §§2129–30).

In these passages of his commentary, Aquinas speaks of the honestum where the context suggests that Aristotle speaks of, or alludes to, one of the three features of the honestum. He ascribes these features to the honestum on the strength of Albert's commentary. He relies, through Albert, on Ambrose and Cicero, and so ultimately on Stoic sources. Aristotle does not clearly express the conception of the *kalon* that the Stoics formulate, but the Stoic conception fits his claims. According to Albert and Aquinas, the honestum is good without qualification (simpliciter); its goodness does not consist in its being the object of a desire. That is why it attracts us by its own character.[63] It involves disinterested concern, as opposed to concern that is guided by one's own advantage. For these reasons, it is praiseworthy, and not simply advantageous.

This interpretation of Aristotle is supported by evidence that Aquinas is unaware of. In the contexts where he thinks Aristotle refers to the honestum, Aristotle actually uses '*kalon*', though the Latin versions use 'bonum'. We ought not to be surprised by the correspondence between Aristotle's Greek and Aquinas' exposition. For the Stoic assumptions about the *kalon* that underlie Aquinas' claims about the honestum also match Aristotle's claims about the *kalon*. Aquinas' success in identifying Aristotle's uses of '*kalon*' on the basis of Stoic views about the honestum suggests that the Stoic views fit the Aristotelian position as well.

334. The Honestum in the *Summa*

Aquinas' treatment of the honestum in his commentary on the *Ethics* provides a starting point for examining his remarks in the *Summa*. Though he does not explicitly introduce the honestum into his explicit discussion of moral goodness (1-2 qq18–21), it has an important place in his conception of the virtues and of moral goodness.

He divides the good in general into the pleasant, the useful, and the honestum, citing Ambrose as his authority.[64] He recognizes that the division seems to be proper to the human good, but takes it to be applicable to good in general, if the honestum is identified with what is desired for its own sake.[65] Elsewhere, he comments on the relation between the honestum and the useful, explaining that everything honestum is also useful, except for the ultimate end.[66]

At the beginning of the Prima Secundae, Aquinas takes for granted this notion of the honestum as the non-instrumental good (1-2 q8 a2 ad2; q8 a3, ad sc). He speaks of the honestum on the assumption that it is moral goodness. In the discussion of the passions, he insists that the honestum is good in accordance with reason (q34 a2 ad1). The passions

[63] See §2070: virtuous actions are 'good in their own right and honesta, so that some also say that honestas is what draws us by its own power and attracts us by its own worthiness'.

[64] Ambrose, *Off.* i 27. See §332 above.

[65] 'This division seems to be proper to human good. But if we consider the character of good from a higher and more universal point of view, we shall find that this division belongs to good in so far as it is good. . . . What is desired (appetitur) as the last thing, completely ending the motion of desire, as a thing towards which, in its own right, desire (appetitus) tends, is called honestum, because what is called honestum is what is desired (desiderare) in itself' (1a q5 a6).

[66] 'Among goods, however, is found what is good without qualification and in its own right, as honesta goods are, which are desired as ends for their own sake, even though they lead to something else, because in all honesta usefulness coincides with honestas, except in the ultimate <good>, which is the end of ends, which is to be desired (cupere) only for itself' (*2Sent.* d21 q1 a3).

are relevant to moral virtue, in so far as they can be regulated by the rule of reason, which is the root of the honestum good.[67] In saying that the honestum has the character of the praiseworthy and the meritorious (q39 a2 obj2), he refers back to the discussion of moral goodness (q21 a2), without suggesting that any further explanation is needed. He assumes—even though he did not say so in his discussion of moral goodness—that the features of moral goodness belong to the honestum.

In the Secunda Secundae he assumes that the virtues involve the honestum. Friendship has the character of the praiseworthy and honestum only in so far as it is 'founded on the honestas of the virtues', hence only in the best kind of friendship (2-2 q23 a3 ad1). The duty (debitum) of honestas extends to the requirements of the virtues in general, going beyond the demands of strict justice (q102 a2 ad2; q106 a1 ad2; a4 ad1; q114 a2).[68] This honestas of virtue involves unselfishness; it is especially displayed in benefiting another, in contrast to the merely useful good of gaining a benefit for oneself (q26 a12). This remark occurs in a discussion of Aristotle's chapter on benefactors and beneficiaries (*EN* ix 7), where Aquinas' commentary introduces a reference to the honestum. Aristotle claims that virtuous people prefer the *kalon* even at the cost of their life (1169a25–6); Aquinas follows him (with a modification), claiming (without specific reference to Aristotle) that the honestum is to be preferred even at the cost of one's bodily life (2-2 q110 a2).

After these brief references to the honestum, Aquinas discusses it more explicitly quite late in the Secunda Secundae, when he considers honestas as a part of temperance (q143 a1). He relies on a remark by Cicero that connects the honestum with the fitting (decorum, *prepon*), and connects the fitting with (among other things) temperance, because the temperate person does what is fitting for a human being, as opposed to a non-rational creature (Cic. *Off.* i 93–4).[69] Aquinas follows Cicero to this extent (2-2 q141 a2 obj3 ad3).[70]

The connexion of the honestum with temperance leads him to consider the honestum in general. He confirms its connexion with virtue as a whole (q145 a1); the virtues are honestum because they are ends in themselves though not the ultimate end (q145 a1 ad1).[71] It is characteristic of the honestum to direct all human affairs in accord with reason; this is what makes it 'fitting' (decorum) (q145 a2). What is ordered in accordance with reason is thereby naturally fitting for a human being (q145 a3); temperance is especially honestum because it prevents actions that are especially base (*turpe*) by being contrary to rational nature (q141 a8 ad1). The features that Aquinas attributes to the honestum are those he previously attributed to the morally good.[72]

For this account of the honestum Aquinas relies on Stoic sources, and especially on Cicero. On this point the *Summa* is similar to the commentary on the *Ethics*. His attitude to

[67] 'Now every honestum good proceeds from these two things, namely from correctness of reason and of will' (q39 a2). 'All the passions of the soul ought to be regulated in accordance with the rule (or "standard", regula) of reason, which (sc. rule? reason?) is the root of the honestum good' (q39 a2 ad1).

[68] On debitum see §320.

[69] On the decorum see §332 above on Ambrose.

[70] On temperance and the honestum see Albert, *De Temperantia* q4 a4 = *OO* xxviii 192.81, 193.3–7.

[71] Cajetan comments that Aquinas speaks differently of the honestum in 1a q5 a6 from how he speaks in 2–2. In the Prima Pars he takes honestum, utile, and delectabile to divide the good exhaustively. Here, however, he speaks more narrowly, with special reference to morals; 'et ideo honestum concidit hic cum virtute seu virtuoso' (ad 2-2 q145 a1 = L x 147, also quoted in M).

[72] See also 2-2 q110 a2 (the honestas of virtue); Supp. q49 a2 ad6 (the correct use of something useful is the basis of honestas).

Stoic sources is critical, however. He rejects the Stoic doctrine that the honestum is the only good. He agrees that it is the principal human good, because it belongs to reason, which is principal in a human being; but since it is not the only human good, sorrow can reasonably be directed to the loss of non-moral goods (3a q15 a6 ad2).

Aquinas, therefore, treats honestas as moral goodness, a good that is discovered by reason, specifying what fits rational nature, and not only good for the individual, but also meritorious because of its contribution to the common good maintained by justice. In the *Summa*, no less than in the commentary on the *Ethics*, Aquinas' conception of the honestum forms his Aristotelian account of moral goodness.

These points about the role of the honestum in Aquinas' theory are clear to Suarez. As we will see, he recognizes the cumulative importance of Aquinas' scattered remarks, and presents a connected account of moral rightness (honestas) as fitness to rational nature.[73] He has good reason to claim that he is making Aquinas clear and explicit, not adding a new element to Aquinas' position. The position that can reasonably be ascribed to Aquinas can no less reasonably be ascribed to Aristotle as well.[74]

These details on Aquinas' treatment of the honestum should help us to see what he commits himself to in his claims about the deliberative aspects of prudence. Once we see that he is committed to an account of moral virtue that gives this central place to the impartial, rational outlook concerned with the common good, we can ask more precise questions about his description of prudence and its relation to the moral virtues. We need to see whether he can argue that prudence forms a conception of the ultimate end from which deliberation leads us to the honestum.

335. Justice

The virtues as a whole, including the self-regarding virtues, aim at the honestum primarily because they require justice; for the impartial outlook aiming at the honestum is characteristic of justice.[75] Aquinas suggests that justice is especially concerned with actions rather than passions, and that it belongs to the will in contrast to non-rational desire. He is right to claim that acting virtuously requires a contribution by the will as well as the passions. But why should this contribution belong to a distinct virtue, and why should this virtue be justice? We might suppose that bravery and temperance themselves require a rightly-directed will that the virtuous person's passions obey. Apparently we can make this clear without mentioning justice.

This objection takes us back to Aquinas' puzzling claim that bravery and temperance belong to the non-rational parts and justice belongs to the will.[76] We may agree that it is not the function of justice to correct and modify any particular set of non-rational desires, whereas this is the function of bravery and temperance. But we can agree about this difference while still insisting that bravery and temperance also engage the will. So far, then, Aquinas has no sufficient reason for making justice a cardinal virtue.

[73] See Suarez, *Bon.* ii. 2.11 = 295a. [74] See §116.

[75] See §320 on debitum. Sometimes the debitum honesti is contrasted with the debitum iustitiae.

[76] See §290.

Why should our pursuit of our ultimate end, which is our own happiness, involve a virtue that is directed towards the good of others? Aquinas does not answer this question when he discusses whether justice is a virtue.[77] He simply assumes that justice correctly directs (rectificat) human actions, and that therefore it makes a human being good. We do not learn much more from his reasons for thinking that right (ius) is the object of justice (2-2 q57 a1). He assumes that justice involves some 'work that is equalized (adaequatum) to another in accordance with some way of being equal' (q57 a2). But the basis for this claim about the connexion between right direction and equality is not clear.

Aquinas is right to suppose that the cardinal virtues must include some provision for 'co-ordinating' the actions of different human beings (q58 a8).[78] But some sorts of co-ordination might appear to result from my successful manipulation of other people for my own advantage. This is not the sort of co-ordination on the basis of equality that Aquinas has in mind. What would support the more precise claims he makes about the content of justice?

He claims that human beings are naturally social, and that their social inclination underlies the common principles of natural law (1-2 q94 a2).[79] But Aquinas does not describe the inclination in much detail.[80] In particular, he does not make it clear how a bare inclination towards society supports a demand to treat others on some basis of equality. This lack of detail in Aquinas corresponds to a similar gap in Aristotle, who also fails to explain fully why the other-regarding virtue of justice must be included among the virtues that are necessary for an agent's happiness.[81]

336. Friendship

At this stage in Aristotle's argument, we appealed to his discussion of friendship. Does Aquinas' treatment of friendship give us any similar help? At first sight, it is different from Aristotle's treatment; he treats friendship as one of the two types of love, and he treats love as the primary passion.[82] But he does not really treat friendship as a species of passion; for he distinguishes the love belonging to friendship from the love belonging to appetite.[83] The love

[77] 'A human being's action is made good by meeting the standard (regula) of reason, in accordance with which human actions are made correct. Hence, since justice makes human actions correct, it is clear that it makes the action of a human being good' (2-2 q58 a3). Cf. *2Sent.* d27 a3 ad3 = P vi 633b; *in EN* v 2 §908.

[78] 'Whatever can be corrected through reason is the matter for moral virtue, which is defined through correct reason . . . Now through reason one can correct the internal passions of the soul, and the external actions, and also the external things that a human being can use. But through external actions and external things, by which human beings can have a common life (communicare), one looks for the proper direction (ordinatio) of one human being to another . . . And that is why, since justice is directed to another person, it is . . . only about external actions and things, . . . in so far as one human being is co-ordinated with another (alteri coordinatur) in accordance with them' (2-2 q58 a8). Cf. *3Sent.* d33 q1 a1 sol.3 ad3 = P vii 350b.

[79] See §311. Cf. *SG* iii 128–9, partly quoted at §307n39.

[80] The commentary on Aristotle's *Politics* i 1 (= P xxi 371a) is also brief on this point.

[81] On egoism see Finnis, *Aq.* 111, citing *2Sent.* d3 q4 a1 ad2 = P vi 427a (we do not love something because it is ours but because it is good; for good is per se the object of will); *ST* 2-2 q31 a2 ad2 (the human nature of sinners has a claim on us apart from their fault); q64 a6 (we ought to love the nature that God has made).

[82] In *Rhetoric* ii 4 Aristotle treats love or friendliness (*philia*) as a passion, but he makes no such claim about friendship in his discussion in the *Ethics*.

[83] '. . . the movement of love tends towards two things: towards the good that one wills to someone (to oneself or to another) and towards that to which one wills good. Therefore one has appetitive love towards the good that one wills

of friendship is intellectual love, belonging to the will, in contrast to sensory love, belonging to the sensory appetite.[84] Intellectual love, resulting from the recognition of the good pursued by the will, is not a passion, though it has the same name as the passion of love (q26 a2). This sort of love is 'dilection', the product of election rather than passion (q26 a3; cf. 1a q60 a3).

Aquinas argues that this different relation to reason and election is connected with a difference in the objects of love (1-2 q26 a4; cf. 2–2 q23 a1). Amicable love for another person is love of the person in his own right (secundum se), whereas love of the other for the sake of some further benefit to oneself is purely appetitive love (1-2 q27 a3). In amicable love we do not look for any further result for ourselves, and in this respect the object of love can be an ultimate object.[85] This does not make it the ultimate end, but it is an ultimate end in the sense that it is not simply directed towards a further end of ours.[86] If we do not wish good to the other person himself, but want his good for our sake, that is appetitive love rather than amicable love.[87]

The basis for this amicable love is some similarity between oneself and the other.[88] This recognition of similarity is also described as an 'apprehension of unity', in which one recognizes the other as 'another oneself' (alius ipse),[89] and achieves the 'intimacy' (inhaesio)

to another, and amicable love towards the one to whom one wills good. Now the members of this division are related as primary and secondary: for whatever is loved with amicable love is loved without qualification (simpliciter) and in its own right (per se), but whatever is loved with appetitive love is loved, not without qualification and in its own right, but for something else. . . . Consequently the love with which a thing is loved, that it may have some good, is love without qualification, whereas while the love with which a thing is loved so that it may be another's good is love in a certain respect (secundum quid)' (1-2 q26 a4).

[84] 'Love is something belonging to desire, since good is the object of both. Hence the division of love corresponds to the division of desires. . . . there is . . . desire following an apprehension in the subject of the desire, but from necessity and not from free judgment. This is the character of sensory desire in non-rational animals. In human beings, however, it has some share in freedom, to the extent that it obeys reason. Again, there is another desire following an apprehension in the subject of the desire in accordance with free judgment. And this is the rational or intellectual desire, which is called will' (1-2 q26 a1).

[85] 'The object of love is of two sorts. One is the sort that is loved in the manner of goodwill, whenever we wish someone's good because of himself, as when we love friends even if nothing has to come about from them for us. Another is the sort that is loved with appetitive love; and this is good that is in us or it is loved because some good in us arises from it, as when we love pleasure or we love wine to the extent that it produces pleasure. Now whatever is loved with appetitive love cannot be an ultimate object of love, since it is referred to the good of another—the one who has the appetite; but what is loved with the love of goodwill can be an ultimate object of love' (*4Sent* d49 q1 a2 sol.1 ad3 = P vii 1188a).

[86] 'Loving someone because of himself can be understood in two ways. One is the way in which something is loved as ultimate end; and in this way only God is to be loved because of himself. Another is the way in which we love someone to whom we will good, as comes about in morally right (honesta) friendship, but not the way <in which we love> a good that we will for ourselves, as comes about in pleasant or advantageous friendship, in which we love the friend as a good of ours—not because we desire advantage or pleasure for the friend, but because from the friend we desire advantage and pleasure for ourselves, just as we love other things that are pleasant and advantageous for us, such as food or clothes. But when we love someone because of virtue, we will good to him, not for ourselves [or: not him for ourselves?]; and this especially arises in the friendship of charity' (*Car.* a8 ad16).

[87] 'According to the Philosopher, not just any love has the character of friendship, but the love that is with goodwill—that is to way, when we love someone in such a way that we will good to him. If, however, we do not will good to the things we love, but we will their good for ourselves, in the way in which we are said to love wine, or a horse, or anything of that sort, it is not amicable love, but a sort of appetitive love. For it would be absurd to speak of having friendship for wine or for a horse' (2-2 q23 a1).

[88] 'For from the very fact that two are similar, as having one form, they are in a way one in that form: thus two human beings are one thing in the species of humanity, and two white human beings are one thing in whiteness. Hence the affection of one tends towards the other, as being one with him, and he wills good to him as to himself' (1-2 q27 a3).

[89] 'Now since love is of two kinds, appetitive love and amicable love, each of these arises from a kind of apprehension of the oneness of the beloved with the lover. For when we love a thing, as having an appetite for it, we apprehend it as

that seeks to know the other as one knows oneself. Since this amicable love is directed to features of the other person, apart from one's own previous needs, it produces 'ecstasy', taking one's concern outside oneself. Appetitive love involves a concern for something outside oneself, but only in relation to oneself and what one lacks. Amicable love takes one more radically outside oneself, in making one concerned for the other person in his own right,[90] so that it remains in the object, whereas appetitive love turns back to oneself.[91] In this respect amicable love values its object apart from its relation to oneself. Hence one loves the good for its own sake, not because it is one's own good.[92] Whereas appetitive love draws external things into ourselves, in so far as we fit them to our antecedent concerns, amicable love draws us towards external things, by fitting our concerns to other people's concerns.[93]

Since amicable love is directed towards other people in their own right, it is 'complete' or 'perfect' love, whereas appetitive love is imperfect.[94] We perfectly love another person when we want his good; for our love is directed entirely towards him. We love him imperfectly when we want his good for some further end to which our love is primarily directed.[95] In amicable love, therefore, we love the other person 'as ourselves', not because

belonging to our well-being. Similarly, when one loves another with amicable love, one wills good to him, just as one wills good to oneself, and that is why one apprehends him as another oneself—that is to say, in so far as one wills good to him as to oneself. That is why a friend is said to be "another oneself".' (1-2 q28 a1).

[90] As far as the desiring part is concerned, one is said to undergo ecstasy, when one's desire is carried towards something else, going out from oneself in a way. . . . [This] ecstasy is caused . . . by amicable love, without qualification, but by appetitive love not without qualification, but in a certain respect. For in appetitive love the lover is carried out of himself in a certain way—namely, to the extent that, when he is not content to enjoy the good that he has, he seeks to enjoy something outside himself. But since he seeks to have this external good for himself, he does not go outside himself without qualification, but this movement remains within him in its end. But in amicable love one's affection goes out from oneself without qualification because he wills and does good to his friend, as having concern and foresight for the friend because of the friend himself' (1-2 q28 a3).

[91] 'One can tend towards the good of a thing in two ways. One is the way in which one refers the good of that thing to another . . . as someone loves wine to the extent that he wishes for the sweetness of the wine, and he delights in this because he enjoys it, not because the wine itself has it. This is the love that some call appetitive love. But this love does not stop with the thing that is said to be love, but is turned back to the subject for which the good of the thing loved is desired. In another way love is carried towards the good of a thing so that it stops at the thing itself, to the extent that one is satisfied that what has a good has it, and one wishes for it a good that it lacks. And this is the love of goodwill, which is the beginning of friendship, as the Philosopher says' (*3Sent* d29 q1 a3 = P vii 318a).

[92] 'Nature is said to be turned to itself, because one always loves one's own good. But it is not necessary that one's aim comes to rest in the fact that it is one's own, but in the fact that it is good. For unless something were good for oneself in some way, either in reality or in appearance, one would never love it. But one does not love it because it is one's own, but because it is good; for good is in its own right the object of will' (*2Sent* d3 q4 ad2 = P vi 427a).

[93] 'In appetitive love, we draw to ourselves things that are external to us, since we love other things with this love to the extent that they are useful or pleasant to us. But in amicable love it is the other way round, because we draw ourselves to things that are outside us; because we are related to the people whom we love with this love as we are related to ourselves, sharing ourselves in a way with them. And so in amicable love similarity is the cause of love; for we do not love someone in this way except to the extent that we are one with him, and similarity is a sort of unity' (*in Ioann.* 15.4 = P x 570b).

[94] 'Now love is of two kinds, one incomplete, and the other complete. It is incomplete love of a thing, when one loves a thing not so that one wills good to it in itself, but so that one wills its good for oneself. Some people call this appetite, as when we love wine, wanting to enjoy its sweetness, or when we love a human being because of our own advantage or pleasure. But another kind of love is complete love, by which the good of someone in himself is loved, as when by loving someone I will that he himself have a good, even if nothing comes to me from it. This is said to be amicable love, by which someone is loved in his own right; that is why it is called complete friendship, as is said in *Ethics* VIII' (*Spe* a3c).

[95] 'Complete love is that by which someone is loved in his own right, as the one for whom one wills good, in the way in which a human being loves his friend. Incomplete love is that by which one loves something not in its own right, but so that he may obtain that good for himself, in the way in which a human being loves the thing he has an appetite for' (2-2 q17 a8).

we love him as much as we love ourselves, but because we love him as someone similar to ourselves.[96]

This description of love is clearer than Aristotle's on some points. Aquinas explains more clearly why friendship for another for the other's own sake is the only complete form of friendship. In his view, it is the only one that proceeds from the love of friendship, which is intellectual rather than appetitive love. The lower two types of Aristotelian friendship lack 'the character of genuine friendship',[97] because they rest on purely appetitive love. In non-amicable love our concern does not go completely outside ourselves, because we want to have some external good for ourselves.[98] Purely appetitive love does not reach its conclusion (terminus) with the good of what we love, but turns back to ourselves (*3Sent* d29 q1 a3). In this respect Aquinas does not distinguish our acquisitive love for wine or other possessions from the lower types of friendship for persons.

We might legitimately criticize him for failing to recognize the respects in which the lower types of friendship are not purely possessive. He seems to assume without warrant that appetitive love is always acquisitive; but it need not be so, except in the formal sense in which (according to Aquinas) every sort of desire aims at some sort of good for oneself. This sort of self-direction does not imply selfishness.

Aquinas could perhaps concede this point without damage to his main argument. In appetitive love we are constrained by affections and inclinations that both begin and sustain love. Recognition of goodness in the other (person or thing) depends on belief in its correspondence with some prior preference of mine; if the preference changes, the reason for loving the other disappears. Intellectual love, by contrast, responds to the recognition of some value that we recognize as a good reason to continue our preference; we suppose that if our preference were to go away but the value that we recognize did not go away, that would be a sign of error in our preference.

This contrast between appetitive and intellectual love helps to explain why intellectual love is needed for the love of friendship. Aquinas identifies a distinctive type of concern for other people, and for some non-personal objects; we have a reason for this concern that does not depend on our antecedent inclination, and we would think our inclination mistaken if it went away while the reason remained unchanged. For these purposes it is more important to ask what sustains the relevant concern than to ask what originates it. Some non-rational preference or attraction may provoke concern for this person rather than that one. But the type of friendship that results depends on the sort of concern that sustains it.

Aquinas' contrast between amicable and appetitive love anticipates Kant's contrast between acting on duty and acting on other motives.[99] Kant's main point is not that all

[96] 'The expression "as himself" can in one way qualify the knowledge and the love on the side of the one known and loved. In this way one angel knows another as himself, because he knows the other to be even as he knows himself to be. In another way the expression can qualify the knowledge and the love on the side of the knower and lover. In this way one angel does not know another as himself, because he knows himself through his essence, and the other not through the other's essence. Similarly he does not love another as himself, because he loves himself through his own will; but he does not love another through the other's will' (1a q60 a4 ad1). 'One is required to love one's neighbour as oneself, not however as much as oneself. Because of this it does not follow that all neighbours are to be loved to an equal degree' (*Car.* a9 ad9). Aquinas' views on degrees of love are discussed by Steel, 'Preferential'.

[97] . . . deficit a ratione verae amicitiae, 1-2 q26 a4 ad3.

[98] . . . affectio in fine infra ipsum concluditur, 1-2 q28 a3.

[99] Kant, *G.* 397.

motives other than the motive of duty are selfish. The two people he contrasts with the person acting out of duty are the trader who does the honest thing for the sake of his business and the philanthropist who acts out of his generous sentiments. The action of the philanthropist lacks moral worth not because it is selfish, but because his reason for doing the generous action rests ultimately on his generous impulses; if he lacked them, he would have lost his reason for these actions. Kant is primarily concerned with the distinction that Aquinas draws in his account of intellectual love.

This account of the love of friendship shows that Aquinas is closer to Aristotle's account of the best kind of friendship than to modern conceptions of friendship. We might well find it surprising to be told that genuine friendship depends on the recognition of value and not on our inclination, preference, or caprice. But Aquinas' view of the love of friendship makes it a more suitable basis for the sort of moral concern that might be defended by appeal to the judgments of prudence.

The appeal to similarity and to union is still not very informative. Aquinas implies that I recognize in another the same features calling for love that I recognize in myself when I have the proper sort of self-love for myself (cf. 1a q60 a3–4). He also seems to suggest, however, that some further type of union is involved besides mere similarity; hence he speaks of the union that results from membership in a family or a political community (1a q60 a4).

These different features of friendship should explain why we care about others for their own sake. They rest on Aquinas' claim that everyone seeks his own perfection. As we have seen, this involves the application of intellectual love to our desires and aims. The desire for perfection differs from the desire for the systematic satisfaction of my desires; it does not take my current desires for granted, but criticizes them to see whether they really fulfil my capacities as a rational agent. This criticism shows us that we perfect ourselves only in so far as we regard other people as valuable in their own right and not simply as means to aims that we can pursue without attributing such value to others.

This argument does not yet make it clear why pursuit of my own perfection requires concern for the good of others for their own sake. Aquinas' view of intellectual love shows why it is possible to care about the good of another person apart from any antecedent inclination of mine. But it does not yet seem to show why such concern for another person is required by reason.

To find the appropriate argument, it is helpful to consider the connexion between intellectual love, concern for one's own perfection, and interaction with others. Intellectual love causes us to aim at our perfection rather than the mere satisfaction of our desires. Equally, concern for our perfection causes us to act on intellectual love. For we seek our perfection as rational agents, and our rational agency consists in acting on intellectual love; as rational agents we pursue ends that we see some good reason for pursuing apart from our antecedent inclinations.

In seeking our own perfection as rational agents, we have reason to co-operate with other rational agents. When Aquinas speaks of 'sharing' (communicatio) with another person, he especially refers to the sharing of rational activity. As Aristotle sees, this shared activity includes common deliberation about what to do. Aquinas' emphasis on intellectual love adds a further element of sharing. In recognizing another as a rational agent, I recognize her as being moved by intellectual love. I therefore take her views on the merits of different

actions to be worth considering, since she at least assesses actions by some estimate of their value. If her views are worth considering, I have reason to share in common deliberation about value with the other person.

This conclusion may seem relevant to 'respecting' (as we say) a person's opinion, in the sense of thinking it worth some consideration. But such respect seems to fall short of concern for persons and their welfare. Can we bring Aquinas' claims about rational agency any closer to the attitudes proper to friendship?

He might plausibly reject any sharp division between respect for a person's opinion as a co-operator in practical reasoning and respect for a person as deserving concern for her welfare in her own right. If we are mutually concerned for each other's welfare, we have more reason to trust each other's opinion about the good. Since my advice to you aims at your good, you have reason to take it seriously; similarly, I have reason to listen to your advice, which aims at my good. Each of us has reason to believe that our joint advice to ourselves aims at our common good.

This argument suggests why Aquinas has a good reason for resting his claims about friendship on the apparently rather austere basis of intellectual love and external reasons. In his view, we cannot recognize ourselves as rational agents, moved by intellectual love to seek our own perfection, without being committed to friendship for rational agents as such.

The argument from intellectual love to friendship is basically the same as the argument for society that Aquinas offers in the context of natural law. He claims that as rational agents we have a natural inclination towards society. Once we try to amplify this claim, we find that he appeals to the connexion between rational agency and concern for other people as participants in rational agency. The basic connexion between rational agency and co-operation with others underlies Aquinas' arguments both about friendship and about justice.

337. Friendship as a Basis for Justice

This account of friendship clarifies Aquinas' claim that a human being is naturally political. This claim does not mean simply that human beings have naturally social instincts or preferences; for in that case the value of social ties would depend (as far as this argument goes) on their satisfying these preferences. Aquinas means that the good of others is a proper concern of intellectual love; the appropriate sort of community fulfils the rational demand for perfection.

It is difficult to find a clear argument in Aquinas that connects intellectual love, concern for the good of others, human beings as naturally political, and the demands of justice.[100] Moreover, the argument we have just attributed to him may appear to give an unwelcome result. Is a defence of friendship not too narrow for a defence of justice? The demands of justice extend to people for whom we lack the sort of concern that is characteristic of friendship.

[100] For further passages on the naturally political nature of human beings see BF xxxviii, App.1. Some of the passages in 2–2 that add some detail to the general claims in 1–2 are 2–2 q26 a3; q47 a10 ad2; q58 a5; a9 ad3; q64 a2; q65 a1; q114 a1 ad2.

This objection overlooks Aquinas' description of the basis of the love of friendship. In claiming that it involves the recognition of similarity and the recognition of value connected with this similarity, he allows the possibility of variations in the closeness of friendship. Since we can recognize relevant sorts of similarity in many people, Aquinas has defined an ethical relation that extends more broadly than friendship as we might naturally conceive it. Hence he speaks of love between citizens as the love that belongs to civic virtue, involving the sharing of right (honesta) actions.[101] His account of the love of friendship and its connexion to similarity is meant to explain the relation between citizens as well as the relation between closer friends (cf. *Div. Nom.* 4.9 = P xv 314a). We are entitled, then, to appeal to Aquinas' claims about friendship in order to understand his views about fellow-citizens.

We can connect friendship more closely with justice through the claim that justice involves the recognition of equality and the appropriate treatment of people as equals (2-2 q57 a1–2). When we recognize the relevant sort of equality, and treat people in accordance with it, we assign to each person what is his own.[102] Not all recognition of similarity involves recognition of equality (1a q60 a4 ad1), but recognition of equality involves the recognition of some aspect of similarity. In the case of distributive justice, the recognition of equality includes A's recognition of the equality of B and C, when A has to divide something between B and C. In the case of corrective justice, recognition of equality includes A's recognition of the equal right or equal claim of B and C. Recognition of the second sort of equality is especially important when we are trying to see how a virtue that concerns the good of others can fit into the outlook of a rational agent who is concerned with his own good.

If Aquinas is right to claim that recognition of the right sort of similarity is the basis for the love of friendship, he has a reason to believe that the sort of co-ordination required by justice (2-2 q58 a8) requires recognition of equality and concern for benefiting others. If we knew nothing of his views on the basis of friendship, we might object to Aquinas' claim by arguing that the appropriate sort of co-ordination is the sort that allows me to exploit other people to fulfil my antecedent inclinations, without any independent concern for their good. He can answer this objection by appeal to his account of friendship. If we are concerned for our own perfection, and we see that we cannot engage in the activities that perfect our own rational agency if we do not pursue the good of other people for their own sakes, we will not suppose that the right sort of co-ordination must be (as far as we can manage) purely exploitative.

338. The Aims of Justice

This argument suggests a possible defence of Aquinas' puzzling claim that justice differs from the other cardinal virtues in belonging to the will and in dealing with actions rather than passions. These features of justice are part of his reason for regarding justice as a distinct cardinal virtue. Earlier we rejected his grounds for believing that bravery and temperance

[101] See 1a q60 a4; *3Sent.* d29 q1 a6 = P vii 321a.

[102] '. . . the matter of justice is an external action in so far as either it or the thing we use through it is made proportionate to some other person towards whom we are directed (ordinamur) by justice. Now each person's own is what is owed (debitum) to him according to equality of proportion. Therefore the proper act of justice is nothing else than to render to each what is his own' (2-2 q58 a11).

belong to the passions rather than the will.[103] We might still agree, however, that justice differs from bravery and temperance in not being concerned with a specific passion or range of passions. The passions must be perfected in a just person, since different sorts of misdirected passions may cloud or distort a will that aims at just action; but no specific passion is connected to justice in the way fear is connected to bravery. The aim of justice is not to perfect any passions, but to turn the will in the right direction. We may be surprised to hear that the right direction of the will turns it towards the good of others; for we might expect that the special virtue of the will would direct it to the agent's own good.[104]

It is easier to agree with Aquinas if we see the connexion that he intends between concern for our perfection and concern for the good of others. When we choose on the basis of reason and deliberation, we act on will in contrast to passion. Aquinas believes that when we take this point of view, we can see why we need to be concerned for the good of others. If we were simply concerned with orderly satisfaction of our current desires, then we would have no desire-independent reason to care about the good of others for their own sake; but when we pass beyond satisfaction to perfection, we see the reasons for accepting justice. Aquinas has a reasonable defence of his view that the appropriate perfection of the will results in the virtue that also embodies the appropriate concern for the good of others.

This argument for connecting justice with the will applies to justice quite generally, but Aquinas believes that it applies in different ways to different types of justice. He follows Aristotle in distinguishing general from special or partial ('particularis') justice. General justice and virtue as a whole imply each other, though they differ in definition; special justice is co-ordinate with the other special virtues, and extends only over part of the area of general justice (2-2 q58 a6–7).

Aristotle's basis for distinguishing these two types of justice is not clear. Aquinas distinguishes them along lines that are not explicitly marked by Aristotle, though they have an Aristotelian basis. While both types of justice are concerned with our relations to other people, general justice is properly concerned with directing different people's actions towards a common good, whereas special justice is concerned with the relations of one individual to another.[105]

In Aquinas' view, general justice 'directs the actions of all the virtues towards a common good' (2-2 q58 a6). He does not mean that we could have all the virtues without directing them towards a common good; he means that if we had them to the extent that is possible without direction towards a common good, we would not have all the virtues. This description of general justice fits Aristotle's claim that general justice prescribes the actions of the other virtues with a view to the good of the political community (*EN* 1129b17–19).[106]

Special justice differs from general because it is properly concerned not with the common good, but with directing an individual's actions in relation to another particular individual (ad alteram singularem personam, 2-2 q58 a7).[107] Aquinas considers whether this distinct virtue is superfluous because general justice already embraces concern for the good of other people. He answers that general justice considers the good of individuals only mediately,

[103] See §290. [104] On justice and the will see Scotus' discussion of the two affections, §363.

[105] On general justice see Finnis, *Aq.* 118. [106] See §117. Aquinas introduces the common good at *in EN* v 2 §912.

[107] Aquinas introduces this aspect of special justice (ad aliquam personam privatam) at *in EN* v 3 §918, without explicit support in the text of Aristotle.

and that therefore it is necessary for some other virtue to consider the good of individuals immediately (2-2 q58 a7 ad1).[108] He connects this division with the division between public and private law (ius; 1-2 q60 a3).[109]

This division fits Aristotle, in so far as Aristotle's divisions of special justice seem to be especially concerned with relations (for instance, distribution, rectification, and exchange) that involve claims by individuals on one another. Aristotle also marks out special from general justice by claiming that special justice is properly concerned with equality (*EN* 1129a31–b1) and with ensuring that each person has his 'own' or his 'due' (*ta hautou*, 1132b16–20). Aquinas, however, takes concern with equality and with one's due to be a feature of justice as a whole, of general no less than of special justice. Nor does he rely on Aristotle's claim that special justice and injustice are concerned only with external goods.[110] Instead, he appeals to the distinction between a concern for individuals and a concern for the common good.

In support of Aristotle and Aquinas, we may notice that some provisions of justice seem to be concerned with facts about individuals—what someone has done, who has paid what, what agreements have been made, and so on—rather than with facts about the common good. By contrast, the requirement that citizens perform military service seems to refer directly to a common good, not to what this or that individual has done; the fact that it is a common good, rather than a good for this particular individual or group, seems to explain, at least in part, why it is just to require service from individuals. The different conditions that show why a requirement is just seem to suggest that the division between facts about individuals and facts about the common good is relevant.

Sometimes, however, both sorts of questions about justice seem to arise about the same action or policy. Even if the requirement of military service or taxation rests on the common good, its imposition on particular individuals raises questions of special justice; unfair benefits and burdens are imposed, for instance, if some people are exempted from service or taxation for inappropriate reasons. From one point of view, this unfairness does not affect the common good. If, for instance, the rich are allowed to avoid military service by paying for substitutes, the substitutes might be equally effective soldiers; similarly, the state might raise as much money by inequitable as by equitable taxation. If this is against the common good precisely because it is unjust, the requirements of special justice constrain the content of general justice. The constraints might also go the other way. Punishments for the crimes of an individual may be affected by considerations of the common good; we may consider whether, for instance, someone is a danger to society or whether a particular sort of punishment is likely to deter other people.

These questions are prominent in later arguments about justice. Aquinas does not discuss them. He does not suggest, for instance, that general justice could achieve the common

[108] 'Legal justice certainly directs someone sufficiently in things related to another—as far as the common good is concerned, immediately, but as far as the good of an individual person is concerned, mediately. And so there needs to be some particular justice to direct someone immediately towards the good of another particular person' (2-2 q58 a7 ad1).

[109] This distinction is briefly discussed by Nicholas, *IRL* 207–8. He remarks that the distinction in Roman law between crimes (public law) and delicts (private law) does not correspond exactly to the distinction between crimes and torts. But he draws a distinction that helps to explain Aquinas' claims: '. . . the distinction is between an act which endangers the order or the security of the state, and one which is an infringement of an individual's rights . . . .'

[110] He mentions this aspect of special justice at *in EN* v 3 §919.

good by ignoring the legitimate claims of individuals. He takes it for granted that general justice considers the good of individuals mediately (2-2 q58 a7 ad1), and he does not suggest that the common good might conflict with the good of this or that particular individual.

Some of his remarks about justice, however, suggest how a conflict might arise. The good of each individual and the common good would not coincide if the common good were calculated by aggregation of the gains and losses to individuals; for in that case a course of action might promote the common good, but harm particular individuals. Aquinas appeals to 'utility' in arguing for the justice of laws and institutions.[111] He does not go into detail about how utility is to be assessed or how it affects justice, but he suggests a basis for claims about general justice that potentially conflicts with the good of each individual.

A further potential conflict appears if the common good is taken to be the good of a society in contrast to the individuals composing it. The difference becomes clear if we think of a society as having an interest in its own survival across generations; this might require a sacrifice of the interests of individuals who are required to harm themselves in order to defend this state from dissolution and absorption into another state. This would be an application of the analogy of part and whole, which Aquinas sometimes uses for the relation of state to individual.[112] The whole has an interest in its survival that sometimes may require it to destroy a part; similarly (we may say) the state as a whole has an interest in its survival that may require harm to individuals.

We would reach a close coincidence between the common good and the good of individuals if we insisted that, contrary to the previous suggestion, the common good must be what is best for everyone. Each individual would have a strong 'veto' over every course of action proposed in the name of the common good, so that if x is proposed as promoting the common good, but A can show that A benefits more from y than from x, then A has shown that x does not promote the common good.

If Aquinas allows this strong veto to individuals, he is entitled to assume that nothing promoting the common good can violate individual goods. But a veto seems to impose unreasonable restrictions on the pursuit of the common good. Institutions and requirements such as military service, taxation, observance of traffic laws, and so on, do not seem to allow individuals the sort of veto that they would allow if they observed Aquinas' constraint, so interpreted.

But Aquinas does not endorse a strong veto; he does not assert that general justice mediately pursues what is best for each individual, but only that it mediately pursues individual good. This condition might be satisfied if pursuit of the common good requires benefit to each individual, but not necessarily greater benefit than would have been achieved in some other way. Perhaps x benefits both A and B, but A would have benefited more from y, which would have harmed B, and B would have benefited more from z, which would have harmed A. In that case, x promotes the common good of A and B, and so is to be preferred over y and z, even though both y and z would have been better for someone. In this case, we may say that A and B have a weak veto though not a strong veto.[113]

[111] See, e.g., 2-2 q64 a3, ad3; q77 a1. [112] On whole and part see n100 above.

[113] This weak veto, in turn, might be understood to require (a) a basic minimum for both A and B, or (b) a reasonable degree of equality between A and B.

This suggestion that the good of individuals imposes a weak veto on the common good, gives Aquinas a plausible claim about justice. For we often suppose that a course of action is unjust if it imposes an unreasonable degree of sacrifice on particular people, even if it also confers a large benefit on a larger number. A weak veto embodies a conception of 'one's own' or 'one's right' (ius suum).[114] Some rights guarantee the protection of certain goods for each individual against the demands of others. A weak veto seems to embody a reasonable guarantee. It may still be too demanding; for we may suppose that many just and beneficial policies make some people worse off than they were before. Such policies might be rejected as unjust only if they impose an unreasonable degree of harm. In deciding what would be an unreasonable degree of harm, we decide what should be guaranteed to individuals as their right.

339. Eudaemonism and Justice

In trying to understand some of these aspects of justice, we seem to raise a more general difficulty for the overall structure of Aquinas' conception of the virtues. Though a weak veto for individuals might seem to do better than a strong veto in capturing an aspect of justice, it might seem to be too weak for the demands of Aquinas' general theory. Since he accepts eudaemonism, he seems to assume that the will aims at the overall good for oneself. How, then, can a rational and informed will accept a course of action that fails to secure what seems best overall for oneself? If individuals have only a weak veto on the common good, they may be required to forgo what seems better for themselves and to accept the just course of action that protects them against unacceptable harm but fails to secure what is best for them. Given Aquinas' eudaemonism, must he not insist on a strong veto? But if he does that, he seems to demand more than it is reasonable to demand in the just pursuit of the common good.

This objection affects the unity of prudence, and hence affects RV. Aquinas believes we can reach the specific end pursued by justice, by deliberation from the universal end of one's own good. If the requirements of justice do not always seem to promote one's own good, how can we justify them by deliberation that refers ultimately to one's own good?

Aquinas might answer by distinguishing the eudaemonist basis of pursuit of a common good from the basis of policies that advance a common good. His eudaemonism requires us to satisfy ourselves that we are better off participating in a society pursuing a common good than we would be without it. We must rely on Aquinas' claim that human beings are naturally political, and on the defence of this claim that rests on his account of friendship. That account supports the claim that one's ultimate good requires participation in a common good, and hence membership of a society that pursues it.

Individuals, therefore, have a strong veto on the existence of a political community, and it is unjust to force them into a community that makes them worse off than they would be under any other arrangement open to them. They also have a strong veto on the effect of the community on their lives as a whole; if they are forced to have a worse life within the community than they would have under any other arrangement open to them,

[114] Some related issues about rights are discussed by Tuck, *NRT*, ch. 1.

the community fails a eudaemonist constraint.[115] Aquinas might reasonably argue that a community does not really pursue a common good unless it meets this constraint.

But an individual need not have a strong veto over every action taken by the community in the pursuit of the common good. For Aquinas' eudaemonism does not necessarily apply eudaemonist reasoning to every question. We have already seen a limit on eudaemonist reasoning in Aristotle's conception of action for the sake of the fine (*kalon*). Virtuous agents who recognize that a situation requires virtuous action act virtuously, without further reflexion on the implications for their own happiness. But the choice of virtuous action depends on deliberation about happiness; for this deliberation shows, according to Aristotle, that we promote our happiness by taking the virtuous person's attitude, which sometimes rejects eudaemonistic deliberation.[116]

Aquinas takes over this limit on eudaemonist reasoning, since he incorporates Aristotle's views about the fine in his own conception of the morally right (honestum). He argues that the brave person acts for the sake of the good of his proper state of character, or 'to express a likeness of his state in his action' (2-2 q123 a7). This aim does not conflict with the claim (quoted from Augustine) that the virtues aim at happiness; happiness is the ultimate end, but the end proper to the virtue is the proximate end.[117] Prudence arranges actions to aim at the ultimate end,[118] but brave people do not focus directly on this end in particular actions; they aim to act appropriately for their state of character.[119] Eudaemonist deliberation justifies the cultivation of bravery as a virtue, but it does not replace the normal reflexions of the brave person facing a particular choice.

We have already noticed that Aquinas distinguishes the ultimate from the proximate end, in explaining how prudence does and does not set the end for virtue. Prudence does not set the ultimate end, but it sets the proximate end by deliberation on the content of the ultimate end. This is the deliberation that belongs to universal prudence reaching the properly virtuous end. The deliberation of particular prudence takes the virtuous end for granted and reaches conclusions about the appropriate actions.

The deliberation of universal prudence has a teleological and eudaemonist form, since it starts from the ultimate end. But the deliberations of particular prudence need not have this form. Once we have concluded that we ought to pursue a specific proximate end for the sake of the ultimate good, we may not need to keep referring to the ultimate good. Indeed, reflexion on the nature of the particular end may convince us that we ought not to refer explicitly to the ultimate good in all circumstances.

It is plausible to suppose that when we form the proximate ends proper to friendship and justice, we will limit reflexion on the ultimate good. For we may find that we can achieve these proximate ends only if we pursue them for their own sake without further reflexion on their effects. This conclusion does not conflict with Aquinas' eudaemonism.

This understanding of the universal and the specific end of virtue explains how Aquinas' eudaemonist outlook both controls the content of justice and marks out an area that is

[115] Plato raises this question at *R*.520. See §62. [116] See §112.

[117] This is relevant to Aquinas' answer to questions about pagan virtue. See §356.

[118] In 'in agibilibus per prudentiam disponuntur actus humani' (q123 a7) Aquinas distinguishes the concern of prudence for the ultimate end from the concern of bravery for the proximate end.

[119] 'intendit enim agere secundum convenientiam sui habitus', q123 a7.

not directly subject to eudaemonist considerations. If the existence of a community that promotes the happiness of individuals requires them to suspend eudaemonist deliberation in some cases, and to be guided simply by the considerations proper to justice, eudaemonist considerations do not imply a strong veto for each individual on pursuit of the common good.

Later theorists recognize the importance of accepting practices that restrict appeals to the sort of deliberation that justifies acceptance of the practice. Aquinas does not emphasize the importance of such restrictions when he discusses justice. But his account of rational action allows such restrictions; he recognizes that 'the power of the first aim' (virtus primae intentionis) remains in actions that do not themselves proceed, on that occasion, directly from reflexion about the end we are aiming at.[120]

Aquinas does not develop his position in the detail that would be necessary for us to see what he thinks it is committed to, or how he thinks it can answer objections. Study of his views on justice is useful partly because they raise many of the issues that concern later theorists, and in particular because he combines several claims—especially those about the common good and about individual rights—that have tended to mark out sharply different conceptions of justice. His position has resources to answer the questions that arise as a result of more detailed examination of justice.

340. Commands and Counsels

RV commits Aquinas to the recognition of virtues that are required for everyone; these virtues are derived from the precepts of natural law, which direct natural human inclinations for one's own good and the good of others. He faces a complication, however, when he needs to make room for some of the specific demands of Christianity, and especially those that are held to justify the outlook of religious orders. These demands seem to create a difficulty, because they require religious (i.e., the members of these orders) to withdraw from the ordinary self-regarding and other-regarding obligations that go with the different virtues, in order to devote themselves to prayer and special discipline.

The moral basis of the religious life is not simply a question for Aquinas in his specific time and circumstances. It also requires us to ask when it is permissible to pursue some aim or aspiration that withdraws us from the ordinary obligations of a member of society, in order to achieve some good that we take to be especially important, in circumstances where we know that most people will not be attracted to this aim.

The obligations that constitute the way of life of a religious order (monks, nuns, or friars) separate some people from the obligations imposed on the rest of their society. Members of these orders are exempt from some of the requirements imposed on ordinary citizens, and they are subject to special obligations that cannot be imposed on everyone. Indeed, the observance of some obligations of the religious life (e.g., virginity) seems to depend on the assumption that other people will not observe them.[121]

[120] See §248. Aquinas' remarks on bravery (just quoted) suggest how his views about 'virtual intention' might clarify his account of the virtuous state of character.

[121] Aquinas' explanation in *SG* iii 130 cites *Matt.* 19:21; 1*Cor.* 7:23, 32–3; *Heb.* 12:17; *Cant.* 8:7; *Matt.* 13:45–6; *Phil.* 3:7–8.

Aquinas faces a difficulty, since he admits that these special obligations do not specify the demands of virtue and justice.[122] He takes them to rest on 'counsels of perfection', as opposed to 'precepts of necessity'. They are not prescribed as necessary for achieving the ultimate end, and hence they are not necessary parts of the virtues; but they are advised as the best way of reaching the end. This claim may puzzle us. If the counsels identify better or easier means to achieve the end that everyone wants, why do they not apply to everyone? For surely good deliberation picks the best and easiest means? Should we not abandon a merely possible means if a better and easier one is available, given the difficulty of the merely possible means and the value of the end being pursued?

Aquinas gives two reasons for not requiring everyone to follow this route: (1) Not everyone is capable of following it; as St Paul suggests, it might be better to be unmarried and free of lust, but since this is not possible for most people, it is better for them to marry than to burn.[123] If it is not possible for everyone, it would be self-defeating to impose this conduct on everyone. (2) The 'reasonable order' of human beings requires most people not to take the road of the counsels but to take the ordinary road.

If the second point were true, but the first false, some people might be compelled to undertake special burdens, since they would be required to undertake difficult tasks that they would like to avoid. Sometimes people have supposed that Plato's rulers must undertake special burdens of this sort.[124] Aquinas does not believe that the counsels force this issue on us. For if most people would not in any case want to follow the counsels, and would not be capable of it, it is not unfair if some people withdraw from ordinary roles and tasks. Those who withdraw do not impose unfair burdens on people who would like to be monks or friars but are needed to maintain the reasonable order of society; for the number of people who are capable of the religious life is small enough to make it unnecessary to select among equally qualified candidates.

To justify this claim that most people neither can nor want to take up the religious life, Aquinas might appeal to the fact that religious—from one point of view—abandon some of the basic human concerns prescribed by natural law because of human nature. This is part of the ground for objecting to voluntary poverty (*SG* iii 131). Self-preservation, reproduction, and concern for others are all abandoned to the extent that the ordinary means for securing them are rejected. Aquinas needs to argue that they are not entirely abandoned; the religious assure themselves that all these functions can be handled 'by proxy', since they are taken care of by other people's deliberation. Other people must carry out these basic provisions of natural law. The religious assume that society takes care of the things that they set aside, and in particular that other people exercise charity by supporting the religious.

[122] 'But this is not necessary to a human being for justice in such a way that justice cannot be without it; for virtue and justice are not destroyed if a human being uses bodily and earthly things in accordance with reasonable order. And for that reason the kinds of advice given by divine law of this kind are called counsels, and not precepts, in so far as a human being is exhorted to lay aside less good things for the sake of better things' (*SG* iii 130). 'Things that belong to excellence come under counsels of perfection rather than under precepts of necessity. That is why precepts were not to be given about magnificence and magnanimity, but rather counsels' (2-2 q140 a2 ad1).

[123] 'I wish that all were as I myself am. But each has his own special gift from God, one having one kind and another a different kind. To the unmarried and the widows I say that it is well for them to remain unmarried as I am. But if they are not practicing self-control, they should marry. For it is better to marry than to be aflame with passion' (*1Cor.* 7:7–9). Aquinas comments in *ST* Suppl. q42 a3 ad4.

[124] See §62.

Is this an unfair expectation? If what other people are required to do is simply what nature makes appropriate for them and is not an unwelcome burden in comparison with the religious life, it is not unfair if the religious live in a way that presupposes that other people will continue with the natural functions. Other people are reluctant to give up the life according to nature for the withdrawn life; and there is no reason to tell them that they must overcome their reluctance. Indeed, it would be disastrous if they all did overcome it.

Moreover, the fact that religious orders withdraw from some aspects of society does not make them socially useless parasites. Aquinas defends voluntary poverty by arguing that a religious undertakes it in order to be more useful to other people in other ways.[125] On this ground, he defends friars, who teach and engage with others, in comparison with monks who withdraw more completely. In his view, complete separation from society is not necessary in order to devote oneself to the contemplative life. Teaching immerses friars in the everyday world less than ordinary occupations and social roles would immerse them. In their partly withdrawn way of life, they devote less anxiety (sollicitudo) to securing the basic means of life; hence the idea of abandoning ordinary pursuits in order to take some of them up again is not as pointless as it sounds.

But even if, from the human point of view, the religious option involves no unfairness to the ordinary people and imposes no special burden on them, does it involve some unfairness from the divine point of view? For if the counsels of perfection are really divine advice about the best way to salvation, do they not give some people an easier route to salvation than other people have? Worldly cares are presumably to be avoided because they introduce temptations, opportunities to abandon one's ultimate good. Is it not unfair for one sort of person to face these temptations that other people can avoid?

One might answer that this is not a special difficulty about the religious life. Even if it were always true that religious are exposed to less dangerous temptations than those that confront other people, they would not necessarily gain an unfair advantage just by being religious. They simply exemplify the more general point that different people face different temptations and dangers. Someone like Trollope's Dr Grantly is not free of dangers in his life as a Christian minister, but he has a relatively easy time fulfilling his vocation to some degree, just as a soldier in peacetime has a relatively easy career as a competent soldier. Dietrich Bonhöffer faced more severe temptations and dangers as a Christian minister, and displayed a degree of heroic virtue that Dr Grantly would never display, even if he were better than he is.[126] Similarly, a general who commands an army in wartime in difficult and dangerous situations has an opportunity to display greatness, and to suffer humiliating

[125] 'Hence the one who through voluntary poverty removes from himself the capacity to help others in temporal goods, in order to acquire spiritual goods through which he can help others more usefully, does not act against the good of human society . . . ' (*SG* iii 134).

[126] See Trollope's description of Dr Grantly: 'He was a moral man, believing the precepts which he taught, and believing also that he acted up to them; though we cannot say that he would give his coat to the man who took his cloak, or that he was prepared to forgive his brother even seven times' (*W*, ch. 2). On another generally sympathetic character Trollope comments: 'Mr Harding's warmest admirers cannot say that he was ever an industrious man; the circumstances of his life have not called on him to be so; and yet he can hardly be called an idler' (ch. 1). Bonhöffer describes the moral predicament of Germans in 1943 in the Prologue to *LPP*: 'The great masquerade of evil has played havoc with all our ethical concepts. For evil to appear disguised as light, charity, historical necessity, or social justice is quite bewildering to anyone brought up on our traditional ethical concepts . . . ' (4). On the attempt to live a life of private virtue that might be reasonable in more normal circumstances he comments: 'Here and there people flee from public altercation into the

failure, that the peacetime general never has. If the Stoics are right to say that a virtuous person acts reasonably in accordance with the circumstances, and that reasonableness includes a disposition to act rightly in counterfactual as well as actual circumstances, the facts about different circumstances do not necessarily introduce unfairness.[127] Hence they do not create any special moral or theological objection to the religious life.

People who are incapable of the religious life cannot reasonably complain that they are not allowed to share in it, provided that their incapacity does not result in their being treated unfairly. Similarly, if some people are capable of the religious life, but are required to renounce it for the sake of the common good (because society needs them as farmers, or plumbers, or politicians), they have no reason to complain, provided that they are not unfairly penalized because they have remained in situations where they cannot follow the counsels of perfection. The demands of RV and the requirements of friendship and justice do not necessarily conflict with the ways of life recommended by the counsels of perfection.[128]

341. Self-Love, Sin, and Virtue

We have noticed that this discussion of the virtues, and especially of friendship and justice, raises a question, for Aquinas no less than for Aristotle, about the primary and fundamental character of one's desire for one's own happiness. Aquinas follows Aristotle in maintaining the primacy of self-love. He rejects the view that self-love needs to be limited by some other affection, and he examines the Scriptural and Augustinian arguments that appear to raise moral objections to self-love, in order to show that they do not support justified objections to self-love, correctly understood.

Aquinas believes that we ought to love God more than ourselves, and hence that we should not take states of ourselves to be the most important end to achieve.[129] He compares the subordination of self-love to the love of God with the subordination of concern for one's own advantage to the common good. The love of God is not separate, any more than concern for the common good is, from one's pursuit of one's own happiness. We come to love God as the common source of all goodness because we are concerned about our own

sanctuary of private virtuousness. But anyone who does this must shut his mouth and his eyes to the injustice around him' (5).

[127] The view that virtue requires an appropriate attitude to a variety of circumstances, as opposed to one definite way of life, is explored by Taylor, *SS*, ch. 13, esp. 222–4 (who discusses this view as a form of opposition to a specifically religious way of life).

[128] I say 'do not necessarily conflict' in order to acknowledge that in some particular situations (e.g., conditions of scarcity or emergency) there may be no room for the withdrawal required by the religious life. Machiavelli might be taken to claim that he lived in such conditions of emergency; see §409.

[129] 'Natural love is founded on the sharing of natural goods given to us by God. By this natural love not only a human being, in the unimpaired condition of his nature, but also every single creature, each in its own way, loves God above all things, and even more than itself, because each part naturally loves the common good of the whole more than its own particular good. This is clear from what they do; for each part has its principal inclination towards common action for the benefit (utilitas) of the whole. This is also evident in civic virtues, in accordance with which citizens sometimes accept damage even to their own property and persons for the sake of the common good. Hence this is found to be true much more in the friendship of charity, which is founded on the sharing of the gifts of grace. For this reason a human being ought, out of charity, to love God, who is the common good of all, more than himself, because happiness is in God as in the common and original principle of all who can share in happiness' (2-2 q26 a3).

good (1-2 q2 a8). Hence we could love God above everything by our uncorrupted natural abilities without grace; we need grace only because of the corruption resulting from sin.[130]

Overriding love of God does not require us to renounce self-love; for self-love does not require us to care less about the love of God. Aquinas agrees with Aristotle in claiming that vicious people have misguided self-love, but have no more self-love than virtuous people have.[131] Vicious people have the 'prudence of the flesh', which rests on a false conception of themselves. This is not a type of genuine prudence, but an impostor, because it does not include a grasp of the correct end.[132] Similarly, vicious people do not love themselves more than virtuous people love themselves; they have the wrong conception of the self who is appropriately loved.

In one way the love of God or the common good limits self-love, but in another way it does not. To see the difference, we may recall Aquinas' division between the universal and the specific end of the virtuous person, and the corresponding roles of universal and particular prudence. The universal end is one's own happiness; inquiry about this discovers the particular end that happiness consists in. Understanding of the particular end may show us that when we act on it we should not ask whether our action promotes the universal end. In our practical thought as a whole, self-love is not limited; for we are always following

[130] 'Now in natural things, everything which, as such, naturally belongs to another, is principally, and more strongly inclined towards what it belongs to than towards itself. . . . And since reason imitates nature, we find the same inclination in the civic virtues; for it is characteristic of a virtuous citizen to expose himself to the danger of death for the safety of the whole commonwealth. . . . And so, since God himself is the universal good, and under this good angels, human beings, and all creatures are included, because every creature naturally, in accordance with what it is, belongs to God, it follows that by natural love angel and human being alike loves God more and more principally than himself. Otherwise, if either of them naturally loved self more than God, it would follow that natural love would be perverse, and that it would not be perfected but destroyed through charity' (1a q60 a5). '. . . in the state of unimpaired nature a human being referred the love of himself to the love of God as to its end, and similarly the love of all other things. And so he loved God more than himself and above all things. But in the state of corrupt nature man falls short of this as far as the desire of his rational will goes; for because of the corruption of nature it follows its private good, unless it is healed through God's grace' (1-2 q109 a3).

[131] 'Properly speaking, it is impossible for someone to hate himself. For everything naturally desires good, nor can anyone desire anything for himself, except under the character of good: for "evil is outside the scope of the will", as Dionysius says. . . . Now to love someone is to will good to him. . . . Hence it is necessary for someone to love himself, and impossible to hate himself, properly speaking' (1-2 q29 a4). 'Now the fact that someone desires a temporal good misdirectedly results from his loving himself misdirectedly; for to will some good to someone is to love him. Therefore it is evident that misdirected love of oneself is the cause of every sin' (1-2 q77 a4). 'Properly directed self-love is required (debitus) and natural, so in such a way that one desires an appropriate good for oneself. But misdirected self-love, which leads to contempt of God, is taken to be the cause of sin, according to Augustine' (1-2 q77 a4 ad1). 'A human being loves himself in this, that he wills his excellence; for loving oneself is the same as willing good to oneself. Hence it amounts to the same to take arrogance or self-love to be a beginning of all sin' (1-2 q84 a2 ad3).

'Love of self is common to all, in one way; in another way it is proper to the good; in a third way, it is proper to the bad. For it is common to all for each one to love what he thinks himself to be. Now a human being is said to be something, in two ways. First, in accordance with his substance and nature; and in accordance with this all take it to be a common good to be what they are, that is, composed of a soul and body. And in this way all, both good and bad, love themselves, in so far as they love their own preservation. Secondly, a human being is said to be something in accordance with some principal characteristic, as the principal one in a state is spoken of as being the state, so that what the principal ones do, the state is said to do. In this way, all do not regard themselves as what they are. For the rational mind is principal in a human being, and the sensory and corporeal nature is secondary. . . . Now the good regard their rational nature . . . as principal in them, and hence in accordance with this they regard themselves as what they are. Bad people, however, regard their sensory and bodily nature . . . as principal in themselves. Hence, since they do not recognize (cognoscentes) themselves correctly, they do not truly love themselves, but they love what they suppose themselves to be. But the good, since they recognize themselves truly, truly love themselves' (2-2 q25 a7). Aquinas continues with a paraphrase of *EN* ix 4.

[132] Aquinas discusses prudence of the flesh (based on *Rm.* 8:6, Vulg.) at 2-2 q47 a13. Contrast Luther, who identifies it with self-love without qualification. See §416.

our judgment about our own happiness. But in our actions in pursuit of the particular end, self-love is limited; for we discover—by deliberation about our happiness—that we ought not to be deliberating directly about happiness when we pursue the particular end.

Aquinas believes, therefore, that when Satan sinned against God, he did not sin simply in so far as he was moved by self-love and treated his own happiness as his ultimate end. In these respects he did not sin at all. His sin resulted from misdirected self-love, not from self-love itself. Though self-love is the source of all sin (amor sui principium peccati, 1-2 q77 a4; 2–2 q25 a7), it does not lead us into error by causing us to care too much about our own happiness. We fall into error only if we assign the supreme place to ourselves in pursuing the relevant particular end. We make a mistake if we believe that our own happiness depends entirely on ourselves and that it does not require subordination to the will of God. This mistake expresses the outlook of arrogance (superbia). Hence it would be more exact to say that arrogance is the source of the sin of Satan (1a q63 a1–2, a4).[133] The claim that self-love is the source of every sin is true only in so far as arrogance is a form of misguided self-love.[134]

The sin of Satan rests on an error about the nature and sources of his happiness, and so on an excessive desire for some condition of himself to the exclusion of anything else. He manifests his error in his failure to direct his own perfection towards a higher end (*SG* iii 109 §2846). But this does not mean that he cares too much about his own happiness as opposed to some other ultimate end; it means that he is wrong to suppose that concern for his happiness justifies exclusive self-love. His particular end ought to have included a correct view about his subordination to God; he ought not to have been so absorbed in himself and his concerns.

This general treatment of self-love fits Aquinas' discussion of friendship and justice. In both cases, the rational will does not have to step outside its desire for happiness. We ought to choose on the basis of beliefs about our perfection. In his view, correct beliefs about perfection support the practice of all the cardinal virtues, including those aspects that require concern for the good of others.

342. Success of the Argument for the Virtues

We have seen how Aquinas explains his conception of the free and rational will, and uses this conception to identify the virtues of a rational agent. Since the freedom of the will depends on deliberation about the good, the virtues that embody the good use of free will result from this deliberation. To show that this is the right way to understand the virtues, Aquinas

[133] 'In spiritual goods there can be no sin while someone has an affection towards them, unless regulation by the superior is not maintained in such an affection. And this is the sin of arrogance, not to be subject to a superior where one ought to be. Hence the first sin of the angel can be nothing other than arrogance' (1a q63 a2).

[134] 'The sin of arrogance may be considered in two ways. First . . . it is a special sin, because it has a special object: for it is misdirected desire of one's own excellence. . . . Secondly, it may be considered as having a certain overflowing into other sins. In this way . . . all sins can arise from arrogance, in two ways. First, properly, to the extent that other sins are directed towards the end of arrogance . . . Secondly, indirectly and as though accidentally, by removing something that prohibits, namely to the extent that through arrogance a human being despises the divine law through which he is prohibited from sinning. . . . But one should notice that it belongs to this generic character of arrogance that all the vices can sometimes arise from arrogance, but it does not belong to it that all the vices always arise from arrogance' (2-2 q162 a2). Cf. 1–2 q84 a2.

argues that universal prudence reaches the specifically virtuous ends by deliberating about how to achieve the universal end of the agent's ultimate good.

At two points in the description of the virtues, Aquinas might appear to deviate from this line of argument, by introducing moral content that cannot be reached by deliberation about the universal end: (1) His list of specific virtues of character might appear to require some views about their content that cannot be derived from reflexion on rational agency; we might expect that such views would be derived from our knowledge of the natural law. (2) His appeal to the first principles of natural law grasped by universal conscience might appear to imply that we have knowledge of moral principles that are independent of an individual rational will's pursuit of its ultimate end.

At both points, however, Aquinas adheres to his main purpose of deriving moral content from deliberation about the universal end. Our grasp of natural law does not yield general moral principles known independently of eudaemonistic grounds. The natural law is the 'law of our nature'; our nature is the sort of rational agency that Aquinas describes; and so an appeal to natural law does not lead us away from rational agency, but leads us back to it.

Aquinas' view of the will and the passions shows why we need the cardinal virtues, both as pervasive features of virtuous action and as distinct traits of character. If we were not subject to passions, we would not need the virtues that are concerned with their proper direction. If we did not have a will that aims at perfection, we would not know, without appeal to some further standard, what the proper direction of the passions consists in. If, for instance, our ultimate end were simply the orderly satisfaction of our first-order desires, whatever they might be, the specific end to be pursued by the virtues would depend on the nature of our first-order desires. Since, however, our ultimate end is our perfection as rational agents, specific desires are open to criticism and reform in the light of this end.

We might concede that this argument explains why some self-regarding conditions are virtues, but still deny that it will account for other-regarding virtues. This objection leads us to Aquinas' description and defence of friendship and justice. He argues that his account of rational agency answers this objection. He believes that if we recognize a virtue of the rational will that co-ordinates one's actions with those of other people, we ought to value friendship, to recognize the appropriate sort of equality, and to participate in a society aiming at a common good.

The arguments supporting Aquinas' conception of the different cardinal and subordinate virtues support his view that universal prudence reaches the specifically virtuous ends, and that the deliberation proper to universal prudence is part of a virtue of character. For the scope and connexions of the virtues are determined by their effect on one another and by their contribution to the ultimate end. We must understand this contribution if we are to understand why bravery sometimes requires active resistance, sometimes passive acceptance, and why both pride and humility are appropriate for different aspects of oneself and for different comparisons of oneself with others. In specifying the requirements of the different virtues, Aquinas argues from the ultimate end of agents who pursue their own perfection as rational agents with wills, and therefore pursue the good of others as part of their own good.

24

AQUINAS: SIN AND GRACE

343. Questions for Aquinas

Apart from the questions about sin and vice that arise for the moral philosopher, Aquinas faces special questions that arise from Christian moral theology. For the Christian moralist, sin is a pervasive feature of human life. The division between vicious people and other people does not mean that only vicious people are subject to the perversion of the will that produces sin. Christian doctrine implies that everyone is marked by original sin, which has some causal influence on actual sin. Even in the regenerate the influence of original sin does not disappear. Baptismal regeneration releases them from some effects of original sin, but not from actual sin. Though divine grace helps them, it does not cancel the effects of sin altogether.

These doctrines require Aquinas to explain how sin can be as pervasive as Christianity says it is, if Aristotle is right about virtue and vice. They raise a question about the voluntariness of sin, and therefore of virtue and vice. Aquinas argues that we are free and responsible agents in our choice between virtue and vice, and between virtuous and vicious actions. In forming our rational conception of ways to achieve happiness, and in consenting or refusing consent to the influence of our passions, we exercise freedom. Aquinas has to show that our most important choices are not mere reactions to the influence of irresistible passions 'submerging' and 'binding' the rational will; our outlook cannot be so warped as to deprive us of choice between good and bad characters and actions.

We might doubt this position if we reflect on ordinary facts about environment, heredity, upbringing, and culture. But these sorts of apparently interfering causal influences seem less severe threats than the threat arising from the Christian doctrine of original sin. This doctrine seems to imply that we are irresistibly inclined to error quite independently of any choice of ours.[1] To solve the theological problem, Aquinas has to show that his account of freewill leaves room for the appropriate degree of freewill despite the influence of original sin.

[1] See e.g. Articles §10 on free will. Cf. *West. Conf.* 6.4–5: 'From this original corruption, whereby we are utterly indisposed, disabled, and made opposite to all good, and wholly inclined to all evil, do proceed all actual transgressions. This corruption of nature, during this life, doth remain in those that are regenerated; and although it be through Christ pardoned and mortified, yet both itself, and all the motions thereof, are truly and properly sin.'

Doubts about freewill raise difficulties not only for Aquinas, but also for the Christian moralist generally. If original sin and divine grace play a primary causal role in making us sinful, vicious, or virtuous, we do not seem to be responsible, praiseworthy, and blameworthy for our virtue and vice. The Christian moralist cannot simply accept this consequence. For the Christian position maintains that sin deserves punishment; without blame and liability to punishment, there would be nothing to forgive.

The pervasiveness of sin implies a correspondingly pervasive role for God on the positive side. Since the acquired moral virtues do not remove sin, we need something else to remove it. We depend on divine grace, working in several ways. It releases us through baptism from some of the effects of original sin. It disposes us to turn to God; it infuses theological and moral virtues in us; and it gives us perseverance to remain in them. Once we recognize the extent of divine intervention, we may well conclude that the acquired moral virtues become insignificant. The infusion of divine grace is not a reward for having acquired the moral virtues by ourselves; why, then, should these virtues have a central place in the pursuit of the ultimate end? The crucial steps seem to proceed from divine grace.

Questions about the connexion between vice, sin, grace, and virtue are not simply questions for someone who agrees with Aquinas' Aristotelian starting point. They also arise in trying to find a coherent statement of the Christian position on sin, grace, and responsibility. We need to see whether Aquinas' Aristotelian theory makes it easier or more difficult to find this coherent statement of the Christian position.

At first sight, Aristotelian assumptions raise doubts about the Christian position. For Aristotle recognizes the possibility of becoming virtuous by our own efforts and through our own will. If we agree with him, we seem to raise difficulties for the Christian belief in the ubiquity of sin; this is why Luther believes that the incorporation of Aristotelian ethics is a fatal dilution of the Christian conception of human nature.[2] If Aquinas is to avoid this objection, he needs to describe sin in such a way that it does not imply an Aristotelian vice, but can be present in someone who has the acquired moral virtues.

Aquinas' views on the roles of original sin, grace, and human merit are complex. On the one hand, he seems to affirm the possibility of being virtuous by our own efforts; and so, if God approves human virtues (which he should, because of his relation to the natural law), our acquired virtues seem to be a source of merit. On the other hand, Aristotle's conditions for voluntariness leave Aquinas with more scope than another theory would allow him for attributing a large causal role to external influences—either original sin or divine grace—while insisting that an action or state of character is up to us and that we are responsible for it. He has a possible basis for reconciling our responsibility for our actions with Christian doctrines about grace and merit.

These questions are relevant not only for the student of Aquinas' theology, but also for the student of some aspects of his moral philosophy. (1) We may reasonably be interested in the coherence of his overall position. If his explanation of central concepts in morality and moral psychology does not fit the Christian doctrines that use these concepts, some aspect of his position needs to be revised. (2) If Aristotelian moral philosophy does not fit Christian theology, the project of 'baptizing' Aristotle does not succeed; Christianity not

[2] See §411n5.

only introduces new moral beliefs but also demands a new theoretical framework to explain them. This view about Christianity is one part of Luther's case against the 'Aristotelian church'.[3] If it is right, it supports the belief in a sharp discontinuity in the history of moral philosophy. (3) Comparison between Aristotelian and Christian views may also help us to decide about their soundness. If the two positions conflict, they cannot both be right. Whether or not we accept the Christian position because it is Christian, we may believe that, as Kant argues, it embodies some reasonable moral assumptions.[4] If these are incompatible with Aristotle, they point to errors in the Aristotelian position. Conversely, we may believe that the superiority of Aristotelian ethics reveals some moral errors in Christianity. If the two positions agree in the way that Aquinas believes they agree, it does not follow that they are both true, but we will not face the objections that arise from a conflict between them.

344. The External Causes of Sin

Aquinas relies on his conception of responsibility and freedom to defend the common assumption that we act freely and responsibly both in sinning and in acting virtuously. We are not victims of passions or of ignorance that we are not responsible for; it is in our power to acquire the virtues. Hence we are responsible for sin no less than for virtuous action.

The common assumption about responsibility faces two objections that arise from God's role in the production of sin: (1) God seems to be responsible, as creator and first cause, for the existence of sin.[5] (2) God has willed all human beings to be subject to original sin.

The second objection casts doubt on a possible answer to the first. For we might argue that God has created us with freewill, and that we have no one but ourselves to blame for our sins. But the doctrine of original sin seems to imply a closer connexion between God and sin; for God seems to have willed us to have an innate tendency to sin. If we claim that Adam was free because he was capable of choosing without any antecedent bias one way or the other, we make it difficult to see how we can be free; for original sin seems to give us an antecedent bias towards sin. If this sort of bias undermines our responsibility for sinning, Aquinas' claims about sin and freewill are inconsistent.

His account of freewill, therefore, needs to leave room for original sin and for divine grace. Augustine's controversies with the Pelagians show the difficulties raised by Christian theology for a philosophical account of freedom.[6] Pelagius' position tries to limit the role of divine grace so that it does not threaten human freedom; God does not determine the human will, but responds to the free actions that we undertake without being determined one way or the other by our sinful nature or by irresistible divine grace. We might take Pelagius to rely on assumptions about freedom that underlie an incompatibilist account. Augustine's answer to him seems to concede that if Pelagius is right about freewill, the right account of divine grace excludes freewill. Augustine, however, does not believe that divine grace really excludes freewill, since he also rejects Pelagius' conception of freedom.

[3] See §411. [4] See Kant, *Religion*, Parts 1–2.

[5] See 1a q19 a9. Cf. *West. Conf.* 5.4: 'the sinfulness thereof [sc. of the sin of Adam and Eve] proceedeth only from the creature, and not from God; who being most holy and righteous, neither is nor can be the author or approver of sin'.

[6] See §225.

He affirms that some sort of freedom is necessary for the sort of responsibility that Christian doctrine attributes to human beings both for their sins and for their merits.[7]

Aquinas approaches the dispute between Augustine and Pelagius with a more explicit account of freewill and responsibility. He claims to have shown that, in the respects necessary for freedom, the human will is not determined, but is capable of going in both directions as a result of deliberation. We have found that he does not commit himself to an incompatibilist account of freedom. We ought to be able to confirm or to refute this account of his views on freedom once we see how he applies them to questions about grace and sin.

345. Sin and Causal Responsibility

Aquinas argues that God is not the cause of sin, because sin is a deviation from the order that is directed to God as the end, whereas God inclines everything to turn towards himself as the end. The sin is to be attributed to the sinful will, not to God himself (*ST* 1-2 q79 a1–2; 1a q49 a2). This answer may seem unsatisfactory, as Aquinas sees, given that God creates human beings with wills that are liable to sin (1-2 q79 a1 obj3). Aquinas needs to show that his claims about responsibility for sin take account of this fact.

God's primary aim in creation is the good of the whole universe (1a q49 a2), and in order to achieve the perfect good of the whole he permits some defects in particular things (1a q22 a2 ad2). It is part of God's providence that some creatures capable of falling sometimes actually fall (1a q49 a2). The defects in particular creatures are the result of God's concern for the good of the whole universe, and so he causes them 'consequently, and as though by accident' (1a q49 a2). Aquinas does not mean that they need not have happened, or that God's choices did not make them inevitable. He means that they are by-products of the aim that God achieves directly.[8]

This causal role might suggest that God is responsible for sin by permitting it. The pilot is the cause of the shipwreck because he is absent from his post and fails to do what would have prevented the shipwreck (cf. 1a q49 a2 obj3). We might analyse this causal role counterfactually; the pilot causes the shipwreck because if he had been present and piloting the ship, the shipwreck would not have happened, and so he made the crucial difference between the shipwreck's happening and not happening. If this analysis is applied to God, God seems to be the cause of sin. For God could have prevented sin, either by not creating the particular sort of free and imperfect will that is liable to sin and is required to sin sometimes for the sake of the whole universe, or by providing the help that would prevent the sin.[9]

Aquinas, however, adds a further clause to the counterfactual analysis; the pilot ought to have been piloting the ship at the time when he was not (potens et debens gubernare, 1-2 q79 a1). The absence of the pilot was not the cause of the shipwreck if the crew foolishly put to sea before the pilot was expected to come on board, even though he would have piloted

[7] See §225n64. [8] Some relevant problems are discussed by Kretzmann; see §307n42.

[9] 'For it happens that God does not provide help to some people to avoid sin, and that if he provided this help, they would not sin' (1-2 q79 a1).

the ship and the ship would have avoided the rocks, if he had come on board earlier. Such examples suggest that the merely counterfactual test allows too many things to count as causes. It not only gives the wrong answer about the pilot's responsibility, but also allows many other inappropriate candidates to be causes. If, for instance, the sailor at the wheel had happened to be better at piloting, the wreck would have been avoided; but his ignorance is not the cause of the wreck, unless there is some reason to expect him to be a better pilot, or to expect a better pilot to be at the wheel.

These examples suggest that our causal judgments assume some background of standing normal conditions. The absence of the pilot causes the shipwreck on the assumption that the crew behaves normally, the ship has no hole in the side, the winds are not irresistibly strong, and so on. Given these presumptions of normality, the absence of the pilot is the crucial deviation from normality that explains what went wrong in this particular case. In Aquinas' view, our assumptions about the standing conditions must include assumptions about what can reasonably be expected not only from a purely predictive point of view, but also from an evaluative point of view. If it would not be reasonable to expect the pilot to be on board, his absence cannot be cited as the cause of the shipwreck. In this case our expectation is moral, not predictive; if he ought to be on board, but more often than not he is drinking in the pub when the ship sails, his absence is still the cause of the shipwreck. Aquinas, therefore, has some reason to claim that sometimes a moral judgment reasonably influences our causal judgment, because the relevant moral facts determine the causal facts.[10]

This analysis of causal judgments about the pilot is important for Aquinas' argument. To decide whether God is the cause of sin, we cannot simply ask whether there would have been no sin if God had wanted to prevent sin. We must also consider whether God ought to have intervened to prevent sin. Aquinas argues that the answer to this question is No. In God's providence and concern for the good of the whole universe (cf. 1a q49 a2 ad3), God creates creatures with freewill who are capable of sinning and will sometimes sin; God did nothing wrong in creating them or in allowing them to sin.

A similar reply deals with the objection that God sometimes turns people's will to evil.[11] Even if A's action could have prevented something happening to B, it does not follow that A caused what happens to B. If the dentist had kidnapped me and filled my tooth against my will, my tooth would not have fallen out; but she does not cause my tooth to fall out by not kidnapping me. But if she failed to do something she ought to have done to take care of my teeth, she might be the cause of my tooth falling out.

If some of the relevant causal judgments depend on judgments about whether an agent who failed to intervene ought to have intervened, we cannot first decide whether God is the cause of sin, and then use our conclusion on this point to decide whether he treats us fairly or not. We must first decide whether God treats us fairly, and then we can say what he causes.

[10] On some cases where judgments about recklessness influence judgments about causation see Hart and Honoré, *CL* 143–5.

[11] 'God is said ... to incline wills towards evil, not by acting or by moving them, but rather by deserting or not impeding, just as if someone were not to give a hand to someone falling and were said to be the cause of that person's fall. God, however, brings it about from a just judgment that he does not provide help to some people to prevent them from falling' (*Mal.* q3 a1 ad1).

346. God and Human Freewill

This evaluative element in some causal judgments underlies Aquinas' account of the role of God in the production of actual sin as well as original sin. Aquinas argues that since God has created us with freewill, God is not responsible for our acts of sin, even though God plays a crucial causal role in bringing them about. The effects of an inferior cause can be attributed (reducere) to a superior cause as long as they follow the direction of the superior cause, but cannot be attributed to the superior cause if they violate its direction. If servants violate their master's instructions, their error cannot be attributed to him; similarly, the error of a freewill that violates God's instructions cannot be attributed to God (1-2 q79 a1 ad3).

We might object that if the master knows his servants are about to make an error and fails to correct them, he is still the cause of the error, since they would not have made the error if he had not left them alone. In Aquinas' view, this objection is sound only if the master could reasonably be expected to intervene to prevent the servant's error. If Aquinas' claims about God's providence are accepted, the crucial condition about reasonable expectation fails when we consider God's relation to our freewill.

On this basis Aquinas tries to show how God's will is the cause of the act of sin even though it is not the cause of sin (q79 a2). He admits that the cause of the act of sin is the movement of the freewill, and that God is the cause of every movement (q79 a2 sc). To make his position consistent Aquinas distinguishes two claims: (1) God is the cause of the act of sin in so far as it is an act of freewill. (2) God is the cause of the sinful character of the act of sin. Since he affirms (1), but denies (2), he claims that his recognition of divine causality does not make God the cause of sin. When we walk with a limp, the fact that we move at all results from our 'motive power'; if we did not decide to walk, we would not walk with a limp. But our limping instead of walking normally is the effect of the condition of our leg, not of our motive power. Similarly, God is the cause of our moving ourselves to action, and therefore is the cause of all our actions, including sinful actions, but God is not the cause of their sinfulness.

This is a satisfactory resolution only if we accept Aquinas' distinction between primary and secondary causes.[12] In claiming that the freewill is the cause of its motion, Aquinas intends a modest claim, that 'a human being moves himself to action through freewill' (1a q83 a1 ad3). This claim does not imply that human beings are the first causes of their actions, so that the motion of the free will has no external first cause. Motion resulting from freewill is the natural form of motion for rational agents, just as other sorts of motion are natural for other creatures. In creating us to be moved by reason and deliberation, God has given us freewill (cf. 1-2 q9 a6).

Aquinas does not say or imply that God gives us freewill only if he creates us so that there is no external cause of any of the movements of our freewill. He implies that we have freewill even if God is the first cause of a necessitating sequence that ends with our sinful action. Aquinas denies that God is the cause of our sin not because he denies that

[12] See §270. *West. Conf.* 5.2 relies on a similar claim about freedom and secondary causes: 'Although in relation to the foreknowledge and decree of God, the first cause, all things come to pass immutably and infallibly, yet, by the same providence, he ordereth them to fall out according to the nature of second causes, either necessarily, freely, or contingently'.

God's action necessitates our sin, but because he thinks it is not reasonable to expect God to prevent our sinning. He relies on his interpretation of the analogy with the pilot.[13]

This reconciliation of God's causal role with human freedom rests on a compatibilist account of freedom. Specifically, it rests on Aquinas' claims that all the facts about freedom are included in the facts about the human will and its deliberative pursuit of the ultimate good. If he had accepted an incompatibilist account of freedom, his concessions about divine causality would raise serious difficulties about the reality of human freedom. His moral psychology fits his theology.[14]

347. How God Causes Sin

Aquinas admits that in an important sense God is the cause of blindness and hardness of heart (1-2 q79 a3), and that these actions express God's predestination, either election or reprobation (1-2 q79 a4).[15] But this causal role does not make God the cause of sin, because God does not arbitrarily choose to blind or to harden someone. The sun does not shine into the house if we pull the curtains[16] to block it out; similarly, Aquinas suggests, it is up to us to present an obstacle to illumination by divine grace.[17] But he recognizes that this comparison is not completely accurate. In the case of the sun and the light, the sun does not withdraw the light by its own judgment; the cause of the withdrawal is the person who closes the curtain. God, however, withdraws grace by his own judgment (proprio iudicio), and so he, as well as the person who creates the obstacle, is a cause of the person's blindness or hardness of heart.

In recognizing that God withdraws grace by his own judgment, Aquinas implies that God does not face an obstacle that he cannot remove. God sees that he could intervene effectively, but he chooses not to; and so he bears some causal responsibility for the hardening of hearts. Indeed, if the purely counterfactual test for causation were adequate, God would be the cause; for our presenting the obstacle to God would not result in the hardening of our hearts if God chose to intervene with his grace to enlighten us. Aquinas, however, prefers to say that both God and the sinner are causes of the hardening of the sinner's heart, since the freewills of two agents play an indispensable role in producing the result. The sinner's presenting the obstacle is indispensable, though it would not have been indispensable if God had decided differently. Though God could have chosen to withdraw grace from anyone he pleased, he chooses in fact to withdraw it only from those who present an obstacle;[18] he would not have withdrawn it if the sinner had not presented the obstacle. None the less—as Aquinas points out in qualifying the comparison with the sun—God's withdrawal of grace is not an automatic result triggered by the sinner's presenting the obstacle; it is God's decision to respond in this way.

To see how large a causal role Aquinas has assigned to God, we should combine this claim about the withdrawal of grace with the previous points about primary and secondary

[13] This point was introduced in §270. [14] On compatibilism see §§264, 270.

[15] Relevant issues are discussed by Stump, 'Sanctification' 227–34.

[16] Aquinas speaks of closing the windows, which makes the same point, given the sort of window he was familiar with.

[17] Cf. 1-2 q79 a3. [18] Hence withdrawal of grace is a punishment for sin; 1-2 q87 a2.

causes. God's providence and predestination initiate a sequence of sufficient conditions that result in the creation of free agents with different kinds of wills; and Aquinas allows the necessitation (in the sense of a sequence of sufficient conditions) of the choices and actions of particular agents.[19] This is the result of God's predestination operating, so to speak, in advance. God also operates, so to speak, at the same time as the sinner chooses rightly or wrongly, by illuminating or blinding, and so ensures that the sinner will or will not persist in sin. God, therefore, contributes both to our initial sins and to our persistence in sin.

Aquinas believes that these divine causal contributions to sin fit his account of how human agents are responsible for their sins. If the will is moved by considerations that make it open to rational criticism, praise, and blame, we are responsible for actions produced by the will. Aquinas' account implies that it does not matter how we came to be in the condition in which we are moved by such considerations; in particular it does not matter whether or not we are responsible for being in this condition. Responsibility and freedom depend on the will as proximate cause. They do not depend on our views about the ultimate cause, and God's causal contribution does not cancel them.

From an incompatibilist point of view, this is a serious flaw. For Aquinas seems to allow the possibility that God creates a series of sufficient causal conditions for sin; if God does this, we cannot, on incompatiblist assumptions, be responsible for our sins. This doubt seems equally pressing if the series of sufficient conditions results from natural processes independent of God. Incompatibilists believe that the type of necessitation involved in causal determination excludes the capacity for choosing opposites that is characteristic of freedom. Aquinas, however, assumes that the relevant capacity allows a compatibilist analysis.[20]

348. Original Sin

Aquinas faces a further objection besides the one that arises from belief in God as omnipotent creator. He supposes that if God leaves us with the sort of will that has the relevant rational capacities, we are responsible for actions that proceed from the will. Another Christian doctrine, however, seems to suggest that God does not leave us with the right sort of will. If we have original sin, one source of sin is not voluntary, but an inevitable feature of human nature (given the sin of Adam). Aquinas recognizes that as a result of the sin of Adam, 'human nature is corrupted (vitiata) to the extent that we are all prone (proclives) to sin' (1-2 q80 a4). He believes there would still be sin without original sin, but he clearly believes that original sin plays an important role in the production of sin.

He suggests that the devil could be regarded as the cause of sin, in the way in which someone who dried out the wood was the cause of the burning of the wood. He implies that the effects of original sin are not by themselves sufficient for actual sin. But he leaves open the question whether they make sin inevitable.[21] In an environment where very few people drop matches, no other sparks fly, and so on, drying out a piece of wood may not result in

[19] The compatibility of Aquinas' position with causal necessitation is affirmed vigorously by Banez. See §418.

[20] Hume accepts compatibilism, but does not believe that it removes objections to predestination. See *IHU* viii (last para.).

[21] Cf. *Articles* §9; see §418n97.

a fire. But if we dry it out in a place where people habitually make campfires, its being dry may well be taken to be the cause of the fire, and even (in the circumstances) to make the fire inevitable.

Aquinas denies that original sin is transmitted because some corrupt element is transmitted in generation, and specifically in the semen of the father. Such a view would make original sin a hereditary defect parallel to an inherited disease such as haemophilia. Aquinas objects that this explanation does not show how original sin could be a source of culpability; it seems to exclude anything blameworthy (q81 a1). He therefore rejects the view that Adam sinned, and passed the fault in him on to us through generation.

In his view, Adam sinned, and generated us, so that we share the blame for his sin. We share the fault of Adam not through something transmitted in our generation, but simply by being his descendants.[22] Aquinas appeals to the solidarity of the human race, treated as a 'collective' (collegium, *Mal.* q4 a1). Membership in a collective allows us to attribute to each member the actions taken on behalf of the collective. Aquinas believes that this solidarity is similar enough to the solidarity of a single organism to justify the transference of the guilt of Adam to us. If my hand carries out a murder, the murder is voluntary, not by the will of the hand, but by the will of the soul that moves the hand, and it can be imputed to the hand because of its connexion with the whole body (1-2 q81 a1c §4). Aquinas suggests that the generative relation of Adam to the rest of the human race implicates the rest of us in his sin just as the will of the soul implicates the hand in the murder.

This analogy seems to collapse just where Aquinas relies on it. In the case of the single organism the hand is not a responsible agent in its own right, and so no question arises about the division of responsibility between it and the will that moves it. If my hand really did have a will of its own, and we knew that it had protested against, or failed to support, the decision of the will, we might doubt whether it would be just to punish the hand as well as the rest of the person. Could God not have chosen not to punish us for the sin of Adam?

Aquinas tries another illustration. He recognizes (following a passage in Aristotle) that someone is not properly reproached for his hereditary defects; but he argues that someone can properly be reproached 'in so far as he is traced back to some origin' (q81 a1 ad5). He suggests that someone shares the disgrace of his family as a result of the fault of his ancestors. This illustration, however, does not make Aquinas' view more plausible. For he has to say it is just to punish descendants for the crimes of their ancestors, even if the descendants are completely ignorant of them, or repudiate them, or try to make amends for them.

We need not deny that descent has some relevance to what we should take responsibility for. Sovereign states and other bodies undertake responsibilities that outlast the life of any particular person or generation; if, for instance, Britain undertook to offer citizenship to emigrants from some other country, a later generation are not free to withdraw the offer simply on the ground that they are not the actual people who made it. Perhaps it is no more unreasonable for a later generation to take responsibility for some of the harm done by their ancestors, and to do something towards undoing the harm or compensating the victims. But it is difficult to see how anything reasonable in these claims about taking responsibility

[22] See esp. q82 a1 ad2. Original sin 'has the character of blameworthiness (culpa), to the extent that it is derived from our first parent'.

for something could be used to show that we are justly punished for the sin of Adam simply because we are his descendants.

349. The Effects of Original Sin

We need to accept Aquinas' belief in collective inherited responsibility if we are to agree with him in believing that we are justly punished for the sin of Adam and that we need baptism to free us from the guilt that we contract simply by being descendants of Adam. But even if we do not agree with these aspects of his view, we may agree with him about the presence of original sin in us, and we can still ask whether his belief in its presence fits his claims about the freedom of the human will.

In claiming that original sin belongs to us because of the sin of Adam, Aquinas means to say that it is not a necessary feature of human nature. Human nature does not exclude the formation of a human being from human flesh, outside the historical connexion with Adam, who would have no original sin (q81 a4). Original sin is a fact about the human beings who actually exist, but not about all possible human beings.

In actual human beings original sin causes the privation of original justice. Original justice in Adam was the appropriate harmony in his soul that turned him firmly towards God and away from concentration on the particular goods pursued by different parts of his soul (q82 a1c, ad1; cf. *Mal.* q4 a1). Original justice is not a natural feature of human beings; God created Adam with freewill and the capacity for virtue, simply by creating a human being; but original justice was a gift from God distinct from the act of creating a human being, and God gave it to Adam as a gift to be passed on to his descendants.[23] Adam lost this gift by sinning through his freewill, and he lost it on the same terms as those on which it had been given, as a gift to him and to his descendants.[24] He sinned in so far as he turned away from God to a created good (*Mal.* q4 a2); the effect of his sin in us is the loss of the original justice that we would have had if he had not sinned.

Even if we do not agree that responsibility and guilt are transmitted, Aquinas might still be right about the possible transmission of original justice. Original justice or its privation need not be transmitted genetically or by a separate act of God for each new person; it could be transmitted historically and culturally. Without any further intervention by God, earlier generations with original justice could bring up later generations in surroundings favourable to justice. In fact, however, the effects of sin are transmitted, and they explain why later generations grow up as they do, among people and institutions resulting from earlier generations who have turned away from original justice.

If Aquinas identifies original sin in us with the privation of original justice, it is not the total corruption that would make us psychologically incapable of avoiding sin. Admittedly, once original justice is lost, the human mind and will are no longer subject to God (1-2 q82 a2; a3). Since we now lack the firm state of character that maintains the appropriate order

[23] *Mal.* q4 a1: 'This gift had been given to the first human being, not only as an individual person, but also as a sort of principle of the whole of human nature, so that from him it would be transmitted to his descendants through the origin'.

[24] *Mal.* q4 a1: 'And when this gift had been received, the first human being by sinning through freewill lost the gift on the same terms (eo tenore) as those on which it had been given—that is to say, for himself and for all his descendants'.

among our different impulses and desires, we are prone to commit sin. But we keep the capacity to avoid sin, in so far as we have freewill in relation to the impulses leading to sin; Aquinas' account of original sin does not deny us freewill. Considerations leading us towards sin attract us more than they would if we had original justice. Since we lack the order that turns us towards God, particular goods that distract us from God attract us more than they otherwise would (q82 a3); they appeal to the inferior part of the soul that can 'cloud and distract reason' (q82 a3 ad3). But clouding and distracting are not the same as 'binding' reason. The passions move us only in so far as the will consents to them; attention to the relevant considerations of overall good changes our minds about consenting to the passions. Original sin does not undermine our responsibility for actual sins.[25]

Baptism removes some, though not all, the effects of original sin.[26] We retain the 'fuel' of sin in the non-rational parts of the soul, and so we retain some tendency towards sin.[27] In baptism, however, we receive grace and virtue to overcome the disorder in the non-rational desires (3a q69 a4). The baptized person still has the appetites that make us prone to evil and make it difficult to act correctly, but baptism reduces these appetites, 'so that a person may not be overcome by them' (q69 a4 ad3), and it is easier to avoid evil and to choose right action.

The difference between the unbaptized and the baptized person seems to be that in the unbaptized person the rational part of the soul is not well enough ordered to avoid finding the suggestions of the inferior part attractive enough to be obeyed. This is partly a fault in the rational part, and partly a result of the strength of the impulses in the non-rational part. Baptism makes a difference to both causes of sin; it supplies grace and virtue to the rational part, and makes the desires of the non-rational part less insistent, so that the rational part both has less to overcome and has more resources for overcoming it.

350. Natural and Supernatural Good

Though Aquinas insists that the corruption of human nature that consists in the loss of original justice still leaves us with freewill, he also believes that our capacity for virtue is limited, and that its limits reveal our need of divine grace.[28] If we had been untouched by original sin, we would be capable, without any further divine grace, of (1) performing particular good actions, (2) achieving the acquired virtues of character, and (3) achieving the good proper to the acquired virtues,[29] though we would be incapable, without further help of divine grace, of (4) achieving our supernatural good.

[25] For Luther's and Melanchthon's views on the effect of original sin see §§415, 418.

[26] 'Original sin is removed by baptism in respect of guilt (reatu), in so far as the soul recovers grace, as far as concerns the mind. Original sin remains, however in respect of actuality (actu), as far as concerns the fuel (fomes), which is the disorder of the inferior parts of the soul and of the body itself.' (1-2 q81 a3 ad1).

[27] 'It belongs to the very character of the fuel that it inclines us towards evil or makes a difficulty in the way of the good' (3a q27 a3).

[28] *Articles* §10; see §419.

[29] 'But in the undamaged condition of nature, as far as sufficiency of active virtue is concerned, a human being was able through his natural powers to will and to achieve in action the good proportionate to human nature, which is the character of the good of <i.e., achieved by> acquired virtue . . .' (1-2 q109 a2).

In our actual state, affected by original sin and its results, we are still capable of particular good actions. Aquinas describes these as 'works leading to some good proper to the nature (connaturale) of a human being' (1-2 q109 a5); he cites Augustine's examples of tilling the fields, drinking, eating, and having friends (q109 a2, a5). We are still incapable of the supernatural good. The difference between our sinful state and the state of original justice appears at the third stage, in our inability to achieve the human good.[30] Though we can achieve the acquired virtues, we cannot achieve the good that they aim at. Since acquired virtue does not require the absence of sin, we can achieve acquired virtue even if we cannot avoid sin. Without grace we are capable of avoiding sin on a particular occasion, but not capable of avoiding it altogether; our misguided passions and intellect present us with false suggestions that we sometimes accept (q109 a8).[31] In the original condition of uncorrupted nature we were able to fulfil the commands of the law without grace, as far as concerns the 'substance of the actions', but in our corrupt condition we cannot fulfil them (q109 a4).[32]

The difference between the particular good actions prescribed by the acquired virtues and the ultimate good aimed at by these virtues helps to explain the places where Aquinas seems to say that we can achieve a good proper to our nature without grace.[33] We are capable of acquired political virtue by our natural ability without divine grace, and this allows us to achieve a 'proportionate' good through the particular actions prescribed by the acquired virtues.[34] By achieving the proportionate good, we take a step towards achieving the good that is proper to human nature, but we cannot achieve that whole human good by our natural ability.[35]

351. The Need for Grace

If we need grace to achieve both the natural and the supernatural good, why, and at what stage, do we need it? We might suggest that even if we cannot achieve the supernatural good by our natural abilities, we can still exercise these abilities to take the necessary steps towards receiving grace. Aquinas asks (1) whether we can prepare ourselves for grace without first receiving grace, (2) whether we can rise from sin without grace, and (3) whether, once we have received grace, we can do good works without further grace. By answering No to all these questions, he shows the different ways in which grace is necessary.

[30] 'In the state of corrupt nature, a human being even falls short of this <good> that he is capable of in accordance with his nature, so as to be unable to achieve (implere) the whole good of this sort through his natural abilities' (q109 a2, following quotation in n29).

[31] Cf. Melanchthon, §418.

[32] On Luther's discussion of the 'substance of the action' see §415.

[33] '<A> good that is proportionate to human nature, a human being is capable of achieving (implere) though freewill' (*Ver.* q24 a14). 'To <a> good that is proper to human nature, a human being is capable <of attaining> through freewill, but <attaining to a> meritorious good is above his nature' (q24 a14 ad4).

[34] 'The good of political virtue is commensurate with human nature. And hence, without the help of grace making him acceptable the will of a human being is capable of tending towards that good, though admittedly not without the help of God' (2-2 q136 a3 ad2).

[35] In *in 2Cor.* iii 1 = P xiii 512b Aquinas explains how Paul affirms the necessity of divine grace without denying free will: 'But so that he does not seem to be doing away with freewill by saying this, he says ''by us, as though out of us'', as though he were to say: I can indeed do something, which belongs to freewill, but the fact that I do it is not out of me but from God, who confers this very ability (posse)'.

To prepare ourselves to receive grace, we would have to turn away from sin by turning towards God, in the sense specific to a just person, who is eager to hold fast to God (cupiunt adhaerere, q109 a6). Since, in our sinful condition, we lack this direction to God, we cannot turn ourselves towards God by our natural abilities; hence we cannot prepare ourselves, without grace, to receive grace.[36] God alone is the cause of grace (q112 a1); though preparation of the human being is needed for the reception of grace, this preparation is the work of God.[37] We cannot, therefore, treat grace as simply a response to some effort or attitude that is independent of grace.[38]

To emphasize the fact that divine grace is not a response to human effort, Aquinas insists that the first grace that turns us to God cannot be merited. No one can merit the first grace of justification for himself (q114 a5), and no one can by his natural powers merit the sort of happiness that consists in eternal life (q114 a2c, ad1). Grace and justification are not a fitting response to someone who does what he can to prepare himself for them (q112 a3), in the way that punishment is a fitting response to crime. On the contrary, 'the gift of grace exceeds all preparation of human virtue' (q112 a3). In 'operating grace', the first grace that God gives, God does not respond to any preparation independent of grace; any preparation is itself the result of operating grace.[39]

These assertions about the necessity of grace independently of any human preparation might suggest that Aquinas takes grace to replace freewill. But he disagrees. Though he denies that we can prepare ourselves for grace without having received grace, he believes we must prepare ourselves.[40] Preparation includes turning ourselves towards God through freewill; but freewill cannot turn to God unless God himself turns it (q109 a6 ad1).

Since turning to God is an act of freewill, we are responsible for remaining in sin and presenting an obstacle to grace (*SG* iii 159).[41] If we exist in sin without grace, we cannot avoid sin in general, even though we can avoid it on each particular occasion. Hence 'it will not be entirely in one's power to present no obstacle to grace' (iii 160). God's withholding grace consists in his not removing this obstacle that we present (160). A person's sins can be imputed to him even if they result from his inability not to sin; for he has acquired this

[36] 'A human being cannot prepare himself for receiving the light of grace, unless through the gracious (gratuitum) help of God internally moving him' (q109 a6).

[37] 'No preparation is needed on the side of the human being, as though preceding the divine help. Rather, whatever preparation there can be in a human being is from the help of God who is moving the soul towards good. And on this account even the good movement of the freewill by which someone is prepared for receiving the gift of grace is the action of the freewill moved by God . . . It is principally from God moving the freewill' (q112 a2). 'It is clear, however, that what belongs to grace is the effect of predestination; and this cannot be taken to be the reason of predestination, since it is included under predestination. . . . Now what comes from freewill is not distinguished from what comes from predestination, just as what comes from a secondary cause is not distinguished from what comes from a first cause; for divine providence produces effects through the action of secondary causes . . . Hence also what is through freewill is from predestination. . . . Whatsoever is in a human being directing him towards salvation is all included under the effect of predestination; even the preparation for grace; for neither does this come about except through divine help . . .' (1a q23 a5).

[38] See also *SG* iii 149. Aquinas' views are discussed by Stump, *Aq*., ch. 13.

[39] 'In that effect in which our mind is moved and does not initiate motion, and God alone initiates the motion, the activity (operatio) is attributed to God; and in accordance with this we speak of operating grace' (1-2 q111 a2).

[40] 'It belongs to a human being to prepare his soul, because he does this through freewill. And yet he does not do this without the help of God moving him and drawing him to God' (1-2 q109 a6 ad4).

[41] '. . . before a human being's reason, in which mortal sin is, is restored by justifying grace, he can avoid individual mortal sins, and avoid them for a time, since it is not necessary for him to be always actually sinning. But to remain for a long time without mortal sin cannot happen' (1-2 q109 a8).

inability by previous sin. Even if he cannot avoid sin altogether, he can avoid it on this occasion, so that it is fairly imputed to him. This complex analysis is intended to show that God is not the cause of sin for anyone (162), but none the less exercises predestination and reprobation (163).

Turning to God has to be an act of freewill, because otherwise it would not be a genuine human action. Similarly, a movement of freewill is needed for the justification of sinners (1-2 q113 a3), because movement according to freewill is the natural form of movement for rational agents (as opposed to young children, q113 a3 ad1). Justification requires a movement of the mind to turn it towards God; and the first such movement is the movement of faith, which has to be an act of freewill (q113 a4).[42] When God infuses grace, God at the same time moves the freewill to accept grace (q113 a3).[43] Aquinas asserts a role for freewill, but not independently of the grace of God. A person's faith is not a contribution distinct from God's, and therefore does not constitute merit or some substitute for merit, independent of, and antecedent to, God's grace. Grace is the mover of the free will.[44]

If we hold an indeterminist view of freewill, Aquinas' claims may appear inconsistent. According to an indeterminist view, it would be self-contradictory to claim that God could initiate causally sufficient conditions for an action of the freewill; God could only initiate a series that includes an undetermined movement of the freewill. Since Aquinas does not insist that acceptance of divine grace depends on some undetermined movement, he seems not to rely on an indeterminist view of freewill.

In Aquinas' view, God moves us by our freewill in the way that is natural for human beings, by presenting us with an apparent good.[45] God presents us with a good that is so clearly the best available good that, given our beliefs and desires, we see no reasonable alternative to pursuing it. God does not interfere with our wills; we could still reject the option that God presents, if we were to concentrate on some other aspect of it (as we can do with all non-final goods).[46] But if God knows our beliefs and desires, God can present us with an option that we will not reject.

God is similar, in this respect, to causes of sin that are outside the will. The passions, for instance, may present a particular course of action as being so attractive that, given the sort of person we are, we will choose that course of action; but the will assents to this course of action as a result of deliberation, in an act of freewill. God has a greater influence over us than our passions have; for God can infallibly determine how good an option will appear to us to be, in the light of our beliefs and desires, and therefore God can determine whether we choose it or not. But God's causal role still allows us to be moved by our freewill.

[42] Conversio; cf. 1-2 q5 a5 ad1.

[43] For this role of grace see *BCP*, Collect for Easter: ' We humbly beseech thee, that as by thy special grace preventing us thou dost put into our minds good desires, so by thy continual help we may bring the same to good effect'. This is translated from the Roman Missal: 'vota nostra, quae praeveniendo aspiras, etiam adiuvando prosequere'.

[44] '. . . the virtues, through which the powers <of the soul> are moved to action, flow into the powers of the soul from grace itself. And in this respect grace is compared to the will as the mover to the moved, which is the comparison of a rider to the horse—but not as an accident to a subject'. (1-2 q110 a4 ad1).

[45] 'For the gift of justifying grace especially orders a human being towards <a> good, which is the object of will, and hence a human being is moved towards it through the movement of the will, which is the movement of freewill' (1-2 q113 a3 ad2).

[46] cf. q13 a6 ad3.

352. Grace, Freewill, and Merit

Though our turning to God is an action of freewill, it is not independent of grace; and so God does not respond to it by giving us grace. On the contrary, our freely turning to God is an effect of grace. Hence we do not merit God's justifying grace. God's grace moves us towards the condition of justice, by forgiving our sins and infusing grace. It is not simply an action of God, but also produces a qualitative change in us, by making us worthy of eternal life (q113 a2).[47] But this justifying grace does not actually make us just people.[48] Justification is a movement towards the condition of justice (in statum iustitiae), but the end of this particular movement is not our being just, but our having our sins forgiven (q113 a6).[49] Justification happens at an instant (q113 a7), but it does not make further, non-instantaneous progress impossible or irrelevant.

Before justification merit is irrelevant, but after the first grace of justification it has a place. God gives us a start without merit, but it is up to us whether we take the further steps; if we take them, we have obtained merit as a basis for reward. Action on freewill is the basis of any merit (q114 a1c, ad1); since actions resulting from grace are also the products of freewill, Aquinas claims that they can have merit. But in allowing a place for merit, he does not mean that a human being acts independently of divine grace in achieving eternal life. He rejects such a division of contributions (q114 a5 ad1, on Augustine's error). Any meritorious action depends on our having received the first grace of justification, and its continuation depends on further grace.

Moreover, the fact that actions have merit at all depends on God's direction. In an ordinary case of merit, A's action merits B's reward if and only if B's reward is proportional to A's action; if B gave a smaller reward to A than A merited, B would be underestimating the degree of benefit that A has done to B and would be trying to escape with doing a smaller benefit to A. This way of measuring merit cannot be applied to the relations between God and human beings. It must be up to God to decide what the appropriate measure of merit is to be.[50] Since human actions have merit only 'from the presupposition of divine ordering', God does not owe any reward to us; he owes this treatment of our actions only to himself (q114 a1 ad3).[51]

Aquinas distinguishes the 'condign' merit of desert from the 'congruous' merit of suitability. Our meritorious actions do not deserve eternal life 'in accordance with the substance of the action', as products of our own freewill, but they are capable of being suitable.[52] 'In accordance with their substance' they are building a house, ending a war, helping a person in need, and so on. None of these, considered as such, could entitle us to

[47] For opposition to this see §420.

[48] See q113 a1, ad statum iustitiae; a5, in statum iustitiae, . . . accedat ad iustitiam; a8 ad1, adeptionis iustitiae. These should be given an ingressive rather than a perfective interpretation.

[49] See Cajetan's note ad loc. (quoted in M).

[50] 'Now the way and measure of virtue for a human being is from God. And therefore a human being's merit in relation to God cannot exist unless in accordance with a presupposition of divine ordering; namely, in such a way that a human being receives by his own activity a sort of reward <for the action> for which God also assigned him a power of acting' (q114 a1).

[51] On God's debita to himself, see §303.

[52] ' . . . it seems appropriate that if a human being acts in accordance with his power (virtutem) God should reward him in accordance with the excellence of his (sc. God's) power (suae virtutis)' (q114 a3). The translation of 'suae virtutis' follows M, which refers to God's generosity.

demand eternal life as a reward. As actions of our freewill, they do not entitle us to eternal life, because our willing of them is still imperfect, and still not entirely free from sin. If human beings do what they can, it is appropriate to reward them in proportion to their actions, even though they have no right to claim the reward that God offers out of divine generosity.

But these meritorious actions also have the merit of desert, in so far as they proceed from the grace of the Holy Spirit, as the results of God's choice to give us the grace that leads us to eternal life.[53] The reward, consisting in eternal life, is not an expression of God's generosity in doing something that God has not undertaken to do, but it is a reward that God has promised to give. Since the actions are the effects of the grace that God has given us to lead us to eternal life, they are the effects of God's promise to give us eternal life, and so they deserve eternal life. God's own actions through grace constitute a claim on God, even though our actions, considered simply as ours, do not.

When we look at our actions in accordance with their substance and as products of freewill, Aquinas means us to abstract from the fact that they are the products of divine grace; in abstraction from that fact, they have only congruous merit. But when we look at our actions as proceeding from the grace of the Holy Spirit, we ought not to abstract from the fact that they also proceed from freewill; for human actions have no genuine merit unless they are the products of freewill. Since the actions inspired by the Holy Spirit have the merit of desert, they result from freewill. The Holy Spirit infuses charity, since what we do out of love is more voluntary than anything else, and voluntariness is the basis of merit.[54] The fact that we depend on the grace of God for inspiration by the Holy Spirit, and the fact that intervention by the Holy Spirit is effective, do not remove freewill. If the Holy Spirit initiates the right sort of deliberation and election in us, our actions are the product of freewill and therefore can claim merit.

Does this intervention by the Holy Spirit undermine Aquinas' claim that we are self-determining in the sense relevant to freedom? If a neuro-surgeon controls me so effectively that I seem to myself to be deliberating as I normally would, the surgeon, not me, seems to control my action, and so I do not seem to be free. Does Aquinas' view imply that such unobserved intervention results in free action?

Intuitive reactions to these cases may not refute his claims about the Holy Spirit. The neuro-surgeon is assumed to manipulate our mental activities in ways that interfere with the normal processes of practical reason and deliberation; perhaps he programmes me to favour one candidate in an election, even though, without his intervention, I would still have been convinced by my previous reasons for preferring the other candidate. But if the neuro-surgeon simply presents me with very convincing arguments—convincing to someone with the outlook I have already formed—for favouring one candidate, he has not manipulated me, since he has contributed to the normal rational process, and has not circumvented it or interfered with it. This description of the neuro-surgeon removes

[53] 'For in this way the value (valor) of the merit depends on the power (virtus) of the Holy Spirit moving us into eternal life. . . . Moreover, the worth (pretium) of the action depends on the worthiness (dignitas) of the grace through which a human being, being made a partaker of the divine nature, is adopted as a son of God, to whom is owed the inheritance by the very right of adoption' (q114 a3).

[54] '. . . in so far as the character of merit requires that it should be voluntary, merit is attributed primarily to charity' (q114 a4 fin.).

the point of calling him a surgeon—someone who can interfere and manipulate purely physiologically and not rationally.

To understand the operations of the Holy Spirit, we need to think of rational intervention, not of the sort of interference that undermines the normal causal role of reasons in deliberation and action. If the Holy Spirit simply makes it clear what the rationally preferable course of action is, it does not interfere with our free will, even if its intervention is always effective; for it is not effective by extra-rational means.

In all these arguments Aquinas affirms that freewill is central in sin, grace, and merit. He denies that God is the cause of sin, but he does not deny that we are causally determined to sin as a result of God's will. Justification requires an act of freewill, and the result of justification is meritorious free action; but both the act of freewill in justification and the merit of our free action depend on divine grace. He affirms the role that Christian doctrine attributes to the will of God in relation both to sin and to justification, while still affirming that we are responsible both for our sinful and for our virtuous actions.

In Aquinas' view, the conception of the will and of freedom that is needed to explain these Christian claims is also the conception that is needed to make sense of rational agency. If we understand how the will is free in relation to the passions, and how we can act freely and responsibly in choosing virtuous action and in turning away from it, we also have the right theoretical basis for understanding the theological claims about sin and grace. Aquinas has defended his moral psychology and ethics from a Christian point of view, and he has defended Christian doctrine from a philosophical point of view.

His defence does not seem completely successful. He does not seem to have vindicated the justice of God in punishing us for the sin of our ancestor. He has a better defence, however, of the justice of God in allowing the descendants of Adam to lack original justice and to be deformed by original sin. God would apparently be treating us unfairly if he held us responsible for actions that we did under the influence of some condition that deprived us of freewill; Christian theology would undermine the presupposition of freedom that seems to be basic for morality. Aquinas argues against this objection to Christian dogma, by explaining why it does not require the denial of freewill and does not make the pursuit of the moral virtues pointless.[55]

Aquinas' conception makes freewill and responsibility co-exist with a large role for external determination. If his conception is wrong, he is also wrong to suppose that sound moral philosophy can be combined with Christian theology in the way he describes. In the 16th and 17th centuries, questions about his position resulted in the disputes between Calvinists and Arminians (in the reformed churches), and between supporters of Banez and of Molina (among Roman Catholics).[56]

353. Infused Virtue

These views on original sin and grace underlie Aquinas' account of the infused virtues and their relation to the acquired virtues. We need infused virtues because of the nature of

[55] Cf. Melanchthon on the 'philosophical virtues', §417n59. [56] See §418.

happiness. One sort of happiness is proportionate to human nature, which human beings are capable of achieving through principles of their own nature. Another sort is a happiness exceeding human nature, which a human being can achieve only by divine power, by some sort of sharing in divinity. Aquinas believes, as Aristotle does, that 'through a virtue a human being is perfected for the acts by which he is directed towards happiness'; and so, since there are two kinds of happiness, two kinds of virtues direct us towards them. Since the second kind of happiness is beyond human ability, the virtue that directs us towards it is also beyond our ability, and hence is infused in us by the grace of God (1-2 q62 a1). This kind of virtue supports Augustine's claim that 'the whole life of unbelievers is sin, and nothing is good without the highest good' (q63 a2 obj1). Aquinas believes Augustine's claim is false of the acquired virtues, but true of the infused virtues (q55 a4).[57]

The three primary infused virtues are the theological virtues of faith, hope, and charity. They turn us towards supernatural happiness in so far as they turn us immediately to God. Since supernatural happiness is our complete and unqualified ultimate good, the virtues that are infused with charity are the only complete and unqualified virtues; for moral virtue requires prudence, and complete prudence has to be directed towards the right ultimate end, which is set by charity (1-2 q65 a2; 2–2 q23 a7).

With this infused charity all the moral virtues are infused (1-2 q65 a3). We need infused moral virtues (q63 a3) to perfect us in relation to the different spheres of the moral virtues, so that we achieve the right order in relation to God (q63 a3 ad2). The supernatural end to which the theological virtues direct us also demands exercises of the moral virtues that we recognize as necessary to achieve this end.[58] Infused temperance makes us abstain from bodily pleasures to a degree that is not necessary for the ordinary acquired virtue of temperance. The infused virtue of generosity makes us go further in benefiting other people than someone with merely acquired generosity could be expected to go. This is the outlook described in the Beatitudes (q63 a2).

The infused virtues differ from the acquired virtues in the place they give the will. The acquired virtues are states leading to actions that constitute 'the good use of freewill', and they are acquired by habituation and training that involve choice by the will. We seem to have no similar role in the production of infused virtue.[59] Does this mean that Aquinas makes freewill unimportant? If we are passive in relation to the infused virtues, supernatural happiness may appear to be outside our control altogether. Aquinas sometimes emphasizes the primacy of the will in the moral virtues; he understands them as the states formed by rational agents who correctly deliberate about the ways to secure the ultimate end and who make the correct election as the result of deliberation. But this emphasis on the will applies only to the acquired moral virtues. We need to decide whether the infused moral virtues reduce the importance of the acquired moral virtues so drastically that the acquired virtues have no important role to play in happiness.

[57] On pagan virtue see §356 below.

[58] Human nature provides the principles from which we acquire the acquired virtues, but the theological virtues provide a different set of principles: 'Hence it is necessary that to these theological virtues there should correspond other states divinely caused in us that are related to the theological virtues in the way in which the moral and intellectual virtues are related to the natural principles of the virtues' (q63 a3; cf. *Virt.* a10).

[59] '. . . but it is caused in us only through divine action (operatio). And that is why Augustine, defining this kind of virtue, included in his definition of virtue "which God brings about (operatur) in us without us" ' (q63 a2).

We might think that the acquired virtues are related to the infused virtues in the way that making soup from scratch is related to opening a tin of soup (or eating the contents of a tin of soup without having to open it); if the tinned soup is equally cheap, nutritious, tasty, and so on, then there seems to be no point in bothering to make soup ourselves, unless we happen to enjoy that sort of thing as a recreation. But Aquinas does not intend this to be the relation between the acquired and the infused virtues. He does not take grace to cancel free will; the operation of grace ensures that our free will leads us in a particular direction, not that we go in that direction independently of free will. Similarly, when God infuses charity in us, the Holy Spirit does not operate without our free will. Since love is a voluntary motion, it has its principle in the human will; it consists in some 'habitual form' that is the source of voluntary action (2-2 q23 a2).

The Holy Spirit is not limited in its operation by the previous state of the human will; hence it does not presuppose the acquired virtues in anyone who is to receive the infused virtues (q24 a3). But in initiating our voluntary action, it also initiates our voluntary approval of the outlook of the moral virtues. Infusion of divine grace causes us to see that other actions besides those we would have approved of otherwise are required by the moral virtues.

The description of the infused virtues helps to explain the degree to which human beings by their natural capacities can achieve happiness. Human beings can make clothes and find other defences to compensate for lack of natural bodily defences; similarly, he says, though a human being lacks the natural capacity to acquire happiness, he has freewill 'by which he is capable of being turned towards God who makes him happy' (1-2 q5 a5 ad1). Since a human being has to turn towards God by freewill, and since he exercises the infused virtues by freewill (q68 a3 ad2), the right direction of the will in the acquisition of moral virtues is not irrelevant to the infusion of the infused virtues. The acquired moral virtues are not needed to prepare us for infused virtues,[60] but they are an appropriate way to direct the will towards the ends that are included in the ends of the infused virtues. 'The good use of freewill' that Aquinas takes to be central in his account of the acquired moral virtues is central in the account of the infused virtues as well.

The acquired and the infused virtues have the same matter. Temperance seeks the mean in the enjoyment of physical pleasures; as we discover further ends that are promoted by restraint in this enjoyment, we discover further reasons for restraint. If, for instance, an athlete needs to eat a lighter meal to stay in training or a scholar needs to eat a lighter meal to keep a clear head, they discover different applications for temperance. This is why the infused moral virtues are still called by the names of the acquired moral virtues, even though they differ in species, because of their different objects (1-2 q63 a4; *Virt.* a10 ad8).

[60] 'The virtue in accordance with which God gives his gifts to each one, is a disposition or previous preparation or attempt (conatus) of the one who receives grace. But the Holy Spirit also precedes (praevenit) this disposition or attempt, by moving a human being's mind either more or less, in accordance with his [sc. the Holy Spirit's] will' (2-2 q24 a3 ad1).

354. How the Infused Virtues Perfect the Acquired Virtues

In his exposition of the Beatitudes Aquinas claims that the infused virtues are the perfections of the acquired virtues.[61] His claim might puzzle us; for we might suspect that the pursuit of supernatural happiness will require us to modify, even to abandon, the states of character that belong to the acquired virtues. Aquinas admits that sometimes the states of character we have acquired may make it more difficult to practise the infused virtues (q65 a3 ad2); why, then, will we not become indifferent or positively hostile to the acquired virtues if we practise the infused virtues? Infused temperance practises a degree of asceticism about bodily appetites that goes beyond the requirements of acquired temperance. Why not say that in relation to Aristotle's Doctrine of the Mean this ascetic outlook goes too far in the direction of deficiency, and so does not really count as the virtue?

Aquinas does not believe the infused virtues, leading us to follow the divine law, conflict with the virtues that we can vindicate by reference to the natural law. He relies on the primacy of charity among the infused virtues. Charity is not only the love of God, but also the love of other people, in so far as they are 'in God' (2-2 q25 a1), or in so far as something of God is in them (q25 a1 ad1). Love for God extends to all rational creatures in so far as they are God's creation and participate in his rational nature. This is why it extends to strangers, enemies, and evil people. Since charity extends an individual's concern more widely than the acquired moral virtues extend it, charity introduces new moral demands. But the point of view of the acquired moral virtues shows us that the demands of charity are reasonable; for it shows us that it is reasonable to love God's creation if we love God. Hence we can see how the infused virtues extend the outlook of the acquired virtues, and do not supplant it with a completely different outlook.

Even from outside the theological perspective, we can see, in Aquinas' view, why the infused virtues are perfections of the acquired virtues. If we have the acquired virtues, we can see what their perfection would be like, but we recognize that we lack it. We ought to be able to see that the degree of justice that we are capable of is the most that can be reasonably expected within human limits, but that a more complete justice would be preferable; and then we ought to see that the infused virtue of justice is preferable in the relevant ways. This is how the person who 'hungers and thirsts after justice' (*Matt.* 5:6) differs from the person who is just within the limits that can ordinarily be expected in a human being.

The particular end of the acquired virtues is 'genuinely good, as being capable of being directed, as far as it is in itself, towards the principal good'. There can be a genuine virtue, if it is directed towards a genuine particular good, though it is imperfect if it is not directed towards the ultimate good (2-2 q23 a7). Aquinas suggests that charity makes a difference in so far as it directs the good pursued by the acquired virtues towards a supernatural good.

The continuity of the infused with the acquired virtues affects the plausibility of Aquinas' theory as a whole. If he could not show that the infused virtues express more fully the outlook of the acquired virtues, it would be difficult for him to show that they are the

[61] 'A virtue withdraws a human being from following the irascible passions, in accordance with the standard of reason, so that one does not exceed in them. But a gift withdraws him in a more excellent way, so that, in accordance with the divine will, one is entirely undisturbed by them' (q69 a3). Aquinas continues with parallel remarks about virtues controlling the appetitive passions and about virtues concerned with the good of others.

exercise of the same free will that is moved by deliberation about the final good to form the states of character that constitute the acquired virtues. If the infused virtues were entirely discontinuous, how could the same processes of deliberation that support the acquired virtues support the infused virtues? It would be reasonable to conclude that infusion by-passes freewill, or that the acquired virtues are not genuine virtues at all, or both.

If we deny that the acquired virtues are genuine virtues, we separate 'secular' from 'Christian' morality. Eudaemonist reasoning seems to lead to the cultivation of the Christian virtues, while secular morality may be regarded simply as a device to protect us from death and violence. Such a division between different areas of morality has Augustinian precedents.[62] Aquinas rejects this division; he agrees that there are distinctively Christian virtues, but he insists that the acquired virtues are genuine virtues too, and that the Christian virtues are developments of, not alternatives to, the virtues that perfect human nature in relation to its natural end.

355. Sin and Infused Virtues

Sometimes Aquinas emphasizes the similarity between acquired and infused virtues. Though infused virtues are not acquired by practice and habituation, they are relatively stable states; they are capable of increase and decrease, and they can be lost. On other points he contrasts infused with acquired virtues; but some of his contrasts are open to question.

He believes that the presence of an acquired virtue is consistent with sin, because the error implied by one sin is consistent with the presence of the aims and patterns of choice that constitute an acquired virtue. Infused virtues, however, are destroyed by just one mortal sin, because they are not acquired by gradual practice. Charity depends on an infusion by God, who infuses it in the way that the sun infuses light into the air. The infusion of light is stopped at once, if some obstacle is put in the way; similarly, the infusion of charity is stopped at once, and the state is lost (2-2 q24 a12). St Peter actually lost charity when he denied Christ, but quickly recovered it (q24 a12 ad2; cf. obj2). Whereas the other infused virtues remain in an unformed state as a result of a mortal sin contrary to them, we cannot say this about charity, since it is the ultimate form of the virtues (q23 a8 ad1; q24 a12 ad5).

This comparison assumes that the infusion of charity must be like the infusion of light, which is absent if any barrier is put in the way.[63] But if we compared it with the infusion of electrical current, we need not say that it is absent if its normal effects are blocked; electricity is still coming into the house even if I pull all the plugs out and do not use any of it; and water is still present in a pipe even if I keep the tap turned off. The mere claim that charity is infused directly by God does not seem to require Aquinas' comparison rather than one of these other comparisons.

His real objection to the compatibility of charity with mortal sin seems to come from his claim that charity is the ultimate form of the virtues. Charity co-ordinates all the other virtues for the right end (cf. q23 a7–8), by fixing our attention on the ultimate end through the love of God. If we turn away from God, as we do in a mortal sin, we must lack the virtue that

[62] See §228. [63] On light and on obstacles to divine grace cf. 1-2 q79 a3.

fixes our attention on the ultimate end, since our attention is not in fact steadily fixed on the ultimate end. Charity is the very virtue whose presence is intended to exclude the sort of lapse that is characteristic of mortal sin; and so we cannot have charity if we commit mortal sin.

This point does not justify Aquinas' division between the acquired and the infused virtues. The acquired virtue of justice requires attention to (say) the common good; and so a grave act of injustice implies that our attention is not in fact fixed where it ought to be. Still, as Aquinas agrees, a sin does not completely destroy the virtuous state that forbids it; an otherwise just person who does an unjust action does not suddenly become an unjust person. Similarly, even though God directly infuses the infused virtues, St Peter did not become indistinguishable from that of a hardened sinner the moment he denied Christ.

These objections to Aquinas are relevant to an evaluation of his conception of the infused virtues. To the extent that he contrasts them with the acquired virtues, he suggests that their infused character marks a contrast with the normal relation of a state and its exercise to the will of the agent. In the case of the acquired virtues, he believes that the possession of a virtue still leaves the will liable to error, but he takes an infused virtue to exclude this sort of error. If the contrast he draws is open to doubt, perhaps he should allow a closer parallel than he recognizes between acquired and infused virtues. Perhaps the two types of virtue are even more closely connected than he allows.

356. Defence of Pagan Virtue

Aquinas' conception of charity and the acquired virtues explains why sinful people can have virtues, and why these virtues are not abolished by charity. When Aquinas asks whether it is possible to have virtues without the theological virtue of charity, he refers specifically to Augustine's attack on pagan virtue (1-2 q63 a2; q65 a2; 2–2 q23 a7; *Virt. Comm.* a9). He argues that we can acquire genuine virtues without theological virtues, though they are imperfect virtues; they rest on a conception of happiness that is correct as far as it goes, though it is a conception only of imperfect happiness (1-2 q5 a5).

According to this argument, Augustine's teleological criterion is right, if it is understood as the moderately strict criterion requiring the virtuous person to have the correct specific end.[64] In Aquinas' view, the acquired moral virtues aim at an end that pagans are capable of aiming at; if pagans do the appropriate actions, and do them for the sake of this end, they have genuine virtues. The absence of the higher end does not imply the absence of the lower, and hence it does not imply the absence of the goodness appropriate to the lower end.[65]

Aquinas' division of virtues and ends supports, but also restricts, Augustine's claim that actions lacking charity are sinful because they lack charity.[66] Aquinas adds that this is not the

[64] See §230.

[65] *2Sent.* d41 q1 a2 = P vi 755b: 'Hence, although this goodness, in accordance with which an action is called meritorious, is removed from the actions of unbelievers, none the less there remains another sort of goodness or civil virtue, either from the circumstance or from the kind. And therefore it is not necessary that every action of theirs is bad, but only that it has a goodness that falls short; just as, though a horse falls short of the rationality that a human being has, it is not therefore bad, but it has goodness that falls short of the goodness of a human being.' The views of Aquinas and some predecessors and successors on the acquired virtues are discussed by Lottin, *EM*, chs. 2–3.

[66] Augustine, *c. Iul.* iv 3.

only aspect of such actions that deserves moral evaluation; they should also be evaluated with reference to their more immediate ends (*Virt. Card* a2).[67] If the actions of agents who lack the infused virtue of charity proceed from an acquired virtue, their goodness is limited, but genuine.[68] In this respect, they do not sin,[69] and their action does not constitute demerit before God.[70]

These two aspects of the virtuous actions of a virtuous pagan clarify a point that Augustine leaves obscure. If the agent does not believe in God, he does not love God for God's sake, does not acknowledge his dependence on God, and so on. But these errors do not remove the goodness of his actions or of his character. The presence of the motive appropriate to the relevant virtue (together with the appropriate action) implies the presence of the virtue.[71] Pagan virtues are genuine virtues because they aim at some particular praiseworthy end.[72] A genuine virtue cannot aim at a genuine good that one uses for a bad end; it must also use goods for a good end. Measured by this standard, the acquired virtues are the appropriate, though imperfect, formation of the free will in ways that make it suitable for being directed by grace towards the supernatural ultimate good.

When Aquinas distinguishes perfect from imperfect happiness, and tries to connect two distinct kinds of virtue with these two types of happiness, he goes beyond Augustine's explicit remarks. But he clarifies an aspect of pagan virtue that Augustine implicitly recognizes, since Augustine also recognizes that pagan virtues identify some genuine elements of happiness.[73]

[67] Aquinas replies to objections derived from Augustine: 'An unbeliever having intercourse with his wife does not sin, if he does it for the good of offspring, or renders what is due to the fidelity by which he is bound to his wife, since this is an act of justice and temperance, which observes the due circumstances in pleasures of touch; just as he does not sin in doing other actions of civil virtues. Nor is it said that all the life of unbelievers is sin because they sin in every action whatever, but because they cannot be freed from the slavery of sin through their action' (*4Sent.* d39 q1 a2 ad5 = P vii 1025b).

[68] 'There can be another act of someone lacking charity, not in so far as he lacks charity, but in so far as he has some other gift of God, either faith or hope, or, indeed, some good of nature, which is not entirely removed through sin, as has been said above. And in this way there can be without charity an act that is good in its kind, but not perfectly good, because it lacks the necessary direction towards the ultimate end' (2-2 q23 a7 ad1). 'As has been said above' refers to 2-2 q10 a4; cf. 1-2 q85 a2.

[69] *in Rm.* 14:23: 'But in an unbeliever there is a good of nature together with unbelief. And therefore, when an unbeliever does something good on the instruction of reason, not by referring it to a bad end, he does not sin.'

[70] *Mal.* q2 a5 ad7: 'Hence someone who, not having charity, honours his parents, does not merit eternal life, but does not incur demerit either.'

[71] See 2-2 q123 a7 obj2: 'Augustine says (*De Trin.* xiii 8): "We love virtues for the sake of happiness alone, and yet some dare to seek to persuade us <to love them> in such a way", (namely by saying that the virtues are to be desired because of themselves) "that we do not love happiness itself. If they do this, we will even cease to love them, whenever we do not love that because of which alone we loved them". But bravery is a virtue. Therefore the act of bravery is to be referred not to bravery but to happiness. . . . [Reply in corpus:] . . . as his proximate end, the brave person aims at expressing in action a likeness of his state; for he aims at acting in accord with what is appropriate for his state. But his remote end is happiness or God.' Cf. Augustine's discussion of this text in §231.

[72] 'If, however, we take virtue in so far as it is directed towards some particular end, in this way some virtue can be spoken of without charity, to the extent that it is directed to some particular good. But if this particular good is not a true, but an apparent good, the virtue that is directed to this good, will also not be a true virtue, but a false likeness of a virtue. . . . If, however, this particular good is a true good, for instance the preservation of the state, or the like, it will indeed be a true virtue, but an imperfect virtue, unless it is referred to the final and perfect good. And according to this, a true virtue simpliciter cannot be without charity' (2-2 q23 a7). I have omitted Aquinas' quotation from Augustine; see §230n106.

[73] Contrast Kent's comparison of Aquinas with Augustine, *VW* 27: 'Aquinas argued that only supernatural virtues are virtues *simpliciter*, that those virtues alone direct one to the ultimate end, that they alone are perfect virtues. To that extent he followed Augustine's teachings. Yet he broke with Augustine in arguing that natural virtues are true virtues even in the absence of charity and other supernatural virtues.' On Aquinas and Augustine cf. Lottin, *EM* 98–9.

But does Aquinas take proper account of Augustine's objections to the pagans?[74] Augustine urges that the good conduct of the miser, who aims at a good immediate end for the sake of a bad ultimate end, is insufficient for a virtue. But Aquinas also argues that pagan virtues aim at a correct, though incomplete, conception of the ultimate end; that is why he speaks of imperfect happiness (1-2 q5 a5).[75] Imperfect happiness is not simply a particular good; someone who aims at it, and correctly (though incompletely) grasps its composition, is not like Augustine's miser, but aims (within limits) at the right ultimate end.[76]

One sort of Augustinian might answer Aquinas by appeal to an extremely strict teleological criterion, and might argue that pagans who are wrong about the ultimate end have no virtue at all.[77] According to this view, one's conception of the ultimate end is fundamental. If we think of the ultimate end as a foundation, it is reasonable to suppose that effects of error about it will be pervasive. If the foundation of a tower leans, the tower will lean, however good the upper parts may be. Similarly, if pagans are wrong about the ultimate end, they set out in the wrong direction, and so cannot have any virtues.

Aquinas' conception of pagan virtue reverses the relation of foundation and superstructure. We may build a leaning tower if we begin with a straight foundation, and add a leaning superstructure. In his view, failure to pursue the right ultimate end does not entirely warp the direction of one's will.[78] Though pagans do the right action for an incorrect end, they also do the right action for a correct end.[79]

This explanation of Augustine's remarks on pagan virtue removes a reason for believing that secular and Christian morality are sharply separate. According to Aquinas, Christian moral reflexion should not denounce the acquired virtues as misguided or irrelevant, but

[74] See Baius' criticism of Aquinas, quoted at §417.

[75] See 1-2 q65 a2: 'Moral virtues, in so far as they work good as directed to an end that does not exceed the natural capacity of a human being, can be acquired through human works. And acquired in that way, they can be without charity, even as they were in many of the Gentiles.' Cf. q63 a2.

[76] The question that arises about the misuse of the intellectual virtues also seems to arise about the acquired and the infused virtues. Cf. §291. Since acquired virtues can be present in a state of sin (not properly acknowledging one's limitations and one's dependence on God, as Augustine argues), they are—in a way—subordinate to the sinful disposition that 'misuses' them by failure to recognize God's role in their acquisition.

[77] Ockham does not go this far, but he argues that since Christians perform virtuous actions for the honour of God, their end in performing such actions is different from the end of a pagan who performs the same actions. Since different ends define different virtues, the virtues of pagans and of Christians differ specifically, not just numerically (*4Sent.* q5 = P vii 58.5–23; *Quaest. var.* q7 a4 = P viii 402.634–403.652).

[78] 2-2 q10 a4 ad2–3: 'Faith directs one's aim in relation to the supernatural last end: but even the light of natural reason can direct one's aim in relation to a connatural good. [ad 3] Unbelief does not so wholly ruin natural reason in unbelievers that it prevents some cognition of the truth from remaining in them, through which they are able to do some work that is good in its kind.' This distinction between the incorrect and the correct end of the pagans seems to be overlooked in Ockham's discussion of pagan virtue at *4Sent.* q5 = OT vii 58.5–23. He argues against the view that the virtues of pagans are 'eiusdem rationis' (53.19–27) as the virtues of Christians. He has no difficulty in showing that there is one end they do not share, in so far as the Christian acts 'because of God' and 'because God has prescribed' (58.11). But he does not discuss the possibility that Christians and pagans also have the same end in so far as they aim at virtue and human happiness. His view is more complicated at *Q var.* q7 a2 = OT viii 335.115–337.167. Here he mentions different degrees (gradus) of virtue. He recognizes one stage at which the virtuous person chooses the right action precisely because it is required by right reason (335.132–6). A person with heroic virtue acts in addition (praeter hoc) for the love of God (335.137–336.142). Since heroic virtue adds an additional end to the end of the virtuous person not moved by the love of God, Ockham is in a position to accept Aquinas' account of pagan virtue. Indeed, he considers such an account favourably at *Dial.* i 6.77 On the degrees of virtue see King, 'Theory' 233–5; Wood, *OV* 208–15.

[79] I have not considered the difference between an incomplete conception of the ultimate end and a correct conception of the imperfect ultimate end. See further Bradley, *ATHG*, ch. 8; Shanley, 'Pagan virtue'.

should defend the Christian point of view from the principles that we already accept if we take the point of view of the acquired virtues. Aquinas' views on this question did not convince all his successors; a more extreme 'Augustinian' view was revived during and after the Reformation. But his discussion suggests that this extreme Augustinian view may not be the authentically Christian or the authentically Augustinian outlook.

25

SCOTUS: WILL, FREEDOM, AND REASON

357. Alternatives to Aquinas

Aquinas intends his position to be (1) faithful to Aristotle, (2) philosophically plausible, and (3) theologically adequate.[1] Scotus and Ockham share Aquinas' aims, but believe they can improve on his position. First, they argue that their position, as opposed to Aquinas' position, is really supported by Aristotle, or at least fits Aristotle no less well than the Thomist position fits it. In particular, Scotus' discussion of Aristotle on rational capacities and of the relation of virtue to the rational and non-rational parts raises legitimate questions about the soundness of Aquinas' interpretation.

Secondly, Scotus and Ockham sometimes doubt whether the position that Aquinas finds in Aristotle is true, and they are reluctant to attribute a false view to Aristotle if a true view can be attributed to him with equal plausibility.[2] But they do not follow Aristotle uncritically. One of Scotus' major departures from Aquinas—the belief in the primary and irreducible affections of the will for the advantageous and for the just—is introduced without any appeal to Aristotelian authority.

Thirdly, Scotus and Ockham argue that Christian doctrine conflicts with some of Aquinas' major doctrines, especially on human freedom and divine grace. If Aquinas' position is closer to Aristotle, but it conflicts with Christian doctrine, Aristotelian moral philosophy cannot be reconciled with Christian faith.

Some of these mediaeval criticisms of Aquinas underlie objections to the Aristotelian outlook that are sometimes regarded as distinctively modern. If we go straight from Aquinas to Hobbes, we may be struck by some rather sharp contrasts, and we may attribute these

[1] On these aims see §235.

[2] Wolter, 'Potency' 165, cites a comment by Scotus on his attitude to Aristotle: 'Regarding the meaning (intentio) of these philosophers, Aristotle and Avicenna, I do not want to attribute more absurd things to them than the things they themselves say, or the things that necessarily follow from the things they say. And from the things they say I want to take the most reasonable understanding (intellectus) I can' (*1Sent.* d8 q5 = OO v 2, 810 = *Ord.* i d8 = V iv 294 §250). The text in V differs from OO. In citations from Scotus 'OO' refers to Wadding's edition of Scotus' *Opera Omnia*, the only fairly complete edition. 'W' refers to Wolter, *DSWM*, the only extensive selection of relevant texts and translations (sometimes unreliable). 'V' refers to the incomplete Vatican edition. 'OP' refers to the incomplete St Bonaventure edition (consulted for *QM*). On texts and editions of Scotus see Williams, *CCDS* 6–13.

contrasts to the difference between a mediaeval outlook and a distinctively modern outlook raising questions that could not have arisen within a mediaeval framework. If, however, we find that the 'modern' views are either present in or anticipated by Aquinas' mediaeval critics, we will be less inclined to mark a sharp division between mediaeval and modern outlooks.

We might suppose, for instance, that modern views differ from mediaeval views in not taking Aristotelian eudaemonism for granted. Hobbes argues that there is no supreme good of the sort that the old moral philosophers accepted. Butler argues that the principle of self-love is not supreme, but is subordinate to conscience.[3] But these objections to the Aristotelian view are not modern innovations. Scotus raises them both. It should be worth our while, therefore, to see why he raises these objections and how he defends them.

358. Early Critics of Aquinas

It may be helpful to consider Scotus' views in the context of other objections to Aquinas, and especially to Aquinas' moderate intellectualist doctrine of the will. This doctrine is a basic element in his account of freewill, of the will and the ultimate good, and of the relation between practical reason and virtue. Aquinas believes that his doctrine shows how human actions are free and not necessitated, and how the freedom he accords to the will guarantees freewill and responsibility.

His view provoked disagreement. In 1270, while Aquinas was probably composing the Prima Secundae, Stephen Tempier, the bishop of Paris, condemned thirteen theses, including two theses about will and freewill that might plausibly be ascribed to Aquinas.[4] One of them maintains that the human will wills or elects by necessity; the other claims that freewill is a passive capacity that is moved necessarily by the object of desire.[5] In the *Summa* Aquinas rejects these theses about necessity, on the strength of his views about deliberation and about the capacity of the will to alter our attention.[6]

The *Summa*, however, did not reassure everyone. In 1277, just after the death of Aquinas, Bishop Tempier again condemned a list of philosophical theses incompatible with Christian orthodoxy.[7] This time he condemned 219 theses, including several that Aquinas seems to accept. One of the condemned theses is the intellectualist claim that the will is determined by reason, but is none the less free.[8] Tempier did not name Aquinas, and one might argue that this thesis does not capture Aquinas' position.[9]

[3] See Hobbes, *L*11.1; Butler, *S* ii 16.

[4] See Torrell, *Aq*. 146–7 (on the date of the Prima Secundae); 191 (on the condemnation of 1270).

[5] See Props. 3, 9; in Aquinas, *SG* = M iii 492–3.

[6] Torrell, *Aq*. 225, says that in the commentary on *De Int*. Aquinas 'alludes to the errors of the moderni on free will (i 14)'. He presumably refers to i 14 sub fin. (= P xviii 36), where Aquinas discusses the claim that the will cannot fail to desire what appears good, and therefore is moved by necessity.

[7] On Tempier see Korolec, 'Free will' 637; Piché, *CP* 159–82; Hissette, *Enquête* 230–63; Torrell, Aq. 299–303.

[8] 'That the will necessarily follows what is firmly believed by reason, and that it cannot refrain from what reason prescribes. For this necessitation is not force, but the nature of the will.' (Prop. 163; see Piché, *CP* 128) Cf. Props. 158–60, 164. Prop. 129 is closely related to intellectualism. It appears to condemn Aquinas' account of incontinence, which Prop. 163 may allude to in 'firmly believed'. See §295.

[9] Lottin, *PM* i 280, argues that, though Prop. 163 probably aimed at Aquinas, it does not accurately capture his views. See also Torrell, *Aq*. 244–5. Torrell, 299–302, is confident that Aquinas was an implicit target of the condemnation. This claim is defended by Wippel, '1277'.

After the death of Aquinas, both Franciscans and fellow-Dominicans attacked him. An early Franciscan opponent, William de la Mare, compiled a 'Correctory of Brother Thomas', to warn readers against his errors.[10] A Franciscan chapter general of 1282 prohibited the reading of the *Summa* except by readers with understanding,[11] and in copies that had the Correctory copied in the text. On the other side, some of the Dominican chapters general denounced detractors of the works of Aquinas, and reaffirmed his authority.[12]

The Correctory concentrates on the intellectualism that was condemned in 1277.[13] It asserts that the condemned thesis about the will being determined by the intellect follows from Aquinas' explanation of freedom through reason (a7). The discussion of happiness and the will supports the primacy of the will against Aquinas' emphasis on intellect. William attacks Aquinas for claiming that a human being is in control of his actions because he has deliberation about them (a6), that a human being determines himself through reason to willing one thing or another (a7), that command is an act of reason (a8), and that reason is the cause of freedom (a10). In all these cases, William objects that Aquinas undermines freedom by subjecting the will to necessitation by the intellect. One Thomist critic implicitly admits that the objection is damaging if it is true; for his defence of Aquinas underestimates the role that Aquinas actually assigns to reason in explaining freedom.[14]

Is the condemned thesis a fair summary of Aquinas' position? One critic, Henry of Ghent, believes it is, and criticizes Aquinas' view on that basis. He ascribes to 'certain people' (98.90) the view that the will is determined by judgment in the way in which natural desire in non-rational animals is determined by their cognition (98.02–03).[15] One supporter of Aquinas, Godfrey of Fontaines, does not deny that Aquinas holds the thesis, but argues instead that the thesis should not have been condemned.[16] Eventually Godfrey was vindicated. Aquinas was canonized in July 1323, and in early 1325 the Bishop of Paris rescinded the condemnation of 1277, in so far as it might be taken to apply to Aquinas' position.[17] The rescission, however,

[10] On William de la Mare's 'Correctorium fratris Thomae' and the replies written by Thomists see Glorieux, *Correctorium* vii–x; Kent, *VW* 81–4; Stadter, *PMMF* 239–44.

[11] The text in Fussenberger, 'Definitiones' 139, has 'rationabiliter intelligentes', with the variant reading 'notabiliter intelligentes'.

[12] See Reichert, *Monumenta* 199.1–11 (for the year 1278); 204.19–25 (for 1279); 235.1–9 (for 1286).

[13] The discussion of Aquinas' moral philosophy in the Correctory is selective. In its treatment of the Prima Secundae it discusses happiness and the will, but it passes from Question 17 (a10) to Question 88, and then to 110 (a12); hence it omits Aquinas' main treatment of the virtues and of the natural law.

[14] William's objections and the replies of a Thomist are in Glorieux, *Correctorium* 230–40. The Thomist's attempt to explain away Aquinas' views is hasty: 'I am always amazed by the way in which these people twist Thomas' words into their own false construction, when he himself in his whole discussion teaches the opposite. Hence this fairy-tale deserves no answer' (233).

[15] See Henry, *Quodl.* 1 q16 (ed. Macken, 98.90–101.57). See Prop. 159, quoted in §389n12. His view is discussed by Wippel, '1277', 256n68. Stone, 'Freedom', offers a survey of Henry's views on will and action.

[16] See Godfrey, *Quodl.* 12 q5, p. 102. Godfrey says that this and others among the condemned theses seem (videntur, p. 102, last para) to have been taken from Aquinas' writings. He also insists that some of the condemned theses do not seem to be false (non est multum manifestum quod sint erronei, p. 103, para 3). He does not say that the thesis about the will and the intellect is both Aquinas' view and not clearly false, but he does not say that it misrepresents Aquinas either.

[17] 'If in the past any of our predecessors of blessed memory as bishops of Paris condemned as erroneous certain articles, by a sentence of excommunication, and expressly prohibited them, for fear that people understanding them badly would fall into error, among which articles some were asserted by some people to touch on the teaching of blessed Thomas Aquinas:—by the firm opinion of those present, we entirely annul the aforesaid condemnation of the articles and the sentence of excommunication, to the extent that they touch on, or are asserted to touch on, the teaching of the aforesaid blessed Thomas, without thereby either approving or rejecting the articles themselves, but freely leaving them to discussion in the schools' (Denifle and Chatelain, *CUP* ii §838, for the year 1325). On the rescission see Torrell, *Aq.* 324.

neither identifies any theses that had been taken to represent Aquinas' views nor asserts that he did or did not hold any of the theses.

Aquinas' attitude to the condemned thesis depends on his account of the influence of the will on the intellect. The will may move us to act against a conclusion of reason, if we choose to attend to more attractive aspects of the option that we have just rejected, so that we change our minds and come to prefer the option previously rejected. But this role for the will does not modify Aquinas' intellectualism; the effects of the will on the intellect still depend on the apparent good, and hence on the intellect.

Moreover, even if Aquinas' views about the influence of will on intellect implied the rejection of intellectualism, it would not follow that the condemned thesis misrepresents him. The condemned thesis does not refer to the operations of the will that influence intellect by causing us to change our minds after forming an initial impression of the goodness of some object; for while we are subject to these operations that make us eventually prefer y to x, we do not firmly believe that x is better. The condemned thesis says only that the will necessarily follows what is firmly believed by reason; 'firmly' excludes the operations of the will that make us change our minds. Even if Aquinas held that the will's influence on deliberation is undetermined by reason, he still holds that the will necessarily follows the firmly-held conclusion of reason, and hence he holds the condemned thesis.[18]

The critics reject the claim that determination of the will by the firm belief of reason is not a case of force (coactio), but simply the nature of the will. They imply that such determination forces the will, and therefore takes away freewill.[19] Another condemned thesis claims that the will of a human being is necessitated by its cognition, just as the desire of a non-rational animal is (Prop. 159). The critics would be wrong to ascribe this thesis to Aquinas if they meant that he makes the relation of human cognition to human willing just the same as the relation of an animal's perception to its sensory desire. But they are right if they mean that without a cognitive change the will cannot change.

The critics infer that 'after the conclusion has been reached about something to be done, the will does not remain free' (Prop. 158). Their claim would be false, if it means that we cannot reconsider conclusions we have reached, but it is true if it means that we are not free to will not to act on a conclusion without seeing any reason to object to it. The critics suppose, then, that we are forced and not free in our action unless our action proceeds from a will that is free to change its direction independently of any cognitive change.

The implicit view of the critics is the explicit position of Henry of Ghent, one of the commissioners who drew up the condemnation. He argues that the will has the appropriate sort of freedom only if it is not determined by the apparent good presented by intellect. In

[18] Lottin, Hissette, and Wippel (see nn8–9) hold that the thesis does not express Aquinas' view; they do not give enough weight to 'firmly'. They assume that the role of will in directing our attention proves that Aquinas does not hold the view.

[19] It is perhaps confusing to suggest that the objector is opposing 'determinism' (as Hissette claims, *Enquête* 225, speaking of 'déterminisme psychologique', which he takes to be evidently incompatible with the Christian conception of liberty). Determinism may be irrelevant for two reasons: (1) It is not clear that if the will is undetermined by reason it is not determined by anything; hence the objector does not rule out all forms of determinism. (2) Even if Aquinas were to allow the operations of will in influencing intellect to be undetermined, this would not make it false that the will necessarily follows the firm belief of reason. We need not suppose that the objector takes indeterminism to be necessary or sufficient for the absence of force.

his view, the intellect simply presents the apparent good, and the will is free to accept or to reject it.[20] If we said only that the will is free to prefer an apparently greater good to an apparently lesser good, we would make the will inappropriately dependent on the intellect. Without voluntarist freedom the will is forced.

Henry has good reason to assume that Aquinas holds the position that he rejects.[21] According to Aquinas, we are free because we can deliberate well and badly, and can attend rightly or wrongly to different aspects of different options open to us; hence it is reasonable to assess our actions by the standards that are involved in praising and blaming. Henry argues that Aquinas' defence of freedom is inadequate, and hence the condemnation of the intellectualist position is justified.

Henry's defence of the condemnation of 1277 shows that Aquinas' intellectualism appeared to conflict with Christian doctrine because it appeared to preclude freewill. If the critics are right, they not only undermine Aquinas' views on the will, but also raise doubts about his conception of the final good, and about its role in moral theory; for his moral theory rests on his conception of rational agency, and hence on his conception of the will.

Scotus formulates the anti-intellectualist objections clearly, and presents a voluntarist account of the will. He also explores some of the implications of voluntarism for freewill, for the virtues, and for the theological issues that Aquinas tries to understand within his conception of the will. He argues for both voluntarism and rationalism. On the one hand, he denies that the will is determined by intellect. On the other hand, he maintains a sharp division between the rational will and the non-rational passions. He maintains voluntarism to defend freedom, but maintains rationalism to maintain the primacy of reason over passion in determining virtuous action.

To show that his voluntarism is consistent with his rationalism, Scotus needs to show that the will is rational even though it is not determined, as the intellectualist supposes, by reason. If he shows this, he also needs to show that the rational character of the will allows voluntarism about freewill. Some disputes among interpreters of Scotus reflect disagreement about the relative importance of the voluntarist and the rationalist strands in his position. It is perhaps less important to decide where exactly Scotus stands than to see where his arguments against Aquinas might lead.[22]

Some of Aquinas' critics argue that his position is an unstable combination of conflicting elements. In particular, he tries to combine Aristotelian eudaemonism and intellectualism with the Christian and Augustinian views on will and freedom. The solution offered by the critics abandons eudaemonism and intellectualism in order to maintain freedom. But, as we will see, the critics' solution may be less stable than Aquinas' position.

The view of Scotus as a sharp critic of Aquinas may be criticized for attributing too extreme a position to him. Similar objections have been raised against attempts to draw a sharp contrast between Aquinas' intellectualism in ethics and the voluntarism attributed to Ockham and his successors as well as to Scotus. Whether or not these objections are

[20] See Henry, *Quodl.* 9 q5 = Macken 121.27–122.50 (tr. Teske, 51–2).

[21] He paraphrases Aquinas, *Mal.* q6 at *Quodl.* 9 = 120.14–16 Macken (tr. Teske, 50–1).

[22] Some critics believe it is misleading or unhelpful to describe Scotus as a voluntarist, or even to be preoccupied with the question of whether he is a voluntarist: 'Thanks to the serious research advanced by notable scholars, this question no longer preoccupies us' (Ingham, 'Moral order' 127, with references).

justified, it is none the less useful to consider the arguments that might be used to support a strongly voluntarist reaction to Aquinas. Even if they lead to a more extreme voluntarist conclusion than Scotus himself accepts, the arguments have been thought to justify a strongly voluntarist conclusion, and this feature of them has made them both historically and philosophically important and influential.[23]

359. The Character of the Will

To explain his conception of the will, Scotus exploits Aquinas' interpretation of Aristotle. In *EN* i 13 Aristotle distinguishes the rational part of the soul from the 'desiring' part that is capable of obedience to reason and is rational by participation. Aquinas takes this division to divide intellect from every form of desire, including will, and so he includes will among the states of the soul that are rational only by participation (*ST* 1-2 q56 a6 ad2).[24] Scotus endorses Aquinas' conclusion that the will is rational not essentially, but by participation (*3Sent*. d33 q1 schol. = OO vii 2, 697 = W 322–4). According to Scotus, this means that the will, like the passions, does not necessarily follow the judgment of reason.

This is not Aquinas' interpretation of 'by participation'. In his view, the will is necessarily and essentially rational; it is rational by participation only because it is rational derivatively, because of its relation to intellect. Scotus, however, argues that 'by participation' implies that the will is neither essentially nor necessarily rational. He maintains that unless we agree that the will does not necessarily follow intellect, we deny freewill.

His conception of freedom sets out from another point of agreement with Aquinas. Freewill depends on the capacity of the will to go in either of two directions. Aquinas derives this capacity of the will from the capacity of deliberating reason to go in either of two directions (1-2 q6 a2 ad2). Scotus agrees that freedom involves the capacity for opposites, but he does not agree with Aquinas' attempt to trace this capacity to deliberation.

Aquinas connects the capacity for opposites with deliberation because he takes it to be confined to election of means to the ultimate end, which are the concern of deliberation. Since it is not in our power not to pursue the ultimate end, our will is determined to follow the course of action that appears, as a result of deliberation, to promote the ultimate end.[25] We are free in being determined by the result of our deliberation about the good. If we did not necessarily pursue the final good, we would not be applying reason to our desires, and hence we would not be acting on our wills.

This pursuit of the final good requires external reasons. If there were no external reasons, we could discover what promotes happiness only by reference to our non-rational desires, and the will would be ultimately non-rational. Our discovery that x is better than y would always be open to revision as a result of our simply coming to prefer ends to which y is a

[23] Wolter, *PTJDS*, chs. 7–9, argues that the voluntarist elements in Scotus' position have been exaggerated. A strongly voluntarist account of Scotus is defended by Williams, *MPJDS*, who is criticized by Vos et al., *DSDL* 58–62. Cross, *DS*, ch. 7, maintains a voluntarist account of Scotus' moral psychology, but a less voluntarist account of his ethics.

[24] See §257 for further discussion of this passage in the *EN*.

[25] This claim needs some qualifications: (1) It does not exclude the possibility of reconsidering our deliberation. (2) It does not allow for cases where a non-rational impulse deprives us of the use of reason. See §253.

means over ends to which x is a means. Aquinas, however, believes that we can change our mind about the merits of x and y only if we concentrate on aspects of y that make y seem better to us (cf. 1-2 q13 a6).

Since Aquinas' views on freedom are so closely connected with his eudaemonism, Scotus disagrees on both counts. He argues that eudaemonism not only excludes freedom but also conflicts with obvious truths about rational action. He has three main arguments against eudaemonism: (1) Psychological: facts of experience show that we sometimes fail to pursue what we believe to promote our happiness. (2) Moral: the eudaemonist position conflicts with facts about the moral virtues and the motives of the virtuous person. (3) Metaphysical (libertarian): the eudaemonist position implies that the will is not free, because we are not free to reject happiness, or to choose contrary to what we believe to promote it. Though these arguments raise distinct issues, they are difficult to keep apart; in particular, Scotus' views about rationality and freedom influence his objections to eudaemonism on psychological and moral grounds.

360. Psychological Objections to Eudaemonism

In Scotus' view, the will is partly a natural desire; to this extent, it 'necessarily and perpetually and above all (summe) desires happiness' both in general and in a particular case (*4Sent*. d49 q10 schol = OO x 506 §3 = W 184). Because of this natural desire, the will never rejects something precisely because it promotes happiness and never wills anything precisely because it leads to unhappiness (*4Sent*. d49 q10 = OO x 514 §10 = W 192). But since the will is also a free desire, it cannot be necessarily determined to will any end, even happiness.[26] Our pursuit of happiness, therefore, is natural only in a loose sense, because the will often freely chooses to follow its natural inclination to happiness (*4Sent*. d49 q10 = OO x 513 §6 = W 190).

If the will necessarily pursued happiness, it would follow that whenever I believed both x and y were open to me and that x rather than y would promote my happiness, I would choose x rather than y. But Scotus replies that sometimes we are aware that x rather than y promotes happiness, but we can simply choose to pursue neither x nor y. If we suspend further action, we choose to be indifferent towards happiness.[27]

Even when we act, we do not always act with a view to happiness, and hence we do not necessarily will happiness.[28] Since we aim at particular ends without reference to happiness, and we do not always stop to think about how they bear on happiness, eudaemonism is

[26] '. . . the will contingently wills the end and happiness, both in general and in particular, although in most cases it seeks happiness in general, and also in particular when the intellect has no prior doubt that happiness consists in this particular thing' (*4Sent*. d49 q10 = OO x 513 §6 = W 188–90).

[27] ' . . . it can suspend itself from every act, when happiness is shown to it. Hence, for any object, the will is capable of neither willing nor rejecting it, and of suspending itself from any act in a particular case about this or that object. And this anyone can experience in himself, when someone offers him some good, even if <the other> were to show him a good as a good to be considered and willed; he is capable of turning away from this, and of eliciting no act of will about it' (*4Sent*. d49 q10 = OO x 514 §10 = W 194).

[28] '. . . if the will necessarily willed happiness, it would determine [determinabit] the intellect to consider about happiness always, which is false' (*4Sent*. d49 q10 = OO x 513 §5 = W 188).

false. In such cases, we choose 'negatively' not to pursue happiness, because we have a good reason for pursuing something without considering happiness. In other cases, we choose 'contrarily' not to pursue happiness, because we recognize that our action is contrary to happiness, but we still choose to do it.[29]

361. Defences of Eudaemonism

Scotus treats his arguments against eudaemonism as appeals to obvious facts of common observation that a eudaemonist cannot describe or explain. But Aquinas does not say that we consciously think about happiness whenever we act. He claims that in many cases the 'power of the first aim' (virtus primae intentionis) remains in the pursuit of subordinate ends (*ST* 1-2 q1 a6 ad3).[30] We 'consider' happiness only in so far as we are guided by our conception of the ultimate end; we need not have it in mind all the time. In reply to Scotus Aquinas might reasonably claim that if we hold our particular aims open to scrutiny and revision in the light of our other aims, even though we do not scrutinize them on a particular occasion, we still rely on a conception of happiness. Even if we will to act contrary to our conception of happiness, we act (according to Aquinas) on the consent of the will, and hence we assume that our conception of the good allows us to act on this particular impulse. Given the influence that Aquinas ascribes to our conception of the good, cases where we do not consider it or we act against it do not seem to present decisive objections.

Cajetan's defence of Aquinas against Scotus rests on an apparently more controversial aspect of Aquinas' doctrine. According to Cajetan, if we refrain from pursuing happiness 'negatively', we assume that our action fits our ultimate end, because we do not stop to consider the question; this is what happens in the thoughtless pleasures that are venial sins. If we choose contrary to our conception of happiness, Cajetan argues that we must actually have formed a different conception of our ultimate end, and a mistaken one. If we did not change our conception of happiness, we would desire the contrary of our full perfection, and such a desire is impossible.[31]

Cajetan's answer to Scotus depends on his assumption that no one can desire the contrary of his full perfection. Perfection is the aspect of happiness that requires more than mere comprehensive satisfaction of our actual desires; in appealing to perfection we take our

[29] Even if one recognizes that fornication cannot be directed towards happiness, one may choose it none the less, without directing it towards happiness (*4Sent.* d49 q10 = OO x 540 §15 = W 194–6). It is not clear whether Scotus regards this second case as a case of incontinence, or as a case where the agent sees overriding reason to choose F while still believing that F is contrary to his happiness. If he thinks it is a case of incontinence, Scotus rejects Aquinas' explanation of incontinence by appeal to ignorance. If he thinks it is not a case of incontinence, Scotus disagrees even more deeply with Aquinas' view of rational choice. He should apparently allow both cases.

[30] See §248.

[31] 'For let us speak of the ultimate end taken formally. We say that nothing can be desired except this end itself or something for the sake of this end . . . No one can desire the contrary of his full perfection. For whatever one desires, one desires it so that one may have some perfection, even though he desires contrary to the sort of thing that is the ultimate end (as is evidently the case in someone who sins mortally), and apart from it (as is evidently the case in someone who sins venially)' (Cajetan ad Aquinas, *ST* 1-2 q1 a6 = L vi 15). When he says that the sinner 'desires contrary to the sort of thing that is the ultimate end', Cajetan means that the sinner is acting in accordance with his own conception of the ultimate end, though not in accordance with the correct conception.

desires to be open to criticism by reference to what we take to be a correct conception of ourselves.[32] When Cajetan claims that all our desire aims at some perfection, perhaps he relies on Aquinas' view that we will something on the basis of external reasons that we take to be mutually supporting. If we act on our will, and not on our non-rational desire, we rely on assumptions about external reasons that involve perfection.

Cajetan's objection, therefore, is stronger than it initially appears.[33] If voluntarists cut the link between will and the rational comparison that refers to a final good, do they not cut the link between will and practical reason? If they do that, how does the will differ from a passion? Scotus needs to show not only that we can ignore or reject happiness in our choices, but also that these choices are expressions of the will rather than of some other desire. He would not secure his main point if we were to concede only that some of our desires are immune to 'global' considerations of comprehensiveness and perfection. For Aquinas recognizes such desires; they result from passions so strong and disordered that 'reason is totally bound'; they 'submerge' reason so that they move us irrespective of our rational aims and plans.[34]

Scotus argues not that some desires are independent of the desire for happiness, but that the will is independent of it. Will differs from passion in being rational desire, and hence in being responsive to critical evaluation of one's desires and their objects. Aquinas claims that will is thoroughly rational desire because it responds to the global criticism that our conception of happiness applies to particular objects of desire. This conception of will underlies Cajetan's objection to Scotus. Scotus does not explain why the agent who prefers a particular good over his conception of the ultimate good acts not on a passion, but on a rational desire that belongs to the will. Hence he does not refute eudaemonism.

Scotus describes the will as 'free desire' (liber appetitus), and so denies that it is determined by the antecedent strength of one's non-rational desire—in this case the desire for happiness. Aquinas agrees that the will is free by not being determined by the strength of non-rational desires; he takes this freedom to require the will to respond to the rational evaluation of desires. But the choices that we recognize, according to Scotus, as contrary to our conception of our ultimate end seem to be determined by the antecedent strength of our particular desires. If the 'free desire' identified with the will does not rest on evaluation of our desires, how does it differ from a passion? Scotus' argument to show that we can desire objects contrary to happiness does not show that we can will them.

362. The Conflict between Eudaemonism and Freedom

Scotus replies that eudaemonist claims exclude freewill. Aquinas tries to secure freewill by arguing that though we pursue happiness necessarily, we do not pursue particular goods necessarily. Our freedom consists, then, in the fact that our deliberation compares alternatives and fixes on one of them. But Scotus claims that this account of freedom rests

[32] See §274. [33] Cf. Godfrey in §390.

[34] We might even argue that Aquinas is wrong to deny that incontinence is a case of binding; and so we might understand Scotus' example of choosing contrary to our conception of happiness as a case of incontinence that involves the binding of reason by non-rational passion. Such an argument would not secure Scotus' main aim. See §253.

on two inconsistent claims: (1) We all necessarily desire happiness when it is apprehended universally. (2) We do not necessarily desire it when it is apprehended in a particular case. While the first claim implies that we are necessitated to prefer what apparently promotes happiness, the second claim implies that we are not (*4Sent*. d49 q10 = OO x 505–6, 512–13 = W 184–8).

This objection raises questions about Aquinas' account of the influence of the will on deliberation. He believes it is in our power to fix on the alternative that we will pursue. He even believes that we are free not to pursue the option that initially seems best; if we focus on the bad aspects of x and the good aspects of y, we may change our initial view that x is better than y. Since it is up to us what we attend to, our choice and our action are in our power.

A voluntarist might infer that it is up to us to focus on whatever aspects of a subordinate good we please, independently of our conception of the good. But, according to Aquinas, I can will to stop deliberating or to ignore some features of an action in favour of others only if I believe it is better to direct my deliberation and attention in these ways. Our other beliefs determine what we look for and what we discover. If we cannot persuade ourselves, in the light of our beliefs, that a particular good is not on the whole desirable, we are necessitated (in his view) to choose it. From Aquinas' point of view, this sort of necessitation does not threaten freewill, but preserves it.

From the voluntarist point of view, however, this intellectualist conception of the role of the will excludes freedom. Scotus argues that if the will is not free not to pursue the final good, it is not free not to pursue subordinate goods. We lack freedom in relation to the final good (according to Aquinas) because our will depends on our conception of the good; if, then, our will equally depends on our conception of subordinate goods, it equally lacks freedom in relation to these subordinate goods.

This argument is cogent only if Scotus has given the right account of how we lack freedom in relation to the final good. In Aquinas' view, lack of freedom does not result from the dependence of our will on our conception of the good; he believes we would lack freedom only if we were incapable of recognizing and of acting on alternatives. In relation to subordinate goods we have the relevant capacity for recognition and action. Aquinas argues that we can ascribe this capacity to ourselves without denying the dependence of will on intellect.[35]

Even if Aquinas claimed that the will is independent of intellect in forming our deliberation about subordinate goods, he would still have to agree that it depends on intellect once we

[35] It may be useful to distinguish two claims: (1) It is not necessary that (when we recognize x as promoting the ultimate end, we desire x). (2) In cases where we recognize x as promoting the ultimate end, it is not necessary that we desire x. (1) denies the necessity of the connexion between recognizing x as good (i.e., as promoting happiness) and desiring x. Scotus is right to say that if we accept (1), we can no longer maintain eudaemonism. (2), however, denies the necessity of desiring x, but not because it denies the necessity of desiring x once we recognize it as good. We might accept (2) if we accept the necessity of desiring happiness, but reject any necessary connexion between desiring happiness and desiring x. Acceptance of (2) rather than (1) seems to underlie Aquinas' argument for denying the necessity of pursuing a non-ultimate good. For, in his view, every non-ultimate good can be looked at from some point of view that would make it appear not good; we must deliberate correctly if we are to look at it from the right point of view (1-2 q10 a2; q13 a6). Aquinas believes that our general desire for the ultimate end does not necessitate us, independently of our deliberation, to recognize one or another particular good as a means to the ultimate end. But he does not deny that we are determined to pursue something as a means to the ultimate end once we recognize it as such and do not change our mind.

have definitely made up our minds; when we have a firm belief about what is better, we have no alternative but to follow it. This is the claim that Tempier's commission took to be incompatible with freewill, and Scotus agrees with the commission. But why should Aquinas agree? In his view, freewill gives a reasonable basis for praise and blame, and we have a reasonable basis in the antecedents of a human action, as he describes them. We need to go further into Scotus' position to see why he believes that Aquinas' account cannot justify praise and blame.

The disputes about happiness identify the main points of disagreement between Aquinas and Scotus about how the will is a free and rational desire. From the voluntarist point of view, Aquinas' conditions for freedom are inadequate, because they imply that the will is determined by our natural desire for happiness and our beliefs about what promote it. Scotus believes that the will is not free unless it is free in relation to our natural desires. From Aquinas' point of view, however, the voluntarist conception of freedom is self-defeating; since it rejects determination by the ultimate end, it rejects determination by reason, and hence prevents the will from being free in relation to non-rational desires.

One might conclude that Aquinas is right about rationality, but Scotus is right about freedom, so that our initial belief in the will as a free rational desire is incoherent. In order to settle the issue in favour of Scotus, we must be able to understand how a will that has the degree of freedom required by voluntarism is also rational.

363. Moral Objections to Eudaemonism: The Two Affections of the Will[36]

To answer the eudaemonist objection that he cannot attribute both rationality and freedom to a will detached from eudaemonist global reasoning, Scotus appeals to the two primary affections that Anselm ascribes to the will: the affection for advantage and the affection for justice.[37] If we had only the will to happiness, we could not be blamed for pursuing happiness through unjust means; for if we believed that these unjust means promoted happiness, we could not avoid pursuing them (Anselm, *De Casu Diaboli* 13). In order to be open to praise and blame for acting justly and unjustly, we must have a will to justice that is independent of the will to happiness.[38] The affection for justice causes us to will something that is not directed towards ourselves. It manifests freedom in the will, because an agent who is capable of choosing the just rather than the advantageous is not necessitated by nature to pursue only his own advantage.[39]

[36] On the two affections see Boler, 'Transcending'.

[37] For Anselm's distinction see *3Sent.* d26 q1 = OO vii 2, 635 §17 = W 178; *2Sent.* d6 q2 = OO vi 1, 537 §5 = W 464; Wolter, 'Native freedom' 149–50; Visser and Williams, 'Freedom'; Delahaye, 'Morale'. Cf. §280n46.

[38] '. . . it is necessary that God make both wills come together in him [sc. Satan], so that he would both will to be happy and will justly. In this way justice being added would control the will for happiness in such a way that it would both restrain the excess of the will and would not cut off the power of exceeding' (Anselm, *De Casu* 14).

[39] If we pursued everything with a view only to advantage, we would not have a free will; we would only have a 'natural desire belonging to an intellectual nature' just as a non-rational animal has a 'natural desire belonging to a sensory nature' (*2Sent.* d39 q2 = OO vi 2, 1021 §5 = W 202).

We might recognize these two affections without rejecting eudaemonism. Aristotle contrasts the choice of the fine with the choice of the advantageous, meaning that in choosing the fine I forgo some advantage for myself.[40] Similarly, the Stoics contrast the useful (utile) with the fine (honestum), and Aquinas takes over the contrast.[41] A eudaemonist claims that both of these affections are expressions of our pursuit of happiness, and that someone with a correct conception of his own happiness will prefer the just over the merely advantageous. Aquinas agrees that justice has some special connexion with the will because it requires an agent to consider other people's advantage, and not merely her own; he does not regard this as an objection to eudaemonism.[42]

Anselm suggests a further argument against eudaemonism besides this argument from responsibility. He describes a just person as one who 'preserves correctness of will not because of anything else, in so far as he is to be called just, than the correctness itself' (*De Veritate* 12). The clause 'not because of anything else than the correctness itself' might be taken to mean that the just person regards correctness of will as worth preserving even if no further benefit results from it. This is what Aristotle means in saying that the virtuous person acts for the sake of the fine itself. But Anselm might intend a further and more restrictive claim, that the just person cannot value correctness of will for anything other than itself, and hence cannot value it for the sake of happiness.[43] He maintains that we are not just if we will the action we ought to will only because we are led to it by force or by external reward.[44] But he does not make it clear whether the prospect of happiness is necessarily an external reward that excludes choosing correctness of will for its own sake. If the prospect of happiness counts as an external reward, the just person does not always choose for the sake of happiness.

Scotus accepts this restrictive claim. He takes the existence of an affection for justice to refute eudaemonism, because he identifies the pursuit of happiness with the pursuit of advantage (*3Sent*. d27 q1 = OO vii.2, 651 §12 = W 434). If our happiness were our supreme end, we would not be free to choose justice over our own advantage, and we would not be free to love God above everything. Hence the appropriate sort of love for God subordinates self-love to the love of God, and so subordinates our desire for our happiness to the love of God.[45]

Scotus rejects the 'refined' eudaemonism that tries to reconcile apparently self-sacrificing action with the primacy of one's pursuit of one's own happiness. He argues that brave people who sacrifice their lives will the non-existence of themselves and their virtue for the good of the community; they act for the sake of the community, not for the sake of their

[40] See, e.g., *EN* 1162b34–1163a1; §§106–7. [41] See §§180, 332. [42] See §339.

[43] See Delahaye, 'Morale' 406, on *De Veritate*: 'La finalité morale s'exprime en termes de justice, non pas en termes de béatitude'.

[44] '. . . someone who wills what he ought to will only if he is forced to, or when induced by an external reward, does not preserve correctness for its own sake, but preserves it only for the sake of something else—if he can be said to preserve it at all' (*De Veritate* 12).

[45] 'Everyone who loves out of charity loves himself as directed towards the infinite good, because he loves the act or state by which he tends towards that good, and in this respect his love tends towards another, because his act is towards God as its principal object, and then he has charity to himself not as the final object, but as a proximate object directed towards the final and first object which is distinct from himself' (*3Sent*. d29 q1 supp = OO vii 2, 667 §4 = W 456).

own virtue.[46] It must be possible, therefore, for virtuous people to choose the common good while recognizing that it conflicts with their own happiness.

This example is similar in one respect to Scotus' earlier example of the person who chooses 'contrarily' against happiness; it reflects the deliberate choice of a course of action that is contrary to one's own happiness. But in the earlier case, we objected that Scotus does not show that the choice against happiness really proceeds from the will, because he does not show that it proceeds from rational desire. In the present case, he answers that objection. For he assumes that if we are moved by justice, or bravery, or the love of God, we take it to be best all things considered; what we have best reason to do does not necessarily promote our own happiness. Familiar assumptions about morality show, in his view, that choice with a view to one's happiness is not the only sort of rational choice that can be ascribed to the will. The eudaemonist position is indefensible, if it fails to make room for the non-self referential character of the choices required by morality.[47]

364. Freedom Identified with the Affection for Justice

Scotus identifies this affection for justice with the innate freedom of the will.[48] If the will were merely an intellectual desire focussed on happiness, it would not be free; hence the free will is not bound to the pursuit of happiness.[49] We have a natural tendency to pursue our own happiness (identified with our self-confined advantage); freedom not to follow this natural tendency is a necessary condition of having the affection for justice.

Such freedom, however, seems to be insufficient for justice. Scotus accepts Anselm's account of justice as 'correctness of will maintained for its own sake' (*4Sent*. d46 q1 = OO x 238 §2 = W 240).[50] In speaking of justice he refers to what is right and reasonable from an impartial point of view distinct from one's own preferences. Why should innate freedom of the will involve an affection for some impartial standard of rightness?

Perhaps Scotus means that the virtuous person who freely rejects his happiness is free because he is not simply moved by the strength of some inclination, but is moved by some rational appraisal of the options open to him. Scotus suggests that rational appraisal is embodied in the outlook of justice. If we are considering our own advantage against some action for the sake of some different end, we need to compare the two actions by some

[46] 'The Philosopher maintains in Ethics iii that the person with the bravery of a citizen in accordance with correct reason ought to expose himself to death for the good of the commonwealth. But the philosopher would not suppose that such a person would have any reward after this life . . . And so, setting aside all future reward, this is in accord with right reason, that every person with the bravery of a citizen should will his own non-existence to prevent the perishing of the good of the commonwealth. Now according to correct reason, the divine good and the good of the community (politicum) are to be loved more than the good of some individual. Therefore a given person, in accordance with correct reason, ought to will his own non-existence because of the divine good' (*3Sent*. d27 q1 = OO vii 2, 652 §13 = W 436).

[47] On Scotus' rejection of eudaemonism see Williams, 'Happiness'; 425–45; Cross, *DS* 85–9.

[48] 'Justice can be understood either as infused (which is called "gratuitous") or as acquired (which is called "moral") or as innate (which is the very freedom of the will)' (*2Sent*. d6 q2 = OO vi 1, 539 §8 = W 468). Scotus identifies the affection for justice with 'the innate freedom of the will, in accordance with which it is capable of willing some good not directed towards itself' (*3Sent*. d26 q1 = OO vii 2, 635 §17 = W 178).

[49] 'In this way, therefore, it is clear that a free will is not bound in every way to will happiness, in the way in which it would will it if it were only an intellectual desire without freedom' (*2Sent*. d6 q2 = OO vi 1, 540 §9 = W 470).

[50] Cf. Anselm, *De Veritate* 12 (quoted above, n44); Lottin, *PM* i 13.

standard that shows us how far it is reasonable to pursue our own advantage and how far it is reasonable to pursue the other end. This standard estimates different ends by reference to some impartial conception of what deserves to be chosen. Attachment to this impartial standard is the affection for justice. Hence the affection for justice is not a natural affection that we freely chose to follow; it is the expression of freedom.

Scotus seems to believe, then, that the affection for justice, not the desire for one's own happiness, is the standard for the evaluation of our natural inclinations. Aquinas says that we have freewill in so far as we act on deliberation about our own happiness, but Scotus argues that we have freewill in so far as we act on deliberation about justice.[51] The freedom of a rational will is displayed in the recognition of some impartial standard of rightness.[52]

This defence of Scotus' claims about freedom and the affection for justice helps to explain a disagreement with Aquinas over the status of the desire for happiness. For Aquinas, it is not a contingent fact that a rational will desires the ultimate good identified with happiness; a correct explication of the desire for happiness also explicates a rational will. Aquinas thinks it is essential to a rational will to assess the comparative merits of different actions; and he identifies this comparative assessment with assessment in the light of an ultimate end. An agent who was incapable of this comparative assessment would not be a free agent at all.

In contrast to Aquinas, Scotus treats the pursuit of happiness as a contingent feature of a rational will. It is a necessary and natural feature of a human will, but it is not essential to its being a rational will. In Aquinas' view, we no longer have a rational will if we do not have a will that decides in the light of an ultimate end. Scotus, however, argues that impartiality is essential to a rational will. The rational point of view identifies and considers the actual merits of different courses of action, and sets aside the particular inclinations of the various 'interested parties'. Ordinary inter-personal justice may be understood as the application of this attitude to inter-personal questions, but the attitude applies to cases where the 'interested parties' are aspects of one person, rather than different people.[53]

This aspect of the affection for justice is also an aspect of the desire for happiness, as Aquinas understands it. The pursuit of happiness requires global and systematic practical reasoning. But it also includes aiming at perfection; this aim rests on a conception of the merits of different options, not simply on how they fit into the agent's preferences. This aspect of Aquinas' position is strongly and appropriately emphasized in Scotus' claims about the affection for justice.

365. Sin and Self-Love

This comparison between Aquinas and Scotus might suggest that they emphasize distinct, but perhaps complementary, aspects of the rational will. Aquinas insists that its outlook is

[51] If he means this, the difference between him and Aquinas might not be very great. The difference would be that Aquinas emphasizes the desire for happiness as our starting point, whereas Scotus emphasizes the application of an impartial standard as the conclusion that we reach.

[52] To show that we are capable of not pursuing our own advantage, it is sufficient to cite disinterested actions. But these do not show that we have freewill, if that is a property of a rational will.

[53] On reason and impartiality see Cumberland, *LN*, i 30; Berkeley, *PO* 7.

global and systematic, whereas Scotus insists that it is impartial. But Scotus also believes that eudaemonism is mistaken, because it would sometimes be wrong to choose happiness over justice. Since the choice of happiness is sometimes blameworthy, it must be the free choice of evil; since the will is free to refuse it, the will cannot be determined to pursue happiness. When Lucifer asserts himself against God, he does not act out of love of God, which cannot be excessive; hence, he does not act on the affection for justice, which would require the love of God above all else. He must, then, be acting on excessive affection for the advantageous, which Scotus identifies with desire for one's own happiness.[54] The city of the devil rests on 'love of self that goes as far as contempt of God' (*2Sent.* d6 q2 = OO vi 1, 535 §4 = W 464); Lucifer ought to have preferred justice over his own advantage, but he sinned by preferring his own advantage.[55] If he sinned, he must have chosen freely between his own advantage and justice. Lucifer sins in so far as he pursues his own happiness, but, according to the eudaemonist, he has no choice about whether to pursue his own happiness. Hence the eudaemonist has to say that Lucifer does not act freely, and that we cannot fairly blame him.

This example does not refute eudaemonism. Aquinas agrees that Lucifer's sin is excessive love of himself to the exclusion of others. Self-love is excessive in someone who focusses on himself to the exclusion of other things and people; but this exclusive focus rests on a mistake about one's own happiness.[56] Aquinas agrees that the affection for justice and the love of God ought to override self-absorbed self-love, but he distinguishes this sort of self-love from the desire for happiness.

Is it worthwhile to defend Aquinas' position in this way? Why should we insist that the affection for justice and the love of God are really the expression of the desire for one's own happiness? Such a defence seems to force us into a misleadingly self-centred way of describing desires that do not really put self-love above everything.

Aquinas might answer by appeal to Scotus' belief that in pursuing the demands of justice and charity we pursue what is best all things considered. To justify this belief, we need to explain why we should care about the requirements of justice and charity in relation to other appropriate objects of concern, including self-regarding goods. Aquinas defends non-self-regarding concerns by appeal to the sort of good that we also pursue in the pursuit of self-regarding goods. Concern for our own good leads us to impartial love for another person, for the common good of a community, and for God as including all the good that we find partly realized in other things (*ST* 2-2 q26 a3; *Car.* a4 ad2 = M 764a). A self-regarding starting point shows why we have good reason to take an impartial attitude to some goods.

This progress from self-regarding to impartial concern does not reduce non-self-regarding concern to self-regarding concern. But it shows how our self-regarding concerns pursue an end that we achieve more fully in impartial concerns. If we connect our actions to a systematic ultimate end, we can show (according to Aquinas) that the aims of impartial

[54] See *2Sent.* d6 q2 = OO vi 1,537 §5 = W 464: 'the greatest advantage is one's complete happiness'.

[55] Scotus' quotation is inexact. Augustine actually speaks of the earthly city, not the city of the devil, as the one that is guided by excessive self-love (*CD* xiv 28a). Augustine also speaks of the earthly city with its angels as founded on self-love (xiv 13–14). He agrees with Scotus in saying that the basis of Lucifer's sin is excessive self-love. But he does not commit himself to Scotus' view that Lucifer is moved by desire for his happiness rather than some other desire. See §226; O'Donovan, *PSLSA*, ch. 2.

[56] On Aquinas' view see §341.

concerns are not completely separate from the aims of self-regarding concerns. If Scotus agrees that it is reasonable to look for this sort of connexion, he accepts one of Aquinas' claims about happiness as the ultimate end.

These questions about the implication of eudaemonism are relevant to Scotus' argument to show that some rational choices are not directed to one's happiness. He argues as follows: (1) The desire for happiness is directed towards oneself. (2) Virtuous people's choice is not directed towards themselves. (3) But their choice is rational. (4) Therefore, some rational choice is not directed towards oneself. (5) Therefore, it is not directed towards one's own happiness.[57] The argument depends on the claim that some choices are or are not 'directed to oneself' (ordinatum ad se). If Scotus is right, eudaemonism is incompatible with admitted facts about the virtuous person's rational choices (stated in (2) and (3)).

'Directed towards oneself' seems to have different senses in Scotus' argument. The virtues forbid the self-centred attitude that takes one's own interest to be more important than anyone else's, or takes the interests of others to be purely instrumental to one's own. According to Aristotle and Aquinas, however, this self-centred attitude is not required by the desire for one's own happiness. To desire one's own happiness is to aim at some feature of oneself in contrast to other people; but it does not imply that one cares less about others than about oneself.

The first step of Scotus' argument is true, therefore, if 'directed towards oneself' refers to the self-referential character of the desire for happiness. But the second step is false, if it refers to the same thing. The second step is true if 'directed towards oneself' means 'self-centred'; but if it means the same in the first step, that step is false. The conclusion damages eudaemonism only if 'directed towards oneself' means 'self-referential'; but it does not follow from the first two steps if they are both true.

This reply does not show that a eudaemonist can justify the non-self-centred attitude of the virtues within the self-referential outlook of the desire for one's own happiness. But it suggests that this question about justification is at least worth asking. If Scotus were right, it would not be worth asking, because the eudaemonist would be attempting an impossible task.

366. Sin and Freedom

In Scotus' view, eudaemonism distorts the relation between the pursuit of happiness and the affection for justice. The sin of Lucifer is a genuine sin only because we are capable of moderating our desire for happiness, and are required to moderate it. Lucifer could have freely chosen to moderate his affection for advantage, but he freely chooses not to moderate it.

According to this picture, the will has two affections, for advantage and for justice, and freedom consists in our choosing between them. But how are we to reconcile this picture with Scotus' claim that the freedom of the will is its affection for justice? (*2Sent* d6 q2 = OO

[57] 'The affection for justice is nobler than the affection for the advantageous, where "justice" is understood not only as acquired and infused justice, but as innate justice, which is the inborn freedom in accordance with which one can will something not directed towards oneself' (*3Sent*. d26 q1 = OO vii 2, 635 §17 = W 178).

vi.1, 539 §8 = W 468)?[58] Scotus explains that if the will simply had an affection for advantage, it would be simply a natural rational desire, and would not be free. The affection for justice is freedom, because it is the primary controller of the affection for advantage.[59]

But what are we to say about the will of Lucifer who chooses his own happiness freely but inappropriately? If his freedom consists in his affection for justice, apparently he acts on his affection for justice. In that case, he believes that justice supports his self-assertion, because the divine law imposes unreasonable limits on his happiness. God requires Lucifer to find his own happiness in loving God rather than in loving himself without God, to achieve it at the time God wills, and to achieve it by merit (*2Sent* d6 q2 = 00 vi.1, 540 §9 = W 470); perhaps Lucifer thinks these are unreasonable restraints on him. He exercises freedom, therefore, in so far as he compares God's demands on him with some impartial standard of reasonable action, and concludes that it is unreasonable for him to sacrifice his happiness to God's demands. This explanation traces Lucifer's sin to an error about the justice of the limits that God imposes on Lucifer's happiness. It is similar, therefore, to the eudaemonist explanation, in so far as it appeals to error, but it differs about the content of the error.

But if Scotus agrees with the eudaemonist even to this extent, can he maintain his objection to eudaemonism? He rejects the eudaemonist explanation not only because of its broad conception of one's own happiness, but also because it traces Lucifer's sin to his false belief about the means to happiness. If his choice resulted from this false belief, his intellectual error would not convict him of sin, because such errors are not subject to freewill.[60] If Lucifer acts on some rational standard that he mistakenly supposes to justify his self-assertion, his mistake explains his sin. Ignorance resulting in misapplication of a rational standard should deprive him of freedom in precisely the way in which, according to Scotus, the pursuit of happiness would deprive us of freedom, if Aquinas were right about the status of happiness. Scotus' argument about ignorance and freedom seems to undermine his account of how Lucifer sins freely.

We might answer that it is too simple to assert that ignorance and error exclude freedom by excluding praise and blame. Sometimes ignorance and error are blameworthy; and if Lucifer's ignorance is blameworthy, it does not exempt him from blame and praise. But if Scotus relies on this defence to show that Lucifer sins freely, the eudaemonist may also rely on it. Whether it is difficult or easy to identify the relevant kind of ignorance, Scotus and the eudaemonist seem to face the same task.

If, then, Scotus sticks to his objection about ignorance and responsibility, he should not say that Lucifer's free choice of his own happiness is a result of his affection for justice. Instead he should say that the choice is the result of his preference for following his natural desire for happiness over the affection for justice, and that this preference is to be ascribed to the free will. Lucifer compares the requirements of justice and the requirements of his own advantage, and chooses to follow his own advantage, by the free exercise of his rational will, but not because he misapplies some rational principle.

[58] Quoted in n48.

[59] '. . . that affection for justice, I say, is the inborn freedom of the will, because it is itself the primary controller of such an affection [sc. for advantage]' (*2Sent*. d6 q2 sch. = OO vi 1, 540 §8 = W 468–9).

[60] See *2Sent*. d6 q2 = OO vi 1, 539 §8 = W 468: nec imputaretur sibi ad peccatum. Hume uses the same sort of argument to show that false judgments cannot be the source of immorality: *T* iii 1.1 §12.

According to this view, freedom is not identical to the affection for justice; for Lucifer's will is free and he acts freely even though he rejects the affection for justice and the rational standard that it follows. Scotus' rejection of explanations appealing to ignorance implies that a free will could be fully informed about the implications of any rational standard and could still refuse to follow that standard. The affection for justice makes freewill possible, since an agent without such an affection could not reject happiness; but it is not identical to the freedom of the will. The will is no less free in rejecting than in accepting the affection for justice.

But how can Lucifer's sin, understood as a rejection of the affection for justice, express the choice of his will rather than his passion? Scotus' argument about freedom and ignorance excludes any explanation that refers to Lucifer's mistaken belief about what is best. Hence his choice depends on some motive that does not respond to a judgment about what is best. The passions are motives of this sort, but Scotus argues that Lucifer acts on his will rather than his passions. What is the difference? Scotus complains that when Aquinas seeks to make the will rational, he deprives it of freedom; but when Scotus wants to make the will free, he deprives it of rationality. Admittedly, Scotus does not believe that the will is insensitive to the greater good; he recognizes that it is difficult to reject the conclusion of practical reason.[61] Still, he believes we can reject this conclusion, on the basis of some reason that we acknowledge to be inferior. We might, therefore, wonder why this is an act of the will rather than a passion.

367. Eudaemonism, Intellectualism, and Voluntarism

Scotus' claims about the two affections and about freedom attack Aquinas' eudaemonism and intellectualism. Against eudaemonism Scotus argues that a free rational will chooses by reference to an impartial rational standard that is distinct from, and not subordinate to, one's own happiness. His objection to eudaemonism would be plausible if Aquinas treated the desire for happiness as a self-confined natural impulse; but Aquinas treats the desire for happiness as a necessary characteristic of a free and rational will, not as an impulse that restricts the freedom of a rational will.

But even if Scotus' argument against eudaemonism fails, his positive claim that a free will is rational and impartial may be a viable alternative to eudaemonism. We might, then, understand him as a non-eudaemonist intellectualist who assigns to the affection for justice the place that Aquinas assigns to the desire for happiness. Scotus might be right to take some impartial perspective as the defining feature of a rational will. Aquinas believes that this impartial perspective can be fitted into a broadly eudaemonistic perspective; but the reverse procedure might appear equally plausible, or even more plausible.[62]

[61] Bonansea, 'Voluntarism' 99, cites *2Sent.* d6 q2 = OO vi 1, 540 §8: 'In so far as the will is simply intellectual desire, it would be inclined actually above all to the highest intelligible good . . . But in so far as it is free it can restrain itself in eliciting an act, so as not to follow that inclination, neither as regards the substance of the act nor as regards the intention to which the capacity is naturally inclined.' Bonansea adds *Rep. Par.* ii d39 q2 = OO xi 1, 406 §5: 'It is difficult for the will not to incline to what is prescribed finally by practical reason, but it is not impossible'.

[62] To pursue this line of inquiry is to see some of the reasons that might support Butler's belief that conscience is the supreme principle in a rational agent.

It is difficult, however, to combine this intellectualist position with Scotus' other main attack on eudaemonism. He argues that if the will were not free to reject happiness, it would not be free, since it could not choose between opposites in this respect. A parallel argument shows that the will must be free to reject justice. While Scotus sometimes identifies the freedom of the will with the affection for justice, he cannot identify the two if he also maintains his broader objection to eudaemonism. Freedom seems to require the ability to reject justice no less than the ability to reject happiness.

This voluntarist aspect of Scotus' position dissolves any special connexion between freedom and the affection for justice.[63] Disinterested malice, for instance, seems to express freedom in a choice that rejects both happiness and justice. If you harm me or someone or something I care about, I may want you to suffer even if I recognize that I will gain nothing and that it is quite unjust for you to suffer (if what you did was completely justifiable or excusable). Scotus should apparently agree that a free will can make such choices.[64] He cannot identify the affection for justice with the innate freedom of the will, if disinterested malice expresses innate freedom.

Scotus could maintain a consistently voluntarist position by abandoning his claim that freedom of the will consists in the affection for justice. But then he would also abandon his reason for believing that a free will is also a rational will. On the one hand, he contrasts the free will with dependence on natural inclination, but on the other hand, he contrasts it with dependence on the greater good. The first contrast gives us a reason to reject the second; for the relevant contrast between the rational will and non-rational inclination requires the will to be responsive to value in a way that is excluded by the second contrast.

We would free his position from conflict if we were to deny any connexion between the doctrine of the two affections and voluntarism.[65] We might take the doctrine of the two affections as a part of Scotus' moral theory, not as part of his theory of the will and its freedom. In that case, we could affirm that the will is equally free whichever of the two affections guides it, and that the affection for the just is morally better, but not a fuller expression of freedom. Perhaps Scotus is confused in identifying freedom with the affection for justice.

We should not conclude so readily, however, that he is confused. For if we deny the identification of freedom with the affection for justice, we make it more difficult to separate the will from the passions. If the impartial attitude of the affection for the just is the outlook of reason, the free and rational will acts primarily through the affection for the just. But if the will is equally expressed through the rejection of happiness for something worse, through the affection for advantage, and through the affection for the just, what makes the will a rational capacity? It is not easy to defend Scotus' belief that the will is rational without his claim that the affection for the just most fully expresses the free will. We might even decide that his claims about freedom and the affection for the just are plausible apart from his voluntarism.[66]

[63] For a more sympathetic account of Scotus on freedom and justice cf. Adams, 'Will' 252–4.

[64] Scotus might say that malicious action of this sort really manifests my desire for revenge, and so it is self-regarding after all; but if he is willing to allow a eudaemonist explanation in this case, it is difficult to see why he is entitled to resist a parallel explanation of behaviour that he takes to rest on the affection for justice.

[65] Boler, for instance, in 'Transcending', treats the doctrine of the two affections as primarily an aspect of Scotus' moral theory.

[66] A similar conclusion may emerge from consideration of similar questions about Kant's position.

368. A Dualism of Practical Reason?

Scotus' attack on eudaemonism shows that he does not take the supremacy of self-interest for granted, and that he does not treat this as the only principle of practical reason. On this point, he rejects the main tradition of ancient and mediaeval ethics.[67] In modern moral philosophy Butler rejects this primacy of self-love. Sidgwick recognizes the importance of the question raised by Butler, and discusses it in his account of practical reason. Since Scotus anticipates Butler and Sidgwick, it is helpful to anticipate some of the questions that they raise.[68]

One of Sidgwick's claims about Butler raises a worthwhile question about Scotus as well. Since Butler rejects the primacy of self-love, we may say that he accepts a 'duality' of practical reason, marked by the irreducible principles of self-love and conscience. Sidgwick also claims that Butler recognizes a 'dualism' of practical reason; not only are there two irreducible principles, but neither is subordinate to the other or to any third principle. But Butler does not seem to treat his duality as a dualism. He maintains that self-love and conscience are distinct superior principles, but conscience is supreme. He therefore denies that they are equally ultimate principles.

Where does Scotus stand on this question? Does he regard the affection for advantage and the affection for justice as two ultimate and equal principles, or does he take the affection for justice to be superior? A non-eudaemonist intellectualist interpretation of his account of the will suggests that the affection for justice is the supreme principle. If the will is a rational capacity, and the two affections of the will are two aspects of the application of practical reason to our actions, perhaps they express the same general principle. In deliberating with a view to our own happiness, we impose the appropriate rational order on our desires with reference to our own good; in deliberating with a view to justice, we impose the appropriate rational order on the desires of the different people affected. Deliberation with reference to happiness imperfectly embodies practical reason for only one person's desires, whereas deliberation with reference to justice embodies it more fully.

This interpretation of Scotus fits the intellectualist version of his doctrine of freedom. But it does not account for all of his position. The most plausible argument for the supremacy of justice treats the affection for justice as a higher level of the sort of rational order that is present in the desire for happiness. If we find this rational order in the desire for happiness, it is plausible to treat the desire for happiness as a necessary structural feature of a rational agent. But this structural conception of the desire for happiness is Aquinas' conception. Scotus does not treat the desire for happiness, as Aquinas does, as a rational order in desires. On the contrary, he tends to treat the desire for happiness as though it were a desire for some specific object, or some specific bias in our desires, that is not an essential feature of a rational agent.

Scotus' conception of happiness is consistent with the supremacy of the affection for justice, but it deprives him of a plausible argument for it. If we doubt whether practical reason involves the impartial outlook of justice, we can remove this doubt by noticing that

[67] The Cyrenaics are his only predecessors; they reject eudaemonism for quite different reasons. See §§31–2.

[68] See Sidgwick, *ME* 197–8.

we acknowledge a similar, though partial, outlook in rational self-love. Butler, Reid, and Sidgwick see this parallel between the outlooks of prudence and of impartial morality. The parallel gives a good reason for taking the affection for justice to be superior to the desire for happiness. But this reason is not available to Scotus, given his conception of happiness. In trying to maintain the rationality of the affection for justice without allowing the rationality of the desire for happiness, he weakens his case for the supremacy of justice. Kant faces a similar difficulty for similar reasons.

Even apart from his views on happiness, Scotus' views about freedom make it difficult for him to maintain the superiority of the affection for justice. For he believes that freedom requires the capacity both to follow the affection for justice and to reject it. Lucifer exercises this capacity by rejecting justice in favour of his own advantage. This position is consistent with the supremacy of the affection for justice; for we might say that justice is rationally supreme, resting on the best reasons, and that Lucifer exercises his freedom by rejecting action based on the best reasons. But it is difficult for Scotus to defend this view, if he also believes that the free will is essentially rational, and hence that Lucifer made a rational choice in favour of self-interest. The essential rationality of the free will makes it plausible to affirm a dualism, not merely a duality, of practical reason, so that neither the affection for advantage nor the affection for justice is superior. According to this dualist position, deliberation with a view to happiness does not rest on a principle that also underlies deliberation with a view to justice. The two kinds of deliberation rest on fundamentally different aims and assumptions that cannot be rationally subordinated to each other. Though Sidgwick's description of the dualism of practical reason may not fit Butler, it may fit Scotus.

This conclusion reveals a question about the non-eudaemonist intellectualism that Scotus sometimes seems to accept (when he identifies freedom with the affection for justice, or with innate justice). If we accept the argument from prudence to justice, relying on impartial reason, we may be less tempted to reject eudaemonism; for the impartial aspects of the affection for justice do not (for the reasons we have considered) require us to abandon the supremacy of the desire for happiness.

A similar question may face Butler.[69] His argument to show that self-love is a superior principle with authority over particular passions seems to presuppose a structural conception; self-love does not pursue some specific object co-ordinate with the objects of the other desires and competing with them, but it pursues some more abstract object that is partly constituted by the satisfaction of particular passions. This conception of self-love fits the Aristotelian conception of the desire for happiness, and also fits Butler's conception of the role of conscience in inter-personal relations. But this Aristotelian conception of self-love may make us less inclined to deny the supremacy (properly understood) of self-love.

Butler has a more plausible argument against the supremacy of self-love if he relies on the hedonist conception that he sometimes accepts. This conception partly corresponds to Scotus' view of the affection for advantage as a purely natural feature of a human being, rather than an essential feature of a rational agent. But this conception also carries a cost for Butler; for it does not include the abstract and structural conception that displays the continuity between self-love and conscience.

[69] For Butler's account of the superiority of self-love see, e.g., *S* ii 11–13.

Perhaps, then, Sidgwick's claims about Butler point to an important question about both Butler and Scotus. Perhaps Butler's most plausible argument for the supremacy of conscience rests on a conception of self-love that makes it less plausible to deny the supremacy of self-love. Similarly, perhaps Scotus' conception of the pursuit of justice as the fullest manifestation of freedom and practical reason is most plausible in the light of an account of happiness that Scotus rejects. This does not imply that either Scotus or Butler ought to be a dualist, believing in two equally ultimate principles. It may imply that they are wrong to reject the eudaemonist assumptions that they reject.

This conclusion may not do justice to the case for maintaining a duality of practical reason without a dualism. Perhaps the acceptance of Aquinas' conception of the desire for happiness does not justify us in accepting the supremacy of happiness, once we consider the claims of impartial justice to express human freedom. The non-eudaemonist intellectualist interpretation of Scotus anticipates a Kantian argument for connecting freedom with practical reason. This argument raises difficulties for Kant that are parallel to some of the difficulties that we have found in trying to make room for Scotus' voluntarism. Both Scotus and Kant may be better off with a more intellectualist conception of freedom than the one that they tend to accept.

369. Will as Rational Capacity

From an intellectualist point of view, therefore, Scotus' view that freedom requires the freedom to reject the rational standards both of happiness and of justice seems to be his fatal error. Intellectualism without eudaemonism would be an intelligible and consistent position; why does Scotus insist on his further claim about freedom?

His answer depends on his view about the defining characteristic of the will. In his view, the will differs essentially from other desires in being an Aristotelian rational capacity (potentia rationalis; *QM* ix q15 = OO iv 796b = W 144), and hence a capacity for opposites.[70] Will, rather than intellect, matches Aristotle's conception of a capacity for opposites; hence Aristotle even 'hints' (innuit) that his conception of a rational capacity applies strictly to nothing except the will (*QM* ix 15 schol. 3 = OO iv 799b–800a §§9–11 = W 160–4).

According to Aquinas, however, Aristotle believes that rational capacities are actualized in ways that are subject to will and election, and that the will itself is not a rational capacity (1-2 q55 a1).[71] Aristotle cites sciences and crafts as his examples of capacities for opposites (*Met.* 1046b2–3, 6–8). He even distinguishes desire and decision from the capacities that he describes as capacities for opposites (1048a10–11). These remarks support Aquinas, and Scotus recognizes this objection to his own view (*QM* ix q15 = OO iv 797a §3 = W 148; 'Secundo, quia . . .'). Still, he believes that Aristotle's account of rational capacities does not fit intellect, which is not capable of opposites in its own right.[72] Once intellect is determined

[70] He agrees, therefore, with Henry of Ghent's claim that 'the will in a human being is called a rational capacity because it is capable of opposites' (*Summa* a36 q5, sol., Bad. 237B (p.124, Wilson), quoted by Wolter, 'Potency' 164n9).

[71] Cf. §285.

[72] 'Reason is not determinative, since it is of opposites with respect to which it cannot determine itself, and much less something other than itself' (*QM* ix 15 schol. 3 = OO iv 799b §9 = W 160).

to one effect, it no longer has the other in its power; and so it is no longer a capacity for opposites.

This argument assumes a strong sense of 'capacity for opposites', so that a subject has this capacity only if nothing external to the capacity itself ever determines it to one of the opposites. But the assumption is doubtful. We might say that a car can travel at either under or over 100 km/h, but when I press the accelerator hard enough, it is determined to travel at over 100 km/h; it is no longer able to travel at under 100 km/h at that very time in those very circumstances. If Aristotle attributes such a capacity to intellect, he can say that we are capable of believing either that the earth is round or that the earth is flat, until we find strong evidence for its being round; this evidence determines us to believe that it is round. Similarly, the doctor's knowledge makes her capable of healing and of poisoning, until she decides to heal; then she is determined to heal.

But in this sense non-rational capacities also seem to be capacities for opposites. The capacity of water to heat or to cool whatever is placed in it is capable of opposite actualizations before it is determined to one of the opposites. If we throw an ice cube into water at 20 degrees C, the ice cube will be warmed; if we throw a red-hot poker in, the poker will be cooled.[73] Since Aristotle claims that rational capacities differ from non-rational in being capacities for opposites, he cannot mean that x has a capacity for opposites by being capable of F and not F before being determined to F. Scotus infers that Aristotle intends rational capacities to be capable of opposites in Scotus' strong sense.[74] Intellect, therefore, is not a rational capacity (since it is not capable of opposites in the strong sense implying absence of external determination); only will is a rational capacity.

This argument is open to question if Aristotle believes that intellect has a capacity for opposites that distinguishes it from non-rational capacities but does not imply absence of external determination. And in fact Scotus acknowledges such a capacity: intellect has a special relation to opposites because of its representative character; it includes awareness of the relevant opposites.[75] Medical knowledge gives us awareness both of sickness and of health and of a rational basis for preferring one over the other; this is a difference between its relation to opposites and the relation of non-rational capacities to opposites.

Aquinas relies on this conception of a rational capacity to show how action caused by the will results from the exercise of a capacity for opposites. He argues that rational agents are moved by their will as a result of rational comparison.[76] This comparison requires both awareness of the possibility of opposite actions and consideration of their merits. In acting on such a comparison we realize a capacity for opposites; since we compare and evaluate these opposites, our capacity is different from that of a non-rational agent.

Scotus objects that if this were sufficient for a rational capacity, the possession of the rational capacity for F and the opposite of F would be insufficient for doing F and for doing

[73] Scotus cites this example from Boethius (quoted in OP iv 693) on Aristotle, *De Int.* 21b10.

[74] 'If it is said that a rational capacity is capable of opposites unless it is determined to one of them, in which case it is not [capable of both], it follows from this that there is no difference between opposed rational and irrational capacities as far as concerns this point, of being capable of opposites' (*QM* ix 15 schol. 3 = OO iv 800 §12 = W 166).

[75] 'A form that is grasped by intellect, as a science is, is a principle for assimilating to opposites by an intentional similitude, just as the science itself is a virtual similitude of opposites that are cognized, since one contrary includes the privation of the other' (*QM* ix 15 = OO iv 797a, §2 = W 148).

[76] See §245.

the opposite of F, even if the external conditions are suitable for one or the other; for if we know how to cure and how to poison, but we do not choose to do one or the other, we will do neither. Scotus takes this consequence to refute the claim that awareness of opposites gives us a capacity for opposites, because he assumes that x is not really the capacity for F if something external to x is needed to cause F.

This demanding conception of a capacity, however, does not seem to be Aristotle's; for, in his view, rational capacities need something else in the agent, and not just suitable external conditions, if they are to be actualized.[77] Hence he accepts the consequence that Scotus regards as unacceptable. That is why he denies, as Aquinas sees, that the will is a rational capacity. For rational capacities need something further to determine them in one direction or the other, but since the will determines the direction in which we apply a rational capacity; it is not itself a rational capacity.

These features of Aristotle's account cast doubt on Scotus' claims that intellect does not meet Aristotle's condition for rational capacities, and that only will meets this condition. But even if Aristotle had identified will with a rational capacity, he would not have implied that, as Scotus claims, nothing external can determine the will; for he does not believe that rational capacities cannot be determined by anything external to them. If Scotus were right, Aristotle would have claimed that if we have a capacity for opposites, then we must be able to do not-F at every time before we do F, and that nothing before actually doing F provides a sufficient condition for our doing F. This would be an indeterminist conception of the relevant sort of capacity. In claiming that Aristotle attributes an indeterminist capacity for opposites to us, Scotus ascribes indeterminism to Aristotle. In claiming that only the will satisfies the appropriate conditions for being a capacity for opposites, he accepts indeterminism in his own right. His argument fails, since we can apparently draw the distinctions that Aristotle draws without committing ourselves to indeterminism.

370. Rational Capacity and Contingency

But even if Scotus is wrong about *Metaphysics* ix, he still has a reason to believe that Aristotle needs Scotus' conception of the will. For Scotus argues that a will with the strong capacity for opposites (i.e., the capacity to actualize either one without external determination) is needed if our action is to be contingent.[78] Aristotle insists (in *De Interpretatione* 9) that some events happen contingently; hence (Scotus infers) he accepts Scotus' conception of rational capacity as involving this strong ability to do opposites.

Scotus assumes: (1) If my doing F is contingent, then when I choose to do F I am capable of refraining from F. (2) If I have this capacity when I choose to do F, then nothing prior

[77] 'Something else, then, namely desire or decision, must control the action; for when the agent has an overriding desire for one alternative, that is how it will act, whenever it is in the conditions suitable for its potentiality and meets the thing that is acted on. Necessarily, then, when anything with a rational potentiality desires to act in a way for which it has a potentiality, and it is in the conditions suitable for the potentiality, it acts' (Ar. *Met.* 1048a10–15).

[78] '. . . unless <a rational capacity> were capable of opposites when it is determined in actuality—that is, at that very moment in which <it decides> for that one—no effect that actualizes <it> would be actually contingent' (*QM* ix 15 schol. 3 = OO iv 800a §12 = W 166).

to my choosing to do F determines my choosing to do F.[79] Both assumptions are open to doubt. We might question the first assumption by claiming that my doing F is contingent even if my choosing to do F removes my capacity to refrain from F. But even if we accept Scotus' first assumption, we might question the second. Even if I have some capacity to refrain from F when I do F, it is not clear why this capacity excludes prior determination to do F. If there are antecedent sufficient conditions determining me to choose F rather than not F, my choosing F is necessitated; but Aristotle does not infer that it is necessary. In his discussion of the Sea Battle he denies that past truth necessitates a future event, but he does not infer that contingent human choices and actions have no sufficient causal conditions.[80] He does not rely on the strong conception of rational capacity that Scotus attributes to him, and he does not treat the will as such a capacity.[81]

Still, Scotus may have identified a serious difficulty in Aristotle and in Aquinas. Perhaps the distinctions Aristotle draws are too weak to support his claims about contingency. He believes that something about the contingency of human choices and actions justifies us in taking them to be open to praise, blame, and moral evaluation. Scotus claims that we cannot find the relevant sort of contingency in human choices unless we identify the will with a rational capacity, as he conceives it.

371. Voluntarism and Indeterminism

Scotus maintains, against Aquinas' intellectualism, that the belief that x is better than y does not determine the will to choose x rather than y. If anything external to the will determined the will, it would exclude freewill; for it would imply that the will itself is not a capacity for opposites, since something external to it would determine which opposite would be realized.

This argument helps us to see how Scotus' position goes beyond the simple rejection of intellectualism. If I freely choose between x and y, my choice (according to the anti-intellectualist) is not determined by my conception of the merits of x and y, since that would be determination by an appearance that lies outside the will; but my choice may still be determined by how the will is. If we attribute this sort of freedom to the will, we might still accept a determinist (or compatibilist) account of the formation of the will. Voluntarism, therefore, does not include incompatibilism, and so does not require indeterminism.

But this version of voluntarism may well seem unattractive. It is difficult to see why appearances and considerations should be the only external determinants that exclude free will. Compatibilist voluntarism, however, allows our beliefs, values, and choices, to be

[79] '. . . I say that the will can be moved to an act with no determination to the act previously understood in it, in such a way that the first determination in time and nature is in the positing of the act, and that if then it is supposed that it is capable of nothing unless previously determined, that is false' (*QM* ix 15 = OO iv 801a §13 = OP 696 = W 168). I follow the text of OO and OP rather than W.

[80] Some readers have claimed to find it in *Met.* vi 3, but it is difficult to convince ourselves that he accepts it there if we are not already persuaded that Aristotle accepts indeterminism. For references see Kirwan, *Met.* 222–5. Aquinas explains the chapter through his doctrine of different types of causes in *in Met.* vi 3 §§1215–22.

[81] On Scotus' view that he agrees with Aristotle see Wolter, 'Potency' 177–8. On earlier Franciscan disagreements with Aristotelian views see Stadter, *PMMF* 4–6, 79–80, 124, 136, 182, 210–11.

determined by a sequence of sufficient conditions that goes back outside us, indeed to events long before we were born.

Scotus might reasonably claim to offer a more plausible version of voluntarism. In his view determination of the will by considerations external to it is to be rejected not because the determinants are intellectual, but because they are external to the will. His belief in self-determination rests on his belief that the will is a rational capacity, capable by itself of going in opposite directions.

Scotus' defence of voluntarism, therefore, commits him to indeterminism. If something prior to my willing now to raise my arm determined my willing this now, my will would not now be a rational capacity that determines itself to opposite effects. His strong claim about the will as a rational capacity commits him to both voluntarism and indeterminism.

Just as voluntarism without indeterminism is consistent but unattractive, Aquinas' intellectualism makes compatibilism attractive. The determination of will by intellect is compatible with indeterminism about freewill; perhaps the will is determined by the intellect, but we act freely only if the conclusion of the intellect is not causally necessitated.[82] This view, however, is unstable. Aquinas suggests that we have freewill because we deliberate about alternatives, and the result of our deliberation affects our choice and action. This is his explanation of the intuitions that suggest that freedom requires some ability to do otherwise. If his explanation is correct, these intuitions do not require incompatibilism; hence we undermine one argument to show that the ability to do otherwise must include an indeterministic process.

Aquinas' intellectualism, therefore, supports compatibilism, and Scotus' voluntarism supports indeterminism. These are not the only consistent combinations; later discussions of freewill try other combinations.[83] But Aquinas and Scotus have good reasons for believing that they are more plausible than the other consistent combinations would be.[84]

[82] On incompatibilist intellectualism see §270n62.

[83] Hobbes, e.g., defends both compatibilism and anti-intellectualism against Bramhall.

[84] The issue about determination leads to another dispute between Aquinas and Scotus. Aquinas' account of human freedom in relation to external causal influences depends heavily on his distinctions among types of causes. Provided that the proximate cause is in the will responding in the right way to the merits of the situation, the fact that the will's response is itself the product of external causal influences does not seem to him to compromise human freedom; it simply has to be connected to human action by the right sort of causal chain. Aquinas relies on this distinction to argue that external causal influences such as the passions, human nature, external events, the Devil, and God do not threaten human freedom. See §270. Scotus is dissatisfied with Aquinas' solution, because he rejects Aquinas' distinction among causes. See Adams, *WO* ii 1117–30.

26

SCOTUS: VIRTUE AND PRACTICAL REASON

372. Passion, Will, and Virtue

Scotus believes that since freedom depends on will rather than intellect, and since virtuous action is (as Augustine says) the good use of freewill, the will is also the subject of the moral virtues. If the moral virtues belonged to the passions or to the intellect, they would not be subject to freewill, and so we would not be open to praise or blame for being virtuous or vicious.

If the will is the subject of the moral virtues, Aristotle and Aquinas are wrong to make the passions the subjects. Scotus rejects Aristotle's view that (as Averroes remarks) assigns the virtues to the sensory appetite rather than to the will (*3Sent. d33* q1 = OO vii 2, 696 §1 = W 318). This is also the view of Aquinas (*ST* 1–2 q56 a4). Such a view seems to leave out the essential role of the will.

Though he rejects the view that he ascribes to Aristotle, Scotus also believes that Aristotle sometimes treats the will as the subject of the virtues. He mentions some plausible Aristotelian reasons: (1) Virtue is a state involving election, which is a product of the will. (2) Virtue is the origin of praiseworthy actions, which must proceed from the will. Scotus assumes that voluntary actions and states depend on the will, and that states and actions are praiseworthy in so far as they are voluntary. (3) The object of virtue is the right (or 'fine'; bonum honestum), which is the intrinsic object of the will (*3Sent.* d33 q1 = OO vii 2, 696 §2 = W 320). Aristotle connects the pursuit of the right with the rational part (e.g. *EN* 1169a3–6). Since he insists that the virtuous person elects what is right for its own sake, he seems to attribute the characteristically virtuous attitude to the will.

These are good reasons for treating the will as essential to moral virtue. They rest so firmly on Aristotelian principles that neither Aristotle nor Aquinas could reasonably reject them. Scotus is justified in claiming that Aristotle's explicit account does not reflect the importance of the will in virtue. Moreover, Aquinas does not completely correct Aristotle. On the one hand, he agrees that the subject of a state that is to be called a virtue without qualification is the will or some other capacity in so far as it is moved by the will (1-2 q56

a3);[1] hence a virtue must be either in the will itself or in some capacity that is moved by the will. On the other hand, he denies that the will is the subject of bravery and temperance. He allows only that it is the subject of virtues aiming at some external good, directed towards God or one's neighbour (q56 a6c; ad3).

Some of Scotus' arguments expose this internal difficulty in Aquinas. He does not rely on voluntarist claims about the will that Aquinas rejects, but he explains why Aquinas' views about the will should make the will a subject of the moral virtues (*3Sent*. d33 q1 = OO vii 2, 702 §13 = W 332). Scotus argues that every moral virtue requires a good habituated state in the will no less than in the sensory desires. Since Aquinas gives inadequate reasons for assigning some of the virtues to the passions and some to the will,[2] he should amend his view so as to give a larger role to will, in contrast to passion, in the moral virtues.

373. Intellect, Will, and Virtue

Some of Scotus' other objections to Aquinas, however, are more strongly voluntaristic. He rejects not only passions but also intellect as the subject of the moral virtues. Aquinas agrees with him in denying that intellect is the subject, but Scotus draws a more extreme conclusion from this point. He believes that if we place virtue in the intellect, we make vice a matter of ignorance, so that virtue and vice will not be open to praise and blame. Against this position, he defends the view that he attributes to Augustine, ascribing virtues to the direction of an agent's 'love', and therefore to the will.[3]

He argues, therefore, against the view that virtue consists in correct reason.[4] If this view were right, the will would be passive in relation to the intellect; hence (Scotus infers) we would not be blameworthy, since our errors could be traced back to cognitive mistake or ignorance.[5] If a mistaken choice of the will results from ignorance of the good, the will did not choose freely, and therefore we cannot be blamed for the choice. Since we are praised and blamed for virtue and vice, virtue and vice must belong fundamentally to a will that does not necessarily follow practical reason. If the will necessarily followed practical reason, it would not warrant praise or blame, and so would not be the subject of virtue and vice.

The view that Scotus attributes to his opponents is more extreme than Aquinas' view. Aquinas does not claim that knowledge is all that is needed for virtue. He argues that we must also be turned towards the right ends, and that therefore virtue requires a good state of the passions (1-2 q56 a4 ad4). Since the passions present some goods to us in an especially attractive way, we can be diverted from our conviction about what is best by the particular attractions offered by the passions. Since Aquinas does not suggest that every error is purely cognitive, he does not hold a purely intellectualist view of virtue.

[1] See §290. [2] Walter of Bruges criticizes Aquinas on this point. See Kent, *VW* 66.

[3] On Augustine see §218.

[4] He denies that 'it suffices <for virtue> that reason presents <the object> correctly, and therefore virtue is needed in reason, not in the will' (*3Sent*. d33 q1 schol. = OO vii 2, 698 §5 = W 324).

[5] '. . . then reason would have to go wrong first in presenting <the object> before the will elected badly, and thus there would be an error in the intellect before the first sin of the will. This is unreasonable; for in that case the punishment would precede the crime' (*3Sent*. d33 q1 schol. = OO vii 2, 698 §5 = W 324–6). This proposition (si ratio recta, et voluntas recta) about the primacy of intellect was condemned in 1277. See Prop. 130 (Piché, *CP* 118).

None the less, if we have a clear and firm grasp of the greater good, that greater good, according to Aquinas, is what we choose. Since Aquinas believes that the will follows the intellect's conception of the good, he believes that in this respect the intellect is prior to will, so that in this respect the will is not primary in moral virtue. If the true grasp of the good is the source of virtue, failure to be virtuous must result from an imperfect grasp of it. In Aquinas' view, the imperfect grasp is not always the result of ignorance; in some cases, the will is 'clouded' by the passions, though it is not forced to consent to them. Even when our imperfect grasp of the end results from ignorance, we may be responsible, since the ignorance may be culpable.[6]

From a voluntarist point of view, these attempts to hold us responsible for our imperfect grasp of the end are unsatisfactory. First, we may ask why the will consents to the erroneous suggestions of the passions. Its error in consenting must apparently be explained either by ignorance or by negligence. But negligence must be explained by ignorance or by the influence of passions, which we are still trying to understand. Moreover, ignorance itself does not merit blame; if it is to be blameworthy, the ignorance must be the result of some blameworthy omission or negligence; but what makes this blameworthy? If we appeal to the passions again, we seem to be embarked on an infinite and vicious regress.

We embark on this regress if we assume that responsibility is to be explained wholly by reference to the causation of the state or action, and that this causation must involve the transmission of responsibility from some subject that is more fundamentally responsible. Eventually we need to describe fundamental responsibility.[7] Aquinas disappoints us here, since the causal sequences he traces for us seem to leave us with our original question about fundamental responsibility still unanswered. Dissatisfaction with this result leads naturally into a voluntarist account of fundamental responsibility.

This is Scotus' account. He argues that passion and ignorance are not sources of blameworthy error, and that only the will is fundamentally responsible. An erring will need not be misled by the attractiveness of some object of the passions, and it need not be ignorant. Even if it is fully informed about the better, it may none the less choose the worse. This fundamental level of responsibility neither allows nor needs further explanation.

The difficulties that face a voluntarist account of the will, however, also cast doubt on this fundamental responsibility. If we cannot stop with ignorance or passion because we still need an explanation of our ignorance or of our consent to the passion, we equally seem to need some explanation of the choice made by the will. But voluntarism seems to preclude any explanation of the choice. If the appeal to ignorance or passion is unsatisfactory, the appeal to the will, as conceived by a voluntarist, seems equally unsatisfactory.

Aquinas, therefore, ought not to agree that the cause of responsible action is something that we are more fundamentally responsible for. He ought to argue that we look for the sort of causal origin that will make it appropriate and fair to praise and to blame the agent. Praise and blame look forward, since they seek to modify the agent. They also look backwards, since they presuppose that the agent was open to praise and blame in choosing to behave one way or another, and therefore that he could reasonably have been expected to take account of these consequences when he decided what to do.[8]

[6] See §262. [7] See Strawson, *FB* 48–50.

[8] This retrospective aspect of praise and blame distinguishes them from the mere attempt to change someone's behaviour in the future; it is also needed to justify the infliction of punishment in cases where future reform is not to be expected.

Aquinas' description of the influence of the passions and of the role of the will supports the claim that agents are open to the influence of praise and blame, and so are justifiably praised or blamed for choosing one way or the other. Praise and blame appeal to the agent as being rational and capable of modifying his choices as a result of considering what is best all things considered. If we recognize the influence of passions, and also recognize the decisive role of the will, we can modify our actions by consideration of the overall good. We need not be most fundamentally responsible for the action or state that causes us to be deliberately ignorant or negligent; it is only necessary to show that when we are in this state we are open to the sorts of rational considerations that belong to praise and blame.

This defence of Aquinas raises doubts about Scotus' specifically voluntarist reasons for believing that the will is the subject of virtue. Even if virtue is praiseworthy, knowledge and ignorance may be a basis of responsibility. And even if a firm and clear conviction of what is best necessarily results in the corresponding action, the will may still be a subject of virtue.

Scotus' basic disagreement with Aquinas, therefore, is not about whether the will is the subject of the moral virtues, but about the sense in which we should understand this claim. If we were to agree that the will is the subject of these virtues, but we maintained Aquinas' intellectualist conception of the will, Scotus would still believe that we had failed to explain how we exercise our freewill in virtue and vice, and therefore how we are responsible for our actions and characters.

374. Universal Conscience

Since, therefore, Scotus believes that the subject of moral virtue is the will, understood as the voluntarist understands it, he rejects those aspects of Aquinas' account of the virtues that rest on assumptions derived from Aquinas' intellectualism and eudaemonism. These assumptions are prominent at different places in Aquinas' doctrine of practical reason. The ultimate principles of practical reason, grasped by universal conscience, refer to the final good and what is required of a rational agent who pursues it. The principles grasped by universal conscience necessarily move the will once they are grasped, since they show us what is required for our happiness. The subordinate principles of natural law are not grasped by universal conscience and do not necessarily move the will, because some people do not recognize their connexion with happiness. These people go wrong because negligence, ignorance, passion, or bad upbringing makes them unaware of, or inattentive to, the connexion between (say) the different precepts of the Decalogue and the ultimate end.

Since Scotus rejects the conception of the will that underlies Aquinas' doctrine of practical reason, he rejects Aquinas' account of the relation between universal conscience, prudence, and motivation. In his view, the recognition of a connexion between a particular action (or state of character) and one's ultimate good is not sufficient for the choice of that action; we are free to reject happiness either for something better or for something worse. Hence the explanation for failure to follow the requirements of the moral law cannot simply be failure to see the connexion between these requirements and one's own happiness; it must also be possible to exercise one's freewill in rejecting happiness. Nor can recognition of the

connexion between a particular action and one's own happiness be the appropriate motive for the virtuous person's choice of that action; that motive is inappropriate for those virtues that require us to be moved by the affection for the just.

Scotus, therefore, alters Aquinas' claims to fit a voluntarist position. Intellect grasps the first principles of morality, but they do not necessarily move the will, since the will is free and is not necessarily moved in one or the other direction by what intellect discovers (*2Sent*. d39 q2 = OO vi. 2, 1018–19 §3 = W 200–2). An undetermined choice of the will is needed to determine whether it will follow our natural inclination to justice.

Universal conscience tells us what is just. In doing what it tells us, we follow our affection for justice rather than our affection for advantage (*2Sent*. d39 q2 = OO vi 2, 1021 §5 = W 202 [ad 2]). This answer is similar to Scotus' treatment of the desire for happiness. He admits that we have a natural inclination towards happiness (*4Sent*. q49 d10 = OO x 513 §6 = W 190), and agrees that most of the time the will chooses to follow this; but he denies that the will necessarily pursues happiness, and insists that it freely chooses whether or not to follow our natural inclination.[9]

According to this strongly voluntarist view, the will freely chooses between the affection for justice and the affection for advantage; once it has chosen justice, it follows the demands of the natural law. The will is not moved by the thought that it is more reasonable to follow the inclination towards justice or the inclination towards advantage; for if that were the basis of the will's choice, it would remain passive towards reason, contrary to Scotus' view.[10]

Scotus' anti-intellectualism gives a clear reason for separating the cognitive from the motive aspects of prudence. Neither Aristotle nor Aquinas treats the operations of prudence as simply theoretical reasoning that may or may not move the agent. Prudence includes a motivational aspect because it begins its deliberation from the agent's desire for happiness, and discovers ways to fulfil that desire. From Aquinas' point of view, someone who grasps all the precepts of prudence but does not act on them has failed to grasp clearly and steadily the connexion between these actions and his own happiness. Scotus denies this link between prudence and motivation, whether prudence tells us about what is required for happiness or about what is required for justice. The information that it gives us must leave the will free to choose one way or another.

Since Scotus applies his voluntarism to practical reason and prudence, he separates the cognitive from the motive element in moral virtues more than Aquinas ever does. If the virtuous person has a good will, and chooses the right actions for the right reasons, will, as opposed to intellect, is the primary element of virtue. Aquinas is not forced into this choice; since both the virtuous and the vicious person aim at happiness, the difference between them reflects their different conceptions of happiness. But if Scotus is right, the virtuous and the vicious person may have the same conception of happiness.

[9] Sometimes Scotus, as we have seen, affirms a necessary connexion between the freedom of the will and its affection for justice. In that case, the free will must choose in accordance with the impartial norms of justice. But such a view makes it difficult to maintain that universal conscience belongs entirely to the intellect and has no necessary effect on the will. For if universal conscience discovers what is just by discovering the first principles of natural law, it seems to determine the free will that is determined by the norms of justice.

[10] Cf. §393.

375. Practical Reason and Prudence[11]

Scotus' doubts about Aquinas' eudaemonism, and hence about Aquinas' conception of practical reason and prudence, influence his treatment of the reciprocity of the virtues (RV), and of the horizontal and vertical unity of prudence. In his view, different virtues embody independent ways in which the will can be correct, and independent aspects of prudence belong to the different virtues. Prudence is vertically unified because the prudence belonging to each virtue includes both universal and particular prudence; but it is horizontally divided among the different virtues.

To show that prudence is vertically unified, Scotus assumes that virtue requires not only the acceptance, but also the election, of a specific end. In electing things for their own sakes we are electing them as ends (or as constituents of them). Since election rests on deliberation, the correct election of an end must rest on some deliberative virtue. This deliberative virtue is prudence.[12] Scotus might reasonably connect this claim about grasping the end with Aristotle's conception of a moral virtue as an elective state (*hexis prohairetikê*). The virtuous state is distinguished from others by its tendency to elect specific things for their own sakes. He might reasonably argue that Aristotle's description of a virtue presupposes deliberation resulting in the choice of ends.

A second argument for the vertical unity of prudence rests on the unity of each virtue. This unity depends on the unity of the end 'towards the election of which it primarily inclines us' (*3Sent*. d36 = OO vii 2, 813 §18 = W 408). If there were no prudence prescribing the election of this end, there would be no single end for the virtue to elect. This argument presupposes that virtue involves election of things for their own sakes, and so involves a distinctive pattern of deliberation. This distinctive pattern requires a distinct end, and therefore requires universal prudence.

While Scotus argues on these grounds that virtue is inseparable from both universal and particular prudence, and so defends the vertical unity of prudence, he denies the horizontal unity of prudence, and so denies RV. He claims that Aristotle's account implies the separability of the virtues, because both correct action and correct judgment about the subject-matter of one virtue can be present by themselves, without correct action or judgment on the other virtues.[13] The different virtues are similar to different senses; each may work perfectly well without the others.[14] The state of a perfectly

[11] See §394; Adams, 'Connection'. 375

[12] 'Moral virtue always, by a certain natural direction, follows some sort of prudence; now from the election of a particular end, say chastity, a moral virtue is generated. And so some sort of prudence precedes that election' (*3Sent.* d36 = OO vii 2, 813 §18 = W 408).

[13] 'The character of a virtuous act or state needs nothing except conformity to right reason, which is evident from the first chapter of the second book of the Ethics: "A virtue is a state that elects, existing in a mean, determined as a wise person will determine it." But without any agreement of virtues concurring in the same agent, it is possible for there to be such conformity, of state no less than act, to right reason in accordance with which one elects. What is assumed is evident; for one does not elect rightly about the matter of temperance except by right reason preceding and prescribing about such-and-such an object of election; but it is possible for the correct prescription of one virtue to precede without any prescription of reason about the matter of a second virtue' (*3Sent.* d36 = OO vii 2, 787 §5 = W 384).

[14] 'One is not . . . a moral person without qualification unless one has all the virtues, just as one is not a perceiver [sentiens] without qualification unless one has all the senses. But one is none the less perfectly temperate, even if one is less perfectly moral, just as one is not less perfect as a seer or hearer even if one is less perfect as a perceiver' (*3Sent.* d36 = OO vii 2, 793 §9 = W 388).

virtuous person's character is not unified, but simply a conjunction of the different specific virtues.[15]

Even if we allow that the virtues ought to co-operate, we need not accept RV. Perhaps the actions and motives appropriate for each virtue depend partly on the other virtues, so that the virtues do not tread on each other's toes. But we might know enough to avoid conflict with the other virtues even if we lacked the other virtues. If I am painting a room and you are going to polish the floor, I may know that I ought not to splash paint all over the floor because it will make your work more difficult, but I may not know how to polish the floor. Similarly, we may need some principles of universal prudence if our different virtues are to co-operate; but it does not follow that we need universal prudence.

376. The Unity of Prudence: Aquinas against Scotus

Aquinas implicitly rejects both horizontal and vertical separation, in explaining why we need prudence. Virtue requires both doing good actions and acting well (bene operari, *ST* 1-2 q57 a5), but we do not act well if we depend entirely on other people's deliberation; 'one's own action is not yet completely perfected as far as concerns reason that directs and desire that sets us in motion' (q57 a5 ad2). If we deliberate for ourselves about how to fulfil the specifically virtuous end, but we rely on other people's deliberation to form the specifically virtuous end, our reason and desire are not completely perfected.

Aquinas assumes that virtuous agents can see how different virtues interact, and how they together promote the final good. The requirements of justice, for instance, determine which situations and goals require us to face danger, and so they influence brave people's conception of why they ought to face this danger but not that one. Moreover, the requirements of justice preserve a human community with a specific form of social life that promotes the human good; hence the requirements of justice ought to determine some requirements of bravery.

If Aquinas is right about this, he has an answer to Scotus. Though Scotus points out that some motivational and deliberative aspects of virtue fall short of RV, the aspects that he recognizes do not satisfy Aquinas' demand for perfected desire and reason. Agents who lack universal prudence cannot grasp why these actions are really brave, or why co-operation with other virtues requires these actions; and so, since their own deliberation does not grasp these things, they have to rely on the deliberation of others.

Is Aquinas right, or does his argument about the importance of one's own deliberation and the perfection of one's own reason rest on an absurdly demanding conception of perfect virtue?[16] If he is right, we have less than a complete virtue if we do not see the point of the virtue and the actions it requires, and we do not see how it ought to co-operate with the other virtues. In the Secunda Secundae Aquinas illustrates his claims in his discussion

[15] This analogy with the senses might fit virtuous motives as well as virtuous actions. Even if we agree that each virtue requires the right motive, we need not agree that we have the motive appropriate for one virtue if and only if we have the motive appropriate for each of the others. And so, even if we need prudence to give us the right motive for each virtue, we need separable aspects of prudence for the different virtues.

[16] See §§98, 322.

of such virtues as bravery, magnificence, and magnanimity (2-2 qq 123–35).[17] Many of the objections he answers rest on a narrow conception of these virtues. He rejects this narrow conception by an appeal to wider moral principles. These principles explain why a martyr can be as brave as a soldier, and why magnanimity does not conflict with humility (2-2 q129 a3 ad4). We need universal prudence if we are to understand what a particular virtue requires; if we have too narrow a conception of the virtue, we have the virtue imperfectly.[18]

Scotus, therefore, seems to overlook some requirements that are included in the virtues. We do not face these requirements on every occasion; that is why we recognize everyday virtuous acts, and take the virtue of the agent for granted, without demanding everything that Aquinas demands of the virtuous agent. But we should not attend only to easy and everyday cases; states of character are revealed by difficult and testing situations.[19] In these situations Aquinas' requirements are relevant, and the opponents of RV demand too little.[20]

377. Eudaemonism and the Unity of Prudence

Universal prudence, according to Aquinas, aims at achieving the ultimate good, and so must be horizontally unified.[21] Scotus, by contrast, recognizes no common end for all the virtues or for every branch of prudence. For, in his view, the will aims either at the advantageous, if it follows our natural inclination, or at the just, if it exercises its freedom. Since some of the moral virtues aim at the agent's own advantage, and some aim at the advantage of others, some appeal to our affection for advantage, and others appeal to our affection for the just. Scotus recognizes no comprehensive end regulating our tendency to follow these two affections; the will has no further reason for following the affection for the just in some cases and the affection for advantage in other cases.

[17] See §331.

[18] Some more modern examples support Aquinas. The sense of honour that leads some characters in nineteenth-century novels to suppose that insults need to be avenged by duelling, or that gambling debts have to be paid first, or that different standards of fidelity apply to husbands and wives, turn out to rest on misunderstandings of the nature and point of different virtues and their relation. More recently, the assumption that concern for fairness and justice requires exclusive attention to merits and qualifications, narrowly conceived, can be challenged in various ways; one reasonable challenge argues that the assumption rests on a misconception of the nature of the relevant virtues and of their connexion to other virtues and principles. These examples suggest that it is difficult to divide the concerns of particular prudence from those of universal prudence, or the concerns of the moral agent from those of the moral theorist. Aquinas' suggestion that virtuous agents need universal prudence to carry out the correct deliberation does not betray any exaggeration, or any tendency to confuse the agent with the theorist. It would be exaggerated to suggest that a virtuous agent must be able to construct the sort of theory that Aristotle or Aquinas constructs; but it is not exaggerated to suggest that a virtuous agent must grasp (perhaps without formulating) the sorts of considerations that concern the theorist. Aquinas' own discussion of the virtues illustrates this role for universal prudence in influencing the outlook of agents on their virtues.

[19] See Aristotle, *EN* 1130a1–2; Aquinas, *in EN* v 2 §909.

[20] We can defend RV against some objections that appeal to historical and psychological counter-examples. To say that virtuous agents must grasp the relations of a particular virtue to other virtues, and must guide their actions by their grasp of those relations, is not to claim that they must display all the virtues to an equal degree, or that their situations require the actions characteristic of all the virtues. People may 'specialize' in different virtues; social and psychological facts may make specialization mandatory or desirable. But we can be specialized in one virtue without ignoring the claims of other virtues; and the demand for virtuous agents to attend to the claims of the different virtues is the central demand that supports RV. RV is exacting, and we cannot take it for granted that even the people conventionally regarded as exemplars of the virtues have actually fulfilled it; but it is neither unrealistic nor unreasonable.

[21] See §324.

Since Scotus rejects eudaemonism, he loses some reasons that convince Aquinas of RV. Aquinas believes that reference to some single comprehensive end is necessary for rational willing. Since Scotus rejects any such condition on rational willing, he denies that the virtuous person's deliberation would be defective if it did not refer to a comprehensive end; and so he has no reason to insist on RV.

If we agree with Aquinas on universal prudence, and accept his suggestion that the aims of the different virtues are connected and mutually supportive, we accept the main assumptions about practical reason that underlie his belief in an ultimate end. Indeed, his belief in an ultimate end simply extends this picture of the virtuous person's reasoning to rational action in general.[22]

Equally, Scotus' view about the connexion between eudaemonism and the reciprocity of the virtues is intelligible in the light of his views about freewill. For if the virtuous person has to see some connexion between the self-regarding and the other-regarding virtues in the light of some end that makes them all reasonable, a will that refuses to choose all or some of them fails to see something that makes them reasonable objects of choice. But this explanation of wrong choice by reference to ignorance is the very sort of explanation that Scotus rejects as inconsistent with the freedom of the will. We may welcome this consequence of Scotus' voluntarism. Alternatively, we may decide that it casts doubt on his account of a free and rational will.

378. Knowledge of Natural Law

Scotus disagrees with Aquinas not only on the connexion between practical reason, prudence, and motivation, but also on the nature of the principles grasped by practical reason. In agreement with Aquinas, he recognizes a natural law that we grasp by natural reason, and he believes that God prescribes the observance of this natural law. But he differs from Aquinas about the extent of the natural law, and about its relation to the will of God. He is less optimistic about the practical guidance we can derive from the higher principles of natural law.

According to Scotus, natural law is relevant to our moral knowledge in three ways: (1) We know that some moral principle is true from its terms, so that it is a first principle corresponding to a first principle of demonstration in theoretical science. (2) A principle follows evidently from a first principle. (3) A principle is said to belong to natural law by extension if it is a practical truth concordant (consonum) with the principles or conclusions of natural law, 'in so far as it is immediately known to all to agree (convenire) with such a law' (*4Sent*. d17 = OO ix 296–7 §3 = W 262).

We do not need any special revelation to know natural law; it is known by 'natural light'. On this basis we can know all three classes of truths about natural law, and hence we can know, for instance, that monogamy rather than bigamy accords with natural law (*4Sent*. d33 q1 = OO ix 706 §7 = W 294). Similarly, we can know by the natural light that a guilty person must be judged, because this accords with natural law (*4Sent*. d17 = OO ix 298 §7 = W 266). Scotus allows that paternal authority is just by natural law, but he denies that

[22] See §§271–3.

political authority can claim any title in natural law; it rests on the agreement and choice of the community (*4Sent*. d15 q2 = OO ix 156 §6 = W 314). It seems to follow that political life is not justified by the natural law.

As Scotus explains the natural law, its highest principles do not proceed from the sovereign will of God. Scotus reports other people's view that principles belonging to the law of nature 'possess necessary truth; therefore God cannot make them false' (*3Sent*. d37 = OO vii 2, 857 §1 = W 270).[23] He agrees with this view as far as concerns the first two types of principles; for he agrees that God's intellect by itself, apart from God's will, recognizes principles of the first two types.[24] If, therefore, all the precepts of the Decalogue were of these two types, God's will would not be free to reject them; God would have practical knowledge of moral principles whose rightness is independent of God's will.[25]

Scotus, however, claims that the precepts of the second table of the Decalogue, containing duties towards our neighbour, belong to the third class of principles. Unlike principles in the second class, they do not follow evidently from the first principles. Though they 'agree' with the natural law, they are not required by it.[26] In opposition to the view of Aquinas that all the moral precepts of the Decalogue belong to the natural law, [27] Scotus claims that the second table does not belong to it in the strictest sense. Its precepts are not necessary for achieving the end that is pursued in the natural law.[28]

Gabriel Biel elaborates Scotus' views about the relation of the second table to the natural law. He maintains that it is not strictly part of the natural law, because, as Scotus maintains, it is not necessary for reaching the ultimate end (*3Sent* d37 a2 concl. 3 = W & H 636 M 2). In Biel's view, these precepts are only part of natural law 'construed broadly' (large accepta).[29] He follows Scotus in relying on 'consonance' to explain the relation of these precepts to the natural law.[30]

[23] These people infer that 'the things that are commanded <in natural law> are not good only because they are commanded, but, on the contrary, it is because they are good in their own right (secundum se) that they are commanded' (*3Sent*. d37 = OO vii 2, 878 §2 = W 272).

[24] For any principles of these first two types it would follow that 'God's will would be necessarily determined without qualification about objects of will other than himself' (*3Sent*. d37 = OO vii 2, 879 §4 = W 274).

[25] *3Sent*. d37 q1 sch. = OO vii 2, 879 §4 = W 274. See n41 below.

[26] 'Things are said to belong to the law of nature in another way, because they are highly consonant with that law, even though they do not follow necessarily from the practical first principles that are known from their terms and are necessarily known by every apprehending intellect. And in this way it is certain that all the precepts of the second table as well <as the first> belong to the law of nature, because their rightness is very much consonant with the practical first principles that are necessarily known' (*3Sent*. d37 = OO vii 2, 898 §8 = W 278).

[27] For Aquinas' view see *ST* 1-2 q100 a1, described by Scotus *3Sent*. d37 = OO vii 2, 877–8 §2 = W 272. Cf. §309.

[28] 'For in the things prescribed in it [sc. the second table] there is no goodness that is necessary for <achieving> the goodness of the ultimate end; nor in the things prohibited in it is there evil necessarily turning us away from the ultimate end. Rather, if that good were not prescribed, the ultimate end could <still> be achieved and loved. And if that evil were not prohibited, the achieving of the ultimate end would <still> be consistent with it.' (*3Sent*. d37 = OO vii 2, 898 §5 = W 276). Scotus' views on the natural law are discussed by Crowe, *CPNL*, ch. 7.

[29] 'But that they belong to the law of nature, as commonly construed, is clear because they are highly consonant with that law, even though they do not follow from the first practical principles, which are known from their terms to every understanding and are necessary. For the first precept <of the second table>, the one about honouring one's parents, is highly consonant with this principle: benefits are to be repaid to a benefactor. The other precepts, the negative ones, are consonant with this one: one's neighbour is not to be unjustly condemned' (Biel, *3Sent*. d37 a2 = W&H 637 M 17–21). See Oberman, *HMT* 94. Suarez criticizes Scotus' view at *Leg*. ii 15.6–12. See also Cajetan ad 1-2 q100 a8.

[30] On 'valde consonans' cf. Suarez, *Leg*. ii 19.9, who takes it to mean 'suitable' ('utilem et consentaneum ipsi naturae') rather than 'consistent'.

Scotus and Biel differ from Aquinas on this point. In Aquinas' view, prudence discovers by rational inquiry that principles at this level are required by the law of nature. Even though prudence can discover such principles, the Decalogue was issued because some of them are difficult to discover, partly because of the ingrained tendency to sin. A divine command is needed to make them clear to everyone. Scotus might reasonably point out that Aquinas does not give a very clear account of how prudence discovers these principles. His disagreement about the second table of the Decalogue may rest partly on doubts about Aquinas' claims on behalf of prudence, and especially universal prudence.

379. Divine Commands and Natural Law

If Scotus is right, we cannot reach the precepts of the second table of the Decalogue by deliberation about means to the ultimate end. Greater insight into the requirements of the natural law and greater knowledge of the circumstances of human life cannot close the gap between the principles of natural law and requirements at the level of the second table.[31]

Scotus infers that the precepts of the second table are aspects of divine positive law expressing commands of God. A peaceful social life does not require a positive law prescribing private property, because we could achieve a peaceful social life by other means.[32] God specifies the natural law, not through practical knowledge of what it requires, but through a free choice of how it is to be applied.

This treatment of the moral principles of the Decalogue leaves room for dispensations.[33] Scotus agrees with Aquinas' view that the provisions of the natural law itself are indispensable. But he believes that the second table of the Decalogue goes beyond the natural law, strictly speaking, and that its precepts are dispensable. Contrary to Aquinas, Abraham's willingness to sacrifice Isaac is not justified by the natural law, but is permissible only because of a dispensation; God decides that Abraham need not obey the moral principle that we are usually required to obey. Though Abraham's intended action is murder, God does not require him to refrain from intending murder in this case. Since the specific prohibition on intending murder is not required by the natural law, but is a command of God, intending murder is wrong only because it violates a command of God. If, therefore, God commands us to commit a murder, he makes murder permissible in this case.[34] God is free to dispense from the general rules because they are the result of God's choice.

[31] Scotus' views on the natural law were among the 'rash opinions' of his that were attacked by a 'doctorum theologiae multitudo' (according to Du Plessis d'Argentré). Scotus (with Biel and Almain) is taken to claim that 'the things prohibited in the second table of the Decalogue (including lying) are not bad in their own right'. His critics maintain that all injustice against one's neighbour is immutably bad 'propter ipsam rationem connexi cum sapientia Dei et iustitia' (*Iohannis Duns Scoti temerariae opiniones*, §10, in Du Plessis, *CJNE* i. 289–90.) See Oberman, *DR* 207.

[32] 'And this is how it is perhaps in all cases of positive rights (iuribus positivis), because, granted that there is some one principle that is the foundation in establishing all these laws or rights (leges sive iura), still the positive laws do not follow necessarily without qualification from that principle; rather, they clarify (declarant) that principle or explain it (explicant) as far as it applies to certain particular cases; and these explanations are very much in accord with the universal first principle' (*3Sent.* d37 Schol. §190 = OO vii 2, 898–9 = W 280).

[33] On the difference between dispensations and exceptions see §314.

[34] 'What belongs secondarily to the law of nature is what is regularly consonant with the law of nature spoken of in the primary way. About the first [type of precept of natural law] no dispensation applies, and therefore its opposite seems to be invariably a mortal sin. About the second a dispensation applies in a case in which the opposite seems to be commonly consonant with the law of nature' (*4Sent.* d33 q1 = OO ix 706 §7 = W 294).

Biel is less permissive than Scotus. He argues that though God could dispense from the precepts of the second table, God chooses not to dispense from them, because their consonance with natural law makes them so close to it.[35] Though Biel does not allow actual dispensations, he agrees with Scotus that God is free to dispense from these precepts, because God is sovereign over them.[36]

This affirmation of God's power of dispensation differs from Aquinas' appeal to God's insight into the requirements of the natural law. Aquinas denies that the natural law is dispensable. Since it prescribes what suits human nature, God cannot want to violate it or to permit others to violate it. He can, however, act on his understanding of why the natural law requires Abraham to be ready to sacrifice Isaac. In Scotus' view, God is not bound by any requirement of the natural law. Since he imposed the prohibition on murder, he is also free to dispense from it.

380. Natural Law and the Will of God

The objections to Aquinas that we have considered so far do not rely on voluntarism. Even if we agreed with Aquinas' conception of the will, we might share Scotus' doubts about the derivation of specific precepts from the higher principles of natural law. These doubts arise from Aquinas' claim that if we consider 'the law of our nature', and what is naturally suitable for creatures with our nature, we can find some rational basis for accepting some specific moral and social precepts over others.

In appealing to natural law as the source of such precepts, Aquinas maintains the demand for external reasons that we have found to be central in his conception of freedom. If we appeal to natural law, we appeal to some reason that rests on what we are and what is suitable for us. This reason is external to what particular rational agents want, and so we exercise freedom in examining our desires in relation to this external reason. Aquinas' intellectualist conception of freedom imposes conditions that he seeks to satisfy through his conception of practical reason and natural law.

If we accepted this intellectualist conception of freedom, and rejected Aquinas' optimism about deriving precepts from the higher principles of natural law, we would have to recognize that our freedom is limited at this level, or else we would have to find some rational standard distinct from our nature. To recognize that some appeal to something other than our nature must enter at this stage, however, is compatible with accepting the rest of Aquinas' conception of the will.

But a voluntarist must reject Aquinas' account of the relation of God's will to the natural law. If we suppose that God creates the world, defines the natural law, and speaks through the prophets and the Scriptures, because God recognizes that this is best, we seem to deprive God of freewill, as the voluntarist understands it. Some of the reasons for this voluntarist

[35] 'Though God as legislator could, without qualification, dispense by relaxation of the precept, in relation to the observance of the precepts of the second table, still God does not dispense in this way in fact, because of their great closeness to the law of nature properly so called' (*3Sent.* d37 a2 concl. 5 = W&H 637 N 1–5).

[36] Among later Scotists Poncius, *PMSCI 366*, affirms the possibility and the actuality of dispensations. He argues that Abraham and so on really violated the natural law.

objection apply to God in the same way as they apply to human wills; just as we are free not to observe the natural law even if practical reason prescribes it to us, God must also be free not to observe it.

Other reasons for the voluntarist objection apply particularly to God. God differs from a human agent in being omnipotent. Intellectualists and voluntarists agree about this, but they do not agree on the relevant conditions for omnipotence. From a voluntarist point of view, an intellectualist conception of God's will limits God's power. If God responds to external reasons in the same way as we do, their influence on God seems to limit divine power. The doctrine of divine omnipotence seems to support a voluntarist account of the freedom of the divine will.

381. God's Justice

Some of Scotus' disagreements with Aquinas' views on practical reason are closely connected with these voluntarist claims about God. If he agreed with Aquinas about the derivation of practical precepts, while still maintaining voluntarism, the results would be unwelcome. The principles of the natural law, according to Aquinas, support the precepts of justice, because they show that the precepts of justice are best all things considered; but, according to the voluntarist, God is free to reject what is best all things considered; hence God is free to violate the precepts of justice. Since it is possible for God to do what he is free to do, it is possible for God to violate the precepts of justice.

Scotus rejects this conclusion; for he agrees with Anselm's claim that only what God wills is just and what God does not will is not just (*4Sent.* d46 q1 §8 = OO x 252 §8 = W 246). Anselm does not affirm a voluntarist interpretation of this claim. On the contrary, he argues that since God is just, and it is just to give both the good and the bad what they deserve, God must give both the good and the bad what they deserve. Similarly, he argues that God's justice must give rise to mercy because that is just.[37] Scotus agrees that Anselm's claim about God's necessarily willing what is just expresses a necessary truth about God's will.

If Anselm is right, and Aquinas is right about the natural basis of precepts of justice, God is not free to violate the precepts of justice. A voluntarist, however, cannot accept Aquinas' explanation of how God necessarily wills what is just. Aquinas makes knowledge of justice part of God's nature, so that from the voluntarist point of view, God is not free, since the choice of moral principles is not left entirely to God's will.

Scotus, therefore, interprets Anselm's claim so that it fits voluntarism. He treats justice as the result of God's choice, undetermined by any knowledge of what is best.[38] Just as the

[37] Anselm, *Proslogion* 11: 'For the one who rewards the merits of both the good and the bad is more just than the one who rewards the merits of the good alone. It is just, therefore, in relation to (secundum) you, just and benevolent God, both when you punish and when you spare.... For only what you will is just, and what you do not will is not just. In this way therefore your mercy arises from your justice, because it is just for you to be good in such a way that you are good in sparing.'

[38] 'The divine will is not inclined determinately through anything within itself towards any secondary object in such a way that it would be inconsistent for it to incline to the opposite object to that one, because just as the divine will can will the opposite without contradiction, so it can will it justly; otherwise it could without qualification will something and not will it justly, which is inappropriate' (*4Sent.* d46 q1 §8 = OO x 252 §8 = W 246).

legal is defined by the decision of the legislator, the just is defined by the decision of God the legislator. This is why God cannot act unjustly and cannot instruct us to violate justice.[39]

God's relation to justice is different, therefore, from the relation of a human will to justice. Scotus believes (in some of his comments, at least) that we have freewill because we are capable of rejecting the affection for justice. God, however, is incapable of rejecting it; his freedom consists in following the affection for justice. Scotus sometimes implies that this is true of human wills as well, though he cannot easily reconcile this claim with his voluntarism.[40] But he affirms unequivocally that the divine will is necessarily just. In the divine will, however, adherence to the affection for justice does not constrain the content of the willing as it does in a human will; for Scotus believes that whatever God freely wills is just in so far as God wills it. A human will guided by an affection for justice is guided by impartial rational standards, but God acts justly whatever standard God follows or violates.

These claims about divine and human justice form a consistent position. A human will follows justice by following an impartial rational standard because that is the standard that God has chosen to follow. But since God's choice establishes impartial rationality as the standard of justice, God's own will cannot be related to it in the same way as a human will.

We may find it difficult to reconcile this account of justice with our belief that justice essentially has some more definite content. According to Scotus, if God had chosen to treat human beings completely capriciously, without reference to their merits, their desert, or their nature, that treatment would have been just. Our belief that treatment in accordance with one's nature is just reflects our knowledge of the secondary principle of justice that rests on God's undetermined choice. God retains the power to alter secondary principles and to replace them with others that would be equally just (*1Sent.* d44 q1 sch. = OO v 2, 1368–9 §§1–2 = W 256).[41] Our beliefs about the content of justice do not tell us what justice requires in all possible worlds; they tell us only about the situation that is maintained by God's 'directed' (or 'ordered', ordinata) power, not about the situations that are possible within God's unqualified (absoluta) power.[42]

If we supposed that it would be unjust for God to treat us in ways that conflict with our nature, we would be assuming that God has a duty (debitum) towards us. But Scotus denies that God has any duties towards us. Since God does not owe (debere) us anything, God cannot violate any duty.[43] The fact that God treats us in accordance with our nature is an expression of God's generosity, but it does not fulfil God's duty of justice, since God has no such duty.[44] God is not bound to do anything except to love his own goodness. Treatment in accordance with one's nature is recognized as just by the creature; but God makes it just

[39] This issue returns in Shaftesbury's criticism of voluntarism. See *Sens. Comm.* 3.4 = *Char.* i 123 = 57 K.

[40] See §364.

[41] 'If, before the act of divine will, the divine understanding could have such knowledge, it would have it purely naturally and necessarily, because all knowledge that precedes the act of will is purely natural, and through its essence, as is the purely natural character (ratio) of understanding. Of necessity therefore it would know that this is to be done, and then the <divine> will, to which <the understanding> presents it, could not fail to will it, because in that case it could fail to be correct, because a will that can disagree with practical reason can fail to be correct' (*1Sent.* d38 q1 schol §2 = OO v 2, 1286) The text at V vi 305 is slightly different.

[42] On potentia ordinata v. absoluta see §396.

[43] On debitum and obligatio in Aquinas see §303.

[44] 'He owes something to creatures out of his generosity, to share among them what their nature demands; for this demand in them is taken as something just, as a sort of secondary object of that [primary] justice. Still in truth nothing is both determinately just and outside God, except in a qualified way, namely with this modification, as far as a creature is

out of generosity, having chosen to treat creatures in accordance with their nature. It was God's free choice, independent of any antecedent requirements of justice, to create us and to treat us in accordance with our nature. If God had chosen differently, God would have been no less good and no less just; for what counts as just is the result of God's choice.

Scotus, therefore, rejects Aquinas' views about practical reason and natural law. If practical reason were able to derive specific precepts of justice from natural law, the content of justice would be fixed (to this extent) by natural reason, and if God chose to follow different precepts, God would choose to violate justice, contrary to Anselm's principle. Scotus denies that practical reason can find precepts of justice, because he denies that we can argue from the higher principles to specific precepts. The content of precepts of justice depends on the free choice of God.

We can now understand the connexion between Scotus' voluntarism and his doubts about practical reason. While he could have maintained a consistent voluntarist position together with Aquinas' views on practical reason, such a view would have required him to maintain that it is possible for God to violate justice. To maintain a version of voluntarism that denies this possibility, he needs to limit the scope of prudence.

382. Consonance with Natural Law

Has Scotus reached a satisfactory conclusion about the ways in which God's commands determine the content of precepts of justice? In his view, secondary principles, including the precepts of justice, are not required by the higher principles of natural law. Hence he claims that the precepts of the second table of the Decalogue are not necessarily connected with the final good.[45] What does he mean?

We might take him to mean that the natural law never requires (for instance) truthfulness rather than lying, so that, even if all the circumstances of a given action are taken into account, lying is never contrary to the higher precept requiring love of God and one's neighbour. On this view, both truthfulness and lying are equally consistent with natural law, just as driving on the right and on the left are equally consistent with it. It is up to God to decide whether truthfulness is to be prescribed as a general rule, just as it is up to a legislator to decide on the rule of the road. Equally, it is up to God to dispense from that general rule in particular cases, just as a legislator might choose to allow some vehicles (such as bicycles or trams) to travel on the opposite side to other vehicles.

But this interpretation does not fit Scotus' claim that some specific secondary principles are 'highly consonant' with the primary principles of natural law. In saying that some rules are highly consonant with natural law, he seems to mean that their observance promotes

concerned. What is just without qualification is only what is related to the primary justice, because, that is to say, it has actually been willed by the divine will' (*4Sent* d46 q1 = OO x 253 §12 = W 252–4).

[45] 'The reasons (rationes) of the things that are prescribed or prohibited there are not unqualifiedly necessary practical principles or unqualifiedly necessary conclusions. For in the things prescribed there is no goodness necessary towards the goodness of the ultimate end, turning us towards the ultimate end, nor in the things prohibited is there badness necessarily turning us away from the ultimate end. Rather, if that good thing were not prescribed, the ultimate end could be loved and achieved, and if that bad thing were not prohibited, the acquiring of the ultimate good would be compatible with (staret cum) it' (*3Sent*. d37 q1 = OO vii 2, 898 §5 = W 276).

its aims better than other action would. Hence the prohibitions of lying and stealing are not simply consistent with natural law, but very much in accord with it (*3Sent*. d37 = OO vii2, 899 §8 = W 280). The requirements of the natural law show that truthfulness rather than lying is generally, though not always, more in accordance with it.

Scotus, therefore, concedes something to those who take the secondary principles to be independent of God's legislative will. For the fact that truthfulness is more consonant with the primary principles of natural law is not a result of God's legislation. The primary principles are not fixed by God's free choice, and their content, rather than God's choice, determines what is more or less consonant with them. Scotus sees a role for God's choice, however, in the fact that these rules should not always be observed. They are highly consonant, but not required, because sometimes we ought not to follow them. In claiming that some rules derived from the common principles of natural law should not always be observed, Scotus agrees with Aquinas (*ST* 1-2 q94 a4).[46] He infers that on the occasions when we ought not to observe the highly consonant rules, God freely dispenses us from their observance. Hence, in his view, the secondary principles are not required by natural law, but are fixed by God's choice.

But this is a puzzling conclusion. Scotus seems to argue that if a given secondary principle is not required by natural law, it depends on God's free choice and God can dispense us from observing it. But how can it be up to God to choose the secondary principles, if some courses of action are especially consonant with nature and the higher principles? Scotus concedes that even though the correct secondary principles do not follow necessarily from the higher principles, rational inquiry can discover their special consonance with the higher principles. In that case God should have practical knowledge of the secondary principles, contrary to Scotus' view. Since practical reason can establish them, God could not reject them without willing injustice.

If some secondary principles are especially consonant with the higher principles, the fact that they have exceptions may not help Scotus. He assumes that exceptions are dispensations, depending on the authoritative legislative will of God, rather than exceptions discoverable by practical reason.[47] But it is difficult to agree with him. If we can discover by practical reason that a general rule is consonant with the law of nature, we should also be able to discover by practical reason the exceptions to the general rule that are consonant with the primary aim of the rule. If natural law is necessarily connected to the human good, the principles about the human good that tell us what is usually in accord with natural law should also tell us that the usual provisions have exceptions and why these are reasonable exceptions to make. When Aristotle discusses equity, he suggests that exceptions to a generalization are to be justified by the principles underlying the generalization (Aristotle, *EN* 1137b11–24).[48]

But if Scotus were to say this, he could not claim that God exercises freedom in dispensing us from the natural law; he would have to claim that God's superior practical knowledge sees appropriate grounds for recognizing exceptions to general rules.[49] If breaking this promise

[46] See §318. [47] See §§314, §379.

[48] See also Suarez on the difference between the principle and the formulations of it, *Leg*. ii 13.6.

[49] Wolter's account of dispensations, *DSWM* 26–7, seems to explain them by appeal to God's practical knowledge; that is why 'they are something the human mind did figure out, or might have, if emotions did not blind one's reason' (26). Boler, 'Psychology' 44–56 discusses Scotus' claims about commands and dispensations in detail.

here and now is more consonant with the natural law than keeping this promise would be, God's permission to break this promise does not dispense us from the natural law; for it is based on the wise recognition that the natural law supports breaking rather than keeping this promise. If God is not free to reject natural law, God is not free to reject the rule that is more in accordance, either in general or in a particular case, with natural law. The second table of the Decalogue, then, does not consist of laws that God is free to change or to dispense us from in particular cases; it is guided by aims and principles that are independent of God's legislation.

In that case, the admission that correct precepts of justice are especially consonant with natural law creates serious difficulties for Scotus.[50] It would be easier for him to defend his claims about the role of God's free choice if he held that both monogamy and polygamy, both respect for human life and committing murder, are equally consonant with the primary principles. If he took this view, he could say that only God's legislation makes respect for human life more consonant with the natural law. He would then reconcile his views about the natural law with his claim that God is free to do anything that does not involve a contradiction and that everything God is free to do would be right and just if he were to choose to do it.[51]

Perhaps the conflicting tendencies in Scotus' claims about secondary principles can be explained by an ambiguity in his claim that observance of these principles is not necessary for achieving the final good. This claim might mean two things: (1) We can achieve the final good even if we violate these rules in every case. (2) We can achieve the final good even if we violate them in some cases. The second claim, but not the first, allows us to believe that the rules are highly consonant with natural law. The first claim, but not the second, allows us to believe that God exercises free choice in prescribing the observance of these rules and in dispensing us from it.

Since some of Scotus' claims seem to depend on the first interpretation of his claim about non-necessity and some seem to depend on the second, and since the two interpretations are incompatible, his position seems to be unstable. The claims about consonance moderate his voluntarism. But if they conflict with the voluntarist claims he accepts, they suggest that his version of voluntarism is difficult to maintain.

383. Biel on Consonance and Dispensations

Some of the difficulties in Scotus' position become clearer if we consider Biel's efforts to explain what we know in knowing that a subordinate precept is 'consonant' with natural law. Biel includes among things 'naturally known' as part of natural law both the necessary consequences of the principles and the non-necessary consequences that are 'very consonant'

[50] Contrast Wolter, *DSWM* 24, 59, 71. It is not clear that the position he ascribes to Scotus is consistent.

[51] On the second table of the Decalogue see Prentice, 'Contingent', who explains the non-necessity of the second table by arguing that these precepts are not strictly necessary in all circumstances for achieving the ultimate end. But it is difficult to see what this means. It would be relatively simple to argue that God could have placed us in circumstances where we could have done without private property. But this would only show that, given the nature of the human good, different arrangements are required in different circumstances. That does not necessarily increase divine freedom in dispensing from the requirements of the second table.

(multum consona) with the principles, and therefore form subordinate precepts. Private property, for instance, is not necessary for a political community, since people might maintain peace even if they had everything in common. But private property 'is highly consonant' with peaceful living among individuals with human weaknesses. For such people take better care of private assets than of public, and are prone to struggle for the possession of public assets (*3Sent.* d37 q1 a1 not. 2 F = 631.1–15).

If this is Biel's conception of what is consonant with the principles of natural law, consonance is more than consistency. A consonant precept also tends to promote the end prescribed by the principle. Private property is not simply one means to secure peace; it is usually the best way, though in some circumstances some other arrangement might be as good or better.

It is difficult to see how principles that are consonant with natural law in this sense are dispensable. In the usual circumstances, private property (let us suppose) advances peace better than common possession would. In those circumstances, then, the abandonment of private property would violate natural law, by frustrating the end of the precept. Similarly, the precepts against murder and theft do not seem to be dispensable in most cases. But in the circumstances where the observance of these precepts would violate the end of the relevant higher principles, we ought not to avoid murder and theft; murder or theft seems to be not only allowed but even required by natural law. It is only in the circumstances where the observance and the violation of the rule equally fulfil natural law that both observance and violation of the rule might reasonably be permitted. But in such circumstances we do not seem to need anyone's permission; we only need the reasonable belief that both actions are permissible.

Given Biel's conception of the subordinate principles as highly consonant with the higher principles, it is reasonable for him to understand dispensations more narrowly than Scotus understands them. The only two types of dispensation that he allows are the revocation of a law and its clarification (631 G 1–4) He rejects dispensations that would give permission to violate a precept without revoking it. This last kind of dispensation is the kind that Scotus and Ockham seem to allow; hence Biel does not seem to agree with them about what dispensations are possible.

Even within the range of dispensations that he allows Biel is quite restrictive. He argues that the precepts of the second table are not part of natural law in a strict sense, but only in a broad sense (636–7, M 1–21). They do not follow necessarily, or from the meaning of the terms, or from the principles that strictly belong to natural law, but are said to belong to natural law because of their consonance with the higher principles (637 M 17–21). Biel claims that these principles are dispensable, in the sense that God could dispense us from their observance; he mentions Abraham's willingness to kill Isaac and Hosea's marrying a prostitute as examples to prove that God has the relevant power. None the less, he argues, these precepts are not in fact subject to dispensation, because God does not exercise his power to dispense from them. God refrains from actual dispensation because these principles are consonant with the strict law of nature (637 N 1–4).

This is a puzzling conclusion. It would be intelligible if Biel were to deny that God dispenses from these precepts in the sense that Biel mentions and sets aside—giving permission to

violate them, while leaving them standing. It is also reasonable for him to reject dispensations in the first sense he allows, by revoking the precept altogether. But it is more difficult to see why he rejects dispensations of the sort that clarify the import of the law and the intention of the legislator. The general consonance of the precept with natural law does not seem a good reason for refusing to point out that in these circumstances observance of the precept does not promote the end of the higher precept. In such cases, we might suppose, we are not simply allowed, but even required, to point out that observance of the precept does not promote the end of a higher precept. Perhaps Biel has a more indirect argument in mind, claiming that because of the general benefit of following a rule we ought not to weaken respect for it by violating it even on the occasions when violation would have better results. But he offers no such argument for rejecting dispensations.

Biel's reflexions on dispensations are instructive. He agrees with Scotus and Ockham in allowing possible dispensations from precepts that belong to natural law only by being consonant with its higher principles. But he finds their arguments for actual dispensations unsatisfactory, and so confines himself to claims about possible dispensation. He is also dissatisfied with their account of a dispensation, and rejects the possibility of dispensations that give permission to violate a precept that one recognizes as correct. But after he has narrowed his conception of dispensation, it becomes difficult to see why he rejects actual dispensation.

384. The Extent of God's Freedom

Some of the difficulties that Scotus raises are clearer if we distinguish different things that might or might not be subject to the will of God. Three claims deserve to be considered: (1) Avoiding murder and theft is usually, though not always, good for creatures with our nature. (2) Avoiding murder and theft is usually, though not always, in accordance with natural law. (3) It is usually, though not always, right, to follow the natural law. Different types of voluntarism result from giving God power over the truth or falsity of these three claims.[52]

Scotus does not take God to have power over the first claim. He does not suggest that God's free choice determines what is good for creatures with our nature. When God decided to create two things, no further choice was needed to make more than one thing; God could not both have created two things and refrained from creating more than one thing. This limitation follows from God's lack of freedom to make contradictions true. Similarly, then, although it was God's choice to create human beings, no further choice was needed about what would be good for them. In creating beings with human nature, God created creatures for whom specific things are good.

If God were free in relation to these sorts of choices, Scotus would have to choose between some unappealing explanations of God's freedom. Could there be, without contradiction, creatures with the same nature but different goods? Or could there be, without contradiction,

[52] Cf. Wolter, *DSWM* 23–5.

the same creatures with different natures? Or, even if these things are self-contradictory, could God none the less have made them true? Scotus does not seem to be tempted to answer Yes to any of these questions. If he were tempted in any of these directions, he would face serious difficulties about goods, natures, and species, or about the extent of God's power.

If Scotus claims that God's will determines whether the natural law accords with what is good for creatures with our nature, he affirms that the natural law might not have been connected with our good. This claim would be difficult to accept; what would be natural about natural law if it were not connected with what is good for creatures with our nature? Scotus seems to believe that the rules derived from natural law depend on what is good for creatures with our nature. We consider our good in asking which rules are highly consonant with natural law, and the answer to this question depends on practical reason, not on the divine will.

Apparently, then, the most plausible way for Scotus to affirm divine freedom is to maintain that, though natural law makes peace rather than war good for human beings, God is free to violate natural law. Though God cannot (in the sense explained) change natural law, God can, on this view, violate it by ordering us to lie, cheat, steal, and so on indiscriminately. But Scotus rejects this view; he affirms that whatever God wills is just, and therefore in accordance with the natural law, even if it is not in accord with the usual provisions of the natural law.

Scotus does not claim that God is free to change the usual provisions of the natural law, but that God is free to dispense us from them. Hence he allows a necessary connexion, not subject to God's will, between the requirements of the human good and the usual provisions of natural law, but he denies that this necessary connexion eliminates God's power over the natural law. This solution faces the difficulties about consonance that we have noticed.

The same difficulties cast doubt on Scotus' explanation of the view that necessarily whatever God wills is just. In the actual world justice accords with our nature. But the precepts of justice depend on God's will. Hence there is a possible world in which God chooses to treat us in ways that violate our nature, and chooses to command us to treat one another in such ways. In this possible world, such violations of our nature are just, since whatever God wills is just. Moreover, in this possible world, people who understand human nature and justice know what treatment accords with human nature, but do not believe that this treatment is just.

This combination of views is open to doubt. Our knowledge that justice requires treating people in accordance with what is naturally appropriate seems to be similar to our knowledge that temperance requires the proper control of desires for physical pleasure, and that bravery requires the proper control of fear. Scotus does not suggest that God could decide that temperance requires unrestrained indulgence, bravery requires unrestrained fear, friendship requires indifference to the interests of others, and so on. He might say that these suggestions would be self-contradictory, and that God cannot make self-contradictions true. But his claim about justice seems no less self-contradictory than these claims about the other virtues would be.

Scotus might answer this objection by claiming that he is not speaking of justice as simply one virtue among others, but using 'just' to refer to rightness in general. This answer does not seem to fit everything he says; for when he begins the discussion of divine justice, he refers to the Aristotelian virtue. But when he says that whatever God wills is just, he may identify justice with rightness (rectum) generally. He seems to distinguish this sort of justice from the type of justice that prescribes treatment appropriate to the subject.[53] Perhaps he means that if God exercised unqualified power differently, God would act rightly in prescribing intemperance rather than temperance and in prescribing injustice rather than justice.

The difficulty that Scotus faces here results from his voluntarist conception of God's omnipotence, combined with the ethical demand for God to act justly. To make his position consistent, he has to interpret justice as simply the product of God's exercise of unqualified power in preferring one type of requirement over another. But normally he believes that the natural law imposes certain restrictions on the content of acceptable precepts; this is why only some precepts are consonant with natural law. Since these are the precepts that God commands us to observe, the right principles have some content that is not simply the product of God's choice. But once we make this clear, Scotus' claims about God's freedom in relation to the precepts of justice are difficult to accept.

385. God's Promises and God's Generosity

Scotus argues that God's freedom in relation to precepts of justice does not make God arbitrary or capricious; God's goodwill is reliable even though it is not necessary. God's generosity explains how God reliably benefits us even though God is free not to benefit us. When God created us, God freely undertook to follow natural law, which seems to express the same impartial norms as those that appeal to our affection for justice. God undertakes this by making a promise like the promise to Noah (*Gen.* 9:12–17).

But how can we rely on God's undertaking, unless God accepts the principles of right and justice underlying the keeping of promises? But if God already accepts these, must they not already have guided God in creation? If God reliably accepts them, God reliably follows the affection for justice. But it is not necessary that God follows the affection for justice, since God is free; hence God's preference for the affection for justice must result from God's free choice. A choice in favour of the precepts of justice does not seem any less arbitrary if it is supported by a promise.[54] We might suppose that, in Scotus' view, God is necessarily guided by an affection for justice, since it is necessary that whatever he wills is just. But this necessary truth, if understood to fit Scotus' voluntarism, does not commit God to any

[53] 'The claim that <the divine will> cannot sometimes act against the second <sort of justice> does not seem defensible (probabile) because whatever does not include a contradiction is something that <the divine will> is capable without qualification of doing, and thus of willing. But it cannot will anything that it could not will correctly (recte) because God's will is the primary rule; and so whatever does not include a contradiction God can be understood to will. And so since this secondary justice determines to something whose opposite does not include a contradiction, God can will and will rightly, and act against this secondary justice' (*4Sent.* d46 q1 = OO x 241 §6 = W 244).

[54] A similar question arises for Hobbesian people making a covenant in the state of nature. Cudworth raises this question, supposing that Hobbes faces the difficulties faced by theological voluntarism. See Cudworth, *EIM* i 1.4 = H13.

definite content for justice; in particular, it does not commit him to the aspect of justice that requires the keeping of promises. The objection that God's promises are unreliable still seems to be unanswered.

Biel also combines voluntarism about the will of God with claims about God's generosity and mercy.[55] In justifying us God does not owe us anything. God's treatment of us manifests divine mercy (misericordia), expressing God's indescribable righteousness (ineffabilis iustitia), and not responding to our goodness. Biel relies on the Christian doctrine that God does not justify us because God sees that we are good,[56] but seems to draw the unwarranted conclusion that God does not justify us because God sees that it is the best thing to do.

Truths about divine mercy and generosity do not seem to support voluntarism. Generous people do more, for the right reasons, than justice demands, or they demand less, for the right reasons, than justice allows them to demand. But if they act for the right reasons, they are not indifferent to justice.[57] If, for instance, A threatens harm to an innocent victim B, it is not generous of C to refrain from harming A, if harming A is the only way to prevent harm to B; and if A wants to buy C's gun to harm B, it is not generous of C to give A the gun as a free gift. If we were to call C generous in these cases, we would normally say it was 'misplaced' generosity, to separate it from the virtue of generosity.

If, then, Scotus believes that God is not bound by obligations of justice, but acts out of generosity, he should not ascribe to God a motive independent of justice. He should show that God acts on principles that do even more for us than can be demanded by justice, but in harmony with, and not contrary to, the aims of justice. If, then, God is necessarily generous, God is necessarily guided by the aims of justice. But being necessarily generous seems no less incompatible with divine freedom (as a voluntarist conceives it) than being necessarily just would be. Hence God cannot be necessarily generous, if God is free.

According to Christian doctrine, some of God's actions towards human beings are not owed to them in strict justice, but express God's readiness to do more for us than God could be expected to do in strict justice. But God's willingness to go beyond strict requirements does not mean that God is not guided by what is best all things considered; on the contrary, if an intellectualist is right, God sees that the generous treatment of human beings is better than the merely just treatment of them, and God sees that this generous treatment does not violate the aims of justice, but fulfils them. Attempts to support voluntarism through appeals to the Christian doctrine of divine mercy do not seem to succeed. They do not seem to remove the doubts that Scotus' voluntarism raises about divine goodness. We do not make the voluntarist account of divine freedom any more intelligible by trying to connect it with generosity; it is no more appropriate for generosity than for any other virtue.

[55] 'For neither is it because something is good or just that God wills it, but it is because God wills it that it is thereby good and just. For the divine will does not depend on our goodness, but our goodness depends on the divine will, and nothing is good except because God has accepted it as such' (Biel, *Can. Miss. Exp.*, Lect. 23E [= O&C i 212]). See Oberman, *HMT* 96–7. For Luther's view see §411.

[56] On justification see §351. [57] Cf. Aquinas, *ST* 2-2 q117 a5.

27

OCKHAM

386. Approaches to Ockham

Ockham has become notorious for holding views that, from a later philosophical perspective, have appeared to undermine the Aristotelian outlook that is expounded by Aquinas.[1] This is true in ethics as in other areas of philosophy. Such an approach to Ockham is open to question. Ockham does not affirm the radical consequences that other people draw from him. Moreover, it is not obvious that Aquinas always presents the best account or defence of Aristotle; his opponents may intend to offer a better defence of Aristotle rather than abandon an Aristotelian outlook. It is not always easy to decide what Aristotle means, or how to give Aristotelian answers to questions that arise for his theory. Scotus and Ockham disagree with Aquinas' answers to these questions, but they often believe that Aquinas is wrong about Aristotle as well as about the truth.

Still, it may be reasonable to examine aspects of Scotus or Ockham that suggest more extreme conclusions than they draw. Some aspects of their position may commit them to more than they recognize, and on this point later philosophy may sometimes be a good guide to the interpretation of earlier philosophers. We have illustrated this point in Scotus, especially on freedom and on the natural law. His claims about freedom, the will, and the affection for justice express both a more intellectualist tendency (identifying freedom with the rational affection for justice) and a more voluntarist tendency (identifying freedom with the undetermined capacity to choose either advantage or justice). Similarly, he treats God as partly sovereign over the natural law, but denies that God alters the natural law randomly or arbitrarily; hence he claims that the precepts of the second table of the Decalogue are 'highly consonant' with the natural law, though not required by it. On these and related points, Ockham develops a more strongly voluntarist position; it is useful to see how he answers some questions that Scotus appears to leave unsettled.

Ockham believes he rejects the insufficiently Aristotelian elements in Aquinas and others. He believes, for instance, that Aristotle's rejection of Platonic Forms supports the metaphysical priority of the particular, and that the views of Aquinas and Scotus on universals concede too much to an un-Aristotelian Platonic realism.[2] In moral philosophy

[1] See Freddoso in Ockham, *QQ* i, pp. xix–xxi. [2] See Freddoso in *QQ* p. xx; Adams, *WO*, ch. 2.

Ockham agrees with Scotus' view that Aquinas' intellectualism and eudaemonism conflict with the freedom and contingency of human action. Since Aristotle insists on these features of human action, a plausible defence of Aristotle should, in Ockham's view, reject Aquinas' position. Similarly, Ockham gives Aristotelian reasons for rejecting Aquinas' claims about virtue, practical reason, and prudence.

387. How to Reject Happiness

Ockham rejects eudaemonism, because he agrees with Scotus in believing that we do not necessarily will happiness. Some of his arguments appeal to experience; they might persuade us without reference to any controversial doctrine about freewill. He argues, for instance, that in some circumstances we might believe we cannot achieve happiness, and therefore might cease to will to be happy. Similarly, if we will not to exist, we thereby also will not to be happy.[3] Since it is possible in these ways not to will happiness, we do not necessarily will happiness.[4]

The eudaemonist position would be open to this objection if it claimed that we always will happiness in a sense of 'will' that implies we always believe happiness is possible for us. In this sense I do not will to lift a sack that I believe weighs a ton, though I might wish I could lift it. But this is not the sense of 'will' that is relevant to the eudaemonist thesis. As Aristotle says, we can wish (*boulesthai*; 'velle' in the Latin version) even for things that we believe to be impossible and for things that are not up to us (*EN* 1111b20–30), and this is the attitude that, according to the eudaemonist, we take towards happiness as an end.

This attitude to happiness does not imply that our desire for it is empty, or practically irrelevant. We might wish we could be invulnerable to disease or immortal, but our wish might make no difference, since there is nothing we can reasonably do about it. We can, however, act in ways that bring us closer to happiness, even if we cannot ensure our happiness. That is why our pursuit of happiness guides our actions even when we think happiness is not open to us; for even in these cases we try to get closer to happiness. This defence answers Ockham's first example.

A similar defence answers his second example, of willing our own non-existence. If, for instance, I choose to suffer death rather than betray people who count on me, I recognize that I would be worse off as a traitor than I would be if I were dead. The suggestion that I would be better off dead is initially paradoxical, but not unintelligible; it implies that I would be so much worse off if I remained alive as a coward that I ought to prefer non-existence to such a life.[5]

These ways of dealing with Ockham's alleged counter-examples will not convince anyone who does not find eudaemonism plausible in other respects. But if we are convinced by

[3] 'I say first that the will . . . can reject (nolle) the ultimate end whether it is shown in general or in particular. . . . What the intellect can dictate is to be rejected can be rejected. This is evident in itself. But the intellect can believe that there is no ultimate end or happiness, and consequently can dictate that the ultimate end or happiness is to be rejected. Secondly, whoever can will the antecedent can will a consequent that he believes to be a consequent. But one can will not to exist, therefore he can reject existence, therefore he can reject the happiness that he believes to follow on his existing' (*4Sent.* q16 = OT vii 350.5–14).

[4] On rejection of happiness cf. Adams, 'Will' 257–62; Heinaman, 'Rationality'.

[5] Cf. Plato, *La.* 195c7–d3.

the theoretical reasons for accepting Aquinas' version of eudaemonism, we need not be dissuaded by these objections.

388. Does Eudaemonism Exclude Freedom?

Ockham also argues against eudaemonism on the ground that the will is a free capacity and can therefore receive two contrary actualities (*4Sent.* q16 = OT vii 350.17). If the will is free, then, in Ockham's view, it must be free to refuse happiness; hence we cannot will the ultimate end naturally, unless 'naturally' means simply that we most commonly do it (*1Sent.* d1 q6 = OT i 507.9–16). If the will is free, it can refuse happiness, both in general and in particular, because otherwise it would lose the indifference needed for freedom (*1Sent.* d1 q6 = OT i 501–2; *4Sent.* q16 = OT vii 350–3).[6]

Aquinas maintains that the will is not free in relation to the pursuit of the ultimate end, but is free in relation to the pursuit of subordinate ends, because it has the capacity for contrary actualities in relation to these ends. Ockham rejects this defence of freedom because he rejects Aquinas' account of how the will is free in relation to subordinate ends. From Ockham's point of view, Aquinas' position implies that the choice of the will is determined by the judgment of intellect about means to the final good. If this determination does not ensure freewill, Aquinas does not allow us freedom.

Even if Aquinas showed that the will is in some way indifferent in relation to means, he would not meet Ockham's conditions for indifference. We recognize freedom and contingency, in Ockham's view, if we regard human beings as being in control of (or 'masters of', domini) their actions.[7] Control and power over one's actions comes from freewill,[8] which involves indifference and contingency.[9] Hence it requires metaphysical indeterminism.[10] Admitted facts about freedom require us to have powers that are indeterministically actualized; no past conditions determine the actualization of these powers in one way or the other.

Ockham, therefore, demands more than Aquinas' conditions for contingency and freedom. Though Aquinas agrees that control requires contingency, he does not interpret contingency in Ockham's strict sense, which assumes Scotus' conception of a rational capacity. Scotus argues that the will is free to choose either of two opposite courses of action, and that therefore nothing outside the will determines our choice; hence the greater apparent good does not determine the will. Ockham follows Scotus on this point.

This claim about freedom raises a question about Ockham's views on how we know we are free. He argues that any attempt to prove the reality of freedom must rely on some

[6] Cf. Scotus, *1Sent.* d1 q4 schol. = OO v 1, 209 §3 = d1 pars 2 q2, V ii 66–7 §§91–2.

[7] He discusses, for instance, Damascene's remark that non-rational agents are acted on as opposed to acting. On Damascene see §243n40.

[8] See Aquinas, *in Met.* ix 2 §1787: 'For only the rational part of the soul is in control (domina) of its action, and in this it differs from inanimate things'.

[9] 'Those things that have freewill have control and power over their actions; but this requires indifference and contingency' (*1Sent.* d1 q6 = OT i 502.10–15).

[10] [Freedom:] 'I can cause and not cause the same effect, there being no difference anywhere else outside that capacity' (*Quodl.* i q16 a1 = OT ix 87.12–15). [The contingent:] 'what produces a given effect, and, with nothing changed either on its own part or on the part of anything else, has it in its power equally to produce or not to produce, because from its own nature it is determined to neither' (*1Sent.* d1 q6 = OT i 501.8–11).

premiss less known, or no better known, than the conclusion, but none the less our freedom can be grasped (cognosci) evidently through experience, through the fact that a person experiences that whenever reason dictates (dictet) something, the will is still able to will or not to will or to reject it (*Quodl.* i 16 = OT ix 88.25–8).

This appeal to experience may show that we can conceive opposites and choose between them. But might we not explain this capacity through Aquinas' appeals to the role of deliberation? Aquinas does not guarantee the precise sort of contingency that Scotus and Ockham have in mind; but we might doubt whether we experience this sort of contingency in our deliberation and choice. It is not clear that experience gives us certain knowledge of undetermined choice.

389. Moderate v. Extreme Voluntarism

On these points Ockham agrees with Scotus. But he goes further than Scotus in rejecting a connexion between will and reason. Though Scotus rejects the dependence of will on intellect, he takes the will to involve a rational capacity, and hence a certain kind of rational preference. Hence he attributes to the will both an affection for advantage and an affection for justice, and he sometimes identifies the freedom of the will with the affection for justice. This identification raises difficulties. If freedom consists in acting from the affection for justice, it seems to consist in a certain kind of determination, not in the absence of determination. If, however, the will is equally free in acting on either of its main affections, it is not clear why freedom is expressed in acting on one rather than on the other.

Ockham does not follow Scotus in treating the will as essentially rational; nor does he connect freedom with the affection for justice. Instead, he emphasizes indifference, contingency, and self-determination. His claims about freedom and capacity exclude an intellectualist account of the will—both in its eudaemonist version and in Scotus' version that identifies the freedom of the will with the affection for justice. An intellectualist account implies that the will does not meet the strong conditions for a rational capacity; for it implies that the will is determined by the conception of the overall good (happiness or justice) as it appears to the intellect, and therefore by something outside itself. But—Ockham replies—in an agent with freewill, the will is self-determining; if it were not, its choices would be necessitated by something outside it. According to Ockham, Scotus' claims about the self-determining character of the will conflict with the primacy that Scotus assigns to the affection for justice. Ockham asserts the independence of the will from reason and makes reason simply the servant of the will.

According to Henry of Ghent, this is the only sense in which reason has a 'directive' function. Just as a servant directs his master by carrying a light to show him how to go where he wants to, reason directs the will, and since the will is the master, it can withdraw reason from its enlightening function when it wants to.[11] The demotion of reason to the 'guiding'

[11] 'To the fifth point, that what directs is superior to what is directed, it must be said that something can direct in two ways. First, by authority, as a master directs a servant. He is superior. In this way the will directs the intellect. Second, by providing a service, as a servant directs a master, by holding a lamp before him at night, so that the master does not

role of a servant expresses the difference between Scotus and Ockham, on the one hand, and Aquinas, on the other. The difference is obscured by Scotus' claims about the affection for justice, but it is clear once Ockham discards these claims.

This demotion of reason fits the voluntarist attempt to explain how action on the will differs from action on the passions. Whereas external or internal stimuli determine the passions, nothing determines the will; even considerations presented by the intellect cannot determine it. The intellectualist position makes the will too much like the passions, by taking it to be determined by an external stimulus.

This objection to intellectualism underlies some criticisms of Aquinas' position. Tempier, for instance, condemned any belief in the necessitation of the will by the apparent good.[12] If we free the will from this sort of necessitation, we may claim to have done what Aquinas failed to do, by identifying the distinctively human form of choice and action.

390. Difficulties for Voluntarism

Once Ockham makes clear the implications of voluntarism, he also invites criticisms. Voluntarists set out to explain phenomena that they believe Aquinas' intellectualism fails to explain; but one may doubt whether they really explain these phenomena.

Freedom is supposed to provide appropriate grounds for praise and blame; hence Scotus complains that an intellectualist account makes sin non-blameworthy by reducing it to cognitive error. To see whether the voluntarist position does any better, we may consider the choice that faces the will when it gets advice from reason. Voluntarists do not allow the will to choose in the light of the apparent overall good; for if that determines it, practical reason determines it. But if it decides by something other than the overall good, does it not choose non-rationally, as we would choose on the basis of a passion? And if we conclude that it cannot decide on the basis of any considerations at all, do we not introduce a degree of randomness and irrationality that makes us wonder why we should care so much about having freewill?

Such questions raise doubts about voluntarism. It tries to capture the difference between the free and rational will and the non-rational passions. But a degree of freedom that excludes intellectualism also seems to exclude a genuinely rational will. In that case, how are praise and blame appropriate? For if the will is not necessarily moved by rational considerations, it does not seem to respond to the considerations that are mentioned in praise and blame.

This objection may seem unfair. For we might argue, on behalf of the voluntarist, that if the will is not necessarily moved by reason, but usually follows reason, it still seems fair to expect us to respond to the right considerations; claims about responsibility do not seem to

stumble. Such a director is inferior. And this is the way in which the intellect directs the will. Hence the will can withdraw the intellect from directing and understanding whenever it wills, as a master can withdraw a servant' (Henry of Ghent, *Quodl. quodl.* i q14, ad 5am f 17vb = Lottin, *PM* i 275). 'It must be said therefore without qualification that, when a good and a better thing have been proposed, the will can elect a less good thing' (q16 f21va = Lottin 277). Here Henry follows Tempier's condemnation of rationalism (prop. 163, quoted in §358). See §403.

[12] 'That the will of a human being is necessitated by his cognition, just as the desire of a non-rational animal is' (Prop. 159 in Piché, *CP* 126). Cf. Prop. 164.

need a necessary connexion. This reply does not entirely answer the objection, however. Any choice that is an appropriate basis for praise and blame should be appropriately connected to the right reasons; an arbitrary or capricious choice of the right course of action does not warrant praise, and such a choice of the wrong course does not seem to justify the blame that would apply to a non-arbitrary choice. According to the intellectualist, non-arbitrary choice of the right or wrong action is determined by the right or wrong reasons. What can the voluntarist say? If recognition of the right reasons leaves us no less free to choose the wrong action, and we are no more determined by the right reasons when we choose correctly than when we choose arbitrarily, how does correct choice differ from arbitrary choice of the right action?

Godfrey of Fontaines supports this objection by arguing that 'one is less able to maintain freewill by claiming that the will moves itself immediately than by claiming that it is moved by an object'.[13] Since voluntarism makes all choices equally undetermined by considerations adduced by reason, it cannot draw the appropriate distinction between deliberate and impulsive ('sudden') actions, and cannot explain why the distinction matters.[14] We would normally say that deliberate actions are caused by deliberation, and respond to the reasons presented in deliberation, whereas impulsive actions are not determined by consideration of the comparative weight of reasons on each side. Voluntarists, however, cannot draw the distinction in this way, and cannot say how the good will responds to the right considerations; for, in their view, all free actions are equally undetermined by the considerations revealed by deliberation.

If this is a fair objection to voluntarism, Aquinas' position may seem more attractive. His intellectualism would restrict our freedom to an unwelcome degree if he did not allow such a wide scope for deliberation and rational comparison of alternatives.[15] If, for instance, we necessarily pursued not only some conception of an ultimate end, but a rather precisely specified ultimate end, then some important choices that we take to be in our control would not be in our control and we would be less free than we think we are. Aquinas, however, is not open to this objection; in his view, we are free to pursue or to reject specific conceptions of an ultimate end, and our deliberation determines the specific ends we pursue. His intellectualism is more plausible given the wide scope that he attributes to deliberation.

Aquinas, then, has a reasonable reply to voluntarism. He argues that freewill consists in the operation of the will that results in free election, and that we are capable of free election.

[13] Godfrey of Fontaines, *Quodl.* xv q4b 26. Korolec, *CHLMP* 637, mentions other opponents of voluntarism.

[14] 'The third reason is of this sort: The position that cannot preserve the freewill in the second act more than in the first, and <cannot preserve it> in a deliberate act more than in a sudden one, is less able to preserve freewill than a position that can do this. But that position that proposes that a human being has freewill precisely because the will is in no case moved by anything else, but moves itself immediately, cannot preserve freewill in the first act any more than in the second, or in a deliberate act any more than in a sudden one; for in all cases without distinction the will moves itself. But that other position, which proposes that a human being has no freewill except through the fact that by the mediation of the deliberation of reason a human being moves himself towards secondary objects of will, is more able to preserve mastery of one's act and freedom of the act in the second act than in the first one, and in a deliberate act more than in a sudden one. . . . And from this same point it follows, as was said above, that all acquiescence, however sudden, in things that are mortal sins in their genus would be a mortal sin' (Godfrey, *Quodl.* xiv q4b 28). A position similar to Godfrey's is defended by one of the 'Averroist' commentaries on Aristotle's *Ethics* discussed by Gauthier, 'Commentaires' 199.

[15] See §270.

If he makes the will subject to the appearance of the greater good, that does not refute his account.

391. Developments of Voluntarism

Even though the objections presented by Godfrey of Fontaines are serious, they do not necessarily require a return to intellectualism. They might suggest that a voluntarist should abandon the remaining element of intellectualism that remains in Scotus and Ockham. They separate will from passion by treating the will as a rational capacity, and they connect the rationality of the will with freedom and responsibility. Ockham rejects the connexion that Scotus sees between freewill and the affection for justice, but he still connects freedom with reason. Though he rejects intellectualism, and even abandons the elements of intellectualism in Scotus' position, he still (according to our previous distinctions) maintains rationalism rather than anti-rationalism, in so far as he distinguishes the rational will from the non-rational passions.[16] But the difficulty that Ockham faces in explaining the rationality of the will may raise doubts about his separation of will from passions.

Some of the later history of reflexions on reason and will suggests how one might separate will, freedom, and reason, and why it is difficult to separate them. Voluntarism is one element in the Kantian conception of the will. But Kant does not give up the connexion between the will and practical reason. The voluntarist aspects of his position conflict with the intellectualist aspects. He returns to Scotus' belief that the affection for justice is somehow constitutive of, not simply one possible manifestation of, the freedom of the will; and so some of the objections to Scotus seem to fit Kant as well. A thorough attempt to separate the freedom from the rationality of the will appears only in Schopenhauer and in existentialist views about radical freedom.[17]

Ockham does not accept any of the later views that abandon the essential rationality of the will and rely exclusively on self-determination. But it is relevant to compare these later views with his view. For if they are the most plausible attempts to develop the voluntarist side of Scotus and Ockham, they show how one might defend the voluntarist position.

Ockham claims to account for our intuitive knowledge of our freedom. But he seems to undermine some of our further intuitive beliefs about the will and agency. For it now becomes difficult to see why self-determination by the will should be either necessary or sufficient for rational agency. Ockham begins, as Aquinas does, by seeking to give an account of the distinctive features of rational agents who have control over their actions. But even if self-determination, as Ockham understands it, ensures control, as he understands it, it does not seem to ensure rational agency. If a voluntarist tries to answer this objection by adding some further condition satisfied by rational agents, we may wonder whether the 'further' condition does not capture rational agency by itself without any appeal to self-determination by the will.

This doubt about voluntarism might suggest an anti-rationalist solution. Voluntarist arguments may convince us that an intellectualist conception makes the will no more

[16] On intellectualism v. rationalism see §256.

[17] See Schopenhauer, *EFW* 41. On existentialism, see Olafson, *PP*, chs. 1–2.

free than the passions, since it implies that both are externally determined. Intellectualist arguments may convince us that a voluntarist conception of the will also blurs the distinction between will and passion, since it does not make will essentially rational. We might respond by rejecting the division between will and passion. If the mere fact that an action is self-determined (according to the voluntarist conception) does not make it morally more significant, we may infer that the contrast between the will and the non-rational impulses is not morally significant either. Hence we might as well say that the will is a sort of passion, or that reason is the servant of the passions no less than of the will.

This is the anti-rationalist ('sentimentalist') conclusion of Hobbes and Hume. In their view, freedom consists simply in internal determination; they see no relevant distinction between the will and the 'sentiments' or 'passions' as sources of the internal determination. They reject both an indeterminist and an intellectualist account of freedom.[18] Though they accept the voluntarist criticisms of intellectualism far enough to believe that determination by intellect is not freedom, they do not regard voluntarism as an adequate alternative. Against both intellectualists and voluntarists, they conclude that the will is a passion.

Hence Hume's sentimentalist maxim (in which he follows Locke and Hobbes) that 'reason is and ought to be the slave of the passions' is an intelligible outcome of Henry of Ghent's claim that reason is the servant of the will. Voluntarism opposes sentimentalism in asserting a sharp distinction between the passions and the will; but the voluntarist claim about the subordination of reason might well appear more plausible than the voluntarist account of the difference between the will and the passions. Hume's sentimentalist conception of the will and practical reason is therefore an indirect result of voluntarist criticism of Aquinas.[19] But it is not clear that arguments for voluntarism and sentimentalism justify the rejection of Aquinas' view.

392. Virtue and Passion

Ockham not only believes that Aquinas gives an inadequate account of the freedom of the will, but he also believes that the free will should have a more prominent part than Aquinas allows it in an account of the moral virtues. He supports Scotus' objections to the role that Aquinas assigns to the passions. He rejects Aquinas' view that virtue must belong to the sensory part because the sensory part has to be perfected (*3Sent.* q11 = OT vi 352). He agrees with Scotus in placing virtue in the will (354), because only a condition of the will is properly a virtue (358). Since the will is the basis of praise and blame, it must be the subject of virtue.[20] Ockham argues that the will has to have a causal role in the formation of a virtue sufficient to justify praise and blame.[21]

[18] See Hobbes, *L*6.53; Cudworth, *F* c.5, 167H; Hutcheson, *IMS* 165–6. On Locke's hesitations about sentimentalism see E ii 21.47.

[19] Similarly, Reid's reply to Hume is a partial, though not total, return to Aquinas' position. See, e.g., *EAP* 534H.

[20] 'The only state that is properly virtue is the one whose act is the only one that is virtuous. But only the act of the will is virtuous. Proof: Only the act of will is praiseworthy or blameworthy; hence only it is virtuous; hence only the state produced from such an act is virtue. This is confirmed by the Philosopher in *Ethics* III, where he says that no act is blameworthy unless it is in our power. For no one faults a person blind by nature for being blind. But if he is blind by his own sin, then he is at fault' (*3Sent.* q11 = OT vi 366.1–9).

[21] Cf. *Quodl.* ii q16 = OT ix 182.19–25; Freppert, *BMWO* 49.

This argument shows only that the will must be one subject of virtue, and that any other subject of it must be closely enough connected to the will to make the virtue as a whole praiseworthy. But this conclusion does not conflict with the basic elements of Aquinas' position. Nor does it justify Ockham's further claim that the will is the only subject of virtue, so that the passions cannot also be a subject.

Ockham claims that his view is consistent with Aristotle. According to Ockham, Aristotle's frequent remarks that the virtues of character are in the non-rational part mean that these virtues are in the will, not that they are in the passions; the will is a 'non-rational' part because it is rational only by participation (*3Sent.* q11 = OT vi 368.14–21).[22]

But even if Aristotle treats the will as non-rational in this sense, his remarks about the role of the non-rational part of the soul in virtue do not seem to fit the will. For he explains his claim that the moral virtues are in the non-rational part by discussing the training of passions, pleasure, and pain. He refers to this aspect of the non-rational part (contrary to Ockham's view) when he takes moral virtue to be virtue of the non-rational part.

In treating the will as a subject of moral virtue, Ockham draws attention to a feature of the will that is insufficiently recognized in Aquinas' account of virtue. The arguments that Ockham and Scotus present show that Aquinas should make the will a subject of every moral virtue. But they do not undermine Aquinas' arguments for making the passions a subject of some virtues. Consideration of all these arguments should lead us to deny that each moral virtue must have just one subject. These claims of Ockham's about the importance of the will in virtue are not necessarily voluntaristic. We could accept them even if we accepted Aquinas' view that the will is determined by one's conception of the good. We have argued that Aquinas should accept these conclusions, given his conception of the will. We have no further reason, so far, to suppose that a true account of the virtues rests on a voluntarist conception of the will.

393. Correct Reason and Will

As we have understood Scotus, he holds an externalist view about the relation between the grasp of moral principles and motivation. This raises a difficulty for his claim that prudence makes an action morally good. Ockham exploits this difficulty, in his discussion of the sense in which virtue involves acting in accordance with correct reason.[23] As elsewhere, he revises Scotus' position so as to give the free will a more prominent place.

The primacy of the will implies that a morally good action cannot simply be an action conforming to correct reason. If God were to cause my will to conform to correct reason, but my will remained completely passive (voluntate nihil agente) in this process, this act would be neither virtuous nor deserving (*3Sent.* q11 = OT vi 389.18–22). Only the act of the will conforming to correct reason is primarily good or bad, because this is primarily imputable to the agent (vi 390.3–4).

To evaluate Ockham's argument, we need to see what it means for God to cause my will to conform to correct reason. God might induce purely external conformity, by causing

[22] In applying this formula to the will Ockham follows Aquinas' questionable account of *EN* i 13. See §257.

[23] See Freppert, *BMWO* 59–68.

a series of random thoughts in a 'Random Good Samaritan' to conclude with an equally random choice to take the injured stranger to the inn. This choice is not praiseworthy and does not engage the will actively. Alternatively, God might cause an 'Intellectualist Good Samaritan' to notice all the features of the injured stranger and his situation that justify helping him, so that the Samaritan's will is engaged by the greater good of helping the stranger. In the second case, an intellectualist does not admit that the Samaritan's will does nothing; the conformity of the will to right reason is not purely external, but includes a correct response. This sort of conformity to correct reason seems—to an intellectualist—to be imputable to the agent.

Ockham seems to believe that neither the Random nor the Intellectualist Good Samaritan has genuine virtue; for in neither case would the will be 'active' in the sense that is needed for imputability. In denying that the will of the Intellectualist Good Samaritan is active he relies on a voluntarist account of the conditions for activity of the will and for imputability of an action to an agent. If the will necessarily conformed to correct reason, virtuous action would not be in the power of the will, because the will would be unable to prevent action on correct reason. Since one's will does not necessarily conform to one's correct reason, correct reason itself cannot ensure virtue, but may be present in either a virtuous or a vicious agent. An agent who chooses to act for a bad end may have correct reason but freely choose to disregard it; hence correct reason is not the primary cause of virtuous action (*Q. var.* q7 a3 = OT viii 364.534–48). Virtuous action needs both actual prudence and the activity of the will (*Q. var.* q8 = OT viii 417.189–418.2).

Virtue, then, seems to consist in a choice by the will to act in accordance with the provisions of correct reason. This choice is not in accordance, or in conflict, with correct reason, but is undetermined by reason.[24] If we are virtuous, or even continent, we need not only the appropriate dictate of correct reason, but also the undetermined free choice of the will.

These views conflict with Aquinas' view about the role of prudence in virtue. He claims that universal prudence grasps the components of happiness, and thereby fixes (praestituere) the end for the moral virtues.[25] Given this conception of universal prudence, and given Aquinas' conception of the will and its relation to the good, prudence is responsible for the distinctively virtuous condition of the will. Since the will aims necessarily at the ultimate good, and since prudence discovers the constitution of this good, the will of a prudent person necessarily pursues the distinctively virtuous end that prudence has discovered. We can distinguish the cognitive contribution of prudence from the motive contribution of the will; but, given Aquinas' eudaemonism, the right direction of the will follows from the discovery of the constitution of the ultimate end. Since prudence is necessary and sufficient for virtue, the virtuous person differs cognitively from the incontinent, continent, and vicious person.

Scotus rejects this role for prudence, since he takes the will to be independent of practical reason. In his view, neither the affection for advantage nor the affection for justice determines the will; whatever we take to be the content of practical principles grasped by prudence, no will necessarily accepts them once it is aware of them. But Ockham believes that Scotus

[24] '. . . Correct reason dictates the contrary of what is desired by sensory desire. And the will from its freedom does not will what sensory desire desires, but what is dictated by correct reason . . .' (*Q. var.* q6 a10 = OT viii 272.11–13).

[25] See §320.

does not go far enough in pursuing the implications of his voluntarism.[26] Ockham agrees that prudence accords with correct reason, so that prudence is a partial efficient cause of the virtuous action. It is not the whole efficient cause, however, because virtue requires an independent act of willing in accordance with the dictates of correct reason. Since this is an act of a will that is free to reject any dictate of reason, it does not result from attention to a decisive practical consideration; for if there were such a consideration, its decisiveness would limit the freedom of the will. No consideration, therefore, moves the will reliably.

Ockham offers one answer to a difficulty that faces Aristotle's claims about the relation between prudence and virtue of character. When Aristotle claims that virtue makes the end right and prudence the means, we might take this in an anti-rationalist sense, so as to imply that correctly-oriented passions make the end right.[27] Ockham approaches this anti-rationalist interpretation, though he does not completely accept it. He takes Aristotle's references to a non-rational part to indicate the role of will, and so he infers that an act of will, independent of reason, is essential to virtue. Ockham does not deny that virtue is more reasonable than vice; in Hutcheson's terms, he grants that we have justifying reasons in favour of virtue rather than vice.[28] But he denies that these justifying reasons supply the virtuous person with decisive motivating reasons.

Ockham's development of Scotus' voluntarism about prudence and virtue results in his claim about the motivation of the virtuous person. This cannot be the general desire for the good, since that belongs to every will. It must be a choice, not determined by any further reasons, to accept the conclusions reached by correct reason. In this respect, it must be a choice beyond the scope of practical reason.

394. Separability of the Virtues

Ockham goes further than Scotus goes in rejecting Aquinas' belief in the reciprocity of the virtues and in the unity of prudence.[29] His views on prudence reflect the role that he attributes to the will in each virtue. He denies that the different virtues aim at any unified good, since he does not believe that they all aim at happiness. He has no reason, therefore, to believe that the same deliberative knowledge is required to grasp the relations and connexions of the different ends of the virtues in a single conception of happiness.

Once we admit these differences in the ends of different virtues, we have no reason to recognize prudence as a horizontally unified science of the good. Moreover, if the will is not determined by the conclusions of prudence, we lose one of Aquinas' reasons for accepting the necessary connexion of the different virtues. Since the prescriptions of prudence belonging to the different virtues belong to distinct sciences, a will assenting to the conclusions of prudence for one virtue may not assent to its conclusions for another virtue.

Ockham therefore claims that different virtues have independent desires and aims. Even if we are intemperate to some degree, we may still have the will (velle) to carry out the actions required by justice (*Q. var*. q7 a3 = OT viii 346.115–23). If, for instance, we suppose that justice requires us to aim at the common good, we can have this aim while still having

[26] See §§383–4. [27] See §89. [28] See Hutcheson, *IMS* 121. [29] On Scotus see §375.

some tendency to intemperance.[30] In such cases we are not so intemperate that we would be willing to damage the common good for the sake of our intemperate desires, but we are intemperate enough to indulge our intemperate desires when we do not seem to harm the common good.

For similar reasons, Ockham believes we can have correct reason about the subject-matter of one virtue (for instance, temperance) and not about the subject-matter of another (for instance, generosity). Hence he agrees with Scotus in rejecting the horizontal unity of prudence (*Q. var.* q6 a10 = OT viii 284.290–285.303). The virtues are connected in so far as they all accept certain universal principles such as 'everything right (honestum) is to be done', 'everything good is to be loved', and 'everything prescribed by correct reason is to be done' (*Q. var.* q7 a3 = OT viii 347.141–52). But to reach a practical conclusion from these general principles we need the different types of prudence that are acquired by experience in the different areas of the different virtues.[31] Prudence in the proper sense has to be both about particulars and acquired by experience, and so there is a different prudence for each virtue (*Q. var.* q6 a10 = OT viii 282.233–41).

This division of prudence seems to conflict with Aristotle's view that there is one prudence for many virtues (*3Sent.* q12 a4 = OT vi 406.5–10).[32] Ockham replies that there are different prudences for the principles and for the conclusions, and in fact prudence is most properly about particular things that we can do (*3Sent.* q12 = OT vi 419.17–18). Hence the horizontal unity that Aristotle attributes to prudence is a purely generic unity that allows different and independent species of prudence to belong to different virtues. In this treatment of prudence Ockham agrees with Scotus, who argues that 'different things to be done require different prudences' (*3Sent.* q36 = OO vii 2, 823 §22 = W 410), so that prudence is a genus embracing the specific prudences belonging to the different virtues.[33]

Contrary to Scotus, however, the prudence that is needed for a given virtue does not include any universal prudence, and so prudence is not vertically unified. In Ockham's view, only a loose and improper use of 'prudence' allows prudence to grasp universal principles reached through experience.[34] Prudence in the proper sense is confined to particulars (*Q. var.* q6 a10 = OT viii 282.249); it is 'immediate directive knowledge acquired only through experience with respect to something that can be done' (*Q. var.* q7 a2 = OT viii 331.20–6). It is exemplified in the knowledge that this angry person is to be pacified by gentle words (*Q. var.* q7 a2 = OT viii 331.20–6;[35] cf. q6 a10 = OT viii 281.225–282.232).

Ockham, therefore, disagrees with Scotus' view that any application of moral science to action is an exercise of prudence.[36] In his view, an exercise of prudence involves a singular

[30] Ockham takes prudence to be necessary for each virtuous action. See Freppert, *BMWO* 53.

[31] 'The <different forms of> knowledge are prudences that are directive in different virtuous actions' (*Q. var.* q7 a3 = OT viii 347.149–50).

[32] The editors of OT suggest that Ockham is referring to *EN* 1140a25–7. A more appropriate passage is 1145a1–2.

[33] Ockham concedes that when one virtue is sufficiently perfected, it inclines us towards the primary expression (actus) of another virtue (*Q. var.* q7 a3 = OT viii 347–8); he also allows that the virtues share their common principles (*3Sent.* q12 = OT vi 425–6). But he insists that each virtue requires its own prudence derived from the experience that is necessary for that virtue and unnecessary for other virtues.

[34] Cf. *Q. var.* q7 a2 = OT viii 330.1–13.

[35] Cf. *1Sent.* Prol. q11 = OT i 319.25–321.9; q12 = OT i 359.16–360.16; *Quodl.* 2 q14 a3 = OT ix 177.30–178.50. Strictly speaking, prudence is the grasp of the 'minimum universale', which the craftsman (artifex) has.

[36] Scotus, *Ord.*, Prol. 5, q1–2 = V i 227–8 §351 = Prol. q4 schol. = OO v 1, 163 §41.

proposition acquired by experience (*Q. var.* q6 a10 = OT viii 283.252–80). The virtues do not aim at any single good, and so they are not essentially connected. While they may share some general principles, the sharing of these general principles is not essential to each of the specific virtues.

It is easy to quote passages from Aristotle on Ockham's side. Aristotle often insists that prudence requires grasp of particulars if it is to be genuinely practical knowledge (e.g., *EN* 1141b21–2; 1142a23–30; 1143b2–5). One might argue, in support of Ockham, that Aquinas and his successors introduce a conception of universal prudence with no solid support in Aristotle. But we have seen that Aquinas' conception of prudence rests on a plausible interpretation of Aristotle's doctrine of practical reason. Aquinas sees that Aristotle's eudaemonism requires the expansive conception of prudence that is not prominent in Aristotle's own remarks on prudence. Though Ockham relies on one genuine element in Aristotle, the doctrines of Aquinas that he rejects are central Aristotelian doctrines.

395. Non-positive v. Positive Morality

Aquinas' account of practical reason influences his treatment of two elements of Christian moral theology that have no explicit place in Aristotelian ethics: the belief in universal conscience and the doctrine of natural law as an expression of the eternal divine law. Aquinas fits these Christian elements into his Aristotelian theory, by identifying universal conscience with the constitutive elements of practical reason, and by taking the precepts of natural law to be discovered by practical reason deliberating about the human good that is grasped, in schematic form, by universal conscience. Aquinas infers that the content of natural law is a matter of practical knowledge, and specifically of deliberation. It is not an expression of divine positive law that is created by God's willing it to be so. It expresses divine reason, since it embodies the principles on which God creates the natural world and human beings in it.

Scotus and Ockham agree with Aquinas in recognizing moral principles grasped by natural reason. According to Scotus, these constitute the principles of natural law, properly so called, which are not subject to God's will or dispensation. But their content is restricted, since the second table of the Decalogue cannot be derived from them. Since Scotus restricts the content of natural law properly so called, he expands the area of divine positive law, and so restricts the deliberative task of practical reason; deliberative prudence cannot discover the second table from the precepts of practical reason. But this apparently clear division is obscured, as we have seen, by Scotus' claim that the principles of the second table are 'highly consonant' with natural law in the strict sense.

Similar questions arise about Ockham. He recognizes both a non-positive part of moral science and a positive part (*Quodl.* ii q14 a2 = OT ix 177.18). He does not follow Scotus in regarding the whole second table as positive, and so he seems to be less voluntarist than Scotus. But it is difficult to understand the extent of non-positive morality and its relation to the divine will.[37]

[37] Non-positive morality: King, 'Theory' 228.

Non-positive moral science directs human actions without any precept of a superior. It is demonstrative because its first principles are grasped (notis, 177.25–6) through themselves or known (scitis) through experience, and it derives its conclusions necessarily from these. Principles known through themselves include 'Everything right (honestum) is to be done' (ix 177.26); 'The will ought to conform itself to correct reason'; and 'Every blameworthy evil is to be avoided'. As an example of a principle known through experience Ockham mentions 'Any angry person on such an occasion is to be mollified and calmed by gentle words'; this can be known only by experience of calming particular angry people by gentle words (*Q. var.* q6 a10 = OT viii 282.228).[38]

Positive moral science contains human and divine laws, which oblige (obligant, ix 177.21) us to pursue or avoid things that are good or bad only because they are ordered or prohibited by a superior to whom it belongs to legislate. This part of moral science is not demonstrative.

Principles of non-positive morality are not specific precepts at the level of the second table of the Decalogue. But they are not all as tautologous or analytic as 'The will ought to conform itself to correct reason' seems to be. They also include 'One should benefit a benefactor'.[39] Hence Ockham seems to allow more content than Scotus allows to natural law in the strict sense.[40] Aristotle's *Ethics* discusses principles of non-positive morality,[41] but Ockham does not say whether these principles are the whole, or only a part, of the *Ethics*. His views do not suggest that non-positive morality includes the sort of detail that we find in the *Ethics*; he does not seem to share Aquinas' confidence in the competence of rational inquiry and deliberation to reach specific precepts of justice.[42]

Ockham implies, therefore, that at least some of our moral knowledge—both of general principles and of particular prescriptions for action—is epistemically independent of any beliefs about the legislative will of God. But he also denies that the principles of correct reason are independent of God's legislative will.[43] Since the divine will is prior to correct reason, virtue is in accord with correct reason 'as long as the divine command stands' (stante praecepto divino) or as long as the present order stands.[44]

What sort of priority does Ockham ascribe to the divine will? We might take him to mean that though the requirements of correct reason are independent of God's will, God is free to endorse or to reject them. If God were to reject them, and to demand that we act contrary to correct reason, virtue would not be in accord with correct reason. That is why—we might

[38] For these examples cf. *Q. var.* q7 a2 = OT viii 330.11–13.

[39] See *Q. var.* q6 a10 = OT viii 281.219–282.232 (omni benefactori est benefaciendum). Ockham argues (viii 283.252–284.280, against Scotus) that this knowledge, combined with the recognition that this person is a benefactor, can direct our action, so that in this case prudence is not required for directing action.

[40] See §378.

[41] In *Quodl.* ii q14 a2 = OT ix 177.24–8, Ockham mentions principles known through themselves and known through experience, 'such as that everything right (honestum) is to be done and everything wrong is to be avoided, and <principles> of this sort, about which Aristotle speaks in moral philosophy'.

[42] On non-positive and positive morality see Clark, 'Voluntarism'. He suggests that Ockham's basic principle relies on right reason, which requires the love of God, and that the will of God gives all further content to morality. But the example of the benefactor suggests that Clark may exaggerate the emptiness of non-positive morality. See also Adams, 'Naturalist?'; 'Structure'.

[43] See McGrade, 'Omnipotence' 274–9 (a more moderate interpretation of Ockham's position); Clark, 'Right reason'.

[44] See *Quodl.* iii q14 = OT ix 255.43–5; cf. *Q. var.* q7 a3 = OT viii 363.515; *Q. var.* q7 a4 = OT viii 394.440–2. On directed and unqualified divine power see §396 below.

suppose—Ockham believes that the accord between virtue and correct reason holds only as long as the divine command (accepting the conclusions of correct reason) stands.

But this is not Ockham's view. For he also seems to believe that two facts depend on the divine will, both (1) the fact that virtue agrees with correct reason, and (2) the fact that correct reason requires the specific actions it requires.[45] The fact that God wills an action makes it true that the action conforms to correct reason. Ockham does not simply hold, as Aquinas holds, that the divine will and correct reason necessarily agree; he also holds that correct reason prescribes a given action only because God wills it. God cannot reject the dictates of correct reason, but this does not mean that God's freedom is limited by the requirements of correct reason; on the contrary, whatever God wills thereby becomes a dictate of correct reason. Our intuitive knowledge of the requirements of correct reason reflects God's prior willing that has made it true that correct reason requires this action rather than another.[46]

This view of correct reason supports Ockham's view of dispensations. If God's will fixes the requirements of correct reason, it seems to be within God's power to change them. Since the fact that correct reason accepts a principle does not show that it is not dependent on the divine will, all the precepts of the Decalogue are dispensable.[47] Ockham, therefore, goes further than Scotus, who makes only the second table of the Decalogue dispensable. God could make hatred of God meritorious, even though the love of God is—given what God has actually willed—required by correct reason.

This dependence of correct reason on the prior will of God makes it difficult to understand what content we are to attribute to correct reason. Ockham's position would be intelligible if we found that some synthetic practical principles appeared irresistibly to us as fundamentally reasonable, even though we could not say what is reasonable about them. One might say that they seem basically reasonable but not further justifiable, because they record the results of God's antecedent acts of will that have constituted these principles as reasonable. If, however, we follow Aquinas in supposing that the basic principles of morality can be discovered by the appropriate sort of deliberation on the human good, it is difficult to see how correct reason and morality, so understood, could simply express God's antecedent will; they seem to reflect distinct facts about human nature, which do not depend on the divine legislative will.

It is rather difficult, then, to see what Ockham means about the relation between the divine will and correct reason. He seems to treat correct reason as a source of non-positive morality in a purely epistemic sense; though we grasp these moral principles without any explicit reference to the divine legislative will, our knowledge of their content does not capture their metaphysical status. Though we can know them without reference to divine legislation, in fact they depend on divine legislation. This claim that correct reason depends

[45] Ockham takes this view when he asks whether there is some cause of predestination in the predestined (*1Sent.* d41 q1 = OT iv 597.19–598.4). He denies that something must cause God's will to conform to correct reason: 'It can be said that every correct will conforms to correct reason. But it does not always conform to a prior correct reason that shows the cause why the will ought to will this. Rather, by the very fact that the divine will wills this, correct reason dictates that it is to be willed' (*1Sent.* d41 = OT iv 610.1–5). This passage is discussed by Oakley, 'Natural law'. See also Kilcullen, 'Natural law and will'; Clark, 'Right reason'.

[46] Cf. Scotus' treatment of Anselm's maxim, §381.

[47] See Suarez, *Leg.* ii 15.3, relying on Ockham, *2Sent.* q15 ad 3 = OT v 352.

on the divine legislative will seems to require a rather impoverished conception of the content of correct reason. If this is what he means, his departure from Aquinas is more radical than it might initially have seemed if we attended simply to the prominence of Ockham's remarks on correct reason.

None the less, since he believes that we can grasp some important elements of morality by correct reason, Ockham is justified in endorsing a conception of natural law.[48] Though he discusses it in his political writings, rather than a moral context, his remarks on it are not surprising. Indeed, it would be plausible to identify the basic principles of natural law with the basic principles of non-positive morality, as he understands it. These are principles that we know because we are rational agents, not because we recognize any specific divine precepts.

396. Divine Freedom and Divine Justice

If we agree that moral principles—both positive and non-positive—depend on divine legislation, a further question arises about the relation of the divine will to this legislation. Is God free to change this divine legislation or not? Ockham's conception of divine freedom prevents him from agreeing that morality consists of principles that God cannot change. He is dissatisfied with Aquinas' argument to show that God acts freely and not from necessity (Aquinas, *Pot.* q1 a5; q3 a15), because he thinks Aquinas sets the standards for freedom too low.[49] In Ockham's view, Aquinas shows only that God acts through his intellect and will, but this is insufficient to show that he acts freely.[50] Ockham cites Aquinas' own remark that action through intellect and will is not necessarily free action.[51]

Aquinas argues that his conception of freedom answers this objection. In his view, God does not act out of a necessity of his nature, but is self-determining.[52] He understands necessity as 'mere' necessity, to be contrasted with acting for an end of one's own. In saying that God does not act out of mere necessity, he does not concede that it is possible for God not to act for the end for which God acts; on the contrary, he affirms that God cannot fail to act for the sake of God's goodness.[53] God's non-necessary choice is reflected in the fact that more than one good ordering of creatures would have been consistent with God's essential

[48] Ockham's views on natural law are rather loosely connected to his moral theory in general. But his discussion of the first two types of natural law ('absolute' v. 'with some condition') fits his conception of non-positive morality. The main passage is *Dial.* iii, Tract 2, 10, translated in Ockham, *LFM* 261. For further details see Crowe, *CPNL* 201–5; Offler, 'Modes'; McGrade, *PTWO* 177–85.

[49] See Pegis, 'Necessity'; Freppert, *BMWO* 105.

[50] See *2Sent.* q3–4 = OT v 52.14–53.3; q3–4 = OT v 55.15–56.5; *1Sent.* d43 q1 = OT iv 625.8–626.19.

[51] See Aquinas, *ST* 1a q60 a2 (natural dilectio involves intellect and will but is not free); 1-2 q1 a2; *Pot.* q10 a2 ad4, 5.

[52] '. . . whatever acts out of necessity by nature (ex necessitate natura), it is impossible for it to be an acting principle, since the end would be determined for it by something else. And so it is clear that it is impossible for God to act out of necessity of nature' (Aquinas, *Pot.* q1 a5c = M 19a).

[53] 'The natural end of the divine will . . . is its goodness, which it cannot not will. But creatures are not commensurate with this end in such a way that without these the divine goodness could not be revealed; and it is this revealing that God aims at from creatures. For just as the divine goodness is revealed through the things that now are and through the ordering of these things, so also it can be revealed through other creatures and creatures ordered in another way. . . .' (*Pot.* q1 a5c = M 19b).

goodness. God does not act necessarily; God chooses one of these good options, when it is open to God to choose one of the other good options.[54]

This answer does not satisfy Ockham. In his view, God must be free to reject all the various good options; no constraint requiring God to choose among the good options is consistent with divine freedom. God was free to choose some other set of laws than the ones God actually chose, and therefore God is free to alter those already chosen. The decision not to alter them is an expression of God's 'directed' or 'ordered' (ordinata) power; this is God's power directed in the way God has freely chosen to direct it. This directed power is distinct from God's 'unqualified' or 'absolute' (absoluta) power.[55] Hence the fact that it is not within God's directed power to change a given law simply means that God has directed his power so as to leave this law unchanged; it still remains within God's unqualified power to change the law. God has the unqualified power to cause A without causing B unless A and B are identical (so that it would be self-contradictory for something to be A without being B) (*2Sent.* q15 = OT v 342.8–21). Hence God's power extends to doing everything that can be done without a contradiction or blameworthy evil.[56] Only God's currently-directed power would be violated if God were to change the current order to another order. When Ockham says that certain principles are stable 'given that the divine command stands', he means that they are stable from the point of view of God's directed power, but it is still within God's unqualified power to change them.[57]

In the light of these views about morality and divine freedom, Ockham defends his version of Anselm's claim that what God wills is necessarily just and right. God is not obliged to do anything, because God is no one's debtor. Even if a human being is obliged to do x and would act wrongly by doing not-x, God is not obliged to do x and would not act wrongly by doing not-x (*Q. var.* q8 = OT viii 434.573–436.607). For sin consists not only in a specific sort of action, but also in the fact that the action violates an obligation. Since God cannot be obliged, God cannot sin.[58] Similarly, punishment is owed to any human being only because this is how God has ordered it.[59] Since God is not obliged to do anything, and therefore is not obliged to do anything other than what God does, Anselm is right to believe that God cannot act unjustly. A human will needs some rule to direct it to act rightly, because it does

[54] On divine freedom and creation see Aquinas, §§307, 347.

[55] On potentia absoluta and potentia ordinata see §381; Aquinas, *ST* 1a q25 a3 ad1; Scotus, *1Sent.* d44 = OO v 2, 1368 §2 = W 256 (with Wolter's introduction, 56–7); Ockham, *Quodl.* vi q6 = OT ix 604.14–16; *1Sent.* d20 = OT iv 36.4–10; Adams, *WO* ii 1186–207; Wood, *OV* 22–5. Aspects of the historical influence of the distinction are explored by Oakley, 'Absolute'.

[56] 'omne quod non includit contradictionem nec malum culpae potest fieri a Deo solo', *2Sent.* q15 = OT v 342.19–21.

[57] For 'given that the divine command stands' see n45 above.

[58] 'For one does not call a sin, as has been said, anything other than some act of commission <that a human being is obliged not to do> or of omission <of an action> that a human being is obliged to do. . . . But God cannot be obliged to do any act, and therefore, by the very fact that God wills this, it is just to be done. . . . It is obligation, therefore, that makes someone a sinner or not a sinner' (*4Sent.* q10–11 = OT vii 198.4–13). On God's debts and obligations see Adams, 'Will' 264–5.

[59] '. . . for, just as God creates any creature out of his mere will (mera voluntate), so also by his mere will he is able to do whatever pleases him about his creature. For just as, if someone were always to love God and were to do all works accepted by God, God could annihilate him without doing <him?> any wrong (sine aliqua iniuria), so also he can give him, after such works, not eternal life but eternal punishment without doing <him> wrong. And the reason is that God is no one's debtor, but whatever he does for us, he does out of mere grace. That is why, by the very fact that God does something, it is done justly. For it is clear that Christ never sinned, and yet was most severely punished even unto death' (*4Sent.* q5 = OT vii 55.11–21). Cf. *4Sent.* q11 = OT vii 225.19–226.5; Holopainen, *WOTFE* 134.

not act rightly of itself. The divine will, by contrast, needs nothing to direct it, because it is itself the primary directive rule, and cannot act badly (*Q. var.* q8 = OT viii 410.19–23).

Ockham seems to assume a strictly positive conception of obligation and of right and wrong. Apart from principles that cannot be denied without self-contradiction, all right and wrong is the creation of someone's will. Hence nothing that God chooses to do, whatever it might be, could be wrong.[60] Right and wrong presuppose the imposition of a debt or obligation by an imposer who is distinct from the debtor or the person obliged.[61]

397. Questions about God's Justice

Ockham's claims about the necessary conditions for obligation and sin seem to require a voluntarist interpretation of his claims about non-positive morality. His claims about the connexion between obligation and imposition seem to require him to deny that the principles of non-positive morality have any content that is independent of God's legislative will. If they had independent content, some things that are always morally right might not be obligatory until God chooses them. But Ockham does not seem to allow the possibility that in some circumstances non-positive morality might be possibly right but non-obligatory; he expresses moral principles with gerundives ('right actions are to be done' etc.), which he normally uses to express obligations.

His claims about God's freedom from obligations and duties seem to rest on a narrow use of 'obligation' and 'duty' (or 'debt', debitum).[62] We might disagree with him on several grounds: (1) We might agree that obligations and duties are the same, but deny that obligation requires imposition.[63] (2) We might agree that obligations and duties are the same, and agree that obligations are imposed or incurred by voluntary action. On this view, non-obligatory actions might create obligations or duties. We might believe that while people have no obligation to become parents, or spouses, or monks, they incur obligations once they enter into these conditions. Similarly, then, though God was not obliged to create us, God might incur an obligation towards us by creating us; once God created us, perhaps some things that would not otherwise have been wrong for God to do became wrong. (3) We might agree with Ockham's assumption that obligation requires not mere imposition, but imposition by a superior. But then we might follow Suarez in separating obligations from duties and maintain that God has duties, though no obligations, towards us.[64] (4) Even if we agree with Ockham that obligations and duties are the same and that they all require imposition by a superior, we might believe that some right and wrong action is independent of obligation and duty.

To agree with Ockham, then, we must reject all of these views, and agree that obligations imposed by a superior exhaust the content of the morally right and wrong. It is not clear

[60] 'A human being never sins except because he is required (tenetur) to do what he does not do or because he does what he ought (debet) not to do. By this account a human being is made a debtor (debitor). God, however, is required to do nothing and is not obliged as a debtor, and for that reason he cannot do what he ought (debet) not to do and cannot not do what he ought to do' (*2Sent.* q15 = OT v 343.17–22).

[61] See Aquinas on God and debitum; *ST* 1a q21 a1.

[62] Ockham does not seem to distinguish debitum from obligatio.

[63] Perhaps Aquinas accepts this view. See §303.

[64] On obligationes v debita see Suarez, *Leg.* ii 9.4.

why we should agree on this general point about obligation and morality, since the four other views seem at least as plausible, from the moral point of view, as Ockham's view. We seem to have a reason to accept his views about obligation only if we already accept Ockham's views on divine freedom. In this case, then, his views on freedom seem to be the basis of his views on morality.

But even if we agree that all right and wrong action by one agent presupposes a debt or obligation imposed by another agent, Ockham still has not vindicated Anselm's claim. For even if he has shown that it is impossible for God to act wrongly or unjustly, given God's freedom from imposed obligations, it does not follow that everything God does is just and right. Why should we not say instead that what God does is neither right nor wrong?

It is not clear how Ockham answers this question. Though he claims that wrongness requires the violation of an imposed obligation, he does not say that rightness requires the fulfilment of an imposed obligation. But it is difficult to see why rightness and wrongness should differ in their relation to imposed obligations. If Ockham claims that God's will, simply by being God's will, is just, he apparently ought to say that whatever violates or opposes God's will is unjust, whether or not God has laid any obligation on us to obey his will.[65] But if he takes wrongness to presuppose an imposed obligation, he apparently ought to say the same about rightness.

Perhaps Ockham is not clear about the relation between two claims that he seems to accept: (1) What is right is what accords with God's will. (2) What is right is what is imposed by the will of a superior. If we consider which human actions are right, both claims imply that God's legislative will determines what it is right for us to do. But if we consider God's actions, the two claims have different implications; for the first implies that what God does is right, whereas the second implies that it is neither right nor wrong. Ockham's claims about obligation, rightness, and wrongness commit him to the view of some later voluntarists, that God's actions are neither just nor unjust, because they are above any imposition of obligation.[66] He should not agree, therefore, with Anselm's view that God's actions are necessarily just.

398. Conflicts within Morality

These claims about the dependence of morality on God's will do not cancel the difference between non-positive and positive morality. If we consider God's unqualified power, even non-positive morality is—according to one of Ockham's explanations, at any rate—a product of God's freely willing one content rather than another for the principles of correct reason. But once God has willed that content, we can consider morality with reference to God's directed power; with this condition assumed, we can know by correct reason, without reference to any further act of divine legislation, that some actions are right and others are wrong, and we can also count on God to act and prescribe in accordance with the principles we grasp by correct reason.

[65] As Ockham sees, this point requires some qualification, to take account of the fact that God wills that we not will our parents' death, even though God wills that our parents will die (*Q. var.* q8 = OT viii 434.573–435.583).

[66] Cf. Locke, discussed by Price, *RPQM* 43.

Though the content of non-positive morality known to correct reason is fixed, in relation to God's directed power, non-positive morality may still conflict with divine positive morality. For apparently God might freely choose to violate a precept of non-positive morality, or might instruct us to violate it. Scotus does not acknowledge this possibility; the only dispensations he mentions are dispensations from divine positive law. Ockham, however, acknowledges the possibility of a conflict. God's unqualified power extends to everything that does not involve a contradiction, and (according to Ockham) it is not self-contradictory to deny that theft and adultery are sometimes right; hence God could (by his unqualified power) command us to commit adultery, so that adultery would be right.[67] In the extreme case, God could make it right to hate God.[68]

On the strength of this claim, Suarez takes Ockham to hold that no action is bad except in so far as it is prohibited by God, and no action could not become good if it were prescribed by God, and conversely.[69] Ockham relies on God's freedom from obligation, and on the fact that God's will, exercising unqualified power, fixes the content of non-positive morality. Non-positive morality does not consist entirely of analytic truths that would be immutable even within God's unqualified power (because God could not make them false without self-contradiction). It consists of substantive principles that contain obligations resulting from the divine will. Hence non-positive morality is mutable within God's unqualified power.

It is therefore logically possible for God to give us a command that we could not obey. In Ockham's view, we obey God's commands because we follow the precept of non-positive morality that enjoins the love for God. In following this precept we follow the law that accords with the will of God, and it is not within God's directed power to change it. But God could, as far as God's unqualified power goes, change loving God from being right to being wrong. God might command us not to love God; we could not be moved to obey this command unless we loved God, but if we loved God we would not be obeying this command. Hence we could not obey God's command not to love God (*Quodl.* iii 14 = OT ix 256.74–257.94).[70]

This argument presupposes that the only motive for obeying God that we need to consider is love for God. Ockham is not considering obedience out of 'servile' fear of God's power to harm us,[71] but obedience on moral grounds, and hence obedience based on the love of God. On this assumption, God can give us a command that we cannot fulfil—not because God

[67] 'On another point I say that, granted that hatred, theft, adultery, have a bad circumstance attached to them, and so do similar things in the common law, in so far as they are done by someone who by a divine precept is obliged to the contrary; still, as far as concerns the unqualified being of such actions, they can be done by God without any bad circumstance attached. And they can even be done meritoriously by a traveller <in this life>, if they were to fall under a divine precept, just as now in fact their opposites fall under a divine precept' (*2Sent.* q15 ad3 = OT v 352.3–9).

[68] 'God is not obliged to cause any action, and therefore he can cause any action at all without any blameworthy evil (malum culpae), and similarly <he can cause> its opposite. And for that reason, just as he can cause entirely an act of loving without moral goodness or badness (because moral goodness and badness connote that the agent is obliged to that act or to its opposite), so also he can cause entirely an act of hating God without any moral badness for the same reason, because he is not obliged to cause any act' (*2Sent.* q15 ad4 = OT v 353.11–18). Ockham uses 'connote' (connotare) for a secondary or indirect signification; see Adams, *WO* i 147–8.

[69] 'nullum esse actum malum, nisi quatenus a Deo prohibitus est, et qui non possit fieri bonus si a Deo praecipiatur, et e converso', Suarez, *Leg.* ii 6.4.

[70] Cf. *Quodl.* iii 15 = ix 260 fin.

[71] On servile fear see Aquinas, *ST* 2-2 q7 a1.

commands us to do something self-contradictory in itself, but because our obedience to any command of God presupposes a motive that is prohibited by this particular command.[72]

Ockham describes this possibility in order to show what his position implies about the will of God, not because he believes that God does or will command us not to love God. He takes divine freedom to exclude any conception of God that makes God's choices depend on God's understanding of what is best. Though Ockham accepts the Anselmian principle about God's justice, he accepts it in the attenuated sense that regards justice as simply a product of God's choice.

399. God and Morality: Versions of Voluntarism

Neither Scotus nor Ockham is an unqualified voluntarist about morality and the divine will. The qualifications are especially clear in Scotus. He attributes to God an affection for justice that is the mark of divine freedom no less than of human freedom. This affection for justice ensures the truth of the Anselmian principle that necessarily God wills what is just. Moreover, not all the principles of morality are products of God's choice, since the higher principles of natural law (including the first table of the Decalogue) are discoverable by natural reason as principles about natural suitability. The positive laws that God imposes on us (including the second table of the Decalogue) also manifest the affection for justice, since they are highly consonant with the higher principles of natural law. Ockham also recognizes the rational and just aspects of the divine will. He does not follow Scotus in connecting the affection for justice with freedom, but he recognizes a non-positive area of morality, and believes that God endorses it.

It is not easy to combine God's acceptance of justice with God's freedom, as Scotus conceives it. If he is right about freedom, God's preference for justice and for the principles of natural law is a preference of God's self-determining will that chooses between justice and injustice, but not on the basis of goodness or rightness. To maintain the Anselmian maxim, Scotus has to treat justice as simply the product of God's choice. Similarly, Ockham believes that God's legislative will is necessarily rational; it is not guided by rational principles, but creates them. Human moral judgment, however, is guided by reason; facts about moral rightness and wrongness are accessible to human reason, and virtue consists in willing in accordance with correct reason. Ockham does not share the scepticism of later writers who deny any special connexion between practical reason and morality.

The position of Scotus and Ockham is often taken to be an important influence on the direction taken by later moral philosophy. Sometimes it is taken to be the origin of 'divine command' conceptions of morality defended during and after the Reformation.[73] This is not simply the view of historians in the nineteenth century or later. Cudworth defends eternal and immutable morality, as he conceives it, both against the positivism that he traces back to Protagoras and against the theological voluntarism that he attributes to Ockham, other

[72] See Adams 'Structure' 27–31; *WO* ii 1273–8 (on divine power). According to Oberman, *HMT* 94–5, Biel rejects Ockham's account of God's command to hate him. The evidence cited for this claim about Biel is insufficient; see *3Sent.* d37 a2 concl 3 = 636L W&H. Gregory of Rimini argues against Ockham at *1Sent.* d42–4 q1 a2 = 384–7 T&M.

[73] See §§411, 421–2.

mediaeval theologians, 'modern' theologians, and Descartes. From Cudworth's point of view, the mediaeval voluntarists abandon the view that morality has rational foundations. Cudworth does not invent this assessment of voluntarism; he relies on the critique of Ockham by Suarez, who cannot be accused of ignorance of Scholasticism or of raising anachronistic questions.[74]

This assessment of Scotus and Ockham may not be correct, since they may not accept all the views that later critics, or later followers, connect with voluntarism. They both understand morality as conformity to correct reason.[75] Is this a reason for rejecting the criticisms presented by Suarez and Cudworth?

Ockham maintains: (1) Moral virtue is in accord with correct reason. (2) Correct reason grasps the principles of non-positive morality. (3) Non-positive morality consists of obligations. (4) All obligations are imposed by God. (5) God's will does not follow any independent principles of morality. These claims are consistent, but they force Ockham into an awkward position. He has to claim that the content of correct reason itself is the product of a choice made by the free will of God independently of any antecedent principles of right. But this way of safeguarding the freedom of the divine will makes it difficult to see what is rational about the principles accepted by correct reason. We cannot say that some specific aim or character constitutes their rationality, since that would constrain God's choice of what to count as correct reason.

Ockham seems to be committed, therefore, to saying that it is logically possible for God to have made correct reason require cruelty, self-destruction, injustice, neglect of the future for the sake of the present, and so on. If this is indeed a consequence of his position, we might reasonably conclude that the appeal to correct reason has lost the sense that it has in Aquinas, and really amounts to nothing more than the claim that God has put some specific convictions into us.

Ockham seems to imply that it is up to God to choose what the natural law will be. He thereby denies any necessary connexion between the nature of a creature, the good of that creature, and the natural law applying to that creature. If the creature's nature fixes its good, but God is free to vary the natural law so that it does not conform to a creature's nature, apparently God is free to prescribe laws that conflict with the creature's good. Ockham does not claim that the principles of justice are unconnected with the good of human beings, or that God is free to impose new principles of justice that are unconnected with human good; but it is difficult to see how he can avoid such a claim, if he admits that the nature of human beings fixes their good.

He might, therefore, reply that the nature of a creature does not fix its good, and that God is free to change a creature's good together with changes in the natural law. This denial of a necessary connexion between human nature and the human good ought not to appeal to Scotus; for belief in such a necessary connexion seems to underlie his account of the affection for advantage. He accepts the Aristotelian view that facts about a creature's nature, rather than the creature's preferences or divine preferences, fix its good. As long as we maintain this connexion between a creature's nature and its good, we cannot make its good depend

[74] See Cudworth, *EIM* i 1.5 = H14.

[75] See Wolter, *DSWM* 16–29; Adams 'Structure'; Bonansea, 'Voluntarism' 95–6.

on the divine legislative will. Ockham does not explicitly reject Scotus' claims about nature and good, but his position might be more defensible if he rejected them.

A thoroughly voluntarist position, eliminating the possibility of conflict between nature and the will of God, might seek to make the human good depend on God's will, without completely severing it from human nature. Ordinary legislators support their commands with sanctions. If God does this too, God can attach pleasure to the fulfilment of divine commands and pain to the violation of them. Since we naturally aim at pleasure and avoid pain, God can change the natural law without changing this aspect of our nature.

This penal conception of our reason for obeying natural law would not avoid a conflict between God's commands and our nature, if our nature made other things non-instrumentally good for us apart from pleasure. If, then, we want to maintain the penal account of natural law, we are well advised to accept a hedonist account of the good. Hence Hobbes combines a penal account of natural law with hedonism. In his view, the laws of nature, apart from divine commands, are not really laws, but counsels of prudence prescribing means to our pleasure. As divine commands they are laws combined with sanctions appealing to pain and pleasure. The appropriate connexion with human nature relies on a hedonist conception of the good.[76]

This more extreme voluntarist position is not the logical outcome of Scotus' and Ockham's qualified voluntarism. From the extreme voluntarist point of view, Scotus and Ockham create difficulties for themselves by failing to reject Aristotelian assumptions about the connexion between natural law, the human good, and facts about human nature. These assumptions open the prospect of conflict between human nature, the human good, and the will of God. Ockham accepts the possibility of such conflict. If we take it to be morally and theologically unacceptable, we will discard the Aristotelian assumptions. This is not the only possible conclusion, however. Perhaps we should accept the possible conflicts resulting from Scotus' and Ockham's position, or we should prefer Aquinas' position over voluntarism.

A different sort of voluntarist response to the difficulties faced by Scotus and Ockham might deny that divine legislation fixes the human good, and confine it to the fixing of moral rightness and wrongness. According to this view, facts about human nature and human good are fixed by the existence of human beings in their natural environment, but they are separate from moral rightness and wrongness until God commands the observance of principles promoting the human good. According to this view, the will of God is sovereign over whether the natural law is really law; without the divine command, it would not be natural law, but simply a set of principles. This conception of law relies on Ockham's narrow conception of obligation, making obligation depend on imposition by the will of another, and taking law to imply obligation.[77]

This version of voluntarism avoids the difficulty that arises for Ockham, since it does not fix the content of correct reason by acts of divine free choice, but allows the content of correct reason to be fixed by human nature and human good. But this advantage is costly; if we separate the content of correct reason from the strictly moral principles that require divine imposition, we sever the connexion that Ockham preserves between correct reason and morality. This element of anti-intellectualism takes a step beyond Scotus and Ockham, though one can see why reflexion on the difficulties in their position might support this step.

[76] See Hobbes, *L.* 15.41.

[77] Different versions of this view are defended by Suarez and Pufendorf.

400. Voluntarism, Morality, and Reasons

We have now discussed the aspects of voluntarism that are intended to maintain divine freedom against the restrictions (as Scotus and Ockham suppose) that would follow from acceptance of Aquinas' view. Similarly, voluntarists intend to safeguard human freedom in relation to God and morality. In their view, God does not present us with principles that are rationally compelling for us, so that we would be acting irrationally if we rejected them. Instead, Scotus argues that God presents the natural law as a series of requirements of justice; we will have a reason to follow them if we choose to follow our affection towards justice, but we have no overriding reason to choose to follow this affection rather than some other.

If facts about human nature do not provide external reasons, the voluntarist loses Aquinas' account of the basis of ethics in natural reason. The voluntarist's alternative basis consists in principles that provide internal reasons for agents who already have the relevant sorts of affections and have made the appropriate sorts of undetermined choices. If we choose to follow our affection towards our own advantage, self-interested principles give us internal reasons; if we choose to follow our affection towards justice, other principles provide internal reasons.

If all reasons are internal, we can solve difficulties about divine commands and ethics that might seem to arise otherwise. A believer in external reasons must apparently recognize at least the logical possibility of a conflict between divine commands and rational principles of morality; for why, we might ask, should God not order us to do one thing while rational morality orders us to do another? If we are thorough voluntarists at the human as well as the divine level, we can remove this difficulty. God cannot command us to act contrary to external reasons, if there are none. The right way to describe a conflict between God's commands and some other principle is to say that some other affection of ours prompts us to do x, but God commands us to do y. It is then up to us to choose whether to follow the affections that incline us to obey God (love of God, fear of divine punishment) or to follow our other affections. None of these courses of action is externally more reasonable than another; which it is reasonable for us to follow depends on our undetermined choice to follow one or another affection.

These voluntarist views help us to understand some of Hobbes's assumptions. If there are no external reasons, reasons and obligations rest on some affection and some choice. If our basic affection aims at self-preservation, any obligation must ultimately appeal to that affection; hence it must appeal to our desire for self-preservation either directly or indirectly (through a sanction for violation). Since God and human legislators impose a sanction for the violation of their commands, their commands provide us with obligations.[78]

Hobbesian assumptions about motivation and affection do not follow from a voluntarist position. But the starting point of the Hobbesian argument, assuming the unintelligibility of external reasons, may well appear arbitrary and unjustified unless we are already convinced by voluntarist arguments against Aquinas' version of intellectualism.

[78] For this sort of view see Tuck, *NRT*, ch. 4, on Selden.

MACHIAVELLI

401. Questions about Moral Philosophy

In some ways Machiavelli is not a very suitable source if we are looking for serious philosophical criticism of Aquinas. His main interests and abilities lie in politics and history, and he is neither a deep nor a systematic philosophical thinker. Still, these very features of his views make it even more useful to examine them; for he shows how specific practical problems and attitudes may suggest objections to the Christian assumptions embodied in Aquinas' system. Machiavelli intends to challenge the Christian conception of the place of the Christian virtues in social and political life. But he also raises a broader question that he does not intend: what counts as an adequate theory of the virtues? Machiavelli sets out some demands that the Christian conception does not satisfy; but it is not obvious that any other conception of the virtues can satisfy his demands.[1]

Aquinas intends his account of the ultimate end and the moral virtues to embrace different sorts of practical situations and demands. The virtues satisfy the demands of (i) self-interest; (ii) morality; (iii) the common good of a community; (iv) a human being's approach to the vision of God. Machiavelli rejects Aquinas' system by arguing that no one set of virtues can satisfy all four sorts of demands.

Aquinas believes that the virtues contribute to a person's own interest because they require the regulation of passion by practical reason, and because the particular sort of regulation they require is appropriate for a human being's social and political nature. The kinds of demands and restrictions imposed on us by the requirements of morality do not conflict with the good of the individual human being; on the contrary, they fulfil it.

The second and third demands on the virtues are not sharply distinct; for Aquinas, following Aristotle, identifies the requirements of social morality with the common good of some community, small or large. But it is useful to see that two distinct conditions have to be satisfied. Aquinas connects them closely because he does not believe that we can determine

[1] Burd, *Il Principe* xiv, remarks: 'It is no paradox to say that *The Prince*, though in many ways immoral, has been none the less of indirect service to morality. . . . [It] has the significance which belongs to the works of all authors who have questioned, not in a spirit of selfishness or from indifference, but from a reasoned conviction, the commonly accepted codes of morality. Such writings serve, by contrast, for a perpetual reminder that the ultimate sanction of morality is, for the non-religious mind at any rate, the suicidal nature of immorality . . .'

the good of the community by some non-moral standard, and then subordinate morality to this goal. The community whose good is to be promoted must itself be formed on principles suitable for the nature of the individuals belonging to it; this is one consequence of the Aristotelian claim that the state is a natural association. Principles derived from the moral virtues partly determine what counts as the good of a community.

The virtues are to satisfy the fourth demand because the pursuit of a comprehensive good in this life is the appropriate preliminary to the vision of God in the next life; Aquinas' conception of the final good prevents him from saying that if we want the vision of God, we ought to renounce the world altogether. He has to appeal to his specific analysis of the virtues to show that the moral virtues needed for social life do not conflict with the Christian virtues. The kinds of bravery and magnanimity that are appropriate to a citizen do not conflict with the humility required of a Christian.

Machiavelli offers a powerful objection to Aquinas because he casts serious doubt on whether any one set of virtues can really satisfy all the four sorts of demands that Aquinas recognizes as legitimate. It is useful to consider his grounds for scepticism.

402. Civic Virtues

Machiavelli and Aquinas share one of their starting points. For Machiavelli follows Greek and Roman political theory in placing a high value on the virtues of the citizen and on the demands of civic life. He is concerned with the fortunes of a city-state that has to struggle to maintain its political independence and its civic harmony; and to this extent the problems he faces are similar to those that face Thucydides, Plato, and Aristotle. Even though his major work is a series of discourses on Livy, his situation and experience are closer to those of the Greek historians and political theorists than to the actual situation of Livy, who looks back on Rome's existence as a city-state from the rather different perspective of the early Empire under Augustus.

Some of Machiavelli's priorities are also similar to those of Greek political thinkers. He aims at a city's independence from external control and at its internal cohesion. He sees that factions tend to form, especially around powerful and ambitious individuals, and the deeper division between the rich and the poor tends to divide the citizens along more permanent lines. The citizens rightly want to preserve their liberty, including both freedom from external domination and freedom to choose the rulers they prefer. Most people, in Machiavelli's view, want freedom from interference by the state so that they can ensure security for themselves in their private lives (*D* i 16.8); but citizens with the right sort of civic spirit seem to want such freedom for its own sake (cf. ii 23.4).

The sovereign 'republic' governed by its citizens[2] (or some of them) is not the only sort of state that Machiavelli knows. He also discusses monarchies, and indeed *The Prince* is a book of advice for autocratic rulers. But he makes it clear that he prefers a republic. In the *Discourses*

[2] 'Free government'; *D* i 18.1. I cite *D* by the chapters and sections in Walker, and *P* by chapters and pages in Atkinson. I usually follow Walker's translation of *D* (severely criticized by Whitfield, *DM* 231–7) and Atkinson's translation of *P*. I cite Walker's edition as 'W'. Walker is forthright about the point of view from which he considers his subject: '. . . scholarship in the broad sense should place a man's stature against the background of really great thinkers, indeed against the background of common human judgment and of Christian perception, and, as judged from this standpoint, many of Machiavelli's principles, principles which are basic to his outlook and his theory, stand universally condemned' (i 8).

he is mainly concerned with republics, and clearly thinks it is desirable to maintain a republic in good condition if it is already healthy. He thinks it is a more difficult task to introduce a republic among people who have been used to absolute rule, or to restore a republic that has been 'corrupted' (*D* i 49); corruption is easy, and the danger is always present (i 42). The welfare of the state is always precarious; Machiavelli tries to protect it by giving advice about the sorts of dangers that may arise, and by suggesting ways to counteract them.

The aims of a republic, and the threats that it faces in trying to achieve these aims, determine Machiavelli's conception of a citizen's virtue. A good state maintains virtue in its citizens, and the only way to reform a state is to introduce laws and institutions that encourage the development of virtue. The virtue of a citizen is the set of characteristics that promotes the preservation of the republican state. The primary characteristic is willingness to make sacrifices for the common good. A secondary characteristic is a desire for glory, which is the most reliable motive leading to public spirit (cf. i 43). This desire is secondary in civic virtue because it needs to be restrained and controlled by the demands of the public interest; if it is necessary to sacrifice glory in order to preserve the state, that sacrifice should be made.[3]

Machiavelli does not always speak of virtue in exactly this way. He uses the term univocally[4] for the qualities that are most appropriate for achieving a given end; but since he considers different ends in different contexts, the qualities he includes under 'virtue' may differ also. He speaks of virtue not only in a civic, but also in a military context; the virtue of a general or a soldier is the appropriate sort of military efficiency rather than efficiency in promoting the common good of a state.[5] Civic virtue includes the appropriate degree of military virtue; and no doubt a good soldier must be ready to do his part in the whole army he belongs to. But still the two sorts of virtue may not be identical; it is clear and familiar to Machiavelli that an efficient and successful general may not be devoted to the common good of his state, and indeed may often be a threat to it.[6] A ruler may even be successful in maintaining his power and ensuring stability in the state; but if he behaves as Agathocles did, he cannot win glory and cannot count as having virtue (*P* 8). Machiavelli's use of 'virtue' for these two different, though related, sets of qualities raises no special difficulty; it is no less natural than the use of 'good' in 'good politician', 'good citizen', and 'good general'; but we have to be careful to see what sort of virtue he is referring to on each occasion.

403. Civic v. Christian Virtue

In the light of his conception of virtue, Machiavelli thinks he can show that the Christian virtues conflict with civic and military virtue. The Christian attitude to the world tends to develop the wrong traits of character and to impede the development of the right ones.[7]

[3] 'For when on the decision to be taken wholly depends the safety of one's country, no attention should be paid either to justice or injustice, to kindness or cruelty, or to its being praiseworthy or ignominious' (iii 41.2). W ad loc. points out that the historical examples cited by Machiavelli do not show that either the Romans or the French agree with his general principle.

[4] On 'virtue' see W i 99–102; Skinner, *FMPT* i 138; 'Virtù' 163; Plamenatz, 'Virtù;'. On contemporary uses of 'virtue', compared with Machiavelli's use, see Skinner, *FMPT* i 125–6.

[5] See W i 100–2.

[6] See *D* i 10.6; *P*19 (on Severus); *P*7 (on Cesare Borgia).

[7] 'For our religion, having taught us the truth and the true way of life leads us to ascribe less esteem to worldly honour' (*D* ii 2.6).

The cultivation of 'humility, abnegation, and contempt for mundane things' as the highest human good weakens the proper civic attachment to 'magnanimity, bodily strength, and everything else that tends to make men very bold' (*D* ii 2.6). Christianity demands strength in suffering rather than strength in action.[8]

It is not clear, however, that Machiavelli regards these harmful effects as necessary results of Christianity. For he suggests that the apparent conflict between the Christian virtues and active civic virtue may result from a misunderstanding of Christianity.[9] Unfortunately he does not try to reconcile this suggestion with his previous remarks. It would be strange if he meant that Christianity does not encourage the virtues of humility and detachment from the concerns of the world; for he is correct in saying that it does not place a person's highest good in worldly success. But he may mean that the cultivation of the Christian outlook need not conflict with a proper civic spirit, because Christian principles allow[10] loyalty to one's community and vigour in promoting its welfare.

This is an important concession by Machiavelli. For even the less 'monkish' form of Christianity that he recognizes does not regard loyalty to the state as an individual's overriding goal. He does not suggest that 'civic Christianity' would regard every action necessary for the defence of the state as morally legitimate and beyond criticism. If he concedes this, he also concedes that the appropriate civic virtue need not include an unreserved commitment to the preservation of the state.

It is doubtful, however, whether Machiavelli consistently intends to allow that civic virtue requires only the Christian's limited loyalty to the state. For his usual view implies a much deeper objection to Christian morality. His position is summed up in the claim that 'it is good to defend one's country in whatever way it is done, whether it entail ignominy or glory' (iii 41.1). Machiavelli illustrates this extreme principle with some relatively innocuous examples that might be consistent with a more moderate principle; he mentions the use of tricks and stratagems in war[11] and the acceptance of humiliating terms of peace. But he accepts the extreme principle without restriction, as a defence of actions that are not merely humiliating but clearly immoral. Any action taken by a ruler organizing a republic is justified if its effects are good enough.[12]

[8] 'This pattern of life, therefore, appears to have made the world weak, and to have handed it over as a prey to the wicked, who run it successfully and securely since they are well aware that the generality of men, with paradise for their goal, consider how best to bear, rather than how best to avenge, their injuries' (ii 2.7).

[9] 'But though it looks as if the world were become effeminate and as if heaven were powerless, this undoubtedly is due rather to the pusillanimity of those who have interpreted our religion in terms of laissez faire [or 'inactivity'; ozio], not in terms of virtue. For, had they borne in mind that religion permits us to exalt and defend the fatherland, they would have seen that it also wishes us to love and honour it, and to train ourselves to be such that we may defend it' (ii 2.7). W ad loc. cites Aquinas' comments on the bad effects of tyranny, *Reg. Princ.* i 3 = M 5a: 'Moreover it is natural that when people are brought up under fear, they decline into a servile outlook, and become pusillanimous towards every manly and demanding (strenuum) activity'. Aquinas blames tyranny for the outlook that Machiavelli blames on Christianity.

[10] In the passage just quoted from W, Machiavelli says only 'allows' rather than 'enjoins'. W translates 'permette', but some texts read 'promette' (preferred by Rinaldi, *O*, and glossed 'invita a').

[11] On these W ii 204 cites Aquinas, *ST* 2-2 q40 a3. Aquinas argues that attempts to deceive the enemy by lying or breaking promises are impermissible and contrary to the 'iura bellorum' that should always be observed. But stratagems (insidiae) that may mislead the enemy are permissible.

[12] 'Nor will any reasonable man blame him for taking any action, however extraordinary, which may be of service in the organizing of a kingdom or the constituting of a republic. It is a sound maxim that reprehensible actions may be justified by their effects, and that when the effect is good, as it was in the case of Romulus, it always justifies the action' (i 9.2). W ad loc. cites examples given in iii 3–4.

This general principle explains Machiavelli's conviction that the recognized moral virtues do not suit a ruler who tries to do what has to be done for the sake of the state. In discussing the qualities that a ruler should cultivate, he rejects the usual advice of moralists who urge rulers to cultivate the moral virtues.[13] Such advice is inapplicable to the real world, where a ruler has to be willing to act immorally on the right occasions, if he is to maintain his position.[14] This instruction to any ruler who wants to maintain his power follows from Machiavelli's separation of civic virtue from moral virtue. He rejects the advice of moralists because he assumes that the overriding aim is the safety of the state or the ruler; moral principles conflicting with this aim are irrelevant.

We might, then, suppose that Machiavelli accepts Augustine's contrast between pagan and Christian virtue, but draws the opposite conclusion from it. If Augustine treats pagan virtues as 'splendid vices' and insists that genuine moral virtue is based on Christian faith, Machiavelli agrees with him on both points. He disagrees with Augustine in preferring the splendid vices of pagans to the Christian virtues, because he believes that the arrogance and self-assertion that Augustine finds in the pagan outlook are desirable traits.

404. Machiavellian Virtue v. Moral Virtue

We have found, however, that Augustine does not hold this view of pagan virtue, and that he is right not to hold it.[15] The virtues advocated by pagan moralists are not forms of self-assertion or arrogance; they include concern for the interests of others for their own sake. Machiavelli's division between the pagan and the Christian outlook does not fit the views of pagan moralists.

We can confirm this claim by considering the example of Romulus' murder of Remus. Machiavelli cites this incident to show that ruthlessness is sometimes necessary (i 9.2; Livy i 7.1–2). In this case it was immoral and vicious for Romulus to do what he did, but it was necessary for the preservation of his own rule and for the preservation of the state; hence it was justified, though not morally justified. Machiavelli admits that the traits of character he advises a ruler to acquire will appear deplorable and vicious from the moral point of view, not simply from the Christian point of view.[16]

Cicero mentions this incident as an apparent example of a conflict between the right (honestum) and the expedient (*Off.* iii 40–1). He assumes that it would be wrong to prefer the expedient over the right (nam id quidem improbum est, 40). He argues that in some cases reflexion on a particular case shows that the expedient course of action that seemed

[13] For the usual advice to a prince see the selections from Pontano and Platina in Kraye, *CTRPT* ii, chs. 5–6.

[14] 'Many writers have conceived of republics and princedoms which have never in fact been seen or known to exist. Since there is so great a discrepancy between how one lives and how one ought to live, whoever forsakes what is done for what ought to be done is learning his ruin rather than his preservation. For a man who wants to practise goodness in all situations is inevitably ruined, among so many men who are not good. Hence a prince who wishes to retain his power must learn to be able not to be good, and to use, or not to use, that ability according to necessity' (*P* 15, 255–7).

[15] See §228.

[16] 'I know everyone will admit that it would be most laudable for a prince to be endowed with all the qualities mentioned above, those that are considered good. But since he is unable to possess them, or comply with them, entirely because of human conditions which do not permit it—he must be prudent enough to know how to escape the infamy of those vices that do cost him his power' (*P* 15, 257–9).

unjust is not really unjust (Collatinus, 40);[17] but he rejects this defence of Romulus' conduct, and concludes that what Romulus did was wrong (41).

Cicero qualifies his judgment by remarking that Romulus did not simply assert the claims of expediency over morality; he cited the incident of Remus' jumping over the walls as an aggressive action that deserved punishment. Even if we think Romulus was justified, we need not agree that his action was clearly immoral, and hence we need not agree that it clearly illustrates the separation of the expedient from the right.

Machiavelli's brusque rejection of Cicero's argument shows that his attack on Christian morality is misleading. He attacks morality on a broader front, and repudiates the values of Cicero no less than those of Christian moralists. His focus on Christian values has misled interpreters who have supposed that he advocates the Classical, civic virtues against the other-worldly, Christian virtues.[18] This contrast is misleading because Machiavelli's outlook conflicts with the views of pagan moralists, who agree with Christians in denying that an appeal to the expedient can justify violation of justice.

It is not entirely misleading to connect Machiavelli's views with Classical antiquity. His conception of the ruler who values strength and self-assertion, and of the citizen or soldier who values glory, fits some aspects of the Homeric outlook. This outlook never entirely faded from Greek and Roman life and thought. Machiavelli's contrast between the active and aggressive pagan outlook and Christian humility anticipates Nietzsche's contrast between the Hellenic and the Jewish outlooks.[19] But while he captures the self-assertive aspect of Greek and Roman thought, he conveys the false impression that this is the dominant character of pagan moral theory. To suggest that principles for the moral restraint of self-assertion are the invention of Christians, or of philosophers out of touch with ordinary morality, is to distort the apparent facts. Since Machiavelli distorts history in this way, he makes his own position seem more attractive than it ought to seem.

Cicero offers a further comment on morality and expediency that corrects any over-simplified contrast between the 'pagan' and the 'Christian' ideals. After his judgment that Romulus was wrong to murder Remus, he adds that it would be unreasonable to require complete self-sacrifice, and that self-assertion without injury to other people is legitimate. He endorses Chrysippus' comparison with a race, in which competition is legitimate, but tripping up the other runners is prohibited.[20] Neither Cicero nor Chrysippus maintains that it is always wrong to harm anyone else; the successful competitor harms the losers, by winning

[17] See *D* i 28.3; iii 5.1; Livy ii 2.7.

[18] For a misleading contrast between Machiavelli and Christian morality see Berlin, 'Originality' 45: '. . . what he institutes is . . . a differentiation between two incompatible ideals of life, and therefore two moralities. One is the morality of the pagan world: its values are courage, vigour, fortitude in adversity, public achievement, order, discipline, happiness, strength, justice, above all assertion of one's proper claims and the knowledge and power needed to secure their satisfaction . . . These seem to Machiavelli the best hours of mankind and, Renaissance humanist that he is, he wishes to restore them. Against this moral universe . . . stands in the first and foremost place, Christian morality.' The conflict between Machiavelli and Cicero is appropriately emphasized by W ii 278; Skinner, *M*36–47; *FMPT* i 128–35 (on Machiavelli's rejection of traditional, and not only Christian, conceptions of the virtues). It is underestimated by Colish, 'Cicero and Machiavelli'.

[19] See Nietzsche, *GM* i 7.

[20] 'Someone who is running a race ought to strain and strive as hard as he can to win; but he ought not at all to trip up another competitor or to push him aside with his hand. So also in life, it is not unfair for each person to seek for himself what is appropriate for his use, but it is not right for him to snatch from someone else' (*Off.* iii 42 = SVF iii 689) Cf. §182n45.

at their expense. But Chrysippus implies that competition and self-assertion are subject to some constraints of justice, so that legitimate competition should not injure others, even if it harms them.

The constraints accepted by Cicero and Chrysippus do not offer very definite guidance in practice. They do not say, for instance, whether two states at war are engaged in legitimate competition or illegitimate aggression. But they are not practically empty either; for they imply that exclusive concern for one's own interest without reference to the interests and legitimate claims of others does not sufficiently justify one's action. If Chrysippus had been our only ancient source for this moral constraint on self-assertion and competition, we might have treated it as a Stoic paradox that was out of step with common morality. But Cicero does not treat it as a Stoic paradox; he treats it as being obviously right and not very controversial, a maxim that he expects to find broad acceptance. This is the elementary moral restraint, accepted by both pagan and Christian moralists, that Machiavelli thinks must be rejected.

For this reason we should not take Machiavelli at face value when he appears to be defending pagan virtue against Christian virtues. His advice to rulers is incompatible with the civic virtue that is recognized as a support of the Classical city-state, no less than with the Christian virtues that he accuses of undermining civic virtue. In both cases Machiavelli rejects any moral restraints on the end that he regards as overriding. Why does he suppose that the end he favours has this overriding status?

405. Civic Virtue and its End

It is difficult to see what Machiavelli's argument is. Some clarification is useful, not for the sake of finding out what he really means, but for the sake of a better understanding of some recurrent ambiguities in many people's presentation of the issues. For in this case too we can find a more extreme and a more moderate defence of his position.

If certain virtues and moral restraints are to be rejected because they conflict with specific ends, they must have less value than the ends that they conflict with; if this were not so, the conflict might equally give us a reason for rejecting the ends. Why does Machiavelli believe that the moral virtues must always give way in case of a conflict? His extreme defence requires him to claim that some particular end is more important than the moral virtues; his more moderate defence does not require this claim.

According to the extreme defence, Machiavelli means: 'If we have the correct view of what is worth pursuing in life, we will see that the preservation of the state is a more important end than any other end or any combination of other values; and so it is irrational to observe any other principle that conflicts with this end'. This is the most reasonable interpretation of Machiavelli's favourable remarks about Roman civic virtue. The Romans (in Machiavelli's image of them) take the preservation of the state to be the supreme end, and subordinate every other end and value to this one; because they organize their lives on this principle, they have civic virtue, and deserve praise for it.

Why, then, does Machiavelli believe that the preservation of the state should be the overriding end? He could certainly find widespread support in Classical theorists for the view that civic life is the best form of life, or one of the best forms of life, for a human being, or that

life in a state is necessary for other goods that make life worth living. We might even concede to him that if we face a choice between the preservation of this state and an irrevocable relapse into the disorganized, fragmented, insecure way of life that would result from the non-existence of any state, we ought to preserve the state at all costs. But any such concession clearly falls far short of the conclusion that Machiavelli needs. For he appeals to civic virtue to show that we ought to prefer the preservation of this particular state, as an independent political entity with this particular form of government, over anything else, whatever the moral cost might be. Nothing we have said seems to support this extreme claim.

Greek and Roman theory and practice seem to reject the extreme claim. Throughout Greek history groups within a city were willing to compromise its political independence in order to change the constitution; both sides did this in Athens at the end of the Peloponnesian War, and Polybius defends those who preferred Macedonian control over the degree of independence that allowed pro-Spartan oligarchies to rule.[21] These are not exactly cases of a conflict between the preservation of the state and the observance of moral principles; but they show that the end Machiavelli regards as overriding is at least not self-evidently overriding. His appeal to antiquity does not support his claim that unconditional loyalty to Athens or Florence is more reasonable than, say, loyalty to Athens or Florence with this constitution and this way of life following these moral principles. If the price of preserving the state is the violation of a principle that partly defines the object of our loyalty, then it is not clear that we always ought to preserve the state.

This objection to Machiavelli does not dispose of all the reasons that might be offered for choosing immoral means to the preservation of the state on particular occasions. But at least it casts doubt on his claim that we ought to pay any moral cost, however steep, because the mere preservation of the state, irrespective of its character or constitution, is the supreme end. The fact that his supreme end violates morality does not show that it needs no defence; and he offers no defence of it.

Perhaps, then, he does not intend the extreme claim that the preservation of the state is the supreme end. A more moderate defence of his position might set out from the assumption that all virtues, moral principles, and other values derive their value for an agent from the agent's choice of some ultimate end. If the ultimate end is the source of all other values, we cannot appeal to any of them to defend the choice of an ultimate end. If, then, we choose the preservation of the state as our ultimate end, we cannot appeal to the moral virtues, whose value for us is entirely derived from our choice of ultimate end, to justify moral restraints on our pursuit of this ultimate end. Hence we should be willing to violate the moral virtues for the sake of this ultimate end.

406. Instrumental Practical Reason

This defence has an advantage over the extreme defence, since it does not require Machiavelli to explain why the supreme end he picks is the best one to choose. He no longer has to pronounce on this question. He is free to say that neither the Christian nor the civic ideal

[21] Polybius xviii 14.

(understood as entirely devoted to the preservation of the state) is more rational than the other. In that case, he has nothing to say against us if we choose the outlook of the moral virtues, but he warns us that we had better recognize the price we must pay. Since he is not willing to pay the price, he prefers to subordinate morality to the preservation of the state. He is not claiming that the moralists are wrong, but simply warning us that if we listen to them, we may find the results disagreeable.

This second interpretation of Machiavelli's position makes it easier to understand why he sometimes offers his advice in a conditional form that might allow him to deny that he advocates immorality. In the *Prince* he often remarks that he is not saying whether monarchy is a desirable form of government, whether someone ought to have set up a particular regime, or whether a particular regime ought to survive. He confines himself to saying what a ruler has to do if he wants to survive, and what will affect his reputation in different ways. He need not concern himself with questions about whether there ought to be any such rulers or whether they ought, all things considered, to act in the ways he describes.[22]

It is more difficult to make this interpretation fit the *Discourses*, however; Machiavelli does not seem to be neutral on the question whether the unconditional preservation of the state is the supreme end, or whether civic virtue should be cultivated. But perhaps his partisan position can be reconciled with a refusal to evaluate ends. He might consistently admit that he is offering no reason for preferring the end that he prefers, but, since he prefers it, he advocates the course of action needed to advance it.

If this is the right interpretation of Machiavelli, it is easier to see why he does not offer any justification of his preferred ultimate end. If he thinks that justification has to proceed by reference to some more ultimate end, he has a reason for denying that the choice of one or another ultimate end can itself be justified. On this point he anticipates an argument of Hume's. The Humean argument might be taken to develop one aspect of a voluntarist treatment of will and reason. When Henry of Ghent maintains the subordination of intellect to will, he suggests that intellect is limited to the role of counsellor or guide along the path that the will chooses.[23]

One aspect of this argument is Aristotelian, and not exclusively voluntarist; for it is a standard Aristotelian view that—in some sense—the ultimate end provides the justification for other ends, and is not itself justified. But Aquinas does not infer that a choice between different conceptions of the ultimate end cannot be justified. The ultimate end that Aquinas takes as the starting point for further justification is the human good, identified with happiness; he believes that this can be specified enough to justify one conception of the ultimate end over another.

This is the point at which Machiavelli disagrees. Though he gives no reason for disagreeing with Aquinas, he identifies a point where Aquinas' position especially needs defence. Aquinas assumes that our views about worthwhile ultimate ends can be reconciled and explained in the light of his conception of happiness; if he is wrong about this, but still accepts a teleological pattern of justification, the questions raised by Machiavelli become more pressing.

But even if we think Machiavelli has raised a reasonable question, we need not follow him to his conclusion. For even if we find it difficult to say why one ultimate end is preferable to another, we ought to find it even more difficult to believe that it is never more reasonable

[22] On advice and generalizations see W i 69–73.

[23] See §389.

to prefer one over another. It seems possible to form trivial and silly conceptions of what is ultimately worthwhile; and Machiavelli does not try to persuade us that these are just as reasonable as any other conception. Once we admit this, we may well be surprised by the suggestion that we should take the unconditional preservation of the state as our ultimate end. If we separate unconditional loyalty to this state from loyalty to a certain kind of state, it does not seem a particularly reasonable end, given the costs that it is likely to involve.

It is still less obvious why a ruler should take the preservation of his own power as the ultimate end. Why should we not suppose that he has a mistaken conception of what is most important? Since he stands to lose heavily if he is driven from power, we may suspect that he exaggerates the importance of his staying in power. Machiavelli makes his conception of the overriding end seem more attractive and plausible because he tries to connect it with the Classical ideals of civic virtue; but the connexion breaks down at the very point where he needs it to prove his case. Once he departs from pagan as well as Christian morality, he removes one crucial support for his claim that there are worthwhile ultimate ends for which the Christian virtues have to be sacrificed.

One might argue that it does not matter if Machiavelli has no rational defence for the overriding end that he favours; for perhaps he can show that it is our natural and inevitable end, and that we will take the necessary means to it once we see that they are necessary for that end. This is the basis of Hobbes's argument for some of Machiavelli's conclusions about the paramount importance of the preservation of the state.[24] But it is difficult to argue that preservation of the state or of the present regime in the state corresponds to any natural and inevitable end of human motives. To show that it is connected with any such end, we need to show that the preservation of the present regime is necessary for reliable and secure self-preservation. Hobbes tries to find arguments to support this conclusion. His difficulty in finding such arguments suggests that Machiavelli's position is difficult to defend.

But even if we reject Machiavelli's argument to show that there is some conflict in principle between the Christian virtues and the appropriate sort of loyalty to the appropriate sort of state, we have not necessarily disposed of his objections to moral constraints on the preservation of the state. Many of the considerations he appeals to could be used in support of a different argument. We might argue that, in the actual circumstances we face, any moral system that allows overriding importance either to Christian or to pagan moral virtues must also face conflicts. Even if we do not demand unconditional loyalty, we may find, for instance, that the preservation of a just state seems to require resort to immoral means. Lenin and Trotsky came to this conclusion in their defence of the Bolshevik Revolution. They were not concerned with the territorial integrity of the former Russian empire for its own sake, but they believed that they could not preserve or construct a just society without resort to apparent immorality.

The existence of such conflicts need not result from a confrontation between two opposed ideals; it may turn out that one and the same ideal pursues aims that are not incompatible in principle, but turn out to result in serious conflicts when we try to realize them in the actual circumstances. The discovery of these conflicts, if they are serious and widespread enough, will show us that we cannot rely on our moral ideal for the sort of guidance that we might reasonably expect; and then we may want to consider whether our moral ideal needs to be revised.

[24] See Hobbes, *L*13.14.

This way of using Machiavelli's argument does not count as an interpretation of it; for he clearly intends a more radical criticism of morality than would follow from the exposure of internal conflict. But this more moderate use of his arguments may result in a more damaging criticism of the ideals connected with morality. We should therefore look more closely at Machiavelli's reasons for thinking that we will often have compelling reasons for rejecting the normal constraints of morality.

407. Morality and Circumstances

Aristotelian ethics relies on some assumptions not only about human nature—the sort of creature a human being is—but also about what human beings are like in actual circumstances. It also relies on assumptions about other external circumstances—the material resources available, the different kinds of dangers and threats presented by the external world and by other societies. In the *Politics* Aristotle makes it clear how important these assumptions are in arguments to show that particular virtues are to be cultivated in one or another set of circumstances.[25] The ideal state, in which the Aristotelian virtues can be fully developed, needs the right sort of people, with the right sorts of occupations, and therefore in the right sorts of material circumstances.

Aristotle insists that the conditions taken for granted by a political theorist should not be totally unrealistic; they should not assume that human beings are omniscient or free of their normal tendencies to vice, or that they can achieve physical security and comfort without any effort. But though our assumptions should not be unrealistic to this degree, Aristotle allows them to be quite demanding; the description of the ideal state and of the virtues of its citizens is not meant to present an attainable ideal for all of us in our ordinary circumstances.

Aquinas' conception of the virtues is intended to make them less dependent on favourable circumstances than they appear to be in Aristotle's account.[26] Still, Aquinas must make some assumption about reasonably favourable circumstances; these are the circumstances in which the actions normally characteristic of the virtues can be expected to have the results that make them appropriate expressions of the virtues.

Magnanimity, for instance, requires people to accept gracefully the honours they receive for virtuous actions; this requirement presupposes circumstances in which people will be honoured for the appropriate actions. Justice requires us to keep promises; this requirement presupposes circumstances in which we trust other people enough to keep promises. The virtues that involve reference to other people and to external circumstances have to rely on presuppositions about people and circumstances, if they are to give us definite advice about what to do. In metaphysical terms, virtues impose a certain form on the actions and circumstances that provide their matter; the characteristics of the matter affect the sort of form that can be imposed on it, and the means that allow the form to be imposed.[27]

[25] See, e.g., *Pol.* vii 4–7.

[26] Aquinas' accounts of bravery and magnanimity, e.g., make these virtues applicable in conditions where the corresponding Aristotelian virtues would not apply. See §331.

[27] Machiavelli uses the contrast between matter and form at i 18.5.

Machiavelli's arguments are relevant to this feature of a moral theory, since they tend to reject the presuppositions that normally underlie the moral virtues. Machiavelli's remarks about human nature suggest that we cannot rely on other people as much we would have to if the virtues were to have their 'normal' application. People do not in general behave like rational agents. Even if they live in a sound and uncorrupted republic, they are not content with what they have, but are always looking for novelty, and begin to seek domination over other states.[28] Hence prosperity and success lead to corruption; and when people are corrupted, they are even more unreliable (e.g., *D* iii 8.5–6).

Corruption arises gradually, especially from inequality (i 17.5). It is difficult to reverse, since any reversal requires re-education; and once corruption has happened, strong action is needed to restore the state to its original sound condition. Restoration requires either the elimination of small defects before they become too serious, or removal of the large defects after they have become apparent. But Machiavelli thinks neither of these courses of actions is very likely. Before the defects have become serious, they are likely to be unnoticed or ignored; and after they have become serious enough to be noticed, it is too late to do anything about them by normal 'constitutional' methods, since these normal methods will also have been corrupted (i 18.5).

At this point extraordinary means are needed to remove corruption and to restore the state to its original soundness. But Machiavelli thinks this is unlikely to work out satisfactorily.[29] The sort of person who is likely to be willing to seize power in a corrupt republic is not usually the sort of person who might be expected to remove its corruption.

In Machiavelli's view, then, the circumstances of a republic are always precarious. In favourable external conditions, people's desire for novelty and domination tends to begin the processes leading to corruption; and in unfavourable conditions the corruption is difficult to remove. The Greek view that we should establish the best constitution, and then make sure by legislation and moral education that it does not collapse, does not fit Machiavelli's view of the actual circumstances. He does not believe that the right legislation and moral education will produce the moral characters and the forms of political and social life that will maintain the best constitution. On the contrary, he believes that states find it difficult to restrain their tendency to corruption. 'Normal' political behaviour, in which we can reasonably assume that the state will survive in its present form or in a better form, has no place in Machiavelli's account of the relation between human beings and their social environment.

408. Adaptation to Circumstances

In the light of these views, Machiavelli forms a conception of virtue that is quite different from the moral virtues recognized by the moralists he opposes. External conditions, summed

[28] See i 37.1; ii, Pref.7 (where W cites Polybius vi 57); iii 21.2 ('. . . men are fond of novelty; so much so that it is often those who are prosperous who desire it than those who are in evil plight'); *P* 3, 103.

[29] 'Hence it is necessary to resort to extraordinary methods, such as the use of force and an appeal to arms, and, before doing anything, to become a prince in the state, so that one can dispose it as one thinks fit. But, to reconstitute political life in a state presupposes a good man, whereas to have recourse to violence in order to make oneself prince in a republic supposes a bad man. Hence very rarely will there be found a good man ready to use bad methods in order to make himself prince, though with a good end in view, nor yet a bad man who, having become a prince, is ready to do the right things and to whose mind it will occur to use well that authority which he has acquired by bad means' (i 18.5–6).

up by Machiavelli under the head of 'Fortune', interfere with everyone's plans; but he does not think we should just resign ourselves to frustration by fortune. On the contrary, part of virtue is the capacity to plan effectively for the results of fortune, so that they will not ruin our plans completely; for though we cannot control it, we can to some extent foresee it, and adapt ourselves to it when it happens.[30] For this reason Machiavelli argues that virtue as well as fortune played a large role in the rise of Rome (ii 1–2).

From his remarks about fortune Machiavelli infers that virtue consists in being prepared for fortune. The Stoics might agree with him, but not exactly in the sense that he has in mind.[31] In his view, virtue, and especially prudence, consists in the ability to adapt ourselves to fortune. To this extent his conception of prudence is closer to the one that is most familiar to us than to an Aristotelian conception. Machiavelli remarks that in the wars that the Romans won 'it will be seen that in them, mingled with fortune, was virtue and prudence of a very high order' (ii 1.4). The prudent person does not care about loss of honour or dignity if the dishonourable course is the most efficient way to deal with present circumstances (i 38.2). Someone who refuses to change his character to fit the demands of the circumstances is bound to come off worst (iii 9). The Romans showed their prudence in so far as they dealt with fortune actively, by anticipating it and adjusting to it.[32] But most people cling irrationally to tactics that have succeeded in the past, so that they cannot deal with new circumstances.[33]

Machiavelli's advice to be adaptable might be interpreted in more than one way. Some sort of adaptability is reasonable; if we care enough about our ends, it is foolish not to think about ways to secure them in different circumstances. Totally inflexible people simply show that they are too lazy or too unconcerned to think about ways to promote their ends. But some circumstances make it more difficult to promote some ends than others, and in these cases we face a choice between failure and adaptation. It is not clear in this case why Machiavelli should always advise adaptation. Some of our goals consist in trying to achieve particular results, while other goals consist in acting in particular ways. If the first sort of goal conflicts with the second, it is not clear why the second should always give way. In advising complete adaptability Machiavelli seems to assume that every other aim should give way to the aim of achieving what we can in the circumstances.

Once we accept Machiavelli's conception of the ends to be aimed at, and of the circumstances in which we have to aim at them, his view that virtue differs from the recognized moral virtues becomes easier to understand. However admirable it may be for rulers to keep their word, they must, in the prevailing conditions, be ready to break it. They

[30] '[Fortune] shows her power in places where no virtue has been directed (ordinate) towards resisting her; she directs her onslaught to those places where embankments and dams have not been constructed to retain her' (*P* 25, 363).

[31] Skinner, *M*25–7, presents a somewhat misleading contrast between Classical moralists (who think fortune favours the brave and whom Machiavelli follows) and Christians (especially Boethius, who think of fortune as indifferent to human aims). The 'Christian' conception is also Stoic, and therefore Classical.

[32] 'Nor were they ever satisfied with what is constantly on the lips of current sages, "reap the benefit of time", but rather they reaped the benefit of their virtue and prudence' (*P* 3, 117). The Romans displayed the prudence that 'consists in knowing how to recognize the character of the obstacles and in choosing the lesser evil as good' (*P* 21, 339).

[33] 'Nor is there a man prudent enough to know how to adjust to all this; either he is incapable of deviating from what nature inclines him to do, or else, since he has always flourished by keeping to one path, he is unable to persuade himself to leave it . . . Yet if nature were to change with the times and circumstances, fortune would not change' (*P* 25, 367).

must resort to both force and fraud when the occasion demands them.[34] In advocating force and fraud, the tactics of the lion and the fox, Machiavelli alludes again to Cicero's condemnation of such tactics. When Cicero mentions these two ways of committing injustice, he remarks that 'both are most foreign to a human being, but fraud deserves greater hatred' (*Off.* i 41).[35]

409. Exceptions to Morality?

Machiavelli's argument for the legitimacy and appropriateness of fraud is not completely clear; in fact he seems to rely on two arguments, whose combination makes his claim seem less immoral than he intends it to be. He argues: (1) We have to take account of the fact that other people are dishonest and cannot be relied on; and so we have to be prepared to forestall their dishonest behaviour. (2) Considerations of efficiency often suggest that we should break promises; we should make and break them simply on grounds of self-interest.

If we accept the first argument, we have some reason to reject the second. We may reasonably cite other people's wickedness as a moral defence of our behaviour. Machiavelli points out that the circumstances in which a promise is made reasonably affect one's obligation to keep it (*D* iii 42), so that, for instance, a promise extracted by force may be regarded as non-binding. He might appear to be arguing for limits on our moral obligation to keep promises. But if we think we need to make a moral case for breaking our promises, we do not suppose that expediency is all that matters; hence we will reject Machiavelli's second argument, which appeals exclusively to expediency.

If, however, we accept Machiavelli's second argument, it is not clear why his advice would be invalid, as he says it would be, if other people were just and reliable. When most people keep their promises, the advantage to be gained by a false promise is often greater, since people will be readier to believe that you will keep your promise and will be taken off guard if you break it. The second argument makes it irrelevant to ask whether I am violating a promise to an honest person who is morally entitled to rely on me.

Apparently, then, Machiavelli's reliance on these two argument reveals some confusion of thought about the relation of morality and expediency. Each argument seems to undermine the other. But their combination may none the less appear to help his case. For if we confusedly suppose that the moral considerations he offers justify the unscrupulous policy he advocates, we may overlook the immoral character of his policy.

We will perhaps move more readily from Machiavelli's first claim to his second if we believe that the demands of morality are entirely abrogated whenever we cannot count on their reciprocal observance. This might be thought either to support, or to follow from, the view that morality consists in the observance of mutually recognized rules, and therefore requires the existence of stable social institutions enforcing compliance and reciprocity.

[34] 'Hence a prudent ruler cannot and should not respect his word, when such respect works to his disadvantage and when the occasions that made him promise no longer exist. And if all men were good, this precept would not be good; but since they are bad and do not respect their own promise to you, you need not respect your promise to them either' (*P* 18, 281).

[35] W i 104 discusses Machiavelli and the relevant senses of 'fraud'.

This is Hobbes's view of morality.[36] But it is not clear that we should accept it; certainly a defender of such a view cannot take it for granted that all moral obligations are cancelled towards those who violate moral obligations. It is reasonable to say that we have different moral obligations in these cases; but that admission does not force us into acceptance of Machiavelli's second argument.

He might mislead both himself and us because of another obscurity in his advice. Many of his examples suggest that he is advocating this policy: (1) Disregard ordinary constraints of morality when the survival of the state depends on disregarding them.[37] This policy applies to many of the incidents that Machiavelli records from Roman history, when the Romans thought they had their backs to the wall and that extraordinary means were needed. But his policy on promises is rather different: (2) Take account only of instrumental considerations in deciding what to do for the preservation of the state.

The second policy implies, but the first does not, that one should never be willing to pay any price in efficiency in order to follow the requirements of morality. Machiavelli suggests, however, that we ought to endorse it if we endorse the first policy. Perhaps some of the ordinary rules of morality are suspended if we face genuine emergencies. As he argues, considerations of glory and honour may be secondary to the safety of the state, if our survival depends on it (cf. *D* iii 41). But if this is so, the adoption of extraordinary means in emergencies is consistent with acceptance of the moral virtues; for the moral virtues leave room for these extraordinary means. Machiavelli seems to argue that since extraordinary means are morally acceptable in emergencies, we ought to disregard morality altogether in all circumstances. The argument is not only unconvincing but also inconsistent; for if we think it matters to find moral grounds or permission for extraordinary means in emergencies, we cannot consistently suppose that moral considerations never matter.

Perhaps this conflict in his argument is less evident to Machiavelli because he does not see any sharp distinction between ordinary and extraordinary circumstances. Given the inherent defects in human nature, and the ever-present danger of corruption, every situation is an emergency in which the prudent politician must be ready to use measures that (from the moral point of view) might be regarded as extraordinary. We cannot count on finding circumstances in which it is safe to follow the ordinary moral rules prescribing the conduct typical of the different virtues.

The demand for extraordinary means assumes that any middle course is disastrous. We might be tempted to conclude from Machiavelli's arguments that we need to be prepared to compromise—that on the whole we should follow the recognized moral virtues, but we should be ready to depart from them in an emergency, to the minimum degree that seems necessary to resolve the immediate difficulty. But Machiavelli believes that this effort to incorporate his advice into a more respectable and traditional framework is bound to get the worst of both worlds. A strictly moralistic course of action, indifferent to worldly success or civic considerations, is at any rate consistent; we know where we are with such people, and we will keep them out of public life. But if we adopt immoral means only reluctantly and in

[36] Hobbes draws this sharp distinction between the state of nature and the commonwealth at *L* 15.40.

[37] Cicero endorses a restricted version of this principle: 'For them [sc. consuls exercising military command in the field] let the safety of the people be the supreme law' (*Leg*. iii 8). See W ii 207.

small doses, they will not have the proper effect; too little severity today will only make the situation worse and require more severity tomorrow.

He argues, therefore, that we ought to set out on the immoral course whole-heartedly and without any half-measures. We cannot hope to keep a republic exactly in the right condition; and so it is better to be frankly aggressive and to pursue expansion in the hope of maintaining the status quo (i 6.10).[38] We face a clear choice between the moral virtues and the unscrupulous outlook; and his warnings about the dangers of corruption in a republic imply that any politician will have to be prepared to 'enter on the path of wrong doing'. Though Machiavelli speaks as though he is giving advice only to people who want to be tyrants, the principles underlying his advice support a much broader rejection of morality.

He defends his advice by arguing that people who have listened to their moral objections to ruthless measures have made things worse than they would have made them if they had frankly and whole-heartedly disregarded moral scruples. The scrupulous policies of Soderini, whose excessive mildness and reluctance to use harsh measures caused his overthrow, show why it is a mistake to shrink from immorality (iii 3.2; cf. i 52.2). Soderini failed to adapt himself as he should have to circumstances (iii 9.5; cf. iii 30.4). The foolish people who try to practise the ordinary moral virtues, even in cases where the overriding end requires immoral means, defeat all of their ends. Instead of condemning ourselves to such failures, we ought to make up our mind about which ends we are going to take to be primary.

Even if Machiavelli were right to claim that 'extraordinary' measures should be more ordinary than we suppose, he hardly shows that extreme situations occur so often that the moral principles applying to non-extreme situations are inapplicable to practice. Moreover, the more convincing he makes his case to show that normal moral restrictions should be suspended, the more he undermines his case to show that expediency is all that matters. For the most convincing case for suspension of ordinary moral restraints will draw attention to the prohibitive moral cost of sticking to ordinary restraints. The more strongly we can demonstrate the prohibitive moral cost, the more we support the moral principles in the light of which we assess moral costs. If Machiavelli simply argued that sometimes morality involves some sacrifice of advantage, he would hardly make a convincing case for the immoral course of action. He has a much stronger case if he appeals to moral cost; but that appeal does not show that moral considerations are irrelevant; on the contrary, it acknowledges that they are relevant.

410. The Strength of Machiavelli's Objections to Morality

Machiavelli's case against the moral virtues seems to generalize hastily from a few examples.[39] He does not consider the broader consequences of the tactics that he advocates. In inter-state relations mutual distrust is no less damaging to the interests of each state than naive

[38] 'Such methods are exceedingly cruel, and are repugnant to any form of life (vivere), not only Christian, but also human. It behooves, therefore, every man to shun them, and to prefer rather to live as a private citizen than as a king with such ruin of human beings. None the less, the sort of man who is unwilling to take up this first course of well doing, if he wants to hold what he has, he must enter on the path of wrong doing. Actually, however, most men prefer to steer a middle course, which is very harmful; for they know not how to be wholly good nor yet wholly bad . . .' (i 26.3; cf. i 30.2; ii 23.2). On Machiavelli's use of 'vivere' for social and political life see Rinaldi ad loc., n19.

[39] W i 102–14 criticizes some of Machiavelli's claims.

trustfulness would be. Machiavelli has something in common with many people who suggest that the moral virtues do not pay; he offers arguments for his own side that are much less rigorous than those he demands from his opponents. If one concedes that there are cases of the sort Machiavelli describes, it is equally necessary to consider the destructive effects of ruthlessness within a society and of deception in relations between societies.

It is doubtful in the end whether Machiavelli actually leaves himself with a more coherent outlook than the one he rejects. In his view, the only consistent course of action for advocates of the Christian virtues is to retire to a monastery; their efforts to combine Christian virtues with civic virtues result in a half-hearted and dangerous attitude to the needs of states and citizens. But his own position seems to contain an internal conflict at least as serious as the one he alleges in his opponents' views. For the tactics he recommends to political leaders seem to conflict with his admiration for civic virtue. He recognizes that a sound republic depends on general confidence in the observance of laws; but he advises rulers to disregard these laws whenever it is to get rid of their opponents. As an advocate of civic virtue he advocates loyalty by citizens to rulers whom they have no reason to trust; in expecting them to be loyal to a community, he is indifferent to the character and behaviour of the rulers of the community. As he recognizes, the sort of person who is willing to take the measures needed for effective government is not likely to be the sort of person who inspires trust.

But even if Machiavelli's own position is incoherent, he might still have found serious objections to the moral outlook that he criticizes. Suppose it is true that in a significant number of cases the preservation of a state requires measures that would normally be rejected as immoral. What should the defender of the moral virtues say in reply? Three main types of answers might be considered: (1) Morality, as normally understood, is supreme, and the price has to be paid. If survival ever requires killing of the innocent, it requires something that is absolutely wrong, and we must forgo survival. (2) Morality is not supreme; when these issues are at stake, it does not apply, and it should not restrain us from taking the prudent course of action. (3) Morality is supreme, but it does not require us to pay the extreme price; it can explain why what would ordinarily be impermissible is required or permitted in these extreme cases.

The only possibility that Machiavelli really considers is the first. He assumes that the defender of the Christian virtues is obliged to condemn all emergency measures, and thereby is obliged to admit that the Christian virtues are not a promising option for anyone who has some concern about social and political life. Machiavelli has a rather loose conception of an emergency; he tends to confuse genuine emergencies with cases where nothing more than the survival of a particular government is at stake. Still, we may concede for the sake of argument that there are cases like the one faced by Soderini, where the survival of a free community depends on the adoption of measures that would normally be rejected. How should Machiavelli's moralist opponents respond?

Moralists who reject extraordinary means in principle seem to set themselves against concern for social and political life. But then what, we may ask, is the point of their system of virtues? The other-worldly answer that Machiavelli envisages is one consistent answer. But it is not available to Aquinas; for he thinks the moral virtues are not simply a preparation for the afterlife, but contain the right principles for the organization of social life that recognizes

a human being's political nature. An extreme world-renouncing view seems to threaten the social character of Aquinas' moral outlook.

Does this make it difficult to defend the first answer to Machiavelli's objections? This question depends partly on how often the situations described by Machiavelli arise. Defenders of the first answer, holding that some measures are absolutely wrong whatever the cost, point out legitimately that the cases where an action is both clearly immoral and clearly required by circumstances are difficult to identify in actual conditions. Machiavelli's examples seem similar to the artificial examples in which the deliberate killing of one innocent person is both necessary and sufficient for saving the lives of many other innocents. Even though Machiavelli's examples are historical rather than fictional, they are similar to fictional examples in failing to consider the possibility of other measures that would not be open to the same moral objections.[40]

But though this defence shows that the first answer may not have the extreme and costly consequences that might appear to result from it, we may doubt whether it entirely answers Machiavelli. If morality refuses to acknowledge the possibility of emergencies in which extreme measures are needed to defend those social relations that are necessary for the embodiment of the moral virtues in social life, morality seems to undermine its own necessary conditions.[41] A supporter of Aquinas' conception of social morality has some reason to reject the sort of absolutism that allows no room for emergencies.

The second answer to Machiavelli's objections might appeal, in different forms, to Luther and to Hobbes. For each of them, for different reasons, tries to withdraw some of the moral virtues from any competition with the outlook that Machiavelli advocates. From Luther's Augustinian point of view—or at least from one of Luther's points of view, corresponding to one Augustinian point of view—the Christian virtues are other-worldly, and do not apply to secular rulers in secular situations. Different standards apply to secular rulers, and they are allowed to operate independently of moral scrutiny from the Christian point of view.[42] From Hobbes's point of view, the virtues are relevant only when the essential background of peace and stability is assured; and this is the background that concerns Machiavelli. Hobbes's account of morality relieves Machiavelli from any need to admit that the measures he advocates are immoral; they are simply beyond moral evaluation.

The third answer would no doubt appear to Machiavelli to be the sort of unsatisfactory compromise that he condemns. But the very considerations that make his examples seem attractive support the third answer. If we are moved by any of Machiavelli's examples, it is not because we recognize some conflict between moral considerations and some totally different kind of consideration. That might be our reaction to a conflict between the demands of morality and those of art or culture or religion. Whatever questions are raised by these sorts of conflicts, they do not seem relevant to the present issue. If we agree with Machiavelli

[40] Geach, *V* 114–16, discusses related issues, suggesting that it is not clear how often immoral means are the only effective ones.

[41] Rawls, *TJ* 217, recognizes circumstances where liberty may reasonably be limited for the sake of forming conditions for the fuller exercise of liberty.

[42] This concession from the Christian point of view does not lead directly to Machiavelli's conclusion; for Christians who hold this view still assume that the secular moral virtues will guide secular life. But it may be easier from this point of view to regard secular morality as simply a means to the ends of secular life, rather than forming the ends against which it can be evaluated.

that extreme measures are sometimes necessary, we recognize that people's survival and welfare are involved; and indeed if someone failed to take extreme measures, we might well think he was open to moral condemnation for sacrificing the lives and welfare of the people who could have been saved. The very fact that absolutist theories try to justify failure to bring about a great good at the cost of some moral evil shows that we are powerfully impressed by the moral force of the argument for extraordinary measures. If we are really moved by moral considerations here, then it seems that we ought to be able to articulate these considerations within our general view of the moral virtues.

The mere acceptance of this solution does not imply that an account of the virtues can easily be adjusted to suit Machiavelli's objections. If the kinds of cases that concern him arise very often, then any attempt to take account of them might result in principles and policies very different from those that Aquinas connects with the moral virtues. But here we should recall the limits of Machiavelli's argument. The fact that in some cases some moral considerations have to be sacrificed to others does not show that no moral consideration ever has anything more than an instrumental role. A reasonable view of which elements in Machiavelli's case are plausible makes it easier to see how his opponents' position can be defended.

We ought to conclude, then, that Machiavelli presents no devastating objection in principle to the account of the virtues and of human welfare that is defended by Aquinas. His arguments and examples might appear to show that the Christian virtues are irrelevant or harmful in social and political life; but this appearance is deceptive.

29

THE REFORMATION AND SCHOLASTIC MORAL PHILOSOPHY

411. Objections to Scholasticism

Modern moral philosophy developed especially in England, Scotland, and Germany, in areas where the Reformation was widely accepted, in its Lutheran, or Calvinist, or Anglican forms. Since mediaeval moral philosophers were also theologians, expounding the doctrines and practices of the mediaeval Latin Church, and since the Reformers rejected some of these doctrines and practices, it is worth considering whether the religious and theological disputes connected with the Reformation affect prevalent attitudes to mediaeval moral philosophy.[1]

We may recall some of Aquinas' views about the relation of theology and moral philosophy: (1) His theology explains why it is worthwhile to engage in moral philosophy. God's wisdom reveals itself in the natural law, and in the system of moral virtues that we can construct on the basis of what we know in the natural law. The Christian doctrine of God and creation, as Aquinas understands it, justifies us in supposing that God has created us with the capacity to find the truth about the world and about ourselves by rational inquiry. Aristotle's ethics is the system that results from the most successful use so far of our capacity for rational inquiry. Hence, we have reason to suppose that it shows us the truth, and that it reveals to us part of the mind of God. (2) Aquinas' theology not only makes room for moral philosophy, based on reason without revelation; it also relies on the conclusions of moral philosophy. The virtues that result from the infusion of divine grace do not require us to reject or to abandon the acquired virtues. They build on the acquired virtues, and perfect them, even though they also go beyond them in aiming at an ultimate end beyond anything that we can conceive or realize through the acquired virtues.[2] Part of the reason for supposing that the infused virtues are genuine virtues is the fact that they

[1] 'The Reformers' include Luther, Melanchthon, Calvin, and confessional documents of various dates (including the Augsburg Confession (1530), the Westminster Confession (1647), and the English Articles (1553, 1563)). Schaff, *CC* iii, prints these documents.

[2] See §353.

fit the acquired virtues in these ways.[3] (3) Aquinas discusses the nature of sin, free will, divine grace, justification, faith, and good works. His views on these questions are closely connected with views about the role of the institutional Church in (for instance) the grace conferred in baptism and the Eucharist, the functions of confession and repentance, and the relation of the monastic to the secular way of life.

Though we have seen that Aquinas' successors do not agree with him about everything, the summary we have given applies fairly well to later Scholasticism as well, and suggests a starting point for comparison with the Reformers. It is easy to see that the Reformers reject Scholastic views in the third set of questions, about the Christian doctrine of salvation, and about its institutional implications for the life and discipline of the Church. Disputes on these questions are elaborated in the Reformers' confessions of faith and the responses produced by the Council of Trent.

These disputes are connected with disputes on the first and second sets of questions. Luther and Calvin assert that the Scholastics are mistaken in their views about the acquired moral virtues and their relation to the moral demands of the Christian faith. These Scholastic errors are connected to errors about freewill. The Reformers oppose these errors through their distinctive doctrines of predestination, election, grace, and faith.

Luther and Calvin advocate the study of Scripture without the overlay of Scholastic doctrine. Luther sometimes suggests that this doctrine is not only unhelpful, but positively misleading in the search for a true understanding of Scripture.[4] He charges that the Scholastics have replaced the genuine Church with a 'Thomist or Aristotelian Church'.[5] One of his early works, the 'Disputation against the Scholastic theologians', is a long list of Scholastic theses he rejects.[6] Calvin conveys the same judgment in constantly referring to the Scholastics as 'sophists'.[7] Neither Luther nor Calvin rejects the use of post-Biblical authorities to understand Christian doctrine. They often cite Augustine with approval, and criticize some Scholastics for misunderstanding him.[8]

[3] See Aquinas, *ST* 1-2 q65 a2–3.

[4] 'Indeed, I believe that I owe this duty to the Lord of crying out against philosophy and turning men to Holy Scripture. For, perhaps, if someone else who had not been through it all were to do it, he would either be scared to do it or he would not be believed. But I have been in the grind of these studies for, lo, these many years, and am worn out by it, and, on the basis of long experience, I have come to be persuaded that it is a vain study doomed to perdition' (Luther, *Rm.* 8:19 = Pauck 236).

[5] See *Babylonian Captivity* = *Works* xxxi = Dillenberger 265–6. Luther is discussing the doctrine of transubstantiation, which he ascribes to Aquinas' misunderstanding of Aristotle's doctrine of substance and accident. He concludes: 'I feel we ought to be sorry for so great a man, not only for drawing his views from Aristotle in matters of faith, but also for attempting to found them upon a man whom he did not understand, thus building an unfortunate superstructure on an unfortunate foundation'.

[6] See C v 320–6 = *Works* xxxi 9–16. Some of his comments on Aristotle: (41) 'Almost the entire *Ethics* of Aristotle is the worst enemy of grace. (42) It is an error to maintain that Aristotle's doctrine concerning happiness does not contradict Catholic doctrine. (43) It is an error to say: without Aristotle no one becomes a theologian. (44) On the contrary, no one becomes a theologian unless he does it without Aristotle.'

[7] See, e.g., *Inst.* i 16.3, with McNeill's note (200n5).

[8] 'Now let us hear Augustine speaking in his own words, lest the Pelagians of our own age, that is, the Sophists of the Sorbonne, according to their custom, charge that all antiquity is against us' (Calvin, *Inst.* ii 3.13). 'Moreover, they unjustly set the fathers against us (I mean the ancient writers of a better age of the church) as if in them they had supporters of their own impiety. If the contest were to be determined by the authority of these fathers, the tide of victory—to put it very modestly—would turn to our side' (*Inst.*, Pref. §4). 'Obviously, he [sc. Peter Lombard] intended to follow Augustine's opinion, but he follows it at a distance and even departs considerably from the right imitation of it. . . . The schools have gone continually from bad to worse until, in headlong ruin, they have plunged into a sort of Pelagianism'

Though the Reformers attack Scholasticism, it is not always easy to see what these attacks imply about Aquinas. They normally have in mind the views of later Scholastics. Calvin sometimes discusses the 'sounder Schoolmen', who are less seriously wrong than the later Scholastics.[9] His division between Scholastics deserves to be taken seriously. For on some critical questions in moral psychology and the foundations of morality, the later Scholastics disagree sharply with Aquinas. Hence, some of the Reformers' objections to the Scholastics may not constitute objections to Aquinas.[10] We need to compare the views of the Reformers with Aquinas' actual position, not simply with the Scholastic position as they interpret it.

The Reformers' views on questions in moral philosophy are secondary to their theological arguments. Neither Luther nor Calvin offers the detailed discussion that we find in Aquinas or Scotus. Melanchthon, however, provides an outline of his moral philosophy in a short textbook. Though this material does not amount to a detailed discussion or critique of Scholastic ethics, it gives us enough to ask our main question: does the theological position of the Reformers require a departure from Scholastic moral philosophy?

412. Natural law

The Reformers accept the Scholastic belief in natural law as a source of our basic knowledge of moral principles.[11] They rely on St Paul's remark that the Gentiles without the Mosaic law are a law to themselves. According to Augustine and his successors, St Paul affirms a natural law known independently of revelation.[12] Calvin, agreeing with Aquinas, takes the Decalogue to make clear the requirements of the natural law, which are known independently of revelation. He appeals to St Paul in his support.[13] We know the principles

(iii 11.15). In iii 15.7 Calvin distinguishes the later sophists from Lombard, 'their Pythagoras', who is sound and sober in comparison with them.

[9] After a discussion of Peter Lombard on operating and co-operating grace, he adds: 'I chose to note these two points in passing that you, my reader, may see how far I disagree with the sounder Schoolmen (sanioribus Scholasticis). I differ with the more recent Sophists to an even greater extent, as they are further removed from antiquity' (ii 2.6). In iv 17.14 he suggests that Lombard and others try to explain away the extreme statements by the Papacy on transubstantiation.

[10] Luther's conception of the Scholastic position is largely, but not entirely, derived from Biel (but see n5 above, on transubstantiation). On Calvin's knowledge of Aquinas see Wendel, *Calvin* 126–7. Barth, *TJC* 22 comments on Luther's and Calvin's neglect of Aquinas: '[They] avoided the man in whom they must have recognized, even if he was not then the most widely read author, and whom they ought to have fought as their most dangerous opponent, the true genius of the Catholic Middle Ages. I refer to Thomas Aquinas. . . . The reformers engaged in close combat with late scholastics of the age of decline, about whom we say nothing today, when all the time behind these, and biding his time, stood their main adversary Thomas . . . How could it be possible that in the first half of the 17th century a Lutheran theologian from Strassburg could write a book entitled *Thomas Aquinas veritatis evangelicae confessor*!'

[11] Cf. *West. Conf.* 19.1–2: ' God gave to Adam a law, as a covenant of works, by which he bound (obligavit) him and all his posterity to personal, entire, exact, and perpetual obedience; promised life upon the fulfilling, and threatened death upon the breach of it; and endued him with power and ability to keep it. This law, after his fall, continued to be a perfect rule of righteousness; and, as such, was delivered by God upon Mount Sinai in ten commandments, and written in two tables; the first four commandments containing our duty toward God, and the other six our duty to man.. . . '

[12] The views of the Reformers are summarized by McNeill in 'Reformers' and 'Luther'. He suggests that Zwingli is the most inclined to treat St Paul's remarks on the natural law as simply a reference to especially good pagans who received special grace. See §226 (on Ambrosiaster).

[13] 'For he proves that ignorance is put forward in vain by the Gentiles, since by their deeds they declared themselves to have no small rule of righteousness; for no people did ever at any time so abhor from humanity, that they did not keep themselves within some laws. Since, therefore, all the Gentiles voluntarily, and without any [external] supervisor

of natural law through conscience, and so we cannot plead ignorance of morality as an excuse for our errors.[14] We need the Decalogue to remind us of the requirements of the natural law, but we do not depend on it for our grasp of these requirements.[15]

This description of the natural law gives it an epistemological function independent of the will of God; Ockham accepts this epistemological function, while claiming that it is metaphysically dependent on the will of God.[16] According to Aquinas, the natural law is not only known naturally without revelation, but is also appropriate for human beings with their nature; hence it is the basis of 'intrinsic rightness' (as Suarez puts it), so that morality is not the result of divine imposition, but of facts about human beings. Ockham rejects this view, arguing that the provisions of natural law are the result of divine imposition, and subject to dispensation.[17] It is not clear how the Reformers understand the metaphysical status of the natural law.

Luther sometimes adopts a voluntarist position close to Ockham's. He follows Ockham and Biel in arguing that God's mercy and generosity require the voluntarist conception of the relation between his will and the moral law. Luther argues that if God acted as he does because he sees it is good, then his action is required of him, and he is bound to act as he does. But the Christian doctrine of God's grace and God's love imply that God is not bound to act as he does. His treatment of us is not owed to us in justice, as a response to our merits, but an expression of his mercy and grace. This argument leads Luther into a sharp contrast between the divine and the human will and between divine and human love. God does not love something because it is an appropriate object of love; on the contrary, God makes something lovable by loving it.[18]

(monitore), are inclined to make laws unto themselves, it is out of all question that there are naturally grafted in the minds of all men certain conceptions of justice and uprightness, which the Greeks call *prolêpseis*. They have, therefore, law without law, because, even though they have not the written law of Moses, they are by no means devoid of the knowledge of right and equity; for otherwise they could not discern between vice and virtue . . . He has opposed nature to the written law, meaning that there appeared in the Gentiles a natural light of justice, which supplied the place of the law by which the Jews are taught, so that they were a law to themselves.' (Calvin, *ad Rm.* 2:14).

Luther, *ad Rm.* ad loc. mentions Augustine's two interpretations, and prefers the second.

[14] '. . . natural law is that apprehension of the conscience which distinguishes sufficiently between just and unjust, and which deprives men of the excuse of ignorance, while it proves them guilty by their own testimony' (*Inst.* ii 2.22). Cf. *West. Conf.* 4.2: ' After God had made all other creatures, he created man, male and female, with reasonable and immortal souls, endued with knowledge, righteousness, and true holiness after his own image, having the law of God written in their hearts, and power to fulfil it; and yet under a possibility of transgressing, being left to the liberty of their own will, which was subject unto change. Besides this law written in their hearts, they received a command not to eat of the tree of the knowledge of good and evil; which while they kept were happy in their communion with God, and had dominion over the creatures.' On this difference between the natural law and the command not to eat the apple see §307n45.

[15] 'If the Gentiles by nature have law righteousness (legis iustitiam) engraved upon their minds, we surely cannot say they are utterly blind as to the conduct of life. There is nothing more common than for a man to be sufficiently instructed in a right standard of conduct by natural law (of which the apostle is here speaking)' (*Inst.* ii 2.22). 'Now that inward law, which we have above described as written, even engraved, upon the hearts of all, in a sense asserts the very same things that are to be learned from the two Tables. For our conscience does not allow us to sleep a perpetual insensible sleep without being an inner witness and monitor of what we owe God, without holding before us the difference between good and evil, and thus accusing us when we fail in our duty' (*Inst.* ii 8.1). For further references see McNeill's note ad loc.

[16] See §395. [17] See §395.

[18] *Heidelberg Disputation* = C v 391.30 = *Works* xxxi §28: 'Divine love does not find but creates its object of love. Human love of a human being comes into being through its object of love. The second part is clear and accepted by all philosophers and theologians. For the object of love is its cause, assuming, in agreement with Aristotle, that every

This attempt to connect a voluntarist conception of God's will with the Christian doctrine of God's grace and mercy seems to rest on the confusion that we have found in Biel. The argument seems to assume that if God does not recognize a requirement based on justice, he cannot act on the belief that what he does is the best thing to do, or is appropriate to the nature of the recipient. But this assumption rests on the further questionable assumption that only a voluntarist can give an account of mercy and generosity.

Calvin's position in the dispute between naturalism and voluntarism is less evident. One might expect him to favour voluntarism, given his emphasis on the sovereignty of God. Moreover, some of his remarks on the inscrutability of God's decrees might be taken in a voluntarist sense. This interpretation, however, is too hasty. His description of the natural law as the law of God is indecisive.[19] He takes a more definite position, however, in rejecting the doctrine of God's unqualified power. He denies that God is 'without law' (exlegem).[20] God's will is free of all vice, 'the highest rule of perfection, and the law of all laws'. Hence 'whatever God wills must be accounted just from the very fact that he wills it' (iii 23.2).

This Anselmian formula allows, but does not require, a voluntarist interpretation. Calvin invokes it in his discussion of predestination, in order to answer those who demand to be given a reason that explains to them why God elected those who were elected rather than others. Calvin's denial that we can understand these decrees of God does not commit him to the general claim that rightness is wholly dependent on God's will. In his view, we can reasonably be confident that what God wills is right, even though we cannot always know why it is right; he does not deny that God's willing conforms to standards of rightness that are not wholly dependent on it. Hence he rejects the doctrine of God's unqualified power, antecedent to any standard of right.[21]

Melanchthon expresses the most definite commitment to metaphysical naturalism. It is because moral philosophy relies on facts about human nature that its principles are certain, even though some more specific rules may be merely plausible. For this reason, sceptical doubt about the principles is excluded.[22] When he begins his exposition of ethics,

capacity of the soul is passive and material and acts by receiving . . . The first part is clear, because the love of God living in a human being loves sinners, evil people, fools, and weaklings in order to make them just, good, wise and strong. . . . For sinners are beautiful (pulchri) because they are loved, not loved because they are beautiful.'

[19] *Inst*. iv 20.16.

[20] 'But we do not give any countenance to absolute power, which, as being profane, should rightly be hateful to us. We do not imagine a God outside law who is a law to himself (non fingimus Deum exlegem qui sibi ipsi lex est). For, as Plato says, human beings oppressed by appetites need law; but the will of God is not only pure of all vice, but the highest rule of perfection, and indeed the law of all laws' (iii 23.2). Battles translates 'qui sibi ipsi lex est' as part of the view that Calvin repudiates, whereas Beveridge translates it as part of Calvin's view (Wendel, *Calvin* 127–9, agrees with him). Battles' rendering is more probable. Calvin seems to contrast the view that God has no inherent law but gives it to himself (sibi lex est), with the view that he has an inherent law in his will ('the law of all laws'). Wendel incautiously cites this passage as evidence of Calvin's agreement with Scotus on God and the natural law. Schneewind, *IA* 32n, treats it as evidence of Calvin's voluntarism about the natural law.

[21] *Inst*. i 17.2: '. . . let our law of soberness and modesty be to assent to his supreme command, that his will may be for us the sole rule of justice, and the most just cause of all things. Not, indeed, that absolute will of which the Sophists babble, separating his justice from his power by an impious and profane division—but providence, that governing principle of all things, from which flows nothing but right (rectum), though the reasons have been hidden from us.' McNeill ad loc. quotes parallel passages.

[22] 'But here we must take note that philosophy is not every opinion of everyone, but certain items of knowledge, which are demonstrations, or else the parts of them, i.e., principles or conclusions. For just as in other arts there are principles and demonstrations that cannot be mistaken, so also in moral philosophy there are certain practical principles,

Melanchthon repeats that we must begin from human nature, because we must begin from the ultimate end for a human being.[23] In these ways, he treats natural law as the law of human nature, and hence treats moral philosophy as a study of the good that is determined by human nature.

413. Dispensations from Natural Law?

This connexion between natural law and human nature also settles some questions about the relation of natural law to the divine will and especially to divine freedom. In claiming that natural law is a law of human nature, Melanchthon implies that, even if we had this nature without being created by God, we would still have rational principles guiding our actions and character. He also implies that by creating us with this nature and this knowledge, God did not have to do anything else to give us rational principles for guiding our action. If the natural law is the law of our nature, some actions are rationally and morally significant for us apart from the legislative will of God. If, however, our knowledge of natural law were simply (as Ockham supposes) our natural knowledge of God's legislative will, we would have no reason to follow it distinct from any reason we had to follow God's legislative will.

If natural law depends on facts, distinct from God's legislative will, about human nature, how is it related to morality and to the legislative will of God? If God were to require us to violate natural law, would that be a case in which it would be right to violate natural law, or would it be a case in which God would require us to act wrongly? This counterfactual question raises the general question about divine dispensations.

Melanchthon's view on this question rests on his account of the immutability of natural law. He argues that natural right (ius[24] naturae) is always immutable (*PME* 210.7), but he explains this claim in ways that take account of apparent mutability.

First, he argues, using Plato's example in *Republic* i, that a lower principle must be interpreted in the light of a higher, so that the principle of returning deposits must be qualified by reference to the principle of not harming someone who is not inflicting harm. Such examples show that a law of nature is immutable, given its place in the order of laws of nature.[25] Sometimes one law has to be limited by another because of human sin. The law of nature prescribes that everything should be available for common use; but, because of human sin, common use would allow harm to innocent people; and so the principle of not

and from them secure demonstrations result. And just as the arts are an exposition (explicatio) of nature, so also demonstrations in moral philosophy are an exposition of human nature. . . . We must therefore reject the Academics, who remove the reputation of certainty from the arts. Rather, philosophy sometimes accepts, just as medicine does, creditable (probabiles) arguments, and it is for the expert to judge how far they hold; for those that conflict with the principles are to be altogether repudiated' (*PME* 158.32–159.6).

[23] 'Now the first question is about the end, because, just as natural philosophy looks for the other causes of a human being, so moral philosophy properly considers the end of a human being. Therefore in order to grasp the nature of a human being we need moral philosophy, because the complete grasp of anything, in so far as it can be achieved, requires a search for all the causes. Next, the learned person must consider at this point, that moral philosophy arises from nature, because the search for a cause belongs primarily to the natural philosophers' (*PME* 163.19–27). Melanchthon's teleology is a major topic omitted from Kusukawa, *TNP*, chs. 4–5.

[24] He defines ius as a facultas, 207.34.

[25] 'Thus, the law of nature is immutable in such a way that each item of knowledge is maintained in its proper place and order' (210.17–19).

harming the innocent makes private property preferable in our actual circumstances. In this sense, private property belongs to natural right.[26]

A second division among requirements of natural right distinguishes those that cannot be violated without a complete corruption of human nature. These include not harming the innocent, the responsibility of parents to bring up children, and the keeping of honest agreements. These are genuine practical principles, or conclusions necessarily derived from them.[27] Other principles are in accordance with nature, but may be violated without a complete corruption and ruin of human nature. In our present state of sin, it is sometimes better to permit them, and to concentrate on preventing the violations of the higher principles.[28]

This is Melanchthon's explanation of some of the so-called 'dispensations' from the natural law that are described in the Old Testament. In his view, they are not genuine dispensations. God tolerated polygamy in Israel because it was not a breach of the higher principles of natural right. Melanchthon gives two explanations: (1) Since God is the author of nature, natural right is also in his power. (2) In contrast to the principles of natural knowledge, our assent to moral principles is weakened because of sin and the corruption of our nature.[29] These explanations are meant to show why the Israelites allowed polygamy.[30] The second is fairly easy to understand. The first is more puzzling, since it suggests that God has power over natural right, and therefore can dispense from its observance. If that is what Melanchthon means, he aligns himself with Scotus in believing that these are genuine dispensations, and hence exercises of God's will as legislator.

But Melanchthon does not seem to regard God as dispensing from the natural law. If I am dispensed from observing the law, then the law remains in force and applies to me, but I have no obligation to keep it because the legislator has given me permission not to keep it. Melanchthon seems to have a different view, that God in his role as judge remits any punishment, and in his role as overseer permits the Israelites to go on with this practice. The sense in which God has power over natural right is not the power to change it or to dispense from the obligation to keep it, but the power to refrain from enforcing it with sanctions.

Melanchthon does not commit himself, therefore, to the voluntarist account of dispensations endorsed by Scotus and Ockham. He does not deal with all the cases discussed in the dispute about dispensations; the commands to Abraham and Hosea, for instance, do not seem to fit the pattern he suggests. Nor is it clear whether he takes God to have been free, as Ockham believes, to prescribe some other set of laws that would not have been appropriate for human nature.

[26] 'So also it is the law of nature to use things in common. But because this law now, in corrupt nature, conflicts with the higher law to harm no one, reason now teaches the one who has harmed no one to distinguish areas of ownership (dominia), because under the pretext of the law about common use, many in this corruption of nature would be moved by unjust appetites to harm others' (210.21–7).

[27] 'For the wreckage and destruction of human nature would immediately follow, if everyone were allowed, whenever he felt like it, to attack the fortunes or bodies of others' (211.1–4).

[28] See Suarez, *Leg*. ii 20.3 on toleration of behaviour prohibited by natural law.

[29] 'For since God alone is the founder of nature, even the law of nature is in his power alone. Moreover, the following must be added. Though moral principles are secure, just as natural principles are, that heavy things are borne downwards, and so on, still assent to moral principles is less secure, because of the corruption of nature. For because they do not obey nature enough, assent becomes less secure, and the items of knowledge themselves are less clear, and we easily assent to imaginings that are contrary to them' (211.21–8).

[30] Cf. Suarez on prostitution etc., *Leg*. ii 20.3.

Melanchthon makes no basic innovation in Scholastic views of natural law. He does not maintain the most strongly voluntarist Scholastic view. In his claims about human nature and the ultimate end for human beings, he is still influenced by Aristotelian assumptions.

414. Hooker on Natural Law

Melanchthon's predominantly naturalist account of natural law may be compared with Hooker's unequivocally naturalist position. Hooker defends the principles of the Reformation (as he understands them) against a more extreme voluntarist position that rejects natural reason as a moral authority and demands direct warrant from Scripture, and he uses his doctrine of natural law to defend natural reason in morality. He faces opponents who appeal directly to the will of God, as revealed in Scripture, as authority for church order, and hence (in their view) for a presbyterian rather than an episcopal polity.

Hooker does not try to resolve this issue about government by arguing for the unique Scriptural authority of episcopacy. Instead he argues that God acts in accord with natural law, which is not a product of God's purely legislative will.[31] Since the principles of natural law are the basic principles of practical reason, we have access to them through our practical reason. When God does not legislate specifically on a particular question, he leaves us free to settle it through our practical reason, guided by the principles of natural law. One such question is the question about the government of the Church, which we ought to settle by consideration of what is just and expedient for particular places at particular times.

Hooker begins this argument by accepting the naturalist view that the principles of natural law constitute moral requirements antecedent to any legislative act of God. Hooker agrees with Aquinas on the natural law and natural reason. In his view, God's intellect grasps the principles of natural law, apart from any act of will or command. This view of the role of reason and will in natural law is close to the position later defended by Vasquez, and lacks the voluntarist elements (however limited these may be) found in Suarez.[32]

To explain why he speaks of a natural law that God does not legislate, Hooker distinguishes two senses of 'law'. In the narrower sense law requires imposition by superior authority, but in an 'enlarged' sense it requires only a rule by which actions are framed. The natural law and the eternal law are laws in the enlarged sense. Their existence does not imply that anyone imposes them on anyone; it requires only the appropriate sort of fact to constitute a rule, canon, or norm.[33]

[31] 'They err therefore who think that of the will of God to do this or that there is no reason besides his will' (*LEP* i 2.5 = Keble i 203). Hooker cites *Eph.* 1:11 on God's 'counsel' (*boulê*).

[32] For Suarez's narrower conception of law see *Leg.* i 12.4.

[33] 'I am not ignorant that by "law eternal" the learned for the most part do understand the order, not which God hath eternally purposed himself in all his works to observe, but rather that which with himself he hath set down as expedient to be kept by all his creatures according to the several conditions wherewith he hath endued them. They who thus are accustomed to speak apply the name of Law unto that only rule of working which superior authority imposeth; whereas we somewhat more enlarging the sense thereof term any kind of rule or canon whereby actions are framed, a law.' (*LEP* i 3.1). For more evidence of Hooker's naturalist attitude to natural law, as the expression of the divine intellect, see i 2.2 ('The being of God is a kind of law to his working: for that perfection which God is giveth perfection to that he doth') 5.1–2; 8.4; ('A law therefore generally taken, is a directive rule unto goodness of operation') 8.8; 12.3; 14.4; ('. . . so our own words also, when we extol the complete sufficiency of the whole entire body of the Scripture, must . . . be

This appeal to reason and natural law, understood as a rule rather than as a product of legislative will, influences Hooker's ecclesiology as well as his moral philosophy. In controversies about the episcopal government of the Church, he rejects the position of his Puritan opponents, that a specific form of church government must be justified directly from the Scriptures as having divine authority. In his view, episcopacy is justified by appeal to natural reason, and that should be sufficient warrant for it.[34] We should not suppose that God directs us only through laws revealed in Scripture; God also directs us through the natural law and through practical reason drawing conclusions from the natural law.[35]

Hooker not only rejects an extreme Protestant position on the sources of authority in church and state, but also rejects an extreme voluntarist position on divine commands and morality. His argument helps us to understand the significance of the Reformation for the doctrine of natural law. While voluntarism was defended before the Reformation, the particular emphasis of the Reformers on the sovereignty of God and the sufficiency of Scripture as a rule of doctrine and life might easily suggest a voluntarist conclusion. Luther draws this conclusion in his early work.[36] Hooker's opponents are Calvinists who draw the same conclusion. But though the views of the Reformers might suggest this conclusion, they do not require it. Melanchthon rejects it and Hooker argues strongly against it. If one objects that they are too moderate to count as authentic exponents of the Reformers' position, Calvin's position is even more significant; for though he might be expected to find voluntarism congenial to his general position, he does not endorse it. The later Calvinists, such as those whom Cudworth attacks for their voluntarism, go beyond Calvin's position.[37] The sympathetic attitude to naturalism that we find in Culverwell is a plausible development of Calvin's position.[38]

415. The Effects of Sin

Belief in a natural moral law implies belief in moral principles prescribing actions suitable for human nature and known by natural reason. These principles provide a standard for measuring one's actions. Since, according to Aquinas, natural law requires the cultivation of the virtues of character, we observe natural law by forming the Aristotelian virtues. If we acquire these virtues, we should be able, in reasonably favourable external conditions, to achieve the natural good for human beings.

Aquinas examines our capacity to achieve the virtues and the natural human good, in the light of Christian doctrines of sin, and of the necessity of grace (*ST* 1-2 q109). He maintains

understood with this caution, that the benefit of nature's light be not thought excluded as unnecessary, because the necessity of a diviner light is magnified') 16.2.

[34] See e.g. vii 14.3. Hooker's moderation on this point does not satisfy his editor Keble. See Keble's elaborate discussion, lxvii–lxxv.

[35] 'For as they [sc. our opponents] rightly maintain that God must be glorified in all things, and that the actions of men cannot tend unto his glory unless they be framed after his law; so it is their error to think that the only law which God hath appointed unto men in that behalf is the sacred Scripture . . . yea, those men which have no written law of God to show what is good or evil, carry written in their hearts the universal law of mankind, the Law of Reason, whereby they judge as by a rule which God hath given unto all men for that purpose. . . . So that in moral actions, divine law helpeth exceedingly the law of reason to guide man's life; but in supernatural it alone guideth' (i 16.5).

[36] See n18 on the *Heidelberg Disputation*.

[37] See Cudworth, *EIM* i 1.5 = H15.

[38] See Culverwell, *LN*, ch. 6 = G&M 55.

(q109 a2) that we can both will and do good without grace in the state of sin, even though we cannot attain our natural good in the state of sin.[39] According to the Reformers, this concession to human beings in the state of sin underestimates the effects of original sin.[40] But it is not so easy to see where they disagree with Aquinas, or what difference their disagreement makes.

Sometimes Luther expresses his disagreement with the Scholastics by rejecting their claim that 'as far as the substance of the act is concerned', we can fulfil the law even in the state of sin. This contrast may be somewhat misleading. In rejecting the Scholastic view, Luther does not mean to deny that on particular occasions we can do the very action required by the moral law, if this is understood in a purely behavioural sense. In this sense, both the person who cares about justice and the person who simply wants to avoid getting caught may do what justice requires, as far as the substance of the act is concerned.

In speaking of the substance of the act, however, neither Luther nor the Scholastics have in mind this purely external sense.[41] When Aquinas speaks of 'the substance of the works (opera)' (e.g., 1-2 q109 a4), he does not refer simply to behaviour. He speaks of 'just and brave actions and the other works of the virtues' so that they include the virtues themselves; for he believes that even in the condition of sin we can acquire the moral virtues (q109 a2). Luther disagrees on this point; he often rejects Aristotle's claim that we become good by doing good actions.[42] He seems to deny that we can achieve the acquired virtues, as Aquinas understands them.

In Luther's view, the Scholastic pursuit of the moral virtues conflicts with St Paul's view that 'through the law comes the consciousness of sin'.[43] In trying to keep the moral law, we realize that we cannot keep it by our own efforts, and this realization makes us aware of our need of divine grace. The belief that we can acquire the moral virtues prevents us from recognizing our incapacity to keep the law.

This objection by itself is not convincing. Aquinas does not claim that we can keep the law by our own efforts; he does not even claim that we can do all the works of the law (q109 a4). The virtues that we can acquire, in his view, are not those that fulfil the divine law, but only those that are suitable for human nature without the further help of divine grace. It would

[39] See §350.

[40] See *West. Conf.* 9.1–3: ' God hath endued the will of man with that natural liberty, that it is neither forced, nor by any absolute necessity of nature determined to good or evil. Man, in his state of innocency, had freedom and power to will and to do that which is good and well-pleasing to God; but yet mutably, so that he might fall from it. Man, by his Fall into a state of sin, hath wholly lost all ability of will to any spiritual good accompanying salvation; so as a natural man, being altogether averse from that good, and dead in sin, is not able, by his own strength, to convert himself, or to prepare himself thereunto.' On original justice in Aquinas see §349; Abercrombie, *OJ* 60–72.

[41] 'It may be, then, that they mean by "substance of the deed" an external action. But they do not do this at all; they have reference also to an internal action. For they subsume under "substance of the deed" a work that is done for the sake of God from the heart by an act of the will that is naturally educed. Fools that they are, they do not notice that the will, even if it could, would never do what the law prescribes. For it resists the good, and inclines towards evil. . . . For as long as it is reluctant towards the law, it is turned away from it and thus does not fulfil it. Consequently, it needs grace to make it willing and cheerful towards the law' (*Rm.* 4:7 = Pauck 133–4). See also *Rm.* 8:1–4 = Pauck 218.

[42] See *Rm.* 1:17 = Pauck 18: 'The righteousness of God must be distinguished from the righteousness of men which comes from works—as Aristotle clearly indicates . . . According to him, righteousness follows upon and flows from actions. But, according to God, righteousness precedes works and works result from it.' Cf. *Rm.* 8:3 = Pauck 228: 'Works and actions do not produce virtue, as Aristotle says, but virtues determine actions, as Christ teaches'.

[43] See *Rm* 3:20 = Pauck 106.

be possible, indeed appropriate, for virtuous people, by the standards of the moral virtues, to be acutely aware of their sinfulness and of their incapacity to keep the divine law.[44]

Luther rejects this position because he believes the aim of acquiring the moral virtues is more deeply misguided. Sometimes he suggests that the virtues, as Aristotle conceives them, are not the source of praiseworthy actions, since no action can be praiseworthy in the state of sin.[45] His argument is Augustinian, in so far as he claims there is something lacking in the motives of even the best of us without divine grace. His view about what is lacking reflects his disagreement with the Scholastics about the effects of original sin.

According to the Scholastics, the primary effect is in the 'fuel' (fomes)[46] in the appetitive part of the soul. This makes our desires misdirected by lacking the proper direction towards God that they all had in the condition of original justice. Aquinas does not mean that the rational part is still completely correct, and that our fault can be confined to the non-rational part. The rational part is clouded, and hence liable to be misled, by misdirected passions, and it lacks the basic direction towards God that would make all the other genuine goods clear to it.

Aquinas' view is optimistic, however, in so far as he believes that original sin does not inevitably turn the will to a wholly perverted conception of the ultimate end. Without divine grace, we cannot conceive our supernatural end, and without original justice we cannot even keep an adequate conception of our natural end constantly in mind. But we are capable of forming a conception that, even if inadequate, is correct, because it contains the components of contemplation and virtuous activity. If the will forms this conception of the end, we are capable of acting on it far enough to form the states of character that constitute the moral virtues. Since we have universal conscience (synderesis) to grasp the first principles, and we have prudence, to take us from first principles to the specifically virtuous end, we are capable of acquiring the virtues.[47]

On this point, Luther disagrees. For he believes that our conception of our ultimate end, in the state of sin, is basically and inevitably misguided; he denies that universal conscience gives us a true grasp of the ultimate end.[48]

[44] See §§350, 356.

[45] *Rm.* 9:6–9 = Pauck 266: 'So then, why does man take pride in his merits and good works? They cannot in any way please God because they *are* good and meritorious, but only because God has elected from eternity that they would please him. We do the good only on the basis of gratitude, because our works do not make us good, but our goodness, or, rather, the goodness of God makes us good and our actions as well. For what we do is not good in itself, but only because God reckons it to be so . . . It is therefore wrong to define virtue in the way of Aristotle: It makes us perfect and produces laudable acts only in the sense that it makes us perfect and causes our acts to be praiseworthy before men and in our own eyes. Before God this is abominable, and the opposite would please him much more.'

[46] Luther speaks of the fomes at *Rm* 4:7 = Pauck 126: '. . . sin itself is that passion (fuel) and concupiscence, or that inclination towards evil and resistance against the good which is meant in the statement, "I had not known that concupiscence is sin" ' (*Rm.* 7:7).

[47] To this degree Aquinas maintains the principle that the keeping of a law is practicable. See (against the 'heretics') Suarez, *Leg.* i 9.18 (referring to the Council of Trent).

[48] See *Rm.* 4:7 = Pauck 130: 'They [sc. the Scholastic theologians] said . . . that when the will is subject to synteresis, it is, only slightly to be sure, "inclined toward the good". And this tiny motion towards God (of which man is naturally capable) they imagine to be an act of loving God above everything!' Cf. 8:1–4 = Pauck 218: 'Thus philosophy stinks in our nostrils, as if reason could plead at all times for the best, and we tell tall tales about the law of nature. Now it is true that everyone knows the law of nature and that reason pleads for the best. But what best? It pleads for that which is best, not according to God's standards, but according to ours, in other words: it pleads for an evil kind of good. For it seeks itself and its own in all things but not in God. . . . it knows only its own good or what is good, honourable, and useful for

416. Objections to Self-Love

Luther is pessimistic about our prospects for acquiring virtues because he believes that our motives and aims in the state of sin are basically corrupted by self-love.[49] The commandment to love our neighbour as ourselves does not, according to Luther, include a command to love ourselves. On the contrary, it condemns the love of ourselves, and instructs us to turn the attention and love that we now sinfully turn towards ourselves, until it becomes the love of our neighbour instead of ourselves.[50]

Like Scotus, Luther takes self-love to be a natural attitude that has to be abandoned if we are to love God as our ultimate end. In contrast to Scotus, he assumes that self-love is in itself bad, and that in a genuinely virtuous person it would have to be renounced in favour of the love of God. He also rejects Scotus' view that we are capable, in the state of sin, both of self-love and of the love of God, and hence capable of rejecting self-love as our ultimate end. In assuming the inevitable supremacy of self-love in the state of sin, he agrees with eudaemonists against Scotus. In assuming that the love of God requires the renunciation of self-love, he agrees with, and goes beyond, Scotus against the eudaemonism of Aquinas.

Calvin agrees with Luther's view that we are not commanded to love ourselves; he denounces the primacy of self-love as a fiction of the 'Sophists'.[51] But he does not suggest

itself, but not what is good for God and for others. Therefore it knows and wills mainly a good that is a particular good, indeed, that is good only for the individual self.' On Luther's treatment of synteresis see Rupp, *RG* 150–3.

[49] '. . . these words will appear strange and even foolish to those who regard themselves as holy and who love God with a covetous love, i.e., for the sake of their own salvation and eternal rest, and for the purpose of avoiding hell, in other words: not for God's sake but for their own sake. They are the ones who babble that ordered love begins with itself and that everyone must first of all wish his own salvation and then his neighbour's as his own. . . . But as a matter of fact, to be blessed means to seek in everything God's will and his glory, and to want nothing for oneself, neither here nor in the life to come' (*Rm.* 9:3 = Pauck 262). See also *Rm.* 8:5–13 = Pauck 224: 'The "prudence of the flesh" chooses what is to selfish advantage and it avoids what is harmful to the self. Moreover, it rejects the common good and chooses what harms the common spirit. This is the prudence that directs the flesh, i.e. concupiscence and self-will. It enjoys only itself, and uses everyone else, even God; it seeks itself and its own interests in everything . . . Good is only what is good for him and bad only what is bad for him.' Luther alludes to Augustine's division between usus and fruitio; see §231n122.

On the ordo caritatis see Scotus *3Sent*. d29 schol. = OO vii 2, 667; Biel *3Sent* d29 a2 = 523C–528H (W&H).

[50] Luther argues against the view that ordered love begins with oneself and extends to one's neighbour: 'It does not seem to me to be a solid understanding of the commandment "You shall love your neighbour" if one interprets it in terms of the notion that in view of the fact that the commandment itself says "as yourself", the one who loves is the model according to which he loves his neighbour. For one derives the following conclusion from this: You must love yourself first and according to the pattern of this self-love of yours you must also love your neighbour. . . . I believe . . . that by this commandment "as yourself" man is not commanded to love himself but he is shown the wicked love with which in fact he loves himself; in other words, it says to him: You are wholly bent in on yourself and versed in self-love, and you will not be straightened out and made upright unless you cease entirely to love yourself and, forgetting yourself, love only your neighbour. . . . we are commanded to have the same eagerness for the love of others as for self-love. . . . what is commanded (namely, the love of the neighbour) is based on what is prohibited (namely, self-love)' (*Rm.* 15:2 = Pauck 407–8).

[51] 'Let us therefore hold, that our life will be framed in best accordance with the will of God, and the requirements of his Law, when it is, in every respect, most fruitful for our brothers. But in the whole Law, there is not one syllable which lays down a rule as to what man is to do or avoid for the advantage of his own flesh. Indeed, since men are naturally prone to excessive self-love, which they always retain, however far they depart from the truth, there was no need of a law to inflame a love already present in excess. Hence it is perfectly plain that the observance of the Commandments consists not in the love of ourselves, but in the love of God and our neighbour; and that the one who leads the best and holiest life is the one who as little as possible lives and is concerned for himself; and that no one lives worse or more wrongly than the one who lives and is concerned only for himself, and considers and seeks only what is his own. Indeed, to express more clearly how strongly we should be inclined to love our neighbour, the Lord has referred to self-love as the rule (regula), because he could refer to no stronger or more intense feeling. And the force of the way of speaking

that self-love is itself a result of sin, or that the moral law condemns self-love; it condemns only excessive self-love. The persistence of self-love is not a reason for condemning human beings in their natural and sinful state; nor does the moral law require the renunciation of self-love.

The primacy of self-love guarantees, for Luther, that we cannot acquire the moral virtues, if these are taken to require the choice of virtuous action for its own sake. If we choose them for the sake of pleasure, or to avoid punishment, or in the hope of glory, then, Luther assumes, we cannot be genuinely virtuous.[52] But if we deny that we are moved by either of these motives, that is also boastful vainglory.[53] For if we are pleased to do good works, we lay ourselves open to subtle self-deception about our moral condition; we are acting for our delight and inward satisfaction, not out of the love of God.[54] In all these cases our good action is really 'passive', because fear and desire force us to do what we would not do voluntarily.[55]

Luther's attack on the motives of allegedly virtuous people combines two charges: (1) Because of original sin, we are subject to self-assertion, arrogance, and delusions of perfection that may corrupt our motives even when we do virtuous actions. (2) If we are moved primarily by self-love, we are inevitably dominated by self-assertion, arrogance, and so on. If the second charge is correct, then we cannot consistently both be psychological eudaemonists and take the moral virtues to be attainable.

This attack does not imply that the philosophers' conception of moral virtue is mistaken. On the contrary, Luther seems to take it for granted that virtue requires the pursuit of virtuous action for its own sake; on the basis of this assumption he argues that the aspiration to virtue of character is misguided, once we acknowledge the dominance of self-love in the state of sin. He does not seem to endorse one objection that might be attributed to Augustine—that the pagan philosophers' conception of moral virtue is itself flawed.[56]

Aquinas could accept—though he does not accept—Luther's first charge without any basic damage to his Aristotelian conception of virtue and happiness. If arrogance and self-satisfaction are more widespread and pervasive than Aquinas believes they are, then it

must be carefully considered. For he does not (as some sophists have stupidly dreamed) assign the first place to self-love (*philautia*), and the second to charity. He rather transfers to others the affection of love that we feel for ourselves. Hence the Apostle declares, that charity "does not seek its own," (*1Cor.* 13:5). Nor is the Sophists' argument worth a straw, that the thing regulated (regulatum) is always inferior to its rule (regula). The Lord did not make self-love the rule, as if love towards others was subordinate to it; but whereas, through natural depravity the feeling used to stay within ourselves, he shows that it ought to be diffused to another, so that we should be prepared to do good to our neighbour with no less eagerness, ardour, and concern, than to ourselves' (Calvin, *Inst.* ii 8.54). Contrast Aquinas' explanation of the omission of self-love from the Decalogue, §313.

[52] 'Even though they do good works outwardly, they do them either because they fear punishment or because they love riches or glory or some other created good, but not willingly and gladly (non voluntate et hilaritate)' (*Rm.* 3:9 = Pauck 86).

[53] A human being 'cannot but seek his own and love himself above everything. That is the sum and substance of all his faults' (*Rm.* 3:10 = Pauck 88–9).

[54] 'Inasmuch as the love of spiritual values is honourable and good, it very often becomes an end in itself, so that these values are not placed in relation to God and referred to him. And so we pursue them not because they are pleasing to God but because they give us delight and inward satisfaction, and also because we thereby earn the plaudits of men; in other words: we pursue them not for God's sake but for our own' (*Rm.* 3:21 = Pauck 112–13).

[55] 'And thus they do the good not actively but (if I may say so) passively (non faciunt, sed potius . . . faciuntur); i.e., fear and desire force them to do the good that they would not do voluntarily. But people who seek God do the good gratuitously and joyfully and only for God's sake, and not in order to obtain some created good either spiritual or corporeal' (*Rm.* 3:12 = Pauck 93).

[56] See §§229–30.

is more difficult than Aquinas supposes it is to acquire the moral virtues. It is the second charge that attacks Aquinas' basic principles. For it relies on Scotus' view that the supremacy of self-love prevents the appropriate love of virtue for its own sake and the appropriate love of God for his own sake. In his treatment of self-love, arrogance, and the sin of Lucifer, Aquinas answers this objection to the supremacy of self-love.

Luther's objection to self-love is more extreme and more strident than Scotus' objection. It is also more disputable. If self-love is understood as the desire for happiness, as Aquinas understands it, it does not necessarily conflict with the love of God above everything else; for Aquinas believes he can show that our happiness consists in the self-forgetful love of God, just as it consists partly in the self-forgetful love of our neighbour.

417. Pagan Virtue

These reflexions on the condition of human beings in the state of sin lead the Reformers back to Augustine's attack on the pagan virtues. They do not seem to be satisfied with Aquinas' attempt to reconcile Augustine's position with the acknowledgment of genuine moral virtues independent of Christian faith. Augustine's remarks inspire later Christian attacks on pagan virtues. Such attacks were ascribed to Jan Hus, and condemned as heretical by the Council of Konstanz in 1415.[57]

Luther argues that since all the alleged virtues of pagans rest on self-love, they are really vices and not virtues.[58] Melanchthon suggests that when the Scholastics recognize pagan virtues, they are really allowing justification by works, not recognizing the necessity of grace and faith.[59] Calvin's position is more qualified, and closer to Augustine's. He suggests that the fault of pagans is that they do not refer their actions to the appropriate end, the service of God; they are open to this objection even if they are not vicious, measured by non-theological standards.[60]

Attacks on Aquinas were not confined to the Reformers. On the Roman side, Michael Baius discusses these issues at length in *De Virtutibus Impiorum*, where he often appeals

[57] D §1216.

[58] 'No one loves justice, except Christ alone. All others love either money or pleasure or honour, or, despising these, love glory at any rate, or, if they are the best of all, love themselves above justice. . . . Therefore, since love of oneself remains, it is quite impossible for a human being to love, speak, or do justice, even though he may simulate all these things. It follows that the virtues of all philosophers, indeed of all human beings, whether jurists or theologians, are virtues in appearance, but really vices' (Luther, *Heb.* 1:9 = C v 347.8–18 = *Works* xxix 119). Further passages are quoted by Rupp, *RG* 203–5.

[59] Melanchthon, *LC* 21–2 = Pauck 33–4: 'And our sophists are not yet ashamed to teach righteousness of works, satisfactions, and philosophical virtues. Let us grant that there was some kind of constancy in Socrates, chastity in Xenocrates, temperance in Zeno. Still, because they were in impure minds—indeed, because these shadows of virtues arose by love of oneself (amore sui) from selfishness (philautia), they ought not to be counted as true virtues, but as vices. . . . what do most philosophers teach, even the best of them, except trust and love of ourselves?' Chemnitz defends a hostile view of pagan virtue against Trent at *ECT* i 387–405 (Topic 6).

[60] Calvin discusses *c. Iul.* at some length in *Inst.* iii 14.3. He does not actually claim that pagan virtues are really vices. He comes close to saying so: 'Therefore, since by the very impurity of the heart these <good works> have been corrupted as from their origin, they ought no more to be reckoned among virtues than the vices that commonly deceive on account of their affinity and likeness to virtue. . . . He [sc. Augustine] therefore affirms that all Fabricii, Scipiones, and Catones in their illustrious achievements have sinned in that, since they lacked the light of faith, they did not refer them to the end to which they ought to have referred them.'

to Augustine. The Pope condemned his views in 1567.[61] The Jansenists revived similar views, with the same Augustinian inspiration;[62] the Pope condemned them in 1690.[63] Baius' objection seems to be similar to Calvin's rather than Luther's; he appeals to the absence of the right end (serving God) rather than the presence of the wrong end (self-love) to explain why pagan virtues are spurious.[64]

The Council of Trent presents the official Roman reaction to these views. It rejects the view that all the actions of pagans, whatever their reason or motive, are really sins and deserve the hatred of God.[65] The English Articles are more cautious than Luther and Baius and simply say that the works of unbelievers have the 'nature' or 'character' of sin.[66]

[61] Pius V, 1567, *Errores Michaeli Baii* = D §1925: 'All the actions of unbelievers are sins, and the virtues of philosophers are vices'. §1933: 'Everything that a sinner, or slave of sin, does is sin'. §1937: 'Anyone who acknowledges any natural good, that is to say, any good that takes its origin from natural powers alone, agrees with Pelagius'. On this ground Baius supports Ambrosiaster's interpretation of Paul's remarks on the Gentiles in *Rm*. 2; he argues that those who accept a 'natural law' interpretation of these remarks endorse Pelagianism (§1992). These are the Pope's descriptions of Baius' views, not quotations from Baius.

[62] Knox, *E*209, explains the connexion between Jansenism and objections to pagan virtue: 'If you believe in the Fall as a shattering blow that unmade man to his very essence, . . . you begin to suspect common human virtues; you trace ulterior motives in them, and write them down as "natural", useless in God's sight'. At 219 he discusses the Jansenist use of the Augustinian division: 'either by charity or by cupidity'. See Augustine, §230n113. Wang, *SAVP* 33–5, discusses this disjunction, and its role in the controversy arising from the Jansenist-inclined Synod of Pistoia (D §§2623–4).

Abercrombie, *OJ* 87–92, 125–8, summarizes the views of Baius and Jansen. In his long, tedious, and polemical *Augustinus* Jansen presents an extreme version of Augustine's case against pagan virtue, relying especially on Augustine's polemic against Julian (see §230). In his view, Augustine allows only the right officium and nothing more to pagans. He tries to show (ii 162) that Aquinas really agrees with his view that any genuine virtue must refer all one's actions to God as their end As an example of someone who tries to evade Augustine's plain meaning, Jansen attacks Suarez, *De Gratia* i 7.19–20 = OO vii 399, who interprets Augustine along the lines we have attributed to Aquinas; see §356.

[63] The Pope ascribes these views to Baius: 'It is necessary for an unbeliever to sin in every work. Anyone who hates a sin simply because of its wrongness and inappropriateness to nature, without any reference to the offence against God, truly sins' (D §§2308–9).

[64] 'St Thomas . . . thinks they are virtues because they are referred to some particular genuine good, which can be referred to the universal good, even if these states are found in those who are ignorant of the one true God because of blindness, or who despise him because of arrogance. However, these are clearly similar to the one of whom the Psalmist says: "The fool has said in his heart, There is no God". Here one must especially wonder how St Thomas thought this possible reference of a proximate end to the universal good could be enough to constitute a virtue, given that the same possible reference belongs also to that particular good that the impious seek above the universal good and in explicit contempt of it. . . . A human being is made, and is required, to love God with all his might and to serve him alone; now anyone who lives in accord with virtue does what he is required to and what he is made for; therefore, anyone who does not serve God and seeks to do the duties belonging to the virtues not because of something else but for their own sakes, does not live in accord with virtue' (Baius, *Virt. Imp*. 4 = p. 65). The omitted passage includes a quotation from *c. Iul*. iv 3.

Gregory of Rimini also presents an Augustinian attack on pagan virtue: 'And for that reason one must say the following about the pagans and unqualifiedly faithless who are said to have practised such things: Granted that they did things of the sort that were good in their genus and in accordance with duty (ex officio), as Augustine puts it, still they did not do these things ultimately because of God, and for that reason neither did they do them finally because of the end they ought to have done them for, and thus they did not do them virtuously, but badly and viciously . . .' (*2Sent*. d26–8 q1 98N (p.73 ed Marcolino et al.)). He refers to Augustine, *c. Iul*. iv 3.22. See Leff, *GR* 176; Trinkaus, *IL* 74.

[65] 'If any one says that all the things done before justification, in whatever way they may be done, are truly sins, or merit the hatred of God . . . let him be anathema' (D §1557).

[66] 'Works done before the grace of Christ, and the inspiration of the Spirit, are not pleasing to God, forasmuch as they spring not of faith in Jesu Christ, neither do they make men meet to receive grace, or (as the School-authors say) deserve grace of congruity: yea rather, for that they are not done as God hath willed and commanded them to be done, we doubt not but they have the nature of sin' (*Articles* §13). The Irish Articles of 1615 have 'we doubt not but they are sinful' (§26 = Schaff, *CC* iii 531). 'Have the nature of sin' corresponds to 'peccati rationem habere' in the Latin version, which one might be more inclined to render 'have the character of sin'. This Article is not on exactly the same question as the passage from Trent just quoted. For even though the Article is entitled 'Of works before justification', it actually

The Westminster Confession takes a similar view, that the works of unbelievers are sinful in so far as they lack the appropriate motive.[67]

Aquinas' interpretation of Augustine is consistent both with the position of the Council of Trent, that not every aspect of all works before justification is truly sinful, and with the view of the English Articles, that 'forasmuch' as these works are the works of pagans, they have the nature of sin, and cannot even deserve grace by congruity.[68] The Council of Trent and the Articles mention the two aspects of pagan virtue that Aquinas distinguishes; he also agrees with the Articles that works before justification do not deserve grace even by congruity.[69]

Among these different views about pagan virtues, the most radical is Luther's attack based on claims about self-love. He draws on Augustine's description of the outlook of the 'earthly city' as the self-love that goes as far as contempt of God. This description might be taken to imply a sharp contrast between self-love and the love of God; this is how Scotus takes it.

Such a contrast, however, raises a difficulty for Augustine, who also recognizes the basic and universal character of the desire for one's own happiness.[70] He might appear to be committed to all these claims: (1) The desire for one's own happiness is basic and universal in human beings. (2) The desire for one's own happiness is a manifestation of self-love. (3) To love God above all things requires the abandonment of self-love. (4) The Christian is required to love God above all things. Since Aquinas accepts (2), he rejects (3), and claims that Augustine rejects it; in his view, Augustine condemns only misguided self-love. Scotus accepts (3), and therefore denies (1).

Luther accepts all four of these claims, applied to human beings in the state of sin without grace, and so he infers that we cannot fulfil the requirement of loving God above all things in that state. But he suggests that even if we cannot fulfil the law in our state of sin, because of self-love, we can at least recognize and lament our inability to fulfil it; he sometimes regards this as the appropriate preparation for the reception of grace.[71] He seems to expose a difficulty in his position. For his unqualified claims about the pervasiveness of self-love seem to imply that self-love must underlie even our sorrow at our failure to keep the law; and so even this sorrow must be no less sinful than all our efforts to keep the law.

The strong claims about self-love, selfishness, and arrogance support Luther's claim that all actions in the state of sin without grace are sinful because of their motives. But we do not need to accept these strong claims if we are to say more generally, as the English Articles say, that actions in the state of sin 'have the character of sin', in so far as they are not appropriately directed towards God.[72]

mentions works 'before the grace of Christ', which are not the same (since some works that are not before the grace of Christ are before justification).

[67] 'Works done by unregenerate men, although for the matter of them they may be things which God commands, and of good use both to themselves and others; yet, because they proceed not from a heart purified by faith; nor are done in a right manner, according to the Word; nor to a right end, the glory of God; they are therefore sinful and cannot please God, or make a man meet to receive grace from God. And yet their neglect of them is more sinful and displeasing unto God' (*West. Conf.* 16.7).

[68] See the passages just quoted in n66.

[69] See *ST* 1-2 q109 a6; q114 a5; §§350–2.

[70] See Augustine, §231n121.

[71] 'Their works are good, not when they put their trust in them, but when they do them in preparation for justification, confident that they will be made righteous through it alone' (*Rm.* 3:21–2 = Pauck 108).

[72] See *Articles* §13 (n66 above).

Even if Luther were right in his strong claims about self-love, he would not be entitled to infer that the Scholastic pursuit of the moral virtues is entirely misguided. He would be right to say that the Scholastics are wrong to suppose that the moral virtues, as they understand them, really move us to act virtuously for its own sake; they cannot, then, meet the Scholastics' own standards for being genuine virtues. They might still, however, be states preferable to their opposites, in so far as they move us to the right actions on the basis of motives that, however sinful, are none the less preferable to the motives characteristic of the vices.

Luther could avoid this qualified endorsement of the moral virtues, if he denied that the actions and motives they encourage are preferable to their opposites. He does not deny this, however, and he has good reason not to deny it. For he acknowledges that, even in the state of sin, we are bound by the natural law, that we acknowledge it, and are capable of fulfilling it to some degree. Neither St Paul nor Luther suggests that observance of the natural law consists simply in behavioural conformity to it; the observers of the law are supposed to have a trained and sensitive conscience as well.[73] Once this is conceded, the virtues of character must be worth cultivating, even if all that we can achieve in the state of sin is a state of character that is irreparably flawed by self-love.

But it is not clear in any case why we ought to agree with Luther's claim that pagans are so dominated by inappropriate self-love that they are incapable of the degree of unselfish motivation that is needed for moral virtue. If we appeal to eudaemonist arguments to show that they are dominated by self-love, we have not shown that this self-love is inappropriate; even if we agree that (as Calvin claims) we are excessively prone to inappropriate self-love, we may believe we are capable of overcoming it far enough to acquire the moral virtues. Luther's most extreme claims may appear to depend on a shift between self-love in general (universal, but not inappropriate) and selfish self-love (inappropriate if taken to excess, but not universally dominant). If we fail to distinguish the two, we may agree too hastily with this claim that self-love is both universally dominant and inappropriate.

If we reject Luther's extreme position, the claim that the works of unbelievers are sinful need not conflict with the claim that unbelievers can acquire genuine virtues. Aquinas agrees with the Augustinian and Calvinist claim that in failing to pursue a supernatural end, unbelievers sin; but this claim is consistent with acknowledging that they can have genuine virtues that are focussed on moral rightness (honestas). This position is set out clearly by Gonet, a later Thomist, who argues that the moral virtues are directed towards the moral good, which is a genuine good, though not a complete good (verum bonum, sed non perfectum).[74]

[73] *Rm.* 2:15: 'They show that what the law requires is written on their hearts, while their conscience also bears witness and their conflicting thoughts accuse or perhaps excuse them'.

[74] In *MT* Trac. iv, ch. 6, Gonet discusses the question 'Can there be moral virtues without charity?' because modern (recentiores) writers have said No, and have appealed to Augustine, *c. Iul.* iv 3, and to *De nupt. et concup*. 3–4. He answers (iv 6.8, p. 212) that these passages refer to perfect virtues that lead to eternal life, and that Augustine (*Ep.* 130) also recognizes real but imperfect virtues. Aquinas takes the same view, that the acquired virtues are genuine virtues because they focus on the honestum: ' From what has been said you will understand that there are three kinds of virtue. Some are not true virtues, but only apparent, because they are not directed to true good, but to apparent, [e.g., the 'prudence' of the miser]. Others are true virtues, but not perfect, because they are directed to true good, but not to perfect good; for they are directed to good as right (bonum honestum), which has not got the character of the ultimate end, but only of an intermediate end; the acquired moral virtues are of this kind' (iv 6.13, p. 212).

These areas of agreement and disagreement about the works of unbelievers also help us to understand the dispute about whether it is possible for us to keep the moral law in the state of nature. Luther and Calvin believe it is impossible; Calvin recognizes that his view 'is commonly looked upon as a most absurd opinion' (*Inst*. ii 7.5), but he takes it to be obviously true none the less. He argues that no one has succeeded in loving God completely, and that no one has ever been free of sensory appetite (concupiscentia).[75]

On the other side, Suarez rejects the heretics' view that we cannot keep the law in the state of sin. He argues that God does not require what is impossible, but God requires the keeping of the law (*Leg*. i 9.17–18). This raises complex questions about different views of freedom, which Calvin discusses at length (*Inst*. ii 5). But the opposition between the two views is not quite as sharp as it first appears. Aquinas agrees with Calvin that in the state of sin we cannot fulfil the whole law, because we cannot completely fulfil the commandment to love God (*ST* 1-2 q109 a4). It is possible for us to fulfil the law only because it is possible to act with the help of God (q109 a4 ad2).

The impossibility of fulfilling the law would be much more serious if we agreed that every action that is not done out of the love of God is sin, and therefore violates the natural law. Suarez opposes this view, which he ascribes to Baius and to the Lutherans (*Leg*. ii 11.6–7). Baius appeals, as Luther does in such contexts, to Augustine.[76] But if we do not accept the extreme view about self-love, we need not accept this indiscriminate condemnation of the works of unbelievers. Nor is it necessary for Calvin's argument about the necessity of grace for justification.

A summary account that ignores the details of the complex and polemical arguments on each side inevitably over-simplifies the issues and exaggerates the extent of agreement. But it may none the less be useful for our main purpose. Apart from Luther's exaggerated claims about self-love, the arguments of the Reformers do not show that the Scholastics were wasting their time in advocating the Aristotelian virtues of character. To refute the Scholastics on this point, the Reformers would have had to show that they had seriously misunderstood the demands of the natural law and the states of character needed to fulfil these demands. But the arguments about the effects of original sin do not show that the Scholastics were wrong on these points.

One might, however, draw a conclusion more hostile to the Scholastics from these questions about the motives of allegedly virtuous pagans. If one accepts the extreme Lutheran claims about self-love and its corrupting effects, one might infer that it is a mistake to connect the natural law with the cultivation of the virtues. If we grant that genuine virtue is impossible without the transformation resulting from divine grace, we might decide that natural reason has nothing to do with this 'genuine' virtue, and that we can abandon genuine virtue to the theologians. Hence we might prefer to confine the natural law to prescriptions for action, without reference to motives. Even if these actions are worthless, from the

[75] 'By impossible I mean that which never was, and, being prevented by the direction and decree of God, never will be. I say, that if we go back to the remotest period, we shall not find a single saint who, clothed with a mortal body, ever reached the goal of love so as to love the Lord with all his heart, and soul, and mind, and strength. And again I say there has been no one who has not been weighed down by appetite. Who will answer this?' (*Inst*. ii 7.5).

[76] The relevant passage from Baius is quoted by Perena ad loc.

theological point of view, without divine grace, they are still useful for the good of society; perhaps these are the real concern of natural law.

This reduced conception of natural law is a Hobbesian conception; the dismissal of genuine virtue is Mandeville's reaction to disputes about virtues and motives.[77] Such a conclusion does not express the views of the Reformers. Their central views about the effects of original sin, and about grace and justification, do not undermine the pursuit and cultivation of the moral virtues, as Aquinas understands them.

418. Sin and Freewill

The Reformers believe that the Scholastics over-estimate the role of freewill in human beings in the state of original sin. Luther sometimes asserts that freewill remains 'in name alone' in the state of sin.[78] The Council of Trent condemns this formulation,[79] though it affirms that freewill was weakened by original sin.[80] The Augsburg Confession takes a more moderate position than Luther's extreme view, claiming that freewill extends to 'civil justice' and to 'things subject to reason'.[81]

It is sometimes difficult to see what the disputes are about because of some obscurities in claims about freewill. Melanchthon recognizes three sorts of freedom: (1) Power over external actions; it depends on our choice whether we act one way or the other. (2) Contingency of our actions in relation to external causes, both natural and divine. (3) Independence of will from the passions.[82] According to Melanchthon, we clearly have

[77] See Hobbes, *L*15.40; Mandeville, *FB* i 56–7.

[78] 'After <original> sin freewill is present in name alone, and as long as it does what is up to it, it sins mortally. After <original> sin free will is capable of good as a subjective capacity, but of evil always as an active capacity' (Luther, *Heid. Disp*. 13–14 = C v 378 = *Works* xxxi 48–9 = Dillenberger 502).

[79] Canon 5 on Justification: 'If anyone says that after the sin of Adam human freewill is lost and extinguished, or says that it is a thing in name only, in fact a name without any <corresponding> reality, and a fiction that Satan introduced into the Church, let him be anathema' (D §1555).

[80] '. . . in them [sc. the Jews] freewill was not at all extinguished, though admittedly it was weakened in its powers and bent down' (D §1521).

[81] 'Of freewill they [sc. the Lutherans] teach that man's will has some liberty to choose civil righteousness, and to work things subject to reason. But it has no power, without the Holy Spirit, to work the righteousness of God, that is, spiritual righteousness; . . . but this righteousness is wrought in the heart when the Holy Spirit is received through the Word. . . . [A quotation from Augustine follows.] They condemn the Pelagians and others, who teach that without the Holy Spirit, by the power of nature alone, we are able to love God above all things' (*Aug. Conf.* 18). Melanchthon expands this claim by distinguishing the roles of reason and faith: 'Nor, indeed, do we deny liberty to the human will. The human will has liberty in the choice of works and things which reason comprehends by itself. It can to a certain extent render civil righteousness or the righteousness of works; it can speak of God, offer to God a certain service by an outward work, obey magistrates, parents; in the choice of an outward work it can restrain the hands from murder, from adultery, from theft. Since there is left in human nature reason and judgment concerning objects subjected to the senses, choice between these things, the liberty and power to render civil righteousness, are also left. . . . But . . . human hearts without the Holy Spirit sare without the fear of God; without trust toward God, they do not believe that they are heard, forgiven, helped, and preserved by God. Therefore they are godless. . . . Therefore, although we concede to free will the liberty and power to perform the outward works of the Law, yet we do not ascribe to free will these spiritual matters, namely, truly to fear God, truly to believe God, truly to be confident and hold that God regards us, hears us, forgives us, etc. . . . Therefore such a distribution is of advantage in which civil righteousness is ascribed to the free will and spiritual righteousness to the governing of the Holy Spirit in the regenerate' (*Apol. Aug. Conf.* 18). On civil righteousness see Maurer, *HCAC* 89–101.

[82] For (1) see *LC* 13.2 = Pauck 27. For (2) see 11.17 = Pauck 24–5. For (3) see 13.11 = Pauck 27.

the first sort of freedom; we can experience it in our actions. But it is not enough for the freewill that the Scholastics affirm. We lack the second type of freedom, since nothing is contingent in relation to the will of God. We also lack the third type of freedom. Since the second and third types of freedom are essential for the truth of the Scholastic claims, we must reject these Scholastic claims.[83]

In arguing against Erasmus, Luther agrees that we have the first type of freedom, but denies that we have the second type.[84] To claim the second kind of freedom, we must, in Luther's view, deny the sovereignty and efficacy of the will of God, as we know of it through the Scriptures.[85] Luther rejects the view of providence and predestination that makes it depend on God's foreknowledge of what will happen independently of God's will. If God's providence simply rested on foreknowledge of what we will do freely, our sinning or avoiding sin would be up to us, and we would not depend on divine grace to escape from sin. Since we have Scriptural authority to show that we are absolutely dependent on divine grace, we cannot have freewill to act independently of God in the state of sin, and God's providence cannot rest simply on foreknowledge. We cannot restrict God's role to foreknowledge. We must also allow, according to Luther, that God begins a causal chain that, given God's initial will, inevitably results in one or another action of ours. This is God's predestination.[86]

Luther and Erasmus agree that if God initiates a causal chain in which each previous condition is sufficient for a specific successor, and in which the whole chain is sufficient for my action, I lack freewill. Since Luther is convinced of the truth of predestination through such a causal chain of sufficient conditions, he believes he must deny freewill; the mere fact that our choice to do A rather than B is among the conditions determining our doing A rather than B does not ensure that our doing A rather than B is an exercise of freewill. Since Erasmus is convinced that it would be unjust of God to condemn us for actions that we are not free not to do, he believes he must deny predestination, as Luther understands it.

We can find a role for predestination without denying freewill, as Luther and Erasmus understand it, if we adopt a Molinist solution.[87] According to this view, predestination is an act of the divine will, not simply the product of God's foreknowledge of what we will do independently of him. But it rests on a special kind of divine knowledge. God knows not only the laws of nature and the actual future. He also knows the counterfactual futures; this is his 'middle knowledge'.

God knows, for instance, what I would freely do in different circumstances. He knows that if I were offered a bribe of §10, I would not sell state secrets to the enemy, but if I were offered §10m, and threatened with the death of my family, I would sell the secrets. He also knows the circumstances in which an enemy agent would offer me the small bribe, and those in which he would offer me the large bribe and present me with this threat. Both

[83] When Chemnitz states what he takes to be the 'chief point at issue' about freewill, he does not go as far as Luther in denying contingency; see *ECT* i 420–7. At 426–7 he accuses Trent of obscuring the issues by its condemnation of Pelagianism.

[84] Luther discusses Erasmus' account of freewill in *SA* Part 3 = C iii 150–6 = *BW*, tr. Packer and Johnson), 137–43.

[85] See *SA* = C iii 150–93 = *BW* 137–89.

[86] Calvin discusses freewill at length in *Inst.* ii 2. At ii 3.5, he distinguishes necessity from compulsion (coactio), as Luther does at *SA* = C iii 125 = *BW* 102.

[87] See Freddoso's helpful edition of Molina's *Concordia*. The controversy is discussed by Farrelly, *PGFW*. Molina sets out from Aquinas' discussion of non-actual possibles in *ST* 1a q14 a9.

my decisions and the enemy's decisions are free; the antecedents and circumstances do not provide sufficient conditions.

If God knows all this, and wants me to sell the secrets, God arranges the second set of circumstances. Hence my selling the secrets is the result of God's will, not simply of God's foreknowledge; for God chooses to put me in these circumstances rather than in any of those in which God knows I would not sell the secrets. None the less, it does not threaten my freedom, because God's choice of the circumstances rests on knowledge of what I would freely do in different circumstances.

The Molinist appeal to middle knowledge as the basis of predestination identifies a role for predestination within an incompatibilist conception of freewill. A compatibilist might also attribute knowledge of counterfactual futures to God, but such knowledge would play no special role in a defence of freewill. The special role in a defence of freewill relies on the claim that God's middle knowledge is of what I would do in different circumstances, without being determined to do it. If each set of circumstances and antecedent conditions provided sufficient conditions for one or another action by me, middle knowledge would be irrelevant.

The Molinist solution does not fit the Reformers' conception of predestination and divine grace. If we remain free to avoid sin in the state without grace, then we do not depend on God's grace; both sin and virtue are in our power and independent of God. This is why Luther insists that the proper recognition of divine sovereignty and divine grace requires the rejection of freewill. The form of predestination that rests on middle knowledge falls short of the form of predestination that Luther takes to be required by Christian doctrine.

One might argue, in any case, that the Molinist position fails to do all that might be expected of it. One reason for insisting on freewill, conceived as excluding determinism, is the belief that if we allow God's choices to initiate a causal chain of conditions sufficient for sin, we make God the author of sin, and hence responsible both for the sin and for the condemnation of the sinners whom God chooses not to save. Middle knowledge may seem to avoid this objection, since sinners would not sin without having made the undetermined choice to sin; hence, they, and not God, are responsible.

To be content with this answer, however, we must ignore the fact that God chooses to confront sinners with circumstances in which God knows they will sin. God could have confronted them with different circumstances in which they would have freely chosen not to sin. If, then, Judas would not have sinned without God's predestination, and since God's predestination ensures that Judas will sin, by ensuring the circumstances in which—as God knows—he will sin, God seems to bear responsibility for Judas's sinning, even if Judas himself also bears responsibility for it.

These arguments between Erasmus, the Reformers, and the Molinists proceed on assumptions that are shared by Scotus and Ockham, who also believe that if the will is determined by antecedent external conditions, we lack freewill.[88] But Aquinas does not seem to accept these assumptions, since his account of the relation between human freedom and divine foreknowledge and predestination does not depend on the denial of determinism. In his view, contingency requires secondary causes operating in the way proper to their nature; it does not require any gap in sufficient conditions. Human wills are secondary causes

[88] See §371.

operating properly when they are moved by the greater apparent good; if our actions are caused by our wills moved by the greater apparent good, we act freely, no matter how it comes about that the greater apparent good is presented to us in this way.

According to Aquinas, then, we are responsible for our sinful actions because we choose them as a result of will and election. We, and not God, are the causes of our sins because God does nothing wrong in failing to prevent them.[89] This all remains true even though God's will initiates a set of sufficient conditions for our sinful action. This is the position that Banez ascribes to Aquinas and defends in opposition to the Molinist solution.[90]

Aquinas' position, as defended by Banez, maintains the claims about freewill that Luther opposes, but it does not weaken the claims about predestination that Luther supports. It is not surprising, then, that Banez's position was attacked as being too close to that of the Reformers. The Banezians and the Molinists agreed on a series of agreed statements on freewill and predestination, to distinguish them both from Pelagians and Calvinists.[91] But their agreement concealed a disagreement about the nature of freewill. Aquinas maintains his combination of views because he maintains a weaker condition for freewill than the one that Luther and Erasmus share. Hence, the conditions that appear to Luther to exclude freewill may not exclude it, if we accept Aquinas' conception.

If this is true, Luther has a reason for rejecting the Tridentine formulations about freewill if he accepts an indeterminist conception of freewill. But his Scriptural reasons for denying freewill are reasons for affirming predestination, and may not require the denial of freewill as Aquinas understands it.

On this issue, then, the conflict between the Reformers and the Scholastics may be less sharp than it initially appears. Luther's primary dispute is with the position of Scotus, Ockham, and Biel on freewill; this is the position that Erasmus defends. The debate between Luther and Erasmus neglects the conception of freewill that goes back to the Stoics and to Aristotle. This is also Aquinas' conception of freewill.

On the division between the will and the passions, the opposition between Melanchthon and Aquinas is sharper. Melanchthon opposes Aquinas on both historical and philosophical grounds: (1) He believes that the division between will and passion is un-Biblical. In the Scriptures, the source of motivation and action is the 'heart', without further distinction.[92] (2) The division between will and passion conceals the fact that we necessarily follow our strongest passion. In suggesting that it is up to us to resist our passions, the Scholastic position commits itself to a Pelagian position about our freedom in the face of sin.[93]

[89] See §345.

[90] Banez presents his view in *SC* ad 1a q19 a8 = 425–35; ad q23 a5 = 506–59. Freddoso, *DF* 24–8 differentiates the Banezian view from simple compatibilism about freewill and determinism.

[91] In 1607 Pope Paul V forbade the opposing sides to accuse each other of heresy. See D §1997; Farrelly, *PGFW* 147–8.

[92] '... philosophy gradually crept into Christianity, and the impious doctrine about freewill was accepted ... The term "freewill" was used, a term most foreign to the divine writings, and to the sense and judgment of the Spirit, and a term by which we see holy men have often been offended. The equally harmful term "reason" was added from Plato's philosophy. For just as we in these later ages of the Church have embraced Aristotle in place of Christ, so immediately after the beginning of the Church Christian doctrine was weakened through Platonic philosophy' (*LC* = *MWA* ii 1, 8.32–9.2 = Pauck 23). It would have been better to follow the Scriptural doctrine that God judges hearts, and to avoid the Aristotelian notion of the will (15.22–31 = Pauck 29).

[93] According to Melanchthon the crucial division separates the cognitive power from what we can indifferently call 'will', 'affection', or 'desire' (9.13–14 = Pauck 23). He rejects an intellectualist account of the will: 'For just as a tyrant

Melanchthon's historical argument is open to question. While the Aristotelian distinction is not constant or explicit in the Scriptures, it does not seem alien to Paul's remarks about willing and doing, or about the contrast between appetites and mind.[94] Moreover, if it is anachronistic to apply the Scholastic division to the Scriptures, it is no less anachronistic to apply Melanchthon's anti-rationalist thesis about action on the strongest affection to them.

The more important objection to the Scholastic division is the second, resting on philosophical and theological argument. Melanchthon suggests that if the will is capable of rejecting and restraining the suggestions of the passions, it is in our power to refrain from sin, and hence—contrary to fact—we do not depend wholly on divine grace to free us from sin. [95] The Scholastics do not see what is wrong with the claims of pagans to genuine virtue, because they do not see that confidence in our capacity to achieve virtue is simply the arrogance that excludes the appropriate sort of trust in God. According to Melanchthon, the Scholastics are open to Augustine's objections to pagan pretensions to virtue.[96]

This would be a fair objection, if the Scholastic division implied a voluntarist conception of the will. According to this conception, the will cannot be determined, and hence cannot be determined to sin, by anything external to it. Aquinas' intellectualist conception of the will, however, is not committed to this claim about external determination. If sinful action is attractive enough to our non-rational desires and to our intellect, it may present an irresistibly attractive apparent greater good to our will, so that our will is determined to pursue the sinful course of action. We are free to avoid a sinful action on a particular occasion, because our acting or not acting depends on the consent of our will.[97] But if the sinful action is so attractive to our will that the will must recognize it as the greater good, then it is impossible for us not to choose the sinful action. This sort of impossibility is consistent with Aquinas' division between will and passion, and with his claim that the will is not necessarily moved by the passions. Aquinas offers this explanation of our inability to refrain from sin (1-2 q109 a8).[98]

On this issue, then, we ought to reach the conclusion that we reached on the issue about predestination. The Reformers have a good reason, from within their own theological perspective, for criticizing the Scholastics who are also voluntarists. They have no equally

is in a republic, so is the will in a human being, and just as the senate is subjected to the tyrant, so is cognition to the will, so that, although cognition gives good advice, still the will rejects it and is carried off by its affection . . . ' (9.24–8 = Pauck 24). In some cases where the Scholastics think will rather than affection controls us, Melanchthon suggests that we are really controlled by the stronger affection, and in other cases we act against affection because of pretence (per simulationem, 14.1 = Pauck 28), 'as when someone behaves in a friendly, affable, and polite way, perhaps for no certain reason, towards one whom he sincerely hates and wishes harm to'. This sort of pretence encourages the Scholastics to recognize a distinct faculty of will: 'And this <apparent freedom> is that will that the stupid scholastics have imagined for us, namely a power such that however you may be affected it can still direct and control the affection. . . . However you may be affected, they ascribe to the will a power of eliciting, as they put it, good actions' (14.8–13 = Pauck 28).

[94] See §212. [95] See *LC* 21.31–22.16 = Pauck 34, quoted at n59 above.

[96] You pretend that you do not deny original sin, and yet you teach that a human being by his own powers can do something good' (*LC* 24.5–7).

[97] Articles §9 describes the pervasive effect of sin without explicit denial of freewill: 'Original sin consisteth not in the following of Adam (as the Pelagains do vainly talk), but it is the fault and corruption of the nature of every man, that naturally is engendered of the offspring of Adam; whereby man is very far gone from original righteousness, and is of his own nature inclined to evil, so that the flesh lusteth always contrary to the spirit; and therefore in every person born into the world, it deserveth God's wrath and damnation'.

[98] See §350. In *LC* 26.19–24 Melanchthon attacks the 'sophists' who identify the flesh with sensory desire. Articles §9 mentions this and other views of 'flesh' without deciding between them.

good reason for rejecting the views of the Scholastics who are intellectualists. Their claims about predestination and sin rule out human freedom as Scotus, Ockham, and Biel understand it. But they do not rule out freedom as Aquinas understands it, and they do not conflict with Aquinas' moral psychology.

419. Justification, Grace, and Faith

The Reformers emphasize our inability to avoid sin and the sovereign predestination of God, in order to explain the Pauline doctrine of justification. They follow Paul and Augustine in taking justification to be the work of God's grace and generosity, working through faith, and not a human achievement or a response by God to human merits, resulting from voluntary and meritorious actions that require a favourable response from God. Emphasis on human achievements and merits independent of God appears to them to fall into the Pelagian heresy that Augustine exposes and rejects.

The Pelagian position is heretical, if it claims that virtuous actions by themselves merit the divine reward of eternal life. Such a claim makes it difficult to understand the Scriptural emphasis on grace and faith as opposed to works and merits. It is more difficult, however, to reject the (so-called) 'Semi-Pelagian' view that justification requires God's grace and cannot be achieved by human merit, but God's grace is itself a response to human effort.[99] Though this effort does not merit eternal life, it is still a human contribution, independent of divine grace, that prepares us for divine grace. We might conceive this preparation as the faith to which God responds, or we might conceive faith as a gift of grace, given in response to appropriate human endeavour.

Though Luther's *Lectures on Romans* sometimes seem to recognize the possibility of 'preparation' as a human achievement,[100] he normally rejects this view of preparation. He argues that God's grace forgives us our sins, and thereby justifies us. It does not reward us for having refrained from sin as far as possible. It does not even reward us for recognizing and lamenting our inability to avoid sin; for that would itself be a human achievement limiting the operation of divine grace.[101]

Luther attacks a doctrine of preparation that can be found in Ockham and Biel.[102] But it is not so clear how far his attack affects Aquinas' position. For Aquinas denies that we can merit the grace of justification, either by condign or by congruous merit, independently of

[99] Some of the relevant issues are discussed by McGrath, *ID* §7.

[100] *Rm*. 2:12 = Pauck 51: ' . . . people who by some good action toward God, according to the measure of their natural ability, earned grace which then directed them farther—not as if grace were given to them in recognition of such a merit, because then it would not have been grace, but because they thus prepared themselves for receiving it as a free gift'. On preparation see Rupp, *RG* 185.

[101] The Articles reject a doctrine of preparation, understood as our own efforts independent of divine grace. See §10: 'The condition of Man after the fall of Adam is such that he cannot turn, and prepare himself, by his own natural strength and good works, to faith and calling upon God: Wherefore we have no power to do good works pleasant and acceptable to God, without the grace of God by Christ preventing us, that we may have a good will, and working with us when we have that good will'. In 'by his own natural strength and good works', and 'without the grace of God. . . ', the Article explains the sense in which it rejects a doctrine of preparation, and the sense in which it denies a role to freewill. The Article is headed 'Of Free-Will', but it does not deny that we have freewill in the condition of sin.

[102] See McGrath, *ID* §§20–1.

grace (*ST* 1-2 q109 a6; q112 a2).[103] Luther has no reason to reject Aquinas' views on this issue about justification. Might he, however, reasonably reject Aquinas' claim that preparation for grace and turning to God are acts of freewill rather than acts of God operating independently of our freewill? If we accept a voluntarist and indeterminist conception of freedom, Aquinas' claims about preparation and turning to God imply that, despite his views on merit, he believes that justification depends on some human action that is independent of divine grace.

Aquinas does not believe this, however, since he does not rely on a voluntarist and indeterminist conception of freedom. In his view, God's grace moves us in the way that human beings are characteristically moved, and hence it moves us through freewill. God moves us by presenting a good for us to consider and act on, even if God infallibly determines us. Aquinas considers the doctrine of preparation that Luther rejects, according to which a human being's unaided efforts ensure a divine response.[104] He rejects this doctrine, since he denies that preparation precedes grace and is the effect of a human being's unaided efforts.[105] He believes none the less that justification requires preparation that is an act of human freewill.

Luther might object that Aquinas' emphasis on freewill in preparation and turning to God is inconsistent with his claim that preparation and turning to God are the effects of God's grace rather than of unaided human effort. But the charge of inconsistency is unjustified. In the light of Aquinas' conception of freewill, the roles of divine grace and human freewill are consistent. The role that Aquinas allows to freewill does not imply Semi-Pelagianism. Though the Council of Trent is less unambiguous than Aquinas is on this point, it does not disagree with Aquinas on the sufficiency of divine grace for justification.[106] Though both

[103] See §352. The Articles also reject congruous merit before justification. See §13: 'Works done before the grace of Christ, and the inspiration of the Spirit, are not pleasing to God, forasmuch as they spring not of faith in Jesu Christ, neither do they make men meet to receive grace, or (as the School-authors say) deserve grace of congruity: yea rather, for that they are not done as God hath willed and commanded them to be done, we doubt not but they have the nature of sin'.

[104] 'It would seem that grace is necessarily given to whoever prepares himself for grace, or to whoever does what he can, because, on *Rm.* 5:1, "Being justified . . . by faith, let us have peace," etc. the gloss says: "God welcomes whoever flies to Him, otherwise there would be injustice with Him." But it is impossible for injustice to be with God. Therefore it is impossible for God not to welcome whoever flies to Him. Hence he receives grace of necessity' (*ST* 1-2 q112 a3 obj1). This view is rejected by Luther on *Rm.* 14:1 = Pauck 391. Pauck cites this passage from Aquinas, not remarking that it is a view that Aquinas rejects. Luther's view and its antecedents are explored by Oberman, *DR*, ch. 4, esp. 97–9.

[105] 'This gloss is speaking of one who flees to God by a meritorious act of his freewill that has already been informed through grace; for if he did not receive this <meritorious act>, it would be against the justice that God himself established. Or if it is referred to a movement of freewill before grace, it is speaking in the sense that a human being's flight to God is through a divine motion, and that it is just for this motion not to fail' (*ST* 1-2 q112 a3 ad1).

[106] The Council discusses the beginnings of justification in its Decree on Justification, ch. 5 = D §1525: 'While God touches the human heart through the illumination of the Holy Spirit, neither does a human being do nothing at all when he receives that inspiration (since he is also capable of rejecting it), nor, however, is he capable of moving himself towards justice in the sight of God by his own free will without the grace of God'. The context shows that the last phrase means that we move ourselves by our own free will with the grace of God. Cf. Canons 1–4 = D §1551–4. Can. 4 rejects the view that human freewill 'cannot dissent, if he were to will to (si velit), but like some inanimate object does nothing at all, but is in a purely passive condition'. The 'si velit' here introduces ambiguity. For if it is true that if God chooses, then a person will not want to reject grace, God's grace is sufficient for justification even though 'si velit' is true. It is not clear, then, that Luther or Calvin needs to maintain the view that is condemned here, if he wants to maintain the sufficiency of grace. Similarly, Can. 9 (§1559) condemns the view that we are justified by faith alone, 'in such a way as to understand that nothing else is needed to co-operate for gaining the grace of justification, and that it is in no way necessary for him to be prepared and disposed by the movement of his own will'. The Council does not make it clear whether divine grace is sufficient for the movement of one's own will.

Aquinas and the Council emphasize the importance of freewill, they do not treat the role of freewill as involving a role for unaided human effort.[107]

It is clearer that Luther disagrees with Aquinas about whether justification requires both an act of divine grace and an act of the human being who is justified. Sometimes the Reformers state their view of justification by claiming that it is entirely God's action and that human beings are simply recipients. On this view, justification is entirely passive; the 'effect' on the recipient is a mere 'Cambridge' change.[108] If A kills B's wife C, then A makes B a widower, and if A marries C, then A makes C's brother B into A's brother-in-law. But in both cases what 'happens' to B is entirely reducible to what A does and what happens to C. Similarly, one might understand the Reformers' doctrine of justification as a purely forensic action. If it consists simply in God's forgiving sinners, and 'justifying' or 'acquitting' them by remitting the punishment that would otherwise fall on them, then it is a one-sided transaction. Nothing happens to sinners beyond the fact that God chooses to pronounce them innocent.[109] Aquinas is wrong, then, to claim that justification requires a movement of a sinner's freewill in turning to God. Even if this turning to God is itself an effect of God's grace, Aquinas is mistaken, from the purely forensic point of view, in ascribing any real change or any real action to the sinner. He is wrong, that is to say, in treating justification as though it were really making just (iustum facere) rather than simply 'reckoning just', in a sense that does not imply being just.[110]

Some of Luther's remarks certainly suggest a purely forensic and one-sided view of justification. It is less clear that this could be the Reformers' consistent position. To see the issues that arise in trying to settle this question, we may turn to further areas of disagreement with the Scholastic view.

420. Grace and Virtue

As Aquinas understands grace, it begins a qualitative change in the justified sinner. When grace is infused, we also receive the infused moral virtues. Since these virtues are superior to the acquired moral virtues, the infusion of grace ensures that we become better than we were. In our unjustified state, we could not fulfil the 'works of the law', the moral demands of rational morality and the further demands imposed by the Gospel. With the help of grace, however, we can avoid the distorting effects of original sin, and so we can now fulfil the demands that we previously could not fulfil.

Some of Luther's remarks appear to oppose this view. In being justified, we do not cease to be sinners.[111] This is a natural conclusion from a purely forensic conception of justification

[107] The Council's emphasis on freewill is endorsed by Ignatius Loyola, *SE* §17: '. . . we ought not to speak so lengthily and emphatically about grace that we generate a poison harmful to freedom of the will. Hence one may speak about faith and grace as much as possible, with God's help, for the greater praise of his divine majesty; but not in such ways or manners, especially in times as dangerous as our own, that works and free will are impaired or thought worthless.'

[108] On active and passive states see §245.

[109] The Council of Trent affirms that justification is God's work, but still more than a mere Cambridge change in us: 'for the justice that is said to be ours, because we are justified through its being inherent in us, that same justice is God's, because it is infused in us by God through the merit of Christ' (ch. 16 = D §1547). Similarly, it condemns the view that justifying grace is only the favour of God, to the exclusion of infused charity (Can. 11 = D §1561).

[110] On justification and making just in St Paul see §§209–10.

[111] 'Iustus et peccator simul': *Rm.* 7:25 = Pauck 127: '. . . he is at the same time both a sinner and righteous, a sinner in fact but righteous by virtue of the reckoning and the certain promise of God that he will redeem him from sin. . . ' Cf. McGrath, *ID* 199. Related remarks by Luther are cited by Rupp, *RG* 175–80: Maurer, *HCAC* 328–30.

that makes it simply an action of God without any further change in the justified person. If this is the whole of Luther's position, justification consists in being forgiven the sins that are not forgiven in the unjustified sinner. According to this view, we would have no reason to expect the justified person to sin any less often than the unjustified.

Since Luther rejects this conclusion, he cannot believe that justification, forensically conceived, is the only effect of divine grace. Following St Paul, he rejects the suggestion that it is all right to continue in sin once we recognize that we are forgiven and justified.[112] He argues that, on the contrary, good works are required of a justified sinner, and that the justified sinner will want to perform them; as Luther says, they are 'fruits' of faith and justification.[113]

This claim is consistent with a purely forensic view of justification, if we distinguish justifying grace from sanctifying grace. Even if justification itself consists only in forgiveness, and therefore does not by itself make us just, still, God makes sanctifying grace follow justifying grace, and sanctification involves the capacity for the good works that are the fruit of justification. If this is what Luther means, his claim that grace does not involve a qualitative change in the sinner must be confined to justifying grace. Infusion, as Aquinas understands it, is not an aspect of justification, but of sanctification (as Luther conceives them).[114]

Apparently, then, the Reformers have no reason to reject belief in infused moral virtues. Still, they do not recognize any such virtues. Why do they reject them? One possible reason is relatively superficial. Aquinas has a rather extreme conception of the conditions for the presence of an infused virtue; he takes it to be incompatible with any mortal sin. This does not mean that the person with infused moral virtues is guaranteed not to fall into mortal sin; it means that once we fall into mortal sin, we lose all our infused virtues, and on repenting of it, we get them all back. This is what happened to St Peter; in denying Christ he lost all his infused virtues, and in repenting of his betrayal, he got them all back.

One might conclude that Aquinas has an unreasonably demanding conception of the life resulting from justification. Since the Reformers maintain that justifying and sanctifying grace do not eliminate sin, they might reasonably deny that justification results in the infusion of virtues whose presence is incompatible with sin, and so they might reasonably reject Aquinas' conception of infused virtues.

If, then, we were to relax Aquinas' standards for infused virtues, so that both the acquired and the infused virtues allow the presence of sin, would the Reformers have a good reason

[112] See *Rm.* 6:1 (§210n89). Trent condemns the view that the Decalogue does not bind Christians (Can. 19 = D §1569). *West. Conf.* agrees with Trent: 'The moral law doth forever bind all, as well justified persons as others, to the obedience thereof; and that not only in regard of the matter (vi materiae) contained in it, but also in respect of the authority of God the Creator who gave it. Neither doth Christ in the gospel any way dissolve, but much strengthen, this obligation (vinculum)' (19.5).

[113] On fruits of faith see *Aug. Conf.* Art. 6: '. . . that faith ought (debeat) to bring forth good fruits, and that they should (oporteat) do good works, commanded by God, because of the will of God, not so that we may be confident that we merit justification in the sight of God through these works'. Art. 20 repeats this point about works. See McGrath, *ID* 203–4. Other passages are cited by Maurer, *HCAC* 369–71.

Trent condemns the view that even for the justified it is impossible to keep the commandments of God (Can. 18 = D §1568). It affirms that good works are not merely the fruits and signs of justification, and that the justice received is conserved and increased (Can. 24 = D §1574). The *Articles* describe good works as fruits of faith, but do not endorse the view, condemned by Trent, that they are nothing more. See §12: 'Albeit that good works, which are the fruits of faith, and follow after justification, cannot put away our sins, and endure the severity of God's judgment, yet are they pleasing and acceptable to God in Christ, and do spring out necessarily of a true and lively faith; insomuch that by them a lively faith may be evidently known as a tree discerned by the fruit'.

[114] Calvin discusses sin and sanctification in *Inst.* iii 3.10–14.

to believe in infused virtues? An answer to this question partly depends on whether they agree with Aquinas on the relation of the infused to the acquired virtues. Aquinas takes them to increase the acquired virtues, and to fulfil their demands more completely. But if we think of the 'fruits of justification' as simply actions that fulfil God's commands, but are not necessarily connected to the actions enjoined by the acquired virtues, we reject Aquinas' view of the infused virtues.

The Council of Trent distinguishes the Roman from the Reformed view by claiming that good works after justification are more than simply fruits of justification (Canon 24). The point of this claim is to make these good works sources of merit. In so far as genuine virtues might also be regarded as sources of merit, the dispute about merit might also affect different people's judgment about whether good works after justification really proceed from infused virtues.

The belief that good works are sources of merit might easily be regarded as a semi-Pelagian position. Even if we deny that good works before justification merit eternal life, we might argue that two essential roles are left for freewill acting independently of divine grace. We might regard preparation for reception of grace as an action of freewill, and we might regard good works as a response of human freedom to the help given by divine grace in justification. This second role for freewill conflicts with the Reformers' treatment of good works as nothing more than fruits of justification.

From the Tridentine point of view, then, the Reformers seem to deny the essential role of human freewill in co-operating with divine grace. From the Reformers' point of view, the Tridentine position seems to re-assert the insufficiency of divine grace, and to treat God's action as the required response to human merit.

Aquinas denies that human beings by their natural capacities can acquire either condign or congruous merit before justification. But he maintains that good works after justification have congruous merit, as the products of human freewill, and condign merit, as the actions of the Holy Spirit (*ST* 1-2 q114 a3).[115] He recognizes a crucial role for freewill in these good works after justification. But he does not argue that since these works are the products of freewill, they are the products of human choice independent of divine grace. His conception of freewill does not commit him to this claim about independence. In the light of Aquinas' conception of the will, we can understand how we are capable of forming the acquired virtues in a state of sin, and how we receive the infused virtues in a state of grace, without losing the freedom that is characteristic of the will.

421. Natural Law and Ethics

If we accept a Lutheran or Calvinist view of grace, justification, and sanctification, what role is left for morality and moral philosophy? One might argue that in the Christian life ordinary morality has been superseded, because the Christian is not under law, but under

[115] See §352. The Roman Missal expresses this view in the Collect for Pentecost 12: '. . . Deus, de cuius munere venit, ut tibi a fidelibus tuis digne et laudabiliter serviatur'. BCP for Trinity 13 has 'of whose only gift it cometh that thy faithful people do unto thee true and laudable service'. The reference to condign merit is obscured by the substitution of 'true' for 'digne', but not entirely removed (since 'laudable' is retained).

grace (*Rm.* 6:14), and the law is given only for sinners (*1Tim.* 1:9). In some places Luther suggests that Christians are not bound by law, because 'the righteous does of himself all and more than all that the laws demand'.[116] This claim provokes objections from the Roman side. Suarez devotes a chapter of *De Legibus*, Book i to a refutation of the Lutheran view (as he understands it) that the righteous are not subject to the law (i 18–19).[117] But whatever Luther holds on this question, Calvin asserts that the Christian is bound by the moral law (*Inst.* ii 7.12–15).

The positive role of the moral law explains why Melanchthon emphasizes the natural law in his exposition of moral philosophy. His justification for doing this appears in his treatment of the 'righteousness of reason' in the *Apology for the Augsburg Confession*. In this work he follows Luther in denying that we can merit God's favour or forgiveness by the righteousness of reason and 'civil works'. If these works were all we need, Roman theologians would be justified in their practice (as he describes it) of teaching Aristotle's ethics in place of the Gospel; 'for Aristotle wrote so well on natural ethics that nothing further needs to be added' (*Apol. Aug. Conf*, Art. 2).[118] The Roman theologians are wrong, because the righteousness of reason does not make us independent of divine grace. But that does not make the righteousness of reason valueless. It is required both by natural reason and by divine command.[119] Hence Luther's critique of the law and 'righteousness of works' does not imply the rejection of moral philosophy. Natural law is the subject-matter of moral philosophy, as distinct from the Gospel.[120]

Since natural law is not the Gospel, we cannot achieve our ultimate end of knowing God by following the natural law, as prescribed by moral philosophy. Still, moral philosophy is a part of the divine law, in so far as it can be discovered by reason. Even though awareness of it is obscured by sin, it is not completely lost, and it is worth our while to clarify it (*PME* 158.12–24). Melanchthon takes up some of the main topics of Aristotle's *Ethics*—the ultimate end, the virtues, and the voluntary. He expands Aristotle's treatment of justice, including a discussion of particular cases of right and wrong, Biblical, Classical, and contemporary. He concludes with a discussion of some particular virtues and duties, including friendship. He lays less emphasis than Aquinas lays on the individual virtues of character, and more emphasis on the requirements of justice and right. But he does not suggest any basic change in the structure of an Aristotelian moral theory. He discusses moral philosophy and natural

[116] Luther, *Temporal Authority* = *Works* xlv 89 = Dillenberger 369.

[117] See Skinner, *FPMT* ii 139. See also Suarez, *De bonitate*, iii 1 = *OO* iv 305b. He attacks Luther's claim that all the actions of a human being are sins, even though they are not imputed to the faithful.

[118] This is the passage that Leibniz presumably has in mind in saying that in this work Luther 'allowed a favourable mention of Aristotle and his *Ethics*' (*Theod.* Prelim. Diss §12 = Huggard 81).

[119] 'We for our part maintain that God requires the righteousness of reason. Because of God's command, honourable works commanded in the Decalogue should be performed, according to *Galatians* 3:24 and *1 Timothy* 1:19 . . . To some extent reason can produce this righteousness by its own strength, though it is often overwhelmed by its natural weakness and by the devil, who draws it to open crimes. We freely give this righteousness of reason its due credit; for our corrupt nature has no greater good than this, as Aristotle correctly says, 'Neither the evening nor the morning star is more beautiful than righteousness'. . . . Nevertheless, it ought not to be praised at the expense of Christ' (*Apol. Aug. Conf.* Art. 4). On Melanchthon's attitude to moral philosophy see Kusukawa, *TNP* 64–72.

[120] 'Moral philosophy is that part of divine law that prescribes about external actions' (*PME* 157.7). 'For this is the firm and especial merit (laus) of moral philosophy, to understand what is truly a part of divine law. . . ' (157.16). For Leibniz's praise of Melanchthon see Leibniz, *Theod.* Prelim. Diss. §12 = G vi 57 = Huggard 81.

law because he wants to make it clear how the knowledge available to the moral philosopher differs from the proper concern of the theologian.[121]

One aspect of Melanchthon's conception of the natural law and moral philosophy may appear to separate him from Aquinas. He sometimes takes moral philosophy to be concerned specifically with external actions, in contrast with the Gospel, which is concerned with the 'perfect obedience of the heart'.[122] This claim seems difficult to reconcile with Melanchthon's Aristotelian view that moral philosophy is about the virtues, understood as states of character, including states of the will,[123] and therefore not simply about right external behaviour. A virtue requires right judgment, which must guide the will.[124] Given this conception of virtue, Melanchthon cannot consistently claim that moral philosophy is concerned only with external actions, if external actions are mere patterns of behaviour as distinct from their causes in will, judgment, and character.

His view is consistent, however, if the contrast between 'external actions' and 'the obedience of the heart' refers to the difference between the motives of people in the state of sin and the motives of people under grace. In a sinful condition, even virtuous states of character, as measured by moral philosophy, are merely 'external', in so far as they do not proceed from the love of God above everything. If this is what Melanchthon means, his claim about external actions tries to reconcile Aristotelian moral virtues with Luther's extreme Augustinian view that we are totally incapable of genuine virtue when we are in the state of sin. The use of 'external actions' for Aristotelian virtues does not convey this point very well; it would have been better to contrast the motives that are possible without grace with those that become possible under grace, rather than to speak of external and internal. But once we understand Melanchthon's use of 'external', his position is a reasonable clarification or modification of Luther's claim about the possibility of virtue in the state of sin.

422. Implications

Even this superficial survey of some of the issues relevant to moral philosophy that were discussed by the Reformers and their opponents may help to explain some of the different effects of the Reformation. Some elements in the views of the Reformers initiate some significant changes in approach to moral philosophy; but other elements support the outlook of Scholastic naturalism.

[121] 'Thus far we have set out preliminaries about this area of learning, so that it may be distinguished from the Gospel, and so that we can understand how far it is to be approved, and what benefits it has' (163.16–18).

[122] 'For the divine law was stamped on the minds of human beings, but it was darkened in this weakness of nature, so that we cannot sufficiently grasp those precepts, and what they order us to hold about the will of God, and what they prescribe about the perfect obedience of the heart. But there remains judgment about right (honestis) external actions, and this arises in us; it is itself the law of nature and a part of divine law. (158.13–19). And properly instructed philosophy is inherently and truly the clarification of natural law. And so, just as the pious are allowed to rely on the law of God or the law of nature, so also they are allowed to rely on moral philosophy, which applies to external practices (mores)' (160.14–17).

[123] 'Virtue is a state that inclines the will towards obedience to correct reason' (174.30–1).

[124] 'For so that there will be some definite rule of virtue, the will is to be directed by the judgment of the mind. And that judgment is the knowledge of natural law and of divine law and of all learning that has firm grounds taken from natural and divine law, or is the clarification of natural and divine law' (175.23–8).

Hobbes's views on moral philosophy and on Christianity reflect the views of some Reformers.[125] He believes that human nature in its own right is not fulfilled by morality, and that morality has to be imposed on human beings to restrain their self-seeking tendencies. This imposed morality concerns civil obligation in which the civil authorities are supreme. God is free in relation to the moral law and freely chooses to impose it on us, for reasons that do not concern us; reflexion on the Scriptures reveals the commands of God, and these commands require our subjection to the civil authorities. Each one of these claims could be defended from some tendency in the thought of the Reformers, and especially of Luther.

Hobbes did not have to turn to the Reformers to find such views. He develops the outlook of mediaeval voluntarists, derived from a one-sided reading of Augustine's two cities. But since the Reformers make this outlook especially prominent, their influence explains some of Hobbes's attitudes. Hobbes has some support for his claim that he expounds Christian teaching from the point of view of the Reformation.

None the less, Christians had good reason to reject Hobbes's views on morality and on Christianity. For though Hobbes's views draw on some elements in the Reformation, they conflict with the considered views of (for instance) Luther, Melanchthon, Calvin, and Hooker. For different reasons and to different degrees, these all take Aristotelian ethics to be basically sound. They do not believe that morality is simply a device for securing mutually beneficial patterns of action among self-seeking individuals. They believe, as Aquinas believes, that moral thought and action should cultivate the moral virtues that fulfil rational nature. This aspect of the outlook of the Reformers is a defence, not a rejection, of Scholastic naturalism.

INDEX

The numbers refer to sections, not to pages.
Authors who are cited or quoted simply as sources (e.g., Stobaeus) are not indexed.
Italics indicate a cross-reference.
Bold type cross-refers to a more articulated entry.

PREFATORY NOTE

This is the second of three volumes. The division into volumes is not meant to be thematically significant, and so the second volume simply begins where the first left off. The numeration of the sections continues from the first volume, and references to §§1–422 refer to the first volume. The preface, dedication, and introduction to the first volume belong equally to the second. In particular, the introduction explains the aims, scope, and limits of the book.

I have benefited from helpful comments and advice by readers for the Press, and from discussion with Stephen Darwall and Nicholas Sturgeon. For help in the Sisyphean task of checking, verifying, and correcting the penultimate draft I am most grateful to Kristen Inglis and Tom Ainsworth.

ABBREVIATIONS

This list includes only the most frequently used abbreviations, and those that might puzzle a reader. I have tried to cite primary texts from sources that will be fairly readily available.

Greek and Latin texts appearing in the OCT, BT, and Loeb series are listed with a reference to the relevant series, but without further details.

I have mentioned only a few of the available translations and editions.

Acronyms are normally used for the titles of books, journals, and collections. Short titles are used for articles and essays.

Page references include 'p.' only in cases where it might avoid ambiguity.

A page number with a letter (e.g., 'Reid, *EAP* 755 H') usually indicates the relevant edition. For less accessible texts available in Raphael, *BM*, or Selby-Bigge, *BM*, a reference to one of these collections is usually given.

ACPQ = *American Catholic Philosophical Quarterly*
AJP = *Australasian Journal of Philosophy*
Aquinas, *in EN* (etc.) = Aquinas' commentaries on Aristotle and on Biblical books.
BCP = *Book of Common Prayer*
BT = Bibliotheca Teubneriana. Greek and Latin texts
Cic. = Cicero
CSEL = *Corpus Scriptorum Ecclesiasticorum Latinorum*
CUP = Cambridge University Press (Cambridge, London, New York)

SUAREZ: LAW AND OBLIGATION

423. The Questions about Natural Law

Discussion of natural law reaches a new level of sophistication in Suarez's elaborate and careful treatment. He takes account of Aquinas, Scotus, Ockham, and their successors, and claims to defend Aquinas' views on the main issues. Since his discussion is usually fuller than Aquinas' discussion, and explores questions that Aquinas does not discuss at length, Suarez deserves careful study.

We may not always agree with his claim to defend Aquinas' position. Indeed, some readers, especially among those sympathetic to Aquinas, have argued that Suarez does not simply disagree with Aquinas on some details, but radically alters Aquinas' views on natural law and the foundations of ethics, and alters them for the worse. This departure from Aquinas is historically significant because—it is suggested—Suarez strongly influences the theory of natural law that has been prominent in post-Reformation Roman Catholic moral theology.

Historians of ethics and political theory have concentrated on Suarez's treatment of law, and especially of natural law. His treatise 'On Laws and God the Legislator' clarifies many issues that his predecessors pass over. Aquinas has relatively little to say on the relation of the principles of natural law to the will of God. Some of his successors, particularly Scotus and Ockham, have more to say. Suarez sets out and discusses in full the major issues that arise in his predecessors; he considers how many separable claims can be made, and what follows from each of them. Since Grotius and Cudworth are probably familiar with Suarez's discussion, it provides a useful basis for comparing modern with mediaeval views.[1]

The prominence of Suarez's discussion of law might lead us to suppose that law is more important in his conception of morality than in Aquinas' conception. If this were so, Suarez would be closer to a modern than to a mediaeval position on one important issue.[2] We should keep in mind, however, the fact that Suarez conceives his treatise on laws as part of a discussion of Aquinas' *Summa*. When he comes to discuss Aquinas' *Treatise on Law*, he

[1] On Grotius' knowledge of Suarez see §463. On Cudworth see §546.
[2] On modern v. mediaeval views on natural law and ethics see §453.

does not need to remind his readers that he is presupposing the previous parts of the *Prima Secundae*; he takes it for granted. His treatise on laws should be understood in the light of his comments on the rest of the Prima Secundae.

A discussion of Suarez's treatment of natural law will lead us to his treatment of moral goodness. For our purposes, his reflexions on this issue are even more important than his views on natural law; for they correct a misleading impression that we might get from exclusive attention to his treatment of natural law.

424. Some Issues and Clarifications

Discussions about the relation of natural law to the divine will involve several distinct questions that are not always kept apart.[3] Since Suarez does most to distinguish the questions and to show how the answers to them are and are not connected, it is helpful to consider the questions as he sees them.

Orthodox Christians agree that all natural facts that essentially refer to contingent particular beings depend on the creative will of God.[4] Since it was up to God whether or not to create human beings, it depends on God's will whether or not there are any good or bad human actions. But does it equally depend on God's will what human actions are good or bad? Was God free to create human beings for whom murder would have been good and generosity bad? Naturalists answer No, because they believe that moral goodness and badness are fixed by the nature of human beings, and that creatures for whom murder was good would not be human beings. Ockham, however, appears to answer Yes, claiming that our rational knowledge of what fits human nature is itself the result of an exercise of God's free will.

But even if facts about what is good and bad for human beings are grasped by the divine intellect and do not result from a choice made by the divine will, a question still arises about moral goodness. Naturalists believe that moral facts are among the natural facts that are fixed for human beings with our nature. Voluntarists argue that, even if natural facts include facts about the human good, moral facts are not natural facts; for moral facts depend on a further exercise of the divine will, beyond its exercise in creation, and the natural facts do not determine this further exercise. Scotus suggests that the moral principles referring to our neighbours (the second table of the Decalogue) are really divine positive laws, and that in this legislation God's will is not determined by any prior requirements of right and wrong. Ockham goes further, and claims that all the requirements recognized by right reason (including the commandment to love God) result from exercises of the divine will undetermined by any divine knowledge of antecedent right and wrong.

Even if we are naturalists about moral facts, we may still be voluntarists about natural law; for we may claim that facts about intrinsic moral goodness (fixed by natural facts) do

[3] A survey of different conceptions of the natural law is offered by the commentators on Scotus, *3Sent* d37 = OO vii.2 858.

[4] This clumsy formulation is intended to take some account of Suarez's views on essences (*DM* xxxi).

not imply the existence of natural law, because natural law depends on a further act of divine legislation. If we say this, we raise a further question about the relation of the divine will to intrinsic morality; is it necessary that God legislates in accordance with intrinsic morality, or is God free to legislate differently? Different answers give us different degrees of voluntarism about natural law.

In trying to understand the naturalist and the voluntarist answers to these different questions, we may resort to counterfactual questions. We may ask whether the same things would have been right and wrong if God had not legislated, and we may say that intrinsic natural facts are those that would exist even if God had not exercised legislative will. But this claim needs to be treated carefully. On one way of understanding it, there are no intrinsic natural facts; for, since God is a necessary being, God is necessarily good, and God's goodness requires the exercise of God's legislative will, natural facts cannot exist without God's having legislated. We must, therefore, understand the relevant counterfactual differently. We must hold God's goodness fixed, and assume, contrary to fact, that God's goodness does not require God to legislate; then we ask what intrinsic natural facts there would be on that assumption.

The same point applies to all counterfactuals that consider what intrinsic natural facts would exist if God did not exist. Anyone who believes in God as creator must believe that without God there would be no natural world. Moreover, anyone who believes that God is a necessary being must believe that if God did not exist, there would be no intrinsic natural facts. The counterfactuals that ask what would be the case if God did not exist must be taken to assume the impossible situation in which God does not exist and still the world is in other ways as it actually is.

These questions and distinctions may help us to understand how Suarez sees the main issues, and where he stands on the most important questions in dispute.

425. Suarez's 'Intermediate' Position

Suarez describes his account of natural law as a middle way, which he also takes to be the view of Aquinas, and the common view of theologians (*Leg*. ii 6.5). An extreme naturalist view makes the law of nature purely 'indicative', showing us what is intrinsically good and bad (ii 6.3).[5] An extreme voluntarist view claims that the natural law lies entirely in the commands proceeding from the divine will, and is therefore entirely a prescriptive (praeceptiva), not an indicative, law (ii 6.4).[6] Suarez's view is intermediate because it claims that 'the natural law is not only indicative of good and bad, but also contains its own proper prohibition of evil and prescription of good' (ii 6.5).[7] He agrees with the naturalist view that it is indicative of what is intrinsically good and bad,[8] but he claims that it is also essentially prescriptive.

[5] Quoted in §436. [6] Quoted in §435.

[7] Suarez takes the gerundive form to mark indicative law, and only the imperative form to mark prescriptive law. See §442.

[8] Since he takes 'indicative of good and bad' to distinguish his position from the voluntarist position he has just mentioned, he must take this phrase to mean 'indicative of what is intrinsically good and bad'.

To see what Suarez means by speaking of an indicative and a prescriptive law, and why he thinks the natural law must have both features, we should consider his description and discussion of the naturalist and the voluntarist views. Then we can ask what his view claims, and whether it is preferable to the two extreme views.

It is easiest to begin with his discussion of naturalism. For once we understood the points on which he agrees and disagrees with naturalism, we can see what he thinks about voluntarism. His critique of naturalism also includes an affirmation of some aspects of naturalism; these show us where he rejects voluntarism.

Suarez claims to hold an intermediate position about the status of natural law, but we also want to know whether he holds an intermediate position about morality. Since he recognizes that the natural law indicates what is intrinsically good and bad, he is a naturalist about some goods and evils. But which goods and evils are these? If they are moral goods and evils, he is a naturalist about morality, though not about natural law. If they are non-moral, he is a voluntarist both about morality and about natural law.

426. Naturalism

For a statement of a naturalist position that treats natural law as purely indicative, Suarez turns to Gregory of Rimini.[9] Suarez relies on Gregory's admission that even if, per impossibile, God did not exist, or did not use reason, or did not judge correctly, lying, for instance, would still be a sin, because it would still be contrary to correct reason. According to Gregory, sin is contrary to divine reason because divine reason is correct, not because it is divine. Gregory infers that whatever is against correct reason is thereby against the eternal law.[10]

Gregory's account is the basis of Biel's instructive discussion of Augustine's definition of sin. This definition might appear to favour a voluntarist, since it mentions divine law (*2Sent* d35 qun a1), but Biel, following Gregory of Rimini, modifies it gradually in a naturalist direction. First, he argues (a1C = 609) that the divine law is essentially connected with divine reason, and that divine reason is essentially correct. Hence he infers that Augustine's

[9] 'In this matter the first opinion is that natural law is not properly a prescriptive (praeceptiva) law, because it is not a sign of the will of some superior, but that it is a law indicating what is to be done or avoided, what by its own nature is intrinsically good and necessary or intrinsically evil. And thus many people distinguish two sorts of law: one sort indicating, the other prescribing. And they say that the natural law is a law in the first way, but not in the second. . . . And consequently it seems that these authors will concede that the natural law is not from God as from a legislator, because it does not rest on the will of God, and thus by its force God does not behave as a superior prescribing or forbidding. Indeed, Gregory says (followed by the others), even if God did not exist or did not employ reason or did not judge correctly about things, even so, if there were in a human being the same dictate of correct reason dictating, for instance, that it is bad to lie, this would have the same character of law that it has now, because it would be a law showing the badness that exists intrinsically in the object.' (ii 6.3)

[10] 'Whatever is against correct reason is against the eternal law. If it is asked why I say it is against correct reason without qualification, rather than, more narrowly, against divine reason, I reply: so that it will not be thought that a sin is precisely against divine reason, and not contrary to any correct reason about it. Otherwise it would be supposed that something is a sin not because it is against divine reason in so far as it is correct, but because it is against it in so far as it is divine. For if by an impossibility divine reason or God himself did not exist, or if that reason were in error, still, if anyone acted against correct reason—angelic, human, or any other—he would be in error.' (Gregory, *2Sent*, d34 q1 a2, concl.1 = T&M vi 235. 11–12, quoted by Perena on Suarez, *Leg*. ii 6.3.) Gregory's account of sin is quoted by Biel, *2Sent*. d35 q1 a1 D. See Oberman, *HMT* 105–8.

account means that sin is an offence against correct reason. To the objection that such an account eliminates a reference to divine law, Biel replies that the relevant sort of law need not be imperative in the strict sense that involves a command 'expressed through a word in the imperative mood or something used instead of it to signify similarly' (a1E.1–3). It may be an indicative law, 'by which it is signified only that something is not to be done (non esse agendum), or something <is signified> from which it follows that it is not to be done' (a1D.8–9). An indicative law says or implies that something ought (debere) not to be done (a1D.13), and from that we can infer that the action is in some way prohibited. Hence a reference to a law and a prohibition does not imply a reference to an imperative law. When we speak of a divine or an eternal law commanding and prohibiting, we should not take this to imply an imperative law, but should take 'law' broadly so as to include indicative law (a1E.7–8).

Biel's last step towards naturalism, still following Gregory of Rimini, explains the meaning of 'contrary to correct reason' in his revised definition of sin. He now argues that the reference to correct reason should not be taken to imply that someone's actual correct reason has to oppose the sinful action. Even if, per impossibile, God did not exist, or if God's reason were not correct, or if no one had correct reason, what would be contrary to correct reason would still be wrong (a1E.17–25). We need to make this clear, Biel remarks, so that no one will suppose that a sin is an act contrary to divine reason insofar as it is divine; it is contrary to divine reason only insofar as divine reason is correct (a1E.17–21).[11]

It is difficult to reconcile this naturalist account of sin with a voluntarist account of the basis of the natural law. Biel's account of correct reason implies that the relevant sort of correctness does not depend on the reason of any person, human or divine; correct reason would forbid an action because the action is inappropriate for human nature. If we claim that this is all true because of God's exercise of ordered power, we imply that God is free, by an exercise of absolute power, to change what is appropriate for human nature, or free to command actions that are inappropriate for human nature.[12] Neither result is satisfactory. God could change what is appropriate for human nature only by making human beings have a different nature; but then they would not be the same species. Nor does Biel allow that God could command what is inappropriate for human nature, though perhaps Ockham is willing to allow it.[13]

Neither Gregory nor Biel affirms that what is intrinsically wrong is thereby contrary to the natural law; they speak only of what is contrary to correct reason. But Suarez is justified in assuming that Gregory has intrinsic wrongness in mind. When Gregory speaks of correct

[11] 'For if by an impossibility God, who is divine reason, did not exist, or that divine reason were in error, still if anyone acted against correct reason—angelic or human or any other sort, if there were any—they would sin. And if no correct reason at all existed, still if anyone acted against what correct reason, if there were any, would prescribe to be done, they would sin.' (a1E.21–5)

[12] On absolute v. ordered power see §396.

[13] 'This immanent validity, however, is reliable solely for the reason that its justice is derived from the eternal law or divine reason. This eternal law in its turn is dependable because it is not subject to arbitrary decisions of God's will, or reason, but to a final standard of justice that would even endure if there were no divine reason at all; its steadfastness would not be shaken even if the divine reason would deviate from this norm.' (Oberman, *HMT* 107) Oberman tries to reconcile this claim with a voluntarist thesis that the natural law depends on God's ordered power, but it is difficult to see how he reconciles them.

reason, he does not presuppose the existence of anyone who has correct reason—God, angel, or human being. Correctness is not defined by the conclusions of someone's reasoning; on the contrary the correctness of the conclusions of anyone's reasoning is defined by reference to correct reason. Suarez is justified in suggesting that Gregory alludes to the intrinsic rightness and wrongness of actions, in their own nature and apart from anyone's reasoning about them.

These remarks imply only that some actions are wrong intrinsically, and hence contrary to correct reason, whether or not God prohibits them. But Gregory also claims that what is contrary to correct reason is contrary to the eternal law. Whereas he claims that it would still be wrong even if God did not prohibit it, he does not say it would still be wrong even if the eternal law did not prohibit it; hence he seems to infer that what is intrinsically wrong is essentially contrary to the eternal law. If the existence of the eternal law implies the existence of the natural law, whatever is intrinsically wrong is thereby also contrary to the natural law.[14]

Gregory's counterfactual assumption about the non-existence of God makes the implications of the naturalist position clear. Suarez also cites Vasquez's affirmation that the natural law is independent of the will and command of God (*Leg*. ii 5.2).[15] Though Vasquez does not use the supposition of the non-existence of God to explain his point about the natural law, he agrees with Gregory in affirming that the natural law is independent of divine legislation.[16]

Vasquez's main reason for denying that natural law depends on the divine will is his conception of the content of natural law. He insists that it describes things that are good and bad in their own nature, independently of any will. He infers that natural law does not consist in any command; 'for we said that it is primarily rational human nature itself'.[17]

[14] Whether or not Gregory means to say that natural law would still exist even if God did not exist depends on what he means by his claim that whatever is contrary to correct reason is also contrary to the eternal law. He might have either of two claims in mind: (1) Whatever is contrary to what correct reason would say, whether or not anyone's reason says it, is also contrary to what the eternal law would say, whether or not there is any such law. (2) Whatever is contrary to what correct reason would say, whether or not anyone's reason says it, is also contrary to the actual provisions of the actual eternal law. Suarez assumes that Gregory has the second claim in mind; since Gregory does not qualify his claims about eternal law in the way he qualifies his claims about divine reason, Suarez's assumption is fair. I have emphasized the plausibility of Suarez's claims about Gregory because Haakonssen, *NLMP* 20, maintains that 'Suarez's formulation of Gregory's view . . . polemically distorts it in a significant way. Gregory did not say, in the passage referred to by Suarez, that without God the dictates of right reason would still have the same "legal character" . . . He said only that, even without God, there would be sin, or moral evil (peccatum).' This criticism of Suarez does not take sufficient account of Gregory's remarks about the eternal law, which are plausibly taken to say that the dictates of right reason would have the same legal character without God.

[15] Quoted in §427.

[16] 'If, however, one is talking about the natural law, which is said to exist by its own nature, not by decision or by anyone's will, one must speak differently. For since law or right (ius) is a rule that actions must conform to in order to be just (iustae), natural law or natural right will be a natural rule that exists by no will, but by its own nature. And in fact the existence of such a law or right, which is constituted by no will, not even by the will of God, is most of all confirmed by what we said above, in Disputation 97, Chapter 3. That is to say, some things are evils and sins from themselves in such a way that this prohibition depends on no will, even the will of God—this was proved by us more than adequately. Indeed we not only showed this, but we also pointed out that many things are evil from themselves in such a way that their badness is prior in accord with reason to all judgment of the divine intellect. That is to say, they are not bad because they are judged bad by God; rather, they are judged bad because they are such from themselves. From this it results that before any will and command (imperium) of God, indeed before any judgment, some works are good and evil from themselves.' (Vasquez, *Disp*. 150 c.3 §22, p. 7)

[17] nam primarie diximus esse ipsam naturam rationalem hominis, *Disp*. 150 c.4 §29.

In claiming that it is prior to any will, 'we ought not to say on that account that it is any judgment of reason, even of the divine reason; for it is prior to any judgment'.[18] Natural law obliges, simply in virtue of being natural law;[19] obligation requires nothing more than the existence of the rational beings for whom the natural law is natural.[20]

This conception of the source and obligation of natural law supports Vasquez's denial that the natural law is dispensable. If we make it dispensable, we allow, as Scotus and Ockham do, that sometimes the Decalogue requires a specific action, but a particular person is not required to do it. In Scotus' view, dispensations do not dispense from the natural law; for he takes the moral laws concerning our neighbours to be divine positive law. Since, as Aquinas agrees, divine positive law is subject to dispensation, these moral laws are subject to dispensation too. Ockham goes further than Scotus, and takes the whole of the natural law to be subject to dispensation.[21] But according to Vasquez's account of natural law, the whole Decalogue embodies natural law, and therefore is not subject to dispensation.[22] Since natural law is fixed by the facts about rational nature, God cannot make it right to violate natural law simply by dispensation, without any change in the facts about rational nature.

These claims about natural law rest partly on Vasquez's earlier discussion of sin. In connexion with Aquinas' discussion of the account of sin as being contrary to the eternal law (*ST* 1–2 q71 a6),[23] he asks whether 'all sin is sin by being contrary to law'.[24] He argues that this view overlooks the fact that the badness of sin is prior to any law.[25] God cannot change the nature of things, and the nature of things makes anything good or bad.[26] If goodness or badness were in some way constituted by a law, it would be mutable in a respect in which we know it is immutable.

[18] ob id tamen dicendum non est esse iudicium aliquid rationis, etiam divinae; nam quocumque iudicio prior est, *Disp*. 150 c.4 §30.

[19] 'Now about the natural law, which sometimes does not oblige when one faces the danger of death, our philosophical account must be such that we do not say that the danger of death prevails against the obligation of natural law; for if the obligation and every circumstance of the precept <of natural law> still remained, it would oblige even at the price of death. In this way, the law of nature about not lying, even venially, is to be kept even with the danger of death. By this law the substance of the precept about not lying remains untouched, with all its circumstances, and none of them, even the smallest is removed by the danger of death; for <the substance of the precept> consists wholly in this, that one speaks externally against what one believes internally. Rather, our philosophical account must be such that we say that when the danger of death arises, some circumstance of the natural law is removed, given that the law would otherwise oblige.' (Vasquez, *Disp*. 161 c.2 §13, p. 111)

[20] This position on obligation is similar to Clarke's. See §617.

[21] See ii 15.3. On Ockham see §395.

[22] 'For the law of the Decalogue, as we said, is natural law. But the natural law is nature itself, which a given thing is said to agree or disagree with, not without qualification but with the required circumstances. And if these circumstances remain, no one, not even God, can so interpret the law that it does not oblige. For—given that rational nature itself cannot be changed—if the facts and circumstances are unchanged, a true and veracious intellect, such as the divine intellect is, cannot interpret the law itself in different ways.' (*Disp*. 179 §15, p. 268)

[23] Quoted in §235n6.

[24] omne peccatum eo sit peccatum quo est contra legem, *Disp*. 97 = i 657.

[25] He refers to Part 1, *Disp*. 104 c.3, on Scotus; and to 1–2 *Disp*. 179 on dispensations.

[26] 'Moral badness consists in that relation of opposition with rational nature. Moreover, some things are bad from themselves in such a way—that is to say, unfitting to rational nature in the way in which heat is to water—that if they are done with these circumstances, they have this character by their own nature, not by the will of God prohibiting or by his judgment judging. For, just as the essences of things, from themselves and not from the will or intellect of God, do not imply a contradiction, as we were saying above, and one is contrary and unfitting to another, so also hatred of God and perjury are unfitting to a human being from themselves, and not by the intellect or will of God. And therefore not all sins are sins because they are prohibited.' (*Disp*. 97 c.3, p. 658) On mala quia prohibita cf. §307.

427. Two Versions of Naturalism

According to Suarez, the naturalist position claims that rational nature is itself the natural law.[27] It claims that rational nature is the epistemological basis for the law, since our reason gives us access to the actions that do and do not accord with our rational nature. But it also holds the metaphysical thesis that natural law is rational nature (*Leg*. ii 5.1).

Suarez recognizes two versions of this naturalist thesis: (1) Objective naturalism: As Vasquez claims, natural law is rational nature itself, insofar as different things are appropriate for it, and therefore right, or inappropriate, and therefore wrong. (2) Cognitive naturalism: Natural law is rational nature as grasping what is appropriate for rational nature (ii 5.1).

The two versions appeal to the same underlying facts—the facts about appropriateness to nature that make an action right or wrong. But cognitive naturalism takes the natural law to consist in a further fact, the judgment of correct reason about what is appropriate or inappropriate. The point of cognitive naturalism is not to say that natural law consists in the judgment about rightness rather than in rightness itself; since the judgment must be correct, genuine natural law rests on actual rightness itself. But cognitive naturalism claims that the mere fact of something's being right or wrong does not by itself constitute the existence of a natural law; there would be no natural law if correct reason did not also make a judgment about it.

Suarez agrees with one part of objective naturalism. He believes in intrinsic rightness and wrongness that are constituted by facts about rational nature in its environment, not by facts about anyone's beliefs, judgments, or commands (ii 5.5). Rational nature is the 'foundation' of the objective rightness of actions, but that does not make it law. Similarly, rational nature is the 'measure' or 'rule' of rightness, but not every measure or rule is thereby a law (ii 5.6). Suarez appeals to Aquinas' broad use of 'measure' and 'rule', and asserts that Aquinas would not speak of a law in all these cases (ii 5.6, citing Aquinas, *ST* 2–2 q141 a6 and ad1). Both as a foundation and as a measure, rational nature lacks the essential functions of a law in prescribing, directing, and enlightening.[28] To assert that rational nature lacks these features, but is still natural law, is to use 'law' equivocally, and thereby to undermine the whole discussion (quod evertit totam disputationem, ii 5.5).

Suarez now argues that objective naturalism makes natural law insufficiently dependent on God, since natural law turns out to oblige God. Since lying is no less inappropriate to God's rational nature than to ours, God's nature will also be a measure or rule of the rightness that requires truthfulness. Hence it will be a law for God no less than for human beings. If objective naturalism is right, the same result follows from Aquinas' claim that God owes to himself what is appropriate to his nature (*ST* 1a q21 a1 ad3). Since God's nature provides a measure, and a measure is a law (according to objective naturalism), God will be

[27] '. . . rational nature, in its own right and in so far as it does not involve any contradiction, and is the foundation of all rightness of human acts that are appropriate for such a nature, or, on the contrary, of <all> wrongness of them through inappropriateness for that nature, is itself the natural law' (*Leg*. ii 5.2).

[28] '. . . rational nature itself, considered precisely, in so far as it is this sort of essence, neither prescribes, nor displays rightness or wrongness, nor directs, nor enlightens, nor has any other effect that is proper to law' (*Leg*. ii 5.5).

obliged by the law of his nature, just as human beings are obliged by the law of their nature; and this, in Suarez's view, seems absurd (*Leg*. ii 5.7).

The independence of natural law from God, as explained by objective naturalism, has the unwelcome result that natural law is not divine law and is not from God (non esse legem divinam, neque esse ex Deo, ii 5.8).[29] The feature of rational nature that makes actions right and wrong does not depend on God for its character (ratio),[30] though it depends on God for its existence; for the fact that lying is inappropriate to rational nature is not from God, does not depend on God's will, and is even logically (in ordine rationis) prior to a judgment of God (ii 5.8). This passage shows that Suarez takes 'from God' (ex Deo) and 'dependent on God' (pendere ex Deo) to be equivalent. He is not claiming that the relevant facts, according to naturalism, are prior to God, but only that they are not posterior to him, as they ought to be (in his view) if they are really a divine law.

Here Suarez agrees that facts about intrinsic rightness and wrongness do not depend on God. He agrees with objective naturalism about rational nature, intrinsic rightness, and their independence of divine commands. That is why he thinks they cannot be natural law.

After these objections to objective naturalism, Suarez turns to cognitive naturalism. According to this view, the existence of natural law consists not merely in the facts about intrinsic rightness and wrongness, but also in the facts about our rational capacity to discriminate intrinsic rightness and wrongness (ii 5.9). Suarez holds that Aquinas, contrary to Vasquez, takes these cognitive facts to be essential to natural law. He believes that Aquinas agrees with him, against Vasquez, in separating a law (lex) from a standard (regula) and a measure (mensura). When Aquinas refers to our capacity to discriminate right and wrong, he describes (according to Suarez) conditions for the existence of the natural law.

This assumption about Aquinas is insecure. Admittedly, he takes a law to be 'some sort of standard and measure of actions' (quaedam regula . . . et mensura actuum) in accordance with which one is led to act or restrained from acting (*ST* 1–2 q90 a1). But he does not say specifically how a law differs from other standards that might guide action. In order to show that reason is a standard and measure of human action, he asserts simply that it is a measure and standard by being a principle of actions; he infers that law belongs to reason. Our rational capacity for distinguishing right and wrong may be necessary for the presence of the natural law in us, but not for the existence of the natural law (q91 a2).

Aquinas, therefore, may accept objective naturalism, and may not be disturbed by the implications that disturb Suarez. But he does not clearly endorse objective naturalism. In claiming that the natural law consists of precepts, he assumes that it requires 'command' (imperium), which is an act of reason presupposing an act of will.[31] Aquinas' claim that command belongs to reason suggests that a fact external to agents does not constitute a precept until it is grasped by some agent, divine or human. Hence the existence of the

[29] ET mistakenly puts 'therefore' at the beginning of §8. 'Deinde' marks the second of the 'inconvenientia' mentioned at the beginning of §7.

[30] 'Rational basis' ET. Perena's 'en su esencia' is preferable.

[31] For Aquinas' views on imperium see 1–2 q17 a1; a3 ad1; 2–2 q47 a8; q50; §257. Cajetan on 1–2 q17 a1 defends intellect as the source of imperium, connecting it with the view that prudence itself is prescriptive. He attacks Scotus on this point. Suarez agrees with Scotus in taking command to proceed from the will, in contrast to intellect (*Leg*. i 4.14). See Farrell, *NLSTS* 56; Finnis, *NLNR* 54, 337–43, 347.

natural law seems to require rational agents who grasp it. This aspect of Aquinas' view separates him, as Suarez says, from Vasquez.

Still, Vasquez's view captures Aquinas' belief that natural facts make actions right or wrong, and hence provide the content of precepts of natural law. In Aquinas' view, facts about human nature constitute duties (debita), because they would be prescriptive for us if we grasped them and connected them appropriately with our will.

Suarez, therefore, is right to distinguish the two forms of naturalism found in Aquinas and in Vasquez, and to explore their implications.

428. Suarez's Objection to Naturalism

Suarez criticizes cognitive naturalism, which takes knowledge of right and wrong to be essential for the existence of natural law. According to this view, the natural law proceeds from God as creator, not as legislator; it does not essentially convey God's commands, but indicates what is good or bad in itself.[32]

Both objective and cognitive naturalism would be open to attack if they could not be reconciled with the Scriptural evidence that Suarez accumulates to show that natural law is divine prescriptive law (*Leg*. ii 6.7–8). If a naturalist position could not explain how God can command observance of the natural law, it would have to say that the natural law is purely declarative, and not prescriptive (ii 6.3).

A cognitive naturalist might fairly reply that the indicative character of the natural law does not preclude God's also commanding us to obey it. God's command is a further exercise of divine freewill beyond its exercise in creation. Once we exist as creatures who ought to obey the natural law, we still have a choice about whether to obey it. Moreover, God has a choice about whether to command us to obey it. This does not mean it is possible for God to create us and then to abstain from commanding us to obey the natural law; such an abstention would be contrary to God's goodness. But the fact that God's nature makes it impossible for God, having created us, not to command us to obey the natural law does not imply that God does not freely command us to obey it.

This claim about God's freedom will convince us if we explain divine freedom as Aquinas explains it, but not if we agree with Scotus or Ockham about divine freedom. Since Suarez accepts Aquinas' explanation, he cannot reasonably deny that God commands out of his freewill that we obey the natural law that exists independently of his command.

Suarez has a further objection to the naturalist position; it implies that the natural law is not essentially commanded by God. This claim about essence may be expressed by the counterfactual claim that even if God had not commanded us to obey the natural law, there would still have been natural law. In reply Suarez affirms an essential connexion between the natural law and God's commands. Both versions of naturalism imply that if any divine

[32] 'God is, therefore, without doubt the producer and, so to speak, the teacher of the law of nature. But it does not follow from this that he is the legislator, because the law of nature does not indicate God as prescribing but it indicates what is good or bad in itself, just as sight of a certain sort of object indicates that this is white or black, and as an effect of God indicates God as its author, but not as legislator. That, then, is how we will have to think of the natural law.' (*Leg*. ii 6.2)

prohibition were removed, action contrary to the purely indicative principles of goodness and badness would violate the natural law.[33]

Why should we find this result unacceptable? If the naturalist view is right, natural law is not essentially genuine law, as Suarez understands it, because it does not require any command by a superior (ii 6.6). But the best authorities, in his view, understand natural law as genuine law, because they insist that God prohibits offences against the natural law.[34] Suarez misses the mark; a naturalist need not deny that the natural law is in fact commanded by God. The crucial naturalist claim is simply that it is not essential to natural law to be commanded by God.

Suarez now argues that it is not a contingent fact that God commands observance of the natural law. Since God is creator and governor, it is appropriate and necessary for God to command the good and forbid the evil.[35] Given that a rational creature has been created, it is necessary that such a creature is subject to moral government, and therefore to the commands of a superior (i 3.3). Once naturalists concede that the natural law indicates what is naturally right and wrong, and also admit the necessary goodness and rationality of God, they must agree that it is necessary for the natural law to be commanded by God.[36]

These arguments assume a naturalist opponent who believes it is possible that an action violates the natural law and does not violate a divine command. Suarez replies that this conjunction is impossible, because it is necessary that whatever is intrinsically good and bad is commanded and prohibited by God.[37] It cannot simply be a contingent feature of good and bad action that God commands the one and forbids the other; given the nature of good and bad, and the nature of God, something's being good or bad implies that God commands or forbids it. Hence it is not possible for something to be prescribed by the natural law but not commanded by God.[38]

Suarez is open to an objection. Even if the natural law is necessarily commanded by God, it does not follow that it is essentially commanded by God. For not all necessary properties

[33] 'Therefore the natural law, as it is in a human being, does not only indicate the thing itself in its own right, but also as prohibited or prescribed by some superior. The consequence is clear, because if the natural law intrinsically consists in the object by itself in its own right, or in showing it, the violation of it will not, in itself and intrinsically, be against the law of a superior. For, if every law of a superior were removed, a human being would <still> violate the natural law by acting against that dictate <of reason simply showing the goodness and badness of the object>.' (ii 6.7)

[34] 'All the things that the natural law dictates to be evil are prohibited by God, by his special prescription and by the will by which he wills us to be required and obliged by the force of his authority to keep these <dictates>. Therefore the natural law is properly a prescriptive law, or introduces (insinuativa) <its> proper precept.' (ii 6.8)

[35] 'God has perfect providence over human beings. Therefore it is proper for him and his supreme governance of nature to forbid evils and to prescribe goods. Therefore, even though natural reason indicates what is good or evil for a rational nature, nonetheless God, as ruler and governor of such a nature, prescribes the doing or avoiding ["vitare" (Perena); OO has "vetare"] of what reason dictates to be done or avoided.' (ii 6.8)

[36] 'Whatever is done against correct reason displeases God, and the contrary pleases him, because, since the will of God is supremely just, what is wrong cannot not displease him, and what is right cannot not please him, because the will of God cannot be irrational . . . Therefore correct reason, which indicates what is good or bad for a human being in its own right, consequently indicates that it is in accord with the divine will that the one should be done and the other avoided.' (ii 6.8)

[37] This is not quite accurate, since it overlooks the distinction between the required (debitum) and the merely desirable, which I will return to later.

[38] 'Finally, the obligation of the natural law is true obligation. Now this obligation is a good in its own way, existing in the nature of things. Therefore, it is necessary that that obligation should proceed from the divine will willing that human beings be required to observe what correct reason prescribes.' (ii 6.10)

of a subject are part of the essence of the subject, and hence they do not all belong to it as that subject. The essential properties (according to Aristotelian metaphysics) are those (putting it too simply) that explain the subject's having the other necessary properties it has. Suarez does not seem to have shown why the natural law is essentially commanded by God.

One might try to defend Suarez by arguing that the counterfactual accepted by the naturalist is inconsistent with the recognition of a necessary connexion between the natural law and God's command. The naturalist accepts a counterfactual saying that if God did not command observance of the principles requiring good action, observance of them would still be in accordance with natural law. Since it is necessarily true that God commands observance of the natural law, the truth of the antecedent of the counterfactual implies that these good actions are not in accord with the natural law. Hence the conditional as a whole says that these actions both are and are not in accord with the natural law. Hence the naturalist's supposition leads to a contradiction, so that the whole counterfactual conditional is false.

But we would be wrong to argue in this way against the naturalist thesis, however, since we would misinterpret the counterfactual. If a counterfactual has an impossible antecedent, we need to be careful in saying what features of the actual world we hold fixed in evaluating the counterfactual. In particular, we must not regard as false all the truths about the actual world whose falsity follows necessarily from the truth of the antecedent.[39] We are to suppose that the world is otherwise the same, apart from the fact that God does not command the observance of the natural law. This supposed state of affairs is impossible, given what we know about God, but we ignore this impossibility in considering the counterfactual. We may still affirm that the counterfactual is true, even though it is impossible that God does not command observance of the natural law.

Is this an over-subtle interpretation of the relevant counterfactual, or is it anachronistic for Suarez? It is the interpretation that he applies to the counterfactual claim that if God did not command us to observe the natural law, things would still be good and bad in their own right. He defends the coherence of this counterfactual while agreeing that the antecedent is impossible.[40] The same treatment of the naturalist claim (that even if God did not command us, good and bad action would still violate the natural law) removes Suarez's objection to the coherence and the truth of this claim.

The argument about counterfactuals, therefore, does not refute the naturalist claim that the natural law is not essentially commanded by God, and therefore would still be natural law even if God did not command it. Suarez would have found a strong objection against naturalism if he had shown that naturalism makes it false, or merely contingently true, that God commands the observance of the natural law. Perhaps he believes that this follows for any naturalist who accepts the counterfactual that Gregory uses to formulate the naturalist position. But he would be wrong to believe this. We might reasonably believe that natural law is the natural standard that would have existed even if God had not legislated, but the

[39] For Aquinas' treatment of counterfactuals with impossible antecedents see *ST* 1a q25 a3 ad2: 'For nothing rules out a conditional from being true whose antecedent and consequent are impossible, as if it were said, "If a human being is an ass, he has four feet." ' (cf. q44 a1 ad2).

[40] See *Leg*. ii 6.14, discussed in §441.

world had otherwise been the same. This is consistent with the belief that God necessarily commands the observance of the natural law.

429. True Law

Suarez, therefore, has a cogent argument against the naturalist account of natural law only if he can show that natural law is essentially a genuine law, and therefore essentially commanded by God. To see whether he can show this, we should look more closely at his account of genuine law and of its connexion with commands.

In speaking of 'genuine' or 'true' law, Suarez allows a broader sense. Hooker draws a similar distinction between a law imposed by authority and an 'enlarged' sense of 'law' that refers simply to the principles on which God acts, which are not products of divine legislation, but part of the nature of things.[41] This is the sort of law that Vasquez describes in claiming that law is 'an operation of reason, not of will' (*Comm.* ad90.1, p. 6). He considers the view of those who believe that the connexion of law to obligation requires us to think of natural law as 'the will of God by which he wills us to be obliged' (voluntas Dei qua vult nos obligari, *Disp.* 150 c.3 §21, p. 7). These people think that the existence of law requires an act of legislation, but Vasquez believes they are wrong.

To explain how the natural law is law, Vasquez introduces a further sense of 'law'. It depends neither on the divine will nor on the divine intellect. Hence natural law is law in a broader sense, which Vasquez would prefer to call 'ius' rather than 'lex'. The mark of natural law is its being a rule of just and unjust.[42]

Suarez rejects this treatment of natural law. Though he allows the broader sense of 'law' that includes indicative law, he believes that natural law is law in a more precise sense. In his view, a law is 'a common precept, just and stable, sufficiently promulgated' (*Leg.* i 12.4); in this conclusion he agrees with Aquinas (*ST* 1–2 q96 a1 ad2). The crucial emphasis in this definition, for present purposes, lies on 'precept', which Suarez takes to imply a command expressing the will of a superior.

Suarez reaches this definition by rejecting conceptions of law that he takes to be too broad. The first of these is derived from Aquinas' description of law as a rule or measure that guides action.[43] On this conception, all creatures, not only rational agents, receive and obey law. This would be a mistake, because non-rational creatures 'are not properly capable

[41] See §413 on Hooker.

[42] 'From this teaching we infer this noteworthy conclusion, that the name of law (lex) does not fit natural law as well as it fits positive law, whether the word is derived from reading (legere) from a written text, or from election. For the natural law is neither read in a written text, nor is constituted voluntarily by any election, even a divine election; but it exists necessarily by its own nature. Therefore it is more properly called right (ius), because it is the rule of just and unjust.' (Vasquez, *Disp.* 150 c.3 §26, p. 8)

[43] 'Law is a type of rule and measure of acts [Suarez's quotation omits "of acts"] in accordance with which someone is led to action or is restrained from action: for "lex" [law] is so called from binding (ligare), because it obliges (obligat) to action.' (Aquinas, *ST* 1–2 q90 a1) The explanatory clause suggests that Aquinas takes his definition to capture the fact that law binds. But it is difficult to see how the obligatory character of a law, so understood, is captured in Aquinas' description, unless the combination of 'rule' and 'led' (inducere) indicates obligation, or 'a type of rule' (quaedam regula) indicates that he has not fully specified the type of rule that is to be identified with law.

of <receiving> law, just as they are not properly capable of obedience either' (*Leg*. i 1.2).[44] If we speak of non-rational creatures being governed by divine law, when we really refer to 'the efficacy of divine power' and to natural necessity, we are speaking metaphorically (i 1.2). Aquinas takes the eternal law to extend to all creation,[45] but, in Suarez's view, this claim is true only if it is taken metaphorically (i 3.9). Natural law, insofar as it belongs to moral doctrine and to theology, applies only to rational creatures (i 3.10).[46] Aquinas seems to agree, because he distinguishes the way in which rational creatures participate in eternal law from the way in which non-rational creatures do, and concludes that 'natural law is nothing other than participation in eternal law in a rational creature' (*ST* 1–2 q91 a2).

Suarez believes all this because he believes that no command can really be addressed to non-rational creatures; they cannot understand or obey commands as expressions of the reason and will of a superior. This connexion of law with rational will, in both the legislator and the subject, is recognized by Aquinas, according to Suarez, in the derivation of 'lex' from 'ligare', because 'the proper effect of law is to bind (ligare) or oblige (obligare)' (*Leg*. i 1 9).

The reasons that Suarez offers here for taking law to require a command—understood as the expression of the will of a superior—do not seem persuasive, either from Aquinas' point of view or in their own right.[47] We might well agree that rational creatures 'participate' differently in a law, insofar as they are guided by their understanding of it; but this does not mean that it must be addressed to them as a command, or that they must regard it as a command. Similarly, we might agree that a law obliges, but deny that only a command can oblige.

Suarez's arguments make it difficult to identify his basic conviction. Does his whole argument rest on a conception of the nature of law, and does his claim about obligation depend on his view of how law operates? Or does it all rest on his conception of obligation, and does his claim about law depend on his view that law obliges? If we are to accept his claims about natural law we need some independent argument either for his claim about the nature of law or for his claim about the nature of obligation; if this argument is convincing, we must also be convinced that natural law is essentially genuine law, and that it imposes genuine obligation.

430. Obligation and the Natural Law

While the naturalist claims that the natural law would still be natural law even if God did not command it, Suarez denies this claim. He believes that since the natural law essentially imposes a genuine obligation, it essentially proceeds from a divine command.[48] Law requires

[44] nam res carentes ratione non sunt proprie capaces legis, sicut nec oboedientiae. (*Leg*. i 1.2)

[45] '. . . since all things subject to Divine providence are ruled (regulantur) and measured by the eternal law, . . . it is evident that all things partake to some degree of the eternal law—namely, in so far as, from its being imprinted on them, they have their tendencies towards their proper acts and ends' (*ST* 1–2 q91 a2).

[46] 'And so natural law properly speaking, which applies to moral doctrine and to theology, is the law that is seated in the human mind for distinguishing right from wrong (honestum a turpi) . . .' (*Leg*. i 3.9). For the reference to distinguishing honestum from turpe cf. Aquinas *in EN* §1019.

[47] Aquinas holds a broader conception of command (imperium). See §306.

[48] *Leg*. ii 6.10, quoted in previous section.

commands because law imposes obligation,[49] and obligation requires command; hence if natural law is true law, it requires a divine command. Facts about rational nature fall short of natural law, according to Suarez, because natural law is genuine law. For rational nature in itself does not issue commands, but these are essential to genuine law (ii 5.5).[50]

We might doubt whether rational nature lacks all the features relevant to a law. Natural facts may serve as signs or directives to knowers and agents who understand them appropriately. If Suarez objects that they do not do these things 'considered precisely' insofar as they are these sorts of facts, but only in relation to the appropriate sorts of knowers and agents, we may reply that laws do not enlighten or direct 'considered precisely' in themselves, but only insofar as knowers and agents understand them and care about what they say.

Still, Suarez might fairly maintain that laws mark an intention to display, direct, and enlighten, and that natural facts involve no such intention, and hence do not command. On this point about intention he has found a genuine difference between commands and natural facts. He needs to persuade us that the natural law requires this intention. To be persuaded, we have to accept Suarez's claim that natural law is essentially true law, as he conceives it.

Vasquez's discussion suggests that a naturalist has no reason to concede without argument that natural law is essentially true law. He admits that natural law lacks features that we might readily attribute to law, on the basis of what we know about positive law. But he infers not that he has given the wrong account of natural law, but that natural law is properly called 'natural right' (ius) rather than 'natural law' (lex). Has Suarez an argument to show that Vasquez makes some mistake in this answer to the question about law?

He might have a basis for argument in claims about obligation; for Vasquez assumes that the natural law is obligatory. If, then, Suarez is right about the nature of obligation, and the natural law obliges, it requires a command, and hence is true law. Hence he sometimes argues that since the natural law essentially obliges us, and since obligation requires us to be bound by the command of a superior, we are obliged to follow the natural law insofar as it is commanded by God. The natural law, therefore, is essentially commanded by God.

What does Suarez mean by insisting that genuine obligation requires a command? We might take him to present an account of normative facts and principles. Normative—i.e., reason-giving—principles imply that we ought to act in some way, or we have reason to act in this way. Some have argued that these reason-giving facts must include facts about the will or desires of agents; others have maintained that external natural facts by themselves imply that agents of a certain sort ought to act in a specific way, whether or not a given agent's will is appropriately directed.

According to one interpretation, Suarez's separation of intrinsic natural facts from divine commands separates non-normative natural facts from normative principles of morality.[51]

[49] quia de intrinseca ratione eius [sc. legis] est ut aliquam intrinsecam obligationem inducat . . . (i 9.17). See also i 11.2 (the assumption that law obliges is the basis for the claim that it must be promulgated); i 14.1 ('The special effectiveness of law in making human beings good is its obligation, which seems to be especially its intrinsic effect . . .').

[50] Quoted in §427.

[51] This interpretation goes back at least to Culverwell. See §558. It is accepted by (e.g.) Chroust, 'Grotius' 117: 'In order to make any act a truly moral one, we still need the rational insight that this act coincides with the divine will, the author of the natural and moral order.' (Chroust cites *Leg*. ii 6.7, but I do not see where it supports his claim.) According to this interpretation, Suarez is a 'natural-law moralist' in the sense explained in §455. Culverwell's interpretation suggests

His claims about obligation might be taken to affirm that genuinely normative principles require divine commands. Natural goodness and badness exist independently of God's legislation, and, as he often says, they are the 'foundation' of natural law. But they do not become moral goodness and badness until they are the subject matter of divine commands. The natural is to be distinguished from the normative, because the normative is the area of obligation, and hence of command and legislation.

According to this interpretation, then, Suarez separates the natural from the normative. He believes that without laws and commands, we have no genuine moral obligation, and hence no genuine moral ought or conclusive moral reason. His distinction between the indicative and the prescriptive might be taken to suggest this point; we might suppose that he identifies the indicative with the descriptive and therefore non-normative, and identifies the prescriptive with the normative. If that is what he means, we might suppose that obligation is necessary for genuine norms, so that law and commands are necessary for norms, and hence for the moral ought.[52] If this is Suarez's view, he is a natural-law moralist in a strong sense; he not only believes in natural law, but also believes that morality is essentially and fundamentally natural law.[53] He believes this primarily because he is a prescriptivist about norms.

431. Conceptions of Obligation

To test this prescriptivist interpretation of Suarez, we should see how he understands obligation. If he believes that the moral is to be distinguished from the non-moral by the presence of moral obligation, we might reasonably suppose that his concept of obligation is the concept of a genuinely normative requirement. But we cannot simply take it for granted that this is his concept of obligation. In moral philosophy in English, 'oblige' (or 'obligate') and 'obligation' have been a source of dispute and confusion since the 17th century. We must try to see whether Suarez has a reasonably clear concept, and what it is.

To grasp Suarez's concept of obligation (obligatio), it may be useful to survey some different claims that have been made by writers in English about the concept of obligation. Though they do not exactly capture Suarez's concept, they indicate some of the relevant distinctions.

According to a narrow 'impositive' analysis, an obligation is a special sort of moral requirement, in which the source of the requirement is some voluntary act that imposes the obligation. I have an obligation, therefore, to keep a promise insofar as making a promise is acting so as to bind myself in a particular way. But if I have not done anything to bind myself to refrain from harming innocent people, and no one else has imposed the obligation on me,

a division between the merely natural and the moral that is accepted by Locke, Cumberland, and Pufendorf. They all agree that morality depends on natural law, and hence on divine commands, and that the natural foundation of morality consists in natural, but non-moral, goodness and badness. If Suarez anticipates them in marking this division, he is clearly a natural-law moralist, since he takes morality to consist in the obligations that belong to natural law.

[52] This is Finnis's interpretation of Suarez in *NLNR* 47n, 350.

[53] Hence he engages in the 'attempt to understand morality in the legalistic terms of a natural law', Haakonssen, *NLMP* 15. We attribute a natural-law theory in this strong sense to Aquinas, for instance, if we agree that 'for him, the virtues are basically habits of obedience to laws' (Schneewind, *IA* 20). See §315.

I have no obligation to refrain from harming them, even though I nonetheless ought not to harm them.[54]

We accept a 'compulsory' analysis of obligation, in contrast to other sorts of relations between agents and actions, if we concentrate on the necessitating or compulsory aspects of obligations.[55] If I am morally obliged to act in a certain way, it is not simply desirable, or preferable, or a good idea, or attractive, or appealing, to act in that way, but I have no choice about doing it. The sense in which I have no choice is not the physical or the psychological, but the rational sense; nothing else in the circumstances could be a reasonable choice for me. In this way of conceiving it, moral obligations correspond to the compulsory, as opposed to the optional, parts of a syllabus or examination. If we think there are non-moral obligations, they will have the same compulsory character. This contrast between the obligatory and the desirable may be identified with the contrast between the required and the supererogatory areas of morality, if we think morality extends beyond what is required.

In contrast to these analyses, a 'purely deontic' analysis takes an obligation to correspond to every practical use of 'ought'.[56] On this view, since morality and prudence tell us what we ought to do, all true moral and prudential ought-judgments specify obligations.

A 'motivational' analysis might be combined with any of the previous three analyses. It tries to explain the sort of necessity or requirement that belongs to obligations as a motive

[54] Hart, 'Obligation' 100, mentions three features of an obligation: '(1) dependence on the actual practice of a social group, (2) possible independence of content, and (3) coercion'. The first feature introduces imposition. Baier, *MPV* 218, agrees with some of this analysis; in his view, 'obligations between people can arise only on account of what has already happened or been done'. Obligations 'arise only when the normal moral relationship between two or more people, that of moral non-involvement, is disturbed, and they end only when the state of moral non-involvement is restored' (216). In 'Moral obligation', Baier rejects Hart's narrowing of 'obligation' and 'duty' (212). But he still maintains that 'obligations arise when and only when a morally binding directive gives rise . . . to a task . . .' (213). A directive is 'the content of speech acts capable of guiding those to whom it applies' (210). He seems to suppose that the existence of directives depends on the existence of the relevant speech acts. Sometimes he even seems to identify obligations with obligation claims: 'All obligation claims are subclasses of general directives with morally binding force, and so are an integral part of a morality, even though some, e.g., promissory or legal obligations, assign tasks which, but for being *thus* assigned, would not be moral tasks' (226). Baier asserts a similar connexion between obligations and speech acts, in *RMO* 315: 'What is peculiar to them [sc. obligations] is that the institutions that generate them have only one role, that the content of the duties generated in this way is determined by the words used by the role player . . . and that the aim of the institution is the generation of such tailor-made duties . . . In promising one obligates oneself, in legislating one obligates others. The most important thing that distinguishes an obligation from other kinds of assumed duty is that it is generated by one's saying something.' In *TJ* 113/97 Rawls accepts a narrow concept of obligation: 'There are several characteristic features of obligations which distinguish them from other moral requirements. For one thing, they arise as a result of our voluntary acts; these acts may be the giving of express or tacit undertakings, such as promises and agreements, but they need not be, as in the case of accepting benefits. Further, the content of obligations is always defined by an institution or practice the rules of which specify what it is that one is required to do. And finally, obligations are normally owed to definite individuals, namely those who are cooperating together to maintain the arrangement in question.' Rawls contrasts duties: 'Now in contrast with obligations, it is characteristic of natural duties that they apply to us without regard to our voluntary acts. Moreover, they have no necessary connexion with institutions or social practices; their content is not, in general, defined by the rules of these arrangements' (114/98). Hence he recognizes natural duties that do not depend on any institutional background. These differentiating features of obligations do not all fit Suarez's concept of obligation. The clearest point of connexion appears in Rawls's reference to an institutional context as the source of the requirement. This is what Suarez has in mind when he takes obligations to presuppose an act of imposition. (He recognizes something like Rawls's division, as a division within obligations, as he understands them, at *Leg*. ii 14.7, 20, 25.) Rawls refers to Hart, 'Legal'; Whiteley, 'Duties'; and Brandt, 'Obligation'. Brandt offers some parallel with Suarez's narrow concept of obligation, by stressing the connexion of paradigmatic uses of 'obligation' with voluntary undertakings and impositions.

[55] See Adams, *FIG* 231–2.

[56] I say 'practical use' to exclude cases such as 'The bread ought to be baked by now', where no obligation is involved.

that inclines the obliged agent to action. If we also accept a purely deontic analysis of obligation, we will take all true moral judgments to imply a motive.

In calling these analyses of the concept of obligation, we distinguish them from claims about the content of obligations. We should especially keep this distinction in mind in considering restrictive analyses of obligation. If one accepts a purely deontic analysis of obligation, and then claims that all obligations are imposed, one makes the restrictive claim that all genuine moral oughts and reasons are imposed. But one is not committed to this restrictive claim if one accepts the impositive analysis of obligation; acceptance of that analysis allows moral oughts and reasons that are not obligations, and are therefore not imposed.

These remarks may help us to be cautious in approaching Suarez's claims. If he offers an impositive analysis of obligation, and claims that obligation, so understood, requires divine commands, he is making a restricted claim about one area of morality; he does not imply that morality in general requires divine commands. But if he accepts a purely deontic analysis of obligation and holds that obligation, so understood, requires divine commands, he holds a broader thesis about the relation of morality to divine commands.[57]

432. Why Obligation Requires Laws and Commands

Suarez clarifies his views on obligation in dissenting from the naturalist claim that obligation follows from the presence of a specific principle in the divine intellect. Naturalists argue that the obligation and prohibition inherent in the natural law consist in the fact that the principles present in God's intellect as creator have been communicated to us as creatures.[58] Suarez argues that the appeal to the divine intellect makes the alleged obligation consist simply in the intrinsic goodness and badness of the actions.[59] A reference to God introduces no more obligation than we find in intrinsic goodness itself; that is to say, intrinsic goodness plus the divine intellect as its source constitutes no obligation whatever. By referring to God's intellect, we assure ourselves that an action really has intrinsic goodness, but we learn nothing more about any obligation. God's intellect recognizes goodness that does not depend on its being recognized, and therefore the goodness itself has to be the source of the obligation.[60]

[57] For convenience, I represent 'obligare' by 'oblige' and 'obligatio' by 'obligation', without assuming that these provide the best translation into philosophical English of the Latin terms. What Suarez says about obligations may or may not constitute his account of obligation, in any more idiomatic sense.

[58] 'Some people reply that it suffices for natural law that there is some natural dictate of the divine intellect, by which it judges that these evils are to be avoided and these goods to be done. For about those things that in themselves and intrinsically are such, that prescription is not free but necessary. And from that dictate of divine and eternal law in such a subject matter there necessarily extends a certain participation in it to a rational creature, on the assumption that it has been created. And from this participation and derivation, without any other act of the divine will, there extends to a rational creature, as by a sort of natural consequence, a special obligation, because of which he is required to follow correct reason as indicating the eternal rule that is in God. And thus, whatever may be the case about the free act of the divine will, this obligation and prohibition follow altogether necessarily from divine reason.' (*Leg.* ii 6.22)

[59] 'Further, because that <alleged> obligation does not go beyond the force of an object that is good or bad in itself, from which the action has its being good or bad in itself; the judgment of reason has only the character of applying or showing that sort of object.' (ii 6.22) By 'that obligation' (illa obligatio) Suarez must mean 'that obligation alleged by my opponents', which he does not take (in the light of his previous remarks) to be a genuine obligation.

[60] 'Finally, rational nature showing good and bad obliges neither further nor more strongly from the fact that it is a participation in divine reason than it would oblige considered in its own right and if it were from itself.' (ii 6.22)

Suarez believes that these appeals to intrinsic goodness and badness overlook the distinctive features of obligation. Obliging implies a deliberate attempt by the imposer to move the will of the subject who is obliged.[61] If this attempt succeeds, you have obliged me to act, and thereby you have 'conferred' or 'introduced' a new moral necessity that did not already exist before the act of obliging.[62] Hence 'oblige' does not refer to the fact that it is morally necessary for me to act in a specific way, but to the source of this necessity.[63]

The difference between created and antecedent moral necessity marks the difference between the roles of will and of intellect in law. Intellect recognizes an antecedent requirement that does not depend on intellect. But will is needed for the intention to bind someone else by imposing a moral requirement. Since obligation involves this prospective element, it involves will.[64]

The connexion between law, obligation, and intention to bind is so close, according to Suarez, that law is fundamentally a 'mental law'.[65] The written law simply presents and declares this mental law to the subject, in order to make the legislator's act of will effective. But the act of will that the published law declares is not a mental law unless it is an act of obliging, which is an act of will that creates a moral necessity. Every obligation, properly so called, arises from law.[66] The existence of a moral necessity does not always require a law, but obliging—the imposing of a moral necessity—requires a law.[67]

Given this account of obligation, Suarez denies that God is obliged by the intrinsic goodness of (e.g.) keeping a promise.[68] If God is to be obliged, someone must impose the obligation

[61] 'But this answer cannot be understood, because the dictate of intellect without will cannot by itself have the character of a precept in relation to another, nor can it bring about in the other a special obligation, because obligation is a certain kind of moral moving <of someone> towards acting. Now, moving another to operation is a work of will.' (ii 6.22)

[62] '<We must prove> that some conditions necessary for law are found in an act of will and not properly in an act of intellect. The first condition is initiating motion (movere) and applying a subject to carrying out an action (always including omission under action). For the principle initiating motion and applying something to carrying out an action is will; for intellect rather initiates motion to the extent of specifying <an action>, and therefore is said to direct rather than to initiate motion. The second condition is having the force (vis) of obliging, a force which properly is in will and not in intellect. For intellect is only capable of showing the necessity that is in the object itself, and which the intellect itself could not assign (tribuere) to the object if it were not in it. Will, however, confers necessity that was not in the object, and brings it about that, for instance, in the area of justice, that a thing should have this much or that much value, and in the area of the other virtues brings it about that here and now it is necessary to act, which otherwise would not be necessary in its own right.' (i 5.15)

[63] 'For that will that the superior has of obliging a subject to such an action, or (which amounts to the same thing) of constituting such matter within the necessary limits of virtue, is best called by the name of law . . . Nothing antecedent to this will can have the force of law, since it cannot introduce (inducere) necessity.' (i 5.16)

[64] 'For if one attends to the power of initiating motion that is in law, and thereby one calls law that which is in the ruler which initiates motion, in that way law is an act of will. If, however, one looks at and considers the power in law of directing to what is good and necessary, in that way it belongs to intellect.' (i 5.21)

[65] 'The mental law, so to speak, is an act of a just and correct will in the legislator himself, an act by which the superior wills to oblige to the doing of this or that.' (i 5.24)

[66] i 14.12; 'If obligation is properly and proportionately understood, it always arises from some right (ius) and law (lex), and so in this sense this can be called the adequate effect of law.' We must distinguish the 'foundation' or 'proximate material' of an obligation from the obligation itself. If, for instance, we make a vow, the foundation is a voluntary promise; 'but in so far as it properly obliges us to its fulfillment, it is natural and divine law. . . . And that is also why the jurists say that all obligation that arises from contracts is natural or civil, because it arises from the law of nature or nations or from civil law.' (i 14.13)

[67] On the connexion between obligation and imposition see i 18.1; 'But obligation essentially refers to someone on whom it is imposed.'

[68] ii 2.6; 'And so if a promise is added beyond a general law, God will now be obliged to keep that promise, not by positive law, but by the natural correctness that arises in such an object from the force of a promise.' The sequel

on God. But God has no superior who is entitled to impose the obligation; hence no one can oblige God.[69] Since God acts simply on a judgment of reason, no obligation is involved. The dictates of the divine reason express what is morally right and wrong, and thereby dictate what is to be willed by God (dictant de volendis ab ipso Deo), but they lack the character of law (*Leg*. ii 3.5) because they reveal, but do not create, moral requirements. The eternal law is law because God imposes it on intellectual creatures (ii 3.8). Hence the eternal law, as law, must introduce an obligation.[70] God introduces an obligation because God has the supreme power to command (ii 4.2), and commands are the only possible source of obligations.

These claims about obligation and acts of binding help us to understand Suarez's account of obligation as a certain kind of 'moral moving'.[71] Some have understood 'moral moving' as 'moral motivation', and taken Suarez to mean that obligation consists in motivation, so that being obliged (i.e., being under an obligation) is being moved (being motivated) to act in the appropriate way. Since (we might suppose) we morally ought to do x if and only if we are obliged to do x, and the appropriate sort of motivation must come from a command, all genuine moral oughts must come from commands.[72]

This interpretation, however, does not fit Suarez. In this context he discusses the active sense of 'obligation', in which someone obliges someone else; as he says, moving someone else to action is a property of the will. His claim does not mean 'Obligation is a certain moral movement[73] towards acting'. The right rendering is 'Obliging is a certain moral moving of someone <else> to act'.[74] Suarez is concerned with the act of obliging, or putting someone under an obligation, not with the state in which someone is under an obligation.[75] The act of obliging, he claims, must involve a will. He does not suggest that you have obliged me only if you have produced a certain motive in me.

shows that Suarez rejects this consequence; though God ought (debet) to do what is naturally correct, God is not obliged to do it.

[69] 'The judgment of reason is necessary in God only from the fact that nothing can be willed except what is foreknown. However, this judgment has not got the function as of obliging or determining the will. Rather the will is in itself correct and right (honesta), and thereby the dictate of reason, the dictate that is understood to be logically (ratione) prior in intellect, cannot have the proper character of law in respect of the divine will. You will say: Granted that it cannot be said to be a compelling (cogens) law, it can be called a law that directs and that shows the appropriateness (convenientiam) or rightness (honestatem) of the object. I answer: This is not enough for a moral law, as is clear from what has been said, and as will be made clearer in what follows on the natural law; but, as is agreed, a metaphorical way of speaking is not to be admitted, unless it is commonly used.' (ii 2.8)

[70] Lex autem divina, ut lex, habet potius rationem moventis et imprimentis inclinationem vel obligationem ad opus . . . (ii 3.10).

[71] ii 6.22, quoted in §432.

[72] This is Finnis's interpretation, *NLNR* 47: 'Aquinas would deplore the confusion (shared by Hume and Suarez!) of obligation with impulse or influence . . .'. In support of this claim about Suarez Finnis cites ii 6.22, translated 'obligation is a certain moral impulse (motio) to action'. This interpretation is accepted and expanded by Moore, 'Good without God' 236–8. Finnis is right to suggest that, if his interpretation is correct, Suarez's account of obligation is similar to Hume's. It is also similar to Hobbes's account; see §485.

[73] Or 'moral impulse' (ET).

[74] For 'moraliter movere' cf. i 5.5, 'that judgment does not bring about a binding or a moral setting-in-motion, but that is necessary in a law'. See also i 4.8, 'obligatio est effectus moralis et voluntarius principis.' This should be rendered 'obliging is a moral and voluntary bringing-about by the prince'. 'Moral effect' (ET) is misleading. See also i 5.7: 'God by making a law does not impel physically to the act prescribed by law, but only lays down an obligation, which is something moral, and it cannot come about in that physical way . . .'. Cf. i 5.17: 'to oblige by a law is a moral bringing about (effectus), dependent on the freedom of the legislator'.

[75] 'Obligatio' is ambiguous between process and product. Cf. Aquinas' discussion of 'perfectum' in his account of God's perfection, *ST* 1a q4 a1 ad 1.

Suarez assumes this connexion between obligation and the act of binding or obliging whenever he explains the sense in which the eternal law includes obligation.[76] It obliges because it expresses a divine command through which God carries out the relevant sort of moral (as opposed to purely physical) moving. To know that the divine law obliges us we must know that God binds us through the expression of will in commanding obedience to it.[77] Since this act of binding is essential to obligation and to law, the natural law cannot be purely indicative.[78]

433. Obligations v. Duties

This survey of some of Suarez's claims about obligation should help us to decide what question he intends to answer with his account of obligation. Does he use 'obligation' with a broad sense, extending to all moral oughts, and claim that all these obligations require laws and commands? Or is he trying to analyse the concept of obligation as involving will and acts of binding, without claiming that all moral oughts involve these relations?

We have found good reasons for ascribing the second view to him. He never suggests that obligations are the only moral requirements. On the contrary, he takes it for granted that natural facts can provide an indicative law, because they constitute reasons for us to act one way or another. Obligations in his narrow sense are not the only relations that introduce moral requirements; they introduce a different sort of moral requirement from the sorts involved in other moral relations. Obligations introduce a reason for acting that results from imposition, understood to include an expression of the will of the imposer.

Suarez is right to suggest that someone's wanting me to act in a certain way may give me a reason for doing that action beyond the reasons I would have anyhow. If, for instance, I set out to buy you food for a week, I will probably think I should buy you bread and milk among other things and my shopping list will probably not be confined to junk food. If you

[76] 'About the eternal law, therefore, . . . we say that it has a power of obliging of itself, if it is sufficiently promulgated and applied. The proof is this: because otherwise it would not be a true and proper law, since it belongs to the character of law to oblige. . . . Further, because God has the supreme power of commanding (imperare), and therefore of obliging, since the precept of a superior brings in obligation. Now through his eternal law he commands . . . Therefore through this same law he obliges.' (ii 4.2)

[77] 'In the divine law, the obligation is immediately from God himself; for, in so far as it is in a human being it does not oblige except in so far as it indicates the divine reason or will.' (ii 4.8)

[78] 'Finally, a judgment indicating the nature of an action is not an action of a superior, but it can be in an equal or an inferior, who has no power of obliging. Therefore it cannot have the character of a law or a prohibition. If it could, then a teacher showing what is bad or good would impose a law; but we cannot say that. A law, therefore, is that command (imperium) that can bring about an obligation. That judgment, however, <that we just mentioned> does not bring about an obligation, but shows the obligation that must be supposed. (Iudicium autem illud non inducit obligationem, sed ostendit illam quae supponi debet.) That judgment, therefore, in order to have the character of law, needs to indicate some command from which such an obligation flows.' (ii 6.6) It is not completely clear what Suarez means in 'That judgment, however . . .'. 'That judgment' seems to refer back to the judgment indicating the goodness or badness of an action. In what sense does it 'reveal the obligation (illam) that must be supposed'? Suarez would be destroying his argument if he said that the judgment of goodness or badness in its own right revealed an obligation. Probably, then, he means that it reveals an obligation that must be supposed, if we already believe that God commands what is good and prohibits what is evil. In this case the obligation must be 'supposed', and is not stated explicitly. The next sentence ('Therefore that judgment . . .') says what is needed for an explicit statement of an obligation.

have particularly asked for bread and milk, your request is in one way superfluous, since I would have bought it for you anyhow. But it is not altogether superfluous, since it will make me especially careful to make sure I get you bread and milk; it warns me that, even if I had not already included these items on the shopping list, I should include them because you have asked me.

This example does not capture obligation, as Suarez conceives it, which includes necessity. To impose an obligation, the imposer must be in a position to make it true, by the expression of the will for me to act in a certain way, that I have no rational alternative to acting in that way. I oblige myself when I make a promise or some other commitment to another person that expresses my own will to act in a certain way. When another person is in the appropriate position, the expression of her will imposes a necessity on me. This may be true, even if I intend to do the same action anyhow on prudential or moral grounds. The imposition of an obligation makes me aware of reasons that ought to move me even if I were unmoved by the prudential or moral grounds independent of obligation.

Suarez, therefore, does not imply that without an imposed obligation we have no sufficient moral reason for observing the principles of the natural law. God's imposition gives us a further reason, but not the only reason, for observing these principles. This further reason essentially depends on God's expressing the will for us to observe these principles, not on our recognizing that God believes we ought to observe them. Hence natural law requires more than God's intellectual affirmation of the principles of natural law. If Suarez means that we have a distinctive reason to keep the natural law, in addition to other reasons we have, his insistence on the obligatory character of the law, and on the connexion of obligation with God's will, is intelligible.

434. Obligation, Law, and Natural Law

Suarez's introduction of an impositive concept of obligation clarifies some issues about natural law. If we confine 'obligation' to this impositive sense, the element of obligation in the natural law adds moral significance to the moral force that would exist without obligation. God's command, as an expression of God's will communicated to us, introduces a reason for following the principles of natural law that we would not otherwise have.

These observations about obligation justify some of Suarez's objections to some naturalist views. For he is right to suggest that naturalists have not clearly recognized how a divine command affects the moral status of the natural law. His opponents do not make it clear that the natural law includes a divine command, and that this fact alters its moral character. Obligation is morally distinctive because it creates a moral necessity through an act of will, and in particular through an act of the will of a superior. If I recognize an obligation, I recognize that a superior has communicated the will that I do x, and that this expression of the will of the superior leaves me with no rational alternative to doing x. In Suarez's view, this expression of the will of the superior is a command of the superior.

This expression of will differs from a request in its imposition of necessity. If I simply ask you to have dinner with me, I do not claim that my expressing my wish that you have

dinner with me should be rationally decisive for you. I might make this simple request even if I am your superior and entitled to give you orders. But in giving a command I imply that the expression of my will is morally decisive for you. If I am not entitled to command you, my issuing a command is inappropriate, since I have no right to expect you to treat the expression of my will as morally decisive for you.[79]

According to Suarez, 'obliging' is the name for the act of introducing a moral necessity by expressing one's will. The only agent who can introduce such a necessity is an agent who is entitled to introduce it, because he has the appropriate authority. Such an agent introduces the necessity by issuing a command. That is why obligation requires a command by a legitimate authority.

He is right, therefore, to claim that divine commands introduce a distinct type of moral necessity. In recognizing imposed necessity, we recognize that God's having communicated his will to us makes what he commands morally necessary, whether or not it was already morally necessary. Suarez believes that if an action is intrinsically wrong, it is morally necessary to avoid it. But this is not the same moral necessity that God attaches to avoiding the action by forbidding us to do it.

But if we agree with Suarez so far, we still face a difficulty in understanding natural law as divine prescriptive law. For we need to be able to understand this conception of natural law without appealing to specific times when God issued instructions, as he did to Moses. The natural law was divine prescriptive law before the Decalogue was revealed to Moses, and revelation is not necessary for us to be obliged. We must, therefore, be able to infer from natural facts not only the existence of natural rightness and wrongness and the existence of God, but also the fact that God commands us to do what is naturally right, and therefore imposes a natural law on us.

It is rather difficult to understand this claim if we stick to a conception of a command as some act of communication that manifests the will of the commander. Perhaps I am a pilot in a dangerous situation, and my commanding officer knows I am in this situation (he is watching my aircraft on the radar), but I am not in direct communication with him. I might well be able to infer that he would order me to act in a particular way, and I might act this way partly because this is what he would order me to do. Still, it is difficult to see how he could give me an order, or how I could act because I had been ordered to, if we were not in communication. This example seems to count against Suarez's claims.

This example may be unfair, however, because it concerns an order to do a particular action about which we do not communicate. An example that helps Suarez more might be derived from claims about what the law requires without explicit commands. According to one view of the US Constitution, the Constitution requires judges to decide legal cases by reference to the correct principles of political morality, in accordance with principles laid down or implied in the Constitution and the Bill of Rights.[80] Judges might, therefore,

[79] If we distinguish requests from commands in this way, we can see that the difference between them is not grammatical. If I see something interesting out of the window, and I say 'Come and look at this', I do not suggest that you are required to come and look; I am simply using the imperative to make a vigorous request. If, however, the sergeant tells the private, 'You will do fifty push-ups in the next ten minutes', she is neither predicting nor requesting, but—in most circumstances—giving an order, representing the action as introducing rational necessity.

[80] Dworkin has defended this view in many places, e.g., in 'Hard cases' 86–8.

reasonably claim to be obeying the law, and not simply doing what they think right, when they take account of these moral principles in deciding particular cases on which they have no explicit legislative guidance. Perhaps Suarez can argue that, similarly, we obey God's presumed law, and we act because it is God's presumed law, if we follow the requirements of natural law, on the assumption that God commands their observance.

If this is a reasonable defence of Suarez's claims about natural law and divine commands, he is right to insist that laws and commands introduce a morally distinctive requirement, and demand a morally distinctive response. Acting in response to the command of a legitimate authority is a different action, resting on a different reason, from doing what one regards as right because it is right. The first reason is neither a substitute for the second nor reducible to the second. This is the main point that Suarez clarifies through his doctrine of obligation.

The moral distinctiveness of obligations exposes a flaw in some naturalist accounts of the natural law. If we agree, as naturalists agree, that God commands observance of the natural law, we ought not to regard these commands as simply further evidence of the intrinsic rightness or wrongness of an action. If I know that God believes murder is wrong, I have a further reason to believe that murder is wrong. But the moral basis for avoiding murder is just the same; it consists in the intrinsic wrongness of murder. If we treat divine commands as further evidence of intrinsic wrongness, we miss the fact that they give us a new moral reason, not just further evidence to support the old reason.

Suarez might reasonably point out that the distinctive element of imposed moral requirements is left out of naturalist accounts of natural law in Vasquez and Aquinas. Even if they agree that God commands observance of the natural law, they do not explain how divine commands create a moral necessity rather than simply revealing one. Suarez has good reason, therefore, for claiming that his predecessors have not recognized the significance of the fact that natural law is prescriptive and not simply indicative. His analysis of the narrow concept of obligation makes clear the essential elements of imposed moral necessity.

But if we agree with Suarez on this point, how should we modify a naturalist position? We ought to agree that the natural law includes imposed necessity and obligation because it includes divine commands. We ought further to agree that without divine commands it would include no obligation. But ought we to agree that the natural law essentially includes obligations and commands? In support of his view, Suarez appeals to the general agreement that natural law is genuine law; since genuine law imposes an obligation, natural law must impose one too. But this point does not show that natural law is essentially true law; even if it is necessarily true law, we may argue that it would still be natural law even if God did not command it.

This reply to Suarez suggests a defence of the naturalist position. When Vasquez claims that natural law essentially imposes obligations, he does not use 'obligation' in the narrow impositive sense, but in the purely deontic sense. Since he recognizes narrower and wider senses of 'law', he also uses 'obligation' in a wide sense to match the wide sense of law. Suarez's claims about obligation do not refute Vasquez's claims about obligation, once we distinguish the different concepts of obligation.

A defence of these aspects of Vasquez's position allows us to incorporate Suarez's main conclusions about law and obligation. Whether or not we believe that what would be left

without divine commands would properly be called natural law is less important than what we believe about the significance of divine commands. Suarez improves on the naturalist analysis by insisting that insofar as natural law is true law, it involves a new moral relation beyond those involved in intrinsic rightness; it involves the imposed moral necessity that distinguishes prescriptive from purely indicative law.

435. Voluntarism

Suarez, therefore, appears to maintain the naturalist position about intrinsic morality and to criticize the naturalistic analysis of natural law. To see whether this appearance is correct, we may turn to his account of voluntarism. If we are right about his view of naturalism, we ought to find that he disagrees with voluntarism about morality.

He takes the voluntarist to claim not only that the natural law depends on the divine will, but also that the whole natural law consists in divine commands.[81] If that is all there is to natural law, intrinsic rightness is unnecessary. One might ask, then, how the natural law differs from a divine positive law. Suarez answers on behalf of the voluntarist that a divine command constitutes natural law if and only if what it commands is proportionate to the natures of things. If God were to issue commands that are not proportionate to the natures of things, these would not constitute natural law.

How can a voluntarist recognize actions that are proportionate to the nature of things? Is that feature of actions independent of divine commands? If it is, voluntarists deny that being proportionate to nature is sufficient for being intrinsically right. In that case it is possible for God to command actions disproportionate to the natures of things, so that there would be no natural law, and what is right would not accord with the natures of things. Alternatively, the voluntarist might claim that the divine will and command determine what is proportionate to the nature of things.[82]

The voluntarist position that Suarez discusses defends the more extreme view that the divine will determines what actions are proportionate to nature.[83] He takes Anselm to support this position in claiming that all and only what God wills is just.[84] Since at least part of the goodness of a good action consists in its being proportionate to nature, and since all its goodness depends (according to the voluntarist) on God's will and command, proportion to nature must also depend on divine commands.

[81] 'The second opinion, the extreme contrary to the first, is that the natural law is placed entirely in a divine command (imperium) or prohibition proceeding from the will of God as author and governor of nature, and consequently this law, as it is in God, is nothing other than the eternal law, as prescribing and forbidding in this sort of area (materia). In us, however (according to this opinion), the natural law is a judgment of reason, to the extent that it signifies to us the will of God about things to be done and avoided as concerns those things that are in accord with natural reason.' (ii 6.4)

[82] See Ockham, §395.

[83] 'They also add that the whole character of good and evil in things to do with the natural law is placed in the will of God, and not in the judgment of reason, even of the reason of God himself, nor in the things themselves that are forbidden or prescribed through such a law. The basis of this opinion seems to be that actions are not good or bad except because they are prescribed or forbidden by God, because God himself does not will to prescribe or forbid this to a creature precisely because it is bad or good, but, on the contrary, this is just or unjust precisely because God willed it to be done or not done.' (ii 6.4)

[84] For Scotus' use of Anselm's remark see §381. As Idziak (123) notices, the list of authorities that Suarez cites in ii 6.4 agrees with Andreas, *1Sent* d48 q1 a2 concl.2 (p. 28).

The same conclusion follows from the view that the natural law is entirely (omnino) placed in the divine command or prohibition. It is assumed that what God commands as part of the natural law is good, and what he prohibits is bad. If, then, God were to command what is antecedently and intrinsically good, the natural law would not be entirely placed in divine commands and prohibitions.[85] Our access to the natural law through our natural reason is a sign of the fact that God's will requires us to do what fits natural reason. The naturalness of the natural law also depends on God's command.[86]

This position is the extreme contrary to the naturalist thesis ascribed to Gregory of Rimini, because the naturalist thesis makes intrinsic rightness necessary and sufficient, and divine commands unnecessary and insufficient, for the existence of natural law. The voluntarist thesis denies intrinsic rightness, and makes divine commands necessary and sufficient, for the existence of natural law.

This voluntarist position discussed by Suarez is more extreme than the one we find in Scotus. For Scotus takes the principles of the natural law, strictly so called, to state what is right independently of any command of God. That is why God cannot dispense from them; the dispensable principles belong to the natural law only in a broader sense. Ockham comes closer to the position described by Suarez; for he takes God's command and prohibition to be the necessary basis of moral right and wrong. Ockham's belief in non-positive morality that can be grasped by natural reason fits the voluntarist position described by Suarez; for this position allows that 'in us the natural law is a judgment of reason'. Suarez notices that

[85] The position that Suarez describes matches the one defended by Andreas de Novo Castro. He is most probably to be identified (according to Idziak's edition) with Andrew of Neufchateau (André de Neufchâteau, second half of 13th century). As Suarez's source Perena cites Andreas, *1Sent* d48 q1 a1 concl.4, obj. 3 (Idziak, pp. 16, 21). Andreas discusses the question 'whether every good other than God is contingently good, from the free ordering of the divine will' (p. 3). As an objection he cites Augustine, *Lib. Arb.* i 4 (aliquod est malum non quia prohibetur, sed ideo prohibetur quia est malum). He returns to this at q2 concl.1 obj1 (p.76), where he also cites Aug. *Quaest. in Hept.* iii q68, lb. 19.11. He answers in ad 1 (p. 82) that Augustine simply means that the wrongness of adultery and lying precedes any written prohibition, not that it does not consist in being prohibited by God. His reply to the main question is affirmative. He supports the claim for moral good (concl.1, p. 10): 'because it is good in this way because it conforms to prudence and correct moral reason in accord with natural right (ius), but such reason is correct because the divine intellect and will so prescribes and directs and approves'. Here he follows Ockham's view about the divine will as the basis of correct reason. He considers the objection (obj3, p. 16) that 'it follows that from the standpoint of natural light all actions of a rational creature are indifferent and no act would be good or bad in itself from the nature of the thing'. Andreas replies (ad3, p. 20) that it does not follow 'because God instituted natural right and fixed (certas) laws in accord with which many acts are unqualifiedly good according to rule (regulariter), and some are good in their kind; but if one refers to the unqualified power of God, the conclusion is admitted'.

[86] 'In this way it is taken from Ockham . . . to the extent that he says that no action is bad, except to the extent that it is prohibited by God, and <no action is bad> that could not become good, if it were prescribed (praeceptum) by God, and conversely. . . . Hence he supposes that the whole natural law consists in divine precepts (praecepta) laid down by God, which God himself could remove and change. If someone were to object that such a law is not natural but positive, he would reply that it is called natural because it is proportionate to the natures of things, not because it is not laid down by God from outside. Gerson tends towards this opinion . . . This opinion is defended in a broad form (late) by Petrus Alliacus. . . . The same <is defended> most broadly (latissime) by Andreas de Novo Castro.' (ii 6.4) ET translates both 'late' and 'latissime' by 'at length' without distinction. Perena uses 'largamente' and 'extensismamente'. Perhaps 'most broadly', i.e., 'with fewest restrictions', might be the right rendering. 'Taken (sumitur) from Ockham' and 'to the extent that' (quatenus) may indicate that Suarez is not sure how far Ockham goes in endorsing this position. In 'he would reply', he is not reporting Ockham, but saying what he might say in response to the objection. The passage that Suarez cites and paraphrases in support of his claim about Ockham is *2Sent*. q15 ad3, ad4 = *OT* v 352–3, quoted in §398n67. (This is numbered as q19 in the older edition of Ockham.) The fairness of his judgment is discussed by Kilcullen, 'Natural law' 24. On Cudworth's use of this passage in Suarez see §546.

Ockham takes the requirements of right reason to hold only subject to the present order being maintained by God's ordered power.[87]

Since Suarez rejects this voluntarist position, he accepts some elements of naturalism. But which elements? Since the voluntarism he describes is an extreme position, he might reject it by accepting a naturalist view of proportion to nature, and hence of natural goodness and badness, or he might go further and accept a naturalist account of intrinsic rightness and wrongness. How far, then, does he go towards naturalism?

[87] See §395.

31

SUAREZ: NATURALISM

436. The Natural Basis of Natural Law

So far we have not found that Suarez takes every moral ought to require an obligation imposed by the command of a superior. He maintains only that the impositive obligation belonging to the natural law is derived from a divine command. To discover other aspects of his view about the relation between obligation and moral oughts, we need to see what is left of the natural law without the impositive obligation coming from a divine command. His claims about obligation constitute an analysis of a narrow concept of obligation, and do not imply that all moral requirements involve an imposed necessity. In that case, he ought to recognize moral necessity and moral requirements that are independent of obligation (in his sense).

If we abstract from any divine command, what is left cannot meet Suarez's conditions for natural law, since he believes that natural law, as such, includes an obligation derived from a divine command. But we can still consider the actual principles of natural law, if these are understood as the actual principles that constitute natural law when God commands the observance of them. To clarify Suarez's attitude to the voluntarist conception of natural law, we may ask what our moral position would be if we had been created as we are with the nature we have, but God had given us no commands.

According to one voluntarist view, nothing would be morally right or wrong in these circumstances; our natural knowledge of the natural law is simply knowledge of the divine commands. On this view, natural law is natural in the epistemic sense, but not in the metaphysical sense.[1] God was free to make us with the nature we have, but to command something different, and to give us natural knowledge of it; if God had done that, the principles of natural law would have been different, and the morally right and wrong would thereby have been different, even though our nature would have been the same.

A voluntarist view may acknowledge that goods are intrinsic, fixed by the nature of human beings, but deny that the intrinsic character of goods implies a similar fixity in the morally right. Rightness, according to this view, goes beyond natural goodness because it requires a divine command. Good and bad, we might say, can be derived from the

[1] This is Ockham's view. See §395. On Aquinas see §308.

requirements of nature, but moral rightness and wrongness must come from a law.[2] If Suarez means this, his claim about the connexion between obligation and law commits him to a controversial, but defensible, position, that morality, rightness, obligation, and law all go together.

We should ask, therefore, what other properties Suarez takes to be connected with natural goodness. It is useful to consider his use of 'right' (honestum), 'wrong' (turpe), 'ought' (debere, debitum),[3] 'required' (teneri ad) and 'sin' (peccatum). If he attaches all these predicates to naturally good and bad actions in their own right, he believes that actions have moral properties apart from divine commands.

437. The Foundation of Obligation

Suarez's description of the natural facts that underlie natural law answers some of our questions. He believes that he follows Aquinas in claiming that divine commands introduce an obligation added to natural rightness and wrongness.[4] Natural law, as divine command, adds 'its own moral obligation'.[5] But it does not add a second obligation to a previous obligation;[6] such a claim would violate Suarez's careful impositive analysis of obligation. Nor does it add morality to a non-moral basis. In Suarez's view, natural law adds moral obligation to the moral rightness and wrongness that exists apart from divine commands. When he calls this rightness and wrongness natural, he does not mean that it is not moral, but that it is based in nature, and not on any human action.[7]

Suarez clarifies this point later, in asking what a divine command adds to the natural properties of actions. A naturalist might claim that obligation is not created by the natural law, but presupposed by it.[8] Suarez rejects this claim, which conflicts with his analysis of obligation; in his view, we are not obliged to do good and avoid evil before any command and prohibition. But he recognizes a moral requirement before any command and prohibition; for natural goodness and badness tell us what we ought (debere) to do. Divine commands, introducing genuine law, oblige us to do something that we already ought to do.[9] Natural

[2] This is the view that *DTC* declares to be an element of truth in voluntarism; see §603.

[3] On precept and debitum see Aquinas, *ST* 1–2 q100; *Quodl.* v 19. Cf. §303.

[4] He relies (cf. *Leg.* ii 5.2) on Aquinas, *ST* 1–2 q100 a8, and (cf. ii 6.5) 1–2 q71 a6; q100 a8 ad2.

[5] 'Therefore it is necessary that it add some obligation of avoiding the evil that is evil from itself and by its own nature. Further, there is no contradiction if a thing that is right from itself has added to it an obligation to do it, or if a thing that is wrong from itself has added an obligation to avoid it. . . . Therefore also the natural law, inasmuch as it is genuine divine law, can add its own moral obligation arising from a precept, beyond the natural (if I may put it so) badness or rightness that the matter on which this precept falls has from itself.' (ii 6.12)

[6] Williams's rendering 'some sort of additional obligation' is therefore misleading.

[7] On this sense of 'natural' see ii 9.4, quoted below.

[8] '. . . This law forbids something because it is bad. Therefore before that law there is an obligation of avoiding this sort of bad thing. And the same is true, proportionately, about a command (imperium) and precept to do a good thing because it is good' (ii 9.4).

[9] 'For if this law forbids something because it is bad, it brings about its own special necessity of avoiding it, because this is intrinsic to forbidding. At the same time, however, it proves that this law assumes something, which belongs to the intrinsic duty of nature, because everything in a particular way has a duty to itself to do nothing that conflicts with its own nature. But beyond this duty the law adds a special moral obligation, and we say that this obligation is the effect of this law. The jurists customarily call this a natural obligation, not because it is not moral, but in order to distinguish it from a civil obligation.' (ii 9.4) On natural v. civil obligation, cf. i 14.9.

law, therefore, requires both a divine command and prior intrinsic rightness.[10] The moral judgment and the recognition of moral duty (debitum) are prior to any act of will, by the lawgiver or by the subject.[11]

In all this discussion Suarez distinguishes 'ought' (debere) and 'duty' (debitum) from 'obligation' (obligatio).[12] A class of actions that we ought to do, and that it would be right to do and wrong to avoid, is already fixed by nature; the divine command adds an obligation to do the things we already ought to do. Suarez's use of 'debere' follows Aquinas.[13] We noticed earlier that Aquinas sometimes uses 'oblige' rather narrowly, and seems to have in mind a specific action of laying someone under an obligation. Suarez follows him in this narrow use of 'obligation', and in the broad use of 'duty'.

The obligation imposed by a divine command is binding on our conscience. If we abstract from divine command, the principles of natural law do not give rise to an obligation binding on conscience. But even without divine commands, the inherent rightness or wrongness of certain actions implies that we are required (teneri) in conscience to do or avoid them.[14] Suarez's denial of obligation apart from command and law does not lead him to withhold deontic predicates from naturally good and bad actions.[15]

[10] 'Although that obligation which natural law adds, in so far as it is properly prescriptive, is from the divine will, still that will presupposes a judgment about the badness of, for instance, lying, and similar judgments. Still, because from the force of the judgment alone no proper prohibition and no obligation of a precept is introduced, since this cannot be understood without will, for that reason there is added a will to prohibit that action because it is bad.' (ii 6.13) I take 'properly prescriptive' (proprie praeceptiva) to modify 'lex naturalis' (so also Perena). ET renders 'properly preceptive obligation'.

[11] Suarez explains the difference between natural law and other laws: 'Further, this law prescribes what is suitable to rational nature, as rational, and forbids the contrary. But that [sc. what is suitable to rational nature] is precisely the right, as is agreed. Moreover, the natural law differs from other laws on just this point, that the others make something bad because they prohibit it, and make something necessary or right because they prescribe it. But the natural law presupposes in the act or object a rightness that it prescribes or a wrongness that it prohibits; and that is why it is usually said that through this law something is prohibited because it is bad or prescribed because it is good.' (ii 7.1)

[12] ET uses 'obligation' for both 'debitum' and 'obligatio'. Perena uses 'deber' and 'obligacion' to mark the difference in the Latin.

[13] Finnis, *NLNR* 45–6, contrasts Suarez and Aquinas as follows: '. . . Suarez . . . maintained that obligation is essentially the effect of an act of will by a superior, directed to moving the will of an inferior . . . Aquinas, on the other hand, treats obligation as the rational necessity of some means to (or way of realizing) an end or objective (i.e. a good) of a particular sort'. The evidence cited from Suarez deals with his use of 'obligatio'. Hence evidence of a difference between Suarez and Aquinas ought to deal with Aquinas' use of 'obligatio'. However, most of the passages cited by Finnis (46n) do not include 'obligatio' or 'obligare'. Most of them simply deal with the relation of means to the ultimate end. Some of them (*ST* 1–2 q99 a1; 2–2 q44 a1) include 'debitum'. One passage (1–2 q99 a1) says that since a precept of law imposes an obligation (sit obligatorium), it has the character of a debitum; but none of them suggests that Aquinas takes a debitum to imply an obligatio. Later (341n) Finnis contrasts Aquinas with Suarez by saying that 'for Aquinas, obligation is simply a rational necessity of certain sorts of means to certain sorts of ends'. He cites 1–2 q99 a1 and 2–2 q58 a3 ad2. In the latter passage Aquinas says that necessity that is not coaction arises out of the obligatio of a precept or (sive) from the necessity of an end. He implies that an obligatio involves necessity, but does not imply that all teleological necessity, or every debitum, involves an obligatio. Finnis is right to maintain that these passages show something about Aquinas' views on obligation, as we might understand it. But if we want to know Suarez's views on obligation, as we might understand it, we should look at his views on debitum as well as his views on obligatio. If the question about obligation is given the same sense as applied to Suarez and as applied to Aquinas, it is much more difficult to see the difference suggested by Finnis.

[14] 'Hence, if we speak strictly about a natural obligation, it certainly cannot be separated from an obligation in conscience. For if it is <an obligation> to avoid something, it arises from the intrinsic wrongness of an action that is therefore to be avoided in conscience. But if it is to do something, it arises from the intrinsic connexion of such an action with the rightness of virtue, which we are also required in conscience to maintain in our actions. Hence in that case the omission of an action that is a duty is bad in itself.' (ii 9.6)

[15] Ward, *NG* 432–40, summarizes Suarez's position, and presents a generally sound interpretation of it, appropriately emphasizing Suarez's belief in intrinsic morality. He fails, however, to recognize Suarez's distinction between debitum

438. Moral Goodness

These remarks about obligation imply that Suarez rejects voluntarism not only because he recognizes natural goodness apart from the divine will, but also because he recognizes intrinsic morality. If we abstract divine commands from the natural law, what is left is morality (honestas), not just natural goodness. We should examine his conception of moral goodness more closely, to see how strongly he is committed to a naturalist account of honestas, and how far honestas corresponds to morality. In the *De Legibus* he relies on the account of goodness that he expounds more fully in *De Bonitate*[16] and in *Metaphysical Disputation* x.

Suarez places the good as right (bonum honestum) in the threefold division of good into pleasant, useful, and right. Both his account of good in general and his account of the specific good that he identifies with the right commit him to an objectivist and naturalist account; both goodness and rightness belong to the nature of things, and are not constituted by human choice, desire, or judgment. Suarez follows Aquinas' account of the moral good as the honestum; but his specific emphases make clearer the relation of his views on the right and good to issues about voluntarism.[17]

To emphasize this feature of the good, Suarez clarifies Aquinas' claims about the good and the desirable.[18] He follows Cajetan in arguing that goodness cannot be reduced to desirability.[19] This is a reasonable understanding of Aquinas, but the emphasis on the objective character of the good, and its distinctness from anything created or constituted by desire, intellect, will, or command, is characteristic of Suarez. Since many of Aquinas' successors claim that the morally good is the desirable, or what is prescribed by right reason, or what is commanded by God, Suarez tries to be more precise about these connexions between goodness and other properties. He insists that none of these other descriptions gives us the essence of the good or the morally good. He sets out on a meta-ethical inquiry that continues in (among others) Cudworth, Price, and Moore.[20]

Suarez discusses rightness in his exposition of the section of the *Summa* in which Aquinas describes the good to be found in human voluntary actions. Both Aquinas and Suarez take this good to be the moral good.[21] The good as right is to be distinguished from good as

and obligatio; Ward uses the terms without distinction, citing Frassen in his support (449–50). Ward claims that Frassen 'fully admits . . . that the natural law *supposes* an obligation which already exists'. But here Ward uses the words of an objection that Frassen answers. In his answer (*SA* Tract. 4 disp.2 a2 q2 concl.1 = vi 51) Frassen endorses Suarez's view that the natural law presupposes some 'intrinsecum debitum naturae' to which it adds a special obligation. He does not say that the natural law presupposes a prior obligation. In his description of Frassen's view Ward overlooks the difference between obligation and debitum. But he has a stronger basis for his claim about Frassen when he cites a second passage: 'God is not related to the natural law in the way in which a ruler (princeps) is related to positive law. For the ruler confers the entire strength and force (vim et virtutem) of obliging on a law by his will alone. God, however, supposes some obligation on the side of the things, which seems essential to the things themselves, because they are right (honestae) and good from the nature of the thing. For, as we said above, this is the difference between natural and positive law, that the natural law prescribes those things that are right and good in themselves, whereas the civil law only makes right the things that it prescribes, and makes bad the things it prohibits.' (*SA* Tract. 4 disp.2 a3 q1 concl.1 = vi 62. Ward quotes the third sentence of this passage, giving a wrong reference.) Here Frassen forgets or ignores Suarez's distinction between debitum and obligatio. On Ward see also §604.

[16] *De bonitate et malitia obiectiva humanorum actuum* = *OO* iv 288–305.

[17] Aquinas on the honestum; see §§333–4.

[18] Suarez refers to Aquinas *ST* 1a q5 a1; a3 ad1; a4 ad1; q16 a4 ad1, ad3; *SG* i 4 arg.3.

[19] See *DM* x 1.19 = *OO* xxv 334b = Suarez, *MGE*, ed. Gracia and Davis, 116.

[20] See §547.

[21] 'The moral good, therefore, is the same as the good as right more strictly taken as what is fitting through itself and agrees with a rational nature as such. . . . The natural good is said to be whatever agrees with a given nature, in

perfection that belongs to God in himself. Rightness implies a relation; the bonum honestum is not 'absolute' and 'transcendental', in a sense that would imply the sort of perfection that belongs to a subject in itself. Rightness is a relational good, and so it involves relation to rational nature as such (*Bon.* ii 2.8 294a).

Like the pleasant and the useful, the right involves some kind of fittingness (convenientia). But it cannot be simply the fittingness that belongs to these other goods. The goods that the Stoics call primary natural advantages (*ta prôta kata phusin*) and that Aristotle treats as external goods, are not honesta. Suarez supports his claim by referring to Cicero (in *De Finibus* iii–iv).[22] The right has a special relation to rational nature.[23]

Goodness as rightness belongs to the object of a human will. By belonging to the object it makes an action morally good. This is the kind of goodness that Aquinas had in mind in discussing the morally good.[24] Suarez says 'we call this goodness a right object'; he seems to acknowledge that Aquinas' treatment of moral goodness does not use the term 'right' (honestum), but he assumes, reasonably, that this is what Aquinas intends. He clarifies, but does not alter, Aquinas' doctrine by speaking explicitly of honestas. The relevant kind of goodness belonging to the object of will is the right (honestum), because it is neither the pleasant nor the useful. Since we can recognize that something is either pleasant or useful and still regard it as morally indifferent or morally bad, some further feature is needed to make it morally good.[25]

In distinguishing the moral good from the pleasant and the advantageous, Suarez agrees with Scotus. Scotus, however, infers that the moral good cannot consist in agreement with nature; he opposes the natural affection for advantage to the rational affection for the just. Suarez rejects this opposition, which he traces back to Anselm, between the natural and the right. He argues that fittingness to one's nature does not necessarily imply a reference to one's private advantage; it may realize or express one's nature in its own right apart from any further advantage to the subject. In this respect the Incarnation was fitting for God's nature, though it was not advantageous for God.[26]

accordance with what it naturally is or can naturally do. But the moral good is what agrees with a thing, in so far as it acts freely; for custom (mos), from which "moral" is said, consists in free action, as is agreed.' (*DM* x 2.30 = *OO* xxv 344b) Suarez cites the commentators on Aquinas, *ST* 1–2 q18, where Cajetan argues that, according to Aquinas, acts have moral goodness from their objects (Leonine edn. of *ST* vi 129).

[22] See esp. Cic. *F.* iii 24, quoted by Maxwell in a relevant context. See §536.

[23] 'Therefore they have them in them some character of goodness, which we properly call rightness, by the character of which such objects are judged through correct reason to be fitting to a human being, and correctly loveable because of themselves.' (*Bon.* ii 1.5 = 290a)

[24] 'In the objects of human actions that are morally good, some rightness is necessary that fits the object from <the object> itself and not through the action; and that goodness can correctly be called objective goodness.... [He cites Aquinas *ST* 1–2 q19 a1 ad3.] In this <Thomas> says openly that good is presupposed as object before an act of will, and in respect of a morally good action. That good in some way belongs to the genus of morality through direction towards reason. There is therefore in that <good> some goodness that correct reason knows, and this goodness we call a right object.' (*Bon.* ii 1.3 = 289a) At the end he cites Aquinas, 1–2 q20 a1 ad1; *Mal.* q2 a3c, ad8.

[25] 'This is proved by reason, because the object of will is good under the character of good; therefore that goodness that moves the will does not flow from the will, but is assumed in the objects. The same, therefore, is true correspondingly in all states or acts of the will, because all tend towards an adequate object of the power in a corresponding way. Therefore it is necessary to say the same about good and correct actions. Therefore they assume in their objects some goodness moving the will towards such actions and formally completing their tendency. Then further, that goodness of such an object does not constitute the useful or the pleasant good; therefore it is right. Therefore in itself it is a certain rightness, sufficient in its kind to give moral goodness to an action, and thereby it is correctly called objective moral goodness.' (ii 1.4 = 289b)

[26] 'For sometimes the fitting is understood as what is expedient for something in such a way that it provides the thing with some perfection and, one might say, usefulness, and this is the way it is used in the objections. In another way,

To identify the kind of fittingness that is moral goodness, we must insist that it is fitting to human nature as a whole as rational nature.[27] Other things that are fitting to human nature are fitting to part of our nature, and in that way are derived from fittingness to our whole nature.[28] Something may be in accord with some aspect of human nature without being unqualifiedly loveable in its own right. In this sense Suarez agrees with Cicero's division between the good of nature and the good as right; it may be morally wrong to love life or health or the other advantages of nature in some circumstances. The moral good that is grasped by correct reason must be appropriate for the nature of human beings as free and rational agents.[29]

Suarez has now affirmed that the intrinsic goodness and badness independent of divine commands is more than the goodness of advantage and pleasure. In appealing to our judgments about moral goodness in order to show that these other two forms of goodness are not moral goodness, Suarez appeals to something that we recognize as distinct from the agent's own advantage. In referring to Cicero's comments on life and health, he relies on moral judgments. Though some later natural-law moralists restrict intrinsic goodness to pleasure and advantage, Suarez does not.[30]

439. The Objectivity of Moral Goodness: An Argument for Naturalism

Suarez believes that the right, as he has described it, is necessarily connected to correct reason, but not relative to correct reason. Relativity to correct reason gives the wrong direction of causation. Correctness in moral judgments is parallel to correctness of judgment in general; it consists in some conformity to some feature of the object judged, rather than

however, something is said to be fitting that through itself is suitable in some way and in agreement with the thing's nature and tendency. In this way the Incarnation is said to be fitting for God and for his goodness . . . Hence there are many objects of this kind that either bring nothing expedient beyond the rightness itself of virtue or are not aimed at because of that <expedient result>.' (ii 2.13 = 295b)

[27] Passmore, *RC* 103 cites John of Salisbury, *Metalogicon* i 3 = 829d–830 Webb, satirizing the excessive appeals to convenientia among those who try to innovate without much understanding: 'They talked of nothing but "suitability" or "reason", and "argument" sounded in everyone's mouth. To mention an ass or a human being or any work of nature was as bad as a crime, or excessively inept or vulgar and foreign to a philosopher. It was thought impossible to say or do anything appropriately or according to the standard of reason unless a mention of the "appropriate" and "reason" were expressly inserted.'

[28] 'Everything that is loveable (amabile) as fitting in itself is derived from (reduci ad) the good as right; hence, granted that we concede that that fitting with nature objectively founds the goodness of an action, none the less that is truly called a kind of rightness.' (ii 1.5 = 290a)

[29] 'Therefore in the objects of human actions the advantage of nature alone is not enough for the rightness of the actions. Therefore there is in them some character of goodness, which we call rightness properly, by the character of which goodness such objects are judged through correct reason to be fitting (decentia) for a human being, and to be correctly loveable because of themselves.' (ii 1.5 = 290a) 'This right, as such, formally requires fittingness and proportion with rational nature. But we must add that this fittingness must be with rational nature in so far as it is rational and can be governed by correct reason, because this rightness is the supreme goodness that can be present in this sort of fittingness in relation to a human being. Therefore it must be in accordance with the most perfect degree and supreme perfection that is in a human being. Therefore we must look for it in rational nature in so far as it is rational.' (ii 2.11 = 295a)

[30] See §532 on Cumberland; §565 on Pufendorf.

in the creation of such a feature.[31] We ought not, therefore, to define right and wrong by reference to correct reason. Though the right accords with correct reason and judgment, this accord is not what fundamentally makes it right. Reason or judgment is right because it conforms to the nature of a rational agent, but the converse is false.[32]

This argument recalls Suarez's initial discussion of naturalism.[33] He distinguishes 'objective' from 'cognitive' naturalism (as we called them) about natural law, and he prefers cognitive naturalism (though he still rejects it). Cognitive naturalism takes the rational grasp of rightness to be necessary for natural law, and Suarez agrees. But when he discusses moral goodness itself, he prefers objective over cognitive naturalism. He agrees with Vasquez's belief in objective rightness independent of anyone's judgment about it; he disagrees only insofar as he refuses to identify it with natural law. Suarez denies that rightness consists in conformity to a law, and affirms that the correctness of a law presupposes rightness distinct from it. Some cases of rightness arise from law, 'to the extent that this very thing, namely subjection to law and conformity to it, is good'. Nonetheless, this special fact about the goodness of obedience still requires conformity to rational nature if it is to constitute a form of goodness (*Bon*. ii 2.7 = OO iv 294a).

Suarez regards this account of rightness as an account of moral goodness, as Aquinas understands it. Aquinas' fullest discussion of moral goodness (*ST* 1–2 qq18–21) does not include Suarez's explanation. Indeed, our suspicions may be aroused by the fact that Suarez explains the right as appropriateness to rational nature. This would be a suitable explanation of the Stoic notion of the right (*kalon*, honestum), since the Stoics believe that living rightly is living in accordance with nature—one's own rational nature and the nature of the universe.

We have found, however, that Suarez is justified in taking Aquinas' remarks about moral goodness to apply to the honestum. Even though Aquinas does not make this clear in his explicit discussion of moral goodness, he makes it clear in his other remarks about the honestum. Nor does Suarez innovate in connecting the right with what is fitting for rational nature; Aquinas recognizes this same connexion between the morally good and rational nature.[34] Both Aquinas and Suarez believe that the right is fitting for rational nature and therefore contributes to the individual rational agent's own ultimate end,

[31] 'Objects are not right because they are judged right, but rather, on the contrary, correct reason judges them right just because they are such. For just as in other judgments, their truth is founded in things, if indeed they are such as they are judged to be, so also in this judgment of correct reason that correctness is founded in the object judged. Therefore the rightness of the object cannot consist in conformity to such judgment.' (ii 2.3 = 293a)

[32] '. . . this good is usually expounded through fittingness to the dictate of correct reason; for that good is right which correct reason dictates as one to be done or loved, etc. Nevertheless, if this statement is understood about correct reason in so far as it states judgment or knowledge of what it is expedient (expedit) to do, in that case rightness does not consist in conformity to the dictate of reason, nor is <correct reason> the first rule or first principle (ratio) of such rightness. For the good is not right because correct reason judges it to be such, but rather the converse: because the good itself truly and in reality is right, consequently it is judged to be such by correct and true reason. Therefore, as far as we are concerned, correct judgment is the rule of the good as right (bonum honestum) because it reveals it to us. However, in its own right, the judgment presupposes a proper fittingness from which the good as right derives its being so; and we say that this is a fittingness to the rational nature in so far as it is such and has such properties or attributes. If, however, the dictate of reason is taken not formally but as it were radically, then it is said correctly and a priori that the good as right is what conforms to reason—that is to say, what conforms to rational nature, which furthermore is naturally <able> to judge that this <good> is to be done or desired for itself' (*DM* x 2.12 = OO xxv 339a). On Gregory's views see §426.

[33] See *Leg*. ii 5, discussed at §426, on two versions of naturalism.

[34] See §334.

her happiness. Suarez accepts both Aquinas' eudaemonism and his naturalism about the morally good.[35]

Admittedly, Suarez would depart from Aquinas if he supposed that we can discover fitness to rational nature by direct intuition, or by reflexion on logical compatibility and incompatibility. If he took this view, he would anticipate Clarke's interpretation of fitness.[36] In his explicit remarks about rightness and fitness, Suarez does not say much about how they are to be discovered. But he interprets them teleologically, by reference to the appropriate ends for a rational agent.[37] Nor does he suggest that fittingness is to be discovered simply by considering actions and rational nature without reference to the circumstances; on the contrary, circumstances are relevant to deciding fittingness, and therefore rightness (*Bon.* ii 3.5 = 298b).

These claims about moral rightness distinguish morality from the content of divine commands. Suarez recognizes moral goodness and rightness as a property of actions themselves in relation to rational nature. If he were to claim that the imposition of some obligation is needed for rightness, morality, or duty, his position would be deeply inconsistent.[38]

440. Metaphysics and Meta-ethics

In speaking of intrinsic natures Suarez refers to his metaphysics. If we look beyond his meta-ethics to his metaphysical treatment of essences and reality, we can confirm and clarify some of our conclusions about moral rightness.

Metaphysical Disputation xxxi discusses the status of essences and their relation to the existence of finite things.[39] The most robustly realist view of essences claims that, whether or not individual human beings and horses exist, their essences have non-temporal being; it is always true that human beings are rational and horses have four legs, and that a chimaera is an impossible combination of man and horse, whether or not the actual world exists or

[35] Suarez endorses Aquinas' views about happiness as the ultimate end, against Scotus' objections, in *De Ultimo Fine* iii 6.1–3 = *OO* iv 37b–38a. His views on the ultimate end are discussed by Ward, *NG* 404–18 (who unduly weakens the force of Suarez's claim).

[36] See §619.

[37] 'Some things through themselves and by the character of their essential perfection are in agreement with human nature, either because they are its ultimate end, as God is; or else because a human being achieves them together with that end, such as knowledge or the love of God, because from themselves they correctly dispose a human being in the direction of such an end; or remotely, such as acts of justice (iustitiae), etc. For from this it comes about that such things are proportionate to rational nature, in so far as it is capable of happiness and tends towards it, and thereby an action tending towards such objects is also called correct, because through it a human being correctly tends towards the end he ought to tend towards.' (*Bon.* ii 2.14 = *OO* iv 295b)

[38] Suarez's views may influence some of Whichcote's aphorisms on moral objectivism and right reason (cited by Rivers, *RGS* i 64): 'Right is the rule of law; and law is declaratory of right.' (*MRA* §3) 'If we consider what is becoming reasonable nature; then shall we have a rule to guide us as to good and evil.' (§14) 'The rule of right is the reason of things; the judgment of right is the reason of our minds perceiving the reason of things.' (§33) 'There is a reason for what we do, from the things themselves: truth and falsity, good and evil, are first in things, and then in persons. There is a difference in things; and we must comply in all matters with the reason of things and the rule of right, which is the law of God's creation.' (§§455–6). On Whichcote see further §541.

[39] Suarez's views are briefly discussed and compared with other views by Bolton, 'Universals' 180–3, and more fully examined by Wells in Suarez, *EFB* 6–27.

God has created anything. Suarez rejects this most strongly realist view, and argues that 'no Catholic doctor' would maintain that the essences of creatures have some real being distinct from the being of God. Nor did God create them from eternity, since creation takes place in time (*DM* xxxi 2.3 = OO xxvi 230a). The necessary truth that man is a rational animal is to be analysed conditionally: 'if anything is a man, it is a rational animal' (2.8). Things in actuality and in potentiality are to be distinguished formally as being and not-being, not as two kinds of being (3.8). Real actual being depends on a real efficient cause (4.1).

Suarez's discussion seeks to show that essences have no actual being independent of the causal structure of the actual world. Since he takes the efficient cause of the actual world to be God, he believes that the being of essences depends on God as creator. Nothing antecedent to God's freewill makes it true that the appropriate natural kinds for him to place in the world are man, horse, and so on, rather than some other possible kinds.

But after having affirmed the dependence of essences on actual efficient causes and causal laws, Suarez accepts some aspects of the robustly realist case that he has rejected. He allows that essences are real as potential beings, though not as actual beings (2.10). As potential beings, they are independent of the divine will (12.40, 45, 46). Truths about essences include conditionals with impossible antecedents ('if a stone is an animal, it is able to sense') and truths about impossible objects ('a chimaera is both a man and a horse'). All these are true apart from any efficient cause (12.45), and the fact that the conditionals have impossible antecedents does not make them false or incoherent.

In all these cases, Suarez opposes voluntarism about essences. They do not depend on God as creator.[40] The root and origin of necessity in these truths does not depend on divine intellect (12.46). Suarez maintains the position that Descartes takes to undermine divine freedom and omnipotence.[41]

Suarez recognizes different kinds of eternal truths that exist apart from the creative will of God. Some describable kinds are not suitable for being created. Chimaeras are an impossible combination of species, and God could not make it true that they are a possible combination. Man differs from chimaera, apart from the creative will of God, in containing no internal repugnance; its 'non-repugnant' character makes it one of the possibilities among which God chooses (2.2, 10). Just as God could not choose to create round squares, God could not choose to create any other inconsistent combinations.

[40] 'Enunciations . . . are known because they are true; otherwise no reason could be given for why God necessarily knows they are true. For if their truth proceeded from God himself, that would happen by means of God's will, and thence it would not proceed by necessity, but voluntarily. Again, with respect to these enunciations, the divine intellect is compared as merely speculative, not as active; but the speculative intellect assumes the truth of its object, and does not produce it. Therefore, enunciations of this sort, which are spoken of in the first, and indeed in the second, way of being spoken of through itself, have permanent truth not only as they are in the divine intellect, but also in their own right, and in abstraction from the divine intellect.' (*DM* xxxi 12.40)

[41] Cf. Descartes's letter to Mersenne, 6 May 1630 = AT i 149.21: 'As for the eternal truths, I say once more that they are true or possible only because God knows them as true or possible. They are not known as true by God in any way which would imply that they are true independently of him. If men really understood the sense of their words they could never say without blasphemy that the truth of anything is prior to the knowledge which God has of it. In God willing and knowing are a single thing in such a way that by the very fact of willing something he knows it and it is only for this reason that such a thing is true. So we must not say that if God did not exist nevertheless these truths would be true; for the existence of God is the first and most eternal of all possible truths and the one from which alone all others proceed.' Cf. letter of 15 April 1630 = AT i 145.10. Cronin, *OB*, ch. 2, compares the views of Suarez and Descartes on essences and eternal truths.

The similarity between the issues arising in this discussion and those in the discussion of goodness is clear in Suarez's use of the same formula, ultimately derived from Plato's *Euthyphro*, of explanatory asymmetry. God knows the eternal truths because they are true, and it is not the case that they are true because God knows them. It is necessarily true that God knows them, and so it is not possible for them to be true without God's knowing them; still, the counterfactual claim is true that even if God were not to know them, they would be true.

Suarez protests that the voluntarist view distorts the status of the relevant truths. For we want it to be part of God's omniscience and wisdom that he knows all necessary truths, and that he is guided by them in his creative activity. But if we make necessary truths subject to his creative will, they lose their necessity. Similarly, we want to attribute some knowledge to his speculative (i.e., theoretical) rather than his operative (i.e., active and productive) intellect; but it is the mark of speculative intellect that it grasps truths independent of it, not that it acts so as to bring them into being. Voluntarism about the eternal truths undermines any reasonable conception of God's wisdom. To express the point in more recent terminology, voluntarism commits us to the wrong 'direction of fit'; it implies that necessary truth requires the conformity of reality to mind, whereas a proper account of necessary truth should make mind conform to reality.[42]

Even this brief survey of Suarez on essences helps to explain how he uses his metaphysics to clarify his claims about goodness. We notice, as we notice in his discussion of natural law, an initial firm statement of an apparently voluntarist claim, safeguarding divine freedom and sovereignty. But after this initial statement, Suarez does not endorse the whole voluntarist position. He insists that the proper recognition of God's sovereignty leaves untouched the belief in essences and truths that are independent of God's will.

The same is true of his views on goodness. The human good is not an eternal essence that God had to bring into the actual world, since God did not have to choose to bring human beings into the actual world. Nor do the various features of the human good exist independently of God's other creative decisions; it is not necessary, for instance, that human beings need water or shelter, since God could have made water and shelter unnecessary for us without creating creatures of a different species. However, God could not both have made human beings and have made all of the human good and human goodness entirely different from what it is. For the human good is fixed by human nature; to make the human good entirely different, God would have had to create an inconsistent state of affairs, by creating creatures who were human beings, but lacked human nature.

This is why Suarez claims that essences of things that do not imply a contradiction have their own being independent of will. While it is up to God to create human beings or not, it is not up to God to make the human essence inconsistent, as the essences of chimaera and of round square are, or to make inconsistent essences consistent. In order to create human beings and make their good something different from what it is, God would have had to make inconsistent things consistent. On this point Suarez is a naturalist.[43]

[42] On direction of fit see §256n43.

[43] A doctrine of intrinsic evils 'can be founded in that metaphysical principle that natures as far as their being goes are immutable essences, and consequently also <are immutable> as far as the appropriateness or inappropriateness of natural properties goes' (*Leg*. ii 6.11).

441. Intrinsic Rightness

If we now return to the *De Legibus*, and examine Suarez's remarks about obligation and intrinsic morality in the light of the meta-ethical doctrines we have discussed, we see that he adheres to these doctrines, and recognizes their naturalist implications.

In one place he says that rational nature is the foundation of objective right and wrong in human moral actions.[44] References to a 'foundation' are obscure on the relevant point. The foundation of a house is a necessary condition for a house, but it is not a house; but if we grasp the 'foundations' or 'fundamental elements' of French, we speak French, though we may not grasp it completely. In what sense does Suarez speak of the foundations of right? Does he mean that rational nature is sufficient for it, or only that it is necessary?

He answers this question when he agrees that God's command and prohibition presuppose a necessary rightness and wrongness, not only a necessary goodness and badness, in actions themselves.[45] Hence actions are right and wrong by their own nature, and not because of any divine command.[46] The rules that constitute the principles of right are not natural law, but the foundation of the law.[47] We can know enough about rational nature to discover that some types of actions accord with it and others do not. If this is the foundation of natural law, our knowledge of natural law informs us not only about the divine will, but also about the requirements of rational nature.

Suarez believes that actions are right or wrong insofar as they accord with or violate rational nature, even if we abstract from the fact that such actions are commanded and forbidden by God. To explain the abstraction, he relies on the counterfactual supposition that God does not command or forbid. But this counterfactual, as we have seen, needs to be explained carefully. In making the supposition we must not hold fixed the fact that God forbids all and only what is wrong; if we held this fact fixed, our counterfactual assumption would say that the action violating rational nature but not commanded by God is both wrong and not wrong. Instead, we are to consider the consequences of supposing simply that none of the wrongness of an action comes from God's prohibition, and to ask whether it is still wrong.[48]

Suarez relies on the sort of counterfactual argument that Gregory of Rimini uses to establish the independence of the natural law from the will of God. He rejects Gregory's counterfactual, but he accepts the analogous counterfactual in the case of intrinsic rightness and the will of God.[49] In *De Bonitate* he defends the counterfactual claim in order to show

[44] See ii 5.6, discussed in §427.

[45] 'This will of God, prohibition or prescription, is not the whole character of the goodness and badness that is present in the observance or transgression of natural law, but it assumes in the actions themselves some necessary rightness or wrongness, and joins to them a special obligation of divine law.' (*Leg.* ii 6.11)

[46] 'In this opinion, I take to be true the teaching that it assumes in its foundation about the intrinsic rightness or wrongness of actions, by which they fall under the natural law that forbids or prescribes . . .' (ii 5.5).

[47] 'Not everything that is a foundation of the rightness or correctness of an action prescribed by a law, or that is the foundation of the wrongness of an action prohibited by a law, can be called a law. And so, granted that rational nature is the foundation of the objective rightness of good moral actions, it cannot thereby be called a law.' (ii 5.6)

[48] *Leg.* ii 6.14.

[49] 'For let us grant by an impossibility that there is no superior prescribing or prohibiting. This object itself, which is lying, put forward in itself, is wrong, and, on the contrary, speaking the truth is right. And for this reason even in relation to God they are understood to have these characters, and for this reason the latter is repugnant to him and the former is natural. This rightness, therefore, through itself and formally, abstracts from law.' (*Bon.* ii 2.6 = *OO* iv 293b)

that rightness cannot consist in conformity to law. Similarly, in *De Legibus* he takes the truth of the relevant counterfactual to be crucial for settling the issues about the relation between natural law, intrinsic goodness, and divine commands.[50]

He defends the counterfactual against the objection that it involves a contradiction. His opponent suggests that the counterfactual says that lying (a) is a sin, because it is unfitting to rational nature, but (b) is not a sin, because it is not forbidden (ii 6.14). Suarez answers that clause (b) does not follow from the supposition. The supposition simply tries to establish that goodness and badness are prior logically (secundum ordinem rationis) to command and prohibition.

One might, however, still object that even though the counterfactual supposition is not self-contradictory in itself, it has contradictory implications: (a) if God does not forbid an action, it is not displeasing to him, and therefore it is not bad; but (b) if it is unfitting to rational nature, it is bad. Therefore (c) it is bad and not bad. Suarez replies that this objection begs the question, since (a) implicitly denies the truth of the counterfactual claim. The counterfactual claim does not imply that being bad and being prohibited by God are really separable (in re separabilia) (ii 6.15), and so the actual connexion between wrongness and God's prohibition does not refute the counterfactual.

We might still doubt the truth of the counterfactual once we see that it implies that actions not prohibited by God can be sinful and blameworthy. We might be tempted to reject this implication if we accept Augustine's description of sin as an offence against the eternal law (cf. Aquinas, *ST* 1–2 q71 a6). One reply to this objection asserts that actions not prohibited by God are not sinful or blameworthy, even though they are intrinsically bad (*Leg*. ii 6.16). If Suarez accepted this reply, we might say that intrinsic badness falls short of moral wrongness, since it does not imply sin and blameworthiness. But he rejects this reply, because an intrinsically wrong action would still be a sin (peccatum) even if God did not prohibit it; hence neither sin nor blameworthiness (culpa) depends on divine prohibition. Both sin and blameworthiness follow from the fact that a voluntary act is contrary to right reason; hence, sin, so understood, is the proper concern of the moral philosopher.[51] The implication that initially appeared unacceptable is not unacceptable after all.

Suarez's conclusion from this discussion sets out the relation between divine command and intrinsic goodness.[52] Moral badness and blameworthiness, from the moral philosopher's point of view, follow simply from contrariety to reason, apart from any divine command.[53]

[50] 'For it all turns on this hypothesis: Even if God did not prohibit or prescribe the things that belong to the law of nature, none the less lying is bad, and honouring one's parents is good and a duty (debitum).' (*Leg*. ii 6.14)

[51] Suarez cites Aquinas, *ST* 1–2 q21 a1–2; q71 a6 ad4–5 (partly quoted at §235n6).

[52] 'I reply, therefore, that in a human action there is some goodness or badness from the force of the object considered in abstraction (praecise), as it agrees or disagrees with correct reason. In accordance with that <goodness or badness> [Perena, ET supplies "<correct reason>"] it can be called both a sin and blameworthy in the respects mentioned, apart from its relation to proper law. [Or "law, properly speaking" (Perena, ET).] But beyond this <goodness or badness> a human action has a special character of good and evil in being directed towards God, when a divine law is added, either prohibiting or prescribing, and in accordance with that <character> [Perena; ET supplies "law"] a human action is called a sin or blameworthy action, in a special way, in the sight of God, by its character of transgression of a law that properly belongs to God himself.' (ii 6.17)

[53] 'In that case, therefore, the bad action would be a sin and a fault morally, but not theologically, or as directed towards God.' (ii 6.18)

The divine command adds a special sort of sin and blameworthiness that consist in disobedience to God, but it presupposes the sin and blameworthiness that belong to some actions precisely because of their relation to right reason.[54] Without a divine command or prohibition, actions would lack 'the complete and perfect character of a divine fault and offence, which cannot be denied in actions that are precisely against the law of nature' (ii 6.18). But they would not lack moral properties.[55]

The use of deontic terms for naturally good and bad actions makes it clear that Suarez's division between obligation and intrinsic goodness is not the division between impartial morality and mere self-interest. The use of 'right' and 'wrong', as well as 'good' and 'bad' for actions, apart from any divine command, shows that Suarez refers to the impartial aspect of morality.

These moral properties are 'intrinsic' to actions (ii 16.3). By this Suarez does not mean that they belong to actions irrespective of context or circumstances; the principles of natural law need interpretation so that we can identify the relevant circumstances.[56] Rightness and wrongness are intrinsic because they are determined by rational nature in its circumstances, and not by some external command.

The relation of right and wrong to human nature explains the sense in which natural law is everlasting and immutable.[57] Natural law remains the same because it depends on

[54] ii 6.18 fin. Finnis, *NLNR* 350, suggests that Suarez's distinction between debitum and obligatio is unsatisfactory: 'Since Suarez is under pressure from theological tradition to admit that an action can be identified as contrary to one's obligation, and that the doing of it can be described as guilty, *without reference to God's will*, his effort to be consistent with his own concept of obligation is only verbally successful; again and again in these paragraphs he is brought to the brink of saying that even without reference to any divine precept, acts (or their avoidance) can be obligatory (or guilty/sinful); this is betrayed in his repeated statement that the obligation imposed by the divine will underpinning natural law is "some sort of *additional* obligation" (paras. 12, 13), a "special obligation" (paras. 11, 17, 22).' Finnis's objections are unconvincing. Suarez is not 'brought to the brink of saying' that there can be sin without any obligation imposed by God; he clearly insists on this point. Finnis's claims about an 'added' and a 'special' obligation suggest that he takes Suarez to concede that the divinely imposed obligation is added to an obligation that is already there because of natural goodness and badness. I see no justification for this claim. When Suarez claims that an obligation is 'added', he does not mean that it is added to an obligation, but that it is added to a debitum. When he says it is a special obligation, he does not mean that it is to be contrasted with another sort of obligation, but that obligation is special to command, and not present in a natural duty. Finnis assumes that Suarez takes obligations to be identical to oughts and duties, so that it is awkward for Suarez to admit that actions can be wrong and sinful without violating an obligation. The objections collapse once we recognize that Suarez uses 'obligation' in the narrowly impositive sense; once we see that, his remarks about sins, added obligations, and special obligations are clear and intelligible.

[55] For further discussion of sin as offence against God see *De Peccatis* ii 2.5–8 (= *OO* iv 516b–517a). Though Suarez does not directly address the possibility of sin without infraction of divine law, his remarks are consistent with our present passage. He refers to Aquinas, *ST* 1a q48 a6; 2–2 q10 a3.

[56] 'Human actions, in their rightness and badness, depend greatly on circumstances and occasions of action, and in this there is great variety among them. For some are simpler (so to speak) than others, and need fewer conditions for their goodness or badness to arise. Now the natural law, considered in its own right, does not prescribe an action except in so far as it assumes that it is good, and does not prohibit an action except in so far as it assumes that the act is intrinsically bad. And therefore, in order to understand the true sense of a natural precept, it is necessary to inquire into conditions and circumstances with which that action in its own right is bad or good. And this is called interpretation of a natural precept, as far as concerns its true sense.' (*Leg.* ii 16.6) See §447 on dispensations.

[57] 'I say, therefore, that, properly speaking, the natural law through itself cannot cease or be changed, neither as a whole nor in a particular, given that rational nature remains with the use of reason and freedom. For this latter assumption is always taken as understood and assumed; for, since the natural law is a sort of property of this nature, if this nature were wholly removed, the natural law would also be removed, as far as its existence goes, and it would remain only in accordance with the being of essence or as possible objectively in the mind of God, just as rational nature itself would.' (ii 13.2) Suarez cites Aquinas, *ST* 1–2 q94 a4–5; q100 a8; 2–2 q66 a2 ad1; q104 a4 ad2.

human nature, which remains the same.[58] This reference to human nature explains his claim that intrinsic rightness and wrongness rest on non-contradiction.[59] He does not mean that the principles of natural law are necessarily true in a way that would make their denial self-contradictory in itself; he means their denial conflicts with the relevant facts about human nature. Because of the facts about human nature, the natural law 'presupposes in its material an intrinsic rightness or badness altogether inseparable from this material' (ii 15.4). In metaphysics he argues that essences are in certain respects independent of the divine will. He claims the same independence for moral properties.

442. Theoretical and Practical Reason

We have found that Suarez recognizes two morally significant elements in the principles of natural law; they specify intrinsic rightness and they express divine commands. The 'foundation' of natural law is the set of principles describing the right actions appropriate for rational nature. Obligation is imposed by a divine command.

The division between intrinsic morality and obligation may provoke an objection. We may take it to imply that every ultimate moral principle is divisible into a strictly practical and prescriptive component, requiring a command, and a purely theoretical component, describing rational nature. The identification of moral goodness with some relation of appropriateness or fitness to nature may appear to be alien to Aristotle's and Aquinas' conception of practical knowledge. Suarez seems to make moral goodness a matter of purely theoretical study; once we know what human nature is, we can also discover what is appropriate to it.

This conception of moral goodness seems to reduce moral deliberation to theoretical rather than practical knowledge, and hence seems to conflict with Aquinas' emphasis on the strictly practical character of prudence.[60] Aquinas may appear to avoid Suarez's separation of theoretical and practical components, because he expresses the principles in gerundive form ('good is to be pursued' etc.), and so makes them neither purely theoretical nor purely prescriptive.[61] Suarez, however, seems to leave room for someone to accept the truth of the theoretical principles, while refusing to issue any commands.

This objection, we might suppose, is not obvious to Suarez, because he maintains that God in his goodness cannot both create human beings and command that they act contrary to their nature. But the objection seems damaging if we consider human agents confronted by natural law or by its theoretical basis. It seems that we do not necessarily will what is fitting for rational nature; and we might wonder why the mere knowledge that some action

[58] The natural law is natural 'not because its fulfilment is natural or comes about by necessity, but because that law is a sort of proper characteristic (proprietas) of nature and because God himself has planted it in nature.' (i 3.9)

[59] '. . . moral actions have their intrinsic natures and immutable essences, which do not depend on any external cause or will any more than do other essences of things which in themselves do not imply a contradiction, as I now assume from metaphysics.' (ii 5.2) Perena ad loc. cites *DM* x 1.12 = *OO* xxv 332a, where Suarez explains how goodness adds to being only the convenientia that something has in virtue of its being (ratione entitatis). The metaphysical basis of Suarez's ethical conceptions is explored at length by Gemmeke, *MSGFS*, esp. Part 2. Cf. §547 on Cudworth.

[60] Suarez's view of prudence is contrasted with Aquinas' view (on tenuous grounds) by Treloar, 'Demise'.

[61] See §425 on ii 6.3. On gerundives and commands in Aquinas see §257.

fits human nature will move us to choose that action. Even if we know that God commands us to do that action, why should that purely theoretical knowledge make a difference to our action?

This objection to Suarez's position is a version of Hume's argument about 'is' and 'ought'. According to Hume, we have given the wrong account of a moral judgment if our account allows someone to believe that a moral judgment is true without having any motive to act on it.[62] If this is a correct constraint on any acceptable account of a moral judgment, Suarez's account is clearly unacceptable. But Aquinas may appear to satisfy Hume's constraint. For he formulates the basic principles as gerundives, and hence (we might infer) not as indicative statements about what is appropriate for human nature; hence they are neither ungrounded commands nor purely theoretical principles. We cannot accept a gerundive (we may suppose) without having some motive to obey it. If this is an adequate defence of Aquinas, he avoids the Humean objection that confronts Suarez.[63]

Sympathy with the Humean objection may encourage an interpreter to accept the account of Suarez's views on obligation that we have rejected. For we may suppose that Suarez believes that purely indicative judgments cannot contain moral oughts, because they do not by themselves motivate the agents who accept them; that he takes prescriptions, and hence commands, to be necessary for motivation, and hence for moral oughts; and that therefore he takes obligations—i.e., moral oughts—to require commands. According to this view, Suarez separates the two components that Hume takes to be necessary for a genuine moral judgment—the descriptive and the prescriptive—and assigns them, respectively, to intrinsic natural facts and to divine commands.

This is not exactly Hume's view, since the existence of a divine command does not guarantee action on it; it still leaves an open question about whether the agent to whom the command is addressed is moved to act on it. But, according to some views, Suarez tries to cover this gap by speaking of obligation as 'moral moving'. If this is to be understood as 'moral motivation', he assumes that obligation requires both a divine command and the motivation to follow it.

[62] On Hume see §752. Cf. Finnis, *NLNR* 36–48.

[63] Grisez criticizes Suarez for misunderstanding the character of practical knowledge: 'The theory of law is permanently in danger of falling into the illusion that practical knowledge is merely theoretical knowledge plus force of will. This is exactly the mistake Suarez makes when he explains natural law as the natural goodness or badness of actions plus preceptive divine law' ('First principle' 378). He cites *Leg*. ii 7, and refers with approval to Farrell, *NLSTS* 147–55. The description of Suarez's position in 'when he explains . . .' is not grossly inaccurate, but Grisez makes some contestable assumptions in claiming that this position relies on the mistake that Grisez alleges about practical knowledge. He seems to suggest that, according to Suarez: (1) Knowledge of natural goodness and badness is purely theoretical knowledge. (2) Knowledge of natural law is practical knowledge. (3) The difference between the two kinds of knowledge must lie in the command that belongs to natural law. While (2) is right, (1) is dubious. Suarez nowhere says or suggests that if we are aware of natural goodness and badness and unaware of any divine command, we have neither a reason nor a motive to pursue the good and to avoid the bad. Perhaps Grisez attributes this view to Suarez because Suarez takes natural law, and hence divine command, to be necessary for moral obligation. But, as we have seen, obligation, in Suarez's restricted sense, is not the only source of moral reasons or motivation.

On Suarez as a source of 'Scholastic natural-law theory' see also Grisez, *WLJ* 103–5. According to Grisez and Finnis, Suarez's main mistake is to treat the principles of natural law as theoretical principles that simply state that something is fitting to rational nature. They contrast this with Aquinas' view, according to which the principles have a gerundive form, and so avoid moving from is to ought. This is also relevant to the issue about debitum and obligatio. For we might suppose that the prescriptive aspect of morality enters only with the imperative obligatio and that the merely descriptive debitum is purely theoretical and lacks the appropriate prescriptive character.

We need not examine this interpretation further, since we have seen that it does not fit Suarez's claims about obligation and intrinsic morality. This is not surprising, since we have no reason to suppose that Suarez takes Hume's questions seriously. Still, we might argue that, since Hume's questions are legitimate, Suarez ought to have accepted the view that we have rejected on his behalf about obligations, commands, and oughts. If he takes intrinsic facts to be sufficient for moral oughts, he seems to open himself to Hume's objection, since Hume argues that we cannot move directly from such facts to oughts.

Does Aquinas' gerundive formulation avoid the objections Hume raises to deriving ought from is? The gerundive formulation is ambiguous, and the ambiguity may be resolved in different ways: (1) We may take the gerundive as equivalent to an imperative. In that case, the principles of natural law are really imperatives, and are in danger of being groundless, if they lack what Suarez calls their foundation. (2) We may take the gerundive to say that there are reasons for pursuing certain actions and avoiding others. But if these reasons are connected, for instance, with claims about rational nature, a Humean can ask why we should care about these reasons in particular. (3) We may take them to include both an imperative and a purely descriptive element. But in that case we can ask, in a Humean spirit, how the two elements are related. If the Humean gap is a genuine gap, we cannot accept Aquinas' principles unless we have made the transition from 'is' to 'ought' that Hume challenges.

In deciding how we ought to understand Aquinas' gerundives, and how we ought to connect them with Hume's objections, we need to take account of some complications in his position. At first sight, gerundive formulations may appear to be imperatives; for Aquinas himself says that the propositions expressed with these gerundives are the 'precepts' of the natural law. Precepts belong to the natural law because it is essential to law to command (*ST* 1–2 q90 a1 sc) and thereby to move us to action. In order to explain how law can have this motive character and still belong to reason, Aquinas relies on his account of command (imperium) as an act of reason presupposing an act of will (q90 a1 ad3; q17 a1).

But Aquinas' account of command precludes an implicit answer to Hume. If he understood all commands as imperatives, he might agree that anyone who accepts a command must be motivated to act on it, by assenting to an imperative. But his actual conception of command is much broader; for commands can be expressed through the indicative mood, with a gerundive ('This is to be done'), and not only through the imperative mood ('Do this') (q17 a1).[64] Hence the fact that he speaks of commands does not imply that he refers to imperatives addressed to oneself or to others.

This broad use of 'command' is relevant to the natural law. For its precepts are in gerundive form, and hence are 'indicative intimations', not 'imperative intimations'. They direct us to act appropriately, and if their directing is to result in action, we must have the appropriate will; but they do not themselves contain any appropriate act of will, and they do not imply that we have engaged or will engage in any such act of will. If all these precepts were imperative intimations that I address to myself, they would constitute attempts to move my will. But we cannot draw this conclusion from the fact that the precepts are indicative intimations. Once we recognize that Aquinas' conception of a command is

[64] See §257 on Aquinas.

broader than we might expect, we find that the precepts of the natural law—being indicative intimations—belong on the 'is' side of Hume's division.

If, then, Hume is right to suppose that we cannot move from is to ought without some appropriate desire or motive, Aquinas makes an illegitimate transition. For Aquinas believes it is legitimate to move from 'x is good (in the relevant way)' to 'x is to be done by me' and to 'I ought to do x', without any intervening act of will. The gerundive precept that x is to be done need not arise from, and need not produce, any desire to do x or to achieve the end to which x is a means.

Do Suarez's claims about commands make any essential difference? He agrees with Aquinas in taking gerundive judgments to be indicative (indicantem quid agendum vel cavendum sit, *Leg*. ii 6.3).[65] But he rejects Aquinas' view that to make a gerundive judgment of this sort is a way of commanding or prescribing. To express a precept, we must use the imperative mood. When he says that many people distinguish an indicative from a prescriptive law (lex indicans v. lex praecipiens, ii 6.3), he takes a law formulated with gerundives to be an indicative law. In his view, such a law is not a law, strictly speaking, because a law, strictly speaking, must contain actual precepts, which must be in the imperative mood. His use of 'command' and 'precept', therefore, is narrower than Aquinas' use, and closer to our usual use.

Once we recognize this disagreement between Aquinas and Suarez about the extent of commands, we see that their apparent agreement about the character of the natural law conceals an important disagreement. They agree that the provisions of the natural law are precepts. But Aquinas believes that the precepts are indicative, since he expresses them in gerundives. According to Suarez, however, a so-called precept in gerundive form is not a genuine precept, since it is indicative. Hence he believes that Aquinas' conception of a precept is too generous. He does not, therefore, take Aquinas' gerundive formulations to express the prescriptive character of natural law.

Suarez, therefore, might appear to accommodate Hume's demands better than Aquinas does. For if I accept any genuine precept of natural law, I accept a command. I must conform my will to the command by moving in the way I am commanded to move. One might, therefore, argue on Suarez's behalf that in accepting the precepts of natural law, I introduce the motive element that, according to Hume, is needed to explain the transition from is to ought.

This defence of Suarez, however, rests on a misunderstanding. For he does not believe that this motive element is needed to justify the acceptance of ought-judgments. He believes, as Aquinas does, that gerundives and ought-judgments are indicative, and do not include any special motivation. Hence he does not believe that any motive element is needed to explain the transition from is to ought. From Hume's point of view, both he and Aquinas make exactly the same illegitimate transition from is to ought without introducing a motive element to explain the transition.

Suarez's claims about obligation and command, therefore, do not result from any concern to exhibit the prescriptive character of moral judgments, or from any other concern that is related to Hume's questions about is and ought. His account of obligation is not meant to be

[65] Quoted in §426.

an account of moral requirements, reasons, or oughts in general and is not meant to explain how we can be given reasons or motives to act on moral principles in general. He believes that the moral principles constituting the foundation of natural law are 'merely descriptive', if that is taken to mean that they do not embody an attempt to move one's own will or anyone else's; hence he says they are purely indicative rather than prescriptive. But he does not think they are 'merely descriptive', if that is taken to mean that he thinks they require some further explicit prescriptions, conveyed through divine commands, before we have any reason or motive to act on them. Since these indicative principles include gerundives and oughts, they are already normative (i.e., they already give reasons) without any further prescription.

Suarez makes it clear that he does not think divine commands are needed to give us sufficient reasons or motives to act on the principles of intrinsic morality. The principles that require us to seek good and to avoid evil, to preserve ourselves and to promote the interests of others, and, in general, to act rightly and in accordance with rational nature, are grasped by practical reason apart from divine commands. We need not appeal to divine commands in order to have sufficient reason to choose intrinsically right actions. To suppose that moral reasons and moral motivation belong exclusively to obligations, as Suarez conceives them, is to overlook his narrow concept of obligation, and to underestimate the significance of intrinsic morality without imposed obligation.

Practical, rather than theoretical, reason grasps these principles, because we reach them if we start out from our necessary pursuit of the ultimate good; we discover that these principles achieve the ultimate good for a rational agent. We have reason, therefore, to follow them insofar as we are rational agents; and we recognize we have reason to follow them insofar as we recognize ourselves as rational agents pursuing our ultimate good, and recognize that these principles achieve this good. Aquinas gives reasons for supposing that we are rational agents of this sort, and that we necessarily regard ourselves as such, though we do not see all the implications of attributing this agency to ourselves. Suarez endorses these aspects of Aquinas' position; they are the background for his claims about natural law.

If these are the relevant aspects of Aquinas' doctrine, he has two answers to different parts of a Humean objection: (1) If the question 'Why should I care about these principles?' is a request for a justifying reason, it is answered by the connexion between natural law and practical reason. (2) If it is a request for an exciting reason, it is answered by the features of Aquinas' position that are often taken to constitute psychological egoism.

Neither of these answers to Hume meets Hume's demand for an account of moral principles that guarantees that anyone who believes them has a desire to act on them. But that is a highly disputable demand; failure to satisfy it may not be an error in Aquinas or in Suarez.

443. Natural Rightness and Divine Freewill

We have now explored the two elements that Suarez distinguishes in the natural law: intrinsic morality and divine commands. How are they related? Could they diverge? Even if Suarez agrees with naturalism about the existence of moral reasons based on intrinsic

rightness and wrongness, he would still accept a significant part of the voluntarist case, if he were a voluntarist about the relation of intrinsic rightness to God's legislative will. A position we might ascribe to Ockham insists that God is free to command obedience to the principles of non-positive morality or principles conflicting with non-positive morality. By unqualified ('absolute') power God can accept or reject non-positive morality; only ordered power restricts God to the acceptance of non-positive morality.[66] At any given time, God is exercising only ordered power; we do not have to consider both what God might do on the basis of ordered power and what God might do on the basis of unqualified power. Hence we can rely on God to keep on commanding us to follow the non-positive morality that Suarez calls intrinsic morality.

Still, if we rely on God to command intrinsic morality, we rely on God's choice not to change his mind, rather than on his essential goodness. If Ockham is right, it is consistent with God's essential goodness to command us to violate intrinsic morality, though God has told us that he will not command us to do this. If God instructed us to violate intrinsic morality, and gave us innate knowledge of these instructions, there would be no natural law in the metaphysical sense, because God would not command us to act in ways fitting to rational nature; there would only be a natural law in the epistemological sense. The fact that God has created us with the nature we have does not, in Ockham's view, require God to impose any specific laws on us; hence God would have been equally good if God had told us to violate intrinsic morality. That is why God was free to command us to hate God, and hence to give us a command that we could not rationally obey (if we can rationally obey God's commands only out of love of God).[67]

According to Suarez, God was free to create or not to create beings with our nature.[68] The eternal law does not bind God independently of his will; it is a law for creatures arising from God's freewill as legislator. He imposes it on himself, as a craftsman, having decided to make a certain kind of thing, imposes a law on himself (ii 2.4). In this context Suarez speaks of God's ordered power, as Scotus does.[69] Still, God cannot violate his own decrees, because violation would be intrinsically wrong, and therefore is contrary to the intrinsic nature and essence of God (ii 2.7).[70] Suarez relies on this distinction between God's freedom in advance of creation and his lack of freedom after creation, in order to answer the question about whether it is possible for God not to command the observance of intrinsic morality.[71]

Scotus gives a voluntarist answer to this question, by exploiting the distinction between types of power. He claims that general laws come from the divine will, and not from the divine intellect prior to the divine will.[72] Scotus argues that if the divine intellect fixed

[66] On absolute v. ordered power see §396. Ockham probably does not suppose that non-positive morality is independent of the divine will (see §395), but if we did suppose that, we could reconcile naturalism about morality (in the form defended by Gregory of Rimini) with voluntarism about the divine will and morality.

[67] See §398. [68] See §395on Ockham's objections to Aquinas on God's freedom in creation.

[69] At ii 2.4 he cites Scotus, *1Sent*. d44 q1 = *OO* v.2 1368–9. The passage Perena cites ad loc. is from the commentary in *OO*, not from Scotus.

[70] Suarez cites Aquinas, *ST* 1–2 q93 a4 ad1; 1a q21 a1 ad2.

[71] 'Is the hypothesis possible, that God, by the proper act of his will did not attach a proper law forbidding or prescribing the things that belong to the prescription of natural reason?' (ii 6.20)

[72] '. . . some general laws, prescribing correctly, were prefixed by the divine will and not by the divine intellect as preceding the divine will . . .; but when the intellect offers the divine will such a law, . . . if it pleases God's will, which is free, it is a correct law' (Scotus, *1Sent*. d44 q1 §6 = *OO* v.2 1368 §2 = V vi 365.9–15).

the laws, the divine will would not be free, but would will by necessity.[73] God is free to change these laws by his free will; in such a case his action is not disorderly (inordinatus), but according to a different order that is no less right than the first one.[74] This voluntarist conception of the general laws makes room for dispensations that are no less right than the general laws they violate. Scotus agrees that God cannot dispense from observance of natural law, but argues that our duties to our neighbour do not fall under natural law, and therefore God can dispense us from them. Ockham allows dispensation from each precept of the natural law.[75]

The dispensability of natural law may appear to be a welcome consequence of voluntarism; for familiar Scriptural examples seem to show that God makes exceptions to the precepts of natural law, by dispensing particular people from observance of them. If God is free to make exceptions to the natural law, God seems to be sovereign over natural law, so that natural law does not seem to contain any requirements that are independent of God's legislative will.

Suarez, however, follows Aquinas in discussing the alleged possibility of dispensations from a naturalist point of view. He examines the claim that God can, by absolute power, though not by ordered power, refrain from commanding what is intrinsically right.[76] It is not clear that Scotus holds this view, since he does not agree that the principles of justice with regard to one's neighbour are about what is intrinsically right; these principles depend on God's free will, and for that reason are subject to dispensation. Ockham comes closer to the position that Suarez discusses, since he recognizes non-positive morality. But if even non-positive morality depends on God's having freely ordered his absolute power in a particular way, it does not seem to meet Suarez's conditions for intrinsic rightness. Suarez discusses dispensations on the assumption that he has already shown that natural law includes intrinsic morality, so that dispensations from natural law would have to allow the violation of intrinsic morality.

Instead of directly answering the view he ascribes to Ockham, he turns to Aquinas' view that God cannot change his will on the natural law. In Suarez's view, Aquinas cannot be referring simply to immutability on the assumption of a divine decree, since even divine positive law is immutable in that sense. Aquinas, therefore, must refer to absolute immutability; he should be taken to claim that it is not even within God's absolute power to refrain from commanding the natural law.[77] Against Aquinas, Ockham believes that

[73] In *1Sent* d44 Scotus refers back to his discussion of this issue in d38 = *OO* v.2 1286–7 = V vi 306–7.

[74] 'I say, therefore, that God cannot only act otherwise than is ordered by a particular ordering, but can act otherwise than is ordered by universal order—that is, according to the laws of justice, because things that are beyond that order as well as things that are against that order could be brought about in an orderly way by God, in accordance with unqualified power.' (*1Sent*. d44 = *OO* v.2 1369 §3 = V vi 367.9–14)

[75] See next note.

[76] '. . . God can in accordance with unqualified power not make such a prohibition' (Suarez, *Leg*. ii 6.20). Perena cites Ockham, *2Sent*. q15 ad3, ad4 = *OT* v 352–3, quoted in §398n67.

[77] 'God cannot not prohibit what is intrinsically bad and misdirected in rational nature, nor can he not prescribe the contrary. This is openly asserted by St Thomas, . . . in so far as he says that the decree of divine justice about this law is immutable. This assertion cannot be understood as being only about the immutability that assumes a decree. For in this way any decree at all of God in any positive law whatever is immutable. Therefore St Thomas is speaking of unqualified immutability. Hence his view is this, that God cannot in this case remove the order of his justice, just as he cannot deny himself, or just as he cannot not be faithful in his promises.' (*Leg*. ii 6.21) He cites Aquinas, *ST* 1–2 q71 a6 ad4; q100 a8 ad2.

God's absolute power to impose one or another law is not limited by God's having created creatures with our nature. From Ockham's point of view, the necessity that Suarez maintains of prescribing these specific principles to rational creatures is an inadmissible restriction of divine freedom. The necessity of prescribing these principles would follow from the necessity of choosing the best course of action; but, according to a voluntarist, such necessity is inconsistent with freedom.

Suarez agrees with Aquinas on this point.[78] God was free not to impose the natural law, since God was free not to create us. But if rational creatures exist, God's goodness requires God to prescribe obedience to intrinsic morality. Hence God's absolute power does not extend to imposing another law.[79] The freedom of God is exercised in creation; hence the necessity of imposing observance of the principles of natural law does not cancel divine freedom. Suarez relies on this claim to answer Scotus' objection that the necessity of imposing observance of the second table of the Decalogue would restrict divine freedom.[80]

444. Subordinate Principles of Natural Law

If Suarez holds this naturalist position about intrinsic rightness, he cannot allow dispensations from natural law; for its precepts prescribe intrinsically right actions, which God necessarily (in the respect described) wills that we do. Suarez therefore needs to show that apparent dispensations from requirements of natural law are not real dispensations, and hence do not require us to admit that God can allow violations of natural law.

Apparent dispensations are among apparent exceptions to the natural law. Suarez's careful discussion of the various cases that we might—misleadingly, in his view—include under the head of 'exceptions' explains his view about the ways in which God can or cannot create exceptions. To understand this view, we must understand his general view about the relation of subordinate principles to the higher principles of natural law. This view is worth exploring in its own right, before we see how Suarez uses it to explain apparent dispensations.

Following Aquinas, Suarez recognizes principles of natural law at different levels, and sees that the difference between these levels has to be taken into account when one speaks of the immutability or mutability of different provisions of natural law. As we have seen, he insists especially on the importance of fixing the relevant circumstances in considering what a specific provision says.

He therefore denies that the same action can sometimes be bad in itself and sometimes good in itself. Since an intrinsically bad action conflicts, by its own nature, with the requirements of rational nature, one and the same action with the same nature cannot both

[78] On absolute and ordered power see §396.

[79] 'For, speaking without qualification, God could have prescribed or prohibited nothing. However, on the assumption that he willed to have subjects who use reason, he was unable not to be their legislator, at any rate in those things that are necessary for natural rightness of morals.' (ii 6.23)

[80] '. . . it is not inappropriate for the divine will to be necessitated to that prohibition, on the supposition that it decided to establish human nature and to govern it, i.e. (seu), to have appropriate foresight about it' (ii 15.12).

conflict and not conflict with rational nature.[81] To identify the same action, we must fix the relevant circumstances and conditions. The same action, with these fixed, cannot be sometimes good and sometimes bad.[82]

To fix the relevant conditions and circumstances, and hence to find the actions that are intrinsically right and wrong, is the task of prudence, as Aquinas conceives it. Suarez agrees with Aquinas' view that natural law supports some fairly specific rules if the relevant circumstances are built in; hence it supports rules about respect for private property, even though it does not require property. We reach the relevant rules by interpretation (ii 16.6).[83] Suarez's appeal to circumstances and restricting conditions presupposes that the natural law prescribes and prohibits actions with reference to intrinsic goodness and badness, measured by agreement and disagreement with the requirements of rational nature. What rational nature requires depends on circumstances and conditions. Hence, the provisions of natural law take account of the appropriate circumstances and conditions.

A different conclusion would be forced on Suarez if he were to believe that intrinsic rightness and wrongness are intrinsic to action types in themselves, without reference to the agents or the circumstances. This would be a view similar to Clarke's belief in 'eternal relations of fitness'. If such a view were right, then we could infer simply from the fact that A had benefited B that B ought to benefit A in return, without reference to the fact that A and B are rational agents in specific circumstances that affect their rational agency.[84] In appealing to nature, Suarez rejects this explanation of intrinsic rightness, and defends his appeal to circumstances and conditions.

445. Our Knowledge of Natural Law

This discussion of subordinate principles confronts the believer in natural law with a dilemma created by two demands: (1) On the one hand, natural law is supposed to be epistemically accessible and reliable; its principles are readily grasped by everyone and are evidently the basis of any acceptable moral principles. (2) On the other hand, it must yield principles that are applicable to specific questions and practical situations; otherwise it is useless for guiding particular choices and actions.

These two demands seem to conflict. The demand for epistemically accessible and reliable principles encourages us to follow Aquinas in attributing such principles as 'Good is to be done and evil avoided', or 'One must act in accord with reason' to the natural law. But these principles do not include the sort of content that makes them practically applicable. When

[81] 'You will say that it can happen that the same action is sometimes bad from itself, but sometimes is not. On the contrary: in that case it will not be able to have both characters with the same circumstances or conditions on the side of the subject matter. For, since goodness or badness arises from the agreement or disagreement of an act with rational nature, it cannot happen that the same act with the same conditions is through itself both in disagreement and in agreement, because opposite relations do not arise from the same foundation.' (ii 15.30)

[82] Suarez explains the sense in which a right action could become wrong: 'And so, if that occasion with all its circumstances remains the same, the precept cannot fail to oblige; for if the occasion and the circumstances change, then the obligation can fail, but not because of a dispensation, but because this is the nature of an affirmative precept, that it always obliges [i.e., invariably on this occasion] but not for always [i.e., for every occasion].' (ii 15.29)

[83] Quoted in §441. [84] On Clarke see §§618–19.

we try to introduce content without sacrifice of accessibility, we seem to sacrifice reliability. Both Aquinas and Suarez recognize this in the case of the precepts about killing, returning deposits, and keeping secrets; and we might also want to recognize it in the case of the precept against lying. While these precepts seem simple and accessible, they also seem to face counter-examples.

Aquinas answers that some conclusions from the highest principles of natural law hold only usually and have exceptions (*ST* 1–2 q94 a4). He suggests that the precept of returning what you have borrowed holds usually, because we ought to recognize it as valid only subject to certain circumstances that hold usually, but not always. These circumstances do not hold if you are returning a gun to someone who is threatening suicide or murder; in these circumstances you must not return what you have borrowed.

If failure in these circumstances to return what we have borrowed does not violate natural law, the higher principle that supports the usual practice of returning what we have borrowed must support a more complex principle than 'Return what you have borrowed'. If it really supported the unqualified principle, any failure to return what we have borrowed would violate natural law. But any identification of the more complex principle seems to raise a question about accessibility or about applicability. Either (1) the principle is 'Return what you have borrowed unless the lender is suicidal or . . . (listing all the relevant qualifications)'; or (2) the principle is 'Return what you have borrowed in the right circumstances'. In the first case, the relevantly qualified principle does not seem accessible; in the second case, it is not applicable to particular cases, since it still leaves us to list the relevant circumstances.

Suarez considers some of these difficulties in his treatment of the character and content of principles of natural law. In discussing the mutability of natural law, he points out that we need to decide what sorts of principles we are to attribute to natural law. We may formulate the precepts as 'A deposit must be returned', and so on, but these formulations of the precepts are not the precepts themselves.[85] Hence the alleged exceptions to a given precept are really included in the circumstances that are part of the precept (*Leg*. ii 13.7).[86]

[85] 'Hence we must further take account of this: The natural law, since in its own right it is not written on tablets or pages, but in minds, it is not always dictated in the mind in those general or indeterminate (indefinitis) words in which we express it orally or in which it is written. For example, the law about returning a deposit, in so far as it is natural, is not judged in the mind so simply and unqualifiedly (absolute), but with limitation and circumspection; for reason dictates that a deposit is to be returned to one who asks for it lawfully (iure) and rationally, or <that it is to be returned> unless some reason of a just defence, a reason applying either to the commonwealth or to oneself, or to an innocent person, prevents it. Commonly, however, this law tends to be expressed only in these words: "A deposit is to be returned". That is because the other things are implicitly understood, and cannot all be made clear in the form of law laid down in a human way.' (ii 13.6)

[86] Suarez's separation of precepts from formulations in rules rests on the sorts of considerations that move Scanlon, *WWOEO* 199, to deny that principles are to be identified with particular rules that can be applied to settle questions without much further exercise of judgment: 'Principles . . . are general conclusions about the status of various kinds of reasons for action. So understood, principles may rule out some actions by ruling out the reasons on which they would be based, but they also leave wide room for interpretation and judgment.' Scanlon explains his point through an example quite like Suarez's: 'Consider, for example, moral principles concerning the taking of human life. It might seem that this is a simple rule, forbidding a certain class of actions: Thou shalt not kill. But what about self-defence, suicide, and certain acts of killing by police officers and by soldiers in wartime? . . . The parts of this principle that are the clearest are better put in terms of reasons: . . . So even the most familiar moral principles are not rules which can be easily applied without appeals to judgment. Their succinct verbal formulations turn out on closer examination to be mere labels for much more complex ideas.' (*WWOEO* 199) Scanlon speaks as though the fifth commandment in the Decalogue were an unqualified prohibition of killing. But Christian moralists do not normally understand it in this way, as Aquinas' treatment shows; the usual interpretation makes it a 'principle' rather than a 'rule that can be easily applied without appeals to judgment'.

Here he follows Aquinas' interpretation of the fifth commandment. Aquinas considers an argument to show that the precepts of the Decalogue are dispensable, because the Decalogue forbids killing, but human law allows killing of evildoers and enemies.[87] Aquinas answers that the commandment expresses a principle about wrongful killing, but it does not state a rule that prohibits all killing.[88] If we recognize justifiable killing, we have not found an exception to the commandment; we have found a more accurate statement of it. To find a full statement of the commandment we would need to identify all the circumstances that justify killing. If we cannot confidently claim to have done that, we cannot confidently claim to have formulated the whole content of the principle that forbids wrongful killing.

This conception of principles clarifies Suarez's conception of the precepts of natural law. Since they are precepts of practical reason about what is suitable to human nature, they include circumstances and conditions. Since practical reason does not prescribe unqualified precepts, such precepts do not belong to natural law. Practical reason has to take account of the systematic character of the precepts of natural law. Since natural law, taken as a whole, expresses what is intrinsically right and appropriate for human nature, the different precepts do not express separate moral requirements; they express different aspects of the relevant sort of appropriateness.[89] Reflexion on returning deposits and on other precepts of natural law shows us that we need to limit the circumstances for returning deposits. These limits introduce other precepts and virtues; we have to know whether someone is asking 'lawfully', and whether some 'just defence' requires us to withhold the deposit. We cannot apply the precepts one at a time without reference to the rest of natural law.

The implicit flexibility of the precepts of natural law allows us to understand how they make room for some dispensations. Suarez discusses the papal power to dissolve marriages that have been properly and canonically contracted, but not consummated. He argues that the power to dispense from such a marriage is not a power to dispense from

[87] 'Further, among the precepts of the Decalogue is one forbidding murder. But it seems that a dispensation is given by human beings in this precept: for instance, when according to the precept of human law, such people as evil-doers or enemies are permissibly slain. Therefore the precepts of the Decalogue are dispensable.' (*ST* 1–2 q100 a8 obj.3)

[88] 'The killing of a human being is forbidden in the Decalogue, in so far as it has the character of the wrongful (indebitum): for this is how the precept contains the very character of justice. Human law cannot make it permissible for a human being to be killed wrongfully. But it is not wrong for evil-doers or enemies of the common weal to be killed. Hence this is not contrary to the precept of the Decalogue; and such a killing (occisio) is not a murder (homicidium), which is forbidden by that precept, as Augustine says . . . And similarly, if someone's property is taken from him, if it is right (debitum) that he should lose it, this is not theft or robbery, which are forbidden by the Decalogue.' (1–2 q100 a8 ad3) This way of understanding the commandment has been followed in some modern English versions of the Decalogue. See, e.g., NRSV, REB, at *Exodus* 20:13. The sense of the Hebrew is not completely clear. See, e.g., Rylaarsdam in *IB* i ad loc.: 'The verb is not limited to murder in the criminal sense and may be used of unpremeditated killing (*Deut*. 4:22). It forbids all killing not explicitly authorized. This means that in Israelite society it did not forbid the slaying of animals, capital punishment, or the killing of enemies in war.' Stamm and Andrew, *TCRR* 99, after criticizing the rendering 'murder', have nothing more precise to suggest than 'illegal killing inimical to the community'.

[89] This systematic character of the natural law, as Suarez conceives it, may be contrasted with an intuitionist view, such as Clarke's or Price's, that recognizes independent, and possibly conflicting, self-evident and equally basic principles, each of which can be grasped by an independent act of intuition. According to an intuitionist view, we can grasp the principles of justice independently of grasping the principles of benevolence, and a further intuition is needed in case of conflict between the two sets of principles. See §§620, 823.

natural law; on the contrary, the natural law justifies the dissolution of such marriages by public authority.[90] The ends to which the precepts of natural law are directed warrant the dissolution of some marriages by public authority. This is not a concession that allows the violation of natural law for some other end, but a provision that promotes the ends of natural law.

Suarez's treatment of the precepts of natural law shows that he maintains their reliability even if he makes it more difficult to show that they are accessible or applicable. The teleological and rational character of natural law shows that it includes the reasonable moral judgments that lead us to doubt the simple and unqualified formulations of the precepts. Among these simple and unqualified formulations are those contained in the Decalogue. These Scriptural formulations do not fully express, but simply indicate, the underlying precepts of natural law.

446. Application of the Precepts

If this reasoning shows how the precepts of natural law are accessible to us, does it show that they are applicable to action? They are more difficult to apply than the unqualified precepts, because they require us to recognize what a 'just defence' might be, which is more difficult than recognizing whether we have borrowed something and the time has come at which we agreed to give it back. Suarez implies that the study of apparent exceptions that appear on reflexion to be justified, in the light of all the precepts of natural law, gives us a reasonable basis for recognizing the qualifications implicit in each precept. Consideration of the point of keeping promises, returning deposits, and so on reveals limits that we must recognize in the different precepts.

This view of the precepts of natural law affects Suarez's treatment of specific areas of moral perplexity, including the laws of war. One approach assumes that we have already established the precepts of natural law at a rather high level of abstraction; we know, for instance, that the natural law prohibits killing innocent people, and we examine the circumstances of war to see whether they warrant an exception to this general principle. This is not Suarez's approach. We have a reasonable prospect of grasping the precepts of natural law only when we have examined all the relevant circumstances to see how they affect the content of the precepts.

On the one hand, this may appear a rather flexible approach to the moral questions raised by war. Since we do not examine them in the light of principles whose content we already know, the cases we consider in examining war influence our view of what the relevant principles say. Hence they are part of the process of discovering the principles, not part of the process of applying principles we already know.

[90] 'The fact that such a dispensation may be granted by public authority is not contrary to the natural law, but in agreement with it, because nature itself is capable (if I may put it this way) of giving up its own right (ius) because of some greater good that even results in its own advantage. And because the administration of those rights (iurium) that belong to the common good of nature is committed to the power that has charge of the commonwealth, for that reason it is not against natural right (ius) that such an act <of entering into marriage> is dissolved by public authority.' (ii 14.20)

On the other hand, Suarez disallows a familiar means of allowing some moral flexibility in the treatment of war. We might say that in war the normal moral rules are suspended, so that the principles that normally determine the legitimacy of (say) killing or expropriation or deception do not guide our actions in this particular area. According to Suarez, nothing about war makes the ordinary precepts of natural law inapplicable. Hence we have to justify belligerent actions by considerations that we can show to be equally legitimate in other contexts.

If we recognize that the requirements of natural law may be complex, we cannot find them without careful attention to cases in which we see the need for some complication. Hence Suarez's view on natural law leads him directly into the discussion of 'cases of conscience'. His discussion of cases related to lying and deception illustrates his general outlook. He argues that cases of equivocation, ambiguity, and mental reservation should not be classified as lying, since those who speak ambiguously or incompletely (with mental reservation) assert what they really believe, though their audience does not take them to assert this.[91] Hence these misleading ways of speaking are not covered by the prohibition against lying (*Iur.* iii 11.4 = *OO* xiv 700b). But Suarez does not infer that they are permissible simply because they are not lies. Even if one says, strictly speaking, what one believes, the use of equivocation and ambiguity is wrong and contrary to the needs of human society, since it undermines the normal basis of communication. It is justified, however, in cases where one's interrogator has no right to ask the questions, and where one would be open to blame for giving an unequivocal answer.[92] If a dangerous armed intruder asks where his intended victim is, we ought to say 'I don't know', meaning 'I don't know anything I am required to tell you about this'.

Suarez does not apply this casuistical argument to purely imaginary cases. English Roman Catholics put it into practice when they were interrogated by a magistrate who (in their view) was asking questions beyond his legitimate authority.[93] The position Suarez defends was widely criticized, and it is an example of the sort of argument that gave casuistry, and especially Jesuit casuistry, a bad name. But the position is easier to dislike than to refute.[94] His permission for equivocation and reservation is carefully restricted. The restrictions are stated in rules that cannot be applied directly to practice without further moral reasoning. He might be criticized because he leaves room for dispute when he introduces 'necessity' and 'just cause'. But is not clear that such criticism would be justified; perhaps moral rules ought to leave room for further moral reasoning and possible dispute.

Suarez's conception of intrinsic goodness explains his attitude to precepts of natural law. Natural law prescribes what is intrinsically good, and therefore what is suitable for rational nature. The requirements of rational nature help us to see some of the qualifications that

[91] *De iuramenti praeceptis* iii 9.2 = *OO* xiv 695a.

[92] 'Still, one must be careful that people do not take from this excessive permission to speak or swear in this way; for that is without doubt contrary to good morals and contrary to the simplicity of speech, if I may so call it, that is necessary for human society. We must, therefore, add that this way of speaking through ambiguity (amphibologia), and especially by speech that is incomplete in the words uttered and in a way (quasi) completed by concepts, is not permitted, unless from some just cause and necessity, and unless otherwise something blameworthy would be done.' (*Iur.* iii 10.10 = *OO* xiv 699b)

[93] See Zagorin, *WL* 182–4.

[94] Kirk, *CP* 205–6, mentions some Protestant casuists who condemn the defence of mental reservation endorsed by Suarez, but do not seem to reject it so absolutely in their own treatment of cases.

are incorporated and understood in the different precepts of the natural law. Since these requirements underlie all the precepts of the natural law, they determine the demands of one precept in the light of the demands of other precepts.

447. Divine Dispensations from the Natural Law?

This discussion of exceptions to general rules shows us how to interpret apparent exceptions so that they are not contrary to principles of natural law, but only contrary to particular formulations of principles. Such an interpretation of apparent exceptions helps Suarez to explain apparent dispensations from natural law.

If it is necessary for God, given the creation of rational creatures, to impose obedience to the principles of natural law because of their intrinsic rightness, God is not free to dispense us from obedience to them.[95] Suarez therefore rejects Scotus' treatment of dispensations. He needs an alternative explanation of the admitted cases in which God either allows or requires someone to violate a common formulation of a precept of natural law; the explanation should show that God does not really dispense from the natural law, because these cases do not really violate natural law. The previous discussion of apparent exceptions to natural law helps Suarez to explain why precepts of the natural law are not subject to God's free will in a way that allows dispensations.

According to Scotus (as Suarez sees, ii 15.8), God cannot dispense us from the natural law, strictly construed; Scotus takes this to extend only to the first table of the Decalogue, from which God cannot dispense us without self-contradiction. God can dispense us, however, from the second table; its precepts are divine positive law that is 'very much in accord' with natural law. Since these precepts are not required by natural law, violation of them is allowed by natural law, and so God is free to dispense us from them.

In reply Suarez argues that the second table of the Decalogue contains the requirements of the natural law in our treatment of other people. We do not vindicate the possibility of dispensations simply by showing that the precepts of the second table, conceived as unqualified prohibitions of action-types described in entirely non-moral terms, have exceptions. The principles of natural law are not unqualified prohibitions of this sort. They declare what is intrinsically right and wrong given certain circumstances, and we need interpretation to find the relevant circumstances. The view that principles of natural law are dispensable, and the view that they are subject to modification by equity (discussed in ii 16) or any human legislation (ii 14), rest on the same error. We fail to understand the immutability of the natural law, if we do not see that it applies to actions in specific circumstances, not to unqualified action types.

Suarez, therefore, rejects an apparently plausible form of argument for dispensations. We might argue that since the natural law forbids killing, but killing is sometimes permissible (ii 15.13), the natural law is dispensable. Suarez replies that the natural law does not forbid

[95] Similarly, no human power can abrogate or dispense from the law of nature; '. . . the natural law, as far as all its precepts go, belongs to the natural properties of human beings. But human beings cannot change the natures of things' (ii 14.8).

all killing; the types of killing it forbids must be decided by interpretation in the light of the fact that all the principles of the natural law aim at promoting good and avoiding evil.

To show that God cannot dispense from observance of the second table of the Decalogue, Suarez argues that apparent dispensations result from a non-legislative action of God. Aquinas argues that the supposition of a dispensation from natural law involves a contradiction, because it requires us to say both that the action is due (debitum), as required by the natural law, and that it is not due, insofar as God's dispensation permits us not to do it.[96] His opponents argue that this argument simply assumes that God cannot dispense; for that is the only basis for the claim that the action we are dispensed from is still a duty. Since the question is about whether God can dispense. Aquinas simply argues in a circle (ii 15.16–17).

To show that Aquinas does not argue in a circle, Suarez distinguishes two sorts of duty (debitum). One is the duty arising from the law as an effect of it. If this were the only duty in question, Aquinas would be arguing in a circle. But that is not all Aquinas means by saying that we still have a duty to do the action from which God allegedly dispenses us. For he appeals to the duty that follows immediately from the intrinsic proportion between the object and the act compared to correct reason or to rational nature. In this case the action in question is intrinsically right or wrong. Hence the relevant duty is inseparable from the actions themselves, because it is antecedent to any law.[97] Since it is not imposed by any law, God cannot dispense anyone from it, since dispensation can only be from an obligation imposed by a law. In Suarez's terms, God's permission not to fulfil an obligation that God has imposed cannot dispense from a duty that exists independently of divine imposition.[98]

This argument alone does not show that God cannot dispense us from the natural law. It shows only that God's dispensation could not prevent the action from being intrinsically wrong. We might argue that if God dispenses, an action is intrinsically wrong, and hence violates one duty, but is permitted by God, and hence by a second duty, which is an obligation. This solution might seem to be suggested by Suarez's distinction between the two types of duty belonging to the natural law.

Such a solution is unwelcome to Scotus and Biel, who deny that God gives permission for intrinsically wrong actions. Biel, in contrast to Scotus, believes that God is free to permit such actions, and simply decides not to permit them.[99] The solution that allows God to permit intrinsically wrong actions might be more congenial to Ockham, who allows a possible

[96] In §§16–18 ff both Perena and ET translate 'debitum' by 'obligation', giving the impression that Suarez contradicts his normal view about obligation.

[97] 'This duty, however, is inseparable, not because it is not subject to dispensation (for that would be question-begging), but because it is assumed to exist in things themselves intrinsically before every extrinsic law, and therefore, given that the same things remain, it cannot be removed, because it does not depend on any extrinsic will, nor is it anything distinct, but it is a sort of wholly intrinsic mode, or a sort of relation that cannot be prevented, given that the foundation and term <of the relation> is assumed.' (ii 15.18)

[98] 'But granted that we imagine that the prohibition added by the will of God can be removed, still, it is entirely repugnant for what is in its own right and intrinsically bad to cease to be bad, because the nature of a thing cannot be changed. Hence such an action cannot be done freely without being a bad thing and discordant with rational nature, as we showed there from Aristotle and others.' (ii 15.4)

[99] See §379.

conflict between non-positive morality and divine positive morality. But it is difficult to identify non-positive morality, as Ockham conceives it, with intrinsic morality, as Suarez conceives it. For Ockham seems to believe that even non-positive morality expresses the ordered power of God, and so is subject to change within the unqualified power of God. If Suarez were to attribute to God the power to permit intrinsically wrong actions, he would allow a more direct conflict between the will of God and morality than any voluntarist accounts of dispensations have allowed.

Suarez rejects Scotus' view that violations of the moral law could be in accord with natural law. For the natural law prescribes, forbids, and permits actions insofar as they are intrinsically right, wrong, or neither.[100] It would be self-contradictory for the provisions of natural law to be determined both (i) solely by intrinsic right and wrong, and (ii) by God's dispensations.

This argument does not rule out all dispensations. We might argue that God's dispensation does not say that it is in accordance with the natural law to do something intrinsically wrong. It simply says that in this case we do not violate a duty to God if we violate the natural law. Hence the necessary connexion between natural law and intrinsic right and wrong does not show that God cannot dispense from natural law.

To close this loophole for dispensations, Suarez must claim that God necessarily prescribes and prohibits in accordance with intrinsic wrong and right. Hence, since God prescribes obedience to the natural law, God leaves no room for dispensations from it; there would be room for them only if God prescribed obedience to natural law as a positive divine law. In prescribing obedience to a positive law, God does not prescribe or prohibit on any specific basis, and hence it is up to God to change the prescriptions. But in prescribing obedience to the natural law, God prescribes on the basis of intrinsic right and wrong. Hence God would violate the will expressed in prescribing the natural law if God were free to dispense us from its provisions.

Once he has rejected dispensations, Suarez tries to explain the appearance of dispensations. Dispensations embody a legislator's permission to violate the provisions of a law, but God can alter our moral situation without granting dispensations, For God is not only supreme legislator, but also supreme owner (dominus) and supreme judge. Apparent dispensations really result from God's exercise of the powers of an owner or a judge.[101] The standard examples of Abraham and Isaac, the spoiling of the Egyptians, and Hosea are used to illustrate this explanation of apparent dispensations.

Our examination of Suarez's attitude to dispensations shows how far he accepts voluntarism about the will of God and the natural law. He believes that the obligation imposed by the natural law requires a command expressing God's legislative will, but he intends this point to clarify his strict concepts of law and obligation. Though he disagrees with Aquinas on this point, he accepts the further claims of Aquinas that Scotus and Ockham oppose. He claims that actions are intrinsically right and wrong, and hence are the source of duties, apart from any divine command; God necessarily prescribes and forbids these actions because

[100] 'For, as has often been said, the natural law prohibits those things that are bad in their own right, in so far as they are such. And therefore it assumes in the objects or acts themselves an intrinsic duty.' (ii 15.18)

[101] 'Whenever, therefore, God makes permitted an action that by right (ius) of nature appeared to be prohibited, he never does so as a pure legislator, but by using some other power. For that reason he does not dispense.' (ii 15.19)

they are intrinsically right and wrong. Suarez denies, therefore, that morality depends on divine commands.

448. The Natural Law and the Law of Nations

Suarez's exploration of the higher and lower provisions of the natural law leads him into a disagreement with Aquinas over the relation of the 'law' or 'right' (ius) of nations to the natural law. Suarez's views about the extent of law are stricter than Aquinas' views; this is one source of his disagreement with Aquinas about the necessary conditions for the existence of a natural law. Suarez recognizes two distinct sources of the validity of natural law: (1) It is not valid as law unless it expresses the will of the legislator who prescribes it. (2) It is not natural law unless it expresses intrinsic right and wrong. Recognition of different sources of validity also clarifies the status of the law of nations (ius gentium), which belongs to positive law, not to the natural law (*Leg*. ii 19.8). Suarez uses 'law of nations' to refer to two sets of laws: (1) laws common to different nations; and (2) the proper subset of these laws that governs relations between nations. Laws belonging to this second category of the law of nations constitute 'international law', and these include the laws of war.

If the law of nations is positive and not natural, we might infer that all of its provisions owe whatever moral force they have to the fact that they result from some sort of human legislation. If, then, justice in relation to war is a part of the common positive law of nations, different legislation seems to make different kinds of war just and unjust. Suarez, however, qualifies the positive character of the law of nations, by describing it as 'a sort of intermediate' (veluti medium) between natural and civil law (ii 20.10). Though it differs essentially from the natural law, it nonetheless agrees with it on many points (ii 19.1).

Aquinas seems to say, as Suarez acknowledges, that the provisions of the law of nations are conclusions from the higher principles of the law of nature (*ST* 1–2 q95 a4). Indeed, he argues that the provisions of the law of nations are derived from the social nature of human beings. If he is right, the provisions of the law of nations seem to be simply subordinate principles of the natural law, and hence impose duties—with appropriate allowance for circumstances and conditions—in the same way as other subordinate principles do. But if this is what Aquinas means, it is puzzling that he regards the law of nations as positive law; for conclusions from principles of natural law are not merely positive law.

In response to this difficulty in Aquinas, Suarez argues that the law of nations is simply positive law, not part of the natural law (*Leg*. ii 19.3).[102] It is not based on written statues, but on custom (ii 19.6). To explain Aquinas' apparently contrary opinion, Suarez suggests that Aquinas is speaking of 'conclusions' in an extended sense (ii 20.2). Some of the puzzles about Aquinas' position are removed by a distinction he draws when he first distinguishes human positive law from natural law. He says that in this human positive law we can find both conclusions and determinations of natural law. Conclusions have their

[102] The law of nations is positive law; 'The negative precepts of the right of nations do not prohibit something because it is bad in its own right—for that [sc. being bad in its own right] is purely natural. Hence, on the side of human reason, the right of nations does not simply reveal badness, but constitutes it. Therefore, it does not prohibit bad things because they are bad, but by prohibiting makes them bad things.' (ii 19.2)

force from something more than human enactment, whereas determinations rest simply on human enactment.[103] They are enacted, by explicit statute or by custom, as part of positive law.

Aquinas' conception of the law of nations is similar to Suarez's conception of the law of nature, insofar as it has two sources of its 'force' (vigor) and of the duties that it requires. Just as Suarez takes natural law to include a divine command, Aquinas takes the law of nations to require more than derivation from the law of nature; it must also be part of positive law. A conclusion from the law of nature that is not recognized by the common custom of the nations cannot belong to the law of nations.

Suarez draws a somewhat similar distinction in his own account of the law of nations.[104] In the case of civil law, something needs to be done to fulfil the requirements of natural law, but it can be done more than one way, and there is no reason to choose this way over that way (as with the rule of the road), or else the reason for choosing this way of fulfilling the law is quite local, referring to the specific circumstances of a particular people. In the case of the law of nations, however, the reason for having this particular rule is clear from the law of nature and rests on considerations that apply to human beings universally. Though the deduction from natural law is not evident, since the rule is not absolutely necessary for right practices, it still fits nature, and the rule is readily agreed on by all (ii 19.9).

Given Suarez's conception of the subordinate precepts of natural law, the law of nations introduces no dispensations from, or exceptions to, natural law. For natural law specifies what is intrinsically right and in accordance with human nature; if any positive law recognized exceptions to natural law, it would permit intrinsically wrong actions, but these actions cannot be morally justified. Still, the provisions of the law of nations cannot be required by intrinsic rightness and appropriateness to human nature; if they were required, they would be part of natural law.[105]

[103] 'Both <conclusion and determination> therefore, are found in the human law. But things of the first sort are contained in human law not as simply laid down by law, but they have some force from the natural law also. But things of the second sort have their force from human law alone.' (*ST* 1–2 q95 a2)

[104] 'For in civil or private right (ius), a determination takes place either (1) that is merely arbitrary, about which it is said that "what pleased the prince has the force of law", not because his will alone suffices as a reason, but because that determination would be rational, if made in different ways, and often there is no reason why it should be made this way rather than that, and thus it is said to be made by will rather than by reason; or (2) certainly when some special reason intervenes, it is considered in relation to the particular and (so to speak) material circumstances, and thus the determination is more in the circumstances than in the substance. But by the right of nations, precepts are more general, because in them the utility of all nature, and conformity to the first and universal principles of nature, is considered. And for that reason they are called conclusions reached from those <first principles>, because from the power of natural discourse appear at once the suitability and moral utility of such precepts, and this <suitability and moral utility> has led human beings to introduce such moral practices (mores), more by the demand of necessity than by will, as the Emperor Justinian has said.' (ii 20.2)

[105] Suarez rejects some inadequate reasons for distinguishing the law of nations from natural law itself. The mere fact that some provisions of natural law presuppose the existence of human society, or private property, does not make them any less provisions of natural law, since, for the reasons we have seen, the subordinate principles of natural law must include a reference to the relevant circumstances: 'Therefore, in order to distinguish the law of nations from natural law, it is necessary that, even when a given sort of material is presupposed, it does not follow through an evident inference, but through a less certain inference, in such a way that human judgment (arbitrium) and moral expediency (commoditas) rather than necessity, intervene. In my opinion, therefore, we must conclude that the law of nations does not prescribe anything as being from itself necessary for rightness (honestas), nor prohibit anything that is bad in its own right and intrinsically—either <bad> without qualification or <bad> on the supposition of a given state and condition of things . . .' (ii 17.9)

The law of nations, like civil law, differs from natural law because it does not prescribe or forbid something as intrinsically right or wrong.[106] But, in contrast to civil law, it is established by 'custom' or 'practice' (usus, ii 19.1; 6), not by formal acts of legislation. This custom is nonetheless legislative; it does not presuppose that this course of action is intrinsically right, but makes it right because of the custom.[107]

Within this law of nations Suarez distinguishes the laws that different nations have in common for dealing with their internal affairs from those that they have in common for dealing with one another; the latter set of laws constitutes 'the law that all peoples and the different nations ought (debent) to maintain between them' (ii 19.8). Some examples illustrate this international aspect of the law of nations: the immunity of ambassadors; free trade between individuals in different states; the law of war; slavery as a punishment for the defeated side in a war; and truces and treaties of peace.

In these cases, natural reason, seeking to discover the implications of natural law, finds some principles to guide international relations, but it cannot give complete answers.[108] A provision of the law of nations rests on three claims about the law of nature: (1) It is intrinsically right to achieve F. (2) It is equally right to achieve F by doing G or by doing H. (3) It is intrinsically right to make an agreement to do G rather than H or to do H rather than G. None of these three claims is subject to human agreement or decision, but human agreement enters in choosing G rather than H.

In this respect civil law shares the positive character of the law of nations. The preservation of life and health requires some rule of the road. It neither favours driving on the left nor favours driving on the right. But it certainly favours driving on the side that is prescribed by positive law. Once the positive law exists, natural law requires a specific type of action—different in different places (driving on the left in Japan, but on the right in the USA)—that it would not require otherwise. Similarly, natural law does not require the

[106] 'Hence, on the side of human reason, the law of nations does not simply present badness, but constitutes it; and therefore it does not prohibit bad things because they are bad, but by prohibiting them makes them bad.' (ii 19.2)

[107] Circumstantial dependence does not prevent an action from being intrinsically right or wrong; for, as we have seen, Suarez takes intrinsic rightness and wrongness to belong not to action types described without reference to circumstances, but to action types including all the circumstances that are relevant to appropriateness to rational nature. To fall outside the law of nature a precept must include some further uncertainty. This description, taken by itself, might suggest that a precept falls inside or outside natural law because of its degree of certainty. This seems to be a misleading suggestion. We might not be certain whether the good of human society and of rational nature is advanced by supporting the nuclear family or by encouraging communal upbringing of children (as in Plato's *Republic* or in an Israeli kibbutz). But our uncertainty does not by itself make it false that one sort of arrangement is better than the other. If research and experience prove that one arrangement is better, we have not caused it to be required by natural law; it has been required by natural law all along, and we have just discovered that is required. If we take uncertainty to be sufficient to place a precept within positive law, we violate Suarez's claim that no part of the law of nations prescribes what is intrinsically good; for, despite our uncertainty, some precepts might prescribe what is in fact required by natural law. Once we see that Suarez ought not to be relying on mere uncertainty, we can look for a more satisfactory interpretation of his remarks on the role of human judgment.

[108] 'For this reason they [sc. nations] need some law (ius) to rule them and direct them correctly in this sort of communication and association. And although this comes about to a large degree through natural reason, this is not sufficient and immediate on all questions; and so some special laws could be introduced by the practice of these nations. And this is especially so, because the things belonging to this law are few, very close to natural law, and allow a very easy inference from that law, and one that is so useful and so agreeable to nature itself that, granted that there is no evident inference, as being in itself altogether necessary for rightness of conduct, it is still highly appropriate to nature, and in itself acceptable to everyone.' (ii 19.9)

specific institution of immunity for ambassadors, or slavery as a means of punishment. Other means of communication or punishment could have been devised. The established ways are the right ways to communicate or to punish only because of the general agreement that has established the universal or usual practice.

Suarez believes nevertheless that natural law is relevant to the content of the different practices that belong to the law of nations. The unity of the human race implies a natural requirement.[109] Though each state is a complete community in itself, it is nonetheless a member of the moral and political universe, and therefore subject to moral requirements. Natural law is relevant not only because different states need to co-operate for their own advantage, but also because of a prior moral duty derived from mutual love and mercy.

Suarez believes, therefore, that the law of nations is positive law, but closely connected to the provisions of natural law. The provisions of the law of nations are similar to the provisions of the law of nature, insofar as they result from consideration of what is intrinsically right in the relevant circumstances. But since this consideration shows that we need to make an agreement and establish a custom, our conclusion requires us to establish a course of action that is right because it is commanded, not commanded because it is right. Nonetheless, the provisions of the law of nations must conform to natural law.[110] If we correctly judge that both G and H are ways of achieving an intrinsically right result F, the disjunctive requirement of doing either G or H is right. Suarez's point is that neither doing G rather than H nor doing H rather than G can be defended as intrinsically right, but it is right to do one or the other. It is the choice between these two courses of action that is a matter of practice rather than intrinsic rightness.

The law of nations, however, also permits some actions that are contrary to the natural law; for instance, it permits prostitution and a moderate degree of deception in business dealings, even though these actions are evils prohibited by the natural law (ii 20.3). Not every action prohibited by natural law is also prohibited by the law of nations.

How is this claim to be reconciled with the close connexion that Suarez sees between the law of nature and the law of nations? He argues that though the natural law prohibits prostitution, it does not require positive law prohibiting prostitution, but, on the contrary, justifies us in not legislating against prostitution. Hence it is a conclusion from the law of nature that there ought to be no positive law against prostitution; hence the law of nations contains no such positive law. The absence of this positive law does not make the practice of prostitution right. In this case the reasons for refraining from positive legislation appeal to

[109] '. . . the human race, however much divided into different peoples and kingdoms, always has some unity, not only specific, but also, one might say, political and moral; this is indicated by the natural precept of mutual love and mercy, which extends to all people, even to foreigners and to people of every nation. Therefore, granted that any complete state (civitas), either commonwealth or kingdom, is a complete community in itself and consisting of its own members, nonetheless any of them is also a member in a certain way of this universal community, insofar as it relates to the human race. For these communities are never so self-sufficient individually that they have no need of some mutual help, society, and communication, sometimes for their own greater well-being and greater advantage, but also sometimes because of moral necessity and need, as is shown by past practice' (ii 19.9).

[110] '. . . equity and justice must be maintained in the precepts of the law of nations. For this belongs to the character of every law that is a true law, as has been shown above; and the laws that belong to the law of nations are true laws, as has already been explained, and are nearer than civil laws are to natural law; hence it is impossible for them to be contrary to natural equity . . .' (ii 20.3).

the 'fragility and condition of human beings or transactions'.[111] An argument from higher principles of natural law, including the relevant facts about human beings, shows not that these actions are right, but that it is right for positive law to permit them.[112]

This apparent divergence between the law of nations and the law of nature helps to clarify Suarez's position, and to show how he basically agrees with Aquinas. He follows Aquinas in believing that the principles of natural law justify relatively specific conclusions about rules of moral and social behaviour. The positive character of the law of nations does not constitute an objection to this belief about natural law; on the contrary, natural law justifies the existence of the positive law of nations and the ways in which the provisions of the law of nations differ from those of natural law.

449. Natural Law and the Basis of Political Society

Suarez follows Aquinas in believing that a political society (a civitas), no less than smaller social groups, is to be justified by appeal to the law of nature, and, more specifically, to the social nature of human beings.[113] This social nature is the source of our need for positive law (i 3.19–20).[114] Human nature is fulfilled by the different virtues, including justice in relations with other people. The demand for just relations with others is a demand of the law of nature prior to any state or civil law, and the state is needed to fulfil this demand.

Since Suarez derives the state from the law of nature in general, he recognizes no special or overriding claim for self-preservation. He does not suggest, for instance, that the laws of nature incline us towards accepting a state simply because of the dangers and threats to physical security in any condition without a state. They make more specific demands on a state, so that a state does not necessarily fulfil the requirements of the law of nature by ensuring the physical security of its members.

For similar reasons, Suarez does not agree that a state or a government is at liberty to do whatever promotes safety and self-preservation. He takes this view about the liberty of a state to be Machiavelli's view, and he devotes a chapter to refuting it (iii 12). In Suarez's view, Machiavelli wrongly supposes that the preservation of the common weal (res publica) is secured by the preservation of the regime, and that everything promoting this end is to be accepted.[115] This position would be reasonable only if the preservation of a regime could

[111] '. . . this very permission may be so necessary, given the frailty and condition of human beings or transactions, that practically all nations agree in maintaining it' (ii 20.3).

[112] Cf. Melanchthon on toleration of error, §412.

[113] At ii 8.4 Suarez follows Aquinas in tracing different aspects of natural law to different aspects of human nature, living, animal, and rational.

[114] 'For <that necessity of law> is founded on this, that a human being is a sociable animal, demanding by his nature a civil life and communication with other human beings. And for that reason it is necessary that he should live correctly, not only in so far as he is a private person, but also in so far as he is a part of a community.' (i 3.19)

[115] '<According to this view>, the subject matter of the laws is that which serves the political order and its maintenance or increase; and directed towards this end these laws are enacted, whether true rightness is found in them, or only pretended and apparent rightness, by concealing even unjust actions, if they are useful to the temporal commonwealth. This is the teaching of politicians of this age; Machiavelli above all has tried to persuade secular leaders of it. It is founded solely on this claim, that the temporal commonwealth cannot be maintained in any other way.' (iii 12.2)

be given absolute priority over every other demand of natural law. But Suarez's conception of natural law assigns no such absolute priority to the preservation of a particular state, or even to the preservation of one's own life, without regard to the other goods and virtues that natural law maintains.

Suarez's answer relies on the prior validity of natural law and the different duties it imposes. Since these duties include more than the preservation of the state, Machiavelli's position cannot be sustained by appeal to the natural law. And since the natural law is prior to civil law, civil law cannot impose a valid obligation that is contrary to natural law (iii 12.4). Hence Suarez endorses the apostles' view that 'we must obey God rather than human beings' (iii 12.5; *Acts* 5:29).

These features of Suarez's views about political society are worth attention not because they are new, but because they are familiar from Aristotle and Aquinas. His contribution is to make clear their implications in the face of the questions, objections, and alternative views presented in Aquinas' successors, including Suarez's own contemporaries. It is useful to keep them in mind so that we can contrast them with the sharply opposed position of Hobbes, and with the more ambiguous positions of Grotius and Pufendorf.[116]

450. The Law of War as Part of the Law of Nations

It is useful to illustrate some of the more specific applications of Suarez's views about natural law and the law of nations by considering his treatment of the law of war, which is part of the law of nations. An account of the rights and wrongs of war is needed to counter the Machiavellian view that war is simply an instrument of national policy, and hence to be judged simply by its effectiveness.[117] This view ignores the fact that war threatens human welfare. A threat to human welfare constitutes a presumption against war, and hence brings it into the area of natural law.

Nonetheless, questions about the legitimacy of war and of particular practices within war cannot be decided simply by appeal to natural law. For natural law does not require resort to war rather than arbitration.[118] On the contrary: the contending parties ought to submit their

[116] On Suarez's political theory, and especially the role of consent see Sommerville, 'Suarez to Filmer', esp. 534, who argues that Suarez has a more radical constitutionalist view than is sometimes thought. Since Suarez regards the state as essentially aiming at the public good, he argues that it is legitimate for the community to depose a ruler who acts against the public good. A law professing to authorize a ruler to do what he likes, even against the public good, would not meet the conditions of *Leg*. i 6 for being a genuine law, and so citizens could not be obliged to obey it. See also Skinner, *FMPT* ii 158–66; Hamilton, *PTSS* 62; Tuck, *NRT* 56–7.

[117] 'There was an old error current among the Gentiles, who thought that the laws (iura) of nations rested on arms, and that it was permissible to make war simply to acquire reputation and wealth. This view, even from the point of view of natural reason, is most absurd . . . No war can be just unless it relies on a lawful and necessary cause . . . This just and sufficient cause is a serious injury that has been inflicted, and that cannot be punished or compensated in any other way. . . . A war is permissible so that a commonwealth can guard itself against loss. Otherwise war tends against the good of humankind, because of the deaths, loss of property, etc. If then, that <just and sufficient> cause ceases, the justice of the war will also cease.' (*De Bello* 4.1)

[118] We could have formed a practice of always submitting disputes to arbitration and abiding by the results of the arbitration. But war is 'more in agreement with nature' than arbitration by third parties would have been. Presumably Suarez does not mean that it is more in accord with natural law—for in that case it would be part of natural law, not of the law of nations. Probably, then, he means that it is more in accordance with tendencies in human nature. He clarifies

dispute to 'the arbitration of good men' (*De Bello* 6.5).[119] The duty of recourse to arbitration rests on the natural law, and hence on what is appropriate for rational nature. States do not often resort to arbitration, because they are suspicious of the potential arbitrators (6.6). This may be why Suarez maintains that the practice of resort to war is more in accordance with natural law than resort to arbitration would be. But he acknowledges that resort to arbitration, in cases where the arbitrators are not open to suspicion, is better than resort to war.

For similar reasons, Suarez believes that war is needed for the punishment of injuries.[120] Different states do not agree in acknowledging experts who are sufficiently wise and impartial to find the right solution to their disputes; nor do they recognize any common authority with the right and the power to enforce such a solution. Hence each state is both advocate and judge in its own cause.[121] But though a state cannot normally resort to an independent arbitrator in the confidence that the other party to the dispute will accept the result of arbitration, it is nonetheless required to inquire carefully by consulting 'prudent and learned' advisers (6.6).

Suarez allows defensive war to prevent our being victims of aggression. He also allows aggressive war (1.6), in cases where we are not being attacked by another, in order to punish another state for infliction of an injury, if the other state is not willing to give just satisfaction for the injury (4.5).

In these grounds for war Suarez gives no permission for pre-emptive strikes against an enemy. One might argue that they are covered by the right of self-defence in cases where one can be appropriately certain that an attack is imminent, rather than simply believing that the other side is dangerous. The only other ground that he recognizes besides self-defence is punitive. A pre-emptive punitive attack would constitute an attempt to prevent a prospective wrongdoing.

this point in his discussion of the certainty required about the justice of a cause of war: '. . . the law of war, in so far as it is founded on the power possessed by one commonwealth or a supreme monarchy either for punishment and retribution or for reparation for the injury inflicted on itself by a second <state>, seems properly to belong to the law of nations. For from the force of rational nature alone it was not necessary for this power to lie in the commonwealth that suffered the injury; for human beings could have set up another means of retribution, or committed this power to some third ruler as a sort of arbitrator with power to coerce. Still, because the present way <of exacting retribution> that is now followed is easier, and more in agreement with nature, it has been introduced by custom, and is just in such a way that it cannot be lawfully resisted' (*Leg.* ii 19.8).

[119] 'For they are required to avoid war by morally right (honesta) means, as far as they can. Therefore, if no danger of injustice is to be feared, this [sc. arbitration] is the best means, and hence is to be embraced. This opinion is confirmed. For it is impossible that the author of nature should have left human affairs, which are more often governed by conjectures than by certain reason, in such a state that all disputes between supreme rulers and between commonwealths had to be ended only through war. For that is contrary to prudence and to the common good of humankind, and therefore contrary to justice. Moreover in that case the more powerful side would, according to rule (regulariter), have the greater right (ius), and to that extent the right would have to be measured by arms, which is quite clearly barbarous and absurd.' (*De Bello* 6.5)

[120] '. . . just as within a commonwealth some lawful power to punish crimes is necessary to the preservation of peace, so also in the world as a whole, so that different commonwealths may live in peace, some power is necessary for the punishing of injuries inflicted by one on another. But this power is not present in any superior, because they have none, as we assume. Hence it must be present in the supreme ruler of the injured commonwealth, to whom another ruler is subject because of the crime. Hence a war of this sort was introduced in place of a court assigning just punishment' (4.5).

[121] 'The cause is simply that this act of punitive justice was necessary for humankind, and, naturally and in the human way, no more suitable means could be given, especially because we must anticipate, before the war, the contumacy of the offending party, refusing to give satisfaction—for in that case <the offending party> has only himself to blame if he is subject to the one whom he has offended.' (4.7)

Suarez rejects such attempts. He discusses the justice of killing enemy non-combatants who might be capable of bearing arms and who might renew a war. He argues that this practice is no more justified than pre-emptive punishment would be within a state.[122] Similarly, pre-emptive war would have to be aimed against injustice that is not imminent, but merely prospective. A purely judicial and punitive rationale for aggressive war does not support a war that would violate the ordinary restrictions on punishment.

Is it unreasonably narrow of Suarez to consider only a punitive justification for aggressive war? Should he not also consider a preventive justification? One might argue that in a public health emergency we would be justified in isolating the carriers of a disease, in order to protect other people, even though we might thereby reduce the victims' chances of recovery. Could we not offer the same sort of defence for an aggressive war? Perhaps the enemy is not yet guilty of any specific violation, but we are protecting more innocent people from the danger presented by the enemy.

To see how Suarez might answer this objection and defend his narrow justification for aggressive war, we may consider his views about the threshold for any justifiable war. He sees a presumption against war that needs to be overcome.[123] Since it is certain in advance that a war involves great evils, a justification for a war must offer a sufficient degree of practical confidence that it is necessary for the avoidance of still greater evils. Suarez rejects the demand for complete 'moral certainty' (4.10), but still demands 'the maximum certainty that he [sc. the ruler] can obtain'.

These demands on a legitimate cause of war make it difficult to see how a purely pre-emptive war to avoid a prospective injury could be justified. We have strong reasons for avoiding punishment for merely prospective offences. Given these strong reasons, in addition to the admitted evils involved in war, the credible threat of punitive aggression is preferable to pre-emptive aggression. This is why we do not imprison or punish people simply as a pre-emptive measure.

451. Sedition and Rebellion

Suarez does not believe that war between sovereign states involves the suspension of ordinary moral principles. He therefore argues that the same principles apply to violent conflict within a state. In his view, this is justified within the moral limits that also apply to wars between states. The obligation of obedience and non-resistance to a sovereign is limited; Suarez even defends rebellion and tyrannicide in some circumstances. This aspect of his views did not make Suarez popular in England or France in the early 17th century.[124]

[122] '... no one may be punished for a prospective sin, if he does not otherwise deserve death, especially because that presumption <of prospective sin> does not seem sufficient for killing human beings, since especially in a criminal trial there ought to be sufficient proofs, and rather <than being presumed guilty> he who is not proved guilty is presumed to be innocent' (7.16).

[123] '... while a war is not in itself evil, nevertheless, on account of the many disadvantages that it brings with it, it is one of those undertakings that are often executed in an evil way. And that is why it also needs many circumstances to make it right' (1.7).

[124] On the reception of Suarez's *DFC* in England and France, see De Scorraille, *FS* ii 189–216. The book was burnt at St Paul's Cross; it was also condemned by the Parlement of Paris and burnt. James I required William Talbort to say

An aggressive war against the ruler of one's own state is justifiable in the appropriate circumstances, if it meets the normal conditions for a just war. Suarez takes it to be obvious that defence against injury by the ruler is justified. He takes it to be easy to justify aggressive action against a tyrant who has no just claim to be the ruler (8.2). It is more difficult to justify aggression against a second kind of tyrant—a ruler who has a just claim to be ruler, but abuses his power and acts unjustly. In this case Suarez holds that individuals have no right to take aggressive action. He relies on the general principle that the common good requires that only a sovereign should have the authority to attack a sovereign (8.2). But in some cases the whole commonwealth (respublica) has the right of revolt against a legitimate ruler acting tyrannically.[125] If the ruler is clearly behaving tyrannically, the commonwealth as a whole has the right to exercise the power that it retained when it made him the ruler. The commonwealth gave him this right and power on the condition of ruling 'politically'.[126]

Natural law requires some sort of government because it requires the promotion of the common good. Since human beings have a common good, and since the uncoordinated actions of individuals do not achieve the common good, some special provision for it is needed.[127] Though individual human beings are not naturally subject to political rule, they are naturally 'subjectible' (subiicibilis) to it (*Leg*. iii 1.11). The role for human agreement is similar to the role we have already discussed in the law of nations. Natural law does not impose a government independently of human agreement; but it requires us (in normal conditions) to agree to set up a government, and therefore requires us to obey it once we have set it up.

But who are the 'we' who set up a government? In Suarez's view, the legislative power belongs directly to a 'collection' of human beings. It cannot belong to an individual or group unless the 'community' to which it originally belongs has transferred it (iii 2.3). This account might appear to assume the very fact it is supposed to explain. For it seems to assume that some sort of human community is the body that makes the agreement to set up a ruler. But how can we have a community capable of making such an agreement unless we already have a political community with some sort of ruler?

Suarez answers this objection by distinguishing two ways of looking at human beings without government. We can consider them as a mere 'aggregate' (aggregatum quoddam) of individuals with their individual concerns. No legislative power is proper to this collection

what he thought of Suarez's views on the obligations of the subjects of a tyrant deposed by the Pope, before he released him from the Tower. When Talbort did not condemn it, he was given life imprisonment. When John Ogilvie, a Scottish Jesuit, was interrogated, he was also asked to denounce Suarez's views, and refused to do so.

[125] 'The reason is that in this case the whole commonwealth is superior to the king; for since it gave him power, it is regarded as having given it on the condition that he would rule politically, not tyrannically, and if he did not, he could be deposed by the commonwealth.' (8.2)

[126] We might suppose that the ruler is established by a real or implied agreement that requires him to observe the laws and constitution, and that this observance constitutes ruling politically. Suarez, however, does not explain the relation between the ruler and the people in this way.

[127] 'For each individual member has a care for its individual advantage, and these are often opposed to the common good. And sometimes many things are necessary for the common good, which do not belong in the same way to individuals; and though they may at times belong to an individual, he provides for them not because they are common, but because they are proper to him. Therefore in a complete community, a public power is necessary to which it belongs as a matter of duty (ex officio) to aim at and to provide for the common good.' (*Leg*. iii 1.5)

of human beings; they have only the root of it (quasi radicaliter, iii 2.4). We must consider them in another way, so that even without an actual government, a group of people may form a single political community and 'mystical body'.[128] To form a single body, people need not individually want to set up a government, and they need not make a promise or agreement to set it up. Suarez assumes a less specific shared desire and aim. The human good requires promotion of a common good, and hence requires some agent with the specific task of promoting it. Insofar as human beings recognize a common good, and will an effective means of promoting it, they have a common will that makes a single community.

This common will makes it reasonable for them to agree on constituting some agent with the specific task of promoting the common good. This is the 'special will or common consent' that makes a single political body, and hence makes a body capable of placing its legislative power in some agent with the special task of promoting the common good. Common consent is not necessarily explicit consent to a particular ruler or regime. Suarez does not take such consent to be necessary for a legitimate ruler. He allows tacit or presumed consent, to explain why a ruler who initially rules by tyrannical force may in time acquire legitimate legislative power (iii 4.4). In the case of conquest through a just war, the subject people are required (tenetur) to obey their new ruler. In this case also, according to Suarez, we can see consent, either explicit or owed (debitum, 4.4).

Suarez does not recognize the validity of any complete and unconditional transfer of legislative power to a ruler. Breach of the conditions on which power has been transferred is a justification for the community—in contrast to a private individual—to rebel against a ruler.[129] Even if James VI and I—Suarez's immediate target—could persuade the English people, freely and without coercion, to agree to a complete and unconditional transfer of legislative power, such an agreement would not be binding. If it is not invalid because of ignorance or coercion, it still fails to bind, because it is unjust.

To see why any such agreement would be unjust, and therefore could not cancel the exception that is always understood in any transference of power, we need to return to the sort of common consent that Suarez takes to be the basis of legislative power. The common consent was consent to the promotion of the common good that needs to be promoted by an agent with this specific task. This common consent is justified by appeal to natural law, because it aims at the common good. Any agreement that violated the necessary conditions for a legislative power aiming at the common good would violate the initial common consent. Even if it could obtain actual consent, this would not matter, because such consent would be contrary to the natural law. The aspect of the natural law that is

[128] 'A multitude of human beings should therefore be considered in another way in so far as they are gathered together by a special will or common consent into one political body by one bond of association (societas), and in order to give one another help directed to a single political end. In this way they make one mystical body that can be said, from a moral point of view, to be one in its own right; and this body therefore needs a single head'. (iii 2.4)

[129] 'If, then, a lawful ruler is ruling tyrannically, and if the kingdom has available no other remedy for defending itself, except the expulsion and deposition of the king, the whole commonwealth, acting on the public and common advice of the cities and leaders, will be allowed to depose him. This is true both by virtue of natural law, by which it is permissible to repel force with force, and also because this situation, needed for the preservation of the commonwealth itself, is always understood to be excepted in that first agreement by which the commonwealth transferred its power to the king.' (*DFC* vi 4.15)

relevant is intrinsic morality, specifying what is suitable for rational and social agents. Suarez's naturalism about morality informs not only his meta-ethics, but also the concrete applications of his moral theory to political questions.

To grasp the role of common consent, we should look more closely at what the political community gives to the ruler. One might expect Suarez to argue that, since the original legislative power belongs to the political community as a whole, and not to any specific government, the government is simply an agent or delegate of the community, and therefore subject to dismissal at the discretion of the people. Suarez, however, denies that all legislative power is delegated by the people. He argues that the community can give away its legislative power to a government, so that the government is not necessarily bound by its own laws, and does not need to seek the continued approval of the community. In such a case the ruler has 'ordinary' power, and not merely 'delegated' power (4.9), and hence the ruler is entitled to delegate power to a subordinate without any special permission from the community.

On this point, Suarez rejects one element of democratic theory; he does not take the moral basis of political society and government to require a conception of legislative power as delegation. But his claims about the transfer of legislative power do not lead him to conclude that the common consent of the community becomes irrelevant once it has established a ruler with ordinary power. A hereditary ruler, for instance, inherits ordinary power together with the conditions on which the ordinary power was originally transferred (4.3). A community cannot transfer legislative power unconditionally; hence it cannot irrevocably abandon any power to restrain or to replace its rulers.

452. The Separation of Morality from Natural Law

Our discussion suggests that Suarez does not differ from Aquinas in any essential point about the nature and basis of morality. His disagreement about the role of divine commands in the natural law does not affect his view about the moral foundation of the natural law, and, in particular, does not lead him to maintain that morality depends on divine commands. In claiming that moral goodness is fixed by rational nature, he follows Aquinas' naturalism. Moreover, in claiming that we are rationally concerned about moral goodness because we aim at our ultimate end, and our ultimate end is realizing our rational nature, he accepts Aquinas' combination of eudaemonism with naturalism. On these basic points, then, he is a traditional moralist, insofar as he stands in the tradition that includes Aquinas. The naturalist and eudaemonist aspects of his conception of goodness and rightness, as opposed to the voluntarist aspects of his conception of natural law, are the essential features of his theory of morality.

We can sum up some of the specific points we have discussed about Suarez by considering the sense in which he is a 'natural-law theorist'. He is clearly a natural-law theorist in the straightforward sense of believing in natural law. One might also say that he is a natural-law theorist to a greater degree than Aquinas and Scotus are, since he has more to say about it, and in particular has a more precise account of what makes it genuine law. It does not follow, however, that natural law is theoretically more important or basic in Suarez, or

that his conception of it radically changes the character of his moral theory. The length of his treatment reflects the controversy among Aquinas' successors about the character of natural law and its relation to divine freewill and divine commands. Suarez has to deal with articulated options that do not confront Aquinas.

His examination of the issues about natural law results in some major differences from Aquinas. His view that law and obligation rest on command and on will partly reflects his disagreement with Aquinas about the relation of command to will and to intellect. This disagreement helps to explain Suarez's relatively narrow conception of law, in contrast to Aquinas' view that our share in divine providence also gives us a grasp of divine law.

In moral philosophy, however, Suarez does not take natural law to be theoretically fundamental. His imperative conception of natural law as requiring divine commands is not intended to show that morality requires divine commands. He distinguishes morality, which is independent of divine commands, from natural law, which depends on them. He is not a 'natural-law theorist', if such a theorist gives theoretical priority to natural law in an account of morality. His elaborate discussion of natural law really has the opposite effect. For since he believes that natural law essentially depends on divine commands, and that moral right and wrong do not essentially depend on divine commands, he believes that moral right and wrong do not essentially depend on natural law, but are prior to it. He rejects the view, shared by Aquinas and Scotus, that natural law is essential to morality.

To describe his position in this way is to give a misleading impression of the substantive differences between Suarez's views and the naturalist views of his predecessors. In describing morality he includes the features that Aquinas ascribes to the natural law, and so he retains Aquinas' view of the metaphysical status of morality and of its independence of divine commands. He differs from Aquinas in concluding that morality is also independent of natural law, given his conception of law.

One of the most plausible parts of Suarez's argument about law is his account of the distinctive moral relation that is introduced by law, as he understands it. He recognizes that there is a difference between the sort of reason for actions that is given by facts about rational agents in their circumstances and the sort that is derived more directly from the expression of the will of other rational agents. Law introduces a new moral requirement based on the will of an authority, and not only on the recognition of some moral fact that is prior to any expression of will. We recognize the distinct sort of reason that is derived from law if we recognize that the expression of the will of another person in an appropriately authoritative position gives me a further reason to act, beyond the specific content of that other person's will. Suarez argues that God is a legislator in this sense, and that therefore a further set of moral reasons results from his legislation.

Clarity on this point about the reasons derived from law makes the non-legal character of morality clearer to Suarez. He distinguishes natural law from its basis in intrinsic morality, so that we can both see the distinctive moral reason introduced by law and see the moral reasons that are independent of, but presupposed by, the obligation introduced by law. He therefore emphasizes the natural basis of intrinsic morality no less strongly than he emphasizes the character of imposed obligation. All obligation requires an imposer, whereas morality requires no imposer. On this last point Suarez agrees, as he claims, with Aquinas; but since he distinguishes natural morality from non-natural imposition more explicitly than

Aquinas does, the purely natural character of intrinsic morality appears more sharply in Suarez than in Aquinas.

We would misinterpret Suarez, therefore, if we took him to hold that natural law, as he conceives it, is necessary for morality. Such a misinterpretation would distort his most important claims about the natural status of morality. As we will see, however, some of his early readers misinterpreted his views in just this way.[130]

[130] Mahoney, *MMT* 227, describing Suarez's place in the history of moral theology, attributes to him a voluntarist 'view of morality as expressed predominantly in terms of law and the centrality of the will'. See also §461.

32

NATURAL LAW AND 'MODERN' MORAL PHILOSOPHY

453. The Modern Theory of Natural Law

The mid-17th century is often taken to mark the beginning of 'modern' philosophy, because of Descartes's attack on his Scholastic predecessors. Since this is also the period of the 'Scientific Revolution' and of the emergence of the modern nation-state, it would be satisfying (to some historians) to find a similarly sharp break in the history of moral philosophy. This desire to see the origin of a new age in the 17th century is shared by some 17th and 18th-century writers. Hobbes takes himself to turn away from the errors of the 'old moral philosophers' by explaining the virtues as ways of fulfilling natural law. He is not alone in supposing that moral philosophers have taken a new direction by identifying moral philosophy with the study of natural law.

This is why some later writers recognize Hobbes and Grotius as their predecessors. Cumberland mentions Grotius as the first significant writer on natural law.[1] Pufendorf agrees with him; he discusses Grotius in detail and does not bother with writers between antiquity and the 17th century. In his essay 'On the origin and progress of the discipline of natural law', he suggests that no one before Grotius had accurately distinguished natural from positive law.[2] In his view, the Scholastics were too confined by excessive esteem for Aristotle, and so did not add much to the scattered remarks of the ancient philosophers on natural law.[3]

Perhaps Barbeyrac does most to form the view that the modern age in moral theory begins with Grotius' account of natural law. He translated both Grotius and Pufendorf into French, and his valuable notes to the translations were also included in English versions.[4] These notes discuss modern views of natural law, and try to harmonize the views of Grotius

[1] See §530. [2] See Pufendorf, *ES*, ch.1 §1 = *GW* v 123.10–12.

[3] *ES*, ch.1 §4 = *GW* v 125.34–126.6. The index to ET of *JNG* contains no references to Suarez or Aquinas, though some to Vasquez. On Pufendorf's tendency to ignore Spanish Scholastic sources see Simons, 'Introduction' 16a. In *ES* Pufendorf discusses an argument for naturalism by Zentgraf, who cites Suarez in his support; see *GW* v 209.19–30. He remarks that for Zentgraf the name of Suarez is 'par Apostolis nomen'. Zentgraf was a Lutheran theologian; on his critique of Pufendorf see Palladini, *DSSP* 217–21. Chroust, 'Grotius', attacks Pufendorf's estimate of the originality of Grotius and his low estimate of mediaeval philosophy.

[4] Barbeyrac's notes appear in Whewell's edn. of Grotius, and in Kennett's translation of Pufendorf. See Tuck, *NRT* 73n, 160n.

and Pufendorf. Barbeyrac defends the position of Pufendorf against Leibniz's attack.[5] He also defends Pufendorf's conception of natural law through a selective history of moral philosophy that presents Grotius as a pioneer.[6]

In Barbeyrac's view, Bacon inspired Grotius to set moral theory on a new footing based on natural law. By appealing to natural law Grotius 'broke the ice' in moral philosophy. Melanchthon failed to anticipate Grotius, because he was too confined by Scholastic views to make the advance that Grotius made.[7] These Scholastic views are so deeply infected by falsehood that Barbeyrac, like Pufendorf, does not think it worthwhile to try to separate the true elements in them, or even to give an account of their main errors.[8] The honour of emancipating moral philosophy from Scholasticism belongs to Grotius—with certain qualifications to be examined later.[9]

Barbeyrac's view has been taken seriously as a correct estimate of the radical and innovative character of Grotius' and Pufendorf's moral theory in comparison with their predecessors, both the mediaeval Scholastics and the Protestant and Roman moralists of the 16th century. If he is right, these 17th-century theorists of natural law need to be examined, to see where they differ from their predecessors, and whether the differences are improvements.

But while many later critics have agreed with Barbeyrac in treating Grotius as a pioneer, and in taking modern moral philosophy to begin with Grotius, they have not all agreed with him about what makes Grotius a pioneer. In fact, later critics who disagree sharply with Barbeyrac and with one another about what is distinctive of modern moral philosophy have claimed that this distinctive feature begins with Grotius. If they are all right about Grotius, Grotius' position is internally inconsistent. And if they are all right about modern moral philosophy, its distinctive features are inconsistent.

To understand these different claims about Grotius and about modern moral philosophy, we should begin with Barbeyrac, and see how his view compares with other views.

[5] On Leibniz see §591.

[6] Barbeyrac's 'Morality' appeared in the 1706 edn. of his translation of Pufendorf's *JNG*. See Tuck, *NRT* 174–7; Hochstrasser, 'Conscience', esp. 294 on Barbeyrac's history of moral philosophy (underestimating the degree of Barbeyrac's commitment to voluntarism). Hochstrasser, *NLTEE* 11–18, discusses other histories of morals that emphasize modern natural law.

[7] 'Tis pretended, that Melanchthon had already given a sketch of something of this kind [sc. a system of the law of nature], in his Ethics; and they tell us too of one Benedict Winckler, who published in 1615 a book intitled Principia Iuris; wherein he entirely departs from the method of the Schoolmen; and maintains against them, amongst other things; that the will of God is the very fountain and foundation of all justice. But 'tis acknowledged that the latter of these two often confounds the law of nature with that which is positive: And that neither the one, nor the other has afforded any more than a small gleam of light; not sufficient to dissipate those thick clouds of darkness, in which the world had been so long inveloped. Besides, Melanchthon was too much prepossessed in favour of the Peripatetic philosophy, ever to make any great progress in the knowledge of the true fundamental principles of the law of nature, and the right method of explaining that science. Grotius therefore ought to be regarded, as the first who broke the ice.' ('Morality', 79) On Melanchthon cf. Stewart, quoted in §462.

[8] 'From thence [sc. the Peripatetic philosophy] sprang the scholastic philosophy, which spread itself all over Europe, and with its barbarous cant became even more prejudicial to religion and morality, than to the speculative sciences. The ethics of the Schoolmen is a piece of patchwork; a confused collection, without any order, or fixed principles; a medley of divers thoughts and sentences out of Aristotle, civil and canon law, Scripture, and the Fathers. Both good and bad lie there jumbled together; but so as there is more of the latter, than the former. The casuists of the succeeding centuries, made it their sole business to out-do their predecessors, in broaching of vain subtilties; nay, what is worse, monstrous and abominable errors, as all the world knows. But let us pass by these unhappy times; that we may at length come to that age, where in the science of morality was, if I may so say, raised again from the dead.' (79)

[9] On the limitations of Grotius see §463.

454. Barbeyrac's View of Grotius

Barbeyrac examines Grotius and Pufendorf in comparison with Hobbes. Though he praises Hobbes, he also attacks him for treating self-interest as the only basis of society. This is the main flaw in *De Cive*.[10] In the *Leviathan*, according to Barbeyrac, Hobbes goes even further, making the sovereign the basis of morality and religion.[11] Barbeyrac shares Pufendorf's concern to distinguish natural law theory from Hobbes's position. According to Hobbes, the content of natural law, independent of divine or human legislation, consists of the demands of self-interest. Barbeyrac wants to show that Grotius and Pufendorf offer more than this minimal Hobbesian content.

Barbeyrac's estimate of Grotius may usefully be compared with Gershom Carmichael's opinion. Carmichael agrees that Grotius is important, because he gave a lead in the discussion of natural law.[12] Carmichael excludes Selden and Hobbes from those who followed Grotius' lead. Selden relies on the Noachite precepts, and hence on divine positive law, not on natural law, while Hobbes corrupts the study of natural law.[13] Carmichael agrees with Barbeyrac in treating Grotius and Pufendorf as exponents of the same doctrine. He does not discuss the apparent differences that occupy Barbeyrac; in particular, he does not discuss questions about naturalism and voluntarism.[14]

But Carmichael does not seem to agree with Barbeyrac about why Grotius and Pufendorf are important. He regards the modern treatment of natural law as the true successor, in moral philosophy, of Scholastic ethics. It rightly omits irrelevant elements in Scholastic treatments, including those parts of theology that are known only by revelation (viii). Carmichael seems to suggest, therefore, that the originality of modern treatments of natural law is not primarily any novelty in doctrine, but the clear separation of moral philosophy from other disciplines.

To see whether Barbeyrac or Carmichael is right, we need to compare these modern moralists with the Scholastics. Barbeyrac's claim on behalf of Grotius is initially puzzling, since neither Grotius nor Melanchthon was the first to treat the theory of natural law as a part of

[10] '. . . he endeavours to establish, and that too in the geometrical method, the hypothesis of Epicurus, which makes self-preservation and self-interest, to be the original causes of civil society' ('Morality' 88).

[11] 'That the will of the sovereign alone constitutes, not only what we call just and unjust, but even religion also; and that no divine revelation can bind the conscience, till the authority, or rather caprice, of his Leviathan; that is, of the supreme arbitrary power, to which he attributes the government of every civil society; has given it the force of a law.' ('Morality' §29, p. 66)

[12] 'After the ancients moral philosophy was neglected for many centuries, until the work of the incomparable Hugo Grotius, who gave the lead for others to follow.' (Carmichael, *PDOH* vi) Cf. Moore and Silverthorne, 9–10: '. . . Moral science . . . had been most highly esteemed by the wisest of the ancients, who devoted themselves to its study with great care. It then lay burdened under debris, together with almost all the other noble arts, until . . . it was restored to more than its pristine splendour (at least in that part of moral science which concerns the mutual duties of men . . .) by the incomparable Hugo Grotius. . . . For more than fifty years scholars more or less confined their studies within the limits set by Grotius . . . But then that most distinguished man Samuel Pufendorf, . . . by arranging the material in the work of Grotius in a more convenient order and by adding what seemed to be missing from it to make the discipline of morals complete, he produced a more perfect system of morals.'

[13] [Hobbes] 'iuris naturalis disciplinam non illustrare instituit, sed corrumpere' (*PDOH* vi). Barbeyrac offers a similar explanation for Selden's failure, despite his merits, to eclipse Grotius; 'he derives not the principles of the law of nature from the pure dictates of reason', but from the Noachite principles, relying uncritically on tradition (80).

[14] The chapter 'On lasting happiness and the divine law' (Suppl. 1 = M&S 21–9) claims that morality expresses divine commands, but it does not say that it essentially expresses divine commands. Though Carmichael knows Suarez (see M&S 41n), he does not discuss the questions that Suarez discusses about voluntarism.

moral philosophy. Natural law is a standard element of Scholastic moral philosophy; Aquinas and his successors discuss natural law in their accounts of law, morality, the Decalogue, and the moral precepts of the Gospel. We have considered the careful reflexions of Suarez on this Scholastic tradition. Since Barbeyrac does not bother to discuss Scholastic views of natural law, he does not say how Grotius' view differs from Scholastic views. But if Grotius is an innovator, we ought to find some major point on which he departs from the Scholastic views.

455. The Fundamental Status of Natural Law

To explore possible defences of Barbeyrac's claim, we might consider different ways of understanding the place of natural law within morality. Moral theories differ according to their views about which aspect of morality is theoretically fundamental and which aspects can be derived from which. Hence one might recognize natural law as an aspect of morality without being a natural-law moralist, if one does not treat morality as primarily and fundamentally natural law. Perhaps, then, Barbeyrac might claim that Grotius is the first to make natural law primary and to reduce other aspects of morality to features of natural law. If Grotius does this, he is the first natural-law moralist.

One might support Barbeyrac by observing that, though the natural law is prominent and important in Aquinas and in his naturalist and voluntarist successors, it is not primary. The *Prima Secundae* begins not with the natural law, but with the ultimate end. Law, including natural law, is introduced only after the discussion of human actions, passions, states, virtues, and sins. It takes us from the sinful condition of human beings to the infusion of virtues that comes from grace. Suarez also places his treatise on law in this sequence; it is 'on God the legislator', in contrast to the treatise on grace 'on God the justifier'.[15]

In one respect, the principles and precepts of natural law are fundamental. In Aquinas' theory, three apparently distinct basic principles are identified: (1) Universal conscience, grasping the ultimate principles from which prudence deliberates. (2) Natural law. (3) Happiness as the ultimate end. They are connected because universal conscience grasps the basic principles of natural law, which enjoin the pursuit of one's ultimate good. Within Aquinas' theory, then, the principles of natural law provide the starting points for prudence; the conclusions of universal prudence are the ends characteristic of the various virtues.

In assigning this basic status to natural law, however, Aquinas does not make it prior to his teleological argument from the final good and human action to the virtues. On the contrary, the argument from the basic principles of natural law just is this teleological argument. The introduction of natural law provides a new description of the argument that has already been given; it does not provide a different sort of argument, let alone an argument for different conclusions. Aquinas' explanation of natural law implies that facts about rational nature are the basis of the precepts of natural law. If we take natural law just to consist in these facts, natural law is not prior to facts about rational nature.

Different questions arise about the place of natural law in Scholastic theories that reject either Aquinas' eudaemonism, or his belief in intrinsic morality (as Suarez calls it), or both.

[15] See §302n7; Aquinas, *ST* 1–2 q90 pref.; Suarez, Preface to 'Tractatus de gratia Dei, seu de Deo Salvatore, iustificatore, et liberi arbitrii adiutore per gratiam suam', *OO* vii, p. viii.

Scotus rejects eudaemonism, and takes the affection for justice to be separate from the natural pursuit of happiness. He recognizes intrinsic morality consisting in the precepts of the first table of the Decalogue; these are natural law, strictly speaking, and do not depend on the free will of God. The greater part of morality is strictly only 'highly consonant' with natural law, and is part of divine positive law. Ockham asserts a closer dependence of morality on God's free choice. Both non-positive and positive morality reflect God's choice in different ways. In his theological works Ockham does not identify either of them with the provisions of natural law. Remarks in his political works show that he recognizes natural law; but he does not suggest that belonging to natural law is the crucial test of morality.

Aquinas and his successors, therefore, do not seem to be natural-law moralists. Though they take the precepts of natural law to include fundamental moral principles, they do not take moral facts to be reducible to facts about natural law. On the contrary, Aquinas takes facts about natural law to consist in those facts about rational nature that underlie his account of the virtues.[16] Some of these questions about the status of natural law are obscure because of Aquinas' rather broad conception of law. Since he believes that natural law exists if we are guided by rational principles, it is easy for him to believe in natural law; if there are virtues of the kind Aquinas describes, their principles belong to natural law. From this point of view, it is difficult to see how natural law could be primary in morality.[17]

Different questions arise, however, from Suarez's account of law. Since he takes law to require commands and acts of legislation, he takes natural law to require divine commands imposing obligations (in his narrow sense). Relying on this conception of natural law, he argues that natural law is not primary in morality. Natural law presupposes intrinsic morality, which consists in appropriateness to rational nature. Though the duties that belong to intrinsic morality coincide with the precepts of natural law, their place in natural law is not essential to their being part of intrinsic morality. Suarez, therefore, is not a natural-law moralist.

Barbeyrac would have a plausible case, therefore, for his view that modern moralists are innovators, if he could show that they take morality to consist essentially in principles of natural law, as Suarez understands it. On this view, we have no morality without divine commands and acts of legislation that prescribe actions in accord with nature. Such a view rejects both the strong theological voluntarism that identifies morality with divine positive law and the naturalist view that takes commands and legislation to be inessential to morality. Barbeyrac would vindicate his claim if he could show that Grotius and his successors hold

[16] Haakonssen, *NLMP* 15, understands a natural-law moralist as one who engages in the 'attempt to understand morality in the legalistic terms of a natural law'. We attribute a natural-law theory in this strong sense to Aquinas, for instance, if we agree that 'for him, the virtues are basically habits of obedience to laws' (Schneewind, *IA* 20). See §315.

[17] Schneewind, 'Misfortunes' 44–6, argues that emphasis on natural law results from scepticism about virtues and from the reductive project of treating all moral requirements as fundamentally required by rules and laws. The evidence that he offers to show that Christian moralists or moralists who believe in natural law generally endorse this reductive project is not completely convincing. One might agree (as Aristotle agrees) that the requirements of general justice embrace the requirements of all the virtues, and (as Aquinas agrees) that natural law prescribes the actions that accord with all the virtues, without agreeing that the virtues consist fundamentally in tendencies to obey rules. To illustrate his claim Schneewind quotes a passage from William Perkins: 'Universal justice is the practice of all virtue: of that whereby a man observes all the commandments of the Law'. But this passage (recalling Aristotle, Aquinas, and St Paul) does not say what is theoretically fundamental. Schneewind's quotation from Locke, *EHU* ii 28.14, is apposite; but Locke holds a legislative conception of morality (explained in the context), which does not follow from a belief in natural law.

this view about morality as natural law. We will have to see what conception of natural law he relies on in claiming that Grotius and his successors are natural-law moralists.

456. Sidgwick: A Jural Conception of Ethics

It is useful to compare Barbeyrac's interpretation of Grotius and his successors with Sidgwick's description of modern moral philosophy. Sidgwick agrees with Barbeyrac's claim that modern moralists recognize natural law as fundamental. According to Sidgwick, modern moralists take this view because they rely on a 'jural' notion that is largely foreign to the teleological outlook of Greek ethics.[18] According to the teleological outlook, a virtue is fundamentally some kind of good; the theorist's task is to find the connexion between the good that is virtue and other goods (*ME* 106). A jural outlook, on the contrary, conceives moral principles as imperative and inhibitive, rather than teleological.

Sidgwick qualifies his view that jural ethics is characteristic of modern, as opposed to ancient, moral thinking. He argues that Greek philosophers are aware of some idea of moral law, and that Stoic ideas of natural law introduce a transition to a jural conception of ethics. Roman law and Christianity form a jural conception.[19] Mediaeval philosophy, therefore, includes some aspects of a jural conception; Aquinas takes the content of natural law to include the Aristotelian virtues, but, according to Sidgwick, he presents these virtues 'in a new form' (*OHE* 144) that inclines towards a jural conception. Sidgwick, therefore, does not believe in a sharp transition from a teleological to a jural conception of ethics, and does not believe that any sharp transition of this sort separates modern from pre-modern ethics.[20] But he seems to believe that only modern philosophers have clearly stated and articulated this conception.[21] Hence his argument might be taken to support Barbeyrac's view that Grotius begins the modern period in ethics.

[18] 'Ethics may be regarded as an inquiry into the nature of the Good, the intrinsically preferable and desirable, the true end of action, &c; or as an investigation of the Right, the true rules of conduct, Duty, the Moral Law, &c. The former view predominated in the Greek schools, at any rate until the later developments of Stoicism; the latter has been more prominent in English philosophy since Hobbes, in an age of active jural speculation and debate, raised the deepest views of morality in a jural form. Either view can easily be made to comprehend the other; but the second seems to have the widest application.' (*ME* [1] 2–3. *ME* [2] and later editions mention the two views of ethics, but abbreviate the reference to Greek ethics and delete the reference to Hobbes and a jural conception.) '. . . it is possible to take a view of morality which at any rate leaves in the background the cognition of rule and restraint, the imperative, inhibitive, coercive effect of the moral ideal. We may consider the action to which the moral faculty prompts us intrinsically "good"; so that the doing of it is in itself desirable, an end at which it is reasonable to aim. This . . . is the more ancient view of Ethics; it was taken exclusively by all the Greek schools of Moral Philosophy except the Stoics; and even with them "Good" was the more fundamental conception, although in later Stoicism the quasi-jural aspect of good conduct came into prominence.' (*ME* [1] 93) In discussing Sidgwick I sometimes use 'jural' where he uses 'quasi-jural'.

[19] 'Reflexion . . . will show that the common notion of what is good for a human being . . . includes more than the common notion of what is right for him, or his duty; it includes also his interest or happiness. . . . Thus we arrive at another conception of ethics, in which it is thought to be concerned primarily with the general rules of duty or right action—sometimes called the moral code . . . On this view, the study connects itself in a new way with theology, so far as the rules of duty are regarded as a code of divine legislation. . . . it has a close affinity to abstract jurisprudence . . . We might contrast this as a modern view of ethics with the view before given, which was that primarily taken in ancient Greek philosophy generally—the transition from the one to the other being due chiefly to the influence of Christianity, but partly also to that of Roman jurisprudence.' (*OHE* 6–7) See also §224.

[20] *OHE* 144, 160, 163.

[21] Sidgwick is cautious in formulating the jural conception. 'It is . . . possible to take a view of virtuous action in which, though the validity of moral intuitions is not disputed, this notion of rule or dictate is at any rate only latent or implicit,

What is a jural conception? Since Sidgwick hesitates to attribute such a conception to the Stoics and to Aquinas, he implies that we do not hold a jural conception simply by believing in natural law. A jural moralist, in his view, treats moral principles as primarily imperative. Since Sidgwick assumes this connexion between law and imperatives, he seems to hold an imperative conception of law; that is why he takes any inclination to believe in moral law to imply acceptance of an imperative conception of morality. Hence he believes that the crucial element of modern ethics is foreshadowed in the earlier views that connect morality with the provisions of natural law.

But what is an 'imperative' conception of a moral principle? Sidgwick's answer is not completely clear, because he seems to combine two conceptions of the imperative: (1) Sometimes he contrasts 'imperative' with 'attractive'. Attractive principles refer explicitly to some desirable goal that the principles secure, whereas imperative principles do not. Hence 'imperative' seems to be equivalent to 'deontological'.[22] (2) Sometimes he assumes that imperative principles depend on acts of legislation.

These two conceptions of the imperative do not seem to pick out all and only the same principles. We may recognize rational principles that are not explicitly teleological, but nonetheless give reasons; if so, we recognize imperatives in Sidgwick's first sense. But it is not clear that we must also regard these principles as products of legislation, and hence as imperatives in his second sense. Scotus, for instance, may believe that our affection for the just commits us to rational principles that are neither teleological nor legislative. It is not clear whether Sidgwick allows the possibility of such principles, or whether he regards them as imperative.

If a jural conception requires only a deontological conception of moral principles, Sidgwick's contrast between the modern and the pre-modern outlook is insecure. Even if we set aside Scotus, Plato and Aristotle and their successors do not hold a purely teleological theory of the virtues. They believe that the virtues count as virtues because of their relation to the agent's good; but they do not assume that the content of the virtues is determined by reference to the agent's good. Aristotle does not suggest that we find out what is just or brave primarily by reflexion on our own good. What we ought (*dein*) to do, and what it is fine (*kalon*) to do, are determined by the common good of our community, rather than by our own good, though our reason for caring about justice and bravery depends on their relation to our own good. Aristotle's conception of the fine refers to the tendency of actions to promote a common good. His conception of morality is not directly teleological, and so it satisfies one of Sidgwick's conditions for a jural conception.

Sidgwick's position would have been clearer if he had discussed the character of imperatives more fully. Suarez's fuller discussion of law and imperatives suggests a more precise condition for a jural conception of morality. In Suarez's view, law essentially includes commands because it imposes moral necessity through will, rather than revealing a prior moral necessity. This conception of law makes it clear why a jural conception of morality

the moral ideal being presented as attractive rather than imperative. Such a view seems to be taken when the action to which we are morally prompted, or the quality of character manifested in it, is judged to be "good" in itself (and not merely as a means to some ulterior Good). This . . . was the fundamental ethical conception in the Greek schools of Moral Philosophy generally; including even the Stoics, though their system, from the prominence that it gave to the conception of Natural Law, forms a transitional link between ancient and modern ethics.' (*ME* 105)

[22] On this term see §520.

treats moral principles as products of legislation; for acts of legislation are the acts of will that impose moral necessity. But we have seen that Suarez does not use his imperative conception of law to defend a jural conception of morality; on the contrary, he uses it to distinguish morality from natural law. In his view, morality is the foundation of natural law, and would exist even without natural law, because it does not depend on the imperatives of natural law. Perhaps, then, Sidgwick takes a jural conception of morality to be both deontological and legislative.[23]

457. What is Distinctive of a Jural Conception?

Why does a jural conception of morality, as we have explained it, mark an important change in the understanding of morality? Suarez's division between indicative and prescriptive laws implies that they derive their 'moral necessity', their reason-giving character from different sources. Our reason to follow correct indicative laws depends on their content; they correctly represent the moral reality that exists independently of them. But we have good reason to follow prescriptive laws not because of what they tell us to do, but because of who tells us to do it. We need to look back to their source, whereas we need to look through indicative laws to their content. A competent authority issuing a command through the proper procedure introduces moral necessity.

According to this conception of prescriptive law, a command is legally valid if it is issued by legitimate authority in the appropriate circumstances. It does not necessarily say that I should obey it because of some end I care about. Though I may reasonably ask myself why I should obey the law, this question does not bear on its legal validity. Sidgwick may intend to apply this pattern to morality. A legal view of moral rightness makes moral rightness consist in the appropriate relation to a valid moral principle; questions about whether I have any reason to obey the principle, apart from my being commanded to obey it, do not affect what is morally right. This purely procedural test for the legal validity of a particular law does not apply moral, prudential, or pragmatic standards to the law. If I allege that it is invalid because it is not in my interest, or it is not in the interest of the governed, I fail to grasp the fact that law introduces moral necessity because of its imposer rather than its content; I treat a prescriptive law as though it were purely indicative. Since the necessity imposed by a prescriptive law comes from the will of the imposer, once we know that the imposer has imposed it, we know that it is morally necessary.

This procedural conception of the morally right marks a significant departure from the view that moral principles are essentially indicative laws independent of will. If this is what Sidgwick intends, he isolates an important difference between the jural tradition (as he describes it) and the normal Greek and mediaeval conception. The pre-modern moralists treat moral principles as indicative laws. They usually assume that virtue is some sort of good;[24] in the light of that assumption they try to decide what sorts of states of character and what sorts of

[23] Larmore, *MM* 19–24, defends Sidgwick's division between attractive and imperative approaches (identifying the imperative view with belief in the supremacy of morality over self-interest). He defends Anscombe's view (see §459) on the ground that it recognizes the same division.

[24] 'Usually' is needed because of Scotus' view on the affection for justice.

actions are virtuous. Plato's and Aristotle's question is not primarily about whether the virtues promote happiness, but about whether justice, bravery, and the other recognized virtues are genuine virtues; that question is partly answered by asking whether they promote happiness.

A jural conception immediately raises a question that we will find it useful to pursue in modern moralists. A conception of moral rightness as consisting in legal validity, understood by reference to its source, seems to be incomplete. For if a moral obligation results from a command issued by a legitimate commander with the authority to command, we do not know whether this is a genuine obligation until we know whether the commander is legitimate. To know this, we need to know whether it is morally right for the commander to command. That question cannot be answered by a purely procedural answer directing us to the source of a command. If the first commander commands obedience, that does not decide the question of legitimacy. And if we say that the legitimacy of the first commander is settled by the command of a second commander, we begin an infinite regress.[25]

If this argument is sound, a jural conception seems to answer only some of the questions that we might reasonably want a moral theory to answer. For it is difficult to see how the principles determining the authority of a legislator or commander could be prescriptive laws; if we appeal to their content rather than their source, we treat them as indicative laws. According to naturalism, the test for legal validity is not purely procedural, at least in the case of the natural law. In Aquinas' view, a rule belongs to natural law because it is morally right and prescribes what fits rational nature. Even for positive law, his test of validity is not purely procedural; it must have been enjoined by legitimate authority, but it must also be just. It is even more obvious that for natural law moral rightness is prior to any legislation. The basic principles underlying legal validity, therefore, are indicative laws, moral principles that do not rely on moral necessity imposed by will.

We might defend a jural theory of morality against this objection by arguing that the indicative laws determining the authority of a legislator are not moral principles. If this argument succeeds, we can acknowledge that jural morality rests on a non-jural basis without admitting that the non-jural basis is moral. If we examine jural theories, we also need to consider whether they offer a plausible non-moral basis. The task of finding such a basis is not straightforward. We can see why some legislators might be authorized on the basis of non-moral principles. If, for instance, we are members of a club and we want to settle procedures without endless argument, we might all find it in our interest to authorize a committee to make rules that will be binding on all members of the club. But this sort of authorization does not create a moral obligation to obey the rules. We might think that a properly moral obligation can come only from a legislator who is authorized on moral grounds. If a jural theory does not answer this objection, it seems not to offer an adequate account of morality.

458. Sidgwick and Barbeyrac

If this is a reasonable interpretation of Sidgwick's account of jural ethics, it also offers a reasonable interpretation of Barbeyrac's claim that Grotius is a pioneer in developing the

[25] Hart considers the problem of a regress, in *CL*, ch. 6.

theory of ethics as natural law. If Barbeyrac has in mind a jural conception, he is justified in believing that Aquinas and Suarez, for instance, are not part of the tradition that (in his view) begins with Grotius. The mere belief in natural law is not sufficient for Barbeyrac's purposes; for if we treat natural law as a purely indicative law (in Suarez's terms), we do not include the imperative element that is necessary for a jural conception.

Apparently, then, the only conception of natural law that supports a jural theory of morality is a voluntarist conception. If morality essentially consists in the provisions of natural law, and natural law consists essentially in divine commands, morality consists in being commanded by divine authority.[26] If that is Barbeyrac's view, we would expect him to endorse a voluntarist conception of natural law. A voluntarist conception might appear to constitute a distinctive point of view on morality; in contrast to a naturalist conception, it does not identify natural law with an indicative law specifying prior principles about what accords with rational nature, and therefore it does not identify morality with a purely indicative law. This, then, may be the innovation that Barbeyrac attributes to Grotius.

If Barbeyrac has voluntarism in mind, is he ungenerous to mediaeval voluntarists? He might answer that they have not made the voluntarist position clear. Scotus, for instance, believes that some principles of moral rightness are independent of the divine will; these are the parts of the natural law that are not subject either to divine commands or to divine dispensations. Natural law, then, does not primarily constitute moral goodness, since some of natural law recognizes antecedent moral goodness. Ockham seems closer to a purely jural conception, since he seems to regard even non-positive morality as subject to change within God's absolute power.[27] But it is not clear how closely he connects this conception of morality with a theory of natural law. He does not seem to take exactly the view that Barbeyrac ascribes to Grotius.

Whether or not we have accurately captured Barbeyrac's meaning, we have found, with Sidgwick's help, a reasonable interpretation of the claim that morality consists fundamentally in natural law. If Grotius defends the claim, so interpreted, he is a pioneer.

459. The Abandonment of Jural Morality?

Now that we have seen what Barbeyrac and Sidgwick may mean in claiming that modern moral philosophy maintains a jural conception of morality, it is helpful to contrast their view with Anscombe's sharply opposed view of modern moral philosophy. She agrees with Sidgwick in believing that ancient moralists have a non-jural conception. But she argues, contrary to both Sidgwick and Barbeyrac, that mediaeval Christian moralists hold a jural conception. They identified basic moral principles with the precepts of the Decalogue, understood as a body of divine legislation.[28] The Reformers abandon

[26] This view seems to be stated by Locke. See *EHU* ii 28.14, quoted in §562.

[27] On Ockham see §395.

[28] 'How did this come about? The answer is in history: between Aristotle and us came Christianity, with its *law* conception of ethics. For Christianity derived its ethical notions from the Torah. (One might be inclined to think that a law conception of ethics could arise only among people who accepted an allegedly divine positive law; that this is not so is shown by the example of the Stoics, who also thought that whatever was involved in conformity to human virtues was required by divine law.) In consequence of the dominance of Christianity for many centuries, the concepts of being bound, permitted, or excused became deeply embedded in our language and thought.' (Anscombe, 'Modern' 30)

this jural conception of morality because of the Lutheran separation between law and Gospel; in contrast to the mediaeval view about the scope of divine law, Luther claims that it applies only to unregenerate humanity.[29] Given this hostility to law (Anscombe claims), Protestants reject a jural conception of morality as a positive guide to life (though it serves to reveal sin). If she is right, we might expect Protestant moralists to look for an alternative way of understanding morality that separates it from divine law. In Anscombe's view, modern moralists have developed a non-jural outlook, but imperfectly, since they have retained beliefs in obligation that presuppose a jural conception.

According to this view, ancient and modern moralists agree, against the mediaeval Christians, in not appealing to divine legislation as the basis of morality. But modern moralists differ from the ancients in their use of a jural conception that they reject. Anscombe argues that the presuppositions, aims, and outlook of Greek ethics, especially Aristotelian ethics, are so radically different from those of modern moral philosophy that they really constitute a different philosophical enterprise. We cannot find room for our concept of the moral in any accurate account of Aristotle.[30] Aristotle uses 'should' and 'ought' with reference to goodness and badness, but not in the special moral sense that these terms have now acquired.[31] Since Aristotle does not use these terms with the special moral sense, he does not have a concept of the moral.

The special moral sense of the modern concepts of obligation, duty, and 'ought' are the remnants of the jural conception of ethics.[32] In its special moral sense, 'ought' is equivalent to 'is obliged', understood in a legal sense.[33] Our use of 'ought' in this special moral sense presupposes a conception of morality that we take to be false. In claiming that we morally ought to do x, we imply that some law obliges us to do x. But if a law obliges us to do x, some legislator must command us to do x. But we (secular modern philosophers) do

[29] '... the belief in divine law ... was substantially given up among Protestants at the time of the Reformation.' ('Modern' 31) Anscombe explains this surprising claim in a footnote: 'They did not deny the existence of divine law; but their most characteristic doctrine was that it was given, not to be obeyed, but to show man's incapacity to obey it, even by grace, and this applied not merely to the ramified prescriptions of the Torah, but to the requirements of "natural divine law". Cf. in this connexion the decree of Trent against the teaching that Christ was only to be trusted as mediator, not obeyed as legislator.' She refers to the Council of Trent, Decree on Justification, ch. 11 (De observatione mandatorum; see D 1536–9) and to Canon 21 (D 1571). On the views of the Reformers see §420; they do not justify Anscombe's sweeping claim.

[30] 'If someone professes to be expounding Aristotle and talks in a modern fashion about "moral" such-and-such, he must be very imperceptive if he does not constantly feel like someone whose jaws have somehow got out of alignment: the teeth don't come together in a proper bite.' ('Modern' 26) The term 'moral' itself 'doesn't seem to fit, in its modern sense, into an account of Aristotelian ethics' (26).

[31] '[These terms] have now acquired a special so-called "moral" sense—i.e., a sense in which they imply some absolute verdict (like one of guilty/not guilty on a man) on what is described in the "ought" sentences used in certain types of context ... The ordinary (and quite indispensable) terms "should", "needs", "ought", "must"—acquired this special sense by being equated in the relevant contexts with "is obliged" or "is bound" or "is required to", in the sense in which one can be obliged or bound by law, or something can be required by law.' ('Modern' 29–30)

[32] '... the concepts of obligation and duty—*moral* obligation and *moral* duty, that is to say—and of what is *morally* right and wrong, and of the *moral* sense of "ought", ought to be jettisoned if this is psychologically possible; because they are survivals, or derivatives from survivals, from an earlier conception of ethics which no longer generally survives, and are only harmful without it' ('Modern' 26).

[33] Anscombe claims that a legal conception explains a shift in the sense of the Greek term *hamartanein* from 'mistake' to 'sin', understood as a violation of law. The same legal conception makes it appropriate to use 'obligation', in a genuinely legal sense, for conformity with the virtues.

not believe that any legislator commands us to do what we morally ought to do.[34] Unlike Aristotle, we have the concepts of morality and the moral, though, unlike the mediaeval moralists, we do not believe in the divine legislator presupposed by our concepts.[35] Since we are—in this respect—post-Christian, we use the term in the moral sense, but our use rests on presuppositions that have been generally abandoned.[36]

This historical sketch makes Anscombe's position more credible. For if the modern use of 'ought' can be shown to rest on assumptions that once were widely shared, but are no longer widely shared, it is easier to understand how we could be relying on presuppositions that we do not recognize and that we even reject. The relevant use of 'ought' has been established in the light of these presuppositions; but, since they are presuppositions rather than explicit premisses, we may continue to speak in ways that rely on the presuppositions, even though we do not explicitly appeal to them.[37]

Anscombe is not the only one to claim that legislative concepts have influenced the development and the presuppositions of modern ethics. Schopenhauer argues that Kant's

[34] 'So Hume discovered the situation in which the notion "obligation" survived, and the word "ought" was invested with that peculiar force having which it is said to be used in a "moral" sense, but in which the belief in divine law had long since been abandoned: for it was substantially given up among Protestants at the time of the Reformation. The situation, if I am right, was the interesting one of the survival of a concept outside the framework of thought that made it a really intelligible one.' ('Modern' 30–1)

[35] Anscombe, therefore, maintains (1) 'Ought' and related terms ('should', 'must', etc.) have a special moral sense. (2) This special moral sense involves some absolute verdict. (3) The terms have this special moral sense by being equated with 'is obliged' (etc.) in a specific sense. (4) The relevant sense of 'is obliged' is the legal sense. (5) We have the concept of morality only if we use the relevant terms with the special moral sense, so understood.

[36] Does Anscombe mean that whenever we claim we morally ought to do x, our claim is (if measured by our other beliefs) false, so that we actually hold contradictory beliefs about what we morally ought to do? According to this view, my use of the moral 'ought' asserts something that I believe to be false. Perhaps, however, we should not take the use of 'ought' in the moral sense to include a false assertion. It may be more appropriate to connect Anscombe's account with Strawson's claims about presupposition in 'On referring'. Strawson argues that 'The present king of France is bald' does not make the false assertion that there is just one present king of France, and therefore the utterance as a whole is not false. In his view, the utterance lacks a truth-value; it would have a truth-value only if there were just one king of France. In asserting the sentence, I assume that it has a truth-value, because I presuppose that there is just one present king of France. The falsity of my presupposition deprives the assertion of any truth-value. A similar account of the error involved in the moral use of 'ought' might make Anscombe's claims more plausible. It is difficult to argue that an assertion of a moral ought actually asserts that a legislator has issued a command. It may be more plausible to claim that it presupposes such a command, so that it lacks a truth-value if this presupposition is false. Other views of presupposition might suggest different explanations of Anscombe's claim.

[37] To see what Anscombe might have in mind here, we might consider less disputable cases in which we retain attitudes that are intelligible only in the light of presuppositions that we consciously reject. If we have been in the army and under military discipline, we may have learned to dress smartly, with clean belts and boots, to march stiffly, and to conform to parade-ground regulations. If we have had to enforce this military discipline, we have learned to disapprove of failure to conform to these regulations. And we were right (let us assume), for reasons connected with military efficiency, esprit de corps, and so on, to disapprove of such failure. If we return to civilian life, and encounter casually dressed people with scuffed shoes who do not swing their arms, we may continue to disapprove of them. If someone objects that these are civilians and there is nothing wrong with the informality of their dress and manners, we may disagree, insisting that they are dressing or walking improperly. If we deny that the inappropriateness of such dress or manners is restricted to specifically military contexts, we might maintain that it is always more appropriate to have creased trousers, shiny shoes, and a 'military' bearing. In this case, it might be reasonable to conclude that our attitude is unintelligible except in the light of presuppositions that do not hold. To reach something like the situation that Anscombe envisages with the moral 'ought', we would need to suppose that a society retains this respect for 'military' dress and manners even when most people have never been in the army and do not recognize that their respect has this historical basis. The fact that they take these aspects of dress so seriously has no rational basis; but it would have had a rational basis if the military requirements still applied to their situation. As Anscombe suggests, this might all be true even if the people involved were ignorant of it, or explicitly denied it.

views covertly rely on a legal conception of obligation that presupposes a divine legislator.[38] Anscombe agrees with Schopenhauer and Nietzsche[39] in offering a genealogical explanation, showing that what no longer makes rational sense is the residue of practices that relied on assumptions—now rejected—in the light of which they once did make rational sense.

But though Anscombe agrees with many others in connecting legislative concepts with the moral ought, she sharply disagrees with Sidgwick and Barbeyrac. Whereas they take a jural conception of ethics to distinguish modern moral philosophy from ancient and mediaeval outlooks, she takes the abandonment of a jural conception to be characteristic of the Protestant Reformation and of the philosophical views that it has influenced. In her view, the peculiar predicament of modern moral philosophy lies in the combination of a non-jural conception of morality with a concept of obligation that depends on a jural conception.

Further consideration shows that Anscombe and Sidgwick (and Barbeyrac) are not as far apart as they might initially appear. For they agree that a jural conception of ethics results from the influence of Christianity. Anscombe believes that pre-Reformation Christianity holds this jural conception. She agrees with Sidgwick in attributing a non-jural view to the ancient moralists. As we have seen, Sidgwick is not entirely clear about whether he thinks mediaeval moralists hold a jural conception.

One might well suppose that Anscombe's position is more readily intelligible than Sidgwick's. If Christianity is responsible for the acceptance of a jural conception in modern Europe, we might reasonably be surprised if its influence in this direction is delayed for over a millennium and a half. In Anscombe's view, Sidgwick has overlooked the historical evidence showing that a jural conception is prevalent in mediaeval Christian moral philosophy.

460. Who Holds a Jural Conception?

To answer the questions raised by these different views of early modern philosophy, we need to discuss Grotius and his successors. But since some of these views rest on an interpretation of mediaeval moral philosophy, we can usefully ask which views fit better with our account of the Scholastics.

We have good reason to doubt Anscombe's view that a jural conception of morality is characteristic of Scholasticism. The prominence of natural law in Aquinas' account does not imply that he takes acts of legislation to be essential to morality. Given his broad conception of natural law, his belief that morality is essentially natural law does not commit him to a jural conception of morality. He holds a naturalist view that makes natural law essentially an indicative law, but not essentially a prescriptive law.

[38] 'In the centuries of Christianity, philosophical ethics has generally taken its form unconsciously from the theological. Now as theological ethics is essentially *dictatorial*, the philosophical has also appeared in the form of precept and moral obligation, in all innocence and without suspecting that for this, first another sanction is necessary.' (Schopenhauer, *BM* §4 = Payne 54)

[39] 'In *this* sphere, of legal obligation, then we find the breeding-ground of the moral conceptual world of "guilt", "conscience", "duty", "sacred duty"—all begin with a thorough and prolonged blood-letting . . . And may we not add that this world has really never quite lost a certain odour of blood and torture? (not even with old Kant; the categorical imperative smells of cruelty . . .)' (Nietzsche, *GM* ii 6 = Ansell-Pearson 45)

In describing Aquinas' view in this way, we rely on distinctions that are clearly drawn not by Aquinas, but by Suarez. Suarez disagrees with Aquinas in making natural law essentially prescriptive. But he maintains Aquinas' naturalist view of morality by denying that morality is essentially natural law. Reflexion on the views of Aquinas, Vasquez, and Suarez (to go no further) makes it clear that a naturalist, non-jural conception of morality is one prominent tendency in Scholasticism.

One might easily form the opposite impression, however, if one takes a different view about where Aquinas and Suarez agree and disagree. If one supposes that Aquinas shares Suarez's essentially prescriptive conception of natural law, his belief that natural law is essential to morality commits him to a jural conception of morality. Similarly, if one overlooks Suarez's claim that natural law is inessential to morality, one will attribute a jural conception of morality to Suarez as well. From this point of view, Scholasticism offers powerful, though not unanimous, support for Anscombe's account of the mediaeval Christian view.

461. Alleged Contrasts between Aquinas and Suarez

To see how one might defend Anscombe's view that mediaeval moralists hold a jural conception, it is useful to turn to a comparative discussion of Aquinas and Suarez. Walter Farrell compares them from a Thomist point of view, and he regards Suarez's departures from Aquinas as errors. The main differences Farrell mentions are these:[40] (1) According to Aquinas, 'a precept or proposition of natural reason is a true secondary cause, producing a real effect, sc. a real obligation'. Suarez, by contrast, claims that human judgment can only manifest obligation coming from the will of God. (2) According to Aquinas, 'eternal law—an act of divine reason—is the cause of all morality'. According to Suarez, 'this act of will of God—the Eternal Law—supposes in human actions a certain necessary honesty and malice'. (3) According to Aquinas, 'on the hypothesis that God never issued this precept which is Eternal Law and the Natural Moral Law, there would be no honesty or malice, for these consist formally in the accord or discord of human acts with a law or precept'. (4) According to Aquinas, 'in the absence of this divine precept these acts have no morality'. (5) According to Aquinas, 'the Natural Moral Law presupposes no goodness or malice; goodness or malice is the result of obedience or disobedience of this law'. (6) 'The idea of a "natural honesty" preceding all law is an evident contradiction in terms, since a morality would then be constituted without any norm or rule and morality consists precisely in the commensuration with a rule of morality. But the falsity of these propositions of Suarez is too evident to need refutation.'

Farrell is right to suppose that Aquinas and Suarez differ over the status of the natural law, and especially over whether it meets the conditions that Suarez lays down for being a true law. It is difficult to find any support in Aquinas for the view that it is law because it is commanded by the legislative will of God. But, given this difference, we ought to look

[40] Quotations are from Farrell, *NLSTS* 148–52. I have discussed Farrell both because he states some issues clearly, and because Grisez and Finnis follow him. See §§437, 442.

for Suarez's views on morality by considering his account not of natural law, but of the foundation of natural law. This foundation consists in the principles of intrinsic morality, which are the principles of the natural law, considered apart from its status as expressing God's legislative will. Once we attend to this aspect of Suarez's position, we see that his views on morality are close to Aquinas' views, despite their disagreement on the relation of intrinsic morality to natural law. For they agree in believing that the duty (debitum) to follow the actual principles of the natural law holds because of the nature of the relevant actions themselves, not because of a specific command from God's legislative will.

It is not exactly false, therefore, but it is misleading, to rest content with Farrell's second point of contrast. It is true that, according to Suarez, the eternal law requires an act of legislative will. But if one considers the eternal law as expressing the intellect and will of God the creator, Suarez and Aquinas agree that it is the cause of all morality; there would be no morally good and bad actions if there were no rational agents with our nature. Suarez does not believe that once God had decided to create human beings with our nature, it was still possible for him to prescribe a different natural law; but Aquinas does not believe this either.

The most surprising part of Farrell's case is the view expressed in points (3)–(5). His claim about Aquinas is defensible, provided that we do not assume that conformity to natural law essentially involves conformity to God's legislative will. Aquinas does not maintain that rightness and wrongness essentially involve conformity to divine legislative precepts. On the contrary, divine precepts prescribe actions that are intrinsically right insofar as they conform to rational nature.

Farrell's first point, therefore, gives a one-sided picture of Suarez's views on obligation. It is true that Suarez does not take natural law, apart from its being commanded by God's legislative will, to impose any 'obligation' (obligation); but he believes that the foundation of natural law contains its own duty (debitum). When Farrell cites evidence to show that Aquinas takes the natural law to include an obligation, he cites a passage in which Aquinas uses 'duty' (debitum) and not 'obligation' (obligatio).[41]

Farrell's sixth point also overlooks this distinction between duty and obligation. He rejects Suarez's belief in intrinsic natural rightness or wrongness presupposed by law, on the ground that rightness essentially consists in conformity to a rule or norm. He disagrees with Suarez only if every rule (regula) must also be a law (lex). Given his narrow use of 'law', Suarez need not agree that if intrinsic rightness is separate from law, it must also be separate from every sort of rule.[42]

Some of Farrell's objections may reflect misunderstanding of the sort of concession Suarez intends in considering the nature of intrinsic rightness on the supposition of God's non-existence or inaction. Suarez does not mean this supposition to show that right or wrong acts do or could exist independently of the creative will of God. They are only independent of God's legislation, which expresses a further act of freewill in addition to the act that results in creation. This does not mean that it is possible for God to have created us without

[41] Farrell, 130, cites 1–2 q100, and *Quodl.* v 19, both of which use 'debitum'.

[42] Farrell's account tends to assimilate Aquinas' views about morality to the modern Roman view that formal and complete morality requires obligation and legislation. The points on which he criticizes Suarez mark Suarez's deviations from the modern Roman view, on which see §602.

also legislating that we should observe the law of nature. Creation without legislation is impossible because of God's goodness and providence, not because God's creative will is identical to God's legislative will.

For these reasons, Farrell's comparison of Suarez with Aquinas exaggerates disagreements with Aquinas, in ways that distort both Suarez's and Aquinas' views. If we take account of Suarez's narrow conception of obligation, and the crucial deontic elements that he takes to be distinct from obligation, his belief in intrinsic rightness as the basis for God's legislation agrees with Aquinas' view. To deny that Aquinas agrees with Suarez on this point is to miss an essential element in Aquinas' conception of the basis of natural law. Some of Farrell's 'Thomist' criticism of Suarez relies on a voluntarist treatment of Aquinas, supposing that he takes divine legislation to be necessary for morality.

This treatment of Aquinas makes it intelligible that someone might suppose, as Anscombe supposes, that Aquinas holds a jural conception of morality and that Suarez gives it up. For Aquinas takes morality to be inseparable from natural law, whereas Suarez takes it to be separable. If we attend simply to this difference, without understanding its basis, we may infer that Suarez's belief in intrinsic morality represents a departure from Aquinas. We may even suppose that it marks a secular, non-jural conception of morality that Aquinas would reject.[43]

462. Grotius as a Secular Moralist

If we take this view of the contrast between Aquinas and Suarez, we may be ready to follow Anscombe in supposing that the modern conception of morality consists in the separation of moral right and wrong from the precepts of divine law. This outlook on modern morality suggests a corresponding account of the originality of Grotius. Though Anscombe does not support her thesis about modern moral philosophy with a detailed account of 17th-century theories, one might claim that some features of Grotius' position support her claims about the modern outlook. According to some modern readers, Grotius is similar to Hobbes in trying to defend a minimal conception of natural law, shorn of its Scholastic elaborations and addressed to opponents who reject the Scholastic outlook as a whole.

This picture of early modern moral philosophy underlies Dugald Stewart's account of Grotius. He maintains that Grotius follows the suggestion of Melanchthon, who is the first to maintain a naturalist view. Relying on Cudworth's reference to Ockham and other Scholastics, Stewart takes the Scholastics in general to have maintained a jural view.[44]

[43] Villey, *FPJM* 346–7, holds a rather similar view of how 16th-century Jesuits depart from Aquinas. In his view, they make right ('droit') independent of God, contrary to Aquinas, 'qui situait en Dieu les racines du droit naturel . . . Dans l'excès de leur polemique antiprotestante, nos jesuites déjà prêtent la main à ce futur rationalisme qui va déferler sur le monde moderne et mènera la plus grande partie de "l'école du droit naturel moderne" dans un laïcisme intégral.'

[44] At *DPMEP* 38 Stewart claims that Melanchthon's view 'like the other steps of the Reformers, . . . was only a return to common sense, and to the genuine spirit of Christianity, from the dogmas imposed on the credulity of mankind by an ambitious priesthood. Many years were yet to elapse before any attempts were to be made to trace, with analytical accuracy, the moral phenomena of human life to their first principles in the constitution and condition of man . . .' In a footnote, referring to Cudworth's remarks on Ockham, Stewart allows that Ockham was among the first to maintain a voluntarist view, but he says nothing about Scholastic views before Ockham. He acknowledges that 'the Catholics have even begun to recriminate on the Reformers as the first broachers of it [sc. Ockham's view]'.

Hence he takes Grotius to have been an innovator in his conception of natural law (171), and to have broken fundamentally with mediaeval views (174, 177). He agrees with Barbeyrac in treating Grotius as a pioneer; but his reason is the exact opposite of Barbeyrac's reason.

Hobbes and Grotius may be taken to present a new, secular account of morality that differs from the mediaeval account in two ways: (1) It develops a theory of obligation that avoids any reliance on divine commands. As Grotius puts it, even if God did not command observance of the natural law, we would still be obliged by its provisions. Similarly, Hobbes argues that the traditional laws of nature are defensible as means to peaceful and commodious living, apart from any question about divine commands. (2) It abandons dubious Scholastic claims about agreement with human nature, insofar as these claims cannot be expressed in claims about self-interest. Both Grotius and Hobbes suppose that sceptics who reject Scholastic claims about what suits rational nature cannot deny that facts about self-interest give reasons for action. Hence they defend the traditional content of natural law (or some of it) by appeal to self-interest and utility.[45]

If Grotius and Hobbes agree on these points, modern natural-law theory is a substitute for a traditional jural conception. The distinguishing feature of modern moral philosophy, on this view, is not the formulation of a jural conception of ethics, but the abandonment of it. Such an interpretation of Hobbes and Grotius fits Anscombe's general view, and casts doubt on the picture of modern moral philosophy that we find in Barbeyrac and Sidgwick. According to the views of both Stewart and Anscombe, on one side, and Barbeyrac and Sidgwick, on the other side, Grotius is an innovator, but the two sides give exactly opposite reasons. His recognition of morality apart from divine commands may be held to support Anscombe's claim that modern moral philosophy abandons a jural conception.

These contradictory views about modern moral philosophy agree in attaching special importance to a jural conception of morality. According to Anscombe, the primary error of modern moral philosophy is its rejection of a jural conception. According to Stewart, this is its primary advance. According to Anscombe, mediaeval moralists hold a jural conception. According to Barbeyrac, the formulation of a jural conception is the primary advance of modern moral philosophy. The different views reflect different judgments both about the historical developments and about the philosophical merits of a jural conception. But they all agree in supposing that the decision about whether to accept or to reject a jural conception is crucially important.

Our previous discussion counts against Anscombe and Stewart. Mediaeval moral philosophers do not characteristically hold a jural conception of morality. Given Aquinas' broad conception of law, he does not differ from Suarez about the status of intrinsic morality, and hence he does not hold a jural conception of morality. Anscombe's claim might fit Scotus and Ockham better, but it conflicts with the positions of Aquinas and Suarez. Equally, then, we have no reason to believe that a non-jural conception of morality is an innovation. Suarez's

[45] See Tuck, 'Modern'; Haakonssen (quoted in §464); Schneewind, *IA* 67. Korkman, *BNL* 81–115, argues against their reasons for thinking Grotius original (because of his response to scepticism); he does not discuss whether Grotius is original for some other reason. Shaver, 'Grotius', argues against Tuck that Grotius does not maintain an egoist position in his argument against Carneades.

non-jural account expounds Aquinas' non-jural account. Stewart is mistaken to claim that a non-jural account was an innovation by Melanchthon or Grotius.

To see whether Barbeyrac is right to claim that Grotius is the pioneer of a jural account, we must look more closely at what Grotius says and at what Barbeyrac takes him to say.

33

GROTIUS

463. Grotius and his Predecessors

We have seen that Pufendorf, Barbeyrac, and some later writers treat Grotius as the founder of a distinctively modern theory of natural law, even though they do not agree about what is distinctive in his position. They regard his theory not only as an innovation, but also as an advance. To see how far they are right, we should compare Grotius with his Scholastic predecessors, and especially with Suarez, whose work he knew.[1] Though Barbeyrac praises Grotius as a pioneer, he admits that Grotius was not completely emancipated from Aristotle and Scholastic errors.[2] If, then, we compare Grotius' account with Suarez's account, we may be able to decide whether Barbeyrac is justified either in his criticism or in his praise.

Some of Grotius' comments on Aristotle and on the Scholastics tend to confirm Barbeyrac's description of him. He does not dismiss them as curtly as Barbeyrac does, though he does not treat them as his primary authorities. He relies not on Scholastic but on Patristic authority, claiming that the general consent of the clearly orthodox writers, especially the earlier ones, ought to have significant weight in clarifying what is obscure in the Scriptures.[3] He claims to follow these Christian writers in their eclectic attitude to philosophical sources, picking out the elements of truth scattered in different writers. He contrasts this attitude with the Scholastic subjection to Aristotle that made him an intellectual tyrant. But he does not take this misuse of Aristotle to imply any objection to Aristotle himself, who deserves the first

[1] On Grotius' knowledge of Suarez see Scott, in Suarez, *STW* 19a–21a; Suarez, *Leg*. ed. Perena, iv, pp. lxviii–lxx. Grotius cites Suarez in *JBP*, at i 4.15.1; ii 4.5.1; ii 14.5; ii 23.13, but not specifically on the natural law. St Leger, *EDHG*, ch. 5, discusses the influence of Suarez on Grotius, suggesting that Suarez's reputation as a supporter of regicide may have discouraged Grotius from citing him too prominently. He quotes (110) a letter of 15 Oct. 1633 = *Briefwisseling* v 194, in which Grotius criticizes polemics against the Jesuits, and especially against Suarez, 'a man of such subtlety in philosophy . . . that, in my judgment, he scarcely has an equal'. Cf. the letter of 1 Aug. 1635 = vi 121, mentioning the Jesuits 'among whom the not undistinguished Francisco Suarez writes . . .'.

[2] 'Grotius saw what was the fundamental principle of the law of nature: But he does no more than just point it out in his Preface, and that in such a manner too, as gives us reason to conclude, that his ideas on that head were not altogether clear; nor enough disengaged from the prejudices of the Schools.' (Barbeyrac, 'Morality' §31, p. 70)

[3] momentum non exiguum habere debent, *JBP*, Prol. §51. Grotius' attitude to the Fathers as 'witnesses to the truth' is common, though not unchallenged, among Protestant writers. See Backus, 'Scholarship', and Meijering, 'Theology' (esp. 868–70 on Daillé and Rivet). I cite *JBP* from Whewell's edition, based on the one published in 1631. I sometimes modify Whewell's translation. On the editions of *JBP* see Tuck, *NRT* 73n.

place among philosophers.[4] He follows both Platonists and Christians, among whom he cites especially Lactantius,[5] in dissenting from Aristotle's doctrine of the mean, to which he devotes some less than penetrating criticism (Prol. §§43–5).

Still, his attitude to the Scholastics is not entirely hostile. They lived in unfavourable times and were handicapped by their ignorance of 'good learning' (artes bonae), so that it is not surprising that they made mistakes. Still, he takes much of what they say to be praiseworthy. They are good critics, attacking one another with a degree of moderation not found in contemporary controversy, and agreement among them is unlikely to be mistaken (§52).[6]

These remarks from Grotius' preface do not suggest that he rejects the views of his predecessors as a whole. On the contrary, he claims to accept the views generally accepted by the Scholastics, insofar as these agree with the common consent of the Christian Fathers. He does not suggest that either of these groups of authorities has gone radically wrong in its conception of the law of nature. Barbeyrac suggest that so much falsity is present in the Scholastics that it is not worth trying to extract the truth. Grotius holds the opposite view, that there is enough truth, and little enough falsity, to make the effort of extraction well worthwhile. This conciliatory attitude to the Scholastics might lead us to expect both that Grotius will try to find the position that commands most general assent among them, and that he will be sympathetic to such a position.

464. Naturalism

Grotius affirms the existence of a natural right (ius) that proceeds 'from principles internal to a human being' (Prol. §12). They are internal to us not only because we know them by nature, but also because they are appropriate for rational agents with our nature. To prove that something belongs to natural right, we need to show its 'necessary appropriateness or inappropriateness to rational and social nature' (i 1.12.1).[7]

[4] 'Among the philosophers the first place is deservedly assigned to Aristotle . . . Only it were to be wished that his authority had not, some ages ago, been converted into a tyranny; so that truth, in the pursuit of which Aristotle faithfully spent his life, suffers no oppression so great as that which is inflicted in Aristotle's name. I, both here and in other places, follow the liberty of the old Christians, who had not sworn allegiance to any sect of philosophers—not because they agreed with those who say that nothing can be firmly grasped (percipi), which is the most foolish view possible, but because they thought that there was no sect that had seen the whole of the truth, and none that had not seen some part of the truth. They therefore believed that to collect the truth, scattered among different philosophers among sects, into one body: would indeed be nothing other than handing on truly Christian teaching.' (Prol. §42) The last sentence quoted is taken from Lactantius, *DI* vii 7.

[5] See Lactantius, *DI* vi 15–17, cited by Whewell ad §43. Grotius quotes him in §45.

[6] . . . ubi in re morum consentiunt, vix est, ut errent, Prol. §52. Leibniz approves of Grotius' favourable remarks about the Scholastics, in *Theod.* 77.

[7] Grotius' early work *JP* (see Tuck, *PG* 170–6; Saastamoinen, *MFM* 110) appears to take a more voluntarist view of natural law. As his first rule Grotius states: 'What God has shown to be his will, that is law' (ch. 2 = ET 8). But this appearance of voluntarism may be misleading. It is not clear whether Grotius distinguishes the creative from the legislative will of God. Sometimes he seems to refer simply to God's creative will: 'The will of God is revealed . . . above all in the very design of the Creator; for it is from this last source that the law of nature is derived' (8). He might mean that the natural law consists in facts about the nature of creatures: '. . . since God fashioned creation and willed its existence, every individual part thereof has received from him certain natural properties whereby that existence may be preserved and each part may be guided or its own good, in conformity one might say, with the fundamental law inherent in its origin' (9). Grotius does not consider the dispute between voluntarism and naturalism, and does not state the naturalist position that he states in *JBP*; but it is not clear that *JP* maintains a voluntarist position.

On this point Grotius agrees with Scholastic naturalists. He signals his agreement when he says that his remarks would still have some standing even if we were to grant that God does not exist or that he is not concerned with human affairs.[8] This concession about God's non-existence is familiar; Suarez quotes it as part of the case presented by Gregory of Rimini and others, to display the distinctness of the natural law from God's commands.[9]

Grotius adds two points to Gregory: (1) He says this proposition cannot be granted without extreme wickedness (summo scelere). It would indeed be wicked to grant God's non-existence, if 'grant' meant 'accept it as true that God does not exist'. Grotius insists that he does not commit this wickedness, because he does not grant the non-existence of God, but simply entertains it counterfactually. (2) In contrast to Gregory and Suarez, one of his suppositions is that God does not care for human affairs; this is the supposition denounced by Plato in *Laws* X and later accepted by Epicurus. Grotius' familiarity (direct or indirect) with Plato or with Epicurean sources may explain why he modifies Gregory's supposition.

These two additions, then, do not make a significant difference to the issue raised by the counterfactual supposition. But what does Grotius mean by affirming the truth of the counterfactual? We may compare him with Suarez, who discusses two relevant counterfactual assertions: (1) Even if God did not exist or did not issue commands, there would be natural law, and obligation. (2) Even if God did not exist or did not issue commands, actions would be intrinsically right and wrong. Suarez rejects the first assertion, but accepts the second. Hence he holds a partly voluntarist conception of natural law, but a naturalist conception of morality.

Grotius does not say which counterfactual he accepts. He would endorse a more strongly naturalist position than Suarez accepts if he claimed that there is a natural law (lex), properly so called, apart from the legislative will of God, and that this law imposes a genuine obligation apart from God's command. This is Vasquez's naturalist position.[10] Grotius does not discuss it.

His initial discussion is confined to the existence of a right (ius), not a law (lex), of nature. In asking whether there is a right (ius) of nature, he takes himself to be asking whether anything is just (iustum) by nature, apart from positive legislation; in affirming that there is something just by nature, he rejects Carneades' sceptical position (Prol. §5). If his claim about the right of nature means only that something is just by nature, not as a result of divine legislation, Suarez agrees.[11]

When Grotius considers 'ius' in the sense in which he takes it to be equivalent to 'lex', he describes it as 'a rule of moral acts obliging to what is correct'.[12] Obligation, in his view,

[8] 'And certainly these things that we have just said would have some standing even if we were to grant what cannot be granted without extreme wickedness (locum aliquem haberent, etiamsi daremus, quod sine summo scelere dari nequit), that God does not exist, or that he is not concerned with human affairs.' (Prol. §11) In the first edition (1625) Grotius has 'locum haberent'. He added 'aliquem' in the edition of 1631 (presumably to make it clear that the non-existence of God would not leave everything unchanged). See Molhuysen, 'First edition' 106. Tuck, *NRT* 76, *PG* 197–8 ('All we have said now would take place . . .') follows the first edition.

[9] On Gregory see §436.

[10] On Grotius' knowledge of Vasquez see St Leger, *EDHG* 141–2, and Chroust, 'Grotius' 117. They take Grotius to agree with Vasquez rather than Suarez, because they hold a more voluntarist view of Suarez than I would think plausible.

[11] For the distinction between ius and lex in this context see Vasquez (quoted in §429); Suarez, *Leg*. i 2.11 fin.; Grotius i 1.9.1.

[12] '. . . regula actuum moralium obligans ad id quod rectum est.' (i 1.9.1).

implies some necessity that distinguishes it from advice (consilium). But he does not say whether this necessity also belongs to a duty (debitum). Hence he does not say whether every duty is also an obligation. Suarez distinguishes duty from obligation, taking obligation, but not duty, to involve imposed necessity, and therefore command. If Grotius believes that duty implies obligation, and that obligation implies command, he holds an imperative conception of duty. But if he believes that duty implies obligation, and some duties are independent of commands, he holds a non-imperative conception of obligation. It is not quite clear where Grotius stands on these questions.

Grotius describes natural right—understood as law (lex)—as including two elements: the moral wrongness or necessity of some action, because of its inappropriateness or appropriateness to rational nature, and the consequent divine prohibition or command.[13] Hence, insofar as he takes natural right (ius) to be law (lex), he takes it to require a divine command. On this point he seems to agree with Suarez.[14]

465. The Will of God

Though Grotius believes there would be natural right (ius) without law (lex), and hence without the legislative will of God, he does not believe that the existence of God is irrelevant to moral requirements. For we know that God exists and that he offers rewards and punishments (Prol. §11). Grotius now mentions different ways in which the will of God is relevant to questions of right (§13). (1) Right has another origin, besides nature, in the free will of God, whom we must obey. (2) But even natural right, which proceeds from principles internal to a human being, can be ascribed to God, since he willed that such

[13] 'Natural right is a dictate of correct reason indicating that some action, from its agreement or disagreement with rational nature itself, has in it moral wrongness or moral necessity, and for that reason such an action is either forbidden or commanded by God the author of nature. Actions about which such a dictate exists are required or impermissible in themselves, and therefore are understood to be necessarily commanded or forbidden by God.' (i 1.10.1) For 'rational nature' Barbeyrac and Whewell substitute 'rational and social nature', appealing to 12.1. Sidgwick, *OHE* 161n, gives good reasons for rejecting this change.

[14] Schneewind, *MP* i 88–9, describes the alleged innovation in Grotius' position as follows: '. . . he claimed that there would be binding laws of nature even if God did not exist. . . . If Grotius had claimed only that there are goods and ills independent of the existence of God, his view would not have been particularly original. Such claims had been made in one form or another by various earlier thinkers. They were what Suarez had in mind when he asserted that goods and ills alone do not give rise to obligation and that a sanction imposed by a lawgiver must be added if there are to be obligations. Grotius' innovation was his assertion that there would be obligations, and not simply goods and ills, even if God did not exist.' Schneewind refers to Prol. §11 in support of his claim; but this passage says nothing about obligation. The passage on the law of nature (i 1.10.1) includes a reference to a divine command; hence it does not show that Grotius takes a divine command to be unnecessary for natural law. In any case, even if Grotius maintained the position that Schneewind ascribes to him, it would not be an innovation; it would simply be the position of Vasquez (and probably the implicit position of Aquinas); see §426. Haakonssen, *NLMP* 29, contrasts Grotius with Gregory of Rimini: 'The scholastic point was that human beings have the ability to understand what is good and bad even without invoking God, but have no obligation proper to act accordingly without God's command. Grotius is suggesting that people unaided by religion can use their perfect—and even imperfect—rights to establish the contractual and quasi-contractual obligations upon which social life rests.' The epistemic thesis that Haakonssen mentions captures neither Vasquez's conception of natural law nor Suarez's views about intrinsic rightness and wrongness. His claim about 'obligation proper' is correct only if it refers to obligation in Suarez's narrow sense. Suarez distinguishes obligations from duties and recognizes duties without reference to divine commands. In this narrow sense of 'obligation', however, it is not clear that Grotius recognizes natural law and obligations without divine commands. Both Schneewind's and Haakonssen's attempts to separate Grotius from a familiar Scholastic position rest on inadequate evidence.

principles should exist in us.[15] (3) God made these principles more conspicuous to us, by giving the laws (leges) he has given for the guidance of people who are less capable of reasoning.[16]

The first and third of these claims seem to refer to God's revealing of a legislative will in the Decalogue. Grotius seems to contrast the role of God's will in legislation (in the first and third claims) with its role in natural right itself (in the second claim). He suggests, then, that God's legislative will has no role in the existence of natural right, but simply makes natural right clearer by issuing specific commands. He speaks of laws (leges) only when he mentions the laws that God gives us to make the requirements of natural right clearer.

Grotius' second claim intervenes, rather confusingly, between two claims about God's legislative will. The first claim mentions God's free will as a source of right distinct from natural right. The second claim suggests that even natural right is derived from the will of God, because he willed that such principles should exist in us. 'Principles' here does not refer to our knowledge of the natural law, but to the basic facts about human nature that Grotius has already mentioned. God is introduced here not as the source of our knowledge of natural right, but as the creator of human beings with the nature that is the objective basis for natural right.

Here, therefore, Grotius refers to God as creator, not as legislator; he does not endorse voluntarism about natural law or morality. Like Suarez, he acknowledges God's creative will as the source of human beings with their nature, and hence as the source of naturally right and wrong actions; but this does not imply that natural right and wrong are the result of divine legislation. Though it is up to God whether there are any human beings, and hence whether any human beings act rightly or wrongly, it is not up to God to decide what is good or bad, or right or wrong, for creatures with the nature that is essential to human beings.

It would have been helpful if Grotius had been as careful as Suarez is to separate questions about (i) the natural foundation of natural law (lex); (ii) the essential features of natural law; (iii) the relation of the natural foundation and of the law to God's creative will; (iv) their relation to God's legislative will. His treatment suffers from abbreviation, and he introduces the different points in an unhelpful order. We have no reason, however, to attribute any confusion to him.

He agrees with Suarez and Aquinas in recognizing a natural basis for what they call natural law. This basis is what he calls natural right (ius), and what Suarez calls naturally right (honestum).[17] He seems to agree with Suarez in recognizing duties (debita) that are independent of any divine command.[18] He may be closer to Vasquez's and Aquinas' view, that the existence of natural law (lex) consists in the existence of what is naturally right and wrong, than to Suarez's view, that the existence of natural law requires a divine command. This is the conclusion we will draw if we take Grotius' remarks about the role of God to be exhaustive; for he does not mention, as Suarez does, an act of God's legislative will

[15] See Pufendorf's use of this aspect of divine freedom, discussed in §566.

[16] On divine laws (leges) see Prol. §1. Cf. Aquinas on the function of the Decalogue, §319.

[17] On Grotius' use of 'honestum' see i 2.1.2.

[18] This also seems to be implied by i 2.1.1. Law (lex) introduces new duties (debita), but Grotius does not suggest that there are no duties prior to law.

prescribing observance of natural right, apart from the expression of God's revealed will in the Decalogue. But we have seen that his remarks on the role of God are less than completely clear. It might be wisest to attribute to him no clear view on whether the natural law is prescribed, as such, by God's legislative will.

The extent of a philosopher's commitment to naturalism about natural law is often clarified in his treatment of alleged dispensations. Aquinas, followed by Suarez, claims that genuine dispensations are impossible, since the provisions of the natural law specify what is right and wrong intrinsically, apart from God's legislative will. Grotius follows Aquinas on this issue. In his view, the intrinsic rightness and wrongness of actions does not depend on any divine legislation; God prescribes and forbids actions as being intrinsically right and wrong.

In saying that natural right indicates both intrinsic rightness and the divine precept, Grotius appears to agree with Suarez's claim that the natural law, as such, is prescriptive, and not purely indicative, law. With Aquinas and Suarez, he infers that the natural law is immutable, and cannot be changed by God without self-contradiction.[19] Since God cannot change natural law, apparent dispensations cannot be dispensations. Grotius agrees with Aquinas and Suarez that if God commands us to kill someone or take their goods, God does not make murder (homicidium) or theft lawful in this instance, but changes the circumstances so that the action of killing or taking is no longer murder or theft (i 1.10.6).

Though Grotius is less clear and less systematic than Suarez, he agrees with him on the naturalist claims about morality, on which Suarez also agrees with Aquinas. For he recognizes natural right and wrong, resting on the nature of human beings, apart from any divine legislation.

466. Natural Sociality

If Grotius agrees with Suarez so far on the relation of natural law to human nature, does he also agree with him about the basic features of human nature and about the principles that can be derived from it? Grotius begins by asking: Is there any such thing as right (ius) in the dealings of one people (populus) with another, whether this right is derived from nature or from divine laws (leges) or from custom and tacit agreement (Prol. §1)? Some people have denied that there is any such right beyond a mere name, on the ground that usefulness to a state is the measure of justice, or that a common weal

[19] 'Now the Law of Nature is so immutable that it cannot be changed even by God. For although the power of God is measureless (immensa), yet some things can be spoken of to which it does not extend. For things that are spoken of in this way, they are simply spoken of, but they have no sense that would express any reality (res), but are repugnant to themselves. Therefore, just as twice two's not being four cannot be brought about by God, so also it cannot be brought about that what is bad by its intrinsic character is not bad. . . . For as the being (esse) of things when they exist and by which they exist depends on nothing else, the same applies to the properties that necessarily follow on that being. Now such a property is the badness of certain actions, when they are compared with nature using sound reason. Therefore God himself allows judgments about himself in accordance with this norm . . .'. (i 1.10.5) In the omitted passage Grotius cites, as Suarez (see §447) does, Aristotle on adultery etc. Pufendorf (*JNG* i 2.6), Barbeyrac, and Whewell object to his use of this passage. On Pufendorf's criticism of the appeal to self-contradiction see §579.

cannot be administered without doing wrong (iniuria).[20] The second of these opinions is the view of Machiavelli, which Suarez discusses as 'the doctrine of politicians of our time' (*Leg*. iii 12.2).

Grotius seeks to answer this objection to the belief in any right that could impose a moral restraint on a particular state. He follows Lactantius and Vasquez in beginning with the objections to justice that are presented by Carneades.[21] According to Carneades' argument, rights (iura) simply embody calculation of utility, and therefore vary in accordance with practices (mores) and different times and occasions, so that there is no natural right (ius). Since everyone naturally pursues utility above all, either there is no justice (iustitia), or justice is foolishness, since consideration for someone else's advantage involves harm to oneself.[22]

Carneades' argument may be initially puzzling, since he says (i) that right reflects a calculation of utility, but (ii) it is foolish to be just. The first claim implies that it is sometimes sensible to follow provisions of right, since they promote utility. The second claim, however, maintains that it is not sensible to be just. The two claims are consistent because they refer to the advantage of different people. In the first claim Carneades asserts that right reflects a society's view of its advantage. In the second he suggests that in following the advantage of society, I harm myself. This combination of claims is familiar from *Republic* ii, which is Carneades' ultimate source; Glaucon, like Carneades, moves from the first claim, that justice embodies the advantage of a society, to the second claim, that it is 'another's good', and harmful to the individual just person.

This second claim can be answered if we have some reason for being just apart from the advantage of a larger society whose advantage may not coincide with our own. We may have such a reason, if principles of justice embody natural right—something that is right because of its agreement with human nature, apart from the advantage of any particular society. Grotius, therefore, tries to prove that there is such a natural right. On this point, his aim is similar to Suarez's aim in answering Machiavelli. He gives Carneades' scepticism about justice a more prominent place in his argument than Suarez gives it. This may be because he thinks it especially urgent to answer scepticism, or because, in fulfilling his aim of using Patristic sources, he relies on Lactantius, who preserves Carneades' critique of justice.

Grotius answers Carneades by denying that a society's view of its advantage is the only basis for right. In his view, there is a natural basis of right. It is founded on human nature, and especially on the human desire for society. This 'social' aspect of human nature is,

[20] 'In practically everyone's mouth is the remark of Euphemus in Thucydides, that for a king or city holding an empire nothing that is useful is unjust. And similar to that one is the remark that in supreme power (fortuna), whatever is stronger is more just (aequius), and the remark that a state cannot be managed without injustice.' (Prol. §3)

[21] Vasquez mentions the Pyrrhonians, ad *ST* 1–2 q94 a1 (p. 35), and quotes Cicero, *Leg*. i 42–7 against them. Lactantius summarizes Carneades' arguments against justice in Cicero, *Rep*. at *DI* v 12, 15. For Lactantius' views on natural law and pagan virtue see §§206, 228.

[22] 'Human beings established rights in accordance with their utility, rights that varied as their customs (mores) varied and even among the same people often changed with time; but there is no natural right. For all human beings and all other animals tended towards their own advantages (utilitates) under the guidance of nature, so that either there is no justice, or if there is any justice it is the height of folly, since one harms oneself in considering the advantage of others.' (Prol. §5)

according to Grotius, what the Stoics have in mind in speaking of 'conciliation' (*oikeiôsis*) of each person to himself and of one person to another.[23]

He describes this aspect of human nature in Stoic rather than purely Aristotelian terms. But, as Barbeyrac sees, the main idea has an Aristotelian source.[24] Grotius seeks to capture Aristotle's conception of a human being as a 'political' (*politikon*) animal, or, as the mediaeval sources render it, a 'social' (sociale) animal.[25] He ascribes to human nature both this social aim and the capacity to plan for present and future; in the light of this aim and this capacity we find principles that belong to natural right.

By appealing to the social nature of human beings Grotius seeks a natural basis for our pursuit of the right (honestum) as well as the advantageous (utile). Following Stoic sources, he claims that our recognition of the right arises from the growth of reason, as we discover a proper object for 'conciliation'. Our conception of the right is our recognition of what accords or conflicts with a rational and social nature.[26]

These claims about sociality and natural right do not necessarily reject Aristotelian eudaemonism. For Aristotle, the Stoics, and Aquinas, the social nature of a human being is part of the human nature that has to be fulfilled in human happiness; hence, the claim that a human being ought to take an appropriate role in a society does not conflict with the claim that each human being pursues his own happiness above all. Scotus rejects Aquinas' view that the pursuit of one's own ultimate good is the proper basis for concern for justice. Grotius does not mention this dispute between Aquinas and Scotus. He says nothing to suggest that he rejects the eudaemonist explanation of the duties belonging to natural right.

Whatever he thinks about eudaemonism, he rejects Carneades' view that utility is the only rational aim that can be founded in human nature.[27] As soon as he has introduced the Stoic notion of sociality (*oikeiôsis*), he rejects Carneades' claim about utility (Prol. §6 fin.). Against Carneades' claim that utility is the mother of the just and fair, he maintains that human nature is the mother of natural right, and would produce a desire for society even if we could satisfy our basic needs for survival without combining with other people (§16). Utility supports natural right, because we cannot supply our basic needs for survival

[23] 'And among these things that are proper to a human being is the desire (appetitus) for society, in other words for a community, not of just any sort, but a tranquil one that is ordered in accordance with the character of human intellect, with those who are of the same kind. This is what the Stoics called *oikeiôsis*.' (Prol. §6) Grotius cites John Chrysostom and Marcus Aurelius.

[24] On §6 Barbeyrac comments: 'But all these points seem to have flowed from what Aristotle said, "that every human being is akin to and a friend to every other" ' (quoted in Greek from *EN* 1155a21–2).

[25] This point is borne out by Grotius' recollection of Aristotle in §7: 'But a human being of mature age knows to treat like cases alike, and has a dominant desire for society, and is the only animal who has language, as a special means to fulfil this desire. Hence it is reasonable to suppose that he also has a capacity for knowing and acting in accordance with general precepts; the things that turn out to be appropriate for him do not belong to all animals, but are suitable for human nature.' This is partly derived from Aristotle, as well as from the Stoic and Patristic sources that Grotius cites.

[26] i 2.1–3. Tuck, 'Modern', argues that Grotius and Pufendorf differ from mediaeval theorists about natural law, because they intend natural law to answer Renaissance scepticism. According to this interpretation, they maintain that some points about self-interest survive the sceptical critique of objective and non-relative values. However, the view that self-interest is the basis of natural law seems as old as Aquinas' eudaemonism; it is not an innovation by Grotius. Saastamoinen, *MFM* 114, fairly criticizes Tuck's view. Haakonssen, *NLMP* 28–30 maintains a view similar to Tuck's.

[27] Grotius' early work, *JP*, ch. 2 (= Williams 14), affirms the social character of human beings, and cites Aristotle.

without the help of others; but it is not the only basis on which we can reasonably assess a particular state.

In all these claims, Grotius never denies that the natural desire for society is subordinate to one's desire for one's own good. He does not defend this eudaemonist thesis against Carneades. Nor does he suggest that it needs defence.[28]

467. Natural Law and Political Principles

Examination of the foundations of Grotius' theory does not suggest any radical innovation in comparison with Suarez. On the contrary, he offers an abbreviated and simplified version of the central naturalist aspects of Aquinas' and Suarez's theory of morality. The elements that Grotius adds from Stoic and Patristic sources supplement the Scholastic position, but they neither conflict with it nor modify its essential claims.

Even though Grotius agrees with Suarez on these basic issues, he does not agree with all his political conclusions. Suarez asserts claims about natural right in opposition to Machiavelli. Though Grotius agrees with him on some points, he does not follow Suarez in allowing a right of resistance.[29] In his long chapter 'On the war of subjects against superiors' (i 4), Grotius further limits even the limited permission that Suarez gives for rebellion.

One of Grotius' arguments against rebellion relies on a conception of rules and principles that Suarez rejects.[30] Grotius speaks as though we should regard principles as rules that give the right answer in most cases, and we should assume that if they do this, it is better to observe them even when they give the wrong answer than to modify the rule.

Grotius' argument is sometimes acceptable; for it may indeed be better to recognize a class of cases where we will not question a rule, even if our violating it would give better results in individual cases. But it does not follow that whenever we have a rule that most often gives the right answer, we should follow it even when it gives the wrong answer. It may be more reasonable to modify the rule so as to take account of the cases where some modification would give a better answer. This is Suarez's point when he argues that the precepts of natural law are not to be identified with the general rules that most often give the right answer. In his view, the precepts of natural law include the circumstances that introduce qualifications into simple generalizations. Grotius overlooks this aspect of Suarez's doctrine here.

Still, he does not adhere rigidly to his general rule. He acknowledges that 'it is a more difficult question, whether the law about non-resistance obliges us in a most serious and most certain danger' (i 4.7.1). He mentions David's rebellion against Saul and the rebellion of the Maccabees against Antiochus. In both cases he argues that only

[28] Contrast Darwall, *BMIO* 6. [29] On Suarez see §451.

[30] 'If the rulers at any time are misled by excessive fear or anger or other passions, so as to deviate from the right road that leads to tranquillity, this is to be held as one of the less frequent cases, which are to be estimated ... by the occurrence of better cases. Now laws take it to be sufficient to take account of what most frequently happens. ... For this is preferable to living without a rule (norma) or leaving the rule to the judgment of everyone.' (i 4.4.3)

extreme and most certain danger (summum certissimumque periculum, i 4.7.5) could justify their action; he rejects every other argument that might be given to support the Maccabean rebellion. He then adds a final doubt about the legitimacy of rebellion for Christians (i 4.7.8).

If, therefore, Grotius allows any right of resistance at all, he limits it to self-defence. He does not allow the form of aggressive war that Suarez allows, when the commonwealth deposes the ruler. He rejects the arguments of contemporaries who allow this power of deposition to inferior officials speaking on behalf of the commonwealth (i 4.6.1). In his view, they have only the status of private persons in relation to the supreme ruler whom they claim the right to depose.

These objections to the right of resistance and deposition ignore Suarez's main argument for attributing a right of aggressive war to the commonwealth against the ruler. Suarez argues that natural law does not permit ruling without regard to the common good, and that therefore the condition of ruling in accord with the common good always qualifies the legitimate transfer of power from the people to the ruler. Grotius accepts Suarez's grounds for founding political society in natural law and the common good. But he does not consider these grounds in his discussion of the right of rebellion. This sharp political difference from Suarez's claims about legitimacy and resistance is all the more striking in the light of the agreement between Grotius and Suarez on moral foundations.[31]

Grotius does not improve on Suarez here. For in agreeing that natural right precedes any right created by a state and its laws, and that natural right includes more moral demands than those referring to survival and physical security, he implies that states, governments, and political institutions may be judged by reference to the social nature of human beings, and to the success or failure of different states in fulfilling it. This judgment may not always justify obedience. An argument for obedience has to rely on empirical premisses that are sometimes open to dispute.

If this objection to Grotius' political doctrine is justified, the Scholastic and naturalist foundations of his moral theory of natural right tend to undermine his political claims. This conflict in his position is apparent to Pufendorf, who sees that the foundations need to be modified in order to remove the elements of natural right that limit the claims of a particular state on the obedience of a subject. Hobbes attacks the political theorists who rely on Aristotelian principles to support their foolish and dangerous objections to the established regime. If Grotius' position were harmonious, Hobbes's criticisms would be unwarranted, because Aristotelian principles would warrant unrestricted obedience. But when we examine the moral foundation of Grotius' position, we find that Hobbes is right, since Aristotelian principles do not warrant the unrestricted obedience that Grotius advocates. This is not a reason to prefer a Hobbesian over an Aristotelian position.

[31] On this particular issue Rousseau's comparison of Grotius and Hobbes contains a grain of truth in a large distortion: 'When I hear Grotius praised to the skies, and Hobbes covered with abuse, I perceive how little sensible men read or understand these authors. The truth is that their principles are exactly alike, they only differ in expression. Their methods are also different: Hobbes relies on sophisms; Grotius relies on poets; all the rest is common to them.' (*Emile* v = Pleiade iv 836 = Foxley, 421–2)

468. Is Grotius a Pioneer?

Examination of Grotius' basic claims about the moral character of natural law does not show that he is the pioneer of a new approach to natural law.[32] His exposition of natural law is brief and simple, in comparison with Suarez's, and it is not embedded in the moral and metaphysical context of Aquinas' Treatise on Law. But these non-Scholastic features of Grotius' exposition do not result in a new view of the relation of natural law to the legislative will of God and to natural rightness and wrongness.[33]

The obscurities in Grotius' views about the connexion of obligation, duty, and right sometimes make it difficult to say where he agrees or disagrees with Aquinas or Vasquez or Suarez. But they do not cast doubt on one central point of agreement; he believes, as they do, that natural rightness precedes any act of God's legislative will, and that natural law essentially corresponds to the requirements of natural rightness. Since he takes morality to consist in observance of what is naturally right, he holds a naturalist conception of morality.

On these basic issues, Grotius agrees with the naturalists, though it is not clear whether he agrees more closely with Vasquez or with Suarez. These points of agreement refute Barbeyrac's claim that Grotius is a pioneer. He does not introduce a jural conception of morality, but rejects a jural conception in favour of Scholastic naturalism. Nor does his belief that there would be morality even if God did not exist make him a secular moralist; since he shares this belief with leading Scholastics, he is no more secular on this point than they are. His reply to Carneades' scepticism about justice does not reduce justice to utility, but sticks to a Stoic and Peripatetic naturalist conception.

On these points in his theory of morality, therefore, Grotius is no pioneer. The most plausible assessment of his position is Gershom Carmichael's judgment that Grotius extracts from Scholastic views on natural law and moral theology the essential points that are relevant to moral and political philosophy. We have noticed that both Aquinas and Suarez recognize questions and forms of argument that belong to moral philosophy in particular; but they do not gather these questions and arguments in a separate treatise. Grotius may make a different impression on a reader because he collects some of the main elements in Scholastic moral philosophy, and clarifies them with references to Greek and Latin writers and to the Christian Fathers. But the doctrine that he expounds is a naturalist doctrine of morality such as we find both in Aquinas and in Suarez.

[32] Tierney, *INR*, ch.13, offers a balanced discussion of what is and is not distinctively modern in Grotius (without detailed discussion of Barbeyrac's interpretation). The 'natural law' view that Schneewind traces to Grotius in 'Kant and natural law' 56–8 is closer to Pufendorf than to Grotius. I am not taking a position on whether Grotius is in some way an innovator in political theory, as argued by Haakonssen in 'History'. Haakonssen acknowledges that Grotius' views about intrinsic morality and natural law are traditional (248–9); contrast his view quoted in §464 above.

[33] Beiser, *SR* 276, describes an interpretation of natural law theory. 'It assumed that human beings are self-sufficient atoms with a fixed nature prior to the social whole. Rather than depending on the social whole for the formation of their needs and capacities, individuals enter into society with them already formed, and then construct a social order and state according to their self-interest . . . Although this interpretation is indeed correct for the social contract theory developed by Hugo Grotius, Hobbes, John Selden, and Samuel Pufendorf earlier in the seventeenth century, it would be incorrect to generalize it and to apply it to the great majority of natural law theorists in the post-Restoration era.' Apart from the oddity of contrasting Pufendorf with the post-Restoration era, this description unjustifiably assimilates Grotius to Hobbes and Selden, in opposition to Cumberland and the others.

Barbeyrac, therefore, misunderstands Grotius in presenting him as a pioneer. To see why Barbeyrac is so wrong about Grotius, we need to consider his view of Pufendorf. He could hardly have reached his view about Grotius if he had not already accepted the views of Pufendorf, and set out to reconcile Grotius with Pufendorf in a distinctively modern theory of natural law. His efforts to make Grotius the first modern moralist, and a rebel against Scholastic views of morality, are basically misguided.

34

HOBBES: MOTIVES AND REASONS

469. Hobbes's Aims

Hobbes is dissatisfied with the error and disagreement among moral philosophers, in contrast to the consensus that natural philosophers have reached. In natural philosophy, inquiry proceeds from indisputable and undisputed first principles, and secures agreement at each step. Moral philosophy, by contrast, presents us with unresolved controversy, because inquirers begin from common beliefs and apparently plausible views.[1] The Aristotelian dialectical approach to moral inquiry begins from 'appearances' and does not confine itself to evident and indisputable starting points.[2] Hobbes believes that it leads to insoluble and fruitless disputes.

He does not believe that this difference between the progress of natural philosophy and the relative backwardness of moral philosophy marks a difference in the subject matter or in the appropriate method. Nor does he draw the sceptical conclusion[3] that knowledge of moral questions cannot be found, or the nihilist conclusion that there is no moral reality to be known. He believes that disputes result simply from failure to apply the method of natural philosophy.[4] We should begin with clear and indisputable axioms about human nature, and avoid the dialectical method that relies on common beliefs.[5]

[1] '[Those men who have taken in hand to consider nothing else but the comparison of magnitudes, numbers, times, and motions, and how their proportions are to one another] . . . proceed from the most low and humble principles, evident even to the meanest capacity; going on slowly, and with most scrupulous ratiocination.' (*EL* 13.3) '[Moral and political philosophers] . . . take up maxims from their education, and from the authority of men, or of custom, and take the habitual discourse of the tongue for ratiocination; and these are called dogmatici.' (*EL* 13.4) For Hobbes's rejection of appeals to received opinion cf. *Civ*. 1.2 (on human beings as naturally political); 10.8, 12.12 (on rhetoric). Skinner, *RRPH* 263, gives parallels from Bacon and others. References to *EL* follow Gaskin's numeration, which includes *Human Nature* and *De Corpore Politico*, with chapters numbered continuously (so that *De Corpore Politico* i 1 = *EL* 14).

[2] On Aristotle's method see §67.

[3] Tuck, *PG* 285–306, discusses the influence of scepticism on Hobbes's philosophical development. Skinner, *RRPH* 8–9, 299, expresses doubts about the extent of such influence.

[4] '. . . amongst all the writers of this part of philosophy, there is not one that hath used an idoneous principle of tractation.' (commodo usus sit docendi principio, *Civ*., Ep. Ded.) I quote from the translation of *Civ*. by 'C.C', published in 1651 and printed by Warrender and Lamprecht. Warrender, ed. of *DC* (Eng), 4–8, discusses the early evidence on the authorship of the English version, and argues that Hobbes is probably the translator; some of the variations between the Latin and the English versions are difficult to explain as decisions or errors of a translator other than Hobbes. Tuck, ed. of *DC*, pp. xxxiv–xxxvii, argues that Hobbes is not the translator, but he does not satisfactorily answer Warrender's arguments. Silverthorne's translation is in Tuck and Silverthorne's edition.

[5] Hobbes's method is discussed by Skinner in *RRPH* 294–375, who is criticized in Gauthier's review.

Hobbes expects his inquiries to settle moral disputes by offering new solutions. He will not show that (for instance) Aristotle is right against Chrysippus on one issue, or that Ockham is right against Aquinas on another. He believes that his answers will fall outside the range of answers that have been subjects of controversy in moral philosophy. The method of natural philosophy will produce consensus in moral thinking too.[6]

Some of Hobbes's complaints about disagreement in moral philosophy are familiar. The persistence of philosophical disputes is a source of one Sceptical argument for suspension of judgment. Sextus does not draw exactly Hobbes's contrast between natural and moral philosophy; he treats all sciences as open to Sceptical doubt. But he has something corresponding to Hobbes's distinction, since he recognizes instances of disagreement about specific cases ('Ought I to eat or to bury or to cremate my parents?') in the area of morality more than in the area of beliefs about the physical world ('Are ripe tomatoes red or blue?'). Hobbes answers the Sceptic by urging that something like the method of natural science will settle disputes about morality.

It would be unreasonable of him to claim that the persistence of disputes in moral philosophy implies lack of progress. Even if his contemporaries do not agree about the explanation of incontinence, the progress of debate shows that it will not do simply to assert either that the Socratic analysis is obviously true or that it is obviously false. Similarly, though the Scholastics disagree about the relation of natural law to the will of God, the debate summed up by Suarez makes it clear what each side needs to say to defend its position. Examination of the nature and sources of the disputes casts doubt on Hobbes's claim that the discipline has made no progress in 2,000 years.

His main objection to his predecessors is not that they disagree with one another, but that their doctrines are dangerous. A reconstruction of moral philosophy is necessary for the proper understanding of the moral basis of political life, since the mistaken moral philosophy of his predecessors has led to political error. Mistaken theories of Greek and Latin writers have encouraged citizens to believe that they have rights against their rulers. Citizens claim the right to judge their rulers by standards derived from moral principles, and so they try to replace their rulers by agitation or revolution.

Such dangerous claims may be traced back to Aristotle's objections to unjust regimes.[7] Though Aristotle does not derive these objections from a general theory of the rights of the citizen, and does not use them to defend disobedience or revolution, his claims about justice

[6] 'And truly the geometricians have very admirably performed their part . . . If the moral philosophers had as happily discharged their duty, I know not what could have been added by human industry to the completion of that happiness, which is consistent with human life. For were the nature of human actions as distinctly known (cognita pari certitudine), as the nature of quantity in geometrical figures, the strength of avarice and ambition, which is sustained by the erroneous opinion of the vulgar, as touching the nature of right and wrong, would presently faint and languish. . . . But now on the contrary, that neither the sword nor the pen should be allowed any cessation; that the knowledge of the law of nature should lose its growth, not advancing a whit beyond its ancient stature; that there should still be such siding with the several factions of philosophers, that the very same action should be decried by some, and as much elevated by others; these I say are so many signs, so many manifest arguments, that what hath hitherto been written by moral philosophers, hath not made any progress in the knowledge of the truth. . . . So that this part of philosophy hath suffered the same destiny with the public ways, which lie open to all passengers to traverse up and down . . . ; so that what with the impertinencies of some, and the altercations of others, those ways have never a seed time, and therefore yield never a harvest.' (*Civ.*, Ep. Ded.)

[7] Aristotle discusses instability in different forms of government in *Politics* v.

suggest possible defences. The Scholastics develop Aristotle's arguments. Suarez uses them to support a qualified defence of rebellion and tyrannicide.[8]

Contemporary experience in England, Scotland, Ireland, and Continental Europe suggests to Hobbes that this critical attitude to rulers undermines states and societies.[9] Grotius shares some of Hobbes's fears about the effects of philosophical arguments for disobedience, and so he tries to blunt the critical edge of some Scholastic theories.[10] Hobbes, however, does not share Grotius' view that the Scholastic doctrines can be largely maintained without endangering civil peace.[11] He believes they are so dangerous that they should be discarded. Once we discover the true basis of morality, we can explode the moral theories that support dangerous political demands.

These moral theories assert that some things are important enough to justify disobedience. No Scholastic argues that civil peace does not matter, but Scholastics who rely on Aristotelian arguments assert that extremely unjust rulers should not be obeyed. If we have to balance the importance of maintaining peace against the importance of maintaining justice, we are not (from Hobbes's point of view) reliable supporters of peace. To prevent this sort of balancing, we need to show that nothing matters enough to justify the disturbance of civil peace. Hobbes argues, therefore, that peace is absolutely prior to all other moral considerations; they all presuppose the maintenance of peace, and therefore cannot justify disturbances of the peace.

This is an over-simple summary of the practical and political aim of Hobbes's moral philosophy. In support of this aim, he goes back to human nature as the foundation of moral philosophy, because he believes that his predecessors go wrong at this basic level. Nor does he confine himself to moral and political philosophy. He does not, for instance, try to defend the priority of peace by a dialectical argument to show that, on reflexion, we really believe peace matters more than anything else. He does not suggest that if we reach 'narrow reflective equilibrium' among our moral and political views, we will accept the supremacy of peace.[12] He believes that if we recognize the true foundation of moral philosophy, we can

[8] On Suarez see §451.

[9] 'And now, considering how different this doctrine is, from the practice of the greatest part of the world, especially of those western parts, that have received their moral learning from Rome, and Athens; and how much depth of moral philosophy is required in them that have the administration of the sovereign power; I am at the point of believing this my labour as useless, as is the commonwealth of Plato. . . . But when I consider again, that the science of natural justice, is the only science necessary for sovereigns, and their principal ministers; . . . and that neither Plato, nor any other philosopher hitherto, hath put into order, and sufficiently, or probably proved all the theorems of moral doctrine, that men may learn thereby, both how to govern, and how to obey; I recover some hope, that at one time or other, this writing of mine, may fall into the hands of a sovereign, who will consider it himself . . . without the help of any interested, or envious interpreter; and by the exercise of entire sovereignty, in protecting the public teaching of it, convert this truth of speculation, into the utility of practice.' (*L.* 31.41) 'And by reading of these Greek and Latin authors, men from their childhood have gotten a habit, under a false show of liberty, of favouring tumults, and of licentious controlling the actions of their sovereigns; and again of controlling those controllers; with the effusion of so much blood, as I think I may truly say there was never anything so dearly bought as these western parts have bought the learning of the Greek and Latin tongues.' (*L.* 21.9) I cite *L.* by chapter and section in Curley's edition, which also quotes some of the significant variants in the Latin version (cited as 'LV'). LV is discussed at length by Tricaud, xvii–xxix (and briefly by Laird, *H* 33, and Curley, lxxiii). He argues (despite the absence of external evidence) that some parts of it antedate the English, which expands the Latin, whereas other parts postdate the English. Cumberland (see §530) cites the Latin version on the assumption that it is later.

[10] On Grotius see §467.

[11] On Hobbes and Grotius see Tuck, *PG* 305. We lack direct evidence to show that Hobbes read Grotius.

[12] On narrow reflective equilibrium see Rawls, *TJ* 42–5.

dismiss any confident and reflective moral judgments that threaten the supremacy of peace; all such judgments rest on errors about the foundation.

We have spoken of Hobbes's opposition to an 'Aristotelian' and 'Scholastic' view. But it is not easy to say whom he has in mind; for, in contrast to Scholastic writers, he does not compare his views systematically with the views of his predecessors. His explicit targets include Greek and Latin historians, orators, and philosophers. He often mentions Aristotle, both because of his historical prominence and because contemporary writers have relied on him.[13] It would have been instructive if he had discussed Grotius, who shares Hobbes's concern with peace and war, but defends a largely traditional moral theory. But he does not engage Grotius. Nor does he discuss the moral and political views of Scholastic writers—perhaps because he does not think much of them—and so it is not clear how well he knows them. It is reasonable to assume that he knows the *De Legibus* and the other political writings of Suarez, since Suarez became notorious in both France and England as a supporter of regicide, and the Civil War that led to the execution of Charles I made his views rather topical.[14] But though Hobbes refers to Suarez's works on free will, he does not cite his political writings.[15]

We therefore have to present the dispute between Hobbes and his opponents by considering where his views disagree with theirs, and what one might say on behalf of each side.

470. Passion v. Will

Hobbes believes that his new method demands an understanding of human action; if we grasped it as clearly as we grasp the basic elements of geometry, we could resolve

[13] See Laird, 'Aristotle'. Barker, *PTPA* 523, mentions a newspaper published briefly in 1654, entitled *Observations, Historical, Political and Philosophical upon Aristotle's First Book of Political Government*, which seeks to show 'the happiness of those people that live under such a government, where it is the duty of the governors to rule by law, as the Lord Protector here hath sworn to do'.

[14] On Suarez see §451.

[15] He sometimes mentions Suarez as a typical example of Scholastic unintelligibility. After quoting the long title of a chapter of Suarez's work 'Of the concourse, motion, and help of God' (the first opusculum in Suarez, *OO* xi), he comments: 'When men write whole volumes of such stuff, are they not mad, or intend to make others so?' (*Hom.* 8 = *EW* iii 70). In his view, Scholastic writers, such as Peter Lombard, Scotus, and Suarez, support the authority of the Pope by writing incomprehensible works that only a priestly class can read (*Behemoth*, Part 1 = *EW* vi 185). He does not expect them to have a wider appeal: 'But for the multitude, Suarez and the Schoolmen will never gain them, because they are not understood' (*EW* iv 330). He has more than a passing knowledge of Suarez's work on human freedom and divine foreknowledge. He attacks its account of some Scriptural passages (*EW* v 10) and its absurd conclusions: 'Whereof one conclusion is in Suarez, that God doth so concur with the will of man, that "if man will, then God concurs", which is to subject not the will of man to God, but the will of God to man' (*EW* v 18). He claims to find in this work the source of most of Bramhall's arguments on free will: '. . . whoever chanceth to read Suarez's Opuscula, where he writeth of free-will, and the concourse of God with man's will, shall find the greatest part, if not all, that the Bishop hath urged in this question' (*EW* v 37). Bramhall replies: 'It is indifferent to me whether the greatest part of what I urge in this question, or all that I urge, or perhaps more than I urge, be contained in Suarez his Opuscula. . . . In all my life, that I do remember, I never read one line of Suarez his Opuscula, nor any of his works the sixteen years last past. I wish he [sc. Hobbes] had been versed in his greater works, as well as in his Opuscula, that he might not be so averse from the Schools.' (*CMH* = *Works* iv 259–60) Bramhall implies that he had once read Suarez's major works, and that he still finds them reasonable. See also Hobbes, *EW* v 176; 266 (distinguishing Suarez, Scotus, and other Scholastic writers, whom Hobbes slights, from Protestant theologians, whom he respects). Suarez's works, then, seem to give us a fair idea of the style, method, and substantive positions that Hobbes rejects. Martinich, *TGL* 102, 132–4, 379–80, mentions the relevance of Suarez's views on law and political obligation to Hobbes's concerns, but mentions no references or allusions to Suarez in political contexts.

controversies about morality.[16] His predecessors have obscured the facts by their appeals to unintelligible faculties and abilities. He tries to correct them by reference to facts about desire, pleasure, and motivation that he takes to be indisputable.

Hobbes agrees with the Scholastics that an account of morality should rely on an account of action. We have seen how Aquinas' conception of the final good rests on his account of will, rational agency, and freedom. His distinctive contribution lies in his particular views about the nature of action.

To grasp the role of Hobbes's theory of action in his whole position, we might try to answer these questions: (1) Is his account of action plausible? (2) Is it an independent foundation for his moral theory, or should it persuade us only if we already accept his moral views? (3) Does it support his moral theory? (4) Are his moral claims plausible?

These questions suggest that Hobbes's views may not all stand or fall together, and that we might try different partial defences. If we agree with Hobbes's theory of action, but disagree with his moral theory, we may seek to construct another account of morality on a Hobbesian foundation. If we disagree with his theory of action, but agree with his moral theory, we should defend his moral claims independently of his foundation.

Hobbes rejects a basic point of agreement between Scholastics. Both intellectualists and voluntarists hold that human action essentially proceeds from the will and not only from passions. They believe that will, understood as rational desire (appetitus), differs from passion (sensory desire) because it is guided by rational deliberation, and does not simply follow sense-perception. This is not a Scholastic innovation; it simply develops Plato's and Aristotle's division between rational and non-rational desire.[17]

Hobbes denies this distinction between passion and will, by denying that will is a distinctively rational desire. In his view, will is simply the last 'appetite' (i.e., desire, appetitus) in deliberation.[18] Aquinas believes that will is a rational desire confined to rational agents, because it results from deliberation. But Hobbes believes that non-rational agents also deliberate, so that if will is desire resting on deliberation, it is not confined to rational agents. Scholastics claim that human agents act voluntarily because they act on their will and deliberate desire, whereas non-rational animals lack fully voluntary action because they lack deliberation and will. But if Hobbes is right, the will is not an intrinsically rational desire aiming at the good rather than the pleasant.

His account of deliberation assumes that desire is simply anticipatory pleasure or pain, which is the internal movement explaining action (*EL* 7.1–2). We move towards ends (7.4) that differ in their closeness or distance. We deliberate by being struck in succession by different attractive features of a situation.[19] The strongest appetite that emerges from that process immediately precedes action; this is the will.

[16] *Civ.*, Ep. Ded., quoted in §469. [17] On intellectualism and rationalism see §§256, 389.

[18] More fully: 'In deliberation, the last appetite, or aversion, immediately adhering to the action, or to the omission thereof, is that we call the will; the act, not the faculty, of willing. And beasts, that have deliberation, must necessarily also have will. The definition of the will, given commonly by the schools, that it is a rational appetite, is not good. For if it were, then could there be no voluntary act against reason. For a voluntary act is that, which proceedeth from the will, and no other. But if in stead of a rational appetite, we shall say an appetite resulting from a precedent deliberation, then the definition is the same that I have given here.' (*L.* 6.53) Cf. *EL* 12.2; *Hom.* 11.2.

[19] 'When in the mind of man, appetites, and aversions, hopes, and fears, concerning one and the same thing, arise alternately; and divers good and evil consequences of the doing, or omitting the thing propounded, come successively into our thoughts; so that sometimes we have an appetite to it; sometimes an aversion from it . . . the whole sum

Non-rational agents, therefore, also deliberate. They hesitate at the idea of something repellent and advance at the idea of something attractive; hence they deliberate, and act on their wills. Our goal-directed movements, therefore, do not rely on a rational appearance of an overall good (*EL* 7.5). Hence the Scholastic distinction between will and passion is misguided.[20]

This account of deliberation refers only to non-normative states; it does not mention our estimate of the value of the different options that occur to us in deliberation. It does not distinguish our being more attracted to one of two options from our believing that it deserves to be preferred. If we believe (as we suppose) that one option deserves to be preferred, we believe that the reasons for it are better than the reasons for the other option. This aspect of deliberation and will has no place in Hobbes's account; he does not suggest that our will results from the judgment that one option is better than the other, or from the judgment that we have stronger reasons for pursuing it.

471. Hobbes and Greek Scepticism

Hobbes's non-normative conception of deliberation recalls the Greek Sceptics' account of living without belief.[21] Sceptics take themselves to abandon the dogmatic aim of forming attitudes to the world on the basis of evidence and the weighing of reasons; they do not consider whether p is true before they assent to p. They claim to assent to appearances only to the limited extent that is implied by 'yielding', according to how the appearances strike them. Hobbes believes that we ought to treat deliberation and desire in purely psychological and non-normative terms. Deliberation and will, in his account, result from yielding successively to a sequence of appearances about different options, without any rational assessment of their value.[22]

This comparison between Hobbes and the Greek Sceptics is misleading on one point. The Sceptics agree with their dogmatic opponents that belief (*doxa*) is to be understood as a normative state; we form a belief by an attempted assessment of the evidence, and if we change our view about the evidence, we change our belief. Sceptics agree that dogmatists have beliefs, since their view of the world rests on an attempted rational assessment of the evidence. The dogmatists are wrong, however, to suppose that they rationally assess the evidence. Since Sceptics see the dogmatists' error, they give up forming beliefs. Their yielding to appearances is not belief, because it does not rest on an assessment of evidence, and therefore it is non-normative. The meat in the display case looks bright red, but if we are dogmatists we may not infer that it is red, if we remember that a red light is shining on it. The evidence that would otherwise persuade us to believe that the meat is red is open to question once we remember the red light shining on the meat, and so we will not hastily infer that the meat is fresh. But we yield to appearances when we find that the meat looks

of desires, aversions, hopes and fears, continued till the thing be either done, or thought impossible, is that we call deliberation.' (*L.* 6.49)

[20] Hobbes's rejection of the division between will and passion is discussed by James, *PA* 135; Tuck, 'Moral philosophy' 184.

[21] On Scepticism and belief see §139.

[22] On Scepticism and modern moral philosophy see §462.

red and do not question whether it is red, and we yield to them again if we find (when we get it home, in normal light) that it looks dull and dark; in neither case do we take the further step of considering whether it is really how it looks.

The Sceptics' account of the antecedents of action is equally non-normative; they describe a sequence of appearances causing us to yield to one appearance that results in our choice of one option. But the Sceptics, in contrast to Hobbes, do not regard this as deliberation. Aristotelian deliberation involves a rational estimate of grounds for preferring one or another option, and our election is guided by this rational estimate. Sceptics accept this description of deliberation, and therefore give up deliberation, because they make no rational estimates.

Hobbes, however, does not claim to reject deliberation. He does not agree with the Sceptical view that deliberation is a normative activity that dogmatists engage in because of their mistaken normative views. He claims to identify the intelligible elements in deliberation, and hence to describe and to analyse the activity that he and his opponents all engage in. His description is meant to be reductive, since it gives a clear, non-mysterious account of the character of deliberation, by identifying it with a series of simpler and more intelligible mental states. This reduction to something simpler is meant to vindicate the reality of deliberation, not to deny it; Hobbes intends us to agree that his analysis captures what we do when we deliberate, not to conclude that we do not deliberate.

He is right, therefore, to claim that his account of action excludes the Scholastic account, and the Scholastic ethical theory that rests on it. For his analysis of deliberation implies that the Scholastics are wrong to treat will as a distinctively rational appetite.

472. Objections to Hobbes's Account of Will

But ought we to accept Hobbes's account of deliberation? This question divides into three: (1) Is deliberation as described by Hobbes (let us call it 'H-deliberation') really deliberation, so that he gives a vindicating reduction of deliberation? (2) If not, is he right to reject a normative account of deliberation and will? (3) If he is right to reject it, is H-deliberation a good substitute for deliberation?

If we agree that H-deliberation is possible, why should we identify it with deliberation? H-deliberation is not the kind of practical thought that we take to be distinctive of rational agents; for we suppose that they reach a decision in favour of one action or the other in the light of some conception of the overall costs and benefits of their actions. Hobbes does not show that any such conception underlies the advances and hesitations of non-rational agents; hence the advances and hesitations of H-deliberation do not seem to be sufficient for deliberation.

H-deliberation makes a deliberating agent insensitive to any distinction between the strength and the rational weight or 'authority' of desires.[23] This distinction is Butler's formulation of the point underlying Plato's and Aristotle's division between rational and non-rational parts of the soul. It seems to capture a feature of our ordinary deliberation that separates it from H-deliberation. We might, for instance, first H-deliberate, and then ask

[23] See §683 on Butler, §831 on Reid.

ourselves whether we should do what our H-deliberation has inclined us to do. If the police are investigating a crime that I believe my friend George has committed, I may be inclined to lie to protect George, but also inclined to tell the truth because I am afraid of being prosecuted, and because I am angry at George and sympathetic to his victim. But after this H-deliberation, I may reconsider what to do, and ask myself which of these inclinations I should follow. This reconsideration seems to be deliberation; it does not seem to be further H-deliberation, since it examines the reasons for and against the different options.

H-deliberation, therefore, does not seem to be deliberation, and so Hobbes does not seem to have found a vindicating reduction of deliberation to H-deliberation. But what does he think about people who claim to engage in deliberation rather than H-deliberation? Are they mistaken about the character of their mental states, so that they falsely believe they are thinking about the merits of an action when they are really only experiencing a sequence of inclinations and aversions? If this is his view, any alleged deliberation beyond H-deliberation is an invention of the Scholastics, with no basis in the real antecedents of action.

Alternatively, Hobbes might take the view of the Greek Sceptics, admitting that some people deliberate and do not simply H-deliberate, but arguing that these people's deliberation lacks the basis that they think it has. Dogmatists suppose that we can discover reasons that do not simply register the strength of our preferences; but if we cannot find any such reasons, it is pointless to deliberate, though we will still H-deliberate.

If Hobbes took this line, suggesting that we will abandon deliberation when we see it is baseless, he would undermine his argument to show that will is simply the last appetite in H-deliberation. If deliberation is not simply H-deliberation, will is not simply the last appetite. If Hobbes held the Sceptical view, he would agree that we are capable of acts of will, but argue that we have no reasonable basis for them.

It is worth comparing Hobbes with the Greek Sceptics in order to see that he is committed to the eliminative view of deliberation; his claims about the will go beyond the apparently more plausible view that deliberation is possible but pointless. He takes himself to hold a vindicating reductive view of deliberation. He seems, however, to be committed to an eliminative view. He offers a mental substitute for deliberation that fails to mark the distinctions, especially those based on power and authority, that we mark in deliberation, as normally understood.

To support his eliminative position, Hobbes needs to show that we lack the mental capacities that would allow us to engage in more than H-deliberation. But he does not try to show this, and it seems difficult to show. Quite ordinary choices seem to presuppose some capacity for deliberation that involves weighing merits. We need quite strong arguments if we are to be convinced that we misconceive what we are doing when we suppose we are weighing merits. In comparison with the Scholastic account of deliberation and action, Hobbes's account is clear and simple; but it does not explain the choices and actions it seeks to explain.

473. Deliberation and Practical Reason

These doubts about Hobbes's account might matter less if we thought it deprives us of nothing that is practically important. If some H-deliberation results in choices that we

normally regard as reasonable, we can still distinguish reasonable from unreasonable action by appealing to different patterns of H-deliberation.

Hobbes faces a question analogous to a question that arises for the Greek Sceptics who claim to live without beliefs. We may concede, for the sake of argument, that the Sceptical outlook is consistent, and that it is logically possible for someone to live by yielding to appearances without beliefs about good and bad. But how can someone claiming to adopt such an outlook claim to live an ordinary life? For our ordinary life seems to rely on the beliefs that the Sceptic abandons; we often think we see more reason to believe and to do one thing rather than another. Sometimes I have a vivid impression of an elliptical coin, but I do not believe that the penny is elliptical. I pick it up and put it in a slot machine designed for a round coin. Do I not rely on beliefs that the Sceptic abandons?

Sceptics deny that such cases raise any difficulty. In their view, Sceptics do not yield to all appearances. In the case we have mentioned, they have a more vivid and more forceful appearance of the coin being round, and so they yield to that one, and put the coin in a slot machine, just as they would have if they had believed it to be round. Hence, they claim, the Sceptic can live an ordinary life. But this conclusion is plausible only if Sceptics have an appropriately forceful appearance in all or most of the cases where ordinary people form a given belief. Why should we expect they will have such an appearance? I may have a very strong and forceful appearance that this is real fruit in the bowl, but I may not try to eat it if I suspect that it is made of wax.

The Sceptic might deal with such cases by arguing that if I do not yield to the appearance of its being real fruit, the appearance cannot have been as strong as the appearance of its being made of wax. This answer is unconvincing. If strength of appearances is determined by phenomenal features distinct from whether or not I act on the appearances, my yielding to the strongest appearances may not lead me to follow ordinary life. If, however, an appearance is strongest in virtue of the fact that I act on it, the strength of the appearance may depend on the rational assessment of the evidence; but that basis for determining strength is not available to the Sceptic. Neither conception of strength (or forcefulness, or vividness) suggests that the Sceptic's yielding to the strongest appearance agrees with ordinary life.

Just as Sceptics claim to agree with ordinary life, Hobbes assumes that H-deliberation reaches the conclusions that we reach by ordinary deliberation. He claims that deliberation results from the foresight of good or evil consequences, and better deliberation results from the foresight of more consequences.[24] He assumes that if we foresee more of the consequences, we take account of their goodness and badness in our deliberation and in any decision that is based on deliberation. This is a reasonable assumption about ordinary deliberation, but not about H-deliberation. In ordinary deliberation we consider the goodness and badness of the consequences of an action, and our eventual choice results from our estimate of the overall goodness of an action. But H-deliberation is not guided by a comparison of the net balance of future expected good in different courses of action. H-deliberation is a series of advances and hesitations resulting from the appearance of

[24] 'But for so far as a man seeth, if the good in these consequences be greater than the evil, the whole chain is that which writers call apparent, or seeming good. . . . so that he who hath by experience, or reason, the greatest and surest prospect of consequences, deliberates best himself; and is able when he will, to give the best counsel unto others.' (*L.* 6.57)

expected pleasures and pains, and we choose the proposed action that arouses our strongest appetite as a result of these advances and hesitations.

Even if we confine goods to pleasures, we have no reason to assume that in the H-deliberating agent the apparently larger sum of future pleasures always arouses the stronger appetite. We may, for instance, be irrationally indifferent to the remoter future, or irrationally obsessed by it at the expense of shorter-term benefits, and these irrational tendencies may determine the course of H-deliberation. Consideration of more consequences may not improve my deliberation. If I am thinking about travelling by air, and I consider all the possible consequences, I may think about the possibility of the aircraft's crashing or exploding, and this thought, however improbable I may take the event to be, may turn me irrationally against travel by air. I would have reached a more reasonable conclusion if I had ignored these prospects.

If the apparently larger sum of future pleasures may not arouse the stronger appetite, H-deliberation may not follow the apparent balance of future pleasures. H-deliberation considers whatever happens to excite desire or aversion. We do not necessarily deliberate best, therefore, if our H-deliberation considers the 'greatest and surest prospect of consequences'; for the sparse equipment of H-deliberation includes no provision for the rational consideration of these prospects; if we are not guided by the expected balance of future good, the consideration of more consequences may produce irrational desires.

H-deliberation, therefore, does not seem to justify Hobbes's claims about the character of deliberation. His remarks about better and worse deliberation rely on a normative conception of deliberation, taking it to consider what is best overall and what we ought to do in the light of what seems best overall. H-deliberation has no room for this normative conception. If deliberation is guided by consideration of what promotes the overall good, the consideration of more consequences results in better deliberation, as Hobbes claims. But, if we are to accept this claim about deliberation, we can hardly confine it to H-deliberation. It is difficult, therefore, for Hobbes to show that H-deliberation reaches the conclusions that we reach from deliberation in ordinary life. The question that arises for the Greek Sceptics also arises for him.

474. Conflicting Views on Incontinence

Hobbes could answer these objections if he could assume that when we consider different consequences of an action, our advances and hesitations result from an estimate of overall goodness and badness. He may assume that the prospect of a larger sum of pleasures always arouses a stronger desire, so that deliberation and will result in an effort to get the apparently greater pleasure. If we assume that pleasantness and goodness are the same, both ordinary deliberation and H-deliberation are guided by belief about the overall good. This assumption makes H-deliberation appear less unlike ordinary deliberation than it really is, since it comes to somewhat similar conclusions.

This reconciliation of H-deliberation with ordinary deliberation is open to doubt if we are not always guided by overall goodness. The examples we have given suggest that the strength of our desires may diverge irrationally from our beliefs about overall good. Hobbes might try to reject our examples by arguing that in cases such as the 'irrational' fear of flying

we are really exaggerating the probability of a crash. If we are more afraid of flying than of driving on a dangerous road, we must hold false beliefs about the probabilities. Relative to our estimate of probabilities, then, our fear of flying is rational, and it does not refute Hobbes's empirical assumption about H-deliberation.

But however plausible or implausible this empirical assumption may be, it raises a difficulty for Hobbes. If our last appetite is always directed towards the apparently larger sum of pleasures, we cannot act contrary to our view about what will maximize the net balance of future pleasure. This is the view that Socrates holds in the *Protagoras*; he uses it both to reject the possibility of incontinence and to explain the appearance of incontinence. In his view, we appear to be incontinent in choosing the apparently lesser pleasure over the apparently greater only because we actually exaggerate the pleasure of whatever is temporally closer.[25] Hobbes, however, criticizes the Scholastic view because it excludes incontinence, and so he cannot accept the Socratic dissolution of incontinence.

To show that the Scholastics cannot allow incontinence he claims that they are committed to accepting this argument: (1) Incontinent action is voluntary. (2) All voluntary action is initiated by the will. (4) Hence no voluntary action is contrary to our will. (5) But our will aims at what appears best all things considered. (6) In acting incontinently we do not aim at what appears best all things considered. (7) Therefore incontinent action is impossible. Hobbes believes that the Scholastics are committed to the first six steps. Since he assumes that the conclusion is unacceptable, he assumes that incontinence is possible.

Hobbes is right to suggest that incontinence raises difficulties for Aquinas' view of the will.[26] One might suppose that his account is preferable to the Scholastic account in this respect, since H-deliberation leaves room for incontinence. But the empirical assumption that brings H-deliberation closer to ordinary deliberation requires the denial of incontinence.

Hobbes's views on deliberation and will, therefore, present him with a dilemma. On the one hand, his description of H-deliberation supports his objections to the Scholastic account of will, and also allows the possibility of incontinent action. But his description does not fit his claims about the connexion between deliberation and consideration of overall good. On the other hand, he may support his claims about deliberation and overall good by the empirical assumption that we always pursue the greater apparent good; but this empirical assumption conflicts with the possibility of incontinence.

The dilemma raises a question about Hobbes's general position. He cannot easily abandon his view that deliberation is simply H-deliberation; for that is the central element in his anti-Scholastic account of the will. But since H-deliberation does not support all his claims about better and worse deliberation, we may doubt whether his non-normative description of H-deliberation supports his ethical theory.

475. Will, Passion, and Freewill

Hobbes's views about the will support his position in the controversy about freewill. His views on this controversy are most clearly seen in the dispute with Bramhall. Since Bramhall

[25] On Socrates see §27. [26] On Aquinas see §295.

is sympathetic to Scholastic views about will and passion that Hobbes rejects, we might expect Hobbes to give reasons for rejecting the account of freewill that Aquinas offers. This, however, is not exactly what we find. Aquinas' view cuts across the dispute between Hobbes and Bramhall.

The disagreements between Hobbes and Bramhall recall those between Aquinas and Scotus. Both Hobbes and Bramhall reject Aquinas' intellectualism, the view that the will is determined by the greater good presented by reason. Bramhall, however, follows both Aquinas and Scotus in affirming the rationalist view that separates will from passion; on this point Hobbes is an anti-rationalist, in contrast to the mediaeval voluntarists. Bramhall is also an incompatibilist and indeterminist, since he believes in acts of freewill that cannot be parts of sequences of necessitating causes (i.e., sequences in which the earlier member is in each case sufficient for the later). Against Bramhall Hobbes defends the compatibilist view that we have attributed to Aquinas, and goes further by accepting soft determinism.

The mediaeval dispute draws our attention to possibilities that Hobbes and Bramhall overlook. Bramhall maintains a voluntarist, indeterminist, and rationalist position. He assumes that intellectualism is incompatible with rationalism, because intellectualists reduce the will to a passion, by taking it to be determined by the greater apparent good. In his view, then, the difference between will and passion matters because the will has to be free of all determination. For the same reason he assumes that rationalism requires indeterminism. Hobbes replies by rejecting both rationalism and indeterminism. Neither Hobbes nor Bramhall seems to consider rationalist compatibilism.

Bramhall holds the indeterminist view that a free agent is 'that, which, when all things are present which are needful to produce the effect, can nevertheless not produce it' (Hobbes, *LN* §§32, 35).[27] He is an indeterminist because he is a voluntarist; he appeals to the possibility of choosing the lesser good when one knows the greater good. Hence he offers Medea as an example of incontinence supporting voluntarism (§23). He takes this voluntarism to support rationalism (i.e., the rejection of Hobbes's sentimentalism) about the will. He contrasts spontaneous agents with rational and deliberative agents, and claims that only the latter are free. (Bramhall, *DLN* §6; *DTL* §8; Hobbes, *LN* §8.) He assumes that if the will is free from necessitation by passions, it is free from causal necessitation altogether.

This combination of views allies Bramhall with Scotus and Ockham, not with Aquinas. Since Aquinas believes that the will is not necessitated by passions, he speaks of freedom from necessitation, and so his remarks might suggest that he is an indeterminist. But he does not rely on indeterminism. In his view, we have freewill because the will is moved by rational deliberation rather than by the strength of the passions; this is what makes human beings masters of their own actions. Aquinas does not commit himself to Bramhall's incompatibilist indeterminism.[28] If Hobbes simply wanted to affirm determinism and compatibilism, he would have no reason to reject Aquinas' conception of freewill, since it is consistent with the compatibilist arguments against Bramhall. Similarly, Bramhall might reasonably reject Hobbes's anti-rationalism without rejecting determinism and compatibilism.

[27] Scotus and Ockham accept this assumption; see §§369, 388.

[28] On Aquinas see §270.

Hobbes argues for anti-rationalism against Aquinas' conception of freewill. He argues that deliberation is found in animals, and so belongs both to rational and to non-rational agency.[29] Even in human beings deliberation is not necessary for voluntary action, since impulsive and rash actions are also voluntary.[30] Hobbes suggests the reply to this claim about impulsive action; for he acknowledges that we treat it as voluntary because we assume it is subject to deliberation on some occasions, even if not immediately before acting. Aquinas' distinction between directly and indirectly voluntary actions helps to show that unpremeditated action is voluntary if is suitably connected to deliberation, even if deliberation has not immediately preceded.[31]

Hobbes's case against rationalism, then, relies primarily on his first objection, that deliberation is found in non-rational no less than in rational agents. He would be right, if his account of deliberation were right. But if his account is wrong, a Scholastic may fairly distinguish rational deliberation from the succession of impulses that makes H-deliberation. Butler reasserts this distinction as the distinction between authority and power.[32] Bramhall assumes some such distinction; Hobbes undermines it only if he shows that H-deliberation is deliberation.

Since this is Hobbes's only direct argument against the rationalist distinction between will and passion, and since it is a weak argument, a rationalist intellectualist such as Aquinas may reasonably reject Hobbes's case. Hobbes may suppose that he also has a strong indirect argument against rationalism, in his argument against indeterminism. Perhaps he assumes that an argument against indeterminism refutes not only voluntarists, who deny that anything necessitates the will, but also rationalists, who only deny that the passions necessitate the will. But an argument against indeterminism does not affect rationalism.

The weakness of Hobbes's objections to rationalism casts doubt on his account of freedom. He believes that freedom cannot intelligibly be ascribed to the will, and that human freedom cannot intelligibly consist in anything more than determination by the will; moreover, he thinks the will is nothing but the 'last appetite'. He sees no contrast between motivation by the will and motivation by the passions. Hence, since he believes in freedom, the relevant sort of freedom is internal determination by desire. If H-deliberation is not deliberation, his inferences about freedom are insecure.

476. A Hedonist Account of Desire and Emotion[33]

Hobbes links his account of deliberation to his views about pleasure and good; but it is not clear how he understands the link, and so it is not clear which of his various views is prior to

[29] '. . . horses, dogs, and other brute beasts, do demur oftentimes upon the way they are to take, the horse retiring from some strange figure that he sees, and coming on again to avoid the spur. And what else doth a man that deliberateth, but one while proceed toward action, another while retire from it, as the hope of greater good draws him, or the fear of greater evil drives him away' (Hobbes, *LN* §8).

[30] 'Besides, I see it is reasonable to punish a rash action, which could not be justly done by man to man, unless the same were voluntary. For no action of a man can be said to be without deliberation, though never so sudden, because it is supposed he had time to deliberate all the precedent time of his life, whether he should do that kind of action or not.' (*LN* §25)

[31] On Aquinas see §255. [32] On deliberation and will see *Hom.* 11.2.

[33] On egoism and hedonism see Hampton, *HSCT* 17–24. She does not consider all the possible versions of egoism and hedonism one might attribute to Hobbes.

which. We have to try to clarify his view of the connexions between his moral psychology and his conception of value.

He treats deliberation as a succession of advances and retreats consisting in desires and aversions. He understands a desire as an advance towards anticipated pleasure. Perhaps he believes that this conception best fits an account of desire that will apply both to human beings and to animals. Or perhaps he relies on the fact that, generally, if I believe x will please me more than y, or I will enjoy x more than y, I will want x more than y. He generalizes the connexion between desire and pleasure into a general account of the nature of desire, so that he maintains psychological hedonist egoism as a theory of motives.

He applies psychological hedonism to his description of the emotions, taking their objects to be connected with the pleasure or pain that may arise in different circumstances. The objects of our passions are means to our satisfaction or security, or in some other way directly related to it. Since our security involves our relation to other people and their security, many of the passions that Hobbes considers involve comparison between myself and others on the points that affect my security. Hence he describes various passions by reference to the feelings arising at different stages in a race or competition (*EL* 9.21).

Other passions seem to have a less direct relation to one's own satisfaction and security. If I pity someone quite unrelated to me who will not affect my security, I do not believe that this person or what is happening to him actually affects my security. In this case Hobbes believes that I think of what I would feel if my security, for instance, were threatened. In thinking of the counterfactual situation, I actually have some of the feeling that I would have if the situation were actual, and so I have the feeling even when my security is not involved.[34]

But even if this appeal to self-confined pleasure is legitimate, it does not vindicate psychological hedonism; it explains the genesis of the passions, not their nature or their objects.[35] It is not clear whether Hobbes sees this, and so it is not clear whether he recognizes non-egoistic passions. At any rate, he acknowledges no exceptions to a psychological hedonist account of desires and motivation. He believes that the non-egoistic passions (if there are any) motivate us only if they seem to affect our prospects of pleasure and pain. Hobbes does not modify a psychological hedonist account of desire and action.

His hedonism includes a distinctive view about pleasure. We might connect pleasure with satisfaction or contentment, and take this to be the ultimate end of desire. This is Epicurus' account of 'static' pleasures.[36] But Hobbes argues that this view does not explain why we go on desiring and acting and would not regard the cessation of desire as a welcome outcome (*L.* 11.1). Hence, we ought not to identify pleasure with Epicurean satisfaction or contentment; we ought to identify it with Epicurean 'kinetic' pleasure. We seek means to 'secure the way of our future desire'. But securing the way of our future desire cannot be our ultimate end; for we do not want to secure the way of our future desire for its own sake.

[34] This particular appeal to association is not extensively used by Hobbes. Hume exploits its possibilities for explaining the other-regarding feelings and sentiments.

[35] Those who argue that Hobbes is not, or is not consistently, an egoist appeal to the difference between the source and the objects of the passions. See Gert in Hobbes, *MC* 5–13 (citing *L.* 6.46; *Hom.* 12.10); Hampton, *HSCT* 21–4; Kavka, *HMPT* 44–51; Gert, 'Egoism'; 'Mechanism'; McNeilly, 'Egoism'; Watkins, *HSI* 110–14.

[36] On Epicurus see §151.

Presumably we want the uninterrupted sequence of particular satisfactions, and we secure the way of our future desire in order to ensure that the sequence continues.[37]

477. Pleasure and Good

Hobbes's view of the relation between good, desire, and pleasure expresses self-confined egoist hedonism.[38] The different kinds of good—beautiful, delightful, and profitable—are analysed with reference to one's own pleasure.[39] This list omits the honestum, which most people regard as a good that is not assessed by reference to the agent; Hobbes leaves no room for such a good. These remarks imply that every desire is a desire for one's own pleasure or for an apparent means to one's own pleasure.

This hedonist claim seems to rest on a subjectivist analysis of judgments about goodness. In saying that everyone applies 'good' to whatever pleases himself, Hobbes may simply mean that people apply 'good' to things 'at their pleasure' (as we might say), so that their judgments about goods reflect what they desire and prefer. This alleged fact does not show that the only object of their preferences and desires is pleasure. Perhaps Hobbes moves from the general use of 'pleasure' (as in 'at their pleasure'), referring to desire and choice quite generally, to the specific use, referring to one particular object of desire and choice.

But in any case it is not clear what he means by his claim that we call 'good' whatever pleases us. He might be asserting that 'x is good' means 'x pleases me'. If, then, we grasped the meanings of our words clearly, we would realize that if I say 'What pleases me is good', I express an analytic truth that means the same as 'What pleases me pleases me'. This account of the meaning of 'good' is doubtful, for reasons suggested by Price, Sidgwick, and Moore. When anti-hedonists claim that not all goods are pleasant, they seem to disagree about a question that can be discussed on the basis of some shared assumption about the meaning of 'good'. They seem to need more than a reminder of what 'good' means.[40]

Hobbes may intend the more plausible claim that all the things we call 'good' (in the ordinary sense) really have nothing in common beyond the fact that the person calling them 'good' finds them pleasant. This claim recognizes that 'good' does not mean the same as 'pleasant to me'. When we use 'good' in the ordinary sense for actions, people, institutions, and so on, we suppose that we are ascribing to them some property beyond their being pleasant to us. But Hobbes believes that when we use 'good' with this objective sense, we

[37] On the concerns of Hobbesian prudence see Hampton, *HSCT* 37–42.

[38] 'But whatsoever is the object of any man's appetite or desire, that is it which he for his part calleth good; and the object of his hate and aversion, evil; . . . For these words of good, evil, and contemptible, are ever used with relation to the person that useth them: there being nothing simply and absolutely so; nor any common rule of good and evil to be taken from the nature of the objects themselves . . .' (*L.* 6.7) 'Every man, for his own part calleth that which pleaseth, and is delightful to himself, good; and that evil which displeaseth him: insomuch that while every man differeth from another in constitution, they differ also from one another concerning the common distinction of good and evil. Nor is there any such thing as *agathon haplôs*, that is to say, simply good. For even the goodness which we apprehend in God Almighty, is his goodness to us.' (*EL* 7.3) On 'self-confined' egoism cf. Broad, 'Egoism'.

[39] 'So that of good there be three kinds; good in the promise, that is pulchrum; good in effect, as the end desired, which is called iucundum, delightful, and good as the means, which is called utile, profitable.' (*L.* 6.8)

[40] For similar arguments see §812 on Price.

are misled, since good things have no objective goodness distinct from their pleasing the person who judges them good.

Perhaps, then, Hobbes argues: (1) All that good things have in common is their being desired by the agent who calls them 'good'. (2) All that we desire is our own pleasure. (3) Therefore, when we call things 'good', all that we are actually talking about is what we take to promote our own pleasure. The basic illusion about 'good' is the belief that it refers to something that good things have in common beyond being desired. This connexion between calling x 'good' and finding x pleasant follows from the truth of psychological hedonism (whether or not people believe it is true). It does not rest on an implausible claim about the meaning of 'good' (though Hobbes may accept such a claim).[41]

If Hobbes is right about the connexion between judgments of goodness and apparent pleasure, judgments about goodness vary not only among different people, but also within a single person at different times. He sometimes suggests that if I desire x more strongly than y, x appears pleasanter to me than y, and hence I judge x better than y. But if he believes this, it is difficult to understand how I can desire x more strongly than y while believing y to be pleasanter and better than x; hence it is difficult to see how I can be incontinent. Since Hobbes allows the possibility of incontinence, it is not easy to reconcile all his views about desire, pleasure, and goodness.

478. Practical Reason and Prudence

Hobbes's account of will, passion, and pleasure excludes one traditional role for practical reason. According to Aquinas, will differs from passion by being rational desire, formed by practical reasoning that seeks to discover the constitution of the ultimate good and the means to it. Practical reason, therefore, reaches conclusions that guide rational desire. Hobbes disagrees because he denies that will is essentially rational desire. In his view, practical reason simply discovers means to our future-directed desires for pleasure.[42]

In confining practical reason to this function Hobbes avoids questions about how practical reason and prudence (as Aristotle conceives them) can discover what is really good for us, and therefore can discover the external reasons that we already have, independently of our desires, for choosing one course of action rather than another.[43] In order to reject the Scholastic division between mere passion that is guided by pain and pleasure, and rational will that is guided by deliberation about the good, Hobbes argues that all motives either express a passion or result from deliberation about the means to satisfy a passion. He relies on his hedonistic analysis of desires.[44]

The instrumental role of reason in discovering means to future pleasure and the avoidance of future pain explains how reason can 'prescribe' (praecipere) an action and can declare an

[41] Cf. Hampton, *HSCT* 29.

[42] On practical reason see *Hom*. 12.1 (quoted in this section); *Civ*., Ep. Ded. 3.31 (quoted in this section).

[43] 'And this knowledge is called experience; and the wisdom that proceedeth from it, is that ability to conjecture by the present, of what is past and to come, which men call prudence.' (*EL* 27.13)

[44] More precisely, it depends on the truth of some theory that, like hedonism, helps to explain how practical reason could be purely instrumental. Hobbes offers hedonism to fulfil this role.

action to be good, favouring the principles that Hobbes identifies with the laws of nature. Once we desire peace, reason tells us how to achieve it.[45] The laws of nature are 'precepts of reason' or 'precepts of rational nature' (*Civ*. 3.32) because they are 'certain conclusions understood by reason' (3.33) about the means to self-preservation.

In Hobbes's view, reason does not simply take for granted an antecedent desire for peace. It also declares peace to be good.[46] But it is not clear why reason should declare this without qualification; should it not say that peace is good if and only if you want the further pleasures that peace brings?

The attitude of reason to peace reflects the more general preference of reason for prudence. A preference for some present good over a greater long-term good is irrational, in Hobbes's view; it is rational to focus on the long-term rather than the short-term good. The Stoics are right to say that passions disturb the operations of reason, because they distract us from the aim that reason approves—pursuit of a long-term good.[47] Reason, therefore, directs us towards the pursuit of our long-term good, which Hobbes identifies with self-preservation.

Hobbes is right to suggest that passions lead to irrational action if they cause us to act blindly without considering all the consequences that would turn us against the passions. If anger makes us forget some goal that we prefer over revenge, it makes us frustrate our dominant desire, and hence makes us act against reason. But suppose we are well aware of the costs of acting on anger, and still have a stronger desire to act on it. What is irrational, on Hobbes's account, in acting on anger in such cases?

Hobbes avoids this objection if he restricts his claim about reason to situations in which everyone agrees in desiring peace. Since one counts as good simply whatever seems to promise one pleasure, different people's judgments about good differ, just as their pleasures differ. Hence they disagree, and their disagreement leads to strife and discord.[48] But they all dislike this strife that puts them in a state of war, and in this state of war they all prefer peace, and hence agree that peace is good.[49] Peace is not good apart from their different desires,

[45] 'And thus much for the ill condition, which man by mere nature is actually placed in; though with a possibility to come out of it, consisting partly in the passions, partly in his reason. The passions that incline man to peace, are fear of death; desire of such things as are necessary to commodious living; and a hope by their industry to obtain them. And reason suggesteth convenient articles of peace, upon which men may be drawn to agreement.' (*L*. 13.13–14)

[46] 'They therefore who could not agree concerning a present, do agree concerning a future good, which indeed is a work of reason; for things present are obvious to the sense, things to come to our reason only. Reason declaring (or 'prescribing' (praecipiente) peace to be good, it follows by the same reason, that all the necessary means to peace be good also . . . But because men cannot put off this same irrational appetite, whereby they greedily prefer the present good (to which, by strict consequence, many unforeseen evils do adhere) before the future, it happens, that though all men do agree in the commendation of the foresaid virtues, yet they disagree still concerning their nature . . .' (*Civ*. 3.31–2)

[47] 'They are called perturbations because they frequently obstruct right reasoning. They obstruct right reasoning in this, that they militate against the real good and in favour of the apparent and most immediate good, which turns out frequently to be evil when everything associated with it hath been considered. . . . Therefore, although the real good must be sought in the long term, which is the job of reason, appetite seizeth upon a present good without foreseeing the greater evils that necessarily attach to it. Therefore appetite perturbs and impedes the operations of reason; whence it is rightly called a perturbation.' (*Hom*. 12.1) 'Therefore in this instance the emotions need to be governed by reason. For reason is that which, by measuring and comparing both our powers and those of the objects regulates the amount now of hope and then of fear, so that we may neither be mocked by hopes nor lose by fear without just cause those goods that we have.' (*Hom*. 12.4) See also 12.9.

[48] On this argument see §490.

[49] 'We must know therefore, that good and evil are names given to things to signify the inclination, or aversion of them by whom they were given. But the inclinations of men are diverse, according to their diverse constitutions, customs, opinions; as we may see in those things we apprehend by sense, as by tasting, touching, smelling; but much

but in the state of discord that (according to Hobbes) results from disagreement, everyone's desires coincide, because everyone sees that strife frustrates their attempts to secure the way of their future desire.

In this specific case, therefore, reason says just the same thing to everyone, since it tells everyone truly that peace is a means to satisfying their desires. This does not mean that in all circumstances reason prescribes one single course of action to everyone irrespective of their desires. Hence, when reason declares peace and the means to it to be good, it is not really saying more than Hobbes's theory allows it to say. It simply takes for granted the agreement of desires for peace in this state of general disagreement, and issues its precepts on that assumption.

This is a rather elegant result that Hobbes might well take to confirm the soundness of his method. We might reject his simplifying reduction of good to pleasure, on the ground that we make objective judgments about goodness; and do we not need objective judgments in order to find a rational moral basis for political society? Hobbes answers that we do not need the sort of objectivity that he denies about goodness. On the contrary, once we recognize the consequences of his subjectivist view, we can see an acceptable substitute for objectivity. The subjectivity of value judgments, given the actual differences between human beings, leads to discord; but discord, given the similarities between human beings, leads to the unanimous desire for peace.

Hobbes's account of the role of reason, therefore, fits his general view of motivation. He does not revert to the Scholastic view of practical reason that conflicts with his normal view of the role of reason.[50] If we have an overriding desire for self-preservation, we discover the means to it only by reasoning about future goods. If we do not consider the long-term consequences of our action, we frustrate our desire for self-preservation. In the same way we may expect reason to regulate hope and fear; for baseless fear is based on a false supposition about the future, and reason is needed to find true or plausible beliefs that guide our fears. Someone who acts on a fear resulting from groundless beliefs about the future acts 'against reason' by acting contrary to beliefs about what promotes the satisfaction of the overriding desire for self-preservation, or by failing to consider what promotes the satisfaction of this overriding desire.

And so when Hobbes says that reason declares peace to be good, the declaration by reason is elliptical; it means that in these circumstances of strife where everyone wants to get rid of strife, reason declares that peace is a means to the ending of strife. Since human beings are always either in a state of war or in danger of relapsing into a state of war, they always want to avoid strife, and therefore reason declares peace to be good. The declaration is not categorical, in Kant's sense, by being independent of human inclinations; it is a hypothetical imperative that applies to actual situations.

more in those which pertain to the common actions of life, where what this man commends, (that is to say, calls good) the other undervalues, as being evil; Nay, very often the same man at diverse times, praises, and dispraises the same thing. Whilst thus they do, necessary it is there should be discord, and strife: They are therefore so long in the state of war, as by reason of the diversity of the present appetites, they mete good and evil by diverse measures. All men easily acknowledge this state, as long as they are in it, to be evil, and by consequence that Peace is good.' (*Civ.* 3.31)

[50] Gert in Hobbes, *MC* 14–16, discusses Hobbes on practical reason.

Hobbes's view does not imply that it is irrational to act for the sake of revenge rather than self-preservation, if one acts in the light of true beliefs about the consequences of both courses of action. But Hobbes assumes that reason favours the means to self-preservation, because he assumes that when we see that we must choose between an action that promotes our self-preservation and an action that threatens our self-preservation for some shorter-term end, we desire the first course of action more strongly. If, then, we see the consequences for self-preservation, we choose the action that promotes it. Exposure to reason always results in self-preserving action. 'Irrational' action is chosen with less than full awareness of the consequences.

These assumptions about motivation, however, revive the difficulty that arises from Hobbes's views about incontinence. For reason speaks in favour of peace only if our strongest desire is for self-preservation and the means to it. But if we desire something else more strongly than we desire the means to self-preservation, reason should tell us to do what satisfies this other desire. Since Hobbes recognizes that we sometimes have other desires stronger than the desire for self-preservation, he should also agree that reason does not always declare that peace is good. His own views cast doubt on the empirical assumptions that support his claims about practical reason.[51]

Hobbes's treatment of practical reason, therefore, displays two aspects of his reductive outlook. He wants to reduce claims about reason and morality to psychological claims grounded in his account of human nature. This reduction is partly eliminative, showing that there is no sound basis for some traditional beliefs, and partly vindicative, showing that traditional beliefs obscurely grasp some genuine features of human nature. Hobbes's account of the distinction between will and passion is eliminative, arguing that scholastic rationalism is misguided in drawing a distinction. But he intends his reduction of prudence to vindicate it.

The first aspect of his position, however, raises questions about the second. His eliminative treatment of will and passion implies that he can endorse prudence as rational only because he makes an implausible assumption—implausible even within his own account of the passions—about motivation. His position would be more consistent if he were to deny that prudence itself is rational, and to argue that it is rational to follow the prudent course of action only if we have the relevant desire. He ought to agree that when our desires are relevantly different, prudence is not rational, since we will not adopt the prudent course of action when we are informed about the consequences of the choices open to us. Hobbes does not draw this conclusion from his account of practical reason, but Hume draws it.[52]

479. Pleasure, Reason, and the Human Good: Rejection of Eudaemonism

Hobbes's views about motivation and practical reason require the rejection of Scholastic views about the human good. Aquinas follows Plato and Aristotle in taking happiness to be

[51] On reason and motivation see Hampton, *HSCT* 34–42. She introduces an appeal to physiological abnormality to explain why passions are against 'reason' (what one would want if one were in a normal physiological condition). This appeal disguises the controversial move as a physiological speculation.

[52] On Hume see §736.

the goal of rational will as opposed to non-rational passion. Reason approves what is good for oneself as a whole, as opposed to the more limited end sought by a particular passion. Greek eudaemonism asserts that whatever I choose for its own sake I regard as either a means to, or a part of, the good for me; but this restriction does not imply that the only thing I can choose for its own sake is a state exclusively of myself. We can consistently accept eudaemonism and value our friend's good for our own sake, if we regard our friend's good as part of the life that is best for us. While all the goods that I choose for their own sake are self-referential, they need not all be self-confined. Whether they are all self-confined is a further question to be answered by an account of what happiness consists in.

Hobbes's rejection of a division between will and passion and between good and pleasure commits him to the rejection of the ultimate good as an object of will. His views require him to go further than most of his hedonist predecessors go in rejecting eudaemonism.

Some hedonists take hedonism to be subordinate to eudaemonism. Epicurus agrees with Aristotle and Aquinas in taking the ultimate good to be a proper starting point for ethical argument; then he argues that pleasure meets reasonable formal criteria for the final good.[53] According to Aristotle, these criteria include completeness and self-sufficiency, measured by reference to the fulfilment of human nature. Epicurus accepts these criteria, and argues that pleasure—with certain qualifications—satisfies them.

Hobbes, however, does not subordinate pleasure to happiness, since he does not recognize any more general or more ultimate end than my own pleasure. He appeals to pleasure, as the Cyrenaics do, as an alternative to the eudaemonist's ultimate good. In his view, everything I choose for its own sake is some pleasure of my own, and so must be some self-confined condition; it must be a state of myself that does not include (though it may causally depend on) a state of someone or something else.[54]

He opposes eudaemonism by rejecting belief in an ultimate end beyond the continual pursuit of pleasure. He argues that if there were a last end we could reach, our desires would come to an end, and that would not be a desirable life.[55] He recognizes a difference between close and distant ends, but he recognizes no ultimate end. In claiming that the felicity of this life does not consist in the repose of a mind satisfied, Hobbes alludes to the familiar fact that human life is subject to changes and vicissitudes, and that it is not reasonable to look for complete satisfaction in these circumstances. Aquinas agrees with Hobbes on this point (*SG* iii 48);[56] that is part of his reason for concluding that the degree of happiness that we can achieve in this life is incomplete (imperfecta).

Hobbes, however, draws the more extreme conclusion that complete satisfaction is not only unavailable, but undesirable. When we achieve any end we were pursuing, we stop acting. If, then, the ultimate end were attainable, it would require the cessation of activity.

[53] Socrates may agree with Epicurus. See §21.

[54] Kavka, *HMPT* 40–1, discusses this aspect of self-confined egoism. See also Gert, 'Psychology'.

[55] 'To which end we are to consider, that the felicity of this life, consisteth not in the repose of a mind satisfied. For there is no such finis ultimus (utmost aim) nor summum bonum (greatest good,) as is spoken of in the books of the old moral philosophers. Nor can a man any more live, whose desires are at an end, than he, whose senses and imaginations are at a stand.' (*L.* 11.1) 'But for an utmost end, in which the ancient philosophers have placed felicity, and disputed much concerning the way thereto, there is no such thing in this world, nor way to it, more than to Utopia; for while we live, we have desires, and desire presupposeth a further end.' (*EL* 7.6)

[56] On Aquinas see §280.

Since a life without activity is not good for a human being, the achievement of an ultimate end is would not be good for a human being.

In this objection to the eudaemonist belief Hobbes does not distinguish process from activity, as Aristotle understands them.[57] Hobbes assumes that action, as opposed to passive enjoyment, is instrumental, aimed at the achieving of some end separate from it. Aristotle rejects this assumption, since he recognizes activities that are parts of happiness and to be chosen for their own sakes. If we achieve the ultimate end, we still have a motive for action; for we want to perform the activities that are characteristic of being happy. Aristotle's conception seems ridiculous from Hobbes's point of view only because Hobbes cannot see the point of Aristotle's distinction between process and activity. He cannot see the point of it because it conflicts with Hobbes's view that action is all purely instrumental.

Even if Aristotle avoids Hobbes's objection on this point, Hobbes has a further objection to a traditional view of the ultimate good. In his view, it requires a definite list of activities constituting the human good; but any such list fails to recognize that human desires and aims are varied and mutable. According to Hobbes, our conception of the good always changes and develops, according to how much we have already got. Since the achievement of one end leads us to look for something beyond it, we cannot determine any fixed final good.

Perhaps eudaemonism does not require the sort of list that Hobbes rejects. The mere recognition of an ultimate good does not commit us to any definite claims about its content. But this defence of eudaemonism concedes Hobbes's main point; it seems pointless to recognize a final good if we cannot form any fairly definite and defensible views about its content. As Aristotle says, we recognize a final good and ask what it is so that we can use our answer to this question in deciding what to do. Hence we expect our inquiry to discover desirable activities specifying the human good.

Still, Hobbes's objection misinterprets the eudaemonist's commitment to a 'fixed' final good. Aristotle need not recognize any determinate set of particular activities that constitute the good. He need only claim that the activities in question fall into some relatively definite types. It might well be true that if we achieve our aim of knowing one language, say, we set ourselves to learn another; but these are two exercises of our language-learning capacity. Similarly, if the continual progress of desire from one object to another stays within the types of capacities whose fulfilment Aristotle takes to constitute the good, such progress does not count against the Aristotelian view.

480. The Instability of Desire

A cogent objection to Aristotle, then, requires us to deny that the fulfilment of any definite types of capacities constitutes the human good. To see why Hobbes might deny this, we may point to the instability of desires for long-term goals. If a ten-year-old child wants to be a pilot, it would be unwise for her to form, or for us to form on her behalf, a plan for her to be a pilot; for by the time she can do anything to put the plan into effect, she may have lost her enthusiasm for being a pilot and decided to be a rock star instead, and may

[57] Aristotle on activity; see §95.

then have abandoned this second enthusiasm in order to be a stockbroker. In this case the best advice would perhaps be to secure the way of her future desire, not to tie her to one specific plan of life. Hobbes may believe that all our long-term desires, apart from the desire for pleasure, are unstable in this way, so that it is futile to try to construct a conception of an ultimate end. The only sensible long-term plan, therefore, is to secure the way of our future desire.

This does not refute an Aristotelian view of the final good. Even if people change their minds about long-term ends, they may still have a sufficiently determinate ultimate good.[58] We may be able to see why, in their different circumstances, they change their conceptions of their good; as Aristotle suggests, different circumstances and experiences make the value of one or another good more obvious to them (*EN* 1095a23–5). We may be able to correct the one-sided conceptions they form as a result of different experiences. Such variation, therefore, does not undermine the claim that an Aristotelian conception of the good fits human capacities.

This defence of Aristotle conflicts with Hobbes's explanation of variation in people's views about the good. He believes that the different things that are good for us are good because we happen to desire them; hence we cannot discover which things are good for us whether or not we happen to desire them. This desire-based conception of the good, however, needs some defence; the bare assertion of it to begs a crucial question against the Aristotelian conception. Hobbes believes we accept a desire-based conception as soon as we accept psychological hedonism and reject any division between the will and the passions. If, however, we are sympathetic to an Aristotelian conception of the good, we have a good reason for rejecting some of the premisses of Hobbes's argument for these other positions.

Does Hobbes derive psychological hedonism from the assimilation of will to passion, or does he argue in the reverse direction? Perhaps he takes psychological hedonism to be so obvious in its own right that it is a firm basis both for the assimilation of will to passion and for a desire-based conception of the good.[59] He accepts hedonism because it expresses the basic fact (in his view) that people's judgments about goodness simply reflect what they prefer, and hence (as he supposes) what pleases them. If his argument relies on the subjective character of judgments about goods, it rests on a claim that he does not defend fully against an Aristotelian alternative.

From an Aristotelian point of view, therefore, Hobbes is one of the people who argue too hastily from variation in evaluative judgments to metaphysical subjectivism (*EN* 1094b14–19). He does not show that observed variations in judgment require the subjectivist explanation. As Aristotle points out, if sick people value health more than habitually healthy people value it, that disagreement is easily explained by their different perspectives. Again, if some people prefer lobster and others prefer cheese, and we cannot show that one is really better than the other, that may be because they are equally good.[60]

Hobbes's convictions about goods reflect a more general feature of his moral psychology. Aristotelian eudaemonism includes a belief in external reasons. If external reasons must be accessible in principle to deliberation, Hobbes's purely psychological account of deliberation

[58] It needs to be determinate in the sense previously explained (allowing for different ways of achieving the same good).

[59] Butler on Hobbes on pleasure and happiness; see §688.

[60] See Reid's comment on this example; §829.

rules out external reasons; for recognition of reasons, in his view, consists in the awareness of the comparative strength of our desires. Perhaps this is why Hobbes takes his specific points about the insatiable character of desire to refute the whole Aristotelian conception of the human good.

Aristotle believes that in attributing a nature to a human being, we attribute desires with a particular rational structure, because we recognize not only mere desires, but also rational desires that are guided by comparative evaluations derived from a final good. In Aristotle's view, the examination of human capacities and circumstances results in the discovery of a conception of the good. This conception shows what desires a rational agent has good reasons to acquire. Such reasons are external to an agent's desires.

In Hobbes's view, examination of human nature does not reveal these external reasons. We examine human desires, and discover their relative strength, and the means to their satisfaction. This disagreement with Aristotle rests partly on the analysis of deliberation and reasons that we have examined. Since deliberation simply records a series of inclinations of different strengths, it cannot find a course of action that rests on the best reasons. The reasons that emerge from Hobbes's analysis of human nature are strictly internal and dependent on desires.[61]

481. Aristotelian Teleology

Hobbes's rejection of the traditional conception of the ultimate end, and of the whole Aristotelian conception of human nature that supports Aristotelian eudaemonism, rests partly on his broader reasons for doubting the whole Aristotelian argument. In Aristotle's view, we can discover a creature's good from examining its nature. In both human and non-human cases we can discover the characteristic activity that is essential to this organism, distinguishes it from others, and is the goal of its other processes and actions. This argument is summed up in the appeal to the human function.

Hobbes agrees with many of his contemporaries that Aristotelian teleology is incompatible with the truth of corpuscular explanations, because they believe the Aristotelian claims to require empirically undiscoverable non-bodily causal mechanisms with no corpuscular basis. This belief underlies Locke's criticism of substantial forms, entelechies, and so on,[62] on the assumption that they involve the mechanical explanation as we find in corpuscular explanations (in Aristotelian terms, involving material and efficient causes). Since teleological claims do not describe corpuscular mechanisms, they must (it is assumed) be attempts to describe occult, non-corpuscular mechanisms. The interpretation rests on dubious assumptions, accepted by Hobbes, about the Aristotelian conception of formal and final causation.

These doubts about Aristotelian teleology do not imply the rejection of teleology. Boyle objects not to teleology itself, but to Peripatetic views of nature that (he supposes) introduce additional agents besides God, and conflict with the freedom and transcendence of God;

[61] On external reasons see §259 (Aquinas), §684 (Butler).
[62] See, e.g., Locke, *EHU* ii 23.3; 31.6–8 (on substantial forms); iii 10.14.

these views reflect an 'idolatrous' conception of nature.[63] Hobbes agrees with Boyle in rejecting agents distinct from God that have their own inherent goal-directed natures. He treats the study of human action as part of the study of 'motion'. Deliberation and desire should be understood, in his view, as the result of the interplay between motions of varying strengths that determine the motion of the human being as a whole. He regards desire as genuine motion, and attacks those who treat it as merely metaphorical motion (*L.* 6.2).

He has a further reason for scepticism about Aristotelian teleology in morals and politics. Teleological claims about the proper functions and aims of the political community and of the ruler were used to support demands for reform or for limits on the power of the ruler, or for revolutionary action in support of such claims. Hobbes regards such claims as dangerous errors.[64] Even those who agreed with Hobbes's support for the Royalist side in the Civil War did not welcome him as an ally, since they welcomed neither his rejection of traditional arguments nor his use of arguments that appeared to them to place the state on the wrong basis.[65]

Hobbes, then, follows Aristotle in arguing for a conception of the human good from claims about human nature.[66] He disagrees with Aristotle on the conclusions that can be drawn about the human good from an appeal to human nature. In particular he denies that we can discover anything like an Aristotelian ultimate end.

He therefore approaches the task of describing moral good and evil without Aristotelian assumptions. He does not believe that the human good consists in a life that realizes human capacities under the control of practical reason. The examination of human capacities and their relations does not help us to discover the virtues. Nor does he claim that the good for a human being essentially includes the good of others, because he cannot rely on the argument about self-realization that leads Aristotle to this conclusion. Hence he denies that a human being is naturally social.[67]

Though Hobbes's opposition to Aristotelian eudaemonism reflects a broader opposition to Aristotelian teleology, this broader opposition does not wholly explain the dispute about the human good. If Hobbes had agreed with Aristotle about the good, he could have expressed his agreement within a non-Aristotelian account of the physical world. His attempt to reduce deliberation to a process that can be understood in purely psychological and non-normative terms is not required by post-Aristotelian physical science; it seems to reflect doubts about practical reason that are independent of general doubts about teleology.

Perhaps, therefore, we should explain Hobbes's opposition to Aristotelian ethics by going back to his initial complaint about contemporary moral philosophy, that its appeals to practical reason, natural ends, objective goods, and so on, simply lead to disagreement. To resolve the disagreement, he tries to go below the normative level to purely psychological

[63] See Boyle, *FE* iv 48–51. Leibniz answers accusation of idolatry, in 'On nature itself'. In general I assume that Hobbes accepts his professed theological doctrines and puts them forward as seriously meant. Whether or not (as a matter of biography) he sincerely accepted them, we can account for their content and presentation, and for the hostile reaction of many Christian readers, without assuming that they were either insincere or were meant to be recognized as insincere. Martinich, *TGL*, offers an elaborate defence of the sincerity of Hobbes's Christianity. Curley's opposing position is briefly set out in Hobbes, *L.*, pp. xii–xiv, xl–xlvi.

[64] See Laird and Barker, cited in §469.

[65] Some of these critics are discussed by Mintz, *HL* and Bowle, *HC*.

[66] On the appeal to nature cf. §675 (Hobbes v. Butler), §§727–8 (Hume).

[67] See *Civ.* 1.12; *L.* 17.6–12. On Cudworth's criticism see Passmore, *RC* 72; Hampton, *HSCT* 10. See also §§531, 564, 610.

descriptions. He agrees with the Greek Sceptics in separating the normative from the purely psychological, but he uses the separation for different purposes. In the Sceptics' view, reflexion on normative disagreements causes us to abandon the normative outlook in favour of simply 'yielding' to appearances. Hobbes believes that a purely psychological description allows him to interpret normative claims in psychological terms, and so to formulate normative claims that we will accept, once we form the enlightened view of human nature.

We might argue that Hobbes's psychological picture is simpler than Aristotle's. He begins from the desire for pleasure; we already recognize this as a desire that sufficiently explains an action. According to Hobbes, we need not recognize any further desires, irreducible to this one, in order to understand our actions in general. The task of arguing from an Aristotelian account of the ultimate good to specific virtues is difficult; many of the obscurities in Aristotle's arguments remain in Aquinas' arguments. Since Hobbes's argument avoids Aristotelian obscurities, it is worth examining, to see whether it offers a plausible account of moral good and evil.

35

HOBBES: FROM HUMAN NATURE TO MORALITY

482. Moral Philosophy, Old and New

Hobbes tries to follow an 'idoneous principle of tractation' in moral philosophy, by beginning with an account of human nature and human motives.[1] On this basis he hopes to improve the lamentable situation in which knowledge of the law of nature has failed to grow 'beyond its ancient stature'.[2] He assumes that sound moral philosophy will discuss natural law, but will reject previous views of natural law. In claiming that knowledge of natural law has not advanced beyond its ancient stature, Hobbes implies that Scholastic discussions of natural law have not advanced moral philosophy. We can perhaps clarify his aims in moral philosophy if we see what he rejects in Scholastic views of natural law.

Aquinas introduces natural law as part of an Aristotelian and eudaemonist theory. The moral virtues are the states of character that constitute the appropriate control by practical reason, aiming at the good of the agent or the good of others or the good of the community; the good of others and of the community enter because they are parts of the good of the agent. Virtuous actions are all connected to natural law (*ST* 1–2 q94 a3). Natural law prescribes the first principles of ethics, grasped by universal conscience (q94 a1 ad2), because 'everything to which a human being tends in accordance with his nature belongs to the law of nature' (q94 a3). The principles of natural law are those that human beings grasp in the rational pursuit of the ultimate end to which they tend by nature. We tend naturally towards our ultimate end, and we are capable of rational understanding of the means to it; in exercising this rational understanding correctly, we grasp the principles of natural law.

Aquinas does not believe, then, that natural law introduces a source of moral principles apart from the rational pursuit of one's own happiness. He does not introduce a deontological element in morality that is separate from his teleological account of the moral virtues. He believes that a correct grasp of the ultimate end for a human being also grasps the principles of natural law. We grasp the natural law insofar as we grasp the first principles of practical

[1] *Civ.*, Ep. Ded.; see §469. On Hobbes's aims see Hampton, 'Naturalism'.

[2] *Civ.*, Ep. Ded.

reason.[3] Since the task of practical reason is to discover what constitutes and promotes the human good, our view about the content of natural law will match our view of the nature and scope of practical reason.

Aquinas' successors disagree about the relation between the natural law and the will of God. Scotus and Ockham allow more of what Aquinas counts as natural law to depend on the free will of God; they take the rightness of the various precepts to consist in their being prescribed by God. Suarez's discussion of disputes about divine commands leads him to distinguish two aspects of natural law: its status as law depends on divine commands, but it is natural because it prescribes and forbids actions that are intrinsically right and wrong apart from divine commands.

These different aspects of Scholastic discussion of natural law influence Hobbes. Indeed, the extent of their influence makes it initially surprising that he believes the Scholastics have made so little progress. He agrees with Aquinas' claim that we grasp the principles of natural law by grasping the end to which human nature is naturally inclined. Insofar as he derives an account of the virtues from an account of human nature Hobbes agrees with Aquinas. Hence he identifies moral philosophy with the science of the laws of nature. The true doctrine of the laws of nature specifies the virtues and vices that are the subject matter of moral philosophy.[4]

Hobbes suggests that traditional views do not regard moral philosophy as the doctrine of the laws of nature. As we have seen in discussing Grotius, this suggestion is ambiguous. Scholastic views certainly connect the requirements of the virtues with the provisions of natural law. But it is not so clear whether they regard morality as essentially or fundamentally natural law. Suarez argues that though intrinsic morality is prescribed by natural law, this is not essential to intrinsic morality. According to Suarez, moral philosophy is primarily the science of the honestum, of what is fitting for rational nature; it is the science of natural law only because it is necessarily true that natural law prescribes what is fitting for rational nature.

The sense Hobbes attaches to the claim that moral philosophy is about natural law depends on the sense he attaches to claims about natural law. Suarez distinguishes morality from natural law because he believes that natural law is essentially law, and that law essentially requires the command of a legislator, whereas intrinsic morality is prior to natural law. How does Hobbes understand the natural basis of natural law—the facts that Suarez takes to constitute intrinsic morality? And how does he take natural law to be related to divine commands?

483. Human Nature and Natural Law

Hobbes believes that natural law rests on the requirements of human nature. On this point he agrees with Aquinas and his successors. But he departs from Aquinas in claiming this law

[3] On Aquinas see §272.

[4] 'The science of them [sc. the laws of nature] is the true and only moral philosophy. For moral philosophy is nothing but the science of what is good, and evil, in the conversation and society of mankind.' (*L.* 15.40)

simply prescribes means to self-preservation.[5] Past philosophers did not see this essential connexion with self-preservation.[6] They were roughly right about which traits are virtues, but they were wrong about what makes them virtues, not seeing their essential connexion with 'peaceable, sociable, and comfortable living'.[7]

It would be misleading to suggest that previous philosophers thought the virtues do not contribute to peaceful and sociable living. Aquinas and others suppose that this contribution is essential to the virtues, because peaceful and sociable living fulfils the nature of human beings as rational and sociable creatures. But Aquinas believes that the study of human nature allows us to form a conception of the human good that shows us how the moral virtues perfect human nature and achieve the good; peaceful and sociable living is only part of this good. Hobbes denies that when we study human nature we discover that human beings have a natural ultimate good that supports an account of the virtues. If he is right, we cannot discover from the examination of human nature and the human good that we have good reason to follow the principles of natural law. Suarez and Grotius[8] must therefore be wrong to believe that some actions are intrinsically right (honesta) by being appropriate for rational nature. Since their view presupposes that the human good consists in more than the satisfaction of desires, it is not open to Hobbes.[9]

To reach his account of the virtues, therefore, Hobbes appeals to his account of human nature. He rejects the Aristotelian view—later revived by Butler—that human nature constitutes a system, rather than a collection of desires, and that the task of practical reason

[5] A law of nature is '. . . a precept, or general rule, found out by reason, by which a man is forbidden to do that which is destructive of his life or taketh away the means of preserving the same . . .' (*L.* 14.3).

[6] 'Now the science of virtue and vice, is moral philosophy; and therefore the true doctrine of the laws of nature is the true moral philosophy. But the writers of moral philosophy, though they acknowledge the same virtues and vices: Yet not seeing wherein consisted their goodness; nor that they came to be praised, as the means of peaceable, sociable, and comfortable living; place them in a mediocrity of passions: as if not the cause, but the degree of daring, made fortitude; or not the cause, but the quantity of a gift, made liberality.' (*L* 15.40) 'But because men cannot put off this same irrational appetite, whereby they greedily prefer the present good (to which, by strict consequence, many unforeseen evils doe adhere) before the future, it happens, that though all men doe agree in the commendation of the foresaid virtues, yet they disagree still concerning their nature, to wit, in what each of them doth consist; for as oft as another's good action displeaseth any man, that action hath the name given of some neighbouring vice; likewise the bad actions, which please them, are ever entitled to some Virtue; whence it comes to pass that the same action is praised by these, and called virtue, and dispraised by those, and termed vice. Neither is there as yet any remedy found by philosophers for this matter; for since they could not observe the goodness of actions to consist in this, that it was in order to peace, and the evil in this, that it related to discord, they built a moral philosophy wholly estranged from the moral Law, and unconstant to itself; for they would have the nature of virtues seated in a certain kind of mediocrity between two extremes, and the vices in the extremes themselves; which is apparently false . . .' (*Civ.* 3.32). On the doctrine of the mean cf. *EL* 17.14. For further discussion see Skinner, *RRPH* 322–6.

[7] 'Yet reason is still the same, and changeth not her end, which is peace and defence; nor of the mind which the means to attain them, to wit, those virtues we have declared above, and which cannot be abrogated by any custom or law whatsoever.' (*Civ.* 3.29) 'But forasmuch as all men are carried away by the violence of their passion, and by evil customs do those things which are commonly said to be against the law of nature; it is not the consent of passions, or consent in some error gotten by custom, that makes the law of nature. Reason is no less of the nature of man than passion, and is the same in all men, because all men agree in the will to be directed and governed in the way to that which they desire to attain, namely their own good, which is the work of reason: there can therefore be no other law of nature than reason, nor no other precepts of natural law, than those which declare unto us the ways of peace, where the same may be obtained, and of defence where it may not.' (*EL* 15.1)

[8] On Hobbes and Grotius see Tuck, 'Modern', cited at §466n27. His comparison does not mention this important difference over the honestum.

[9] On the relation of Hobbes's position to the voluntarism of Scotus and Ockham see §391.

is to discover what is appropriate for the needs of the system as a whole.[10] In Hobbes's view, human nature is a collection of desires without a system; practical reason, therefore, must simply look for the means to satisfy one's predominant desire. If our predominant desire is to secure the way of our future desire, we care most about our self-preservation. Practical reason justifies the laws of nature if it shows that they specify means to self-preservation. This is what Hobbes tries to show about the laws of nature.[11]

When Hobbes attributes the laws of nature to reason, he means that reason prescribes means to ends that, in the circumstances Hobbes describes, everyone will want more than they want any other ends. These precepts and prescriptions, in his view, depend on our desires, but they are nonetheless genuine precepts of reason and rational nature.[12] When 'reason prescribes peace to be good',[13] its prescription is the empirical proposition that peace promotes the satisfaction of our desires in the specific circumstances of the state of nature.

We might think that this empirical proposition falls short of a precept of reason, since it does not assert that we ought to seek peace, that we have a reason to seek peace, or that we have a duty or obligation to seek peace. Hobbes, however, believes that he can answer this objection, since he believes that natural laws impose obligations. To see what he means by this, we need to grasp his conception of obligation. Since he defines obligation by reference to rights, we need to discuss his view of rights before trying to understand his view of obligation.

484. Freedom and Rights

Hobbes explains an obligation by contrasting it with a right. Being obliged to do F is incompatible with being free to do either F or not-F, and therefore incompatible with having the right to do F or not-F. Hence, if we are obliged to do F, we lack the right to do F or not-F. These connexions between obligation, freedom, and rights make it reasonable for Hobbes to explain obligation as the absence of freedom. Obligations require some restriction of the right of nature, which is one's freedom to use the means of self-defence.[14] Hobbes does not treat this right as a morally protected or justified freedom; he means simply that an individual is not physically prevented from doing what he thinks will preserve him. If someone has a right to preserve himself, it does not follow that it is wrong to prevent him.

Elsewhere, however, Hobbes seems to treat a right as a morally protected liberty, something that we are morally permitted to do, or a 'blameless liberty'.[15] We might suppose

[10] On human nature as a system rather than a collection see §77 (Aristotle); 679–80 (Butler).

[11] Hobbes's restricted conception of natural law, confining it to the preservation of peace, may be compared with Selden's conception, as described by Tuck, *PG* 216–17.

[12] In *L*. 14.3 'praeceptum . . . sive regula generalis' is used for 'precept or general rule'.

[13] *Civ*. 3.31 (quoted in §478). The EV has 'declares'. Silverthorne translates 'teaches'.

[14] 'The right of nature . . . is the liberty each man hath, to use his own power, as he will himself, for the preservation of his own nature; that is to say, of his own life; and consequently, of doing any thing, which in his own judgment, and reason, he shall conceive to be the aptest means thereunto.' (*L*. 14.1) '. . . right consisteth in liberty to do, or to forbear; whereas law determineth and bindeth to one of them: so that law and right differ as much as obligation and liberty, which in one and the same matter are inconsistent' (14.3). Pufendorf, *JNG* i 6.10, criticizes Hobbes's account of right and obligation. See also §624 on Clarke.

[15] 'Neither by the word right is anything else signified, than that liberty which every man hath to make use of his natural faculties according to right reason. Therefore the first foundation of natural right is this, that every man as much

that in claiming that we 'must' be allowed a right to all necessary means to an end that we have a right to pursue, Hobbes introduces a moral claim. If he were talking about purely physical freedom, the claim about means would apparently not follow. If I am not physically prevented from pursuing my self-preservation, it does not follow that I am free to use all the necessary means to it; if I am in the middle of a desert, I may not have access to water.

But perhaps Hobbes will reject this argument. He might reply that if I am physically prevented from using all the necessary means to an end, I am also prevented from pursuing the end, and hence I lack the freedom to pursue it. And so he might still defend a non-moral interpretation of his claims about natural rights.

What does he mean by claiming that we have the natural right to use our faculties 'according to right reason' for our self-preservation?[16] We might take this clause to restrict our right to do whatever we think will promote our preservation; perhaps 'right reason' confines our right to means that accord with right reason. In that case, the use of a rationally unjustifiable means to preserve ourselves (e.g., by practising unnecessary cruelty on our opponents) would exceed our right. Rights, therefore, seem to be confined to legitimate liberties, those that others ought to respect.

But the reference to right reason does not require Hobbes to restrict rights to legitimate liberties. He may simply mean that human beings are free by nature to preserve themselves to the best of their ability, because in the state of nature nothing impedes our taking this course of action. To say this is not to exclude our being free to do other things; hence our right is not confined to prudent action.[17]

Hobbes, however, does not believe—or at least does not always believe—that our natural right extends to everything that is physically possible in the state of nature. Some remarks (outside *Leviathan*) about violations of the law of nature in war suggest ways of exceeding our natural rights. We are physically at liberty to act cruelly or to get drunk, but we violate

as in him lies endeavour to protect his life and members. But because it is vain for a man to have a right to the end, if the right to the necessary means be denied him, it follows, that since every man hath a right to preserve himself, he must also be allowed a right (consequens est . . . ut unusquisque ius etiam habeat, LV) to use all the means, and do all the actions, without which he cannot preserve himself.' (*Civ* 1.7–8) At *EL* 14.6 Hobbes describes a right as a blameless liberty: 'And forasmuch as necessity of nature maketh men to will and desire *bonum sibi*, that which is good for themselves . . . it is not against reason, that a man doth all he can to preserve his own body and limbs both from death and pain. And that which is not against reason, men call *right* or *jus* or *blameless liberty* of using our own natural power and ability. It is therefore a right of nature, that every man may preserve his own life and limbs, with all the power he hath.' *EL* 14.10 seems to imply that statements about rights have some moral content: 'For seeing all things he willeth, must therefore be good to him in his own judgment because he willeth them, and may tend to his preservation some time or other, or he may judge so, and we have made him judge thereof, . . . it followeth that all things may rightly also be done by him. . . . insomuch that *jus* and *utile*, right and profit, is the same thing.' *EL* 14.13 suggests that might makes right: 'A man therefore that hath another man in his power to rule or govern, to do good to, or harm, hath right, by the advantage of this his present power, to take caution at his pleasure, for his security against that other in time to come'. Some of these rights are retained in the commonwealth: 'As it was necessary that a man should not retain his right to every thing, so also was it, that he should retain his right to some things . . . Nor doth the law of nature command any divesting of other rights than of those only which cannot be retained without the loss of peace.' (*EL* 17.2) On Hobbes on the right of nature see Tuck, *NRT* 120–32; §535 (Cumberland).

[16] See Darwall, *BMIO* 62.

[17] *Civ*. 1.9–10 makes each person the judge of what is needed for the preservation of his life. 1.14 allows a right to the stronger that is not restricted by considerations of morality or prudence. On Hobbes's treatment of rights see further Hampton, *HSCT* 51–7; Kavka, *HMPT* 297–303, 319–22.

the law of nature in doing so, and Hobbes infers that we do not act 'with right'.[18] He justifies this inference by arguing that such actions do not promote one's self-preservation, and that one cannot honestly claim that they do.[19] In this case, then, physical freedom does not seem to be sufficient for a right.

485. Obligation as Renunciation of Rights[20]

These different claims about rights complicate our understanding of obligation, because Hobbes understands obligation as the 'laying down' of a right.[21] Sometimes he explains laying down a right as my refraining from exercising a liberty to interfere with your pursuit of a goal that we are both free to pursue. If a 100-euro note is lying in front of it, we are both free to try to pick it up. I lay down my right, and divest myself of my liberty, to hinder your picking it up, if I stand out of your way.[22] If laying down my right is sufficient for obligation, I oblige myself to let you pick up the note by standing out of your way.

But Hobbes usually suggests that this physical renunciation of a right is not the same as obligation. In his view, I lay aside my right by renunciation or by transfer, not by actually standing out of your way, but by saying I will stand out of your way.[23] Once I have done this, I am obliged to stand out of your way and I ought to stand out of your way; if I do not stand out of your way, I act without right.[24] Words and actions

[18] 'There is a little . . . to be said concerning the laws that men are to observe one towards another in time of war, wherein every man's being and well-being is the rule of his actions. Yet this much the law of nature commandeth in war, that men satiate not the cruelty of their present passions, whereby in their own conscience they foresee no benefit to come. For that betrayeth not a necessity, but a disposition of the mind to war, which is against the law of nature.' (*EL* 19.2) 'But there are certain natural laws whose exercise ceaseth not even in the time of war itself; for I cannot understand what drunkenness, or cruelty (that is, revenge which respects not the future good) can advance toward peace, or the preservation of any man. Briefly, in the state of nature, what is just and unjust, is not to be esteemed by the actions, but by the counsel and conscience of the actor. That which is done out of necessity, out of endeavour for peace, for the preservation of ourselves, is done with right; otherwise every damage done to a man would be a breach of the natural law, and an injury against God.' (*Civ*. 3.27n)

[19] Hobbes does not make this point about drunkenness, but he makes it about cruelty (*EL* 19.2). Hence his prohibition of cruelty is consistent with his claim in *Civ*. 1.9 that each person is to be allowed to judge what promotes his own self-preservation. If someone believed that cruelty is expedient (by making people less eager to oppose him in future), Hobbes would presumably have to allow him a right to act cruelly.

[20] See Darwall, *BMIO* 56.

[21] For further discussion see Barry, 'Warrender'; Gauthier, *LL* 40, Kavka, *HMPT* 303.

[22] 'To lay down a man's right to any thing, is to divest himself of the liberty, of hindering another of the benefit of his own right to the same. For he that renounceth, or passeth away his right, giveth not to any other man a right which he had not before; because there is nothing to which every man had not right by nature: but only standeth out of his way, that he may enjoy his own original right, without hindrance from him.' (*L*. 14.6)

[23] 'The way by which a man either simply renounceth, or transferreth his right, is a declaration, or signification, by some voluntary and sufficient sign, or signs, that he doth so renounce, or transfer, or hath so renounced, or transferred the same, to him that accepteth it.' (*L*. 14.7)

[24] 'And when a man hath in either manner abandoned, or granted away his right; then is he said to be obliged or bound [LV 'debet' is all that corresponds to 'obliged or bound'] not to hinder those, to whom such right is granted, or abandoned, from the benefit of it: and that he ought, and it is his duty, not to make void that voluntary act of his own: and that such hindrance is injustice, and injury, as being *sine jure*; the right being before renounced, or transferred. So that injury, or injustice, in the controversies of the world, is somewhat like to that, which in the disputations of scholars is called absurdity.' (*L*. 14.7) In *Civ*. 3.3 wrong is compared to contradiction, on the assumption that it involves violation of a promise.

signifying the transfer of right are 'the bonds by which men are bound, and obliged'. Hence words are 'the verbal bonds of covenant' in contrast to natural bonds (chains; *EL* 22.3).[25]

What we have said so far might suggest that I have obliged myself once I have told you I will lay down my right. This would be a surprising use of 'oblige'. If I tell you that I will eat a boiled egg for breakfast, but then I change my mind and eat a fried egg instead, have I obliged myself to eat a boiled egg and do I violate my obligation by eating a fried egg? His other remarks do not suggest that it is quite so easy to oblige myself. I oblige myself to you through a valid covenant of mutual trust, involving the future performance by both parties. Such a covenant requires some assurance that the other party will also keep the covenant (*L.* 15.3). We can acquire this assurance more easily by recognizing that once A has performed A's part of the covenant, it is reasonable for B to perform B's part (*L.* 15.5).[26] When both A and B have the appropriate assurance, each obliges himself by signifying his intention to lay aside his right.[27]

It is difficult, however, to understand this obligation as a case of laying aside my right, if we stick to Hobbes's initial account of a right as a physical liberty. For if I oblige myself by covenant to repay my debt to you, I do not abridge or 'lay aside' my physical freedom to refrain from paying my debt; on the contrary, if I did not keep that physical freedom, there would be no need for me to make a covenant. The freedom that I abridge or lay aside is my moral freedom. But my moral freedom to keep my money seems to consist simply in the fact that I am not obliged to give you the money. In that case, the account of obligation as laying aside moral freedom is not very illuminating; it simply says that when I oblige myself I make it no longer true that I am not obliged.

Moreover, if Hobbes's claims about liberties and rights must be taken to refer to moral rather than physical liberty, he has not vindicated his claims about the right of nature. For the mere fact that nothing stops me from trying to preserve myself does not show that I am morally free to do whatever I think will preserve me. If Hobbes argues for the right of nature from the mere fact of physical freedom, he is wrong to say that the obligation incurred in making a promise is the laying aside of a right. If his position is consistent, his claim about the right of nature should assert my moral freedom in the state of nature. But then he needs some defence of the claim; the mere fact of physical freedom is not a sufficient defence.[28]

[25] Raphael, 'Obligation', calls this 'artificial' obligation, and Barry, 'Warrender', thinks it is the main kind of obligation that Hobbes is talking about (except in passages where he speaks of natural obligation). *L.* 14.7 (just quoted) is used by both Barry and Raphael. According to Raphael 'A man is artificially obliged to keep his covenants by the mere fact of having made them, but this obligation has little or no force' (348). 'Force' comes from prudential natural obligation. Raphael compares this to the view that it is logically true that we ought to keep our promises, but only utilitarian reasons can be given to justify the practice of making and keeping promises (351). It is not clear, however, that Hobbes takes the making of a promise all by itself to constitute an obligation. This claim has to be restricted to cases where the promise is not 'invalid'. The obligation involved here is also prudential, provided that we think in the indirect prudential way that we must adopt in order to explain why the laws of nature are obligatory in foro externo in a commonwealth. Cf. Kavka, *HMPT* 338–49, on 'rule-egoism', and §501.

[26] This passage is used by Barry, 'Warrender' 50. See also Darwall, *BMIO* 72.

[27] On obligation v. ought-judgments see Kavka, *HMPT* 307, 309.

[28] This point tends to support Clarke's objection. See §§624–5.

486. Obligation as Motivation

In the case we have considered, obligation arises from a voluntary action of binding oneself by covenant. This is to be contrasted with the physical obligation that obliges us to stay where we are if we are bound hand and foot. Sometimes Hobbes suggests that a voluntary act is necessary for all non-physical obligation.[29] But how, we might ask, could this be true of the obligation arising from the laws of nature? And what does the obligation consist in? We have found that it is unhelpful to say simply that it is the renunciation of moral liberty, and then to say that moral liberty is simply the absence of obligation.

Hobbes throws some light on his view of obligation by connecting it with motivation. In non-physical obligation 'liberty is taken away . . . by hope or fear', rather than by physical restraint.[30] When we recognize that something promotes our self-preservation, we have (according to Hobbes's account of motivation) a predominant desire for it, and in that respect our recognition of the effects of the action takes away our liberty not to perform the action and 'binds' us to perform the action. We act freely in choosing the action, in the sense of 'free' that Hobbes applies to actions, because our desires cause our action; but since our desires necessitate our action, they take away (in one respect) our liberty not to act.

This explanation of obligation helps to explain how voluntary agreement may contribute to obligation. We might suppose that the agreement creates the obligation, so that I am obliged to keep my promise in virtue of having made the promise to you and your having accepted it. But this is not Hobbes's view. He believes that we are obliged only when our acts of agreement are made in circumstances that offer us sufficient benefits and assure us of mutual compliance. When these conditions hold, we have a predominant desire to keep the agreement; this predominant desire is the motive that is the obligation. The agreement does not create the obligation; words or other signs are means, but not the source, of obligation.[31] The words contribute to our being obliged only insofar as we have sufficient motives for doing what we say we will do.

In this sense the laws of nature also oblige us. We see that observance of them (in foro interno or externo, as appropriate to the situation)[32] promotes our interest. When we see this, we are moved by hope and anticipation of future good to ourselves; and since

[29] 'For in the act of our submission, consisteth both our obligation and our liberty; which must therefore be inferred by arguments taken from thence; there being no obligation on any man, which ariseth not from some action of his own; for all men equally, are by nature free.' (*L.* 21.10)

[30] 'Now if God have the Right of Sovereignty from his power, it is manifest, that the obligation of yielding him obedience lies on (incumbere) men by reason of their weakness; for that obligation which rises from contract . . . can have no place here, where the right of ruling (no covenant passing between) rises only from nature. But there are two species of natural obligation, one when liberty is taken away by corporal impediments, according to which we say that heaven and earth, and all creatures, do obey the common laws of their creation; the other, when it is taken away by hope or fear, according to which the weaker, despairing of his own power to resist, cannot but yield to the stronger. From this last kind of obligation, that is to say, from fear, or conscience of our own weakness (in respect of the divine power), it comes to pass, that we are obliged to obey God in his natural kingdom; reason dictating to all, acknowledging the divine power and providence, that there is no kicking against the pricks.' (*Civ.* 15.7)

[31] 'And the same [sc. words and actions in an agreement] are the bonds, by which men are bound, and obliged: bonds, that have their strength, not from their own nature, (for nothing is more easily broken than a mere word,) but from fear of some evil consequence upon the rupture.' (*L.* 14.7)

[32] In the state of nature the laws of nature bind only 'in foro interno': 'that is to say, to a desire they should take place: but in foro externo; that is, to the putting them into act, not always' (*L.* 15.36).

this motive always dominates every other motive, it compels us to act. This obligation removes our freedom to violate the laws of nature once we realize what they say.[33] They oblige us only if we recognize that they are counsels of self-preservation. If we do not know this about the laws of nature, their mere existence does not restrict our freedom.[34] Only ignorance of the content and implications of the laws of nature can explain their violation.

The laws of nature and the virtues connected with them are eternal; they oblige, and are laws, in the court of conscience (*Civ.* 3.29).[35] The fulfilment of the natural law is 'all we are obliged to by rational nature' (*Civ.* 3.30). This is why the sovereign is subject to the laws of nature, though not to the civil law (*L.* 24.7, 29.9). The laws of nature oblige him (*L.* 30.1; *Civ.* 13.16), just as they oblige all mankind (*L.* 30.4, 15).[36]

By making obligation include psychological necessitation, Hobbes fulfils his basic aim of reducing moral to psychological claims.[37] If we assume that we form a predominant desire for every action that appears to promote our self-preservation, we see why reason prescribes the means to self-preservation, and why we are obliged to follow the principles that tell us to follow these means. According to Hobbes's moral psychology, all predominant motives necessitate; hence we are obliged insofar as we have a predominant motive necessitating our action. In this sense the laws of nature oblige us.

How is this type of obligation related to the type that belongs to voluntary undertakings such as covenants? It is different since it does not require any specific act of agreement between two parties. It is not so clear, however, whether it violates the principle that all obligation arises from one's voluntary action. The laws of nature do not oblige any agents who do not seek to preserve themselves and to secure the way of their future desire; for they do not tell us to preserve ourselves, but only what we need to do if we want to preserve ourselves. Perhaps, then, the voluntary action that is presupposed is our self-preserving endeavour; this is not an act of agreement or consent that underlies the obligation (as in covenants), but it is still a voluntary action.

Apparently, then, Hobbes holds a unified conception of non-physical obligation as the removal of liberty through voluntary action that results in a predominant motive. Within this conception, he can explain why the laws of nature prescribe and create obligations, by being empirical propositions about means to self-preservation. If they were not propositions about self-preservation, we could not explain how reason could prescribe them, or how they could oblige everyone who understands what they say.

[33] On Hobbes's confusions about freedom, as (i) metaphysical, hence consistent with being psychologically compelled, and (ii) moral, giving permission to act otherwise, see Pufendorf, *JNG* i 6.10; Barry, 'Warrender' 62n.

[34] This is made clear by *Civ.* 3.26, where Hobbes argues that everyone is obliged by the natural law, because everyone can easily see that the provisions of the natural law promote self-preservation. Cf. *Civ.* 2.1n4: '. . . the whole breach of the laws of nature consists in the false reasoning, or rather folly of those men who see not those duties they are necessarily to perform towards others in order to their own conservation'.

[35] Conscience; cf. *Civ.* 12.2.

[36] This is the type of obligation that Oakeshott, 'Introd.' p. lix, calls 'rational obligation' in contrast to 'physical obligation'. Gauthier, *LL* 67, discusses Oakeshott, and concludes: 'Although there is only dubious justification in Hobbes's writings for erecting this concept of rational obligation, we have no major quarrel with Oakeshott, if he wishes to suppose that rational precepts are rationally obliging'. In Gauthier's favoured sense of 'obligation', the laws of nature do not oblige. Cf. Hampton, *HSCT* 242.

[37] On freedom see Barry, 'Warrender' 60, with further references.

487. Natural Law and Divine Commands

This discussion of the laws of nature shows that Hobbes agrees with some of Suarez's claims about intrinsic morality. The laws of nature are precepts of reason in their own right, apart from divine commands, and so we ought to observe them.[38] Hobbes takes a more naturalistic position than Suarez accepts, since he agrees with Vasquez's view that the laws of nature create obligations apart from divine commands; this view follows from Hobbes's motivational account of obligation together with his account of human motivation. Whereas Suarez confines obligations to laws issued by a legislator, and attributes only duties to intrinsic morality, Hobbes finds obligation without legislation. Hobbes's claim that the laws of nature oblige (*L.* 15.3, 36; *Civ.* 3.26, 27, 29) precedes his claims (in *Civ.* 4) about their divine origin and the obligation resulting from it. The obligation to keep the laws of nature does not require them to be laws commanded by God.[39]

But Hobbes also sometimes agrees with Suarez's account of a law, taking it to require the command of a legislator. When he maintains 'true reason is a certain law' and the laws of nature are dictates of reason,[40] he speaks of law in the broader sense allowed by Hooker and Vasquez. But sometimes he claims the laws of nature are laws only because they involve a divine command.[41] Without a divine command, the laws of nature would

[38] 'A law of nature, (*lex naturalis*,) is a precept, or general rule, found out by reason, by which a man is forbidden to do, that, which is destructive of his life, or taketh away the means of preserving the same.' (*L.* 14.3) 'Therefore true reason is a certain law, which (since it is no less a part of human nature, than any other faculty, or affection of the mind) is also termed natural. Therefore the law of nature, that I may define it, is the dictate of right reason, conversant about those things which are either to be done or omitted for the constant preservation of life and members, as much as in us lies.' (*Civ.* 2.1)

[39] See Nagel, 'Obligation'; Plamenatz, 'Warrender' (answered by Warrender, 'Reply').

[40] *Civ.* 2.1, quoted in §486.

[41] The evidence in *L.* is not clear: 'These dictates of reason (dictamina rationis), men use to call by the name of laws; but improperly: for they are but conclusions, or theorems concerning what conduceth to the conservation and defence, of themselves; whereas law, properly is the word of him, that by right hath command over others. But yet if we consider the same theorems, as delivered in the word of God, that by right commandeth all things; then are they properly called laws.' (*L.* 15.41) Nothing corresponds to the last sentence, however, in LV. Nor does Hobbes say anything similar in 26.8, where it is the commonwealth that makes the laws of nature genuine laws. A similar question arises about a later remark: 'The office of the sovereign, be it a monarch or an assembly, consisteth in the end for which he was trusted with the sovereign power, namely the procuration of the safety of the people, to which he is obliged by the law of nature, and to render an account thereof to God, the Author of that law, and to none but Him' (*L.* 30.1). Here again the crucial phrase ('the author of that law') is absent from LV. Indeed, the sense of the Latin is much clearer than that of the English. The Latin reads: Summi imperatoris officia . . . manifeste indicat institutionis finis, nimirum salus populi: quam lege naturae obligatur, quantum potest, procurare: et cuius rationem Deo, et illi soli, tenetur reddere. This might be translated: 'The duties of the supreme commander . . . are indicated by the end of his institution, namely, the safety of the people, which he is obliged by the law of nature to procure as far as he can, and of which he is required to render an account to God and to him alone'. This makes it clear that the safety of the people is not the sovereign's office, but the end for which he was instituted, and that the sovereign is not obliged, but required (teneri) to render an account to God.

On the laws of nature as commanded by God see *EL* 17.12: 'And forasmuch as law, to speak properly, is a command, and these dictates, as they proceed from nature, are not commands, they are not therefore called laws, in respect of nature, but in respect of the author of nature, God Almighty'. Cf. *Civ.* 3.33. *Civ.* conceives divine legislation as positive, given through the Decalogue. This may also be what Hobbes has in mind in *L.*, in speaking of 'theorems, as delivered in the word of God'. But in *Civ.* 15.8 he agrees with Suarez in taking God to have commanded observance of the natural law through our natural reason: 'Because the word of God ruling by nature only, is supposed to be nothing else but right reason, and the Laws of Kings can be known by their word only, its manifest that the Laws of God ruling by nature alone, are only the natural laws; namely those which we have set down in the second and third chapters, and deduced from the dictates of reason, humility, equity, justice, mercy, and other moral virtues befriending peace . . .'

be advice about self-preservation, but they would not carry the obligation that belongs to a law.[42]

What does Hobbes take to be added by a divine command? Suarez believes that a command is needed to create genuine law, and to create obligation, since obligation requires the imposition of necessity through a command. Hobbes agrees with him on the first point, since he claims that the laws of nature are not properly laws unless they are commands. But he does not seem to agree that commands are necessary for obligation. God's commands take away freedom through hope of rewards and fear of punishments; this hope and fear is the source of the obligation. Once we recognize that there is a God and that he is the creator, and that he rewards and punishes for obedience and disobedience to the natural law, we are obliged to obey the natural law.[43] God's commands are relevant because God supports them with sanctions. The command itself does not create the obligation, but the obligation consists in the motives that are excited by the sanctions.[44]

[42] Taylor, 'Hobbes' 40, notices that Hobbes speaks of laws of nature as dictamina. See, e.g., *L.* 15.41 (quoted in §487); *Civ.* 2.1 ('Therefore the law of nature, that I may define it, is the dictate of right reason, conversant about those things which are either to be done, or omitted for the constant preservation of life, and members, as much as in us lies.'). *L.* 14.3 calls a law of nature a 'precept or general rule' ('praeceptum sive regula'). As we have seen (§478), this does not mean that laws of nature are categorical requirements. As the passage in *Civ.* makes clear, they are dictates only for something that we are all presumed to want. From the fact that they are called dictamina, Taylor infers that they are not simply consilia. But this inference conflicts with *Civ.* 14.1, where Hobbes distinguishes counsel from command: 'Now counsel is a precept in which the reason of my obeying it, is taken from the thing itself which is advised; but command is a precept in which the cause of my obedience depends on the will of the commander'. The laws of nature, abstracting from divine commands, are the first sort of praeceptum, and hence are consilia. This aspect of Hobbes, and the critics who have emphasized it, are discussed by Boonin-Vail, *THSMV* 92–106.

[43] Hobbes ascribes obligatory force to divine power: 'The right of nature whereby God reigneth over men, and punisheth those that break his laws, is to be derived, not from his creating them, as if he required obedience as of gratitude for his benefits, but from his irresistible power . . . To those . . . whose power is irresistible, the dominion of all men adhereth naturally by their excellence of power; and consequently it is from that power that the kingdom over men, and the right of afflicting men at his pleasure, belongeth naturally to God Almighty; not as Creator and gracious, but as omnipotent.' (*L.* 31.5) '. . . the divine laws, or dictates of natural reason . . . the same laws of nature, of which I have spoken already . . . ; namely, equity, justice, mercy, humility, and the rest of the moral virtues.' (31.7). Though Hobbes does not use the phrase 'natural obligation' in this chapter, his view seems to be the same as in *Civ.* 15.7, where the phrase occurs. On natural law and the natural kingdom of God see *Civ.* 15.4–5 (not only Christians and Jews recognize the laws of nature as laws).

[44] Bramhall objects to this remark on our obligation to obey God: '. . . it is an absurd and dishonourable assertion, to make our obedience to God to depend upon our weakness, because we cannot help it, and not upon our gratitude, because we owe our being and preservation to him' (Hobbes, *EW* iv 291). Hobbes replies (295) that Bramhall has misinterpreted him. He agrees that he says in *L.* 'that the right of nature whereby God reigneth over men is to be derived not from his creating them, as if he required obedience, as of gratitude; but from his irresistible power'. But he denies that this is dishonourable to God, since all power is honourable and the greatest power is most honourable. Bramhall's view suggests that God needs gratitude. Hobbes claims that Bramhall misinterprets the passage in *De Cive*: '. . . and [he] says I make our obedience to God depend upon our weakness; as if these words signified the dependence, and not the necessity of our submission, or that *incumbere* and *dependere* were all one' (*EW* iv 295). Hobbes's objection to Bramhall's use of 'depend' is not clear. We might suppose that he appeals to his own use of 'incumbere' to indicate that God's power creates an obligation directly, and not through our fear of him; but this cannot be his point, since he goes on at once in *De Cive* to say that fear is the source of obligation. We might look for some clarification to Hobbes's footnote on his claim about obligation: 'If this shall seem hard to any man, I desire him with a silent thought to consider, if there were two Omnipotents, whether were bound to obey; I believe he will confess that neither is bound: if this be true, then it is also true what I have set down, that men are subject unto God because they are not omnipotent' (*Civ.* 15.7n). (Silverthorne translates 'ideo . . . quia' ('precisely because') as 'primarily because' without any warrant.) The supposition of two omnipotents raises some difficulties. If each has the power to do everything, one might suppose that it has the power to do what it wants to despite what anyone else wants. But this cannot be true of either of them, if the other is also omnipotent. So perhaps we must infer that the will of two omnipotent beings must always agree, and that each is omnipotent insofar as it can do what it wants to despite what any non-omnipotent being wants. This point, however,

Since God's commands create an obligation only through providing us with a motive, the motive, rather than its source in a command, is the obligation.[45] Since obligation is imposition of necessity, and since the relevant type of necessity is psychological necessity, we are obliged wherever we have compelling motives, whether or not they result from commands. This is why the laws of nature oblige us, whether or not they are genuine laws. Whether or not God exists or commands them, they are counsels of self-preservation, but they are laws insofar as they are commanded by God (*L.* 15.41).[46]

Our obligation consists in our overriding desire to obey natural laws as means to self-preservation, both because of their intrinsic character (apart from divine commands) and because we fear punishment, since God, even more than the sovereign (*L.* 26.8, 22), can enforce his will by force. A commander is necessary to turn the laws of nature into genuine laws, and their status as genuine laws provides us with a further source of obligation. It does not, however, provide us with a different kind of obligation; in both cases our obligation consists in the prospective benefits of following the laws of nature and the consequent desire to follow them.

Though divine commands do not create a new type of obligation, they are not superfluous. Since we may not always recognize that the laws of nature promote our self-preservation, we may be tempted to violate them. But if we recall that they are also divine commands, we face a further sanction apart from their natural effects, and therefore we have a further motive to obey them.[47]

We might doubt whether this is a realistic appeal to a second source of prudential motivation. For if we believe God commands observance of the natural law because it is a means to our self-preservation, would not any doubts about whether a type of action promotes self-preservation result in doubts about whether God commands it? In that case, both sources of prudential motivation would disappear at once.

Hobbes might answer this objection by denying that God commands observance of the natural law because it promotes our self-preservation. If we thought that this is God's reason, we would be assuming that God is the source of natural law as the creator who aims at the benefit of the creatures, and that we have a reason to obey God as a benevolent creator. Hobbes denies that this is God's relation to the natural law. In his view, we have a reason to obey God simply because of God's power. God is not bound to command one thing rather

does not seem to bear on Hobbes's argument. Perhaps he introduces the two omnipotent beings to suggest that neither would have any motive to obey the other; since we are not omnipotent, and God is, we have a motive to obey God. But this point does not challenge the accuracy of Bramhall's presentation of Hobbes. Bramhall seems to be justified, therefore, in claiming that Hobbes derives obligation from weakness and fear.

[45] Hobbes's claims about obligation have aroused some dispute. Gauthier thinks Hobbes faces a difficulty if the laws of nature oblige irrespective of divine commands. He assumes that 'if obligatory, they must be genuine laws' (*LL* 67). But Hobbes's remarks about obligation do not support this assumption. See Plamenatz, 'Warrender'.

[46] Bramhall accuses Hobbes of contradicting himself about whether the laws of nature are genuine laws. See *CL*, ch. 3, 577–8. He argues that an appeal to divine commands conveyed through the Scriptures will not make Hobbes's position consistent: 'But this will not salve the contradiction, for the laws of nature shall be no laws to any but those who have read the scripture, contrary to the sense of all the world' (578).

[47] Warrender, 'Reply' 95, acknowledges that, contrary to Taylor's view that Hobbes's position is strictly deontological, we can interpret the obligation created by divine commands as prudential. Hence Warrender's defence of Taylor's interpretation seems to amount to the claim that divine commands are the only source of obligation. This claim, however, conflicts with Hobbes's clear remarks. One need not infer that God is irrelevant as a source of obligation (Nagel and Plamenatz sometimes seem to come close to this).

than another, but simply exercises power in commanding what God wills. In that case, we have no reason to infer that God commands an action only if that action seems to us to promote self-preservation; the character of the natural law shows nothing about necessary features of God's will.

In this respect, then, Hobbes is a voluntarist about the divine will and the content of morality. He implies that it is logically possible for God to command us to violate the counsels of self-preservation that we have overriding reason to pursue (apart from any beliefs about divine commands). On this point, he agrees with Ockham's views about divine power and morality.

Our obligation to follow the laws of nature, both as counsels of prudence and as divine commands, differs in its origins from the obligation arising from contract. I do not acquire a natural obligation by any voluntary act of agreement to the obligation. But the character of the obligation itself is not different. Whether or not I enter into the obligation by an act of agreement, the obligation consists in the overriding prudential motive to do what I am obliged to do. Hobbes has a unified account of non-physical obligation, and the laws of nature fit into it, both as counsels of self-preservation and as divine commands.

While Hobbes agrees with Suarez in taking obligation to impose necessity, he differs from Suarez about the nature of the necessity. Suarez believes the necessity is moral necessity, leaving us with no reasonable alternative to compliance.[48] This is a normative necessity, to be explained by reference to reasons and oughts, not further reduced. Hobbes does not allow any irreducible normative necessity; the necessity imposed by obligation is psychological. In Suarez's view, God's communicating a command to me is sufficient to oblige me to obey it, whether or not I want to obey it. According to Hobbes, however, it is not sufficient; my motivation is also necessary.

This disagreement with Suarez is closely connected with Hobbes's rejection of Suarez's view of the 'foundation' of natural law. Suarez identifies this with moral principles recognized by natural reason, and consisting in the requirements of the honestum. Hobbes does not recognize the honestum as an aspect of morality distinct from the pleasant and the useful; hence he takes the natural foundation of natural law to consist wholly in counsels of self-preservation.[49] This disagreement with Suarez also reflects Hobbes's aim of reducing facts about reasons to facts about motives. Natural law is prescribed by correct reason only insofar as we have an overriding motive to obey it; and we have such a motive only towards counsels of self-preservation.

Hobbes's views on natural law are criticized by Sharrock from a more traditional point of view.[50] Sharrock mentions the classical and patristic sources of the doctrine of natural law that recognizes natural rightness (honestas); he connects them all with St Paul on the Gentiles who are a law to themselves. He also points out that the 'more recent' theologians,

[48] Suarez's view would be much more similar to Hobbes's view if Finnis's interpretation of 'moraliter movere' and related phrases were correct. See §442. Bramhall uses 'moral motion' (*LN* 46, ed. Chappell) in the way Suarez uses it. Hobbes, *EW* v 293, professes to be unable to make sense of the expression: 'Moral motion is a mere word, without any imagination of the mind correspondent to it.'

[49] Cf. Pufendorf, discussed in §571.

[50] The full title of Sharrock's work explains its point: *Hupothesis ethike, de officiis secundum naturae ius, seu de moribus ad rationis normam conformandis doctrina. principia item et rationes Hobbesii Malmsburiensis ad ethicam et politicam spectantes, quatenus huic hypothesi contradicere videantur, in examen veniunt.*

both Roman and Protestant, agree with this position.[51] On this basis he argues, against Hobbes, that the laws of nature are properly called laws even without commands (*HE* 46). Here he seems to take Vasquez's position against Suarez. He argues that the laws of nature are laws, because obligation requires law, and the natural dictates of conscience oblige everyone; no command could oblige unless we were already obliged to obey the command. This objection is effective only if Sharrock assumes that all moral requirements and oughts imply obligation, and so fails to draw Suarez's distinction between obligation and ought (debitum). On this assumption he argues against Hobbes's view that self-interest (*philautia*) is the only basis for obligation; in Sharrock's view, we are not required to pursue our self-interest, and hence self-interest cannot yield the sort of necessity that belongs to morality and obligation.[52]

Though Sharrock does not explore the different options that are open to someone who claims that obligation requires commands, and in particular fails to consider Suarez's position, he presents a reasonable alternative to Hobbes's view about the extent of obligation. We will need to consider whether Hobbes can consistently or reasonably maintain a purely psychological conception of obligation in his discussion of the obligatory character of practical reason.

488. Why Moral Principles are Laws of Nature

We can now return to Hobbes's claim that moral philosophy is simply the science of the laws of nature, and ask whether this claim is as distinctive as he suggests it is. He believes that the principles of morality are fundamentally laws of nature, if 'law of nature' is understood as he understands it, as a counsel of self-preservation. Given this understanding, he claims that the principles of morality are counsels of self-preservation.

In Hobbes's view, this account of morality captures the ways in which morality contains precepts that generate obligation. If a genuine virtue includes an obligation to perform some range of virtuous actions, it must conform to the conditions that generate obligations. We cannot specify the virtues simply by considering human nature and the human good. We must also add the fact that we need peace, and have an opportunity to secure it, so that we have good reason to follow the principles that secure it for us.

Hence we have no reason to act on the laws of nature until we can expect the appropriate sorts of effects. Hobbes suggests that if we simply consider the moral virtues by themselves, they tell us nothing more than what we need to do if we are to observe the laws of nature. They do not tell us that we have any reason to observe the laws of nature; and indeed, in Hobbes's view, we have no good reason to observe the laws of nature except insofar as they actually advance our desire for self-preservation.[53] Hence our reason to practise the

[51] 'Idem etiam sine ulla refragatione omnes ex omni secta iuniores affirmant theologi' (*HE* 44). He cites, among others, Suarez, *Leg* i 3.9, 9; Aquinas, *ST* 1–2 91 a2, 93 a4; *in Rm* 2.14; Calvin; and Melanchthon.

[52] 'Nemo enim necessario obligatur ad utilitatem suam, quia iuste possit ab ea recedere et iuri suo commodisque quibuscumque ad placitum et pro arbitrio renuntiare.' (52)

[53] When the observance of them does not directly promote our self-preservation, it may still promote our self-preservation indirectly, if the observance of the laws of nature is commanded by God. When Hobbes says that God 'by

moral virtues is extrinsic to them. We cannot find a reason if we simply consider human nature as shaped by the virtues; we must also consider it in the specific circumstances where we find a predominant desire to practise the virtues.

We might suppose that this difference between Hobbes and Aquinas does not make any practical difference; do they not defend the same virtues by different routes? One important practical difference is that they do not necessarily defend the practice of the same virtues in the same conditions. Hobbes sees that the traditional virtues do not always promote self-preservation. He does not conclude that he is wrong to defend them by appeal to self-preservation, or that the laws of nature are not counsels of self-preservation; instead he concludes that we have no reason to practise the traditional virtues when they do not promote self-preservation.

The aim of demonstrating that the laws of nature are counsels of self-preservation may appear misguided. For Hobbes's conception of the content of these laws is mostly quite traditional; he recognizes that they are different ways of treating other people fairly and with respect. The laws of nature prohibit arrogance and prescribe truthfulness, the keeping of promises, living in harmony with one's neighbours, and so on. Many of these principles require individuals to perform actions that are disadvantageous to them and to refrain from actions that would benefit them.

Hobbes deals with this feature of morality by connecting it with self-preservation in two stages: (1) The observance of moral principles tends to preserve a commonwealth, a stable society offering protection from aggression by others. (2) It is always better for me if the commonwealth is preserved than if it is dissolved or weakened. The connexion with self-preservation does not belong to moral principles directly, but to the commonwealth that they preserve. Hence we need not be surprised that moral principles say nothing directly about self-preservation; we see the connexion with self-preservation only when we consider the cumulative effects of all moral principles. We must see how the observance of moral principles preserves the commonwealth if we are to see how it preserves ourselves.

The two stages in Hobbes's argument suggest that in one respect it is misleading to maintain that the moral virtues are essentially concerned with self-preservation. If we are looking for a goal that will allow us to understand the character of the moral virtues, we ought to turn not to self-preservation, but to the preservation of the commonwealth. A virtue prescribes actions and traits of character insofar as they promote this end, and that is the end that unifies the efforts of the virtuous person. To see whether we have cultivated the virtues in a society we need to see whether we have promoted the traits that tend to preserve the commonwealth. For this purpose, reference to individual self-preservation is beside the point.

Self-preservation enters when we raise a different question: why are these traits that preserve the commonwealth prescribed by correct reason? According to Hobbes's psychological reduction of reason, what is prescribed by correct reason is what produces an overriding motive, and hence creates an obligation; only counsels of prudence do that. If we were not interested in knowing the connexion between morality and correct reason, we could ignore

right' commands the observance of the laws of nature, we must take him to mean that God has a right to command this observance; and if we apply Hobbes's account of a right to this claim about God's right, we must take Hobbes to mean that God is free, since nothing prevents him, to command obedience and to enforce compliance with his command.

the reference to self-preservation. But if we were not interested in this question, we would overlook an essential feature of morality; for genuine morality is recommended by correct reason, and so Hobbes has to show that it meets his conditions for correct reason.

489. The Reduction of Morality

In connecting the laws of nature, as he understands them, with morality, Hobbes seeks to reduce morality to counsels of self-preservation. We can ask two questions about Hobbes's account of morality: (1) Does it provide an explanatory reduction? Hobbes seeks to show what all the recognized moral virtues have in common. By doing this he believes he can explain what other theorists dimly recognized, even though they claimed to construct the list of virtues on some other basis. (2) Does it provide a vindicating reduction? if the moral virtues specify the means of peace and security, have we sufficient reason to follow them?

Hobbes's explanatory account of the moral virtues is worth discussing and criticizing in its own right, apart from his psychological and political views. According to his analysis of the moral virtues, moral considerations are characteristically about the public good, narrowly conceived as the preservation of the commonwealth. Hobbes's egoism and his restrictive conception of reasons do not affect this account of morality. He recognizes—at least implicitly—objective moral properties.[54] He may be right about what these properties are even if he is wrong about the mental states of moral agents.

Still, the questions about explanation and about justification are not completely separable, either in Hobbes's view or in fact. Hobbes would find it unwelcome if he had to conclude that the foundations of morality are quite unconnected with his psychological theory. If Hobbesian agents had no reason to care about morality, Hobbes's theory would separate morality from the principles that might rationally guide our actions. If a theorist reaches this conclusion, we have some reason to suppose that he is wrong about either morality or rationality or both.

The traditional account of the virtues assumes that the virtues are conditions that a rational agent has good reason to acquire. If we had no reason to cultivate the conditions that Hobbes calls moral virtues, that would be a reason for rejecting his account of the virtues. Since he wants to avoid this objection, Hobbes does not separate moral from rational considerations; and so he argues that Hobbesian agents have reason to take moral considerations seriously on some occasions.

Hobbes, therefore, seeks an explanatory and vindicating, not an undermining, reduction. When we see what moral principles really are, we ought to see thereby that we have good reason to follow them in the appropriate circumstances. Hobbes's account of human nature shows why Hobbesian agents have reason to follow counsels of self-preservation. If moral principles simply are these counsels, Hobbesian agents have reason to follow moral principles.

[54] Cf. Hampton, *HSCT* 42–51, on 'objectivism'. Recognition of some form of objectivism does not make Hobbes's position deontological. We have seen that he does not give a deontological ground for our obligation to obey divine commands. Nor does he assess moral rules deontologically. He assesses them with reference to the public interest, and this assessment depends on a rule-utilitarian explanation.

Most moral agents and moral theorists do not believe Hobbes's claim about the character of morality and moral philosophy. Many people suppose that moral obligations extend beyond the circumstances in which their fulfilment promotes peace. We might suppose, for instance, that in some circumstances it is better to rebel than to conform to a government, despite the danger to peace and self-preservation. In Hobbes's view, such beliefs about morality rest on failure to examine the rational grounds of moral obligation. If morality is rationally justifiable to rational agents, and if Hobbes's analysis of human nature is right, he is right about the character and basis of morality.

Hobbes believes that his account of human nature and its pursuit of peace both unifies and justifies the different moral virtues.[55] Hence his theory of human nature influences his account of morality. We could accept his views about which states are virtuous without accepting his claims about the connexion between the virtues, the preservation of peace, the laws of nature, and self-preservation. But if we did not accept these other Hobbesian claims, we would not, according to Hobbes, have explained why the virtues are important for rational agents. Hobbes believes we can see why his defence of the moral virtues is the only plausible defence, once we have accepted his views about the nature of human action and practical reason.

To see whether Hobbes's reduction of morality succeeds, we can raise two questions: (1) Have Hobbesian agents good reasons to follow Hobbes's rules? (2) How far do Hobbes's rules capture morality? The same questions arise for Plato and Aristotle.[56] But Hobbes rejects the solution that they prefer; for he does not adjust his conception of human nature to take account of apparently plausible views about the value of morality. He takes his theory of human nature to be fixed independently of beliefs about morality. This assumption makes the character of his argument, and the criteria for success, clearer than they are in Plato and Aristotle.

This difference between Hobbes and Plato and Aristotle reflects a difference in moral epistemology that we have seen in Hobbes's statement of his method for reaching consensus in moral philosophy and moral thinking generally. He claims that if we follow a 'geometrical method', we begin with simple and indisputable principles and advance from them by uncontroversial steps. Since morality is an area of dispute, we should begin with non-moral foundations, fixing the nature of human action and deriving an account of morality. His procedure is open to question, however, if the non-moral foundations themselves are not simple and indisputable; if they are open to reasonable dispute, they do not offer a decisive reason for accepting the moral consequences that Hobbes draws from them.

A fair estimate of Hobbes's success in his moral theory will take account of the restricted place that he allows for justification. While it is helpful and appropriate to say that he tries to 'vindicate' and to 'justify' morality, and to show that we have 'reason' to follow it, it is also misleading; Hobbes has no room for these normative claims, except insofar as they can be reduced to claims about motivation. A justification of morality and a demonstration that we have reason to follow morality is simply a true prediction that in the specified circumstances we will have an overriding motive to follow it.

[55] This also explains their universality. See *Civ.* 3.32.

[56] See §60 (Plato); §114 (Aristotle).

But can we perhaps ignore this reduction of the normative to the psychological, if we are considering Hobbes's defence of morality as counsels of self-preservation? Might this defence not succeed even if the reduction of the normative to the psychological fails? If it were to succeed, one of Hobbes's attempts at a vindicating reduction would be more plausible than the other.

It is not quite so easy, however, to separate Hobbes's different reductions. For his view that morality consists simply in counsels of self-preservation rests partly on his conception of human nature. He rejects the Aristotelian view that natural law is about what is appropriate for rational nature, because he denies that human nature is the rational system that Aristotle and Aquinas take it to be. He denies that it is a rational system because he does not recognize essentially rational desires, or decisive reasons that are not reducible to overriding motives. He connects morality with self-preservation because he takes the desire for self-preservation to be our overriding motive; hence, his argument for reducing morality to self-preservation depends on his reduction of the normative to the psychological. If we reject the latter reduction, we have good reason to question his defence of morality.

490. The State of Nature

Hobbes's reduction of the moral virtues vindicates them within limits. For his account of human nature implies that the human good and the moral virtues are not connected in all possible circumstances, or even in all circumstances that need to be considered in practical reflexion. Hobbes allows us to consider only the demands of self-preservation, and it seems obvious that, as Thrasymachus, Glaucon, and Adeimantus point out to Socrates, we often promote our self-preservation more effectively by acting against the virtues.

Hobbes deals with this objection in three stages: (1) It is sometimes correct. The state of nature sums up the circumstances in which we have no reason to practise the moral virtues. (2) However, we are worse off in these circumstances than if we are members of a commonwealth. Hence we ought to become members of a commonwealth and to follow the rules for the construction and the preservation of a commonwealth. The relevant rules are counsels for the preservation of peace, which are embodied in the moral virtues. (3) If we are members of a commonwealth, our self-preservation requires us to do whatever preserves peace, and hence requires us to practise the moral virtues.

Glaucon and Adeimantus agree with Hobbes about the first and second stages. They agree that we have no reason to be just outside a commonwealth, and that the existence of a commonwealth requires general observance of justice. They argue, however, that for a reasonably astute individual in an ordinary commonwealth, injustice remains advantageous. Epicurus tries to answer this defence of injustice by arguing that injustice brings fear of punishment and that this fear makes injustice inexpedient for us. His reply is unconvincing. Hobbes's account of the third stage is meant to give a better reply to critics of morality.

Hobbes does not argue that the moral virtues are good for each human being who is rationally concerned with his own good, irrespective of circumstances. He tries to describe the conditions in which the moral virtues are good for us. He does this by contrasting the situation in which the moral virtues do not benefit us with the one in which they do benefit

us, and by arguing that we are better off in the second situation than in the first. The first situation is the state of nature; the second is life under a commonwealth.

Hobbes is not the first philosopher to appeal to a state of nature as a starting-point for understanding the basis of moral principles and political obligation. The 16th-century Scholastics and 17th-century natural law theorists also rely on a state of nature.[57] But agreement in appealing to a state of nature does not imply agreement on the sort of theory that emerges; for different theorists describe the state of nature differently.

According to Aquinas' account of human nature and the law of nature, an appeal to the state of nature helps to explain the moral constraints on the formation of a state. For characteristics of human nature explain why it is reasonable to form a state; and the provisions of the law of nature determine the sorts of powers that people can legitimately assign to the state.[58] Hobbes, by contrast, appeals to the state of nature to show why no moral constraints can reasonably be imposed on the state. He rejects Scholastic conclusions because he relies on a different account of human nature and of the place of moral considerations in the state of nature. For his purposes, he needs to show that the state of nature is a state of conflict or potential conflict.

The state of nature, according to Hobbes, is a state of war.[59] This conclusion relies on his account of human passions and of their effect in the circumstances where no power coerces each individual alike. Given what we know about human nature, we can predict that in the absence of equal coercion each person will try to get what he wants by attacking others. People will not generally observe the principles embodied in the moral virtues. Moreover, given Hobbes's account of the human good, people are right to believe they are better off by not observing the virtues.

Why is the state of nature a condition of perpetual conflict? Hobbes's most general argument rests on one aspect of his views about the subjectivity of goodness.[60] Since I use 'good' for what pleases me (oysters), and you use 'good' for what pleases you (cheese), we differ in our judgments about what things are good. Hence our judgments about goodness display 'discord and strife'. Hobbes argues that this discord in judgments explains the discord that marks the state of nature.

This argument is open to objection; for variation in judgments about goods need not lead to the sort of discord that makes peace seem good. If you find x pleasant and I do not, we are not really disagreeing about any property of x; my report of my reaction to x does not conflict with your report of your reaction to x. The mere fact that we have different reactions does not produce the sort of disagreement that results in strife and war. Again, if I judge x good (because it pleases me) and you judge y good (because it pleases you), this discord in our judgments seems to protect us from any practical conflict or competition. Indeed, agreement in judgments about goodness seems far more likely to produce practical conflict. If you and I both agree that it is good for an ordinary person to possess the 100-euro note on the ground in front of us, our agreement is more likely to produce strife and discord.

[57] Scholastic views on the state of nature are described by Skinner, *FMPT* ii 154–66.

[58] On the state of nature see §§449–50 (Suarez).

[59] 'Hereby is it manifest, that during the time men live without a common power to keep them all in awe, they are in that condition which is called war; and such a war as is of every man against every man.' (*L.* 13.8)

[60] On goodness see §477.

When Hobbes suggests that the subjectivity of goodness results in discord, he seems to confuse variation of taste, disagreement in judgment, and conflict in action. Perhaps he fails to distinguish (1) the 'discord' that consists in failure to agree in objective judgments about which things are good, from (2) the discord that consists in conflicting plans and actions. The first sort of discord is not the source of the most serious conflicts in the state of nature.

491. Competition and Conflict

Hobbes needs a better argument to show that practical conflict is inevitable in the state of nature. He does not show that his description of the state of nature applies to all of us outside a commonwealth. We all desire to assure the way of our future desire; but this desire does not involve conflict with other people, unless their desires threaten our assurance of being able to satisfy ours. If none of us wants unshareable goods that others want, we have no motive, according to Hobbes's account, for competing with other people, and so we are not forced into conflict and instability.

Hobbes's argument, therefore, turns on the prevalence of competition. Competition enters only because we desire 'unshareable' goods—objects that other people also desire and that we cannot share without some of us getting less than we want—and because there are too few of them for each of us to have all we want. These are what Plato and Aristotle call 'contested (*perimachêta*) goods'. The contest over them causes aggression, or at least the constant danger of aggression.

Why can we not all be satisfied with some quota of unshareable goods? Hobbes might have two explanations in mind: (1) Though our desires for them are limited, the supply is even more limited. If I want a loaf of bread to keep me alive, and you want the same for yourself, but there is only one loaf of bread, we will compete for it. But we will no longer compete if two loaves are available. (2) We have essentially competitive desires, so that each of us desires more than the other has, however much the other has; hence, however much you get, I still want more.[61]

Which of these views does Hobbes maintain? Sometimes he seems to believe that some universal human desires are essentially competitive and that these desires are strong enough to produce competitive behaviour even when it threatens our security. If we desire not only to secure the way of our future desire, but also to secure our future superiority over others, the state of nature implies conflict, however abundant the unshareable resources may be. Clarke rightly suggests that, according to Hobbes, the desire for power over other people is 'one of the first and most natural principles of human life'.[62] Glory seems to rest on a desire for eminence in comparison.[63] In general, the analysis of passions and desires

[61] Cf. Rousseau on inflamed amour propre (§884). [62] Clarke, *DNR* = H ii 635 = R 258. Cf. Hobbes, *L.* 11.2, 17.1.

[63] 'First, that men are continually in competition for honour and dignity; which these creatures are not; and consequently among men there ariseth on that ground, envy and hatred, and finally war . . . Secondly, that amongst these creatures the common good differeth not from the private; and being by nature inclined to their private, they procure thereby the common benefit. But man, whose joy consisteth in comparing himself with other men, can relish nothing but what is eminent.' (*L.* 17.7–8) Cf. *EL* 9.1. On competitive desires see McNeilly, 'Egoism' (who underestimates their importance in *L.*). Cf. §675.

gives a prominent place to competition.[64] It might suggest that the passions are essentially competitive, involving a desire to do better than other people, whether or not I gain any further benefit.

This view conflicts with psychological hedonism; for if we essentially take pleasure in power, we desire power for its own sake, and so pleasure is not the only thing we desire for its own sake.[65] But the conflict may not be obvious to Hobbes; it is not a good reason for doubting that he believes in essentially competitive desires.

A better reason for doubt emerges from his discussion of the desire for power. Though he treats this desire as a general inclination, he treats it as a consequence of the desire for assurance of the way of one's future desire.[66] He suggests that power is valued only for the sake of assurance. We pursue greater and greater power as a means to assurance, but if we have this assurance, we may abandon the pursuit of power.[67] In contrast to naturally social animals, human beings can distinguish private from public good; foresight allows them to recognize future dangers to their well-being, and they seek superiority over others as a means of protection against these future dangers. Similarly, competitiveness and desire for glory result from the search for assurance.[68] Men 'naturally love liberty and dominion over others' (*L.* 17.1) because they want assurance; the same search for assurance brings them into the state, from 'foresight of their own preservation'. Competition does not rest on a desire for superiority for its own sake, but on a desire for assurance.[69]

But in what sense does Hobbes subordinate competitive desires to the desire for assurance? Does he believe that they originate in it, or that it controls them? Even if the desire for assurance makes us competitive, competitive desires may become independent of it, so that, even if we are assured about the future, we may persist in competition beyond the demands

[64] See *EL* 14.3. [65] On this argument against hedonism see §95 (Aristotle); §688 (Butler); §804 (Price).

[66] 'Felicity is a continual progress of the desire from one object to another, the attaining of the former being still but the way to the latter. The cause whereof is that the object of man's desire is not to enjoy once only, and for one instant of time, but to assure forever the way of his future desire. And therefore the voluntary actions and inclinations of all men tend not only to the procuring, but also to the assuring of a contented life, and differ only in the way, which ariseth partly from the diversity of passions in diverse men, and partly from the difference of the knowledge or opinion each one has of the causes which produce the effect desired. So that in the first place, I put for a general inclination of all mankind a perpetual and restless desire of power after power, that ceaseth only in death.' (*L.* 11.1–2) 'So that . . .' in the last sentence suggests the subordination of the desire for power to the desire for assurance.

[67] The passage quoted earlier in this section from *L.* 11.2 continues: 'And the cause of this is not always that a man hopes for a more intensive delight than he has already attained to, or that he cannot be content with a moderate power, but because he cannot assure the power and means to live well, which he hath present, without the acquisition of more. And from hence it is that kings, whose power is greatest, turn their endeavours to the assuring it at home by laws, or abroad by wars: and when that is done, there succeedeth a new desire; in some, of fame from new conquest; in others, of ease and sensual pleasure; in others, of admiration, or being flattered for excellence in some art or other ability of the mind.' (*L.* 11.2)

[68] 'Competition of riches, honour, command, or other power inclineth to contention, enmity, and war, because the way of one competitor to the attaining of his desire is to kill, subdue, supplant, or repel the other.' (*L.* 11.3) 'Moreover, considering that many men's appetites carry them to one and the same end; which end sometimes can neither be enjoyed in common, nor divided, it followeth, that the stronger must enjoy it alone, and that it be decided by battle who is the stronger. And thus the greatest part of men, upon no assurance of odds, do nevertheless, through vanity, or comparison, or appetite, provoke the rest, that otherwise would be contented with equality.' (*EL* 14.5)

[69] If this explanation is right, Rousseau is unjustified in attacking Hobbes for presupposing desires that are essentially 'social' and 'competitive'. See §883. Similarly, we have reason to doubt Oakeshott's claim that Hobbes treats pride and competition as basic motives: '. . . although men and animals are like in their self-centredness, the characteristic difference between them lies in the competitive nature of human appetite and passion: every man wishes to out-do all other men' (*RP* 253).

of assurance. But if the desire for assurance controls competition, passions have a stable hierarchy.

The choice between these two views about assurance and competition affects our view about practical reason and the desire for peace. Reason is uniquely concerned with finding the means to peace if and only if the desire for peace is always dominant; if other desires were sometimes dominant, reason would be equally concerned with finding means to satisfying these desires whenever they are dominant. Hobbes's assumptions about practical reason and peace may rely on a more basic assumption about assurance. The desire for assurance is not an inherently rational desire (since Hobbes recognizes no such desires), but (he may assume) it controls the strength of other desires.

If Hobbes does not take competitive desires to be essential to human nature, his state of nature does not include every logically possible condition of human beings outside a commonwealth; it includes only the circumstances in which there do not appear to be enough unshareable goods to go round. Hence Hume believes that justice is appropriate only in specific external circumstances that do not follow from human nature itself.[70] The competition that leads to a state of war results from human nature only in conditions of scarcity.

This may seem a relatively trivial objection to Hobbes, since it concerns what we say about human motives in the rather unlikely counterfactual situation in which there are enough unshareable goods to satisfy everyone's desires (not modified by consideration of other people's desires and needs). It may be important, however, for considering Hobbes's view about the difference between the state of nature and the commonwealth. If our desires are only contingently competitive, it may be more difficult for Hobbes to prove that the state of nature is so insecure that we need to create a commonwealth with unrestricted power to coerce. He may remove this difficulty if he is allowed to assume essentially competitive desires as part of human nature. But that assumption may make it more difficult to explain the stability of a commonwealth of Hobbesian agents. A commonwealth may remove some conflicts, by assuring each of us of protection for our unshareable resources; but it does not prevent conflicts that arise from essentially competitive desires.

492. Why a State of War?

To explain why the state of nature is a state of war, Hobbes might appeal to different sorts of beliefs and desires that suggest three different explanations:[71] (1) In the state of nature no agency compels mutual non-aggression, or compliance with promises, or observance of any of the other laws of nature. Since we lack the necessary assurance that others will behave peaceably to us, it is not in our interest to behave peaceably to them. Hence it is in our interest to violate the laws of nature that we would observe if we were in a commonwealth. (2) In the state of nature we can see that peace is good, and so we want to live at peace. But not everyone sees this all the time. Sometimes it appears that I would be better off

[70] See Hume, §770.

[71] Hampton, *HSCT*, chs. 2–3, discusses these different explanations. Pufendorf implicitly notices them in *JNG* ii 2.8–9.

if I cheated my neighbour this time; I do not attend to the remoter consequences of my actions, or I do not think carefully about their impact on my future desires. In these cases our passions distort our conception of our interest. (3) Even though I recognize that peace is good and that it is in my interest to observe the laws of nature, I sometimes care more about satisfying some particular passion—anger, spite, gratitude, for instance—and so I knowingly act against my perceived interest. In this case my passions do not distort my conception of my interest, but they cause me to act against it nonetheless, and so I violate the demands of peace.[72]

These different explanations for violation of the laws of nature in the state of nature are consistent; each may explain violations of natural law on different occasions in the state of nature. They may suggest different and mutually supporting arguments for establishing a commonwealth. But they may also confront Hobbes with difficult choices; for aspects of the state that remove one source of instability and war may encourage others, and therefore may both remove and create instability.

Hobbes believes that in the state of nature peace seems good to us. Within his moral psychology this claim is true to the extent that peace appears to us to fulfil our overriding desire. If the desire for the end to which peace is a means always dominates us, we always think peace good. But if this is true of us in the state of nature, why do we need to be compelled to keep the peace? Why do we not recognize that we all have an overriding desire for peace, so that we keep the peace? Hobbes argues that we lack assurance that others will keep the peace if they are not compelled to keep it, and therefore we need a coercive power over us. But why should I lack assurance, if I know that everyone else desires peace as strongly as I do?

To answer this question, we need to assume that we are prone to mistakes about the sorts of actions that undermine peace. If (contrary to Hobbes's assumptions) we found ourselves at peace, but without any coercive power over us, I would be strongly tempted to believe that I could gain some benefit for myself by aggression against you—cheating, stealing, or assaulting—without disturbing the peace; for I might predict that, even if you found me out, I could defend myself against retaliation from you, and that others might not find it in their interest to take the trouble to help you retaliate against me. Since I know that you think in just the same way about me, I lack the relevant sort of assurance about you. Since you know that I think in just the same way about you, you lack assurance about me. When we lack assurance, it is not in our interest to make and to keep agreements. Hence we lapse into a state of war.

Hobbes believes we are liable to these errors within a commonwealth. We tend to resent the disagreeable aspects of government and authority, because we do not take a wide enough view to see that these are needed to keep the peace.[73] Though we want peace above all, we have unrealistic views about the necessary means to peace. We need a coercive power over us to deter us from putting our unrealistic views into practice by evading our taxes or cheating our neighbours. In the state of nature, we are prone to equally unrealistic views;

[72] This seems to be Spinoza's view, given his views on reason and self-preservation. See §515; Curley, *BGM* 124.

[73] 'For all men are by nature provided of notable multiplying glasses (that is their passions and self-love) through which every little payment appeareth a great grievance, but are destitute of those prospective glasses (namely moral and civil science) to see afar off the miseries that hang over them and cannot without such payments be avoided.' (*L* 18.20)

but since we have no coercive power over us, nothing stops us from acting on them, and so we cannot get out of the state of war.

This account of the instability of the state of nature fits best into Hobbes's theory. It explains why we can be in a state of war despite our predominant and universal desire for peace; hence it justifies his claims that we think peace good and that practical reason uniquely prescribes the means to peace. It fits his reduction of reasons to motives and his analysis of goodness by appeal to desire.

But it does not fit all his moral psychology. Some of his views commit him to the second explanation of the state of war. For he does not always maintain that our strongest desire is for the long-term assurance that is secured by peace. He allows that we sometimes have stronger desires for short-term satisfactions; according to his account of judgments about goodness, we must judge these short-term satisfactions good when we desire them more strongly. He cannot consistently claim that we steadily judge peace good, even when we desire something else more strongly. Nor can he claim that reason always prescribes the pursuit of peace; for if some desire other than the desire for self-preservation dominates us, reason prescribes pursuit of the means to that dominant desire.

Still, even if Hobbes's moral psychology does not entirely fit his claims about goodness and about practical reason, it may not damage his argument for the commonwealth. He may reasonably rely on the second claim about the state of nature, appealing to varying judgments about goodness that result from the predominance of different passions at different times. On the occasions when we judge peace to be good, we can see the point of taking steps to protect ourselves against the occasions when we or others will judge some short-term gain to be better than peace. We can even use this variation in judgments about goodness to explain why in the state of nature we lack assurance about other people's intentions. Since they are liable, just as we are, to unstable judgments about good, we cannot be assured that we or they will retain a dominant preference for peace. Hence we have a reason to make it difficult for ourselves and others to undermine peace when we or they desire something else more strongly. We need a commonwealth, to make the benefits of peace so clear that we will not be easily persuaded to violate the laws of nature, and to coerce people who do not constantly see the benefits of peace.

The third explanation of the state of war is more difficult to reconcile with Hobbes's views about goodness, but he seems to be committed to it. For he claims that we can sometimes desire one option more strongly even if we believe that the other option is better. This is why he claims, against Bramhall, that incontinence is possible. This claim about incontinence is inconsistent with Hobbes's view that our judgments about goodness correspond to the strength of our desires.

Hobbes appears, therefore, to be committed to different explanations of the state of war that rest on conflicting elements in his moral psychology. It is not yet clear, however, whether the conflicts in his moral psychology make a difference to his argument from the state of nature to the commonwealth. For all three explanations of the state of war agree about how we can escape it. When we are in our far-sighted moods, we agree that peace is good and that we would like to bring it about. We see that to bring it about, we need to counteract the effect of the near-sighted deliberation that sometimes causes us to overlook the long-term benefits of peace, and the effect of near-sighted desires that cause us to choose

some immediate goal at the cost of a longer-term goal. The commonwealth counteracts the effect of the beliefs and desires that divert us from the pursuit of peace.

If we recognize these features of motivation in the state of nature, we may be tempted to infer that Hobbes offers two different sorts of arguments for the state. The first argument asserts that there are moral reasons for establishing the state and that the social contract gives it moral legitimacy. Hence the argument from the goodness of peace and the rationality of pursuing it might be taken to show that the state is morally required. The second argument simply identifies the motives that underlie the foundation of a state, implying that fear of other people is the psychological basis for obedience to law and governments. According to this argument, the social contract establishes only the psychological possibility of the state, saying nothing about whether the state is morally legitimate.[74]

It is plausible to claim that Hobbes offers both sorts of arguments; for he wants to explain both how the state is possible and what makes it morally legitimate. But it is also misleading to distinguish two sorts of argument; for in his view, they are not really distinct. He speaks of the laws of nature as precepts of reason, and says that reason helps us out of the state of nature; but he also believes that this role for reason depends on the appropriate sorts of passions. His account of morality and obligation implies that recognition of reasons demonstrating the goodness of something is simply a dominant motive to pursue it. Hence we recognize that peace is good just insofar as we have a dominant desire for it. With this in mind, we can consider the arguments that he offers to justify a commonwealth, and the motives that he appeals to.

493. Arguments for a Commonwealth

The laws of nature are counsels for securing and preserving peace. Given that we fear death, and seek 'commodious living', we agree that peace is good, and that it is in our interest to join in the formation of a commonwealth.[75] If we cannot secure an agreement that leads to peace, we are allowed to violate the laws of nature.[76] Our overriding desire for peace leads us to accept (in the right circumstances) the agreement to set up a sovereign and the associated covenant that requires all the contractors to give up their freedom to commit aggression on each other by using the 'helps and advantages' of war.

If we make and keep a covenant to live at peace with one another, we gain all the benefits of peace. But our simply making it does not ensure that we will keep it. For some of the different beliefs and desires that explain aggression in the state of nature also explain why some people may not keep a covenant to live at peace. And if the people who lack these misguided beliefs and desires know that other people are likely to break the covenant, they will also be less disposed to rely on it, because of their lack of assurance. If each of us

[74] Passmore, 'Moral', discusses these two tendencies in Hobbes. He finds rational, moral argument ('rationalism') mainly in *Civ.*, and purely psychological argument ('naturalism') in *L.*, but with elements of the rationalist position still present and creating a conflict with the naturalist elements.

[75] *L.* 13.14, quoted later in this section.

[76] '. . . every man, ought to endeavour peace, as far as he has hope of obtaining it; and when he cannot obtain it, . . . he may seek, and use, all helps, and advantages of war' (*L.* 14.4).

oscillates between a peaceful outlook and one of the outlooks that causes violations of a covenant, we will all agree, in our peaceful periods, that we need to be assured that other people will keep their covenants.

The making of an agreement, therefore, cannot by itself generate the sort of community that removes conflict.[77] As a Hobbesian agent, I have a good reason to agree to end the state of war, if other people will comply with the agreement. But I also have a good reason to gain as much as I can from my imperfect compliance with the agreement. For the very best outcome for me would be the one in which other people avoid aggression against me, but I am free to commit aggression on them when it suits me; hence I have a reason for violating the agreement when I can get away with it.

This argument for violating agreements is over-simplified, since we cannot completely separate reasons for making an agreement from reasons for keeping it. I benefit from an agreement insofar as other people keep it; but if my keeping it contributes to their keeping it, and my breaking it contributes to their breaking it, I have reason to keep it. Hence, since I value the survival of the commonwealth, I have a reason to comply to the extent that my compliance encourages other people to comply.

But how much compliance does this principle justify? Questions about the effects of my compliance or violation are not always easy to answer.[78] If very few people make the agreement, and if they will know not only that the agreement has been broken but also who broke it, reflexion on the ways in which my violation would undermine general compliance with the agreement might encourage my reliable compliance. But if the effects of violation are not so easily known, I seem to have a better reason to violate agreements. Moreover, everyone else has these reasons for compliance and for violation, and hence for wariness about other people's likely behaviour. In such conditions, it is difficult to form reliable estimates of consequences, even if we assume that we are all very good at estimating them. Moreover, if we assume, plausibly, that some people may be less good at this than others are, it becomes even more difficult to form a reliable estimate. Hence our collective situation is still unstable, because we have not removed all the sources of instability that are present in the state of nature.

Hobbes infers, therefore, that we must not only agree to live at peace, but also assure compliance with agreements. Hence we must agree on a coercive power to enforce the terms of peace. He defends this claim when he considers 'laying down our arms'.[79] In the

[77] 'Nevertheless, in contracts that consist of such mutual trust, as that nothing be by either party performed for the present, when the contract is between such as are not compellable, he that performeth first, considering the disposition of men to take advantage of every thing for their benefit, doth but betray himself thereby to the covetousness, or other passion of him with whom he contracteth. And therefore such covenants are of none effect. For there is no reason why the one should perform first, if the other be likely not to perform afterward. And whether he be likely or not, he that doubteth, shall be judge himself . . . as long as they remain in the estate and liberty of nature.' (*EL* 15.10)

[78] See Hampton, *HSCT*, ch. 2, esp. 78. She cites Cudworth, *TISU*, ch. 5, part 5 = iii 499–502. In ch. 3 Hampton accepts the 'short-sighted' account of instability in state of nature. But perhaps it becomes more rational to cheat and distrust in the state of nature, if the laws of nature rest on indirect egoist arguments (cf. Hampton 93). If I benefit from observing the laws of nature only insofar as I live under a system in which we all forgo direct egoistic deliberation, it seems rational for us to be direct egoists in the state of nature. Hence it is rational for us to distrust one another; hence it is rational to behave in ways that make the state of nature a state of war. That is why we can only wish we were in circumstances in which we could observe the laws of nature in foro externo; in the state of nature we have not made ourselves indirect egoists.

[79] In the state of nature, 'Reason suggesteth convenient articles of peace upon which men may be drawn to agreement' (*L.* 13.14). 'Therefore before the names of just and unjust can have place, there must be some coercive power to compel

state of nature, we must grasp the arguments justifying the setting up of a coercive power; for they explain how Hobbesian agents could set up a sovereign.

If we set up a sovereign with sufficient coercive power, violation will no longer be so attractive to people who might otherwise be inclined to violation. Coercion alters the options in two related ways: (1) The commonwealth compels me to comply, and punishes me for non-compliance, in cases where it would appear beneficial for me to cheat if I were not going to be punished. Since I now face a threat of punishment, it no longer appears to be in my interest to do what would otherwise appear to be in my interest. (2) I will now be assured that potential violators will be deterred from violation, and so I will be confident about making and keeping agreements. I need no longer refuse to make the agreement out of fear that others will not comply. Moreover, they can reach the same estimate about my behaviour.

According to Hobbes, the second effect of coercion is more important than the first. The main difficulty lies not in giving me a reason to keep my agreements, but in assuring me that others will keep their agreements if I keep mine. I am sufficiently assured only if I know that others will be punished for any violations. The obligation to keep a promise precedes any legal sanction.[80] The coercive power of the commonwealth is relevant, not primarily because it coerces me to do my part, but because it assures me that others will do their part for fear of being punished (*L.* 14.18–19). With this assurance about others, I have sufficient reason to keep my part of the promise. According to Hobbes, I am obliged to keep it, whether or not I will be punished if I do not keep it.[81]

The obligation to keep a promise, apart from the threat of punishment, arises from the law of nature. When we understand the law of nature, we see that the universal keeping of promises promotes the preservation of society; and since the preservation of society promotes my preservation, I have a reason for agreeing to the universal keeping of promises.[82] According to Hobbes's view of reasons, motives, and obligations, my obligation—apart from any threat of punishment—to keep my promise consists in my having a sufficient motive to keep it, when I bear in mind all the relevant consequences of keeping it and of breaking it. Coercion has to be applied to us, not because we have no reason to keep our agreements otherwise, but in order to give everyone sufficient reason to believe that others will keep agreements.

494. Objections to the Prudential Argument

This is a plausible argument to show that a Hobbesian agent has an overriding motive, and therefore (according to Hobbes's analysis of reasons) a sufficient reason, to join in the

men equally to the performance of their covenants, by the terror of some punishment greater than the benefit they expect by the breach of their covenant . . . and such power there is none before the erection of a commonwealth.' (15.3)

[80] 'In contracts we say, I will do this; In laws, Do this. Contracts oblige us, laws tie us fast, being obliged. (lege obligati tenemur.) A contract obligeth of it self, the law holds the party obliged by virtue of the universal contract of yielding obedience. Therefore in contract it is first determined what is to be done, before we are obliged to do it; but in law we are first obliged to perform, and what is to be done is determined afterwards.' (*Civ.* 14.2) Cf. Taylor, 'Hobbes' 55.

[81] This point is emphasized by Barry, 'Warrender' 54.

[82] This is what Kavka, *HMPT* 358, calls 'rule-egoism', discussed by Boonin-Vail, *THSMV* 82–92.

creation of a commonwealth. But it is open to objections, or at least to qualifications, if we look more carefully at the motives of such an agent.

Hobbes compares two situations: (1) We are in the state of nature and we have made no agreement to set up a commonwealth (including the laying down of our arms). (2) We are living in a commonwealth set up as a result of our agreement. He argues plausibly that if we are in the first situation, we prefer the second. But it does not follow that we can replace the first situation with the second. The commonwealth comes into existence only if we have both made and fulfilled an agreement to lay down our arms and to resign the use of force to the sovereign. Can Hobbesian agents be expected to fulfil such an agreement? Will it appear to them to be in their interest to comply with the provisions setting up a sovereign with a monopoly of the use of force?

Hobbes introduces coercion to counteract people's tendencies to violate agreements, but the only mechanism for introducing coercion seems to be an agreement. The sovereign monopolizes the use of coercive force only after we have all laid down our arms, and so the laying down of our arms cannot be coerced. I must lay down my arms without coercion, in compliance with an agreement, before we have a mechanism to assure compliance with agreements. But if agreements without coercion are unstable, the agreement to establish a coercive mechanism is unstable.

Hobbesian agents create this instability. Each one has a good reason for making an agreement that requires all to lay down their arms, but also a good reason for breaking the agreement. Since we are still in the state of nature, it is to my advantage to induce other people to disarm before I do; once they have done that, I have gained a competitive advantage, and the resulting situation will be better for me than either unilateral disarmament by me or simultaneous disarmament by all would be.[83] The analogous position involving sovereign states who try to agree on disarmament seems to suggest the difficulties of securing an effective agreement, given the benefits of inducing others to disarm first.

This suggestion may appear unrealistic. It implies that we can take Hobbes's picture literally enough to imagine the situation in which we are all disarmed, but the sovereign is not yet in a position to exercise coercive power. But perhaps we cannot really distinguish these two stages. Perhaps we should think of the agreement to lay down our arms, to set up the sovereign, and to authorize him to act for us, as a single indivisible agreement enacted all at once, and not in stages.[84] We cannot, then, assume a situation in which all are disarmed and so unable to protect themselves, while waiting for the sovereign to protect them. And even if we could legitimately think of distinct stages in setting up the sovereign, would it really be to my advantage to be the last one to disarm? If the others have a reasonable prospect of setting up a sovereign with the power to coerce, would it not be hazardous for me to hesitate to join them, since I would be exposed to the danger of retaliation? In this

[83] See Hampton, *HSCT* 135.

[84] Hobbes describes authorization: 'This is more than consent, or concord; it is a real unity of them all, in one and the same person, made by covenant of every man with every man, in such manner, as if every man should say to every man, I authorize and give up my right of governing myself, to this man, or to this assembly of men, on this condition, that thou give up thy right to him, and authorize all his actions in like manner' (*L.* 17.13). See Hampton, HSCT, ch. 5; Kavka, *HMPT* 391. Cf. Cudworth (§551).

respect, the comparison between Hobbesian individuals and sovereign states considering disarmament may be misleading.

But Hobbes may face a related difficulty. His argument assumes individuals thinking about forming an agreement to act collectively. But he does not consider the possibility of groups of people who may see a benefit in remaining armed while others disarm. A group may be strong enough collectively to defend itself against punishment, especially if it can organize its aggression so as to prevent the disarmers from forming effective means of coercion.

One might ask on Hobbes's behalf whether this appeal to groups does not take for granted an answer to his question. How can a group be stable enough if it has not already made the sort of agreement that he describes? If unwillingness to disarm prevents the formation of a commonwealth, will it not prevent the formation of smaller groups as well? As Plato remarks, even the members of an aggressive group must refrain from injustice against one another; but how can they manage that without a Hobbesian covenant?[85]

This defence against the objection does not seem adequate. For even if a Hobbesian commonwealth is needed for complete assurance in making and keeping covenants, assurance may come in degrees. We might see enough mutual advantage in the short term to warrant a short-term agreement. Even if an armed gang can manage only a short-term agreement, it may still disrupt the formation of a commonwealth by attacking the people who disarm.

This objection to Hobbes does not assume that the members of a gang are correct in believing it is in their interest to attack the disarmers who are trying to form a commonwealth. It is enough if they believe it. For Hobbes acknowledges that the sovereign needs to coerce people who form false views of their interest even when they are within the commonwealth. Before we form a commonwealth, people are liable to errors about their interest; that is why we need to bring a commonwealth into being. But if some people's false views encourage them to form armed gangs, it is difficult to see how others can bring the commonwealth into being. The very existence of armed gangs makes it more reasonable for those who would like to form a commonwealth to form their own armed gangs instead.

Hobbes might try to turn this objection to his advantage. The difficulty that we face in starting the process of disarmament will be apparent to a Hobbesian agent. He will see that the formation of gangs may leave him and everyone else stuck in the state of nature, which they all recognize to be worse than the commonwealth. Since he recognizes this, can he not also see that they would all be better off if they all refrained from this line of thought and simply accepted the agreement to set up the commonwealth?

We may grant that any individual Hobbesian agent can see this, and that everyone can see this sometimes. But it does not follow that enough people can share this insight for long enough to make disarmament effective. Hobbes seems to rely on an unrealistic assumption about stable and correct shared beliefs; and so he does not show that the process that sets up a commonwealth is accessible to Hobbesian agents. He could ensure stable and correct shared beliefs if he simply postulated that each individual has only true beliefs about his own interest; but he does not intend to postulate this, since he defends the coercive power of the state by arguing that it is needed to coerce individuals with false beliefs about their interest.

[85] Cf. Plato, *Rep*. 352b–c.

This argument tends to show that Hobbes relies on unrealistic claims, as measured by his description of Hobbesian agents, about the people who are supposed to establish the commonwealth. He does not seem to show that Hobbesian agents can establish a commonwealth. Reliance on unrealistic assumptions may in some circumstances be reasonable, as we will see in considering later appeals to a social contract. But it needs to be justified by showing that the unrealistic assumptions give the argument an appropriate rational or moral significance.[86] Hobbes takes its rational and moral significance to be derived from its psychological realism. An attempt to derive rational and moral significance from something other than psychological realistic assumptions requires us to depart from Hobbes's basic aim of reducing moral reasons to overriding motives.

495. Prudence and Motivation in the State of Nature

Our objection to Hobbes has assumed that, as he sometimes assumes, everyone's dominant motive pursues the long-term satisfaction of one's desires; in short, prudent desires dominate. We ought now to withdraw this assumption, and allow, as Hobbes sometimes allows, that people have other motives, concerned with shorter-term satisfaction, that may be stronger than prudent motives. As he acknowledges, it is possible for us, when we deliberate about our interest, to decide in favour of an imprudent action.

If Hobbes agrees that imprudent desires may be stronger than prudent desires, he should not be satisfied with an argument to show—even if he could show—that self-interested and prudent people will form and maintain a commonwealth. Such an argument does not show that the laws of nature always oblige us; for they may not always engage our prevalent motives. The mere knowledge that forming a commonwealth promotes my longer-term interest does not necessarily move me to try to form a commonwealth.

The comparative weakness of prudent desires does not refute Hobbes's claim that we can act on the laws of nature. For if we recognize that in the future we may want to act imprudently, we can do something to prevent ourselves from undoing our prudent choice. If I want to stop drinking whisky, and recognize that I will want to drink more in the future, I may take steps to frustrate my future desire, by pouring the whisky down the sink now, or by making it difficult in the future for me to buy more. These methods of tying my hands in the future explain why it is sensible, from Hobbes's point of view, to join in forming a commonwealth that can coerce me if I try to break its rules. If I foresee that I and others may want to break the rules, I act now to frustrate that future desire.[87]

Moreover, the recognition of imprudent desires may help Hobbes to solve the difficulty that we have raised about starting the process that creates a commonwealth. The instability of our prudent reasoning makes it difficult to see how we could agree to lay down our arms if disarmament must result from an uncoerced agreement. But we can avoid this difficulty about an agreement if we do not assume that submission to coercion must be the product of agreement. Previously we have mentioned the possibility of armed gangs as an objection to Hobbes's argument for the state. But we might try to use them in his favour. If some people form a

[86] Cf. Rawls, *TJ* §§24–5. [87] Cf. Hume on justice, §768.

gang that is stable enough to compel the rest of us to obey, a Hobbesian agent might see that it is in his interest and everyone else's to submit to the gang and make its leader the sovereign.

This attempt to make an armed gang the nucleus of the commonwealth rather than a threat to its formation raises further questions. (1) Why should we trust the gang to avoid aggression against us if we submit? (2) If the gang is made up of Hobbesian agents, how, on Hobbes's view, could it form a stable enough association to be able to compel the rest of us?[88] These questions about assurance do not show that Hobbesian agents cannot form a short-term alliance in a gang; but they become relevant when we consider the gang as a possible basis for a sovereign.

We avoid some difficulties if we exploit Hobbes's admission (sometimes) that our dominant motive is not always prudent. Suppose that A and B form a temporary association in the state of nature. But then A's forceful personality causes B to form a passion of fanatical loyalty to A. A and B then become a strong team, since their partnership is immune to the normal Hobbesian sources of instability; B's fanatical loyalty makes him forgo opportunities to betray A, and A sees that B is too useful to be mistreated; hence the association benefits each of them. Now they see that they will be even better off if they can capture other members, in whom they can form the fanatical attachment to A and B collectively that B had to A. Fanaticism helps to remove the distrust that would be left by a purely prudent desire, and the result of it would be in everyone's interest. A band of fanatics may steadily improve its competitive position against non-fanatics, since non-fanatics lack the rigid and imprudent outlook that would be needed for concerted action against the fanatics. Hence fanaticism might spread.

Rejection of the primacy of prudence, therefore, makes one aspect of Hobbes's account of the basis of morality more plausible. Fanaticism is possible if short-term passions are sometimes stronger than long-term desires. These passions are more attached to their objects than they would be if we were purely prudent. We discover on reflexion that we are all better off because some or all of us are sometimes moved by imprudent passions. Recognizing this, we might try to cultivate some irrational passions so that we benefit in the ways we would not benefit if we were always prudent.[89] Imprudent passions help Hobbes to explain those aspects of the origin of the commonwealth that do not fit his claims about the primacy of prudence. If, therefore, Hobbes recognizes imprudent passions, he can more easily explain the formation of a commonwealth in the state of nature.

496. Reason and the Laws of Nature

But the argument about the state of nature is not merely intended to show how the formation of a commonwealth is psychologically possible; it is also intended to show that

[88] On alliances in the state of nature see *EL* 19.4. Hobbes's views on agreements resulting from submission to force (*EL* 22.2) suggest what he might say about gangs or 'protection associations'. Hampton, *HSCT* 169–82, suggests that gangs can be formed without any appeal to fanaticism, because there are enough sufficiently far-sighted people around to form them. But this does not ensure their stability; if their members are Hobbesian agents, they seem to have the normal motives for treachery. The difficulty that Plato takes to arise for thoroughly unjust members of gangs seems to arise for Hobbesian gangs.

[89] Cf. Parfit's argument for being irrational on occasions, *RP* 12–13. Cf. Hampton, *HSCT* 63–8, on non-rational passions.

the laws of nature are 'precepts of reason' (*Civ.* 3.32). In Hobbes's view, this is because the laws of nature concern a future good, which is the concern of reason; in violating the principles that secure this future good, we act on 'irrational appetite' (*Civ.* 3.32).[90]

All these claims about the laws of nature presuppose that it is rational to do what must be done to preserve peace and to secure commodious living, in preference to acting on desires that threaten our prospect of peace. This presupposition would be correct if we always preferred peace and commodious living over any other end. In that case, the laws of nature would oblige us; our dominant desire for the end to which they secure the means would move us to observe them. But Hobbes is not justified in claiming that it is especially rational to desire peace, or to follow the laws of nature rather than principles that further our imprudent desires at times when they dominate us. Nor are we always obliged, even in foro interno, to follow the laws of nature. For, according to Hobbes's conception of obligation as motivation, we are sometimes obliged to follow the laws of nature, but we are also sometimes obliged to follow principles that conflict with them; our obligations follow our dominant motives.

These aspects of Hobbes's position do not conflict with his claim that the laws of nature are precepts of reason. But they imply that violations of the laws of nature are also precepts of reason. For since precepts are rational insofar as they identify means to satisfy our desires, precepts that prescribe means to satisfy imprudent desires are no less rational than the laws of nature. It is rational to establish a commonwealth, when our prudent desires dominate, and rational to frustrate its establishment, when imprudent desires dominate. When we are prudent, we can take steps to frustrate our imprudent desires when they arise; hence, for instance, we pour the whisky down the sink if we believe we will want to drink too much of it. But equally we can take steps when we are imprudent to frustrate our prudent desires; if I am angry enough at you, I may insult you, even though I know I will want your help in the future and that the insult will turn you against me. Both attitudes to our future desires are equally rational, given the purely instrumental account of rationality.

The position that Hobbes is committed to, therefore, is different from the one he puts forward. It is close to Hume's position. Hume goes further than Hobbes goes in tracing the implications of a purely instrumental view of practical reason. Since Hobbes sometimes accepts this purely instrumental view, he is committed to acceptance of the conclusions that Hume draws from it.[91] But he does not draw these conclusions. In particular he does not apply them to his defence of the laws of nature.

Questions about self-preservation expose some of the basic difficulties in Hobbes's argument. His account of the laws of nature and our obligation to seek peace seems to require the primacy of self-preservation. But that primacy both lacks support in Hobbes's account of deliberation and conflicts with some of the mechanisms that are apparently needed to bring a commonwealth into existence. No easy modification allows Hobbes to defend all his main claims.

[90] Quoted more fully in §493.

[91] See Hume (§736) and §496 above.

36

HOBBES: MORALITY

497. Hobbes's Attitude to Morality

Hobbes believes that the difference between the state of nature and the commonwealth explains why the true moral philosophy is the science of the laws of nature. If Hobbesian agents form a commonwealth that has the power to compel the observance of rules preserving the peace, they have sufficient reason, according to Hobbes, to observe these rules. The benefits of stability and non-aggression are so large and so evident that we must, if we think clearly about our interest, want them to continue at any cost. Since the laws of nature are also the principles of morality, we have good reason to accept morality.

If we attend to Hobbes's defence of morality, we may be surprised that his early critics attacked him for his allegedly immoral conclusions.[1] Did they simply misunderstand him, or did they perversely refuse to give him credit for his aims, or did they believe that he failed in his aims?

Hobbes's approach to morality is reductive; he attacks those who believe that morality rests on justified claims about human nature that go beyond his psychological account. But such a reduction might be intended either as a vindication or as a rejection of morality. It is a vindication if it shows that the main claims of morality are justified within Hobbesian psychology. It is a rejection of morality if it shows that there is no place for morality within Hobbesian psychology.

Some criticisms of Hobbes are unfair because they do not recognize that he seeks a reductive vindication of morality. They treat him as an enemy of morality because he traces morality to these specific psychological foundations; but Hobbes believes that his exposure of these psychological foundations supports morality, by showing that it does not need the indefensible psychological claims invoked by Scholastic theories.

It is unfair to treat Hobbes as an enemy of morality, if we consider only his intentions. But it may not be unfair, if we also consider the implications of his arguments. For if Hobbesian psychology tends to undermine morality, critics fasten on a genuine feature of Hobbes's position, even if he does not intend it.

[1] His critics include Cudworth, Clarke, Cumberland, and Pufendorf. See also Bowle, *HC*; Mintz, *HL*, ch. 6.

498. Hobbes's Defence of Morality

Hobbes's restricted conception of practical reason limits his vindication of morality. Even if he shows that it is instrumental to self-preservation, he does not show that it is uniquely rational; it is rational only on those occasions when the desire for self-preservation is dominant. On other occasions some other principles are rational. But this restriction might not make much difference. If our desire for self-preservation is often dominant, it will be especially useful to find the principles that further this desire rather than others. If morality can be shown to further this desire, that is a significant vindication.

To vindicate morality in this way, we must also restrict its scope. Some of the 'old moral philosophers' claim that morality is good for human beings without qualification, because it suits human nature; it relies on reasons that we can see to be good reasons for rational agents as such. Hobbes believes that this defence of morality is too ambitious, and therefore tends to undermine morality. In some circumstances moral considerations do not give us good reasons, and so the moral virtues are not suitable for human beings as such. In the state of nature we have no reason to accept the principles we intuitively regard as moral principles. It is too dangerous to treat other people well, since we may just increase their ability to harm us when they double-cross us. Since we cannot be assured that they will observe the laws of nature towards us, we are unwise if we observe the laws of nature towards them. Moreover, since our motives and aims are all self-interested, we have no reason to treat other people in accordance with moral principles; for it will not be in our interest to do this in the state of nature.

But though we have no reason to follow moral rules in the state of nature, we can defend them in more restricted circumstances. The commonwealth reduces the costs that deter us from following moral principles in the state of nature; for it coerces violators, and so removes the competitive advantage that others might gain from double-crossing me after I treat them well. In these circumstances morality is not only less dangerous, but also rational; for moral principles are those that informed self-interested agents want to be the rules governing a Hobbesian state. Since a Hobbesian state is in their interest, acceptance of these moral principles is in their interest too.

Only part of this argument presupposes Hobbes's psychology. Even if we are not Hobbesian egoists, we might agree that in the state of nature, as he describes it, the normal moral requirements do not apply, because the cost of fulfilling them is too high. We might agree with Hobbes's view that morality costs us too much, because we lack mutual assurance. If we agree that we ought not to observe the ordinary moral rules if they are ruinous or dangerous to us, we agree that self-preservation imposes some limits on the observance of these rules. But it does not follow that the observance of moral rules must always be in my interest; they may often require some sacrifice of self-interest, as long as it is not ruinous.

Hobbes's psychology supports his further claim that we have reason to observe moral rules only if it promotes our self-preservation. That is why he believes that our agreement to form a commonwealth, to assure mutual compliance, must also be in the interest of each agent. In his view, we are obliged to follow morality if and only if we have a dominant motive to follow it; we have a dominant motive if and only if we recognize that it is in

our interest. If we are members of a commonwealth, we find that morality promotes the preservation of the commonwealth that is in our interest.

499. Indirect Arguments for Morality

Within a commonwealth, therefore, Hobbes argues that we have self-interested reasons to observe ordinary moral principles. But he does not argue that the observance of every single moral principle on every occasion benefits me, or even that it preserves the state. The different moral principles and virtues constitute a set of rules for the preservation of the state and for the preservation of 'peaceful, sociable, and comfortable living' within the state. He mentions justice, gratitude, modesty, equity, mercy, and the other recognized virtues. But none of these virtues explicitly limits itself by the requirements of the preservation of the state.

Hobbes's appeal to these virtues implies that we preserve the commonwealth better if we follow rules that do not aim directly at its preservation. He offers an indirect consequentialist defence of morality. It is indirect because it gives us reasons to follow a specific rule on a particular occasion without attention, on that occasion, to the consequences of our action or of the observance of the rule. The benefits of this inattention are familiar in non-moral action. If we are looking for means to enjoyment, we may discover that whole-hearted absorption in an activity is sometimes the best way to enjoy it. We may interfere with this absorption if we turn our attention to the pleasant consequences of the activity, so that we make it a less effective means to our enjoyment. Something similar may be true about moral rules. If we are acting bravely or kindly, for instance, we may do better if we act spontaneously and immediately; attention to the consequences of our actions may prevent them from achieving the consequences we attend to.

To explain such cases we may introduce a 'two-level' argument. We may distinguish the context of immediate deliberation about what to do here and now from the context of reflexion. We do not consider consequences in our immediate deliberation, but we consider them in reflexion about what virtues we ought to cultivate, what habits of action we ought to strengthen or weaken, and what patterns of immediate deliberation we ought to use. Butler suggests that in the context of reflexion—'in a cool hour', as he puts it—we can appropriately ask questions that ought not to intrude into immediate deliberation.[2] This form of two-level indirect justification is the most plausible way of understanding the relation of the Aristotelian virtues to the pursuit of one's own happiness.

Two-level arguments may involve two different sorts of relations between the two levels. In a 'transparent' theory the principles underlying the two levels are consistent, and the second-level principles explain the truth of the first-level principles, even though we ought not to consider them in immediate deliberation. We can reflect on our first-level principles when we are not engaging in first-level activities, and then we can recognize the second-level basis of the first-level principles; we vindicate our first-level principles. In an 'opaque' theory, however, one level relies on principles that we reject when we think at the other level.

[2] See §708.

The second-level principles do not explain why the first-level principles are true; they might advise us to behave as if they were true, or to induce ourselves to believe in their truth, or to close our eyes to reasons for disbelieving them. In this case the two levels are 'opaque' to each other.

Our previous example of enjoyment illustrates the difference between transparent and opaque theories. Perhaps I regard enjoyment as a worthwhile end, and I recognize that I will gain most enjoyment by pursuing an activity that I value apart from its enjoyment, and by excluding thoughts of enjoyment when I am engaged in the activity. With this in mind, I might play the violin, valuing it for itself. I hold a two-level conception, but the levels are transparent to each other. When I reflect in a cool hour on the fact that I play the violin for my enjoyment, I do not undermine my pursuit of the activity; nor do I question my belief that it is valuable apart from my enjoyment. If, however, I regard enjoyment as the only end worth pursuing for its own sake, and the rest of the story is the same, the two levels are opaque to each other. For when I reflect in a cool hour, I must recognize that I not only believe (at the first level) that playing the violin—something other than enjoyment—is to be valued as an end, but also believe (at the second level) that nothing except enjoyment is to be valued as an end. My belief at one level conflicts with my belief at the other level.

An opaque two-level theory is easy to understand if different people occupy the two levels. If you are trying to educate me, you may want to teach me not only to act in certain ways, but also to act for certain reasons and to follow certain rules. But if you teach me to do this, you may not tell me why you want me to follow these rules or to recognize these reasons; you may have your own reasons for teaching me to follow the rules that I follow. If I learn your reasons, I may or may not change my mind about whether the reasons I act on are good reasons.

But how can a two-level theory be opaque if the same person holds the theory at both levels? If I recognize both levels, how can I avoid rejecting one or the other when I see the conflict between them? We can answer this question once we see that we may fail to recognize the conflict between our beliefs at different levels, or we may fail to confront it. Even if we confront it, we may not abandon either level of the theory; perhaps the opaque theory is the best we can do. One might even argue that, having recognized the conflict, we ought to try to forget about it. A troop of soldiers sent on a dangerous mission with only a slight chance of success might want to try to disregard the evidence showing that they are very likely to be killed. They might prefer to expose themselves to influences that will make them more prone to believe they will succeed in their mission. If they thought about why they form these beliefs in themselves, they would come to see that the beliefs are false; hence it is better if they do not think about this.

These reflexions on two-level theories may help us to identify some of the questions that arise about Hobbes. His definition of a law of nature connects it with one's own preservation (*L.* 14.3); but his discussion of the individual laws of nature does not connect them directly with one's own interest. He connects the individual laws of nature with the preservation of peace and the stability of the commonwealth, and therefore connects them indirectly with my self-interest, because I gain from the preservation of peace. Even if the preservation of the commonwealth is in my interest, it does not follow that everything that is required of

me to preserve the commonwealth is more in my interest than anything else I might do. Hobbes's argument, then, is indirect.

Similarly, the connexion between specific moral principles and the preservation of peace is indirect. Hobbes does not suggest that each principle aims at the preservation of peace. He needs to explain why it is better to follow the recognized moral virtues, which do not refer to the preservation of peace, than to follow rules aiming explicitly at this end. An indirect defence of morality may be more or less plausible if it is a two-level theory, transparent or opaque. An opaque theory is most flexible in accommodating intuitive objections to a consequentialist defence, since the theory implies that we will hold lower-level beliefs inconsistent with the higher-level principles. But an opaque theory raises the prospect of instability between the two levels, if reflexion at one level tends to undermine the beliefs we hold at the other level.

500. Morality and the Preservation of Peace

Hobbes's argument about morality succeeds only if each of his two indirect arguments succeeds. The indirect argument connecting peace with self-interest proves the point about morality only if the indirect argument connecting morality with the preservation of peace succeeds. We may therefore begin with the argument about morality.

Hobbes can show that moral principles tend to preserve peace, if he offers a plausible account of the content of moral principles and he shows that precisely these principles preserve peace. He is justified in claiming that the accepted moral rules help to preserve peace, since observance of them reduces the tendency to conflict. But this fact about the moral rules does not explain their character, unless we can show that no other rules would preserve peace as well or better. If we have reason to prefer the accepted moral rules over other rules that preserve peace as well or better, the tendency to preserve peace cannot be our whole reason for accepting the moral rules or their sole justification.

To see whether Hobbes is right, we need to consider apparent exceptions to the requirements of the traditional virtues. Might we protect the state better and preserve peace better if we followed less sweeping rules with more exceptions? These rules might allow, for instance, the breaking of promises on the right occasions, or might allow public officials to break the law when it is expedient. Machiavelli argues that a ruler should sometimes violate the requirements of justice, gratitude, and mercy, to secure the stability of the state.[3] In his view, steady adherence to moral rules makes the state too inflexible to meet emergencies, and so we ought not to commit ourselves to them.

Hobbes agrees with Machiavelli's claim that my obligation to follow the rules of conventional other-regarding morality is strictly limited, and in particular that it depends on my view of how far I can rely on other people to follow the same rules. Following Machiavelli, he believes that self-preservation and the preservation of the state are the basic

[3] See §404. Influence of Machiavelli on Hobbes's moral and political theory has not been shown, though it has sometimes been suggested. Saxenhouse, 'Modern' 124–37, suggests that the case for such influence is strengthened by consideration of a discourse on Tacitus (which she takes to be an early essay by Hobbes, published in 1620).

aims that give us good reason to follow or to break a moral rule.[4] Machiavelli particularly wants to show that it is legitimate for a ruler (individual or collective) to advance the interests of the ruler or the state (not always clearly distinguished) even by immoral means. Hobbes tries to convince subjects that they have no good reason to disobey the ruler. He believes that if we understand the moral virtues, we see that we have good reason to observe them, in the appropriate circumstances, and in particular we see why we are not justified in disobeying the ruler. Here, then, he is not concerned directly with Machiavelli's concerns. But he also assumes that subjects of the commonwealth can expect their rulers to observe the laws of nature in relation to them. He does not endorse Machiavellian rules that violate the laws of nature.

But Hobbes does not try to show that there are no occasions of the sort that Machiavelli describes. This is a gap in his argument. If his claims about peace commit him to acceptance of Machiavellian rules, he cannot justify the traditional moral rules, which do not allow Machiavellian restrictions on promise-keeping and so on. If Hobbes has reason to reject the traditional moral rules in favour of Machiavellian rules, or if he gives no reason for preferring the traditional rules over Machiavellian rules as means for keeping the peace, he does not explain the moral virtues. Morality, therefore, may not be a system of Hobbesian laws of nature, designed to secure a Hobbesian state. In that case, Hobbes has no good reason to assume that traditional moral principles preserve the state better than Machiavellian rules would.

Hobbes might argue, however, that people are more likely to accept the ordinary moral rules than to accept the more efficient Machiavellian rules, and that therefore the adoption of ordinary moral rules is more likely to lead to the law-abiding habits that increase stability in the commonwealth. Perhaps it is better, he might argue, if people are trained simply to accept ordinary moral rules than if they are trained to consider the preservation of peace all the time. This is a two-level justification.

Are the two levels transparent or opaque to each other? That depends on why ordinary moral rules (requiring, say, that promises be kept and that punishment be inflicted only when guilt has been settled) are better at preserving peace than more flexible rules (allowing public officials to break promises or to inflict penalties on the innocent) would be. If the reason is that most people think there is some reason, apart from preservation of peace, for observing the stricter rules, the two levels are opaque to each other. For, according to Hobbes, the preservation of peace is the only reason for accepting one moral rule rather than another; if we believe that some rules safeguard rights that belong to human beings apart from any commonwealth, we are mistaken.

Hobbes does not go into this question in detail. It is difficult to believe, however, that he can plausibly maintain all these claims: (1) Preservation of peace is the only good reason for prescribing a particular moral rule. (2) Ordinary moral rules are better than Machiavellian rules would be at preserving peace. (3) The two levels are transparent to each other.

If the third claim is true, our readiness to believe ordinary moral rules, and to suppose we have reason to act on them, is not undermined by our coming to believe that they are justified only to the extent that they preserve peace. But this is quite unlikely. We are

[4] On criticisms of Machiavelli by some Scholastics see §449.

relatively stable in our observance of moral rules, apart from what we may regard as the best means to preserve peace, because we think we have some distinct reason for observing them. If this is so, Hobbes's claim to defend ordinary moral rules by appeal to their role in preserving peace depends on our observing them for reasons that, in the light of his theory, are bad reasons. His defence, then, raises some serious objections that he does not try to answer.

These considerations suggest that we might prefer Hobbesian laws of nature over Machiavellian rules on the ground that they preserve the peace more effectively. If Hobbesian laws of nature are generally accepted, and known to be accepted, in a commonwealth, people will trust one another more, and trust their rulers more. There will be less injustice, conflict, and suspicion, and so the commonwealth will be more stable than the sort of republic that Machiavelli imagines. Hence, we might argue, rulers will not need to resort to Machiavellian devices. But this defence of Hobbes is not decisive. For the Machiavellian might still answer that Machiavellian rules allow the rulers to react more flexibly to dangers to the peace.

This dispute between a Hobbesian and a Machiavellian view suggests a possible compromise. Why not allow the rulers to violate Hobbesian laws of nature while teaching their subjects to observe them?[5] In that way we seem to get the benefits of both Machiavellian flexibility and Hobbesian stability. We can reduce the danger of instability arising from distrust if the rulers conceal their violations of the laws of nature as far as possible. Such an arrangement would give us an opaque two-level theory of morality, but the two levels would reflect the outlook of different people. The subjects would accept moral rules without reference to their usefulness for preserving peace, while the rulers would impose them on the subjects, not on themselves, as means to preserving peace. Any moral objections to this arrangement are irrelevant unless they can be expressed in Hobbes's terms, as arguments to show that the arrangement threatens the preservation of peace.

We need not try to settle this dispute between Hobbes and Machiavelli. It is enough to point out that the dispute seems to turn on empirical questions. If Hobbes wants to defend the laws of nature as means to the preservation of peace, he should compare them with more Machiavellian rules and strategies, and explain why he has a better empirical case for the laws of nature. Since he does not do this, he gives us no Hobbesian reason for preferring the laws of nature.

We may overlook this weakness in his case if we evaluate it from the moral point of view. We may be inclined to reject Machiavellian rules, however effective they may be, once we see that they are immoral. Once we see that, further inquiry (we may suppose) is unnecessary. This sort of reply, however, is not open to Hobbes. Since he intends to explain and to justify moral claims by reducing them to rules for the preservation of peace, he cannot reject alternative rules for the preservation of peace on the ground that they are immoral.

Hobbes's claims about morality anticipate some of the difficulties that arise for moralists who try to explain moral principles as maxims for promoting the general good or for maximizing utility. They have to show that the promotion is indirect, and explain why this

[5] Some of Machiavelli's remarks suggest that this is his view. See §§403, 410.

is preferable to more direct promotion. Hobbes is in a weak position, since he takes the laws of nature to aim not at the public good, but simply at the preservation of the state. It seems easier to show that the relatively narrow aim of preserving the state may diverge from morality than to show that the broader aim of maximizing the good of all those affected may diverge from it; for the broader aim is more plausibly connected with the outlook of universal benevolence. But the general question arises for later utilitarians no less than it does for Hobbes.

501. Revolutionary Objections

Let us now suppose that Hobbes succeeds in his indirect consequentialist defence of morality as a means to preserve peace. The next indirect argument in his defence of morality seeks to link preservation of peace with one's individual interest.

To show that it is always in my interest to prefer the preservation of peace over any other prospective benefit, Hobbes needs to answer three different sorts of objections: (1) Some members of a commonwealth might decide that they would be better off if the commonwealth were dissolved and replaced either with the state of nature or with a different commonwealth. This is a 'revolutionary' threat. (2) Some might decide they would be better off if the state were deliberately made less efficient in enforcing its rules, so that they could benefit from the loopholes that would be created. This is a 'libertarian' threat. (3) Some might decide they would be better off if the state remained as efficient as it is, but they disobeyed the laws when they could get away with it. This is a 'non-conformist' threat.

Hobbes answers the revolutionary threat by arguing that since peace and stability are better than war and the state of nature, it is always better to put up with the commonwealth we have. This answer aims at two types of revolutionary: (a) One revolutionary plans a civil war, and therefore a return to the state of nature, as a means to improving the commonwealth. (b) Another takes the risk of war, and hence the risk of returning to the state of nature, as part of the strategy of improvement. The 1917 Bolshevik Revolution followed the first strategy. The Parliamentary leaders in England in the early 1640s followed the second strategy, and found that they had to fight a civil war. In 1688 the risk of a civil war did not result in a war in England, but resulted in one in Ireland. Hobbes's argument is primarily concerned with the second type of revolutionary, since a refutation of this strategy will also refute the first type.

He asks us to compare the worst possible result of pursuing either of the options open to us. The two worst results are: (1) We put up with the commonwealth we have, even though it is extremely oppressive. (2) Our revolutionary strategy returns us to the state of nature. Since the worst outcome of acquiescence in an oppressive state is better than the worst outcome of the revolutionary strategy, we ought to prefer acquiescence. This is an instance of the 'maximin' attitude to risk.

This maximin attitude seems to assume an unjustified degree of aversion to risk. The argument proceeds without any attention to the probability of any of the results, and so it prohibits us from considering the probability in deciding which option to prefer.

Hobbes offers the same argument against those who break rules without intending to cause a revolution. But it seems irrational to ignore probability altogether. Even if peace advances self-preservation more than anything else does, and we value self-preservation above everything else, it does not follow that we should never accept the smallest risk to self-preservation in order to gain some other good. Hobbesian agents who took such an attitude to risk would never cross the street.

Hobbes might answer that this objection misses the point of his attitude to risk. He is not necessarily advocating a maximin attitude to risk in deciding whether to cross the street. But the special features of choices involving the dissolution of the state justify an extremely conservative attitude to the risks involved. In some cases we face a choice between Option 1 (with possible outcomes 1a and 1b) and Option 2 (with possible outcomes 2a and 2b) that satisfies these three conditions: (i) The probabilities are unknown, or difficult to fix with any confidence. (ii) The worst outcome, 2b, is catastrophic. (iii) Neither 1a nor 1b is catastrophic. (iv) 2a is the best outcome, but it offers us comparatively trivial gains over 1a and 1b. In these conditions the maximin attitude is reasonable, and we ought to choose Option 1 over Option 2, even though Option 2 offers us the best of the possible outcomes (2a).

In Hobbes's view, the choices that face us in deciding whether to risk a return to the state of nature have this character. The importance of peace and self-preservation, compared to other goods, ensures that the third and fourth conditions are satisfied. The first option is preservation of the peace with the current unsatisfactory regime either a bit improved (1a) or no better (1b). The second option is revolution, either leading to a much better regime (2a) or back to the state of nature (2b). In this case the second option offers us the prospect of improvement (2a), but this advantage over the first option is small in comparison to the disadvantage of reversion to the state of nature (2b). Hence we should prefer the first over the second option.

Hobbes's argument suffers from his failure to show that the first condition is satisfied. In some cases, may we not reach a reasonable estimate of the probabilities of different outcomes that might justify us in proceeding on a more optimistic assumption than the maximin attitude underlying the choice of the first option? Hobbes might fairly point out that revolutionary action sometimes proceeds on a foolishly optimistic judgment about probabilities, or on a negligent failure to consider them. But it would be difficult to show that all revolutionary action faces this objection. Hence a maximin attitude is unjustified.

But even if we concede Hobbes's assumptions about probabilities, his moral psychology makes it difficult to see how Hobbesian agents could reliably satisfy the second and fourth conditions for a maximin attitude to revolution. In his view, the reasonable course of action is fixed by reference to what promotes our dominant desire at a particular time. But our desire for self-preservation may not always dominate us. Hobbes sometimes maintains that other desires sometimes cause us to act imprudently (from the point of view of self-preservation). From the point of view of such desires, the difference between Option 2a and Option 1 might not be as small as it would need to be to justify the choice of Option 1. Since these other desires may sometimes be stronger than the desire for peace, and since Hobbes treats claims about obligation as predictions about motivation, he is not justified in claiming that

everyone always has an overriding obligation to preserve peace and to choose the means to it. We have seen that some 'fanatical' desires are needed to set up the commonwealth. If some members of a commonwealth still have fanatical desires, they are not always obliged to seek peace above all. Even if the desire for self-preservation is always overriding, it may not override strongly enough to make the difference between Option 2a and Option 1 small enough.

Might Hobbes concede that our desires do not always result in a maximin outlook, but argue that they ought to, and that they would if they were rational? If he claims that a refusal to adopt a maximin outlook in these circumstances is irrational, he relies on an irreducibly normative conception of rationality. But then he violates his aim of reducing reasons to motives.

Hobbes succeeds in his aim of vindicating morality only if he can show that his assumptions about aversion to risk are psychologically correct; they must be true descriptions of the outlook of agents in the situations he describes. But his argument fails this condition. He may still be right to claim that morality rests on assumptions about aversion to risk. If these assumptions cannot be justified on psychological grounds, they may be understood as aspects of the moral outlook; morality refuses to subject certain kinds of protection to gambling. Hobbes notices that these attitudes are characteristic of morality, but he cannot explain, within his psychological assumptions, why they are reasonable.[6] He fails to include them within a vindicating reduction of morality; for Hobbesian psychology makes morality sometimes irrational.

502. Libertarian Objections

Hobbes's defence of morality presupposes that we want an efficient state. He assumes that I will be ready to observe moral rules that require me and everyone else to forgo some immediate advantages for the sake of peace, if I believe that general observance of such rules increases efficiency. But might I not benefit from a less efficient system? If I could gain some advantages over other people, by greater prudence and more acute calculation of my interests, might I not benefit if the state were inefficient enough to allow me to violate the conditions of agreement on occasions when it suited me? I seem to have no sufficient reason for keeping the rules if I am not forced to keep them; and I seem to have no sufficient reason to prefer a very efficient mechanism of enforcement.

Such libertarian arguments fail if it is better for me to live in a state that enforces compliance on its citizens predictably and efficiently than to live in a less efficient state. One might argue in Hobbes's defence that the libertarian argument ignores the corrosive effects of giving other people the opportunity that I want for myself to break the rules. I may be harmed if other people have this opportunity, even though I would benefit if I alone had the opportunity. Though I might want Gyges' Ring for myself alone, I might not want it if everyone else had it too. Hence I might prefer no one's having it over everyone's having if, if these were my only options.

[6] These assumptions are prominent in Rawls, *TJ*, ch. 3. Rawls tries to show why they provide an appropriate basis for a moral theory, without claiming that they are realistic.

This argument does not secure Hobbes's conclusion. We cannot always assume that everyone will be equally astute or active in breaking the rules when it suits him. Hence an opportunity for me to break the rules may not allow a greatly increased scale of rule-breaking. The more astute or unscrupulous or energetic might have reason to welcome an arrangement that they would not welcome if everyone were to exploit it in the way they propose to exploit it.

Hobbes faces a further difficulty from the possibility of fanaticism. We saw earlier how fanaticism might help the formation of a state that would be in the interest of Hobbesian agents. Fanaticism equally makes it easier for the Hobbesian agent to reject the Hobbesian state in favour of a more inefficient one. We could defend an efficient Hobbesian state, if a loophole for even one Hobbesian agent created massive instability; and an inefficient state might leave this dangerous loophole, if all citizens were equally clear-sighted and well-informed Hobbesian agents. But if this is not so, a Hobbesian agent might well prefer a less efficient state. If some citizens are fanatical enough, they will not break the rules even if it is in their interest to do so, and even if they see that it is. If their compliance can be relied on, the Hobbesian agent has good reason to observe the rules less than he would have to if these other people were less fanatical. Evidently, the more disloyal one citizen is, the greater the fanaticism required in the rest of the citizens. It suits him best if other people are so attached to moral rules that they can be relied on to follow them without worrying about their good consequences.

These objections to Hobbes assume that one person takes advantage of the fact that other people are less astute, or lazier, or more fanatical. By taking advantage of these facts, I can do better than I would do if I followed the rules that Hobbes takes to be in each person's interest. From the moral point of view, we clearly take unfair advantage of the differences between people. But the Hobbesian basis of morality does not explain why we should not take this unfair advantage.

503. Non-conformist Objections

The objections of non-conformists to morality raise further questions about the effect of one individual's action on the actions of others. The non-conformist does not want the state to become less efficient, but he wants to take advantage of the opportunities for breaking the rules. If not everyone is equally astute or energetic, not everyone will take advantage of the opportunities for injustice that are open to different people; and so the system need not collapse. Hence Hobbes's 'fool' denies that it is always in his interest to keep the rules of justice. He accepts Hobbes's reasons for agreeing to the commonwealth in the first place, but he points out that these reasons do not justify him in doing what the commonwealth requires of him, if he can gain some greater benefit by unjust action and can avoid punishment for it.[7]

[7] 'He does not therein deny that there be covenants; and that they are sometimes broken, sometimes kept; and that such breach of them may be called injustice, and the observance of them justice: but he questioneth, whether injustice, taking away the fear of God (for the same fool hath said in his heart there is no God), may not sometimes stand with that reason, which dictateth to every man his own good; and particularly then, when it conduceth to such a benefit, as shall put a man in a condition, to neglect not only the dispraise, and revilings, but also the power of other men.' (*L.* 15.4) The fool's argument is discussed by Gauthier, *MD* 136–7, 144–6.

Hobbes argues that the fool's strategy is not rational, since it is not based on a prudent calculation of the fool's interest. The fool assumes that other people make a mistake about his trustworthiness.[8] But Hobbes answers that the fool makes a mistake here, because he 'could not foresee nor reckon upon' these errors by others. What sort of mistake does the fool make?

Hobbes might intend any of three replies to the fool: (1) His assumptions are so unrealistic that his strategy can never be founded on a reasonable estimate of the facts and probabilities. This reply seems empirically unwarranted. (2) An ordinary estimate of probabilities supports the fool. Still, the dangers of being found out are so severe that we ought to be strongly risk-averse in our calculations about breaking rules. This point, anticipated by Epicurus,[9] is reasonable, but it does not justify Hobbes's claim.[10] Even an appropriate allowance for the costs of discovery, or for the fear of discovery, seems to leave us room to break rules. If Hobbes assumes a maximin attitude, he raises the difficulties that we have already noticed. (3) Perhaps 'cannot' in 'cannot reckon upon' refers to a moral prohibition rather than an impossibility or an error in calculation. Perhaps we are morally required to assume that others are as intelligent as we are, and are likely to find us out. Here an assumption of equality plays an important role.

The second and third of these replies might be taken to rest on some basis other than mere empirical prediction. Hobbes might mean that the fool takes unjustified risks, or that he takes unfair advantage of other people's conformity to rules. But such a reply fails to refute the fool, from Hobbes's self-interested and purely psychological point of view.

In answering the fool, Hobbes assumes that from the self-interested point of view we can see the truth of the assumptions on which justice depends, and that therefore we can see the correctness of the laws of nature from the point of view that showed us why we ought to agree to the setting up of this society. He does not vindicate this claim. He does not justify a stable commitment to morality for the sorts of agents he describes.

504. Indirect Prudence

These replies to the fool assume the legitimacy of his question. They assume that it is reasonable for Hobbesian agents within the commonwealth to appraise a particular action with reference to their individual advantage. In order to answer the fool on this assumption, we must show that the observance of rules is directly beneficial. We have seen, however, that an analogous assumption about the relation between moral rules and the preservation of peace does not support Hobbes. It seemed more plausible to maintain the two-level view that peace is preserved best if we observe moral rules without thinking about this effect. Does this sort of indirect strategy refute the fool?

It may be difficult to see the point of observing the laws of nature, if we consider one action at a time; for then it is easy to see how we may profit by violating them. But we see

[8] '... if he live in society, it is by the errors of other men, which he could not foresee, nor reckon upon; and consequently against the reason of his preservation.' (*L.* 15.5)

[9] See §158. [10] Darwall, *BMIO* 75, accepts this account of the answer to the fool.

their point if we consider the benefit of having them observed as a whole, in contrast to having them violated as a whole. This point of view shows us why it is better to have some mechanism for compelling obedience to the laws of nature. A coercive mechanism ensures obedience, obedience ensures peace, and we all benefit from peace. If this indirect, global reflexion shows us the benefits of observing the laws of nature, it ought to influence our choice of the motives we want to encourage.

The argument with the fool shows us some motives that we ought not to encourage. We will all be better off if we are all unlike the fool, so that we do not calculate our advantage in particular situations. We will be better off if we confine our calculation of advantage to the initial calculation of the benefits of peace and general observance of the laws of nature. Hobbes suggests that when we enter the state we give up the condition in which 'private appetite is the measure of good and evil'.[11]

Here Hobbes continues his ambiguous and perhaps confused argument about 'discord and conflicts' in our evaluations in the state of nature.[12] He has argued that since what each person calls good is simply what he desires, we are in 'discord' about goods, because our desires differ. This discord results in a state of war. We resolve the discord by agreeing that peace is good, because it fulfils each person's overriding desire. The commonwealth is founded on this common point of view, and requires us to agree in our judgments about goods.

Agreement about goods is not enough, however. For we might agree that it is good for the fool to violate justice. If this is the judgment on which the fool acts, he is not relying on purely private appetite. Similarly, he agrees with other people in thinking peace is good, though he does not agree in observing all the rules designed for preserving peace. We do not require him simply to agree with us in our judgments about what is good; we also require him to agree in being guided by what is good for all of us. Hobbes obscures this point in his claims about private appetite and agreement.

We might, then, treat the claim about abandoning private appetite as an indirect consequentialist claim; in the commonwealth we abandon the policy of considering the costs and benefits of each particular action prescribed by a moral rule. We take a two-level attitude. At the deliberative level, we accord supremacy to the moral rules, and we do not think about whether we gain most for ourselves by observing them. At the reflective level

[11] 'And therefore, so long a man is in the condition of mere nature, (which is a condition of war), as private appetite is the measure of good, and evil: and consequently all men agree on this, that peace is good, and therefore also the way, or means of peace, which (as I have showed before) are justice, gratitude, modesty, equity, mercy, and the rest of the laws of nature, are good: that is to say: moral virtues; and their contrary vices, evil.' (*L.* 15.40) '. . . one [seditious doctrine] is that every private man is judge of good and evil actions. This is true in the condition of mere nature, where there are no civil laws; and also under civil government in such cases as are not determined by the law. But otherwise, it is manifest that the measure of good and evil actions is the civil law . . . From this false doctrine, men are disposed to debate with themselves and dispute the commands of the Commonwealth, and afterwards to obey or disobey them as in their private judgments they shall think fit; whereby the Commonwealth is distracted and weakened.' (*L.* 29.6) 'And when men that think themselves wiser than all others clamour and demand right reason for judge, yet seek no more but that things should be determined by no other men's reason but their own, it is as intolerable in the society of men, as it is in play after trump is turned to use for trump on every occasion that suit whereof they have most in their hand. For they do nothing else, that will have every of their passions, as it comes to bear sway in them, to be taken for right reason, and that in their own controversies: bewraying their want of right reason by the claim they lay to it.' (*L.* 5.3) *Civ.* 3.32 (quoted in §478) also suggests that when we recognize that the laws of nature aim at peace, we resolve disagreements about what things are good, because we see that the laws of nature aim at peace, which we all take to be good.

[12] See §478.

we observe that in according supremacy to morality at the deliberative level we preserve peace, and therefore gain more for ourselves than we would gain if we were to think about our own advantage at the deliberative level. We do not follow the fool in assessing the consequences of this or that particular violation of the laws of nature; we bind ourselves to accept the laws of nature as the measure of good and evil.

This is a legitimate two-level indirect consequentialist move. We may be able to see that we are better off if we adhere to the laws of nature without consideration of our own advantage. In that case, just people do better for themselves than fools do. The fact that everyone else has equally good reason to draw the fool's conclusion, and that everyone will be worse off if everyone draws it, can be turned to Hobbes's advantage. Prudential calculation, carried out at the right level and in answer to the right question, shows why we are better off if we do not think as the fool thinks.[13]

This two-level argument, however, does not entirely answer the fool. Even if he agrees to abandon his practice of calculating his advantage in particular cases, he might ask whether it is in his interest to keep this agreement. Even if he agrees that people ought to be trained to obey the laws of nature without question, he might still find that his training leaves him aware of the advantages he might gain by violating the laws of nature. He certainly benefits if other people obey the laws of nature and abandon the calculating of advantages. He also benefits if he appears to be like other people in these ways. Still, he may benefit even more if he is different from other people and is ready to take advantage of opportunities for disobedience.[14] The fool takes unfair advantage of others; but why should this concern him from the point of view of his self-interest?[15]

A further argument for indirect prudence might try to exploit the fool's reasoning. Since we can see that everyone, arguing as a direct egoist, may reach the fool's conclusion, we can see that once we allow ourselves the licence to deliberate as direct egoists, we undermine the system that we try to set up in our collective interest. It is in everyone's interest, therefore, to advocate a system of moral education that trains everyone not to think of their individual interest. While we may advocate this system for indirect egoist reasons, we ought not to allow people to ask about its indirect egoist basis; for once they ask that question, they will see that it is rational for each of them not to follow the requirements of the system.[16]

[13] Gauthier, 'Theorist' 21; 'Three' 142–3, suggests this line of argument. He argues that in emerging from the state of nature we must give up the right of nature to think for ourselves about the means to our self-preservation: 'In place of natural reason, one must accept the conventional reason of the law, which directs one to adhere to one's covenants' (143). He quotes from Hobbes's discussion of Bramhall (*EW* v 193): 'We choose no further than we can weigh. That is good to every man, which is so far good as he can see. All the real good, which we call honest and morally virtuous, is that which is not repugnant to the law, civil or natural; for the law is all the right reason we have, and . . . is the infallible rule of moral goodness. The reason whereof is this, that because neither mine nor the Bishop's reason is right reason fit to be a rule of our moral actions, we have therefore set up over ourselves a sovereign governor, and agreed that his laws shall be unto us, whatsoever they be, in the place of right reason, to dictate to us what is really good. In the same manner as men in playing turn up trump, and as in playing their game their morality consisteth in not renouncing, so in our civil conversation our morality is all contained in not disobeying of the laws.'

[14] Gauthier, 'Three' 144–5, acknowledges that these questions arise for his argument. He discusses them in *MA*, ch. 6. See also Hampton, *HSCT* 209–14.

[15] On the fool see Kavka, *HMPT* 137–56. On rule egoism see 358, 380, discussed by Gauthier, 'Taming'.

[16] This would be the moral equivalent of giving up our right to self-defence once we enter the state, also on indirect egoist grounds. See Hampton, *HSCT* 201. An indirect argument could answer the difficulty she raises for Hobbes, but only at the greater cost I describe.

If Hobbes went this far, he would endorse an opaque two-level theory. Once we understand the reason—based on collective self-interest—for the moral rules that we must (for reasons of collective self-interest) obey from non-egoistic motives, we must also see that our individual self-interest sometimes justifies the breaking of the rules. Hence our commitment to the rules cannot survive discovery of their basis.

If Hobbes had to reach this conclusion, he could still maintain that knowledge of his theory of human nature and the basis of morality is useful for the cultivation of the moral virtues. But it will be useful only for the cultivation of moral virtues in people who do not know his theory. If we have the task of constructing and teaching a moral code for a given society, and we are convinced by Hobbesian arguments about the importance of peace and the importance of rigid adherence to the laws of nature, we will try to train citizens, in their collective interest, to adhere rigidly to the laws of nature without raising any questions about their own interest. If they start to ask whether rigid adherence promotes their own interest, they will start thinking like the fool.

We will reach this conclusion from Hobbesian premisses, if we reject his reasons for believing that the deliberative and the reflective point of view are transparent to each other. These reasons underlie his confidence in answering the fool. But if Hobbes were to abandon his belief in transparency, he would have to abandon the psychological assumptions that make it seem plausible to base morality on self-preservation in the first place; for an indirect argument assumes that we can act for reasons that do not seem to us to promote our own interest. If Hobbes were to admit that, he would be abandoning his reason for believing that the desire for self-preservation is the basis of the laws of nature.

Even if Hobbes were to retreat from his actual position to an opaque two-level theory of morality and self-interest, he would face some difficulty in defending a stable commitment to morality. How could a reflective agent be expected not to ask about the relation between her own interest and the moral rules she has been trained to accept? Once she raises the question, she seems to have good Hobbesian reasons for taking the fool's point of view. This conclusion vindicates some of the objections of Hobbes's opponents who regarded his views as dangerous to morality.

To answer these objections Hobbes might appeal to his further claim that the laws of nature are divine commands. If people are trained to recognize this, they have a motive to follow them even if they do not think about their natural consequences (apart from divine sanctions) for the preservation of peace. If Hobbes took this view, he would reach a position rather similar to the one that Berkeley defends in his sermon 'Passive Obedience'.[17] Perhaps God has chosen to exercise divine power by commanding obedience to rules that in fact promote the preservation of peace; but we need not take this consideration into account, since we have a sufficient motive in the prospect of divine punishment for disobedience. If Hobbes took this view, the appeal to divine commands would bear more weight than it bears in his actual argument.[18] He does not consider this possibility; he relies on a transparent two-level defence of morality.

[17] On Berkeley see §699.

[18] This might be regarded as a grain of truth in Warrender's emphasis on divine commands in Hobbes's position. See §487.

505. Psychology and Morality: The Presumption of Equality

In considering objections to Hobbes's defence of morality, we have relied on his psychological assumptions, and on his attempt to reduce norms and obligations to facts about overriding motives. If he maintains this part of his position, he has to rely on some rather strong psychological assumptions that have no obvious basis in his own account of human nature.

It is therefore worth considering a different interpretation of Hobbes's assumptions. We might suggest that, though they are empirically implausible, they deserve consideration as procedural assumptions about morality. Perhaps Hobbes is not describing what is historically or psychologically likely or realistic, but setting out the conditions in which the correctness of a moral rule or system should be assessed. Hobbes seeks to explain the characteristics of moral principles by reference to the state of nature. Demands and assumptions characteristic of moral principles are, in his view, intelligible responses to the specific circumstances of the state of nature. Hence they are intelligible devices for dealing with the threats to peace that arise in the state of nature; since they preserve a commonwealth, they keep us out of the state of nature. So far we have taken arguments from the state of nature to appeal to psychological necessity and plausibility, as determined by Hobbes's psychology. But it is also worth considering them as procedural arguments about the moral point of view.

We can make these different possibilities clearer by examining some of the difficulties that arise for Hobbes's claim that morality presumes equality. The ninth law of nature requires every man to acknowledge every other man as his equal. The tenth law, relying on this acknowledgment, asserts that people have equal rights on entry into the state.[19] People in the state of nature are disposed to demand equal treatment for themselves, and no agreement can be made on any other basis. Hence the rules accepted in the state of nature capture the recognized principles of justice and morality.

[19] 'If nature therefore have made men equal, their equality is to be acknowledged; or if nature have made them unequal, yet because men that think themselves equal will not enter into conditions of peace but upon equal terms, such equality must be admitted. And therefore for the ninth law of nature, I put this: that every man acknowledge another for his equal by nature. The breach of this precept is pride. On this law dependeth another: that at the entrance into conditions of peace, no man require to reserve to himself any right which he is not content should be reserved to every one of the rest.' (*L.* 15.21–2) On equality and justice see also: *EL* 16.5: '. . . injury, which is the injustice of action, consisteth . . . in the inequality that men, contrary to nature and reason, assume unto themselves above their fellows'. On this point Hobbes believes Aristotle is completely mistaken. See *EL* 17.1: 'The question, which is the better man, is determinable only in the estate of government and policy, though it be mistaken for a question of nature, not only by ignorant men, . . . but also by him, whose opinions are at this day, and in these parts of greater authority than any other human writings. . . . For though there were such a difference of nature, that master and servant were not by consent of men, but by inherent virtue; yet who hath that eminency of virtue, above others, and who is so stupid as not to govern himself, shall never be agreed upon amongst men; who do every one naturally think himself as able, at the least, to govern another, as another to govern him. And . . . as long as men arrogate to themselves more honour than they give to others, it cannot be imagined how they can possibly live in peace: and consequently we are to suppose, that for peace sake, nature hath ordained this law, That every man acknowledge other for his equal. And the breach of this law, is that we call pride.' Hobbes interprets the commandments of Jesus as requiring that a man 'should esteem his neighbour worthy all rights and privileges that himself enjoyeth; and attribute unto him whatsoever he looketh should be attributed unto himself: which is no more, but that he should be humble, meek, and contented with equality.' (*EL* 18.6) Failure to acknowledge equality is the source of perpetual war in the state of nature: 'But it is easily judged how disagreeable a thing to the preservation either of mankind, or of each single man, a perpetual war is: But it is perpetual in its own nature, because in regard of the equality of those that strive, it cannot be ended by victory; for in this state the conqueror is subject to so much danger, as it were to be accounted a miracle, if any, even the most strong should close up his life with many years, and old age.' (*Civ.* 1 13) On the importance of equality see Hampton, *HSCT*, 24–7.

If moral rules must satisfy a demand for equality, we can see why not all possible rules for maintaining peace are principles of morality. Hobbes's position on this point is not completely clear. He believes that peace is worth any price; if we can secure peace only by accepting someone's offer to make us his servants on any condition he chooses, that is what we have to do. Hence we have no reasonable objection to tyranny. Hobbes does not regard this condition as slavery, since he believes slaves have given no promise to submit to their captors; but it need not differ from the condition of a slave in any other respect.[20]

But despite this attitude to tyranny and oppression, Hobbes does not consider principles that maintain peace by forcing some people into miserable conditions in order to make others better off, even though this arrangement is not necessary for maintaining peace. This is not a purely theoretical possibility that he neglects; many oppressive governments violate many of Hobbes's laws of nature while still maintaining peace. Still, he does not consider the possibility of these principles that maintain peace, but violate the laws of nature. The presumption of equality explains why we might rule out these principles; if they allow oppression of some people simply for other people's benefit, we would not accept them from a starting point of equality.

Hobbes claims that the presumption of equality is realistic because it expresses the actual facts about individuals in the state of nature, and the terms on which they must be supposed to enter the commonwealth. Is he justified in this claim? Perhaps people in the original position would be sensible not to count too heavily on their physical or mental superiority to other particular individuals. But they surely need to consider the possibility that people are unequal in their capacity to grasp the benefits of peace; for the commonwealth is set up to counteract the effects of miscalculation about the effects of grasping at short-term advantage. This question about inequality arises even if we accept Hobbes's assumption that the desire for self-preservation is dominant among people in the state of nature.

But we have also found reasons to question the assumption about self-preservation. The shared desire for self-preservation is not enough to remove distrust and instability in the state of nature. To explain the formation of the commonwealth, it is more plausible to assume some degree of fanaticism in members of gangs who might coerce or persuade others to submit to them. If this is the most plausible mechanism for generating a Hobbesian commonwealth from the state of nature, Hobbes's defence of the presumption of equality is open to doubt. For if a gang can coerce other people for long enough to set up a relatively stable order, individuals have good reason to accept the benefits of peace without equality.

[20] 'Dominion acquired by conquest, or victory in war, is that which some writers call despotical. . . . And this dominion is then acquired to the victor when the vanquished, to avoid the present stroke of death, covenanteth, . . . that so long as his life and the liberty of his body is allowed him, the victor shall have the use thereof at his pleasure. And after such covenant made, the vanquished is a servant, and not before: for by the word servant . . . is not meant a captive, which is kept in prison, or bonds, till the owner of him that took him, or bought him of one that did, shall consider what to do with him: for such men, commonly called slaves, have no obligation at all; but may break their bonds, or the prison; and kill, or carry away captive their master, justly: but one that, being taken, hath corporal liberty allowed him; and upon promise not to run away, nor to do violence to his master, is trusted by him. It is not therefore the victory that giveth the right of dominion over the vanquished, but his own covenant.' (*L.* 20.10–11) 'And because the name of tyranny signifieth nothing more nor less than the name of sovereignty, be it in one or many men, saving that they that use the former word are understood to be angry with them they call tyrants; I think the toleration of a professed hatred of tyranny is a toleration of hatred to commonwealth in general, and another evil seed, not differing much from the former.' (*L.*, Review 9)

This is a case of 'despotical dominion';[21] Hobbes believes that we must accept it if it is the only option open, since any condition that ends the war of all against all is better than the state of nature.

If this is true, a tyrannical regime, violating the laws of nature but preserving the peace, seems to be the most probable alternative to the state of nature. It is difficult to agree with Hobbes's assumption that facts about the state of nature justify his presumption of equality. The ninth and tenth laws of nature, therefore, do not seem necessary for the preservation of peace. Since these two laws of nature are plausible and important moral principles, Hobbes's failure to explain them as means to the preservation of peace tends to undermine his attempted explanation of the traditional virtues. The unrealistic character of the presumption of equality—regarded from the point of view of Hobbes's state of nature—raises a doubt about Hobbes's account of morality.[22]

Hobbes is right to suggest that it is morally appropriate to insist that some equality 'must be admitted' in specifying the terms of social co-operation. A social institution or practice or law that was designed entirely for the benefit of some people without reference to any benefit of the others would be open to objection on moral grounds. Similarly, one might defend a presumption of equality and equal rights as a basic constraint on the preservation of peace; the only peace that deserves to be maintained, one might argue, is the peace that safeguards equal rights. If Hobbes were entitled to that presumption, it would be easier for him to reject some apparently immoral but efficient measures for preserving peace.

We might offer the same defence of assumptions about the equality of individuals within a commonwealth. Hobbes seems to assume equal astuteness and energy in different individuals; without such an assumption his arguments against the libertarian and the non-conformist collapse. The assumption is not empirically plausible, but we might argue that it describes the right point of view for evaluating moral claims. Hobbes rules out calculations that take advantage of other people's lack of astuteness and energy in breaking rules. We might defend him by arguing that it is unfair to take advantage of people in these ways. To avoid taking advantage of them, we ought to assume the same high level of astuteness in everyone.[23]

Hobbes speaks as though the presumption of equality rests simply on people's presumed unwillingness to accept unequal treatment. Such a presumption is difficult to defend on empirical grounds, and that is the only defence he allows. But his emphasis on the presumption highlights a feature of morality that might be defended apart from Hobbes's psychological assumptions.[24] We might take the presumption of equality to mean that a moral principle is acceptable if and only if it can be defended to a group of rational self-interested, non-benevolent agents who regard themselves as equal to each other. This interpretation of Hobbes explains why he sometimes appeals to reciprocity, and advises us to take the other person's point of view.[25] If we do this, we use a social contract as a point

[21] See §§494–5. [22] On Hobbes on equality cf. Green, *PE* §190.

[23] Kavka, *HMPT* 188–208, 400, offers a moral interpretation of Hobbes's contract. Gauthier, 'Taming', objects that the state of nature is not a privileged situation for choice (analogous to Rawls's original position).

[24] Hume's account of justice also rests moral demands on empirical psychological claims See §770.

[25] '. . . there is an easy rule to know upon a sudden whether the action I be to do, be against the law of nature or not. And it is but this: that a man imagine himself in the place of the party with whom he hath to do, and reciprocally him in

of view for appraising rules from the impartial, and hence (supposedly) the moral point of view.

506. Psychology and Morality: Risk and Reciprocity

This approach to Hobbesian assumptions as features of the moral point of view may also throw light on his treatment of risk. He relies on a strong aversion to risk in his answer to the revolutionary, but it seems empirically implausible to assume that everyone who contemplates revolutionary action is strongly averse to risk. Nonetheless, this attitude may express the morally right point of view for considering the risk of catastrophe. Since moral rules are supposed to insure us against catastrophe, rather than simply to improve our chances of increasing our welfare, perhaps we should appraise them from a point of view that is strongly averse to the risk of catastrophe. This policy might be justified from a moral point of view, if it is assumed that morality requires us to make our decision without reference to the specific circumstances and risks that we face.

Similarly, the reply to the fool is more plausible if Hobbes's assumptions about risk are not empirical, but procedural assumptions that define the considerations that a moral argument should take into account. If the fool ought to assume that others are his equals in astuteness, he ought not to act on the assumption that he can deceive them. Similarly, if he ought to be extremely averse to the dangers of being found out, he ought not to act on ordinary calculations about the probability of being found out. His attitude, on this view, does not necessarily rest on false empirical assumptions, but it violates the procedures that define the moral point of view.

These procedural attitudes to equality and to probability are summed up in Hobbes's treatment of the Golden Rule.[26] He suggests that if we observe it, we can save ourselves the trouble of working out the long-term benefits of observing each law of nature on each occasion. I ought (rationally) to assume it is probable that other people will treat me in the way I treat them, and so I ought (rationally) to treat them in the way I would want them to treat me; if I do this, I will be following the laws of nature. In observing the Golden Rule, I follow a pattern of equal treatment between others and between others and myself. I rely on an assumption of reciprocity that has not been shown to be probable. The thought that other people might not be as malevolent or exploitative or clever as I am may suggest to me that I do not need to worry about retaliation for bad treatment. But Hobbes insists that I ought to exclude any such thought from my moral calculation, since it would allow me to give an unfair advantage to myself.

We might claim that if morality can be seen to be reasonable in the light of these assumptions about knowledge and motives, Hobbes has justified morality. For he has shown (we might suggest) that morality can be justified to a 'hypothetical' egoist, in the light of specific assumptions about the agent's motives, knowledge, and circumstances.

his. Which is no more but a changing, as it were, of the scales. For every man's passion weigheth heavy in his own scale, but not in the scale of his neighbour.' (*EL* 17.9).

[26] See *EL* 17.9, just quoted; *Civ*. 3.26; *L*. 15.35.

If this suggestion can be defended in detail, it is an important result. It captures an important aspect of the moral point of view by reference to a special kind of hypothetical egoist.

But even if we could design a hypothetical egoist to whom it would appear reasonable to choose all or most of morality, we would not have reached Hobbes's intended result. For why is the hypothetical egoist relevant? If the constraints that distinguish him from ordinary people are reasonable only from the moral point of view, how do they explain or justify the moral point of view?

Hobbes does not intend to raise these questions. He intends to describe actual agents and to justify morality to them. If he only describes hypothetical agents whose differences from actual agents are not psychologically plausible, he does not justify morality. If moral principles rely on assumptions that he cannot defend from his account of the state of nature and the commonwealth, his explanation and justification collapse. Still, one might argue that Hobbes's main insight is not the psychological theory that is meant to explain morality, but the moral constraints that capture the moral point of view.[27]

507. Moral Theory in Hobbes's System

The difficulties in Hobbes's account of our reasons for observing morality within the state expose some difficulties in his broader aim of reconciling his account of morality with his psychology. His account of morality as a set of rules for the preservation of peace and the public good departs from older conceptions of morality, by recommending the practice of the moral virtues only within the framework of the commonwealth. Still, the principles that he accepts are a part of morality, as understood by older views.

Moreover, if he is committed to a two-level opaque theory, the first-level reasons for observing these principles may be close to those given by the old moral philosophers. Hobbes's account of morality as consisting of principles for preserving the commonwealth is more plausible at the second level than at the first; it may give reasons for cultivating the virtues and the reasons for acting that the old moral philosophers defend. Similarly, his account of morality as counsels of self-preservation is more plausible at a still higher level, telling us why we have good reason to design principles whose observance preserves the commonwealth.

Hobbes does not clearly distinguish the different roles of his claims about preservation of the commonwealth and about self-preservation. Once we distinguish them, we see that he stays closer to the old moral philosophers than at first he appears to. The possibility of an opaque two-level theory resolves some of the difficulties that face Hobbes's actual theory with its assumption of transparency; but it also raises further difficulties for him.

Human nature itself, as Hobbes understands it, gives us no reason for observing moral rules. Nothing about human nature itself makes morality suitable for it in its own right;

[27] In this way one might support the judgment that he is 'the father of British ethics in its greatest period, although most of his progeny were anxious to show why and in what ways they could not live down to so disreputable an ancestor' (Laird, *H* p. v).

hence knowledge of human nature does not show that morality is a non-instrumental element in the human good.[28] A correct account of human nature shows, in Hobbes's view, that no correct conception of the human good supports claims about the first principles of natural law. To this extent, he is a radical sceptic about morality.

He believes, however, that, given the actual circumstances that face human beings, he can avoid general scepticism about morality. His analysis of the content of morality implies that it aims at the public good; hence, if we find a reason, from an egoistic hedonist point of view, to pursue the public good, we find a reason to observe moral rules. He thinks he has found an appropriate reason in the desirability of peace. Peace is attractive to human beings in the state of nature. Once we see that the moral rules are means to attaining and to preserving peace, we see reason to take them seriously.

This argument fails, if it is intended as a realistic prudential argument aimed at a reasonably astute and well-informed agent who is not already committed to morality for its own sake. It fails, whether it is meant to show that such an agent has overriding reason to enter a commonwealth, or to show that such an agent within a commonwealth has overriding reason to observe the moral rules that preserve the commonwealth.

This objection would confront Hobbes even if he had a traditional conception of practical reason, and did not try to reduce reasons to motives. But he also faces a more serious objection. For he cannot easily begin the appropriate sort of instrumental argument for morality. His argument requires an account of practical reasoning that is alien to his explicit account. In defending morality, he assumes that in order to grasp the instrumental role of the laws of nature we must form a conception of our overall, long-term good and keep this steadily in mind. But we cannot form such a conception if we rely on Hobbesian deliberation. The function of Hobbesian deliberation is simply to discover the means to the satisfaction of our currently strongest desire; the results of this sort of deliberation do not match the results of deliberation about our long-term good.

Hobbes cannot reasonably predict, then, that people who conform to Hobbesian psychological laws will accept morality. If he argues that nonetheless such people have good reason to care about morality, he introduces normative considerations that have no basis in the practical reason that he recognizes. We have reason to doubt Hobbes's claim that if his account of human nature and rationality is right, we can justify a firm commitment to morality. It turns out that we cannot even justify a firm commitment to prudence, as ordinarily understood. Hobbes's attempt to explain and justify morality from an empirically respectable (as he supposes) account of human nature neither explains nor justifies prudence or morality.

When Hobbes sets out to explain why the traditional moral virtues are genuine virtues, he assumes that traditional views are right in supposing that we have good reason to acquire and to practise these virtues, so that the 'fool' and similar doubters are mistaken. In his view, reasons and obligations are reducible to motives. Hence he argues that we have good reason to practise the virtues by arguing that moral obligation is a form of prudential motivation. He does not suppose he could give a correct account of the moral virtues without also showing that we have reason to cultivate them.

[28] Hobbes and Butler on nature; see §675.

If Hobbes does not find a vindicating reduction of the moral virtues, where has he gone wrong? His critics give different answers. According to sentimentalist critics, he has appealed to the wrong non-normative facts, because he is wrong about the motives that actually influence us. Hutcheson treats normative facts as facts about the reactions of our moral sense.

According to rationalist critics, Hobbes is more deeply mistaken. Cudworth and Clarke attack all attempts to vindicate morality by reducing normative facts (i.e., facts about what we ought to do, and what we have reason to do) to non-normative psychological facts (about what we are in fact moved to do). This rationalist criticism of Hobbes also raises a question about Hutcheson's reductive position.

If we are convinced by Cudworth's and Clarke's arguments against Hobbes, and if we reject the reduction of moral obligation to motivation, we open a gap that he keeps closed. We cannot give Hobbes's reason for believing that if we have a moral obligation to do x, we thereby have a sufficient reason and motive for doing x. But if the appropriate connexion between obligations, reasons, and motives does not appear immediately in our account of moral obligation itself, where are we to find it? Once we raise this question, we can see both why the reductive aspirations of Hobbes's account of obligation remain attractive to many theorists, and why theorists who reject these reductive aspirations raise difficulties for themselves.

How far does Hobbes keep his promise to practise a new method in moral philosophy? He offers something new in seeking a vindicating reduction of moral obligation to non-moral psychological facts about motivation. If he had succeeded in his vindicating reduction, he would have discovered the nature of moral virtues and our reasons for practising them, by reference to an account of human motives that does not itself rely on any normative non-psychological assumptions about morality or about rationality. But his reduction fails. His attempted account of deliberation and practical reason is not even descriptively adequate; what he describes is not deliberation, but only the mental processes that are allowed within his psychological theory. Hobbes's psychological theory is questionable; and if it were correct, it would undermine, rather than vindicate, morality. The difficulties that he encounters in practising his new method suggest objections to the method.

37

SPINOZA

508. Spinoza's Attitude to Ethics

Both the title of the *Ethics* and some of its contents imply that Spinoza intends to contribute to moral philosophy. The last three parts of the *Ethics*, on the affects and on human freedom, are directly about ethical questions. The first two parts, on God and on the origin and nature of the mind, are on topics that many philosophers take to be relevant to moral questions. Moreover, Spinoza suggests that his philosophy supports important practical conclusions. It shows us why we should depart from some ordinary assumptions and outlooks on life. We should not care as much as most people care about the goals, aims, and concerns that we adopt under the influence of emotions. Human bondage consists in 'man's lack of power to moderate [or "govern", moderari] and restrain the affects' (*Ethics* 4Pref. = C 543).[1] Spinoza agrees with one of the main tendencies of Platonic and Aristotelian moral philosophy. Aquinas, for instance, clearly believes that the outlook we form under the influence of our passions misleads us about what is worth pursuing in life.

Spinoza, however, rejects Aquinas' alternative to domination by the passions. Aquinas believes that our main ethical task is to exercise our will in free and responsible action that restrains and controls our emotions; we should form our will in accordance with a true conception of the proper ultimate end of a human being, and if we freely choose to adapt, modify, or restrain our passions in the light of this end, we achieve the virtues. These claims about choice and action appear to Spinoza to be basically misguided.

Spinoza exposes the basic errors of traditional eudaemonist moral philosophy, in the parts of the *Ethics* that might appear to be less relevant to ethics. For he believes that a true account of the nature of the universe and of human beings exposes the errors in a Scholastic view of agency. Scholastic errors rest on false conceptions of freedom and of teleological order. Once we reveal these errors, we can understand human freedom and the human good without reference to indefensible claims about will and agency.

This summary of Spinoza's conclusion also raises a question about his position. In rejecting a Scholastic view of will, freedom, and agency, Spinoza agrees with Hobbes. But Hobbes

[1] I will normally omit the title of the *Ethics*, and cite by part and subdivision, with the page in Curley's edition. Thus, 4d1 = C 546, refers to Part Four, Definition 1, on p. 546 of Curley. Quotations are taken from (or based on) Curley.

also tries to replace the Scholastic view with a view of human nature and human agency that supports different ethical conclusions from Spinoza's. We have found reasons for doubt about Hobbes's criticism of the Scholastic view, about his own account of agency, and about the moral theory that he rests on it. We may ask, therefore, whether Spinoza does better than Hobbes on these points.

He argues that, as Hobbes also believes, the Scholastic view implies that human actions are entirely outside the natural order of cause and effect and of natural law. Since Spinoza believes that human actions cannot have this status, he rejects the Scholastic conception of agency. But he does not thereby undermine belief in agency; he might still allow an account that avoided the Scholastic non-naturalist assumptions.

He seems to hold, however, that Hobbes repeats the errors of the Scholastics; for Hobbes retains their assumption that we can affect our behaviour by our will, deliberation, and election. This seems to be a common-sense assumption about will and action, not confined to any particular philosophical theory. If Spinoza rejects this common-sense assumption, he seems to leave little room for agency, and hence little room for ethics. If, then, we are convinced by Spinoza's metaphysics, and we agree that it undermines traditional ethics, perhaps we will find that it undermines his own ethics too. On the other hand, if we interpret the metaphysical conclusions so that they leave room for Spinoza's ethical outlook, perhaps we will find that they lose their force against traditional views.

Spinoza does not believe that he faces this dilemma, because his ethical views seem to him to be defensible without common-sense assumptions about agency. This is perhaps the most challenging aspect of his conception of ethics. Though we might claim that Hobbes undermines agency through his views about deliberation and action, this is not how Hobbes sees it; he takes himself to vindicate agency by explaining it in non-Scholastic terms. Spinoza goes beyond Hobbes in rejecting common-sense views about action. But he still believes, as Hobbes does, that he vindicates ethics. We need to see whether he can reconstruct ethics so that it can do without agency.

This is one reasonable way to approach Spinoza. But we might also consider whether his moral outlook is plausible without reference to the metaphysics views that precede it in his argument. Some of Hobbes's moral views can be evaluated without reference to his claims about action and human nature. It is worth seeing whether the same is true of Spinoza.

509. Mind and the Limits of Agency

To understand how Spinoza argues for his ethical proposals, we have to grasp his distinctive views about agency. We normally assume that we are capable of actions, and that ethics matters because it concerns (among other things) the regulation of actions. Among the sorts of actions that matter to ethics are my walking on your toes, helping you up if you have fallen, signing a cheque to pay you what I owe you, saying something that offends you. Each of these actions includes a bodily movement, and each of them may, in the appropriate circumstances, be right or wrong, virtuous or vicious. The acceptance and improvement of moral judgments seem to matter for action because we seem capable of different bodily movements in the appropriate circumstances. Similarly, when we praise or

blame people, we often praise or blame them not only for having good or bad thoughts, but for forming these thoughts into intentions that normally produce bodily movements of the relevant sort.

Spinoza rejects these claims about agency. They rest on the assumption that mental states can cause bodily movements, but this assumption, in his view, is false. He especially attacks Descartes for his belief in the possibility of interaction between mind and body. Descartes believes in interaction through the medium of the pineal gland, and Spinoza rejects this account of how interaction is possible (5Pref = C 596). But he does not merely reject Descartes's account; he also believes that what Descartes tries to explain cannot be explained, because there is nothing to explain.

Interaction between mind and body is impossible, according to Spinoza, because we cannot recognize the appropriate sorts of necessitating relations between mental and bodily events.[2] We find the appropriate sort of necessitation in the relation of different features of a triangle. The angles of a triangle add up to 180 degrees because a triangle has three sides; the fact about its angles follows from the fact about its sides. Similarly, the conclusion of a syllogism is true because its premisses are true and the conclusion follows from the premisses. According to Spinoza, genuine causation includes this sort of necessity.[3] If we understand the nature of the universe, we see how all of its states of affairs are related by this sort of necessity. If mental and bodily events are not related by this sort of necessity, the genuine states of the universe do not include causal connexions between mind and body.

If mind and body are not causally connected, how are we to explain our stubborn conviction that they are closely related in some way, so that we mistakenly suppose they are causally connected? Spinoza explains our error by claiming that the body is the object of the idea constituting the human mind (2p13d = C 457). What we are aware of, then, in a mental state is some state of the body.

To say that everything we are aware of is some state of the body is to reject a version of mind-body dualism. Spinoza denies that our awareness of an act of will or thought gives us knowledge of a purely mental event with no bodily aspect at all. But even if he is right about this, mind and body may interact; for if mental events are also bodily events, they seem to be capable of causing bodily events. In this respect, we might be tempted to express Spinoza's position as a form of materialism, affirming that all mental events are also physical events with physical causes and effects.[4]

This materialist view, however, does not take account of all of Spinoza's views. He goes further insofar as he also denies interaction between mental and bodily events. For he does not agree that a mental event can cause a physical event, even if the mental event is itself physical. He suggests that the mental event is simply the awareness of a bodily event. When we think our intention of raising our arm has caused us to raise our arm, we are wrong; our intention is simply the awareness of a physical event that has really caused the rising of our arm. The causal connexion holds not between our intention and the rising of our arm, but between the physical event our intention makes us aware of and the rising of our arm.

[2] See Bennett, *SSE* 29–32, on causal rationalism, referring to 1a3.

[3] Cf. 4p57s = C 578.

[4] This is Hampshire's view of Spinoza in *S* 55–61; *TTM* 58.

This account of mental events conflicts with ordinary assumptions about agency. If I am watching an assembly line by closed-circuit television, I may have mental states that are aware of every state of the assembly line, but the content of these mental states does not causally explain anything about the assembly line. In this case the direction of causation and explanation goes from the assembly line to my awareness of it. If I were also provided with a panel of buttons to push while I watch the process on the assembly line, and I did not know what was going on, I might be deceived into believing that I control the assembly line by pushing the buttons. If I had the same sort of access to states of my own brain, but they operated quite independently of the mental content of my awareness of them, I might be under the illusion that I control them through my mental content, but in fact the mental content would be causally irrelevant to the states of my brain; this would still be true even if the states of awareness were themselves further brain states.

This conception of my mental states as merely epiphenomenal states of awareness of physical states fits Spinoza's attack on ordinary assumptions about agency. But it does not completely fit his views about mind and body; for our comparison with the television implies causal interaction between physical states (of the assembly line or brain) and states of awareness. On Spinoza's view, connecting causation with necessity, this direction of causation from body to mind is no less unintelligible than the direction that goes from the mind to the body. He does not explain how he can avoid some sort of causation in his claims about objects and ideas. But since this direction of causation is not the most important one for claims about agency, we need not pursue this objection to his position; we can concentrate on the other direction of causation.

We believe we have reliable access to agency, because we are aware of causal influence of our mental states on our actions. We take this to be familiar from experience.[5] Moreover, we take it to be obvious that the intentional and rational content of our mental states explains intelligent action.[6] This common conviction does not rest on metaphysical dualist assumptions. It asserts that mental properties are relevant to explaining those physical events that are also actions. If the object to be explained is a picture or a temple, it needs to be explained—we assume—by certain kinds of aims and intentions.

Spinoza attacks common convictions about mental explanation and causation on different grounds. Some of his attacks seem to be directed at the conviction that choices and decisions are free.[7] We might take him to mean that our false beliefs about freedom reflect ignorance of the causes of our mental states; if that is all he means, he need not deny that the mental states cause bodily movements.

[5] 'But they will say that—whether or not they know by what means the mind moves the body—they still have experience that unless the human mind were capable of thinking, the body would be inactive.' (3p2s = C 495)

[6] 'But they will say that it cannot happen that the causes of buildings, of paintings, and of things of this kind, which are made only by human skill, should be able to be deduced from the laws of nature alone, insofar as it is considered to be only corporeal; nor would the human body be able to build a temple, if it were not determined and led by the mind.' (3p2s = C 496)

[7] 'So the infant believes he freely desires (appetere) the milk; the angry child that he wills (velle) vengeance; and the timid, flight. So the drunk believes that it is from a free decision of the mind that he speaks the things he later, when sober, would will (vellet) not to have said. . . . So experience itself, no less clearly than reason, teaches that men believe themselves free because they are conscious of their own actions and ignorant of the causes by which they are determined, that the decisions of the mind are nothing but the desires (appetitus) themselves, which therefore vary as the disposition of the body varies.' (3p2s = C 496–7)

But if this were all Spinoza meant, he would not have argued for his more sweeping claim that 'the body cannot determine the mind to thinking, and the mind cannot determine the body to motion, to rest, or to anything else . . .' (3p2 = C 494). He believes that our illusions about freedom reflect general ignorance about causation. Our belief that we are free depends on our ignorance of causal facts about our mental states. When we discover how ignorant we are, we should also admit that we have no good reason to make dogmatic claims about the effects of our mental states, or about the explanatory role of their intentional content. Hence we ought not to assert dogmatically that the body is incapable of producing the relevant events by itself, since we do not know how much the body is capable of by itself. Since we are ignorant of how the mind moves the body, we ought not to assert that it moves the body.

The argument from ignorance is open to question. We might concede that we are sometimes wrong in claiming that our intentions cause our actions, and that they do not cause actions except through a physical process that we are unaware of or do not know in detail. But this does not give us a good reason to doubt that we sometimes know that we act because we intend to act. I do not know everything about how my pressing the accelerator pedal causes a car to move forward, and it is logically possible that the car is really controlled by a computer that is also linked to my brain; perhaps the computer both moves the car forward and depresses the accelerator when I decide to press it, but my deciding to depress the accelerator is entirely epiphenomenal in relation to the movement of the car. But though it is logically possible that all the states of my brain are related to my intentions and my actions in this indirect way, we should not take this logical possibility seriously. We have no reason to believe it, and we have no reason to abandon our initial conviction that the content of my intention to raise my arm is causally relevant to my raising my arm.

Spinoza's argument, then, appears to rely on a questionable sceptical strategy. He argues that since we are sometimes wrong about mental causation, it is logically possible that we are always wrong, and hence we never know, and are never justified in believing, that any mental events explain any bodily events on any occasion. This is a Cartesian form of sceptical argument; it seems to exaggerate the significance of logical possibility.

Perhaps, however, Spinoza finds this Cartesian sceptical argument plausible in this case, because it fits some of his views about causation and logical necessity. If we admit that it is logically possible (for all we know) that our intention to raise our arm does not cause our arm to rise, we admit that it is not logically necessary (for all we know) that our intention causes our arm to rise. But since Spinoza thinks of causation as logical necessitation, our inability to defend a logically necessary connexion implies inability to defend a genuine causal connexion.

We may reply by challenging Spinoza's conception of causation. If we have good reason to believe that intentions cause actions, but we do not assert a logically necessary connexion between intentions and actions, have we not found counter-examples to Spinoza's claim about causation? Spinoza would not allow this form of objection by counter-example. His account of causation is not intended to offer the most plausible understanding of intuitively accepted examples of causes and effects. On the contrary, it is part of a foundationalist argument. The account of causation is supposed to be

certain and evident in itself; it is not intended as an analysis of an intuitive concept of causation, but it is a basis from which intuitive concepts can be criticized, and, if necessary, rejected.

If this is so, we have no good reason to agree with Spinoza's conclusions about agency unless we accept some of the most disputable aspects of his metaphysical system and of its underlying epistemology. He does not seem to have any plausible argument that can be defended independently of his whole system.

But if we accept his conclusions what do they commit us to? If we claim that intentions cause actions, we claim that they cause physical movements and processes, and that their content is causally relevant. But to which movements and processes is it relevant? When we speak of intentions causing actions such as raising my arm or writing a cheque, we are not picking out a type of movement that a physicist's or biologist's or physiologist's description is likely to recognize. The actions caused by our intentions are classified into types partly by the intentions that cause them. At a physiological level, we have no reason to assume that all the actions we distinguish as instances of writing a cheque have something in common that distinguishes them from all other movements of our hands and arms. But if our normal classification of actions rests on the illusory assumption (according to Spinoza) that our intentions cause our actions, we must also be mistaken in believing that some of our bodily movements are actions.

Spinoza introduces this question implicitly, in stating the common beliefs about mental causation. His opponent mentions paintings, buildings, and temples as cases where we need mental causation. Spinoza replies that we are too ignorant to be entitled to rule out the possibility of purely physical causation of these events; but this reply does not seem to grasp the main point of the objection. Suppose that we knew enough about marble, mules, ropes, beams, human physiology, and so on, to explain the events that resulted in the existence of the Parthenon and St Paul's Cathedral, without reference to any human intentions or aims. This is difficult to conceive, but even if we could conceive it, would such an explanation explain the existence of a temple and a cathedral? Temples and cathedrals are similar in some respects (as religious buildings), and different in others (since the Parthenon was intended to house a statue of Athena, whereas St Paul's was build for a congregation and for the bishop's chair). In some respects—external appearance—St Paul's is more similar to the Parthenon than to Notre Dame de Paris, but in other respects—as a Christian cathedral church—it is more similar to Notre Dame. It is difficult to see how we could understand or explain the relevant respects of difference and similarity between these different buildings if we did not refer to anyone's aims and intentions.

This point applies more generally to action. We might concede to Spinoza that a complete physiological non-mental explanation could be found for all the physical events that happen when I go for a walk or sign a cheque. But such an explanation does not explain why I go for a walk or sign a cheque. The properties of going for a walk and signing a cheque belong to events because of particular beliefs, desires, and intentions. Spinoza does not say where he stands on this question. He speaks as though we would face no special difficulty in conceiving purely physical explanations of everything that we explain by appeal to mental states. But once we see the difficulties that arise in eliminating

mental causation of physical events, we might reasonably find his argument for elimination over-simplified.

Spinoza's views about agency, therefore, go beyond the assertion of materialism. They imply that we are quite mistaken in our beliefs about the causal relevance of our mental states. We believe that the fact that our intention is an intention to raise our arm is causally relevant to the fact that our bodily movement is a raising of our arm. But, according to Spinoza, this belief is false. We know that some bodily changes are happening, but we cannot say, on the basis of our mental states, which bodily changes they are, or what causes them.[8]

510. Errors about Freedom

In regarding ourselves as agents, we assume that the content of our mental states is causally relevant to bodily movements. We also assume that we cause these bodily movements in a particular way. We take ourselves to have a will that is distinct from our intellect and does not necessarily follow it. We therefore attribute to the will some sort of freedom that we do not attribute to the intellect.[9] The freedom of our will is a distinctive feature of the agency that we ascribe to ourselves.

In Spinoza's view, this belief in freedom conflicts with facts about the causal order of the universe. He takes the essential element of freedom to be self-determination (the 'liberty of spontaneity') rather than the capacity for opposites (the 'liberty of indifference'). A free agent would have to be determined entirely by itself without any external determination. God is the only free cause, because God acts only from the necessity of the divine nature, and so is determined by nothing external (1p17c2 = C 425). Since God is identical to the whole universe, nothing external to God can compel God to act. But Spinoza denies that God has the capacity for opposites, and so he rejects the mediaeval views that allow God to have created something different from what has been created.[10] God cannot do anything different from what actually happens; for such a capacity would commit us to saying that God can make it false that from the nature of a triangle it follows that it has two right angles.[11]

We might be puzzled by this argument. Spinoza seems to assert that if we attribute any capacity for opposites to God, we must accept Descartes's extreme voluntarism, ascribing to God the capacity to make logical necessities false. His assertion is intelligible in the light of his conception of causation. If God has the capacity for opposites, it could have been false that God caused tortoises to exist. But if tortoises were caused to exist, it is logically

[8] Though Spinoza rejects the common belief that mental states are causally relevant to bodily actions, he does not deny that they are causally relevant to something. He believes that mental states cause mental states. In his view, it is possible to find the right sorts of logical connexions between bodily states and events, and also between mental states and events. Each of these mental states is also the idea of a bodily state.

[9] This is true even if we accept Aquinas' intellectualism. See §286.

[10] On these mediaeval views see Wolfson, *PS* i 308–19; Gueroult, *S* i 272–95.

[11] 'Others think that God is a free cause because he can (so they think) bring it about that the things which we have said follow from his nature (i.e., which are in his power) do not happen or are not produced by him. But this is the same as if they were to say that God can bring it about that it would not follow from the nature of a triangle that its three angles are equal to two right angles; or that from a given cause the effect would not follow—which is absurd.' (1p17s = C 425–6)

necessary that tortoises came into being; hence, if God had the power not to cause tortoises, a logically necessary truth could be false.

God, therefore, is self-determined, being identical to the whole universe, but lacks the capacity for opposites. We are not identical to the whole universe, but are finite modes of it; hence we are determined externally, and so we cannot be free.[12] Since we do not know the causes of our acts of will, we believe they are uncaused, and therefore we believe we are self-determined and free. Since we do not know the effects (or lack of them) of our acts of will, and do not know the causes of our bodily movements, we believe that our acts of will cause our bodily movements.[13]

In Spinoza's view, we should not simply deny that we know we are self-determined; we should also recognize that we are not self-determined, and are therefore not free. God exists necessarily, and acts by the necessity of God's nature. Everything else exists necessarily because of the necessity of God's nature.[14] Hence everything follows from facts about the divine nature, which is the nature of the universe as a whole.

We do not know how everything is necessary in such a way that we can exhibit its necessity. Some people are convinced that things are contingent, but this is because they are influenced by imagination (2p44c = C 480). Imagination picks out superficial features of situations in ways that make them appear different from how they really are, and therefore it obscures the features that make them necessary. But the point of view of reason regards things as necessary, setting aside the appearances that arise from imagination.

This does not mean that everything is necessary in the same way. Spinoza leaves room for recognizing a difference that might partly match the ordinary distinction between the necessary and the contingent. Unlike the facts about the divine nature, which are absolutely necessary in their own right, particular events and objects in the universe are not absolutely necessary in their own right, because they depend on the divine nature, and hence on the laws of the universe, and on prior events. Spinoza expresses this feature of contingent (as we might call them) things and events by saying that they are 'necessary through their causes', though not in their own right.[15]

This recognition of things that are not intrinsically necessary suggests a way of reconciling Spinoza with Aquinas on contingency in creation. Aquinas does not believe that if God's existence is necessary and everything else depends on God, there cannot be any freedom in the world. For, in his view, God creates secondary causes that have a causal role appropriate for their type of agency, and this role allows contingency.[16] We might think that something like this view would be open to Spinoza. But he seems to reject it.[17] He argues that the

[12] '. . . men are deceived in that they think themselves free, [i.e., they think that of their own free will they can either do a thing or forbear doing it], an opinion which consists only in this, that they are conscious of their actions and ignorant of the causes by which they are determined. This, then, is their idea of freedom—that they do not know any cause of their actions. For what they say, that human actions depend on the will, is words for which they have no idea. For all are ignorant of what the will is, and how it moves the body . . .' (2p35s = C 473. Curley includes the bracketed passage, inserted from the Dutch version). '. . . men think themselves free, because they are conscious of their volitions and their desire, and do not think, even in their dreams, of the causes by which they are disposed to desiring and to willing, because they are ignorant of <those causes>' (1appx = C 440).

[13] See Curley, *BGM* 78–82.

[14] 'In nature nothing contingent is given, but all things have been determined from the necessity of the divine nature to a definite way of existing and of producing.' (1p29 = C 433)

[15] See Bennett, *SSE*, ch. 5. [16] On Aquinas see §270. [17] See 1p26–9.

modes of the divine nature depend on God both for their existence and for their action.[18] It follows that particular things cannot determine themselves without God, and cannot make themselves undetermined. From this Spinoza takes his proposition about necessity to follow.

This argument does not directly address Aquinas' position. For Aquinas does not claim that secondary causes make themselves undetermined or self-determining. He claims that God makes them and the rest of the universe in such a way that what happens to them depends on their states—sensory or rational. Since they are not necessitated by the rest of the universe apart from their sensory and rational states, they determine things contingently. Spinoza does not argue clearly against this possibility. If his conclusion that things necessarily produce effects in a certain way follows from his claims about God, it does not rule out Aquinas' view; Aquinas is free to say that God necessarily makes things such that they are necessitated to be secondary causes, and sources of contingent events.

Spinoza can answer this objection to his argument if he appeals to his account of causation. For if causation requires logical necessitation, the suggestion that God could create contingent events—those that could not be shown to be necessary in the light of a complete understanding of their antecedents—must be rejected. If God is the cause of everything, it follows that everything can be known to be necessary in the light of the nature of God.

It is not clear how much room for contingency Spinoza leaves in his account of things that are necessary through their causes. Hobbes's views are hard to follow because he does not always seem to distinguish the claim that one event necessitates another from the claim that the first event makes the second necessary. We can speak of necessitation when the first event is a sufficient condition for the second; hence necessitation follows from the truth of determinism. But necessitation does not imply the necessity of the second event unless the first event is itself necessary, and Hobbes does not make it clear why he thinks human actions that are necessitated are also necessary. Spinoza is perhaps obscure on the same points as Hobbes; but he has a better answer to our question about why necessitation implies necessity. In his view, the initial condition, referring to facts about God or the universe as a whole, is absolutely necessary; and he might believe that whatever is necessitated by the absolutely necessary is itself absolutely necessary.[19] It is reasonable, then, given Spinoza's conception of freedom, for him to believe that facts about causation exclude freedom.

How much of the ordinary conception of freedom does Spinoza undermine with his arguments? If we are incompatibilists, we must deny freedom once we accept his determinism. If we are compatibilists who believe in contingency without indeterminism (as Aquinas does), we must deny freedom if we are convinced by his argument against contingency in secondary causes. But we might be compatibilists who are willing to admit that all our actions are necessary. We might agree that states of our will are caused, but argue that they are caused in the way appropriate for freedom. If our rational capacities make a difference to what happens, and they are not causally idle in the causal chain,

[18] '...God is the cause of these modes, not only in so far as they simply exist, but also...in so far as they are considered to be determined to produce something' (1p29d = C 433).

[19] Bennett, *SSE* 111, finds evidence for Spinoza's acceptance of this transitivity of necessity in 1p21–2.

then—according to some views—we act freely. We would indeed face a threat to freedom if the causation of our actions were entirely independent of our will, choice, and rational capacity; but we need some reason to believe this, beyond the reasons for believing that states of our will are caused.

Spinoza also rejects this aspect of compatibilism, because of his rejection of mental causation.[20] Apparently, then, his case against mental causation is the most important part of his argument against ordinary beliefs about freedom. Compatibilists might try to fit beliefs about agency into a deterministic word, even into a world of necessary events. But the compatibilist core (or, as incompatibilists would say, remnant) of freedom is rational agency, which cannot be reconciled with the truth of Spinoza's claims about mental causation.

511. Intellect and Will

If we are mistaken in believing that our will is free and that it causes our actions, what is left of our initial belief that we have wills? Spinoza does not take the initial belief to be entirely false. It is entirely false to believe that the will is causally relevant to bodily movements. But we are right to attribute some mental states to the will; the truth in our initial belief is clear once we reject any distinction between will and intellect.[21] To show that volitions and ideas are the same, Spinoza considers a volition 'by which the mind affirms that the three angles of a triangle are equal to two right angles' (2p49d = C 484). He argues that this affirmation cannot be distinguished from the idea of a triangle; for we cannot have the relevant idea without the affirmation about its angles.

This may not seem an apposite example of a volition. It involves assent to something's being the case; in this particular instance, we assent to something that we must assent to in order to have the idea of a triangle. But even if we concede Spinoza's claim that we cannot distinguish idea from volition in this particular instance, we may not agree that all volitions can be treated in the same way. My volition to write a cheque may be understood as my assenting to its being good to write a cheque here and now. This assent depends on my having the idea of its being good to write a cheque here and now, and on my having the idea of a cheque and the idea of good. But none of these ideas seems to involve my assenting to its being good to write a cheque. Spinoza, therefore, seems to have generalized inappropriately from an untypical example.

His example seems to us to be untypical because it involves assent to something's being the case, and necessarily being the case. When we exercise our will, we assent—as it seems

[20] This claim about compatibilism needs to be qualified in the light of Spinoza's remarks on freedom. But those remarks do not vindicate a version of compatibilism that relies on mental causation. See Sleigh et al., 'Determinism' 1227–9; Garrett, 'Ethical' 299–301.

[21] 'The will and the intellect are nothing apart from the singular volitions and ideas themselves. But a singular volition and an idea are one and the same thing. Therefore the will and the intellect are one and the same thing.' (2p49dem = C 485) Bolton, 'Universals' 198–9, discusses Spinoza's view of the divine intellect and will. While he rejects voluntarism, he also rejects the naturalist view that God wills in accord with the good: 'For they seem to place something outside God, which does not depend on God, to which God attends, as a model, in what he does, or at which he aims, as at a certain goal. This is simply to subject God to fate, than which nothing more absurd can be maintained about God, whom we have shown to be the first and only free cause, both of the essence of all things, and of their existence.' (1p33s2 = C 438–9) Those who claim that God acts for the sake of an end imply that God is imperfect (1appx = C 442–3).

to us—to something's coming about that is not necessarily the case and that depends on our assenting or dissenting. In Spinoza's view, we might also think in this way of the triangle; we might ignorantly interpret our assent to the size of the angles of the triangle as a decision of ours. Our illusion is dispelled once we recognize that the truth about the triangle is necessary, not up to us. Until we recognize the necessity, we lack adequate knowledge of the triangle, because our idea of it is not clear and distinct (2p35dem = C 473). But when we have adequate knowledge, we see that we cannot have an adequate idea of a triangle without assenting to the truth about its angles.

According to Spinoza, we should explain our beliefs about the will in the same way. We suppose that it is up to us whether something happens, because we believe it does not happen necessarily, and hence independently of our will. But if we knew more about the event that we assume to be up to us, we would recognize that it is necessary, and indeed that we cannot have an adequate idea of it without recognizing its necessity. The appearance that willing is different from assent to a necessary truth is simply the result of our ignorance of the relevant necessity.

Spinoza does not suppose that it is easy to dispel the illusion that makes us think willing is different from recognizing a truth. Indeed, the difficulty of dispelling the illusion helps to explain some of the ethical value of the *Ethics*. Because we form our ideas on the basis of our imaginations, the way things appear to us does not always reflect adequate ideas. Even if we know the real distance of the sun from the earth, it still appears to me to be only 200 feet away (2p35s = C 473). But if we know the real distance, we do not act on the illusory appearance that proceeds from the imagination; we do not set out to reach the sun, as we might set out to reach something that we believe to be only 200 feet away. Though adequate knowledge does not dispel the illusion, it deprives the illusion of the cognitive results it would have if we did not correct it.

The example of our distance from the sun is meant to illustrate our errors about the will. We think things depend on us because we do not know what they really depend on. When we know the truths about the relevant necessities, we still have the appearance of things depending on us, but, because of our adequate knowledge, we no longer take the appearance seriously.

What knowledge is relevant for dispelling the illusions based on imagination? Spinoza might have two answers: (1) When we recognize that the causes of our action are outside us, we see that the action is not up to us, and we simply assent to it as something that is going to happen. (2) When we recognize that it is necessary, we see that it is not up to us, and we assent to it as a necessary truth.

The first answer assumes that freedom and causal determination by external causes are incompatible. If one rejects this incompatibilist assumption, one need not accept Spinoza's argument to show that our belief in freedom rests on ignorance of causes. This defence of freedom does not cope with Spinoza's second answer; for this answer asserts not just that our action is causally determined, but that its occurrence is a necessary truth. He is right to assume that if something is a necessary truth, we are not free to change it.

Spinoza may well not distinguish these two answers, because of his conception of causal explanation. If he believes that causal explanation of an event demonstrates its necessity, he will not admit the possibility of allowing causal determination without necessity. An

adequate explanation of my action will show that it is necessary. The appearance of its not being necessary is simply the result of my not having an adequate explanation.

This case for the identification of intellect and will has the advantages and disadvantages of several of Spinoza's arguments. On the one hand, his most surprising claims about agency and freedom are defensible, indeed unavoidable, within his metaphysical system. On the other hand, the elements of his metaphysical system that support his claims about freedom are quite disputable. Many apparent objections to Spinoza collapse if we accept his views about causation, explanation, and necessity; but these views do not seem so obviously true that we ought to withdraw all our doubts about his views on agency.

512. Emotion and Freedom from Emotion

From these views on agency and freedom, we can understand some of the ethical conclusions that Spinoza draws from his views on the emotions. In his view, it is misguided to deplore the emotions and their destructive effects.[22] We need to understand them and to see how they are a part of nature.[23] Since the emotions have natural causes, we ought to identify these causes. Since they can also be modified by natural causes, we ought also to find the appropriate causes so that we can modify our emotions in accordance with reason.

It is not surprising, in the light of what he has already said, that Spinoza rejects the attitudes of praise and blame that depend on assumptions about freedom, or that he tries to replace these 'active' attitudes with the 'passive' conditions of knowledge and understanding. We may be surprised, however, that after recommending the passive cognitive attitudes, he re-introduces activity and passivity and recommends the active outlook. How can he do this, if he has already undermined the convictions underlying our conception of agency?

Activity regains a place within Spinoza's system once he connects the division between activity and passivity with the division between adequate and inadequate ideas. The passions are essentially passive, and are the results of inadequate ideas.[24] Since inadequate ideas result from the imagination, and adequate ideas from intellect, passions are products of the imaginative point of view.

[22] 'And they attribute the cause of human weakness and inconstancy not to the common power of nature, but to some defect (vitium) or other of human nature, which they therefore bewail, or laugh at, or disdain, or (as usually happens) curse. And he who knows how to censure more eloquently and cunningly the weakness of the human mind is held to be godly.' (3Pref = C 491)

[23] '... nothing happens in nature which can be attributed to any defect in it; for nature is always the same, and its virtue and power of acting are everywhere one and the same—that is to say, the laws and rules of nature, according to which all things happen, and change from one form to another, are always and everywhere the same ... The affects, therefore, of hate, anger, envy, etc., considered in themselves, follow from the same necessity and force of nature as the other singular things' (3Pref = C 492).

[24] '... in so far as the mind has inadequate ideas, it necessarily undergoes certain things. ... From this it follows that the mind is liable to more affects to the extent that more of its ideas are inadequate, and conversely, is active in more ways to the extent that more of its ideas are adequate.' (3p1dem, cor = C 494) 'But in so far as the mind has inadequate ideas, it necessarily is passive (patitur). Therefore, the actions of the mind follow from adequate ideas alone, and the mind is passive only because it has inadequate ideas. ... We see, then, that the affects are not related to the mind except in so far as it has something which involves a negation, or in so far as it is considered as a part of nature which cannot be perceived clearly and distinctly through itself, without the others' (3p3dem, sch = C 498). On the passivity of the passions cf. Aquinas, §244.

The inadequate ideas of passion differ from the adequate ideas of intellect insofar as they do not include a grasp of the causes of events. To the imagination, many events appear contingent that will appear necessary if we look at them from the point of view of intellect; for since intellect grasps their causes, it also grasps their necessity.

We may be surprised that Spinoza connects activity with adequate ideas and passivity with inadequate ideas.[25] For we may suppose that the conviction of activity depends on belief in one's active power, and that this belief, according to Spinoza, rests on inadequate ideas. The replacement of inadequate by adequate ideas, according to this view, implies awareness of our own passivity, not of our activity. The position that Spinoza attributes to the passions seems to be a precondition for agency. He seems to acknowledge this point implicitly; for he uses the inadequacy of the ideas of imagination, which are the sources of the passions, in order to explain why we are subject to the illusions of free will (3p2sch = C 494–5) The same inadequate ideas seem to make us liable both to passions and to the conviction of agency.

From Spinoza's point of view, this close connexion between ideas of agency and the ideas that form passions is not so surprising. Passions and illusions of agency are different sides of a single mistaken picture of the mind and its relation to the world. If I take myself to be injured or affronted, I believe that something has happened to me that ought not to have happened; to that extent I think of myself as a victim of the contingencies of the world, and more specifically of the wills of other people. I react with anger; and in my anger I decide that I ought to do something about it. But if I form a more adequate idea of events, I see that they are necessary. In this respect, I abandon the idea that I interact with them as a free agent. I also abandon the idea that I am a victim of the contingencies of the world. Hence I should infer that neither activity nor response to contingency is part of an enlightened view of myself and the world.[26]

Spinoza might reasonably point out to us that we often connect activity and freedom with independence from passions. We say that we ourselves are acting and are not dominated by passions, if we are guided by our rational convictions and are not distracted by passions. Independence from passions is normally taken to be an aspect of self-government. If I am guided by reasons that seem good to me, and I do not vacillate from moment to moment under the influence of different passions, I am the one who decides and acts.

To be guided by adequate ideas is to be guided by reason, because recognition of the causes of things is recognition of their necessity. Recognition of necessity involves a rational transition of thought in which we see that the conclusion necessarily follows from the premisses. We do not come to believe that we ought to try to modify the influence of our passions on our thoughts and actions; any such belief rests on the illusory idea of free agency. Instead of causing beliefs about what we ought to do, the growth of adequate knowledge inevitably results, without any further action, in the decay of our passions. The conviction

[25] James, *PA* 145–7, discusses Spinoza's treatment of passivity and the passions.

[26] '...it [sc. knowledge of Spinoza's doctrine] teaches us how we must conduct ourselves concerning matters of fortune, or things which are not in our power, that is to say, concerning things that do not follow from our nature—that we must expect and bear calmly both faces of fortune. For all things follow from God's eternal decree with the same necessity as from the essence of a triangle it follows that its three angles are equal to two right angles' (2p49sch, iv(b) = C 490).

of necessity reduces the incidence of passions, or at least reduces their influence on our thoughts. We no longer believe that events in the world are contingencies that we ought to respond to with free actions that involve bodily movements. If we are guided by inadequate ideas, we are irrationally impressed by misleading appearances. But insofar as we are guided by adequate ideas, we become reasonable.

Since guidance by adequate ideas implies guidance by reason without the influence of misleading appearances, it makes us independent of the variations of our passions, and causes us to act as we ourselves think best. In these respects, guidance by adequate ideas makes us more active, and less subject to our passions. But this is not all that we normally include in being active. Normally we take more rationality to imply more freedom and more agency because we assume that our reason is applied to action; we think of guidance by reason as a source of action. Spinoza leaves out this aspect of our intuitive views about freedom and activity, but he assumes that he is still entitled to speak of freedom and activity. He replaces freedom in action with freedom of mind.[27]

But he does not abandon freedom of action altogether. Though he denies interaction between mind and body, he allows interaction among mental states. If we restrict 'action' to mental interaction, Spinoza allows action guided by reason. If this is the only freedom worth having, it is reasonable of him to claim that he allows us the freedom that is worth having, and that he allows us to be active rather than passive. He believes we can be free of the influence of the passions only if we give up the idea of acting (moving our bodies) for reasons altogether.

This is a high price to pay for freedom from disturbance by passion; it precludes Spinoza from giving ethical advice about external actions, and precludes us from giving such advice to ourselves. Perhaps this conclusion attributes too extreme a view to Spinoza; but if we retreat to a more moderate view that does not preclude advice about action, we raise difficulties for his views about freedom from passions. Freedom from passions comes from recognizing the necessity of things that we had previously taken to be contingent; these include the actions that are matters for moral deliberation and choice (before we agree with Spinoza).

But even if we could accept the implications of Spinoza's position and cease giving ourselves ethical advice, it is not clear how far we would modify our passions. Spinoza seems to assume that a change in our beliefs will weaken our passions, because we will recognize the falsity of the beliefs that are presupposed by the passions. But it is not clear that this will happen. Though recognition of the falsity of a belief results in our no longer holding the belief, we may still retain a false appearance, just as we do when we are afraid of being poisoned by a grass snake even after we learn that it is not poisonous.

We might try to defend Spinoza by arguing that adequate knowledge gives us a reason and a motive to try to moderate our passions, once we recognize that they have so far depended on false beliefs and now depend on false appearances. But a deliberate effort to moderate our passions rests on a false assumption about agency. Moreover, the assumption is not only false, but it conflicts with the main point of Spinoza's claims about adequate knowledge. He rejects the aim of deliberately modifying the passions; that aim depends on

[27] Cf. Hampshire, *TTM* 74.

the mistaken belief in freewill. A passion can be removed only by a stronger and opposite passion (4p7dem). Changes in the passions follow, without any further intervention of the will, from adequate knowledge of the necessary connexions in the world.

Spinoza's claims about the passions overlook the attitude of the ancient Sceptics. Sextus agrees with Spinoza, for different reasons, that we have no reason for acting in one way rather than another. He infers that we will give up acting on considerations that seem rational to us. But he does not infer that we will be free of passions. For even if passions include false beliefs or rely on them, recognition of the falsity of the beliefs does not imply the end of the passion. Even if we agree with Spinoza, and decide that we cannot respond as free agents to the contingencies of the world, our passions may not follow this conclusion. It is not clear, therefore, how the mental freedom that Spinoza describes will necessarily result in the modification of the passions.

513. Desires and Tendencies

Spinoza believes that some version of psychological egoism is correct; each person pursues his own good, because every being essentially tends towards its own continuance.[28] We might take him to be referring to a basic desire for one's own preservation; his statement of the basic 'striving' (conatus) may remind us of Aquinas' claim that all things 'desire' (or 'aim at', appetunt) being. But such a claim raises some difficulties for Spinoza.

The difficulty arises from an apparent conflict with his general opposition to all teleological claims.[29] His general view is that there are no final causes in nature. In his view, believers in final causes make the future exercise causal influence on the past, in defiance of the real order of causal influence.[30] They imagine that this is so in nature because they take nature to be a means of satisfying their own desires, and so they ascribe to nature the ends that they pursue for themselves.[31] But we have no reason to accept this anthropomorphic conception of nature.

The conclusion of Spinoza's argument raises some doubt about his premisses. For if all final causes are fictions, what about our belief that we have desires? If he explains our attitude to nature by reference to our desires, does he not explain them by reference to an end we pursue, and hence explain them teleologically, in defiance of the proper direction of causation? He might reply by denying that explanation by desire is teleological. A desire is a mental state earlier than the action, and so the causal influence goes in the proper direction. But this is not a complete reply to the objection. We normally suppose that the desire explains the action because of its goal-directed character; we choose that action as a means to

[28] 'So the power of each thing, *or* the striving by which it (either alone or with others) does anything, or strives to do anything—i.e., the power, *or* striving, by which it tries to persevere in its being, is nothing but the given, *or* actual, essence of the thing itself.' (3p7 = C 499)

[29] See Bennett, *SSE* 245.

[30] '. . . nature has no end set before it, and . . . all final causes are nothing but human fictions. . . . This doctrine concerning the end turns nature completely upside down. For what is really a cause, it considers as an effect, and conversely . . . . What is by nature prior, it makes posterior' (1appx = C 442).

[31] '. . . men act always because of an end, namely, because of an advantage they desire. That is why it happens that they always seek to know only the final causes of things that have been done . . .' (1appx = C 440).

an end that we pursue. The future-directed goal is causally relevant to this action; whether or not the action achieves the end, I chose it because of a desire with this future-directed character. If Spinoza allows this explanatory role to future-directed desire in human action, he leaves open the possibility of states that are future-directed in the same way in other natural explanation.

To avoid this teleological description of desires, Spinoza might argue that we have given the wrong account of their relation to action. Though we think they explain through their teleological content, we are wrong, just as we are wrong more generally in believing that the intentional content of our mental states explains our action. In desire we are simply aware of a bodily state that explains movements non-intentionally.

But what movements does it explain? We might be tempted to say that our desire for self-preservation is our awareness of states that result in our self-preservation, and that in general we can refer to the actual result of our bodily movement to identify the character of our desire. But this account of desire does not cope with the fact that someone's desire for self-preservation may also explain (as we suppose) actions that do not result in his self-preservation, but seem to him to be likely to result in it. The relevant movements are those that are directed towards self-preservation, and we cannot identify these except by reference to their intentional character and aim. If Spinoza adheres strictly to his ban on teleological explanation, he should apparently allow a desire for F only in cases where F is really achieved. This restricted appeal to desire limits the role of desire in explaining action.

A non-teleological reconstruction of desire also raises doubts about the universality of the desire for self-preservation. Since we all succeed in preserving ourselves for some time, Spinoza can consistently claim that we all act on the desire for self-preservation. But he also seems to treat this as a universal desire on all occasions.[32] Since we do not preserve ourselves on all occasions, it is not clear how the desire can be universal. If Spinoza claims that we all try to preserve ourselves even when we fail, he re-introduces a teleological concept. If he tries to remove the teleological content from trying, and replaces it with a mere tendency, he raises the difficulty about unsuccessful action again.

It is not clear, therefore, how much is left of the 'striving' (conatus) that Spinoza attributes to all human beings, once we remove the teleological content that conflicts with his metaphysics.[33]

514. Desire and Goodness

Some of Spinoza's views about the nature of desire affect his claims about the relation of desire and goodness. We might suppose that the desire for self-preservation rests, as Aquinas claims, on an assumption about goodness; in desiring something we see it in a particular light, in relation to other things that we count as good and worthy of desire, and that is why we try to get it. These intentional concepts do not fit Spinoza's attitude to teleology, and so he does not try to explain desire by reference to goodness. Our basic tendency towards

[32] See the passage just quoted.

[33] On Spinoza's conception of desire see Broad, *FTET* 23; Curley, *BGM* 107–9.

self-preservation does not rest on any conviction about goodness; we do not desire our own continuance, or anything else, because we take it to be good. On the contrary, desire is prior to belief about goodness.[34] Joy and sadness result from the recognition of something that satisfies this desire, by promoting or hindering our preservation.[35] This connexion between self-preservation and pleasure also explains why we identify good things with causes of pleasure.[36] Since Spinoza rejects teleology, he does not believe that we act from the idea of self-preservation. Pleasure is a feature of my awareness of states that promote my preservation, and this is the sort of state that I call good.[37]

So far, Spinoza agrees with the egoistic aspects of Aristotelian ethical theory, once they are re-interpreted to fit his own views about the character of desire. He agrees with Aristotle that human beings necessarily pursue their own good, and he identifies this with happiness. He assumes that the appropriate end for ethics is happiness, and that the dispute is about where it is to be found and how it is to be achieved. He does not say much about the composition of happiness, or about hedonistic, subjectivist, and objectivist conceptions of it. He claims that 'happiness consists in man's being able to preserve his being' (4p18s(i) = C 556). In speaking of happiness as satisfaction (acquiescentia), he seems to treat it as consisting in a state of mind, however it is achieved.

515. Passions as the Sources of Conflict

How can we acquire the relevant sort of satisfaction? Spinoza believes that we cannot acquire it if our passions dominate us. For passions rest on a naive and misguided view of the world; we think it is worth our while to be angry or resentful at what happens to us, to feel strong attachment to other people or strong dislike of them, and especially to try to change other people and the world for our own advantage. This outlook rests on the assumption that things happen contingently, and hence are up to us to change, and that we know how to change them because we know that our mental states causally affect external reality. Moreover, since our passions result from imagination, they result from superficial views of the world that are liable to vary from person to person. If we look at the same object from different angles, and we do not try to correct our first impressions, it will appear to us that we see different objects. Similarly, different people's passions fasten on different aspects of the same situation and form different aims. Conflicts result from these different aims, since each person's passions differentiate him from other people in accordance with his imagination.

[34] '. . . we neither strive for, nor will, nor desire, nor have an appetite for, anything (nihil . . . conari, velle, appetere, neque cupure) because we judge it to be good; on the contrary, we judge something to be good because we strive for it, will it, desire it, and have an appetite for it' (3p9s = C 500).

[35] 'By joy, therefore, I shall understand . . . that affect by which the mind passes to a greater perfection. And by sadness that affect by which it passes to a lesser perfection.' (3p11s = C 500–1)

[36] 'We call good or evil what is useful to, or harmful to, preserving our being, i.e., what increases or diminishes, aids or restrains, our power of acting. Therefore . . . in so far as we perceive that a thing affects us with joy or sadness, we call it good or evil. And so cognition of good or evil is nothing but an idea of joy or sadness that follows necessarily from the affect of joy or sadness itself.' (4p8 = C 550–1)

[37] On goodness see Garrett, 'Ethical' 272–4.

The condition of people who are dominated by their passions is therefore a Hobbesian state of nature, in which their disagreements in judgment lead to conflicts in action.[38] Spinoza agrees with Hobbes's view that a state of nature is the result of motives that are naturally present in human nature. But he does not agree exactly with Hobbes's account of why the state of nature is a state of war; his disagreement with Hobbes points to his distinctive view of how to emerge from the state of nature.

Hobbes takes both reason and passion to be sources of potential instability and conflict. Our lack of assurance makes it reasonable for us, from the point of view of self-preservation, not to observe the laws of nature in the state of nature. Hobbes reaches this conclusion because he assumes that reason requires us to compete with others for goods that cannot be shared but must be possessed by one individual to the exclusion of others (we cannot both be adequately nourished by eating a meal that is enough for just one person). Since reason requires us to enter the competition that we recognize as dangerous and destructive, it requires us to set up a commonwealth to restrain competition.

Spinoza's account of the state of nature is similar to Hobbes's account. He speaks of the 'right' of nature and 'law' of nature as one's freedom to exercise one's natural capacity; this is rather similar to Hobbes's view of the right of nature, which has no essentially moral character.[39] But his account of how to escape from the state of nature reflects the difference between his view of reason and Hobbes's.[40] Conflicts arise in the state of nature not because of reason (as Hobbes supposes), but only because of passions, which cause people to act on their partial views of things. But these same passions also tell us that we are better off if we listen to reason, since we dislike the effects of acting on our passions. We turn to reason because it considers the true good of human beings and promises to end conflicts.

We need the state, in Spinoza's view, because of our passions. If we listened to reason, we would be ready to keep promises, avoid deceit and violence, and observe the other Hobbesian laws of nature. We need a state with the power of coercion because of the people who are liable to be swayed by their passions into violating the laws of nature.[41] Spinoza is

[38] 'Men can disagree in nature in so far as they are assailed by affects that are passive, and to that extent one and the same man is also variable and inconstant.' (4p33 = C 561) On Spinoza and Hobbes see Curley, *BGM* 124–6.

[39] 'Since it is the supreme law of nature that each individual thing should strive (conetur) to preserve itself in its state, as much as lies in it, taking no account of another, but only of itself, it follows from this that each individual has the highest right to this, that is . . . to exist and act as it is naturally determined. . . . Hence among human beings, so long as they are considered as living under the command of nature alone, the one who has not yet come to know reason, or who has not yet acquired the state of virtue, lives with the highest right solely by the laws of desire, no less than the one who orders his life by the laws of reason.' (*TTP* 16 = S 527) 'The natural right of each human being is thus determined, not by sound reason, but by appetite and power.' (*TTP* 16 = S 527) I cite *TTP* by chapters and pages of Shirley.

[40] 'Nevertheless, no one can doubt how much more advantageous it is for human beings to live according to the laws and certain dictates of our reason, which . . . aim at nothing except the real advantage of human beings. Moreover, everyone is eager (cupiat) to live as far as possible without anxiety, free from fear, which, however, is quite impossible so long as everyone is permitted (licet) to do what he likes, and nothing more is allowed to the right (ius) of reason than to hatred and anger . . . When we reflect that human beings without mutual help must necessarily live most miserably and without the cultivation of reason . . ., we shall plainly see that men ought (debuisse) to have conspired together to live well and without anxiety . . . But their efforts to do this would have been vain if they willed (vellent) to follow what desire (appetitus) urged on them (for by the laws of desire each person is drawn in a different direction); they ought, therefore, to decree and pledge most firmly that they will direct everything by reason (which no one dares to oppose openly, lest he seem to lack any mind), and to restrain desire insofar as it urges anything harmful to another, and to do nothing to another that one does not will to have done to oneself, and to defend the right of another as one's own.' (*TTP* 16 = S 528)

[41] 'However, if all men could be easily led by the leading of reason alone, and could recognize the highest advantage and necessity of a commonwealth, everyone would repudiate deceit; for everyone would faithfully adhere altogether

justified in claiming to differ from Hobbes on this point, by taking reason to be always on the side of peace.[42] Hobbes sometimes suggests that reason may be the source of violations of the laws of nature, and so it needs coercion to change the rational attractiveness of the different options. Spinoza's claims about reason and passion are much clearer and less ambiguous. If he is right, we need the commonwealth to reduce the influence of the passions, not to make it rational for rational agents to make and keep covenants. He therefore seems to overlook the questions about assurance that lead Hobbes to argue that reason may be a source of conflict in the state of nature.

Spinoza's disagreement with Hobbes partly reflects his acceptance of the Stoic claim that happiness consists in living in accordance with nature.[43] To show how rational perfection is connected to moral virtue, he argues that if we live according to our own nature as rational beings, we live in ways that benefit others as well as ourselves.[44] Our passions tend to create conflicts, but reason resolves them, by giving us a common point of view that appreciates the benefits we gain from each other. Sometimes he suggests that reason presents to us the means of self-preservation, as Hobbes supposes. But his main reason for claiming that reason removes conflict rests on his distinction between the partial outlook of the passions and the insight of reason into general laws, giving it a common point of view.

Conflict does not arise, therefore, from two individuals' desiring the same thing, but from their having different passions towards it.[45] They may be right in both desiring the same thing; that is not the cause of their conflict. Conflict requires the idea of a gain

to their agreements because of their appetite (cupiditate) for this highest good, namely, the preservation of the commonwealth. . . . But it is far from being true that all can always be easily led by the leading of reason alone; for everyone is drawn away by his pleasure, while avarice, ambition, envy, hatred, and the like most often occupy one's mind so much that no room is left for reason. That is why, though human beings promise with certain signs of a sincere mind and undertake to keep their word, still no one can be certain about the good faith of another unless something is added to the promise, since everyone by the right of nature can act deceitfully, and is not required (tenetur) to stick to his agreements, except by the hope of a greater good, or the fear of a greater evil.' (*TTP* 16 = S 529–30)

[42] 'Whatever sort of state (civitas) a human being lives in, he can be free. For certainly a human being is free to the extent that he is led by reason. But reason (though Hobbes thinks otherwise) altogether urges peace; this, however, cannot be attained unless the common laws (iura) of the state are kept. Therefore the more a human being is led by reason—that is to say, the more he is free—the more constantly he will keep the laws of his state, and carry out the commands of the supreme power to which he is subject.' (*TTP* 16n33 = S 580–1)

[43] 'In so far as a thing agrees with our nature, it cannot be evil. Necessarily, then, it is either good or indifferent. In the latter case, namely that it is neither good nor evil, then nothing will follow from its nature that aids the conservation of our nature, i.e. (by hypothesis) that aids the preservation of the nature of the thing itself. But this is absurd. Hence, in so far as it agrees (convenit) with our nature, necessarily it is good.' (4p31d = C 560–1) '. . . what is most useful to a human being is what most agrees with his nature . . . But a human being acts entirely from the laws of his own nature when he lives by the leading of reason . . .' (4p35c1 = C 563).

[44] 'But because each one, from the laws of his own nature, desires what he judges to be good, and strives to avert what he judges to be evil, and moreover, because what we judge by the dictate of reason to be good or evil is necessarily good or evil, it follows that in so far as human beings live by the leading of reason, to that extent necessarily they do only those things that are necessarily good for human nature, and hence for each human being, i.e. those things that agree with the nature of each human being. Hence, in so far as they live by the leading of reason, necessarily they always agree.' (4p35d = C 563)

[45] '. . . it is far from true that they are troublesome to one another in so far as they love the same thing and agree in nature. Instead . . . the cause . . . is nothing but the fact that they are supposed to disagree in nature. For we suppose that Peter has the idea of a thing loved and already possessed, and Paul, on the contrary, has the idea of a thing loved and lost. That is why the one is affected with joy and the other with sadness, and to that extent they are contrary to one another. In this way we can easily show that the other causes of hate depend only on the fact that men disagree in nature, not on that in which they agree' (4p34s = C 562–3).

that causes another's loss; and that idea comes from their passions. The point of view of reason, however, endorses a common and non-competitive good. Hence 'men will be most useful to one another, when each one seeks his own advantage' (4p35c2 = C 563). The common point of view is common to different people who are guided by reason, since it presents the same conclusions to A and to B; it is free from the distorting influence of the passions that give A and B different points of view on the same situation. But it is also a common point of view because it prescribes whatever is for the common good of A and B.

It is difficult, however, to see why Spinoza supposes that a point of view that is shared by different people will necessarily prescribe a common good. Suppose, for instance, that reason tells us that each person needs to eat 3 kg of food per day to stay alive. Since this is true of everyone, reason tells A that each of A, B, and C, needs to eat 3 kg per day; and it tells B and C the same thing. Hence they can agree on its being good for each person to eat 3 kg. But if there are only 3 kg available to divide, the 'common' conclusion that each person ought to eat 3 kg does not tell anyone what to do; still less does it say what policy it will be good for everyone to adopt. In this respect, reason does not seem to present a common good; the good that it presents does not remove competition between individuals. One might say that the competition is only contingent, resulting from the lack of resources; but contingent competition is enough for Hobbes's argument about the state of nature to get started.

Spinoza is perhaps misled (as Hobbes sometimes is) by indiscriminate references to 'agreement' between individuals. We may concede his claim that reason leads to agreement; if two people equally exercise their reason on arithmetic or geometry and reach true conclusions, they will agree on the conclusions. But it does not follow that this agreement points out the sort of common good that eliminates competition between individuals. It may be true that if different people proceed rationally, free from the influence of their particular emotions, they will reach the same conclusion. But why will they not conclude that, for instance, it is good for you to attack me, and good for me to attack you? Why will they agree on a course of action that is good for all of them?

516. The Good of Rational Beings

Spinoza answers this objection through his conception of the nature of the common good. He considers the possibility that the good of one person is not the good of another, but he dismisses the possibility, on the ground that the very nature of human beings makes their good non-competitive. On this point he departs from Hobbes. According to Hobbes, peace is a non-competitive instrumental good; we all benefit from it in pursuing our various sources of pleasure and satisfaction, but our ends are not essentially non-competitive. Even from the rationally enlightened point of view, the non-competitive good is good only insofar as it is a means to other goods. Spinoza, however, believes that the ultimate good is essentially non-competitive. The good for a human being consists in 'an adequate knowledge of God's eternal and infinite essence' (4p36s = C 564). Since human nature is essentially rational nature, he agrees with Aristotle in taking happiness to require intellectual

perfection.[46] Each of us loves this good more to the extent that one sees it loved by others also; hence each of us will strive to make others love the same non-competitive good (4p37alt.dem = C 565).

What is the relation of the adequate and intuitive knowledge of God to blessedness? Perhaps Spinoza allows that internal satisfaction achieved by some other means than intuitive knowledge of God is still blessedness, but recommends intuitive knowledge of God as the best means to it. Alternatively, he may mean that only the satisfaction caused by intuitive knowledge of God is blessedness; in that case, he needs to explain why that specific cause should be regarded as a necessary condition of happiness.

His answer depends on the connexion between adequate knowledge and the intuitive knowledge of God. Since God is to be identified (speaking approximately) with the laws of nature, we come to know God by acquiring adequate knowledge of the laws of nature, and so understanding why what happens is necessary. This is the point of view of reason, which gets us away from the instability of the emotions. Since this point of view removes the disturbances that arise from domination by the passions, it is the only source of the satisfaction that is needed for happiness. Epicurus was right, therefore, to believe that happiness consists in freedom from disturbance (*ataraxia*), and that understanding the character of the gods promotes this undisturbed condition. But Spinoza's account of the understanding that achieves happiness is closer to Aristotle's conception of theoretical wisdom, grasping the necessary truths about the universe.

Once we grasp the connexion between happiness and intellectual perfection, we can reject Hobbes's purely instrumental attitude to the moral virtues. Spinoza believes that virtue deserves to be chosen for its own sake. He disagrees both with Hobbes, who believes it is worthwhile only for its natural consequences, and with theological moralists who believe it is only worthwhile on the assumption of divine rewards. All those who take an instrumental attitude to moral virtue fail to see that, as Spinoza understands it, it is the greatest happiness. God does not need to reward us for service, since the service of God is happiness itself.[47] We have no reason to regard the common point of view as simply a means to peace; it is a source of happiness quite apart from its role in providing counsels of self-preservation.

517. Intellectual Love of God

The enlightened common point of view of reason leads us to the intellectual love of God. This is 'the highest good which we can want from the dictate of reason and is common to all men; we desire that all should enjoy it' (5p20 = C 605). It is the common good that Spinoza believes we will want everyone to share (cf. 4p37alt.dem = C565, discussed above).

In speaking of intellectual love, Spinoza alludes to the sort of love that Aquinas attributes to us when we are moved by the intrinsic goodness of the person loved, rather than by

[46] 'In life, therefore, it is especially useful to perfect, as far as we can, our intellect or reason, and in this one thing consists the highest human happiness or blessedness, because blessedness is nothing but the very satisfaction (acquiescentia) of mind that arises stems from intuitive cognition of God.' (4app(iv) = C 588)

[47] 'From this we clearly understand how far those people stray from the true valuation of virtue, who expect to be honoured by God with the greatest rewards for their virtue and best actions, as for the greatest bondage (servitus)—as though virtue itself, and bondage to God, were not happiness itself, and the greatest freedom.' (2p49s4a = C 490)

pleasure or advantage.[48] But his conception of intellectual love is so different that we may reasonably wonder whether he is talking about the same thing. Aquinas takes the object of intellectual love to be a person, whether human beings or God. In loving God we love a person who also loves us; indeed, God's love towards us makes us capable of love towards God. In Spinoza's view, however, God is incapable of love and of any other affect of joy or sadness, because these affects would be incompatible with God's perfection (5p17 = C 604).

These adaptations of intellectual love take no account of Aquinas' view that God is capable of intellectual love without passions, because love belongs to God's will. It is reasonable for Spinoza to ignore Aquinas' view, given that he disagrees sharply with Aquinas about God's intellect and will. He denies any distinction between intellect and will, and in particular he denies it in God. Moreover, he denies that God has an intellect. God's nature does not allow the appropriate relation between an intellect and its objects; for a divine intellect could not be either posterior or simultaneous to its objects, as an ordinary intellect is. An ordinary intellect achieves knowledge insofar as it is passive, by grasping an object that exists independently of it; that is how it achieves the right direction of fit, by knowing rather than creating an object. But a divine intellect could not grasp its objects in this way; it would have to be prior to everything, since God is the cause of everything (1p17s(ii) = C 427). Since God is so different from any ordinary intellect, Spinoza concludes that intellect, will, and desire and so on, belong to natura naturata, not to natura naturans (1p31 = C 434–5); that is to say, they belong to 'what follows from the necessity of God's nature', and not to 'God, in so far as he is considered as a free cause' (1p29s = C 434).

The effect of these claims about God and intellect is to curtail the possibility of intellectual love, as Aquinas understands it. For Spinoza in contrast to Aquinas, it is not love directed towards God as a distinct person with intellect, will, and love. The features of distinct personality do not belong to natura naturans, and hence do not belong to God understood in his own right. This does not make intellectual love of God insignificant in Spinoza's system. Given his doctrine of intellect and will, intellectual love is directed towards adequate knowledge. Knowledge of God is knowledge of the structure and laws of the universe and of their necessity, not of a distinct person. Intellectual love is completely satisfied once we have a complete grasp of the necessary system of the universe.

Spinoza accepts one aspect of the traditional doctrine of intellectual love of God insofar as he takes it to involve union with God.[49] If we can be united with God, and if we love God, then apparently God also loves God. But Spinoza rejects this conclusion, because of his previous restrictions on the ways in which we can attribute intellect, will, and love to God. 'God loving himself' is not to be understood as love directed towards a distinct person beyond finite persons; for there is no such distinct person. The total system of the universe does not love itself. God's love of himself must be reduced to love by individual finite persons (who are all modes of God) for finite persons. That is the only sense in which one's

[48] See Aquinas, §336. Wolfson, PS ii 274–9, gives further sources, but he does not emphasize the moral and personal character of intellectual love, as Aquinas conceives it.

[49] 'The mind's intellectual love towards God is the very love of God by which God loves himself, not in so far as he is infinite, but in so far as he can be explained by the human mind's essence, considered under a species of eternity; i.e., the mind's intellectual love towards God is part of the infinite love by which God loves himself.' (5p36 = C 612)

intellectual love can be part of God's love of himself; it is part of the total of intellectual love present in all the finite persons.[50]

518. Reason and the Good of Others

Spinoza's account of happiness as intuitive knowledge and intellectual love of God helps us to see the good that is revealed by the common point of view of reason. His conception of the good gives him an answer to our earlier objection that the common point of view might reveal a good that is the object of competition. The intuitive knowledge of God is a non-competitive good; if I acquire it, I do not take any of it away from you, and in recognizing it as good for myself I recognize it as good for you also.

But this non-competitive good does not remove all the objections that Spinoza might face. Even if knowledge of God is the whole of a person's good, the resources we need to achieve it might involve competition; and so we still have no reason for being especially concerned for others in such a competition for resources. Moreover, Spinoza does not argue convincingly for his claim that knowledge of God is the whole of the human good. If we really thought that it is all that matters, we seem to have no reason to secure the more mundane goods for other people or for ourselves. The aspect of Spinoza's outlook that introduces a non-competitive good also curtails one's concern for the goods and evils that are normally taken to matter in inter-personal relations.

In his claims about the purely intellectual good of knowing God, Spinoza offers a genuine alternative to Hobbes. According to Hobbes, the only function for reason in the state of nature is to suggest 'articles of peace', on the assumption that the good of different human beings brings them into conflict and that the conflict has to be managed in people's mutual interest. Spinoza departs from Hobbes in not confining the human good to the sorts of self-confined pleasures that Hobbes considers. But it is not clear that it gets us out of a Hobbesian attitude to our social life.

Spinoza believes that Hobbes would be right if human beings could not reduce domination by passion (4p37sch2 = C 566–7). But he argues that reason can be practical in the ways that Hobbes supposes (4p65–6 = C 583), and he believes that his account of the common good pursued by reason explains how reason can remove Hobbesian conflicts. But it is not clear how this is so, if reason simply turns us towards the knowledge of necessary truths about the universe.

Perhaps he intends his account of reason and adequate knowledge to make a further difference to practical reason. If I am dominated by passions, I use reason to secure advantages for myself, as measured from the limited point of view of my own imagination. But if I

[50] This is Martineau's conclusion in *TET* i 364: 'So it comes out, that for God to love himself is for him to love men. But his love to himself . . . is equivalent to man's love to him; therefore his love towards man is equivalent to man's love to him. These wonderful transformations are all wrought by the mere verbal device of duplicate denominations of the same thing; one of the same feature, of love, is slipped, now under one name, now under another; the double names being of persons with the personality emptied out; and the result is a tissue of apparent contradictions which, on examination, prove to be a monotonous tautology. It was long before I could find courage to look behind the venerable mask of these empty propositions; and it was not without pain that I found in the guise of mystical devotion, what I can hardly rank higher than logical thimble-rigging.'

acquire adequate knowledge of myself and others, I no longer look at myself or others from the individual point of view that is influenced by my passions. I now look at all of us—it may be supposed—from a strictly impartial view, seeing everything as the necessary result of the laws of nature. One might suppose that, from this point of view, no room is left for any special concern with myself as opposed to others. Hence I have no reason to favour myself over others.

These claims about one's own good and the good of others are not alien to the Aristotelian outlook. Aristotle believes that the self-love of the virtuous person is also directed to the common good of rational agents, because each person recognizes himself as essentially rational. We have considered some of the objections that arise against Aristotle's use of these claims, and some of the replies that might be offered in his defence. Spinoza adds his own distinctive argument, in claiming that the point of view of reason removes the passions that produce conflict.[51] Enlightened people will not only be free of the competitive aspects of the emotions, but will also seek to co-operate with others.

This argument is open to question. If Spinoza's claims about the emotions are correct, we can see why enlightenment about the emotions will result in a less competitive attitude. But one might also suppose it will result in a less co-operative attitude as well. The emotions produce concern for others, since we believe we can (for instance) do something to relieve the sufferings of others. If we lose this belief in our agency, and we are less disturbed by grief at the sufferings of others, why should we still be concerned about their welfare? If the universal point of view resulting from adequate knowledge removes any bias in favour of myself, should we not also expect it to remove concern for others? If I am indifferent to others, and I also recognize that from the universal point of view I matter no more than others do, why should I not also become indifferent to myself? Co-operation requires not only removal of bias towards myself, but also positive concern for others. Spinoza does not explain why we will develop this positive impartial concern simply by acquiring an impartial point of view.

This difficulty in connecting rational impartiality with positive concern for others is not peculiar to Spinoza. It suggests a reasonable question that can also be raised about Kant's position. But the difficulty arises especially clearly for Spinoza, in his claims about the common point of view of reason. He does not seem to recognize that he needs to say more about why reason leads to co-operation.

Similarly, when he claims that virtue is worth choosing without any external rewards, he criticizes moralists who claim that only the prospect of rewards and punishments makes it worth our while to pursue virtue and avoid vice. But these moralists are not concerned with adequate knowledge of necessary truths; they might well concede that these are worth pursuing apart form their rewards. They are concerned with the moral virtues; since these virtues seem to require some sacrifice of our own interest, a divine reward is needed (on this view) to convince us that they are in our interest overall. If Spinoza rejects this view, he implies that the moral virtues themselves promote happiness. Since he has already said

[51] 'This doctrine contributes to social life, in so far as it teaches that each one should hate no one, despise no one, mock no one, be angry at no one, and envy no one; and also in so far as it teaches that each one should be content with his own things, and should be helpful to his neighbour, not from womanish compassion, partiality or superstition, but from the leading of reason, as the time and occasion demand.' (2p49s iv (c) = C 490)

that the satisfaction resulting from intuitive knowledge of God is blessedness, he should identify this state with moral virtue and show how it results in concern for the good of others.

Spinoza's metaphysics both suggests some of the most intriguing elements in his moral philosophy and confronts him with serious difficulties. His distinctive ethical recommendations depend directly on some of the elements of his metaphysics that undermine ordinary convictions about agency. When we reject ordinary views about agency, and replace them with adequate knowledge, we undermine the ordinary sources of anger, resentment, and conflict. But we also seem to undermine some of the convictions that lead to morality.

Similarly, Spinoza's conception of intellectual love makes it difficult to see how an appeal to intellectual love could help him at the points where his ethical doctrines are open to question. For even if we restrict it to other finite persons, and do not extend it to God, it is not directed to their characters or personalities or (as we normally conceive them) their interests. It must be confined to assent to the same necessary truths as they are grasped by other finite minds besides our own. If I assent to your grasping the laws of thermodynamics, and in that sense have intellectual love for you, it does not follow that I will enjoy your company, or care about your being free of pain or deprivation. We have seen why it would be unjust to charge Plato with abandoning the love of particular human beings for the intellectual acceptance of abstractions.[52] This charge seems more appropriate for Spinoza's doctrine of intellectual love.

Spinoza, therefore, does not resolve all the doubts that arise about his moral position. The specific metaphysical claims that are meant to free us from the passions that lead to selfishness and conflict seem to free us from too many other things as well. His attack on agency seeks to expose the illusions underlying our passions. But if it succeeded, it would also deprive us of any basis for moral concern, for ourselves and for other people. Spinoza speaks as though we can appeal to his metaphysics to free us from the passions, without drawing its destructive conclusions for morality. But it is not clear how we can reasonably limit the impact of his metaphysics in this way.

[52] On Platonic love see §63.

38

THE 'BRITISH MORALISTS'

519. Rationalists and Sentimentalists

Whewell and Sidgwick both recognize a tradition of British moral philosophers whose outlook is defined, explicitly or implicitly, by questions raised by Hobbes. While philosophers in this tradition are also open to influences from outside Britain, they are especially concerned with Hobbes and his successors. Before we discuss, them, therefore, it may be useful to survey some of the different tendencies in the British moralists, and some of the different ways of dividing them into different schools or movements.

While Whewell and Sidgwick already recognize a distinct British tradition in moral philosophy, modern conceptions of this tradition have no doubt been influenced by Selby-Bigge, who published in 1897 a useful anthology of selections from the British moralists.[1] For the next 70 years, until the publication of Raphael's anthology in 1967, Selby-Bigge's collection introduced non-specialists to the works of the moralists whose works were not available in modern editions. It encouraged the wider knowledge of moralists who had often lain unread since the 18th century.[2] Selby-Bigge divides British moralists between Hobbes and Hume into 'sentimentalists' and 'intellectualists', but he does not explain what he means by these labels, or how they fit different moralists.[3] His first volume contains texts from the leading sentimentalist writers, Shaftesbury, Hutcheson, Butler, Smith, and Bentham. He presumably includes Hobbes, Locke, and Hume in this class.[4] His second volume includes the intellectualist writers Cudworth, Clarke, Balguy, and Price.

This division between sentimentalists and intellectualists recalls the standard division between empiricists and rationalists. Indeed, Selby-Bigge's intellectualists are often called rationalists, and they are all rationalists in the sense often used by the student of the history of

[1] Selby-Bigge's collection is intelligently reviewed, with appropriate criticism of his arrangement, by Albee.

[2] Butler had not been neglected either in Oxford or in Cambridge. See Garnett, 'Butler'. But knowledge of other 18th-century writers in English does not seem to have been widespread. See Martineau, *ERA* iii 378; Taylor, 'Butler'.

[3] Raphael, *BM*, abandons Selby-Bigge's division into schools in favour of a historical arrangement. Schneewind, *MP*, returns to a division by schools, more complex than Selby-Bigge's; his collection is not confined to British writers.

[4] For chronological reasons he relegates Locke and Hobbes to an appendix. He excludes Hume because he had already edited his two major works.

metaphysics and epistemology. Similarly, the sentimentalists generally hold some elements of an empiricist position.[5]

Not all the philosophers on each side are exclusively rationalist or exclusively sentimentalist. Hobbes, for instance, mostly agrees with later sentimentalists, but he sometimes (perhaps inconsistently)[6] treats moral principles as requirements of right reason; on this point he maintains a connexion between reason and morality that Cudworth and Clarke (for instance) defend and that Hutcheson (for instance) denies. Similarly, Shaftesbury anticipates Hutcheson on many points, and so might be counted as a sentimentalist. But he maintains that moral rightness and wrongness are not dependent on the reaction of observers, and so he accepts one of the main rationalist objections against sentimentalism.

If we recognize these complications, we can still follow Selby-Bigge's division in studying these moralists. His sentimentalists, from Hobbes to Bentham, develop one relatively systematic approach to morality, and his intellectualists, from Cudworth to Price, develop a significant alternative approach. A comparison of the two approaches is philosophically instructive, since mutual criticism by philosophers on each side exposes some basic questions in moral theory. This mutual criticism provokes Hume's full defence of an elaborated sentimentalist position. His defence in turn provokes Price and Reid to a fuller defence of the rationalism of their predecessors.

These debates also help us to see how both sides treat the 'traditional naturalism' derived from Aquinas. Rationalists criticize sentimentalists on several points on which sentimentalists follow Hobbes against traditional naturalism. But they also accept some aspects of Hobbes's attacks on traditional naturalism. We can therefore use these discussions to identify the features of traditional naturalism that are abandoned on all sides, and we can try to see whether their abandonment is justified.

Under 'British' moralists, Selby-Bigge includes English, Welsh, Scottish, and Irish writers. They do not form a homogeneous tradition. The idea of a single British nation was formed only gradually during the 18th century,[7] and the relevant philosophical traditions are distinct. In the Scottish universities moral philosophy was a subject for formal and systematic undergraduate lectures, whereas in England it had no equally secure place in university education. Clarke's major work was delivered as a series of sermons. Within the English and Welsh Dissenting academies that produced Butler, Price, and Godwin, moral philosophy was taught more systematically. Both Scottish Presbyterians and English and Welsh Dissenters seem to have been exposed to Continental influences that did not affect English Anglican writers to the same degree. The study of Grotius and Pufendorf was entrenched both in Glasgow and in Philip Doddridge's Dissenting academy,[8] but English Anglican writers do not refer to them as often. Hutcheson unites these different intellectual traditions. He was educated in a Dissenting academy, and taught in one himself. He took part in the non-academic literary life of Dublin, for which he wrote his main

[5] For doubts about the division between rationalism and empiricism see Loeb, *DH,* esp. ch. 1. He does not discuss Platonism, Cudworth, Clarke, Butler, or Price at length. Consideration of them would reinforce doubts about a sharp division, and about the suggestion that empiricism is in some way characteristic of British philosophers.

[6] Hobbes on practical reason; §478.

[7] The Act of Union of 1707 introduced 'one united kingdom by the name of Great Britain'. The growth of a sense of British identity during the 18th century is studied in Colley, *BFN*; see, e.g., 122–4 on Scotland.

[8] On Carmichael in Glasgow and on Doddridge see §585.

works in moral philosophy. He was a professor in Glasgow, where he produced his textbooks.

Even if we doubt whether all these moralists belong to a single ‘British’ tradition, Selby-Bigge’s label is nonetheless justified insofar as the moralists he collects are engaged in debate primarily with one another. In this respect 18th-century writers differ, broadly speaking, both from their 17th-century predecessors and from their 19th-century successors. Though it is reasonable to begin the succession of British moralists with Hobbes, Cudworth, and Cumberland, these three are primarily concerned with the Classical and Scholastic tradition and with its development in natural-law theory. The beginning of the 18th century conveniently coincides with a more purely British intellectual context. Even if we recognize the importance of Grotius, Pufendorf, and the French Quietists, it is still broadly true that the earlier British moralists after Hobbes react to Hobbes, and that the later react to the earlier. Hutcheson’s early work supports Shaftesbury, and criticizes Clarke; it provokes a reply from Balguy and Burnet. His later work is influenced by Butler. Price discusses Clarke, Hutcheson, Butler, and Locke. Hume, Smith, and Reid discuss most of their British predecessors. It is worth our while, therefore, to examine some general approaches to this whole British tradition.

It would be unreasonable to insist on a sharp terminal date. One important division is marked by the return of Continental influence, on Bentham and Godwin through Helvetius, and on 19th-century writers through Kant. But despite these non-British influences, Whewell, Mill, and Sidgwick clearly continue the discussions begun by their British predecessors. Hence an understanding of the more exclusively British discussions of the 18th-century helps us to appreciate the 19th-century discussions as well.

520. Whewell: Dependent v. Independent Morality

Selby-Bigge’s division relies on moral epistemology and psychology, and hence on the foundations of the theories from which normative moral consequences are derived. A different division might appeal to the tendencies of different normative theories. Whewell sees such a division in 17th- and 18th-century British moral philosophy, between belief in ‘independent’ and in ‘dependent’ morality.[9] Morality is independent if it carries its own authority apart from its consequences; it is good in itself and gives us a sufficient reason for observing it, whether or not it also leads to our own pleasure, or the maximum universal pleasure, or to rewards in the afterlife. The authority of ‘dependent’ morality, however, depends on whether it leads to these consequences (*LHMPE* 52, 57). Hence Whewell sometimes speaks of ‘independent morality’ versus ‘the morality of consequences’ (84), and sometimes of ‘the morality of principles’ and ‘the morality of consequences’ (79).[10]

Whewell’s descriptions suggest two ways of distinguishing dependent from independent morality. (1) A metaphysical division. Some people affirm, while others deny, that moral

[9] Though one volume of Whewell’s lecture, *LHMPE*, speaks of England, he includes Scotland, Wales, and (through Hutcheson) Ireland as well.

[10] On independent morality see §604 on Ward.

properties can be reduced to such non-moral properties as our own pleasure, or universal pleasure, or the tendency to result in rewards after death. (2) A normative division. Some people reduce moral rightness to a tendency to promote some specific type of consequences (desired independently of morality?), whereas others deny this reduction.[11]

The parenthesis in the second division marks a question about Whewell's meaning. If it expresses his view, independent morality rejects the reduction of moral rightness to a specific non-moral property. In that case, the second division is a special case of the first division.[12] If, however, the bracketed phrase does not capture Whewell's intention, the second division is neither identical to the first nor a special case of it. We might hold that rightness consists in a tendency to promote morally desirable consequences, but deny that these consequences are themselves desirable independently of morality. If, for instance, we say that rightness consists in a tendency to promote goodness, but we hold that goodness is not reducible to a non-moral property, we believe in 'dependent morality' or 'the morality of consequences' according to Whewell's second division, but not according to his first division.[13]

521. Whewell and Utilitarianism

It is not mere pedantry to point out the difference between Whewell's two divisions. He runs them together because he attributes both conceptions of dependent morality to Paley and Bentham, and rejects them both on his own account. He derives the dependent view

[11] In discussing 'independent morality' Whewell speaks of 'conscience or moral faculty', which Hutcheson called the moral sense. Whewell assumes that Hutcheson and Butler refer to the same thing. (Preface to Mackintosh, *DPEP*, p. xxii.) This question concerns Whewell because he believes a non-utilitarian analysis of moral judgment is needed: 'Right, duty, what we ought to do, are not expressed to the satisfaction of any one by any phraseology borrowed from the consideration of consequences' (p. xxiv). This is why Bentham rejects 'ought' and 'ought not': 'These words—if for this one purpose the use of them may be allowed—*ought* to be banished from the vocabulary of ethics' (*Deont.* ii 1, p. 253). Whewell believes 'deontology' might appropriately be used to describe the outlook of independent morality: 'But the term Deontology expresses moral science (and expresses it well) precisely because it signifies the science of duty, and contains no reference to utility. It is a term well chosen to describe a system of ethics founded on any other than Mr Bentham's principle. Mackintosh, who held that *to deon*—what men ought to do—was the fundamental notion of morality, might very properly have termed the science deontology. The system of which Mr Bentham is the representative—that of those who make morality dependent on the production of happiness, has long been designated in Germany by the term Eudemonism, derived from the Greek word for happiness (eudaimonia). If we were to adopt this term we should have to oppose the deontological to the eudemonist school . . . ' (p. xxviii)

[12] It is only a special case, since there are other logically possible ways of reducing moral to non-moral properties that do not appeal specifically to causal consequences.

[13] Whewell discusses his division further in *LSM*: 'All systems which establish moral rules by their tendency to some external object;—happiness, utility, pleasure, interest, or whatever else; may be called dependent systems, in contradistinction to those which deduce moral rules from the constitution of man, not indeed overlooking the objects of human desires, but not governing themselves by these; such systems may be termed systems of independent morality . . . ' (137). Whewell takes Plato to represent independent morality, because he presents justice as desirable for its own sake as the health of the soul (*Rep.* iv) (138). He recognizes that Aristotle's position appears to be dependent morality, but he argues that the appearance is misleading: 'He analyses happiness, as the first step of his discussion of morality, but this step forthwith throws him back upon the constitution of man, the peculiar ground of the opposite school . . . And thus, in order to determine what modes of action tend to this ultimate and supreme good, he has to consider what the active powers of the soul are . . . ' (139). Hence Aristotle really upholds independent morality: 'For . . . the difference of the two schools of morality is not whether they do or do not speak of happiness; nor whether they do or do not allow happiness to be the supreme object of human action; but whether they do or do not establish their moral rules by their reference to some object considered as distinct from the human faculties themselves; be it called pleasure, or happiness, or utility, or by whatever other name' (141).

from Hobbes and voluntarism, and derives his own position from Cudworth and other rationalists. But a closer look at defenders of independent morality suggests that Whewell over-simplifies. Clarke and Balguy are rationalists who reject Hobbesian, voluntarist, and sentimentalist accounts of moral properties, but both of them show some sympathy to utilitarianism, though they do not accept it. They partly anticipate Sidgwick's combination of independent morality, as a metaphysical position, with utilitarianism as a normative position.

Still, Whewell might be right to combine the metaphysical and the normative conceptions of 'independent morality' as he does. For Adams, Price, and (less explicitly) Butler support his view that arguments for the metaphysical independence of moral properties also support a non-utilitarian normative position.

Is Whewell right? Is it a coincidence that these rationalists believe both his metaphysical and his normative position, and are they mistaken in supposing that the two positions are connected? Or do they show that their arguments for the metaphysical position undermine utilitarianism? Sidgwick implicitly—but perhaps intentionally—disputes Whewell's position, by trying to separate the metaphysical from the normative issue. But he may underestimate the strength and the character of the arguments that Whewell and the rationalists present against utilitarianism.[14]

Whewell's division, therefore, is partly metaphysical (in contrasting realism with anti-realism and voluntarism) and partly normative (in contrasting anti-utilitarianism with utilitarianism). Selby-Bigge's division is primarily epistemological, distinguishing different accounts of the character and basis of moral judgments. Whewell's division matches the epistemological division at some points. For some supporters of independent morality—Clarke and Price, for instance—are rationalists about moral knowledge and motivation. On the other side, some believe that Lockean empiricism commits them to hedonism as an account of motivation.

Whewell's treatment of the moral sense, however, cuts across Selby-Bigge's division between sentimentalists and intellectualists. In his view, some defenders of independent morality try to avoid the obscurities of the rationalist epistemology of Cudworth and Clarke, while still defending their essential metaphysical claims about the irreducibility of morality.[15] Butler is an 'unsystematic' defender of independent morality, whereas Shaftesbury and Hutcheson defend it more systematically, by appealing to a moral sense.

This description of a moral sense theory fits Shaftesbury, since he is a moral realist. Since Hutcheson claims to defend Shaftesbury, we might follow Whewell and suppose that he also defends Cudworth's and Clarke's metaphysical position on moral properties without their moral epistemology. If Whewell is right, Hutcheson rejects rationalism in order to defend realism and independent morality against Hobbesian voluntarism, not in order to defend Hobbes and Locke against the rationalists.

[14] Sidgwick, *ME*, Bk i, chs. 2–3, 8, express his agreement with rationalists on meta-ethical questions.

[15] 'In general the moral realists were aware that they gave their adversaries an advantage, when they ascribed the discernment of moral relations to the reason, narrowed as the domain of that faculty had in later times been. They now found it more convenient to assert that moral distinctions were perceived by a peculiar and separate faculty. To this faculty some did not venture to give a name, but described it only by its operations and results, while others applied to it a term, *The Moral Sense*, which introduced a new set of analogies and connexions.' (*LHMPE* 92)

In support of Whewell, we might cite Reid. Reid is a realist and defends independent morality, but he also sympathizes with those who treat moral knowledge as the product of a moral sense.[16] He argues that reference to a moral sense supports realism and independent morality, because it explains how we can form moral judgments and claim moral knowledge of the properties that Whewell has in mind.

Whewell's division helps us to correct a conclusion we might easily reach from Selby-Bigge's division. We may be tempted to believe that the crucial differences between moral theories lie in their epistemological foundations, and that these foundations determine the rest of a theory. Whewell suggests that metaphysical and normative differences are crucial, and that different epistemological positions may take different routes to the same metaphysical and normative position. His division is consistent with Selby-Bigge's; both divisions identify central issues in dispute, and each division identifies points of agreement and disagreement that the other division may obscure.

522. Whewell on Voluntarism

We may illustrate Whewell's point from an issue closely related to the ones he discusses. Moralists between Hobbes and Butler can be classified as naturalists or voluntarists on questions about morality and the will of God. Hobbes—as generally understood—is a voluntarist. Locke the sentimentalist follows him on this point, and naturalists oppose him. But the division between naturalists and voluntarists does not match the division between rationalists and sentimentalists. Shaftesbury and Hutcheson are naturalists about the relation of the divine will to morality, but they are sentimentalists—Hutcheson more clearly than Shaftesbury—about our knowledge of moral properties. These moralists support Whewell's view that the moral sense theory is a way of supporting independent morality. The belief in independent morality is opposed to voluntarism, and these moralists align themselves with naturalists in opposing voluntarism.

Whewell's judgment disagrees, however, with contemporary rationalist critics of Hutcheson. Burnet, Balguy, and Price argue that Hutcheson's belief in a moral sense requires him to reject realism and the metaphysical independence of morality. Whewell admits that Hutcheson's theory faces difficulties in defending independent morality. But he only discusses Balguy's objections to anti-rationalism, and overlooks Balguy's charge that Hutcheson's account of a moral sense leads to anti-realism.[17] Just as Balguy attacks Hutcheson for rejecting realism, he attacks him for his implicit voluntarism. Naturalists normally oppose voluntarism by arguing for natural rightness and wrongness, understood as objective properties of things, not constituted by anyone's acts of choice, preference, or legislation. This objectivist conception of moral properties seems to conflict with the sentimentalist view that moral properties are constituted by the moral sense of observers.

[16] Reid on the moral sense; §842.

[17] At *LHMPE* 94–7 Whewell discusses the criticisms brought by Balguy and the other 'remaining adherents of the old realist school' (94) against Hutcheson's sentimentalism, but he does not discuss Balguy's objections to Hutcheson's anti-realism (except that at 95 he mentions some 'more peculiarly realist arguments' offered by Balguy).

Hutcheson's critics argue that his sentimentalism exposes him to the objections that he raises against voluntarism.

If these objections to Hutcheson are sound, Whewell is wrong to suppose that a moral sense theory, as Hutcheson and his critics understand it, is compatible with the realism and anti-voluntarism that are the marks of a belief in independent morality. If Whewell is right to connect a moral sense theory with independent morality, either Hutcheson's critics are mistaken or else Hutcheson's version of a moral sense theory does not support independent morality.

Reid's version of a moral sense theory fits Whewell's account better; for Reid's conception of a moral sense is meant to show why we can reasonably claim knowledge of objective moral properties that are irreducible to acts of approval. From Whewell's point of view, we might take Reid to continue the non-rationalist defence of realism that Shaftesbury began.

But even if Whewell is right about Hutcheson's version of a moral sense theory, Hume's version raises a further question. For Hume intends his moral sense theory to express anti-realism and the rejection of independent morality.[18] Moreover, he believes that he continues and develops Hutcheson's approach to morality, and especially his account of the moral sense. If Whewell is to cope with all the facts, he should allow that a moral sense theory may speak on either side of his debate about dependent and independent morality. His approach to the debate makes Hume the exception to the predominant tendency of moral sense theories to support independent morality. If, however, we listen to Hutcheson's critics and to Hume, Hutcheson's doctrine speaks against independent morality. Shaftesbury and Reid, on this view, are sharply opposed to Hutcheson and Hume.

523. Objections to Whewell: Utilitarianism

A further difficulty for Whewell arises from his normative thesis about independent morality. Balguy both accepts metaphysically independent morality and is somewhat sympathetic to utilitarianism. Hutcheson is a utilitarian, and tries to show that a moral sense theory is committed to utilitarianism. He agrees with Whewell in connecting a meta-ethical with a normative thesis, but the connexion is the opposite of the one that Whewell asserts. Whewell believes that a moral sense theory is an expression of belief in metaphysically independent morality that includes non-consequentialist morality; Hutcheson, however, believes that a moral sense theory supports utilitarian morality.

This counter-example to Whewell's general thesis about independent morality and non-utilitarianism is less damaging, however, if Whewell is wrong to regard Hutcheson as a defender of metaphysically independent morality. If, as rationalist critics allege, Hutcheson's sentimentalism really conflicts with metaphysically independent morality, his acceptance of utilitarianism does not undermine Whewell's general position.

On this point also, Whewell may have in mind the position of Reid, who believes in a moral sense, metaphysically independent morality, and non-consequentialist morality.

[18] Whewell's discussion of Hume is very brief (*LHMPE* 181–2). He notices that Hume agrees with Hutcheson in arguing against Clarke's rationalism, and concludes that Hume and Hutcheson 'thus seemed to trample on the very ruins of the old fortress of immutable morality' (182). But he does not try to fit his discussion of Hume into his view that belief in a moral sense constitutes a defence of 'independent morality'.

Perhaps Whewell is misled by this combination of views in Reid, and wrongly attributes it to previous philosophers who reject voluntarism. In his view, the rejection of voluntarism requires belief in independent morality, which is both metaphysically irreducible and normatively non-consequentialist.

Perhaps Whewell is historically incorrect in his claims about how many people see the connexions he alleges between a moral sense, metaphysically independent morality, and non-utilitarian morality. But he is nonetheless philosophically correct, if these positions are connected in the way he suggests. If he is philosophically correct, the failure of some of his predecessors to hold all these components of his view may result from their failure to see how the components are rationally connected.

524. Appropriate Questions

Selby-Bigge's and Whewell's different schemes for classifying moralists after Hobbes point to different and appropriate lines of division among these moralists.

For a start, we have been able to distinguish different views about (1) epistemology, (2) metaphysics, and (3) normative ethics. Sentimentalists and rationalists disagree primarily on epistemological issues. Realists and anti-realists, and voluntarists and naturalists, disagree primarily on metaphysical issues. Consequentialists and non-consequentialists disagree primarily on normative issues. If we mark these different divisions, we need not be surprised if some people are sentimentalists, but also anti-voluntarists.

These divisions may be used either to represent the intentions of different moralists or to represent the positions they are committed to. Whewell tends to use his division between dependent and independent morality for both tasks. His claim that Hutcheson is a moral realist and a defender of independent morality is most plausible as a statement of what Hutcheson is trying to do. It is more difficult to defend as a statement of what Hutcheson actually achieves, for reasons that Balguy and Burnet point out. Whewell agrees with their criticism of Hutcheson, and in doing so casts doubt on his case for treating Hutcheson as a defender of independent morality.[19]

Similarly, Whewell's suggestion that realism and anti-voluntarism leads to non-utilitarian normative conclusions is questionable as an account of what the moralists themselves think; but it may be more defensible as an account of what their positions imply. Some of these divisions, then, need to be defended by exegetical argument, whereas some need to be defended by philosophical argument about the positions that have been distinguished on some reasonable exegetical basis.

525. The Significance of Voluntarism

Whewell distinguishes supporters of 'independent' morality from theological voluntarists, who make morality, and especially moral obligation, dependent on divine commands.

[19] See *LHMPE* 94–9. For Balguy's criticism of Hutcheson's anti-realism see §663.

It is useful to include voluntarism, therefore, in our preliminary survey of British moral philosophy after Hobbes. Though none of the major 18th-century British moralists defends this position, voluntarism is remarkably resilient, despite frequent and convincing attacks on it. Theological voluntarists include John Clarke (1726), Gay (1731), Rutherforth (1744), Brown (1751),[20] and Paley (1785). Their rationalist critics include John Jackson and Catherine Cockburn. Both rationalism, as defended by Cudworth, Clarke, Balguy, Price, and Reid, and sentimentalism, as defended by Hutcheson and Hume, oppose theological voluntarism.

Though British defenders of voluntarism are less careful and sophisticated than Pufendorf and Barbeyrac, they present a clear and forceful argument against naturalism, in both sentimentalist and rationalist versions. Paley's *Moral and Political Philosophy*, first published in 1785, summarizes the voluntarist argument. Since Paley influences both the development of utilitarianism and the criticisms of it, it is useful to see why the voluntarist position appears attractive to readers who compare it with the main rationalist and sentimentalist accounts of morality.

526. Tendencies to Voluntarism

In the view of many voluntarists, the voluntarist position is the orthodox Christian position. We might find this surprising among Anglican writers, given the naturalism of such orthodox and influential writers such as Hooker and Sanderson. But it is less surprising in the light of theological and philosophical influences that seem to raise difficulties for naturalism.

From the theological voluntarist point of view, the view that moral goodness is independent of the will of God seems to challenge the sovereignty of God; and the view that human beings can discover moral goodness either by reason or by a moral sense seems to deny the fallen condition of the human will and its need for grace. This voluntarist outlook is not surprising in moralists who are strongly influenced by Lutheran or Calvinist views. We have seen that it does not express the whole truth about either Luther's or Calvin's position, and in particular that it does not capture their views on natural law.[21] Still, their outlook includes voluntarist elements, and some of their successors emphasize these elements. Cudworth defends his naturalist account of rightness against both Descartes and Dutch Calvinists who maintain the position of Ockham.

The history of Anglican moral theology shows a tendency towards voluntarism.[22] Jeremy Taylor, in contrast to Hooker and Sanderson, tends to minimize the usefulness of appeals to natural law and natural reason. He holds a voluntarist view of the relation of natural law to divine commands, and commends the view that Suarez attributes to Ockham.[23] He implies that the appeal to nature and natural reason is inconclusive, and that we do better to appeal directly to the Scriptures for a guide to action.[24] While he does not deny the existence of a

[20] Mill expresses admiration for Brown's defence of utilitarianism, in 'Bentham' = *CW* x 87.

[21] See §§399, 412.

[22] See McAdoo, *SCMT*. Urban, 'Revolution', argues that Hooker began a basic shift from Aquinas' naturalism to Butler's belief in the subordination of nature to conscience. The story of this 'development' rests on some disputable interpretations of Aquinas and of Butler. For more evidence see Mautner in Hutcheson, *HN* 16–26.

[23] On Sanderson see §557.

[24] On Taylor and on Maxwell's criticism see §539.

natural moral law, his readers might reasonably conclude that it does not matter much to theoretical or practical ethics whether we believe in it or not.

Taylor's view is not accepted without question; Bramhall, for instance, accepts a more traditional view of natural law.[25] But it marks a tendency in English moral thought that tends to take the philosophical structure of Aquinas' ethics less seriously.

Moreover, questions about natural law and natural reason became entangled with a more specifically ecclesiastical controversy. Hooker defends episcopacy by appeal to reason; he does not represent it as prescribed by Scripture, but argues that it can be justified by appeal to natural reason in the relevant historical circumstances. This sort of warrant was not good enough for Hooker's opponents, who insisted that a form of church order and government is legitimate only if it can be proved from Scripture. This was the defence they offered of the presbyterian order. The defenders of episcopacy conceded this procedural question to the presbyterians. In contrast to Hooker, Bancroft argues that episcopacy is the divinely prescribed form of government.

In the early 17th century, voluntarism in morality may have gained some support from the political use of voluntarism about divine law. According to a voluntarist view, God maintains certain laws within his 'ordered' or 'directed' power (potentia ordinata), and therefore makes them stable on the assumption that he continues to directs his power in the same way. But it is always within his 'unqualified' or 'absolute' power (potentia absoluta) to change these laws. James VI and I relies on this distinction to explain the relation of the king to the laws of the state. The king is not bound to observe the laws; his observance of the law is the result of his directing his power in a particular way by deciding that these will be the laws and that he will observe them, but it is always within his unqualified power to change them.[26]

These issues about episcopacy and about monarchy (themselves closely connected) may have encouraged Anglican writers to abandon Hooker's position, or at least to refrain from strenuous defence of his naturalism. Once they conceded that a proof of something's being reasonable was not good enough, and that a proof of divine command was required, they might reasonably be expected to make the same sort of concession in ethics.

A tendency towards a voluntarist account of morality is consistent with recognition of natural law grasped by natural reason. The opponents of naturalism who identify morality with the revealed will of God go further than they need to go in order to maintain voluntarism. But the appeal to revelation is a further step that a voluntarist is likely to find plausible. For if some divine law is revealed through natural reason, we will find it rationally

[25] At *Works* iv 81 Bramhall affirms Aquinas' account of the natural law 'participated', which is 'the ordination of right reason, instituted for the common good, to show unto man what he ought to do and what he ought not to do'. At iv 329 his description is derived from Reginaldus, *PFP*: 'The law of nature is the prescription of right reason, whereby, through that light which nature hath placed in us, we know some things to be done because they are honest, and other things to be shunned because they are dishonest'. He quotes a definition by Reginaldus, *PFP* i 511: 'The natural law . . . is said specially of the dictate or judgment of our reason, the dictate by which through the light impressed on us by eternal law, we know certainly that some things are good, or agreeing with our nature, and judge that they ought to be done . . . '. Bramhall does not repeat the remark about agreement with nature, but he adds the naturalist point that the things prescribed by the natural law are prescribed because they are good, and not the other way round. At v 15–16 he insists on the immutability and indispensability of the natural law.

[26] See James, *PW*, pp. xxv, 180, 184, 186. The theoretical and political significance of these claims is connected with questions about divine right, discussed by Russell, 'Rights'.

acceptable independently of its being commanded by God, and then its moral status does not seem to depend on its being a divine command. A defender of voluntarism is wise to deny that morality is essentially accessible to natural reason.

527. Anti-Scholasticism

A different sort of argument for voluntarism rests on scepticism about the philosophical basis of naturalism. In Aquinas and his successors, a defence of a naturalist account of natural law or (in Suarez) of intrinsic morality rests on claims about nature. In claiming that right action is what fits rational nature, they claim that some actions are appropriate for human nature in itself, independently of divine legislation, and that therefore nature itself has properties independently of divine legislation. These are not simply the properties that natural scientists describe, but also include moral properties, and, more generally, teleological properties implying that natural organisms have natural goals.

Seventeenth-century critics attacked this Aristotelian belief in nature and natural teleology, for more than one reason. Some dismissed Aristotelian metaphysics as hopelessly anti-scientific, primitive, and obscure. Such criticisms are familiar in Descartes and Locke. Others attacked Aristotelian natural teleology on specifically moral and theological grounds. Boyle argues that Aristotelian teleology introduces additional agents besides God, and therefore compromises the freedom and transcendence of God. He attacks such a conception of nature as ‘idolatrous’.[27]

Whether such a charge is reasonable or (as Leibniz believes) unreasonable, it might be expected to inhibit a moralist from appealing too readily to assumptions that might appear Aristotelian and Scholastic. For a 13th-century moralist, the Aristotelian conception of nature provides an accepted background that makes claims about natural law more readily acceptable. For a late 17th-century moralist, any sign of Aristotelian influence might be a liability, not an asset.[28] Even the moralists (Cudworth, Clarke, Balguy, Adams, Butler, and Price) who reject voluntarism do not defend the Aristotelian or Thomist conception of natural law and first principles. The Aristotelian conception makes the grasp of natural law a part of the rational grasp of the ultimate end by rational agents. The later rationalists do not generally assert this connexion between ethical principles and natural teleology.[29]

This reluctance, on strategic grounds, to appeal to Aristotelian authority, is expressed in the defence of the ‘latitude-men’ by ‘S.P’.[30] The ‘latitudinarians’ try to explain Christianity in ways that are broadly comprehensive of Christian doctrine and natural reason. They are indebted to the Platonism of Cudworth and More. S.P. defends the ‘mechanical’ and ‘atomical’ philosophy against the Peripatetic.[31] New philosophy should lead to new divinity.

[27] Boyle, *FE* iv 48–51. In *CV* Boyle does not mention the charge of idolatry, but he alleges (e.g., 17) that the Scholastic outlook inhibits inquiry, and hence inhibits appreciation of the goodness of God in creation. McGuire’s discussion of Boyle in ‘Nature’ connects an anti-Aristotelian view with voluntarism.

[28] On anti-scholasticism cf. Hobbes, §§469, 482.

[29] Cudworth and Leibniz are exceptions. See §§541, 586.

[30] ‘S.P.’ is usually identified with Simon Patrick. Beiser, *SR* 283–4, discusses and quotes him on the disadvantages of appealing to Aristotle.

[31] ‘But there is another crime which cannot be denied, that they have introduced a new philosophy; Aristotle and the schoolmen are out of repute with them.’ (*BANSLM* 14)

Instead of trying to suppress new philosophy, as the Presbyterians did, the Church of England ought to embrace the new learning as the Roman Church has done in the works of Descartes and Gassendi (22).

S.P. qualifies the sense in which Aristotle and the schoolmen are 'out of favour'. The new philosophy does not reject Aristotle altogether.[32] But sensible defenders of Christian doctrine should avoid the appearance of being stuck in a Scholastic mould.[33] S.P. suggests that one would put off the 'ingenious gentry' by appealing to Aristotle or St Thomas. But he also implies that, if it were not for this strategic disadvantage, one might quite reasonably rely on these sources. He does not suggest that their content is theologically or philosophically unacceptable. Nonetheless, he agrees with Cudworth and More in reclaiming Platonism for Christianity, and thereby freeing the Church from an exclusive dependence on Aristotle.[34] A broader philosophical perspective will make the basic Christian claims seem more plausible, since they will not appear to depend on a questionable Aristotelian framework.

The Latitudinarian outlook described here is not intended to support voluntarism about morality. On the contrary; the rationalism of Cudworth and Clarke is an attempt to carry out the task that S.P. describes, showing that the essential Christian claims about morality fit the truths that can be independently discovered by natural reason about human beings and their actions. Still, some latitudinarian assumptions make it easier to be a voluntarist. For if one is reluctant to advertise any commitment to principles that might appear Aristotelian, one makes it more difficult than it would otherwise be to reject voluntarism. It is difficult to defend naturalism without making claims about the nature of things in their own right; and one might suspect that these claims really presuppose some aspects of Aristotelian teleology.

A proper resolution of this question would require some discussion of which aspects of Aristotelian teleology are needed for naturalism about morality, and of whether these aspects depend on other Aristotelian doctrines that are open to legitimate suspicion in the light of modern science or Christian theology. Leibniz sees that this discussion is needed, but he does not carry it out fully.[35] Clarke and Price try to reject voluntarism in favour of realism and rationalism, but without any commitment to Aristotelian claims about nature. Butler is doubtful about the prospects of this rationalist outlook, and returns to naturalism. We need to see what his claims about nature presuppose, and whether they presuppose questionable aspects of the Aristotelian position.

[32] 'Whatever is solid in the writings of Aristotle the new philosophers will readily embrace, and they that are most accused for affecting the new, doubt not but they can give as good an account of the old philosophy as their most violent accusers, and are probably as much conversant in Aristotle's writings, though they do not much value those small wares that are usually retailed by the generality of his interpreters.' (*BANSLM* 22)

[33] 'How shall the clergy be able to maintain their credit with the ingenious gentry, who begin generally to be acquainted with the atomical hypothesis, . . . or how shall they encounter the wits of the age, who assault religion with a new kind of weapon? Will they acquiesce in the authority of Aristotle or St Thomas? or be put off with *Contra negantem principia*? Let not the Church send out her soldiers armed with dock-leaves and bullrushes, to counter swords and guns . . . ' (24)

[34] 'True philosophy can never hurt sound divinity. Christian religion was never bred up in the Peripatetic school, but spent her best and healthfullest years in the more religious Academy . . . but the Schoolmen afterwards ravished her thence, and shut her up in the decayed ruins of Lyceum . . . Let her old loving nurse the Platonic philosophy be admitted again into her family; nor is there any cause to doubt but the mechanic also will be faithful to her, no less against the open violence of atheism than the secret treachery of enthusiasm and superstition, as the excellent works of a late learned author have abundantly demonstrated.' (24)

[35] On Leibniz see §586.

This sketch of different forms of opposition to voluntarism suggests why many people might find voluntarism appealing because of its apparent clarity. Appeals to 'the nature of things' might intelligibly appear to involve vague metaphysics, or exploded natural philosophy, or both.

528. Rationalism v. Orthodoxy

Even if the latitudinarian outlook unwittingly helps voluntarism, the main aim of Latitudinarians is to oppose voluntarism. Hence any doubt about the implications of Latitudinarian views tends to increase sympathy for voluntarism. The connexion between a Latitudinarian outlook and Cudworth's and Clarke's rationalism gives a reason for conservative Anglicans to resist their account of morality. An attempt to recommend Christian moral principles on rational grounds independent of revelation might appear to be part of a general programme of minimizing the dogmatic elements in Christianity. If one supposes that a major part of Christianity is its moral doctrine, and if one then discovers that its moral doctrine rests on rational, non-dogmatic foundations, one may infer that, as one writer puts it, Christianity is 'not mysterious' after all, because there is nothing more to it than we can discover by natural reason.[36]

For these reasons, the attitude to morality and religion that is defended by Cudworth and Clarke, and followed by Balguy, tends to co-exist, in these people, with an attitude to other aspects of Christianity that arouses orthodox objections.[37] Cudworth supports 'undogmatic' Christianity, and Clarke was accused of Arianism.[38] Balguy was a supporter of Hoadly, who wrote an admiring biography of Clarke. All of them were 'Latitudinarians' and defenders of minimalist Christianity (as their opponents conceived it).[39] None of these leading rationalists seemed a completely reliable Christian in the eyes of the defenders of Trinitarian theology. Butler is the exception to this generalization, since he shows no sign of unorthodoxy.[40]

The suggestion that naturalism about morality encourages scepticism about the dogmas of the Christian faith may seem strange if we think of Aquinas or of Suarez. But it is not entirely surprising. Some French Jansenist objections to the Jesuits express similar suspicions and objections.[41] From the point of view of Aquinas, or of the Council of Trent, it seems entirely unwarranted to claim that if Christianity includes basic moral principles that can be justified by natural human reason, it has no essential dogmatic elements that depend

[36] See Toland, *CNM*. Rationalist treatments of Christianity are intelligently discussed by Tulloch, *RTCP* ii, chs. 1–2. Stephen, *HET* i, ch. 3, offers a less subtle account. See also Beiser, *SR* 123–32.

[37] On Cudworth and Whichcote see Passmore, *RC* 81.

[38] On the connexion between Arianism and rationalism see Wiles, *AH*, ch. 4, esp. 110–25 (on Clarke, Butler, and Waterland), 149–51 (on Price). On Cudworth's unpopularity in some orthodox quarters Passmore, *RC* 101, quotes a comment by Warburton, *DL*, ed.1, Pref. to IV–VI: 'There wanted not country clergymen to lead the cry, and tell the world—That, under the pretence of defending Revelation, he wrote in the very manner that an artful infidel might be supposed to use in writing against it'.

[39] The growth of Latitudinarian views in Cambridge, and their rather heterogeneous sources (Puritan and rationalist), are described by Gascoigne, *CAE* 32 (on Pearson and Aquinas); 7, 86 (on John Moore, Clarke's patron); 117 (Clarke); 123 (Waterland); 127 (Rutherforth).

[40] In *Anal.* ii 1.18 Butler refers approvingly to Waterland on the use of the Trinitarian formula in Baptism.

[41] On Jansenism see §417; Knox, *E*, chs. 9–10; Abercrombie, *OJ*; Palmer, *CU*, ch. 2.

on revelation. But the unwarranted claim seems to influence people both for and against voluntarism.

These points help to explain an initially puzzling fact about support for and opposition to voluntarism. During the period of the Reformation, voluntarist tendencies are most marked in Lutheran and Calvinist sources. Voluntarism seems appropriate for a defence of the sovereignty of God, the weakness of human reason, and the dependence of human beings on divine grace. Cudworth still thinks of Calvinists as some of his main opponents. But in 18th-century England, the Dissenters, successors of the Puritans, often support rationalism against voluntarism in morality. The defenders of voluntarism are the orthodox Anglicans, who might have been expected to sympathize with Hooker and his more Thomist views. Butler and Price and (later on) Godwin were all educated in Dissenting academies.[42] Henry Grove and Philip Doddridge were prominent Dissenting ministers who also argued against voluntarism. On the other side, many writers who show most sympathy to voluntarism are Anglican clergy.

This difference between the 17th and the 18th century arises from theological disputes distinct from ethics. The Dissenters were not necessarily complete rationalists about Christianity; Grove and Doddridge clearly were not. But they were sympathetic to some rationalist elements insofar as they appealed to Scripture and reason against the traditional elements in Christianity that supported distinctively Anglican views. An appeal to Scripture and reason seemed to many Dissenters—notably Price—to undermine the dogmas set out in the historic creeds, and in particular the doctrine of the Trinity. Those who minimize the claims of natural reason are not the more extreme Protestants who believe that the Church of England retains too much of the Scholastic framework of mediaeval Christianity, but the defenders of tradition who resist the attempt to replace traditional dogmatic Christianity with a simplified and un-dogmatic appeal to natural reason and morality.

This reversal of attitudes to natural reason, and especially to natural reason applied to morality, helps to explain the curious alliance of orthodox Christianity with tendencies to voluntarism. Aquinas, Hooker, and Suarez would have been surprised, and with good reason. But those who supposed that the rejection of Aristotelian natural philosophy implied the rejection of the Scholastic position as a whole were unwilling to defend Aquinas' views in moral philosophy. They did not try to separate these views from any commitment to obsolete science or to dogmatic positions rejected by the Reformers.

529. Voluntarism and Egoism

The dispute between voluntarism and naturalism tends to be connected with a dispute between an egoistic account of motivation and a non-egoistic account that recognizes disinterested motivation. We might think it is merely accidental that voluntarists tend to be egoists and naturalists tend to reject egoism. The examples of Scotus and Ockham make it clear that voluntarism and egoism need not be combined. But in the 18th-century debates in Britain the connexion is not merely accidental.

[42] On Doddridge and Grove see §§877–8.

The controversy aroused in France by the Quietist movement affected British religious and ethical thought in a surprising way.[43] The Quietists advocated totally self-forgetful love of God; they went so far as to condemn any admixture of thoughts about one's own salvation in one's thoughts about God. Bossuet, with the support of the official Church, rejected this extreme attack on eudaemonism.[44] In Britain the Quietist attitude appeared to be an unwelcome manifestation of 'enthusiasm', displaying a tendency to fanaticism in religious thinking. This reaction was reasonable, but opponents of Quietist enthusiasm did not simply reject the total renunciation of self-interested motivation. They also concluded that the basic error of Quietism lay in its appeal to disinterested motivation altogether. Shaftesbury, Maxwell, and Butler all protest against the view that egoism is the only safe alternative to enthusiasm.

Sympathy towards egoism tends to encourage sympathy towards voluntarism, and tends to gain support from voluntarism. If we are naturalists about morality, we believe that we can grasp intrinsic morality—the reasons that are derived from the nature of human beings and their circumstances. But if we think there are no such reasons forming intrinsic morality, and we believe that moral rightness consists in being commanded by God, we need to explain why we have a reason to act on divine commands. If we say that they provide a reason because they meet some further standard for moral rightness, we seem to revert to naturalism; for conformity to this further standard seems to be what makes them right. We avoid this threat of a regress if we take Hobbes's way out and argue that God makes it in our interest to obey these commands.

An egoist explanation of moral reasons and motives makes voluntarism clear and comprehensible. Naturalism, by contrast, might appear both metaphysically and psychologically obscure and misleading. Naturalism in metaphysics appears to appeal to facts about the nature of things 'in themselves'; these facts seem to need some doubtful Aristotelian explanation. Naturalism about moral reasons and motives appeals to obscure reasons for choosing what is right 'in itself'. Naturalists who are eudaemonists seem to find it difficult to explain how concern for rightness in itself is related to one's own happiness. If they are not eudaemonists, they seem to find it difficult to explain how one can be concerned for what is right in itself. Puzzles of this sort in the naturalist position are solved by the combination of voluntarism with egoism. That is one reason why many English moralists find this combination plausible.

[43] See Knox, *E*, chs. 11–12; Ward, *NG*, ch. 3; Kirk, *VG* 451–63. On English discussions of enthusiasm see Beiser, *SR*, ch. 5. See also §588 (Leibniz); §611 (Shaftesbury); §717 (Butler).

[44] For the extreme rejection of eudaemonism see the Quietist views described in their official condemnation by the Pope in 1699 (Denz. 2351): 'A habitual state of love of God is given, which is pure charity and without any admixture of a motive of one's own interest. . . . No longer is God loved for the sake of (propter) merit, nor for the sake of perfection, nor for the sake of the happiness to be found in loving God.' 2355: 'We will nothing for ourselves, and everything for God. We will nothing in order to be perfect and blessed for the sake of our own interest . . . '. In 1687 similar views, attributed to Michael Molinos, were condemned (see 2207, 2209, 2212).

39

CUMBERLAND AND MAXWELL

530. Cumberland's Aims

Cumberland intends his exposition of the laws of nature to supplement the arguments of his predecessors (Grotius and his brother, Sharrock, and Selden) who have argued 'from the effect to the cause', appealing to the shared sentiments of different people at different times to establish the existence of natural law. Cumberland especially commends Grotius' work, 'which was the first of the kind, worthy both of the author and of immortality' (*LN*, Introd. §1 = P 247).[1] But in contrast to Grotius and the others, he argues from cause to effect, by examining 'the causes, which produce in the mind of man the knowledge of the laws of nature' (Introd. §2 = P 248). He begins from the nature of the universe and the first cause, in order to show that our knowledge of the universe makes it reasonable for us to accept certain principles as laws of nature. We will find that the laws of nature are those principles that promote the greatest common good of rational beings, and that they are supported by divine sanctions.

Cumberland intends his account of the laws of nature to refute Hobbes. His book contains lengthy, often acute, discussion of Hobbes's views, both in *De Cive* and in the English and Latin versions of *Leviathan*.[2] He especially attacks Hobbes's account of human nature, of the state of nature as a state of war, and of natural right. At these points Hobbes reveals his basic errors about the content and aim of the laws of nature, and about our reason for following them. Cumberland argues against Hobbes that the laws of nature are not basically counsels of self-preservation, to be justified by their role in preserving the peace of the commonwealth and keeping us out of the state of nature. According to Cumberland, the laws of nature aim at the common good of rational agents, and this aim by itself makes it reasonable for rational agents to observe them.

[1] I quote from either Raphael or Maxwell, and give references to the sections of the Latin text and to pages of Parkin's reprint of Maxwell (cited as P). Maxwell's version is vigorous, and his notes are often acute. But he is sometimes misleading about the Latin, both by addition and by subtraction. (This may be partly because he has tried to free Cumberland 'from as many of his scholastic terms as I could, without hurting the sense, explaining such of the rest as seemed most to require it' (Pref. = P 5–6).) The list of subscribers to Maxwell's translation includes: Revd Dr Geo. Berkeley, Dean of Derry; Revd Mr Butler; Revd Dr Samuel Clark, Rector of St James's; Revd Mr John Hutchinson. Tyrrell's *BDLN* is a paraphrase of *LN*.

[2] At 1.26 = P 336 (see Parkin's note) and 3.2 = P 467, he comments on a difference between the English and Latin *Leviathan*, taking the Latin to be later. Cf. §469.

To give an account of the laws of nature, Cumberland enters the controversy about natural law and intrinsic morality. He does not discuss Grotius or Suarez or their predecessors, and he does not seem to acknowledge most of them. He describes Grotius as the first of his predecessors, as though Grotius himself were not a participant in a debate carried on by Vasquez, Suarez, and their predecessors. His explicit remarks might suggest that he ignores the Scholastics and thinks nothing can be learned from them. However, though he does not acknowledge them, he discusses some of the issues that they discuss, and he probably has their views in mind.

Cumberland's relation to the Scholastic discussion is quite complex. On the one hand, he rejects intrinsic morality; like Culverwell, he argues that morality and obligation come together and both require law. On the other hand, he does not agree with Hobbes and Pufendorf in supposing that the non-moral natural goods are simply those that promote one's own advantage.[3]

Cumberland's translator and editor John Maxwell carries the discussion further (as Barbeyrac does in translating and editing Grotius and Pufendorf). He is closer than Cumberland is to a Scholastic naturalist position. He sometimes cites Scholastics, and even when he does not cite them he defends them against Cumberland.[4] It is often instructive to consider Maxwell's criticisms of Cumberland, since they present views that Cumberland does not explicitly discuss.

531. Natural Law as Divine Legislation

Cumberland agrees that natural law involves goods and evils that rationally concern human beings, apart from any divine law. But he also insists that it essentially involves divine law and divine commands. Though he praises Grotius' treatment of natural law (Introd. §1), he takes a voluntarist position, which Pufendorf cites in his support.[5]

He accepts Suarez's strict understanding of 'law' (without mentioning Suarez), and criticizes those who speak of the laws of nature loosely, without deriving them from the will of a legislator. He agrees with Selden's view that if laws of nature were simply rational precepts, they would lack the authority that belongs to law.[6] Laws are 'practical propositions, with rewards and punishments annexed, promulged by competent authority' (Introd. §6 = P 253). To show that there are laws of nature, therefore, is not simply to show that there are rational moral principles, but to show also that they are the work of a legislator who imposes sanctions.[7]

[3] Some of the intellectual background to Cumberland's ethics is explored by Parkin, *SRPRE*.

[4] For instance, it is not clear whether Cumberland knows Suarez, but Maxwell cites him in 'Obligation' §1 = P 796n4. Maxwell does not often cite Scholastic sources. Most of his remarks on natural law refer to Selden, but he quite often mentions Grotius.

[5] See §564.

[6] '[Selden] hath well enough corrected our common moralists, who are wont to consider these dictates of reason as laws, without any sufficient proof that they have all the conditions required to make them so, viz., that they are established and declared to us by God as a legislator, who hath annexed to them sufficient rewards and punishments.' (Tyrrell, *BDLN*, Pref. Cf. *LN*, Introd. §3 = P 250.)

[7] 'A law of nature is a proposition quite clearly presented to, or impressed upon, the mind by the nature of things from the will of the First Cause, pointing out an action, of service to the common good of rational beings, the performance of

Cumberland distinguishes two elements of a law of nature. The 'precept' gives the content of a natural law, indicating the particular way in which it aims at the common good of rational beings. The sanction consists of the reward God assigns to observance of the law, or the punishment God assigns to the violation.

The 'sanction' that Cumberland has in mind is not confined to rewards and punishments that God artificially attaches to good and bad conduct, by (for instance) rewarding good conduct with temporal prosperity in this life (as the Psalmists suppose) or with happiness in the afterlife. The relevant sanction also includes the natural and essential contribution of virtue to our own well-being.[8] The fact that, as the ancient moralists claim, virtue promotes happiness appears to Cumberland to support his claim that God attaches a sanction to good and bad conduct. He does not believe that we must regard natural law as divine law if we are to recognize that sanctions are attached to it. In recognizing it as divine law we recognize that the connexion between virtue and happiness is the result of God's intention to impose this law on us. If we left God aside, we could not justifiably treat the natural law as genuine law, but we would still have good reason to obey it because of its natural sanction.

To this extent Cumberland agrees with Hobbes, but he disagrees with Hobbes about what the natural sanction is. Since Hobbes believes we have a good reason to obey the natural law even if we leave God aside, and he believes that the only good reasons are those that appeal to self-interested motives, he argues that it is in my interest to observe the laws of nature. Hence he treats the laws of nature as indirect counsels of self-preservation, because they preserve the commonwealth.

Contrary to Hobbes, Cumberland takes the laws of nature to be prescriptions about the common good of rational beings. They achieve the good of an individual rational being insofar as her good is a part of the common good. Hence observance of the universal law of nature promotes the good of each individual who is part of the whole.[9] This does not imply that in any given society the good of the whole coincides with the good of each part; for in a defective community, no less than in a diseased or injured body, the good of the whole may involve some harm to a particular part.[10] Civil

which is followed, owing to the nature of rational beings, by adequate rewards, while its neglect is followed by adequate punishments. The former part of this definition covers the precept, the latter the sanction; and both are impressed on the mind by the nature of things.' (5.1 = P 495–6 = R 112) Maxwell translates (P 495–6): 'The law of nature is a proposition proposed to the observation of, or impressed upon, the mind, with sufficient clearness by the nature of things, from the will of the first cause, which points out that possible action of a rational agent, which will chiefly promote the common good, and by which only the entire happiness of particular persons can be obtained. ["and . . ." has no basis in the Latin.] The former part of this definition contains the precept, the latter, the sanction; and the mind receives the impression of both, from the nature of things.' The reference to a sanction is introduced in a second printing (see Kirk, *RCNL* 31); but this is not an isolated revision. Cumberland also takes sanctions to be necessary at Introd. §§4, 6, 13.

[8] On Cumberland's lack of emphasis on post-mortem punishments and rewards, see Albee, *HEU* 38–40. Tyrrell (*BDLN*, Ep. Ded.) notices this feature of Cumberland, and adds some material from Parker on these sanctions.

[9] 'The endeavour, to the utmost of our power, of promoting the common good of the whole system of rational agents, conduces, as far as in us lies, to the good of every part, in which our own happiness, as that of a part, is contained.' (Introd. §9 = P 256)

[10] '. . . many things may happen, by means whereof this general care of the whole may not always produce the proposed happiness of individuals, without allay; as breathing and eating, however necessary to the whole body, do not ward off all diseases and accidents' (Introd. §22 = P 272).

government, therefore, seeks to prevent the conflict between individual and common good that arises from the misconduct of other people. The laws of nature secure the common good of rational creatures, and thereby secure the good of each rational creature.[11]

532. Cumberland's Voluntarism: Natural Law and Morality

This description of natural law agrees with Suarez's claim that natural law is genuine law, and hence requires a legislator. Cumberland also follows Suarez in taking obligation to require legislation. He rejects Hobbes's view that 'obligation' is properly applied to the mental state of the person obliged. He applies it to the imposer of the obligation, and therefore takes the divine will and command to oblige.[12] If he is right to claim that the natural law essentially carries obligation, and that obligation involves command, he is right to infer that the natural law requires divine legislation.

Suarez's voluntarism is limited to natural law, and does not extend to morality; he recognizes intrinsic morality independent of legislation and therefore (in Suarez's view) independent of obligation. Culverwell and Locke disagree with him, since they argue that morality requires obligation, and hence divine commands. Culverwell follows Suarez in recognizing natural 'conveniences' and 'disconveniences', and even natural rightness (honestas) apart from divine commands, but he takes these to be insufficient for morality. Locke departs further from Suarez; he allows natural 'convenience', but resolves it into pleasure and advantage without any natural rightness.

Cumberland's view is similar to Locke's, but with some qualifications that bring it closer to a naturalist position. He finds talk of 'agreement' obscure until it is explained by reference to the preservation and perfection of the subject with which an action 'agrees'.[13] But once

[11] Cumberland anticipates and rejects the charge that his account of the laws of nature 'has the effect of ranking the common good, and so the honour of God and the happiness of all other men, below the private happiness of each, and of making the common good serve private good as the supreme end' (5.45 = P 605 = R 117).

[12] 'Therefore the whole force of obligation is this, that the legislator has annexed to the observance of his laws, goods; to the transgression, evils; and those natural goods and evils, by the prospect of which men are moved to perform actions, rather agreeing than disagreeing with the laws.' (5.11 = P 519–20) 'I, therefore, think, that moral obligation may be thus universally and properly defined: Obligation is that act of a legislator, by which he declares, that actions conformable to his law are necessary to those, for whom the law is made. An action is then understood to be necessary to a rational agent, when it is certainly one of the causes necessarily required to that happiness, which he naturally, and consequently necessarily, desires.' (5.27 = P 554) 'I, therefore, resolve moral obligation (which is the immediate effect of nature's laws) into the first and principal cause of these same laws, which is the will and counsel of God who promotes the common good, and, therefore, by annexing rewards and punishments, enacts into laws the practical propositions which tend thereto. Men's care of their own happiness, which causes them to consider, and be moved by, rewards and punishments, is no cause of obligation, since that proceeds, wholly, from the law and the lawgiver; it is only a necessary disposition in the subject, without which the rewards and penalties of the law would be of no force to induce men to the performance of their duty.' (5.22 = P 543–4) On Suarez and Cumberland see Schneewind, *IA* 110n (he does not mention the crucial difference between Cumberland and Suarez about natural law and morality).

[13] 'Good is that which preserves, or enlarges and perfects, the faculties of any one thing or of several. For in their effects is discovered that particular agreement of one thing with another which is requisite to demonstrate anything good to the nature of this thing, rather than of others. In the definition of good I choose to avoid the word [agreement] [convenientia] because of its very uncertain significance. Nevertheless, those things whose actions or motions conduce to the preservation or increase of the powers of other things, consistently with the nature of the individual, may justly be said to agree with them.' (3.1 = P 462)

this explanation is provided, he agrees with those who say that natural law prescribes actions that fit human nature.[14]

In recognizing this natural good antecedent to legislation, Cumberland agrees with Suarez. But he rejects Suarez's further claim that this natural good is sufficient for morality. In his view, the moral good requires legislation.[15] This division between the natural and the moral agrees with Culverwell's interpretation of Suarez. But Cumberland disagrees with Culverwell about which goods are natural. In Culverwell's view, natural goods include natural 'honesty' that can be admired and valued from a point of view outside narrow advantage, but is insufficient for moral goodness. Cumberland restricts the range of natural goods further; he agrees with Suarez in taking honestas to be sufficient for morality, but he denies any natural honestas independent of the will of a legislator. He concedes to Culverwell that the perfection of natural goods gives us an intrinsic reason (antecedent to any divine legislation) to pursue them, but he denies that this is honestas or morality.[16]

This division between the natural and the moral good affects Cumberland's explanation of his account of the natural law. When the natural law is defined as aiming at the common good, 'good' refers to purely natural good, not to the moral good. To understand it as referring to the moral good would be to introduce a vicious circle, since moral good has to be defined by reference to natural law.[17] Only non-moral goods constitute the common good of rational agents. Morally right actions, therefore, should be understood teleologically and instrumentally, as means to non-moral goods.[18]

[14] 'There is also another manner of expressing the laws of nature, as thus, this or that possible action is most agreeable [convenit] to human nature. But the sense is doubtful; for (1) Human nature either signifies the particular nature of the agent, and then it is not expressive enough of what ought to be considered before action; . . . Or (2) human nature respects all men . . . But if, in either of these notions the public good is by consequence implied, this form of speaking is consistent with the first, which is therefore to be preferred, because it is free from this ambiguity. Again, it is doubtful to what the expression [is agreeable] relates: For (1) An action may be said to be agreeable to any nature, when it is agreeable to the principles of acting . . . (2) An action may be said to be agreeable to human nature, when its effects preserve or improve the nature of one or more men. This latter sense coincides with the form I first proposed, which is free from ambiguity. And the first sense of the agreeableness of actions may, for the most part, be reduced thereto.' (4.2 = P 484)

[15] 'Good of this kind, of which we form an idea without the consideration of any laws whatsoever, I call natural good . . . It is distinguished, by its greater extensiveness, from that good which is called moral, which is ascribed only to such actions and habits of rational agents as are agreeable to laws, whether natural or civil, and is ultimately resolved into the natural common good, to the perfection and increase of which alone all the laws of nature and all just civil laws do direct us.' (3.1 = P 463)

[16] See 5.42 = P 598, quoted in §535. Clarke quotes this in *DNR* = ii 628n H; see §617.

[17] 'The good placed in the definition, I understand that which by the philosophers is usually called natural good, and which I have already defined, with respect to created beings, as that which preserves, or renders them more perfect or happy. . . . The reader is to observe, that I have called these things naturally good, in that sense, in which these words, as being of a more extensive signification, (and, consequently, more general and first known in the order of nature) are distinguished from things morally good; for these are only voluntary actions conformable to some law, especially, that of nature. Therefore good is not to be taken in this sense, which it is inserted in the definition of the law of nature, because it is absurd, to define any thing, by what supposes the thing defined, already known. There are many things naturally good, that is, such as contribute somewhat to the happiness of man, which are not morally good, as being either not voluntary actions, or not commanded by any law. . . . When, afterwards we act in pursuance of these conclusions, and upon comparison, find our actions conformable to them; beside the previously known appellation of natural goodness, there accrues to these actions this, that they are morally good, from their conformity with the laws of nature already enacted.' (5.9 = P 516–17)

[18] 'Such actions as take the shortest way to this effect [sc. the common good] as to their end, are naturally right [rectae], because of their natural resemblance to a right line which is the shortest that can be drawn between any two given points. Nevertheless, the same actions afterward, when they are compared with the law, whether natural or positive, which is the rule of morality, and they are found conformable to it; are called morally good, as also right, that is, agreeing with the rule; but the rule itself is called right as pointing out the shortest way to the end . . . actions conducive

Cumberland does not consider Suarez's view that natural goods are sufficient for intrinsic morality that is antecedent to law. According to Suarez, natural law is just because it corresponds to intrinsic morality, but Cumberland implicitly rejects that view. Perhaps he agrees with Culverwell's view that the distinctive features of moral obligation require law, or perhaps he agrees with Suarez's view that obligation in general requires law. But he does not confront Suarez's reasons for distinguishing the duties (debita) of intrinsic morality from obligations, which depend on law.

Does this matter? Is the disagreement between Cumberland and Suarez about intrinsic morality purely verbal, or can we find some reason for agreeing with one or the other view? To answer this question we need to explore Cumberland's view on the non-moral good.

533. Individual Happiness and the Common Good

Cumberland's case for a legislative view of morality becomes clearer from his discussion of the ancient moralists and their non-legislative conception of the virtues.

He recognizes that the ancient moralists are eudaemonists, who take the ultimate end to be the agent's happiness. But he does not confuse their eudaemonism with hedonism, and he rejects hedonism. He takes activity and pleasure to be inseparably connected, and both to be necessary for happiness. Happiness is 'a certain aggregate, whose parts we are continually enjoying' (5.13 = P 523).[19]

He agrees with the ancient moralists who take virtue to be necessary for happiness.[20] Among these he agrees with those who take virtue to be a component of happiness, not merely a means to it. But he rejects the Stoic view that virtue is the only good; he endorses Cicero's argument[21] that the Stoic view takes away the point of virtuous action by denying that the effects it aims at are good.[22]

Though Cumberland agrees with these aspects of Greek eudaemonism, he is not a eudaemonist, since he does not agree that one's own happiness is or ought to be one's supreme end.[23] His reason for rejecting eudaemonism is not that he believes in a conflict

to this end, as being the best and most beautiful, are in themselves amiable, and highly to be commended by all rational beings, and therefore, upon account of that high honour to which their beneficent nature entitles them deservedly called honest or honourable in themselves [merito dici per se honestas; M omits "in themselves"].' (Introd. §16 = P 264)

[19] On happiness see Albee, *HEU* 31–2 (who emphasizes the hedonist side of Cumberland's position); Sharp, 'Cumberland' 377–9 (who argues that Cumberland is a hedonist, and claims rather questionably that Shaftesbury is one too).

[20] 'I might here easily show the wonderful agreement between the Peripatetics, the old and new Academy, and even the Epicureans themselves, though some taught virtue to be the only good; others only the chief good; some that it was itself the very end; others that it was the most proper and absolutely necessary means to the obtaining it.' (5.41 = P 593)

[21] See Cic. *F.* iv 31–3; §187.

[22] 'Upon this head the Stoics are to be reprehended who affirmed nothing to be good but virtue; nothing evil but vice. For whilst they endeavour to establish the transcendent goodness of virtue and the egregious evil of vice, they incautiously entirely take away the only reason why virtue is good and vice evil. For virtue is therefore good (and in truth it is the greatest good) because it determines human actions to such effects as are principal parts of the public natural good...' (5.5 = P 508)

[23] 'Although I have supposed that everyone necessarily seeks his own greatest happiness, yet I am far from thinking that to be the entire and adequate end of anyone.' (5.28 = P 556) 'Therefore, when moral writers speak of every man's happiness as his ultimate end, I would willingly interpret them in this sense, that it is the chief end among those which respect the agent himself only; and I doubt not, but that every good man has an end, that is, intends an effect, that is greater, namely

between one's own good and the common good; on the contrary, he believes that one promotes one's own good by advancing the common good of which it is a part.[24] But he does not believe that the justifying reason for pursuit of the common good depends entirely on its connexion with one's own good. In his view, it is independently reasonable to pursue the common good, and it would be unreasonable to follow some rule that does not aim at everyone's happiness. Even apart from any reference to the will of God, it is unreasonable to claim to be rationally justified in dominating others while admitting that they have an equally good reason for dominating oneself.[25]

Natural law, therefore, not only prescribes actions that promote one's own happiness, as we can see from the arguments of the Greek moralists; it also prescribes actions that are independently reasonable, because they present a common end that rational agents must observe. Since they can all reasonably agree on this end, it is the end that rational beings, as such, must pursue.[26] The 'sanction' of the natural law does not consist simply in its promotion of my private interest. A further 'reward' is the fact that the moral law promotes the common good.

Cumberland's claim about reason is similar to Spinoza's claim that reason expresses a common point of view on which rational beings agree if they use their reason correctly. This claim is plausible. But Cumberland, like Spinoza, is not clear about the difference between different kinds of agreement. We might agree that the same thing is good for me and for you, but it does not follow that we will agree in preferring that both of us pursue it; for if you cannot have as much as you want without leaving me less than I want, I might prefer you not to pursue it, even if I recognize that you have as good reason to pursue it as I have.

Does this objection affect Cumberland's conception of the common end? He might claim that if the common end is the common good, including each person's individual good, we can and should all agree to pursue it, because it is non-competitive. But we might still doubt whether this is so. Perhaps we can agree on pursuit of a common good, because we all hope to get our own good out of it; but it does not immediately follow that I have as good a reason to pursue the common good for its own sake as I have to pursue my own good.

Cumberland's appeal to a common good that is an independently and non-derivatively reasonable object of pursuit for rational agents is a suggestive innovation in a Scholastic

the honour of God and the increase of other men's happiness. I conceive the one chief end or best effect to be composed of our own happiness and that of all other rational beings (which we endeavour as opportunity offers).' (5.47 = P 612)

[24] 'The greatest benevolence of each rational agent towards all forms [constituit] the happiest state of each and of all benevolent persons, so far as it can be produced by them themselves.' (1.4 = P 292 = R 107) 'I use the word "forms" to indicate that the aforesaid benevolence is both the intrinsic cause of present happiness and the efficient cause of future happiness, and is necessarily required in respect of both.' (1.4 = P 293 = R 107) '. . . it is . . . perfectly plain that the happiness of each person, e.g. of Socrates, Plato, and all the other individuals . . . cannot be severally separated from the happiness of all . . . because the whole is no different from the parts taken together.' (1.6 = P 295 = R 108)

[25] 'For example, suppose right reason tells Titius that the happiness possible for him, and the end he should pursue, consist in the enjoyment of complete dominion over the land occupied by Seius and Sempronius, and over their persons, and over the land of all others; then true reason cannot dictate to Seius and Sempronius that their happiness, which they are to seek, lies in the enjoyment of complete dominion over the land and person of Titius and likewise of all others. For the precepts involve an obvious contradiction, so that only one of the two can be supposed true.' (5.16 = P 529 = R 115)

[26] 'For there is only one end in the pursuit of which all can agree; and it is most certain that no decision can be in accordance with right reason unless all can agree on it. Therefore there arises from our common rational nature a necessity that each, by exercising universal benevolence, should always seek the common good, and should seek his own as only a part of that and consequently subordinated to it; and this is the sum of natural law.' (5.46 = P 610 = R 118)

account of practical reason. We might argue that Scholastic views on correct reason are not all essentially eudaemonistic, and that they allow actions to be reasonable in themselves apart from one's own interest. But Scotus is the only one who explicitly distinguishes eudaemonist reasons from impartial practical reason, which he connects with the affection for the just.[27] In Butler, Scotus' division is clearly marked with the division between self-love and conscience. In Cumberland the division is not as explicit as it is in Butler, but he makes it clear that he believes in two irreducibly different aims of practical reason.[28]

534. Non-instrumental Goods v. Moral Goods

Cumberland's view of practical reason assumes that some natural goods are both non-instrumental and non-hedonic. These include the virtues of character recognized by the Greek moralists.[29] He therefore rejects the view of Hobbes and Locke, that the only natural goods are the pleasant (iucundum) and the advantageous (utile). But he disagrees with Suarez's view that the morally right (honestum) is one of the natural goods. In Cumberland's view, the natural goods that are good in their own nature also promote the common good, and may be pursued for the sake of the common good, apart from any law. But these goods cannot be the source of an obligation or a duty (debitum), and so cannot be honesta, without reference to a law. Hence he rejects Suarez's belief in natural duties prior to obligation and law.

For this reason, he believes that the views of the ancient philosophers about virtue fall short of grasping its genuinely moral character.[30] The fact that virtue is choiceworthy in

[27] On Scotus see §363.

[28] On Butler see §708. Sidgwick's judgment on Cumberland is rather severe, and underestimates his consistency: 'His account of the sanction, again, is sufficiently comprehensive, including both the internal and the external rewards of virtue and punishments of vice; and he, like later utilitarians, explains moral obligation to lie primarily in the force exercised on the will by these sanctions. He considers, however, that while this egoistic motive is indispensable, and is the normal spring of action in the earlier stages of man's moral obedience, yet rational beings tend to rise from this to the nobler motives of love to God, regard for His honour, and disinterested affection for the common good. At the same time it is difficult to put together in a clear and consistent view his different statements as to the connexion between the good of the individual and universal good, and as to the manner in which the rational apprehension of either or both goods operates in determining volition.' (*OHE* 174)

[29] 'They are indeed in their own nature good, though there were no law, because they conduce to the good state of the universe: But moral obligation, and the nature of a debt [debiti] thence arising, is unintelligible, without a respect to a law, at least, of nature. Nay further; the very honour, from which actions are, by their own nature, distinguished by the title of honestas, laudable practice, or are called honourable, [a quo actus sua natura boni honestatis titulo insigniantur, seu honesti dicuntur; Maxwell omits ''by their own nature''] seems wholly to come from this, that they are praised by the law of the supreme ruler, discovered by the light of nature, and honoured with the greatest rewards, among which is to be reckoned the concurring praise of good men. And justly are they called naturally lawful and honourable [liciti et honesti], because the law, which makes them such, does not depend upon the pleasure of the civil power, but arises necessarily, in the manner already explained, from the very nature of things, and is altogether unchangeable, whilst nature remains unchanged.' (8.1 = P 684–5)

[30] 'Much has been advanced by philosophers, especially the Stoics and Academics, which with strength and perspicuity demonstrates that the virtues necessarily bring happiness along with them, as essentially connected therewith: Which I did not think fit to transcribe, as being what the learned are already acquainted with. It is sufficient, that I readily acknowledge them to be the principal parts of human happiness, so that neither without them can any man (though abounding with all other advantages) be happy: Nor, if he possess them, can he be miserable, however unfortunate. They are therefore worthy of pursuit because of the perfection intrinsic to them, even if there were no law of nature that commanded them. (Dignae itaque sunt, quae propter intrinsceam sibi perfectionem appetantur, etiamsi nulla esset

itself as the most important part of happiness does not imply that it has moral goodness, which depends on divine law. The ancients should have seen that since the virtues are choiceworthy for themselves, they must have had this reward annexed to them by the first cause, who must therefore have commanded observance of them. They have moral goodness only because of this relation to a divine command.

535. Utilitarianism?

Cumberland's references to the common good, greatest happiness, and benevolence have given him a place in the history of utilitarianism, or at least among the forerunners of utilitarianism.[31] It is reasonable to connect his views with utilitarianism on some points. He takes principles of practical reason to be impartial, because reason is essentially impartial between rational beings. He offers a teleological theory of virtues, principles, duties, and rights with reference to the end of achieving the common good. On the basis of this theory, he rejects Hobbes's claims about the right of nature. He argues that the exercise of a Hobbesian right to do what I please in the state of nature would violate the demands of practical reason, and therefore go beyond my rights.[32]

We may also take Cumberland to be a utilitarian because of his emphasis on benevolence, which he attributes both to God and to virtuous human beings. He claims, as utilitarians do, that the benevolent agent is concerned with the greatest good of the beneficiaries.[33] Here we may see evidence of the maximizing outlook that defines the utilitarian view. It is not surprising that Hutcheson cites Cumberland in support of a maximizing view.

But it is difficult to show that Cumberland takes a utilitarian view of maximization and distribution. Hutcheson is a genuine utilitarian on these points because he argues that it is permissible to harm some people in order to increase the happiness of others, and thereby

naturae lex quae illas imperaret.) . . . What I would infer from these reasonings or concessions of philosophers is that we have a proof from nature that virtuous actions have a reward annexed to them by the will of the first cause; and therefore that it is the will of the same cause that men whom he has instructed how to foresee the rewards consequent upon such actions should act so as to obtain that foreshown happiness. In this discovery of the divine will consists the promulgation of the law of nature, and thence directly flows natural and moral obligation. And this is what even those philosophers who taught virtue to be the chief happiness seem not sufficiently to have regarded.' (5.42 = P 598–9)

[31] '. . . the fountain of all nature's law . . . is this: The greatest benevolence of every rational agent towards all forms the happiest state of every and of all the benevolent, as far as is in their power; and is necessarily requisite to the happiest state which they can attain, and therefore the common good is the supreme law' (1.4 = P 292). '. . . it is also most evident that the happiness of single persons, for example of Socrates and Plato and other individuals . . . cannot singly be separated from the happiness of all . . . because the whole does not differ from all the parts taken together' (1.6 = P 295).

[32] See, e.g., 1.30 = P 347: '. . . there can be no right of acting contrary to the law of nature, or the dictates of right reason, because right is defined to be a liberty of acting according thereto. But right reason . . . points out the necessity of coming to a division of things; and, according to Hobbes's own confession, forbids the retaining a right to all things.' Cf. Tyrrell, *BDLN* 40: '. . . there is no right conferred upon any man, of doing whatever his own wild fancy, or unbounded appetite may prompt him to, but only what he shall, according to right reason, truly judge necessary to his own or family's happiness and preservation, in order to the common good of mankind. . . . so that it can never be proved, that any one hath a right of preserving himself, unless it be first made out, how this right of self-preservation conduces to, or at least consists with this common good.'

[33] Maxwell's comment on 1.8 = P 297–8 pertinently questions Cumberland's claim that the virtue aiming at the common good is properly called benevolence.

to increase the total happiness. But it is not clear that Cumberland commits himself to these utilitarian claims.[34]

He takes the end to be not the greatest quantity of good, but the common good of all rational beings. We might take the common good to be the quantity of good that is composed of the quantities present in the lives of different agents; in that case, what promotes the common good may not promote the good of all, or even of most, individual agents. But this is not the only way to understand a common good. We might also understand it to refer to a good that is good for everyone in common, and not good for one person to the exclusion of others. This is how Aquinas understands the common good.[35]

We have good reason to understand Cumberland's claims about the common good in this second way. He claims that it is the whole of which individual goods are parts; that is why individual goods do not conflict in principle with the common good (though they may conflict because of some defect in a particular society). The common good is the end on which rational beings can agree and ought to agree. Since it is assumed that individual rational beings care about their individual goods, they have a reason to agree on the pursuit of a common good that embraces all the individual goods that they take to be reasonable objects of pursuit for different individuals. They have no similar reason, as far as we can gather from Cumberland, to sacrifice some people's individual goods simply to increase a total good that is indifferent to distribution.

Neither Hutcheson nor Sidgwick, each of whom takes Cumberland to be a precursor of quantitative utilitarianism, mentions this difference between Cumberland's common good and a utilitarian total good. Cumberland's conception stays quite close to the Scholastic conception of a common good. It even captures one of the most plausible elements in Hobbes's account of morality. When Hobbes suggests that morality preserves the commonwealth, he thereby suggests that it promotes a common good; for the preservation of the commonwealth is a common good for everyone. It is not good for one person in opposition to another; individuals do not need to compete for it, and if one of us has it, there is no less to go round for all the others. Cumberland takes this idea of a good for everyone, and extends it beyond a single society to all rational beings.

[34] Albee claims that Cumberland is 'the first English moralist who can properly be termed a utilitarian' (*HEU* 14), and attributes to him 'the first statement by an English writer of the utilitarian principle' (52). He does not say exactly where Cumberland commits himself to utilitarianism, and does not discuss the differences between Cumberland's conception of the common good and the maximizing outlook of utilitarianism. Sidgwick is cautious about treating Cumberland as a utilitarian: 'At any rate he is noteworthy as having been the first to lay down that "the common good of all" is the supreme end and standard, in subordination to which all other rules and virtues are to be determined. So far he may be fairly called the precursor of the later utilitarianism. His fundamental principle and supreme "Law of Nature", in which all other laws of nature are implicitly included, is thus stated: "The greatest possible benevolence of every rational agent towards all the rest constitutes the happiest state of each and all, so far as depends on their own power, and is necessarily required for their happiness; accordingly common good will be the supreme law." It is, however, important to notice that in his "good" is included not merely happiness, in the ordinary sense, but "perfection"; and he does not even define perfection so as strictly to exclude from it the notion of moral perfection or virtue, and thus save his explanation of morality from an obvious logical circle. A notion so incompletely determined could hardly be used for deducing particular moral rules with any precision; but in fact Cumberland does not attempt this; his supreme principle is not designed to rectify, but merely to support and systematize, common morality.' (*OHE* 174) Part of Sidgwick's objection about perfection is curious (and justly criticized by Albee, *HEU* 33), since Cumberland carefully excludes moral good from the good that is mentioned in the definition of natural law and the moral rules belonging to it. In the last sentence quoted Sidgwick correctly notes Cumberland's failure to draw utilitarian conclusions about distribution from his supreme principle.

[35] On Aquinas see §338. Cf. Suarez, §451.

If this is the right way to understand Cumberland, his view is not only non-utilitarian, but even anti-utilitarian. For if a course of action would maximize the total good, but would harm some people simply to achieve this end, it would not achieve a common good, and Cumberland has no reason to endorse it. Hence questions that might be raised about the quantitative and distributive aspects of a utilitarian view do not arise for his view.

536. Maxwell's Criticism of Cumberland's Account of Morality

Still, Cumberland's view of morality and the common good is open to doubt. Maxwell's comments raise some of the most pertinent questions.[36] Maxwell rejects non-normative accounts of goodness that do not make it clear that goodness deserves to be chosen and is a worthy object of pleasure.[37] For similar reasons he finds an account of goodness as 'convenience' unsatisfactory. He takes 'convenience' to refer only to the non-moral good, as Cumberland understands it, and he finds this inadequate to capture moral goodness.[38] If we combine an account of goodness as convenience with a eudaemonist conception of morality, we do not capture the essential features of moral obligation.[39]

It would be unfair to Cumberland to suggest that a non-normative account of goodness as convenience is his account of moral goodness. But Maxwell does not believe that the extra element that Cumberland adds is enough for moral goodness. According to Cumberland, the promotion of non-moral goodness is the whole of morality, if it is prescribed by divine law. But this account still, in Maxwell's view, reduces morality to an instrumental status.[40] Cumberland claims that moral principles are commanded by God simply as means to the public good; but this account of moral obligation makes it a purely prudential, not a moral, bond.[41]

Cumberland's view, according to Maxwell, overlooks the regulative role of morality in relation to the public good. It is morally permissible to pursue the public good only insofar as it does not violate morality.[42] If promotion of the public good requires injustice, for

[36] References are given to the sections and pages of Maxwell's 'obligation', printed at the back of the translation of Cumberland and printed in P as Appendix 2 (cited as 'App.').

[37] '[Good] ought not to be thus defined: "good is that which is pleasant to a perceptive life, jointly with the preservation of the perceiver". For the nature and notion of good does not consist in being pleasant, but in being worthy to be pleased with.' (App. §3 = P 799–800) The quotation is from More, *EE*, Bk. 1, ch. 4

[38] He argues that if something's nature is itself good, goodness cannot be confined to what is convenient for a thing's nature (App. §3(1) = P 800–1).

[39] 'But in the kingdom of God, a kingdom of virtue and of holiness, they . . . are linked together by an adamantine law of right and one agency, and by this legal necessity they are obliged not to be wicked, but to be holy and virtuous. They practise righteousness and true holiness for other ultimate reasons than personal self-respects, and they shun sin for other ultimate reasons than merely because it is a public nuisance and inconvenience.' (App. §3(3) = P 803)

[40] 'Wickedness is to be shunned not only as a public inconvenience, but for its own intrinsic turpitude, as all the virtuous philosophers, in consort with Christians agree.' (App. §3(4) = P 803)

[41] 'This scheme, of the law of nature, and its definition of good, introduceth an institution of morality, not truly moral, but merely politic and prudential. . . . A mere prudential institution of morality careth neither for virtue nor vice, or living well nor living ill, as such and for their own sake, nor any further than as they promote or hinder the public convenience. . . . So this institution affirmeth, that the laws of nature, and all the virtues, are nothing else but means of obtaining the common good. It supposeth, that virtue is not good, but only as a means to the common happiness; and that vice and wickedness is not evil, but as productive of public misery, as will further appear presently.' (App. §3(5) = P 804–5)

[42] 'But the common happiness of rational beings must be sought also from a principle of duty and virtue, and consequently it must be sought only in consistency with virtue, nor otherwise than as virtue requireth. A man may not

instance, it is open to moral objection; hence moral requirements are not exhausted by the requirement to pursue the public good.

This objection touches only some views that connect morality with the common good. It applies to Cumberland's view because he restricts the good promoted by morality to natural good, which does not include moral good. But if an account of natural law holds that the common good promoted by morality includes the moral good, Maxwell's objection does not touch it. This is Suarez's account, since he takes moral goodness to exist independently of any legislation. One might argue that Suarez's non-instrumental account of moral goodness is less clear and intelligible than Cumberland's purely instrumental account; but this does not make Cumberland's instrumental account preferable.

Maxwell acknowledges this point. In opposition to the instrumental view of morality that he attributes to Cumberland, he separates the honestum from other forms of goodness. Here he returns to consider convenience, and draws a distinction that he did not draw earlier. He attributes a non-instrumental notion of convenience, understood as appropriateness for a rational agent, from the Stoics.[43] In applying the Stoic doctrine to his own views about goodness, Maxwell implicitly acknowledges that an action may be 'convenient' to rational agents because it is suitable to their nature, without being purely instrumental 'because of the necessity of their affairs'.[44]

537. Morality and its Sanction

Maxwell believes that Cumberland demotes morality to instrumental prudence by subordinating it to the pursuit of the non-moral good; Cumberland does not see that morality deserves to be chosen for its own sake, and carries an obligation within itself. Hence, according to Maxwell, Cumberland overlooks the obligation that belongs to morality in its own right, apart from any sanction that God attaches to it.[45] According to Cumberland, the fact that virtue is a part of happiness is a sanction attached to virtue by a legislator. Maxwell takes this view to assume the character of virtue itself is distinct from the aspect of virtue that promotes happiness; otherwise that aspect of it could not be the result of 'attachment'. He objects that virtue must be right and obligatory independently of the sanction if the sanction is rightly 'attached' to it.

violate virtue nor touch with wickedness, no, not for the happiness of the universe.' (App. §3(6) = P 806) 'To endeavour the common good of rational beings is so far from comprehending all virtue that, unless our endeavours to promote this common good be duly qualified, it is not virtue, but vice and crime.' (App. §3(8) = P 809)

[43] 'The good life and practice must not be thought merely a public self-convenience which is necessary for men only because of the necessity of their affairs, but it is the doing what is simply and absolutely convenient. "Wisdom is a doing what is convenient—. As a stage player must not have any, but a certain action; and a dancer must not have any, but a certain motion: so a man must live not any, but a certain kind of life, which we call convenient and consentaneous."' (App. §6 = P 841) Maxwell quotes from Cic. *F.* iii 24.

[44] Perhaps Maxwell is influenced by Clarke's doctrine of fitness. See §618.

[45] 'But a man is bound, both when he cannot do a thing without sin and when he cannot do a thing without punishment, and both these obligations are in every law, and both concur to make the obligation of it. But because the obligation of *non licet* is antecedent to the obligation of *non impune*, the precept to the sanction, and the sin is made by the law, the law hath so much obligation as to make the sin, before the penalty is enacted; therefore the law has an obligation antecedently to the sanction of it. For everyone is bound to avoid what is sin.' (App. §3(13) = P 815–16)

This argument does not exactly capture Cumberland's view. According to Cumberland, the goodness of virtue is a sanction, even if it is essential to virtue; even if virtue promotes happiness simply by being good in itself, its promotion of happiness is a sanction. Hence the moral goodness of virtue need not be separate from the attached sanction.

But this reply to Maxwell reveals the basic difficulty in Cumberland's claims about sanctions. If the goodness of virtue is essential to it, because of its relation to the nature of rational agents, how can it have been 'attached' to virtue as a sanction? We cannot attach a key to a chain unless the key and the chain already exist; we do not attach trilaterality to a triangle. To recognize the inherent goodness of virtue is to recognize that this is essential to the nature of the agents whom God has created. One cannot legitimately treat such features as having been attached to the creation.

Might we reply on behalf of Cumberland that his remarks about 'attachment' are misleading, but the substance of his position is reasonable? Perhaps his claim that God 'attached' certain properties to virtue just means that he created human beings in such a way that these states of character would be both good for others and good for the virtuous agent. In that case the sanction might be treated as an essential part of virtue and human nature, not something externally attached as a chain is attached to a key.

But if we say this in support of Cumberland, we raise a more basic question about his appeals to divine legislation. As Suarez points out, claims about natural law and the will of God need to distinguish the creative from the legislative will of God. The fact that there are human beings, creatures for whom justice and benevolence are good, depends on God's will as creator; and if morality depends on human nature, the fact that these actions are morally required depends on God's having created rational animals rather than limiting the creation to plants and non-rational animals. But these facts do not show that morality depends on God's legislative will; for since facts about creation are facts about created nature, they are facts about how things are in their own right, apart from any further legislative act of God.

Some of Cumberland's arguments for his legislative thesis about morality seem to be open to this objection from Suarez. The fact that actions have natural consequences affecting our welfare does not show that God is a legislator, or that moral goodness depends on God's communicating divine law through a command. But Cumberland seems to confuse legislation with creation in his claims about sanctions. The fact that virtue has certain sanctions 'attached' to it, in the broad sense of 'attached' that covers essential properties, shows nothing about God's legislative will. It is simply a fact about the natures of created things.

Exploration of Maxwell's objections, therefore, reveals a serious difficulty in Cumberland's position. Maxwell claims that since morality is good and obligatory in itself, it possesses its goodness and its obligatory character independently of the sanction attached by divine legislation. He may have misunderstood Cumberland's broad use of 'sanction' and 'attach'. But if we allow Cumberland a broad enough use of these terms to answer Maxwell, we also cast doubt on Cumberland's claims about the extent of divine legislation in morality. For a broad use of 'sanction' includes non-legislative 'sanctions' that come from God as creator; the presence of these sanctions does not show that morality depends on divine legislation. The confusion between divine creation and divine legislation may be present in Grotius,

but it does not undermine his main argument.[46] In Cumberland, and even more clearly in Pufendorf, the confusion creates spurious support for a legislative conception of morality.[47]

538. Divine Goodness and the Stability of Morality

Though Cumberland does not know Cudworth's *Eternal and Immutable Morality*, he considers the objection to voluntarism that Cudworth implies in his title.[48] According to Cudworth, a legislative account of morality makes morality mutable in the wrong way, since it implies that if God had legislated differently, it would have been right (e.g.) to murder, cheat, and torture, and that therefore morality is mutable in relation to divine legislation. Cumberland answers that the law of nature is mutable only in relation to human nature (as Cudworth agrees), not in relation to any possible change in God's legislation; hence it is eternal and immutable in the way that Cudworth claims it is. It depends on the divine will only insofar as the maintenance of creation depends on the divine will; but—though Cumberland omits this point—that sort of dependence on God's creative will is different from dependence on God's legislative will.[49]

Cumberland's argument to show that morality is as immutable as human nature conflicts with Ockham's view that God is free to change what accords with human nature, and with Scotus' view that God is free to command us not to act in accord with human nature.[50] In his view, God necessarily wills that we act in accord with our nature, and therefore necessarily wills the common good of rational beings (with 'good' understood in a non-moral sense).[51]

Hence the natural law is not the product of the arbitrary will of God. Divine legislation reflects the divine goodness and wisdom that give God a right to rule and to legislate. Since the goodness of the common good recommends it to God as an end, God necessarily legislates that we promote the common good.[52] In doing so God manifests goodness, benevolence, and the other virtues.[53] Cumberland does not suggest that the natural law

[46] On Grotius see §465. [47] On Pufendorf see §566.

[48] Cumberland's connexions with Cambridge may have informed him of Cudworth's views, even if not of his writings.

[49] 'All considerate persons, therefore, I believe, will think, that I have proved the law of nature sufficiently immutable, when I have shown, that it cannot be changed without contradiction, whilst the nature of things, and their actual powers, (which depend upon the divine will,) remain unchanged.' (Cumberland, *LN* 5.23 = P 545)

[50] See §384 on Scotus; §397 on Ockham. [51] Cf. Pufendorf, §580.

[52] '... the dominion of God is a right or power, given him by his own wisdom and goodness, as by a law, for the government of all those things which ever have been, or shall be, created by him. In the divine wisdom is necessarily contained a dictate to pursue the best end by the necessary means; and in the goodness or perfection of the divine will is by a like necessity included a ready consent to promote the same. And these, by a natural analogy, answer to a ratification of the divine law, whence the divine dominion may take its original' (7.7 = P 673). 'For since he himself is rational, and it cannot be conceived how he can act rationally without proposing an end to himself, nor can there be a greater end than the aforesaid aggregate of all good things; we cannot but think he judges this to be the best end he can propose to himself. Nor is it to be doubted, but that the most perfect being will pursue that end which he has rightly judged to be the best, all circumstances rightly considered. For no reason can be assigned why he should stop short of it; nor can the most perfect will act without reason, much less against it. For although here the obligation of a law properly so called, which proceeds from the will of a superior, has no place, yet that perfection which is essential to him and invariable will invariably determine his will to concur exactly with his omniscient understanding. For it implies a contradiction that the same will should at once be divine, or most perfect, and disagree with the most perfect dictates of the divine understanding.' (5.19 = P 537–8)

[53] 'I choose the rather to observe that, from what I have proved concerning the reason and end of God, may be demonstrated that benevolence, justice, equity, and those other attributes which have any analogy with human virtues,

depends on the contingent fact that God is benevolent. If this were a contingent fact about God, it would also be a contingent fact that God legislates rules that promote the common good of rational agents; for if God were malevolent, rules designed to cause suffering to rational agents would be morally right. To avoid making rightness dependent on the arbitrary will of God, Cumberland insists that God is essentially good, and therefore is not free to legislate evil.

In attributing this character to God, Cumberland raises a familiar difficulty that confronts voluntarists: what do they mean in attributing goodness to God? If we say that God is morally good because God's actions are morally right, we can hardly mean that God obeys a law imposed by a superior, since God has no superior. We also face difficulties if we say that God's actions are right because they conform to God's legislation; for if we say that, we must say that they would still be right if God legislated differently and commanded us to act against the common good of rational beings. Apparently, we have to say that God's actions are morally right because they conform to a divine law prescribing promotion of the common good. But even this account of their rightness is not quite satisfactory. For we also believe that God acts rightly in legislating the natural law; since God does not act in conformity to a second divine law (which would lead us into an infinite regress), this morally right action seems to be right independently of legislation.

Cumberland might avoid these difficulties for his legislative account of morality if he gave up his claim that God is morally good and that God's action in legislating pursuit of the common good is morally right. He believes that practical reason, independently of any legislation, requires pursuit of the common good. Hence he might say that God is essentially rational, and so prescribes pursuit of the common good, because of an essentially rational will, though not because of a morally good will.

539. The Authority of Divine Legislation

Cumberland faces a related difficulty in explaining why we ought to obey God. If we claim that morality consists in acting according to a divine command, we need to explain why we are morally required to obey divine commands. If God issued a second-order command to obey all other divine commands, that would not answer our question, since we could ask the same question about the second-order command. If we believe that God has the right to command because God is essentially wise and good, we imply that we ought to obey a commander who is essentially wise and good. But this requirement seems to be antecedent to any command.

This is the basis of Maxwell's criticisms of Cumberland's account of God's authority. He argues that the authority of a human ruler is based on two conditions: (1) the necessity of rule for achieving the public good, and (2) the legitimacy of the ruler, making it right for us to obey. According to Cumberland, this second condition is established by reference to a divine command requiring obedience to the laws of nature that enjoin actions necessary for the public good.

are actually to be found in God and in his actions, and that it is therefore his will to govern men by precepts guarded with rewards and punishments; . . .' (5.20 = P 538)

But, as Maxwell sees, we cannot rely on the same two conditions to show that God is a legitimate ruler. For God's right to command us to do what is needed to promote the public good cannot be derived from any higher authority than God; hence (according to Cumberland's view of legitimacy) God is not a legitimate ruler. God's title to rule must rest entirely on the first condition; since we care, for non-moral reasons, about the promotion of the public good, and obedience to God's commands allows us to promote the public good, we have a non-moral reason to obey God's commands. Hence God's authority is less firmly established than the authority of human rulers.[54]

We might try to reply on Cumberland's behalf by deriving God's authority from the intrinsic rightness, rather than the non-moral attractiveness of promoting the public good. This would constitute a rationalist defence of God's authority. But it exposes Cumberland to a further objection. For if this intrinsic rightness is intrinsic moral rightness, it seems to presuppose morality antecedent to any law of God, since it cannot depend on divine legislation. Maxwell's objection, therefore, though it at first seems unfair, identifies a weakness in Cumberland's position.

Maxwell believes that we can avoid this fault in Cumberland's position only if we recognize a moral obligation—antecedent to any divine commands—to obey divine commands. Hence, in Maxwell's view, we must abandon Cumberland's voluntarism.[55] This argument for the priority of justice to law is very similar to Cudworth's argument against Hobbes; for, while Cumberland seeks to refute Hobbes, he still accepts some of the basic elements in Hobbes's position. Maxwell argues that Cumberland fails to recognize that divine rewards and punishments presuppose the rightness and wrongness of certain courses of action, and so cannot create it. Price endorses this objection to Cumberland.[56]

These observations on Cumberland support a general attack on voluntarism. Maxwell especially criticizes Jeremy Taylor for his endorsement of Ockham's position on divine commands and moral rightness.[57] Maxwell believes, as Cudworth does, that a voluntarist

[54] 'To this assumed dominion and sovereignty, assumed merely from necessity of common good and in order thereto, he cannot obtain our subjection, save only from necessity of the common good, and in order thereto. But if this is the whole of the divine dominion and sovereignty, he is far from having the most supreme dominion possible, which the Deity must have . . . ' (App. §3(9) = P 810)

[55] 'In this [sc. Cumberland's] scheme of the law of nature, agreeably to its notion of good, the due order of reasoning and of our obligation is inverted. For, antecedently to the law of endeavouring the common good, there is an obligation upon mankind, and therefore a law, of conscientious subjection and obedience to the authority of the lawgiver. He would not make this law for them, if they were not antecedently under such an obligation, if he could not claim subjection and obedience from them. Their subjection to this the supreme lawgiver is, therefore, the first law of nature.' (App. §3(12) = P 813–14)

[56] See Price, *RPQM* 114–16, discussed in §818.

[57] 'A mistake, touching the rule and measure of good and evil, of greater importance than any of these, is this; that the arbitrary will of God is constitutively the adequate rule and measure of good and evil, just and unjust, and that nothing is good or evil, but because it is commanded or forbidden.' Maxwell now illustrates this mistake by quoting two passages from Taylor's discussion of natural law: 'With which absurd notion Bp Taylor (*DD* b2 c1 n4, 52, 58) falleth in, affirming, "that nothing is just or unjust of-it-self, until some law of God or man doth supervene. God cannot do an unjust thing; because whatsoever he willeth or doeth, is therefore just, because he willeth and doeth it, his will being the measure of justice. [Though Maxwell treats "that nothing . . ." as a quotation from Taylor, the actual quotation begins only with "God cannot . . .". See *DD* ii c1 rule 1, #52 = *Works* xi 224.] It is but a weak distinction, to affirm, some things to be forbidden by God, because they are unlawful, and some to be unlawful because they are forbidden. For this last part of the distinction taketh in all that is unlawful in the world, and therefore the other is a dead member, and may be dropped off. So Occham affirmeth, against the common sentence of the schools (as his manner is,) nullus est actus malus, nisi quatenus a Deo prohibitus est, et qui non potest fieri bonus, si a Deo praecipiatur et e converso: every thing is good or

conception of natural law is an aspect of the position that also takes the eternal truths to depend on God's choice; for 'if truth is of so indeterminate a nature, good must be as arbitrary, as some say' (App. §7 = P 843).[58] The voluntarist position is 'absurd' because it undermines the basis of the law that voluntarists take to be the foundation of moral obligation.[59]

In Maxwell's view, as in Cudworth's, the voluntarist position conflicts with the facts about the honestum.[60] He rejects the voluntarist claim that legislation can make something genuinely honestum. His argument seems to be this: (1) The honestum is good in its own right and because of its own nature. (2) If legislation is the sole source of the honestum, it must make some actions good in their own right. (3) But if something is good in its own right, it is good independently of being commanded or legislated. (3) Legislation cannot make something good independently of being legislated. (4) Hence legislation cannot be the sole source of the honestum.

This argument does not show that Cumberland could not be right about natural law being the product of divine legislation. It shows at most that natural law cannot be the sole source of moral goodness, if moral goodness consists in honestas. If one wants to maintain Cumberland's position, one needs to deny the first step of Maxwell's argument. Cumberland, therefore, agrees that some things are good in their own nature and apart from legislation, and denies that these include honesta. But his position is difficult to maintain. For we are confident that God has imposed the right laws because we assume that the actions required by these laws are already honesta, morally good in their own right. Maxwell's argument suggests, therefore, that Cumberland must reject more of our basic beliefs about morality than he admits.

Since he rejects Cumberland's voluntarism, Maxwell also rejects his explanation of the immutability of the natural law.[61] If natural law depended on divine legislation, it could

bad, according as it is commanded or forbidden by God, and no otherwise.'' [The previous sentences are from *DD* ii c1 rule 1, #58 = 226] These sayings are attended with a self-contradiction (*DD* ii, c rule 9 n 12), ''that it is actually and indispensably necessary, that we love God, and that he cannot command us to hate him.'' ' (App. §7 = P 842–3)

Taylor believes that an appeal to a natural or rational basis for morality introduces too much uncertainty, and that we avoid such uncertainty by relying directly on the revealed will of God. He recognizes that the natural law has a rational basis: 'And when wise men say This is naturally understood: it must mean thus, naturally men find it reasonable, but not naturally to be a law; naturally the consent to it, but not naturally find it out, or naturally we may be instructed, but not naturally bound; but when God changes science into conscience, then he makes that which is reasonable to become a law.' (ii rule 1, §40). Taylor ignores the questions that are raised, e.g., by Sanderson (discussed in §557).

[58] He cites Descartes in this connexion, §7 = P 843.

[59] 'According to this scheme, law is supposed to make justice, whereas, without antecedent justice, it is impossible, that there can be any made law. For no law can be made, but by one, who hath right to be obeyed, and to whom obedience is due; right and due obedience, and consequently just and unjust, is necessarily antecedent to any made law. If nothing is unrighteous but by a made law, mankind must be considered as perfectly at liberty and un-obliged, antecedently to that law; and if we suppose them to be perfectly at liberty and un-obliged, then that law could not oblige them; for no command or prohibition can oblige them to obedience who are persons perfectly at liberty and unobliged.' (Maxwell, App. §7 = P 843)

[60] 'Bonum honestum or virtue is not a mere name, but hath its proper specific nature, which is the beauteous-beneficial [i.e., *kalon kagathon*] practice, as is already proved; which it is as certain that this name [virtue] denotes, as that the word [man] denotes a rational animal. . . . Moral good is therefore the beauteous-beneficial practice essentially and in its own nature, and consequently it is necessarily, unchangeably, eternally so. . . . hence it appeareth that the good in morality is that which is essentially and in its own nature such, and is not a matter of arbitrary determination.' (App. §8 = P 844–5) Perhaps Clarke is Maxwell's source for the claim about essences. But cf. §547 on Cudworth.

[61] 'The law of nature therefore, besides that it is imposed by a superior authority, appeareth to be a comprehension of what is, in its own nature, matter of law or obligation, antecedently to that authority; whence three honorary

be changed by a change in divine legislation, whether or not divine legislation will in fact change. If we make natural law depend on divine law in this way, we reverse their proper order; for the legitimacy of divine legislation presupposes an independent natural law giving God the right to legislate.[62]

If we recognize rightness independent of divine law, we also allow the possibility of a non-mercenary love of God as a morally perfect being, not simply as supremely powerful. Maxwell takes himself to be avoiding the extravagant appeals of 'enthusiasts' who claim to be moved by the disinterested love of God, and their 'rational' opponents who over-emphasize the pursuit of non-moral rewards. He agrees with Shaftesbury's efforts to defend the disinterested love of God without endorsing any harmful and irrational 'enthusiasm'.[63] In his view, we can maintain this position only if we recognize moral rightness independent of divine legislation.

540. Morality and Practical Reason

One might argue that Maxwell's objections to Cumberland ignore the differences between Cumberland's moderate voluntarist position and the more extreme voluntarism of Ockham or Hobbes. For Hobbes, the question about why we ought to obey God is easily answered. He derives the obligation (and hence motivation) to obey God from God's overwhelming power; he recognizes no distinction, for moral purposes, between power and authority (or legitimacy). Cumberland agrees with Cudworth in rejecting this basis for the moral requirement to obey God.[64]

Maxwell points out that it is difficult to find any genuinely moral basis for the requirement without violating Cumberland's legislative conditions for morality. But Cumberland might appeal to God's essential reasonableness; though we have no moral obligation, strictly speaking, to obey divine commands, we recognize a rational requirement, since we

attributes necessarily belong to it, immutability, eternity, universality, which Cicero hath conjoined. "All nations are at all times within the extent of one law sempiternal and immutable. In opposition to its immutability, which is generally acknowledged by philosophers, lawyers, and divines, some dispute (or rather loosely declaim), that the laws of nature can be dispensed with by divine power. But these will have (what none will allow them) an altering the case and a changing the matter, to be a dispensing with the law."' (App. §11 = P 854) A footnote to 'some dispute . . .' cites Taylor, *DD* ii1 rule 9. Taylor appeals to dispensations in support of voluntarism: 'I am willing publicly to acknowledge that I was always, since I understood it, a very great enemy to all the questions of the Schools which inquire into the power of God . . . But yet here I am willing to speak in the like manner of expression, because the consequent and effect of it goes not to a direct inquiry concerning the divine power; for it intends to remonstrate that because God does actually dispense in his own law, this prime law, or the law of nature, is nothing else but the express and declared will of God in matters proportionable to right reason and the nature of man.' (rule 9 §1) The last phase ('in matters . . .') agrees with naturalists that the natural law in fact prescribes what accords with reason and nature. Maxwell goes on to discuss polygamy and other alleged cases of dispensation.

[62] 'But, antecedently to this obligation from superior authority, it is of an obligatory nature, and must be considered as what is, in its own nature, matter of law, or of obligation; for, that this law is of this nature, will appear, as from other considerations, so from a due explanation of the good, which it requireth, and of the evil, which it forbiddeth.' (App. §1 = P 796)

[63] He quotes a long passage from Shaftesbury; see §611.

[64] As Whewell, *LHMPE* 54, notices, Cumberland does not say much about post-mortem rewards and punishments, though he mentions them. A fuller statement appears in the first of the introductory essays bound with Maxwell's translation; see §671.

believe it is reasonable to obey a wise and reasonable commander who prescribes actions promoting the common good. Cumberland can save his legislative account of morality if he rejects non-legislative moral requirements in favour of requirements of practical reason.

But if we defend Cumberland's legislative account of morality by these appeals to non-moral practical reason, we raise a deeper question about his position. Why should we not simply by-pass morality, as he conceives it, in favour of the requirements of practical reason? These are the requirements that Suarez attributes to intrinsic morality; Cumberland denies that they belong to intrinsic morality because they are independent of divine legislation, but his reasons for insisting that morality requires obligation (in the narrow sense) and legislation are not clear.

He might claim that, as Culverwell suggests, practical reason without legislation lacks the compulsory character that we ascribe to morality. But this claim would be difficult to defend in the light of the role that Cumberland ascribes to practical reason. He surely believes that it is compulsory, in whatever sense morally right action is compulsory, for us to obey God's commands; but if this requirement is not based on legislation, the compulsory character of morality does not depend on legislation. Similarly, the requirement on God to prescribe pursuit of the common good seems no less stringent than the requirement on us to promote the common good.

If, then, we are moved by the requirements of practical reason to promote the common good and to obey divine legislation that promotes it, we seem to recognize the stringency of moral requirements. Should we not identify moral rightness with action on the demands of practical reason? If Cumberland agreed, he would return to the Scholastic belief in intrinsic morality. Though he criticizes the Scholastic position for ignoring the legislative aspect of morality, the role that he assigns to practical reason brings him closer to the Scholastic position than he recognizes. His voluntarism implies that the promotion of the common good of rational agents would not be the supreme principle of morality unless it had been commanded by God. But he seems to agree that, apart from any divine command, it is recognized as the supreme principle of practical reason. He must claim, then, that this supreme principle, even though it is impartially concerned for the good of rational agents, is not a moral principle until God has commanded it. It is difficult to justify this restriction on the scope of morality.

Maxwell concludes that we can maintain the legitimacy and authority of divine legislation only if we accept a naturalist view of natural law.[65] He agrees with the position of Vasquez and (apparently) of Cudworth, who take natural law and its obligation to precede any divine command. Maxwell does not consider the 'intermediate' position of Suarez, who argues that law and obligation rest on commands, but moral right and wrong do not. Maxwell seems to agree with Cumberland and Pufendorf in taking morality to be inseparable from moral obligation, and so he does not consider the possibility that morality might be distinguished from moral obligation. Suarez's position would avoid the faults that Maxwell sees in Cumberland as well as Maxwell's more extreme naturalism answers them. The most

[65] 'The law of nature, therefore, is the comprehension of what is in its own nature matter of obligation, and ought to be, abstracted from the preceding authority of command, or the subsequent sanctions of rewards and punishments.' (Maxwell, App. §11(3) = P 859–60)

serious objections that face Cumberland arise from his rejection of intrinsic morality; but his emphasis on practical reason raises the legitimate suspicion that he appeals to intrinsic morality after all.

These aspects of Cumberland's position make it intelligible that different people react differently to its voluntaristic and naturalistic elements. On the one hand, Maxwell treats him as a voluntarist; Cumberland gives him the occasion for a general attack on voluntarism, and he believes that some of his attack applies to Cumberland. On the other hand, Clarke cites Cumberland in support of his own naturalist position; though he quotes quite selectively, his quotations pick out a genuine element in Cumberland's view. Though Cumberland defends some elements of voluntarism against Grotius and the Scholastics, his arguments against Hobbes bring him closer to naturalism than he recognizes.

40

CUDWORTH

541. Cudworth's Place in the History of Moral Philosophy

Cudworth died in 1688, but his main work on moral philosophy, *A Treatise concerning Eternal and Immutable Morality*, was not published until 1731. The first major moral philosopher who is clearly influenced by this book is Price.[1] Cudworth's *Treatise of Freewill* was published only in 1838. These facts about his posthumous works, however, may give a misleading impression of Cudworth's influence on the development of ethical thought. For Locke and Clarke may have been acquainted with Cudworth's main ideas, either through reading his manuscripts or through oral dissemination of 'Cambridge Platonism'.[2]

The fact that Cudworth exercised his direct and indirect influence on ethical rationalists may give a one-sided impression of his contribution.[3] Some historians place him in a Cambridge Platonist tradition of which Culverwell is presented as an earlier member. It is appropriate to connect Cudworth with Culverwell, but it is doubtful whether the connexion lies in their Platonism. It is Culverwell's Scholastic Naturalism, rather than his supposed Platonism, that provides the right context for understanding Cudworth's main arguments.[4] The Scholastic aspects of Cambridge Platonism were recognized by Anthony Tuckney, a rigid Calvinist. Tuckney's letters to Benjamin Whichcote show that Tuckney was disturbed by the deviations he saw in the outlook of Cambridge Platonism; he attributed these deviations to a preference for the study of Scholastic philosophy over the Scriptures.[5]

[1] Price; see §802.

[2] On Locke and Cudworth see §555. Scott, 'Introd.' 59–62, presents a series of alleged parallels between Cudworth and Butler. None of them suggests the direct influence of Cudworth on Butler; they can all be explained by reference to Clarke. But they are evidence of similarity between Cudworth and Clarke.

[3] Passmore, *RC* 100–3, argues that Cudworth's position is more sentimentalist than purely rationalist. Hence he connects Cudworth with Shaftesbury as well as with Price, and argues that Price misunderstands him.

[4] On Culverwell see §558.

[5] These informative letters appear in Whichcote, *MRA*, App. In his second letter Tuckney says he has heard that 'you in a great measure for the year laid aside other studies, and betook yourself to philosophy and metaphysics, which, some think, you were then so immersed in, that ever since you have been cast into that mould, both in your private discourse and preaching, both for words and notions; both which, I fear, have rendered your ministry less edifying . . .' (36). He mentions that in Cambridge Whichote was influenced by Field, Jackson, and Hammond: 'Whilst you were fellow here, you were cast into the company of very learned and ingenious men, who, I fear, at least some of them, studied other authors more than the Scriptures; and Plato and his scholars above others: in whom, I must needs acknowledge, from the little insight I have into them, I find many excellent and divine expressions . . . And hence in part hath run a vein of

Cudworth's reflexions on both free will and morality may have been stimulated partly by Hobbes, whom he often quotes. Hobbes intends his views on the will and its freedom to undermine Scholastic intellectualism and rationalism. He intends his account of morality to undermine the Scholastic view, stated by Suarez, that the morally right is what is appropriate to rational nature. Cudworth tries to refute these two aspects of Hobbes's attack on the Scholastic position.

To understand Cudworth in this way is not to imply that he is a thoughtless or uncritical supporter of Scholasticism. Like Simon Patrick, he thinks of Platonism as a way of compensating for the defects of Scholastic Aristotelianism as a defence of orthodox Christianity.[6] But he takes himself to defend Aristotle as well. On the crucial points about the freedom of the will and the natural character of morality, he believes Aristotle is right and Hobbes is wrong. Hobbes's errors reflect not only a mistaken approach to ethics, but also a mistaken approach to basic questions of epistemology and metaphysics. His position is a revival of the 'Democritic doctrine' that Cudworth sees in ancient atomism and empiricism. In Cudworth's view, the ancient doctrine of Democritus and Epicurus, recently revived by Gassendi and Hobbes, rests on an indefensible metaphysics. Hence *Eternal and Immutable Morality* begins and ends with discussion of ethics, but includes a long defence of rationalism in general.[7]

doctrine which divers very able and worthy men . . . are, I fear too much known by.—The power of nature in morals too much advanced—Reason hath too much given to it, in the mysteries of faith—A recta ratio much talked of, which I cannot tell where to find—Mind and understanding is all; heart and will little spoken of—The decrees of God questioned and quarrelled, because, according to our reason we cannot comprehend how they may stand with his goodness, which, according to your phrase, he is under the power of . . . A kind of moral divinity minted, only with a little tincture of Christ added; nay, a Platonic faith unites to God.' (38)

In his second letter Whichcote replies to Tuckney by denying that he has studied the suspect divines and schoolmen as much as Tuckney alleges: 'I should lay open my weakness if I should tell you how little I have read of the books and authors you mention: of ten years past, nothing at all. . . . And for schoolmen, I do not think I have spent four and twenty hours in them divisim these fourteen years. . . . and truly I have more read Calvin, and Perkins, and Beza, than all the authors, books, or names you mention.' (53) Tuckney, however, does not let the point drop. In his third letter he says more precisely whom he includes among Schoolmen: '. . . as to that about the Schoolmen, when I spake of them, I understood not only that narrower compass of them which some make from Albensis to Biel, but so as to take in Vasquez, Suarez, and other later authors of that kind; your perusing of whom so little in so many years, but that you say it and I believe you, I cannot but wonder: and must conclude that either those few hours of your converse with them made a very deep impression in you, moulding you much that way, or as "nascitur non fit poeta", that the natural frame of your head was much in that channel, which must keep us from wondering or finding fault if in your discourse the streams do so much answer the fountain.' (58) (For 'Albensis' Jeffery conjectures 'Alensis' (i.e., Alexander of Hales) or 'Albertus' (i.e., Albertus Magnus).) Whichcote does not answer this point about the later Scholastics, and does not deny the similarity of his views to theirs. Tuckney mentions both the Platonic and the Scholastic character of Whichcote's views; he does not suggest that Whichcote draws on one source rather than the other.

On the influence of Suarez cf. the life of Isaac Barrow, in *Works* i (unpaged). Barrow was appointed a lecturer in geometry at Gresham College, but '. . . when he commented on Archimedes, he did not forbear in discourse to prefer and admire much more Suarez for his book De Legibus . . .'.

[6] On Simon Patrick see §527.
